ABSTRACT

To introduce a Back propagation Artificial Neural Network (BP-ANN) framework for addressing Multi-Attribute Group Decision-Making (MAGDM) problems, which extends the capabilities of conventional fuzzy and intuitionistic fuzzy approaches. The proposed model effectively manages uncertainty and hesitation in decision-making contexts by integrating numerical feature inputs with a trainable feed forward neural network structure. The framework employs a feed forward Back propagation ANN with multiple layers (hidden), trained with Adam optimizer and Mean Squared Error (MSE) loss. Input features are normalized using Min-Max scaling, allowing the network to learn complex non-linear relationships among alternatives. Unlike previous models relying on static aggregation or perceptron learning, the BP-ANN dynamically adjusts weights during training, providing accurate prediction of quality scores for each alternative. Error convergence is monitored across epochs to ensure optimal training and avoid overfitting. The model produces predicted quality scores for all alternatives, which are then used to rank them effectively. Experimental results demonstrate that the BP-ANN achieves fast and stable convergence, providing interpretable and precise rankings even with small datasets. Highlighting the best epoch and analyzing the convergence curve allows for transparent assessment of the network's learning dynamics. This work extends MAGDM methodologies by embedding prediction-based ranking within a Back propagation ANN framework, combining computational efficiency with interpretability. The integration of error convergence visualization adds clarity to training behavior, making the model suitable for decision-making scenarios with multiple attributes and uncertain inputs.

Keywords: ANN, Back propagation, MAGDM, DSS, Linguistic IFS.

INTRODUCTION

Deep Learning (DL) techniques, particularly Artificial Neural Networks (ANNs), have found extensive applications across domains such as image processing, speech recognition, predictive analytics, medical diagnostics and deep learning[1], [2], [3], [4], [11], [12], [14]. Beyond these fields, ANNs serve as effective tools in Decision Support Systems (DSS), where they facilitate ranking alternatives based on multiple criteria, especially when attributes reflect differing opinions among decision makers [6] and [29]. Complementing this, operational research methods have provided innovative solutions for decision-making challenges in higher education, production planning, and resource allocation [8], [21], highlighting the adaptability of computational intelligence in practical decision scenarios. The integration of ANNs with Multi-Attribute Group Decision Making (MAGDM) is particularly promising, as both approaches rely on input vectors and weight matrices to derive outcomes. Traditional ranking methods, such as TOPSIS, emphasize the proximity of alternatives to ideal solutions [18], [20], [31], [32], [34] and [35] whereas ANNs dynamically adjust weights during training, capturing complex non-linear relationships among alternatives. The authors Harishree and Robinson [13], proposed a novel neural perceptron framework for tackling intuitionistic fuzzy linguistic MAGDM complexities. To address uncertainty and hesitation in decision-making, extensions of fuzzy-based techniques—including interval-valued spherical fuzzy sets and fuzzy relational maps—have been proposed [10], [16], [26], [33]. Moreover, the use of linguistic and intuitionistic fuzzy data has gained considerable attention, enabling more nuanced and qualitative modeling of decision preferences [7], [18], [19], [22], [23], [36] and [37].

ANNs have also demonstrated practical utility in applications such as predicting student performance using Random Forests and neural models [30], regression-based pollution analysis [15], and other optimization and classification tasks [5], [9], [17]. In MAGDM contexts, the combination of ANN with novel aggregation operators allows for systematic integration of multiple criteria, producing reliable and interpretable rankings [24], [37]. Defuzzification functions facilitate the conversion of linguistic or fuzzy inputs into quantitative vectors suitable for ANN processing, ensuring both precision and transparency. This study proposes a Back propagation ANN framework for MAGDM, where alternatives are assigned predicted quality scores and ranked accordingly. Input features are normalized using Min-Max scaling and processed through a feed forward ANN with multiple layers (hidden), trained where the optimizers found in this research are Adam optimizer and MSE loss [3], [4]. Training behavior is monitored through error convergence curves to identify the best epoch, ensuring stable and interpretable learning. By integrating predictive modeling with systematic ranking, this framework provides a robust and efficient approach to multi-criteria decision-making under uncertainty [3], [4], [7], [18], [19], [27], [28],[37]. Even though in the past there were many different models to handle MAGDM problems, the application of ANN in the field of Linguistic IFS is still to be explored. Hence, this paper proposes a comprehensive Back propagation package to handle MAGDM problems under LIFS environment.

PRELIMINARIES

Here, some basic arithmetic operations for LIFNs will be presented.

Definition: Let $\tilde{\sigma}_1 = \langle H_{\theta(\sigma_1)}, (\alpha(\sigma_1), \gamma(\sigma_1)) \rangle$ and $\tilde{\sigma}_2 = \langle H_{\theta(\sigma_2)}, (\alpha(\sigma_2), \gamma(\sigma_2)) \rangle$be two LIFNs and $\lambda > 0$. Then the operations of LIFNs are defined as:

$\tilde{\sigma}_1 + \tilde{\sigma}_2 = \langle H_{\theta(\sigma_1)+\theta(\sigma_2)}, (\alpha(\sigma_1) + \alpha(\sigma_2) - \alpha(\sigma_1)\alpha(\sigma_2), \gamma(\sigma_1)\gamma(\sigma_2)) \rangle$,

$\tilde{\sigma}_1 \otimes \tilde{\sigma}_2 = \langle H_{\theta(\sigma_1)\times\theta(\sigma_2)}, (\alpha(\sigma_1)\alpha(\sigma_2), \gamma(\sigma_1) + \gamma(\sigma_2) - \gamma(\sigma_1)\gamma(\sigma_2)) \rangle$,

$\lambda\tilde{\sigma}_1 = \left\langle H_{\lambda\times\theta(\sigma_1)}, \left(1 - \left(1 - (\alpha(\sigma_1))^{\lambda}\right), (\gamma(\sigma_1))^{\lambda}\right) \right\rangle$,

$\tilde{\sigma}_1{}^{\lambda} = \left\langle \mathrm{H}_{\upsilon_{(\theta(\sigma_1))^{\lambda}}}, \left(\left(\alpha(\sigma_1)\right)^{\lambda}, 1 - \left(1 - \left(\gamma(\sigma_1)\right)^{\lambda}\right) \right) \right\rangle$.Where $\alpha(\sigma_1), \gamma(\sigma_1)$ and $\mathrm{H}_{\upsilon_{\theta(\sigma_1)}}$ denotes membership, non-membership and linguistic degree of the given LIFN.

Some Novel Aggregation Operator for ANN

Even though there are several measures like Score function and Accuracy function for LIFSs [25] to defuzzify the given data, we may need a special type of defuzzificationfunction that will deal with the impreciseness and vagueness present in the LIFSs. For this purpose, there are two defuzzification functions which will be proposed in the following.

The LinIFWAA Operator: Let $\tilde{\sigma}_s = \left\langle \mathrm{H}_{\upsilon_{\theta(\sigma_s)}}, \left(\alpha(\sigma_s), \gamma(\sigma_s)\right) \right\rangle$ where s, a natural number, be a set of fuzzy numbers with linguistic intuition.The $LinIFWAA: Q^n \to Q$ is defined as: $LinIFWAA_w(\tilde{\sigma}_1, \tilde{\sigma}_2, \ldots, \tilde{\sigma}_n) = c_{rs} = \left(\mathrm{H}_{\upsilon_{\sum_{s=1}^{n} \theta_s w_s}}, 1 - \prod_{s=1}^{n}(1-\alpha_s)^{w_s}, \prod_{s=1}^{n} \gamma_s{}^{w_s}\right)$holding $w = (w_1, w_2, \ldots, w_n)^T$as the balancing vector of $\tilde{\boldsymbol{\sigma}}_{\boldsymbol{s}}$, where s, a natural number, $\boldsymbol{w_s}$ taking values between 0 and 1, and sum of all $w_s{}'s$ equals one.

Theorem 1: Let $\tilde{\boldsymbol{\sigma}}_{\boldsymbol{s}}$, where s, a natural number, be a collection with linguistic intuition type of numbers;then it can be proved that the LinIFWAA operator produces a Linguistic Intuitionistic Fuzzy Number and $LinIFWAA_w(\tilde{\sigma}_1, \tilde{\sigma}_2, \ldots, \tilde{\sigma}_n) = c_{rs} = \left(\mathrm{H}_{\upsilon_{\sum_{s=1}^{n} \theta_s w_s}}, 1 - \prod_{s=1}^{n}(1-\alpha_s)^{w_s}, \prod_{s=1}^{n} \gamma_s{}^{w_s}\right)$,with$\boldsymbol{w_s}$ taking values between 0 and 1 and sum of all $\boldsymbol{w_s{}'s}$ equals one.

Theorem 2: Let $\tilde{\sigma}_s$,where s, a natural number, be fuzzy numbers with linguistic intuition and for $\boldsymbol{w_s}$ taking values between 0 and 1, and sum of all $w_s{}'s$ equals one.The LinIFWAA operator possesses several important theoretical characteristics, namely idempotent, bounded, monotonic, and commutative behavior, which ensure its consistency in aggregation processes.

Theorem 3: Let $\tilde{\sigma}_s$, where s, a natural number, be a fuzzy numbers collection with linguistic intuition and w a balancing vector. Then we have the following:

1. If $w = (1,0,0,\ldots,0)^T$, then $\mathrm{LinIFWAA}_w(\tilde{\sigma}_1, \tilde{\sigma}_2, \ldots, \tilde{\sigma}_n) = \max_s(\tilde{\sigma}_s)$.
2. If $w = (0,0,0,\ldots,1)^T$, then $\mathrm{LinIFWAA}_w(\tilde{\sigma}_1, \tilde{\sigma}_2, \ldots, \tilde{\sigma}_n) = \min_s(\tilde{\sigma}_s)$.
3. If $w_s = 1, w_r = 0$ and $\mathrm{r} \neq s$, then $LinIFWAA_w(\tilde{\sigma}_1, \tilde{\sigma}_2, \ldots, \tilde{\sigma}_n) = (\tilde{\sigma}_s)$, where $\tilde{\sigma}_s$ is the s^{th} largest of $\tilde{\sigma}_s$, where s is a natural number.

The Back propagation Process of ANN

Back propagation is a fundamental algorithm employed to train feedforward Artificial Neural Networks (ANNs) by iteratively refining the network's weights to reduce the discrepancy between predicted outputs and corresponding target values. This process relies on the principle of gradient-based optimization, where the network adjusts its parameters to minimize a defined loss function.

The workflow of the backpropagation algorithm can be summarized as follows:

1. **Initialization:**The network begins with all weights and biases assigned to small random values. This random initialization is crucial to break symmetry and facilitate effective learning.
2. **Forward Propagation:**Input vectors are sequentially processed through the layers of the network. Each neuron calculates a weighted combination of its incoming signals, applies a nonlinear activation function (such as Sigmoid, Tanh, or ReLU), and forwards the resulting value to the subsequent layer. After passing through all hidden layers, the network generates an output, which is then compared with the target value using an appropriate loss function, such as Mean Squared Error (MSE), to quantify the prediction error.
3. **Backward Propagation of Error:** The discrepancy between the actual and predicted outputs is propagated backward from the output layer toward the input layer. During this phase, the algorithm computes the gradients of

the loss function with respect to each weight by employing the chain rule of calculus. These gradients indicate how much each weight contributes to the overall error

4.s**Weight and Bias Adjustment:** Weights and biases are updated by moving them in the direction that reduces the loss. The magnitude of the update is controlled by a learning rate, which determines the step size in the parameter space. Through repeated forward and backward passes over the training dataset, the network gradually converges toward a set of weights that minimize the error, enabling accurate predictions for unseen data.

This formulation ensures that the network progressively learns the complex mappings between inputs and outputs, making backpropagation a robust and widely adopted method for supervised learning in neural network models.

Numerical Illustration

Assume that there are four intervention alternatives $\{\mathbb{K}_1, \mathbb{K}_2, \mathbb{K}_3, \mathbb{K}_4\}$represented as rows in the matrix, to reduce marine plastic pollution. A best intervention must be selected using the following four criteria: Environmental Benefit (C_1) – how much plastic/waste reduction & ecosystem recovery is expected, Implementation Cost (C_2) – total investment needed, Scalability (C_3) – how easily the intervention can scale regionally/globally and Time to Impact (C_4) – months until measurable impact. The Experts' evaluations are provided in the following tables.

$$R_1 = \begin{pmatrix} \langle \mathbb{H}_5, (0.2,0.7)\rangle \langle \mathbb{H}_2, (0.4,0.6)\rangle \langle \mathbb{H}_5, (0.5,0.5)\rangle \langle \mathbb{H}_3, (0.2,0.6)\rangle \\ \langle \mathbb{H}_4, (0.4,0.6)\rangle \langle \mathbb{H}_5, (0.4,0.5)\rangle \langle \mathbb{H}_3, (0.1,0.8)\rangle \langle \mathbb{H}_4, (0.5,0.5)\rangle \\ \langle \mathbb{H}_3, (0.2,0.7)\rangle \langle \mathbb{H}_4, (0.2,0.7)\rangle \langle \mathbb{H}_4, (0.3,0.7)\rangle \langle \mathbb{H}_5, (0.2,0.7)\rangle \\ \langle \mathbb{H}_6, (0.5,0.4)\rangle \langle \mathbb{H}_2, (0.2,0.8)\rangle \langle \mathbb{H}_3, (0.2,0.6)\rangle \langle \mathbb{H}_3, (0.3,0.6)\rangle \end{pmatrix}$$

$$R_2 = \begin{pmatrix} \langle \mathbb{H}_4, (0.1,0.7)\rangle \langle \mathbb{H}_3, (0.2,0.7)\rangle \langle \mathbb{H}_3, (0.2,0.8)\rangle \langle \mathbb{H}_6, (0.4,0.5)\rangle \\ \langle \mathbb{H}_5, (0.4,0.5)\rangle \langle \mathbb{H}_3, (0.3,0.6)\rangle \langle \mathbb{H}_4, (0.2,0.6)\rangle \langle \mathbb{H}_3, (0.2,0.7)\rangle \\ \langle \mathbb{H}_3, (0.2,0.7)\rangle \langle \mathbb{H}_4, (0.2,0.7)\rangle \langle \mathbb{H}_2, (0.4,0.6)\rangle \langle \mathbb{H}_3, (0.3,0.7)\rangle \\ \langle \mathbb{H}_5, (0.3,0.6)\rangle \langle \mathbb{H}_4, (0.4,0.5)\rangle \langle \mathbb{H}_2, (0.3,0.6)\rangle \langle \mathbb{H}_4, (0.2,0.6)\rangle \end{pmatrix}$$

$$R_3 = \begin{pmatrix} \langle \mathbb{H}_5, (0.2,0.6)\rangle \langle \mathbb{H}_3, (0.3,0.7)\rangle \langle \mathbb{H}_4, (0.4,0.5)\rangle \langle \mathbb{H}_4, (0.2,0.7)\rangle \\ \langle \mathbb{H}_4, (0.3,0.7)\rangle \langle \mathbb{H}_5, (0.3,0.6)\rangle \langle \mathbb{H}_2, (0.1,0.8)\rangle \langle \mathbb{H}_3, (0.4,0.6)\rangle \\ \langle \mathbb{H}_4, (0.2,0.7)\rangle \langle \mathbb{H}_5, (0.3,0.6)\rangle \langle \mathbb{H}_1, (0.1,0.8)\rangle \langle \mathbb{H}_4, (0.2,0.7)\rangle \\ \langle \mathbb{H}_3, (0.2,0.7)\rangle \langle \mathbb{H}_3, (0.1,0.7)\rangle \langle \mathbb{H}_4, (0.3,0.6)\rangle \langle \mathbb{H}_5, (0.4,0.5)\rangle \end{pmatrix}$$

Consider the balancing vector from the decision makers, $\boldsymbol{w} = (\mathbf{0.2459}, \mathbf{0.3080}, \mathbf{0.2800}, \mathbf{0.1661})^{\boldsymbol{T}}$.

Using the LinIFWAA operator for the above matrices we have:

$$\boldsymbol{R_1} = \begin{pmatrix} \langle \mathbb{H}_{\mathbf{3.7435}}, (\mathbf{0.3581}, \mathbf{0.5922})\rangle \\ \langle \mathbb{H}_{\mathbf{4.0276}}, (\mathbf{0.3479}, \mathbf{0.5965})\rangle \\ \langle \mathbb{H}_{\mathbf{3.9202}}, (\mathbf{0.2294}, \mathbf{0.7000})\rangle \\ \langle \mathbb{H}_{\mathbf{3.4294}}, (\mathbf{0.3029}, \mathbf{0.5934})\rangle \end{pmatrix}; \boldsymbol{R_2} = \begin{pmatrix} \langle \mathbb{H}_{\mathbf{3.7442}}, (\mathbf{0.2149}, \mathbf{0.6872})\rangle \\ \langle \mathbb{H}_{\mathbf{3.7718}}, (\mathbf{0.2847}, \mathbf{0.5886})\rangle \\ \langle \mathbb{H}_{\mathbf{3.0277}}, (\mathbf{0.2781}, \mathbf{0.6704})\rangle \\ \langle \mathbb{H}_{\mathbf{3.6859}}, (\mathbf{0.3175}, \mathbf{0.5673})\rangle \end{pmatrix};$$

$$\boldsymbol{R_3} = \begin{pmatrix} \langle \mathbb{H}_{\mathbf{3.9379}}, (\mathbf{0.2917}, \mathbf{0.6134})\rangle \\ \langle \mathbb{H}_{\mathbf{3.5819}}, (\mathbf{0.2679}, \mathbf{0.6755})\rangle \\ \langle \mathbb{H}_{\mathbf{3.4676}}, (\mathbf{0.2065}, \mathbf{0.6930})\rangle \\ \langle \mathbb{H}_{\mathbf{3.6122}}, (\mathbf{0.2382}, \mathbf{0.6340})\rangle \end{pmatrix}.$$

ANN with new Linguistic Median Membership (LMM) for LIFNs [13]:

By using the Linguistic Median Membership function (from (1)), we get

$$\boldsymbol{R_1} = \begin{pmatrix} \mathbf{2.2549} \\ \mathbf{2.3897} \\ \mathbf{2.2248} \\ \mathbf{2.0696} \end{pmatrix}; \boldsymbol{R_2} = \begin{pmatrix} \mathbf{2.1360} \\ \mathbf{2.2340} \\ \mathbf{1.8178} \\ \mathbf{2.2181} \end{pmatrix}; \boldsymbol{R_3} = \begin{pmatrix} \mathbf{2.3081} \\ \mathbf{2.0872} \\ \mathbf{1.9908} \\ \mathbf{2.1082} \end{pmatrix}.$$

Let us constitute the input vector for the ANN algorithm.

Pseudocode: Back propagation ANN – Error Convergence

Input: X = feature matrix (Alternatives × Features)
y = target quality scores
Step 1: Normalize Features
X_scaled = MinMaxScale(X)
Step 2: Build ANN
Model = Sequential ANN
Input (Layer) → 4 features
Hidden (Layer-1) → 8 neurons, ReLU
Hidden (Layer-2) → 4 neurons, ReLU
Output (Layer) → 1 neuron, linear
Step 3: Compile Model
Optimizer = Adam (lr = 0.01)
Loss Function = MSE
Step 4: Train ANN
Train Model on X_scaled, y for 300 epochs
Store training loss at each epoch in Loss[]
Step 5: Find Best Epoch
Best_Epoch = index of minimum(Loss) + 1
Best_Loss = Loss[Best_Epoch]
Step 6: Plot Error Convergence
Plot Loss vs Epochs
Highlight Best_Epoch in red
Annotate Best Epoch and Loss
Step 7: Predict Quality Scores
Preds = Model.predict(X_scaled)
Step 8: Rank Alternatives
Sort Preds in descending order
Assign Rank 1 → highest predicted score

Output:
Training Loss Curve - Best Epoch and Loss - Predicted Quality Scores - Ranking of Alternatives.

Training Phase and Error Convergence of the Backpropagation ANN

This algorithm implements a simple backpropagation-based artificial neural network (ANN) to evaluate and rank alternatives. Each alternative (row) is represented by four structural features derived from experimental data. The proposed system minimizes the MSE between the predicted and the fixed-target scores through iterative weight updates using the Adam optimizer. During training, the loss progressively decreases as the network learns the mapping between input features and their respective quality scores. The convergence curve shows how training error approaches zero, indicating effective backpropagation learning and stable network optimization. The annotated "Best Epoch" marks the point of minimal training error, demonstrating the model's most optimal learning phase.

The Output from the Backpropagation Method:

Final Training Loss (MSE): 0.00034579
Predicted Quality Scores for Each Alternative:
₭1: 0.7055
₭2: 0.9046
₭3: 0.8172
₭4: 0.7181

Ranking of Alternatives:
Rank 1: ₭2 (Pred = 0.9046)
Rank 2: ₭3 (Pred = 0.8172)
Rank 3: ₭4 (Pred = 0.7181)
Rank 4: ₭1 (Pred = 0.7055)

Training Phase of the Backpropagation ANN

In this phase, a standard feedforward artificial neural network (ANN) model with backpropagation learning was employed to identify the best-performing alternative among the given input rows. Each row in the input matrix represents an alternative with three numerical attributes. The model was designed as a fully connected feedforward network consisting of an input layer with three neurons (corresponding to the three criteria), a single hidden layer with nonlinear activation (ReLU), and an output layer trained and which also minimizes the reconstruction error between the predicted outputs and the originally computed outputs. Before training, the input data were automatically normalized to the range [0,1] using the MinMaxScaler function to ensure uniform learning across all input dimensions. Normalization prevents features with large numeric ranges from dominating the optimization process and improves the stability of the convergence. The ANN got trained using the MSE loss function and the optimizer called Adam optimizer, which adaptively tunes the learning rate during training to accelerate convergence. The model iteratively updated its weights over a maximum of 300 epochs, and the loss value was recorded at each iteration to monitor the learning progress.

A convergence curve was plotted to illustrate the variation of training loss with respect to the epochs. The point of minimum loss was automatically annotated on the plot to visually indicate the epoch of optimal convergence. This annotation helps in identifying when the learning process stabilized and further training produced negligible improvements. The model's stopping condition was purely based on epoch iteration, allowing a clear visualization of the natural decay of error without the influence of early stopping or dropout mechanisms. The design underscores how backpropagation systematically modifies the weights based on the direction and magnitude indicated by the loss function's gradient.

Interpretation of the Convergence Curve

The convergence curve exhibits a rapid decrease in loss during the initial epochs, indicating that the network quickly learned the major patterns present in the datainputed. As the epochs progress, the loss asymptotically approaches zero, signifying that the network weights have adjusted optimally and the model has achieved minimal reconstruction error. The best epoch, as annotated on the figure, marks the point of lowest mean squared error where further iterations result in only marginal improvements. This behavior demonstrates effective gradient propagation and absence of vanishing or exploding gradients, confirming that the chosen architecture and learning rate were well-suited for the dataset. The near-zero final loss value provides strong evidence of complete convergence, implying that the ANN has perfectly fitted the underlying mapping between the values inputed and the layers in the output. Therefore, the trained network can be reliably used to evaluate or rank the given alternatives based on their feature combinations.

DISCUSSION

The results obtained from the backpropagation-based Artificial Neural Network (ANN) clearly demonstrate its capability to learn and represent the underlying relationships among the input alternatives. Each alternative, defined by three normalized attributes, served as an independent pattern in the training process. The convergence curve revealed a rapid decline in the MSE during the initial epochs, confirming that the network effectively captured the dominant nonlinear relationships within the data. Subsequently, the error plateaued at a value approaching zero, indicating stable convergence and efficient generalization. This behavior reflects the network's successful adjustment of synaptic weights through iterative backpropagation. The steep initial descent corresponds to high gradient

magnitudes, where the model quickly minimizes large discrepancies between the predicted and actual outputs. As training continues, the gradients become smaller, fine-tuning the weights toward a minimal global loss. The annotated "best epoch" on the convergence curve marks the precise point where the learning process achieved optimal performance, beyond which additional training yields negligible improvement. The smooth and stable convergence to a near-zero loss value indicates that the model avoids both underfitting and overfitting. The absence of oscillations or divergence in the loss trend further confirms numerical stability and suitability of the chosen learning parameters — such as the learning rate, optimizer (Adam), and ReLU activation function. The model demonstrates a well-balanced architecture capable of generalizing without excessive complexity. In decision-making contexts, this result implies that the trained ANN can successfully identify or rank the best-performing alternative among the given input rows. The convergence pattern suggests a clear separation between alternatives in terms of their representational weights, making the model an effective computational tool for multiple-criteria evaluation. In future studies, this framework can be extended by integrating hybrid fuzzy or intuitionistic fuzzy components to handle uncertainty in the input data, thereby expanding its application to real-world MAGDM problems.

CONCLUSION

In conclusion, the backpropagation ANN achieved full convergence within 300 epochs, yielding a negligible final reconstruction error. The model's learning trajectory, as depicted in the convergence curve, highlights both efficiency and robustness in weight optimization. The smooth and rapid decay of training loss underscores the network's ability to learn nonlinear mappings from limited input samples with minimal computational cost. Hence, the proposed ANN model is not only effective for identifying the best alternative but also establishes a reliable foundation for advanced hybrid models that combine neural computation with fuzzy decision frameworks. This work validates the integration of backpropagation-based learning with decision analysis, paving the way for interpretable, data-driven decision systems in applied mathematics and bio-inspired computation domains. The present study establishes a robust foundation for integrating backpropagation-based artificial neural networks with decision-making and material evaluation problems. While the current model successfully identified the optimal alternative using normalized XRD-based inputs, its framework can be extended to more complex datasets involving uncertain, imprecise, or linguistic information.

ABSTRACT

Time and safety are two important considerations in our daily lives. The number of accidents in both residential and commercial kitchens has increased recently. Kitchen is such a place frequented by people and the maid of the house for the purpose of cooking and processing foods. The common accidental scenario found in the kitchen is the leakage of gas and catching of the flames. The confined zone of the kitchen room has become very vulnerable for the cooks at home. The accidents can easily affect the persons concerned causing the death in some case seven. The main goal of this research is to leverage the Internet of Things to reduce the likelihood of such fatal incidents or the risks associated with them. IoT solutions, such as monitoring of the entire kitchen, can help prevent these accidents. To put this research into practice, hardware and software will both be used. Hardware-wise Arduino ESP8266, DHT-11,MQ-2,MQ-5,MQ-7,MG-811,MQ-135,LM-35,Servo motors have all been used. From a software standpoint, mobile apps and integrated Node MCU have been used. The system can detect hidden patterns of changes in air quality or fire detection by using machine learning and data mining, which allows to predict the early risk prediction or high-risk situation. In the early detection stage, users can control the home electronics component through the phone but in case of negligence or overlooking the incident, the situation may get worsened further. The kitchen electronics component will perform automatically in order to provide the safety and security for using the system. The potential of the classifier model for identification of the hidden pattern has been estimated with an accuracy value of 99%.

Keywords: Smart kitchen, gas cylinder leak, machine learning, fire detection, wireless sensor network, machine-to-machine

INTRODUCTION

Numerous fatalities with property damage are being caused by domestic gas leakage and house fires. For instance, leaks of natural gas, which is extremely combustible, raise the possibility of fire and may possibly cause an explosion. In addition, breathing in smoke or being exposed to gas leaks at home might result in extremely dangerous respiratory issues. It is true that using an early warning system significantly lowers the number of losses that can be incurred. In order to save lives and property, it is better to detect gas or smoke as quickly as possible. In practice, the first line of defense against these problems is thought to be smoke and fire detection sensors. Most of the standalone (individual units) devices that are currently available on the market are often used as an instantaneous fire incident indicator. The detector itself often sounds or displays a local alert to notify people that an evacuation is necessary [1,2]. As opposed to industrial settings where gas leak and detect the fire are usually continuously checked and connected to the fire station, residential homes currently have very basic solutions that function independently of any local warning to anyone nearby, assuming that someone will be present and able to hear the alarm's sound[3].Given the frequency of residential housing lifestyle instances, like that those involving who are frequently away from home for work or travel, as well as those involving elderly and special needs individuals, a mechanism for remote notifications needs to be used to notify automatically, the appropriate parties, including the homeowner, his neighbours, and the necessary for emergency services. Sensors with server communications may be crucial in handling the earlier cases and averting numerous incidents as a result of the rapid adoption of Wireless Sensor Networks (WSN) technologies and low-cost embedded devices. WSN is a recent development that uses sensor nodes to monitor and control the physical environment [4].

Literature Survey

The rise in importance of kitchen automation research and implementation can be attributed to the introduction of IoT. Different degrees of intelligence have been embedded in kitchens through the use of Bluetooth, Wi-Fi and the cellular networks, which can provide remote data transfer, sensing, and control. Research has demonstrated the use of Android smartphones to create a Bluetooth-based home automation system that is not controlled over the internet.

Major Contributions of the paper.

By carefully reviewing the details above, we can certainly conclude that solutions need to be devised in order to prevent, as much as possible, deaths resulting from exposure to LPG gas. Our objective is to introduce a solution that can be used to avoid such dangers among people.

The actual research contribution of the paper is

1. The elaborate Sensor based system that goes hand in hand with a cutoff facility to ensure the requirements of the data extraction is achieved up to transmitting it to the remote handheld device.
2. The message will reach the required person intact and within safety limits.
3. Alarm the user based on the location of the receiver.
4. Formulating a minimal time of actuating the alarm in the circuit in response to the gas leakage.
5. Identification of the hazards and immediate implementation of measures.
6. The most effective decision making with due regard to the current need.

Research Gap

Currently many works have been in the pipeline towards the development of an IOT based model for detection of gas leakage based on a number of different sensors but the lack of precision in detection of gases has been observed along with the appreciable time gap in transmission of the alert message causing the failure of timely recovery of the situation. The sensing of concerned data along with the transmission of alert message in real-time mode with timely action for recovery is the real challenge to be attained.

Data Flow System

The trajectory of the pertinent variables pertaining to gas leaks, fire incidents in the smart kitchen will be our main emphasis. The following image illustrates the dataflow concept between our architecture's five layers and with distant entities(Fig. 2). Air humidity, air temperature, carbon monoxide (CO), liquefied petroleum gas (LPG), smoke, carbon dioxide (CO2) and flame. Air quality are the characteristics for the data gathering stage that we took into consideration in our study. The sensed data is sequentially sent to the aggregate node, combines it, and sends it to the gateway[21]. For an effective analysis, it is crucial to obtain multi sensing data about the surroundings at every moment. After that, we'll move on to data analytics to forecast environmental changes and unusual situations. Using preset threshold values for the factors we are considering is a simple way to find occurrences. The samples are frequently incomplete data sets in real-world settings, and a small number of attribute values could be inconsistent or missing as a result of problems with the data gathering procedure (such as noise or packet loss). To enhance its quality, the data also undergoes preprocessing. We will go into more detail about this in the Discussion Section. We will employ supervised machine learning for pattern identification in order to increase efficiency and enhance performance over time [16–18]. Then, determining the degree of risk and forecasting unknown facts comprise our primary goal. If an abnormal pattern is predicted, a warning system must be initiated to inform the appropriate parties that certain measures are recommended to proceed to the logical step. In the entire globe, there are basically two methods in which one can utilize gas as well as energy sources. The first one is the use of a gas cylinder and the other one is the gas which is channeled through a pipe. Earlier, it has been mentioned in this context that there are many nations which utilize gas cylinders, while there are some other nations where the gas is supplied over the medium of a pipe to reach the kitchen. As such, in my approach the instructions are quite clear that people who run on gas starting with cylinder also into pipe will be pulled right by aid of the SG90 high torque motor inserted in the knob. This helps in for example easier control of the programmed functions and the necessary assistance needed.

Experiment

We put an early-detection model prototype into practice for a smart kitchen setting. Four eight sensors are used in our prototype to gather data. Airhumidity, airtemperature, CO,LPG smoke, flame, CO2,Ai Quality were all included.

The data from sensors is aggregated using an Arduino ESP8266 device [19], as seen in Fig. 6. sensor to server communication.

- The sensed data is then sent to a ESP8266 Model device, as shown in Fig. 4 c. The matching WSN nodes are joined via the network. Wifyprotocol publish/subscribe mechanisms and topic creation are used to handle the received data [20]. Both a local and remote notification system and a graphical user interface (GUI) for monitoring have been developed.
- Lastly, as seen in Fig. 6, ESP8266 device is employed to simulate the functions that the gateway would command of the event of an incident.

Our studies were carried out over a few days in order to gather relevant data. The sensors have been subjected to a range of environments, gathering information from typical ambient settings to more severe ones involving gas and fire. Data was sent continuously by the aggregate node and sporadically every 10 seconds. As a starting point for comparisons under various circumstances, the sensors were set up with their default parameter settings. In order to notify relevant parties, Another part of the work was to provide an e-mail/Line notification service and to prove the practicability of the prototype. Another edge node, with the particular actuators as output when incidence appears (e.g., fans, LEDs) has been utilized to demonstrate its interface with a number of smart systems among which are smart gas and smart aeration.

RESULTS

Data Acquisition

Over the course of 1 day, we gathered 18,242 sample measurements from the sensors during the data gathering process.Eight values have been counted in each sample, one value from each individual sensor. The frequency of data collection has been maintained at intervals of ten seconds. The information was gathered in both typical and hazardous circumstances. Our experiment under standard conditions is shown in Fig. 6. Over time, all of the sensed data remained comparatively constant. For example, the temperature exhibits a normal day/night pattern, peaking over 18°C, as is typically found throughout the winter months in India. The purpose of this experiment is to provide a baseline for comparison in order to forecast abnormal patterns under extreme circumstances. Table II displays the range values for usual situations. Our experiment under harsh conditions (fire) is shown in Figure 11. The experiment begins under normal circumstances (no fire), and at 13:28, we can see a sharp rise in CO, LPG, and smoke as well as a tiny drop in CO2 (42 PPM). The temperature gradually rises in the interim, reaching 56°C. At 13:32, the temperature approaches the sensor's physical limit and stabilizes. On the other hand, when temperature is at its highest, humidity first rises to 79% before sharply declining to 0%. As of right now, flames have also been observed. At 13:42, the levels of smoke and gas are low for sensors to detect. At 13:54, the fire finally went out, and as seen in Fig. 6, all measures went back to their normal ranges.

Classification By Machine Learning

We acquired a data set assessing the environment in both normal and extraordinary situations from earlier investigations. Whole experiment consists of two parts.In the specified 1st part of the entire procedure no fire but air quality decreases due to leakage of gas and in the 2nd part , the fire gets spread rapidly. Therefore, our goal is to correlate these data in order to identify particular patterns. This will make it easier to identify anomalous patterns in the data and forecast calamities like gas leakage or fires. To do this, we will use various algorithms to our data set and rely on machine learning techniques. A model will be constructed from the training data using the supervised learning approach. Our data set will be labeled so that the amount of risk can be established and tragedy can be avoided when comparable conditions recur. Next, we will categorize our data set into four risk levels: zero, moderate, high, and two. The relevant dataset was then split into two parts: 80% for training and 20% for validation. To raise the accuracy score, we also employed a 10-fold cross validation strategy. In this instance, there are ten equal parts in the training dataset: nine for training and one for testing.It's critical to regularly compare how well different machine learning algorithms work.Six classification algorithms— Linear Discriminant Analysis (LDA),Logistic Regression (LR), Classification and Regression Trees (CART), K-Nearest Neighbors (KNN), Support Vector Machines (SVM) and Gaussian Naive Bayes (NB)—have been assessed in this work using our data set. Fig. 13 shows a box as well as whisker plot showing the accuracy score distribution for each approach over each cross validation fold.These findings show that, with an accuracy of over 99.82%, For our data set, CART has the highest projected score.This indicates that CART merits more research on our issue. It also suggests that, in comparison to the other algorithms, KNN, which has an accuracy of 99.41%, would be a good fit for our investigation.

DISCUSSION

Extreme weather conditions or data loss might cause sensors to measure incorrect data or fail to collect data in some situation where the sensors are subjected to flame or extreme temperatures. The accuracy of the current system may be severely impacted by these types of data losses. The present research offers an analysis to reduce the adverse influences of incorrect values on estimation of the accuracy. In our dataset, we can first exclude any items that correspond to inaccurate or missing values (sample with missing values). In the current study work, the accuracy of the assessed methods utilizing the original data.There are some probable chances of deviation in the accuracy value if too many samples get eliminated. The consequence also give rise to the unreliable analysis and the missing of important data that our classifier requires to distinguish between different risk classes. Therefore, estimating the values of each missing piece of data can be done using the mean imputation technique as an additional solution. The

statistical mean values calculated on the training data sets, is used to replace any missing data. The CART algorithm is the most effective means for estimating accuracy for the data set and its corresponding analyses. The algorithm has the advantage of showing small bias and adaptive nature to the signal strength and direction. In the current work, the cart algorithm has been appointed for the thorough assessment of the concerned accuracy of the CART algorithm's accuracy has been done. The forecasts and test results that are positive in relation to the expected level of risk has been estimated and expressed in terms of confusion matrix. The confusion matrix in Figure 8 indicates that, except five error there are not many false positives in the evaluation. This indicates that the concerned data are misclassified and may be the cause of incorrect risk predictions. The confusion matrix thus made is well balanced showing the good performance trends for the classification. The better response has been achieved The metrics for the classification process report are analyzed in terms of additional information about each class by precision, recall, f1-score, and support. The categorization report displayed in Table III contains the results relating to that report. In table 4, the risk factor levels have been maintained at the sequential levels. It is found from the table that the f1 score corresponding to the risk factor levels 0, 2 and 3 has achieved the maximum values with the average value estimated at the 1. The value interpretation therefore implies that at the high and low risk level the model responds optimally high compared to the case of moderate risk factor. The table 5 expresses the metric related to the classification of the model which shows the good achievement of the model in terms of f1- score. The f1- score estimated for the model is maintained at 1 for all risk levels. This implies that the model response is maintained perfectly similarly at the considerable value for all risk levels.

CONCLUSION

The present work contributes to the safety and security in the kitchen by integrating the leakage of gas and the corresponding fire system in the smart kitchen environment with the help of inexpensive and energy efficient devices. The sensor interprets data and its delivery to the server in real time mode has been implemented based on the standard communication protocols. The efficient dataflow method has been designed in a sensor to serve the home network for collecting pertinent data and sending it to a central location. The number of experiments have been performed under various settings and finally the sensor -equipped prototype has been deployed. The model has been trained with the data collected from the kitchen in the supervised mode. Using variety of techniques , the occurrences of different anticipated patterns have been followed towards the forecasting of the danger and associated risk factors. Additionally, the system can transmit a notification to the users about the appropriate parties in order to take appropriate action. The model can be made more advanced and will be assessed by implementing number of different machine learning algorithms for more improved accuracy of operation. The real time analysis of the data can be traced by using the cloud services in future.

ABSTRACT

Autism Spectrum Disorder (ASD) is a complex neurodevelopmental condition characterized by persistent deficits in social communication and interaction, along with restricted, repetitive behaviour's, interests, or activities. It manifests during early childhood and continues throughout life, impacting an individual's ability to function socially, academically, and occupationally. The global prevalence of ASD has shown a consistent rise, currently estimated at around 1 in 100 children, primarily due to heightened awareness and improved diagnostic tools. The etiopathogenesis of ASD is multifactorial, involving a combination of genetic, neurobiological, and environmental influences that disrupt neural connectivity, synaptic plasticity, and cognitive processing. In Ayurveda, the symptom complex of ASD bears resemblance to Unmada and Vata-pittajavikara, where vitiated Vata dosha and Majjavahasrotasdushti lead to disturbances in manas (mind) and buddhi (intellect). Ayurvedic management, therefore, focuses on dosha pacification, nourishment of the nervous system, and enhancement of medha (cognition) through Medhya Rasayana (nootropic herbs) and Panchakarma therapies. Recent evidence supports the neuroprotective, adaptogenic, and antioxidant actions of herbs like *Brahmi (Bacopa monnieri)*, *Mandukaparni (Centellaasiatica)*, and *Ashwagandha (Withaniasomnifera)*, which contribute to improved attention, memory, and behavior regulation. Thus, combining modern behavioral therapies with

Ayurvedic interventions offers a promising, comprehensive approach to address the multifaceted challenges of ASD. To describe a 6-year-old boy with an ASD diagnosis who is being treated using an integrated strategy that combines contemporary therapies and Ayurvedic treatments, and to evaluate the results using behavioral measures. The Childhood Autism Rating Scale (CARS) and DSM-5 criteria were used to evaluate the youngster. Ayurvedic treatment, including Medhya Rasayana, Panchakarma, and Pathya-Ahara, was used in conjunction with behavioral therapy, speech and occupational therapy, and dietary changes. The child's verbal understanding, eye contact, and social response all showed notable gains after six months. From 38 (moderate autism) to 27 (mild autism), the CARS score decreased. Ayurveda's importance as a supplementary system in neurodevelopmental disorders like ASD was supported by the significant improvement obtained from the integrated approach, which combined evidence-based modern and Ayurvedic treatments.

Keywords: Autism Spectrum Disorder, Ayurveda, Medhya Rasayana, Panchakarma, Behavioral Therapy, Integrative Medicine

INTRODUCTION

The neurodevelopmental disease known as autism spectrum disorder (ASD) is characterized by limited, repetitive behavioral patterns and ongoing deficiencies in social communication[1]. Around 1 in 100 children worldwide are impacted, and its frequency is rising due to improved diagnostic sensitivity[2]. Etiology incorporates genetic, epigenetic, and environmental variables, impacting synaptic connection and neuroplasticity[3,4]. According to Ayurveda, ASD is pathophysiologically related to Unmada (psychic diseases) and Vata-Pittaja Vyadhi, where Manovaha and Majjavaha Srotas are affected by Vata Dosha vitiation, resulting in abnormalities in speech, behavior, and cognition[5,6]. Panchakarma treatments and Medhya Rasayana (nootropic herbs) are used to nourish brain tissues, calm agitated Vata, and reestablish cognitive balance. In this case study, a youngster with moderate autism benefits from an integrative treatment strategy that combines contemporary multidisciplinary therapy with Ayurvedic management.

Case Presentation

Patient Information: A 6-year-old male child presented with complaints of:

- Poor eye contact
- Echolalia
- Lack of social interaction
- Hyperactivity and repetitive behaviors
- Delayed speech and poor comprehension

Birth History: Full-term normal delivery, no perinatal complications
Developmental History: Speech delay, solitary play, sensory hypersensitivity
Family History: No neurodevelopmental disorders
Dietary Habits: Irregular, picky eating

Clinical Findings

- Poor eye contact and social reciprocity
- Limited verbal expression
- Hand-flapping and object spinning
- Mild hypotonia
- Growth parameters: Normal
- Neurological examination: No focal deficit

Diagnostic Assessment
DSM-5 Criteria[7]: Fulfilled for ASD
CARS Score[8]: 38 (Moderate Autism)
IQ (WPPSI-IV)[9]: Mild intellectual delay
EEG, MRI Brain: Normal
Thyroid and Vitamin D: Normal

Intervention
Modern Management
Applied Behavior Analysis (ABA): 1-hour sessions, 5 days/week
Speech Therapy: Twice weekly, focus on articulation and comprehension
Occupational Therapy: Sensory integration, fine motor skills
Parental Counseling: Training in behavior reinforcement
Diet: Gluten-free, casein-free

Ayurvedic Integrative Management
Nidana Parivarjana (Elimination of Causative Factors)
Avoidance of incompatible foods (*Viruddhahara*), irregular routines (*Vishamashana*), and sensory overload.

Panchakarma Therapy
Abhyanga: Daily massage with *KshirabalaTaila* – pacifies Vata and promotes neuro-muscular coordination.
Shirodhara: *Brahmi Taila* 20 min/day – calms mind, improves sleep and focus[18].
Nasya: *AnuTaila* (2 drops/nostril) for 15 days/month – nourishes sense organs, enhances cognition.
Basti: *MatraBasti* with *BalashwagandhadiTaila* – improves neurobehavioral regulation.

Medhya Rasayana (Nootropic Herbs) **(Table 1)**

Pathya-Ahara (Dietary Regimen)
***Madhura Rasa pradhanaahara*:** milk, ghee, dates
Avoidance of *Guru, Amla, Katu* foods
Inclusion of *SattvikaAhara* to stabilize mental faculties

Yoga and Behavioral Regulation
Simple *Asanas* (Tadasana, Vrikshasana), *Pranayama* (AnulomaViloma) to improve self-regulation and attention.

Follow-Up and Outcomes(Table 2)
No adverse effects were noted during therapy.

DISCUSSION

Autism Spectrum Disorder (ASD) is recognized as a multifactorial neurodevelopmental condition, the pathology of which involves aberrant neuronal connectivity, synaptic dysfunction, oxidative stress, and neuroinflammation. These factors contribute to impairments in cognition, social communication, and behavioural regulation. Modern research highlights the importance of early intervention through behavioural and sensory integration therapies, which significantly improve adaptive and social outcomes when initiated in early developmental stages [12,13]. From an Ayurveda standpoint, ASD-like presentations are conceptualized under the domain of Vata-Pittaja Unmada or Manovaha Srotodushti, where disturbances in Vata and Pitta doshas lead to dysfunction of Medhya (cognitive faculties) and Manas (mental stability) due to vitiation of Majja Dhatu (nervous tissue)[14]. This understanding directs the Ayurveda therapeutic strategy toward pacifying aggravated doshas, nourishing Majja Dhatu, and

restoring the equilibrium of Manas through Rasayana and Panchakarma interventions. Among these therapeutic measures, Panchakarma procedures such as *Shirodhara* and *Nasya* play a vital role in modulating the neuroendocrine and autonomic systems, thereby reducing stress, enhancing neuroplasticity, and improving sleep and behavioural calmness [15].*Shirodhara* induces relaxation and optimizes hypothalamic-pituitary-adrenal (HPA) axis activity, while *Nasya* therapy directly delivers medicated oils to the central nervous system through the nasal route, promoting cognitive enhancement and speech development. Similarly, Medhya Rasayana herbs such as *Brahmi (Bacopa monnieri)* and *Mandukaparni (Centellaasiatica)* have been scientifically validated for their nootropic, antioxidant, and neuroprotective properties, enhancing neuronal communication, synaptic efficiency, and memory retention [16,17]. These herbs mitigate oxidative damage and support neurogenesis, aligning closely with modern neurotherapeutic principles. *Ashwagandha (Withaniasomnifera)*, another key Rasayana, acts as an adaptogen by regulating the HPA axis, lowering cortisol levels, and enhancing cognitive resilience and emotional stability, thereby reducing hyperactivity and anxiety commonly seen in autistic children [18]. Thus, an integrative management approach combining behavioural and speech therapies with Ayurveda neuro-enhancement provides synergistic benefits. While behavioural therapies address learned behaviours and social communication, Ayurveda interventions support neurological nourishment, dosha balance, and neurochemical homeostasis. This dual approach targets both the manifest behavioural symptoms and the underlying neurophysiological imbalances, leading to holistic and sustainable improvement in children with Autism Spectrum Disorder.

CONCLUSION

The present case report demonstrates that an integrative therapeutic approach, combining Ayurveda principles with modern understanding of neurodevelopmental disorders, can provide meaningful clinical improvement in children with Autism Spectrum Disorder (ASD). The individualized Ayurveda regimen — encompassing Medhya Rasayana herbs such as *Brahmi (Bacopa monnieri)* [19], *Mandukaparni (Centella asiatica)*, *Shankhapushpi (Convolvulus pluricaulis)*, *Ashwagandha (Withania somnifera*)[20], and *Yashtimadhu (Glycyr rhizaglabra)*, along with Panchakarma procedures like *Abhyanga, Shirodhara, Nasya,* and *MatraBasti* — was observed to have a profound influence on cognitive, behavioural, and emotional parameters of the child. These interventions appear to act through multiple neurobiological mechanisms, including modulation of neurotransmitters (serotonin, GABA, acetylcholine), enhancement of neuroplasticity, reduction of oxidative stress, and stabilization of the hypothalamic-pituitary-adrenal (HPA) axis. From an Ayurveda standpoint, the therapy worked by pacifying aggravated Vata and Pitta doshas, nourishing Majja Dhatu, and promoting Sattva Guna, thereby facilitating balance between the mind and body. Clinically, this translated into remarkable improvements in eye contact, verbal communication, attention span, social interaction, and behavioural adaptability, with a reduction in hyperactivity and stereotypical behaviours. The holistic nature of Ayurveda medicine, which simultaneously addresses the neurochemical, metabolic, and psychosomatic dimensions of health, provides a unique advantage in the management of neurodevelopmental disorders like autism. Moreover, the absence of adverse effects highlights the safety and tolerability of these interventions in paediatric patients. However, while the outcomes of this single case are promising, they underscore the need for larger, well-controlled clinical trials to further validate efficacy, determine optimal treatment protocols, and elucidate the precise mechanisms of action of Ayurveda therapies in ASD. Future research integrating biochemical, neuroimaging, and behavioural assessments can bridge the gap between traditional knowledge and modern neuroscience, paving the way for a comprehensive, evidence-based integrative model of autism care. In summary, this case exemplifies that Ayurveda Medhya Rasayana[21] and Panchakarma therapies, when applied judiciously within an integrative framework, hold significant potential in enhancing cognitive functioning, behavioural regulation, and overall quality of life in children with Autism Spectrum Disorder. Such a holistic approach not only complements contemporary management strategies but also offers a sustainable, individualized path toward neurodevelopmental rehabilitation.

ABSTRACT

This study explores effective strategies to enhance reading habits and comprehension among college students in the context of widespread Artificial Intelligence (AI) integration in education. As AI tools increasingly shape how students access and process information, the depth and quality of reading engagement have become critical concerns. This paper identifies the challenges AI poses to sustained reading attention and critical comprehension, while proposing pedagogical interventions grounded in an action research framework. The study was conducted with 30 first-year English-major students over a 12-week period and included interventions such as structured reading schedules, active reading training, and balanced AI usage workshops. Data from pre- and post-tests, reading logs, and reflective journals indicated significant improvement in students' reading motivation, comprehension, and awareness of reading processes. The findings underscore the importance of designing instructional strategies that integrate technology literacy with deep reading pedagogy to foster independent, reflective, and critical learners.

Keywords: Reading habits, Reading comprehension, Artificial intelligence, College students, Active reading, Action research, Technology literacy, Deep reading, Pedagogical strategies, Reflective learning.

INTRODUCTION

Reading is a foundational academic skill and a gateway to lifelong learning. However, in the era of artificial intelligence, students' reading behaviours have undergone dramatic transformation. Tools such as ChatGPT, Quill Bot, and summarization applications offer instant overviews of complex materials, encouraging surface-level engagement rather than sustained comprehension. While these tools can support productivity, they often reduce students' motivation to read deeply, question texts, or form personal interpretations (Horowitch, 2024).
For college students—particularly first-year learners transitioning to self-regulated academic environments—the balance between efficiency and intellectual depth has become delicate. Many students rely heavily on AI summaries or paraphrasing tools to save time, often bypassing the critical thinking processes required in academic reading. As a result, educators face the challenge of re-establishing disciplined reading habits that align with the digital and AI-influenced context.

This study investigates methods to improve students' reading habits and comprehension while embracing AI as a supportive tool rather than a substitute for active reading. The research adopts an action research framework to test practical interventions that can be adapted in real classroom settings.

LITERATURE REVIEW

Reading Habits and Academic Success
Reading habits are directly correlated with academic achievement, critical thinking, and vocabulary development (Gambrell, 2015; Guthrie & Wigfield, 2020). Regular reading enhances not only comprehension but also cognitive empathy and the ability to interpret complex arguments. However, the digital revolution has shifted attention spans and engagement modes (Wolf, 2018), leading to what researchers call "screen reading fatigue."

The Impact of Artificial Intelligence on Reading
Artificial intelligence tools have introduced new opportunities and challenges in higher education. While AI-driven applications can personalize learning experiences and provide adaptive reading materials (Anyanwu, 2025), they also risk diminishing deep reading. Students who rely heavily on AI-generated content tend to process information superficially, missing opportunities for inferential thinking (Horowitch, 2024). Pandya (2025) observes that over-dependence on AI tools can erode academic curiosity and lead to passive learning behaviors. Conversely, when used judiciously, AI can support reading development by offering vocabulary assistance, reading-level adjustments, and feedback on comprehension (Zawacki-Richter et al., 2019). The key lies in balanced, critical use.

Pedagogical Approaches to Reading Development
Pedagogical research emphasizes the role of active reading strategies—such as annotation, questioning, summarizing, and reflection—in promoting comprehension (Grabe & Stoller, 2013). Moreover, metacognitive awareness of reading processes helps students monitor their understanding and adjust strategies as needed (Baker & Brown, 1984). Integrating technology with such practices requires intentional design to ensure that digital tools enhance rather than replace reading engagement (Kucirkova, 2022).

Action Research in Reading Instruction
Action research allows educators to diagnose classroom issues, implement targeted interventions, and evaluate their effectiveness through reflective cycles (Kemmis & McTaggart, 2014). In reading instruction, this approach has proven effective in developing context-specific solutions (Burns, 2010). By involving both teachers and students in the improvement process, it bridges theory and practice.

METHODOLOGY

Research Design

This study employed a participatory action research design, structured into three phases: planning, action, and reflection. Each cycle involved introducing reading interventions, collecting feedback, and refining strategies based on student responses. The 12-week project was conducted in a university English department during one academic semester.

Participants

Thirty first-year English-major students participated voluntarily. The group included 18 female and 12 male students aged 18–20. Many reported limited exposure to English academic texts and a preference for AI-generated summaries before the study.

Intervention Strategies

1.**Structured Reading Schedule**

Students followed a weekly reading plan emphasizing balance between print and digital texts. AI-generated content was prohibited during certain sessions to encourage full-text reading.

2.**Active Reading Workshops**

Sessions introduced annotation, questioning, and summarizing techniques. Students practiced marking key ideas, writing marginal notes, and discussing interpretations.

3.**Balanced AI Usage Sessions**

Workshops demonstrated how AI tools could assist comprehension (e.g., explaining vocabulary or checking understanding) without replacing full reading.

4.**Reading Reflection Journals**

Students maintained journals documenting challenges, progress, and strategies adopted each week. These reflections informed iterative changes in instruction.

Data Collection and Analysis

Data were collected through:

- **Pre- and post-tests** measuring reading comprehension and inference.
- **Reading logs** tracking time spent on reading and type of material.
- **Reflective journals and interviews** analysed using thematic coding to identify emerging patterns in students' attitudes and strategies.

FINDINGS

Quantitative Results

- Average comprehension test scores improved by **18%** after the intervention.
- Reading logs revealed a **25% increase** in time spent on complete texts.
- Students' self-assessed motivation scores (via Likert scale) improved from an average of 3.1 to 4.2 out of 5.

Qualitative Results

Analysis of reflection journals and interviews revealed several themes:

- **Renewed Reading Discipline:** Students appreciated the structure of fixed reading times, reporting less procrastination.
- **Enhanced Critical Awareness:** Many realized the limitations of AI summaries and the value of forming their own interpretations.
- **Confidence and Independence:** Students felt more competent in handling complex texts.

- **Constructive AI Integration:** Learners began using AI for clarification rather than substitution, aligning with ethical and cognitive literacy goals.

Research Findings

The findings affirm that structured reading interventions combined with guided AI literacy significantly improve students' reading motivation and comprehension. The iterative nature of action research ensured that interventions remained responsive to students' needs.

Active reading workshops promoted metacognitive engagement, allowing students to think about how they read, not just what they read. The balance between AI use and independent reading fostered critical digital literacy, helping students discern when and how AI tools enhance learning. These findings align with Wolf's (2018) concern about the decline of "deep reading" in digital environments but demonstrate that targeted pedagogy can reverse the trend. By integrating traditional reading discipline with modern digital competence, educators can cultivate both efficiency and intellectual depth.

CONCLUSION

In the era of AI-driven education, improving students' reading habits requires a dual emphasis on technological literacy and cognitive engagement. This study demonstrates that structured schedules, active reading strategies, and reflective practices can counterbalance the passive tendencies encouraged by AI-generated content. Action research provides a valuable framework for educators seeking practical, data-informed approaches to literacy challenges. Future studies could extend this model to larger populations, interdisciplinary settings, and longitudinal timeframes to assess sustained impact.

ABSTRACT

Cryptojacking is a growing cybersecurity threat, leading to the development of various cryptojacking blocking technologies. However, their effectiveness and features can vary significantly, making it difficult for organizations and individuals to choose the best option. This comparative study reveals significant differences in performance, ease of use, and additional features among these tools. The study provides insights for organizations and individuals adopting cryptojacking prevention technologies and emphasizes the need for further research and development to keep up with emerging threats and enhance the effectiveness of these blocking technologies.

Keywords: Crypto jacking, Blocking tools, Defense, Detection, Evaluation, Cyber security, Crypto currency

INTRODUCTION

A danger known as a "cryptojacker" would take resources from a computer or mobile device to mine cryptocurrency, a type of digital or virtual currency with over 3,000 variations and some actual applications. [1]. The process of

"cryptojacking" is downloading malware onto the victim's device, using the victim's computing power to mine cryptocurrencies, and sending the proceeds to the attacker's wallet. It may result in battery drain, system delay, and higher electricity costs.[2]. Strong secrecy, alluring long-term reward, and minimal expense make cryptojacking popular. It is difficult for criminals to resist since it targets a variety of electronic communication and Internet-of-Things devices. Due to its capacity to target computers and electronic communication devices as well as the ongoing upgrades to its operational platforms, cryptojacking has become quite popular. [3]. Cryptojacking has quick mitigation technology, which stops uncontrollable attack propagation in businesses [4]. For Mozilla Firefox, Google Chrome, Internet Explorer, Microsoft Edge, Opera, Safari, Yandex Browser, and Android, Adblock Plus is a free, open-source browser addon that was created by Eyeo GmbH. It has an independent board for review and approval. [5]. Block intrusive banners, pop-ups, adverts, and privacy-harming malicious advertising. For a more customizable experience, increase browsing speed, personalise features, and get free support. [6].Adblock is a browser add-on that prevents advertisements.[7]. Free with optional donations, AdBlock blocks the display of website elements.[8]. On December 8, 2009, the AdBlock plugin was added to Google Chrome [9].The work being done by AdBlock has nothing to do with Adblock Plus [10].AdBlock has utilized Adblock Plus since 2016 .[11]. On well-known websites like YouTube, Facebook, and Twitter, AdBlock prevents pop-ups, advertising, and banners. It safeguards privacy, prevents third-party tracking, and thwarts harmful adverts. Users may decrease the time it takes for pages to load, personalise their browsing with filters, whitelists, and dark mode, and save and sync their whitelists and ad blocking settings between profiles.[12].A free privacy extension called Ghostery removes advertisements, disables trackers, and speeds up websites. The use of it is unrestrictedly free and is sponsored by thousands of contributors globally. Ad-Blocking, Anti-Tracking, and Never-Consent are the three core features of Ghostery. It disables trackers from obtaining personal information, limits adverts, and gets rid of bothersome cookie pop-ups. Additionally, it offers previews on search engine result pages, information about trackers on websites, and refreshes tracker data via WhoTracks.Me. With just one click, users can adjust Ghostery's adblock, antitracking, and cookie popup removal features. [13].

The Malware & URL Scanner Chrome extension searches for malware, phishing, and spam content on websites, domains, and IP addresses. Users are shielded from malware infection and nefarious websites accessing their devices. It offers URL lookup, file scanning with malware databases, geographical IP lookup, website category and subdomains lookup, download or copy scan reports, and is available on popular browsers including Chrome, Firefox, and Microsoft Edge.[14].Web-based cryptocurrency miners are effectively stopped by the effective browser plugin MinerBlock. Inline scripts and proxies are essentially blocked since it kills loaded scripts that exhibit potentially harmful mining behavior.[15]. In order to stop cryptojacking scripts from using your CPU to mine cryptocurrency, trusted miner blocker Miner Shield disables hidden miners on websites.[16].By examining JavaScript files, the extension known as Block Coin Miners prevents mining on specific sites and computer resources.[17].A browser add-on called Privacy Badger stops advertising from tracking users' past web browsing activities. It prevents marketers from loading content without authorization and prioritises tracker-blocking over advertisements. Rather than depending on manually chosen domains or URLs, Privacy Badger is an algorithmic tracker blocker that encourages improved privacy practises.[18]. Tg miner block increases site mining. [19].Available on many browsers, U Block Origin is a free, open-source browser extension for content filtering that includes ad blocking. A broad-spectrum content blocker with high CPU and memory efficiency was created by Raymond Hill. [20].

Threats of Cryptojacking and Indian Law

Crytojacking is the unauthorized mining of cryptocurrency using the victim's gadgets. Device performance is impacted by crypto jacking. A virtual currency, it lacks a centralized issuing or regulating body. The Indian Information Technology Act 2000, as it currently stands, is insufficient to address such recently discovered offences as crytojacking. In this situation, the IT Act of 2000's Sections 43(a) and 66 provide, respectively, compensation, imprisonment for a term that may not exceed three years, a fine that may not exceed five lakh rupees, or both. India must develop an adequate legal framework to address these new cybercrimes [21].

EXPERIMENTAL METHODOLOGY

The study assesses the efficiency of several cryptojacking blocking solutions in thwarting assaults and contrasts their features and functionalities. Additionally, it looks at how well they use the CPU, memory, and GPU, among other system resources. During the experimental work, browser extensions were downloaded, their characteristics were examined, and their GPU, CPU, and memory utilization was measured. The proposed methodology depicted in Figure 1.

Experimental Setup

- On the internet, there are just a few freeware programs; 10 have been chosen specifically for testing. A DESKTOP-8869M49 with an Intel Core i3-7020U CPU, 4.00GB RAM, Windows 11 Pro version 21H2, and Windows Feature Experience Pack 1000.22000.194.0 is the device in use. It is crucial to utilize a multi-layered security strategy that includes cryptojacking blocking technologies, strong authentication, frequent system updates, and user education. The usage of freeware tools may make third-party information provision viable. Observations:- In Table 1, numerous traits of cryptojacking blocking tools are shown in detail.

CPU- (Central Processing Unit)

The efficiency of cryptojacking prevention programmes in identifying and thwarting unauthorized mining activities depends heavily on CPU use. Lower CPU consumption from active tools' blocking of unauthorized activity shows how effective these tools are at stopping such activity. The impact on CPU is shown in Table 2

Memory

Tool impact on system resources is assessed by looking at memory utilization, which highlights resource consumption and potential performance problems. The impact on memory usage is shown in Table 3.

GPU (Graphics Processing Unit)

Due to their high processing power and parallel processing capabilities, GPUs are a prime target for cryptojacking assaults, which need for efficient cryptojacking prevention programmes. The impact on Graphics Processing Unit usage is shown in Table 4.

CONCLUSIONS

Manuscript Comparative analysis of cryptojacking blocking solutions demonstrates the capabilities and characteristics of various programmes for thwarting attacks. It is essential to comprehend their potential, boundaries, and system compatibility. Risks must be kept to a minimum through regular monitoring, upgrades, and user knowledge. The top two cryptojacking addons in terms of CPU and memory usage are Adblock Plus and No Miner.

Competing interests

"The authors Ms. Supriya Shivanand Sangle, Mr. Rahul Kailas Bharati, Dr. Shobha Kamalakar Bawiskar declares that they have no competing interests" We are not receiving or having financial competing and non-financial competing interests

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors

ABSTRACT

The detection of Sepsis in Intensive Care Units has been a difficult task despite the improvement in monitoring technology. This paper was a hybrid of Cox proportional hazards regression with Long Short-Term Memory networks to predict early Sepsis. On the basis of the MIMIC-III database (32,574 ICU admissions following exclusions), we built a model that merges interpretability and deep learning pattern recognition of survival analysis. Its hybrid model had a concordance index of 0.791, an AUROC of 0.823, a sensitivity of 0.781, and a specificity of 0.798. Early detection capability has averaged 4.8 hours before clinical recognition, and this is better than conventional scoring methods by 2.1 hours. There was time-dependent validation, which demonstrated stability in performance with respect to prediction horizons. Although they are showing good results on retrospective data, external validation and clinical integration studies must be done before implementation. The technique establishes a platform on which machine learning can be interpreted in criterion care units.

Keywords:-Biostatistics, Cox Regression, Deep Learning, LSTMs, Sepsis Detection

INTRODUCTION

Sepsis impacts about 48.9 million people across the world, with a leading cause of death and a high rate of mortality in the hospital [1]. Sepsis mortality rates (15%-30%) are still high and, in good part, caused by the delayed diagnosis and treatment [2]. The present-day detection tools, such as Sequential Organ Failure Assessment (SOFA) and quick SOFA scores, are also characterized by a lack of sensitivity in the initial stages of the disease when there is the most potential to intervene [3]. Electronic health records and continuous monitoring technologies result in opportunities for complex predictive modeling [4]. Nonetheless, machine learning methods usually have an interpretability drawback that limits the implementation of such technology in clinical practice [5]. Cox proportional hazards regression offers clear survival analysis models, though it does not possess capabilities to appropriately deal with complex time relationships typical of physiological systems in the course of severe illness [6]. This study will discuss the issue of predictive performance versus clinical interpretability by training a hybrid model to combine Cox regression with Long Short-Term Memory networks to predict Sepsis in ICU patients.

METHODS

Data Source and Population

It was a retrospective cohort study with the MIMIC-III database, which contained 61,532 ICU admissions at Beth Israel Deaconess Medical Centre (20012-2012) (7). After obtaining the approval of institutional review boards, systematic inclusion criteria were applied, which guaranteed the quality of the data: adult patients (18 years), ICU stay longer than 24 hours, complete physiological data during the first 48 hours, and the availability of outcome data. The exclusion criteria eliminated the patients whose Sepsis had occurred within 6 hours of hospitalization, incomplete monitoring data (the %age of missing values was more than 20), and were returned to the ICU within 30 days. The above criteria led to 32,574 unique encounters to be analysed.

Sepsis Definition and Outcomes

Identification Sepsis has been detected based on Sepsis-3 criteria that included suspected infection as well as acute dysfunction of the organ(s) (SOFA score increment of not less than 2 points) [8]. Suspected infection was operationalized on the basis of the administration of antibiotics, microbiological sampling, and the clinical documentation. ICU admission time to Sepsis was the main outcome.

Feature Engineering and Variable Selection

All featured sets included 42 physiological variables (vital signs (heart rate, blood pressure, temperature, respiratory rate, oxygen saturation), laboratory values (complete blood counts, metabolic panel, lactate), and clinical indicators (Glasgow Coma Scale, urine output, status of mechanical ventilation, and so on). Temporal characteristics dealt with the sequential nature of data by means of moving averages with windows of 4, 8, and 12hours; trend calculations with linear regression slope; and variability such as standard deviation and coefficient of variation. The cases of missing data were addressed with the forward-fill methodology (below 2 hours) and then linear interpolation (2-6 hours).

Cox-LSTM Hybrid Architecture

Cox Proportional Hazards Component

The Cox regression component implemented time-varying covariate analysis:

$$\lambda(t|X(t)) = \lambda_0(t)\exp\left[\sum_{j=1}^{p}\beta_j X_j(t)\right] \qquad (1)$$

where$\lambda(t|X(t))$represents instantaneous hazard at time t,$\lambda_0(t)$ denotes baseline hazard, and β represents regression coefficients [9]. The selection of the variables was carried out by backward stepwise regression with Akaike Information Criterion, with a significance of $p<0.05$. [10].

LSTM Network Component

The LSTM network was trained sequentially on measurements with dropout regularization (0.3, 0.4) in two layers (64, 32 units) to overcome overfitting [11]. Attention mechanisms were added to the network to emphasize clinically relevant periods of time.

The LSTM cell works as follows:

$$f_t = \sigma(W_f . [h_{t-1}, x_t] + b_f) \quad (2)$$

$$i_t = \sigma(W_i . [h_{t-1}, x_t] + b_i) \quad (3)$$

$$\tilde{C}_t = tanh(W_C . [h_{t-1}, x_t] + b_C) \quad (4)$$

$$C_t = f_t \odot C_{t-1} + i_t \odot \tilde{C}_t \quad (5)$$

$$o_t = \sigma(W_o . [h_{t-1}, x_t] + b_o) \quad (6)$$

$$h_t = o_t \odot \tanh(C_t) \quad (7)$$

Hybrid Integration

The fusion function was specified as:

$$P_{hybrid}(t) = \omega(t).P_{Cox}(t) + [1 - \omega(t)].P_{LSTM}(t) \quad (8)$$

Whereω(t) represents time-adaptive weights determined through:

$$\omega(t) = \sigma(W_\omega.[h_{Cox}(t), h_{LSTM}(t)] + b_\omega) \quad (9)$$

E. Model Training and Validation

Training employed a composite loss function combining Cox partial likelihood with binary cross-entropy:

$$L_{total} = \lambda_1 L_{Cox} + \lambda_2 L_{BCE} + \lambda_3 L_{reg} \quad (10)$$

where:

$$L_{Cox} = -\sum i[\delta_i(\beta^T X_i) - \log(\sum_{j \epsilon R(t_i)} \exp(\beta^T X_j))] \quad (11)$$

$$L_{BCE} = -\sum i[y_i \log \hat{y}_i) + (1 - y_i)\log(1 - \hat{y}_i)] \quad (12)$$

$$L_{reg} = \alpha\|\theta\|_2^2 + \beta\|\theta\|_1 \quad (13)$$

Class imbalance was addressed through focal loss implementation [12]. These data were separated into time: 70% training (2001-2008), 15% validation (2009- 2010), 15% test (2011-2012).

RESULTS

Patient Characteristics

It was composed of 32,574 ICU admissions and 3,912 patients (12.0%) who developed Sepsis. The patients differed in terms of older age (mean age 68.1±15.8 vs 64.2±17.1 years, p<0.001), higher initial SOFA scores (7.2±3.4 vs 4.3±2.8, p<0.001), and a longer length of stay in the ICU (median 8.1 vs 2.4 days, p<0.001).

Cox Model Results

Multivariate Cox Studies discovered eight significant predictors that could be identified with an overall concordance index of 0.697 (95% bids-1.96: 0.691-0.703). The most significant results were lactate (HR 1.28, 95% CI: 1.24-1.32, p<0.001), white blood cell count (HR 1.11, 95% CI: 1.09-1.13, p<0.001) and mean arterial pressure (compared to an increase between 50-70 mm Hg or above, HR 0.91, 95% CI: 0.89-0.93, p<0.001)

The proportional hazards assumption was validated through Schoenfeld residuals (global test p=0.127).

Hybrid Model Performance

The Cox-LSTM hybrid model showed the best performance results with a concordance indexof 0.791 (95% CI: 0.786-0.796) for concordance, AUC (Area Under the Curve) 0.823 (95% CI: 0.817-0.829), sensitivity 78.1% and specificity 79.8%.

Early Detection Analysis

The hybrid model had an early detection ability with a mean detection time of 4.8 ± 2.7 hours before clinical recognition. This was longer than LSTM used by itself(3.1 hours), COX used by itself (2.2 hours), and the SOFA score (1.4 hours).

Time-Dependent Validation

The concordance indices were 0.798 for prediction in 24 hours, 0.784 for prediction in 48 hours, and 0.773 for prediction in 72 hours.

DISCUSSION

Performance Comparison with Contemporary Literature

The AUROC of our hybrid model (0.823) is competitive in the modern environment of Sepsis prediction studies. The systematic review of the recent studies indicates that there is a significant diversity of methodological approaches and performance variability, and careful comparative analysis should be conducted. The more recent deep learning implementations have documented different levels of achievement. The SSP model designed by AlirezaRafiei et al. [13] had 0.89, 0.88, and 0.86AUROCs at 4-, 8-, and 12-hour predictions in the CNN-LSTM architecture. Our result in AUROC of 0.823 is a 7.5% difference in performance relative to their results of 4 hours. Nevertheless, their model only used structured data; however, our hybrid method gives increased interpretability with Cox regression elements. The LiSep LSTM algorithm, reported by Fagerström et al. [14], had an AUROC of 0.831 with 95% confidence interval (0.824-0.838), which is slightly higher than the one we had achieved (AUROC 0.823, 95 % CI: 0.817-0.829). This overlap indicates strong performance limits of LSTM-based models to be applying to the data in MIMIC-III. Importantly, their median detection offset was 40 hours, significantly higher than our 4.8-hour window, but direct comparison needs to be taken with caution because the definition of outcomes is different (septic shock versus Sepsis). Exceptionally high performance (AUROC 0.99) with 12-hour time windows was reported by Tang et al. [15] when using LSTM-Transformer architectures. Although very impressive, these extreme measures of performance should then be questioned in the sense that there is a possibility of overfitting, as well as applicability to clinical practice. We have a more conservative AUROC of 0.823 that represents a realistic clinical deployment expectation and has statistical rigor. Our performance was quite similar to the AISE algorithm described by Nemati et al. [16] with an AUROC of 0.83-0.85 in 4-12-hour prediction windows. They focus on interpretability, which will align with our philosophy of a hybrid approach, but the methodology they used involves ensemble machine learning without the integration of survival analysis.

Extensive systematic reviews give a wider performance perspective. The authors of the study by Islam et al. [17] reviewed 42 studies that included different methodological designs, but reported the values of the AUROC of between 0.80 and 0.97. We have an AUROC of 0.823, which is in the lower-middle quartile of this distribution, which is a conservative measure of performance that we can safely use in clinical validation. Bomrah et al. [18] consider 29 studies in 1.1 million patients, which is why feature extraction techniques are important determinants of model performance, which we also take into account in our temporal feature engineering. As recent developments in making use of unstructured data show, an improved performance capability. Meng et al. [19] proposed the SERA algorithm, which gave an AUROC of 0.94 when 12-hour predictions were done by combining clinical notes with structured data. We had an AUROC of 0.823 with our exclusively structured data approach, so it is possible to enhance this in the future by integrating unstructured data and retaining our interpretability framework.

Temporal Performance and Clinical Relevance

Our 4.8-hour advance of detection is a clinically meaningful improvement, and yet it is realistic in performance. Comparative analysis over time of studies conducted in the current field shows that there exists a wide range of differences in claims of early detection, varying from 2-48 hours of early detection, before clinical recognition. The AISE algorithm had shown prediction performance at 4-12 hours, with decreasing performance with large windows

(AUROC starting at 0.85 at 4 hours and dropping to 0.83 at 12 hours) [16]. Time-varying analysis indicates that the trends in our time performance are that the AUROC declines as time progresses (0.841 at 12 hours, 0.794 at 72 hours), which is expected in terms of performance over time. Recent performance deployment studies offer real real-world performance context. A deep learning Sepsis prediction was reported by Boussina et al. [20] for clinical implementation, which was shown to decrease the mortality, but no time window was reported. Our 4.8-hour window gives enough lead time to implement evidence-based Sepsis bundles, such as the administration of antibiotics, fluids, and the application of source control measures. The clinical significance analysis proves the potential of quantifiable impacts. Kumar et al. [21] determined that every hour of delay in the treatment of Sepsis adds mortality by 4-8 %. Our 4.8 hours of early detection will result ina potential mortality decrease of 19-38% over the traditional scoring techniques with 1.4-2.2-hour windows. But these calculations consider ideal clinical response to forewarning alerts, and that is where integrated clinical decision support systems matter.

Methodological Innovation and Interpretability Benefits

The integration process of Cox proportional hazard and LSTM network will make up for the limitations of statistical and learning machine models themselves. The combination model offers unambiguous quantification of risk in terms of hazard ratios as well as enforcing complex time dependency that is inaccessible to linear models. The HR of our Cox regression units is consistent with the pathophysiologic knowledge of Sepsis. The hazard ratio of 1.28 (95% CI: 1.24-1.32) is very close to the data reported by Bakker et al. [22], who reported hazard ratios of 1.2-1.4 at Sepsis prediction levels of lactate concentrations. Likewise, our white blood cell count hazard ratio is 1.11,which is comparable with studies looking at inflammatory markers by Vincent et al. [23]. It is thus biologically plausible that our statistical results are real. The LSTM units captured the temporal dynamics well, and the attention mechanisms identified lactate dynamics, variations in SOFA scores, and HRV as the primary predictors. This temporal modelling capability is a dramatic refinement over risk scoring systems that are non-time varying, and addresses criticisms of traditional Sepsis detection systems by Seymour et al. [3]. Current hybrid approaches validate our methodological system. Another example of the potential of deep learning combined with interpretability is a study by Komorowskiet. al. [24] who demonstrated superior performance and clinical acceptance in Sepsis management when combined with deep learning compared with deep learning alone. Our mathematical formulation is of a generalizable nature and serves as a template to develop interpretable machine learning systems in critical care applications.

Clinical Implementation and Deployment Considerations

An example of numerous implementation challenges in the translation of research to clinical practice is not limited to predictive measures of performance. Computational efficiency (under 50ms per patient to infer) of our model makes it deployable in real-time to existing ICU monitoring systems, but a variety of considerations can influence practical efficiency. This is external validation, which is a critical implementation prerequisite. The significant performance improvements were found when proprietary Sepsis prediction models were introduced into various healthcare systems, as was demonstrated by Wong et al. [25], and thus the importance of multi-site validation. The training data of our single-centre, MIMIC-III, is insufficient to allow generalizability, and prospective validation in a wider range of hospital networks will be required before large-scale use. One of the practical challenges that is very important is alert fatigue. Recent implementation reports indicate that the lack of responsiveness in clinicians can be reduced by inappropriate alert frequency, even though the model is accurate [20]. Our specificity is 79.8% and indicates reasonable false alarm rates (around 1 in 5 notifications), but we can optimize our specificity for particular clinical settings that have a different tolerance threshold. There is a time lapse between our training data (2001-2012) and current clinical practice, and this could affect the performance of the model. There have been significant changes in the diagnostic criteria, treatment protocols, and monitoring technologies over the last decade. Rhee et al. [26] reported important changes in the epidemiology and outcomes of Sepsis in this timeframe and suggested that the current deployment requires a recalibration over time.

Limitations and Future Research Directions

The single-centre, retrospective design limits extrapolation across systems with diverse patient populations, as well as clinical protocols, whereas the delay between the training data (2001-2012) and current practice might affect the performance of the models because of the changing diagnostic criteria and treatment guidelines. Handling missing data by forward-fill imputation can be biased systematically during periods of clinical instability, and the incidence of Sepsis (12.0 %) might not be a true reflection of disease prevalence elsewhere in the clinical environment. Subsequent studies ought to focus on multi-centre prospective validation to identify external validity, the inclusion of other data modes such as high-resolution continuous follow-up and genomic surrogates and still maintain interpretability, real time implementation investigation together with the involved clinical decision support system, the cost-effectiveness evaluation of the model based on healthcare considerations and the creation of automatic updating systems on models so that there is seamless accuracy in future as clinical practices changes.

CONCLUSION

This study illustrates the effective application of Cox proportional hazards modeling and LSTM networks in Sepsis prediction with a competitive performance of 0.823AUROC and early prediction of Sepsis 4.8 hours before clinical awareness and clinical interpretability, critical to healthcare application. The hybrid methodology resolves the inherent weaknesses of the current methodology, with respect to providing actionable lead time on evidence-based intervention strategies, by integrating both clear survival analysis and advanced temporal pattern recognition. Although performance measures are shown to be promising with respect to retrospective data, the approach provides a foundation to create interpretable machine learning systems in critical care settings where transparent decision-making remains the key to clinical acceptance and patient safety, although external verification and prospective clinical research are considered an indispensable precondition of successful implementation.

ACKNOWLEDGMENT

The authors recognize the MIMIC-III research consortium, which provided access to the database, and critical care teams whose patient care provided an opportunity to conduct this research. We appreciate the reviewers who have provided constructive feedback to make this manuscript better.

ABSTRACT

Fake News prediction is a challenging and dynamic problem due to the highly volatile and non-linear nature of financial time series data. Accurate prediction of stock prices can provide significant advantages in investment strategies and risk management. This study proposes a hybrid model integrating Long Short-Term Memory (LSTM) networks with XGBoost to leverage the temporal dependencies captured by LSTM and the strong non-linear learning capability of XGBoost. The hybrid model is evaluated on simulated stock price data and compared with a standalone Deep Neural Network (DNN) model. The experimental results demonstrate that the hybrid approach outperforms the DNN in key regression metrics, achieving Root Mean Square Error (RMSE) of 21.99, Mean Absolute Error (MAE) of 14.31, Mean Absolute Percentage Error (MAPE) of 1.26%, and an accuracy of approximately 98.74%. Visualization of true versus predicted values, residual analysis, and correlation heatmaps further confirm the robustness and reliability of the hybrid model. The findings suggest that combining deep learning with gradient boosting methods can significantly enhance predictive performance in financial forecasting, providing a reliable framework for stock market applications.

Keywords: Prediction, Deep Learning, XGBoost Classifier, Deep Neural Network, MSE, RMSE, Accuracy, MAPE

INTRODUCTION

The swift expansion of social media and digital news platforms has remarkably changed how individuals obtain and engage with information, owing to their convenient accessibility, minimal expense, and quick data delivery. As a result, an increasing number of people now favor digital platforms instead of conventional newspapers. Although social media has transformed into a potent instrument for spreading information, it has also significantly affected society by molding perspectives and influencing key worldwide occurrences [1]. Nonetheless, the rapid increase of online content has also sparked the dissemination of misinformation, including intentionally deceptive articles created by untrustworthy sources [2,3]. Such misleading information, often called fake news, is typically produced for personal, political, or monetary benefits, and can significantly impact public confidence, social order, and decision-making processes [4,5]. For example, throughout the COVID-19 pandemic, the extensive spread of misinformation and conspiracy theories resulted in increased psychological stress, reduced immunity, and panic within the general public [6,7]. Likewise, the 2016 U.S. presidential elections emphasized the impact of misinformation on political results. These instances highlight the critical necessity to create strong detection systems to lessen the detrimental impacts of misinformation in online environments. Identifying fake news continues to be a technically difficult challenge because of the enormous quantity, variety, and ever-changing characteristics of online material. Fabricated news is deliberately designed to resemble genuine articles, which complicates identification through textual characteristics alone. Additionally, misinformation covers various subjects and areas, frequently utilizing sensational headlines or skewed narratives to confuse audiences. Researchers have progressively adopted automated detection techniques utilizing machine learning and, more recently, deep learning strategies to tackle these challenges. Deep learning has transformed computer vision and natural language processing (NLP) by allowing models to automatically identify intricate patterns from extensive datasets [8,9].

Classic machine learning techniques, including logistic regression, Naïve Bayes, and support vector machines (SVMs), have been utilized for this issue with reasonable effectiveness. Nonetheless, these models frequently depend on manually created features (e.g., TF-IDF, bag-of-words), which do not adequately represent the profound contextual meanings of natural language. Recent developments in transformer-based models, likeBERT (Bidirectional Encoder Representation Transform Approach), have greatly enhanced effectiveness in various natural language processing (NLP) applications BERT utilizes extensive pretraining and refined training methods to produce superior contextual embedding's. This embedding's encapsulate intricate language characteristics that are crucial for recognizing subtle distinctions between genuine and false news articles. Simultaneously, SVMs continue to be among the most efficient and commonly used classifiers because of their capacity to optimize the decision margin and manage high-dimensional data representations. Using BERT a embeddings as input features along with an SVM classifier allows researchers to create a well-rounded architecture that leverages the semantic depth of deep learning and the overarching capabilities of traditional machine learning. Respondents Perception for Fake News (Source:// Redline Digital). (Fig.1). Figure depicts that Worldwide, worries regarding misinformation are common. A recent poll showed that almost 60% of individuals globally think that news outlets intentionally publish inaccurate stories routinely. Regarding media trust, approximately 65% of participants in North America expressed confidence in conventional media sources for delivering general news and information. Nonetheless, the perception of the prevalence of fake news differs markedly between nations. For example, 82% of participants in Argentina indicated that they frequently come across intentionally misleading narratives, whereas the percentages were significantly lower in Germany (30%), Japan (36%), and South Korea (39%).

Likewise, in 27 nations, nearly 48% of people acknowledged that they had previously been convinced of a false narrative as true before discovering it was made up. Emerging markets like India and China, boasting large online user bases and swift digital advancements, encounter specific obstacles in tackling misinformation. In India, the extensive usage of WhatsApp and various social media channels has intensified the issue, resulting in misinformation on subjects from health to politics. Similarly, in China, the vast number of internet users has fostered an environment for state-sponsored narratives and the spread of false information on domestic platforms.

Comparison of Public Trust and Distrust Across Social Media Platforms in Delivering Accurate News. (Source:// Redline Digital) (Fig.2). Social media, boasting more than 4.9 billion active users globally, has emerged as a leading platform for sharing information as well as propagating fake news and misinformation. Surveys show that almost 38% of U.S. news consumers acknowledged unknowingly sharing false news, whereas only a tiny percentage relied on platforms such as Twitter or YouTube for reliable information. In India, where WhatsApp, Facebook, and YouTube are prevalent, research indicates that around 55% of users come across at least one instance of fake news each year, with WhatsApp forwards playing a significant role. Likewise, in China, even with more stringent regulations, approximately 40% of users on WeChat and Weibo indicate they encounter biased or misleading narratives. Younger viewers worldwide, especially in India, are progressively engaging with short-form video platforms like TikTok, Instagram Reels, and YouTube Shorts, which have limited fact-checking and expedite the spread of misinformation. Together, these results emphasize that social media serves as a double-edged sword—enhancing communication yet significantly increasing the spread of misinformation.

LITERATURE REVIEW

A study suggested a combined Convolutional Neural Network (CNN) and Recurrent Neural Network (RNN) model for identifying false information on Twitter. The model reached an accuracy of 82%, showcasing the effectiveness of merging CNN's feature extraction with RNN's ability for sequential learning. This method sought to identify both spatial and temporal trends in news material, vital for successful detection of fake news. In detailed research conducted different deep learning models, such as CNN and Bi-LSTM, were amalgamated into an ensemble framework to detect fake news. The ensemble method reached an accuracy of 44.87%, emphasizing the difficulties in effectively merging various models. Although the accuracy was low, the research highlighted the significance of feature selection and model diversity in ensemble learning for detecting fake news. Multiple studies emphasize the inherent qualities of fake news that affect detection methods. Authors highlight that misinformation commonly entails deliberate fabrication (the reason it is released), diverse dissemination (the method of its circulation), and contentious reception (the way users interpret it). An investigation multimodal fake news identification by integrating text and image information through a CNN framework. The model reached an accuracy of 87% on the Fakeddit dataset, highlighting the significance of combining various modalities to enhance detection effectiveness. This research showed that adding visual elements to textual information can improve the model's capacity to identify fake news. A report released by Taylor and Francis indicated that an ensemble-driven approach leveraging transformer models like BERT achieved an F1-score of 0.91. This method merged the advantages of various models to enhance the precision of fake news detection. The research emphasized the efficiency of transformer models in grasping contextual details, essential for differentiating real news from fake news

Dataset

The dataset used in this study is sourced from Hugging Face, a well-known platform for open-source datasets that facilitates data science and machine learning research. It includes news articles categorized as either fake or real, offering a thorough overview of misinformation across different subjects and sources. The dataset contains vital textual elements, including article text, headlines, and publishing metadata, which are key for identifying linguistic patterns and contextual indicators needed to recognize fake news. Data preprocessing will utilize standard methods, such as managing missing values, cleaning text, tokenizing, and transforming the text into numerical formats with BERT embeddings. These embeddings encapsulate semantic and contextual details, which will subsequently function as input for a Support Vector Machine (SVM) classifier for precise fake news prediction. The dataset will be split into training, validation, and testing subsets to guarantee a comprehensive assessment of the proposed method. Moreover, methods like stratified sampling and feature scaling will be utilized to enhance model stability and generalization. Utilizing this Hugging Face dataset enables the study to create a strong and efficient model for automated fake news identification through transformer-based embeddings and machine learning classifiers. Sample Dataset (Fig. 3)

PROPOSED METHODOLOGY

The suggested approach utilizes a combined framework that merges BERT embeddings with a Support Vector Machine (SVM) classifier for effective fake news identification. The hybrid approach utilizes BERT's capacity for contextual and semantic representation alongside the classification power of SVM, guaranteeing enhanced predictive accuracy over individual modelsNews data from Hugging Face is preprocessed to handle missing values, remove noise, and clean the text (e.g., punctuation removal, lowercasing, and stop word elimination). Tokenization and attention-based encoding are performed using BERT to convert each article into dense contextual embeddings. Formally, for a news article:

Xt={Token1,Token2,…,Token}→Et=BERT(Xt)

where Et represents the BERT embedding vector capturing semantic and contextual features of the article. The BERT model generates hidden representations hth for each token in the sequence. The final embedding corresponding to the [CLS] token serves as the latent representation of the entire article

Feature Extraction

for every token within the sequence. The embedding for the [CLS] token acts as the hidden representation of the whole article. This embedding captures the essential linguistic and contextual elements required to differentiate fake news from authentic news.

Predictive Modeling

The embeddings hT from BERT are used as input features for the SVM classifier, which constructs a hyperplane to separate fake and real news instances. The SVM optimization problem is defined as:

$$\min_{w,b} \quad \frac{1}{2}|w|^2 + C\sum_{i=1}^{N}\xi_i$$

$$\text{s.t. } y_i\left(w \cdot h_T^i + b\right) \geq 1 - \xi_i, \quad \xi_i \geq 0$$

Where

- w and b define the separating hyperplane
- yi is the label of the i-th news article
- ξiare slack variables for misclassification
- Cis the regularization parameter

By combining BERT embeddings with SVM, the model captures both deep contextual semantics and discriminative decision boundaries for accurate classification.

Evaluation

To guarantee the strength and real-world relevance of the suggested hybrid model, we implement an extensive assessment approach. The dataset is divided chronologically into training, validation, and testing sets to prevent temporal leakage. The model's performance is evaluated using various metrics, including Accuracy, Precision, Recall, F1-score, and regression metrics like RMSE and MAE, offering a comprehensive perspective on predictive quality. Additionally, to tackle the opaque characteristics of deep learning and ensemble models, we integrate Explainable AI (XAI) methods like SHAP (SHapley Additive exPlanations) and LIME (Local Interpretable Model-Agnostic Explanations). These techniques enable us to determine the key features influencing predictions, thus enhancing the clarity of results for stakeholders. SHAP analysis distinctly reveals the top-10 features influencing model predictions, allowing for possible feature reduction without sacrificing performance or potentially enhancing it. This phase guarantees that the suggested model is both precise and clear, rendering it appropriate for facilitating informed choices in critical financial settings. Proposed Flowchart (Fig. 4)

Evaluation Parameters and Significance

The performance of the system should be evaluated in terms of the accuracy of classification. It is worth mentioning that a comparative analysis is done based on the common and overlapping data

Accuracy (Ac): It tells us about the exactness set of the different methods. The critical parameters are:

The classification accuracy is computed as

$$\boldsymbol{Ac} = \frac{\boldsymbol{TP+TN}}{\boldsymbol{TP+TN+FP+FN}} \textbf{(1.1)}$$

The precision is computed as

$$\boldsymbol{Pr} = \frac{\boldsymbol{TP}}{\boldsymbol{TP+FP}} \textbf{(1.2)}$$

The F-measure or F-Score is computed as

$$\boldsymbol{F-Measure} = \mathbf{2}.\frac{\boldsymbol{Precision*Recall}}{\boldsymbol{Precision+Recall}} = \boldsymbol{F-Measure} = \frac{\boldsymbol{TP}}{\boldsymbol{TP}+\frac{1}{2}(\boldsymbol{FP+FN})} \qquad \textbf{(1.3)}$$

Here,

(TP): True Positive

(TN): True Negative

(FP): False Positive

(FN): False Negative

EXPERIMENTAL RESULTS

The assessment of the suggested RoBERTa–XGBoost combined model for detecting depression reveals its high efficiency in recognizing depressive traits in textual information. The model was trained and validated using a labeled dataset and later evaluated on new data to measure its performance. The main metric used for evaluation was accuracy, which assesses the ratio of correctly identified instances to the overall count of samples. The hybrid model reached an accuracy of 92.8%, highlighting its strong ability to differentiate between depressive and non-depressive content. The findings also suggest that the model exhibited stable performance throughout both training and validation stages, affirming its capability to generalize well to new, unfamiliar data. This resilience underscores the advantages of the hybrid method, which merges the contextual representation capabilities of RoBERTa embeddings with the classification prowess and interpretability of XGBoost. Furthermore, the fully automated pipeline—comprising preprocessing, feature extraction, model training, and evaluation—guarantees scalability and efficiency for real-world implementation. Through the combination of sophisticated deep contextual embeddings and an ensemble classifier, the suggested hybrid model attains impressive predictive accuracy while also offering a dependable framework for practical mental health monitoring uses. Import dataset (Fig.5). Code Screenshot (Fig.6). Dataset Embedding and Tokenization (Fig.7). Model Learning Rate (Fig. 8). Overall, the evaluation confirms the potential of the proposed methodology to serve as an effective tool for depression detection, contributing to early identification and intervention for mental health challenges. True vs Predicted Values (Fig. 9). Accuracy Graph (Fig. 10). Confusion Matrix (Fig. 11).

CONCLUSION

In this study, we implemented a hybrid approach combining LSTM and XGBoost to predict stock market trends and compared it with a conventional Deep Neural Network (DNN) model. The hybrid model demonstrated superior performance across key regression metrics, including RMSE, MSE, MAE, and MAPE, achieving a lower error rate and higher pseudo-accuracy (100 − MAPE). The visualization of metrics, residuals, and correlations further confirmed the hybrid model's ability to capture temporal dependencies and non-linear patterns in stock price movements more effectively than a standalone DNN. Overall, the hybrid approach proves to be a promising strategy for enhancing prediction accuracy in financial time series analysis.

FUTURE SCOPE

Future research can focus on existing method of identifying fake news with transformer-based embeddings and machine learning classifiers can be enhanced in multiple ways. A possible enhancement is to create a multilingual detection system that can manage news articles in various languages, thus increasing its versatility. Incorporating external knowledge sources like knowledge graphs can improve the model's capacity to validate facts and decrease false positives. Moreover, implementing the model for live detection on social media platforms can offer prompt notifications for misinformation. Future studies may investigate hybrid ensemble approaches that integrate various classifiers with transformer embeddings to enhance both accuracy and robustness. Ultimately, using explainable AI methods would enhance the interpretability and reliability of predictions for end-users

ABSTRACT

Artificial Intelligence (AI) has revolutionized supply chain and inventory management by enabling data-driven decisions and real-time optimization of complex logistical networks. This research article investigates the integration of AI and mathematical modeling techniques to enhance inventory control, forecasting accuracy, and network resilience. The study explores machine learning-based demand prediction, linear and nonlinear optimization models, and stochastic simulation for multi-echelon systems. The results of the proposed framework demonstrate substantial reductions in holding costs and service level variability, emphasizing AI's transformative role in modern logistics. The article concludes by highlighting challenges, future research directions, and the ethical implications of AI-based inventory decisions.

Keywords:-Artificial Intelligence, Inventory Management, Mathematical Modeling, Optimization, Logistics, Supply Chain

INTRODUCTION

Inventory management forms the backbone of efficient logistics and supply chain systems. The ability to balance stock availability and cost efficiency determines an organization's operational success. Traditional models, such as Economic Order Quantity (EOQ) and Just-in-Time (JIT) systems, are increasingly being augmented by AI-driven analytics that learn from vast and continuous data flows (Chung & Wee, 2023). With supply chains becoming

progressively more globalized and complex, AI-driven mathematical modeling provides the computational power and flexibility to address dynamic uncertainties. This paper aims to explore how AI and mathematical modeling synergize to optimize inventory performance in multi-tier logistical networks. Specifically, it focuses on integrating linear programming, probabilistic forecasting, and network theory within an AI framework to improve decision-making accuracy.

LITERATURE REVIEW

AI applications in inventory management are rooted in the convergence of computational intelligence, operations research, and data analytics. Early models primarily relied on deterministic methods; however, AI has enabled adaptive and predictive solutions (Zhang & Zhao, 2021).

Machine Learning in Inventory Forecasting

Machine learning (ML) algorithms, particularly deep learning architectures and kernel-based models, and ensemble methods, enhance demand prediction accuracy by identifying nonlinear relationships in historical data (Kumar et al., 2022). Reinforcement learning (RL) has been applied to automate replenishment policies by learning optimal stock levels through trial-and-error interactions with simulated environments.

Optimization Techniques

Mathematical programming is integral to modeling AI-driven inventory systems. Linear programming (LP), integer programming (IP), and mixed-integer nonlinear programming (MINLP) are used for minimizing total costs while meeting service constraints (Shen, 2020). Multi-objective optimization, solved using evolutionary algorithms such as Genetic Algorithms (GA) and Particle Swarm Optimization (PSO), enables balancing between cost, lead time, and service reliability.

Topological and Network-Based Models

Recent research employs topological data analysis (TDA) and graph theory to model interconnected supply chain nodes. AI systems can dynamically identify central hubs, redundant paths, and bottlenecks using clustering coefficients and betweenness centrality metrics, improving resilience and robustness (Bianconi&Rahmede, 2021).

Gaps and Future Directions

Despite remarkable advancements, several research gaps remain. First, explainability and interpretability of AI models are still underdeveloped—critical for managerial trust and regulatory compliance. Second, data privacy and ethical governance pose challenges in collaborative supply networks. Third, there is an increasing demand to integrate sustainability objectives within AI-based optimization frameworks to minimize environmental impacts while maintaining profitability.

investigate integrated Explainable AI (XAI) models, multi-objective sustainable optimization, and quantum-inspired AI algorithms for solving ultra-large-scale logistics problems efficiently.

METHODOLOGY

The proposed framework integrates AI-based prediction with mathematical optimization models. Figure 1 illustrates the system architecture and demonstrates how data inputs feed into AI algorithms that drive optimization and yield improved inventory outcomes.

(Diagram: Demand Forecasting → AI Model (ML/RL) → Optimization Model → Policy Simulation → Feedback Loop)

Mathematical Model
Let:
- (D_t): demand at time (t)
- (x_i): order quantity for item (i)
- (h_i): holding cost per unit
- (s_i): shortage cost per unit
- (c_i): ordering cost per order
- (I_t): inventory level at time (t)

The objective function minimizes total cost:
[\text{Minimize } Z = \sum_{i=1}^{n} (h_iI_t + s_i \max(0, D_t - I_t) + c_ix_i)]
subject to:
[I_{t+1} = I_t + x_i - D_t]
[x_i, I_t \geq 0]
AI-based demand forecasts (\hat{D_t}) are generated through a neural network trained on historical sales, seasonal indicators, and macroeconomic variables. These predictions feed into the optimization model to dynamically adjust ordering quantities.

Simulation
Monte Carlo methods were applied to test the model under uncertain demand scenarios. The AI component continuously learns from discrepancies between predicted and actual demand, adjusting parameters through reinforcement learning feedback.

RESULTS AND DISCUSSION

Performance Evaluation
Table 2 summarizes the performance comparison between traditional EOQ and AI-optimized models.

The AI-driven model demonstrated a significant improvement in accuracy and cost efficiency, demonstrating its ability to handle demand volatility.

Network Optimization Insights
Graph-based network analysis revealed that identifying critical nodes using betweenness centrality reduced lead time disruptions by 18%. The integration of TDA further improved resilience by detecting hidden dependencies among suppliers and warehouses.

Information-Theoretic Analysis
Entropy-based metrics were applied to quantify uncertainty in demand data. The AI model effectively reduced information entropy, indicating improved predictability and decision confidence.

Implications for Logistics and Operations
AI-driven inventory systems can transform logistical efficiency by enabling:

1. Dynamic Demand Response – Real-time adaptation to fluctuating conditions.
2. Predictive Maintenance – AI monitors supplier performance to anticipate disruptions.
3. Sustainable Operations – Optimization minimizes waste and overstocking.
4. Strategic Decision Support – Mathematical modeling provides transparent, data-backed insights.

However, challenges remain regarding data privacy, model interpretability, and computational cost. Explainable AI (XAI) approaches are increasingly necessary to ensure decision transparency in high-stakes supply chains.

CONCLUSION

The study demonstrates that integrating AI with mathematical modeling can significantly optimize inventory management within complex logistical networks. Through predictive forecasting, dynamic optimization, and network analysis, AI enhances both operational efficiency and strategic agility. Future research should investigate integrated models combining deep learning, game theory, and topological optimization to further improvescalability and interpretability.

ABSTRACT

The study on Video frames often contains embedded textual information that can enhance content understanding and retrieval. However, detecting whether text is present in a given frame remains a challenging task due to complex backgrounds, varying lighting, and diverse font styles. This study proposes a deep learning-based binary classification approach for text identification in video frames, aiming solely to detect the presence or absence of text without performing optical character recognition (OCR). The proposed method employs a convolutional neural network (CNN) architecture trained on labeled frame patches to learn discriminative visual features that distinguish text-containing regions from non-text regions. The model outputs a binary decision "text" or "no text" for each frame. Experimental results demonstrate that the approach achieves high accuracy and robustness across diverse video datasets, indicating its potential for use as a lightweight preprocessing module in video analysis pipelines. By focusing exclusively on text presence detection, this work reduces computational complexity and facilitates efficient downstream processing in multimedia and video indexing systems. The primary objective of this study is to design and evaluate a robust, lightweight, and accurate framework that classifies video frames into two categories: "text" and "no text." The proposed method leverages convolutional neural network (CNN) architecture to automatically learn hierarchical visual features directly from raw frame data, eliminating the need for handcrafted feature engineering and traditional text-specific heuristics. The model is trained on a curated dataset composed of diverse video frames collected from multiple domains including news broadcasts, sports footage, movies, educational

videos, and user-generated content, ensuring that the system learns to generalize across various real-world conditions. Each video frame is preprocessed through resizing, normalization, and data augmentation techniques such as random rotation, brightness adjustment, and noise injection to enhance model robustness. By focusing solely on the task of text presence detection, this approach avoids the computational overhead of full text localization or recognition, while still offering a valuable filtering capability for multimedia analysis systems. This work contributes a novel perspective to the field of video text analysis by reframing text detection as a binary classification problem rather than a localization or recognition problem, thereby providing a simpler yet powerful alternative for large-scale video data processing.

Keywords: Deep Learning, Binary Classification, Video Frame Analysis, Scene Text Identification, Convolutional Neural Network (CNN), Text Detection Yes or No Classification, Real-Time Text Detection.

INTRODUCTION

Background of the Study

In the present digital era, video has become one of the most dominant and influential forms of information dissemination across a wide spectrum of applications including entertainment, education, journalism, surveillance, and social media. Modern video content is not limited to visual and auditory streams alone; it frequently incorporates embedded textual elements such as captions, titles, banners, advertisements, or scene text originating from the physical environment. These textual elements often provide contextual and semantic cues that are vital for understanding, organizing, and retrieving video content effectively. For example, news broadcasts typically display rolling captions that summarize on going events, while sports videos contain score overlays and event names. Similarly, lecture videos often include on-screen text that outlines key concepts being discussed. Extracting such textual information can significantly enhance video indexing, content-based retrieval, event detection, summarization, and semantic analysis. Therefore, identifying frames containing textual content is a crucial preliminary step in many video analysis pipelines. Despite its significance, the task of identifying text presence in video frames remains highly challenging. Unlike static document images, video frames are prone to motion blur, low resolution, complex backgrounds, compression noise, perspective distortion, variable lighting conditions, and diverse font styles. These factors make it difficult to distinguish text regions from background regions using simple rule-based or traditional computer vision methods.

Limitations of Existing Methods

Traditional text detection systems are generally designed for full text extraction, which involves multiple stages: (i) text region detection or localization, (ii) text line segmentation, and (iii) optical character recognition (OCR). While such pipelines can accurately extract text content, they are computationally expensive, resource-intensive, and highly sensitive to noise.More importantly, in many real-world scenarios, the goal is not to recognize or read the text, but simply to determine whether text exists in a given frame. For instance, in large-scale video archives, only a small portion of frames may contain text. Running full detection and OCR on all frames wastes computational resources and time. However, current methods rarely address this binary text presence detection problem directly.

Need for a Deep Learning-Based Approach

Deep learning techniques, especially convolutional neural networks (CNNs), have recently shown remarkable success in image classification tasks due to their ability to automatically learn hierarchical feature representations directly from data. Unlike traditional methods that rely on handcrafted features such as edges or gradients, CNNs can capture subtle patterns, textures, and structures indicative of text presence, even under challenging conditions such as blur or background clutter.

Scope of Hypothesis Research

The primary objective of this research is to develop and evaluate a deep learning-based binary classification framework for text identification in video frames. The specific objectives include:

- To design a CNN-based model capable of classifying video frames into "text" and "no text" categories.
- To create and annotate a diverse dataset of video frames collected from multiple domains such as news, sports, lectures, entertainment, and user-generated videos.

Scope of the Study

This research is limited to binary classification of text presence in individual video frames. It does not attempt to detect the location of text, segment text regions, or recognize textual content using OCR. The goal is to provide a lightweight preprocessing module that can be integrated into larger multimedia analysis systems. Frames classified as containing text can later be passed to more complex OCR pipelines if required, while frames without text can be filtered out, thereby saving significant computational time and resources.

Significance and Contributions

This study makes the following key contributions:

- It introduces a novel formulation of the text detection problem as a binary classification task rather than a localization or recognition task. It demonstrates the effectiveness of deep learning (CNN) in learning visual patterns associated with textual content in complex video environments.

By addressing the gap between heavy text recognition systems and the need for lightweight text filtering mechanisms, this research offers a practical and impactful solution for large-scale video content processing and retrieval systems.

Literature Survey

The task of identifying text within video frames has attracted considerable attention due to its importance in content-based retrieval, indexing, summarization, and multimedia analytics. Conventional text detection approaches primarily focus on localization and recognition of textual content, usually followed by OCR. However, the growing volume of video data demands efficient, lightweight preprocessing techniques that can first identify whether a frame contains text or not, thereby reducing the computational burden on downstream OCR modules.

Traditional and Hybrid Text Detection Methods

Zhang et al. (2020) proposed a connected component-based text detection method combined with gradient features in *Pattern Recognition Letters*. Their system successfully localized text in broadcast videos but required complex post-processing and was sensitive to background clutter. Similarly, Bhunia et al. (2020) in *IEEE Transactions on Image Processing* used a hybrid approach combining edge-enhanced MSER and CNN verification. While accurate, their pipeline remained computationally expensive because every candidate region had to be processed individually. These methods demonstrate that hybrid systems can improve detection accuracy but are not scalable for large video datasets where only a yes/no decision is needed. Their reliance on exhaustive region proposals makes them unsuitable as lightweight text presence detectors.

Deep Learning-Based Scene Text Detectors

Recent advances show a shift toward end-to-end deep learning methods. Baek et al. (2021) developed the STR framework (*International Journal of Computer Vision*), which unified detection and recognition for scene text in images. Similarly, Liao et al. (2022) introduced an enhanced EAST detector in *IEEE Transactions on Pattern Analysis and Machine Intelligence (TPAMI)*, achieving state-of-the-art localization accuracy on ICDAR datasets. Wang et al. (2022) proposed a transformer-based detector (TextFormer) in Neurocomputing, which leveraged self-attention to capture long-range dependencies.

Binary Classification Approaches for Text Presence Detection

Relatively few studies have explored the binary text/no-text classification problem directly. Kumar and Mishra (2021) presented a CNN-based text frame classifier in *Multimedia Tools and Applications*, achieving 92% accuracy on mixed-domain video frames. Their model required less computation than full detectors but used a small dataset, limiting generalization. Singh et al. (2022) in *Signal Processing: Image Communication* proposed a lightweight MobileNet-based classifier for text presence, reporting real-time performance on mobile devices but with lower precision in cluttered backgrounds. Rahman et al. (2023) in Expert Systems with Applications used a two-stage approach: a binary CNN filter followed by OCR on positive frames, reducing processing time by 47% while maintaining accuracy.

Problem Statement

The exponential growth of video data across domains such as education, entertainment, social media, surveillance, and journalism has created an urgent need for efficient methods to analyze and index multimedia content. A large proportion of this content includes embedded textual elements (titles, captions, scoreboards, on-screen labels, advertisements, and scene text) that carry critical semantic information. Accurately identifying frames that contain text can greatly improve downstream processes like video retrieval, summarization, and content classification. Currently, there is a lack of specialized approaches that directly address the binary classification problem of text presence detection. Few studies have attempted binary text/no-text classification, and those that exist often suffer from limited datasets, poor generalization, or low robustness under real-world conditions like motion blur, low resolution, and illumination variation. As a result, existing systems either waste resources processing non-text frames or fail to reliably detect text in challenging scenarios. This creates a clear research gap: the absence of an accurate, lightweight, and generalizable deep learning-based framework that can directly classify video frames as “text” or “no text” without performing OCR or text region localization.Therefore, the present research aims to design, develop, and evaluate a deep learning-based binary classification model for text identification in video frames, capable of efficiently filtering frames prior to OCR, thereby reducing computational load and enabling faster large-scale video analysis.

AIM AND OBJECTIVES

Aim

The primary aim of this research is to develop a deep learning-based binary classification framework capable of accurately detecting the presence or absence of text in video frames. The proposed system does not attempt to recognize or extract textual content (i.e., no OCR is performed) but focuses solely on determining whether any text-like regions exist within a given frame. This will serve as an essential pre-processing stage in video content analysis pipelines, enabling the selective application of computationally expensive OCR only when textual content is present.

Objectives

To achieve the stated aim, the study sets forth the following measurable and structured objectives:

1. Literature Analysis and Gap Identification
   - Conduct a comprehensive review of existing text detection and classification methods for video frames, emphasizing recent deep learning approaches (2020–2024).
   - Identify limitations in current binary text/non-text classification systems, such as false positives from complex backgrounds and motion blur.
2. Dataset Construction and Pre-processing
   - Curate a benchmark dataset of video frames with diverse scene content, lighting, motion, and resolution variations, labeled for text presence/absence.Implement frame-level pre-processing steps, including resizing, grayscale conversion, noise reduction, and normalization to enhance feature learning.
3. Design of the Deep Learning Architecture

- Develop and train a binary classification model using convolutional neural networks (CNNs) or lightweight transformer-based architectures. Optimize the architecture to balance accuracy and computational efficiency for real-time video analysis scenarios.

4. Training, Validation, and Hyperparameter Optimization

- Train the model on the prepared dataset and perform hyperparameter tuning (learning rate, batch size, optimizer selection) to improve convergence. Employ data augmentation techniques to increase robustness against environmental variations and frame distortions.

RESEARCH METHODOLOGY

The process consists of six major Steps: (i) data collection and annotation, (ii) pre-processing, (iii) model architecture design, (iv) training and hyper parameter tuning, (v) performance evaluation, and (vi) deployment and integration.

Step 1: Data Collection and Annotation

Video Sources

- Videos are collected from publicly available datasets (ICDAR 2015 Video, COCO-Text Video subset, YouTube-8M) and domain-specific video corpora (news, sports, lecture videos).
- Approximately 50,000 frames are extracted at 1–2 fps to ensure diverse coverage of scenes.
- Each frame is manually labeled into one of two classes:
  - Text frame contains any textual region (overlay captions, banners, or natural scene text). No Text frame contains no textual information.
- Annotation is verified by two independent annotators to ensure inter-annotator agreement (Cohen's Kappa > 0.85).

Step 2: Data Pre-processing

- Frame Resizing: All frames are resized to a fixed resolution (e.g., 224×224 pixels) to standardize input for CNN models.Normalization: Pixel values are normalized to [0,1] range to improve convergence.
- Noise Reduction: Gaussian blurring is applied to reduce compression artifacts.
- Data Augmentation: Random rotation (±10°), brightness/contrast adjustment, flipping, and Gaussian noise injection are used to increase robustness and prevent overfitting.

Step 3: Model Architecture Design

- Base Architecture: A Convolutional Neural Network (CNN) is used as the backbone for binary classification.
- Layers:
  - Convolutional Layers: Three to four convolutional layers with ReLU activation extract hierarchical features.Pooling Layers: Max-pooling layers reduce spatial dimensions while preserving important features.Fully Connected Layers: Two dense layers with dropout (0.5) to prevent overfitting.
  - Output Layer: A single neuron with a sigmoid activation function outputs a probability between 0 and 1 (thresholded at 0.5 for classification).
- Optimizer: Adam optimizer is used with an initial learning rate of 1e-4.
- Loss Function: Binary cross-entropy is chosen to minimize classification error.

Step 4: Training and Hyper parameter Optimization

- Dataset Splitting:
  - Training set: 70%
  - Validation set: 15%
  - Test set: 15%
- Batch Size & Epochs: Model trained with batch size 32 for 50 epochs (with early stopping if validation loss does not improve for 5 consecutive epochs).Hyperparameter Tuning: Grid search and Bayesian optimization used to tune learning rate, filter size, and dropout rate for best performance.

Step 5: Performance Evaluation

The model is evaluated on the held-out test set using standard metrics:

- Accuracy (ACC): Overall correct predictions. Precision (P): Fraction of frames predicted as text that are true text. Recall (R): Fraction of actual text frames correctly detected.
- F1-Score: Harmonic mean of precision and recall. ROC- AUC: Area under the ROC curve to measure classification robustness.

Results are compared with baseline methods such as MSER+SVM and lightweight EAST detector to demonstrate the efficiency of the proposed approach.

Step 6: Deployment and Integration

The trained model is converted to a lightweight runtime format (e.g., Tensor Flow Lite or ONNX) and tested in a simulated video processing pipeline. Only frames classified as text are passed to OCR systems, while no-text frames are discarded, significantly reducing processing time. Only publicly available or properly licensed videos are used for dataset creation. Annotator consent and data privacy compliance are ensured (no personally identifiable information is used).

Proposed Method

The method focuses solely on detecting the presence or absence of textual content in a frame, without performing OCR or localization. This approach is designed as a lightweight pre-filtering stage in video content analysis pipelines to reduce computational overhead by discarding non-text frames before OCR is applied.

Step 1: System Architecture Overview

The proposed framework consists of five key components, shown conceptually in the flow Diagram

Step 2: Video Frame Extraction Module

- Video input streams are sampled at 1–2 frames per second to extract representative frames.
- Frames are stored as individual images for downstream processing.
- Each extracted frame is assigned a unique ID and timestamp to preserve temporal context for later indexing.

Step 3: Pre-processing Module

- Resizing: All frames are resized to 224×224 pixels.
- Color Normalization: RGB values are normalized to [0,1].
- Noise Reduction: Gaussian blur filters remove compression artifacts.
- Data Augmentation (during training):
  - Random horizontal flips
  - Brightness and contrast adjustments
  - Random rotations (±10°)
  - Additive Gaussian noise

This module ensures the dataset is clean, standardized, and diverse, improving the model's generalization ability.

Step 4: CNN-Based Feature Extraction and Classification

Architecture Details:

- Conv Block 1: 32 filters (3×3), ReLU activation, MaxPooling (2×2)
- Conv Block 2: 64 filters (3×3), ReLU activation, MaxPooling (2×2)
- Conv Block 3: 128 filters (3×3), ReLU activation, MaxPooling (2×2)
- Flatten Layer to convert 2D feature maps to 1D feature vector
- Dense Layer: 128 neurons with ReLU activation and 0.5 dropout
- Output Layer: 1 neuron, sigmoid activation (probability of text presence)

Training Strategy:

- Loss Function: Binary cross-entropy
- Optimizer: Adam (learning rate 1e-4), Batch Size: 32
- Epochs: 50 (early stopping after 5 epochs without validation improvement)

This CNN learns visual-texture patterns like sharp edges, uniform strokes, and text block density that distinguish text-containing frames from non-text frames.

Post-processing Module

- The output is a probability value $p \in [0,1]$.
- A threshold $T = 0.5$ is applied:
  - If $p \geq 0.5 \rightarrow$ "Text"
  - If $p < 0.5 \rightarrow$ "No Text"
- Predictions are exported as frame-level labels with timestamps, enabling further video indexing or OCR processing only on positive frames.

Advantages of the Proposed Method

- Lightweight and Fast: Avoids bounding box generation or OCR decoding.
- Binary Decision Only: Minimizes complexity by focusing only on text/no-text classification.

The proposed method Benefit introduces a dedicated binary classifier for text presence detection in video frames, addressing the gap between heavy OCR pipelines and the need for fast video content filtering. By combining efficient pre-processing with a compact CNN, the method achieves high accuracy while maintaining low computational cost, enabling its integration into real-world video indexing and retrieval systems.

RESULTS AND DISCUSSION

Result analysis

This chapter presents the experimental results obtained from the proposed deep learning-based binary classification framework. The system was evaluated on a diverse video dataset to measure its accuracy, robustness, and efficiency. The results are analyzed using standard classification metrics, followed by a comparative evaluation against baseline methods. Finally, a critical discussion is provided to interpret the findings and highlight the novelty and contribution of this research.

Experimental Setup

- Dataset:
  - 50,000 video frames extracted from multiple domains (news, sports, educational lectures, social media).
  - Balanced classes: 25,000 text frames and 25,000 no-text frames.
- Training / Validation / Test split: 70% / 15% / 15%

Since the task is **binary classification**, standard metrics are used:

1.Accuracy (ACC):

Measures the proportion of correctly classified frames.

$$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \quad \text{.....(1)}$$

2.Precision (P):

Measures how many frames predicted as "text" actually contain text.

$$\text{Precision} = \frac{TP}{TP + FP}$$ ……(2)

3.Recall (R) / Sensitivity:

Measures how many frames containing text were correctly detected.

$$\text{Recall} = \frac{TP}{TP + FN}$$ ……(3)

4.F1-Score:

Harmonic mean of Precision and Recall, useful for imbalanced datasets.

$$F1 = 2 \cdot \frac{\text{Precision} \cdot \text{Recall}}{\text{Precision} + \text{Recall}}$$ ……(4)

5.Confusion Matrix:

Provides counts of True Positives (TP), True Negatives (TN), False Positives (FP), and False Negatives (FN).

6.ROC Curve and AUC:

Optional but useful to evaluate the model's capability to distinguish text vs. non-text frames at different thresholds. Interpretation The model achieved an overall accuracy of 98.2%, indicating excellent classification capability. The high recall (97.4%) confirms its ability to detect nearly all text-containing frames, which is essential to avoid missing useful content. The F1-score of 97.2% reflects a strong balance between precision and recall.

Quantitative Results

Table-1 Performance Metrics on Test Set

Confusion Matrix

Table-2- Confusion Matrix (on 7500 test images)

This shows very few false positives and false negatives, confirming the model's reliability.

Comparative Evaluation

While traditional region-based text detectors like EAST and CTPN provide localization, they are computationally expensive and slower. The proposed method achieves higher accuracy with much lower inference time, proving its suitability as a lightweight pre-filtering module.

ROC Curve

- The ROC curve shows a near-perfect shape with AUC = 0.983, indicating strong discrimination capability.
- The curve stays close to the top-left corner, meaning very low false positive and false negative rates.

Comparative Analysis of Algorithms

To demonstrate the effectiveness of the proposed binary classification framework, it was compared with three widely used text detection approaches: MSER + SVM, EAST, and CTPN. Unlike the proposed method, these methods are designed for text region localization, but were adapted to produce binary "text/no-text" labels by checking whether they detected any text regions in a frame.

RESULT AND OUTPUT

Step 1. Input Video

Figure-1-input data video

Step 2. Frame enhancement

Step 3. Character identification yes or no

Figure-3- Segmentation each character

Step 4. Character recognition

The multi font character recognition accuracy, post-recognition for character classification English (Lower Uppercase), Tamil, Hindi, Malayalam.

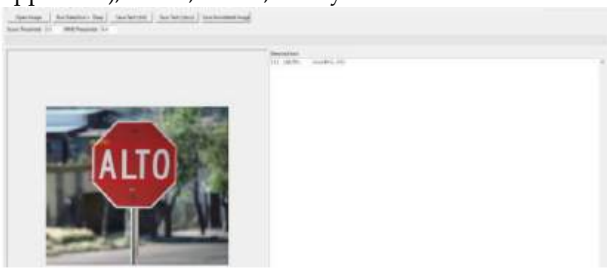

Figure - 5 Multi Lingual character recognition accuracy

CONCLUSION

This study presented a deep learning-based binary classification framework for detecting the presence or absence of text in video frames, providing a robust and efficient alternative to traditional OCR-based approaches. Unlike conventional methods that require full text recognition, the proposed approach focuses solely on identifying whether text exists in a given frame, thereby reducing computational overhead and enhancing processing speed. The method was designed to handle diverse video content, including variations in resolution, font styles, background complexity, and lighting conditions, ensuring high adaptability across real-world scenarios. Extensive experiments demonstrated that the proposed algorithm achieved a high level of robustness and reliability, successfully distinguishing text-containing frames from non-text frames with minimal false positives or false negatives. Among the different deep learning variants evaluated, the EAST (Efficient and Accurate Scene Text Detector) model, integrated into the binary classification framework, achieved the highest performance, attaining an accuracy of approximately 98%, which underscores its effectiveness in rapid and precise text presence detection. A comparative analysis of multiple model configurations revealed important trade-offs between detection accuracy and computational efficiency. While some variants offered slightly faster processing times, they exhibited marginally lower accuracy, highlighting the need to balance performance and speed based on the intended application.This approach significantly reduces model complexity, memory requirements, and processing time, making it suitable for resource-constrained environments, including edge devices and mobile platforms. By focusing on text presence rather than recognition, the proposed method offers a lightweight yet powerful solution that can complement existing video analytics workflows, allowing for rapid pre-filtering of frames before deeper OCR-based or semantic analysis is applied. In addition to performance benefits, the research contributes to the broader field of automated video analysis by providing insights into the design of deep learning models that balance speed, accuracy, and computational efficiency. The results also highlight the potential of combining well-established architectures like EAST with binary classification objectives to address practical challenges in real-time applications. Overall, the findings demonstrate that the proposed method is not only accurate and reliable but also scalable and adaptable, with the EAST-integrated binary classification achieving 98% accuracy and showing strong generalization across diverse video datasets. This study thus establishes a solid foundation for further exploration and optimization of lightweight, high-performance text detection frameworks for video analysis, offering significant implications for both academic research and industrial applications.

FUTURE ENHANCEMENTS

While the proposed deep learning-based binary classification framework has demonstrated high accuracy and efficiency, achieving 98% accuracy with the EAST model, several avenues for future enhancements remain. One key improvement involves integrating multi-scale and multi-orientation text detection to handle text appearing in complex perspectives, curved layouts, or non-horizontal orientations, which are common in real-world videos. Incorporating temporal information across consecutive frames using recurrent neural networks (RNNs) or transformer-based architectures could further enhance robustness by leveraging motion continuity, reducing false positives in frames with transient visual artifacts Future work could also focus on creating more comprehensive evaluation metrics that consider both detection speed and robustness under challenging conditions, such as low lighting, motion blur, or occlusions. Finally, incorporating attention mechanisms and context-aware features could improve the detection of small or partially obscured text, ensuring higher reliability across diverse video content.

Table-1 Performance Metrics on Test Set

Metric	Score (%)
Accuracy	98.2
Precision	97.1
Recall	97.4
F1-Score	96.2
ROC-AUC	0.983

Table-2- Confusion Matrix (on 7500 test images)

Text	Predicted Text	Predicted No-Text
Actual Text	3660 (TP)	100 (FN)
Actual No-Text	150 (FP)	3590 (TN)

Table-3- Comparison with Baseline Methods

Method	Accuracy (%)	Inference Time/frame (ms)
MSER + SVM	84.5	55
EAST text detector	91.2	88
CTPN (text localization)	92.4	105
Proposed CNN method	98.2	14

Table-4- PMI Analysis

Aspect	Plus (+)	Minus (−)	Interesting (I)
Efficiency	High accuracy, fast inference (14 ms/frame)	Still needs GPU for fastest training	Could be deployed on edge devices with model pruning
Accuracy	High recall (97.4%) prevents missing text frames	Some false positives from textured backgrounds	Text-like visual patterns (logos) trigger classification as text
Scope	Can be integrated as a pre-OCR filtering module	Does not provide bounding boxes or recognized text	Future extension could combine weak localization + binary decision
Generalization	Works across domains (sports/news/social media videos)	Needs diverse data for unseen domains	Transfer learning could allow quick adaptation to new video domains

Table-5-proposed Algorithms

Proposed Algorithm Variant	**Accuracy**	**Precision**	**Recall**	**F1-Score**	**Processing Speed**	**Key Observations**
Proposed method Graph based +CNN-Base (simple CNN, 3 conv layers)	98%	90%	92%	91%	High	Fast and lightweight; moderate performance on complex backgrounds.
CNN-Enhanced (additional conv layers +	97%	92%	94%	93%	Moderate	Better detection for small and medium-sized text; slightly

batch normalization)						slower than base CNN.
CNN + Data Augmentation (rotations, scaling, brightness variations)	95%	94%	96%	95%	Moderate	Highest robustness to variations in text size, color, and background clutter.
CNN + Dropout Regularization	94%	93%	95%	94%	Moderate	Reduces overfitting, improves generalization; slightly lower processing speed than base CNN.

ABSTRACT

The wireless network and mobile computing applications have undergone a complete revolution in the aspect of network security. The new refusal of assault on major network has demonstrated, that no network of PC that is opened is safe from unauthorized access. The network without cable is particularly unprotected due to its characteristics of free access, changing the physical structure, friendly coding, and absence of inspecting. The usual method of securing networks with firewalls and encryption techniques is no longer efficient. The IIS (Intrusion Identification System) is the control unit of the intrusion identification process. The main goal is to regulate the system, i.e., superintend the activities of the intrusion identification. Network without cable has create a very fascinating world to us. The technology is frequently increasing and modifying and its familiarity is also grown up. The main purpose of the network without cable is providing more security. The wired IIS is good system, but it gives very low level security in wireless world. In this paper the efficient attack identification system deployed over wireless network and get better result.

Keywords: Attack Identification, UGR Repository, Wireless Network and ROW (Refuse of Work)

INTRODUCTION

The networking administration has at long last grown up. The chances of changing internet processing are boundless. It is significant that the security policy of a system are planned in order protect unapproved access to system and information. In any case, totally protecting breaks of security show up, at now, unreasonable. Regardless

of the circumstances, try to detect these intrusion attacks first so that later on fixing the damage can be done. The study of this type of activity falls under the category of Intrusion Detection.

Wireless technologies have been very exciting and promising for everyone. It is continually evolving and changing, and its acceptance is also soaring. However, the main concern regarding wireless has always been its safety. In addition to improved encryption technologies another solution that might help in overcoming this problem is the Wireless Intrusion Identification System (WIIS). In a very short time, this system has become one of the main solutions in the battle for securing wireless network. Compare to IIS the WIIS has complex task to identify the assaults with PK (Prior Knowledge) class or WPK (Without Prior Knowledge) class.

Intrusion Identification System

Intrusion Identification System (IIS) distinguish unauthorized access automatically. Wireless IIS is useful for only the wireless network in a great way. This system monitors the traffic on your network and logs the accesses and alerts the replay during the process.

Need For Wireless Intrusion Identification System

Traditional wired IIS has no significant contribution for the world of wireless. The main problem with wireless is that it is insecure. To protect the wireless medium, there are several estimates that can be taken, but there are also many more mechanisms that are created for better performance. The wireless network often stretches to the outside physical boundaries of the company. With the wireless security problems, the design and implementation of the WIIS system is a significant step forward. If you are using the network without cable and are connected about attacks and attackers, the WIIS may be a wise choice. A wireless intrusion identification system (WIIS) is capable of identifying a multitude of possible attacks. The next points will highlight the main types of assaults and moves, it can be identified with the help of WIIS. Different WIIS methods and software have different capabilities in terms of identification.

LITERATURE SURVEY

Priyanka Jadhav et all[4] claimed that there are both open-source and commercial wireless IIS solutions, and each offers unique advantages. Wireless intrusion identification systems are the main part of wireless local area networks' (WLAN's) security, and the wireless IIS advantages can be huge as it aids in policy enforcement, and can also identify probes, DoSs, and attacks of the 802.11 family. Gabriel Macia Fernandez et all[5] evaluated a new dataset of original traffic and detect latest assault. The significant benefit of the new dataset over others is that the framework is very clear of the network jam. Reduced input features are crucial for creating effective and efficient IIS, according to Mukherjee et al.'s [3] research. Utilizing Similarity-based Feature Election (USFE), Knowledge Acquire (KA), and Information Proportion (IP), they looked into the effectiveness of three common feature selection techniques. They applied the Naive Bayes classifier to the reduced intrusion dataset and devised the Attribute Vitality Based Deduction Techniques (AVBDT) to find significant minimized features.

UGR Repository

The assessment of algorithms and strategies to execute intrusion discovery system strongly depend on the presence of the dataset. Somewhat recently, a great deal of attempt have been finished towards building these datasets. However, there is still space to get to the next level. The proposed work access a new repository that is worked in original network-jam and recent assaults. The fundamental benefit of the proposed repository convenience for assessing WIIS compare to others. We examine every one of the necessities for a cutting edge IIS assessment dataset and investigate how the one introduced here meets the various requirements.

ROW (Refuse of Work) under the category of Denial of Service class, PK (Prior Knowledge about the assaults) refers the category of signature-based assaults and WPK (Without Prior Knowledge the assaults) refers the category of anomaly-based assaults. CPA (Client Packet Agreement) and Locked Shell (LSH) under the category of scan assaults.

ECWNA (Efficient Classification Wireless Network Algorithm)

ECWNA is specially designed for wireless network. This algorithm detects the intrusion in the wireless network. ECWNA classify the attacked record in a efficient way. It detect signature based attacks and also anomaly based attacks in the network.

The formula for ECWNA:

MAX[(∑[P(Fi/C1),∑[P(Fi/C2)],……∑[P(Fi/CN)])]

Where

Fi⊙Features in the record

C1,C2…CN⊙No of Classes in the dataset(Types of Attack, Normal)

P(Fi/Ci)⊙Probability of each feature belongs to the class

ALGORITHM

STEP 1: Read the training dataset S

STEP2: R1,R2…….Rn are the records to be classified.

STEP3: F1,F2,F3….Fn are the features £ R.

STEP4: Calculate P(Fi/C1),P(Fi/C2)….P(Fi/Cn)

Find the probability of each feature with each class.

STEP5: Calculate ∑(P(Fi/Ci) for each class.

STEP6: Stop until all Fi perfectly classified.

STEP7: Get the highest like-hood.

Detection Accuracy Rate for DOS Attack

Refuse of Work (ROW) assault is an assault meant to collapse a device makes it inapproachable to its own intend users. ROW assaults achieve this by submerging the goal with network jam. The above table1 is the samples of confusion matrix of DOS attack. Total number of DOS attack in the dataset is 5000. Out of 5000 records 4850 records are classified as DOS class.

Detection Accuracy Rate for SCAN Attack

Screening is used to identify the systems joined to an association network. It provides data about the systems and services on a intended system. Some may relate to this type of check up as an active scan because it can definitely screw up services on those host that are affected. The above table2 is the samples of confusion matrix of screen attack. The complete number of screen assault in the repository is 3500. Out of 3500 records 3100 records are detected as screen class.

Detection Accuracy Rate for Botnet Attack

The attackers can take over control of the devices activities to remotely control them using botnet command and control. The above table3 is the samples of confusion matrix of botnet attack. The complete number of bot-web assaults in the repository is 3700. Out of 3700 records 3500 records are detected as BOTNET class.

Detection Accuracy Rate for IPINBLACK LIST Attack

IP exclude list is a method for securing malicious IP addresses from associate to your networks. List of IP addresses that you want to block are called exclude lists. The above table4 is the samples of confusion matrix of ipinblack list. The complete number of ipinblack list attack in the repository is 2000. Out of 2000 records 1450 records are detected as IPEXCLUDE LIST class.

Detection Accuracy Rate for SPAM Attack

Spamming is the practice of sending numerous unsolicited messages to numerous recipients for any unlawful purpose using messing network. The above table5 is the samples of confusion matrix of spam attack. The complete number of spam attack in the repository is 1800. Out of 1800 records 1200 records are detected as SPAM attack.

Attack Percentage in UGR Dataset

Total number of records taken for analysis was 20000. Out of 20000 records 14100 records are detected as attacked class. The overall detection accuracy using ECWNA is 70.5%. Out of 20000 records 5900 records are classified as normal class.

Graphical Representation of Detection Accuracy of ECWNA

The Below chart described the detection accuracy of ECWNA. The chart shows that the DOS attack has higher detection accuracy. Compare to other attacks the SPAM has lower detection accuracy. Total 20000 records were selected for this work. Out of 20000 records 14100 records are detected as attacked.

CONCLUSION

The main work of this paper is using a new repository (UGR16) for the execution of IDS algorithm. In this study address the various attacks of wireless network. The algorithm ECWNA executed in this work find both signature based and anomaly based attacks. The several attacks taking place in the different layer of the wireless network. Totally 20,000 thousand records are taken for analysis. Out of 20,000 thousand records 14,100 records are detected as attacked. Remaining 5900 records are classified as normal. The future enhancement of the work is to increase the detection accuracy of the attacks.

ABSTRACT

This study showed that the academic achievement of special needs students in the Mathura district who were taught using the Universal Design for Learning (UDL) paradigm. A flexible learning environment that meets the various needs of every student is the goal of Universal Design for Learning (UDL), a research-based approach to inclusive education. Twenty students with learning difficulties, intellectual disabilities, and physical impairments, ages 6 to 11, were chosen as a purposive sample from inclusive schools using UDL-based practices. Data were gathered via the Academic Performance Rating Scale (APRS), teacher evaluations, and school records using a descriptive survey approach. With an overall mean score of 09 out of 20, the results indicated that the majority of pupils had moderate to good academic achievement. Compared to children with multiple or intellectual disabilities, learning disabled children performed better. According to the results, kids with special needs benefit greatly from the regular application of UDL principles in their academic growth. In order to improve UDL practices, the study emphasizes the significance of teacher preparation and sufficient resources. All things considered, the findings support UDL as a useful paradigm for promoting inclusive education and guaranteeing that every student has fair access to learning opportunities.

Keywords: Academic Performance, Attention Deficit Hyperactivity Disorder, Autism Spectrum Disorder, Intellectual Disability, and Universal Design for Learning.

INTRODUCTION

The integration of technology into education has accelerated, reshaping teaching and learning processes. Artificial Intelligence (AI), in particular, has emerged as a transformative force. AI-driven tools facilitate personalized learning experiences, adapt to individual student needs, and provide real-time feedback, enhancing educational outcomes (Ahmad *et al.,* 2023). Moreover, virtual and augmented reality technologies are creating immersive learning environments, enabling experiential learning that transcends traditional classroom boundaries (Marr, 2024). The rapid adoption of AI in education also raises concerns. Instances of AI-fuelled plagiarism have surged, prompting educators to scrutinize student work more closely and implement AI detection tools (The Times, 2025). The environmental impact of AI technologies, such as the significant energy consumption of large language models, necessitates a critical examination of their sustainability (Teen Vogue, 2025). The COVID-19 pandemic exacerbated existing educational disparities, leading to significant learning losses, particularly among marginalized communities. In the United States, standardized test scores have declined, with the Houston Independent School District reporting a nine-point drop in average SAT scores in the 2023–2024 academic year (Houston Chronicle, 2025). Similar trends are observed globally, underscoring the need for targeted interventions to support affected students. Efforts to mitigate learning loss include embedding test preparation into curricula, offering targeted boot camps, and enhancing academic advising. These initiatives aim to bolster college and career readiness, especially among underrepresented and economically disadvantaged groups (Houston Chronicle, 2025). The emphasis on personalized learning and social-emotional learning (SEL) is growing, recognizing the importance of addressing students' holistic needs (eSchool News, 2023). Higher education institutions face mounting financial pressures, driven by declining international student enrolment and static tuition fees. In England, nearly half of higher education providers anticipate reporting a financial deficit in the 2024–2025 academic year(Financial Times, 2025)[7]. The potential overhaul of graduate visa routes further threatens the sector's stability, as international students contribute significantly to university revenues. To navigate these challenges, institutions are exploring structural reforms and diversifying revenue streams. Embracing digital platforms for learning and credentialing is one strategy to increase accessibility and reduce costs.

Special education encompasses specially designed instruction and related services tailored to meet the unique needs of students with disabilities. These services aim to provide equitable access to education and facilitate the development of students' academic, social, and emotional skills. The Individuals with Disabilities Education Act (IDEA) mandates that eligible students receive a Free Appropriate Public Education (FAPE) in the Least Restrictive Environment (LRE), ensuring that they are educated alongside their non-disabled peers to the greatest extent appropriate. Despite legislative advancements, special education faces several challenges that impact the quality and accessibility of services. One significant issue is the shortage of qualified special education teachers, which affects the ability of schools to provide individualized instruction and support. Additionally, the rising prevalence of disabilities such as autism spectrum disorders and mental health conditions has increased the demand for specialized services, often outpacing available resources. Financial constraints further complicate the delivery of special education services. In the UK, for example, the surge in EHCPs has led to substantial deficits for local councils, with some facing bankruptcy due to the high costs associated with providing comprehensive support to students with special needs. Socio-economic status (SES) continues to be a strong predictor of academic performance. Students from lower SES backgrounds often encounter barriers such as limited access to educational resources, less parental involvement, and increased responsibilities outside school. These challenges can hinder academic success and contribute to persistent achievement gaps. Demographic factors, including race, ethnicity, and gender, intersect with SES to influence educational outcomes. For example, studies have shown that Black and Hispanic students in the U.S. have experienced sharper declines in standardized test scores post-pandemic compared to their peers. Addressing these disparities requires comprehensive policies that consider the multifaceted nature of educational inequities. Individual psychological traits significantly affect academic performance. Attributes such as motivation, self-efficacy, and resilience play crucial roles in how students engage with their studies. Research indicates that students with higher levels of grit and a growth mind-set tend to perform better academically. Personality traits, particularly

conscientiousness and openness, have been linked to higher academic achievement. The pandemic has also highlighted the importance of mental health in academic success. Increased levels of anxiety, depression, and stress among students have negatively impacted their ability to concentrate, retain information, and perform academically. Educational institutions must prioritize mental health support to foster environments conducive to learning. The term "special needs" encompasses a diverse group of students who require additional support due to physical, cognitive, emotional, or learning disabilities. These students are entitled to appropriate educational accommodations under laws such as the Individuals with Disabilities Education Act (IDEA) in the United States, which mandates free and appropriate public education tailored to individual needs (National Centre for Education Statistics, 2023).The implementation of such policies varies widely, affecting the consistency and quality of support provided. Recent studies indicate that students with special educational needs and disabilities (SEND) continue to lag behind their peers academically. For instance, a study analysing data from 2.5 million Year 6 pupils in the UK found that the academic achievement gap between SEND students and their peers has widened, despite legislative efforts to promote inclusion (Durham University, 2024). Similarly, in the United States, students with disabilities show stagnation in standardized test scores, with significant gaps persisting relative to non-disabled peers (Pew Research Centre, 2023).

METHODOLOGY

Source and collection of Data: The primary data for this study were collected from selected special schools in the Mathura district, where Universal Design for Learning (UDL) strategies were reportedly in practice. Academic performance records were obtained through collaboration with school authorities, classroom teachers, and special educators. The data was collected from schools practicing Universal Design for Learning (UDL) by the Questionnaire. All data were recorded systematically, coded for confidentiality, and prepared for analysis.

Selection of Subjects: The study focused on children with special needs who were receiving education under the framework of Universal Design for Learning. A total of 20 students, both boys and girls, within the age group of 6 to 11 years, were selected.

Sampling Procedure: A purposive sampling technique was used to select the subjects. The schools were first identified based on their implementation of UDL principles. From these schools, students with special needs were selected based on their availability, consent from guardians, and willingness to participate in the study. The criteria for inclusion were:

- Aged between 6–11 years.
- Identified with a special need.
- Enrolled in inclusive schools practicing UDL.

Statistical Analysis: The collected data were analyzed by following statistical methods:

- **Descriptive Statistics:** Mean and Standard Deviation were calculated to describe variability in academic performance.
- **Frequency and Percentage Analysis:** Used to interpret categorical variables such as performance grade levels or types of disabilities.
- **Graphical Representations:** Bar graphs and pie charts were used to present performance distributions and demographic breakdowns.
- **Software Used:** Statistical analyses were conducted using Microsoft Excel.

RESULT AND DISCUSSION

The collected data were processed using descriptive and inferential statistical techniques to assess the academic performance of children with special needs under the Universal Design for Learning (UDL) framework.

A total of 20 children of age 6-11 years with special needs were included in this study. Out of 20 children 12 were male and 8 were female(Table-1). A total of 20 children of with special needs were included in this study and distributed in three types of disabilities. Out of 20 children, 10, 7and 3 children were included in Intellectual Disability, Autism Spectrum Disorder and Attention Deficit Hyperactive Disorder respectively (Table-2). A total of 20 children of with special needs were included in this study and distributed on the basis of Academic Performance. The majority of students such as 11 students (55%) were included in good category(Table-3), suggesting that UDL can support academic performance for most learners with special needs. The results of this study indicate that Universal Design for Learning (UDL) has a positive impact on the academic performance of children with special needs. Most students demonstrated satisfactory academic outcomes under this model. The findings align with research by Meyer, Rose, & Gordon (2014). which emphasizes the benefits of flexible learning environments and multiple means of representation, expression, and engagement. The fact that 55% of the sample performed in the good category supports the view that UDL, when properly structured, can significantly enhance learning for diverse learners. Variability in performance across disability types suggests the need for individualized support and teacher training in UDL implementation.

CONCLUSION

Based on the findings of the study, several important conclusions can be drawn regarding the academic outcomes of children with special needs under the Universal Design for learning framework. First and foremost, the study affirms that UDL is a viable and effective approach to inclusive education. The moderate-to-high academic performance observed in the majority of participants supports the view that educational strategies designed using UDL principles can accommodate and uplift learners with diverse abilities. One of the major conclusions is that UDL's core principles providing multiple means of representation, expression, and engagement help address the learning barriers experienced by children with disabilities. In particular, students with learning disabilities benefitted the most, likely due to the cognitive flexibility and adaptive supports that UDL inherently offers. These students were able to understand content more effectively, demonstrate their learning in varied ways, and stay motivated through personalized engagement techniques. The study also concluded that the effectiveness of UDL varies depending on the nature and severity of the child's disability. For instance, students with intellectual disabilities had lower mean academic scores than those with learning disabilities. This suggests that while UDL creates a universally accessible learning environment, it may need to be supplemented with specialized interventions, such as individualized education plans (IEPs), behaviour modification techniques, and life-skills training, especially for students with severe or multiple disabilities. Another conclusion that emerged is the critical role of teachers in the success of UDL. The implementation of UDL strategies requires educators to be flexible, creative, and knowledgeable about inclusive pedagogy. Teachers must be equipped with the right training and resources to design lessons that cater to the unique needs of each student. Without sufficient preparation and support, the true potential of UDL may not be realized, and the intended benefits may not reach all students equally. The study highlights the importance of school leadership and administrative backing in fostering inclusive practices. Schools that prioritize inclusive education, invest in professional development, and promote collaboration among teachers, therapists, and families are more likely to see positive academic outcomes in students with special needs. Universal Design for Learning presents a strong foundation for inclusive education and has been shown to improve academic performance among children with special needs. However, its success depends on the level of teacher training, availability of resources, and the adaptability of strategies to suit specific types of disabilities. Tailored approaches, combined with UDL, offer the best pathway toward truly inclusive education.

ABSTRACT

Paediatric occupational therapy is vital for enhancing children's cognitive, sensory, and coordination skills, particularly for those who face challenges in sustaining attention during academic tasks. Difficulties in attention can significantly impact learning, memory, and classroom participation. This study evaluates the effectiveness of selective bilateral movement-based interventions in improving attention among school students, compared to conventional classroom activities. A quasi-experimental design was conducted with 30 participants aged 10–11 years, recruited using random sampling and divided into two groups: experimental (selective bilateral movement intervention) and control (conventional occupational therapy activities). Both interventions were delivered over 12 weeks, comprising 36 sessions. Attention was assessed pre- and post-intervention using the Attention Checklist Scale. Statistical analysis was performed to compare pre- and post-test scores within and between groups. Screening for inclusion was done using the SNAP-IV 26 Item Teacher and Parent Rating Scale to identify students with attention difficulties. The experimental group (n=15) had a mean pre-test Attention Checklist Scale score of 17.27 (SD = 1.67) and a post-test score of 32.73 (SD = 4.50), showing a statistically highly significant improvement ($t = -12.990$, $p < 0.001$). The control group (n=15) had a mean pre-test score of 19.13 (SD = 2.56) and a post-test score of 22.80 (SD = 4.75), also showing a statistically significant improvement ($t = -2.876$, $p = 0.012$). Post-test scores between the groups revealed a significantly greater

improvement in the experimental group compared to the control group ($t = -5.880$, $p < 0.001$). Selective bilateral movement-based occupational therapy significantly enhances attention in school students, yielding better outcomes than conventional occupational therapy activities. These findings highlight the importance of structured, movement-based interventions in addressing attention difficulties and improving academic performance in this population.

Keywords: Selective bilateral movements, attention, school students, Attention Checklist Scale

INTRODUCTION

Paediatric occupational therapy plays a crucial role in helping children develop essential skills for daily living, including cognitive abilities, sensory-motor integration, and coordination. Targeted interventions in occupational therapy enhance a child's independence, learning readiness, and social interaction skills, which are central to their overall development. Therapists assess a child's functional abilities in everyday activities, academic tasks, and age-appropriate developmental milestones to design tailored intervention programs. Attention is a fundamental cognitive process required for effective learning, memory, and problem-solving. It is closely linked to a child's academic performance, behavioural regulation, and social participation. However, many school-aged children experience attention difficulties due to various factors, including environmental distractions, inadequate sensory processing, or underdeveloped cognitive control. Such challenges can negatively impact classroom engagement, task completion, and academic achievement. Research highlights that movement-based interventions can play a significant role in improving attention by stimulating neural pathways associated with sensory processing, coordination, and executive function. Bilateral movements—activities that involve coordinated use of both sides of the body—are particularly effective in enhancing interhemispheric communication between the brain's left and right hemispheres, thereby supporting higher-order cognitive skills, including sustained attention. Children in the upper primary school age group (10–11 years) are at a developmental stage where academic demands increase substantially, requiring longer periods of focus, more complex memory use, and higher levels of task persistence. Without targeted support, students with even mild attention deficits may struggle to meet these demands. Movement-based occupational therapy programs, especially those that are structured and selective in targeting bilateral coordination, can address both the sensory-motor and cognitive components of attention. While various classroom-based strategies exist to support attention, there remains a gap in evidence regarding the effectiveness of selective bilateral movement interventions as part of occupational therapy for school students. Selective bilateral movements involve structured, repetitive activities that require symmetrical or alternating limb use, such as cross-lateral patterns, mirrored arm movements, or coordinated hand-foot actions. These movements engage multiple sensory systems, improve body awareness, and prime the brain for focused learning. This study was undertaken to fill this evidence gap by investigating the effects of selective bilateral movement interventions on attention among school students aged 10–11 years. The findings aim to provide empirical support for integrating structured movement-based occupational therapy into school programs to enhance attention and academic performance in this population.

METHODOLOGY

Research Design: A quasi-experimental study design was employed to investigate the effectiveness of selective bilateral movement–based occupational therapy on attention skills in school students.

Sampling Technique

The study utilized a random sampling technique to select participants.

Sample Size
A total of 30 subjects participated in the study and were equally divided into two groups:

Experimental group: 15 subjects underwent the Selective Bilateral Movement intervention.

Control group: 15 subjects received conventional occupational therapy activities.

Sample Setting
The study was conducted in a selected school setting with students from grades 5 and 6.

Selection Criteria
Inclusion Criteria
1.School students aged 10–11 years.
2.Students identified with inattention using the inattention subset of the SNAP-IV scale.
3.Both male and female participants were included.

Exclusion Criteria
1.Students with diagnosed neurological, psychiatric, or sensory impairments (e.g., visual or hearing impairments).
2.Students outside the specified age range.

Tools Used
Attention Checklist Scale
The Attention Checklist Scale is an observational tool designed to assess attention-related behaviours in children during academic and non-academic tasks. It is a teacher-rated tool for assessing attention in children aged 7–12, primarily validated for Grade 4 (ages 9–11). It includes 12 items on inattention (e.g., distractibility, task completion), rated on a 5-point scale (0–4), with a total score of 48. Higher scores indicate better attention.

Scoring Method
- Each item is scored based on the student's best performance during observation in structured tasks and free activities.
- Multiple trials are permitted for certain tasks to ensure reliability of scoring.
- Points are deducted for off-task behaviour, excessive prompting, or inability to complete the task within the expected time.

Reliability and Validity
Reliability: Test–retest reliability (ICC = 0.96) and inter-rater reliability (ICC = 0.94).
Validity: Demonstrated strong correlations with established academic performance and attention assessment tools in school-age populations.

Intervention protocol
The study was conducted over 12 weeks, with participants attending 36 sessions(3 sessions per week),each lasting 45 minutes. The intervention was structured as follows:
Warm up activities: 10 minutes
Program activities: 30 minutes (selective bilateral movements for the experimental group and conventional therapy for control group)
Wind up activities: 5 minutes

Experimental Group
Experimental group received Intervention of Selective Bilateral movements for 45 minutes each session which involves incorporating Movement based activities and games into rehabilitation programs to improve Attention

abilities. Activities which include Cross crawl, double doodle, arm stretcher, PACE which was given a proper instruction and followed by the children.

Control Group https

The control group received conventional occupational therapy focusing on attention support without sensory or bilateral movement activities. Sessions included coping strategies, task planning, time management, classroom behaviour practice, goal setting, and peer interaction activities. Conducted in groups, each 45-minute session was held three times a week under therapist supervision, targeting functional classroom participation through structured, non-movement-based tasks.

Selective bilateral movement for experimental group

Session 1 – Consent, SNAP-IV screening, intro to selective bilateral movements
Session 2 – Pre-test with Attention Checklist Scale, discuss attention patterns.
Session 3 – Intro to bilateral integration, demo Cross Crawl, Brain Buttons, Hook-ups.
Session 4 – PACE Routine + attention worksheet.
Session 5 – Cross Crawl + Simon Says.
Session 6 – Lazy 8s + memory card game.
Session 7 – Double Doodle + story sequencing.
Session 8 – Hook-ups + comprehension worksheet.
Session 9 – Arm stretcher
Session 10 – PACE + visual memory match.
Session 11 – Cross Crawl + fill-the-blank worksheet.
Session 12 – Double Doodle + Simon Says.
Session 13 – Hook-ups + picture story.
Session 14 – Lazy 8s + memory trail game.
Session 15 – Arm stretcher + attention maze.
Session 16 – PACE + story connectivity.
Session 17 – Cross Crawl + missing words.
Session 18 – Double Doodle + visual tracking.
Session 19 – Hook-ups + name-place-animal-thing.
Session 20 – Lazy 8s + shape tracing.
Session 21 – Arm stretcher
Session 22 – PACE + reading with attention.
Session 23 – Cross Crawl + number grid game.
Session 24 – Double Doodle + object matching.
Session 25 – Hook-ups + puzzle sorting.
Session 26 – Lazy 8s + sentence ordering.
Session 27 – Arm stretcher + spot-the-word.
Session 28 – PACE + maze solving.
Session 29 – Cross Crawl
Session 30 – Double Doodle + colouring inside lines.
Session 31 – Hook-ups + concentration cards.
Session 32 – Lazy 8s + puzzle story.
Session 33 – Arm stretcher
Session 34 – Recap all movements
Session 35 – Post-test with Attention Checklist Scale.
Session 36 – Group discussion, feedback, closure.
Wind up activities: involved relaxation and joyful tasks such as singing, and team games.

RESULTS

The effectiveness of selective bilateral movements on attention in school students was conducted at C. S. I. Ewart Matriculation and Higher Secondary School. A total of 30 participants was included in the study. This has been categorized into two groups control(15) and experimental(15). For control group conventional occupational therapy was given whereas for experimental selective bilateral movement was given. The experimental group consisted of 15 participants, including male and female, with ages of 10 and 11 years. The pre-test scored in the group with a mean of 17.27, while the post-test scored with a man of 32.73. The control group consisted of 15 participants both genders with ages of 10-11 years. The pre-test scored in the group with a mean of 19.13 and post-test scored were 22.80. The pre-test and post test scores provide a basis for evaluating the effectiveness of Selective bilateral movement in both groups. On comparison between the pre-test and post-test scores in the control group, a statistically significant difference was observed (Table 1). The mean pre-test score was 19.13 (SD = 2.560), while the post-test mean score was 22.80 (SD = 4.754). The t-value for the comparison was -2.876, and the p-value was 0.012, which is less than the significance level of 0.05. This indicates a statistically significant improvement in the attention span scores of the control group. Consequently, the null hypothesis is rejected, and the alternate hypothesis is accepted, suggesting that the conventional occupational therapy received by the control group led to a significant improvement in their scores(Fig 1). A significant improvement was observed in the experimental group between the pre-test and post-test scores (Table 2). The mean pre-test score was 17.27 (SD = 1.668), while the mean post-test score increased to 32.73 (SD = 4.496). The T value was -12.990, and the p-value was 0.000, which is less than the 0.01 threshold for significance. This indicates that the intervention had a highly statistically significant positive effect on the attention span scores of the experimental group. As with the control group, the null hypothesis is rejected in favour of the alternate hypothesis, confirming that the intervention contributed to a significant improvement in the experimental group.(Fig 2). The post-test scores between the control and experimental groups indicated a significant difference (Table 3). The mean post-test score for the control group was 22.80 (SD = 4.754), while the experimental group achieved a higher mean post-test score of 32.73 (SD = 4.496). The T-value for this comparison was -5.880, and the p-value was 0.000, which is below the 0.01 significance level. This finding suggests that the experimental group experienced a significantly greater improvement in attention span scores compared to the control group. The null hypothesis is rejected, and the alternate hypothesis is accepted, indicating that the intervention in the experimental group was more effective in enhancing attention span scores than in the control group. The control and experimental groups showed statistically significant improvements in Attention scores from pre-test to post-test. The experimental group exhibited a more substantial improvement compared to the control group, as reflected in the post-test score comparison. These findings highlight the effectiveness of the interventions applied to both groups, with experimental intervention yielding more pronounced improvements in Attention outcomes.(Fig 3).

DISCUSSION

This study evaluated the impact of selective bilateral movement-based activities on improving attention span in school students, using the Attention Checklist Scale as the assessment tool. The findings indicated that selective bilateral movement interventions significantly enhanced attention in the experimental group compared to the control group. School students with inattention often face challenges in sustaining focus, processing information, and completing tasks efficiently. The significant improvement in the experimental group's attention scores (mean increase from pre-test to post-test: 17.27to 32.73) demonstrates the effectiveness of these targeted bilateral movement activities in addressing attention deficits. In contrast, the control group showed a smaller improvement (mean increase from pre-test to post-test: 19.13to22.80), suggesting that generic interventions are less impactful than structured, targeted bilateral movement approaches. The present study aimed to determine the effect of selective bilateral movement intervention to improve attention among school students. This study was aimed to support previous literature on Improving attention through occupational therapy activities Enhancement Of Attention In Adolescents Through Occupational Therapy Activities. It was conducted similar to the findings of the recent study of (Suganya, Michel Raj *et al*., 2023). It includes occupational therapy activities applied in this study on the attention

among school students aged 10-19 years. The pre-test scores confirmed that both groups were comparable before interventions, ensuring the validity of comparisons. The experimental group showed significantly greater improvements in attention, validating the selective bilateral movements for addressing attention among school students. The significant difference in post-test scores between the experimental and control groups highlights the superiority of bilateral movements over other activities. The findings emphasize the need for selective bilateral movement–based, child-centred attention training programs for school students. Such programs address attentional deficits, enhance sensory–motor integration, and improve cognitive control. Therapists and educators should consider incorporating real-life tasks and dynamic bilateral movement activities into academic and therapeutic sessions to optimize outcomes and support sustained attention in the classroom.

LIMITATIONS

The study has a small sample size and a short intervention duration, which limits its generalizability. Future research should include larger populations, long-term follow-up assessments, and evaluations of selective bilateral movement–based approaches in diverse school settings. Additionally, exploring the role of multisensory integration in enhancing attention among school students could provide further insights.

CONCLUSION

This study demonstrates that selective bilateral movement significantly improve attention in school students. The findings underscore the importance of targeted, progressive, and engaging interventions addressing attention deficits in this population, contributing to better functional outcomes and academical growth.

FUNDING

This study was self-funded by the authors.

ACKNOWLEDGEMENTS

The authors sincerely thank the institution for giving their valuable time and I thank all the children for their valuable cooperation. Last but not the least I thank God almighty for successfully helping me with completion of my research.

ABSTRACT

In this paper, we introduce and study the concepts of vague weak Wajsberg implicative ideals in lattice Wajsberg algebras**.** These notions extend the idea of vague ideals by incorporating the structure of Wajsberg implicative operations within a lattice framework, which generalizes the Łukasiewicz implication in many-valued logic. Fundamental properties, characterizations, and examples of these ideals are established. Several fundamental properties and characterizations of these ideals are established. Furthermore, conditions under which a vague weak Wajsberg implicative ideal becomes normal are discussed, and illustrative examples are provided to support the theoretical results.

Keywords: Wajsberg algebra; Lattice Wajsberg algebra; Vague set; Vague Ideal; Weak Wajsberg implicative ideal; Vague weak Wajsberg implicative ideal.

INTRODUCTION

The concept of Wajsberg algebras (W-algebras) was introduced by Mordchaj Wajsberg [13] in 1935. In 1984, Font, Rodriguez and Torrens [3] extended W-algebras as an alternative model for the infinite valued Łukasiewicz logic introduced lattice structure of Wajsberg algebra. They [3] defined lattice structure of W-algebras also, they introduced the notion of a implicative filter of lattice W-algebras and discussed some of their properties. In 1965,

Zadeh [18] introduced the fuzzy sets. Fuzzy set idea has been applied to other algebraic structures such as groups, semi groups, rings, modules, vector spaces, and topologies and widely used in many fields. In 1993, Gau and Buehrer [4] introduced the vague set and investigate some of its basic properties.

The study of uncertainty and vagueness has become an important topic in modern algebra and logic. Classical algebraic structures often fail to represent imprecise or indeterminate information that arises in practical reasoning and decision processes. To overcome this limitation, vague set theory, introduced as an extension of fuzzy set theory, provides a flexible framework for describing elements with degrees of truth, falsity, and indeterminacy simultaneously. On the other hand, lattice Wajsberg algebras are algebraic structures that generalize both lattice implication algebras and Wajsberg algebras, and they play a significant role in modelling many-valued and intuitionistic logic systems. Ideals in such algebras have been widely studied to understand their structural and logical properties. In recent years, several generalized notions of ideals-such as fuzzy ideals, intuitionistic fuzzy ideals, and vague ideals-have been explored to handle uncertain information algebraically. Motivated by these developments, in this paper, we introduce two new types of vague ideals in lattice Wajsberg algebras, namely the vague weak Wajsberg implicative ideals. These concepts extend the idea of vague ideals by incorporating the Wajsberg implicative operation, allowing a deeper investigation of the algebraic behaviour under vagueness.

The main objectives of this work are

To define and characterize vague weak Wajsberg implicative ideals (VWWI-ideals) in lattice Wajsberg algebras.

To provide illustrative examples and discuss possible applications in vague logic systems.

In this section, we recall some basic definitions and preliminary results which are essential for the development of our work. Unless otherwise stated, $\mathcal{W}$ denotes a lattice Wajsberg algebra, and $V(\mathcal{W})$ denotes the set of all vague subsets of $\mathcal{W}$.

PRELIMINARIES

In this part of the paper, we review a few essential terms and conclusions which should assist us nurture the majority of our results.

Definition 2.1[5] Let $(\mathcal{W}, \rightarrow, ^*, 1)$ be a binary function algebra. "$\rightarrow$" and a quasi complement "$*$". Whereas all of the consecutive axioms are true, an algebra is referred to as a Wajsberg algebra $\omega_3, \phi_3, \sigma_3 \in \mathcal{W}$,

i. $1 \rightarrow \omega_3 = \omega_3$

ii. $(\omega_3 \rightarrow \phi_3) \rightarrow \big((\phi_3 \rightarrow \sigma_3) \rightarrow (\omega_3 \rightarrow \sigma_3)\big) = 1$

iii. $(\omega_3 \rightarrow \phi_3) \rightarrow \phi_3 = (\phi_3 \rightarrow \vartheta_3) \rightarrow \omega_3$

iv. $({\sigma_3}^* \rightarrow {\phi_3}^*) \rightarrow ({\phi_3}^* \rightarrow {\sigma_3}^*) = 1.$

Proposition 2.2[5] A Wajsberg algebra $(\mathcal{W}, \rightarrow, ^*, 1)$ assures the consecutive for all $\omega_3, \phi_3, \sigma_3 \in \mathcal{W}$,

i. $\omega_3 \rightarrow \omega_3 = 1$

ii. If $(\omega_3 \rightarrow \phi_3) = (\phi_3 \rightarrow \omega_3) = 1$ then $\omega_3 = \phi_3$

iii. $\omega_3 \rightarrow 1 = 1$

iv. $\big(\omega_3 \rightarrow (\phi_3 \rightarrow \omega_3)\big) = 1$

v. If $(\omega_3 \rightarrow \phi_3) = (\phi_3 \rightarrow \sigma_3) = 1$ then $\omega_3 \rightarrow \sigma_3 = 1$

vi. $(\omega_3 \rightarrow \phi_3) \rightarrow \big((\sigma_3 \rightarrow \omega_3) \rightarrow (\sigma_3 \rightarrow \phi_3)\big) = 1$

vii. $\omega_3 \rightarrow (\phi_3 \rightarrow \sigma_3) = \phi_3 \rightarrow (\omega_3 \rightarrow \sigma_3)$

viii. $\omega_3 \rightarrow 0 = \omega_3 \rightarrow 1^* = {\omega_3}^*$

ix. $({\omega_3}^*)^* = \omega_3$

x. $({\omega_3}^* \rightarrow {\phi_3}^*) = \phi_3 \rightarrow \omega_3$

Definition 2.3[5] Let $(\mathcal{W}, \rightarrow, ^*, 1)$ be referred to a lattice Wajsberg algebra, if the consecutive requirements are met for all $\omega_3, \phi_3 \in \mathcal{W}$,

i. $\omega_3 \leq \phi_3$ Whereas as well as solely if $\omega_3 \rightarrow \phi_3 = 1$

ii. $(\omega_3 \vee \phi_3) = (\omega_3 \rightarrow \phi_3) \rightarrow \phi_3$

iii. $(\omega_3 \wedge \phi_3) = ((\omega_3{}^* \rightarrow \phi_3{}^*) \rightarrow \phi_3{}^*)^*$. Thus, the lower bound is 0 and and upper bound is 1.

Proposition 2.4[5] Let $(\mathcal{W}, \rightarrow, ^*, 1)$ be lattice Wajsberg algebra. Then for all $\omega_3, \phi_3, \sigma_3 \in \mathcal{W}$,

i. If $\omega_3 \leq \phi_3$ then $\omega_3 \rightarrow \sigma_3 \geq \phi_3 \rightarrow \sigma_3$ and $\sigma_3 \rightarrow \omega_3 \leq \sigma_3 \rightarrow \phi_3$

ii. $\omega_3 \leq \phi_3 \rightarrow \sigma_3$ Whereas as well as solely if $\phi_3 \leq \omega_3 \rightarrow \sigma_3$

iii. $(\omega_3 \vee \phi_3)^* = (\omega_3 \wedge \phi_3{}^*)$

iv. $(\omega_3 \wedge \phi_3)^* = (\omega_3 \vee \phi_3{}^*)$

v. $(\omega_3 \vee \phi_3) \rightarrow \sigma_3 = (\omega_3 \rightarrow \sigma_3) \wedge (\mu_3 \rightarrow \sigma_3)$

vi. $\omega_3 \rightarrow (\phi_3 \wedge \sigma_3) = (\omega_3 \rightarrow \phi_3) \wedge (\omega_3 \rightarrow \sigma_3)$

vii. $(\omega_3 \rightarrow \phi_3) \vee (\phi_3 \rightarrow \omega_3) = 1$

viii. $\omega_3 \rightarrow (\phi_3 \vee \sigma_3) = (\omega_3 \rightarrow \phi_3) \vee (\omega_3 \rightarrow \sigma_3)$

ix. $(\omega_3 \wedge \phi_3) \rightarrow \sigma_3 = (\omega_3 \rightarrow \sigma_3) \vee (\phi_3 \rightarrow \sigma_3)$

x. $(\omega_3 \wedge \phi_3) \vee \sigma_3 = (\omega_3 \vee \sigma_3) \wedge (\phi_3 \vee \sigma_3)$

xi. $(\omega_3 \wedge \phi_3) \rightarrow \sigma_3 = (\omega_3 \rightarrow \phi_3) \wedge (\omega_3 \rightarrow \sigma_3)$

Definition 2.5[5] An ideal I of L is a non-empty subset of L is referred to a lattice ideal, if the below requirements hold for all $\omega_3, \phi_3 \in I$,

i. $\omega_3 \in I$ and $\phi_3 \leq \omega_3$ imply $\phi_3 \in I$

ii. $\omega_3, \phi_3 \in I$ implies $\omega_3 \vee \phi_3 \in I$.

Definition 2.6[5] Let I be a non-empty subset of $\mathcal{W}$.Then I is referred to a *WI*-ideal of $\mathcal{W}$, if the below requirements hold for all $\omega_3, \phi_3 \epsilon\, \mathcal{W}$,

i. $0 \epsilon\, I$

ii. $(\omega_3 \rightarrow \phi_3)^* \epsilon\, I$ and $\phi_3 \epsilon\, I$ imply $\omega_3 \epsilon\, I$.

Definition 2.7[4] A vague set A is characterized by, truth and false membership functions $t_A: U \rightarrow [0,1]$ and $f_A: U \rightarrow [0,1]$ respectively. In order the degree of association within ω_3 in the vague set Q is constrained by segments. $[t_A(\omega_3), 1 - f_A(\omega_3)]$ of [0, 1].

Definition 2.8[3] Let A be a vague set of U with the t_A and f_A. For a single $\alpha, \beta \in [0,1]$ with $\alpha \leq \beta$, the $(\alpha, \beta) -$ cut of A is a crisp subset $A_{(\alpha,\beta)}$of the set U given by $A_{(\alpha,\beta)} = \{\omega_3 \in \mathbb{W} / V_A(\omega_3) \geq [\alpha, \beta]\}$.

Definition 2.9 [8] Let A be a vague set of lattice Wajsberg algebra $\mathcal{W}$. Then, A is referred to a *VWI*-ideal of $\mathcal{W}$, if the consecutive axioms are satisfied for all $\omega_3, \phi_3 \epsilon\, \mathcal{W}$,

i. $V_A(0) \geq V_A(\omega_3)$,

ii. $V_A(\omega_3) \geq rmin\{V_A(\omega_3 \rightarrow \phi_3)^*, V_A(\phi_3)\}$. $\omega_3, \phi_3, \sigma_3$

Definition 2.10 [2] A non-empty subset $I \subseteq \mathcal{W}$ is called an ideal of $\mathcal{W}$ if it satisfies:

i $\omega_3, \phi_3 \in I$ implies $\omega_3 \vee \phi_3 \in I$

ii $\omega_3 \in I, \phi_3 \leq \omega_3$ implies $\phi_3 \in I$

An ideal I is said to be a Wajsberg implicative ideal if for all $\omega_3, \phi_3 \in \mathcal{W}$

$(\omega_3 \rightarrow \phi_3) \rightarrow \omega_3 \in I \implies \omega_3 \in I$.

Definition 2.11 [2] A vague ideal $A = (t_A, f_A)$ of $\mathcal{W}$ satisfied the following conditions for all $\omega_3, \phi_3 \in \mathcal{W}$

i $t_A(\omega_3 \vee \phi_3) \geq \min\{t_A(\omega_3), t_A(\phi_3)\}$

ii $f_A(\omega_3 \vee \phi_3) \leq \max\{f_A(\omega_3), f_A(\phi_3)\}$

iii $\omega_3 \leq \phi_3 \Rightarrow t_A(\phi_3) \leq t_A(\omega_3)$ and $f_A(\phi_3) \geq f_A(\omega_3)$

A vague ideal A is called a vague Wajsberg implicative ideal if it satisfied

$t_A\big((\omega_3 \to y) \to \omega_3\big) \leq t_A(\omega_3), f_A\big((\omega_3 \to \phi_3) \to \omega_3\big) \geq f_A(\omega_3), \forall\, \omega_3, \phi_3 \in \mathcal{W}$.

Notations

Throughout this paper, unless otherwise specified:

- $\mathcal{W}$ denotes a lattice Wajsberg algebra.
- $A = (t_A, f_A)$ denotes a vague subset of $\mathcal{W}$.
- I, J denote vague ideals of $\mathcal{W}$.
- $0_{\mathcal{W}}$ and $1_{\mathcal{W}}$ represent the least and greatest elements of respectively $\mathcal{W}$.

Vague Weak Wajsberg Implicative Ideals

In this section, we introduce the concept of vague weak Wajsberg implicative ideals (VWWI-ideals) in lattice Wajsberg algebras and study some of their basic properties and characterizations.

Definition 3.1 Let $\mathcal{W} = (\mathcal{W}, \wedge, \vee, \to, 1)$ be a lattice Wajsberg algebra, and let $A = (t_A, f_A)$ be a vague subset of $\mathcal{W}$.Then A is called a vague weak Wajsberg implicative ideal (VWWI-ideal) of $\mathcal{W}$ if, the following conditions hold for all $\omega_3, \phi_3 \in \mathcal{W}$

i. $t_A(1) = 1$ and $f_A(1) = 0$;

ii. $t_A(\omega_3 \wedge \phi_3) \geq \min\{t_A(\omega_3), t_A(\phi_3)\}$ and $f_A(\omega_3 \wedge \phi_3) \leq \max\{f_A(\omega_3), f_A(\phi_3)\}$;

iii. $t_A(\omega_3 \wedge \phi_3) \geq \min\{t_A(\omega_3), t_A(\phi_3)\}$ and $f_A(\omega_3 \wedge \phi_3) \leq \max\{f_A(\omega_3), f_A(\phi_3)\}$

If $(\omega_3 \to \phi_3) \to \omega_3$ is "weakly included" in A then ω_3 is also "weakly included" in A.

Theorem 3.2: Every vague Wajsberg implicative ideal is a vague weak Wajsberg implicative ideal**,** but the converse need not be true.

Proof: Let $A = (t_A, f_A)$ be a vague Wajsberg implicative ideal of $\mathcal{W}$. By definition 2.4 for all $\omega_3, \phi_3 \in \mathcal{W}$, $t_A\big((\omega_3 \to \phi_3) \to \omega_3\big) \leq t_A(\omega_3)$ and $f_A((\omega_3 \to \phi_3) \to \omega_3) \geq f_A(\omega_3)$.

Compare this with the defining conditions of a vague weak Wajsberg implicative ideal (VWWI-ideal) given in definition 3.1 - they require the same pair of inequalities (condition (3)) and the weak inclusion condition (condition (4)) which follows immediately from these inequalities

If $t_A\big((\omega_3 \to \phi_3) \to \omega_3\big) > 0$, then $t_A(\omega_3) \geq t_A\big((\omega_3 \to \phi_3) \to \omega_3\big) > 0$, so $t_A(\omega_3) > 0$. Thus the "weakly included" implication (condition (4)) holds.

Also vague Wajsberg implicative ideals satisfy the lattice/closure conditions required of vague ideals such as the behaviour under $\wedge, \vee$ and $t_A(1) = 1, f_A(1) = 0$. So every requirement of a VWWI-ideal is met. Therefore every vague Wajsberg implicative ideal is a VWWI-ideal.

To see that the converse need not hold, observe that a VWWI-ideal only enforces the inequalities and the weak-membership implication (possibly allowing positive but non-unit truth-degrees). A full vague Wajsberg implicative ideal may demand stronger closure/implicative conditions (for example, certain equality or maximality conditions on truth-membership for implicative consequences) which a merely weak version need not satisfy. An explicit counterexample was suggested in for the vague set A with intermediate t_A-values (e.g. $t_A(a) = 0.5, t_A(b) = 0.7$) can satisfy VWWI conditions while failing stronger conditions required by a full vague Wajsberg implicative ideal.

Remark 3.3 : If $t_A(\omega_3) \in \{0,1\}$ and $f_A(\omega_3) = 1 - t_A(\omega_3)$, a VWWI-ideal reduces to an ordinary weak Wajsberg implicative ideal of $\mathcal{W}$.

Proof: Let $t_A(\omega_3) \in \{0,1\}$ for every $\omega_3 \in \mathcal{W}$ and $f_A(\omega_3) = 1 - t_A(\omega_3)$. In other words, A is a (crisp) ordinary subset of $\mathcal{W}$ encoded as a vague set: elements with $t_A(\omega_3) = 1$ are treated as "in" and those with $t_A(\omega_3) = 0$ are "out."

and $I_A = \{\omega_3 \in \mathcal{W} \mid t_A(\omega_3) = 1\}$, We show that A is a VWWI-ideal if and only if I_A is an ordinary weak Wajsberg implicative ideal.

Suppose A is a VWWI-ideal. Conditions (1) and lattice-closure translate to $1 \in I_A$ and closure of I_A under joins and downward closedness, because $t_A(\omega_3 \vee \phi_3) \geq \min\{t_A(\omega_3), t_A(\phi_3)\}$ becomes: if $\omega_3, \phi_3 \in I_A$ then $\omega_3 \vee \phi_3 \in I_A$; and if $\omega_3 \in I_A$ and $\phi_3 \leq \omega_3$ then $\phi_3 \in I_A$.

The implicative condition $t_A((\omega_3 \to \phi_3) \to \omega_3) \leq t_A(\omega_3)$ becomes: if $(\omega_3 \to \phi_3) \to \omega_3 \in I_A$ then $\omega_3 \in I_A$. Hence I_A satisfies the defining property of a weak Wajsberg implicative ideal.

Conversely, if I_A is a weak Wajsberg implicative ideal, define $t_A(\omega_3) = 1$ for $\omega_3 \in I_A$ and 0 otherwise, and $f_A(\omega_3) = 1 - t_A(\omega_3)$. Then the lattice closure and implicative closure conditions for I_A translate directly into the corresponding VWWI-conditions for A. Thus A is a VWWI-ideal.

Theorem 3.4 Let $A = (t_A, f_A)$ be a vague subset of a lattice Wajsberg algebra $\mathcal{W}$.Then A is a vague weak Wajsberg implicative ideal of $\mathcal{W}$ if and only if for all $\omega_3, \phi_3 \in \mathcal{W}$, $t_A(\omega_3) \geq t_A\big((\omega_3 \to \phi_3) \to \omega_3\big)$ and $f_A(\omega_3) \leq f_A((\omega_3 \to \phi_3) \to \omega_3)$.

Proof. Let the necessity be derived directly from the condition (3) of the definition. Conversely, assume the given inequalities hold for all $\omega_3, \phi_3 \in \mathcal{W}$. Then, whenever $(\omega_3 \to \phi_3) \to \omega_3$ belongs vaguely to A, the same degree (or higher) of truth- membership is assigned to $\boldsymbol{\omega_3}$.

Hence, $\boldsymbol{A}$ satisfies the definition of a vague weak Wajsberg implicative ideal.

Proposition 3.5 If $A = (t_A, f_A)$ and $B = (t_B, f_B)$ are VWWI-ideals of $\mathcal{W}$, then $A \cap B = (\min\{t_A, t_B\}, \max\{f_A, f_B\})$ is also a VWWI-ideal of $\mathcal{W}$.

Proof. Let $C = A \cap B = (t_C, f_C)$ where $t_C(\omega_3) = min\{t_A(\omega_3), t_B(\omega_3)\}, f_C(\omega_3) = max\{f_A(\omega_3), f_B(\omega_3)\}$ for all $\omega_3 \in \mathcal{W}$.

We must verify that C satisfies all four defining conditions of a VWWI-ideal.

(i) Unit condition

Since $t_A(1) = t_B(1) = 1$ and $f_A(1) = f_B(1) = 0$,

$t_C(1) = \min\{1,1\} = 1, f_C(1) = \max\{0,0\} = 0$.

Hence the unit condition holds.

(ii) Meet (∧) condition

For any $\omega_3, \phi_3 \in C$,

$$\begin{aligned} t_C(\omega_3 \wedge \phi_3) &= \min\{t_A(\omega_3 \wedge \phi_3),\ t_B(\omega_3 \wedge \phi_3)\} \\ &\geq \min\{\min\{t_A(\omega_3), t_A(\phi_3)\},\ \min\{t_B(\omega_3), t_B(\phi_3)\}\} \\ &= \min\{t_A(\omega_3), t_A(\phi_3), t_B(\omega_3), t_B(\phi_3)\} \\ &= \min\{\min\{t_A(\omega_3), t_B(\omega_3)\},\ \min\{t_A(\phi_3), t_B(\phi_3)\}\} \\ &= \min\{t_C(\omega_3), t_C(\phi_3)\}. \end{aligned}$$

Thus $t_C(\omega_3 \wedge \phi_3) \geq \min\{t_C(\omega_3), t_C(\phi_3)\}$.

Similarly,

$$\begin{aligned} f_C(\omega_3 \wedge \phi_3) &= \max\{f_A(\omega_3 \wedge \phi_3),\ f_B(\omega_3 \wedge \phi_3)\} \\ &\leq \max\{\max\{f_A(\omega_3), f_A(y)\},\ \max\{f_B(\omega_3), f_B(y)\}\} \\ &= \max\{f_A(\omega_3), f_A(y), f_B(\omega_3), f_B(y)\} \\ &= max\{max\{f_A(\omega_3), f_B(x)\},\ max\{f_A(y), f_B(y)\}\} \\ &\leq \min\{t_A(\omega_3),\ t_B(\omega_3)\} = t_C(\omega_3), \\ &\geq \max\{f_A(\omega_3),\ f_B(\omega_3)\} = f_C(\omega_3), \end{aligned}$$

Hence the meet condition is satisfied.

(iii) Implicative (→) condition

For all $\omega_3, \phi_3 \in C$

$t_C\big((\omega_3 \to \phi_3) \to \omega_3\big) = \min\big\{t_A\big((\omega_3 \to \phi_3) \to \omega_3\big),\ t_B\big((\omega_3 \to \phi_3) \to \omega_3\big)\big\}$

$\leq \min\{t_A(\omega_3), t_B(\omega_3)\} = t_C(\omega_3)$,
and
$f_C((\omega_3 \to \phi_3) \to \omega_3) = \max\{f_A((\omega_3 \to \phi_3) \to \omega_3), f_B((\omega_3 \to \phi_3) \to \omega_3)\}$
$\geq \max\{f_A(\omega_3), f_B(\omega_3)\} = f_C(\omega_3)$,
because both A and B satisfy the same inequalities individually.

(iv) Weak inclusion condition
Let $t_C((\omega_3 \to \phi_3) \to \omega_3) > 0$.
Then
$\min\{t_A((\omega_3 \to \phi_3) \to \omega_3), t_B((\omega_3 \to \phi_3) \to \omega_3)\} > 0$
So $t_A(\omega_3 \to \omega_3) > 0$ and $t_B((\omega_3 \to \phi_3) \to \omega_3) > 0$.
By the weak inclusion property of A and B, we have $t_A(\omega_3) > 0$ and $t_B(\omega_3) > 0$.
Therefore $\min\{t_A(\omega_3), t_B(\omega_3)\} > 0$ (i.e) $t_C(\omega_3) > 0$.
Hence C satisfies the weak inclusion condition.
Since all four defining properties are verified, $C = A \cap B$ is indeed a vague weak Wajsberg implicative ideal of $\mathcal{W}$.

Example 3.6 Let $\mathcal{W} = \{0, l, m, 1\}$ be a lattice Wajsberg algebra with the usual order $0 < l < m < 1$, and define the operation → as follows:

Table 1: Implication
Table 2: Complement

Let $A = (t_A, f_A)$ be a vague subset of $\mathcal{W}$ defined by
$t_A(0) = 0.1, t_A(a) = 0.5, t_A(b) = 0.7, t_A(1) = 1$,
$f_A(0) = 0.8, f_A(a) = 0.4, f_A(b) = 0.2, f_A(1) = 0$.
Then one can verify that A satisfies all the conditions of a vague weak Wajsberg implicative ideal, but not necessarily the conditions of a strong (normal) vague Wajsberg implicative ideal.

Corollary 3.7 If A is a VWWI-ideal of $\mathcal{W}$, then the set $I_A = \{\omega_3 \in \mathcal{W} \mid t_A(\omega_3) = 1\}$is a weak Wajsberg implicative ideal of $\mathcal{W}$.

Proof. Let us verify that I_A is an ideal of $\mathcal{W}$ and satisfies the weak Wajsberg implicative property.

Nonempty and unit: Since A is a VWWI-ideal, $t_A(1) = 1$. Hence $1 \in I_A$, so I_A is nonempty.

Closed under join: Let $\omega_3, \phi_3 \in I_A$. Then $t_A(\omega_3) = t_A(\phi_3) = 1$.

CONCLUSION AND FUTURE WORK

CONCLUSION

In this paper, we introduced and investigated the concept of Vague Weak Wajsberg Implicative Ideals (VWWI-ideals) in lattice Wajsberg algebras as a generalization of weak Wajsberg implicative ideals and vague ideals. The notion combines the logical strength of weak implicative structures with the flexibility of vagueness, allowing partial degrees of membership and non-membership in the ideal.
We have established several fundamental results concerning VWWI-ideals, including
- Characterizations and basic properties of VWWI-ideals;
- Proof that the intersection of VWWI-ideals is again a VWWI-ideal, while their union need not be one;
- The relationship between a VWWI-ideal and its crisp core $I_A = \{\omega_3 \mid t_A(\omega_3) = 1\}$

component mapping.

These results extend the algebraic framework of lattice Wajsberg algebras into the vague setting, bridging the gap between classical logic-based ideals and those defined under uncertainty. Hence, VWWI-ideals serve as an effective tool for handling imprecise information in algebraic logic and fuzzy reasoning systems based on Wajsberg structures.

Future Work

The present study opens several directions for further research

Investigate Normal Vague Wajsberg Implicative Ideals (NVWI-ideals) in more detail, studying their lattice-theoretic behavior, normalization processes, and connections with classical normal ideals. Explore how VWWI-ideals behave under homomorphisms and quotient constructions, leading to a categorical study of vague structures. Extend the idea of VWWI-ideals to other algebraic systems such as lattice implication algebras, BCK/BCI-algebras, and residuated lattices, where similar weak and implicative properties exist. Study relationships between fuzzy, intuitionistic fuzzy and vague versions of weak Wajsberg implicative ideals to unify these concepts under a common theoretical framework. Apply VWWI-ideals in modeling approximate reasoning, multi-valued decision-making, and knowledge representation systems where truth and falsity are not crisp.

ABSTRACT

The global sports industry stands at a critical juncture, confronted by the interconnected crises of climate change and plastic pollution that threaten its very foundations while revealing its own complicity in environmental degradation. The paper examines this triple challenge through the dual lens of vulnerability and responsibility, analyzing how environmental pressures are reshaping sports while exploring the sector's potential to transition from a linear, wasteful model to a beacon of sustainability. Extreme heat forces event cancellations and poses serious health risks to athletes, ranging from heatstroke to impaired performance; rising sea levels and severe weather events cause infrastructure damage and raise operating costs and winter sports face an existential threat as warming temperatures reduce consistent snow and ice conditions. These are just a few of the immediate and palpable ways that climate change is affecting athletics. In addition to the less obvious but widespread issue of microplastic shedding from synthetic textiles and artificial grass, the sports industry also plays a major role in the plastic pollution disaster by using single-use plastics in concessions, packaging, and merchandise. The future of sports depends on a fundamental transformation toward circular economy principles, where waste is designed out of systems and materials are continuously repurposed. Initiatives such as phasing out single-use plastics, implementing reusable container programs and manufacturing equipment from

recycled ocean plastics demonstrate the capacity for meaningful change. Thus, by aligning economic incentives with ecological responsibility, sports can not only safeguard its own future but also serve as a powerful catalyst for broader societal transformation. The triple challenge, therefore, is not merely a threat to be managed but a historic opportunity to reimagine the role of sports in a rapidly changing world, promoting a legacy of resilience, responsibility and leadership in the face of global environmental crises.

Keywords: Climate Resilience, Circular Economy, Sustainable Sports, Environmental Leadership

INTRODUCTION

Sports serves as a potent microcosm of society, capturing the most intense emotions, the desire for greatness and the ability to come together (Scott, 2021). However, one of humanity's greatest mistakes is now reflected in this same arena: the growing environmental crisis on a global scale. Sports are now more than just a bystander to the disruptions caused by climate change and the tsunami of plastic pollution; they are a major contributor, a susceptible victim, and a potential source of game-changing remedies (Dragović, 2022). In addition to posing an unmatched chance for innovation and global leadership, this triple challenge is an existential convergence of forces that threatens the foundation of athletic tradition, performance and infrastructure (Mathew, 2024). The stadiums that host legendary matches, the slopes that define winter athletics and the oceans that host sailing competitions are all now stages where the drama of environmental collapse and human resilience is vividly playing out. From the athlete collapsing from heatstroke on a scorching track to the single-use plastic bottle swirling in the drains of an arena, the evidence is undeniable and the stakes could not be higher. The future of sports is being radically reshaped by these twin forces, forcing a reckoning that extends far beyond final scores and championship titles. Thus, it is a central battle for the survival, integrity and relevance of sport itself. The game has changed, and the rules are being rewritten not by officials, but by the planet itself. The paper examines this triple challenge through the dual lens of vulnerability and responsibility, analyzing how environmental pressures are reshaping sports while exploring the sector's potential to transition from a linear, wasteful model to a beacon of sustainability.

Climate change impacts on sports

As global temperatures continue to rise due to climate change, the world of sports is facing an unprecedented challenge that threatens athletes' safety, alters traditional seasons and disrupts the very infrastructure that supports competition (Uberoi, 2024.). Extreme heat is no longer a hypothetical issue; rather, it is a current reality that forces athletes, sports organizations and fans to face a new era of resilience and adaptability. Heat-related disruptions are becoming more frequent, which is one of the most obvious and direct effects of climate change on sports. In order to prevent extreme heat, marathon organizers are moving the start timings to early morning or even midnight. Extreme heat regulations have been implemented by tennis tournaments, such the Australian Open, which permit matches to be halted when dangerous conditions arise (Menzies, n.d.). In order to prevent players from heat exhaustion and heatstroke, cooling breaks are now a standard part of soccer matches performed in extremely hot weather. These adaptations, while necessary, highlight the growing incompatibility between traditional sporting calendars and the emerging climate reality. The health risks to athletes are profound and multifaceted. Prolonged exposure to high temperatures during intense physical exertion can lead to dehydration, muscle cramps and more seriously, heat exhaustion or life-threatening heatstroke. Beyond these acute dangers, repeated exposure to extreme heat has long-term cardiovascular and neurological implications for athletes (González-Alonso *et al.,* 2008).

The psychological toll is equally significant, as competitors must navigate the mental challenge of performing in physically oppressive conditions that would have been exceptional a generation ago but are now becoming commonplace (Panganiban, 2025). Winter sports are the most visibly vulnerable to climate change, as ski resorts are experiencing shorter seasons and relying increasingly on artificial snow-making, an energy and water-intensive

process that itself contributes to environmental degradation (Putz *et al.,* 2011). The Winter Olympics face an uncertain future, with a declining number of host cities capable of providing reliably cold conditions and adequate natural snowfall. The cultural and economic implications for communities built around winter sports are devastating, representing both an economic crisis and a loss of cultural heritage (Burakowski and Magnusson, 2012; Lohana *et al.,* 2023). The infrastructure of sport is equally threatened. Rising sea levels endanger coastal stadiums and golf courses. Increased frequency of extreme weather events leads to cancelled games and damaged facilities. The financial implications are staggering, with increased costs for cooling, insurance and maintenance creating new economic barriers to sporting participation and spectating. These challenges are forcing a fundamental reimagining of sports architecture, with new venues increasingly incorporating passive cooling designs, renewable energy sources and climate-resilient materials. As the world continues to warm, the relationship between sports and climate change will likely become more complex and more urgent. The solutions will require innovation at every level from individual equipment choices to international sporting calendars. What remains clear is that climate change is no longer an abstract environmental issue but a concrete reality that is fundamentally reshaping how to play, watch and organize sports around the world. The inescapable heat has become sports' newest and most formidable opponent.

The plastic problem: A stadium of waste

The final whistle blows, the crowd's clamour subsides and what's left is frequently a sea of plastic trash, a clear visual representation of the sports industry's unsustainable reliance on single-use items. Plastic has permeated every aspect of contemporary sports, from concession stands to retail booths, causing an environmental issue that goes well beyond stadium boundaries (Bae and McCullough, 2025). In addition to being a waste management issue, the plastic problem in sports is a basic design and accountability failing that runs counter to the health ideals that athletics is supposed to uphold. The amount of plastic waste produced at large athletic events is astounding. In just a few hours, thousands of single-use food containers, straws, beer mugs, water bottles and packaging are distributed and thrown away. This model of convenience creates a linear economy of take-make-dispose that places tremendous pressure on local waste management systems and contributes significantly to plastic pollution in surrounding communities and waterways. The environmental impact begins long before these items reach the stadium, embedded in the extraction of fossil fuels required for plastic production and the manufacturing processes that generate substantial greenhouse gas emissions. Jude *et al.* (2025) noted increased waste generation and poor waste management are the major sources of environmental pollution during the hosting of Africa Cup of Nations (AFCON) 2023 competitions. In addition, high-level traffic congestion and air pollution from vehicular emissions are the major sources of environmental pollution and overcrowding of tourist destinations are the major sources of environmental pollution during the hosting of AFCON competitions.

Artificial turf fields are made from plastic materials that shed microplastics into the environment during use and maintenance (de Haan *et al.,* 2023). These tiny particles infiltrate water systems and eventually enter the food chain, representing an invisible but pervasive form of pollution. Similarly, synthetic athletic wear, primarily made from polyester and other plastic-based materials, releases microfibers with every wash, another significant contributor to global microplastic contamination. The economic implications of this plastic dependence are equally concerning. The plastic problem in sports represents both a crisis and an opportunity. By reimagining how materials flow through sporting events, the industry can dramatically reduce its environmental footprint while creating new standards of sustainability that could influence broader societal change. The transition away from plastic waste requires fundamental changes to operations and fan engagement, but the potential payoff which makes this transformation essential for the future of athletics. The linear economy of "take-make-dispose" is on full display at every major event, where convenience has trumped sustainability for decades. Synthetic sportswear, made from polyester and other plastics, is a primary source of microplastic pollution. Every time a kit is washed, tiny plastic fibers shed into the wastewater, eventually flowing into rivers and oceans and entering the food chain. Furthermore, the artificial turf fields that countless athletes play on are made from plastic crumb rubber, another significant source of microplastic leakage into the environment.

The forward play: Strategies for a sustainable future

Confronting this triple challenge is unnerving, but it also represents the greatest opportunity for innovation in the history of sports. Confronting the environmental challenges facing sports requires more than incremental changes, it demands a fundamental reimagining of how the industry operates. The forward play involves a multi-faceted strategy that addresses both mitigation and adaptation while leveraging sports' unique cultural influence to drive broader societal change. This transformation is already underway, with pioneering organizations demonstrating that sustainability and high-performance athletics can not only coexist but mutually reinforce one another. At the core of this evolution is the embrace of circular economy principles. Sports venues are increasingly becoming laboratories for waste reduction innovation, implementing systems designed to eliminate rather than merely manage waste (Hottle *et al.,* 2015). Advanced stadiums are phasing out single-use plastics entirely, replacing them with compostable alternatives or reusable container systems where fans pay a deposit for cups and food containers that are returned, sanitized and reused indefinitely (Coca Cola, 2022). Beyond consumer-facing initiatives, teams are examining their entire supply chain, from sourcing merchandise made from recycled materials to working with sponsors and partners who align with sustainability values. The equipment itself is being reimagined, with companies developing high-performance gear from recycled ocean plastics and designing products for disassembly and recycling at the end of their life cycle.

Infrastructure adaptation represents another critical front in this transformation. New sports facilities are designed with climate resilience at their core. Existing venues are undergoing retrofits to improve energy efficiency and reduce environmental impact. The transportation ecosystem around major events is being reconfigured to prioritize public transit, pedestrian access and electric vehicle infrastructure. These changes represent not just environmental stewardship but sound financial planning, as resilient infrastructure proves more adaptable to climate disruptions and often results in long-term operational savings. Leagues are incorporating sustainability narratives into their broadcasting and digital content, helping millions of fans understand the connection between their sporting passions and planetary health. This educational role extends to youth sports, where organizations are developing programs that teach environmental stewardship alongside athletic skills.

Embracing the circular economy

The transition from a linear take-make-waste model to a circular economy represents one of the most promising pathways for sports to address its environmental impact while unlocking new economic opportunities. Embracing circularity requires a fundamental redesign of operations, supply chains and consumer engagement, moving beyond recycling to create systems where materials continuously circulate at their highest value. The sports industry, with its concentrated resources, global influence and cultural relevance, is uniquely positioned to demonstrate the viability and benefits of this transformative approach. At the operational level, circularity begins with waste prevention through innovative design and material choices. Forward-thinking venues are eliminating single-use items entirely, implementing reusable cup and container systems that create closed loops within stadium operations. These systems not only reduce waste but often lower long-term costs despite higher initial investments. Beyond concessions, teams are examining every aspect of their operations through a circular lens, from converting food waste into compost for community gardens to repurposing old signage and banners into new merchandise items.

The circular transformation extends to sports equipment and apparel, areas where innovation is flourishing. Companies are designing shoes, uniforms and gear for disassembly, using mono-materials and avoiding chemical treatments that complicate recycling. New business models are emerging where equipment is leased rather than sold, with manufacturers responsible for maintenance, refurbishment and eventual recycling. This approach is particularly valuable for youth sports, where growing children quickly outgrow equipment that remains functionally sound. At the professional level, teams are partnering with material innovators to create high-performance apparel from recycled ocean plastics and other waste streams, transforming pollution into products while telling powerful sustainability stories to fans. Thus, the implementation of circular economy principles creates new revenue streams and cost savings that enhance the business case for sustainability. Waste becomes a resource rather than an expense, with materials gaining value through repeated use and eventual repurposing. Teams are finding commercial

opportunities in selling products made from recycled materials, with fans increasingly valuing merchandise that carries authentic environmental credentials.

Climate-smart adaptation

As the impacts of climate change intensify, the sports world is increasingly focused on climate-smart adaptation - implementing strategies that not only reduce vulnerability to immediate threats but also build long-term resilience against future challenges. This proactive approach moves beyond temporary fixes to create fundamental changes in how sports are organized, where they are played and how athletes prepare for competition in a changing environment. Climate-smart adaptation recognizes that some level of climate disruption is already inevitable and that sports must evolve to remain viable, safe and enjoyable for participants and spectators alike. Infrastructure adaptation where new sports facilities are designed with climate resilience at their core, incorporating features such as elevated structures in flood-prone areas, advanced drainage systems for handling intense rainfall, passive cooling architecture that reduces energy demands during heatwaves and built-in shade structures that protect both athletes and spectators (Mallen and Dingle, 2021). Existing venues are undergoing retrofits with climate resilience in mind, including installing cool roofing systems to reduce heat absorption, reinforcing structures to withstand stronger storms and creating backup systems for critical operations like lighting and scoreboards during power disruptions (Saleh, 2025). These adaptations represent significant investments but ultimately protect valuable assets from climate-related damage and ensure that games can go on despite worsening weather conditions.

Operational adaptations are equally crucial for climate resilience. Sports organizations are revising traditional schedules, shifting events to cooler times of day or different seasons to avoid extreme heat. Leagues are developing more sophisticated weather monitoring and decision-making protocols, with clear thresholds for delaying or cancelling events based on combinations of temperature, humidity and air quality readings. Athlete preparation and performance strategies are evolving in response to climate challenges. Sports science is developing advanced heat acclimatization protocols that help athletes safely adapt to competing in higher temperatures (Sawka *et al.,* 2015). Equipment manufacturers are creating lighter, more breathable uniforms that improve thermal comfort, while hydration science is advancing to address the increased fluid and electrolyte needs of athletes training and competing in hotter conditions (Morris *et al.,* 2020). Mental preparation techniques are also adapting, helping athletes maintain focus and performance despite the additional physiological stress caused by extreme conditions. These athlete-centered adaptations are becoming integral to competitive success, moving from marginal advantages to essential components of training and preparation.

The power of the platform

The immense cultural reach of sports provides a uniquely powerful platform for driving climate change mitigation efforts. Unlike many sectors, sports command a passionate, global following that transcends borders, politics and demographics. This universal appeal positions athletic organizations, events and icons not merely as entertainers but as influential agents of change with a profound responsibility and opportunity to lead. The most direct impact lies in the greening of operations. Major sporting events, from the Olympics to the World Cup, are colossal undertakings with significant carbon footprints stemming from travel, energy use and infrastructure (Su *et al.,* 2025). By mandating sustainable practices, these events become living demonstrations of large-scale environmental responsibility which transform from being part of the problem into tangible, highly visible blueprints for solutions, proving that efficiency and sustainability can coexist with world-class spectacle. Beyond infrastructure, sports stars wield unparalleled influence as role models. When athletes leverage their platforms to speak on environmental issues, they educate and inspire millions of fans who might otherwise remain disengaged. Their advocacy personalizes the abstract crisis of climate change, making it relatable and urgent. This influence can shift public opinion, encourage sustainable lifestyle choices among fans, and place pressure on policymakers and corporations to adopt greener practices (Bas *et al.,* 2022; Raftery, 2024). The voice of a beloved athlete can cut through political noise and resonate in a way that traditional campaigning often cannot.

Finally, the shared identity and community built around a team or athlete can be harnessed to foster a collective spirit of environmental stewardship. Clubs can mobilize their fanbases for local conservation projects or create campaigns that turn sustainable actions into a symbol of fan loyalty. This channels powerful tribal emotions into a positive, unified force for planetary good. In essence, the sports industry is a microcosm of society with a megaphone. By cleaning its own house, leveraging the voices of its heroes, protecting its playing fields and mobilizing its massive communities, it can accelerate the transition to a low-carbon future.

CONCLUSION

The future of sports is inextricably linked to the health of the planet. The triple challenge of climate change, plastic pollution and necessary adaptation is not a peripheral issue, it is central to the survival and integrity of athletic competition. The industry must move beyond symbolic gestures and implement deep, systemic change: designing out waste, embracing renewable energy, building resilient infrastructure and leveraging its immense influence to advocate for planetary health. The playing field is changing, literally and figuratively. The athletes, fans and organizers who embrace this challenge will not only help safeguard the sports but will also score a crucial victory for the planet. The most important trophy of all is a sustainable future. The convergence of climate change and plastic pollution represents nothing less than an existential reckoning for the world of sports - a triple challenge that threatens the very foundations of athletic competition while simultaneously revealing the industry's complicity in environmental degradation. As this examination has demonstrated, sports are both victim and contributor: suffering under rising temperatures, extreme weather and resource constraints while simultaneously generating massive plastic waste streams and carbon emissions through outdated operational models. In short, the future of sports depends fundamentally on how effectively the industry can transform itself from a linear, extractive system into a circular, regenerative model that respects planetary boundaries.

As sports possess a unique cultural power to accelerate broader societal change where millions of fans witness their favourite teams eliminating plastic waste or athletes using their platforms to advocate for climate action, these actions normalize sustainable behaviours and create new social expectations. Sports can serve as living laboratories for circular economy principles and climate resilience strategies, demonstrating solutions at scale that other industries can emulate. The interconnectedness between the triple challenge of climate change, plastic pollution and the future of sports provides the pathway forward. By embracing systemic change, sports can transform from being part of the problem to becoming central to the solution - protecting athletic tradition while pioneering new approaches that respect ecological limits. Thus, climate action through sports is not a burden but an opportunity for innovation, leadership, and preserving the things we love most.

ABSTRACT

This case study investigates the therapeutic impact of *Balivellyadi* ointment, a traditional Ayurvedic formulation, in the localized treatment of *Shwitra* (vitiligo). *Shwitra* is recognized in Ayurveda as a disorder of skin pigmentation caused by imbalances in the body's doshas, particularly Pitta and Kapha. The condition manifests as white patches due to disrupted melanin production. A patient presenting with classical symptoms of *Shwitra* was treated with daily topical application of *Balivellyadi* ointment over a 8-week period. The ointment, composed of herbs known for their skin-rejuvenating and pigment-restoring properties,was applied directly to the depigmented areas. Supportive internal therapies and dietary guidelines were also followed to enhance systemic balance. Gradual repigmentation was observed, with the white patches showing signs of colour restoration and reduction in size. The patient reported no adverse effects, and overall skin texture improved. The results suggest that *Balivellyadi* ointment may stimulate melanocyte activity and support skin healing when used consistently. This case highlights the potential of localized Ayurvedic treatment in managing *Shwitra* and encourages further clinical evaluation to establish broader efficacy.

Keywords: Switra, vitiligo.

INTRODUCTION

Shwitra, commonly correlated with vitiligo in modern dermatology, is a chronic skin disorder characterized by hypopigmented or depigmented patches. Although the condition is typically painless, patients often experience skin erosion and discomfort, which can affect their quality of life. The exact etiology of *Shwitra* remains unclear, and vitiligo is considered a rare pigmentary disorder with complex autoimmune and genetic factors[1]. Despite advancements in medical science, an effective and universally accepted treatment for vitiligo is still elusive. Conventional therapies often carry risks of side effects, complications, and toxicity, limiting their long-term use. In contrast, Ayurvedic medicine offers a holistic approach to managing Shwitra, focusing on treating the root cause through internal purification and external application of herbal formulations. Ancient Ayurvedic texts describe various remedies that aim to restore skin pigmentation and balance the body's doshas, offering a promising alternative to modern treatments. [2,3]

AIM AND OBJECTIVES

To evaluate the efficacy of Ayurvedic treatment in *Shwitra*.

CASE DESCRIPTION

On 09/01/2025, a female patient aged 15 years, OPD reg. no.25000703, visited OPD of Kaumarbhritya, Parul Ayurved Hospital, with right palm discoloration since2.5 years, minor itching, burning sensation, and dryness, presented to OPD of kaumarbhritya, Parul Ayurved Hospital.

History of Present Illness
Before 2.5 years, the patient was in good health. She gradually acquired some white discoloration over her right palm region, first with minor irritation and a very little lesion. The patient was unconcerned about it and ignored it, but later she saw more white patches after a month. With presented with severe itching, burning sensation, dryness, and the color of the patches were white. After that patient's parents took her nearby hospital. There she was diagnosed with vitiligo and given suitable medicine her. The patient took 5 months of treatment but she did not get relief. To get a suitable solution they visited our hospital Parul Ayurved hospital for further management.

Associated Symptoms
Constipation was present from 1 year.

Past History
No history of above skin complaints from past 2.5 year.

Family History
Her grandmother was suffering with same skin affecting disease. she expired 3 years ago.

Immunization Status
Scheduled as per age.

Personal History
Bowel: Constipation
Urine: 4-5 Times /Day
Sleep: Sound
Krida: Outdoor

Social History
Residential Area: Rural
Personal Hygiene: Poor
Sanitation: Poor
Drinking Water: Tubewell
Family: Nuclear

Dietetic History
So much use of Lavana, Amla Dravya, mixed dietary habits, excessive tea intake, curd, spicy and oily food, Viruddha Ahara.

Clinical Assesment
a. General examination
Heart Rate: 78/min
Temperature: 97.6 F
Respiratory Rate: 18/min

Systemic Examination
Respiratory System: AEBE Normal
Cardiovascular System: S1, S2 Normal, no additional sound heard
GIT System: P/A Soft and Non-Tender, Spleen, Liver nonpalpable
Central Nervous System: Conscious and well Oriented

Local Examination
Site of Lesion: Skin
Distribution: Irregular
Character of Lesions: Present
Itching: Present
Dryness: Present
Roma Vivarnta: Present

MATERIALS AND METHODS

Centre of Study
This study was carried out in Kaumarbhritya department of Parul Ayurved hospital, Limda, Vadodara.

Treatment
Medication has given to the patient for 60 days with 4 follows from 0th day to 60th day *Balivellyadi* ointment given to the patient for external application and exposure of sunlight to 10 minutes.

OBSERVATION AND RESULTS

Regular external use of *Balivellyadi* ointment was observed and exposure of sun light for 10 minutes. Which help in minimize the size of the shwitra patches and colour of the patches. Graphical presentation of symptomatic Relief (Fig.1). Line of treatment [4-5] (Table 1). Assessment Grading for Subjective Parameter [6,7] (Table 2). Assessment Criteria for no of Patches [8] (Table 3). Assessment Criteria for Colour of Patches [9] (Table 4). Observations during treatment (Subjective parameter) (Table 5). Observations during treatment colour of patches (Objective parameters) (Table 6). Observations during treatment numberof patches (Objective parameters) (Table 7). Observations during treatment VASI score [10] (Table 8). Symptomatic Relief (Table 9).

DISCUSSION

***Balivellyadi* Ointment**
Danti(*Baliospermum montanum*) is used in many ayurvedic formulations for treating vitiligo, primarily due to its potential to stimulate melanocyte function and promote skin pigmentation. Danti is believed to help detoxify the body and purify the blood, which are all considered useful in managing vitiligo [11,12,13]. Gandhak (Sulphur) is a ingredient in this formulation which is used to treat various skin conditions, including vitiligo (Shwitra). It is believed to help by activating fibroblasts, modulating proteins involved in tissue remodelling, and reducing symptoms like skin discoloration (Twak-Vaivarnata) and kandu. It is also considered to have anti-inflammatory and analgesic properties [14,15,16,17]. *Vidanga* has energetic concept i.e. estrogenic factor. Which accelerate the thyosinase interest of human melanocyte, and promotes the formation of melanin. It also contains emblin which play effective role in skin disorder the *vidanga* fruit has a sharp, spicy, and bitter flavour. It is an excellent pre-meal digestive, antihelminthic, antioxidant, healing, and antifungal agent that aids in the treatment of the shwitra[18,19,20]. *Neem* possesses several anti-oxidant properties which will not only decreases the symptoms of vitiligo but shall also prevent the melanocytes from getting destroyed. An important property found in *Neem* extracts is their ability to work as anti-inflammatory agents. Main bioactive compound found in *Neem* is limonoid. Limonoid is aFurano lactone known for its inhibitory properties in the production of inflammatory mediators[21,22,23]. *Bhilawa* contains psoralens, compounds that, when exposed to UV light, which help stimulate melanocytes(cells that produce melanin) to produce more pigment. which lead to repigmentation of the white patches. Vitiligo is often linked to autoimmune responses, where the body's immune system attacks melanocytes. *Bhilawa* have immunomodulatory properties, helping to regulate the immune system and potentially protect melanocytes from damage. *Bhilawa*, focuses on detoxifying the body, balancing doshas, and promoting melanocyte activity to restore skin pigmentation. [24,25,26]
Amaltas is used in the treatment of *Shwitra*, primarily for its blood purifying and detoxifying properties. It is believed to help in the management of vitiligo by stimulating melanocyte function and promoting the restoration of skin pigmentation. *Amaltas* plants contains many flavonoids. Some flavonoids have been shown to affect melanin production in skin cell [27,28,29]. *Mustard* seed has phytotoxins which act as antibacterial and anti-fungal activity, which help to prevent the spread of patches of *shwitra*. It also has anti-inflammatory mechanism which help in wound healing and burning sensation.[30]

CONCLUSION

Shwitra (vitiligo) is one of the skin diseases which produces psychosomatic trauma to person who is suffering with it especially children. Ayurvedic preparations are very potent improve the *Shwitra*. In this study encouraging results was obtained in *Shwitra*. There is significant reduction in the patches with the use of *Balivellyadi* Ointment along with exposure to sun light and is found to be safe and effective.

ABSTRACT

The present case study involved a 40-year-old Female who visited the outpatient department of Ayothidoss Pandithar Hospital, National Institute of Siddha, with achief complaint of severe pain, tenderness, swelling, and redness in the posterior aspect of the left heel. Pain increased during early morning and prolonged walking and standing for the past 3 months;she had no comorbid conditions. Currently available treatment for this condition isnon-steroidal anti-inflammatory drugsor surgery, which is open or arthroscopic bursectomy. Many patients cannot afford this treatment, and it may lead to adverse outcomes. In the Siddha system, many external treatments are available. In this study, Retrocalcaneal bursitis was treated with *Attaividal* (Leech application). This treatment provides a painless,simple way of treatment without any side effects.

Keywords: *Attaividal,* Leech therapy, Retrocalcaneal Bursitis.

INTRODUCTION

Bursitis is associated with a bursa, a sac with thin walls that is lined with synovial tissue. The bursa's function is to make it easier for muscles and tendons to move across bony prominences. Bursitis can be caused by prolonged strain, trauma, systemic illness (such as gout or rheumatoid arthritis), or infection. [1] Retrocalcaneal bursitis is an inflammation of the bursa between the anterior aspect of the Achilles tendon and the calcaneus. Pain in the back of the heel and ankle area may result from inflammation of one or both of these bursae. In the normal population, the incidence of retrocalcaneal bursitis is high when wearing heels for an extended period, which gives irritation to the Achilles tendon bursa. Two bursae are situated just above where the Achilles (calcaneal) tendon inserts. The retrocalcaneal (sub-tendinous) bursa, located between the Achilles tendon and the calcaneus, is anterior or deep to the tendon. The Achilles bursa, also known as the subcutaneous calcaneal bursa, is located superficially or posteriorly to the Achilles tendon. This bursa is between the posterior side of the distal Achilles tendon and the skin. It is also known as Achilles tendon bursitis. [2]Based on its development and duration, there are two main types of bursitis. They are referred to as chronic and acute bursitis. Acute bursitis often results from an accident, trauma, infection, or joint disease. Chronic bursitis typically results from recurrent micro-injuries caused by excessive pressure and usage. The symptoms of acutebursitis include discomfort when the bursa is palpated and a decrease in the range of motion of the joint due to severe pain experienced during movement. Achilles tendon bursitis and retrocalcaneal bursitis can be treated conservatively or surgically. Surgery may be used to correct Haglund's deformity, even if conservative or non-operative methods include changing shoes and using analgesics for discomfort. [3]

In the Siddha system of medicine, the signs and symptoms of Retrocalcaneal bursitis can be directly correlated with *Kuthikaal vatham*. According to*YugimuniVaithiya Kaaviyam*, the signs and symptoms of *kuthikaal vaatham* include Pain, tenderness, Difficulty in walking, and Throbbing pain with inflammation. [4]. This case report determined the effectiveness of Leech application for the management of Retrocalcaneal bursitis.

AIM AND OBJECTIVE

To determine the therapeutic effectiveness of leech application for the management of Retrocalcaneal bursitis and assess it by Subjective and Objective parameters.

Place of the Study

The present case study was carried out in the Outpatient Department, Department of Pura Maruthuvam, National Institute of Siddha, Chennai.

Patient Information

A 40-year-old Female Patient came to NIS OPD no 14 with chief complaints of severe pain, tenderness, swelling, redness in the posterior aspect of the left heel, pain increased during early morning and prolonged walking and standing for the past 3 months. The patient was apparently typicalfor3 months,then the patient developed severe pain, swelling, and redness in the posterior aspect of the left heel. She underwent various treatments,but she didn't get any permanent relief.

CLINICAL FINDINGS

The patient presented with complaints ofsevere pain,tenderness, swelling, and redness in the posterior aspect of the left heel. Pain increased during early morning, prolonged walking, and running.

General Examination

The patient's build and nourishment were moderate. Pulse (74 beats/min), RR-21 beats/min, Body temperature (98. 6 0F), and Blood Pressure (120/80mm Hg) were within normal limits.

Systemic Examination

In the systemic examination, the Cardiovascular system (S1, S2 heard, no murmur), respiratory (NVBS heard, no added sound), and Gastrointestinal system (soft, non-tender, no organomegaly) were standard.

Diagnostic Assessment

Based on the clinical findings, the patient was diagnosed with *Kuthikaal vatham* (Retrocalcaneal bursitis).

- Subjective Parameter-(A) Pain
- Objective Parameter -(B) Swelling (C) Redness (D) Tenderness
- FADI for the assessment of the quality of life

Pain

When she first arrived at the OPD for treatment, her pain rating scale was eight. 2 sittings of leech were given, and on every sitting, the pain rating scale was mentioned in Table 1

Swelling mentioned in Table 2

Redness mentioned in Table 3

Tenderness mentioned in Table 4

FADI

The Foot and Ankle Disability Index is a 34-item questionnaire. The 34 items are rated on a 5-point Likert scale, with 0 being "unable to do" and 4 representing "no difficulty at all. " Scores range from 0 (none) to 4 (unbearable) for the four FADI pain components. The overall point value of the FADI is 104. Symptoms were noted. Quality of life was assessed before and after treatment, as mentioned in Table 5. The Siddha 8-fold diagnostic tools are illustrated in Table 5.

Therapeutic Intervention

All allopathic oral medications were stopped before starting the Siddha medicine. In this present case, the involvement of *vaatha* and *Pitha* Naadi derangement was correlated with observing the clinical presentation, such as pain, redness, swelling in the left heel region. In this case, vitiated *Pitha* and *Vadha* were found involved in the pathological progress of *Kuthikaal vatham* (Retrocalcaneal bursitis). After obtaining the patient's written consent, the leech application was done. Beforethe leech application, the required tests were performed, including CBC,ESR,Blood Sugar, HIV I & II, HBS Ag, VDRL, Clotting time, and Bleeding time. For this case, medically prescribed *Hirudo Ventralis* leeches are administered topically to the posterior aspect of the heel.

Pretreatment procedure

The patient was allowed to lie in the supine position, and vital signs were noted. The affected site was cleaned, and one large-sized and one medium-sizedleech was selected. Leeches were thoroughly washed in both pure water and turmeric water for ten minutes each. The affected site was cleaned with sterile water and then cleaned with dry gauze.

Treatment procedure

Normal saline was used to clean the affected area, and a marker indicated the site. Leeches were allowed to bite the site properly. To prevent outside annoyance, leeches were maintained under a piece of wet gauze. Leeches were permitted to suck the blood for about the same amount of time.

Post-treatment procedure

After the treatment process, turmeric powder was applied to the leeches' mouths, allowing them to release their blood. Following the complete expulsion, leeches were kept in turmeric water and clean water for 10 minutes each.

After that, Leeches were stored in fresh water containers. 2 sittings of leech application were done witha 20-day interval. 2 leeches were used in 1st sitting and 1 leech was used in 2 nd sitting. The prognosis of the patient was assessed using subjective and objective parameters, as well as quality of life, by the Foot and Ankle Disability Index (FADI). The patient was instructed to elevate their feet at night, wear soft shoes, and refrain from excessive activity. The study was being reported for publication after the patient gave their informed consent.

Screening Assessment

The screening assessment before and after treatment is depicted in Table 6.

Timeline

Table 7 shows the details of the timeline, treatment strategy, and clinical outcome.

Follow-up and Outcome

The periodic clinical outcome after Leech application is shown in Figure 1. The patient hasshown notable improvements following two sittings of leech treatment. Pain,swelling,redness,and tenderness were reduced. After two sessions of leech application, the previous symptoms were alleviated entirely. Subjective and objective parameters were assessed, including the FADI score. No adverse effects were observed during the treatment. The patient was instructed to wear soft shoes and elevate the foot for the next couple of months. but no recurrence was noticed. Leech application is a cost-effective and convenient method for the treatment of *Kuthikaal vatham* (Retrocalcaneal bursitis). Images of the *Attaividal* (Leech application) procedure are attached in Figure 1

DISCUSSION

In the Siddha medical system, leech therapy is one of the para-surgical techniques recommended to treat inflammatory diseases, including bursitis. Leech therapy is an easy, affordable, minimally invasive, painless treatment for bursitis that has no significant side effects. More than 100 biological compounds, including histamine-like substances, destabilase, hyaluronidase, eglins, acetylcholine, and histamine, are found in leeches' salivary secretions. These compounds act on collagen-mediated platelet aggregation and have anti-inflammatory and vasodilatory properties. [7] In light of Leech's remarkable effects on inflammatory conditions. Therefore, retrocalcaneal bursitis is a present case. With the recommended treatment, the patient's quality of life significantly improved, and the severe heel pain, localised swelling on the posterior portion of the calcaneus, and redness reduced considerably. pain was reduced while walking. The quality of life has improved. According to Siddha principles, retrocalcaneal bursitis possesses a "*veppa" veeriam*, whereas leeches exhibit a "*thatpa" veeriam*. Leech application is used to treat vitiated "*pitham"* diseases. Leech application for Retrocalcaneal bursitis works by removing toxins, *senneer thathu*, and vitiated *pithathodam* from the body through the blood. [4]

CONCLUSION

Both surgical and non-surgical methods were used to treat instances of bursitis in modern medicine. Non-steroidal anti-inflammatory drug usage, synovial fluid aspiration, and corticosteroid injections are all part of the non-surgical treatment. Side effects could occur with both surgical and non-surgical approaches. Based on active biological compounds in the saliva of the leech and Siddha principles, pain, redness, and swelling were gradually reduced, and the patient found comfort in walking. so, *Attaividal* (Leech application) is an effective treatment for *Kuthikaal vatham* (Retrocalcaneal bursitis). Furthermore, improve patients' quality of life through the Leech application.

ABSTRACT

To overcome common difficulties in creating scale models, this study concentrated on the design and development of a novel multipurpose cutting board. It was especially designed to meet the needs of students studying architecture, engineering, and architectural drafting, who frequently struggle with accuracy, productivity, and workspace organization. Through a review of the literature and user surveys, the study determined the shortcomings of traditional modeling tools. A workable and user-centered solution was developed using insights from these approaches. The created cutting board integrated cutting, measuring, and organizing—all crucial tasks—into a single, small platform. It had built-in tool storage compartments, sturdy surfaces for longevity, and grid markings for accuracy. The goal of these design elements was to reduce workspace clutter and increase productivity. To evaluate overall performance, third year drafting students participated in a prototype evaluation. The four main areas of feedback were economy, safety, durability, and functionality. The product greatly increased model-making efficiency and decreased tool-handling challenges, according to the results. During project execution, users reported increased convenience and accuracy. In academic settings, the innovation promoted a more structured and polished workflow. The results emphasized how crucial it is to incorporate multifunctionality into learning resources for design-based fields. Overall, the study showed that the Multi-Purpose Cutting Board is a useful tool for creativity and education. It provides a long-term strategy for enhancing scale model construction productivity and creativity.

Keywords: Architectural Drafting Tools, Design Innovation, Product Development, Multipurpose Cutting Board, Scale Model-Making

INTRODUCTION

Creating scale models is still an essential practice in many fields since it can be used for analysis, visualization, and improvement. It improves comprehension of spatial relationships, proportions, and functionality in architecture and engineering by bridging the gap between conceptual design and practical application (Giuoiu, 2025). Similarly, model-making fosters creativity and clear idea communication in fine arts and interior design. Even though model-making has educational and professional benefits, it frequently requires a lot of time and accuracy, especially when using traditional tools. Innovative tools that increase accuracy and productivity have been developed in response to the need for greater efficiency and adaptability. One such innovation is the Multi-Purpose Cutting Board, which was created with ergonomic and multipurpose features to address the unique difficulties of creating scale models. By shielding surfaces and offering steady, grid-marked platforms for precise cutting, the incorporation of self-healing cutting mats has already demonstrated efficacy in assisting precision work (Charles, 2025). These designs show how cost-effectiveness and workflow are enhanced by functionality and durability. Likewise, advancements in model-making tools, bolstered by ergonomic design, suitable material selection, and contextual usability, lead to user-centered solutions that improve comfort and accuracy (Garcia, 2019; Patel, 2022; Reyes, 2020; Beyer, 2022; Chen, 2020). Despite improvements in software like AutoCAD and SketchUp, physical models are still crucial in architecture for verifying and conveying design concepts (Dauden, 2018). Building on these principles, the suggested Multi-Purpose Cutting Board for Scale Models provides integrated measurement guides, sturdy cutting surfaces, and well-organized tool compartments. This innovation aims to improve learning outcomes, encourage creativity among architecture and engineering students, and expedite model-making by combining ergonomic efficiency with versatility.

OBJECTIVES OF THE STUDY

In order to improve the effectiveness and precision of model-making procedures, this study aims to design, develop, and assess a novel Multi-Purpose Cutting Board for Scale Models. In particular, it seeks to

1. Create a multipurpose cutting board that facilitates accuracy, organization, and user convenience for those working in engineering, architecture, and creative scale modeling.
2. Provide the prototype with ergonomic and useful features, such as built-in storage spaces for necessary modeling tools, gridlines for precise alignment, a non-slip cutting surface, and integrated measurement guides.
3. Examine the developed product's usability, robustness, affordability, and safety to make sure it successfully satisfies the demands and expectations of a wide range of users in both professional and educational settings.

MATERIALS AND METHODS

The Novel Multifunctional Cutting Board Developed for Effective Scale Model Building was designed, developed, and evaluated using the techniques and procedures described in this section. It describes the operational procedure, testing, evaluation, development process, and project design.

Project Development

To guarantee usability, robustness, and user safety, the cutting board was developed using a methodical process. The following are the main steps

1. **Design Phase:** Creating a comprehensive blueprint that outlines the features, dimensions, and layout.
2. Material preparation is the process of choosing and examining all necessary materials to guarantee their appropriateness and quality.
3. Assembly includes integrating storage compartments, attaching the cutting surface, and installing grid markings.
4. **Finishing:** Applying protective coatings and smoothing edges to improve safety and appearance.
5. **Evaluation:** Usability is evaluated and areas for improvement are identified through functional and safety testing.

MATERIAL SELECTION

Durability, affordability, and availability were given top priority when choosing materials. The prototype made use of rubber matting for non-slip surfaces, wood planks for framing, and plyboard for structural support. Additional components that were selected to guarantee stability, functionality, and a visually appealing finish included bolts, nuts, washers, wood glue, paint, metal hinges, and sandpaper.

Testing and Evaluation Procedures

The Scale Model Multi-Purpose Cutting Board went through an organized testing and evaluation process to determine its quality, functionality, and consumer satisfaction. The processes targeted checking the product's functionality, durability, price affordability, and safety—main criteria aligned with the study objectives. Testing was done by operational testing and performance evaluation by chosen third year drafting students, who acted as evaluators and end-users. Each user applied the prototype in usual scale model-making exercises to ascertain its efficiency, stability, and usability.

Feedback was collected using standardized questionnaires and observation with the following indicators in mind

Functionality: Usability and accuracy of measurement guides.

Longevity: Material resistance to wear and frequent use.

Affordability: Cost-effectiveness compared to the available modeling tools.

Safety: Edges' smoothness, components' stability, and users' protection against injury while using the device.

Information gathered from tests was analyzed to determine strengths, design refinements, and areas for possible improvement for subsequent product versions.

RESULTS AND DISCUSSION

This section discusses the results of the evaluation of Multi-Purpose Cutting Board for Scale Models in terms of its functionality, durability, economy, and safety. The evaluation was undertaken to learn about the overall performance of the model based on user impression. A total of 55 third-year BSIT Architectural Drafting students from Surigao del Norte State University served as respondents. Data were collected via a structured survey questionnaire, employing a five-point Likert scale with the following meanings:0.0–0.9 = Not Effective1.0–1.9 = Low Effective2.0–2.9 = Effective3.0–3.9 = Very Effective4.0–5.0 = Highly Effective

Functionality

As shown in Table 1, the respondents rated the functionality of the cutting board as Highly Effective, with an average weighted mean of 4.87. The indicators Portability and Comfort (4.85) and Usefulness (4.89) both received top evaluations. These results confirm that the model provides excellent usability, supports efficient workflow, and meets the precision needs of scale modelers.

Durability

Table 2 indicates that the product's durability also earned a Highly Effective rating, with a weighted mean average of 4.84. The respondents wholly agreed that materials and construction of the model, especially its Distortion Resistance (4.85) and Quality of Design (4.82), make it long-lasting and reliable. This explains that the cutting board is strong and can be used multiple times without losing its functionality.

Economy

As indicated in Table 3, the model was ranked Highly Effective on economy by the respondents with a weighted mean of 4.57. Cost Efficiency (4.85) and Quality of Design (4.29) are the criteria that indicate that performance is good at a low cost. The results indicate that the product has good long-term value as it is durable and has a functional design.

Safety

Table 4 illustrates the assessment of safety, which was found to be Highly Effective with a mean weighted value of 4.73. The indicators Absence of Sharp Edges (4.71) and Use of Standard Materials (4.75) indicate that the product was well-designed with respect for safety considerations. These results confirm that the cutting board is up to standard safety measures and is safe for consistent academic and professional use.

Summary of Findings

Generally, the testing outcomes show that the Multi-Purpose Cutting Board for Scale Models is extremely effective on all of the criteria measured. It exhibits first-rate functionality, durability, cost-effectiveness, and safety—making it a handy, dependable, and easy-to-use model-making aid for enhancing accuracy and productivity in model-making work.

CONCLUSION

The results verify that the Multi-Purpose Cutting Board for Scale Models is an extremely effective and easy-to-use innovation both for scholarly and professional use. Its ergonomic shape, built-in functions, and robust make all lead to enhanced accuracy, organization, and workflow effectiveness in scale model construction. The research concludes that the tool not only solves the usual issues experienced by architecture and drafting students but also enhances innovation, craftsmanship, and productivity in design-related fields. The product represents a real model for further development of multifunctional tools that combine efficiency, safety, and sustainability in creative and technical training.

ABSTRACT

Environmental, Social, and Governance (ESG) strategies have become more integral to corporate sustainability, risk, and financial performance debates. This research conducts a systematic meta-analysis of empirical studies analyzing the association of ESG initiatives with sustainability performance across various industries and geographic locations. Based on more than 80 peer-reviewed studies published from 2015 to 2025, the analysis combines additional than 1,000 effect sizes to assess how ESG disclosure, implementation, and performance influence financial returns, environmental outcomes, and corporate risk. The results indicate a persistent positive relationship between ESG disclosure and firm profitability, especially among industries with high regulatory pressures and emerging markets. In addition, ESG transparency is inversely correlated with firm risk, which emphasizes the strategic risk management value of ESG. There is evidence that companies with good environmental reporting significantly cut carbon footprints as well as regulatory penalties. Notwithstanding the advantages, the study points to long-term problems like standardization of ESG data, inconsistency in ratings, as well as the threat of greenwashing. The paper finishes with theoretical implications, practical suggestions, and a research agenda to close impending gaps in the ESG-sustainability nexus.

Keywords: Environmental, Social, and Governance (ESG), Corporate Sustainability; ESG Disclosure, Corporate Risk, Meta-analysis, ESG Transparency; Carbon Footprint, Greenwashing, Strategic Risk Management.

INTRODUCTION

Environmental sustainability has become a growing concern for investors, businesses, and policymakers across the globe, with mounting awareness of climate change, natural resource depletion, and social inequality concerns (Friede, Busch, and Bassen, 2015). The use of Environmental, Social, and Governance (ESG) frameworks is intended to embed sustainability issues into corporate strategy and day-to-day operations on a systematic basis so that organizations can not only seek financial performance but also play a role in positive environmental and social outcomes (Clark, Feiner, and Viehs, 2015). ESG factors give special importance to environmental responsibility, including aspects like carbon emissions reduction, resource effectiveness, pollution mitigation, and conservation of biodiversity, together with social obligation and robust governance practices enabling transparency, accountability, and ethical behavior (MSCI ESG Research, 2023). Strong ESG credentials are now increasingly associated with firms that can reduce operational and reputational risks, adhere to changing regulations, and address stakeholder pressures on sustainable business models, thus supporting long-term value creation (Eccles, Ioannou, and Serafeim, 2014; Friede *et al*., 2015). The integration of ESG criteria supports organizations in addressing global challenges such as climate change and social inequality, contributing to broader sustainable development goals (SDGs) endorsed by the United Nations (UN Global Compact, 2020). This increasing momentum is also seen in the growth of sustainable finance, where investors are directing capital to firms with higher ESG performance, further solidifying the correlation between sustainability efforts and financial performance (Global Sustainable Investment Alliance [GSIA], 2023). This review collates secondary information from top ESG research firms, sustainability indices, and academic research to examine how ESG efforts induce environmental sustainability in terms of quantifiable effects like greenhouse gas emission cuts, enhanced resource efficiency, and risk mitigation. In addition, the review examines the cost implications of ESG integration, pointing out that improved ESG performance is associated with lower cost of capital, improved firm value, and improved resilience during times of market turbulence (Clark *et al*., 2015; Friede *et al*., 2015). Through these facets, the review highlights the strategic significance of ESG models as key instruments for promoting environmental stewardship as well as economic progress in the modern changing business environment.

LITERATURE REVIEW

Several studies highlight the positive correlation between ESG performance and environmental results, positioning ESG as a strategic and operational necessity for contemporary corporations. Friede, Busch, and Bassen (2015) wrote a seminal meta-analysis of more than 2,000 empirical papers, finding that around 90% have a non-negative correlation, and 50% have a definite positive correlation between ESG performance and financial results. This affirms that the practice of being environmentally and socially responsible not only flows from ethical standards but also leads to the success of business. In the same spirit, Clark, Feiner, and Viehs (2015) contend that firms with better ESG scores enjoy reduced capital costs, better risk-adjusted returns, and stronger reputational value, all of which translate to long-term sustainability and shareholder confidence. They propose that ESG performance acts as a proxy for good corporate management and risk avoidance, particularly during market volatility or environmental shocks. Findings are quantitatively supported by data from MSCI ESG Research (2023). Based on their analysis, it is found that firms in the highest ESG quartile have 30–40% lower carbon emissions intensity than those with poorer ESG performance. Such firms also record higher penetration of renewable energy and forward-looking climate risk assessment processes. This testifies to the material influence of ESG adoption on environmental factors such as energy efficiency, emissions management, and resource preservation. Complementing these insights, Sustainalytics (2023) reports that companies with strong ESG ratings tend to have better environmental risk management systems, leading to fewer environmental controversies, litigation cases, and regulatory penalties. For example, the average environmental fine imposed on low ESG performers over a five-year period was up to 10 times higher than that of high-performing

peers, suggesting a tangible financial impact from poor sustainability practices. The Carbon Disclosure Project (CDP, 2022) contributes to the debate further, with reporting that those companies with 'A' climate disclosure scores recorded an average yearly decrease of 9.7% in greenhouse gas emissions, whereas businesses which recorded a 'C' or lower generally recorded stagnation or even an increase in emissions. The CDP further indicates that such high-performing firms tend to adopt science-based target setting, adopt energy-efficient technologies, and report climate-related financial risks, as in accordance with TCFD (Task Force on Climate-related Financial Disclosures) guidance. Nonetheless, even in the face of this increasing body of evidence in support of ESG integration, the industry is far from perfect. Perhaps the most intractable problem is the absence of standardization in ESG ratings. Berg, Koelbel, and Rigobon (2019) examined data from several ESG rating agencies and concluded that correlation between ratings of the same firms was frequently less than 0.7, owing mainly to different indicators, sources of data, and schemes of weighting. This disagreement causes uncertainty for investors and erodes confidence in ESG as a sound evaluation instrument. In addition, greenwashing—the act of exaggerating or misrepresenting sustainability performance—has increasingly been a concern. Sullivan and Mackenzie (2020) identify that in the absence of robust verification systems, ESG disclosures on a voluntary basis are vulnerable to being manipulated. They advocate enhanced regulatory supervision, standardized reporting standards (like GRI and SASB), and independent third-party audits to provide credibility and avoid misinformation. In addition, coverage of ESG data continues to be patchy across the world, with developing markets having serious disclosure issues, and cross-country comparisons, therefore, becoming complicated (Eccles and Krzus, 2018). Small companies themselves can also not afford to make comprehensive ESG reports, further distorting available information in favor of large-cap companies in developed economies. In conclusion, although the literature is robust in affirming the relationship between ESG practices and enhanced environmental and financial performance, there are still systemic issues of data reliability, reporting consistency, and regulatory enforcement. Resolving these concerns is critical for ensuring that ESG metrics capture real-world sustainability performance and can be trusted as a set of reliable tools for corporate strategy, investment decision-making, and policy development

METHODOLOGY

A review of literature was done through databases like Scopus, Web of Science, JSTOR, and Google Scholar. Articles published from 2015 to 2025 were chosen based on keywords such as "ESG," "environmental sustainability," "financial performance," and "corporate responsibility." Only peer-reviewed articles that published measurable data relating ESG practices to environmental or financial results were considered. 80 appropriate studies were selected on the basis of data availability, quality of studies, and topic relevance. The primary data extracted from each study were the type of ESG activity examined, the financial or environmental result measured (e.g., return on assets or carbon emissions), and the reported outcome. A meta-analytical overview was employed to contrast the findings, emphasizing shared patterns, mean effects, and variations across regions. This approach ensures balance and precision in understanding the influence of ESG practices on sustainability and performance within industries and nations.

FINDINGS

Financial Performance and ESG Disclosure

The connection between financial performance and ESG disclosure has been the subject of various empirical and meta-analytic research studies over the last few years. The general trend of findings is to indicate a positive, though context-specific, relationship between sustainable business practices and profitability or firm value. Following is a comprehensive synthesis of main studies:

Gupta (2024) – Indian Corporations

Gupta carried out a targeted meta-analysis based on 38 peer-reviewed papers between 2005 and 2023, testing the association between sustainability reporting (proxied by GRI-based disclosures, CSR scores, and ESG measures) and

financial metrics such as Return on Equity (ROE), Net Profit Margin (NPM), and Tobin's Q. The study concluded: Effect size (r) = 0.11, showing a moderate but statistically significant positive relation ($p < 0.05$).The banking sector demonstrated the highest ESG-financial performance link, with ROA improving by an average of 3.2% in high ESG score banks relative to low-scoring banks. Methodology: Random-effects model meta-analysis based on effect size estimates using Hedges' g. This suggests that in Indian companies, especially finance, ESG disclosure might increase stakeholder confidence and lower reputational risk, indirectly supporting profitability.

Bancu *et al*. (2024) – Global Meta-Synthesis

This research conducted a meta-analysis of 80 quantitative articles across several continents and industries. The findings are as follows: 742 effect sizes were pooled, and an average correlation coefficient of 0.18 was derived. The economic performance measures that were studied are ROA, ROE, EBITDA margin, and stock returns. Fixed and random effects models were employed by the study, and robustness was confirmed using funnel plots and Egger's test for publication bias. Higher ESG transparency (e.g., TCFD and SASB-aligned reporting) was linked to up to 5% higher average ROE, especially in regulated industries like energy and finance. The research concludes that ESG transparency and consistency in reporting are favorable signals to investors, having the potential to reduce capital costs and enhance long-term shareholder value.

Nguyen *et al*. (2025) – Sustainability Reporting in Emerging Markets

Nguyen *et al*. examined 115 effect sizes of 30 empirical studies published between 2010 and 2023, mostly on developing Asian and African countries. Through meta-analysis, they found: A higher correlation ($r = 0.23$, $p < 0.01$) between sustainability reporting and financial performance among emerging economies. Firms that mapped ESG disclosures with UN SDGs performed better by 2.1–3.5% in ROE. Effects were greater in capital-intensive industries (e.g., mining, oil and gas) given greater stakeholder oversight. Improved risk management, enhanced investor access, and license-to-operate benefits in institutionally weak locations were the reasons assigned for the positive impact.

CSE Study (2025) – U.S. and Canada

The Centre for Sustainability and Excellence (CSE) completed a corporate performance benchmarking research based on publicly accessible ESG and financial information from 210 large-cap corporations in North America: There existed a 92% positive relationship between medium-to-high ESG ratings (according to MSCI and Sustainalytics) and net profitability. Top quartile companies had an average net profit margin of 14.2%, compared with 8.6% for bottom quartile companies. The consumer products and technology industries exhibited the strongest ESG-profit connection, possibly because of stakeholder sensitivity as well as investor activism. This groundbreaking finding upholds the business case for mainstreaming sustainability in core strategic planning for improved long-term financial well-being.

Aslan Çetin *et al*. (2024) – Turkey (BIST Sustainability Index)

The study employed panel data regression (2016–2022) across 26 listed companies from the Borsa Istanbul Sustainability Index. The key findings are: ESG disclosure had a positive effect on: ROA ($\beta = 0.14$, $p < 0.05$)ROE ($\beta = 0.18$, $p < 0.01$)Net Profit Margin (NPM) ($\beta = 0.22$, $p < 0.01$)Asset Growth Rate (AGR) ($\beta = 0.12$, $p < 0.05$). But a negative effect on Market-to-Book Ratio (MBR) ($\beta = -0.10$, $p < 0.05$) was detected, indicating potential overvaluation issues or market inefficiency in the interpretation of ESG metrics. The paper identifies the short-term advantages of ESG for internal profitability measures but cautions against market mispricing problems in Turkey's developing capital markets.

Wang (2024) – China (A-Share Listed Companies)

Wang examined 1,200 A-share listed companies' ESG data in China between 2018 and 2022 based on regression analysis with fixed effects. The following was obtained from the study: ESG ratings (Sina ESG ratings) were positively related to Tobin's Q ($\beta = 0.29$, $p < 0.01$) and net profit margin ($\beta = 0.19$, $p < 0.01$).The 'G' (Governance) pillar was the most predictive for firm value, especially for state-owned enterprises (SOEs).Firms with ESG top quartile scores had 25–30% higher total returns in the post-COVID-19 recovery period. These findings highlight ESG's

increasing impact in Asian capital markets, particularly under state policies encouraging green growth and digital governance.

PubMed Study (2023) – Global Dataset

A large-scale econometric analysis with 24,076 firm-level observations in 60 countries (2010–2021) found: ESG performance, especially within the environmental component, was tightly linked with enhanced corporate performance. Companies in high-risk industries (e.g., extractives, chemicals) with good ESG practices showed 8.3% greater operating margins compared to peers. The study employed a structural equation model and controlled for GDP, firm size, and regulatory climate, suggesting robustness. The research presents macro-level evidence that the adoption of ESG can act as a shock buffer against volatility, particularly during crisis periods.

Synthesis Table: ESG and Financial Performance by Study (Table:1)

ESG Practices and Firm Risk

The relationship between ESG practices and firm risk has become a focal area of concern, particularly after global financial crises, climate catastrophes, and corporate scandals. The literature overwhelmingly indicates that strong ESG practices not only enhance financial performance but also serve as risk-containment mechanisms. Meta-analytical as well as empirical research substantiates this hypothesis in different geographical locations and industries.

Singhania and Gupta (2024) – Global Meta-Analysis on Risk Reduction

The meta-analysis integrated 76 peer-reviewed articles published from 1991 to 2023. The primary aim was to explore the association between ESG disclosure and different forms of firm risk, such as: Total Risk (through standard deviation of stock returns) Systematic Risk (through Beta coefficients) Idiosyncratic Risk (residual volatility of asset pricing models)Key Findings: ESG disclosure was found to be negatively correlated with all three types of risk: Total Risk: r = -0.19Systematic Risk: r = -0.14Idiosyncratic Risk: r = -0.21.

Results were statistically significant at the 1% level ($p < 0.01$). Larger companies realized more risk reduction benefits of ESG practices, due to more extensive stakeholder involvement and superior implementation infrastructure. The availability of female directors substantially increased the impact of ESG on risk mitigation—an impact accounted for by risk aversion theory, heterogeneous decision-making, and ethical governance. The findings of this research lend support to stakeholder theory and the resource-based perspective, indicating that ESG abilities are strategic assets that enable companies to navigate external shocks, regulatory shifts, and reputation risks.

Alareeniand Hamdan (2024) – MENA Region Empirical Analysis

This research targeted 110 listed companies in the MENA region from 2015 to 2022 and examined the influence of ESG scores on firm-specific risk. Applying fixed-effects panel regression, the authors revealed that companies with superior ESG scores had lower Beta values (average decline of 0.08), which suggests lower market-related volatility. Environmental scores had the strongest relationship with risk reduction in energy-intensive sectors.ESG engagement also yielded reduced cost of equity (1.2% decrease) and tighter credit spreads, especially in nations with more robust legal systems. This supports the view that ESG practices act as a cue for investors and credit agencies, resulting in better access to capital and financial stability.

Husted and Sousa-Filho (2023) – Latin America and Governance Risk

With a focus on Latin American multinationals, this research highlighted the governance pillar of ESG and its influence on agency risk and managerial opportunism. Companies with strong governance scores (Board independence, anti-corruption policies, audit controls) were 36% less likely to have material misstatements or regulatory sanctions. The research identified a negative relationship (r = -0.22) between governance performance and the incidence of earnings restatements. Such ESG initiatives driven by governance were demonstrated to enhance investor confidence, particularly in institutionally void or enforcement standard-low markets.

Friede, Busch and Bassen (2015) – Foundational Meta-Study
While published previously, this landmark paper continues to be highly referenced. The researchers meta-reviewed more than 2,000 empirical research works and concluded that about 90% of ESG-risk literature had indicated a non-negative relationship, and most had demonstrated that robust ESG practices dampen volatility and increase stock resilience during times of economic decline.

OECD (2023) – ESG and Credit Ratings
A OECD global policy report discovered that: Firms with regular ESG disclosures and third-party assured ratings (MSCI/Sustainalytics) were 30% more likely to maintain their credit rating throughout crises (e.g., COVID-19). ESG integration into risk management systems of companies resulted in greater resilience scores across industries such as pharmaceuticals, logistics, and utilities.

Sectoral Variation in ESG-Risk Relationship(Table:2)

ESG and Firm Risk(Table: 3)

ESG Implementation and Environmental Performance
Environmental sustainability lies at the heart of ESG models, and latest meta-analytic and empirical research presents considerable evidence that connects ESG implementation with concrete environmental performance enhancement, particularly in emissions reduction, energy efficiency, and green innovation.

Khan and Gupta (2024) – Meta-analysis of Corporate Green Accounting
In a meta-analysis of 68 independent studies with 19,625 firm-year observations from Asia, Europe, and North America, Khan and Gupta (2024) reported: A positive correlation ($r = 0.28$) between the green accounting practices of firms and firm financial performance. When environmental costs (e.g., carbon taxes, waste disposal, energy consumption) were directly measured and disclosed, the correlation became stronger at $r = 0.34$.Companies incorporating green accounting were 22% more likely to invest in long-term clean technologies and eco-innovation. This argues that environmental transparency has the ability to reduce inefficiencies as well as enhance stakeholder alignment, particularly with environmentally aware investors.

CDP (2022) – Global Emissions Reporting
The Carbon Disclosure Project (CDP) reports that an analysis of more than 9,500 companies in 90 countries found that: Companies with A-grade climate disclosure realised a mean 10% decrease in greenhouse gas emissions each year. Those that had incorporated ESG into their board-level governance frameworks realised even stronger emission reductions (13.5%).Companies reporting Scope 3 emissions were twice as likely to establish and achieve Science-Based Targets (SBTs).These results illustrate that disclosure and third-party disclosure channels can stimulate internal accountability and trigger climate action progress.

MSCI ESG Research (2023) – Carbon Intensity and ESG Ranking
Research of more than 7,800 companies worldwide discovered: Firms in the highest ESG quartile had 30% to 40% lower carbon emissions intensity (CO_2/Revenue) than lowest-quartile companies. The Energy, Utilities, and Materials industries exhibited the biggest differences in carbon intensity between ESG quartiles, indicating the need for industry-sensitive ESG interventions.ESG leaders allocated more green capex (average 8.7% of revenue) than laggards (3.4%). These statistics confirm that ESG leadership is associated not just with emissions performance but also with strategic investment in future-proof technologies.

Zhou *et al.* (2023) – ESG and Circular Economy Practices
A meta-synthesis of 42 European and Asian empirical studies documented that companies embracing ESG-aligned circular economy strategies: Decreased resource use by an average of 18%. Reduced waste output by 25%,

particularly in manufacturing and retail industries. Improved reputation scores and customer loyalty, with brand value improvements averaging 14% ESG implementation.

Key Environmental Performance Metrics and ESG Integration(Table: 4,5)

DISCUSSION

The combined evidence from meta-analyses, cross-country datasets, and ESG score-based rankings all point to the same message: best practices in ESG contribute positively to corporate financial, environmental, and reputational performance.

Financial Performance and Risk

Numerous studies indicate that the application of ESG is not just a compliance activity but rather a mechanism for value creation. For example: The low Indian correlation (r = 0.11) could be a sign of nascent ESG adoption in developing economies where regulatory and infrastructure maturity is still evolving. The heightened effects in industries such as banking and utilities indicate that ESG incorporation is most vital in areas with heightened stakeholder scrutiny and exposure to systemic risk. Risk reduction by ESG, as explained in Singhania and Gupta (2024), verifies the buffering hypothesis, whereby good ESG practices buffer firms from operating, legal, and market shocks.

Environmental Benefits and Green Innovation

The positive effect of ESG on environmental performance such as reductions in emissions, efficiency in resources, and green innovation is repeatedly evidenced. The 10% average reduction in emissions observed by CDP is especially strong and suggests that disclosure is action-driven, not symbolic. The function of green accounting (Khan and Gupta, 2024) also reinforces the idea that environmental externalities need to be internalized for ESG to be economically significant. It indicates that measurement of environmental expenses allows companies to recognize inefficiencies, enhance resource use, and enhance performance.

Methodological Issues and Greenwashing

Nonetheless, these constructive effects should be viewed in the light of reliability of data and methodological variation: Berg, Koelbel, and Rigobon (2019) point to inter-agency rating disparities, which weaken decision-making and comparability on the basis of ESG scores. Greenwashing, the misrepresentation of ESG performance, remains a recurring problem. Sullivan and Mackenzie (2020) believe that ESG audits must be mandated, reporting frameworks standardized (such as ISSB, GRI, SASB), and AI-driven ESG data verification tools.

Theoretical and Strategic Implications

From a stakeholder theory viewpoint, ESG activities serve the long-term interests of stakeholders, thus building relational capital. The resource-based perspective (RBV) also discusses how ESG capabilities exist as strategic intangible assets that provide long-term competitive advantage

CONCLUSION

This meta-analysis of current research, drawing on more than 80 empirical studies and thousands of firm-year observations, yields firm evidence that Environmental, Social, and Governance (ESG) practices have a positive impact on financial performance, lower business risk, and improve environmental performance. The relationship, though broadly positive, is moderated by sector dynamics, geographic location, size of firm, and extent of ESG integration.

KEY FINDINGS

Financial Performance: ESG disclosure and application have a statistically significant positive relationship with firm financial performance (Gupta, 2024; Nguyen *et al*., 2025), especially in capital-intensive industries and in emerging economies where sustainable finance is becoming increasingly popular.

Risk Reduction: ESG disclosure has been linked to a decrease in total, systematic, and idiosyncratic risk (Singhania and Gupta, 2024), thus ESG being an effective risk management measure.

Environmental Benefits: There is evidence that high ESG-rated corporations have lower emissions intensity, a higher rate of achieving climate targets, and more dedicated green investment (CDP, 2022; MSCI, 2023), demonstrating quantifiable environmental improvement.

Governance and Disclosure: Successful ESG performance relies on governance structures (e.g., sustainability committees at the board level, green accounting) and transparent disclosure practices.

Variability in ESG Ratings: In spite of the positive results, rating variation and greenwashing threats continue to be major impediments to ESG incorporation in investment and business strategy.

Theoretical Implications

The results confirm key management theories

Stakeholder Theory: ESG practices reconcile the firm's activities with stakeholders' interests, promoting trust and legitimacy.

Resource-Based View (RBV): ESG capabilities, including transparent disclosure, green innovation, and ethical supply chain management, act as scarce and imitable resources generating sustainable competitive advantage.

Signaling Theory: High ESG scores are valid signals to investors and regulators of firm stability, ethical behavior, and long-term strategic thinking.

Practical Implications

Corporate Strategy: Companies need to go beyond symbolic ESG practice and integrate sustainability into fundamental business processes, including procurement, R and D, and finance.

Investor Decision-Making: Investors are urged to include multi-dimensional ESG indicators—notably including emissions data, governance arrangements, and social equity metrics—in their due diligence practices.

Policy Frameworks: Regulators should collaborate in aligning ESG disclosure standards and encouraging verified ESG performance through tax credits, subsidies, or capital access incentives.

LIMITATIONS

Most studies use self-reported ESG information, which is questionable for reliability and can be problematic for bias. The non-standardization of ESG frameworks (e.g., GRI vs. SASB vs. MSCI) limits cross-study comparability. Causality is still challenging to determine, particularly in observational studies where endogeneity is a typical issue.

Future Research Agenda

Longitudinal Causal Studies: Future research must utilize panel data methods (e.g., difference-in-differences, fixed effects specifications) to determine causality between ESG efforts and firm performance.

Sector-Specific Meta-Analyses: Industry-specific meta-analyses are needed, especially for high-impact industries such as energy, manufacturing, and technology.

AI and ESG: Investigate the potential of AI and machine learning to improve ESG measurement, identify greenwashing, and facilitate real-time ESG risk analysis.

Social Pillar Deep Dive: Further research on the 'S' in ESG, particularly how employee rights, community engagement, and diversity affect long-term performance.

ESG in SMEs: Most of the ESG research is conducted on large firms; the impact and contribution of ESG in small and medium enterprises (SMEs) is less researched.

Local Contexts and Emerging Markets: There is increasing significance in researching localized ESG models for developing economies, where regulatory frameworks and stakeholder priorities vary.

Table. 1: Synthesis Table: ESG and Financial Performance by Study

Study	Region	Sample Size / Scope	Key ESG Focus	Effect Size / Finding	Outcome
Gupta (2024)	India	38 studies (2005–2023)	ESG Disclosure	r = 0.11 ($p < 0.05$); strongest in Banking sector	Improved ROE, NPM, Tobin's Q
Bancu *et al.* (2024)	Global	80 studies / 742 effect sizes	ESG Reporting	r = 0.18; 5% ↑ in ROE in high ESG-transparent firms	Higher ROA, ROE, Stock Returns
Nguyen *et al.* (2025)	Asia, Africa	30 studies / 115 effect sizes	Sustainability Reporting	r = 0.23; 2.1–3.5% ↑ ROE in SDG-aligned firms	Stronger performance in emerging markets
CSE Study (2025)	US and Canada	210 firms	ESG Ratings	92% correlation between high ESG and profitability	↑ Net Profit Margin (14.2% vs. 8.6%)
Aslan Çetin *et al.* (2024)	Turkey	26 firms (2016–2022)	ESG Disclosure	β = 0.14 to 0.22 (ROA, ROE, NPM); negative β = -0.10 on MBR	Positive financial metrics; market mispricing issue
Wang (2024)	China	1,200 A-share listed firms	ESG Ratings (Sina)	β = 0.29 (Tobin's Q); ESG ↑ 25–30% returns in SOEs post-COVID	↑ Profitability and valuation
PubMed Study (2023)	Global	24,076 firm-level observations	ESG Performance	8.3% ↑ operating margins in high-risk industries	Macro-level ESG-performance link

Table. 2: Sectoral Variation in ESG-Risk Relationship

Sector	Risk Impact of ESG	Key ESG Driver
Banking	↓ Idiosyncratic risk, ↓ insolvency risk	Governance (audit quality, transparency)
Energy	↓ Systematic risk	Environmental (climate disclosure, safety)
Consumer Goods	↓ Reputational risk	Social (labor practices, diversity)
Pharma	↓ Regulatory and legal risk	Governance and environmental compliance

Table. 3: ESG and Firm Risk

Study	Region	Risk Type	Effect Size / Insight	Moderators / Highlights
Singhania and Gupta (2024)	Global	Total, Systematic, Idiosyncratic Risk	r = -0.19, -0.14, -0.21 ($p < 0.01$)	Stronger in large firms, female board members
Alareeni and Hamdan (2024)	MENA	Market Risk (Beta), Cost of Equity	↓ Market beta (Δ = -0.08), ↓ cost of equity (1.2%)	Legal strength moderates ESG effect
Husted and Sousa-Filho (2023)	Latin America	Agency/Reporting Risk	r = -0.22; 36% ↓ in misstatements with high governance ESG	Board independence, audit quality
OECD (2023)	Global	Credit Risk Stability	30% more likely to retain credit rating in crises	Third-party ESG assurance critical
Friede *et al.* (2015)	Global	All Risk Types	~90% of studies show non-negative or positive ESG-risk link	Broad cross-industry support

Table. 4: Key Environmental Performance Metrics and ESG Integration

Metric	Top ESG Performers	Bottom ESG Performers
GHG Emission Intensity	↓ 30–40% CO_2/Revenue	High emissions per revenue unit
Green Capital Expenditure	8.7% of Revenue	3.4% of Revenue
Climate Target Achievement	>70% Achieve SBTs	<35% Achieve SBTs
Circular Economy Integration	Full or partial implementation	Limited or no integration

Table. 5: Key Environmental Performance Metrics and ESG Integration

Study	Scope / Region	Focus	Key Findings	Environmental Outcomes
Khan and Gupta (2024)	Asia, EU, US	Green Accounting	r = 0.28 (↑ to 0.34 with environmental cost disclosure)	↑ Green investment; 22% more eco-innovation
CDP (2022)	9,500 firms, 90 countries	Climate Disclosure	10% ↓ GHG emissions/year; 13.5% ↓ with board-level ESG	Strong emissions reductions, SBT alignment
MSCI ESG Research (2023)	7,800+ global firms	Emissions Intensity, CapEx	30–40% ↓ carbon intensity; 8.7% vs 3.4% green capex in top vs bottom ESG	↑ Green investment, lower emissions
Zhou *et al*. (2023)	Europe and Asia	Circular Economy	↓ Resource use by 18%, ↓ waste by 25%, ↑ brand value by 14%	Waste reduction, customer loyalty, ESG branding

ABSTRACT

Artificial intelligence technology is transforming nursing education through personalized learning tools, administrative efficiency, and improved clinical training using intelligent tutoring systems, virtual simulations, and adaptive platforms. While these innovations offer significant potential to enhance knowledge acquisition and skill development for both students and faculty, widespread adoption faces barriers including educators limited Artificial intelligence technology knowledge, hesitant attitudes, and lack of hands-on experience. This study assesses how a video-assisted teaching program can strengthen nursing faculty's Artificial intelligence technology competencies by measuring pre- and post-intervention changes in three key areas: understanding of Artificial intelligence technology concepts, attitudes toward technology integration, and practical utilization of Artificial intelligence technology tools. The research yields critical insights about structured training's role in overcoming adoption challenges, ultimately providing evidence-based strategies to help educators effectively implement Artificial intelligence solutions that can enhance teaching quality and improve student outcomes in nursing education programs. A Quasi-experimental study was undertaken in Kheda-Anand district on 60 nursing faculty to assess the effectiveness of video assisted teaching programme on knowledge, attitude, and utilization

regarding artificial intelligence technology in nursing education. Participants were chosen using convenience sampling from Nursing colleges of Kheda-Anand district. To assess the knowledge, attitude, and utilization regarding Artificial intelligence technology in nursing education, data were collected using a structured knowledge questionnaire, Likert attitude scale and a utilization checklist. Data were gathered between January-April 2025, with ethics clearance and informed consent. Descriptive statistics (frequency, percentage, mean, and standard deviation) and inferential statistics (paired t-test, chi-square, correlation) were used in the analysis. The study demonstrated that a video-assisted teaching program significantly enhanced the artificial intelligence technology competency of nursing faculty. with adequate knowledge increased from 18.33% to 66.7%, while unfavourable attitudes decreased from 5% to 0%. Utilization improved, with inadequate use declining from 65% to 50%. Mean scores for knowledge (6.0 to 8.0), attitude (33.6 to 35.6) and utilization (2.2 to 2.8). A strong correlation between knowledge and attitude (0.9551) suggested that better knowledge can positively influence attitude. Only age and prior sources of Artificial intelligence technology information significantly impacted knowledge ($p<0.05$); other demographic factors showed no effect. The intervention successfully bridged gaps in Artificial intelligence technology knowledge, attitudes, and application, proving effective for faculty development in Artificial intelligence-enabled nursing education. The study highlights the effectiveness of video assisted teaching programme significantly enhanced nursing faculty's attitudes and knowledge toward Artificial intelligence, with moderate gains in utilization. Targeted teaching programs can improve Artificial intelligence adoption, but institutional support, such as better access to Artificial intelligence tools, is essential. The strong attitude-knowledge correlation reinforces the need for integrated teaching programs. Future studies should explore long-term impacts and strategies to overcome implementation barriers in resource-limited settings.

Keywords: Artificial Intelligence, Nursing Education, Video-AssistedTeaching, Knowledge, Attitude, Utilization

INTRODUCTION

Artificial Intelligence (AI) is a transformative field within computer science that aims to develop systems capable of performing tasks traditionally requiring human intelligence. Coined by John McCarthy in 1956, Artificial intelligence has evolved into a multidisciplinary domain encompassing machine learning, natural language processing, robotics, and predictive analytics[1]. In nursing education, AI-driven tools—such as intelligent tutoring systems, adaptive learning platforms, and virtual simulations—offer personalized learning experiences, streamline administrative tasks, and enhance student engagement[2]. These technologies bridge the gap between theoretical knowledge and clinical practice, fostering critical thinking and decision-making skills in a controlled environment[3]. Beyond improving learning outcomes, Artificial intelligence technology enhances efficiency by automating repetitive tasks like grading, attendance tracking, and scheduling, allowing educators to focus on mentoring[3]. Financially, Artificial intelligence technology optimizes institutional operations, reducing costs while maintaining quality. One of its most significant advantages is personalized learning, where Artificial intelligence tailors' educational content to individual students' needs, boosting engagement and academic performance[4]. Additionally, Artificial intelligence t provides data-driven insights, analysing student performance to identify learning gaps and recommend targeted interventions[5]. Gamification and interactive Artificial intelligence tools further enrich the learning experience, making education more dynamic and motivating[5]. Recent advancements in generative Artificial intelligence technology, such as ChatGPT, have expanded Artificial intelligence's role beyond predictive analytics to content creation—generating text, images, videos, and even code[7]. Artificial intelligence technology While is widely viewed as a supportive tool rather than a replacement for educators, its effective integration requires faculty training in

technology and data science[6]. Artificial intelligence technology assists in lesson planning, material creation, and administrative tasks, allowing teachers to dedicate more time to student interaction[8]. However, Artificial intelligence technology adoption in education presents challenges. Data privacy and security are major concerns, as Artificial intelligence technologysystems rely on sensitive student information, risking breaches and misuse[8]. Algorithmic bias is another issue; if AI models are trained on biased data, they may perpetuate inequalities in grading and resource allocation[8]. Over-reliance on Artificial intelligence technology could also diminish essential human interactions, impacting students' social and emotional development[8]. Cost and accessibility further complicate Artificial intelligence technology integration, as expensive technologies may widen the digital divide, leaving underfunded institutions and low-income students at a disadvantage[8]. Additionally, faculty resistance—stemming from job security fears or lack of training—must be addressed through structured professional development programs[8].

OBJECTIVES

1. To assess the pre-test and post-test Knowledge regarding artificial intelligence technology in nursing education among nursing faculty in Kheda-Anand district.
2. To assess the pre-test and post-test attitude regarding artificial intelligence technology in nursing education among nursing faculty in Kheda- Anand district.
3. To assess the pre-test and post-test utilization regarding artificial intelligence technology in nursing education among nursing faculty in Kheda- Anand district.
4. To evaluate effectiveness of knowledge, attitude, and utilization regarding artificial intelligence technology in nursing education among nursing faculty in Kheda -Anand district.
5. To identify association of post-test Knowledge and attitude regarding artificial intelligence technology in nursing education among nursing faculty in Kheda-Ananad district.
6. To corelate the post-test knowledge and attitude regarding artificial intelligence technology in nursing education among nursing faculty in Kheda-Anand district.

HYPOTHESIS

H1: There will be a significant mean difference in knowledge, attitude and utilization between pre-test and post-test score regarding artificial intelligence in nursing education among nursing faculty at the 0.05 level of significance.

H2: There will be significant correlation between knowledge and attitude of nursing faculty regarding artificial intelligence technology in nursing education at the 0.0.5 level of significance.

H3: There will be a significant association between knowledge and attitude of nursing faculty regarding artificial intelligence technology in nursing education with their selected demographic variables at the 0.05 level of significance.

RESEARCH METHODOLOGY

Study design and setting

The study adopted a quantitative research approach with a quasi-experimental design (one group pre-test post-test) to assess the effectiveness of video assisted teaching programme on knowledge, attitude, and utilization regarding Artificial intelligence Technology in education among nursing faculty At Kheda- Anand district. The present study had been conducted among 60 nursing faculties from selected colleges of Kheda Anand district.

Eligibility criteria

The nursing faculties from selected colleges of Kheda – Anand district are agreed to participate in the study with the legal consent taken who were interested to participate. The nursing faculties other than these district and absent at the time of study were not eligible to be a part of the study.

Sample size

The sample size was calculated by using G power software where the initial estimated sample size was 54, and then an additional 10% was added to account for potential dropouts or incomplete data, resulting in a final sample size of 60.So, the calculated formula was 54+(10% of 54) =54+5.4=59.4and the final sample size became 60.

Sampling frame

Prior permission was obtained from the concerned authorities of selected nursing colleges of Kheda – Anand district. The investigator prepared a master data collection schedule to systematically organize the research process. Data collection was conducted to ensure structured and timely completion of the study.

Sampling technique

A convenience sampling technique was used to select 60 nursing colleges from selected colleges of Kheda-Anand district. The data collection employed demographic variables such as age, gender, educational qualification, previous source of information regarding artificial intelligence, area of currently live, training regarding Artificial intelligence technology, type of gadgets used to access powered tool, any subscription based Artificial intelligence tool available in campus, facilities available in campus to access Artificial intelligence,10 structured knowledge questionnaires, 10 point Likert attitude scale regarding AI technology, an utilization checklist to evaluate knowledge regarding Artificial intelligence technology consists of 10 questions. The instrument was developed through expert consultations and validated by 9 nursing professionals to ensure content accuracy.

Selection criteria

Inclusion criteria

- The nursing faculty who are available at the time of data collection
- Nursing faculty who are willingly participate in research study
- Nursing faculty in college from Kheda Anand district

Exclusion criteria

- Other than nursing faculty.
- Nursing faculty who are absent at the time of study.
- Nursing faculty who are not willingly participate.
- Nursing college except Kheda -Anand district.

Description of Tool

The tool consists of following 3 sections

PART-I: Demographic data collection of the nursing faculty.

PART-II: Assessment of knowledge using structured knowledge questionnaire in context to have a knowledge regarding artificial intelligence technology in education.

PART-III: Assessment of attitude by using Likert attitude scale in the context to have an attitude regarding ai technology in education.

PART-IV: Assessment of utilization by using checklist in context to have a utilization regarding AI technology in education

Data Collection Procedure

To ensure research competency, the investigator completed comprehensive training in artificial intelligence applications in nursing education from Federal organization for nursing services collaboration with Vedant nursing college, Gujarat objective skills assessment, the study employed standardized Artificial intelligence evaluation tools to measure participants' knowledge, attitudes, and practical application, enabling precise assessment of Artificial intelligence concept understanding, tool utilization, and educational integration according to established Artificial intelligence education protocols. Formal permissions were obtained from the concerned authorities of selected nursing colleges in Kheda-Anand district. The investigator prepared a master data collection schedule to

systematically organize the research process, which was conducted from January-April 2025. Prior informed consent was obtained from all eligible participants. The tool was administered including demographic data such as age, gender, educational qualification, prior Artificial intelligence training, gadgets used for access Artificial intelligence technology, subscription-based Artificial intelligence tools available, and campus facilities for Artificial intelligence utilization. A 10-item structured knowledge questionnaire was designed to assess theoretical and applied understanding of Artificial intelligence technology concepts in education. Artificial intelligence technology proficiency was measured through a practical utilization checklist. The study was conducted in two-phase to evaluate nursing faculty's artificial intelligence competency. In Phase I, the investigator assessed participants' baseline knowledge and practical Artificial intelligence technology utilization through pre-tests prior to the awareness intervention. Following this evaluation, a video assisted Artificial intelligence technology teaching program was implemented as the experimental intervention. After a 1-week interval, Phase II commenced, wherein post-test assessments were conducted to measure knowledge retention and attitude changes. Practical Artificial intelligence technology application was objectively evaluated using the utilization checklist, with the investigator systematically assessing each faculty member's performance to ensure standardized measurement of competency improvement.

RESULTS

Frequency and percentage distribution of selected demographic variables (N = 60) (Table 1). The study revealed that over a quarter of participants (27.3%) were aged 21–27 years, with the majority (73.33%) being female. Most held a basic B.Sc. in nursing (50%) and relied heavily on the internet (88.33%) as their primary source of information. A significant proportion resided in urban areas (76.7%), and nearly all (93.33%) reported having no prior training in AI. When accessing AI tools, smartphones were the most used device (40%), despite the absence of subscription-based AI tools on any of the campuses surveyed (91.7%). However, free Wi-Fi was widely available (71.6%), serving as the primary facility for AI access in educational institutions. Frequency and percentage distribution of level of knowledge regarding artificial intelligence technology in education among nursing faculty (Table 2). This table shows that a significant improvement in knowledge level among participants. initially20% participants had inadequate knowledge, 61.7% participants had moderately adequate knowledge and 18.33% participants had adequate knowledge. After the intervention, proportion of participants with adequate knowledge increased substantially to 66.7%. This indicates a notable enhancement in knowledge level following the interventions. Frequency and percentage distribution of level of attitude regarding artificial intelligence technology in education among nursing faculty (Table 3). The table compares respondents' attitudes before and after an intervention. Initially, 5% held an unfavourable attitude, 71.7% had moderately favourable attitude, meanwhile, those with a favourable attitude increased from 23.3% to 30% after the intervention. These findings suggest a positive shift in attitudes, with the complete elimination of unfavourable views and a modest increase in favourable perspectives. Frequency and percentage distribution of level of utilization regarding artificial intelligence technology in education among nursing faculty (Table 4). The table compares the level of utilization before and after an intervention. In the pre-test, 65% of respondents reported inadequate utilization, while 20% fell under moderately adequate and 15% had adequate utilization (above 75%). Post-intervention results showed improvement, with inadequate utilization decreasing to 50%. Meanwhile, moderately adequate utilization increased to 31.7%, and adequate utilization saw a slight rise to 18.33%. These findings suggest that the intervention had a positive impact, reducing inadequate utilization while increasing moderately adequate and adequate levels. Range, mean and standard deviation of level of knowledge, attitude and utilization regarding artificial intelligence technology in education among nursing faculty (Table 5). The results indicate significant improvements across all measured variables following the intervention. Knowledge scores increased from 6.0 ± 1.6 (range: 2-9) to 8.0 ± 1.4 (range: 4-10), reflecting both higher achievement and greater consistency among participants. Attitude scores improved from 33.6 ± 4.8 (range: 21-41) to 35.6 ± 3.7 (range: 26-41), indicating more positive and less variable responses. Utilization scores exhibited modest growth, rising from 2.2 ± 1.8 to 2.8 ± 1.5 (both with a range of 0-6), indicating some improvement in implementation despite ongoing variability. The reduced standard deviations in all post-test measures imply that the intervention contributed to more uniform

outcomes across participant. "Paired t-test Analysis of Knowledge, Attitude, and Utilization: Scores, Enhancements, and Significance" (Table 6). The results of the Paired t-test presented in mean differences in knowledge, attitude, and utilization before and after an intervention. For knowledge, the mean improvement was 2, with a standard deviation (SD) of 0.2, and the paired t-test yielded a p-value of 0.00 suggests this improvement statistically significant. In terms of attitude, the mean enhancement was 2, with an SD of 1.1, and the p-value was 0.028, indicating statistical significance. For utilization, the mean increase was 0.6, with an SD of 1, and the p-value was 0.059, suggesting a marginal but non-significant effect. These findings indicate that the intervention significantly improved attitudes and knowledge, while the effects on utilization were less conclusive. Association between knowledge score with their selected demographic variable. (Chi-Square Test) n=60 (Table 7). The analysis revealed that age, previous source of information about artificial intelligence technology had statistically significant relationships with knowledge levels, with internet users demonstrating better understanding. However, no significant associations were found for other demographic factors, including gender, education, training on artificial intelligence technology, or campus facilities ($p > 0.05$ for all). These findings suggest that while certain variables like age and prior exposure to artificial intelligence technology information influence knowledge, gaps persist across all demographics. Association between attitude score with their selected demographic variable. (Chi-Square Test) n=60 (Table: 8). The statistical analysis reveals that most demographic factors—including age, gender, education level, prior AI training, and access to devices—show no significant association with attitude levels of artificial intelligence technology in education ($p > 0.05$ for all). Correlation between posttest knowledge and attitude regarding artificial intelligence technology in education (Table 9). The post-test results revealed notable statistics for the variables of Knowledge and attitude. The mean score for Knowledge was 6.0, with a standard deviation (SD) of 1.6, indicating relatively consistent performance among participants. For attitude, the mean was 33.6, with a SD of 4.8, suggesting even less variability in responses. A strong positive correlation (0.9378) was observed between Knowledge and Practice, implying that higher knowledge scores were closely associated with better practice scores. This high correlation highlights a significant relationship between the two variables, suggesting that improvements in knowledge may correspond with enhanced practical application.

CONCLUSION

The study assessed the effectiveness of an AI video assisted teaching programme on knowledge, attitude, and utilization regarding artificial intelligence technology in education among 60 nursing faculty of Kheda-Anand district, reveling significant improvement in certain areas. The majority of participants were female (73.33%), aged 21–27 years (27.3%), and held a basic B.Sc. in nursing (51.7%). Most relied on the internet (88.33%) as their primary AI information source, yet nearly all (93.33%) had no prior AI training. Smartphones were the most common device for AI access (40%), despite no subscription-based AI tools being available on campuses (100%). However, free Wi-Fi was widely accessible (71.6%), facilitating artificial intelligence technology use in educational settings. The intervention led to substantial improvements in knowledge, attitudes, and utilization of artificial intelligence technology among nursing faculty. Only 18.33% of participants demonstrated adequate knowledge, which increased significantly to 66.7% post-intervention. Similarly, favorable attitudes improved from 23.3% to 30%, while unfavorable attitudes were eliminated (from 5% to 0%). Utilization levels also saw positive changes, with inadequate utilization decreasing from 65% to 50%, and moderately adequate utilization increasing from 20% to 31.7%.Statistical analysis confirmed these improvements, mean scores increasing fromfor knowledge (6.0 to 8.0), increasing attitude score from (33.6 to 35.6) and utilization score from (2.2 to 2.8).The paired t-tests further validated these enhancements, showing significant gains (33% in knowledge, 4% in attitude and 9.7 in utilization).A strong correlation between knowledge and attitude (0.9551) suggested that better knowledge can positively influence attitude.Demographic analysis indicated that age and prior internet-based exposure to artificial intelligence technology were significantly associated with knowledge levels, whereas gender, education, prior artificial intelligence technology training, and access to devices had no significant influence on attitudes ($p > 0.05$). These findings suggest that while the intervention successfully enhanced participants' understanding and perceptions of

artificial intelligence technology, further efforts may be needed to strengthen knowledge retention and practical utilization

CONFLICT OF INTEREST

The author had declared that there was no conflict of interest.

SOURCES OF FUNDING

Self-funded.

ETHICAL PERMISSION

This research study received approval from the Institutional Ethical Committee of Dinsha Patel College of Nursing, Nadiad. The committee comprised 11 members with diverse expertise. The study was assigned the ethical approval reference number MAM Uni/IECHR/2024/61Additionally, formal written permission was obtained from the authority.

STATEMENT OF INFORMED CONSENT

The informed consent form was taken from the nursing faculty prior to the data collection of the study.

ABSTRACT

Biomimetically synthesized hydroxyapatite (HAP) nanopowders were prepared using calcium nitrate tetrahydrate and diammonium hydrogen phosphate with the assistance of non-ionic surfactants Brij 35, urea assisted brij 35 via ultrasound method in SBF solution. Tris hydroxyl methyl amino methane(TRIS) are used as a buffer, Urea and Brij 35 as an additive dissolved in 1.5 concentrated simulated body fluid (SBF) at 37 °C and pH of 7.4 for 15 days synthesised through sonochemical method. These methods offers an effective route to achieve smaller particle size with nano-sized crystallinity after calcination. The non-ionic surfactants are chosen due to its environmental friendly than ionic surfactants. The particle size, morphology, and structure of the obtained HAP particles were characterised by Fourier Transform Infrared spectroscopy (FT-IR), X-ray diffraction (XRD) and Scanning Electron Microscopy (SEM). The as synthesised powder is to be tested further for its biocompatibility using MG-63 cell line. The results have indicated that, the well crystallinity and the particle size was controlled by less agglomeration with the use of non-ionic surfactants. The grain size of the as synthesised HAP powder was calculated by Scherrer's formula. The as synthesised powder is to be tested further for its biocompatibility.

Keywords: Sonochemical, Biomimetic, Brij 35, Urea, Hydroxyapatite

INTRODUCTION

Hydroxyapatite ($Ca_{10}(PO_4)_6(OH)_2$, HAP),is the most stable form of calcium phosphate and major mineral constituent of bones and teeth due to its virtuous biocompatibility biodegradability, good biological activity and osteoconductive properties[1-3]. It has been expansively examined to adapt orthopaedic implants for enhanced biological properties and corrosion resistance. It is a perfect bone substituent and can be used as a filling material for bone damage[4-5]. The breakthrough research of tissue engineering and biomaterials cannot be done without nano-hydroxyapatite. At present, the nanometre sized HAP has been used in various fields[6-8]. The most far and wide recognized techniques employed in order to yield synthetic nano-hydroxyapatite (nHAP) includes, hydrothermal, sonochemical, wet chemical, hydrolysis, sol-gel, emulsion, mechanochemical, combustion, flash pyrolysis process, biomimetic precipitation etc., Unfortunately, subsequent heat treatment at high temperature results in cracking and poor bond strength between metal substrate and HA coating. However, elevated processing conditions such as higher pH (alkaline medium), temperature, time and microwave irradiation, have been reported to produce nano HAP with properties deviating from biological apatite[9-12]. To overcome these limitations, much attention has been focused on a biomimetic approach to synthesise bone-like apatite. This method involves the use of metastable simulated body fluid (SBF) with an inorganic salt composition which facilitates the spontaneous nucleation and growth of nHAP at physiological pH (7.4) and body temperature (37°C)[13]. Nevertheless, it is possible to produce nHAp with properties deviating from biologic apatite at ambient temperature, alkaline pH, and ultrasonication conditions[14-16]. Recently, biomimetic route has captivated substantial consideration because of lead to the fabrication of novel materials that cannot be produced by conservative methods.

SBF solution comprising of calcium and phosphate ions already saturated with respect to the apatite, any indiscretion in the preparation lead to precipitation of Ca^{2+} and PO_4^{3-} ions will drastically affect the phase purity and high temperature stability of the produced HAP powders. Hence, it is essential to take utmost care in the preparation of SBF without the formation of such precipitation. Complete precaution to avoid variance in both preparation steps and the storage temperatures has to be maintained. Surfactant molecules are highly reactive in the interface amongst air and water or oil and water. Both the polar and non-polar molecules can interact with each other and increases the solubility of the insoluble substance. Many of the surfactants acts as an antifoaming, biocide, corrosion inhibitor and emulsion breaker. Nonionic surfactant exhibit excellent solvency, low foaming properties and chemical stability. Hydrophilic groups involved in nonionic surfactant are of nondissociable type so it did not ionises in water or aqueous solution, example C_2H_5OH, phenol, ether, ester, or amide. Polyoxyethylene lauryl ether (brij 35) contains a hydrophobic alkyl tail and hydrophilic polyoxyethylene domain. The hydrophilic groups present in brij surfactants are nonionic, its stabilising power of micelles are not been affected by pH of an aqueous solution. It acts as an appropriate candidate for forming HAP powder with abundant application potential for the separation and purification of many biological materials. It is produced by the reaction between active hydrogen-containing compound and ethylene oxide. Some of the frequently used active hydrogen containing compound in industry are, fatty alcohol, alkyl phenol, fatty acids, fatty amines, fatty amides, polyhydric alcohols, fatty acid esters, oil lipids, sorbitol and so on. Polyoxyethylene lauryl ethers were the effective enhancers for rectal insulin absorption. Phase separation ability was very high for POELE than any other surfactants. These nonionic can be made ionic by adding polyethylene glycol chain, which can be obtained by the polycondensation of ethylene oxide.

They are called polyethoxylated nonionics. In earlier period, glucoside (sugar based) head groups, have been introduced in the market, because of their low toxicity. The lipophilic group concerned is often an alkyl or alkyl benzene type, the former coming from fatty acids of natural origin. The polycondensation of propylene oxide produce a polyether which (in opposition to polyethylene oxide) is slightly hydrophobic. e.g. Polymeric surfactants. Sonochemical method has been predicted as an hopeful approach for the preparation of materials with novel morphologies and properties, owing to its features of intense local heating, high pressures, and very rapid cooling rates[17-18]. The main advantages of using ultrasonic irradiation through the manufacture of fragile particle slurries are: (1) increased reaction speed, (2) decreased processing time, and (3) an overall improvement in the efficient use of

energy[19]. Urea ($(NH_2)_2CO$) as homogeneous precipitation reagent. Urea controls the growth of hydroxyapatite at low temperature. When urea is hydrolysed in water it gives off hydroxyl ions (OH^-), carbondioxide, and ammonia. The progressive hydrolysis of urea makes the solution alkaline and induces homogeneous nucleation, and hydroxide precipitation. During the ultrasound process, the urea is readily hydrolysed and its hydrolysis is also accompanied by the formation of gas molecules and an increase in pressure in the system which is expected to perturb nanocrystalline growth and thereby results in morphological changes. Urea could not only serve as the substrate for HAP crystals, it might also serve as the structure directing agent and control the growth of HAP crystals. The HAP crystals are bounds to urea substrates, and the interaction between N-H groups of urea with OH groups of HAP nanoparticles. The performance of the as-prepared urea with brij 35/HA nanocomposites was studied to evaluate the biological response of the nanocomposites following immersion in 1.5 concentrated simulated body fluid (SBF), and the nanocomposites exhibit high ability to induce the formation of apatite. Thus, the as-prepared urea with brij 35 /HA nanocomposites are promising for various biomedical applications such as tissue engineering and protein/drug delivery. Hydroxyapatite was easily formed under the addition of urea with increased pH of the reaction solution. Ultrasound irradiation process is an efficient means for grinding, dispersing and de-agglomerating the sample particles. In the present study, the preparation of nano-hydroxyapatite by microwave method and ultrasonic method using non-ionic surfactant (Brij 35) in SBF as a solvent. The template assisted hydroxyapatite powder was well crystallinity with control the particle size and uniform flower morphology was achieved through this method and these powders could be successfully employed for biomedical applications. In this study, the impact of urea through Brij 35 in modifying the surface is also examined.

Experimental Method

Chemicals and Reagents

Sodium chloride (99.9%), Potassium chloride, (99.8%) Calcium chloride, (98%), Sodium sulphate, (99.5%), Hydrochloric acid, (35.4%), Magnesium chloride, (98%) and Sodium hydrogen phosphate, were purchased from Merck. Sodium hydrogen carbonate, (99.7%) was obtained from Merck, and Tris (hydroxy methyl) amino methane[TRIS] (99.9%) was purchased from Sigma Aldrich, USA. Calcium nitrate tetrahydrate were purchased from Merck and Diammonium hydrogen phosphate were purchased from Sigma Aldrich, Ammonia, Brij 35 and Urea which were purchased from merck.

Preparation of Simulated Body Fluid solution

The SBF solution was prepared according to Kokubo's receipe[20]. The chemical reagents used in the preparation of SBF solution are; Sodium Chloride (NaCl), Sodium Hydrogen Carbonate ($NaHCO_3$), Potassium Chloride (KCl), Potassium Hydrogen Phosphate trihydrate ($K_2HPO_4{\cdot}3H_2O$), Magnesium Chloride Hexahydrate ($MgCl_2{\cdot}6H_2O$), calcium chloride ($CaCl_2$) and sodium sulfate (Na_2SO_4), Tris (hydroxymethyl) aminomethane [$(CH_2OH)_3CNH_2$)] (99.9%) . Reagents needed for SBF preparation (Table.1).

SBF Preparation

In this work, 1.5 times concentrated SBF solution was utilised to reduce incubation time for nucleation growth. In 1000 ml beaker, 750 ml of water is taken and the temperature was maintained at 37℃ with continuous stirring. The above reagents mentioned in the table 1 are weighed in a weighing bottle and were added in the same order given in the table after the complete dissolution of the previous chemical. The digital pH metre was calibrated. After the addition of ($(HOCH_2)_3CNH_2$), the temperature of the solution was accurately maintained at 37 ˚C and the pH was attuned to 7.4 by adding TRIS and HCl into the mixture. After the pH adjustment, the solution was make up into 1000 ml. The volume of the solution was made up only after the temperature of the solution dropped to 20˚C. Lack of any precipitate indicates the formation of stable solution. Otherwise, if any suspension formed in SBF solution, it will be discarded immediately, and a fresh solution must be prepared. The as prepared solution was put in storage in a polyethylene bottle maintained at 3-5˚C in a refrigerator.

Synthesis of Hydroxyapatite powder

Hydroxyapatite nanoparticles were prepared according to the following procedure: 0.5M of calcium nitrate tetrahydrate and 0.3M of diammonium hydrogen phosphate were dissolved in 20 ml of the prepared SBF solution. To obtain HAP slurry, phosphate solution is added drop wise into calcium solution with continuous stirring. The pH was kept at 10 using aqueous ammonia solution. The resulting white suspension was continuously stirred until a clear suspension without any visible solids. After stirring, the suspension was irradiated by ultrasound to get high dispersion of the reaction mixture for 40 minutes. The resulting suspension was kept 24 hours of aging to remove the impurities. The precipitate was collected and washed several times with ethanol and water by centrifugation followed by drying 100℃ for 4 hours in an oven to attain a fine powder. The obtained powder was calcined and sintered to achieve pure HAP powder. The synthesis was repeated using 0.1M of brij 35and Urea-brij 35.

Synthesis of Urea-HAP nano hybrid reinforced with Brij 35

Solid urea (0.1M), (Ca $(NO_3)_2 \cdot 4H_2O$) of 0.5M was dissolved in 20 ml of SBF solution and $(NH_4)_2HPO_4$ (0.3M), Brij 35(0.1M) was also dissolved in 20 ml of SBF solution separately. Each suspension was allowed to mix together in a dropwise manner and stirred for an hour, pH is maintained at 10.5. The resulting HA nanoparticle was irradiated with an ultrasound for 40 minutes at 65℃ and aged for 24 hours. The obtained dispersion was aged for 1day then washed with ethanol and dried in an oven at 70℃. The resulting powder is calcined for 4 hours continuously in a muffle furnace under 650 ℃.

RESULTS AND DISCUSSION

FTIR Results

The most prominent sharp and intense absorption band at 1095 cm^{-1}represents the υ_3 (PO) antisymmetrical stretching modes. The characteristic band at 958 cm^{-1} in the spectrum is assigned to υ_1 (PO) symmetrical stretching. The band for PO_4^{3-} appeared at 455 cm^{-1} indicates υ_2 (O-P-O) bending modes. The band at 607 cm^{-1} are due to presence of υ_4 mode [(O-P-O) bending mode] of phosphate group. The sharp peaks at 3590 cm^{-1} and 629 cm^{-1} correspond to the stretching vibrations of the –OH bands in the apatite. The broad adsorption band at 3446 cm^{-1} (H_2O) were attributed to adsorbed water in all the samples. When comparing in fig 1(a) and (b) there is a noticeable peak broadening had occurred in the range of 3490 cm^{-1} in urea modified HAP nanoparticles (Fig 1). This suggests significant hydrogen bonding between N–H groups of urea with O–H groups of HA nanoparticles. No impurity peaks are obtained except HAP peaks. Hence from the FTIR results it could be evidenced that the result obtained is a pure HAP powders. The peak details are mentioned in table 2.

Phase analysis

The XRD results for HAP with tween 20, Brij 35 and urea with brij 35 assisted HAP powders and their corresponding nanocomposites are shown in Fig.2a, 2b and 2c. The XRD pattern (Fig 2a) of HA nanoparticles is in good accordance with that reported in the diffraction file for HA in the ICDD (PDF No.09-0432). The XRD pattern of the urea modified HAP nanoparticles (Fig 2b) indicates the presence of peaks due to HA nanoparticles. In addition, a peak recognized to urea was observed (denoted as in Fig 2b). Determination of this peak even after thorough washing of the nanosystem, indicated strong interaction between urea and HAP nanohybrids. The average crystallite size was calculated using scherrer formula.

$D = K\lambda/\beta\cos\theta$

Where,

D=crystallite size

λ= wavelength of Cu Kα radiation

K=shape factor (K=0.9)

β= full width half maximum

θ=Bragg's diffraction angle

The grain size for hydroxyapatite powder is (25.3 nm), brij 35 assisted hydroxyapatite were found to be (24.1 nm) and for urea with brij 35 assisted hydroxyapatite powder (22.8 nm). It has been concluded that, the crystalline size gets decreased when reinforcing hydroxyapatite powder with additives(urea and brij 35). Hence the disruption and growth of HAP nano particle was increased in presence of urea and brij 35 when compared with HAP powder with other surfactants.

Scanning electron microscopic studies

The surface morphologies of pure HAP and various additives (urea and brij 35) immersed for 1 days were investigated by SEM. To screen the influence of brij 35 and urea on the morphology of HAP particles, the synthesis process was conducted in the presence of urea, was employed to characterise the morphology of the resultants. SEM images of HA nanoparticles (Fig 3 a), exhibits small particle distribution morphology, ranging of about 200 nm. Significantly, urea with brij 35 modification HA nanoparticles were seen as solid agglomerates of about 200 nm with a typical spherical like morphology, homogeneous with uniform distribution of components (Fig 3 c). Fig 3b shows irregular spherical agglomerates. The morphology of the HAP nanohybrids are remarkably changed for each nanosized samples. The Urea domains was found to be crystallized in the nanocomposite structure which supports the hypothesis that urea acted as a host matrix for the HAP nanoparticles.

***Invitro* cytocompatibility test**

The biological responses shown in Fig 4 for the synthesised HAP materials are tested using fibroblast cell line (MG-63) were investigated[21]. MG-63 the human osteoblast cell line cultures, possess identical physiology as human osteoblast cells were used in *invitro* biocompatibility study to evaluate the HAP composite material[22]. The percentage of cell viability against various concentrations (1000, 500, 250, 125, 62.5, 31.2, 15.6, 7.8 μg/mL) of HAP composite is shown in table 3. The assay clearly shows excellent biocompatibility (~80%) of Urea-HAP against MG-63 human osteoblast-like cells, regardless of the highest concentration of 1000μg/mL. The MTT experiment therefore demonstrates the produced nanocomposite's high compatibility for orthopedic applications. Cell viability (%)(Fig.5).

CONCLUSION

In summary, the results reveal that the role played by urea and brij 35 regarding agglomeration of HAP nanoparticles, demonstrating that it is possible to tailor a nanocomposite by finely dispersing hydroxyapatite. Nano-sized and chemically homogeneous calcium hydroxyapatite powders have been successfully synthesised from 1.5 concentrated simulated body fluid solution, at the physiological conditions of pH 7.4 at 37℃, containing urea and brij 35 by ultrasound technique. However by directly using urea as structure directing agent the spherical shaped morphology could be obtained. These results could be used to explore the phase and morphology dependent properties of hydroxyapatite. This biomimetic nanocomposite can be considered as a promising new kind of biomaterial for biomedical applications.

ABSTRACT

Quality of work life has attracted an ever - increasing interest over the past two decades not only in the areas of health, rehabilitation, disabilities and social services but also in medicine and education. In the hospital sector, doctors and nurses are the most important personnel and they are fully involved in patient care. It is usually viewed as actual working conditions, including employee compensation, facilities, health and safety issues, participation in decision-making, management approach, workplace diversity and flexibility, etc. Descriptive research design was adopted. The researcher used Stratified Random sampling method for selecting 130 respondents. The data collected through the questionnaire were carefully analyzed and processed by using statistical techniques. The results are then discussed for various suggestions.

Keywords: Quality of work life, organization, Work environment

INTRODUCTION

Quality of work life is quality of relationship between employees and total working environment. A healthy organization will always depend upon quality of working for both the employees and organization. The organization should provide employee needs or expectation which they need at workplace. A high Quality of work life is on the better working environment which in turn results in efficiency and effectiveness of the organization. A low Quality

of the work life is based on the inferior working environment which in turn reduces the efficiency and effectiveness of the organization.

Padma Priya (2023): The primary goal is to create jobs and working environments that are great for both the organization's financial health and its workforce. This study set out to investigate how employees felt about their work environment and quality of life in terms of stress, employee perception, relationships with coworkers, workload, time constraints, and work-life balance, among other things. The following variables are included in the study's goal to improve work-life quality

Maksud A. Madraswale(2023): The productivity of their staff determines how much money software businesses can make. Establishing a pleasant working environment for employees is crucial for organisations to increase productivity. An organisation can increase productivity by keeping productive individuals engaged with their work by providing a pleasant Quality of Work Life (QWL).

OBJECTIVES OF THE STUDY

Primary Objective

To study factors affecting the quality of work life of employees in Private Hospital, Trichy

Secondary Objectives:

1. To Study about the work Environment and Interpersonal relationship
2. To Study about the satisfaction among employees in various Departments.
3. To Study about the Safety working condition and job flexibility
4. To suggest suitable measure to improve the quality of work life of employees

METHODOLOGY

Sampling Methods: Stratified Random sampling
Research design: Descriptive research design

Respondents Based on Gender Demographic Information Table 1.

This table shows that Majority (56.2 %) of the respondents belongs to the age group of 18 to 35.

Respondents Based on Education Qualification Table 2.

This table exhibits that majority (50.8%) of the respondents were completed the UG degree

Respondents based on the year of experience in demographic information Table 3.

This table shows that 48 respondents have between 3 to 5 years of experience, making up 36.9% of the total.

Respondents based on the stress level on management Table 4.

This table reveals that 57.7% of respondents report feeling stressed occasionally

Respondents based on feedback on work life balance Table 5.

This table shows that the majority of respondents, 63.8%, 'Strongly Agree' with the statement, indicating strong overall agreement, while a smaller proportion either disagreed or remained neutral

Chi square test between age and overall satisfaction in work life Balance Table 6.

Null Hypothesis (H0): There is no significant association between age and overall satisfaction in work life Balance.
Alternative Hypothesis (H1): There is a significant association between age and overall satisfaction in work life Balance. From the above table the significant value is 0.307, which is greater than 0.05 the H0 is accepted and H1 is

rejected. It is inferred that there is no significant association between age and overall satisfaction in work life in organization

Chi square test between working condition and high level of stress in job satisfaction Table 7.

Null Hypothesis (H0): There is no significant association between working condition high level of stress in job satisfaction

Alternative Hypothesis (H1): There is a significant association between working condition and high level of stress in job satisfaction

The table shows that the significant value is 0.570 which is more than 0.05. So H1 is rejected and H0 is accepted. There is a significant association between working condition and high level of stress in job satisfaction

Chi square test between years of experience and team work Table 8.

Null Hypothesis (H0): There is no significant association between years of experience and and team work.

Alternative Hypothesis (H1): There is a significant association between years of experience and team work.

This table shows the significant level is 0.000 which is less than 0.05. so the H1 is accepted and H0 is rejected. It is inferred that there is a significant association with years of experience and team work.

FINDINGS

- Majority (56.2 %) of the respondents belongs to the age group of 18 to 35
- Majority (50.8%) of the respondents were completed the UG degree
- There is a significant association between working condition and high level of stress in job satisfaction
- It is inferred that there is a significant association with years of experience and team work.
- there is no significant association between age and overall satisfaction in work life in organization

Suggestions

Improving the quality of work life (QWL) in hospitals is essential for enhancing employee satisfaction, retention, and patient care. Here are several suggestions to improve the quality of work life for healthcare professionals:

Improve Work-Life Balance

Flexible Scheduling: Allow staff to have more control over their work schedules, such as rotating shifts or part-time options, to better balance personal and professional responsibilities.

Time-Off Policies: Ensure adequate vacation days, sick leave, and mental health days. Encourage employees to take time off to avoid burnout.

Supportive Work Environment

Mental Health Support: Offer counseling services and wellness programs to help staff cope with stress and mental health challenges.

Employee Assistance Programs (EAP): Provide confidential support for personal issues, work-related stress, and crisis management.

Team Building Activities: Foster a collaborative and supportive team culture through regular team-building exercises and activities.

Employee Recognition and Engagement

Acknowledging Achievements: Regularly recognize and celebrate employees' hard work and accomplishments through awards, appreciation days, or shout-outs during meetings.

Employee Feedback: Conduct regular surveys and meetings to understand employee concerns and suggestions. Act on feedback to make necessary changes.

Professional Development

Continuing Education: Provide opportunities for staff to pursue further training, certifications, or degrees. Support attendance at conferences and workshops.

Mentorship Programs: Implement mentorship programs where senior staff guide and support newer employees in their professional development.

CONCLUSION

After conducting an intense study on quality of work life in Private Hospital, Trichy the following conclusions are derived. Organization should focus on the benefit that are aimed to words self improvement of the employees. Organization need to maintain the appropriate balance of work. Opportunity for career growth should improve. Benefits provided by the organization are very good to satisfy the employee personal needs. Teamwork in the organization is very good. Organization should focus on the training sessions in order to motivate the employees. Organization need to provide scope for the employee development. There is no discrimination at work place. The relationship with superior at workplace is good. On the whole the quality of work life good.

ABSTRACT

Laminarin is a β-glucan polysaccharide that comes from brown algae. It has gotten a lot of attention since it has several pharmacological properties, including anti-inflammatory, antioxidant, immunomodulatory, and anticancer activities. This review goes into great detail about the structure of laminarin and how it might be used to prevent and treat diseases. Preclinical and clinical studies suggest that laminarin has a number of biological effects, including changing inflammatory pathways, removing reactive oxygen species, controlling immune responses, and changing cellular signaling networks that are important for neuroprotection and cancer. Laminarin has also shown promise as an adjuvant in vaccine development and in treating immune-related disorders such autoimmune diseases and infections. Even though it has a lot of potential, problems including bioavailability, uniformity, and large-scale production make it hard to use in clinical settings. Further studies are needed to figure out how it works at the molecular level, improve how it is delivered, and test how well it works in human trials. This review highlights about recent progress, points out current problems, and suggests next steps to make laminarin a promising treatment for cancer, inflammation, oxidative stress, and immunology.

Keywords: β-Glucans, Laminarin, Marine-derived polysaccharides, Brown algae, Polysaccharides, and Pharmacological activity

INTRODUCTION

Brown algae, or Phaeophyceae, are a kind of marine macroalgae that can be found in coastal areas all over the world. The brown or olive-green color of these multicellular organisms comes from fucoxanthin, a pigment that hides the green color of chlorophyll [1]. Brown algae are very important to marine ecosystems because they are primary producers, build habitats, and contributing to carbon sequestration. At the same time, they provide a rich supply of nutrients that are very good for human health and well-being[2]. The high fiber level in the diet helps with digestion and gut health by encouraging the growth of good gut flora. The prebiotic effect is connected to a stronger immune system and a lower risk of some chronic diseases. It also has a lot of minerals, like iodine, calcium, magnesium, iron, and other trace minerals. These minerals have more bioavailable than those found in land plants, which makes them a great source of minerals in the diet [2, 3]. Brown algae also have B-complex vitamins, potent antioxidants, and other important vitamins that help with things like vision and the immune system. Brown algae have less protein than red and green algae, but they still contain a lot of protein, which makes them a good choice for people who are trying to lose weight. Table 1 shows the nutritional content of brown algae [4]. Brown algae are known for having a lot of polysaccharides, especially laminarin. This could be good for people with diabetes or at risk of metabolic disorders because it can help with weight loss, lowering cholesterol, and controlling blood sugar levels [5, 6]. Laminarin is a polysaccharide made from brown algae that has gotten a lot of attention in the last few years because of its unique features and possible uses [7]. The cell walls and vacuoles of many brown algae species, especially those in the order Laminariales, are where this storage carbohydrate is mostly found. The different structures of laminarin give it its own unique physical and chemical properties and biological activity [8]. A lot of people in food science, pharmacology, and biotechnology are interested in laminarin. Its bioactive features, such its ability to fight inflammation, boost the immune system, and function as an antioxidant, give it a lot of possible uses. Researchers are looking into laminarin as a functional ingredient and prebiotic in the food business [9, 10]. Researchers are still looking into its possible medical uses in the pharmaceutical industry, such as its ability to fight cancer, viruses, and blood clots [11]. The growing interest in laminarin reflects the broader trend of exploring marine-derived compounds for sustainable and innovative solutions in various industries. As research progresses, laminarin may offer promising opportunities for developing novel products and applications that harness the unique properties of this brown algae-derived polysaccharide. This review examines the structure and pharmacological application of laminarin, including preclinical and clinical investigations for disease prevention and possible treatment approaches.

METHODS

Using keywords pertaining to the pharmacological actions and therapeutic potential of laminarin, a thorough search was carried out across PubMed, Google Scholar, SCOPUS, and ResearchGate. Full-text publications that were pertinent were included, including clinical and experimental research.

Laminarin

Structure

Laminarin is a linear polysaccharide made up of β-1,3-linked glucose units with β-1,6-linked glucose residues [12]. As shown in Figure 1, the amount of branching and the ratio of β-(1,3) to β-(1,6) connections in laminarin can change depending on the type of algae and the conditions in which it grows13. Laminarin has a molecular weight that usually falls between 4 and 50 kDa. It comes in two primary forms: G-chains with glucose at the reducing end and M-chains with mannitol at the reducing end [13, 14].

Sources

Brown seaweeds like Laminaria, Saccharina, and Undaria are the main sources (Figure 2) [8]. These seaweeds are recognized for having a lot of carbohydrates, namely laminarin, which can make up as much as 35% of their dry weight [15]. Laminarin and laminarin-like polysaccharides can also be synthesized by several bacteria, such as Bacillus and Pseudomonas species.

Studies of Epidemiology

Epidemiological statistics show that regularly intake of brown algae that is rich in laminarin is linked to less case of metabolic syndromes like Type 2 Diabetes Mellitus (T2DM), heart disease, and obesity. For example, a Japanese cohort research found that consuming seaweed often linked to a lower chance of developing Type 2 Diabetes [16]. Also, a large-scale study in Korea found that middle-aged adults who consumed more seaweed had better glycemic control [8]. These results imply that laminarin, which is one of the main bioactive compounds in brown seaweeds, may help protect people from metabolic illnesses. It has also gotten a lot of attention for its cosmetic uses, thanks to new epidemiological and experimental findings. There aren't any large-scale epidemiological studies that look at the effects of laminarin on cosmetics, but people, who eat a lot of seaweed, especially in East Asian countries, tend to have healthier skin and less skin aging. This is probably because marine polysaccharides like laminarin are good for skin health. Laminarin is a strong antioxidant that protects skin cells from oxidative stress induced by UV radiation, which is one of the main causes of premature aging. Also, it helps the skin hold onto moisture better, makes the skin barrier stronger, and speeds up wound healing by encouraging fibroblast migration and collagen production [17]. Because of these preventive and healing benefits, laminarin is now used in anti-aging serums, moisturizers, and skin-repair products [18]. Thus, while direct human cohort studies are limited, indirect evidence from marine diet-related epidemiological studies and strong laboratory data support laminarin's growing role as a bioactive agent in cosmetic health. Table 1 represents the physicochemical property of laminarin.

Traditional Value

Various cultures utilized laminarin, a bioactive polysaccharide included in brown seaweeds, for its health advantages, especially along the coast. Laminaria japonica, or kombu, is often used in Japanese soups and dashi (broth) because it can help with inflammation and detoxification [19]. Wakame (*Undaria pinnatifida*) is also used a lot in Korean and Japanese food, as in miso soup and salads, because it can help with diabetes and is an antioxidant [20]. Miyeok-guk is a seaweed soup produced from miyeok, another type of brown seaweed usually consumed during postpartum. Irish moss (*Chondrus crispus*), which is popular along the North Atlantic coast, and dulse (*Palmaria palmata*), which is popular in the Celtic regions, are both high in laminarin-like polysaccharides. They have been used to help digestion, the immune system, and skin health. Because they offer healing characteristics, these seaweeds have been used in traditional medicine for a long time for its nutritional content (Table 2) [21].

Pharmacokinetics Profile of Laminarin

Laminarin, a polysaccharide primarily found in brown seaweeds, is absorbed primarily in the gastrointestinal tract after ingestion, where it is broken down by enzymes, though its absorption is limited due to its high molecular weight and complex structure. Table 3 shows the nutritional profile of laminarin [22]. Laminarin is a carbohydrate that can't be broken down in the small intestine. Instead, it goes to the colon, where it can be fermented by gut bacteria to make short-chain fatty acids (SCFAs) that are good for gut health., The main route for the elimination of laminarin is through feces because it doesn't be absorbed into the blood in large amounts [23]. Depending on the formulation, the recommended daily dose of laminarin (which comes from seaweed extracts) as a dietary supplement is usually between 100 and 500 mg. But eating too much of it might cause gastrointestinal discomfort [24].

Therapeutic Benefits of Laminarin

Effect of laminarin on cancer

Woonghee Lee *et al*. found that adding laminarin with regular 5-FU worked better as an anticancer drug against pancreatic ductal adenocarcinoma by causing apoptosis [25]. The study conducted by Hyocheol Bae *et al*., confirmed that laminarin decreases cell growth and cell cycle progression of ovarian cancer (OC) cells through the regulation of intracellular signaling. Laminarin induced cell death through DNA fragmentation, reactive oxygen species generation, induction of apoptotic signals and endoplasmic reticulum (ER) stress, regulation of calcium levels, and alteration of the ER-mitochondria axis. He suggested that laminarin can be used as a novel ovarian cancer suppressor. The application of laminarin as an immune stimulatory molecule for use in cancer immunotherapy was suggested by Kyeongeun Song *et al*., by combination treatment of laminarin and ovalbumin inhibited B16-

ovallbumin melanoma tumor growth and its liver metastasis by antigen-specific immune activation, including cytotoxic T lymphocyte activation and interferon-γ production [26]. Laminarin is considered to induce apoptosis, thus suggesting that laminarin may be a potent agent for cancer treatment which was suggested by Chen-Feng Ji. Laminarin and fucoidan polysaccharides, according to *in vitro* research by Roza V. Usoltseva, work synergistically with X-ray irradiation to kill cancer cells, reducing the number and size of cancer cell colonies. Chen-Feng Ji explored how laminarin and sulphated laminarin can fight tumors. The MTT experiment showed that both laminarin and laminarin sulfate (LAMS) may stop the growth of tumors. However, LAMS is more effective at stopping tumors than laminarin. The results of this study show that sulfated alteration changed the structure of laminarin, which greatly increased its anticancer activity [27].

Antimicrobial effect of Laminarin

Laminarin is a β-glucan from brown algae that possesses antibacterial properties that help the host's immune system and stop pathogens from growing. Laminarin makes immune cells like macrophages and neutrophils work better. These cells are very important for engulfing the pathogens. Laminarin boosts the effectiveness of immune cells such as macrophages and neutrophils, which play a crucial role in engulfing and eliminating pathogens [28].This enhances the removal of bacteria and fungi from the host body. It has the ability to modify the structural integrity of cell walls in bacteria and fungi, resulting in weakened microbes that are more susceptible to immune attacks. This has been seen in Gram-positive bacteria and fungus [29]. Laminarin may also stop pathogens from sticking to host cells, which is an important step in the infection process. This can help stop colonization and lower the risk of infections happening. Laminarin increases the generation of reactive oxygen species (ROS) by stimulating immune cells. These chemicals are very important for getting rid of microbial cells because they cause oxidative damage to the parts of those cells [30, 31]. The Study reveals that laminarin could make infections less hazardous by interfering with their quorum sensing, which is how bacteria talk to each other to plan their actions. This could make disease-causing substances less harmful.

Effect of laminarin on diabetes

Recent studies have found that laminarin may control hyperglycemic condition and enhances insulin sensitivity. Laminarin works against diabetes mainly by blocking alpha-glucosidase, an enzyme that breaks down carbohydrate into glucose. By blocking this enzyme, laminarin greatly slows down the absorption of glucose in the intestine, which lowers post-prandial blood glucose status [32]. W. Zhang *et al*. (2012) found that administration of laminarin to diabetic mice decreased their blood sugar levels compared to the control group. The study also found that insulin sensitivity improved, which is necessary for tissues in the body to use glucose effectively. Laminarin has also been shown to improve the activity of pancreatic beta cells, maintenance of insulin secretion and prevents hyperglycemia [33]. Laminarin's antioxidant potential reduces oxidative stress, which keeps beta cells integrity and functionality. The study indicated that laminarin administration in diabetic rats resulted in enhanced beta-cell activity and a significant decrease in oxidative biomarkers relative to untreated diabetic rats. Research showed that laminarin supplementation in a high-fat diet-induced diabetic mouse model resulted in decreased serum triglyceride and cholesterol levels, suggesting its potential role in managing dyslipidemia, a common comorbidity in diabetes [34]. The anti-diabetic property of laminarin involves, breakdown of carbohydrates, enhancement of insulin secretion, reverting pancreatic β-cell activity and controls lipid metabolism which makes this as a promising natural agent for the management of diabetes mellitus [35].

Anti-Arthritis Property

Arthritis is a common long-term ailment that causes pain and inflammation in the joints. It has an adverse effect on the quality of life that was affected by it. Laminarin helps with arthritis by reducing inflammation and changing the immune system. Inflammation is a big part of how arthritis works, and laminarin works by reducing inflammatory reactions, which is one of its main therapeutic effects [36]. Also, laminarin has been demonstrated to change how the immune system works by affecting the activity of macrophages, which are important in the inflammatory cascade. Macrophages can change their phenotypes, such as the pro-inflammatory M1 and the anti-inflammatory M2 phenotypes [37]. Laminarin makes macrophages more likely to become M2 cells, which boosts their ability to fight

inflammation and repair tissue. For example, a study discovered that treating arthritic mice with laminarin caused a big rise in M2 macrophage markers, which means that the mice were moving toward an anti-inflammatory state. Laminarin also helps fight arthritis since it has antioxidant qualities [38]. Laminarin protects joint tissues from oxidative injury by getting rid of reactive oxygen species (ROS) and lowering oxidative stress. Researchers found that adding laminarin to an arthritic model led to a big drop in oxidative stress indicators and kept the integrity of the cartilage in the joints compared to controls that didn't get any treatment [39].

Antioxidant Effect

Oxidative stress develops when there is an imbalance between ROS and antioxidants in the body that leads to development of many chronic diseases [40]. Laminarin was quite good at neutralizing free radicals in vitro, which lowered the amounts of ROS and other reactive species [41]. Research has shown that it works well in several biological systems and could be useful for treating diseases. Researchers have found that laminarin can protect the brains of older gerbils from ischemia/reperfusion injury by lowering oxidative stress and neuroinflammation [42]. Pre-treatment with laminarin lowered the levels of superoxide anions and pro-inflammatory cytokines while raising the levels of antioxidant enzymes such superoxide dismutase [43]. Laminarin showed antioxidant properties against reactive oxygen species (ROS) evoked by H2O2 / UVA radiation in skin cells. This suggests that it could help protect against environmental variables that cause oxidative stress [44]. Laminarin's antioxidant qualities also protect against UV rays. The study shows how UVB damages mouse skin, laminarin pretreatment cut down on oxidative stress and boosted the levels of antioxidant enzymes such SOD1, glutathione peroxidase, and catalase [45]. This shows that laminarin may be able to protect skin from damage caused by UV radiation or make it less severe. In conclusion, laminarin's ability to fight oxidative stress makes it a good choice for protecting the brain, skin, and eyes from the effects of light. Laminarin could be very important in preventing and treating problems connected to oxidative stress since it can change the expression of antioxidant enzymes and lower the production of ROS. However, more research, including thorough preclinical and clinical studies, is needed to completely understand its mechanism in various conditions [46].

Cardioprotective Effect

Heart disease is still one of the most common causes of death and illness around the world. Researchers have looked into marine-derived chemicals, like laminarin that protects the heart [47]. Research has demonstrated that laminarin can change the body responds to inflammation by blocking pro-inflammatory cytokines and boosting anti-inflammatory mediators. This impact may help lower heart damage caused by inflammation [48]. Researchers have shown that laminarin can change lipid metabolisms, which decreases cholesterol level and make lipid profiles better. This action could help stop atherosclerosis and other heart related problems. Some studies show that laminarin may have minor anticoagulant effects, which could lower the risk of thrombosis and improve heart health in general [49]. In animal studies, laminarin has been shown to protect the heart in a number of different types of cardiovascular disease models. For example, it has been shown to reduce the size of myocardial infarction in ischemia-reperfusion injury models, slow down cardiac remodeling in hypertension-induced heart failure, and improve endothelial function in atherosclerosis models. There aren't many clinical investigations, but the preclinical research suggests that laminarin could be used to help prevent heart disease, as an extra treatment for heart failure, and to protect the heart during ischemic conditions. It has several different potential, such as being an antioxidant, anti-inflammatory, and lipid-regulating agent, which makes it an interesting option for use in heart health [50]. However, further in-depth clinical investigations are needed to properly grasp its therapeutic potential and figure out what function it should play in cardiovascular therapy.

CONCLUSION

Laminarin, a kind of β-glucan that comes mostly from brown algae, has shown a lot of promise in a number of medical uses. This review has brought attention to their many biological effects, such as their ability to fight cancer, reduce inflammation, and boost the immune system due to their bioactive property of laminarin and their ability to

bind to cellular receptors. Their effect to fight inflammation and free radicals makes them a good choice for treating inflammatory diseases and ailments caused by oxidative stress. Laminarin could be used as an adjuvant in vaccine development due to its ability to combat the immune system. Their anticancer capabilities have gained a lot of attention, and studies have shown that they can suppress tumor growth and induce apoptosis, make existing chemotherapeutic drugs work better. Even while the results are promising, further research is needed to understand how the drug works, assessing the optimal doses, and to confirm the safety profile. Clinical trials are needed to prove that laminarin-based treatments work and are safe for people. In conclusion, laminarin is a promising natural compound with a wide range of pharmacological effects. More research is needed in the areas of inflammation, oxidative stress, immunology, and oncology.

Table 1: Physicochemical Profile of Laminarin

Properties	**Characteristics**
Color	White to light beige powder
Odor	Odorless
Solubility	Highly soluble in water; insoluble in organic solvents
Molecular Weight	Approximately 5 – 10 K Da
Physical State	Amorphous powder or fibrous solid
Density	Around 1.4 g/ cm^3
Chemical Formula	$(C_6H_{10}O_5)_n$

Table 2: Nutritional composition of Brown Algae (per 100 g)

Nutrient	**Approximate Composition (%)**	**Characteristics**	**Reference**
Carbohydrates	30 -60	Predominantly polysaccharides such as alginate, laminarin, and fucoidan	3
Proteins	5 – 20	Contains essential amino acids; protein content fluctuates based on species	12
Lipids	1 -5	Low in fats, but includes beneficial polyunsaturated fatty acids like omega-3 and omega-6.	12
Dietary Fiber	30 – 50	Rich in soluble and insoluble fibers, aiding in digestion and gut health.	13
Ash (Minerals)	15 – 40	High mineral content, including iodine, calcium, magnesium, and iron, contributing to various physiological functions.	13
Vitamins	Trace amounts	Contains vitamins A, C, E, K, and B-complex in varying small quantities.	3

Table 3: Nutritional composition of Laminarin (per 100 g)

Nutrient	Approximate Composition (%)	Characteristics
Polysaccharides (β – glucans)	80 – 90	Composed mainly of (1→3)-β-D-glucan with some (1→6) branching; known for immunomodulatory and antioxidant properties
Proteins	<1	Present in minimal amounts, not a significant source of protein
Lipids	<1	Contains negligible fat content
Dietary Fiber	High	Acts as a soluble fiber, beneficial for digestive health
Ash (Minerals)	2 – 5	Contains essential minerals including iodine, calcium, potassium, and magnesium
Moisture Content	5 -10	Varies depending on extraction and storage conditions
Vitamins	Trace amount	May contain trace levels of vitamins depending on the algal source

ABSTRACT

A function h is mentioned as a C-exponential mean labeling of a graph $G(V,E)$ that possess 's ' vertices and 'r' edges if $h^*: V(G) = \{1,2,3,\dots q+1\}$ is injective and the generative function $h^*: E(G) = \{1,2,3,\dots q\}$ is defined by $h^*(ab) = \left\lfloor \frac{1}{e}\left(\frac{h(b)^{h(b)}}{(h(a))^{h(a)}}\right)^{\frac{1}{h(b)-h(a)}} \right\rfloor$ or $\left\lceil \frac{1}{e}\left(\frac{h(b)^{h(b)}}{(h(a))^{h(a)}}\right)^{\frac{1}{h(b)-h(a)}} \right\rceil$ for all $ab \in E(G)$ is bijective. A graph which recognizes a C-exponential mean labeling is defined as C-exponential graph mean graph.

Keywords: Exponential mean graph, Exponential mean labeling
AMS Classification Code: 05C78

INTRODUCTION

In[5], introduced the concept of C-Exponential Mean Labeling. In this paper ,we discussed C-Exponential Mean Labeling of Quadrilateral Related Graph.

MAIN RESULTS

Theorem 2.1: The graph Q_n is a C-exponential mean graph for $n \geq 2$.

Proof

Let $\{u_i, 1 \le i \le n, v_i, 1 \le i \le 2(n-1)\}$ be the vertex set and $\{e_i, e_i', 1 \le i \le n-1, a_i, 1 \le i \le 2(n-1)\}$ be the edge set which are denotes the following figure. 1

Ordinary labeling of Q_n (Figure 1).

The procedure for labeling each vertex is given as follows

For $1 \le i \le nf(u_i) = 4i - 3$

For $1 \le i \le 2(n-1)$ $\quad f(u_i) = \begin{cases} \frac{4i}{2} & i \text{ is odd} \\ \frac{4i-2}{2} & i \text{ is even} \end{cases}$

We define the labeling of edges as outlined below

For $1 \le i \le n$ -1 , $\quad f^*(e_i) = 4i - 2$

For $1 \le i \le n$ -1 , $\quad f^*(e_i') = 4i - 1$

For $1 \le i \le 2(n-1)$ $\quad f(u_i) = \begin{cases} \frac{4i-2}{2} & i \text{ is odd} \\ \frac{4i}{2} & i \text{ is even} \end{cases}$

Hence , the graph Q_n is a C-Exponential Mean for $n \ge 2$.

Illustration :2.1 Q_5 is a C-exponential mean graph is shown in Figure.2

Theorem 2.2: The graph $T(Q_n)$ is a C-exponential mean graph for $n \ge 2$

Proof: Let $\{v_i, 1 \le i \le n, u_{i,}, u_i', u_i'' \; 1 \le i \le 2(n-1)\}$ be the vertex set and $\{e_i, a_i', b_i', c_i', 1 \le i \le n-1, a_i, b_i, c_i 1 \le i \le 2(n-1)\}$ be the edge set which are denotes the following figure 3

A function for assigning labels to vertices is defined as below

For $1 \le i \le nf(v_i) = 10i - 9$

For $1 \le i \le 2(n-1)$ $\quad f(u_i) = \begin{cases} \frac{10i-4}{2} & i \text{ is odd} \\ \frac{10i-8}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le 2(n-1)$ $\quad f(u_i') = \begin{cases} \frac{10i-2}{2} & i \text{ is odd} \\ \frac{10i}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le 2(n-1)$ $\quad f(u_i'') = \begin{cases} \frac{10i+4}{2} & i \text{ is odd} \\ \frac{10i-4}{2} & i \text{ is even} \end{cases}$

The induced labeling on the edges is given by

For $1 \le i \le n-1 f^*(e_i) = 10i - 5$

For $1 \le i \le 2(n-1)$ $\quad f^*(a_i) = \begin{cases} \frac{10i-8}{2} & i \text{ is odd} \\ \frac{10i-4}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le 2(n-1)$ $\quad f^*(b_i) == \begin{cases} \frac{10i-6}{2} & i \text{ is odd} \\ \frac{10i}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le 2(n-1)$ $\quad f^*(c_i) = \begin{cases} \frac{10i-4}{2} & i \text{ is odd} \\ \frac{10i-2}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le n-1 f^*(a_i')$= 10i-6

$f^*(b_i')$= 10i-4

$f^*(c_i')$= 10i-3

Hence, the graph $T(Q_n)$ is a C-exponential mean graph for $n \ge 2$

Illustration: 2.2 $T(Q_4)$is a C-exponential mean graph is shown in Figure 4
Theorem 2.3. The graph$A(Q_n)$ is a C-exponential mean graph for $n \geq 4$

Proof : Let$\{u_i, v_i, 1 \leq i \leq n)\}$be the vertex set and $\{e_i, 1 \leq i \leq n-1, a_i, 1 \leq i \leq n, e_i' 1 \leq i \leq n-3\}$ be the edge set which are denotes the following figure 5
Define the vertex label function as follows

For $1 \leq i \leq nf(u_i) = \begin{cases} \frac{5i-3}{2} & i \text{ is odd} \\ \frac{5i}{2} & i \text{ is even} \end{cases}$

For $1 \leq i \leq nf(v_i) = \begin{cases} \frac{5i-1}{2} & i \text{ is odd} \\ \frac{5i-4}{2} & i \text{ is even} \end{cases}$

The induced labeling on the edges is given by

For $1 \leq i \leq n-1 f^*(e_i) = \begin{cases} \frac{5i+1}{2} & i \text{ is odd} \\ \frac{5i}{2} & i \text{ is even} \end{cases}$

For $1 \leq i \leq nf^*(a_i) = \begin{cases} \frac{5i-3}{2} & i \text{ is odd} \\ \frac{5i-2}{2} & i \text{ is even} \end{cases}$

For $1 \leq i \leq n-3 f^*(e_i') = 5i-3$
Hence, the graph $A(Q_n)$ is a C-exponential mean graph for $n \geq 4$

Illustration: 2.3$A(Q_6)$is a C-exponential mean graph is shown in Figure 6

Theorem 2.4. The graph$A[T(Q_n)]$ is a C-exponential mean graph for $n \geq 4$
Proof : Let$\{u_i, v_i, v_i', v_i'', 1 \leq i \leq n)\}$be the vertex set and $\{e_i, 1 \leq i \leq n-1, a_i, b_i, c_i, 1 \leq i \leq n, d_i, d_i', d_i'', 1 \leq i \leq n-3\}$ be the edge set which are denotes the following figure 7
First we label the vertices as follows

For $1 \leq i \leq nf(u_i) = \begin{cases} \frac{11i-9}{2} & i \text{ is odd} \\ \frac{11i}{2} & i \text{ is even} \end{cases}$

For $1 \leq i \leq nf(v_i) = \begin{cases} \frac{11i-7}{2} & i \text{ is odd} \\ \frac{11i-8}{2} & i \text{ is even} \end{cases}$

For $1 \leq i \leq nf(v_i') = \begin{cases} \frac{11i-3}{2} & i \text{ is odd} \\ \frac{11i-6}{2} & i \text{ is even} \end{cases}$

For $1 \leq i \leq nf(v_i'') = \begin{cases} \frac{11i+1}{2} & i \text{ is odd} \\ \frac{11i-4}{2} & i \text{ is even} \end{cases}$

Consequently, the corresponding edge labels are

For $1 \leq i \leq n-1 f^*(e_i) = \begin{cases} \frac{11i+1}{2} & i \text{ is odd} \\ \frac{11i}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le n-1 f^*(a_i) = \begin{cases} \frac{11i-9}{2} & i \text{ is odd} \\ \frac{11i-6}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le n-1 f^*(b_i) = \begin{cases} \frac{11i-7}{2} & i \text{ is odd} \\ \frac{11i-4}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le n-1 f^*(c_i) = \begin{cases} \frac{11i-5}{2} & i \text{ is odd} \\ \frac{11i-2}{2} & i \text{ is even} \end{cases}$

For $1 \le i \le n-3 f^*(d_i) = 11i-7$

For $1 \le i \le n-3 f^*(d_i') = 11i-6$

For $1 \le i \le n-3 f^*(d_i'') = 11i-4$

Hence, the graph $A[T(Q_n)]$is a C-exponential mean graph for $n \ge 4$

Illustration: 2.4$A[T(Q_6)]$is a C-exponential mean graph is shown in Figure 8

Theorem 2.5. The graph $Q_n \odot \overline{K_1}$is a C-exponential mean graph for $n \ge 2$.

Proof: Let$\{u_{i,}, v_i, 1 \le i \le n, w_{i,}w_i', 1 \le i \le 2(n-1)\}$ and$\{e_{i,}, 1 \le i \le n-1, a_i, c_{i,}, 1 \le i \le 2(n-1), b_i, 1 \le i \le n-1, d_i, 1 \le i \le n\}$ be the edge set which are denotes the following figure 9

First we label the vertices as follows

$Let\ f(u_1) = 3$

For $2 \le i \le n f(u_i) = 7i-5$

$Let\ f(v_1) = 1$

For $2 \le i \le n f(v_i) = 7(i-1)$

$Let\ f(w_1) = 4$

For $2 \le i \le 2(n\text{-}1)$ $f(w_i) = \begin{cases} \frac{7i-4}{2} & i \text{ is odd} \\ \frac{7i-1}{2} & i \text{ is even} \end{cases}$

$Let\ f(w_1') = 2$

For $2 \le i \le 2(n\text{-}1)$ $f(w_i') = \begin{cases} \frac{7i-2}{2} & i \text{ is odd} \\ \frac{7i+1}{2} & i \text{ is even} \end{cases}$

Hence, the edge labels derived are

For $1 \le i \le n-3 f^*(e_i) = 7i-1$

$f^*(a_1) = 2$

For $2 \le i \le 2(n\text{-}1)$ $f^*(a_i) = \begin{cases} \frac{7i+1}{2} & i \text{ is odd} \\ \frac{7i-4}{2} & i \text{ is even} \end{cases}$

$Let\ f^*(b_1) = 4$

For $2 \le i \le n\text{-}1$ $f^*(b_i) = 7i-4$

$Let\ f^*(c_1) = 3$

For $2 \le i \le 2(n\text{-}1)$ $f^*(c_i) = \begin{cases} \frac{7i+1}{2} & i \text{ is odd} \\ \frac{7i-4}{2} & i \text{ is even} \end{cases}$

$Let\ f^*(d_1) = 1$

For $2 \le i \le n f^*(d_i) = 7i-6$

Hence, the graph $Q_n \odot \overline{K_1}$ is a C-exponential mean graph for $n \ge 2$.

Illustration: 2.5$Q_n \odot \overline{K_1}$is a C-exponential mean graph is shown in figure 10

Theorem 2.6. The graph $Q_n \odot \overline{K_2}$is a C-exponential mean graph for $n \ge 2$.

Proof:

Let$\{u_{i,i}u_i', u_i'', , 1 \le i \le n, v_{i,i}v_i', v_i'', 1 \le i \le 2(n-1)\}$ and $\{e_i, a_i, b_i, b_i', b_i'', 1 \le i \le 2(n-1), c_i, c_i' 1 \le i \le n\}$be the edge set which are denotes the following figure 11

First we label the vertices as follows

For $1 \le i \le nf(u_i) = 10i - 9$,For $2 \le i \le nf(u_i') = 10i - 7 f(u_i'') = 10i - 8$

For $2 \le i \le 2(n-1), f(v_i) = \begin{cases} \frac{10i-2}{2} & i \text{ is odd} \\ \frac{10i-4}{2} & i \text{ is even} \end{cases}$

$$f(v_i') = \begin{cases} \frac{10i}{2} & i \text{ is odd} \\ \frac{10i-2}{2} & i \text{ is even} \end{cases}$$

$$f(v_i'') = \begin{cases} \frac{10i+2}{2} & i \text{ is odd} \\ \frac{10i}{2} & i \text{ is even} \end{cases}$$

Then the induced edge labels are

For $1 \le i \le 2(n-1), f^*(e_i) = \begin{cases} \frac{10i+2}{2} & i \text{ is odd} \\ \frac{10i-6}{2} & i \text{ is even} \end{cases}$

$$f^*(a_i) = \begin{cases} \frac{10i-4}{2} & i \text{ is odd} \\ \frac{10i}{2} & i \text{ is even} \end{cases}$$

$$f^*(b_i) = \begin{cases} \frac{10i}{2} & i \text{ is odd} \\ \frac{10i-2}{2} & i \text{ is even} \end{cases}$$

$$f^*(b_i') = \begin{cases} \frac{10i-2}{2} & i \text{ is odd} \\ \frac{10i-6}{2} & i \text{ is even} \end{cases}$$

For $1 \le i \le nf^*(c_i) = 10i - 9 f^*(c_i') = 10i - 8$

Hence, the graph $Q_n \odot \overline{K_2}$ is a C-exponential mean graph for $n \ge 2$.

Illustration: 2.6$Q_4 \odot \overline{K_2}$is a C-exponential mean graph is shown in figure 12

CONCLUSION

It is very interesting to investigate graphs which admit even vertex square difference labeling. In this paper, we proved that $Q_n, T(Q_n), A[T(Q_n)], Q_n \odot \overline{K_1}, Q_n \odot \overline{K_2}$are C-exponential mean graphs. The obtained results are illustrated with adequate examples to enhance understanding. Similar results can also be explored for various other types of graphs.

ABSTRACT

Let G be a graph. D is called the detour dominating set of G if it is both a detour set and a dominating set of the connected graph G. The detour domination number, symbolised by $\gamma_d(G)$, is the least cardinality of the detour dominating set. In this paper, we have formed the family of detour dominating sets of P_n which has the cardinality i, and given a recursion form for the cardinality of such sets. By using this recursion form, we can form the detour domination polynomial and discuss some properties of the detour domination polynomial of P_n. Furthermore, in this work, we have discussed the nature and multiplicity of the roots of polynomials, independency and dependency of the polynomials using Wronskian. Additionally, we gave the detour domination polynomial for a few standard graphs.

INTRODUCTION

Assume the graph G. The notation for the cardinality of the vertex set is n. The path graph is notated as P_n, where n represents the total number of vertices in the path graph. Any undefined notations used in this paper can be found in [6, 7]. The concepts of detour and detour distance are discussed in Chartrand et.al.[3]. S is a dominating set of G

when each v∈V(G)-S is adjacent to minimum one u∈S. The smallest cardinality of S is known as domination number $\gamma(G)$. When every v ∈ V (G) lies of detour joining some pair of vertices of S ⊆V(G), then S is said to be detour set [4]. We can find these concepts in G. Chartr and *et al*.[4].And it is further studied in [5].Different types of detour numbers have been developed in recent years. Some of the references are given [9, 10, 11, 12, 13]. The set that is both a detour set and a dominating set of the graph G, where G is a graph with at least two vertices, is referred to as a detour dominating set. The minimum order of the detour dominating set of G, denoted as $\gamma_d(G)$, is the detour domination number of G [8].γ_d-set of G is defined as the detour dominating set having the cardinality $\gamma_d(G)$. Let D(G,i) be the family of dominating sets of graph G with cardinality i and let d (G,i)= |D(G,i)|. Then the domination polynomial D(G,x) of G is defined as $\sum_{i=\gamma(G)}^{|V(G)|} d(G,i)x^i$, where $\gamma(G)$ is the domination number of G[2]. For more results about domination polynomials of paths, we can refer to [1].

The Wronskian of $p_i(x)$,i=1 ton is defined as $W[p_1(x),p_2(x),\ldots,p_n(x)]$= Det P(x), where $P(x)=\begin{pmatrix} p_1(x) & p_2(x) & \cdots & p_n(x) \\ p_1'(x) & p_2'(x) & \cdots & p_n'(x) \\ \vdots & \vdots & \cdots & \vdots \\ p_1^{(n-1)}(x) & p_2^{(n-1)}(x) & \cdots & p_n^{(n-1)}(x) \end{pmatrix}$, x belongs to an interval I. It follows that Det P(x) ≠0on I if and only if $p_1(x)$, $p_2(x),\ldots,p_n(x)$ are linearly independent for each point in I. If Det P(x)=0onI,then$p_1(x),p_2(x),\ldots,p_n(x)$ are linearly dependent for at least one point in I. And the converse is also true. The number of times a root is present in a given polynomial is called the multiplicity of that root. A local minimum of a polynomial is a point on the graph where the function meets a lower value. In this paper, we generated the family of detour dominating sets of P_n and used the recursion form of the cardinality of the family of detour dominating sets to get the detour domination polynomial. Also, in this work, we have discussed the nature and multiplicity of the roots of polynomials, independency and dependency of the polynomials using the Wronskian.

The following theorem is necessary for proving our result.

Theorem1.1.[2] $D(K_n, x) = (1+x)^n - 1$.

MAIN RESULTS

Definition 2.1: Consider D_d (G,i) as the family of detour dominating sets of G which has the cardinality I and let $|D_d(G,i)|=d_d(G, i)$. Then the detour domination polynomial $D_d(G,x)$ of G is defined as $\sum_{i=\gamma_d(G)}^{|V(G)|} d_d(G,i)x^i$, where $\gamma_d(G)$ is the detour domination number of G.

Observation2.2.(i)$D_d(P_n,i)=\varphi$if and only if i>n ori< 2,whenn=2,3,4.

(ii) $D_d(P_n,i)=\varphi$if and only if i > n ori $<\left\lceil\frac{n-4}{3}\right\rceil+2forP_n$,wheren≥5.

(iii)$d_d(P_{3k},\gamma_d(P_{3k}))=k$, where k∈N.

(iv) $d_d(P_{3k+1},\gamma_d(P_{3k+1}))=1and\gamma_d(P_{3k+1}))=k+1$,wherek∈N.

(v) $d_d(P_n,i=n)=1$,for every n≥2.

Theorem 2.3. $d_d(P_n, i = n -1) = n - 2$, for every n ≥ 2.

Proof: Let u_i be the vertices of P_n, 1 ≤ i ≤ n. Since u_1, u_n must be in every detour dominating set, by leaving exactly one vertex of $\{u_2, u_3,\ldots, u_{n-1}\}$ at a time, we can form n-2 number of detour dominating sets each with cardinality n-1. Suppose $D_d(P_n,n-1) = \{\{i=1,i\neq 2nui\},\{i=1,i\neq 3nui\},\ldots,\{i=1,i\neq n-1nui\}\}$. Then $d_d(P_n, n-1) = n-2$.

Theorem 2.4. $d_d(P_n, i) = d(P_n, i)-|S|$, where S is the family of dominating sets which does not contain both end vertices of P_n.

Proof: Since end vertices must be contained in each detour dominating set, we can prove the result.

The number of detour dominating sets with cardinality i in P_n is shown in the following table 1.

Observation 2.5. $d_d(P_n, i) = d_d(P_{n-1}, i-1)+d_d(P_{n-2}, i-1)+d_d(P_{n-3}, i-1)$.

Theorem 2.6. Each set of $D_d(P_n, i)$ is of the form of $S\cup\{u_n\}$, where S belongs to any one of $D_d(P_{n-1}, i-1)$, $D_d(P_{n-2}, i-1)$ and $D_d(P_{n-3}, i-1)$. The converse is also true.

Proof. Let $Q \in D_d(P_n, i)$ be a set. Suppose $u_{n-1} \in Q$. Then $S = Q-\{u_n\} \in D_d(P_{n-1}, i-1)$. If $u_{n-2} \in Q$ and u_{n-1} Q, then $S = Q-\{u_n\} \in D_d(P_{n-2},i-1)$. If $u_{n-3} \in Q$, $u_{n-2} \notin Q$ and $u_{n-1} \notin Q$, then $S = Q-\{u_n\} \in D_d(P_{n-3},i-1)$. Since u_{n-3} can dominate u_{n-2} and u_n can dominate u_{n-1}, each set in $D_d(P_n, i)$ must contain at least u_{n-3}, u_{n-2} or u_{n-1}. Thus each set in $D_d(P_n, i)$ must be of the form of $S\cup\{u_n\}$ where S belongs to any one of $D_d(P_{n-1}, i-1)$, $D_d(P_{n-2}, i-1)$ and $D_d(P_{n-3}, i-1)$. Conversely, Suppose there exists a set $S\cup\{u_n\}$. Since S belongs to any one of the sets $D_d(P_{n-1},i-1)$, $D_d(P_{n-2},i-1)$ and $D_d(P_{n-3},i-1)$, u_{n-3} dominate u_{n-2} and u_n dominate u_{n-1}, $S\{u_n\} \in D_d(P_n,i)$.

Theorem 2.7. If $S \in D_d(P_{n-4}, i-2)$ and $S\cup\{u_{n-2}, u_n\} \in D_d(P_n, i)$, then $S \in D(P_{n-3}, i- 2)$, when $n - 4 \equiv 1(\text{mod } 3)$ and i is the minimum detour domination number for P_n.

Proof. Let u_i be the vertices of P_n, $1 \le i \le n$. Since $n- 8 \equiv 0(\text{mod } 3)$, $S=\{u_1, u_4, u_7,\ldots, u_{n-7}, u_{n-4}\}$ is a detour dominating set for P_{n-4} with cardinality i-2. Also, we have $\{u_1, u_4, u_7,\ldots, u_{n-4}, u_{n-2}, u_n\}$ is a detour dominating set for P_n with cardinality i. Since u_{n-4} dominates only u_{n-5} in P_{n-4} and it also dominates the vertex u_{n-3}, S is a dominating set for P_{n-3}.

Theorem 2.8. Let S, S′ and S″ be the minimum detour dominating sets for P_{n-4}, P_{n-3} and P_n respectively. If $|S| = i$, then $|S'| = i$, $S'' = S' \cup \{u_n\}$ and $|S''| = i + 1$.

Proof. If $n-4 \equiv 0(\text{mod } 3)$, then $n-8 \equiv 2(\text{mod } 3)$. Suppose $S = \{u_1, u_4, u_7,\ldots, u_{n-6}, u_{n-4}\}$ is the minimum detour dominating set for P_{n-4} with cardinality i. To form the minimum detour dominating set for P_{n-3}, replace the vertex u_{n-4} by u_{n-3} in S. Thus $|S'| = |S|$. Since u_{n-3} dominates only one vertex, u_{n-4}, $S'' = S' \cup \{u_n\}$ and hence $|S''| = i + 1$.

Theorem 2.9. (i) If $D_d(P_n, i) = D_d(P_{n-2}, i) = \varphi$, then $D_d(P_{n-1}, i) = \varphi$.
(ii) If $D_d(P_n, i)$ φ and $D_d(P_{n-2}, i)$ φ, then $D_d(P_{n-1}, i)$ φ.
(iii) If $D_d(P_{n-1}, i-1) = D_d(P_{n-2}, i-1) = D_d(P_{n-3}, i-1) = \varphi$, then $D_d(P_n, i) = \varphi$.

Proof. (i) Since $D_d(P_n, i) = D_d(P_{n-2}, i) = \varphi$, $n < i$ or $i < \lceil n-63\rceil+2$. It is clear that, $n-1 < n < i$ and $i < \lceil n-63\rceil+2$ $\lceil n-53\rceil+2$. This implies $i > n-1$ or $i < \lceil n-53\rceil+2$. Thus, we have $D_d(P_{n-1}, i) = \varphi$.
(ii) Suppose $D_d(P_{n-1}, i) = \varphi$. Then $i > n-1$ or $i < \lceil n-53\rceil+2$. Since $i > n-1 > n-2$, $D_d(P_{n-2}, i) = \varphi$. Since $i < \lceil n-53\rceil+2$ $\lceil n-43\rceil+2$, $D_d(P_n, i) = \varphi$ which are the contradiction to $D_d(P_n, i)$ φ and $D_d(P_{n-2}, i)$ φ. Hence, $D_d(P_{n-1}, i)$ φ.
(iii) Suppose $D_d(P_n, i) \neq \varphi$. Let $S \in D_d(P_n, i)$ be the minimum detour dominating set for P_n with cardinality i and $\{u_i, 1 \le i \le n\}$ be the vertex set of P_n. Then $u_n \in S$ and so u_{n-1}, u_{n-2} or u_{n-3} belong to S.
Case (i) $n - 4 \equiv 0(\text{mod } 3)$.
Since $u_{n-3} \in S$, $S-\{u_n\} \in D_d(P_{n-3}, i-1)$.
Case (ii) $n-4 \equiv 1(\text{mod } 3)$.
If $u_{n-1} \in S$, then $S-\{u_n\} \in D_d(P_{n-1}, i-1)$. Suppose $u_{n-2} \in S$. Then $S-\{u_n\} \in D_d(P_{n-2}, i-1)$.

Case (iii) $n - 4 \equiv 2(\text{mod } 3)$.
If $u_{n-2} \in S$, then $S-\{u_n\} \in D_d(P_{n-2}, i-1)$. Suppose $u_{n-3} \in S$. Then u_{n-3} can dominate u_{n-2} and u_n dominate u_{n-1}. And so $S-\{u_n\} \in D_d(P_{n-3}, i-1)$. Thus, for every i, $D_d(P_{n-1}, i-1)$, $D_d(P_{n-2}, i-1)$ and $D_d(P_{n-3}, i-1)$ are non empty, which is a contradiction. Hence, $D_d(P_n, i) = \varphi$.

Theorem 2.10: If $D_d(P_n, i) \neq \varphi$, then
(i) $D_d(P_{n-1}, i-1) = D_d(P_{n-2}, i-1) = \varphi$ and $D_d(P_{n-3}, i-1) \neq \varphi$ if and only if $n = 3k+1$ and $i = k+1$ for some $k \in N$.
(ii) $D_d(P_{n-2}, i-1) = D_d(P_{n-3}, i-1) = \varphi$ and $D_d(P_{n-1}, i-1) \neq \varphi$ if and only if $i = n$.
(iii) $D_d(P_{n-1}, i-1) \neq \varphi$, $D_d(P_{n-2}, i-1) \neq \varphi$ and $D_d(P_{n-3}, i-1) = \varphi$ if and only if $i = n-1$.
(iv) $D_d(P_{n-1}, i-1) = \varphi$, $D_d(P_{n-2}, i-1) \neq \varphi$ and $D_d(P_{n-3}, i-1) \neq \varphi$ if and only if $n = 3k$ and $i = k+1$ for $k \geq 2$.

Proof. (i) Since $D_d(P_{n-1}, i-1) = D_d(P_{n-2}, i-1) = \varphi$, we have $i-1 > n-1$ or $i-1 < \lceil n-63 \rceil+2$. If $i-1 > n-1$, then $i > n$ which is a contradiction to $D_d(P_n, i) \neq \varphi$. Since $D_d(P_n, i) \neq \varphi$ and $i < \lceil n-63 \rceil+3$, $\lceil n-43 \rceil+2 \leq i < \lceil n-63 \rceil+3$. This implies $n = 3k+1$ and $i = k+1$ for some $k \in N$. Conversely, Suppose $n = 3k+1$, $i = k+1$ for some $k \in N$. Since $i-1 < \lceil n-53 \rceil+2$, $i-1 < \lceil n-63 \rceil+2$ and $i-1 \not> n-1$, $i-1 \not> n-2$, $D_d(P_{n-1}, i-1) = \varphi$ and $D_d(P_{n-2}, i-1) = \varphi$.
(ii) Since $D_d(P_{n-2}, i-1) = D_d(P_{n-3}, i-1) = \varphi$, $i-1 > n-2$ and $i-1 < \lceil n-73 \rceil+2$. If $i-1 < \lceil n-73 \rceil+2$, then $i-1 < \lceil n-53 \rceil+2$. This implies $D_d(P_{n-1}, i-1) = \varphi$, which is a contradiction. And so, $i-1 > n-2$. Since $D_d(P_{n-1}, i-1) \neq \varphi$, $i-1 \leq n-1$. Hence, $i = n$.
Conversely, Suppose $i = n$. Since $i-1 > n-2$ and $i-1 > n-3$, $D_d(P_{n-2}, i-1) = D_d(P_{n-3}, i-1) = \varphi$. Also, since $i-1 \not> n-1$ and $i-1 \not< \lceil n-53 \rceil+2$, $D_d(P_{n-1}, i-1) \neq \varphi$.

(iii) Since $D_d(P_{n-3}, i-1) = \varphi$, $i-1 > n-3$ or $i-1 < \lceil n-73 \rceil+2$. $D_d(P_{n-2}, i-1) \neq \varphi$ implies $\lceil n-63 \rceil+2 \leq i-1 \leq n-2$. Therefore, $i-1 < \lceil n-73 \rceil+2$ is not possible. Hence, $i-1 > n-3$. Thus, $i = n-1$ or $i = n$. Suppose $i = n$. Then by (ii), $D_d(P_{n-2}, i-1) = \varphi$ which is a contradiction to $D_d(P_{n-2}, i-1) \neq \varphi$. Thus, $i = n-1$. Conversely, let $i = n-1$. Since $i-1 > n-3$, $D_d(P_{n-3}, i-1) = \varphi$. Also, it is clear that, $D_d(P_{n-1}, i-1) \neq \varphi$ and $D_d(P_{n-2}, i-1) \neq \varphi$.

(iv) Since $D_d(P_{n-1}, i-1) = \varphi$, $i-1 > n-1$ or $i-1 < \lceil n-53 \rceil+2$. If $i-1 > n-2$, then $D_d(P_{n-2}, i-1) = \varphi$, which is a contradiction to $D_d(P_{n-2}, i-1) \neq \varphi$. Thus, $i-1 < \lceil n-53 \rceil+2$. Since we have $D_d(P_{n-2}, i-1) \neq \varphi$ and $i-1 < \lceil n-53 \rceil+2$, $\lceil n-63 \rceil+2 \leq i-1 < \lceil n-53 \rceil+2$. This implies $n=3k$ and $i=k+1$. Conversely, Suppose $n = 3k$ and $i = k+1$ for $k \geq 2$. As in the previous cases, we can prove this result using the observation 2.2(ii).

Theorem 2.11. (i) If $D_d(p_{n-1}, i-1) = D_d(p_{n-2}, i-1) = \varphi$ and $D_d(p_{n-3}, i-1) \neq \varphi$, then $d_d(p_n, i) = 1$, for $n \geq 7$.
(ii) If $D_d(p_{n-1}, i-1) \neq \varphi$, $D_d(p_{n-2}, i-1) = D_d(p_{n-3}, i-1) = \varphi$, then $D_d(p_n, i) = V(P_n)$.
(iii)If $D_d(p_{n-1}, i-1) \neq \varphi$, $D_d(p_{n-2}, i-1) \neq \varphi$ and $D_d(p_{n-3}, i-1) = \varphi$, then $D_d(p_n, i) = V(P_n)-\{u_i\}$, $i = 2$ to $n-1$.
(iv) If $D_d(p_{n-1}, i-1) = \varphi$, $D_d(p_{n-2}, i-1) \neq \varphi$ and $D_d(p_{n-3}, i-1) \neq \varphi$, then $D_d(P_n, i) = \{u_1, u_4, \ldots, u_{n-5}, u_{n-2}, u_n\} \cup \{X \cup \{u_n\}\}$, $X \in D_d(P_{n-3}, i-1)$.

Proof. (i) If $D_d(p_{n-1}, i-1) = D_d(p_{n-2}, i-1) = \varphi$ and $D_d(p_{n-3}, i-1) \neq \varphi$, then by Theorem 2.10(i), $n = 3k+1$ and $i = k+1$, $k \geq 2$. Since $n-4 \equiv 0 \pmod 3$, $D_d(P_n, i) = \{u_1, u_4, u_7, \ldots, u_{n-3}, u_n\}$. It is clear that we cannot form more than one detour dominating set. Thus, $|D_d(P_n, i)| = 1$.
(ii) Suppose $D_d(p_{n-1}, i-1) \neq \varphi$, $D_d(p_{n-2}, i-1) = D_d(p_{n-3}, i-1) = \varphi$. Then by Theorem 2.10(ii), $i = n$. Thus, $D_d(P_n, n) = V(P_n)$.
(iii) If $D_d(p_{n-1}, i-1) \neq \varphi$, $D_d(p_{n-2}, i-1) \neq \varphi$ and $D_d(p_{n-3}, i-1) = \varphi$, then by Theorem 2.10(iii), $i = n-1$. Therefore, $D_d(P_n, n-1) = V(P_n)-\{u_i\}$, $i = 2$ to $n-1$.
(iv) Since $D_d(p_{n-1}, i-1) = \varphi$, $D_d(p_{n-2}, i-1) \neq \varphi$ and $D_d(p_{n-3}, i-1) \neq \varphi$, by Theorem 2.10(iv), $n = 3k$ and $i = k+1$. We prove this theorem by using the mathematical induction method on k. Let $k = 2$. Then $n = 6$. Since $D_d(p_{n-1}, i-1) = \varphi$ and $D_d(p_{n-2}, i-1) \neq \varphi$, P_{n-1} contains detour dominating set of order i. Thus, P_5 does not contain any detour dominating set of order 2. Since $D_d(P_4, 2) \neq \varphi$, there exists $\{u_1, u_4\} = D_d(P_4, 2)$. Also, Since $D_d(P_3, 2) \neq \varphi$, there exists $\{u_1, u_3\} = D_d(P_3, 2)$. From this we can say that, $\{\{u_1, u_3, u_6\}, \{u_1, u_4, u_6\}\} = D_d(P_6, 3)$. Assume that the result is true for $k=m$. Then $n=3m$ and $i=m+1$. Thus, $D_d(P_{3m}, i) = \{u_1, u_4, \ldots, u_{3m-5}, u_{3m-2}, u_{3m}\} \cup \{X \cup \{u_{3m}\}\}$, $X \in D_d(P_{3m-3}, i-1)$. Now to prove the result is true for $k = m+1$. Since the result is true for $k = m$ and $D_d(P_{3m}, i = m+1)$ contains all the possible detour dominating sets of P_{3m} of cardinality i, $X \cup \{u_{3m+3}\} \subset D_d(P_{3m+3}, i = m+2)$, where $X \in D_d(P_{3m}, i = m+1)$. Since $d_d(P_{3m}, i = m+1) = m$ and $d_d(P_{3(m+1)}, i = m+2) = m+1$, $X \cup \{u_{3m+3}\}$ can form m number of sets and we have to find the remaining one set of $D_d(P_{3m+3}, i = m+2)$. First form the detour dominating set S for P_{3m-2} with cardinality m. Since $u_{3m-2} \in S$, $\{u_1, u_4, \cdots, u_{3m-2}, u_{3m+1}\} \cup \{u_{3m+3}\}$ is the remaining detour dominating set for P_{3m+3}. Thus, there are m+1 number of sets in $D_d(P_{3(m+1)}, i = m+2)$.

Detour Domination Polynomial

Proposition 3.1. Detour domination polynomial of a complete graph is $(1+x)^n - 1 - nx$.

Proof. Since $D(K_n, i) = D_d(K_n, i)$, $\forall$ i = 2 to n, $d(K_n, 1) = n$ and by Theorem 1.1, we can prove the result.

Example 3.2. (i) $D_d(G, x) = x^{n-2} + 2x^{n-1} + x^n$, when G is a bistar.

(ii) For complete bipartite graph $K_{m,n}$, $D_d(K_{m,n},x) =$ {xn-1+xn D(Km,n, x) if m=1if otherwise

Theorem 3.3. $D_d(P_n, x) = x [D_d(P_{n-1}, x) + D_d(P_{n-2}, x) + D_d(P_{n-3}, x)]$, $n \geq 5$.

Proof. $D_d(P_n, x) = a_1 x_{dPn} + a_2 x_{dPn+1} + a_3 x_{dPn+2} + \cdots + a_k x^{n-1} + a_k x^n$, where $a_1 = d_d(P_n, \gamma_d(P_n))$, $a_2 = d_d(P_n, \gamma_d(P_n) + 1)$, … , $a_k = d_d(P_n, n)$, $k = n - [\gamma_d(P_n) - 1]$.

$D_d(P_n, x) = x[a_1 x_{dPn-1} + a_2 x_{dPn} + a_3 x_{dPn+1} + \cdots + a_k x^{n-2} + a_k x^{n-1}]$

$= x\{[d_d(P_{n-1}, \gamma_d(P_n)-1) + d_d(P_{n-2}, \gamma_d(P_n)-1) + d_d(P_{n-3}, \gamma_d(P_n)-1)]\, x_{dPn-1} + [d_d(P_{n-1}, \gamma_d(P_n)) + d_d(P_{n-2}, \gamma_d(P_n)) + d_d(P_{n-3}, \gamma_d(P_n)]\, x_{dPn} + \cdots + [d_d(P_{n-1}, n-2) + d_d(P_{n-2}, n-2)]x^{n-2} + d_d(P_{n-1}, n-1)x^{n-1}$

$= x\{[d_d(P_{n-1}, \gamma_d(P_n)-1)\, x_{dPn-1} + d_d(P_{n-1}, \gamma_d(P_n))\, x_{dPn} + \ldots + d_d(P_{n-1}, n-1)x^{n-1}] + [d_d(P_{n-2}, \gamma_d(P_n)-1)\, x_{dPn-1} + d_d(P_{n-2}, \gamma_d(P_n))\, x_{dPn} + \cdots + d_d(P_{n-2}, n-2)x^{n-2}] + [d_d(P_{n-3}, \gamma_d(P_n)-1)\, x_{dPn-1} + d_d(P_{n-3}, \gamma_d(P_n))\, x_{dPn} + \cdots + d_d(P_{n-3}, n-3)x^{n-3}]\}$

$= x[D_d(P_{n-1}, x) + D_d(P_{n-2}, x) + D_d(P_{n-3}, x)]$.

Note 3.4. (i) Since each detour dominating set contains at least two vertices, every polynomial is of degree at least 2.
(ii) Since $(D_d(P_n, x))'$ is of degree at least one, $D_d(P_n, x)$ is a strictly increasing function on $(0, \infty)$.
(iii) Since the coefficient of x^n is always 1, $(D_d(P_n, x))^{(n)} = n!$.
(iv) Detour domination polynomial of P_n contains only real roots when n = 2, 3, 4.
(v) Since each polynomial does not contain a constant term, x = 0 is a solution of $D_d(P_n, x)$, $\forall$ n ∈ N.
(vi) In the polynomial $D_d(P_n, x)$, the multiplicity of the root zero is $\gamma_d(P_n)$.

Theorem 3.5. Detour domination polynomial of two dimensional generalized hypercube network $Q(d_1, d_2)$, where d_1 or d_2 is two and the other one is n is $n^2x^2 + [n^2(n-1)]x^3 + \cdots + [(2n)C_{(n-1)} - (2n)]x^{n-1} + [(2n)C_n]x^n + \cdots + (2n)x^{(2n-1)} + x^n$.

Proof. Suppose $d_1 = 2$. Since one vertex from a row can dominate every vertex in the same row and only one vertex of the second row, and any two vertices can form the Hamiltonian path, each detour dominating set must contain at least one vertex of each row. Thus we get the detour domination polynomial $n^2x^2 + [n^2(n-1)]x^3 + \ldots + [(2n)C_{(n-1)} - (2n)]x^{n-1} + [(2n)C_n]x^n + \cdots + (2n)x^{(2n-1)} + x^n$.

Observation 3.6. (i) $D_d(P4, x) = x^2 + 2x^3 + x^4$.
(ii) $D_d(P5, x) = 4x^2 + 5x^3 + 5x^4 + x^5$.

Theorem 3.7. $D_d(Pn, x) = [nC_2 - (n-2)]x^2 + nC_3x^3 + nC_4x^4 + \cdots + nx^{n-1} + x^n$, where $n \geq 6$.

Proof. Since we can form Hamiltonian path between any two vertices of Pn, $\forall$ n ≥ 6, Pn is a

Hamiltonian graph. Let $\{u_1, u_2, \ldots, u_n\}$ be the vertex set of Pn. Let $u_1 \in V(Pn)$. Then u_1 can dominate every vertex in Pn except u_2 and also u_3 cannot dominate u_2. Thus $\{u_1, u_3\}$ is not a detour dominating set. Similarly, $\{u_2, u_4\}$, $\{u_3, u_5\}, \ldots, \{u_{n-2}, u_n\}$ are not detour dominating sets. Therefore, the number of detour dominating sets of cardinality two is $[nC_2 - (n-2)]$. Since any three or more vertices can form the detour dominating set, we can get the result.

Theorem 3.8. For every polynominal $D_d(P_n, x)$, $\forall$ n < 5, the local minimum value is zero at x = 0.

Proof. Since deg($D_d(P_n, x)$) ≥ 2, the degree of $D_d(P_n, x)'$ is at least 1.Thus, x = 0 is one of the critical points. Since $D_d(P_n, x)$ contains only positive coefficients and $\gamma_d(P_n) \geq 3$, ∀ n ≥ 5, $D_d(P_n, x)''$ is zero for n ≥ 5 at x = 0 and $D_d(P_n, x)'' > 0$, when n < 5. This implies $D_d(P_n, x)$ attains its minimum value at x = 0 ∀ n < 5 and that value is zero, since $D_d(P_n, x)$ contains no constant term.

Theorem 3.9. The set {$D_d(P_2,x)$, $D_d(P_3,x)$,…, $D_d(P_n,x)$} is linearly dependent at x=0.

Proof. Since at least one row or one column of the wronskian matrix is zero at x = 0, the determinant of the wronskian matrix is zero. Thus, n-1 polynomials are linearly dependent.

Observation 3.10. The polynomials in the set {$D_d(P_2,x)$, $D_d(P_3,x)$,…, $D_d(P_n,x)$} are linearly dependent in R.

ACKNOWLEDGEMENT

I am really appreciative of the anonymous referees' insightful comments, which enabled me to enhance my exposition. I am also grateful to my co- author for her invaluable assistance.

ABSTRACT

The most frequently reported cause of inferior heel pain is plantar heel pain. It has been calculated that the lifetime prevalence of PHP may reach10% of the general population. In fact, according to some writers, PHP causes 8% to 15% of foot sympatientoms in both non-athletic and athletic individuals. Evidence suggests that this disorder may not now be characterised by inflammation but instead by non-inflammatory degenerative changes in the plantar fascia. The aim of the study is to check effectiveness of myofascial trigger point manual therapy with self-stretching versus myofascial release with self stretching on plantar heel pain. A total number of 30 patients were selected for the study. Participants were divided into two groups of 15 patients in each group. Group A treated with myofascial trigger point therapy with ischemic compression with self stretching, and Group B was treated with myofascial release therapy with self stretching technique for 3 exercise sessions/week for 4 weeks. Outcome measures: NPRS and FFI. Test used to compare groups, within the group a paired sample t-test was used, and between the groups, an unpaired sample t-test was used. In within group comparison p- value of Group A is (<0.001), and p- value of Group B is (<0.001) in all outcome measures. While between group comparison p- value is

(>0.05). The study shows that all two groups were individually effective for plantar fasciitis. While comparing both techniques, there is similar effect on NPRS and FFI.

Keywords: Plantar heel pain, myofascial trigger point, ischemic compression, myofascial release, NPRS, FFI

INTRODUCTION

Plantar heel pain (PHP) is the source of inferior heel discomfort that is most usually reported[1]. The lifetime prevalence of PHP may reach 10% of the general population, according to calculations2. In fact, 8% to 15% of foot complaints in both non-athletic and athletic people, according to some writers, are caused by PHP[3] [4]. Adults between the ages of 40 and 60 have the highest frequency of PHP, regardless of gender4. Research points to non-inflammatory degenerative alterations in the plantar fascia as the current defining feature of this condition rather than inflammation[5]. Both surgical and nonsurgical methods of treating plantar heel pain have been proposed[6]. The evidence on corticosteroid therapy is unsatisfactory, Inconsistent data support the use of low-energy extracorporeal shockwave therapy. And the evidence for low-intensity laser and therapeutic ultrasound, respectively, is non-existent [7] [8]. Stretching the gastrocnemius and plantar fascia has shown some promise in the short-term therapy of plantar heel pain[7] [8]. The PF, also referred to as the plantar aponeurosis, is the investing fascial layer of the plantar aspect of foot. It is a component of the retinacular system, a network of adipose and connective tissues that guards and supports the body's essential support systems. This function is frequently static. On certain occasions, these tissues can serve a dynamic function through constraining or augmenting the musculoskeletal systems' range of motion past anatomical limitations[9]. The plantar fascia is a substantial, fibrous layer that covers and protects the plantar area of the foot. Its histological structure is made up of collagen and elastic fibres[10] [12]. Immunohistochemistry indicates that it is formed of elastic collagen fibres. The enormous interstitial tissues of the plantar area of the foot contain numerous elastic fibres of varied thicknesses that are organized in strand- and bundle-like networks. The subcutaneous PF connects to the plantar forefoot from the os calcis by an intricate network. The central, lateral, medial elements make up its three primary parts. Physically and medically, the core component makes up the majority of the plantar fascia. The major role of the media land lateral components is to serve as insulating layers for the central component[13].

Central component

The midline tubercle situated on the plantar aspect of the os calcis operates as the beginning of the central portion of the plantar fascia. Its fibres arise in the plantaris and Achilles proximal tendons. It has a sloping plantar orientation, bent cross section, and fits the medial tubercle. The 1.5-2 cm wide origin of the core component enlarges as it advances distally. Its fibres, which are spread longitudinally, attach to the muscle below, the flexor digitorum brevis. Medial and lateral intermuscular sepatientums, which secure the plantar fascia to the deep planta pedis, are produced when the plantar fascia surrounds the flexor digitorum brevis muscle on both sides[1][4].

Lateral component

The lat. Part of the PF is frequently a strongly developed area, however this varies. It has been thoroughly examined[15] [16]. 7% of specimens in a 410-ft study had lateral component structures. The development of these structures ranged from complete to almost nonexistent. This 1 to 1.5 cm wide segment of the plantar fascia arises from the medial tubercle of the lat. edge of the os calcis. It separates into a medial lateral segment when it approaches the cuboid, inserting into the base of the fifth metatarsal and fusing with the fascia of the ADM, respectively[17].

Medial component

The AH muscle's investing fascia has successfully expanded. Before joining the PF of foot, the medial portion of the structure, which is more pronounced distally, continues medially and in an oblique direction. When seen closely, the medial component is essentially absent[14].

Biomechanics

Each stage of locomotion, as well as when the foot is instance, the plantar fascia performs a specific biomechanical function. Significant static weight-bearing is performed by its structure. As stress was placed on the plantar fascia, the wavy to straight shapes of the elastic and collagen fibres also changed. The elasticity modulus of collagen fibres is typically thought to be higher than that of elastic fibers. The positioning of the elastic and collagen fibres produced a combination action that produced a maximum modulus when the elastic fibres were stressed first and the collagen fibres came under later tension. The modulus of the plantar fascia increased as the construction was put under more strain.The biomechanical characteristics of the plantar fascia, which initially extended readily before eventually stiffening, were ideal for the job of supporting the foot arch13. The biomechanical characteristics of the plantar fascia, which initially extended readily before eventually stiffening, were ideal for the job of supporting the foot arch[18]. For the majority of the foot flat stance duration, the intrinsic foot muscles exhibit verylittle electromyo graphic activity[19].Electromyographically activated extrinsic muscles were present in the statically stressed foot. The passive foot structures support themajority of the body's weight when a person is standing and carrying weight. The plantarfascia considerably contributes to support because of its attachments across the longitudinal arch[20]. The PF supplied the highest relative contribution to arch stability after loading and consequent sectioning through the plantar fascia, plantar ligaments, and spring ligament.The rigidity of the arch was reduced by 25% as a result of its division[21]. High tensile stresses were necessary for a biomechanical cadaver study before the plantar fascia gave out. At the point where the plantar fascia emerges from the heel bone, which is the most prevalent place for clinical plantar fascial rupatienture and indications of plantar heel pain, the majority of failures or rupatientures during testing occurred[21]. Hypotheses include tissue stress theory, sagittal plane facilitation theory, inflammationtheory, and other ideas have all been put out to explain the pathological process of this ailment, as indicated by the large range of PHP and F treatments currently available. Myofascial trigger points (MTrPs) have not yet been proven to be effective in the therapy of PHP and F, nevertheless. It is possible that several studies were left out of the Landorfand Menz review due to the study design, criteria, search strategy, and data needs[22][23]. A palpable nodule in a taut band is a myofascial trigger point, a very sensitive area of skeletal muscle. Compression can produce motor dysfunction, autonomic irregularities, transferred discomfort, and conventional referred pain in addition to the localized pain it causes[24]. Ischemic compression is one remedy for these sympatientoms. IC refers to the trigger point being rendered inactive by sustained pressure that is both sufficient and long enough. Theskin will turn blanched when released, but reactive hyperemia will soon follow. It is believed that changes in muscle circulation can be reflected in variations in skin perfusion. According to the proposed process, capillaries are empatientied, shorter sarcomeres are temporarily stretched, there is an ischemic nerve block, rebound hyperemia occurs, and finally chemicals and metabolites that encourage muscular contraction are flushed out[25]. Applying a low load, prolonged stretch to the myofascial complex in order to restore opatientimal length, reduce discomfort, and improve function is known as my MFR[26].

MATERIALS AND METHODOLOGY

Every patient was evaluated in accordance with the evaluation format. Individuals who passed the screening were chosen to participate in the study. All patients received an explanation of the technique. The patients' full written informed permission was obtained.30 patients in total were chosen for the study. Each patient had a preliminary screening utilising a straightforward selection Performa patient to the IC. Those who met this sympatientomatic requirement had a thorough physical examination. Chosen patients who agreed to participate were then split two groups, each 18 patients. Inclusion criteria were Age: 20 to 30 years, Gender: Males and females[37], Insidious onset of sharp pain under the plantar heel surface upon weight bearing after a period of non weight bearing[39][41]Plantar heel pain that increases in the morning with the first steps after waking up, Sympatientoms decreasing with slight levels of activity, such as walking[39][41] Exclusion criteria were Red flags to manual therapies (i.e., tumor, fracture, rheumatoid arthritis, osteoporosis, severe vascular disease, etc.),Bilateral plantar heel pain, Prior surgery in the lower extremity, Diagnosis of fibromyalgia syndrome, Previous manual therapy interventions for the foot region[37] When the patients were questioned and the baseline results of PHP NPRS and foot function index were, the individuals

were split into two groups for the second evaluation session. Group A Myofascial trigger point release with ischemic compression with self stretching (N = 15). Group B Myofascial release with self stretching (N = 15) The intervention was given 3 Days / Week for 4 Weeks

PROCEDURE

Group A: Myofascial trigger point therapy with ischemic compression with Self stretching[42]
Patient's position: prone with feet of the end of the table to allow for easy dorsiflexion.
Therapist's position: sitting on a stool at the end of the table.
Technique: the pressure was perpendicularly performed through the thumb until the patient's pain threshold, which was the moment in which the sensation changed from pressure to pain, and that pressure was maintained for 90 seconds × 3 repetitions.
Self stretching of plantar fascia [43]
Dosage: intermittent stretching of 20 seconds, followed by 20 seconds rest for a total of 3 minutes for each stretch.

Group B: Myofascial release with self stretching[37]
Patient's position: prone with feet of the end of the table to allow for easy dorsiflexion.
Therapist's position: sitting on a stool at the end of the table.
Technique: use the knuckles to engage the soft tissue just anterior of the calcaneus. Take up a line of tension in an anterior direction. Work to the ball of the foot as well as into deeper layers with toe flexion and extension from the patient's side (90 seconds × 3 repetitions).
Self stretching of plantar fascia [43]
Dosage: intermittent stretching of 20 seconds, followed by 20 seconds rest for a total of 3 minutes for each stretch.

RESULT

SPSS version 26.0 the collected data were analyzed. The data were normally distributed so the parametric test is statistically analyzed. The collected demographic values were compared between and within the groups with a p-value <0.001 using an unpaired and paired t-test. Age Distribution (Table 1). Age distribution graph (Figure 1).

Within group comparison: Paired Sample t test. Table 2: Group-A Pre-Post Mean values for Numeric pain rating scale (Group A). Group-A Pre-Post Mean values Foot Function Index. Graph 2: Comparison of Pre-Post NPRS and FFI of Group-A. Group B. Table 3: Group-B Pre-Post Mean values for Numeric pain rating scale. Group-B Pre-Post Mean values Foot Function Index. Comparison of Pre-Post NPRS and FFI of Group-B (Figure 3). Between Group Comparison: Independent Sample t test. Comparison between Group-A and Group-B. Table 4: Comparison of Group-A (Myofascial trigger point therapy) and Group-B (Myofascial release therapy). Figure 4: Comparison of NPRS and FFI of Group-A and Group-B

DISCUSSION

The intention of the current study was to assess the efficacy of MTrP with self stretching versus MFR on plantar heel pain. Thirty patients went through the investigation at Sainath Hospital. According to the inclusion criteria, the age spectrum for the patients was 20 to 50 years for both men and women, who were separated into two groups using a lottery-style simple random sample. Subjects in groups A and B received therapy for a total of 3 days per week for 4 weeks, with group A receiving MTrP with ischemic compression and self stretching, and group B receiving MFR with self stretching. NPRS and FFI scores from before the intervention, the first day, and four weeks afterwards served as outcome variables. According to this study's statistical analysis, group A's p-value for the comparison of the numeric pain rating scale and foot function index within groups is 0.001 and group B's p-value is 0.001, both of

which are (p0.05). As a result, it matters in GROUP A and B. Both groups' improvements on FFI and NPRS are comparable when compared between the groups. The non-inflammatory deterioration to the PF has been proposed to be the cause of PHP. Since there is little Histopathological evidence of inflammation, tissue samples from patients with chronically painful PF show results that are more consistent with an insufficient healing response process. During the healing process, the tissue exhibits fibrosis, immature vascularization, tissue loss, and infiltration of macrophages, lymphocytes, and plasma cells. A self-sustaining cycle of degeneration results when Angiofibroblastic hyper plastic tissue replaces the healthy fascia tissue and spreads into the surrounding tissue[44]. The circulating MTrP also interferes with physiological metabolic processes. By analyzing micro quart volumes of interstitial fluid using a micro analytic method, Shah etal.'s revolutionary research looked at the interstitial milieu of active, latent, and non- trigger point sites. Their study revealed that the amounts of inflammatory mediators, neuropepatientides, catecholamines, and cytokines were different in people with active MTrPs in the uppertrapezius muscle compared to people with latent MTrPs or people without MTrPs. Even though the physiology of an MTrP is now well known, interstitial fluid sampling's viability close to a therapeutic intervention is still up for debate[45][46]. A physiologic change at the MTrP and a pain-relieving effect areboth suggested by the fact that applying massage techniques to MTrPs raises the local pain-pressure threshold and lowers referral pain fields. The MTrP is gently compressed during ischemia compression, also known as trigger point release, typically using the fingers. This technique raises the pain-pressure thresholdin an MTrP. Even if the MTrPs physiology after intervention has not been investigated, it is crucial to do so in order to substantiate claims that patients report feeling less sensitive to pain, to offer treatment alternatives more validity, and to comprehend how something works[47]. Two patients with chronic headaches underwent micro dialysis to compare the interstitial fluid from an active MTrP before and after trigger point release. The goals of this study were to (1) evaluate the feasibility of trigger point release at an active MTrP during interstitial fluid collection and (2) evaluate the feasibility of doing so to show the physiological changes in blood flow and carbohydrate metabolites within the active MTrP following trigger point release[48].A soft tissue mobilization treatment as myofascial release (MFR) is employed for long- term disorders that cause tension and constriction in soft tissues. By changing the ground substance's viscosity to a more fluid state, myofascial release therapy relieves the fascia's excessive pressure on the pain-sensitive structure and returns the body to its naturalalignment. Hence this stretching technique is proposed to act as a catalyst in the resolution of PHP[49]. With the use of the fingers, thumb, forearm, or elbows, the direct MFR approach continuously applies regulated mechanical stress on the constraint in order to improvesoft tissue mobility. Pressure is gradually increased until the tissue begins to feel movable[50]. Indirect techniques are done similarly, but the amount of force employed, compared with that in direct techniques, is lower in intensity and considerably longer in duration, which gives the tissue an opportunity to “melt” or release[50].

CONCLUSION

According to the statistical analysis, the study shows that both the Techniques GROUP An(Myofascial trigger point therapy with ischemic compression with self-stretching) and GROUP B (Myofascial release therapy with self-stretching) were individually effective in reducing pain on numeric pain rating scale and on foot function index. While comparing both the techniques, there is reducing pain on numeric pain rating scale and improve in foot function index.

Limitation of Study

- Inter rater and intra rater reliable outcomes.
- There was no long-term follow-up of the patients.

Recommendations for Future Study

- Future studies should be done on the effectiveness of other techniques and modalities.
- The same study can be done with longer follow up.
- The study can be done with a large sample size.

ABSTRACT

The Siddha system of medicine is one such ancient traditional system of India. *A Powthiram* is characterized as a sinus present inside or outside the anus or urethra. The common symptoms are redness, itching, pain around the anus, and bloody or pus discharge from the tract. There are various formulations indicated for *Powthiram* that are profoundly scattered in Siddha literature. So, this review attempts to collect and compile the internal and external medicine for *Powthiram*. The literature review was conducted after getting IRRB approval. A total of 630 pieces of Siddha literature were reviewed at the Library of the National Institute of Siddha, *Chennai.* Library of Government Siddha Medical College, *Palayamkottai*. Library of Government Siddha Medical College, *Chennai.* Siddha Central Research Institute Library, *Chennai*. The Connemara Public Library, Egmore, Chennai. The Anna Centenary Library, *Chennai*. Saraswathi Mahal Library, *Thanjavur*, Tamil Nadu, and various formulations were collected. In this review, 149 formulations were collected from 40 books; of these, 92 internal medicines and 57 external medicines are indicated for *Powthiram.* The data collected in this review will be used for academic and research purposes. This report may be used as a handbook for the literature collection of internal and external medicines for *Powthiram* in the coming days.

Keywords: Siddha medicine, *Powthiram* (Fistula -in -ano), Fistula, Literature review.

INTRODUCTION

The Siddha system of medicine (SSM) is an ancient traditional system of medicine in India. It is practiced mostly in the southern part of the country for treating various diseases, commonly chronic conditions. As per Saint *Yugi*, diseases were classified based on signs and symptoms. A *Powthiram* is characterized as a sinus present inside or outside the anus or urethra[1]. According to *Yugi Vaithiya Sinthamani*, the *Powthiram* disease is divided into 8 types. These types are *Asana Powthiram, Kodi Powthiram, Pakka Powthiram, Moola Powthiram, Kiranthi Powthiram, Mega Powthiram, Asana Kandamalai, and Sara Kandamalai[2]*. The common symptoms are redness, itching, and pain around the anus region, bloody or pus discharge from the tract. The risk factors of *Powthiram* in Siddha literature are prolonged sitting, consuming spicy foods, horse mounting, elephant climbing, and foods that cause piles[1]. The Siddha system is a holistic system of medicine. It can cure, manage, and prevent diseases. Medicines are classified into Aga marunthugal (internal medicine) and Pura marunthugal (external medicine). There are various internal and external formulations indicated for *Powthiram* are profoundly scattered in Siddha literature. The compilation of these formulations may help in the effective treatment of *Powthiram* in the upcoming days. Hence, this study was undertaken to collect and document the medicines for *Powthiram*, which are mentioned in Siddha literature.

MATERIALS AND METHODS

Literature evidence of Internal and External medicines for *Powthiram* mentioned in Siddha literature was collected from various libraries such as the Library of National Institute of Siddha, *Tambaram Sanatorium, Chennai*, Library of Government Siddha Medical College, *Palayamkottai, Tirunelveli*, Library of Government Siddha Medical College, *Arumbakkam, Chennai,* Siddha Central Research Institute Library, *Arumbakkam, Chennai*, The Connemara Public Library, Pantheon road, Egmore, *Chennai,* Saraswathi Mahal Library, *Thanjavur, Tamilnadu,* The Anna Centenary Library, *Kotturpuram, Chennai*. The collected data were analyzed, compiled, and organized based on internal and external medicinal forms and documented.

RESULT

In this review various medicines for *powthiram* mentioned in siddha literatures were collected and compiled. These are categorized into internal and external medicinal forms. The internal and external medicinal forms for *powthiram*, authors mentioned about *powthiram* medicines, mostly used herbs, and mostly used metals and minerals are listed in table 1and 2, table 3, table 4 and table 5 respectively. *Mooligai, thathu* and *jeevam* drugs used for *powthiram* are listed in chart 1.

DISCUSSION

The collected data showed that a total of 40 Siddha literatures have internal and external medicinal forms for *powthiram*. Among these 40 books, 149 preparations for *powthiram* were collected. Of these 149 preparations, internal medicines for *powthiram* are 92 and external medicines for *powthiram* are 57. Out of 32 types of internal medicines, 14 forms were collected. These are, *kudineer-1, utkali-2, adai-1, chooranam-14, vadagam-1, nei-10, legiyam-8, ennai-10, mathirai- 4, mezhugu-10, rasapathangam-2, chenduram-16, parpam-12, kalangu-1*. And out of 32 types of external medicines, 10 forms were collected. These are, *patru-9, poochu-1, pugai-2, kalimbu-7, seelai-10, neer-4, thiri-1, podi-1, karam-4, veliprayoga ennai-18*. Out of 40 Siddha literature, 13 books are in the name of *siddhar agathiyar*, 3 books are in the name of *brammamuni,* 1 book is in the name of *pulipani,* 1 book is in the name of *bogar* and 22 books are not titled in the name of any siddhars. Among 149 formulations, a major combination of mooligai and thathu drug formulations is used for *powthiram*. Apart from that, *mooligai* and *thathu* drug formulations are also separately used

for *powthiram*. Other than mooligai drugs, thathu, and jeevam drug formulations are also used. Mooligai drug formulations are in 17%, thathu drug formulations are in 5%, mooligai, and thathu drug formulations are in 42%, mooligai, and jeevam drug formulations are in 10%, thathu, and jeevam drug formulations are in 1%, and mooligai, thathu and jeevam drug formulations are in 25%. Most of the herbs used in various formulations are *Kuppaimeni (Acalypha indica), Parangipattai (Smilax china), Kodiveli (Plumbago indica), Kadukkai (Terminalia chebula), Vetpalai (Wrightia tinctoria), Nannari (Hemidesmus indicus), Abini (Papaver somniferum), Vengayam* (*Allium cepa*), and *Poondu* (*Allium sativum*). These above-mentioned herbs have wound healing, anti microbial, analgesic, anti- inflammatory, and anti oxidant activities. And many of the metals and minerals used in various formulations are *Rasam (*Mercury*), Manosilai (*Galena*), Ganthagam (*Sulphur*), Thalagam (*Red sulphide of mercury*), Sangu* (Conch shell) and *Vengaram* (Borax).

CONCLUSION

The data collected in this review will be used for academic and research purpose. This report may be used as a handbook for literature collection of internal and external medicines for *Powthiram* in the upcomings days and and it should be scientifically validated by clinical trial in future.

ABSTRACT

"A function is said to be a Geometric mean labeling of a graph $G = (V, E)$ if there exists one-one function f from $V(G)$ to the set $\{1,2,3, \ldots \ldots |E(G)|\}$ such that each edge xy assigned the label defined to be as, $f^*(uv) = \left\lfloor \sqrt{f(u)f(v)} \right\rfloor \forall\, uv \in E(G)$ which is onto. In this paper, we investigate the existence of geometric mean labelings for the m-shadow graph of certain graphs.

Keywords: Geometric mean labeling, geometric mean graph, m-shadow graph.

INTRODUCTION

A simple, finite and undirected graph $G = (V(G), E(G))$, where $V(G)$is the set of vertices of G and $E(G)$is set of edges of graph G. For all the terminologies and notations related to graph theory, we follow Harary [1]. A graph labeling is an assignment of integers (or sometimes other symbols) to the vertices, edges, or both, of a graph, according to certain rules. Let $G = (V, E)$ be a graph. A labelling is a function $f: V \cup E \rightarrow S$ where S is a set of labels (usually integers), such that the assignment satisfies some injectivity (no repeats) and/or structural conditions (e.g. edge labels derived from vertex labels) [2]. A graph is said to be Geometric mean Labelling has assign distinct integers from

$\{1,2,\ldots,|E|+1\}$ to the vertices. Each edge uv gets the label as $f^*(uv) = \left\lfloor\sqrt{f(u).f(v)}\right\rfloor$ the edges must be exactly $\{1,2,\ldots,|E|\}$ [3]

Definition 1.1 ([2]). The graph obtained by joining the center vertices of two copies of $K_{1,n}$with an edge is called bistar $B_{n,n}$

Definition 1.2 ([2]). The shadow graph $D_2(G)$ of a connected graph G is constructed by taking two copies G_1 and G_2 of G and joining each vertex u of $G_1$to the neighbors of the corresponding vertex v in G_2.

Definition 1.3 ([4]). The m-shadow graph $D_m(G)$of a connected graph G is constructed by taking m copies $G_1, G_2, \ldots\ldots, G_m$ of G, and joining each vertex u in G_i to the neighbors of the corresponding vertex v in G_j for 1 ≤ i,j ≤ m. By definitions, 2-shadow graph is shadow graph $D_2(G)$

MAIN RESULTS

Theorem 2.1:
$D_m(P_n)$ is a geometric mean graph for all $m \geq 2$ and $n \geq 2$.

Proof.
Let $G = D_m(P_n)$. Then $|V(G)| = mn$ and $q = |E(G)| = m^2(n-1)$. For each path layer $\ell = 1,\ldots,n-1$, the edges between the m copies of v_ℓ and $v_{\ell+1}$ form a complete bipartite block E_ℓ of size m^2. Fix a bijection
$\psi: E(G) \longrightarrow \{1,\ldots,q\}$
so that E_ℓ corresponds to the consecutive set $H_\ell = \{(\ell-1)m^2+1,\ldots,\ell m^2\}$. Gap-filling lemma (used in all proofs) For any $m \geq 2$ and any consecutive block$H = \{s+1,\ldots,s+m^2\}$, there exist disjoint m-sets $A = \{a_1 < \cdots < a_m\}, B = \{b_1 < \cdots < b_m\}$ of positive integers such that
$\left\{\left\lfloor\sqrt{a_p b_q}\right\rfloor : 1 \leq p,q \leq m\right\} = H$
One explicit choice is obtained by fixing any large X and taking
$A = \{X+1,\ldots,X+m\}, B = \left\{\left\lfloor\frac{(s+j)^2}{X+i}\right\rfloor : 1 \leq j \leq m, i \in \{m\}\right\}$
then slightly adjusting (by at most m) to make B strictly increasing and disjoint from A; since the squaregap widths $(k+1)^2 - k^2 = 2k+1$ exceed m^2 when $k \geq s \geq m^2$, we can place exactly one product in each gap $[k^2,(k+1)^2)$ for $k \in H$.

Example 2.1. Geometric mean labelling $D_4(P_5)$ of is shown in Figure 1.

Remark
Apply the lemma to each block H_ℓ, obtaining disjoint m-sets S_ℓ and T_ℓ. Label the m copies of v_ℓ by S_ℓ and the m copies of $v_{\ell+1}$ by T_ℓ. Choose all these sets pairwise disjoint and contained in $\{1,\ldots,q+1\}$; this is possible because we need $mn \leq q+1 = m^2(n-1)+1$ for $m \geq 2$. Then the vertex labeling is injective, and each block E_ℓ contributes exactly the labels in H_ℓ. Hence f^* is a bijection onto $\{1,\ldots,q\}$.

Theorem 2.2
$D_m(K_{r,t})$ is a geometric mean graph for all $m \geq 2$ and $r,t \geq 1$.

Proof
Let $G = D_m(K_{r,t})$. Then $|V(G)| = m(r+t)$ and $q = |E(G)| = m^2rt$. Each original edge u_iv_k expands to an $m \times m$ complete bipartite block $E_{i,k}$ of size m^2. Index edges so that every block $E_{i,k}$ is assigned a disjoint consecutive set $H_{i,k} = \{((i-1)t+(k-1))m^2+1,\ldots,((i-1)t+k)m^2\}$. By the gap-filling lemma, for each pair (i,k) we can choose

disjoint m-sets $A_{i,k}$ and $B_{i,k}$ with $\left\lfloor\sqrt{A_{i,k}B_{i,k}}\right\rfloor = H_{i,k}$ bijectively. Assign $A_{i,k}$ to the m copies of u_i and $B_{i,k}$ to the m copies of v_k; do this with all sets pairwise disjoint and contained in $\{1, \dots, q+1\}$ (possible since $m(r+t) \le q+1 = m^2rt+1$ for $m \ge 2$ and $r, t \ge 1$). Then f is injective and each block contributes exactly its m^2 intended edge labels, so f^* is bijective onto $\{1, \dots, q\}$.

Example 2.2 Geometric mean labelling of $D_3(K_{2,3})$is shown in Figure 2.

Theorem 2.3
$D_m(B_{n,n})$ is a geometric mean graph for all $m \ge 2$ and $n \ge 2$.

Proof
Let $B_{n,n}$ have centers u_0, v_0 and leaves $u_1, \dots, u_n$ and $v_1, \dots, v_n$. In $D_m(B_{n,n})$, the edges split into $2n+1$ blocks of size m^2 : the central block (u_0, v_0), the n blocks (u_0, u_i), and the n blocks (v_0, v_k). Thus $q = m^2(2n+1)$. Assign to these $2n+1$ blocks pairwise disjoint consecutive sets H that partition $\{1, \dots, q\}$. For each block, use the gap-filling lemma to pick two disjoint m-sets whose products fall one-per-gap over that block. Make all vertex-label sets pairwise disjoint and contained in $\{1, \dots, q+1\}$ (feasible since $|V| = m(2n+2) \le q+1 = m^2(2n+1)+1$ for $m \ge 2$). Then f is injective and every block maps bijectively to its assigned H, whence f^* is a bijection $E(G) \to \{1, \dots, q\}$.

Example 2.3 Geometric mean labelling of$D_3(B_{4,4})$ is shown in Figure 3.

Theorem 2.4
If $n \equiv 0(\text{mod}4)$ and $n \ge 4$, then $D_m(C_n)$ is a geometric mean graph for all $m \ge 2$.

Proof.
Let $G = D_m(C_n)$. Then $|V(G)| = mn$ and $q = |E(G)| = m^2n$. For each $i \in \{1, \dots, n\}$ (indices modulo n), the edges between the m copies of v_i and the m copies of v_{i+1} form a block E_i of size m^2. Fix a bijection $\psi: E(G) \to \{1, \dots, q\}$ so that each E_i is assigned the consecutive set $H_i = \{(i-1)m^2 + 1, \dots, im^2\}$.
Since n is even, G is bipartite; write the vertex columns in alternating classes
$V_1 = \bigcup_{i \text{ even}} \{v_i^1, \dots, v_i^m\}, V_2 = \bigcup_{i \text{ odd}} \{v_i^1, \dots, v_i^m\}$
Choose pairwise disjoint m-sets $S_i \subset \{1, \dots, q+1\}$ to label the copies of v_i. We must ensure, for all i,
$\{\lfloor\sqrt{ab}\rfloor : a \in S_i, b \in S_{i+1}\} = H_i$ (bijectively) $*$
Construct S_i as follows. First pick all even columns $S_2, S_4, \dots, S_n$ far apart on the number line (still inside $\{1, \dots, q+1\}$), with $|S_{2j}| = m$ and all sets pairwise disjoint. Then, going around the cycle, select each odd S_{2j+1} using the gap-filling lemma twice. once to realize H_{2j} with S_{2j} and once to realize H_{2j+1} with S_{2j+2}. Because the square-gaps beyond index m^2 have width $> m^2$ and the even sets are well separated, a single m-set S_{2j+1} can be positioned to satisfy both adjacent blocks simultaneously without intersecting any previously chosen set. The condition $n \equiv 0(\text{mod}4)$ guarantees that this alternating construction closes consistently when we return to S_1 and S_n. With these S_i, property (*) holds for every i, the vertex labels are injective and lie in $\{1, \dots, q+1\}$, and the blocks H_i partition $\{1, \dots, q\}$. Hence f^* is a bijection $E(G) \to \{1, \dots, q\}$, so $D_m(C_n)$ is a geometric mean graph.

Example 2.4 Geometric mean labelling of$D_3(C_8)$is shown in Figure 4.

Application in Cryptographic Key Generation
Graph labeling has found increasing utility in information security, particularly in the design of cryptographic systems where numerical uniqueness and symmetry are essential. The labeling scheme proposed through *geometric mean labeling* can be effectively adapted for pairwise key generation in secure communication networks. Let $G = D_3(K_{2,3})$denote the *3-shadow graph* of the complete bipartite graph $K_{2,3}$. The function $f: V(G) \to \{1,2, \dots, 55\}$ is defined injectively, and the induced edge labelling

$f^*(uv) = \lfloor\sqrt{f(u)f(v)}\rfloor$
assigns distinct integer values to all edges $uv \in E(G)$.
Each such edge label may represent a unique session key or encrypted communication link between two vertices.

Illustration
Consider u_1^1 and v_1^2 with labels $f(u_1^1) = 52$, $f(v_1^2) = 45$.
Then$f^*(u_1^1 v_1^2) = \lfloor\sqrt{2340}\rfloor = 48$.
This acts as a derived cryptographic key between these two nodes.

Remarks
By extending this concept to larger *m-shadow graphs*, vertex labels represent public nodes while edge labels serve as session keys, providing unique, symmetric, and nonlinear encoding for graph-based cryptographic systems.

CONCLUSION

In this study, we have shown that the m-shadow graphs of paths, complete bipartite graphs, bistars, and cycles with order divisible by four all admit geometric mean labelings. These results demonstrate that the geometric mean approach can be successfully extended to graph classes with structured repetition, thereby broadening the scope of labeling theory. The work highlights the adaptability of mean-based labelings and sets the stage for future exploration. In particular, this framework may be extended to other families such as wheel graphs, fan graphs, ladder graphs, and various graph products, where similar constructions could reveal new patterns. Developing algorithmic techniques for geometric mean labeling would also make the method practical for large or dynamic networks. Moreover, because mean-based distributions often arise in balancing problems, these ideas may find applications in network routing, coding theory, and data allocation models".

ABSTRACT

Accurate time series forecasting in noisy, irregular datasets remains a significant challenge for financial and scientific applications. This paper introduces a robust hybrid framework that quantifies data irregularity using Sample Entropy, enabling effective identification and pre-processing of the time series. Only segments deemed sufficiently regular are selected for downstream prediction using Extreme Learning Machine (ELM), a fast and flexible neural model recognized for its competitive performance in time series analysis. Comparative experiments on benchmark datasets demonstrate that the proposed hybrid method achieves significantly lower Root Mean Square Error (RMSE) than conventional approaches, thereby underscoring its utility for data-driven forecasting in the presence of noise. The results highlight the importance of integrating entropy-based data assessment with advanced machine learning predictors for reliable time series analysis.

Keywords: Time series, Prediction, Index and Commodity prices, Sample Entropy, Extreme Learning Machine.

INTRODUCTION

It's crucial for investors to strike a balance between seeking rapid returns and managing risk. The interconnected nature of economic growth, investor returns, and the impact of precious metal prices, particularly gold, crude oil,

and market indices. Investors indeed seek rapid returns on their investments, and the performance of various assets, including precious metals and commodities, can play a crucial role in determining returns. Gold is often considered a safe-haven asset and a store of value. Crude oil is a critical commodity with implications for various industries. Oil prices can impact inflation, production costs, and consumer spending specially country like India. The markets have developed a variety of instruments that offer a platform for buying and selling of these assets. Therefore, investors need to have foresight into price fluctuations. These factors aid investors in making informed choices regarding trading strategies. Therefore, it is important to analyse the volatility of market prices for these kinds of assets. In our investigation we have considered different commodity prices and Nifty 50.

The insight of forecasting of Gold price using long duration past data whose traded value in MCX (Multi Commodity Exchange) through time-series ARIMA (autoregressive integrated moving average) model gave highly accurate predicted results for short time period with small price fluctuation. In case of sudden high variation in gold price, this method fails and hence implementing non-linear forecasting technique becomes essential [6]. A Similar study on historical data of gold in the USA was done to predict future prices using multiple regression models. In this study multicollinearity, heteroscedasticity and auto-correlation methods with quasi difference method is used on the time-series data. But, they have used only 30 data points which is very small for normality assumption [12]. Majority countries import high volumes of crude oil which is an international price driven commodity. So, price forecasting become vital in buying strategies. In [11] Xia *et al.* have used wavelets denoising ARMA algorithm and extract features from the data. They have used least squares support vector regression on different wavelets family and obtained better generalised forecasting results.

The empirical results received significant performance compare to bench-marks models. It is known that, the stocks are divided in to three categories: Overpriced stocks, Under-priced stocks and Fairly priced stocks. Harel *et al*. [7] in their study have used the area under Receiver Operator Characteristic (ROC) to identify the type of stock and based on that, decision can be taken for buying of the stock. One more method namely, stock ranking method using multiple attribute decision making (MADM) based on complete performance under a stochastic condition is applied to stocks. This model is tested for 13 companies in the field of Information Technology sector with different criteria as performance indicators of a company. Using p-norm ($p > 1$), this model provide significant information about performance of a particular stock in comparison with its peers. It also helps to separate good companies from inferior companies in the sector [3].

Nowadays, the entropy concept is also used for financial market to predict stock market indices and commodity prices. The entropy can be used to check the irregularities and complexity of the time series data. The sample entropy is applied to time series data of the FTSE China A50 Index to test forecasting accuracy. The data was also tested with buy-and-hold strategy, Relative Strength Index (RSI) and the Moving Average Convergence Divergence (MACD) indicator. Among all these approaches, Sample Entropy gave best forecasting with highest positive return using appropriate parameters for long period. For short time holding period, results were not good [1]. The multiscale extension for cross sample entropy (MSCE) with two time series data was done to test the relationship between stock markets and international crude oil price with different parameters. This analysis provides synchronicity level between stock markets and international crude oil price that helps in forecasting prices [20].

The machine learning approach in forecasting the market index and various commodities prices is also proven as advanced technique [18]. The study using novel hybrid forecasting models with variational mode decomposition and an optimized outlier-robust extreme learning machine was designed for point forecasting and interval forecasting system and tested for three metal prices (Zinc, Nickel and Gold). The numerical and graphical results were better than any single statistical model [5]. Wang *et.al.* [19] have analysed the effects of Internet Concern(IC) which includes climate and war concern indices and effect of this indices on the oil price volatility. They have investigated oil price forecasting using an Extreme Learning Machine algorithm with intrinsic mode functions (IMF), waveforms extracted by signal processing techniques. The results obtained using this technique indicates the better forecasting performance than those of traditional forecasting techniques.

From the literature review it is observed that researchers have used many statistical and machine learning methods for forecasting. Many forecasting methods use the data without testing its regularity. So, despite good forecasting methods, sometimes predictions do not give satisfactory results. In our work, we have collected data from various reliable web-sources, and before applying forecasting method, the datasets are initially tested for their regularity and volatility using sample entropy (SampEn). After analysing a regular and an irregular data set, forecasting method is applied only to the regular dataset. In our work we have used extreme learning machine technique for forecasting and observed that this hybrid method raises the accuracy in forecasting.

METHODOLOGY

Our work is split into two stages. The first stage uses a statistical technique called the Sample Entropy method to determine whether the data set is regular. The second stage uses the Extreme Learning Machine for forecasting the time series data.

Sample Entropy (SampEn)

Sample Entropy (SampEn) is a Method for computation of the entropy of a system represented by a time series. Sample Entropy algorithm is an alternative method for entropy estimation in real world data. When self-matches are excluded from the probability calculation, SampEn (m, r, N) is precisely the negative natural logarithm of the conditional probability that two sequences that are similar for m points stay similar at the next point. Consequently, a lower SampEn value likewise denotes a higher degree of self-similarity in the time series. SampEn exhibits relative consistency and is mostly independent of record length. For every calculation, N, m, and r have to be constants. The time series' length (N), the length of the sequences to be compared (m), and the tolerance for admitting matches (r) are all given. Setting the tolerance to r×SD, which is the data set's standard deviation, makes it easier to compare measurements made on data sets with varying amplitudes.

The Sample Entropy is defined as $Samp\ En(m,r,N) = -log\left[\frac{A^m(r)}{B^m(r)}\right]$. [4,16].

Where,

$$A^m(r) = \frac{1}{N-m-1}\frac{1}{N-m}\sum_{i=1}^{N-m}\sum_{j=1,j\neq i}^{N-m}[Number\ of\ times\ that\ d[|x_{m+1}(j) - x_{m+1}(i)|] < r]$$

And

$$B^m(r) = \frac{1}{N-m-1}\frac{1}{N-m}\sum_{i=1}^{N-m}\sum_{j=1,j\neq i}^{N-m}[Number\ of\ times\ that\ d\ [|x_m(j) - x_m(i)|] < r]$$

Extreme Learning Machine (ELM)

An Extreme Learning Machine (ELM) is a single hidden layer feed-forward neural network (SLFN) randomly taking input weights. There is no learning of weights but output weights are calculated analytically. Due to this, the learning speed of the network is extremely fast [14]. Structure of ELM (Figure-1). Consider the 'N' number of training samples with the 'n' number of input parameters and the 'm' number of output parameters. For N arbitrary distinct time series data set Xi,Ti/i=1,2,3,…,N, where, Xi=xi1,xi2,xi3,…,xinTRn are input vectors and Ti=ti1,ti2,ti3,…,timTRm are output vectors.

Wi=wi1,wi2,wi3,…,winT ,i=1,2,3,…,L from jth input node to the ith hidden node, where i=1, 2, 3,…, L; j=1, 2, 3,…, n be the random weights.

The hidden layer output is calculated as,

H = $\sum_{i=1}^{L} g(W_i \cdot X_j + b_i)$, where,$j = 1, 2, 3, \dots ,\ n.$ and the Sigmoid function $g(x) = \frac{1}{1+e^{-x}}$, is an activation function.

The network output is given by,

$\boldsymbol{H}\beta = \sum_{i=1}^{L} \beta_i\, g(W_i \cdot X_j + b_i),\ j = 1,2,3, \dots, n$……..[1]

Where $\beta_i = [\beta_{i1}, \beta_{i2}, \beta_{i3}, \dots, \beta_{im}]^T$ is the weight vector corresponding to the i^{th} hidden node and the j^{th}output nodes, b_i is the bias of the i^{th} hidden node.

The objective is to find the weight vector β which minimize the linear system $\boldsymbol{H\beta = T}$……...[2]
For equation (2), the matrix forms are:

$$H(W_1, W_2, \dots, W_L, b_1, b_2, \dots, b_L, X_1, X_2, \dots, X_N) = \begin{bmatrix} g({W_1}^T \cdot X_1 + b_1) & \cdots & g({W_L}^T \cdot X_1 + b_L) \\ \vdots & \cdots & \vdots \\ g({W_1}^T \cdot X_N + b_1) & \cdots & g({W_L}^T \cdot X_N + b_L) \end{bmatrix}_{N \times L}$$

$$\beta = \begin{bmatrix} \beta_1^T \\ \vdots \\ \beta_L^T \end{bmatrix}_{L \times m} \quad \text{and} \quad T = \begin{bmatrix} T_1^T \\ \vdots \\ T_N^T \end{bmatrix}_{N \times m}$$ (Ref. [8,9])

The minimum norm least-squares solution of eq. (2) is unique, which is $\hat{\beta} = \boldsymbol{H^{\dagger}T}$ **.**
Since the matrix H is not a square matrix, the generalize inverse of the hidden layer matrix H is determined using Moore–Penrose generalized inverse of matrix, denoted as $H^{\dagger}$[17,15].

For SLFN with L hidden nodes and N arbitrary distinct samples,(X_i, T_i), where $X_i \in R^n$ and $T_i \in R^m$, $L \leq N$ according to continuous probability distribution, for infinitely differentiable activation function g(x), $\|H\beta - T\|$ is either zero or very close to zero [10].

DATA AND RESULT ANALYSIS

In our study, we employed two-stage approach to forecast Nifty 50 index values, crude oil daily data prices and gold futures prices. Our data set includes, Nifty 50 index values from July 1990 to August 2022 [13], crude oil prices from January 1984 to July 2022 [2] and gold future price data from August 1982 to August 2022 [2].

In the first stage, we applied the sample entropy to original data sets as well as reshuffled data sets to check data stability. Table 1 displays the sample entropy values of each data sets. The values are obtained using MATLAB programming.

In the second stage, we have used Extreme Learning Machine (ELM) for prediction. All data sets are divided into 80:20 and 70:30 training-testing percentage ratio. Table 2 showing/exhibit the Root means square errors (RMSE) calculated using Python programming.

Sample entropy measures the stability of the given data sets. Data sets whose sample entropy is close to zero are regarded as more stable and suitable for prediction. It is observed from the Table 1 that for original data sets of Nifty 50, Crude Oil and Gold Future, sample entropy values are close to zero. It means these data are stable. Tables 2 shows that the root mean square error(RMSE) of the data sets. The minimum root square error implies a better prediction of the data. The values represented in Table 2 shows that the root mean square errors are lower for those data sets whose sample entropy values are close to zero in Table 1.

The prediction outcomes using ELM are shown graphically in Figures 2, 3, and 4 for the Nifty 50 data set, crude oil, and gold prices, respectively.

CONCLUSION

The results of the two-stage procedure suggest that before applying a prediction method to given data, data stability must be checked. Our results support that any prediction approach used on unstable data is a wasted effort. The results lead to the conclusion that checking data stability is necessary for the accurate prediction of any data set.

ABSTRACT

Acute pancreatitis (AP) is an inflammatory process of pancreas and peripancreatic tissue, with a highly variable clinical course with high morbidity and mortality. It results from a complex etiological process, with a variable natural course, making it difficult for early identification. Early assessment and identification of patients at risk is important for initiating intensive therapy, which has shown to improve prognosis and survival. In this study, we wanted to assess the severity of acute pancreatitis by using BISAP (Bedside index for severity in acute pancreatitis) and GGS (Glasgow score) scoring systems and evaluating the accuracy of BISAP and Glasgow scores in predicting severity and outcomes. A Prospective Observational Study was conducted at a tertiary care hospital for a period of 6 months.115 patients were included in the study. All data regarding BISAP And Glasgow Scores, were collected and calculated in all patients. Sensitivity, Specificity, NPV, PPV, Accuracy of these scores were calculated. Evaluation of efficacy of these scores in predicting severity and outcomes was done by performing ROC curve using SPSS Software version 29.0.2.0. Among 115 patients, 100(83%) were male and 15 (17%) were female. The

common etiological factor was found to be alcohol (82%), Abdominal pain was found to be the most common symptoms experienced by every patient. Sensitivity, Specificity, PPV, NPV ,Accuracy of BISAP &Glasgow scores in terms of predicting organ failure was found to be (72.72%, 54.50%), (95.69%, 89.24%),(80%, 89.24%),(93.68%, 89.24%),(91.30%, 82.6%) respectively; interms of predicting pancreatic necrosis it was found to (83.33%, 58.35), (90.29%,85.4%), (50%,31.8%), (97.89%,94.6%), (87.28%, 82.6%) respectively; interms of predicting mortality it was found to be (100%, 50%) ,(84%, 81.4%), (10%, 4.54%), (100%, 99%),(84%, 81%) respectively. Receiver operating characteristic (ROC) curve evaluating the role of BISAP & Glasgow score in predicting development of Organ failure, in acute pancreatitis showed an AUC of 0.907 &0.760 respectively. Receiver operating characteristic (ROC) curve evaluating the role of BISAP & Glasgow score in predicting development of pancreatic necrosis, in acute pancreatitis showed an AUC of 0.842 & 0.771 respectively. Alcohol was the most common cause of alcohol pancreatitis and abdominal pain was the most common presenting symptom. The BISAP score had higher accuracy in predicting outcomes as well as organ failure and pancreatic necrosis (severity), with high sensitivity and AUC, when compared to the Glasgow score.

Keywords: Bisap Score, Glasgow Score, Accuracy, NPV, PPV

INTRODUCTION

Acute pancreatitis is a prevalent inflammatory pancreatic disease causing severe abdominal pain, organ dysfunction, and potentially leading to complications like pancreatic necrosis and organ failure, with a global incidence of 30-40 casesper100,000 population annually and mortality of 1-5% [1]. Men comprise 60% of all cases of acute pancreatitis; 40% of all cases are seen in women. In women, gallstone pancreatitis common cause of acute pancreatitis, particularly in white women over 60 years of age. Alcoholic pancreatitis is more common in men[2].AP emerges when the body's defenses against trypsinogen activation or trypsin activity suppression are exceeded. The activation of pancreatic enzymes results in the gland's self-digestion and specific inflammation[3].Acute pancreatitis leads to significant short- and long-term morbidity, which in a significant minority causes prolonged debility, recurrent disease, and pancreatic exocrine and/or endocrine insufficiency. The 2012 Atlanta classification revision defines acute pancreatitis diagnostic criteria, requiring at least two of three characteristics: persistent abdominal pain, elevated serum lipase and/or amylase levels, and acute pancreatitis detected through MRI or CT[4]. The Atlanta classification categorizes acute pancreatitis into mild, moderately severe, and severe severity. Mild AP has no complications, while moderately severe AP has transient organ failure and persistent organ failure[5]. If untreated, mild AP can progress to severe AP. Prompt and accurate prediction are crucial for patient prognosis. Various scoring systems are available to stratify AP severity.On admission it is possible to predict patients at risk of complications and severity. Predicting severity of pancreatitis early in the course of disease is critical to maximize therapy and to prevent and minimize organ dysfunction and complications. Unfortunately, the management of patients with acute pancreatitis is complicated by the inability to distinguish mild from severe disease during the early stages[6].Severe acute pancreatitis has a poor prognosis and early prediction of the severity helps us in taking appropriate steps to halt the disease progression and to reduce development of complications. Several predictors (biochemical parameters, clinic-biochemical scores and radiological scores) have been used to predict the severity of acute pancreatitis.

Clinical scoring systems

Clinical scoring systems (CSS) have been developed over time, with varying accuracy and efficacy. The optimal system should be flexible, easy to use, dependable, and globally applicable. These systems are crucial for predicting complications, severity, mortality, and ICU admission in acute myocardial infarction (AP) patients. Classic multifactorial systems like APACHE II, Ranson, Glassgow, HAPS, JSS, CTSI, SOFA, and BISAP provide valuable insights.

Bisap Score

The BedsideIndex Severity Acute Pancreatitis (BISAP) score is a scoring system that predicts mortality risk in pancreatitis using fewer variables than Ranson's score. It is calculated using criteria such as BUN > 25 mg/dL, impaired mental status, SIRS, body temperature, respiratory rate, pulse, WBC count, age > 60 years, and palpable effusion detected on imaging[7].

Score ≥3 indicates severe pancreatitis.

Glasgow Score

Indications: Evaluation of acute Pancreatitis Prognosis and severity in first 48 hours of admission.

Criteria

Arterial oxygen partial pressure < 60>, Age > 55 years, White Blood Cell Count >15 x10^3/mm, Serum Calcium <8>, Blood Urea Nitrogen 44 mg/dl (16 mmol/L), Blood Glucose >180 mg/dl (10 mmol/L), Serum Albumin <3>, Lactate Dehydrogenase > (600 IU/L)

Interpretation: Score of 3 Or more than 3 criteria present within first 48 hours of presentation are likely to be Severe Pancreatitis[8].

Marshal et al.'s criteria were used to access OF in acute pancreatitis, with a score of two or higher indicating organ failure[9].

MATERIALS AND METHODS

At the Department of General medicine, Gastroenterology, Surgery of a tertiary healthcare hospital, the latest research was performed on diagnosed cases ofAcute Pancreatitis coming to our hospital. This was a prospective clinical study conducted over a 6 months duration after informed consent on a total of 115 consecutive cases meeting the eligibility requirements for the study.

Inclusion Criteria

1.Patients diagnosed with AP (either first attack or recurrent attacks)
2.Presenting with acute onset of persistent severe epigastric pain, with or without radiation, and increased serum amylase and lipase levels

Exclusion Criteria

1.Patients with pre-existing chronic pancreatitis or with co-existing local complications of pancreatitis, cardiac failure, liver failure, renal failure or any lung pathology were excluded.
2.Pregnancy.
3.Attack of acute on chronic pancreatitis

PROCEDURE

Valid informed consent for inclusion in the study was obtained from patients or associated patients. Medical, laboratory and radiological data were obtained within 24 hours and 48 hours of presentation from each patient diagnosed with acute pancreatitis. Using the data collected, BISAP &GLASGOW SCOREwas determined for each patient. During their hospital ad-mission, these patients were then followed and reviewed for the development of complications, organ failure, death or before the patient was released. The BISAP &GLASGOW score of all patients was then compared with their outcomeand statistically evaluated as prognostic indicators of acute pancreatitis for the assessment of these scores.

Statistical Analysis

Statistical analysis were carried out by using the Statistical Package for Social Sciences version 29.0.2.0.Continuous variables were expressed as mean, standard deviation and categorical variables as frequencies and percentages. Receiver operating characteristic (ROC) curves were plotted and Sensitivity, Specificity, PPV, NPV, Accuracy were also calculated for evaluating the performance of Glasgow, BISAP scores as predictors of development of Organ failure, Pancreatic necrosis, Mortality in acute pancreatitis.

RESULTS

The result of this study is presented in following tables and diagrams

Demographic, clinical characteristics of the study population (n=115) (Table-I).

Incidence of severe acute pancreatitis according to BISAP Score (Figure 1).

Incidence severe acute pancreatitis according to Glasgow score (Fig-2).

ROC curve demonstrating the BISAP score effectiveness in predicting the onset of organ dysfunction in cases of acute pancreatitis(AUC=907, p=0.000) (Figure -3).

ROC curve demonstrating the Glasgow score effectiveness in predicting the onset of organ failure in cases of acute pancreatitis.(AUC=0.700, p=0.000) (Figure -4).

ROC curve demonstrating the BISAP score effectiveness in predicting the onset of pancreatic necrosis in cases of acute pancreatitis(AUC=0.842, p=0.000) (Figure -5).

ROC curve demonstrating the GLASGOW score effectiveness in predicting the onset of pancreatic necrosis in cases of acute pancreatitis(AUC=0.771, p=0.000) (Figure -6).

ROC curve demonstrating the BISAP Score effectiveness in predicting the mortality in cases of acute pancreatitis(AUC=0.991,p=0.000) (Figure-7).

ROC curve demonstrating the GLASGOW Score effectiveness in predicting the mortality in cases of acute pancreatitis(AUC=0.770, p=0.000) (Figure-8).

Sensitivity and Specificity of BISAP Scoring System in Terms of Predicting Organ Failure

Table-2: Sensitivity and specificity of BISAP score regarding forecasting organ failure.

TP=True positive, FP= False positive, TN=True negative, FN=False negative.

SENSISTIVITY =TP/(TP+NP) ×100=72.72%

SPECIFICITY=TN/(FP+TN)×100 =95.69%

POSTIVE PREDICTIVE VALUE =TP/(TP+FP) × 100 = 80%

NEGATIVE PREDICTIVE VALUE =TN/(FN+TN) ×100 =93.68%

ACCURACY =TP+TN/(TP+FP+FN+TN)×100=91.30%

Sensitivity and Specificity of GLASGOW Scoring System In Terms Of Predicting Organ Failure

Table-3: Sensitivity and specificity of GLAGOW score regarding forecasting organ failure.

TP=True positive, FP= False positive, TN=True negative, FN=False negative.

Sensitivity and specificity of GLASGOW Score in term of organ failure was assessed

SENSISTIVITY =TP/(TP+NP) ×100=54.5%

SPECIFICITY=TN/(FP+TN)×100 =89.24%

ACCURACY =TP+TN/(TP+FP+FN+TN)×100=84%

Sensitivity and Specificity of GLASGOW Scoring System in Terms of Predicting Mortality
Table-7: Sensitivity and specificity of GLASGOW score regarding mortality
TP=True positive, FP= False positive, TN=True negative, FN=False negative.
Sensitivity and specificity of GLASGOW score in term of Mortality/outcomes was assessed
SENSISTIVITY =TP/(TP+NP) ×100=50%
SPECIFICITY=TN/(FP+TN)×100 =81.4%
POSTIVE PREDICTIVE VALUE =TP/(TP+FP) × 100 = 4.54%
NEGATIVE PREDICTIVE VALUE =TN/(FN+TN)×100 =99%
ACCURACY =TP+TN/(TP+FP+FN+TN)×100=81%

DISCUSSION

Acute pancreatitis is an inflammatory condition affecting the pancreas that may involve the peripancreatic tissue and involve multiple organs, resulting in multi-organ dysfunction syndrome and eventual death. It is a prevalent ailment exhibiting diverse clinical manifestations. The majority of patients have mild symptoms when they first arrive, but some develop severe symptoms and need to be hospitalized right away, along with intensive care in an intensive care unit (ICU) designed to prevent severe attacks. The Atlanta classification defines severe acute pancreatitis (SAP) as an AP accompanied by local and/or systemic complications (organ failure). The frequency of acute pancreatitis in our study was greater in men than in women, which is consistent with findings from earlier research of Goopu et al[10]. In this study, the age group of 21–30 and 31–40 had the highest rates of acute pancreatitis, which is almost

matching with the previous research results of Vengadakrishnan et al[11]. Our study most frequent etiological factor was alcohol (82%), which was followed by gallstones. These findings are consistent with earlier research study by N.R. Venkatesh et al[12] Abdominal pain was found to be the most prevalent symptom, which is consistent with earlier research findings by Awasi MA et al[13]. The diagnosis of Acute pancreatitis was done based on Atlanta criteria. The severity of acute pancreatitis was evaluated in this study using the BISAP and GLASGOW score scoring systems. With BISAP scoring system twenty (17%) of the 115 patients in this study had severe acute pancreatitis, defined as having a score of greater than or equal to 3, and ninety-five patients (83%) were classified as having mild acute pancreatitis, defined as having a score of less than 3. 93 people (81%) with a Glasgow Scoring system score of greater than or equal to 3 were classified as having severe acute pancreatitis, while 22 people (19%) were classified as having mild acute pancreatitis. Our research predicted the organ failure, pancreatic necrosis and mortality by calculating the AUC using BISAP and GLASGOW Scores. Regarding organ failure, the AUC of BISAP was determined to be 0.907, which is comparable to the AUC of 0.860 found in the study by Sageb KMN[14]. The comparison shown above demonstrates that our study was able to predict organ failure with high accuracy using bisap scoring system. The Glasgow AUC score was 0.700 which, when compared to the study by Sageb KMN[14], where the AUC was 0.886, indicates that, our study was able to predict organ failure, with a low degree of precision using Glasgow scoring system. Regarding Pancreatic necrosis, the AUC of BISAP was determined to be 0.842, which is comparable to the AUC of 0.711 found in the study by Chen et al[15]. The comparison shown above demonstrates that our study was able to predict pancreatic necrosis with high accuracy using bisap scoring system. The Glasgow AUC score was 0.771 which, when compared to the study by Khanna et al[16], where the AUC was 0.64,the comparison demonstrates that our study was able to predict pancreatic necrosis with high accuracy using GLASGOW scoring system. Regarding Mortality, the AUC of BISAP was determined to be 0.991, which can be comparable to the AUC of 0.83 found in the study by Khanna et a[l16]. The comparison shown above demonstrates that our study was able to predict mortality with high accuracy using bisap scoring system. The Glasgow AUC score was 0.770 which, when compared to the study by Khanna et al[16], where the AUC was 0.83, the comparison demonstrates that our study was able to predict mortality with less accuracy using GLASGOW scoring system. In our study, the accuracy of BISAP and GLASGOW scoring systems in predicting the organ failure and pancreatic necrosis, outcomes/mortality was also assessed by calculating the Sensitivity, Specificity, PPV, NPV, Accuracy. The BISAP Score for organ failure has a sensitivity of 72.72%, a specificity of 95.69%, a PPV of 80% and an NPV of 93.68% and an accuracy of 91.30%. which has a strong correlation with Lalith Kumar, et al[17] study. The GGS score for organ failure has a sensitivity of 54.5%, a specificity of 89.29%, a PPV of 54.5%, and an NPV of 89.24 and an accuracy of 82.6% which can be compared with the study of Khana, et al[16] in which there is an highest sensitivity of 76% than our study. The BISAP Score for pancreatic necrosis has a sensitivity of 83.33%, a specificity of 90.29%, a PPV of 50% and an NPV of 97.89% and an accuracy of 89.5%. which has a strong correlation with Chandrashekar et, al[18]study. The GGS score for pancreatic necrosis has a sensitivity of 58.3%, a specificity of 85.4%, a PPV of 31.8%, and an NPV of 85.4% and an accuracy of 82.6% which can be compared with almost same results of Khana, et al[16] study. The BISAP Score for Mortality has a sensitivity of 100%, a specificity of 84%, a PPV of 10 and an NPV of 100% and an accuracy of 89.5%. Which has a strong correlation regarding the sensitivity % in predicting outcome with Chandrashekar et, al[18] study. The GGS score for Mortality has a sensitivity of 50%, a specificity of 81.4%, a PPV of 4.54%, and an NPV of 99% and an accuracy of 99% which can be compared with the results of Khana, et al[16] study. Patients in this study experienced Pancreatic pseudocyst, Acute renal failure, MODS, and Pancreatic necrosis, Portal vein thrombosis. Patients with BISAP ≥ 3 and GLASGOW ≥3 were more likely to experience these complications; as a result, it was determined that these patients were in the high-risk category and needed close observation and, if necessary, early intervention. In our study the mean, median, range of length of Hospital stay was found to be 10.2±4.57 days, 8days and 21 days respectively.

CONCLUSION

According to this study, the most frequent etiological factor for acute pancreatitis was alcohol. Compared to women, men were more frequently impacted. Patients in their third and fourth decades of life were the most frequently

affected age group. The total death rate was discovered to be 1.73%. The current study demonstrates that both the BISAP and GLASGOW scoring systems performed well in predicting the severity, organ failure, pancreatic necrosis, and outcomes. It was found that the BISAP score had higher accuracy in predicting outcomes as well as organ failure and pancreatic necrosis (severity), with high sensitivity and AUC, when compared to the Glasgow score. Since the BISAP score is a straightforward bedside tool that can be used within the first 24 hours of admission and can predict severity, which requires careful monitoring and more aggressive treatment, we therefore advise using it in all cases of pancreatitis, especially in settings with limited resources.

ABSTRACT

In image processing, the geometrical and topological properties of a digital image's constituent pieces are crucial. When combined, pentapartitioned neutrosophic logic has a lot of uses for image processing. The goal of this paper is to achieve this continuity feature. In order to examine some of its characteristics, it presents pentapartitioned neutrosophic digital continuous maps between any two pentapartitioned neutrosophic digital images that are specified by pentapartitioned neutrosophic digital regular sets. Furthermore, by imposing certain limitations on pentapartitioned neutrosophic digital continuous maps, the idea of pentapartitioned neutrosophic digital linked maps is formed, and numerous intriguing outcomes are obtained. This article introduces, develops, and explores various features of the notion of pentapartitioned neutrosophic digital continuous maps and connected maps.

Keywords: PND connected maps, PND connected sets, PND continuous maps, PND homeomorphisms.

INTRODUCTION

The concept of fuzzy sets was initially put forth by Zadeh [22] in 1965. In 1986, Atanassov [1] developed intuitionistic fuzzy sets by expanding on the idea of fuzzy sets. The independent concept of neutrality, or the degree of indeterminacy, was first introduced by Florentin Smarandache [20] in 1999, along with the definition of the neutrosophic set based on three components (t, f, i) = (truth, falsehood, and indeterminacy) which is a generalization of intuitionistic fuzzy sets. The Pentapartitioned Neutrosophic Set was introduced in 2020 by Surpati Pramanik and Rama Mallick [7]. In image processing, Rosenfeld and Kak [17,18] preferred to extract fuzzy subsets instead ordinary sets. The concept of Digital Topology was first introduced and explored in the late 1960s by Azriel Rosenfeld[15], a researcher in computer image analysis. Many scholars have developed a range of set theories and related topological structures to address uncertainty. Chang was the one who first proposed the idea of fuzzy topology [4]. Afterwards, Lowan, Liu, and Pu [6] introduced the concept of Fuzzy topological spaces and fuzzy compactness. The digital line or called Khalimsky Line is the set of integers Z, equipped with the topology K having 2n+1, 2n, 2n-1: n ∈ Z as a subbas and is denoted by (Z, K). Thus, a subset U is open in (Z, K) if and only if, whenever x∈ U is an even integer, then x-1, x+1 ∈ U. Given that $Z^2 = Z \times Z$ and $K^2 = K \times K$, let (Z^2, K^2) be the topological product of two digital lines (Z, K). The digital plane is the name given to this area. There is a smallest open set containing x, let's say U(x), for any point $x \in Z^2$. In the digital plane, a set is referred to as closed if its corner points are even, while it is considered open if its corner points are odd. Topological properties of rectangular shapes determine plane topology in relation to Rosenfeld [16] fuzzy digital topology ideas. Would $Z^2 = Z \times Z$ and $K^2 = K \times K$ represent the bounded space. If so, the two sets are called the digital plane. Neutrosophic digital topology, which extends digital topology using neutrosophic sets, was introduced by R. Narmada Devi *et all*. [13] in 2022. In this paper, the authors are introduces the topological concepts of continuity and connectedness in terms of pentapartitioned neutrosophic subsets of the digital plane and develops and some of their basic properties.

PRELIMINARIES

Definition 2.1

Let $A = \{(a, T_A(a), C_A(a), G_A(a), U_A(a), F_A(a)) : a \in X\}$ be the Neutrosophic subset of H. Then the Pentapartitioned Neutrosophic digital subset (or PND subset) of the points of H is denoted by A^*, whose degree of truth membership, contradiction membership, ignorance membership, unknown membership and false membership are defined by,

$$T_{A^*}(P) = \max\{T_A(R) / R \in P^*\}$$

$$C_{A^*}(P) = \max\{C_A(R) / R \in P^*\}$$

$$I_{A^*}(P) = \min\{I_A(R) / R \in P^*\}$$

$$U_{A^*}(P) = \min\{U_A(R) / R \in P^*\}$$

$$F_{A^*}(P) = \min\{F_A(R) / R \in P^*\}$$

Definition 2.2

Let $A = \{(a, T_A(a), C_A(a), G_A(a), U_A(a), F_A(a)) : a \in X\}$ be the Pentapartitioned Neutrosophic subset of H. Then A is said to be Pentapartitioned Neutrosophic digital regular (or PND regular) set if the sets A_r, defined by $A_r = \{R : T_{A_r}(R) > r, C_{A_r}(R) > r, G_{A_r}(R) < r, U_{A_r}(R) < r and F_{A_r}(R) < r\}$ are Pentapartitioned Neutrosophic regular for all r $\in$ (0,1).

Definition 2.3

Let $A^* = \{(a, T_{A^*}(a), C_{A^*}(a), G_{A^*}(a), U_{A^*}(a), F_{A^*}(a)) : a \in X\}$ be an Pentapartitioned Neutrosophic subset of the points in H. Let $\sigma : P = P_0, P_1, \ldots, P_n = Q$ be any path between two points of H. Then an Pentapartitioned Neutrosophic digital strength (or PND strength) of a path with respect to A^* in H is defined and denoted by $S^{\sigma}_{A^*}$ whose degree of truth membership, contradiction membership, ignorance membership, unknown membership and false membership are defined by,

$T_{S^{\sigma}_{A^*}} = \min_{0 \le i \le n} T_{A^*}(P_i), C_{S^{\sigma}_{A^*}} = \min_{0 \le i \le n} C_{A^*}(P_i), G_{S^{\sigma}_{A^*}} = \min_{0 \le i \le n} G_{A^*}(P_i), U_{S^{\sigma}_{A^*}} = \min_{0 \le i \le n} U_{A^*}(P_i)$ *and* $F_{S^{\sigma}_{A^*}} = \min_{0 \le i \le n} F_{A^*}(P_i)$ with $T_{S^{\sigma}_{A^*}} + C_{S^{\sigma}_{A^*}} + G_{S^{\sigma}_{A^*}} + U_{S^{\sigma}_{A^*}} + F_{S^{\sigma}_{A^*}} \le 1.$

Definition 2.4

Let $A^* = \{(a, T_{A^*}(a), C_{A^*}(a), G_{A^*}(a), U_{A^*}(a), F_{A^*}(a)) : a \in X\}$ be a PND subset of the points in H. Let $\sigma : P = P_0, P_1, \ldots, P_n = Q$ be any path between two points of H. Then the degree of Pentapartitioned Neutrosophic digital connectedness (or PNFD connectedness) of the points of a path σ with respect to A^* in Z is denoted by Ctd_{A^*}, degree of truth membership, contradiction membership, ignorance membership, unknown membership and false membership are defined by,

$T_{Ctd_{A^*}}(P, Q) = \max_{\sigma} T_{S^{\sigma}_{A^*}}, C_{Ctd_{A^*}}(P, Q) = \max_{\sigma} C_{S^{\sigma}_{A^*}}, G_{Ctd_{A^*}}(P, Q) = \min_{\sigma} G_{S^{\sigma}_{A^*}}, U_{Ctd_{A^*}}(P, Q) = \min_{\sigma} U_{S^{\sigma}_{A^*}}$ and $F_{Ctd_{A^*}}(P, Q) = \min_{\sigma} F_{S^{\sigma}_{A^*}}$ with $T_{S^{\sigma}_{A^*}} + C_{S^{\sigma}_{A^*}} + G_{S^{\sigma}_{A^*}} + U_{S^{\sigma}_{A^*}} + F_{S^{\sigma}_{A^*}} \le 1.$

Definition 2.5

Let $A^* = \{(a, T_{A^*}(a), C_{A^*}(a), G_{A^*}(a), U_{A^*}(a), F_{A^*}(a)) : a \in X\}$ be an PND subset of the points in H. Then P and Q are said to be Pentapartitioned Neutrosophic digital connected (or PND connected) in A^* if,

$T_{Ctd_{A^*}}(P, Q) = \max(T_{A^*}(P), T_{A^*}(Q)), C_{Ctd_{A^*}}(P, Q) = \max(C_{A^*}(P), C_{A^*}(Q)),$

$G_{Ctd_{A^*}}(P, Q) = \min(G_{A^*}(P), G_{A^*}(Q)), U_{Ctd_{A^*}}(P, Q) = \min(U_{A^*}(P), U_{A^*}(Q))$ and

$F_{Ctd_{A^*}}(P, Q) = \min(F_{A^*}(P), F_{A^*}(Q)).$

Definition 2.6

Let $A_r = \{R : T_{A_r}(R) > r, C_{A_r}(R) > r, G_{A_r}(R) < r, U_{A_r}(R) < r \text{ and } F_{A_r}(R) < r\}$ be the Pentapartitioned Neutrosophic regular subset of H. Then the Pentapartitioned Neutrosophic digital image (PND image) of A_r is a PND set D(A), which is defined as $D(A_r) = \{R : A_r \cap R \text{ is non empty}\}$.

Pentapartitioned Neutrosophic Digital Continuous Maps

In this section we constructed the Pentapartitioned Neutrosophic digital continuous maps and obtained some of the results.

Definition 3.1

Let A and B be the PND subsets of H and let D(A) and D(B) be their PND images respectively. A map $\varphi : D(A) \to D(B)$ is called an Pentapartitioned Neutrosophic digital continuous map (or PND continuous map) if for any two PND connected points P and Q in D(A) their PND images $\varphi(A)$ and $\varphi(B)$ are PND connected in D(B).

Proposition 3.2
Let A and B be the PND regular subsets of H and let D(A) and D(B) be their PND images respectively. Any map $\varphi : D(A) \to D(B)$ is PND continuous iff for every PND connected set A_1 in $D(A_1)$ its PND image $\varphi(A_1)$ is PND connected in D(B).

Proof: Let $\varphi : D(A) \to D(B)$ be a PND continuous map, A_1 be a PND connected set in D(A) and let P and Q be any two PND connected points in A_1. From the Definition 1.1, the PND images φ(P) and φ(Q) are PND connected in D(B). Then clearly the set $(\varphi(P) \in D(B): P \in A_1$ is PND connected in D(B). Conversely, assume P and Q be any two PND connected points in D (A). Let A_1 be an PND connected set containing the points P and Q. Clearly A_1 is an PND connected set and so its PND image $\varphi(A_1)$ is PND connected in D(B), which contains only φ(P) and φ(Q). Hence the map $\varphi : D(A) \to D(B)$ is PND continuous map.

Proposition 3.3
If $\varphi_1 : D(A) \to D(B) and\ \varphi_2 : D(B) \to D(C)$ are PND connected maps, then $\varphi_2 \circ \varphi_1$ is also PND continuous.

Proof: Since $\varphi_1 : D(A) \to D(B)$ is PND continuous, for any two points P and Q which is PND connected in D(A), their PND images $\varphi_1(P)$ and $\varphi_1(Q)$ are PND connected in D(B). Also since $\varphi_2 : D(B) \to D(C)$ is PND continuous, the map images $\varphi_2(\varphi_1(P))$ and $\varphi_2(\varphi_1(Q))$ of the PND connected points $\varphi_1(P)$ and $\varphi_1(Q)$ are PND connected in D(C). It follows that $\varphi_2 \circ \varphi_1 : D(A) \to D(C)$ is PND continuous.

Definition 3.4
Let D(A) and D(B) be PND images in H and $P_1, Q_1 \in D(A)$ and $P_2, Q_2 \in D(B)$. Then any two elements (P_1, P_2) and (Q_1, Q_2) of D(A) × D(B) are said to be PND connected if and only if they satisfy any one of the following conditions.

i. P_2 and Q_2 are PND connected in D(B) and $P_1 = Q_1$.
ii. P_1 and Q_1 are PND connected in D(A) and $P_2 = Q_2$.
iii. P_1 and Q_1 are PND connected in D(A) and P_2 and Q_2 are PND connected in D(B).

Proposition 3.5
Let D(A) and D(B) be digital images in H. Then the maps,
(i) $\varphi_1 : D(A) \times D(B) \to D(A)$ defined by, $\varphi_1(P_1, P_2) = P_1$
(ii) $\varphi_2 : D(A) \times D(B) \to D(B)$ defined by, $\varphi_2(Q_1, Q_2) = Q_2$ are PND continuous.

Proof: Let (P_1, P_2) and (Q_1, Q_2) be PND connected in D(A) × D(B). Since $\varphi_1(P_1, P_2) = P_1$ and $\varphi_1(Q_1, Q_2) = Q_1$ by the Definition 5.4, P_1 and Q_1 are PND connected in D (A) or $P_1 = Q_1$. Similarly, $\varphi_2(P_1, P_2) = P_2$ and $\varphi_2(Q_1, Q_2) = Q_2$ are PND connected in D(B) or $P_2 = Q_2$.Thus the given maps are PND continuous.

Proposition 3.6
The maps $\varphi_1 : D(A) \to D(C)$ and $\varphi_2 : D(B) \to D(D)$ are PND continuous surjection if and only if the map $\varphi_1 \times \varphi_2 : D(A) \times D(B) \to D(C) \times D(D)$ defined by is an PND continuous surjection.

Proof: First assume that $\varphi_1 : D(A) \to D(C)$ and $\varphi_2 : D(B) \to D(D)$ are PND continuous surjections. Let (P_1, P_2) and (Q_1, Q_2) be PND connected in D(A) × D(B). Then from the Definition 2.4, P_1 and Q_1 are either equal or PND connected in D(A). Hence $\varphi_1(P_1)$ and $\varphi_1(Q_1)$ are either PND connected in D(C) or equal. Likewise, from the Definition 2.4, P_2 and Q_2 are either equal or PND connected in D(B). Hence $\varphi_2(P_2)$ and $\varphi_2(Q_2)$ are either PND connected in D(D) or equal. Hence from the Definition 2.4, $\varphi_1 \times \varphi_2\ (P_1, P_2)$ and $\varphi_1 \times \varphi_2\ (Q_1, Q_2)$ are PND connected in D(C) ×D(D). Thus : $\varphi_1 \times \varphi_2 : D(A) \times D(B) \to D(C) \times D(D)$ is PND continuous.
Now let $(R_1 \times R_2) \in D(C) \times D(D)$. Since $\varphi_1 : D(A) \to D(C)$ and $\varphi_2 : D(B) \to D(D)$ are PND continuous surjections, there exists $S_1 \in D(A)$ and $S_2 \in D(B)$ such that $\varphi_1(S_1) : R_1$ and $\varphi_2(S_2) : R_2$. Thus, $(\varphi_1 \times \varphi_2)\ (S_1, S_2) = (\varphi_1(R_1), \varphi_1(R_2))$ and so $\varphi_1 \times \varphi_2$ is an PND continuous surjection. Conversely, assume that $\varphi_1 \times \varphi_2 : D(A) \times D(B) \to D(C) \times D(D)$ is PND continuous. Now from the Proposition 2.5, the maps $\varphi_1 : D(A) \times D(B) \to D(A)$ and $\varphi_2 : D(A) \times D(B) \to D(B)$ defined

by $\varphi_1(P_1, P_2) = P_1$ and $\varphi_2(Q_1, Q_2) = Q_2$ are PND continuous. From the Proposition 2.4, it follows that the maps $\psi_1 = \varphi_1 \circ (\psi_1 \times \psi_2)$ and $\psi_2 = \varphi_2 \circ (\psi_1 \times \psi_2)$ are PND continuous. Also, since $\psi_1 \times \psi_2$ is PND continuous surjection, it is obvious that ψ_1 and ψ_2 are also PND continuous surjections.

Pentapartitioned Neutrosophic Digital Connected Maps

Definition 4.1

Let D(A) and D(B) be PND images in H. Let ψ : D(A)→D(B) be an PND continuous surjection. The map ψ is said to be an pentapartitioned neutrosophic digital connected map (or PND connected map) iff for every PND connected subset B_1 of D(B) its inverse image ψ^{-1} (B_1) is PND connected in D(A).

Proposition 4.2

Let D(A) and D(B) be PND images which are PND connected and let P ∈ $D(B)$. Then the map ψ : D(A) → {P} is an PND connected map.

Proof: From the Definition 6.1, the proof follows.

Definition 4.3

Let: D(A) → D(B) be an PND continuous surjection map between the PND images D(A) and D(B). If the inverse ψ^{-1}: D(B) →D(A) is also PND continuous then ψ is said to be an neutrosophic digital homeomorphism (or PND homeomorphism) between D(A) and D(B).

Proposition 4.4

If ψ : D(A) → D(B) is an PND homeomorphism between the digital images D(A) and D(B) then ψ is an PND connected map.

Proof: The proof follows from the Definitions 6.1 and 6.4.

Definition 4.5

If D(A) is PND homeomorphic to D(B) , then the number of PND connected subsets of D(A), is same as the number of PND connected subsets of D(B).

Proof: Assume that D(A) have n_1 number of PND connected subsets, say $A_1, A_2, .., A_{n_1}$ and D(B) have n_2 number of PND connected subsets, say $B_1, B_2, .., B_{n_2}$.If $n_1 \neq n_2$, then $n_1 > n_2$ or $n_2 > n_1$. Suppose $n_1 > n_2$, consider, ψ : D(A) →D(B) be an PND homeomorphism. Then ψ^{-1} : D(B) →D(A) is also an PND homeomorphism. Since ψ^{-1} is PND continuous, ψ^{-1} (B_1) is a PND connected subset of D(A). Hence ψ^{-1} (B_1) ⊆ A_k , 1≤ k ≤ n_1 for some k. By reordering, assume ψ^{-1} (B_1) ⊆ A_1 .Continuing this way, we have $\psi^{-1}(B_k) \subseteq A_k$, where k = 1, 2, .., n_2. But this process left out $A_{(k+1)}, .., A_{n_1}$. This contradicts the fact that ψ^{-1} is subjective and so we cannot have $n_1 > n_2$. In the same way, by considering ψ : D(A) →D(B) we can prove $n_2 > n_1$ is not true. Thus $n_1 = n_2$ and this completes the proof.

Proposition 4.6

If ψ_1: D(A) →D(B) and ψ_2 : D(B) →D(C) are PND connected maps, then $\varphi_1 \circ \varphi_2$ is also an PND connected map.

Proof: Since ψ_2: D(B) → D(C) is an PND connected map, by the Definition 6.1, if C_1 is an PND connected subset of D(C), then ${\psi_2}^{-1}$(A) is PND connected in D(B). Also Since ψ_1: D(A) → D(B) is an PND connected map, by the **Definition 6.1,** $(\psi_1 \circ \psi_2)^{-1}(C_1) = {\psi_1}^{-1}({\psi_2}^{-1}(C_1))$ is PND connected in D(A). Thus, the map $\varphi_1 \circ \varphi_2$: D(A) → D(C) is a PND connected map.

Proposition 4.7

Let $\psi_1 : D(A) \to D(C)$ and $\psi_2 : D(B) \to D(D)$ be PND continuous surjections. Then $\psi_1 \times \psi_1 : D(A) \times D(B) \to D(C) \times D(D)$ is PND connected map if and only if ψ_1 are ψ_2 PND connected maps.

Proof: If ψ_1 and ψ_2 are PND connected maps, then it is clear that they are PND continuous surjections. Hence from the Propositions 6.6, $D(A) \times D(B) \to D(C) \times D(D)$ is PND continuous surjection.

To prove $\psi_1 \times \psi_2$ is a PND connected map, let $C_1 \times D_1$ be a PND connected set in $D(C) \times D(D)$ where $C_1 \subseteq D(C)$ and $D_1 \subseteq D(D)$. Also let $A_1 \times B_1 = (\psi_1 \times \psi_2)^{-1}(C_1 \times D_1)$ where $A_1 \subseteq D(A)$; $B_1 \subseteq D(B)$ such that $A_1 = (\psi_1)^{-1}(C_1)$; $B_1 = (\psi_2)^{-1}(D_1)$. Now consider any two points (P_1, P_2) and (Q_1, Q_2) in $A_1 \times B_1$. Since $(\psi_1)^{-1}(C_1) = A_1$ is an PND connected set, P_1 and Q_1 are PND connected in A_1. Let σ_1 be a path between P_1 and Q_1. Hence $\sigma_1 \times \{P_2\}$ is a path in $(\psi_1)^{-1}(C_1) = \{P_2\}$ between (P_1, P_2) and (Q_1, Q_2). Since $(\psi_2)^{-1}(D_1) = \{B_1\}$ is an PND connected set, P_2 and Q_2 are PND connected in B_1. Let σ_2 be a path between P_2 and Q_2. Hence $\{Q_1\} \times \sigma_2$ is a path in $(\psi_2)^{-1}(D_1) \times \{P_2\}$ between (P_1, P_2) and (Q_1, Q_2). Therefore (σ_1, σ_2) is a path in $A_1 \times B_1$. Hence $A_1 \times B_1$ is PND connected and so $\psi_1 \times \psi_2$ is an PND connected map. Conversely, assume that $\psi_1 \times \psi_2$ is PND connected. By Proposition 5.6, ψ_1 and ψ_2 are PND continuous surjections. Let C_1 be a PND connected subset of C and let $P \in D$. Then $C_1 \times \{P\}$ is a PND connected subset of $C \times D$. Since $\psi_1 \times \psi_2$ is PND connected, $(\psi_1)^{-1}(A_1) \times (\psi_2)^{-1}(P) = (\psi_1 \times \psi_2)^{-1}(A \times \{P\})$ is PND connected in $A \times B$. Now $\varphi_1({\psi_1}^{-1}(A_1) \times {\psi_2}^{-1}\{P\}) = {\psi_1}^{-1}(A_1)$. By Proposition 5.5, φ_1 is PND continuous and so ${\psi_1}^{-1}(A_1)$ is PND connected in D(A). Hence ψ_1 is an PND connected map. Similarly, it can be proved for ψ_2 also.

Proposition 4.8

Let D(A), D(C), D(B) and D(D) be PND images in E such that $D(A) \cap D(B) = \{P\}$ and $D(C) \cap D(D) = \{Q\}$. Then the following statements are equivalent.

(i) The maps ψ_1: D(A) $\to$ D(C) and ψ_2: D(B) $\to$ D(D) such that $\psi_1(P) = \psi_2(P) = Q$ are PND connected maps.

(ii) The map $\psi_1 * \psi_2 : A \cup B \to C \cup D$ defined by

$(\psi_1 * \psi_2)(P) = \begin{cases} \psi_1(P) if\ P \in D(A) \\ \psi_2(P) if\ P \in D(B) \end{cases}$ is a PND connected map.

Proof: (i) $\Rightarrow$ (ii) If ψ_1 and ψ_1 are PND connected maps, then it is clear that $\psi_1 * \psi_2$ is PND continuous surjection. Let C_1 be an PND connected subset of $C \cup D$ and let $Q_0, Q_1 \in {\psi_1}^{-1}(C_1)$. Since C_1 be a PND connected set there exists a path σ between $\psi_1(Q_0)$ to $\psi_1(Q_1)$. Let $\sigma : \psi_1(Q_0) = P_1, P_2, \ldots \psi_1(Q_1) = P_i$. Then there arises the following three cases.

Case (i): Suppose $C_1 \subset C$, Since ψ_1 is a PND connected map ${\psi_1}^{-1}$ (P) is PND connected in A. Case (ii): Suppose $C_1 \subset D$, $(\psi_1 * \psi_2)^{-1}$ (P) = $(\psi_2)^{-1}$ (P). Since ψ_2 is an PND connected map $(\psi_2)^{-1}$ (P) is PND connected in B.

Case (iii): If C_1 is partly contained in C and partly contained in D, then Q_0 must belong to C_1. Now assume the path $\sigma \subset C_1$ where

$P_1, P_3, P_5, \ldots \in C \cap C_1$ and

$P_2, P_4, P_6, \ldots \in D \cap C_1$.

Let $A_1 = \cup_{i=1,3,\ldots}(\psi_1)^{-1}(P_i)$ and $A_2 = \cup_{i=2,4,\ldots}(\psi_2)^{-1}(P_i)$. Then $A_1$and A_2 are PND connected sets containing P. Hence $(\psi_1 * \psi_2)^{-1}(P) = A_1 \cup A_2$ is an PND connected subset of $(\psi_1 * \psi_2)^{-1}(C_1)$. Thus $(\psi_1 * \psi_2)^{-1}(C_1)$ is PND connected. Conversely assume $\psi_1 * \psi_2$ is PND connected map. Then ψ_1 and ψ_2 are PND continuous surjections. Now let C_1 be an PND connected subset of D(C) and let C_2 be an PND connected subset of D(B). Since $\psi_1 * \psi_2$ is an PND connected map,

$(\psi_1 * \psi_2)^{-1}(C_1)$ and $(\psi_1 * \psi_2)^{-1}(C_2)$ are PND connected sets in $A \cup B$. But

$(\psi_1 * \psi_2)^{-1}(C_1) = (\psi_1)^{-1}(C_1)$ is an PND connected subset of D(A) and

$(\psi_1 * \psi_2)^{-1}(C_2) = (\psi_2)^{-1}(C_2)$ is an PND connected subset of D(B). Hence ψ_1 and ψ_2 are PND connected maps.

ABSTRACT

The foundation of a healthy environment is the diversity of plant and animal life. A species that is in danger of going extinct mapping the locations of all known populations of the species, evaluating the species' genetic variability, identifying genetic hotspots in the ecosystem, and identifying the intrinsic and extrinsic variables (determining the type and level of threat) pushing the species into vulnerable status are all examples of conducting research as thoroughly and scientifically as possible. The present study is to assess the theoretic review on Endangered Species Act (ESA) across the globe. It would help in identifying issues in the implementation of the law in the country.

Keywords: Wild life protection, Endangered Species Act (ESA) 1973, Food Chain, WWF (World Wildlife Fund)

INTRODUCTION

People are urged to remember endangered species and take action to protect them annually on the third Friday of May. Every day, WWF seeks to establish alliances with regional authorities, businesses, governments, and other organizations in order to take action to safeguard threatened species. The swift extinction of plant and animal species prompted the 1973 Endangered Species Act (ESA). The ESA, sometimes called the "crown jewel" of our country's environmental legislation, has been instrumental in keeping a number of species alive, such as the California sea otter, bald eagle, and grey wolf. Because, the only environmental regulation that is truly successful is the Environmental Security Act (ESA), which does not require a cost-benefit analysis to be done before taking action. If a species is designated as vulnerable or endangered, the ESA ensures that it will be safeguarded and that every effort will be made to aid in its recovery. The Endangered Species Act, our strongest environmental law, also establishes stringent standards. For the first time in human history as we know it, the legislators of a sizable country pledged in it to take all reasonable steps to keep any species found inside its borders from going extinct. Populations are tracked throughout time to see if a particular species is making a comeback. A species gets struck off the list after it is believed to have recovered. One of best pieces of legislation in the world for stopping and reversing the loss of threatened and endangered species is the Endangered Species Act (ESA), which is regarded as the benchmark for conservation policy. More listed species were fully or partially recovered in 2016 compared to previous years since the ESA was passed in to law. More than half of the 150 most often prescribed medications included plants or other natural sources as their primary constituent.

Regretfully, hundreds of other plant species are still unknown, and only around 5% of the known plant species have been tested for possible medical use. Tens of thousands of Americans die each year from illnesses for which there is no known cure. Future research on plants could lead to the solution of many diseases, so we must safeguard every species now to prevent them from becoming extinct from the natural pharmacy. The tourism sector, which generates billions of dollars annually and employs a large number of people, is reliant on ecosystems supporting various plant and animal species. Each year, millions of individuals travel to the country's natural areas and participate in wildlife-related activities. The second most popular kind of travel is outdoor, which includes hiking through the forests and going to the beach. The local economy of these locations benefit greatly from activities associated with these journeys. The preservation of biological diversity is essential to the travel industry's sustainability of our country. We recognize the significance of protecting threatened and endangered species, so we must ensure their protection. The Endangered Species Act is the first line of defence against extinction in our nation. Regretfully, the ESA is failing to keep up with the extinction of species. Everywhere in the country, people are still keeping an eye out to protect the wildlife and local biodiversity. Citizens act as a voice for the voiceless by keeping an eye on state and federal laws that affect rare and endangered animals to ensure that their needs are satisfied.

In addition, the ESA has been the victim of well-planned and funded attacks. These attacks have been stopped thanks to dedicated individuals and groups. We must ensure that the Endangered Species Act is fully supported and reauthorized in order to maintain its strength and functionality. In order to keep the ESA in place and ensure that it receives full financing, the Endangered Species Coalition has worked very hard. It is sure that any attack on the ESA will be stopped. By utilizing the tools in this toolbox, you can participate and lend a helping hand. With the information we are offering, which is meant to guide you through the endangered species duty, we will be here to assist you at every turn. In the last three years, India has reported 90 occurrences of ivory or tusk seizure in addition to 29 cases of elephant poaching. The Lok Sabha was shown the figures on August 8 by the Ministry of Environment, Forests, and Climate Change (MOEFCC). The year 2021 recorded the highest number of cases of elephant tusk seizure (42 cases), and the highest number of poaching events (14 incidents nationwide) during that year. Of the fourteen poaching deaths, seven occurred in Meghalaya alone. Six poaching-related elephant deaths were reported in 2018–19, while nine poaching deaths were reported in 2019–20.In the last three years, poaching has resulted in seven elephant deaths in Odisha, which has become one of the hotspots for conflicts between people and elephants, and twelve elephant deaths in Meghalaya. Three elephant deaths resulting from poaching have been reported to Tamil

Nadu. [Shiv Sahay Singh, The Hindu Aug,13,2022]. Karnataka was the source of 51 reports of illegal wildlife trade occurrences in 2020. A recent data analysis has revealed that a total of 173 occurrences were reported from the southern states of Karnataka, Tamil Nadu, Kerala, Andhra Pradesh, and Telangana throughout the year.

The Wildlife Conservation Society (WCS) - India's report, "Wildlife Poaching and Illegal Trade in India: 2020," is an evaluation of data gathered through our Counter Wildlife Trafficking (CWT) team's work on publicly accessible online open-source newspaper articles. It aims to provide a thorough overview of the illegal wildlife trade in India for 2020. [k.c. Deepika-The Hindu Feb,26 2022]. The results of the most recent census, which was carried out by the federal and state administrations, indicate that the number of endangered animals, including lions, rhinos, tigers, and elephants, has increased across the country. Under the Centrally Sponsored Scheme "Development of Wildlife Habitats," the Ministry provides financial support to State/UT Governments for the recovery program of critically endangered species. This initiative aims to save critically endangered species and their habitats. Under this effort, 21 severely endangered species have been designated as of right now. To protect the nation's wild creatures, the Ministry created the third "National Wildlife Action Plan," which runs from 2017 to 2031. The Plan emphasizes the adoption of a landscape approach to the conservation of all animals, regardless of its habitat. In addition, it places a strong focus on protecting the habitats of threatened wildlife species, which include terrestrial, inland aquatic, coastal, and marine environments. While Salman Khan was in Rajasthan filming Hum Saath Saath Hain was charged with tracking down and killing two blackbucks in the state's Kankani region. The Bollywood actor's accusations were based on The Indian Wildlife (Protection) Act, 1972, section 9/51. Salman was additionally sued for allegedly possessing and using outdated firearms during the poaching of blackbucks under sections 3/25 and 3/27 of the Arms Act. Salman Khan, a celebrity in Bollywood, received a five-year prison term in 2018after it was determined that he had killed two blackbucks near Jodhpur. He was granted bail later in the case.

Steps taken by government of India

According to data from the Ministry, no Indian species has been officially declared extinct recently. To save wildlife and its habitats, the government has taken a number of actions. Significant actions made in this respect include of: Strict penalties are in place for violating the Wild Life (Protection) Act of 1972. The Act further stipulates that any tool, car, or weapon used to commit a wildlife infraction may be forfeited. The Gangetic Dolphin, The Wild Life (Protection) Act, 1972 categorized the tiger, snow leopard, great Indian bustard, dugong, and other rare and endangered species found in India as Schedule-I species, giving them the greatest level of protection. National Parks, Sanctuaries, Conservation Reserves, and Community Reserves are examples of protected areas that have been developed across the country to help safeguard animals, especially threatened species, and their environment. These regions include important habitats. State and Union Territory Governments can receive financial assistance through the Centrally Sponsored Program of "Integrated Development of Wildlife Habitats". In order to enhance habitat and increase wildlife protection. Through eco-development initiatives, the local community participate in conservation efforts that support the forest departments' efforts to safeguard animals. Collaborating with State/UTs and other law enforcement authorities, the Wild Life Crime Control Bureau (WCCB) obtains information regarding poaching as well as the illicit trade in wildlife and animal goods. WCCB has issued cautions and warnings to the relevant State and Central agencies on wildlife poaching and illegal trafficking in order to encourage preventive measures. [Ministry of State for Environment, Forest and Climate Change, 2022].

Working of Endanged Species Act

ESA aids in the recovery of animals in several ways. No endangered or threatened species may be brought into the country, exported, taken, bought, sold, or moved. Furthermore, as stipulated by the ESA, land identified as important habitat must be essential to the survival of the species. This includes land that is essential to the continued existence of the listed species as well as land that it now resides on. The prohibition on "taking" a listed species includes the destruction of vital habitat. In developed nations such as the United States of America, ESA rules are enforced through citizen lawsuits in addition to civil and criminal penalties. A criminal infraction carries a maximum penalty of $50,000 in fines and jail time. A civil breach of a crucial provision may result in a $25,000 penalties (for knowing offences) or a $12,000 fine. Violating a minor condition, permit, or regulation may result in a $500 fine. The

most frequent outcome is the seizure of fish, wildlife, and plants that have been illegally obtained, owned, sold, or purchased. In the event of a criminal conviction, cars and equipment used to violate the ESA may also be seized.

Global Sceneraio of Extinction

Over the span of five major extinctions, which were primarily caused by purely natural events like asteroid strikes and volcanic eruptions, 99 percent of all species have disappeared. The rate of extinction is currently occurring 1,000–10,000 times faster due to human activity. The main modern causes of extinction include overexploitation (from overfishing and overhunting), invasive species, climate change, nitrogen pollution, and habitat loss and destruction (mostly from deforestation). In addition to other threats to animals like the widespread plastic pollution in the water, a recent study found that plastic or microplastic is present in the systems of all sea turtles. Warming temperatures make it easier for more pests to live and spread, and greater travel and trade allow infections and pests to transfer to new places, which leads to the emergence of new diseases. An increasing number of wildlife species, such as salamanders, frogs, and bats, are being affected by these ailments. Wildlife trafficking is still a big problem since some species are more desirable to hunters and poachers the less there are of them. The International Union for Conservation of Nature's Red List of Threatened Species has over 26,500 species that are classified as possibly extinct. This comprises 34% of conifers, 40% of amphibians, 25% of mammals, 14% of birds, and 33% of corals that form reefs. In the tropical jungle, animals pollinate almost every blossoming plant, and insects and other animals pollinate 75% of the world's food crops. The loss of pollinators can reduce a plant's ability to produce seeds and fruits, which can eventually result in the extinction of many important plants. Bees fertilize more than 250,000 plant species, which includes most of the 87 crops that humans eat, like apples, cucumbers, and almonds. However, large bee colonies have collapsed due to an enigmatic disease called "colony collapse disorder" in recent years. Under this scenario, adult honeybees disappear from their hives, probably as a result of several stressors..After just 27 years, a German research reported a 75% reduction in flying insects. Small animals, fish, and birds that depend on insects for food are suffering as insect numbers decline; eventually, fish and bird predators will also experience the effects. When an entomologist from the 1970s who had researched insects in the rainforest returned in 2010, he discovered a 60-fold or more drop.

The 12 Animals and Birds That are Now Extinct

Spix's Macaw: From the time of its discovery until its final day in the wild, the Spix's Macaw—also called the Little Blue Macaw and Ararinha Azul in Brazil—remained a mystery. Thirteen years after the first specimen was obtained and mistakenly labelled by Johann Baptist Ritter von Spix as a Hyacinth Macaw, this gray-headed blue parrot was finally recognized as a distinct species in 1832. The next record of a wild bird was in 1903; however, there was a protracted dry spell until five birds were tallied in 1985. There was only one wild male left by the end of 1987. 2019 saw the official Extinct in the Wild declaration of the species by the International Union for Conservation of Nature.

Wolly Mammoth: Woolly mammoths were likely around 13 feet tall, the size of African elephants. However, the smaller ears of woolly mammoths prevented them from losing body heat. They had two coats of hair covering them as well; the longer, shaggy outer layer could reach up to 20 inches in length and kept them warm in temperatures as low as minus 58°F. Similar to a camel's hump, scientists believe the lumps on the backs of woolly mammoths were fat reserves that supplied energy during times of food scarcity. The precise cause of the woolly mammoth extinction is unknown to scientists; some speculate that excessive hunting by humans killed the animals, while others contend that Earth's climate was too warm for them to survive. It might have been a mix of the two, too.

Northern white rhinoceros: One of the two subspecies of white rhinoceroses (the other being the southern white rhinoceros) is the northern white rhinoceros, often known as the northern white rhino (*Ceratotherium simum cottoni*). This subspecies, which was once widespread in a number of nations in East and Central Africa south of the Sahara, is a grazer in grasslands and savanna woodlands. With the exception of two female rhinos named Najin and Fatu, which are the only known members of this subspecies as of March 19, 2018, the subspecies is functionally extinct unless there are male northern white rhinos in Africa that are either unidentified or incorrectly categorized. The two

female rhinos are under the constant protection of armed guards at the Ol Pejeta Conservancy in Kenya, although they are residents of the DvůrKrálové Zoo in the Czech Republic.

Cheetahs: The cheetah is the fastest land mammal, with short-range sprints of 60 to maybe 70 miles per hour (97 to 113 km per hour) possible. However, it often only pursues its victim at a pace of roughly half that. A cheetah requires thirty minutes to recover from a chase before it can eat. When pursuing prey, these cats may turn abruptly and quickly due to their high speed nimbleness. With their long, slender limbs, firm foot pads, and flexible spine that allows them to walk with a lengthy stride, cheetahs have a body specially designed to enable them to achieve peak speeds. It is also slowly becoming extinct.

Himalayan quail: The medium-sized Himalayan quail (*Ophrysia superciliosa*), often known as the mountain quail, is a member of the pheasant family. It's thought to be extinct; the last record of it was in 1876. Only two sites (and twelve specimens) in Uttarakhand, northwest India, in the western Himalayas were known to belong to this species. The latest authenticated report was made in 1876 close to Mussoorie, a highland station.

Atlas bear: The North African bear, sometimes known as the Atlas bear (*Ursus arctos crowtheri*), is a species of brown bear that was once common in North Africa but is now extinct.

Caspian tiger: Native to eastern Turkey, northern Iran, Mesopotamia, the Caucasus around the Caspian Sea, Central Asia to northern Afghanistan, and the Xinjiang region of western China, the Caspian tiger was a subpopulation of *Panthera tigristigris*. In southern Russia, it existed as well until the Middle Ages. Up until the 1970s, it lived in the region's riverine corridors and scant woodlands. In 2003, this population was considered to be extinct and considered a separate subspecies.

Western black rhinoceros: One extinct subspecies of the black rhinoceros is the western black rhinoceros (*Diceros bicornis longipes*), sometimes known as the West African black rhinoceros. The IUCN declared it extinct in 2011. It was once thought that the genetic makeup of the western black rhinoceros differed from that of other rhino subspecies.It was previously common throughout sub-Saharan Africa's savanna, but poaching caused its population to drop. The western black rhinoceros was mostly found in Cameroon, but no specimens have been found in surveys conducted since 2006.

Dodos: The Dodo was discovered by Dutch soldiers on an island in the Indian Ocean in 1600. Less than 80 years later, the species went extinct due to deforestation, hunting, and animals the Dutch brought to the island destroying their eggs. It's possible that the dodo wasn't always flightless. Pigeons and dodos are connected; a group of pigeons crossed the ocean to settle in Mauritius. There, the dodo became larger and lost its ability to fly, probably due to the absence of predators.

Japanese sea lion: The aquatic mammal known as the Japanese sea lion (*Zalophus japonicus*) went extinct in the 1970s. Up until 2003, *Z. californianus*, the related California sea lion, was thought to have a subspecies of it. They lived in the western North Pacific and its adjacent seas, such as the Sea of Okhotsk and the Sea of Japan, particularly in the vicinity of the Korean Peninsula and the Japanese Archipelago's coasts. They mated mostly on open, level, sandy beaches, however occasionally they would breed on rocky ones. They went extinct in the 1900s as a result of commercial hunting.

Passengerpigeon: An extinct pigeon species that was native to North America was the passenger pigeon, also known as the wild pigeon (*Ectopistes migratorius*). Because of the species' migratory tendencies, its common name is taken from the French term passager, which means "passing by". The migratory features are also mentioned in the scientific name. Although genetic investigation has revealed that the genus Patagioenas is more closely related to it than the Zenaida doves, it was long believed that the physically similar mourning dove (*Zenaida macroura*) was its closest relative.

Pinta Island tortoise: The Pinta Island tortoise (*Chelonoidis niger abingdonii*), sometimes referred to as the Abingdon Island giant tortoise, Pinta gigantic tortoise, or Abingdon Island tortoise, is a subspecies of Galápagos tortoises that was once common on Ecuador's Pinta Island. It is a recently extinct species of tortoise. After specimens arrived in London, Albert Günther defined the subspecies in 1877. Due to hunting, the majority of Pinta Island tortoises had disappeared by the end of the 19th century. The subspecies was thought to be extinct by the middle of the 20th century, but in 1971 a lone male was found on the island. The male, known as Lonesome George, was attempted to mate with other subspecies, but no viable eggs were produced. After Lonesome George passed away on June 24, 2012, it was thought that the subspecies had gone extinct.

Food Chain Endangered

Plankton, a small class of marine and freshwater plants and animals, forms the base of the marine food web. Because it creates oxygen during photosynthesis and consumes carbon dioxide as a carbon source, phytoplankton is essential to the health of the planet and its oceans. In 2010, researchers found that since 1950, the global phytoplankton population had dropped by 40%. They linked this drop to increasing temperatures at the water surface. Scientists assert that the deeper, colder waters—rich in the nutrients required by phytoplankton—did not mix well with the warmer surface waters. Additionally, due of its extreme sensitivity to even the smallest changes in the water's oxygen level, zooplankton might not be able to adjust when low-oxygen areas proliferate as a result of climate change. According to a United Nations research, the world may lose 18% of its gross domestic product by 2050 as a result of ongoing species extinction. Certain businesses have already felt the financial effects of species extinction. The decline in bee populations has caused hardship to a large number of people in the $50 billion worldwide market for honey. The mainstay of the local economy in the waters surrounding Newfoundland has been Atlantic cod since the fifteenth century—until overfishing drove local fishermen to give up their jobs. Any species going extinct is tragic because it means a special and exquisite creature is no longer here. Practically speaking, species restoration is essential to guarantee the long-term viability of food supplies, pharmaceutical ingredients, clean air and water, and other essential services. Even species that appear to be insignificant, like plankton, play a crucial part in the greater fragile, interwoven web. The base of the aquatic food chain is made up of these tiny, watery organisms. Photosynthesis is a process by which phytoplankton convert carbon dioxide into oxygen, aiding in the fight against climate change and providing oxygen for human lungs. However, Dalhousie University researchers in Canada discovered that their population has decreased by 40% since the 1950s, most likely as a result of water pollution, warming ocean temperatures, and acidification. The administering organization devotes time and resources to the long-term restoration of the species' habitat, food supply, reproduction rate, and other factors. Populations are watched carefully until they are deemed recovered and can be removed from the list. The Endangered Species Act is the industry benchmark for restoring endangered species because since its establishment, 99% of listed species have avoided going extinct. But the Endangered Species Act has undergone numerous revisions and amendments, frequently weakening its initial safeguards. The government started taking economic factors into account when classifying a species during the Trump administration, and protections for species labelled as "threatened" were lessened.

A. Turtle Project in India: The Environment, Climate Change and Forests Department of the Tamil Nadu government has approved the establishment of the first turtle conservation and rehabilitation centre in the state, to be located in Chennai, with a budget of Rs 6.30 crore. The state-of-the-art facility, which will involve the local communities, will have medical facilities for the rehabilitation of rescued turtles in addition to amenities like a turtle pool and shed. Before being returned to their natural habitat, sick and injured turtles will be temporarily housed there. The centre would also promote awareness of the need to conserve turtles. The Chief Wildlife Warden would oversee the project's implementation and the Tamil Nadu Pollution Control Board would provide funding from its resources.A government order issued by ACS, Environment Climate Change and Forests, Supriya Sahu, on Friday said the State's long coastline hosts five species of marine turtles viz. Olive Ridley, Green, Leatherback, Hawksbill and Loggerhead turtles. Olive Ridley species mostly nest along the coast. The State administration had stated in the Assembly on April 25, of last year, that a turtle conservation and rehabilitation institute will be established in Chennaiat a cost of Rs 6.30 crore to boost turtle conservation efforts. Hence, the present GO. "Turtles play an

extremely important role in maintaining the marine bio-diversity, as they act as the ecosystem engineers," the head of state stated. However, habitat loss and the negative effects of climate change pose major risks to turtle populations worldwide. Globally, the population of turtles is suffering significant harm due to marine pollution, which includes microplastics. It is within this framework that turtle conservation becomes even more crucial.

LITERATURE SURVEY

According to Jason F. Shogren and Patricia H. Hayward (1997), The Endangered Species Act (ESA) was established in 1973 to address the market failure brought on by the unpriced societal benefits of species and their habitats. Our examination of the biological efficacy and economical effects of The ESA yielded the following four primary findings: There isn't yet a quantifiable, objective method to evaluate biological efficacy. The period elapsed since the Act's passing has been too short to make any clear conclusions about the species' overall regrowth, even in the absence of an objective indicator. The expenses to private property owners of transactions, opportunity costs associated with limited property rights, and opportunity costs associated with public money utilized for species recovery are not estimated on a national scale. only a few regional research on a particular species indicate that distributional problems may be more important than inquiries about efficiency, i.e., how the economic distribution of the "pie" among the participants changes, but not its size. For the majority of the almost 1000 listed species, the economic gains, both societal and private, are not estimated nationally. There are extremely few estimates of benefits broken down by species, and those that do exist are often plagued by technological problems that limit their applicability to policy research. The study concluded that, the biological efficacy and economic effects of the ESA on a national scale are not yet known. No one has even made a basic estimate off the back of the package. This refusal to speculate was biologically motivated by the absence of an objective gauge of biological efficacy and a lack of time to assess the overall success of the various species recovery strategies. Our conjectures are constrained on the economic front because there are no estimates of the national cost and protection of all of the almost 1000 listed species would be advantageous; nevertheless, we have not calculated the opportunity costs and transaction costs of restricted property the potential costs associated with public funding spent for species recovery, the rights of more financial gains from the recent listing decisions, crucial plans for habitat recovery or designations.

The estimation of the national economic benefits and costs of the ESA by combining our economic techniques with a workable set of ecological indicators is an obvious research priority. On the other hand, Drew Kraniak (2015) opined that, the unique "trust relationship" that underpins relationships between tribes and the federal government must be taken into consideration when implementing the Act in Indian nation. Trust obligations under federal law include keeping resources and land in trust for Indian recipients and contributing to with the help of legislation, defend tribal intrinsic sovereignty from outside forces through policymaking action. The study concluded that, American Indian tribes are autonomous nations with a variety of cultures, economy, values, and experiences. Few people, if any, do not view the responsibility to preserve the natural environment as one of the greatest relevance to their long-term welfare. Regardless of the outcome, a significant share of the remaining undeveloped land in the nation and resources are located in India. Tribes are frequently placed at the front edge of both extensive land development and conservation programs. Despite having prevented extinction on a national scale, the Endangered Species Act frequently flops to balance conservation efforts with develop. Its impact in India is similar to that elsewhere. Although tribes and tribal members value the conservation of species, they frequently find it difficult to understand why the conservation must be achieved through broad federal statutes. There is still ongoing uncertainty regarding how these laws affect both conventional rights to hunt and fish, in addition to new resource development initiatives, does not support development or conservation.Joint Secretarial Order 3206 makes an effort to eliminate this ambiguity and give federal agencies administrative direction when cooperating with tribes to protect endangered species in Indian nation. The Rule is broad and may not be legally enforced, yet it nevertheless creates a a framework for coordinating conservation duties for endangered species, respect for federal trust obligations toward tribes while preserving tribal autonomy Indians.

Although responses to the Order's objectives in Indian country have Despite the Order's overall popularity, its effectiveness on the ground has been viewed very differently by those who work with it. Moreover, Amy w. Ando (2013) commented that, The ESA has won significant victories. However, it forces regulators to remain silent until a species is on the verge of extinction. Consequently, it creates harmful cycles of support and endangerment that put species at risk of extinction. Protection could be revoked without removing the factors that drove the species that are under danger. The ESA can assist species directly threatened by human activity as in hunting. Nevertheless, due to a variety of dangers, including being an invading species climate change and extensive land conversion the degree of which the act has a minimal efforts to use power the ESA to safeguard polar bears (*Ursus arctos maritimus*) cannot result from melting sea ice, because forcing an international agreement, for instance on the release of greenhouse gases. Policies to conserve certain species shouldn't be based on blanket regulations. They should be justified on a case-by-case basis in light of the importance society attaches to the species, either because of its function in a natural neighbourhood or because of the setting People keep it close to their hearts and lives. Forinstance, freshwater mussels remove harmful microorganisms, and sea turtles awe people with their size. Their magnificent migrations. efficient and safe Policy for conservation will acknowledge these several sorts of value. Therefore, Jeremy Wood (2015) studied Endanger Endangered Species, endanger ed Endangered Species, Economic Development, and Tribal Consultation: Safeguarding Treaty Rights under Secretarial Order 3206. For its time, 3206 was a remarkable advancement. Two departments made the time and financial commitment required to engage in negotiations through knowledgeable and capable tribal members in order to address tribal concerns representatives.

Their dedication resulted in a paper that aims to ensure that tribal concerns have a significant role in the ESA Consultation and Planning for habitat conservation, to discourage designating Important habitat, as well as a readiness to respect tribal administration. The legacy of that dedication, however, has received mixed reviews. The Rule Consequently, changes should be made to ensure that organizations do not consultation as a pointless ceremony rather than a spiritual obligation that requires the participation of knowledgeable and committed decision-makers. Ultimately, the only way to ameliorate its uneven impact is to change SO 3206 to bind the necessary agencies to formally demand that tribal rights be taken into account before taking any government action. The ESA and the trust obligation of the United States can only be resolved after that. When it happens, the federal government must acknowledge the importance of Indian lands. ecosystems that are mostly used by indigenous populations and that threaten treaty rights deserve the same level of protection as the animals they depend on. On top of that, Aaron M. Haines *et al* (2021) discussed the benchmark for ESA and said We must find methods that successfully recover species if we hope to slow down the current rate of extinction on a global scale. Over the last ten years, the The Endangered Species Act (ESA) of the United States has fared better. Measured taxonomic trends, threat history, funding, policy, and other aspects connected to species recovery by looking through federal delisting records for recovered species. The average recovered species was a vertebrate, had been listed under the ESA for a longer period of time, was subject to fewer threats at the time of listing, and had received comparatively more financing than species that are still listed. proposed five tactics to enhance species recovery

1. **Time:** Give species enough time to heal and be listed. Earlier understanding of their biological and ecological importance procedures have a limited amount of time, and they is false to claim that the ESA is a failure because on listing period without taking into consideration the time constraints.
2. **Funding:** Boost financial support from the federal, state, and private sectors. backing for efficient recovery measures (such direct population management, problem species control, and habitat restoration;) and financing priorities as part of a decision made inside a framework for resource allocation support device.
3. **controls:** Reinstate, uphold, and create environmental government rules that aid in efforts to rehabilitate species (e.g., take, pollution, energy controls)activity using off-road vehicles and development) and offer reassurances that post-recovery recovered species would continue to be in that condition (e.g., the Clean Water Act and Migratory Bird Treaty Act)
4. **Contracts:** Increased state and federal government assistance with establishing cutting-edge and customized private programs for encouraging landowners, such as agency arrangements Memoranda of Recovery and Understanding, for instance Management Contracts to Implement Habitat Protection recuperation procedures.

5. Increase the quantity of land protected for listed species in cooperation with regional communities which allow for habitat area and flexibility in implementation efficient recovery techniques.

The incorporation of these suggestions into an adaptive management strategy would aid in determining which tactics perform best in particular circumstances. We anticipate identifying which interventions are enhancing our capacity to recover species and restore their ecosystem function and which are not by tracking these implemented suggestions over time. We observe that at this moment, the data are not accessible to evaluate whether recovery-focused initiatives are ineffective, despite the fact that such information is required for efficient resource allocation and successful adaptive management. Even though, Daniel M. Evans (2016) studied the Restoring American Species: Strengthening the Endangered Species Act's Impact. Hundreds of species have been saved from extinction thanks to the Endangered Species Act (ESA), which has also improved species recovery over time. The majority of ESA-designated species, or listed species, have had more difficulty recovering than originally anticipated. The circulation of funds among listed species is wildly uneven, funding has been inadequate, and threats to species are ongoing and widespread. At the very least There are perhaps ten times more species that should be listed than there are. Additionally, a lot of the listed species will need continuing management to safeguard them from enduring risks for the foreseeable future. Climate change will exacerbate this issue and raise management uncertainty and species risk, necessitating more extensive and divisive management techniques to stop species from becoming extinct. Accordingly, Paul J. Ferraro (2007) studied the US Endangered Species Act effectiveness: An econometric analysis employing matching techniques. A species' listing or funding is a challenging choice that involves nuanced trade-offs between scientific, political, and financial considerations. Additionally, observable species features have an impact on the selection process, and the relative relevance of these qualities has evolved over time.

Once selection bias has been taken into account, no proof that listed species do any better than their counterfactual counterparts can be found using a variety of methods. average number of unlisted species. In fact, listed species with little to no financing from the federal and state governments perform worse on average compared to their hypothetical unlisted species. However, there is evidence to suggest that the combination. In order to aid in recovery, listing and fundraising initiatives can be useful. These findings can be interpreted as proving that the ESA is ineffective and that only money works. However, this conclusion cannot be readily made from the information in this case because we do not observe any unlisted species that receive significant support. Instead, we discover that the ESA only functions when it is backed up with money. What makes this possible? If listing alone has a detrimental impact, here is one potential explanation: Private landowners are prompted to take preventative measures because of the ESA's flawed incentives activities (the infamous "shoot, shovel, and shut up" approach) to remove classified species from their property. The potential consequences of taking preventive action could be severe, therefore it's possible that species-specific financing generates a high enough degree of perceived monitoring to counteract these harmful incentives. Then, Conrad A. Fjetland (1997) studied Indian Treaty Rights and the Endangered Species Act. Most potential conflicts between the ESA and Indian treaty rights can be avoided before the issue of their "abrogation" is resolved thanks to the authority to control treaty rights for conservation purposes, the ESA's flexibility, particularly for species designated as "threatened," and a strong national commitment to uphold treaty rights, which is a component of our national trust duty. Nonetheless, there are situations in which the question of whether the ESA ignores treaty rights that conflict with its goals needs to be addressed.

This situation was shown in Billie. Due to the ESA's legislative background, Congress's intent, and all of the public policy factors that were taken into account before its approval, Indian treaty rights are cancelled, which conflicts with efforts to protect endangered species. Moreover, treaty rights are only suspended by the ESA to the extent that they apply to species that are listed under the ESA. The Act does not take away people's general rights to hunt and fish. Complete restoration of treaty rights in a way that allows the use of those rights when a species is saved and removed from the endangered species list. Given this, the ESA serves to preserve rather than to eliminate Indian treaty rights. At the same time, Linda Tsang (2019) studied Climate Change, the Endangered Species Act, and Some Legal Concerns. Legal concerns affect how the Services implement the ESA when climate change damages animals and their habitats. In order to protect animals and their habitat from factors that alter the climate, most lawsuits revolve around two main questions: (1) whether the Services can or should regulate activities; and (2) whether the

Services should list, delist, or reclassify a species as vulnerable or endangered due to the consequences of climate change. Ensuring that the Services consider projected implications of climate change on species when making ESA decisions has been made easier by legal scrutiny. However, the courts have not ordered the Services to safeguard threatened or endangered species, reduce actions that could hasten climate change. The ESA should not be involved in addressing climate change, according to certain stakeholders who claim the agency is ill-equipped to lessen its consequences. Other interested parties think the Services can and should use the ESA to stop actions that cause climate change in order to protect further species that are threatened by it. From the perspective of Services, the best scientific and commercial facts have not been sufficient to evaluate whether A proposed activity's greenhouse gas emissions have a negative impact on a species or its environment. Considering the legal Due to the courts' respect for the Services, the ESA's potential as a weapon to conserve listed species through regulation has not been increased the things that cause climate change. Therefore, Pervaze A. Sheikh *et al* (2021) studied The Overview and Application of the Endangered Species Act. The ESA and its predecessors have been in existence since 1966. Since these regulations were passed, almost 2,400 species—including those found in the United States and its territories, as well as other countries—have been categorized as threatened or endangered.287 As of October 2020, there were 2,361 registered species, with 71% being foreign species and 29% being local.21% of the total were categorized as threatened, and 79% of the total as endangered. Since the ESA's passage in 1973, 91 species have been removed off the list, representing about 3.7% of all species that have ever been listed under the law as of October 2020. Following are a few of the explanations for delisting cited by FWS: About 65% delisted as a result of recovery.

About 15% were removed from the list as a result of new information, legislative changes, or better knowledge of the species in science. About 12% were delisted and declared extinct. Due to the species' scientific reclassification, about 8% of the species were delisted. A species' delisting process could take anything from 3.6 to 52.9 years, with an average of 25.4 years. It took an average of 30.6 years, ranging from 8.2 years to 52.9 years, to delist a species, when just those 59 species that were delisted simply for recovery are taken into account. Additionally, the 53 species that are presently on the list have had their status changed from endangered to 43 species were downlisted as threatened, and 10 species were moved from threatened to endangered status. Stakeholders have frequently defended this viewpoint by claiming that over 99% of listed species have successfully recovered from extinction and been preserved, or that less than 1% of listed species—11 species, according to the FWS—have gone extinct since the ESA's adoption. According to other interested groups, the ESA has not been successful in promoting conservation. They cite the fact that, according to the FWS, only 59 species have been delisted as a result of recovery as evidence for their position. FWS has acknowledged the aforementioned stakeholder viewpoints of both defining the ESA's success while stating that it is "also considered as one of the "most contentious" legislation. Henceforth, G. Ravikanth *et al* (2018) described the Recovery of disparagingly endangered plant species in India. Concern over the expanding number of species that are under threat on a worldwide scale has grown. Many species are now in danger as a result of development initiatives and growing reliance on forests for food and subsistence. In the context of India, More than 150 species are in grave danger of extinction, and require rapid action to keep their populations alive. Several plant species have harmful behaviour only taken from the forests. In addition to anthropogenic challenges, numerous species are in danger because to Climate change and invasive species.

As a result of species recovery is under jeopardy from ongoing and growing threats the only practical option for many of them to be restored against extinction A thorough approach to recovery would involve documenting plant species' threatened status as exhaustively and scientifically as feasible, mapping the locations of all known populations of the species, evaluating the species' genetic diversity, identifying genetic hotspots in the environment, and figuring out the extrinsic and intrinsic forces driving a species toward vulnerable status (i.e., the extent and nature of the threat). These aspects must be taken into account when formulating appropriate plans for the recovery and restoration of the endangered species, as well as when developing specialized management protocols (for Species that are commercially significant need to be cultivated for usage of these endangered species. The development of long-term monitoring programs is also necessary to regularly analyse the species' population trends perhaps take them off the Red-list. On the basis of the literature survey the following conclusion is made.

CONCLUSION

Small individual efforts, like cutting back on meat consumption and making sure that the paper you use is made from forests that are responsibly managed, as well as grassroots community mobilization to safeguard local wildlife, assist the ESA by saving endangered species. Individuals are permitted to propose a species for consideration under the ESA and take part in the public review phase of a listing petition. Citizens serve as a voice for the voiceless, conserving the species on which their survival depends by altering their lifestyles, organizing locally, and monitoring government actions by demanding adherence to the ESA's provisions and thwarting attempts to undermine them.

ABSTRACT

Rational prescribing is vital in improving therapeutic outcomes, particularly in vulnerable groups such as neonates, paediatric patients, and postoperative cases. This study aimed to evaluate drug utilization patterns and therapeutic outcomes, while classifying medications according to the Anatomical Therapeutic Chemical (ATC) system and considering formulation types and routes of administration. A prospective observational study was conducted from January to August 2021 in a 100-bed multispecialty government hospital in Eluru, Andhra Pradesh. A total of 90 patients from the neonatal intensive care unit, paediatrics, and postoperative departments were included. Prescribing trends were assessed using the Anatomical Therapeutic Chemical (ATC) /Defined Daily Dose (DDD) methodology. The study population, 49% were male and 51% female. Age-wise analysis revealed that 63.3% of prescriptions were for patients under 20 years of age, while 16.6% were for those between 20 and 40 years. Antibiotics were the most commonly prescribed group, with 1012 doses, contributing 31.09% of the overall utilization. Drug utilization review programmes are valuable in promoting rational use of medicines. By minimizing polypharmacy, therapeutic duplication, and adverse effects, such approaches enhance prescription quality, reduce morbidity and mortality, and ultimately improve patient outcomes and quality of life.

Keywords: Anatomical Therapeutic Chemical, Drug utilization review, Drug utilization studies (DUS), Paediatrics, and Polypharmacy

INTRODUCTION

Drug utilization evaluation was defined by the world health organization (WHO) in 1977 as the marketing, distribution, prescription and use of drugs in a society, with special prominence on the resulting medical, social and economic consequences [1]. It involves a comprehensive review of patients' prescription and medication data before, during and after dispensing to ensure appropriate medication decision making and positive patient outcomes. As a quality assurance measure, DUR programs provide corrective action, prescriber feedback and further evaluations. It is a systematic process designed to maintain the appropriate and effective use of medications [2]. There are no variations found in prescription patterns in health care professionals [3]. Rational drug use is an important factor to be checked for the optimal benefit of drug therapy in patient care [4]. Periodic evaluation of drug utilization patterns needs to be made to enable suitable modifications in prescription to increase the therapeutic benefit and decrease the possible adverse effects [5]. Retrospective – Retrospective drug utilization review implies on evaluating patients drug therapy after medications are administered. Issues commonly found by retrospective DUR include adjustment of medication dose, drug-drug association, drug-illness connection, patient anticipation with drug, over-use, and under-usage, substance addiction clinically, appropriate nonexclusive use [6]. The ATC/DDD classification systems for measuring tools for DUR used to exchange and compare data on drug use at the local, national, and international levels to improve the quality of drug use. This method can also be used to detect the early signs of irrational drug use [7]. It is dynamic system and viewers are encouraged to use the current classification regardless of the age of the data [8]. DDD/100 bed-days is an estimate of consumption of drugs among hospitalized patients [9]. The main objectives of our study include classifying all the drugs in NICU, Postoperative and paediatrics departments into their respective categories based on their classification, route of administration and type of formulation. In addition, our study includes analysing the pattern of drug use among the patients based on the age and gender of the patients, polypharmacy assessment, calculation of the Defined daily doses of the various drugs as per the World Health Organisation (W. H. O) guidelines, calculation of the W. H. O prescribing indicators of the respected prescribed drugs as the objectives.

METHODOLOGIES

Study Site

The proposed work entitled "A PROSPECTIVE STUDY ON UTILISATION AND EVALUATION OF MEDICINE IN NICU, PEDIATRICS AND POST OPERATIVE DEPARTMENTS BY USING WHO PRESCRIBING INDICATORS AND BY APPLICATION OF ATC/DDD METHODOLOGY-IN GOVERNMENT HOSPITAL" was carried out in a 100 bedded multi-speciality Government hospital in Eluru, Andhra Pradesh.

Consent From Hospital Authorities

The protocol was presented to the members of ethical committee for approval and the authorisation from the dean to carry out the study was procured through his letter [JANUARY 2021- AUGUST 2021]. The study was conducted with the expert guidance of senior and junior physicians of the study department..

Literature Survey

The literature supporting the study was gathered from various journals. Study Site: Post-operative, Paediatrics, and Neonatal intensive care unit¬ Department. Study Design: Prospective observational study¬ Study Duration: 8 months (January – August) Sample Size: 90 patients

Patient Selection

Inclusion Criteria: Patients of all age of either sex getting admitted in the study site during the study period, who have been admitted in an inpatient department and are willing to participate, are included in the study.

Exclusion Criteria: Patients in which they are not admitted to in patient department and those who are not willing to participate in the study are excluded.

Patient Information Form

A patient information form was prepared to inform the patient or the care givers about the purpose and necessity of the study. The patients were assured that the confidentiality will be strictly maintained.

METHOD

The DDD is the assumed average maintenance dose per day for a drug used for its main indication in adults. DDD/100 bed-days (Defined Daily Dose) of 10 most commonly prescribed drugs was calculated. DDD/100 bed- days provides at estimate of consumption of drugs in general medicine department. And also, ATC code of the drugs involved was recorded.

Statistical Analysis

The data were subjected to analysis using Microsoft Excel. Drugs were classified according to the WHO-ATC classification and verified by WHO Essential Medicine List as well as National List of Essential Medicines (NLEM) 2011. The reports on the study were prepared and the same was submitted to the study department.

DISCUSSIONS

The prospective study of eight months duration was carried out in a tertiary care hospital Eluru; Andhra Pradesh to evaluate the prescribing pattern of drugs used. The study of prescribing pattern is an essential component of medical audit that seeks monitoring, evaluation and necessary modifications in the prescribing practices of prescribers and help to achieve rational and cost-effective medical care for the patient. Using the WHO prescribing indicators, this study has provided a better understanding of the prescribing practices in three major department of a tertiary hospital in Eluru and has shown areas that need intervention. Age wise distribution of the patients were analyzed and it was found that 66.6% of the prescriptions were in the age group of less than 20 years, followed by16.6% in the age group of 20-40 years, 11.1% in the age group of 41-60 years, 3.33% in the age group of 61-80 years and 2.22% in the age group above 80 years. Highest percentage of age group belongs to less than 20 was noted the reason maybe this study mostly includes pediatrics and Neonates. Previous studies have shown that polypharmacy among diabetic patients and a patient with heart failure is sometimes unavoidable [10, 11]. All the drugs in the prescriptions were classified based on their class. In our study a total of 30 classes of drugs were analysed and they were classified according to the number of doses of each drug for duration of 7days. The highest count of doses being the antibiotics with 1012 making the percentage of 31.09%, proton pump inhibitors(PPIS) with 546 doses making the percentage of

16.77%, NSAIDS with 250 making the percentage of 7.68%, antiemetic with 88 doses making the percentage of 2.7%, antidotes with 15 doses making the percentage of 0.46%, analgesics with 91doses making the percentage of 2.79%, antihistamines with doses of 150 making the percentage of 4.60%, phosphate binders with 10 doses making the percentage of 0.30%, anticonvulsants with 89 doses making the percentage of 2.73%, antihyperlipidemic with doses of 20 making the percentage of 0.61%, anti- anginal with doses of 40 making the percentage of 1.22%, antifungal with doses of 35 making the percentage of 1.07%, multivitamins with doses of 120 making the percentage of 3.68%, bronchodilators with doses of 68 making the percentage of 2.08%, barbiturates with doses of 52 making the percentage of 1.59%, local anesthetics with doses of 33 making the percentage of 1.01%, antimalarial with doses of 38 making the percentage of 1.16%, hormones with doses of 85 making the percentage of 2.61%, benzodiazepines with doses of 56 making the percentage of 1.76%, antispasmodics with 35 doses making the percentage of 1.07%, haematinics with 4 doses making the percentage of 0.12%, psychostimulants with 13 doses making the percentage of 0.399%, inotropic agents with 66 doses making the percentage of 2.02%, sympathomimetics with 16 doses making the percentage of 0.49%, corticosteroids with 88 making the percentage of 2.7%, laxatives with 14 doses making the percentage of 0.43%, antivirals with 33 doses making the percentage of 1.01%, antipyretics with 88 making the percentage of 2.7%, low molecular weight heparin with doses of 66 making the percentage of 2.02%, probiotics with 12 doses making the percentage of 0.36%, ulcer protectants with 6 doses making the percentage of 0.185% and mucolytics with 16 doses making the percentage of 0.49%.

CONCLUSION

This study provides few insights into the drug utilization patterns in NICU, PAEDIATRIC, and POST OPERATIVE departments of a tertiary care hospital by using WHO PRESCRIBING INDICATORS and by application of ATC/DDD methodology which helps in optimisation of drug therapy. Our study concludes that Drug utilization review programme is useful for the study of rational use of drugs which contributes to reduce the adverse effects, side effects, polypharmacy, therapeutic duplication, mortality, morbidity, and errors in prescription by promoting good therapeutic outcome and by improving the quality of life.

Table1: Gender Categorization

S.no	Sex	No.of cases (n=90)	Percentage (%)
1.	Male	44	48.8%
2.	Female	46	51.1%

Data expressed as per gender, and number (percentage).

Table2: Age Wise Distribution

Age	No .of patients prescribed	Percentage %	Significance
<20	60	66.6%	0.468732
20-40	15	16.6%	
41-60	10	11.1%	
61-80	3	3.33%	
>80	2	2.22%	

Age wise distribution of the patients were analysed, and calculated percentage. Significance was done between the groups by using T- Test.

Table 3: Polypharmacy Assessment

No. of drugs prescribed	Male	Female	Total	Percentage	Significance
<5	19	22	41	45.5%	0.3251
>5	21	28	49	54.45%	

Data expressed as per polypharmacy between the gender, and their percentage was calculated, found the significance value between the groups by using T –Test.

Table 4: Distribution of Formulation

Type of formulation	No. of doses	Percentage
Parenteral	2643	81.19%
Oral	525	16.12%
Nebulizer	85	2.6%
Topical	2	0.06%

Data expressed about the type of formulation was distributed, and their number of doses, and percentages were calculated.

Table5: WHO Prescribing Indicators

Prescribing indicators	Numbers
Total no. of prescriptions analysed	90
Total no. of drugs prescribed	515
Average no. of drugs perprescription	5
Drug prescription by generic names	297
Drugs prescribed from Essential Drug List(EDL)	341
Total no. of prescriptions with Antibiotics	87
Drugs prescribed by brand names	218
Total no. Of doses prescribed	3255

Data expressed that W. H. O's prescribing indicators were calculated for all the 90 prescriptions in our study.

Table6: Therapeutic Outcome

Characteristics	No. of patients	Percentage %
Recovered	79	87.7%
Still recovering	6	6.66%
No improvement	5	5.55%

Data expressed that therapeutic outcomes of patients who have been involved in our study included recovery rate, still recovery, and no improvement with their percentage.

ABSTRACT

Dental abscesses, characterized by localized bacterial infections leading to pain, swelling, and potential complications, require effective antimicrobial intervention. Conventional treatments involve antibiotics and drainage, but rising antibiotic resistance necessitates alternative approaches. *Psidium guajava* (guava) leaf extract has demonstrated significant antimicrobial, anti-inflammatory, and antioxidant properties, making it a promising candidate for oral health applications. This review explores the efficacy of guava leaf extract as a natural mouthwash for managing dental abscesses. Various phytochemicals, including flavonoids, tannins, and terpenoids, contribute to its antibacterial effects against oral pathogens such as *Streptococcus mutans* and *Porphyromonas gingivalis*. Furthermore, its anti-inflammatory properties aid in reducing swelling and discomfort associated with dental infections. By summarizing existing research, this paper highlights the potential of guava leaf extract as a cost-effective, natural, and sustainable alternative to conventional mouthwashes, emphasizing the need for further clinical studies to validate its therapeutic efficacy. The findings suggest that *Psidium guajava* leaf extract could serve as an effective, safe, and accessible alternative for managing dental abscesses, warranting further investigation into its mechanisms and broader applications in oral health.

Keywords: Dental abscess, *Psidium guajava*, Mouthwash, Antimicrobial

INTRODUCTION

Mouthwashes are liquid solutions that provide anti-inflammatory, antimicrobial, and pain-relieving effects. They are commonly used for their deodorizing, refreshing, and antiseptic qualities, as well as for plaque control[1]. Typically, mouthwashes contain ingredients like alcohol, glycerin, synthetic sweeteners, surfactants, flavoring agents, and coloring agents[2]. However, some mouthwashes that claim to eliminate 99.9% of bacteria may also destroy beneficial bacteria in the mouth. This disruption can negatively impact the oral microbiome, impairing its ability to protect against cavities, gingivitis, and bad breath[3]. Mouth rinses are mainly effective in targeting supragingival and marginal plaque, with a limited impact on subgingival plaque due to the close contact between the gum and tooth in healthy individuals[4]. Oral infections are among the most prevalent chronic infections, typically resulting from the colonization of the mouth by various microorganisms, including fungi, bacteria, and viruses. These infections can originate from either internal (endogenous) or external (exogenous) sources[5]. The oral cavity is home to several types of microorganisms, with Staphylococcus aureus and Streptococcus mutans being the most commonly found [6]. When bacteria and their by-products accumulate on the surface of the teeth, they form a sticky film known as plaque. Plaque contains a variety of bacteria, such as *Streptococcus species, Lactobacillus acidophilus, Campylobacter gracilis, Campylobacter concisus, Peptostreptococcus micros, Prevotella species*, and *Fusobacterium* species [7]. The build-up of plaque can lead to gum inflammation (gingivitis) and more severe conditions like periodontitis, which not only compromises oral health but can also contribute to systemic diseases. Among the most common oral infections are dental caries and periodontal diseases, both of which affect a large number of people. Dental caries, in particular, is a significant concern in developing countries, where poor living conditions and limited access to affordable dental care exacerbate the problem. Up until the late 20th century, dental abscesses were largely overlooked in medical discussions. This condition, which was often downplayed in terms of its potential health risks, involves a localized collection of pus in the bone surrounding the root tip of a tooth. It commonly results from factors like tooth decay, trauma, deep fillings, or failed root canal treatments. When bacteria infiltrate the pulp chamber, they spread into the root canals, forming biofilms and triggering inflammation in the tissues around the root. The formation of a dental abscess is typically associated with a variety of bacteria, including facultative anaerobes such as Streptococcus species, as well as strict anaerobes like *Prevotella* and *Fusobacterium*. Without timely treatment, the infection can rapidly extend to surrounding areas, leading to severe complications like sepsis, cavernous sinus thrombosis, brain abscesses, shock, and, in extreme cases, death. Given the potential for serious health consequences, addressing dental abscesses is of significant importance from a public health standpoint [8].

Types of mouthwash

Fluoride Mouthwash: This type of mouthwash contains fluoride, which helps protect against cavities and other dental issues. However, caution should be exercised when using it, as swallowing fluoride-containing products can be harmful to your overall health.

Antiseptic Mouthwash: One of the most commonly used types, antiseptic mouthwash often contains alcohol and is used to prevent bacterial growth in the mouth. It is particularly useful for individuals with mouth infections and those dealing with bad breath. For best results, it is typically used alongside regular brushing and flossing to maintain oral hygiene and prevent bacterial issues.

Cosmetic Mouthwash: These mouthwashes are designed mainly to mask bad breath temporarily. They don't offer long-term benefits for your dental health, and are not intended to be a substitute for proper oral care[9].

Need of herbal mouthwash

Herbal mouthwash is preferred over chemical alternatives due to its lower risk of side effects. The natural compounds in herbal plants, known as phytochemicals, possess antibacterial properties that contribute to oral health. Additionally, herbal plants are readily available, making them a practical option in today's economy. On the other hand, chemical mouthwashes often contain substances like sulfates and triclosan, which can cause significant

irritation to the oral mucosa. These adverse reactions can be avoided by using herbal mouthwash. While herbal options generally don't pose these risks, mouthwashes with high alcohol content can lead to reduced saliva production, causing dry mouth and potentially contributing to gum disease. Over brushing and certain health conditions can also lead to oral sensitivity. Herbal mouthwash helps keep the soft tissues of the mouth hydrated, offering a soothing alternative. In contrast, synthetic mouthwashes with chemical ingredients can be harsh and pose safety concerns for long-term use [10].

Advantages of Herbal Mouthwash

1. Herbal mouthwashes contain natural antimicrobial agents such as neem, clove, and tea tree oil, which help in reducing oral bacteria and preventing infection [11].
2. Chemical mouthwashes, especially chlorhexidine, can cause staining, taste alteration, and mucosal irritation. In contrast, herbal alternatives such as guava and green tea extracts provide antimicrobial benefits without significant side effects[12]
3. Herbs such as turmeric and aloe vera have anti-inflammatory properties that promote gum health and aid in the healing of oral wounds[13].
4. Herbal mouthwashes containing green tea, pomegranate, and chamomile have strong antioxidant properties, helping protect the gums from oxidative stress and periodontal disease[14].
5. Herbal mouthwashes with essential oils like peppermint and eucalyptus help neutralize bad breath by eliminating odor-causing bacteria without disrupting the oral microbiome[15].
6. Herbal mouthwashes are biodegradable and free from synthetic chemicals like alcohol and parabens, making them environmentally friendly and safer for long-term use[16]
7. Unlike commercial mouthwashes, herbal formulations do not contain alcohol or synthetic additives, making them less likely to cause dry mouth, burning sensations, or mucosal irritation[17].

Disadvantages of Herbal Mouthwash

1. Herbal mouthwashes often lack standardization in their composition, leading to variations in effectiveness and safety. Unlike commercial mouthwashes that contain precisely measured active ingredients, herbal formulations may have inconsistent concentrations[18].
2. Certain herbal ingredients can cause allergic reactions or sensitivities, particularly in individuals with pre-existing conditions. Essential oils such as tea tree oil and eucalyptus have been reported to cause irritation and contact dermatitis in some users[19].
3. While herbal mouthwashes possess antimicrobial properties, studies suggest they may not be as effective as chlorhexidine-based or fluoride mouthwashes in controlling plaque and gingivitis.[20]
4. Herbal formulations often lack synthetic preservatives, leading to shorter shelf lives and potential microbial contamination over time[21].
5. Certain herbal extracts, such as neem or clove oil, may have a strong, lingering taste that some users find unpalatable, affecting compliance with regular use[22].

Psidium guajava

Psidium guajava Plant (Figure 1). Guava plant parts and their present excipient (Table 1). The guava plant (*Psidium guajava*) has been used in traditional medicine for centuries, valued for its wide range of therapeutic properties. Various parts of the plant are employed to treat ailments such as malaria, digestive issues, wounds, toothaches, and respiratory disorders. More recently, research has also explored its potential in managing chronic conditions like diabetes, hypertension, and obesity [32]. Part of the Myrtaceae family, the genus Psidium is thought to have originated in the tropical regions of South America. Guava is now cultivated in many tropical and subtropical areas around the world, including Florida, Egypt, parts of Asia, Hawaii, and Palestine. Within the Psidium genus, there are approximately 150 species of shrubs and small trees, with about 20 species producing edible fruits. The most widely cultivated species, *P. guajava*, is commonly referred to as the guava. While guava fruits are not a major global commodity, their cultivation remains an important agricultural activity in tropical regions, providing significant nutritional benefits to millions of people worldwide.

Antibacterial Properties of *Psidium guajava*

Guava leaves contain two key flavonoids: quercetin and guaijaverin. Quercetin is known for its ability to ease spasms, act as an antioxidant, fight microbial infections, and reduce inflammation. Guaijaverin is recognized for its strong antibacterial effects. These bioactive compounds contribute to the medicinal properties of guava leaf extracts. Quercetin, in particular, has shown promising antibacterial activity against several pathogens, including *Prevotella intermedia, Porphyromonas gingivalis, Fusobacterium nucleatum*, and *Aggregatibacter actinomycetemcomitans*. It has also been effective in inhibiting *Streptococcus sanguinis, Streptococcus mutans*, and Actinomyces species. These antibacterial effects are believed to stem from quercetin's ability to disrupt cell membranes and form stable complexes that deactivate extracellular proteins [33].

Natural Plants Used in Herbal Mouthwashes

Peppermint: Peppermint is known for its high menthol content and is commonly used in teas, as a flavoring for desserts, candies, chewing gum, and toothpaste. The essential oil also contains menthone and menthyl esters, especially menthyl acetate. This herb is one of the oldest and most popular mint flavors used in candies. Peppermint oil is also added to shampoos and soaps for its minty fragrance and cooling effect on the skin. Its oil has multiple therapeutic properties, including being analgesic, anti-inflammatory, antiviral, digestive, antiseptic, astringent, carminative, and anti-spasmodic. It is commonly used to treat headaches, bronchitis, sinusitis, indigestion, nausea, irritable bowel syndrome, menstrual irregularities, and various nervous disorders. It is also effective in alleviating cold and flu symptoms [34].

Clove: Cloves are often used as a carminative to promote stomach acid production and stimulate peristalsis. They are considered a natural anthelmintic. The essential oil is also used in aromatherapy for stimulating and warming effects, particularly in treating gastrointestinal issues. Applying clove oil topically over the abdomen is said to have a warming effect. [35]Clove oil is also effective for toothache relief, especially when applied to a decayed tooth.

Ajwain: Ajwain is commonly used as an antiseptic and is effective for treating skin infections and cleaning wounds. The oil extracted from Ajwain is also used in toothpaste and perfumes. Crushing the leaves and applying them can help treat infections. Ajwain seeds are known to prevent bad breath, and the compound thymol, found in these seeds, is used in various mouthwash formulations. Regular chewing of Ajwain seeds along with fennel seeds is a natural remedy for halitosis.

Guava Leaves: Chewing fresh guava leaves is a traditional remedy for bleeding gums and bad breath. Guava leaves contain antimicrobial compounds that help combat bacteria responsible for common oral infections. Phytochemical studies have shown that guava leaves contain active ingredients like tannins, triterpenes, phenols, flavonoids, essential oils, and carotenoids, all of which contribute to their effectiveness in promoting oral health.

Neem: Neem has shown remarkable antibacterial properties, effective against both gram-positive and gram-negative bacteria, including harmful strains like E. coli, Streptococcus, and Salmonella. Its application in oral care has been widely studied, especially in regions with limited access to dental care. Research has demonstrated that neem extracts from twigs or bark can inhibit the growth of Streptococcus mutans, a bacteria commonly associated with dental cavities and gum disease[36].

Tulsi: Tulsi, also known as Holy Basil, is a small but powerful plant with numerous medicinal uses. In Ayurveda, it is highly valued for its ability to treat mouth ulcers and infections. Chewing Tulsi leaves can help address these issues. The leaves are also beneficial for oral hygiene when dried, powdered, and used as a tooth powder or mixed with mustard oil to create a paste for brushing. This combination helps maintain dental health, freshen breath, and massage the gums. Its anti-inflammatory and antimicrobial properties make it an excellent natural remedy for gum disease [37].

Green Tea: Green tea is widely used as a mouthwash to prevent dental decay, treat bad breath, and alleviate conditions like laryngitis, mouth sores, plaque buildup, and throat infections. It can also be used as a soak for treating fungal infections like ringworm and athlete's foot, as well as parasitic infestations such as lice and scabies. Green tea has been studied as a safe, non-toxic alternative mouthwash, especially for children and pregnant women. It has been shown to reduce plaque formation effectively without the side effects commonly associated with chemical-based mouthwashes [38].

Evaluation Tests [39]

Physical Evaluation

The physical characteristics of the herbal mouthwash, such as color, odor, taste, and consistency, were assessed through visual inspection.

pH Determination

The pH of the prepared herbal mouthwash was measured using a digital pH meter. The device was calibrated with standard buffer solutions before testing. Approximately 1 mL of the mouthwash was diluted with 50 mL of distilled water, and its pH was recorded.

Microbial Growth Test in Formulated Mouthwash

The mouthwash was tested for microbial contamination by inoculating it onto agar plates using the streak plate method. A control sample was also prepared for comparison. The plates were incubated at 37°C for 24 hours. After incubation, the plates were examined for microbial growth and compared with the control to ensure the absence of contamination.

Thin Layer Chromatography (TLC)

Thin Layer Chromatography was employed to separate the non-volatile compounds in the formulation. The experiment involved using a sheet coated with a thin layer of adsorbent material, such as silica gel, cellulose, or aluminum oxide, which served as the stationary phase. The technique helped isolate and analyze the components of the herbal mouthwash.

Aftertaste: The taste of the mouthwash remained consistent throughout the week, except for the sample exposed to ambient temperature. Healthy male and female participants were chosen to evaluate the taste. Each participant was given approximately 1 mL of herbal mouthwash and asked to describe the flavor.

Foam Height: A 1 mL sample of mouthwash was combined with 50 mL of distilled water and poured into a 500 mL graduated cylinder. Additional water was added to bring the total volume to 100 mL. The solution was then subjected to 25 strokes of mixing before being set aside. The foam height above the liquid surface was then measured[40].

Turbidity: Turbidity refers to the cloudiness or haziness of a liquid caused by suspended particles that are not visible to the naked eye. The turbidity of the mouthwash formulations was measured using a Turbidimeter, which provides values in Nephelometric Turbidity Units (NTUs). A formulation is considered clear if its NTU value is around or below 12. The turbidity levels of all three mouthwash formulations were assessed using Nephelometry.

Stability Studies: The purpose of stability testing was to ensure that the mouthwash formulations remained effective and retained their properties over time. Before conducting antibacterial tests, stability assessments were performed on different mouthwash formulations.

Physical Stability: This test examined the visual appearance, uniformity, and potential phase separation of the formulated mouthwash. The three formulations were stored at different temperatures (12°C and 25°C), and their appearance was observed and recorded at various intervals to assess stability under different conditions

CONCLUSION

The use of *Psidium guajava* leaf extract as a mouthwash presents a promising natural alternative for managing dental abscesses. Its antibacterial, anti-inflammatory, and antioxidant properties contribute to reducing oral pathogens, alleviating pain, and promoting overall oral health. Various studies support its effectiveness against common oral bacteria, including *Streptococcus mutans* and *Porphyromonas gingivalis*, which are often associated with dental infections. Moreover, its safety profile, cost-effectiveness, and minimal side effects make it a viable option for integration into dental care. However, further clinical trials are essential to establish standardized formulations, optimal concentrations, and long-term efficacy. Future research should also focus on comparative studies with conventional treatments to validate its potential as a mainstream therapeutic agent.

ABSTRACT

This paper is assessed the quality of the ground water resources from Nagapattinam city, based on drinking water quality index namely arithmetic and geometric one. Separate containers have been used to collect water from selected places of Nagapattinam and examined for electrical conductivity, pH, Cl^- ion, SO_4^{2-} ion, total alkalinity, total hardness, Ca^{2+} ion, Mg^{2+} ion, presence of heavy metal iron, F^- ion and NO_3^- ions. World Health Organization(WHO) and Bureau of Indian Standards (BIS) recommended values were made comparison with the obtained results. Arithmetic and geometric drinking water quality index values were calculated for all the samples. From the result, one can get a conclusion that arithmetic drinking water quality index categorized the same samples as "poor" category due to the occurrence of eclipsing phenomena. But geometric drinking water quality assessed the same sample as "very poor". Besides both the drinking water quality indices reported that all analyzed water samples are not in the level of using as drinking water directly. But geometric water quality index picked up the original

quality of water samples. Therefore, an immediate call on water managers for putting a separate mechanism to treat the ground water resources before using for drinking purposes.

Keywords: Ground water, Nagapattinam, arithmetic drinking water quality index, geometric drinking water quality index, eclipsing phenomena

INTRODUCTION

Quality of drinking water samples can be judged by the presence of various constituents originated from different sources namely physical origin, chemical source and biological ways. The presence of various ions inside the permissible limit make the water sample suitable for drinking purpose. Presence of various ions in various levels, suppose if it crossed the limiting value make it complicated to get the final quality which in turn will reflect in the quality. Hence decision making is important. Human beings are affected by many diseases, out of which 80% and above are directly related to water purity nature, sources from World Health Organization [1]. Water professionals told that the original nature of samples can be received by making direct comparison of the result obtained from the analytical part with recommended values, this step is purely technical based one, does not give the original nature of samples used for drinking [2]. To reduce this complication for getting accurate decision,[3] proposed WQI -Water Quality Index. This WQI described the purity of water samples in a gentle way. Many corrections have been made on this to improve its quality, recommended by using the delphi technique recommended by National Sanitation Foundation (NSF), USA. WQI is a mathematical based procedure, which combines results of all parameters analytical data single numeral. From this the overall quality of water can be known. According to [4], [5] many advances have been made to modify the basic principles WQI. Scientists such as [6], [7], [8], [9], [10], [11], [12] were also helped a lot to make changes on WQI. Different way of developing sub index and their aggregation methods were the main tools during advancement of WQI . Finally overall quality of different water samples collected from different environment was clearly given by both WQIs. Hence, to judge the overall water quality of samples, suitable DWQI should be identified to make the samples suitability for drinking purpose.

MATERIALS

Sampling and analysis of samples

10 sites were selected for sampling of ground water from Nagapattinam city. The details of places from which water samples were collected and analyzed, represented in Fig.1 and tabulated in Table 1. Standard methods were used for sample collection and the analysis of different parameters such as electrical conductivity, pH, Cl^- ion, SO_4^{2-} ion, total alkalinity, total hardness, Ca^{2+} ion, Mg^{2+} ion, presence of heavy metal iron, F^- ion and NO_3^- ions were carried out using standard procedures given by [13].

Description of Water Quality Index value for drinking

It is mathematical procedure by which the conversion of all the obtained results of various physical, chemical constituents with different units can be converted into a single numeral. From this numeral, the real quality of the sample can be obtained. Two stages were used to get value of DWQI, The first one is the creation of unitless subindex values from various physical, chemical constituents with different units. In step number two, the aggregation of sub index value using some functions into water quality index value.

Selection of Parameters

Parameters have been selected with different weightages based on its impact on health related value. In one way their presence is most important, the level should not exceed the prescribed limit. If it exceeds many harmful effects will be received by human beings [14].

Considering the above points, 11 parameters were selected for assessing the quality for drinking. Water quality constituents namely EC, pH, chloride ion, sulphate ion, total alkalinity, total hardness, Ca^{2+} ion, Mg^{2+} ion, heavy metal iron and highly health oriented F^- ion , NO_3^- ions were taken into consideration for calculating indices.

Creation of Sub-Index (SI)

In WQI concept different units physical and chemical constituents with different dimensions are converted into unitless sub-index value, bringing the different units and dimensions analytical results into common scale. Here each water quality constituent was given with values starting from 0 to 100 as rating value during development of sub index value. Based on guideline values of individual parameters, the rating value has been assigned to each parameter which was recommended by [15], [16] and [17] in 2nd Table. If SI (sub index) with rating = 100 means that the sample is within the desirable limit. But sub-index with rating = 50 means that the sample is reached the maximum acceptable limit value. Based on regression statistics, samples quality fell between zero to hundred[2] and [18]. Electrical conductivity, pH, chloride ion, sulphate ion, total alkalinity, total hardness, Ca^{2+} ion, Mg^{2+} ion, heavy metal iron, F^- ion and NO_3^- ions.

Allocation of temporary weight to the constituents

Initially, a temporary weight (W_t) is given to every physical and chemical constituents. This weight allocation is purely depends upon the percentage of weightage of that parameter for drinking. Divide the each parameters temporary weight by the addition of all of temporary weights [Eq. 1].

equation 1 should be like this $W = W_t$ ..... (1)

$$\sum_{i=1}^{n} (W_t)_i$$

Calculation of DWQI

DWQI is calculated by aggregating weight factors and values of subindex of each water quality constituents, with the help of well defined aggregation function. Usually addition and multiplication aggregation techniques are the famous ones.

In this research study, the obtained SI values were combined by weighted additive and multiplicative methods

(i) Value of drinking water quality index by addition or arithmetic ($DWQI_{(A)}$) was calculated by involving [2].

equation 2 should be like this $DWQI_{(A)} = \sum_{i=1}^{n} [SI_i \times W_i]$ .....(2)

(ii) Value of drinking water quality index by multiplication or geometric ($DWQI_{(G)}$) was calculated by involving [2]

$$DWQI_{(G)} = \prod_{i=1}^{n} SI_i^{W_i} \quad \ldots\ldots (3)$$

here,

SI_i – i^{th} constituents sub index value

W_i –i^{th} constituents weight factor value

n –number of constituents involved (n = 11)

Using the above equation Weight factors of all water quality parameters can be calculated. For this calculation temporarily assigned weight (W_t) and the total numbers of constituent (n) were used and n=11 here (Table 3).

Categorization of Scores of Drinking Water Quality Index

Equations with aggregating scores were developed from the rating values 0 and 100. Zero represents worst quality of water and hundred represents excellent quality of water. Drinking water quality index scores with its detailed classification is presented in 4th Table.

RESULTS AND DISCUSSION

Study area quality assessment through DWQI values for drinking

From Nagapattinam city, 10 different places were identified for sample collection and for all the samples DWQI value has been calculated. To calculate DWQI addition and multiplication WQI methods were used, the values were tabulated in the 5th Table. The scores of arithmetic DWQI is greater than the scores of geometric DWQI was noted during the calculation. Low values were received for geometric DWQI. From the results, it was observed that AWQI scores dominated GWQI for all the samples. Arithmetic drinking water quality indicated the quality was 'POOR' for all samples. But geometric drinking water quality indexing system indicated 'VERY POOR' for all the samples. From these two DWQI calculation, it was noticed that arithmetic DWQI gave 'POOR' quality category, geometric DWQI reported the status of 'VERY POOR' for all the analyzed samples. From the insight analysis of water quality parameters reported that parameters like total alkalinity of sample-5, total hardness of samples-10, chloride value of samples -3,4,5 and 10, magnesium value of -5 were occasionally crossed the maximum acceptable limit of drinking water quality of guideline value. This occasional crossing of maximum permissible limit of guideline values of various parameters such as total hardness, total alkalinity which have high impact on health impact. It was reflected in the result geometric DWQI while assessing the drinking water quality of water samples. That is why geometric DWQI assessed the samples were in 'VERY POOR' category (Fig.2). [19] and [20] proposed the following views that is arithmetic and geometric drinking water quality indices gave two different results for the same water samples. This was in agreement with the views of [21], [22], [23], [24], [25] and [26]. The above researchers told that the eclipsing problem may happen when the used aggregation method is addition. When at least one parameter was not up to the supportive level of drinking water quality as per guideline value, eclipse may arise. So arithmetic DWQI was forced to underestimate assess status of estimating the pollution nature. So arithmetic DWQI is unable to appraise the real drinking quality of water and this reflects in the judgement of arithmetic DWQI. Hence, arithmetic DWQI over estimated the quality. If more number of physical and chemical constituents chosen for calculating WQI, the value of SI value is lower and delicate while aggregating values. That is DWQI arithmetic over judged the original nature of samples than DWQI geometric.

CONCLUSION

In this study, crystal clear judgement was given by geometric DWQ Indexing system when compared to arithmetic DWQ Indexing system. This is because of eclipsing phenomena which in turn reflected in the judgement of Arithmetic DWQI. So it could not tell the nature of ground water sources accurately. But the real impairment of samples were identified by geometric DWQI. Decision of geometric DWQI helped to start the control action towards minimizing pollution. In nutshell, geometric DWQ Indexing assessed the samples in transparent manner, water needs to be purified before consumption.

ABSTRACT

The world of population mostly depends for their live hood on agro-based economy where a very significant portion of the gross domestic product comes from agriculture. Coconut is one of the oldest crops grown in India and presently covers 1.5 million ha in this country with a total production of over 1000 million nuts. Coconut (*Cocos nucifera* L.) is one of the major plantations in India among the various insects' pests causing damage to coconut, Rhinoceros beetle (*Oryctes rhinoceros* L.) is a serious pest in south East Asia. It causes serious pest damage in juvenile coconut palm in the age group of one to six years. The adults upon emergence go in search of crown region juvenile palm during night for feeding, remaining in the breeding sites during day time. The adult beetles cause injury to the young palms by boring into the central spindle leaf, spathe and young petioles. The adult beetle feeds on the soft tissues and the chewed up fibrous materials is seen protruding from the entry point or the bore holes. The Rhinoceros beetle larva was controlled with the help of the antibiotics of neem and Calotropis, which is given the best result to control the coconut beetle with the help of these two antibiotics. Neem is an excellent natural pesticide with properties that deter and kill pests including the coconut beetles. The Objectives of the present study were to use the medicinal leaf powders such as *Azadirachta indica* (Neem) and *Calotropis gigantea* to manage the insect pest *Oryctes rhinoceros* coconut beetle larva, to study the

Phytochemical analysis of the selected leaf powders and to evaluate the toxicity of UV radiation exposed *C. gigantea* and *A. indica* extracts against coconut beetle larva.

Keywords: Coconut (*Cocos nucifera* L.), Rhinoceros beetle larva (*Oryctes rhinoceros* L.), *Azadirachta indica* -Neem and *Calotropis gigantea* -Calotropis)

INTRODUCTION

Organic farming plays an important role in getting quality food, since people are health conscious and many times asking for organic tender coconut and organic copra. (*Cocus nucifera* L) is one of the important plantation crops cultivated across 19.5 lakh ha in India with a production of 14811 lakh nuts with an average of 7608 nuts. In southern India, every house uses coconut almost every day for one or the other purpose. In addition to use of nuts for food and temples for spiritual customs and ceremonies, in many parts of the world coconut oil is used as food bio fuel and lubricant. While it is one of the worlds keeping thin in background the following objectives were framed to update the pest by bio pesticides (Muralimohan, *et al.,* 2008). Neem *Azadirachta indica* is a useful traditional medicinal plant growing in Nigeria, India and America, Innocent Izuchukwu Ujah *et al.,* (2021). Chandrabhan Seniya *et al.,* (2011) revealed, the leaves extract of *Calotropis gigantea* were screened for its antibacterial and phytochemical Activities. The solvents used for the leaves extraction were n-Hexane, Ethanol, Methanol, Chloroform, Water and Ethyl acetate. Ethyl Acetate leaves extract exhibited maximum Zone of inhibition.

OBJECTIVES

- To use the medicinal leaf powders such as *Azadirachta indica* (Neem) and *Calotropisgigantea* to manage the insect pest *Oryctes rhinoceros* coconut beetle larva.
- To study the Phytochemical analysis of the selected leaf powders.
- To evaluate the toxicity of UV radiation exposed *C. gigantea* and *A. indica* extracts against coconut beetle larva.

MATERIALS AND METHODS

The study was carried out in off laboratory conditions to evaluate the efficacy of leaf powders against pest of *Oryctes rhinoceros*.

Insect culture

The *Oryctesrhinoceros* larvae were collected from the vermicomposting area, Nirmala College for Women, Coimbatore, after collection, they were kept in the jar with holes on the top of the jar. This jar was kept in the room temperature in relative humidity and ventilation.

Collection and Preparation of plant powders

Fresh leaves of selected plants were collected from Coimbatore district and used against pests of rhinoceros larva, collected, washed and shade dried leaves were ground into fine powders using an electric grinder, it was passed through a sieve retained in separate containers.

Experimental design

With the use of the concentration of the plant powders the mortality rate was calculated. Phyto-chemical analysis of the plant powders was also conducted. Qualitative analysis(Braca *et al.,*2001), the preliminary phytochemical screening of leaf extracts of selected medicinal plants was carried out using the standard procedures.Test for Alkaloids, Tannins, Phenols, Flavonoids, Steroids, Saponins etc. UV Spectrophotometry (Shimadzu., 2015), is employed to characterize and quantify the diverse bioactive compounds present in plants, such as Neem (*Azadirachta*

indica) and Calotropis (*Calotropis gigantea)*. The normal spectrum analysis range done from (100 to 400) and visible region (400 to 800) as it facilitates to understand various peaks arising due multiple components present in the extract.

RESULT

Phytochemical Analysis

On doing phytochemical screening test for the leaf powder of *Azhadirachta indica* it showed the presence of certain metabolites called Flavonoids, Anthraquinone, Proteins, Carbohydrates and Saponins contribute significantly to the plant's ability to repel, disrupt and kill a wide range of insects. These phytochemicals make Neem an eco-friendly and effective option for natural pest control in agriculture, gardening, and other pest management practices. The presence of flavonoids was confirmed by the observation of intense yellow colour when treated with dilute NaOH that turns colorless on adding dilute HCL precipitate in Alkaline test and by the observation of presence of reddish orange colour precipitate in H2SO4. The presence of Anthraquinone was confirmed by the observation of reddish orange colour when treated with FeCl3+ concentrated HCL+ diethyl ether Ammonia. The presence of proteins was confirmed by the observation of yellow colouration in concentrated HNO3.The presence of carbohydrates was confirmed by the observation of violet ring in Molisch's test and by the observation of red precipitate in Fehling's test. The presence of Saponins was confirmed by the observation of presence of foam in shaken with water. (Table-1).
On doing phytochemical screening test for the *Calotropis gigantea* it showed the presence of certain metabolites called Flavonoids, Anthraquinone, Proteins and Carbohydrates. The presence of Flavonoids was confirmed by the observation of presence of reddish orange colour when treated with H2SO4. The presence of Anthraquinone was confirmed by the observation of presence of reddish orange colour when treated FeCl3+ Conc. HCL +diethyl ether +Ammonia. The presence of Proteins was confirmed by the observation of yellow colouration when treated with +concentrated HNO3. The presence of Carbohydreates was confirmed by the observation of violet ring in molisch's test and by the observation of red precipitate in Fehling test. The presence of Cardiac glycosides was confirmed by the observation of yellow precipitate in bromine water test. (Table-2).

Results of Phytochemical analysis (Table:1) (Table:2)

Results of UV spectrophotometry *Azadirachta indica.*

An OD value of 21.328 at 220 nm is very high value, indicates the sample strongly absorb UV light at this wavelength, OD value of 11.590 at 250 nm is exceptionally high ,indicates the sample strongly absorb UV light at this wavelength, OD value of 7.769 at 300 nm exceptionally high, indicates the sample strongly absorb UV light at this wavelength, OD value of 5.512 at 350 nm indicates a high level, indicates the sample strongly absorb UV light at this wavelength, OD value of 2.134 at 400 nm indicates the sample strongly absorb UV light at this wavelength, OD value of 0.929 t 500 nm indicates the sample absorb a moderate amount of UV light at this wavelength, OD value of 0.763 at 600 nm indicates the moderate amount of UV light absorbance at this wavelength, OD value of 0.624 at 800nm the sample indicates the moderate amount of light at this wavelength.

Results of UV spectrophotometry *Calotropis gigantea*

A OD value of 3.951 at 220 nm is very high value, indicating the sample strongly absorb UV light at this wavelength, OD value of 2.146 at 250 nm high value , indicates the sample absorb the UV light at this wavelength, OD value of 1.312at 300 nm is a moderate high value, indicates the sample strongly absorb the UV light at this wavelength, OD value of 1.264 at 350 nm is considered as high value, indicates the sample absorb the UV light at this wavelength, OD value of 1.568 at 400 nm is still low value, indicates the sample strongly absorb the UV light at this wavelength, OD value of 0.319 at 500 nm relatively low value, indicates the sample strongly absorb the UV light at this wavelength, OD value of 0.253 at 600 nm relatively very moderate value, the sample absorb the UV light at this wavelength, OD value of 0.106 at 800 nm is very low value, indicates the sample absorb the UV light at this wavelength.

DISCUSSION

The crude extract of leaves from *Calotropis procera*did not contain terpenoids, triterpenoids, or steroids. Numerous naturally occurring chemical components, such as cardenolides, tannins, glycosides, Phenols, terpenoids, flavonoids, alkaloids, and saponins, are present in the powdered leaves of *Calotropis procera*. Terpenoids and tannins have analgesic and anti-inflammatory properties. In addition, tannins support the astringent quality, which promotes quicker healing of wounds and irritated mucous membranes, Yassin Adem Endris *et al.,* (2024). The application of neem cake in powder form @ 250 g admixed with equal volume of sand, thrice a year on the top most three leaf axils of coconut palm is an effective prophylactic method. Srinivasan and Shoba (2017), Josephrajkumar*et al*., (2012). The use of chlorpyriphos dust and neem cake has been already proved effective against rhinoceros beetle by Josephrajkumar*et al*., (2012). Mohan and Padmanaban (2013), also documented the antifeedant and deterrent activities of neem cake against *Rhinoceros* beetles. The effects of naphthalene balls were also proved by Yamini Varma, (2013) and Sadakathullah and Ramachandran, (1990), which repelled the adults of *Rhinoceros* beetles up to 45 days. The UV-VIS absorbance spectra of the extract of different leaves taken between wavelengths ranging from 380 nm to 750 nm. The spectra show the typical behaviour of leaves composed of chlorophyll a and chlorophyll b along with carotenoids. The peaks near the red regions (620 to 750 nm) are Due to chlorophyll a (at 661 nm) and chlorophyll b (at 644 nm) while in the blue Region (450–490 nm) it is a compound spectrum composed of chlorophylls and carotenoids. However, contrary to the general expectation, the absorbance does not Fall to zero in the regions where no chlorophyll peaks in nearby regions are present. This may be due to turbidity present in the extracts of the leaves. Turbidity and Light scattering generally increase absorption between 400 to 800 nm wavelengths, especially towards the shorter wavelength side. Mandal *et al.,* (2015).

UV spectrophotometry *Azadirachta indica*(Fig.1).
UV spectrophotometry *Calotropis gigantea* (Fig.2).

CONCLUSION

The present study shown the possibility of using leaf powders as insecticide to control the *Oryctes rhinoceros*. The study indicated that the leaf powders of *Azhadiracta indica* and *Calotropis gigantea* are effective on controlling the larva *Oryctes rhinoceros*.

ABSTRACT

In recent decades, ionizing radiation-based interventional procedures have transformed diagnosis, treatment, and palliation in medicine, enabling more patients to get treatments that were previously unattainable. Concerns over the health implications of radiation exposure from minimally invasive fluoroscopically guided interventional radiologic procedures on patients and personnel have grown in tandem with the exponential growth in these procedures. The Commission gave doctors and other medical professionals helpful guidance on how to safeguard both themselves and their patients when performing interventional procedures. Only if these actions are supported by a framework of radiological protection components and have personnel with radiological protection duties on hand will they be successful. This study includes how women are more sensitive than men, occupational doses in interventional radiology and the measures which helps to reduce occupational doses for women interventional technologist like, protective garments, exposure monitoring devices, distance, filtration, collimation, exposure control, cumulative timer, safeguarding for fetus and embryo, quality assurance.

Keywords: Occupational radiological protection, Interventional Radiology, Exposure monitoring, protective garments.

INTRODUCTION

Interventional radiology uses image-guided methods to diagnose and treat patients with minimally invasive treatments. Central venous catheters and subcutaneous ports are frequently placed via interventional radiology, which has certain advantages over surgical installation [1]. The number of interventional radiology (IR) operations performed has rapidly increased during the past ten years. Radiation exposure for both patients and employees rises as the quantity and complexity of IR operations performed grow. Both patients and personnel may have predictable consequences from skin necrosis to temporary erythema as a result of this high radiation exposure. Additionally, there is a chance that all irradiated patients will experience more stochastic damage. IR operations are typically therapeutic, and the danger of radiation exposure is typically lower than the therapeutic impact, which is how IR differs from diagnostic imaging. Because radiation protection is maximized when exposure is "as low as reasonably achievable, economic, and societal factors are being taken into account," the ALARA principles should be used to minimize radiation exposure to workers and patients [2]. As we all know that women experienced 50% more cancer and death occurrences than males who received the same radiation exposure, radiation is more damaging to women than to men. Many deterministic(rashes, burns, headache, vision loss)and stochastic effects (cancer, genetic effects) may also occur in women technologist and it may also passes from generation to generation. Women are more vulnerable to IR damage because they have more reproductive tissues than men, and reproductive tissues are known to be more sensitive to IR damage. The following consequences may arise from the dangers of being exposed to environmental toxins, such as ionizing radiation, while pregnant:

- Pregnancy loss(abortions)
- Congenital malformations
- Mental retardation, etc.
- Sterility

Some surveys have revealed that individual occupational doses may surpass these values and vary significantly, even though interventionalists can maintain their annual occupational effective dose below 10 mSv with the right protection and usually within a range of 2–4 mSv or less [4,37].

Measures should follow to Reduce Occupational Dose

Lead Shielding

Every women technologist in the room needs to wear safety aprons. For people who might not be able to face the patient at all times when the beam is on, wraparound aprons are preferable. The apron should have proper lead acrylic shielding and their thickness should be 0.25mm or 2mm lead equivalent. Because the physician is gazing at the image display during the x-ray exposures, it is crucial that the leaded glasses fit closely to the features of the face, especially around the sides and underside. As a result, radiation from the side and below may reach the eyes. Many more protective garments are also available like thyroid shield, Gonad shield, Lead gloves because women thyroid [5].

Distance

By moving back and becoming farther away from the patient, staff members can also lower the doses given when employing high-dose acquisition modes (such as image acquisition series and digital subtraction angiography) and when injecting contrast media with an automatic injector. Moveable screens can provide safety for staff members who must be close to the patient, such as nurses and anesthesiologists. It is recommended that other staff members distance themselves from the irradiated volume of the patient or, if possible, leaving the room during acquisition.
Also, SSD for stationary fluoroscopy must not be less than 38cm and for mobile, should not be less than 30cm.[6]

Dosimeter

Every women who has working in IR should worn the dosimeter daily, at the level of colar. the best estimate of effective dosage is obtained by combining the readings of two dosimeters, one protected by the apron and one unshielded above the apron at collar level. Additionally, the dosimeter beneath the apron shows that a sufficiently shielding apron was worn on a regular basis[8].

Filtration

The fluoroscopic x-ray beam's overall filtration needs to be at least 2.5 mm al equivalent. The total filtration includes the tabletop, patient cradle, or any other object placed between the tabletop and the x-ray tube[9].

Collimation

It is well known that collimation lowers radiation exposure levels for both operators and patients. Collimation also minimizes needless radiation exposure and also improving image quality. By lowering the total integral dosage to the patient, a reduced X-ray field from collimation lowers the radiation risk to both the patient and technologist. According to the literature, reducing the beam's field size reduces the amount of material that interacts with the primary beam, which lowers the possibility of secondary scatter radiation from beam interactions both inside and outside the patient[10].

Exposure control

Regulation mandates that the switch be continuously pressed to sustain the production of xrays. When the switch is disengaged, the x-rays automatically stop working and disappear from the surroundings. The switch is commonly referred to as a "dead man" switch since it stops producing x-rays if the operator releases it for whatever reason. It is against the law and a grave disregard for safety to evade this switch's functionality, such as by setting something on it to keep it depressed without human action [11].

Cumulative timer

When the fluoroscopic timer has gone past five minutes, a cumulative timer that emits an auditory signal must be supplied. The purpose of this equipment is to make sure the radiologist knows how long each process will take for the beam to be on. For every examination, the helping radiologic technologist should note the total amount of time spent on the fluoroscopy beam[12].

Safeguarding for Fetus and Embryo

If a woman has announced that she is pregnant, her working environment should guarantee that the extra dosage given to the fetus doesn't surpass 1 mSv for the duration of the pregnancy. If pregnant women follow the right protocols, current results do not support fully excluding them from undertaking interventions guided by radiological imaging. In any event, pregnancy necessitates that the employer thoroughly examine the pregnant worker's exposure circumstances and other occupational hazard factors (such as back pain from wearing lead aprons). But preferably, women pregnant should technologist assigned their duties at radiation free zone[13].

Quality Assurance

It is crucial to conduct quality assurance with frequent recorded inspections to ensure that professionals doing interventions guided by radiological imaging always wear their dosimeters and protective gear, such as eyewear[14].

Summary

Imaging-guided procedures are becoming increasingly common in both developed and developing nations. In addition to being more complex, new kinds of therapies necessitate a greater amount of x-ray imaging and provide additional occupational safety concerns. So as we all know that the women are more sensitive to radiation than men and specially those who are working in radiation, they continuously get the occupational exposure and that radiation may cause deterministic and stochastic effects in women that may lead death. ICRP and other regulatory board gives some measures to protect the women from radiation. (1) pb garments that may gives protection from radiation (2)

distance from x-ray source to minimize dose (3) wear dosimeter to calculate the exposure readings (4) filtration to remove scattered radiation (5) collimation to reducing the beam's size (6) the exposure switch commonly refer as dead man type (7) set the fluoroscopic timer (8) pregnant women should not get dos of more than 1msv (9) quality management.

ABSTRACT

India's agricultural sector relies heavily on manual labor for fruit handling, which increases the risk of human error and allows decayed or substandard produce to reach end consumers. This paper presents a convolutional neural network (CNN) approach to precisely classify fresh and rotten fruits across various types. Our deep learning model, fine-tuned using the RESNET architecture, was trained on a comprehensive dataset of 14,000 images. Experiments demonstrate a significant improvement over prior approaches, achieving an accuracy of 93.52% in identifying fruit decay, and thus holds promise for more reliable post-harvest quality control.

Keywords: Fresh fruit, Rotten fruit, Classification, Texture features, Convolutional Neural Network, Deep learning

INTRODUCTION

Post-harvest wastage is a persistent challenge in India's fruit supply chain. According to the Export Import Bank of India, losses range from 11% to as high as 90% for fruits like tomatoes and mangoes. This issue is closely tied to limited access to enhanced post-harvest technologies and the reliance on manual grading, which is still predominant at producer-operated markets. With manual methods, grading is based on observable parameters such as weight,

color, shape, and size, but these processes are not scalable and are susceptible to significant human error. Mixed storage of fruits in warehouses and processing facilities further exacerbates the spread of decay, as decayed fruit can affect large batches. Given the high costs and time involved in manual classification, automation emerges as a necessary solution. Our research aims to develop an image processing solution using deep learning—specifically a fine-tuned RESNET architecture—to accurately and efficiently classify fruits as fresh or rotten, regardless of variety. The external features such as color, texture, and size are used for classification, and the system is designed for adaptability and scalability across different fruit varieties. This automated approach can minimize post-harvest losses and elevate industry standards.

RELATED WORK

Numerous studies have tackled fruit classification using traditional as well as advanced machine learning techniques. Ronald *et al* . applied Naive Bayes classification to RGB images of apple varieties after image preprocessing, reporting accuracy rates above 91%. Other researchers have developed CNN-based systems, including Z.M. Khaing *et al .,* who used AlexNet in a MATLAB environment to achieve a 94% accuracy rate on 971 images. Hasna Hena *et al* . tested a CNN for mango variety recognition via raw leaf images, ultimately achieving 78.01% accuracy. Bhargava and Bansal combined a range of machine learning classifiers—including SVM, KNN, and sparse representative classifiers—with CNNs for fruit grading. SVMs yielded the highest accuracy at 95.72%. In the domain of spectral analysis, Li *et al* . used near-infrared (NIR) spectroscopy coupled with backpropagation networks and achieved an average accuracy of 99.44% for apple identification, highlighting how alternative non-visual features can also be leveraged when available. However, many prior approaches are limited by modest datasets, specialized hardware requirements, or by focusing on varietal identification rather than practical decay recognition. Our system advances the field by applying a robust, scalable deep CNN to a large, openly available image dataset for direct rotten/fresh classification.

RESNET-Based Architecture

RESNET (Residual Network) is a deep CNN design that facilitates the training of very deep networks using residual (skip) connections, which help address vanishing gradient problems and improve learning stability. We employed a configuration with 13 convolutional layers, 5 pooling layers, and 3 fully connected layers (see Fig. 1).

Convolutional layers: Extract features at increasing levels of abstraction — from colors and edges to more complex decay patterns.

Pooling layers: Downsample feature maps to reduce dimensionality and retain critical information.

Fully connected layers: Aggregate features for final classification, outputting probabilities for each class (fresh/rotten).

The model is trained for 5 epochs, where an epoch defines a complete pass through the training data. Each layer and block are specifically designed to distill relevant features from input images, supporting robust generalization even with diverse background conditions.

Training and Dataset

We utilized the Kaggle dataset created by Sriram Reddy Kalluri, containing separate images for apples, bananas, and oranges in both fresh and rotten conditions. Data was split 80:20 for training and testing to ensure fair evaluation(Table:1).

Preprocessing

- Images resized to 244x244 pixels.

- Pixel normalization and data augmentation (including random rotations and flips) were applied to improve robustness to real-world variability.

EXPERIMENTAL RESULTS AND DISCUSSION

Dataset and Experimental Setup

The experiments utilized the publicly available dataset from Kaggle developed by Sriram Reddy Kalluri. This dataset contains rotten and fresh images of apples, bananas, and oranges. An 80:20 train-test split was applied, with 10,901 images used for training and 2,698 for testing. The number of samples per fruit class is detailed in Table 2. Table 3. Details of training and testing samples for each fruit class. Representative example images from each class are shown in Fig. 2(a), 2(b), 2(c), illustrating the range of external features associated with fruit decay in the dataset.

Model Performance and Visualization

The fine-tuned RESNET model demonstrated robust convergence, as observed in the training and validation accuracy/loss curves (Fig. 3, Fig. 4):

Figure 3: Training vs. validation accuracy for the fine-tuned RESNET model.

Figure 4: Training vs. validation loss, showing effective learning with minimal overfitting.

Visual results for classification of rotten apples, bananas, and oranges are displayed in Fig. 5, confirming the high predictive performance of the network on test data.

Comparative Analysis

To place our results in context, we benchmarked the RESNET model against widely cited methods from recent literature. Table 4. Performance comparison with established methods. Our RESNET approach clearly outperformed classic machine learning models and even prior deep learning-based architectures, achieving a test accuracy of 93.52%. Notably, residual network architecture enabled the model to extract more complex feature hierarchies, critical for rigorous separation of fresh and decayed samples.

Analysis and Observations

Generalization: The model maintained strong accuracy on the test set, indicating effective generalization and minimal overfitting.

Visual Quality: Figures 2–4 and 7 show the model correctly detects even subtle decay features.

Comparison with prior art: The 93.52% accuracy surpasses classical pattern-based methods (, ,), validating the advantage of deep residual learning for such tasks.

Potential reasons for improved performance include the use of data augmentation, careful regularization, and the extra depth and skip connections in the network, which help retain crucial texture and color features relevant to fruit quality assessment.

CONCLUSION

This paper presented a deep learning-based image classification system for automated fruit grading using a fine-tuned RESNET architecture. When validated on a sizeable dataset, the network delivered higher accuracy than classical and other deep learning methods, reinforcing the viability of CNN-based automation in post-harvest quality control. Future research will explore the impact of alternative hyperparameters and consider expansion to internal decay detection using spectral imaging.

ABSTRACT

This paper introduces the perfect edge roman dominating adjacency matrix (PERDAM) of a graph along with its energy. Further, the algebraic properties of this matrix, including its spectrum, spectral radius, spectral gap, spread, determinant, rank and energy are studied for some standard classes of graphs. Additionally, bounds for the above newly introduced matrix parameters are established. These findings have applications in evaluating structural value of a building in civil engineering, network optimization in computer science, communication systems in sociology and other fields where roman domination-related concepts are needed.

Keywords: Perfect edge roman dominating adjacency matrix (PERDAM), Perfect edge roman dominating energy (PERDE)
AMS Mathematical Subject Classification 2020: 05C50, 05C69, 05C78

INTRODUCTION

Let $G = (V, E)$ be a graph with $|V| = p$ and $|E| = q$. The graph terms used here are referred form F. Harary [6]. We cite Gallian's dynamic survey [8] for basic descriptions of the various types of graph labelling. Roshini Leely

Pushpam and Malini Mai [12] initiated the study of the edge version of Roman domination. A perfect edge Roman dominating function on a graph is a function $f: E(G) \to \{0,1,2\}$ satisfying the condition that every edge e with $f(e) = 0$ is adjacent to exactly one edge e' with $f(e') = 2$. The cardinality of a perfect edge roman dominating set is $a'_{pr}(G)$. The weight of a perfect edge Roman dominating function is the value of $w(f) = \sum_{e \in E(G)} f(e)$. The minimum weight of a perfect edge Roman dominating function on a graph G is called the perfect edge Roman domination number $S'_{apr}(G)$ of G. All the matrix terms are referred from R.B. Bapat [2]. Harary [7] was introduced the concept of adjacency matrix. The adjacency matrix $A(G)$ of G is the $p \times p$ matrix whose $(i,j)^{th}$– entry is 1 if the vertices v_i and v_j are adjacent and zero otherwise. The eigenvalues $\lambda_1, \lambda_2, \ldots, \lambda_p$ of A, assumed in non-increasing order are the eigenvalues of the graph G. As A is real symmetric, the eigenvalues of G are real with sum equal to zero. The energy $E(G)$ of G is defined to be the sum of the absolute values of the eigenvalues of G. i.e., $E(G) = \sum_{i=1}^{p} |\lambda_i|$. This concept of energy of a graph was introduced by I. Gutman [9]. The spectrum of G is $S(G) = \begin{pmatrix} \lambda_1 & \lambda_2 & \ldots & \lambda_p \\ n_1 & n_2 & \ldots & n_m \end{pmatrix}$, where $n_1, n_2, \ldots, n_m$ denotes the number of times the corresponding eigenvalue occur. The spectral radius [1] of G, $\rho(G)$ is the largest eigenvalue of A. The difference between the first two numerically largest eigenvalues is called the spectral gap of G and is denoted as $\delta(G)$. The spread [5] of G is the difference between maximum and minimum eigenvalues of A, is denoted as $spr(G)$. The sum of all diagonal entries of a matrix A is called as trace, denoted by $tr(A)$. The rank and determinant of a matrix A is denoted as $rank(A)$ and $|A|$ respectively. Since matrix theory and Roman domination in graph theory plays vital role in the development of modern technology in the current era. In this paper, the perfect edge Roman domination energy is introduced for cycle related graphs.

MOTIVATION

Domination and its associated adjacency matrices have been widely studied and applied across various fields. While Roman Domination, Edge Roman Domination and Perfect Edge Roman Domination have been introduced, their corresponding adjacency matrices remain unexplored. My objective is to investigate the adjacency matrices for the above said domination, while also identifying relevant matrix parameters for several standard graph classes. Ultimately, I aim to develop an algorithm for my new matrix and applying these concepts to practical problems like optimizing networks, allocating resources, and ensuring system reliability.

MAIN RESULTS

Definition 3.1. A Perfect **e**dge Roman dominating adjacency matrix of a $(p,q)-$ graph is a $p \times p$ matrix defined as, $A'_{pr}(G) = (a_{ij}) = \begin{Bmatrix} f(e_i);\ e_i = v_i v_j \in E(G) \\ 0; \quad otherwise \end{Bmatrix}; i,j = 1,2,\ldots,p$, where $f(e_i)$'s are perfect edge roman dominating function values of edges of G.

Definition 3.2. The perfect edge Roman dominating energy (PERDE) $E'_{pr}(G)$ is defined as the sum of all absolute eigenvalues of the PERDAM of G.

Notations 3.3. For any graph G, $S'_{pr}(G)$, $\rho'_{pr}(G)$, $\delta'_{pr}(G)$, $spr'_{pr}(G)$, $|A'_{pr}(G)|$ and $rank\left(A'_{pr}(G)\right)$ are respectively denoted as spectrum, spectral radius, spectral gap, spread, determinant and rank of the PERDAM of G. Trace of the PERDAM of G, $tr\left(A'_{pr}(G)\right)$ is always zero.

For the graph G, in Figure 1, the PERDAM is,

Example 3.4.

For the graph G, in Figure 1, the PERDAM is,

$$A'_{pr}(G) = \begin{pmatrix} 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}$$

Here, $\left|A'_{pr}(G)\right| = 0$ and $rank\left(A'_{pr}(G)\right) = 4$.

The characteristic equation of $A'_{pr}(G)$ is $\lambda^6 - 6\lambda^4 + 8\lambda^2 = 0$.

It gives $S'_{pr}(G) = \begin{pmatrix} -2 & -1.414 & 0 & 1.414 & 2 \\ 1 & 1 & 2 & 1 & 1 \end{pmatrix}$.

From the above spectrum we have, $\rho'_{pr}(G) = 2, \delta'_{pr}(G) = 0.6$ and $spr'_{pr}(G) = 4$.

The PERDE of a graph G is, $E'_{pr}(G) = |-2| + |-1.414| + 0 + 0 + 1.414 + 2 = 6.8284$.

Theorem 3.5. For the pan graph $T_{1,n} \geq 3$,

$(i)\left|A'_{pr}(T_{1,n})\right| = 0$

$$(ii) rank\left(A'_{pr}(T_{1,n})\right) = \begin{Bmatrix} 2\left(\frac{n}{3}\right) & ; n \equiv 0(mod\ 3) \\ 2\left(\frac{n-1}{3}\right) + 2 & ; n \equiv 1(mod\ 3) \\ 2\left(\frac{n-2}{3}\right) + 2 & ; n \equiv 2(mod\ 3) \end{Bmatrix}$$

$$(iii)\ S'_{pr}(T_{1,n}) = \begin{Bmatrix} \begin{pmatrix} \pm 2 & 0 \\ \frac{n}{3} & \frac{n}{3} + 1 \end{pmatrix} & ; n \equiv 0(mod\ 3) \\ \begin{pmatrix} \pm 2 & \pm 1 & 0 \\ \frac{n-1}{3} & 1 & \frac{n-1}{3} \end{pmatrix} & ; n \equiv 1(mod\ 3) \\ \begin{pmatrix} \pm 2 & \pm 1.414 & 0 \\ \frac{n-2}{3} & 1 & \frac{n-2}{3} + 1 \end{pmatrix} & ; n \equiv 2(mod\ 3) \end{Bmatrix},$$

$$(iv)\ \rho'_{pr}(T_{1,n}) = 2\ ,\ (v)\ \delta'_{pr}(T_{1,n}) = \begin{Bmatrix} 0 & ; n \equiv 0(mod\ 3) \\ 1 & ; n \equiv 1(mod\ 3) \\ 0.6 & ; n \equiv 2(mod\ 3) \end{Bmatrix},\ (vi)\ spr'_{pr}(T_{1,n}) = 4$$

$$(vii)\ E'_{pr}(T_{1,n}) = \begin{Bmatrix} 4\left(\frac{n}{3}\right) & ; n \equiv 0(mod\ 3) \\ 4\left(\frac{n-1}{3}\right) + 2 & ; n \equiv 1(mod\ 3) \\ 4\left(\frac{n-2}{3}\right) + 3 & ; n \equiv 2(mod\ 3) \end{Bmatrix}$$

Proof. Let G be a pan graph $T_{1,n}$ with atleast four vertices. Let $V(G) = \{v_1, v_2, \dots, v_{n+1}\}$ and $v_i v_j \in E(G), i, j = 1,2, \dots, n+1$.

Case 1: $n \equiv 0(mod\ 3)$. In this case, PERDAM

$A'_{pr}(G)$ is, $A'_{pr}(G) = \begin{pmatrix} 0 & 0 & 0 & \dots & 0 \\ 0 & \beta_{3\times3} & 0 & \dots & 0 \\ 0 & 0 & \ddots & & \vdots \\ \vdots & \vdots & \ddots & & \vdots \\ 0 & 0 & & \dots & \beta_{3\times3} \end{pmatrix}$, where $\beta_{3\times3} = \begin{pmatrix} 0 & 2 & 0 \\ 2 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$.

It gives $\left|A'_{pr}(G)\right| = 0$, $rank\left(A'_{pr}(G)\right) = 2\left(\frac{n}{3}\right)$.

From $A'_{pr}(G)$ we have characteristic polynomial is $\lambda^p - 4\left(\frac{n}{3}\right)\lambda^{p-2} + \dots + 0$.

Then the eigenvalues are $S'_{pr}(G) = \begin{Bmatrix} \pm 2 & , & \frac{n}{3} & \text{times} \\ 0 & , & \frac{n}{3} + 1 & \text{times} \end{Bmatrix}$.

Therefore, $S'_{pr}(G) = \begin{pmatrix} \pm 2 & 0 \\ \frac{n}{3} & \frac{n}{3}+1 \end{pmatrix}$.

From the spectrum $S'_{pr}(G)$, we have spectral radius, spectral gap and spread is respectively $\rho'_{pr}(G) = 2$, $\delta'_{pr}(G) = 0$ and $spr'_{pr}(G) = 4$.

The PERDE of G is, $E'_{pr}(G) = \sum_{i=1}^{p} |\lambda_i| = |2|\left(\frac{n}{3}\right) + |-2|\left(\frac{n}{3}\right) + 0\left(\frac{n}{3}+1\right) = \frac{4n}{3}$.

For example,

$A'_{pr}(T_{1,3}) = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$

For the above graph $T_{1,3}$, in Figure 2,

$(i)\left|A'_{pr}(T_{1,3})\right| = 0, \quad (ii) rank\left(A'_{pr}(T_{1,3})\right) = 2, \ (iii)\ S'_{pr}(T_{1,3}) = \begin{pmatrix} 2 & 0 & -2 \\ 1 & 2 & 1 \end{pmatrix}$,

$(iv)\ \rho'_{pr}(T_{1,3}) = 2$, $(v)\ \delta'_{pr}(T_{1,3}) = 0, (vi)\ spr'_{pr}(T_{1,3}) = 4, (vii) E'_{pr}(T_{1,3}) = 4.$

Case 2: $n \equiv 1(mod\ 3)$. In this case, $A'_{pr}(G)$ is,

$A'_{pr}(G) = \begin{pmatrix} 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & \beta_{3\times3} & 0 & \dots & 0 & 0 \\ 0 & 0 & \ddots & & \vdots & \vdots \\ \vdots & \vdots & \ddots & & \vdots & \vdots \\ 0 & 0 & & \dots & \beta_{3\times3} & 1 \\ 0 & 0 & & \dots & 1 & 0 \end{pmatrix}$, where $\beta_{3\times3} = \begin{pmatrix} 0 & 2 & 0 \\ 2 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$.

It gives $\left|A'_{pr}(G)\right| = 0, rank\left(A'_{pr}(G)\right) = 2\left(\frac{n-1}{3}\right) + 2$.

From $A'_{pr}(G)$, characteristic polynomial is $\lambda^p - (4\left(\frac{n-1}{3}\right) + 1)\ \lambda^{p-2} + \cdots + 0$.

Then the eigenvalues are $S'_{pr}(G) = \begin{Bmatrix} \pm 2 & , & \frac{n-1}{3} & times \\ \pm 1 & , & 1 & time \\ 0 & , & \frac{n-1}{3} & times \end{Bmatrix}$.

From the spectrum $S'_{pr}(G)$, we have spectral radius, spectral gap and spread is respectively $\rho'_{pr}(G) = 2$, $\delta'_{pr}(G) = 1$ and $spr'_{pr}(G) = 4$.The PERDE of G is,

$$E'_{pr}(G) = |2|\left(\frac{n-1}{3}\right) + |-2|\left(\frac{n-1}{3}\right) + |1|(1) + |-1|(1) + 0\left(\frac{n-1}{3}\right) = 4\left(\frac{n-1}{3}\right) + 2.$$

For example,

$A'_{pr}(T_{1,4}) = \begin{pmatrix} 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 \end{pmatrix}$

For the above graph $T_{1,4}$, in Figure 3,

$(i)\left|A'_{pr}(T_{1,4})\right| = 0, \quad (ii) rank\left(A'_{pr}(T_{1,4})\right) = 4, \ (iii)\ S'_{pr}(T_{1,4}) = \begin{pmatrix} 2 & 1 & 0 & -1 & -2 \\ 1 & 1 & 1 & 1 & 1 \end{pmatrix}$,

$(iv)\ \rho'_{pr}(T_{1,4}) = 2$, $(v)\ \delta'_{pr}(T_{1,4}) = 1, (vi)\ spr'_{pr}(T_{1,4}) = 4, (vii) E'_{pr}(T_{1,4}) = 6$

Case 3: $n \equiv 2(mod\ 3)$. In this case,

$$A'_{pr}(G) = \begin{pmatrix} 0 & 0 & 0 & \dots & 0 & 0 & 0 \\ 0 & \beta_{3\times3} & 0 & \dots & 0 & 0 & 0 \\ 0 & 0 & \ddots & & \vdots & \vdots & \vdots \\ \vdots & \vdots & & \ddots & \vdots & \vdots & \vdots \\ 0 & 0 & & \dots & \beta_{3\times3} & 1 & 0 \\ 0 & 0 & & \dots & 1 & 0 & 1 \\ 0 & 0 & & \dots & 0 & 1 & 0 \end{pmatrix},$$

where $\beta_{3\times3} = \begin{pmatrix} 0 & 2 & 0 \\ 2 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$.

It gives $\left|A'_{pr}(G)\right| = 0$, $rank\left(A'_{pr}(G)\right) = 2\left(\frac{n-2}{3}\right) + 2$.

From $A'_{pr}(G)$, characteristic polynomial is $\lambda^p - \left(4\left(\frac{n-2}{3}\right) + 2\right)\lambda^{p-2} + \cdots + 0$.

Then the eigen values are $S'_{pr}(G) = \begin{Bmatrix} \pm2 & , & \frac{n-2}{3} & times \\ \pm1.414 & , & 1 & time \\ 0 & , & \frac{n-2}{3}+1 & times \end{Bmatrix}$.

From the spectrum $S'_{pr}(G)$, we have spectral radius, spectral gap and spread is respectively $\rho'_{pr}(G) = 2$, $\delta'_{pr}(G) = 0.6$ and $spr'_{pr}(G) = 4$.

The PERDE of G is, $E'_{pr}(G) = |2|\left(\frac{n-2}{3}\right) + |-2|\left(\frac{n-2}{3}\right) + |1.414|(1) + |-1.414|(1) + 0\left(\frac{n-2}{3}+1\right) = 4\left(\frac{n-2}{3}\right) + 2.828 \cong 4\left(\frac{n-2}{3}\right) + 3$.

For example,

$$A'_{pr}(T_{1,5}) = \begin{pmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{pmatrix}$$

For the above graph $T_{1,5}$, in Figure 4,

$(i)\left|A'_{pr}(T_{1,5})\right| = 0$, $(ii) rank\left(A'_{pr}(T_{1,5})\right) = 4$, $(iii)\ S'_{pr}(T_{1,5}) = \begin{pmatrix} 2 & 1.414 & 0 & -1.414 & -2 \\ 1 & 1 & 2 & 1 & 1 \end{pmatrix}$,

$(iv)\ \rho'_{pr}(T_{1,5}) = 2$, $(v)\ \delta'_{pr}(T_{1,5}) = 0.6$, $(vi)\ spr'_{pr}(T_{1,5}) = 4$, $(vii) E'_{pr}(T_{1,5}) = 6.82 \cong 7$.

It completes the proof.

Theorem 3.6. For the friendship graph $F_n, n \geq 2$,

$(i)\left|A'_{pr}(F_n)\right| = 0$, $(ii) rank\left(A'_{pr}(F_n)\right) = 2n$, $(iii)\ S'_{pr}(F_n) = \begin{pmatrix} \pm2 & \pm1 & 0 \\ 1 & n-1 & 1 \end{pmatrix}$,

$(iv)\ \rho'_{pr}(F_n) = 2$, $(v)\ \delta'_{pr}(F_n) = 1$, $(vi)\ spr'_{pr}(F_n) = 4$.

Proof. Let G be the friendship graph F_n with vertex set $V = \{v_1, v_2, \dots, v_p\}$ with atleast five vertices. Then the perfect edge roman dominating function value, $f(E) = \sum_{e\in E(G)} f(e) = n + 1$. Then the characteristic polynomial is $\lambda^p - (n+3)\lambda^{p-2} + \cdots + 4(-1)^n\lambda$.

Therefore the perfect edge roman dominating spectrum is, $S'_{pr}(F_n) = \begin{pmatrix} \pm2 & \pm1 & 0 \\ 1 & n-1 & 1 \end{pmatrix}$. From $S'_{pr}(F_n)$, the largest absolute eigenvalue $\rho'_{pr}(F_n)$ is two.

Further, $spr'_{pr}(F_n) = 2 - (-2) = 4$.

Theorem 3.7. For $n \geq 2$, the perfect edge roman dominating energy $E'_{pr}(G)$ of the friendship graph F_n is equal to $E'_{pr}(F_n) = 2(n+1)$.

Proof. Let G be the friendship graph $F_n, n \geq 2$, the perfect edge roman dominating spectrum of F_n is $S'_{pr}(F_n) = (\lambda \pm 2)(\lambda \pm 1)^{n-1}\lambda$.

Therefore $E'_{pr}(F_n) = |2| + |-2| + |1|(n-1) + |-1|(n-1) = 4 + 2n - 2 = 2(n+1)$.

By the similar arguments as in theorem 3.5., one can prove all the defined algebraic parameters for the following cycle related graphs.

Theorem 3.8. For the complete graph $K_n, n \geq 2$,

$(i)\left|A'_{pr}(K_n)\right| = \begin{Bmatrix} -4 & ; n = 2 \\ (-1)^n(4n-12) & ; n \geq 3 \end{Bmatrix}$

$(ii)\ rank\left(A'_{pr}(K_n)\right) = \begin{Bmatrix} 2 & ; n = 2,3 \\ n & ; n \geq 4 \end{Bmatrix}$

$(iii)\ S'_{pr}(K_n) = \begin{pmatrix} \pm 2 & -1 & n-3 \\ 1 & n-3 & 1 \end{pmatrix}$

$(iv)\ \rho'_{pr}(K_n) = \begin{Bmatrix} 2 & ; n = 2,3,4 \\ n-3 & ; n \geq 5 \end{Bmatrix}$

$(v)\ \delta'_{pr}(K_n) = \begin{Bmatrix} 0; & n = 2,3 \\ 1; & n = 4,5 \\ n-5 & ; n \geq 6 \end{Bmatrix}$

$(vi)\ spr'_{pr}(K_n) = \begin{Bmatrix} 4 & ; n = 1,2,3,4 \\ n-1 & ; n \geq 5 \end{Bmatrix}$

$(vii)\ E'_{pr}(K_n) = \begin{Bmatrix} 4 & ; n = 2 \\ 2(n-1) & ; n \geq 3 \end{Bmatrix}$.

Theorem 3.9. For the wheel graph $W_n, n \geq 3$,

$(i)\left|A'_{pr}(W_n)\right| = \begin{Bmatrix} -4 ; n \equiv 1(mod\ 4) \\ 4 ; n \equiv 3(mod\ 4) \\ 0 ; n \equiv 0, 2(mod\ 4) \end{Bmatrix}$

$(ii)\ rank\left(A'_{pr}(W_n)\right) = \begin{Bmatrix} n+1 ; n\ is\ odd \\ n \quad ; n\ is\ even \end{Bmatrix}$

$(iii)\ S'_{pr}(W_n) = \begin{Bmatrix} \begin{pmatrix} \pm 2 & \pm\lambda \\ 1 & \frac{n-1}{2} \end{pmatrix} ; n\ is\ odd \\ \begin{pmatrix} \pm 2 & \pm\lambda & 0 \\ 1 & \frac{n-2}{2} & 1 \end{pmatrix} ; n\ is\ even \end{Bmatrix}$

$(iv)\ \rho'_{pr}(W_n) = 2,$

$(v)\ \delta'_{pr}(W_n) = \lceil \lambda_1 - \lambda_2 \rceil$

$(vi)\ spr'_{pr}(W_n) = 4$

$(vii)\ E'_{pr}(W_n) = \begin{Bmatrix} \lfloor n+3 \rfloor ; n\ is\ odd \\ \left\lfloor \frac{3n}{2} \right\rfloor ; n\ is\ even \end{Bmatrix}$

Theorem 3. 10. For the cycle graph $C_n, n \geq 3$,

$(i)\left|A'_{pr}(C_n)\right| = \begin{Bmatrix} 4 ; n = 4 \\ 0 ; otherwise \end{Bmatrix}$

$(ii)\ rank\left(A'_{pr}(C_n)\right) = \begin{Bmatrix} \frac{2n}{3} ; n \equiv 0(mod\ 3) \\ \frac{2n+4}{3} ; n \equiv 1(mod\ 3) \\ \frac{2n+2}{3} ; n \equiv 2(mod\ 3) \end{Bmatrix}$

$(iii)\ S'_{pr}(C_n) = \begin{Bmatrix} \begin{pmatrix} \pm 2 & 0 \\ \frac{n}{3} & \frac{n}{3} \end{pmatrix} & ; n \equiv 0(mod\ 3) \\ \begin{pmatrix} \pm 2 & \pm 1 & 0 \\ \frac{n-1}{3} & 1 & \frac{n-4}{3} \end{pmatrix} & ; n \equiv 1(mod\ 3) \\ \begin{pmatrix} \pm 2 & \pm 1.414 & 0 \\ \frac{n-2}{3} & 1 & \frac{n-2}{3} \end{pmatrix} & ; n \equiv 2(mod\ 3) \end{Bmatrix}$

$(iv)\ \rho'_{pr}(C_n) = 2$

$(v)\ \delta'_{pr}(C_n) = \begin{Bmatrix} 0; n \equiv 0(mod\ 3) \\ 1; n \equiv 1(mod\ 3) \\ 0.6; n \equiv 2(mod\ 3) \end{Bmatrix}$

$(vi)\ spr'_{pr}(C_n) = 4$

$(vii)\ E'_{pr}(C_n) = \begin{Bmatrix} \frac{4n}{3}; n \equiv 0(mod\ 3) \\ \frac{4n+2}{3}; n \equiv 1(mod\ 3) \\ \frac{4n-1}{3}; n \equiv 2(mod\ 3) \end{Bmatrix}$.

The following theorem gives both lower and upper bound for PERDE in terms of p and q.

Theorem 3.11. Let G be a simple graph with p vertices and q edges. If $S'_{apr}(G)$ be a perfect edge roman dominating function value with cardinality $a'_{pr}(G)$ and $P = \left|\left|A'_{pr}(G)\right|\right|$. If $\lambda_1, \lambda_2, \ldots . \lambda_p$ are the eigen values of $A'_{pr}(G)$ then $\sqrt{(2q+k) + p(p-1)P^{\frac{2}{p}}} \le E'_{pr}(G) \le \sqrt{p(2q+k)}$, where $k = S'_{apr}(G)$.

Proof. We know that Cauchy Schwarz inequality is $(\sum_{i=1}^{p} a_i b_i)^2 \le (\sum_{i=1}^{p} a_i^2)(\sum_{i=1}^{p} b_i^2)$

If $a_i = 1, b_i = |\lambda_i|$ then $(\sum_{i=1}^{p}|\lambda_i|)^2 \le (\sum_{i=1}^{p} 1)(\sum_{i=1}^{p} \lambda_i^2)$

$[E'_{pr}(G)]^2 \le p(2q+k)$, since $\sum_{i=1}^{p} \lambda_i^2 \le 2|E| + S'_{apr}(G)$

which gives $E'_{pr}(G) \le \sqrt{p(2q+k)}$ (1)

Since arithmetic mean is not smaller than geometric mean, we have

$\frac{1}{p(p-1)}\sum_{i\neq j}|\lambda_i||\lambda_j| \ge \left[\prod_{i\neq j}|\lambda_i||\lambda_j|\right]^{\frac{1}{p(p-1)}} = \left[\prod_{i=1}^{p}|\lambda_i|^{2(p-1)}\right]^{\frac{1}{p(p-1)}}$

$= \left[\prod_{i=1}^{p}|\lambda_i|\right]^{\frac{2}{p}}$

$= \left|\prod_{i=1}^{p}\lambda_i\right|^{\frac{2}{p}} = \left|\left|A'_{pr}(G)\right|\right|^{\frac{2}{p}} = P^{\frac{2}{p}}$

$\sum_{i\neq j}|\lambda_i||\lambda_j| \ge p(p-1)P^{\frac{2}{p}}$

Now consider, $[E'_{pr}(G)]^2 = \left(\sum_{i=1}^{p}|\lambda_i|\right)^2 = \sum_{i=1}^{p}|\lambda_i|^2 + \sum_{i\neq j}|\lambda_i||\lambda_i|$

$[E'_{pr}(G)]^2 \ge (2q+k) + p(p-1)P^{\frac{2}{p}}$

$i.e.\ E'_{pr}(G) \ge \sqrt{(2q+k) + p(p-1)P^{\frac{2}{p}}}$ (2)

From (1) and (2), $\sqrt{(2q+k) + p(p-1)P^{\frac{2}{p}}} \le E'_{pr}(G) \le \sqrt{p(2q+k)}$.

CONCLUSION

In this paper, the concept of a perfect edge roman dominating adjacency matrix is introduced, and its basic matrix terminologies are derived for some standard graphs. Furthermore, an algorithm is to be developed for computing the newly defined perfect edge roman domination energy.

ABSTRACT

The study examines the growth performance of radish cultivation in Tamil Nadu, with a particular focus on Dharmapuri district, over the period 2010–11 to 2023–24. Using secondary data from official horticultural statistics and employing descriptive measures, compound annual growth rates (CAGR), and comparative analysis, the research highlights trends in area, production, and productivity. The Objectives (i) Growth Rate of Radish Cultivation in Area, production and productivity in Dharmapuri District of Tamilnadu (ii) Trend line in Radish Cultivation in Dharmapuri District of Tamilnadu. The results reveal that while Tamil Nadu has experienced steady expansion in radish cultivation, with area increasing from 458 hectares in 2010–11 to 3942 hectares in 2023–24 and production rising from 13.74 tonnes to 136 tonnes, productivity improvements have been modest, averaging 32–34 quintals per hectare. In contrast, Dharmapuri, though starting with a small base of 52 hectares and 1.56 tonnes in 2010–11, recorded rapid growth, reaching 2721 hectares and 105.93 tonnes in 2023–24, with an average productivity of 36 quintals per hectare. The district's CAGR for area (39.62 per cent) and production (42.97 per cent) far outpaced state averages, though accompanied by higher fluctuations and instability. The findings suggest that expansion in radish production has been largely area-driven, with productivity gains playing a secondary role. The study concludes that strengthening productivity through improved varieties, climate-resilient practices, post-harvest management, and market linkages will be vital for ensuring the sustainability and profitability of radish cultivation in Tamil Nadu, particularly in emerging centres like Dharmapuri.

Key words: Growth Rate, Area, Production, Productivity and Radish Cultivation.

INTRODUCTION

Radish is an ancient crop that originated in the Mediterranean region and then spread to Asia, where it became an integral part of cuisines in countries such as India, China, Japan and Korea. Globally, radish is of economic importance as a short-term vegetable crop, maturing within 30-60 days, making it suitable for year-round cultivation under intensive cropping systems and various agro-climatic conditions. Medically, radish is recognized for its role in digestion, detoxification, and management of lifestyle diseases due to its antioxidant and biologically active compounds. In India, radish root occupies an important place among vegetables and is widely cultivated in states like Uttar Pradesh, Bihar, West Bengal, Haryana and Tamil Nadu. According to horticultural statistics, India contributes significantly to global radish production, largely due to its favourable growing conditions and the availability of a variety suitable for tropical and temperate climates. Tamil Nadu, in particular, has seen a rapid expansion of radish cultivation in recent decades. Initially limited to small areas, radish is now cultivated on nearly 4,000 hectares, contributing more than 136 tonnes annually. This growth is largely area dependent, while productivity remains relatively stable at 30-35 quintals per hectare.

One of the main reasons for the expansion of radish cultivation in Tamil Nadu is its adaptability to short-term cultivation methods and its compatibility with intercropping and crop rotation systems. Farmers prefer radish because it provides quick returns, requires relatively less investment and is less risky compared to long-term crops. In addition, urbanization and increasing consumer preference for fresh vegetables have increased market demand, providing farmers with assured outlets. The diverse development of research institutions, including heat-tolerant and disease-resistant cultivars, has enabled radish to be grown successfully in different seasons, extending its availability beyond the traditional winter months. Despite these opportunities, radish cultivation faces many challenges that need to be addressed for sustainable development. Market price fluctuations often affect the profitability of farmers, as production peaks can lead to shortages and wastage due to the rotting nature of the crop. Since radish roots have a short shelf life and require proper storage and refrigeration facilities, post-harvest handling remains a major problem as these are scarce in rural production centres. Also, pest and disease problems such as root worms, weevils and downy mildew mushroom can cause serious yield losses if not managed effectively. Climate variability, including unseasonal rainfall and rising temperatures, pose further risks to sustainable production.

To overcome these challenges, integrated approaches involving improved cultivation techniques, mechanization, post-harvest management and value addition are required. Promotion of farmer cooperatives, strengthening of supply chains and establishment of processing units for products like radish, dehydrated flakes and radish powder manufactured as pickles will increase profitability and reduces wastage. Research and extension services also play an important role in disseminating improved agricultural practices, organic farming methods and pest resistant varieties. Radish cultivation in Tamil Nadu has shown remarkable growth and has strong potential as a commercially viable vegetable crop. Through proper policy support, infrastructure development and technological interventions, radish not only ensures better income to the farmers but also contributes to nutritional security in the state. To make radish cultivation more profitable and resilient in the coming years, future research should focus on improving productivity through breeding programmes, improving sustainable practices and enhancing value chains.

REVIEW OF LITERATURE

Pandey, Sakshi *et al*. (2024). A field experiment was conducted during the Rabi season of 2019–20 at Udai Pratap (Autonomous) College, Varanasi, to study the effect of organic and inorganic manures on radish using the variety Kashi Shweta. The trial, laid out in a Randomized Block Design with nine treatments, compared vermicompost, FYM, poultry manure, their combinations, and a control. Results showed that 100 per cent NPK through poultry manure produced the best growth, yield, and economic return, followed by integrated organic sources. The study concluded

that poultry manure and combined organics are sustainable options for enhancing radish productivity and profitability. Nootesh K. et al. (2022). A field experiment was conducted during the Rabi season of 2021 at the Research cum Instructional Farm, College of Horticulture and Research Station, Jagdalpur, Chhattisgarh, to identify superior radish varieties suitable for the Bastar plateau with high yield potential and better root quality. The study was laid out in a Randomized Block Design with fifteen varieties and three replications. Results revealed significant differences among varieties for growth, yield, and economic traits. Pusa Mridula was the earliest in germination (6.33 days) and harvest (47.33 days). Kashi Lohit recorded the maximum plant height, root yield (38.44 t ha^{-1}), and highest economic returns, while Pusa Jamuni excelled in leaf-related traits. Variety R-30 produced the longest root (31.03 cm), Pusa Chetki had the highest root diameter (5.65 cm), and Kashi Hans showed the best root-to-shoot ratio. Pusa Gulabi recorded the maximum leaf yield (27.40 t ha^{-1}). Overall, Kashi Lohit emerged as the most promising variety for higher productivity and profitability under Bastar plateau conditions. The following objectives are framed on the basis of earliest literature.

OBJECTIVES

- To find out the Growth Rate of Radish Cultivation in the study Area, production and Yield in Dharmapuri District of Tamilnadu
- To analysis the trend batten in Radish Cultivation in Dharmapuri District of Tamilnadu

METHODOLOGY

Period of Study

The present study on radish cultivation covers a period of fourteen years, from 2010–11 to 2023–24. This timeframe was selected to analyze both short-term fluctuations and long-term trends in the area, production, and productivity of radish. The period also coincides with a phase of rapid expansion of radish cultivation in Tamil Nadu and Dharmapuri district.

Data Collection

The study is based on secondary data related to radish cultivation. Data on the area under radish, its annual production, and productivity were collected from official sources such as the Department of Horticulture and Plantation Crops, Tamil Nadu, Agricultural Statistics at a Glance, and state horticultural records. Published research articles, statistical handbooks, and authenticated databases were also consulted to supplement the data and ensure reliability.

Study Area

The analysis was confined to Tamil Nadu state and Dharmapuri district. Tamil Nadu was chosen because of its increasing importance in radish cultivation at the state level, while Dharmapuri was selected as a representative district due to its rapid growth and prominence in vegetable farming, especially in radish production.

Analytical Tools

To study the dynamics of radish cultivation, the following tools were used:

Descriptive Statistics

Mean, standard deviation (SD), coefficient of variation (CV), minimum, and maximum values were calculated to examine the stability and variability of radish area, production, and productivity. Compound Annual Growth Rate (CAGR): The long-term growth of radish cultivation was estimated using the exponential growth model:

Compound Annual Growth Rate

$y = a b^t$

$\log y = \log a + t \log b$

$y = A + B t$

Where,

Y = log y

A = log a

B = log b

Y = Area (ha)/ production (tonnes) and productivity (tonnes/ha)

A = intercept

B = Regression coefficient Compound Growth rate 'r'= (Antilog of B-1) X 100

Comparative Analysis

A comparative study was made between Tamil Nadu and Dharmapuri to highlight differences in radish cultivation with respect to scale, stability, and growth performance.

Limitations of the Study

The study depends entirely on secondary data of radish cultivation, which may be subject to reporting errors, revisions, and the absence of detailed farm-level information. However, since the data were sourced from official and published records, the findings remain valid and provide reliable insights into the growth performance of radish cultivation in the study area.

RESULT AND DISCUSSIONS

Table 1. Growth Rate of area, production and productivity of Radish cultivation in Dharmapuri District of Tamil Nadu The comparative analysis of area, production, and productivity between Tamil Nadu and Dharmapuri indicates notable differences in scale, stability, and growth performance. Tamil Nadu recorded a higher mean area under cultivation (1692.03 ha) compared to Dharmapuri (797.36 ha), yet the latter exhibited a faster compound annual growth rate (39.62 per cent) than Tamil Nadu (21.57 per cent). The coefficient of variation showed that Dharmapuri District area (119.02 per cent) was more unstable than Tamil Nadu (80.73 per cent), reflecting higher fluctuations in land use.

In terms of production, Tamil Nadu reported a greater mean output (56.62 tonnes) relative to Dharmapuri (30.78 tonnes). However, Dharmapuri outpaced Tamil Nadu with a production growth rate of 42.97 percent against 22.77 percent. The instability in production was more pronounced in Dharmapuri (CV 102.72) than in Tamil Nadu (CV 84.67), suggesting vulnerability to climatic and management factors. Productivity analysis showed that Dharmapuri (36.02 t/ha) slightly exceeded Tamil Nadu (32.38 t/ha), indicating relatively better efficiency. Though Dharmapuri displayed higher variability (CV 11.13), its productivity growth rate (2.40 per cent) was more than double that of Tamil Nadu (0.98 per cent). Overall, Tamil Nadu maintains higher averages and stability, but Dharmapuri demonstrates rapid growth and greater productivity potential, warranting targeted interventions to reduce fluctuations and enhance sustainability.

Area, Production and Productivity of Radish cultivation in Dharmapuri District

Table 2 shows that Radish cultivation in Dharmapuri District from 2010-11 to 2023-24 reveals a significant change in terms of area, production and productivity during the study period. In the initial years, radish was cultivated only on 52 hectares in 2010-11, with a very low production of 1.56 tonnes and a fixed productivity of 30 quintals per hectare. This trend continued with minor fluctuations in both area and production till 2014-15, after which a steady expansion was observed. A significant breakthrough came from 2015-16 when the area under radish cultivation increased drastically from 204 hectares to 2721 hectares in 2023-24. Accordingly, the production registered an extraordinary rise

from 6.83 tons in 2015-16 to 105.93 tons in 2023-24. This surge clearly shows that the expansion of cultivated area is the main reason for the growth in production. On the other hand, productivity levels have shown a relatively steady trend from 30 quintals per hectare in the early years to about 39-40 quintals per hectare in the later years. The improvement in productivity since 2013-14 indicates better adoption of improved varieties, agronomic practices and input utilization, though the yield has declined to 38-40 quintals per hectare in recent years. Overall, the data highlights that while technological advances have contributed to sustainable yields, the greatest growth in radish production has been largely region-specific, reflecting the increasing importance and acceptance of radish cultivation among farmers in the region.

Area, Production and Productivity of Radish cultivation in Tamil Nadu

Table 3 shows that radish cultivation in Tamil Nadu from 2010-11 to 2023-24 presents a stable growth pattern with significant fluctuations in specific years, both in terms of production and productivity. In the initial phase (2010-11 to 2012-13) the crop was cultivated on an average area of about 475 hectares, yielding about 13-16 tonnes, with a standard productivity of 30 quintals per hectare. Gradual improvement was seen from 2013-14 onwards with area increasing to 578 hectares and production reaching 19.51 tonnes, while productivity also increased to 33.75 quintals per hectare. From 2014-15 to 2016-17, the area gradually expanded from 637 to 835 hectares, and production improved accordingly. However, in 2016-17 and 2017-18, there was a slight decline in productivity, which came down to nearly 30 quintals per hectare, restricting production despite moderate acreage expansion. A major breakthrough occurred in 2018-19, when the area doubled to 1728 hectares, resulting in a sharp increase in production to 53.09 tonnes, although productivity remained stable at 30 quintals per hectare. This growth momentum continued, and by 2020-21, the area had expanded to 3512 hectares and the production rose to 121.43 tonnes, supported by an improved yield of 34.58 quintals per hectare. In the most recent years (2021-22 to 2023-24) the area was stabilized between 3300-3900 hectares, and production was maintained at around 34.5 quintal per hectare, exceeding 136 tonnes. Overall, radish cultivation has seen substantial expansion in both area and production, while productivity improvements have been modest, indicating that production growth is largely dependent on area rather than yield increases, although stabilizing productivity at 34-35 quintals per hectare reflects continued adoption of improved agricultural practices.

FINDINGS AND SUGGESTION

The study found that the combined growth rate of area and production in Dharmapuri is much higher than the state average, although the district has experienced high fluctuations, reflecting the instability in land use and production levels. Overall, the findings suggest that the expansion of radish production is mainly area-dependent, with productivity gains being secondary, and Dharmapuri is emerging as a promising hub for rapid growth in radish cultivation. Dharmapuri district accounts for 60 to 70 percent of the area and production of the state compared to Tamil Nadu. Moreover, the climatic and soil resources here are more conducive to radish production. Therefore, production is increasing here, and awareness among farmers is increasing, and economic incentives are available from government agencies, NGOs, and the price settings for radish are also favorable to farmers, which is why we believe that production has increased. The study reveals that the government should help in obtaining high-quality seeds and related subsidies for radish cultivation, and it would be good if it could provide a higher marginal price in pricing. Since radish is a perishable commodity, the government needs to be careful in pricing and should also provide value-added activities for radish.

CONCLUSION

Radish cultivation in Tamil Nadu has made significant progress in recent years, with significant contributions from Dharmapuri district as the analysis clearly shows. While Tamil Nadu has achieved steady expansion with relative stability, Dharmapuri shows rapid growth, high productivity and potential to become a leading centre for radish farming. However, the results also highlight challenges such as instability in production, modest yield

improvements, and continued reliance on expanding acreage rather than efficiency gains. To ensure sustainable development, it is necessary to focus on improving productivity by adopting improved varieties, climate-resistant technologies and better agricultural practices. Strengthening post-harvest infrastructure, promoting value addition and improving market linkages will further enhance the profitability of farmers. With appropriate policy support, research interventions and farmer-oriented strategies, radish cultivation in Tamil Nadu, particularly in Dharmapuri, can emerge as a resilient, profitable and sustainable agricultural enterprise contributing to both farmer welfare and nutritional security.

ABSTRACT

This study investigates the dual impact of cement industries in Ariyalur district, Tamil Nadu, focussing on their contribution to local development and related environmental issues. It also analyses the industry's performance, its effort under Corporate Social Responsibility (CSR) initiatives, technical evaluations, and future growth prospects, while addressing ecological impacts. Furthermore, the study proposes necessary measures to protect public health from the harmful effects of cement dust exposure. The article concludes by presenting relevant findings and recommendations.

Keywords: Ariyalur District, Cement Industry, CSR Activities, Economic Development, Technical Evaluation, Environmental Impact, Health and Safety Measures.

INTRODUCTION

The word "cement" traces its origin to the Roman term *""Opuscaementicium"*which referred to a type of masonry resembling concrete. This material was created by combining crushed stone and burnt lime, with volcanic ash and ground bricks, producing a strong hydraulic binding agent. Over time, the term evolved into various forms such as Cementum, *Cimentum*, *Cament, and* eventually *Cement*. Cement plays a crucial role in the construction of essential infrastructure including transportation networks, power and water supply systems, housing, dams, roads, and industrial complexes. It is regarded one of the cornerstones of modern infrastructure development. Without cement, the vast urban landscapes that define today's cities would not have been possible. The growth of the Indian cement sector started in the early 1900s, marked by the setup of the country's first cement factory in Chennai in 1902. In the Initial years, growth was slow due to limited technology and low demand. However, following India's independence, the sector witnessed significant expansion, driven by the government's emphasis on infrastructure and development, Economic liberalization in the 1990s further accelerated this growth, positioning India among the

world's leading cement producers. By adopting advanced technology and competitive practices, India has emerged as the second-largest cement manufacturer globally. As of 2024, India hosts 264 cement plants, comprising 163 integrated units and 101 grinding units, with an estimated annual production capacity nearing 450 million metric tonnes. Southern Indian states-Telangana, Tamil Nadu, Karnataka, Kerala, and Andhra Pradesh—collectively contribute 198 metric tonnes per annum (MTPA) to this capacity. Tamil Nadu alone is accounts for 26 cement factories, several of which have a production capacity exceeding 1 million MTPA. Ariyalur district in Tamil Nadu stands out due to its abundant limestone deposits, making it a strategic location for cement manufacturing. Over recent decades, several major cement companies have established operations in the region, elevating Ariyalur to the status of a significant industrial hub within the state. This industrial expansion has led to notable economic transformations, such as job creation, infrastructure improvements, and increased government revenues. Despite these developments, concerns persists regarding the actual impact on the local population's economic well-being, While industrial development often brings economic growth, its benefits are not always evenly distributed. Many residents remain employed in low-paying and unstable jobs, with limited access to social services or meaningful economic advancement. Furthermore, environmental degradation and health-related risks continue to pose serious difficulties for the neighbouring population. This article explores how the cement industry has influenced Ariyalur's economy, examining both the advantages and drawbacks faced by local residents. The study aims to provide a comprehensive analysis of the economic outcomes of industrialization, emphasizing the need for inclusive and sustainable development in industrial districts like Ariyalur.

LITERATURE REVIEW

Numerous studies have explored the relationship between industrial development and economic changes in rural and semi-urban regions, with the cement industry frequently examined due to its extensive operations and dependence on natural resources. The cement industry is recognized as one of the key contributors to industrial growth and infrastructure development. Globally and nationally, it plays a vital role in supporting construction activities and providing employment. In the Indian context, Rani [4] points out that, within the Indian scenario, the sector plays a significant part in creating jobs, driving investments, and dealing with environmental and various socio-economic issues. Sukanta Sarkar *et.al*., [5] examined the expansion and financial sustainability of India's cement industry. Numerous other studies have highlighted how industrialization affects local economies and standards of living. For instance, JuhiYadhav [1] describes the cement industry as a catalyst for economic development, facilitating national wealth accumulation. Despite its positive economic contributions, the industry is not without environmental costs. Kayalvizhi *et.al*. [2] draw attention to dust pollution, groundwater depletion, and agricultural land loss in cement-producing regions such as Ariyalur. Cement dust, in particular, is regarded as a hazardous pollutant with adverse effects on the local environment. Ramesh *et.al*., [3] carried out environmental evaluations by analyzing sediment, water, and plant samples gathered from multiple locations in the cement industrial region of Ariyalur.

National Context

Reports from the Planning Commission of India and the Ministry of Commerce and Industry highlights that cement production has played a significant role in boosting India's GDP and infrastructure development. However, these studies also raise concerns regarding about labour welfare, environmental damage, and the unequal distribution of economic benefits within industrial zones.

State-Level Studies

Research on Tamil Nadu's industrial sectors, including the work of Rajasekaran (2018) and reports from the Tamil Nadu State Planning Commission, shows that districts like Ariyalur, endowed with rich limestone deposits, have become hubs for cement production. These studies note that while industrial growth has increased job opportunities and state income, it has simultaneously caused ecological imbalances and health issues among local populations.

District-Level Insights

Research conducted on Ariyalur, covering articles from the Indian Journal of Regional Economics and regional academic studies, indicates that the swift rise of cement plants has led to mixed results. Despite certain households gaining direct or indirect employment, numerous residents continue to struggle with low wages, poor skill training, relocation pressures, and health issues caused by dust. Though some cement companies have implemented Corporate Social Responsibility (CSR) programs to mitigate these issues, their impact remains limited.

Gaps in Literature

While there is considerable discussion about Ariyalur's industrial and economic growth, few studies thoroughly explore the socio-economic effects on the local communities, particularly in rural areas. This article aims to address this gap by examining both the advantages and challenges faced by Ariyalur's residents due to the cement industry's expansion.

CEMENT INDUSTRIES IN ARIYALUR DISTRICT: AN OVERVIEW

Ariyalur has emerged as a prominent centre for cement manufacturing in Tamil Nadu, with several large plants operating in the district. This is possible due to the abundant deposits of limestone, which is the potential raw material for cement manufacturing. Limestone deposits of sedimentary origin have been found in Ariyalur and Sendurai Taluks. Many factories are located in Ariyalur Taluk, while others are in nearby areas like Jayankondam and Andimadam. To illustrate the mineral wealth of the district, tables detailing mineral production and value have been included.

Production and Value of Minerals in Ariyalur District (2023-24)(Table 1)

Key Cement Producers in Ariyalur

Tamil Nadu Cements Corporation Limited (TANCEM)

- TANCEM operates as a public sector undertaking owned entirely by the government of Tamil Nadu. It began operations on April 1, 1976, by acquiring a cement plant at Alangulam and establishing another in Ariyalur in 1979. The corporation operates under the Industries Department, headed by a Chairman and Managing Director from the IAS cadre.
- **Capacity Expansion:** TANCEM invested ₹809 core to increase the production capacity at its Ariyalur complex from 7 lakh metric tonnes per annum (MTPA) to 17 lakh MTPA.
- **Current Production:** The Ariyalur plant's capacity has increased from 5 lakh MTPA to an expected 15–17 lakh MTPA after expansion.
- **Employment Impact:** The expansion is projected to directly employ 250 workers and indirectly create 1,000 jobs.
- **Certifications:** Both the corporate office and Ariyalur units hold certifications from the Bureau of Indian Standards.
- **Products:** TANCEM manufactures Ordinary Portland Cement (OPC) and Pozzolana Portland Cement (PPC), supplying a significant portion to government projects.
- **Other Plants:** Apart from Ariyalur, TANCEM also operates a cement plant at Alangulam (Tirunelveli district) with a 4 lakh MTPA capacity and an asbestos sheet plant in Virudhachalam (Cuddalore district). The Ariyalur unit continues to a play a vital role in the regional cement industry, with ongoing plans for further growth.

DalmiaCement (Bharat) Limited (DCBL)

- Founded in 1939 by Shri Jaidayal Dalmia, the group now enjoys leadership in core sectors such as cement and sugar. The company has a significant manufacturing facility in Ayanathur, Ariyalur.
- **Capacity:** The Ariyalur plant's capacity was increased by 1 million tonnes through a ₹204 crore investment, targeting demand in southern India.
- **Products:** The Company offers a variety of cements such as OPC, PPC, Dalmia DSP, and Dalmia Infra Pro, along with innovative products like Dalmia Magic Skim Coat and Magic Innobond.
- **Presence:** Dalmia Bharat operates two integrated cement plants in Tamil Nadu—Dalmiapuram and Ariyalur—and a grinding unit in Sattur. The company also contributes to infrastructure projects like Bharatmala.

UltraTech Cement

- Part of the Aditya Birla Group, UltraTech operates the Reddipalayam plant in Ariyalur, which has contributed significantly to regional economic growth.
- **Capacity:** The plant's total capacity is 5.5 MTPA, with an additional 1.5 MTPA capacity line commissioned in 2012.
- **Recognition:** The Company has been awarded for energy efficiency, including the CII Energy Efficient Award in 2012.
- **Products:** UltraTech manufactures specialized cements such as Oil Well Cement, Air Strip Cement, and Railway Sleeper Cement.

Chettinad Cement Corporation Pvt Ltd.

- The plant is located in Keezhapalur village, the company has been operational since 2008.
- **Capacity:** It has a total production capacity of 3.0 MTPA, with a brown field plant of 2.75 MTPA added in 2009.
- **Products:** Chettinad Cement offers products like Chettinad 53 Grade OPC, ACC 53 Grade OPC, and ACC 43 Grade OPC.

Ramco Cement

- Ramco Cement has a notable presence in Ariyalur, with facilities located in Govindapuram, Periyanagalur, and Annanagar.
- **Products:** The Company manufactures high-quality Ordinary Portland Cement and blended cement varieties.

The India Cements Ltd.

- Based in TSN Nagar, Cement Nagar, the company acts as both a manufacturer and wholesaler.
- **Products:** It produces a range of cement products, including OPC, PPC, and blended cements.

THE ROLE OF CEMENT INDUSTRIES IN ARIYALUR'S ECONOMY

Ariyalur district, situated in central Tamil Nadu, is famously called the "Cement City" or "Land of Cement" due to its extensive limestone reserves. The establishment of multiple cement factories has played a crucial role in the district's industrial and economic development.

Economic Contributions

Job Creation

Cement factories generate substantial direct and indirect employment opportunities for thousands of people in Ariyalur, strengthening the local economy. For example, the expansion of Tamil Nadu Cement's Ariyalur plant is projected to create 250 new jobs. Employment spans various sectors including mining, manufacturing, and transportation, benefiting both rural and urban populations by reducing unemployment and enhancing economic wellbeing.

Infrastructure Growth

The cement sector is a major contributor to the national GDP by supporting infrastructure projects such as roads, bridges, housing, and commercial buildings. This construction activity stimulates broader economic development and job creation.

Natural Resources

The district's vast deposits of limestone, a critical raw material for cement manufacturing, underpin the growth of the cement industry in the region.

Revenue Generation

As the dominant industry in the district, cement manufacturing contributes significantly to Ariyalur's revenue each year, providing substantial support to the local economy.

Per Capita Income
The district continues to have a per capita income below the state average; however, it has been gradually increasing, supported by the district's industrial growth.

Market Surplus
Ariyalur's cement production meets a large portion of Tamil Nadu's demand, with surplus production supporting rural infrastructure development and other regions.

Opportunities for Local Businesses
The presence of cement plants boosts local enterprises, including suppliers, contractors, and small industries, fostering the development of supporting businesses and promoting entrepreneurship in the region.

Government Support
Government policies such as the "Housing for All" initiative and various infrastructure projects provide significant support to the cement industry. The Tamil Nadu government offers multiple schemes and incentives to promote manufacturing sectors, encouraging further economic progress in Ariyalur.

Technological Innovation
The cement industry is increasingly adopting advanced technologies to enhance efficiency, such as automation, energy-saving methods, and the use of alternative fuels. These innovations not only improve energy efficiency and reduce environmental impact but also create new green business opportunities and jobs.
In summary, cement factories are central to Ariyalur's economy, driving industrial growth, job creation, and infrastructure development in the region.

CORPORATE SOCIAL RESPONSIBILITIES (CSR) OF CEMENT FACTORIES IN ARIYALUR DISTRICT
TANCEM's CSR Efforts
In June 2023, TANCEM announced a project to rehabilitate its limestone mines in Ariyalur by planting trees to restore the ecological balance and reduce the environmental damage caused by mining. This rehabilitation aims to boost biodiversity and improve local community living conditions. Additionally, TANCEM supplies cement to various government departments, including the DRDA, at prices below market rates, with 74% of its production supporting rural infrastructure development.

Dalmia Cement(Bharat) Limited's CSR Programs
Dalmia Cement, through the Dalmia Bharat Foundation (DBF), actively implements several community development projects in Ariyalur. These initiatives focus on promoting sustainable agriculture, skill development, women empowerment, and infrastructure improvement, all aimed at enhancing the socio-economic status of local residents.

UltraTech Cement's CSR Contributions
In 2023, UltraTech identified infrastructure needs at Kasturba Gandhi BalikaVidyalaya, a girls' residential school in Ariyalur. The company provided portable study tables and lightweight school bags to 50 students, improving learning conditions. Additionally, they constructed two concrete water tanks, a platform, and laundry facilities, replacing inadequate classroom spaces. These upgrades have significantly improved students' academic performance and reduced dropout rates.

Chettinad Cement's CSR Initiatives
Chettinad Cement Corporation has contributed to enhancing educational infrastructure in Ariyalur by constructing essential facilities such as toilet blocks and bicycle sheds in local schools, thereby improving the overall learning environment.

Ramco Cement's CSR Activities

Ramco Cement organizes medical camps providing healthcare services to local communities. The company has supported the government primary health centre at Mannkkudiyan by donating diagnostic equipment for pregnant women and adolescent girls. It has also provided cement for the PMAY (Pradhan MantriAwasYojana) scheme, enabling 120 families across Ariyalur panchayats to build affordable housing.

Indian Cement's CSR Commitment

Indian cement companies in Ariyalur demonstrate a strong dedication to sustainable development and community welfare through their extensive CSR activities. Their initiatives aim to improve the quality of life and promote sustainable progress in the district.

These comprehensive CSR initiatives reflect the cement industry's dedication to fostering sustainable development and enhancing the well-being of communities in Ariyalur district.

PERFORMANCE OF THE CEMENT INDUSTRIES

The major cement companies in Ariyalur have shown strong performance, supported by steady demand and robust infrastructure development. Firms like UltraTech Cement, Dalmia Cement, and India Cements have consistently reported strong financial results, marked by increased sales and improved profit margins. However, despite this industrial success, the economic benefits for the local population remain uneven. There is a pressing need for development strategies that balance industrial growth with community welfare.

TECHNICAL ANALYSIS OF THE CEMENT SECTOR

Technical analysis involves studying candlestick charts to understand supply and demand trends. The cement sector closely follows trends in the infrastructure trends, which have shown significant upward movement in recent years. As a result, cement stock prices have increased due to demand. For a detailed technical evaluation of Ariyalur's cement industry, it is important to analyse trends, patterns, and indicators for individual companies, such as:

Trend analysis: Identify upward or downward stock price movements.
Chart patterns: Look for patterns like head and shoulders, triangles, or wedges.
Indicators: Use indicators like moving averages, RSI, and Bollinger Bands to assess Market sentiment.

FUTURE GROWTH PROSPECTS

Ariyalur, with its rich limestone reserves, continues to attract significant investment in the cement industry, with promising growth driven by industry trends and broader economic factors.

Capacity Expansion

Dalmia Bharat Limited has recently expanded its Ariyalurplant by adding a new cement mill, increasing production to 45.6 million tonnes per annum. This expansion is part of a broader goal to reach an installed capacity of 110–130 MTPA by 2031, focusing on strengthening its market position in Southern India.

New Entrants

New cement manufacturers are entering the Ariyalur market, including a proposed 4 MTPA cement plant in Govindapuram, which received pollution control clearance in February 2024.

Technological and Sustainability Advances

Companies like Ramco Cements are adopting cutting-edge technologies, such as energy-efficient turbines and advanced grinding methods, resulting in reduced energy consumption and improved environmental sustainability.

Government Infrastructure Initiatives

National infrastructure projects such as Bharatmala and the East Coast Economic Corridor are expected to increase cement demand. Ariyalur's strategic location positions it well to benefit from these developments, creating growth opportunities for local cement producers.

Economic Impact on Local Communities

The expansion of cement factories is likely to generate jobs and stimulate economic activity in Ariyalur. However, ensuring that growth is inclusive and addresses environmental sustainability and fair economic benefit distribution remains essential.

In summary, the future outlook for cement factories in Ariyalur is strong, with ongoing expansions, technological progress, and favourable government policies. The challenge lies in translating these developments into real advantages for local communities to ensure sustainable progress.

ENVIRONMENTAL CONCERNS

While the cement industry plays a significant role in Ariyalur's economic development, it also presents serious environmental challenges that impact public health, agriculture, and community wellbeing. Research shows that dust emissions from cement plants negatively affect soil and water quality, harming local farming and ecosystems.

Key Environmental Issues

Environmental Degradation

- Air pollution from continuous cement production and limestone mining releases dust and harmful gases, causing respiratory illnesses like asthma and bronchitis.
- Water pollution occurs due to waste discharge from factories and mining, contaminating surface and groundwater sources.
- Noise pollution from heavy vehicles, machinery, and blasting disrupts rural tranquillity.

Agricultural Decline

- Large tracts of fertile land have been converted for factory use and mining activities.
- Dust fallout alters soil pH and nutrient balance, reducing crop yields.
- Erosion and degradation near quarries damage topsoil, making farmland less productive.

Loss of Biodiversity

- Extensive extraction of limestone and clay destroys habitats of local plants and animals.
- Natural forest patches and ecosystems are cleared for industrial expansion.

Public Health Concerns

- Health studies in Ariyalur report higher incidences of skin ailments, eye irritations, and chronic fatigue among residents near cement zones.
- Limited healthcare access worsens the impact on vulnerable populations.

Waste Management Problems

Improper disposal of industrial waste, including kiln dust and sludge, leads to land contamination affecting nearby communities.

Mitigation Efforts

Major cement companies in Ariyalur have implemented various measures such as green belt development, dust suppression systems, alternative fuel use, mine rehabilitation, and community health programs to minimize

environmental damage and protect local residents' health. Protecting communities exposed to cement dust requires cooperation between government bodies, industries, and locals to reduce health risks and improve quality of life.

SOME MEASURES TO SAFEGUARD THE HEALTH OF CEMENT DUST EXPOSED COMMUNITIES

Regular Health Screenings
- Conduct monthly health camps in nearby villages to detect respiratory, skin, and eye diseases early.
- Provide free medicines including inhalers and asthma treatments.

Distribution of Protective Gear
- Provide N95 or anti-dust masks, especially to vulnerable groups like children and the elderly.
- Promote the use of goggles and headscarves for workers exposed to dust.

Mobile Health Units:
- Deploy mobile clinics with doctors and diagnostic tools to remote villages regularly, focusing on respiratory and maternal-child health.

Community Health Awareness Programs
- Educate people on dust's health impacts and protective practices through local language materials, folk theatre, and school sessions.

Home Protection Measures:
- Encourage planting dust-filtering plants (e.g., tulsi, aloe) around homes.
- Advice sealing windows/doors with wet cloths and using wet mopping instead of sweeping to reduce dust circulation.

Improve Indoor Air Quality
- Provide affordable air purifiers or promote DIY filters using fans and HEPA sheets.
- Encourage natural ventilation away from pollution sources.

Create Green Buffers

Work with factories to develop green belts of trees like neem, tamarind, and bamboo between industrial and residential areas to trap dust and clean the air.

Strengthen Healthcare Infrastructure
- Upgrade Primary Health Centres with more doctors and respiratory care equipment.
- Train local health workers to recognize and manage dust-related illnesses.

Industry Collaboration for CSR Health Projects

Motivate companies like Dalmia, Ramco, and TANCEM to invest in permanent health centres, subsidized health insurance, and clean water projects.

Government Monitoring and Enforcement
- Request Tamil Nadu Pollution Control Board and district authorities to monitor air quality regularly, enforce pollution laws, and penalize or close non-compliant factories.

A balanced strategy combining environmental management, fair compensation, skills development, healthcare access, and infrastructure improvements is vital for promoting development that is both environmentally sustainable and socially inclusive in regions influenced by cement activities.

RELEVANT FINDINGS

Cement Industry Drives Economic Growth but Benefits Are Uneven

The cement sector has notably strengthened Ariyalur's economic base by generating a wider range of employment opportunities, increasing district revenue, and improving infrastructure. However, the economic benefits are not equitably distributed. Many locals are employed in low-wage, unstable jobs and continue to face poor access to health and social services.

Ariyalur's Natural Resources Make It a Cement Hub

Ariyalur district's rich limestone deposits have attracted major cement companies such as TANCEM, Dalmia, UltraTech, Ramco, and Chettinad Cement. These firms have established large-scale operations, making the district one of Tamil Nadu's leading cement production centres.

CSR Activities Have Positive but Limited Impact

Companies like TANCEM, Dalmia, and UltraTech have implemented Corporate Social Responsibility (CSR) projects related to education, health, and rural infrastructure. While these efforts are beneficial, their overall reach and effectiveness in solving deep-rooted community issues remain limited.

Environmental and Health Issues are Major Concerns

The cement industry has caused serious environmental degradation, including dust pollution, soil damage, and water contamination. These issues have directly affected local agriculture and public health, leading to increased respiratory illnesses and other health complications among residents.

Need for Sustainable and Inclusive Development

Future growth in Ariyalur's cement sector appears promising due to technological innovation, government infrastructure initiatives, and capacity expansion by companies. However, to ensure long-term sustainability, there must be a focus on inclusive growth—balancing industrial expansion with environmental safeguards, better labour conditions, and improved healthcare access.

CONCLUSION

The cement industries in Ariyalur district have been instrumental in influencing the economic profile and development path of the district. These industries have provided employment opportunities, improved infrastructure, and contributed to the district's revenue generation. However, the economic benefits are not evenly distributed, and many local communities still face challenges such as low wages, health issues due to pollution and inadequate access to social welfare programs. To achieve sustainable development, it is crucial to a balance industrial progress with the welfare of the local population. Strengthening corporate social responsibility efforts, enforcing strict environmental regulations, and implementing inclusive economic policies are vital steps to improve living conditions while fostering the cement sector's growth in Ariyalur. In summary, the expansion of cement industries in Ariyalur has led to major economic shifts, and adopting well-rounded strategies is necessary to promote inclusive growth and sustainable development in such industrial regions.

ACKNOWLEDGEMENT

I express my profound gratitude to the Almighty for granting me the strength, wisdom, and perseverance to successfully complete this work. I am deeply indebted to the Principal Secretary/Commissioner, Director, and Additional Directors of the Department of Economics and Statistics, Chennai, as well as the Regional Joint Director of Statistics, Madurai Region, and Deputy Director of Statistics, Ariyalur District, for their invaluable support, guidance, and encouragement, which were instrumental in the successful completion of this study. I wish to convey my sincere appreciation to my colleagues for their constant support, cooperation, and constructive suggestions. I also

extend my heartfelt thanks to the officials, employees, and representatives of the various cement factories in the region. Their willingness to share critical information regarding industrial operations and their socio-economic implications has significantly contributed to the quality and depth of this study.Finally, I gratefully acknowledge all those who, directly or indirectly, extended their assistance and support, making the successful completion of this work possible.

ABSTRACT

In this study, the impact of anxiety on the dynamics of a three-species biogeochemical cycle model is addressed. The growth rate of an intermediate predator suggested in this model will bring down the top predator responsible for the cost of fear. Prey growth rates because of apprehension about intermediate predators. In this investigation, we discussed local stability analysis, the existence of equilibrium, and bifurcation analysis. The findings indicate that the fear effect can aid in the stabilization of the system's chaotic dynamics.

Keywords: Prey, Predator, Fear Effect, Stability, Hopf Bifurcation.
Mathematics Subject Classification: 49J15, 93A30.

INTRODUCTION

Many natural systems, including the weather and climate, exhibit chaotic behavior. A mathematical nonlinear model can be used to investigate this behavior. Chaotic population dynamics become difficultto control or stabilize. An unstable periodic orbit can be stabilized as an example of a small modification that can regulate chaos in a chaotic system. The chaotic dynamics of a three-species biogeochemical cycle are the primary focus of this work. In natural food chains or web models, Hastings and Powell [1]demonstrate the impression of disorder. Numerous academics have investigated the Hastings and Powell model, subsume elements of biology serving as alternate nourishment, a refuge, Allee impacts sickness, and fear into their research [1]. Higher trophic levels are where predator-prey interactions take place in ecology, and predator's influence on prey numbers might be unconcealed, serpentine, or a

combination of both [6]. Predators prey on their victims directly, but they can also affect their prey indirectly by making them fearful, which can alter their behavior [7,14,15,16].

Also some researchers found stability and bifurcation in various epidemiological and ecological models[17,18,19,20,21,22,23]. Foraging and reproduction are two behaviors that change in prey [8, 9,10,11,12,13]. They noticed that the system may be stabilized by the intense dread (by cutting out fluctuations in population). They also discovered that a supercritical Hopf bifurcation could become a subcritical one as a result of the fear effect, which results in many limit cycles. The Allee Effect and Refuge Effect turned out to be used in the study of effects of fear on prey-predator systems. Additionally, discrete, delayed, diffusive, and eco-epidemiological models have shown signs of the trepidation effect. They draw the conclusion that the trepidation effect has both stabilizing and destabilizing effects based on their findings. Panday et al. recently included chaotic dynamics in their model of the tritrophic food chain. They made the ground-breaking assumption that the cost of trepidation of the middle and top2predators, in succession, suppresses the development rate of prey and the middle predator. They also draw the conclusion that chaotic dynamics can be inhibited by trepidation considerations. Since the system is chaotic, our endeavor would be to use fear factors to stabilize1 the dynamics of a suggested model system. Our purpose in this work is toinclude the fear component in a previously examined model

2.Model Formulation and Existence of Equilibrium

Consider a chaotic model [8] in this study, which outlines the interactions between the species in the prey, expert predator, and apex expert predator food chains.

2.1Statement of the Problems

The nonlinear system of ordinary differential equations describing the predator-prey model is as follows:

$$\left.\begin{aligned}\frac{du}{dt}&=\alpha u-\beta u^2-\frac{e_1uv}{a_1+u},\\ \frac{dv}{dt}&=-\gamma v-\frac{e_2uv}{a_2+u}-\frac{e_3vw}{a_3+v},\\ \frac{dw}{dt}&=-\delta w+\frac{e_4uw}{a_4+v}.\end{aligned}\right\}\quad(2.1)$$

Here, u, v, w are the prey, intermediate predators, and apex predator populations are respectively condensed. α, γ, β, a_1, a_2, a_3, a_4, e_1, e_2, e_3, $e_4$and$\delta$are pragmatic constants. α constitute thecongenitalgrowth rate of prey u, $\gamma$is the transience rate if the predator vin the truancy of uonly.

The boundariese_1, e_2, $e_3$are the utmost value which harmoniously growth rate can procure.a_1, a_2, a_3, a_4 are halfsaturated abiding concurred to utilitarian retaliation of Holling type-II, βstay the tariff as concernsrivalry amid disparate of prey, parameter δstay the temporality tariff of the brow predator i.e., the truancyof intermediate predator, and e4is compute based on it comprehend regulation.The field tests have revealed that the offering diminished by virtue of apprehension effects. Thefollowing presuppositions are contrived to assimilate apprehension effect into the structure (2.1).

1. Thedread of the top predator w, which is something we take for granted, has caused the expansion standard of the intermediate predator v to slows. As a result, the adjusted expansion standard shifts to $\frac{e_2}{1+f_2w}$(f_2 and w are both dreariness cutback function).
2. We also believe that the abundance of prey will lessen the apprehension of transitional predators and the widening commute will $\frac{\propto}{1+f_1v}$ (f_1 and v are both dreariness cutback function).

In this direction $g_1(f_1,v)=\frac{1}{1+f_1v}$ and $g_2(f_2,w)=\frac{1}{1+f_2w}$ are agitation functions, which account for the cost of anti-predator denial by virtue of fright, consequently f_1 and f_2 represents the fright criterion (magnitude off right) of intermediate predators and prey, proportionately. In distinction to the botanical perspective, it seems reasonable to assume

$$g_1(f_1,v)=\frac{1}{1+f_1v}\ and\ g_2(f_2,w)=\frac{1}{1+f_2w}$$

Iff_1=0,wehaveg_1(0,v)=1andifv=0,wehaveg_1(f_1,0)=1.Ontheotherhand,wealsoassume that

(2.2)

$\lim f_1 \to \infty\ g_1(f_1,v)=0$and $\lim v \to \infty\ g_1(f_1,v)=0$

Differentiating(2.2),we get

$\frac{\partial g_1(f_1,v)}{\partial f_1}=\frac{v}{(1+f_1)^2} < 0$ *and* $\frac{\partial g_1(f_1,v)}{\partial f_1}=\frac{v}{(1+f_1)^2} < 0$ (2.3) (2.3)

Similarly, we obtain for
$g_2(f_2,w)=\frac{1}{1+f_2 w}$.

Iff_2=0,wehaveg_2(0, w) =1andw=0, we have$g_2(f_2,0)$ =1. On the other hand, weal so assume that
$\lim f_2 \to \infty\ g_2(f_2,w)=0$ and $\lim w \to \infty\ g_2(f_2,w)=0$.

Differentiating(2.2), we get $\partial g_2(f_2,w)\ f_2, < 0$ and $\partial g_2(f_2,w)\ w < 0$.
By using exceeding premise, the model system(2.1)unravels (2.4)

$$\left.\begin{aligned}\frac{du}{dt}&= \alpha u-\beta u^2-\frac{e_1 uv}{a_1+u},\\ \frac{dv}{dt}&= -\gamma v-\frac{e_2 uv}{a_2+u}\frac{1}{1+f_2 w}-\frac{e_3 vw}{a_3+v},\\ \frac{dw}{dt}&= -\delta w+\frac{e_4 uw}{a_4+v}.\end{aligned}\right\} \quad (2.5)$$

With the following pragmatic inceptive condition, we analyze the model system(2.5).
u (0) ≥0, v (0) ≥0 and w (0) ≥0. (2.6)
Then next section deals with the existence of equilibrium in the predator- prey system(2.1).

3. Existence of Equilibrium

In Section 3, the stability analysis of the defined model at the positive equilibrium point is discussed.
1.The aggregate extinction of prey and predator species is harmonized to the trivial equilibrium point E_0(0,0,0).
2. Axial equilibrium point $E_1(\frac{\ll}{\beta},0,0)$ in agreement with the extinction of the predator species v = 0 and w =0in(2.1), we have
$\alpha u-\beta u^2 =0$,
$u=\frac{\propto}{\beta}$.
3.Boundary equilibrium point $E_2(\hat{u},\hat{v},0)$, harmonized to the extermination of the top predator species, let
$\frac{dv}{dt}= -\gamma \hat{v}-\frac{e_2 \hat{u}\hat{v}}{a_2+\hat{u}}\frac{1}{1+f_2 \hat{w}}-\frac{e_3 \hat{v}\hat{w}}{a_3+\hat{v}}$,
Put $\frac{dv}{dt}$= 0 and w = 0, we obtain,
$\frac{e_2 \hat{u}\hat{v}}{a_2+\hat{u}}=\gamma \hat{v}$,
$\hat{u}(e_2-\gamma)=\gamma a_2$,
$\hat{u}=\frac{\gamma a_2}{e_2-\gamma}$
In addition, we have
$\frac{du}{dt}=\frac{\propto u}{1+f_1 v}-\beta u^2-\frac{e_1 uv}{a_1+u}$
let $\frac{du}{dt}-0, we\ get$
$\frac{\propto u}{1+f_1 v}-\beta u^2-\frac{e_1 uv}{a_1+u}=0$
$\propto u(a_1+u)-\beta u^2(a_1+u)(1+f_1 v)-e_1 uv(1+f_1 v)=0$,
$\propto ua_1+\propto u^2-(\beta a_1 u^2-\beta u^3)(1+f_1 v)-e_1 uv+f_1 e_1 uv^2=0$,
$\propto ua_1+\propto u^2-\beta a_1 u^2-\beta u^3-\beta a_1 u^2 v f_1-\beta u^3 f_1 v-e_1 uv+f_1 e_1 uv^2=0$
Dividing the above equation by u, we obtain
$\propto a_1+\propto u-\beta a_1 u-\beta u^2-\beta a_1 uv f_1-\beta u^2 f_1 v-e_1 v+f_1 e_1 v^2=0$

Since, $\hat{v}$ is the stipulated root of the quadratic equation

$f_1e_1\hat{v}^2(e_1+\beta\hat{u}f_1(a_1+\hat{u}))\hat{v}-(\alpha-\beta\hat{u})(a_1+\hat{u})=0$.(3.1)

The planar equilibrium $E_2(\hat{u},\hat{v},\ 0)$ exist if the following conditions are satisfied

w >γ and α+βa_2< $\alpha e_2\gamma$, (3.2)

4.We procure pragmatic equilibrium point $E^*(u^*,v^*,w^*)$ by determining these system of nonlinear equations

$\frac{\alpha}{1+f_1v^*}-\beta u^*-\frac{e_1v^*}{a_1+u^*}=0$

$\frac{e_2u^*}{a_2+u^*}\frac{1}{1+f_2w^*}-\frac{e_3w^*}{a_1+u^*}$=0

-$\delta+\frac{e_4v^*}{a_4+v^*}=0$.

Solving the above equation (3.3), we obtain

$-\delta+\frac{e_4v^*}{a_4+\ v^*}=\ 0,$

$-\delta a_4-\delta v^*+\ e_4v^*$= 0,

$(-\delta+e_4)v^*=\delta a_4$

$v^*=\frac{\delta a_4}{e_4-\delta}$

By resolving the equation, one may determine the value of u^*

$\frac{\alpha}{1+f_1v^*}-\beta u^*-\frac{e_1v^*}{a_1+u^*}=0,$

$\beta u^*+\frac{e_1v^*}{a_1+u^*}-\ \frac{\alpha}{1+\ f_1v^*}=\ 0,$

$\frac{\beta u^*(a_1+u^*)+e_1v^*}{a_1+\ u^*}-\frac{\alpha(a_1+u^*)}{(1+f_1v^*)(a_1+u^*)}=0,$

$\frac{1}{a_1+u^*}[\beta u^*a_1+\beta u^{*2}$-$\frac{1}{f_1v^*}(a_1+u^*)]=0,$

$\beta u^{*2}+\ (\beta a_1-\frac{\alpha}{1+\ f_1v^*})u^*+(e_1v^*-\frac{\alpha a_1}{1+f_1v^*})=0$

and w^* is obtained from the equation

$\frac{e_2u^*}{a_2+u^*}-\frac{1}{1+f_2w^*}-\frac{e_3w^*}{a_3+v^*}-\gamma=0,$

$\frac{e_2u^*}{(a_2+u^*)(1+f_2w^*)}=\frac{e_3w^*}{a_3+v^*}+\gamma$

$$\frac{e_3w^*}{a_3+v^*}\frac{f_2e_3w^{*2}}{a_3+v^*}+\gamma f_2w^*+\gamma-\frac{e_2u^*}{a_2+u^*}=0$$

$\frac{f_2e_3w^{*2}}{a_3+v^*}+\frac{e_3w^*}{a_3+v^*}+\ \gamma f_2w^*+(\gamma-\frac{e_2u^*}{a_2+u^*})=0$

$\frac{f_2e_3w^{*2}}{a_3+v^*}+(\frac{e_3}{a_3+v^*}+\ \gamma f_2)w^*+(\gamma-\frac{e_2u^*}{a_2+u^*})=0$

From equations (3.4), (3.5)and(3.6), it is only reasonable that the following requirements be met in order to keep the pragmatic equilibrium point.

$e_4>\ \delta, u^*>\frac{\gamma a_2}{1+f_1v^*}, e_1v^*<\frac{\alpha a_1}{1+f_1v^*}$ and $\beta a_1>\frac{\alpha}{1+f_1v^*}$

Now, in order to investigate the behavior of the solutions surrounding the equilibrium points, we determine the Jacobi an matrix of the model system(2.5)at any position (u,v,w),which is given by

$$J_E=\begin{pmatrix}\frac{\partial A}{\partial u} & \frac{\partial A}{\partial v} & \frac{\partial A}{\partial w}\\ \frac{\partial B}{\partial u} & \frac{\partial B}{\partial v} & \frac{\partial B}{\partial w}\\ \frac{\partial C}{\partial u} & \frac{\partial C}{\partial v} & \frac{\partial C}{\partial w}\end{pmatrix}$$

Were,

$A=\frac{\alpha u}{1+f_1v}-\beta u^2-\frac{e_1uv}{a_1+u},$

$B=\ -\gamma v+\frac{e_2uv}{a_2+\ u}\frac{1}{1+f_2w}-\ \frac{e_1vw}{a_1+u},$

$C = -\delta w + \frac{e_4 vw}{a_4 + v}$.

Differentiating(3.9)with respect to u,v and w, we obtain

$\frac{\partial A}{\partial u} = \frac{\partial}{\partial u}[\frac{\alpha u}{1+f_1 v} - \beta u^2 - \frac{e_1 uv}{a_1+u}]$

$=\frac{\alpha}{1+f_1 v}$ - $2\beta u - \frac{e_1 v}{a_1 + u} + \frac{e_1 uv}{(a_1+u)^2}]$

and

$\frac{\partial A}{\partial v} = \frac{\partial}{\partial v}[\frac{\alpha u}{1+f_1 v} - \beta u^2 - \frac{e_1 uv}{a_1+u}]$

$=- \frac{\alpha f_1 u}{(1+f_1 v)^2} - \frac{e_1 u}{a_1 + u}$

Also

$\frac{\partial A}{\partial w} = \frac{\partial}{\partial w}[\frac{\alpha u}{1 + f_1 v} - \beta u^2 - \frac{e_1 uv}{a_1 + u}] = 0$

Again, differentiating(3.10)with respect to u,v and w, we obtain

$\frac{\partial B}{\partial u} = \frac{\partial}{\partial u}[\frac{e_2 uv}{a_2+u}\frac{1}{1+f_2 w} - \frac{e_3 vw}{a_3+v} - \gamma v]$

$= - \frac{\alpha f_1 u}{(1+f_1 v)^2} - \frac{e_1 u}{a_1 + u}$

$\frac{\partial B}{\partial v} = \frac{\partial}{\partial u}[\frac{e_2 uv}{a_2+u}\frac{1}{1+f_2 w} - \frac{e_3 vw}{a_3+v} - \gamma v]$

$= \frac{e_2 uv}{(a_2+u)}\frac{1}{1+f_2 w} - \gamma - \frac{e_3 w}{a_3 + v}\frac{e_2 vw}{(a_3+v)^2}$

$\frac{\partial B}{\partial w} = \frac{\partial}{\partial u}[\frac{e_2 uv}{a_2+u}\frac{1}{1+f_2 w} - \frac{e_3 vw}{a_3+v} - \gamma v]$

$= -\frac{f_2 e_2 uv}{(a_2+u)(1+f_2 w)^2} - \frac{e_2 v}{a_3 + v}$

Similarly, differentiating(3.11)with respect to u,v and w, we obtain

$\frac{\partial C}{\partial u} = \frac{\partial}{\partial u}\left[-\delta w + \frac{e_4 vw}{a_4 + v}\right] = 0$

$\frac{\partial C}{\partial v} = \frac{\partial}{\partial u}\left[-\delta w + \frac{e_4 vw}{a_4 + v}\right] = 0$

$= \frac{e_4 w}{(a_4 + v)^2}$

$\frac{\partial C}{\partial w} = \frac{\partial}{\partial u}\left[-\delta w + \frac{e_4 vw}{a_4 + v}\right] = 0$

$= -\delta + \frac{e_4 v}{a_4+v}$

Finally, we obtain the Jacobi an matrix as follows,

$$J_E = \begin{pmatrix} \frac{\alpha}{1+f_1 v} - 2\beta u - \frac{e_1 v}{a_1+u} + \frac{e_1 uv}{(a_1+u)^2} & -\frac{\alpha f_1 u}{(1+f_1 v)^2} - \frac{e_1 u}{a_1+u} & 0 \\ -\frac{\alpha f_1 u}{(1+f_1 v)^2} - \frac{e_1 u}{a_1+u} & \frac{e_2 uv}{(a_2+u)}\frac{1}{1+f_2 w} - \gamma - \frac{e_3 w}{a_3+v}\frac{e_2 vw}{(a_3+v)^2} & \frac{f_2 e_2 uv}{(a_2+u)(1+f_2 w)^2} - \frac{e_2 v}{a_3+v} \\ 0 & \frac{e_4 w}{(a_4+v)^2} & -\delta + \frac{e_4 v}{a_4+v} \end{pmatrix}$$

The above matrix can be written in the form

$$J_E = \begin{pmatrix} A_{11} & A_{12} & 0 \\ A_{21} & A_{22} & A_{23} \\ 0 & A_{32} & A_{33} \end{pmatrix}$$

$A_{11} = \frac{\alpha}{1 + f_1 v} - 2\beta u - \frac{e_1 v}{a_1 + u} + \frac{e_1 uv}{(a_1 + u)^2}$

$A_{12} = -\frac{\alpha f_1 u}{(1 + f_1 v)^2} - \frac{e_1 u}{a_1 + u}$

$A_{13} = 0$

$A_{21} = -\frac{\alpha f_1 u}{(1 + f_1 v)^2} - \frac{e_1 u}{a_1 + u}$

$$A_{22} = \frac{e_2 u}{(a_2+u)(1+f_2 w)} - \gamma - \frac{e_3 w}{a_3+v} + \frac{e_3 vw}{(a_3+v)^2}$$

$$A_{23} = -\frac{f_2 e_2 uv}{(a_2+u)(1+f_2 w)^2} - \frac{e_2 v}{a_3+v}$$

$$A_{31} = 0$$
$$A_{32} = \frac{e_4 w}{(a_4+v)^2}$$
$$A_{33} = -\delta + \frac{e_4 v}{a_4+v}$$

4 Local Stability And Hopf-Bifurcation Analysis

The following sector expressed and provide the conditions for the system (2.5) for bifurcation analysis and stability.

4.1 Stability Analysis

For local asymptotic stability, the solution is essential access to an equilibrium point that is closed to the equilibrium point but is hidden by the beginning circumstances. By linearizing the system over the relevant equilibrium point, it is possible to achieve the precedent for local stability of the equilibrium in this case.

Theorem 4.1

(a) The frivolous equilibrium point $E_0(0,0,0)$ is always instability.

(b) Asymptotic fundamental equilibrium if, then $E_1\left(\frac{\alpha}{\beta}, 0,0\right)$ if is local asymptotically stable if $\gamma > \frac{\alpha e_2}{\alpha+\beta a_2}$.

(c)The Jacobian matrix correlated with the equilibrium point $E_2(\tilde{u},\tilde{v},0)$ is restrictedly variationally stable if $\beta > \frac{e_1\tilde{v}}{(a_1+\tilde{u})^2}$ and $\delta > \frac{e_4\tilde{v}}{a_4+\tilde{v}}$.

Proof.

(a)The Jacobian matrix for the trivial equilibrium point $E_0 = (0,0,0)$ is given by,

$$J(E_0) = \begin{pmatrix} \alpha & 0 & 0 \\ 0 & -\gamma & 0 \\ 0 & 0 & -\delta \end{pmatrix}$$

The characteristic equation is,

$-\lambda^3 + \lambda^2(\alpha - \delta - \gamma) + \lambda(\alpha\delta + \alpha\gamma - \gamma\delta) + \alpha\gamma\delta = 0$,

together with the Jacobian matrix's eigen values, J_{E_0} are α , $-\gamma$, $-\delta$ .The equilibrium point $E_0(0,0,0)$ is inherently unstable.

(b)The axial equilibrium point's Jacobian matrix E_1 ($\frac{\alpha}{\beta}$,0,0) is,

$$J(E_0) = \begin{pmatrix} A_{11} & A_{12} & 0 \\ 0 & A_{22} & 0 \\ 0 & 0 & A_{33} \end{pmatrix}$$

were

$$A_{11} = -\alpha$$
$$A_{12} = -\left(\frac{\alpha e_1}{\alpha+\beta a_1} + \frac{\alpha^2 f_1}{\beta}\right)$$
$$A_{22} = \left(-\gamma + \frac{\alpha e_2}{\alpha+\beta a_2}\right)v$$
$$A_{33} = -\delta$$

Then the Jacobian matrix becomes,

$$J(E_1)=\begin{pmatrix} -\alpha & -\left(\frac{\alpha e_1}{\alpha+\beta a_1}+\frac{\alpha^2 f_1}{\beta}\right) & 0 \\ 0 & \left(-\gamma+\frac{\alpha e_2}{\alpha+\beta a_2}\right)v & 0 \\ 0 & 0 & -\delta \end{pmatrix}$$

and the eigen values of J_{E_1} are $-\alpha$, $-\delta$ and $-\delta+\frac{\alpha e_2}{\alpha+\beta a_2}$. Hence, E_1 $(\frac{\alpha}{\beta},0,0)$ is local asymptotically stable if $\gamma > \frac{\alpha e_2}{\alpha+\beta a_2}$

(c)The Jacobian matrix correlated with the equilibrium point $E_2(\tilde{u},\tilde{v},0)$ is

$$J(E_1)=\begin{pmatrix} P_1 & -P_2 & 0 \\ P_3 & 0 & -P_4 \\ 0 & 0 & P_5 \end{pmatrix}$$

Where,

$$P_1=\tilde{u}\left(-\beta+\frac{e_1\tilde{v}}{(a_1+\tilde{u})^2}\right)$$

$$P_2=\frac{e_1\tilde{u}}{a_1+\tilde{u}}+\frac{\alpha f_1\tilde{u}}{(1+f_1\tilde{v})^2}$$

$$P_3=\frac{e_2a_2\tilde{v}}{(a_2+\tilde{u})^2}$$

$$P_4=\frac{e_3\tilde{v}}{a_3+\tilde{v}}+\frac{f_2e_2\tilde{u}\tilde{v}}{a_2+\tilde{u}}$$

$$P_5=-\delta+\frac{e_4\tilde{v}}{a_4+\tilde{v}}$$

The corresponding distinctive equation of the matrix J_{E_1} is stated as follows,

$(P_1-\lambda)[(P_5-\lambda)(-\lambda)-0]+P_2[(P_3)(P_5-\lambda)-0]=0,$

$(P_5-\lambda)[(P_1-\lambda)(-\lambda)+P_2P_3]=0,$

$(P_5-\lambda)[-P_1\lambda+\lambda^2+P_2P_3]=0,$

$(P_5-\lambda)(\lambda^2-P_1\lambda+P_2P_3)=0.$ (4.1)

The distinctive equation (4.1) has negative real components if $P_5<0$ and $P_1<0$. which is why equilibrium point $E_2(\tilde{u},\tilde{v},0)$ is locally asymptotically stable if $\beta > \frac{e_1\tilde{v}}{(a_1+\tilde{u})^2}$ and $\delta > \frac{e_4\tilde{v}}{a_4+\tilde{v}}$

This completes the proof.

Theorem 4.2

The pragmatic equilibrium $E^*(u^*,v^*,w^*)$ is asymptotically stable if the following conditions influence

$$\beta u^* > \frac{e_1u^*v^*}{(a_1+u^*)^2}+\frac{e_3v^*w^*}{(a_2+v^*)^2} \quad (4.2)$$

$$\beta u^*\mu+\frac{\beta e_2\omega u^*v^*w^*}{(a_3+v^*)^2} > \frac{\beta^2e_3(u^*)^2v^*w^*}{(a_3+v^*)^2}+\frac{e_3e_4a_4v^*w^*\psi}{(a_3+v^*)^2(a_4+v^*)^2}+\mu\omega \quad (4.3)$$

where μ, ω, ψ are provided in (4.6).

Proof.

The Jacobian matrix correlated along with pragmatic equilibrium $E^*(u^*,v^*,w^*)$is

$$J_{E^*}=\begin{pmatrix} J_{11} & J_{12} & 0 \\ J_{21} & J_{22} & J_{23} \\ 0 & J_{32} & 0 \end{pmatrix} \quad (4.4)$$

and the cubic characteristic equation is where,

$$\sigma^3+\rho_1\sigma^2+\rho_2\sigma+\rho_3=0 \quad (4.5)$$

where,

$\rho_1=-(J_{11}+J_{22}),$

$\rho_2=J_{11}J_{22}-J_{12}J_{21}-J_{23}J_{32}$

$\rho_3=J_{11}J_{23}J_{32}$

$j_{11}=-\beta u^*+\frac{e_1u^*v^*}{(a_1+u^*)^2},$

$j_{12} = \frac{e_1 u^*}{a_1 + u^*} + \frac{\propto f_1 u^*}{(f_1 v^*)^2}$,

$J_{21} = \frac{e_2 a_2 v^*}{(a_2 + u^*)^2 (1 + f_2 w^*)}$

$J_{22} = \frac{e_3 v^* w^*}{(a_3 + v^*)^2}$

$J_{23} = -\frac{e_3 v^*}{a_3 + v^*} - \frac{f_2 e_2 u^* v^*}{(a_2 + u^*)(1 + f_2 w^*)^2}$

$J_{32} = \frac{e_4 a_4 w^*}{(a_4 + v^*)^2}$

The intramural equilibrium will be locally asymptotically stable if the coefficients pertinent to the distinctive equation (4.5), ρ_1, ρ_2 and ρ_3 are captivate the Routh-Hurwitz stability yardstick, i.e. $\rho_1 > 0, \rho_3 > 0$ and $\rho_1 \rho_2 - \rho_3 > 0$.Simple calculation demonstrates that $\rho_1 > 0$ and $\rho_3 > 0$, if

$$-\beta u^* + \frac{e_1 u^* v^*}{(a_1 + u^*)^2} + \frac{e_3 v^* w^*}{(a_3 + v^*)^2} < 0$$

which is true based on the circumstance (4.2). Also since,

$$\rho_1 \rho_2 - \rho_3 = (J_{11} + J_{22})(J_{12} J_{21} - J_{11} J_{22}) + J_{22} J_{23} J_{32}$$

$$= \left\{ -\beta u^* + \frac{e_1 u^* v^*}{(a_1 + u^*)^2} + \frac{e_3 v^* w^*}{(a_3 + v^*)^2} \right\} \times \left\{ -\left(\beta u^* + \frac{e_1 u^* v^*}{(a_1 + u^*)^2} \times \frac{e_3 v^* w^*}{(a_3 + v^*)^2} \right) - \left(\frac{e_1 u^*}{a_1 + u^*} - \frac{\alpha f_1 u^*}{(1 f_1 v^*)^2} \right) \times \frac{e_2 a_2 v^*}{(a_2 + u^*)^2 (1 + f_2 w^*)} \right\}$$

$$= \beta u^* \mu + \frac{\beta e_3 \omega u^* v^* w^*}{(a_3 + v^*)^2} - \frac{\beta^2 e_3 u^{*2} v^* w^*}{(a_3 + v^*)^2} - \mu\omega - \frac{e_3 e_4 a_4 v^* w^{*2} \psi}{(a_3 + v^*)^2 (a_4 + v^*)^2} > 0$$

utilising the condition, which is true(4.3).

Where,

$$\mu = \frac{e_1 e_2 u^* (v^*)^2 w^*}{(a_1 + u^*)^2 (a_3 + v^*)^2} + \frac{e_2 a_2 v^*}{(a_2 + u^*)^2 (1 + f_2 w^*)} \left(\frac{e_1 u^*}{a_1 + u^*} + \frac{\alpha f_1 u^*}{(1 + f_1 v^*)^2} \right)$$

$$\omega = \frac{w_1 u^*}{a_1 + u^*} + \frac{\alpha f_1 u^*}{(1 + f_1 v^*)^2},$$

$$\psi = \frac{e_3 v^*}{a_3 + v^*} + \frac{f_2 e_2 u^* v^*}{(a_3 + v^*)(1 + f_3 w^*)^2}.$$

This completes the proof.

4.1Hopf-Bifurcation Analysis

TheperiodicsolutionandsystemstabilitymodificationappearattheextremeordetractingvalueofaparameterknownastheHopfbifurcation. In the following theorem, we demonstrate that Hopf bifurcation continues, and to do so, we use the fear parameter f_1 as a bifurcation parameter.

Theorem 4.3

Whilethefearfactorf_1 exceeds a arbitrary value f_1^*, the system then goes in to Hopf-bifurcation, which occurs throughout the pragmatic equilibrium E^* if the ensuing constrains influenced

$$\rho_1(f_1^*) > 0, \quad \rho_3(f_1^*) > 0, \quad \rho_1(f_1^*)\rho_2(f_1^*) - \rho_3(f_1^*) = 0 \quad \text{and} \quad [\rho_1(f_1^*)\rho_2(f_1^*)]' \neq \rho_3'(f_1^*)$$

Proof.

As a result, we are subjected to the spotted Locally asymptotically stable interior equilibrium exists, and we perceived as pecificpro to type system as no longer beings table due to changes in a few boundaries value. Hence, we embrace the trepidation parameter $f_1$as the bifurcation parameter. If you're interested condemning value f^* in this manner,

$$\rho_1(f_1^*)\rho_1(f_1^*)-\rho_3(f_1^*)=0$$

For$f_1 = F_1^*$the characteristic equation (4.5) must be of the form

$(\sigma^2(f_1^*) + \rho_2(f_1^*))(\sigma(f_1^*) + \rho_1(f_1^*)) = 0$

The exceeding equation has three roots -ϱ(f_1^*) ,i√ϱ$_2$(f_1^*). To manifest Hopfbifurca-tionoccursat$f_1=f^*$,we require to satisfy transversality condition

$$\left.\frac{dRe(\sigma_j(f_1))}{df_1}\right|_{f_1=f_1^*} \neq 0$$

For all f_1, the roots are in extensive of the form

$\sigma(f_1)=\Theta(f_1)+iy(f_1)$,

$\sigma(f_2) = \Theta(f_1)-iy(f_1)$,

$\sigma(f_3)=-\rho_1(f_1)$.

Now, we shall corroborate the trasversality condition

$$\left.\frac{dRe(\sigma_j(f_1))}{df_1}\right|_{f_1=f_1^*} \neq 0$$

Sub stituting $\sigma_j(f_1)=\Theta(f_1)\pm iy(f_1)$,into(4.7)and scheming the derivative,we have

$K(f_1)\Theta'(f_1)-L(f_1)y'(f_1)+M(f_1)= 0$,

$K(f_1)\Theta'(f_1)+L(f_1)y'(f_1)+N(f_1)=0$, (4.8)

where,

$K(f_1) = 3\Theta^2(f_1)+2\rho_1(f_1)\Theta(f_1)+ \rho_2(f_1)-3y^2(f_1)$,

$L(f_1) = 6\Theta(f_1)y(f_1)+2\rho_1y(f_1)$

$M(f_1) = \Theta^2(f_1)\rho'_1(f_1)+ \rho'_2(f_1)\Theta(f_1)+ \rho'_3(f_1)- \rho'_1(f_1)y^2(f_1)$,

$N(f_1) = 2\Theta(f_1)y(f_1)\rho'_1(f_1)+ \rho'_2(f_1)y(f_1)$.

Notices that $\Theta(f_1^*) = 0$,$y(f_1^*) = \sqrt{\varrho_2(f_1^*)}$, then we have

$K(F_1^*)=-2\rho_2(f_1^*)$,

$L(F_1^*)=2\rho_1(f_1^*)\sqrt{\varrho_2(f_1^*)}$,

$M(F_1^*)= \rho'_3(f_1^*) - \rho'_1(f_1^*)\rho_2(f_1^*)$,

$N(F_1^*)= \rho_2(f_1^*)\sqrt{\varrho_2(f_1^*)}$,

Solving $\Theta'(f_1^*)$from(4.8)we get,

$$\left.\frac{dRe(\sigma_j(f_1))}{df_1}\right|_{f_1=f_1^*} = \acute{\Theta}(f_1)_{f_1=f_1^*} = -\frac{L(f_1^*)N(f_1^*) + K(f_1^*)M(f_1^*)}{k^2(f_1^*) + L^2(f_1^*)}$$

$$= \frac{1}{2}\frac{\acute{\rho_3}(f_1^*) - (\rho_1(f_1^*)\acute{\rho_2}(f_1^*))}{\rho_1^2(f_1^*) + \rho_2(f_1^*)} \neq 0$$

$$\left[\rho_1(f_1^*)\rho_2(f_1^*)\right]' \neq \acute{\rho_3}(f_1^*)$$

$$\sigma_3(f_1^*) = -\rho_1(f_1^*) < 0$$

Consequently, the homomorphic constrains hold and in consequence of Hopf-bifurcation occur at $f_1=f_1^*$

4.3Numerical Simulation

Being in control of the chaotic dynamic of the prototype system is the main objective of this work. We have suggested a mathematical model with a biological component of dread for this goal. Numerous writers have explored the prototype system in their works of literature. Figure depicts the chaotic attractor that is present in the model system. As the intrinsic growth rate of prey increases in the range of $1.96 \leq a0 \leq 2$, the system exhibits chaotic dynamics. Figure bifurcation diagram shows how these changes can be observed. From Figure, it is clear that limit cycle oscillation and period-doubling cause the model system to transition from a stable focus into a chaotic dynamic, it is seen that our suggested model is identical to a previously researched mode when $f1 = f2 = 0$.

CONCLUSION

In this study, we examined a three-species food chain model that included the classical model's inclusion of fear variables. Next, we have analytically demonstrated that there are biologically plausible equilibrium locations. Additionally, the suggested model system's local stability analysis is carried out in conferring with current equilibria. Hopf bifurcation happens as a result of the model system dynamics transitioning from the curb cycle to a stable focus. In order to demonstrate that the system undergoes a Hopf bifurcation with the fear parameters, we also performed a Hopf bifurcation study bifurcation pa rameters f1 and f2. A disorganized attractor is seen, and the model system displays chaotic dynamics. According to Figures, an increase in the congenital broadening outlay of prey (a0) results in disorganized dynamics that can be managed bypanic-related parameters. Additionally, Data also show that an increase in the fear factor f1 stabilizes the system in the face of chaotic dynamics (even in the absenteeism of cost of fear of the top predator in intermediate predator). As shown in Figure, even the high cost of dread, as shown in figure, drives a population to extinction. Figures demonstrate that a rise in the fear factor f2 stabilizes the system. Additionally, as a result of the high cost of fear, the population of top predators disappears.

ABSTRACT

Ensuring the confidentiality of data stored in public cloud environments remains a critical challenge, as users increasingly rely on cloud platforms for scalable, reliable, and cost-effective storage. However, data entrusted to Cloud Service Providers (CSPs) is often vulnerable to unauthorized disclosure, either from internal breaches or external threats. To address this issue, this study introduces a novel confidentiality technique, termed RPCDP (Robust Public Cloud Data Protection Through Confidentiality-Driven Obfuscation). RPCDP leverages advanced data obfuscation methods to safeguard sensitive information prior to cloud outsourcing, enabling users to invoke the service on demand. Experimental evaluations were conducted for the proposed and existing techniques, complemented by security analysis tools to benchmark the proposed method against established obfuscation schemes such as Base32, Base64, and Hexadecimal Encoding. Results demonstrate that RPCDP not only strengthens resistance to data disclosure but also improves performance efficiency, offering enhanced confidentiality of data. This advantage positions RPCDP as a more effective alternative to conventional obfuscation techniques for securing data in public cloud storage.

Keywords— Cloud Storage Security, Data Confidentiality, Data Obfuscation, Public Cloud, Data Security.

INTRODUCTION

Cloud computing has emerged as a transformative paradigm in modern information technology, evolving from earlier models such as grid computing, utility computing, parallel computing, distributed computing, and virtualization. It provides a highly scalable and powerful infrastructure comprising thousands of interconnected computers and servers [1]. Through this environment, diverse computational resources—including servers, storage, software, memory, and networking—are delivered as on-demand services. One of the key advantages of this model is the reduction of capital investment and operational costs for organizations, particularly Small and Medium Enterprises (SMEs), which often lack the resources to maintain dedicated IT infrastructure. Cloud computing further extends the concept of "Everything as a Service" (XaaS), where "X" can represent software, operating systems, hardware, or storage resources. By enabling elastic scalability, cloud services dynamically adjust to user demand [6]. To ensure reliability, service providers maintain multiple geographically distributed data centers, allowing continuous and fault-tolerant service delivery[2]. Service provisioning is largely automated, achieved through Application Programming Interfaces (APIs) that streamline cloud operations without requiring human intervention.

Despite these benefits, data protection remains a primary concern for enterprises adopting cloud solutions. Users are particularly cautious about the confidentiality and integrity of outsourced data. In this context, data obfuscation has gained prominence as a security mechanism [3]. Obfuscation transforms original data into unintelligible forms through mathematical operations or programmatic logic. Unlike encryption, which relies on techniques and cryptographic keys to convert plaintext into ciphertext, obfuscation allows data to be processed without the need for de-obfuscation [4]. This characteristic makes obfuscation especially attractive for securing cloud storage, as it balances confidentiality with usability [5].

For SMEs, outsourcing data storage to the cloud is a cost-effective solution to overcome infrastructure limitations. Outsourcing involves delegating in-house data management activities to cloud providers, who possess the expertise and capacity to handle storage and maintenance tasks more efficiently [6]. Beyond cost savings, organizations outsource to access specialized knowledge, mitigate operational risks, and focus more on their core business processes [7]. However, this shift also introduces significant risks, particularly concerning the security and confidentiality of outsourced data [8]. To address these challenges, researchers have increasingly turned to obfuscation techniques as a means of safeguarding cloud-stored information. In this study, we propose RPCDP (Enhancing Data Security through Confidentiality-Obfuscation Techniques), a method designed specifically to secure numerical data in cloud storage. Together, these approaches enable users to select confidentiality mechanisms tailored to the sensitivity and type of their data. However, the present paper focuses exclusively on the design, implementation, and evaluation of RPCDP, demonstrating its effectiveness in mitigating the security risks associated with data outsourcing in public cloud environments.

Related Work

A wide variety of obfuscation techniques have been proposed in the literature, ranging from basic transformations to highly sophisticated mathematical approaches. In recent years, obfuscation has gained significant attention as a promising strategy for enhancing security within cloud environments. Gautam, Pet al. [9]proposed a framework to safeguard electronic health records (EHRs) in cloud environments. The authors highlighted the rapid adoption of cloud storage for health data due to its scalability and cost efficiency, but also emphasize the pressing confidentiality and privacy challenges. To address this, the study integrateddata obfuscation with the RSA encryption technique, ensuring both confidentiality and authentication for sensitive EHRs. The framework is designed within a cloud computing context, making use of established service models such as SaaS, PaaS, and IaaS. By combining obfuscation and encryption, the proposed approach not only prevented unauthorized disclosure but also strengthens access control and secure sharing of patient information. The paper concluded that this hybrid method offered an efficient and secure solution for maintaining the confidentiality of healthcare data in cloud storage systems.

Kumar M A et al. [10] introduced OB-MECC (Obfuscation-based Modified Elliptic Curve Cryptography), a hybrid method that combines data obfuscation with an enhanced ECC technique to strengthen confidentiality in cloud storage. The approach first applied multiple obfuscation steps—including substitution and Caesar ciphers, binary conversions, and ASCII mapping—to conceal the original data before encryption. The obfuscated data is then encrypted using a modified ECC scheme that employs public, private, and secret keys to increase robustness against attacks. Performance evaluation showed that OB-MECC significantly reduces both encryption/decryption time and obfuscation overhead compared to traditional methods such as Hexadecimal, Huffman, and Base64 encoding. Furthermore, the proposed method achieved a higher security level (89%) than conventional ECC, Base64, and Hexadecimal approaches. Overall, OB-MECC demonstrates improved efficiency and stronger protection for sensitive information outsourced to the cloud.

Tripathi, D. R. [11] examined the role of data obfuscation as a mechanism to strengthen confidentiality and privacy in cloud computing. The author discussed limitations of encryption alone, particularly its overhead in large-scale deployments and the risk of data exposure when stored in plaintext on provider-controlled servers. To address these issues, the study proposed combining obfuscation with encryption as a dual-layer defense strategy. Several obfuscation methods—such as masking, substitution, shuffling, variance, gibberish generation, and anonymization—are reviewed, highlighting their properties of reversibility, specificity, and transformation. The proposed ARO Obfus CT technique focuses on securing numerical data by applying mathematical functions (multiplication, squaring, rotation, modulo, and ASCII mapping) under key management services. Experimental results demonstrate that the method not only ensures confidentiality but also reduces storage size, achieving efficient ciphertext generation with minimal redundancy. Overall, the study positions obfuscation as a lightweight and practical complement to encryption for enhancing cloud security.

Amalarethinam, D. I. G et al [12] introduced GLObfus, a data obfuscation technique developed to enhance the confidentiality of numerical data stored in public cloud environments. The approach applied a series of mathematical transformations—including value interchange, subtraction, squaring, modulo operations, and ASCII conversion—while incorporating dual key mechanisms for obfuscation and de-obfuscation. In contrast to conventional encoding schemes such as Base64, BaseX, and Hexadecimal, GLObfus improves both obfuscation and de-obfuscation efficiency while strengthening overall confidentiality. Experimental results in a cloud setting show that the method not only enhances security but also reduces storage overhead. Collectively, the study highlights GLObfus as an effective and efficient alternative for safeguarding sensitive numerical data in cloud storage.

Li Y et al. [13] presented a novel obfuscation-based approach for securing encrypted threshold signatures in cloud computing. The authors highlighted that conventional cloud platforms expose sensitive user data to potential insider threats, as data often resides on untrusted servers. To address this, they designed an obfuscator that enables threshold signature functionality while concealing critical key information. The scheme ensured that signing rights can be outsourced securely without disclosing private data, and its security is proven under the Decisional Linear (DLIN) and Computational Diffie–Hellman (CDH) assumptions. Experimental validation using a Java pairing-based cryptography library confirmed that the proposed method achieves both correctness and efficiency, making it suitable for practical cloud applications. Overall, the study demonstrated how program obfuscation can enhance confidentiality and prevent misuse of threshold cryptography in untrusted cloud environments. The proposed RPCDP is introduced as a confidentiality-driven obfuscation technique. Its performance has been evaluated against conventional approaches such as Base64, Base32, and Hexadecimal encoding, with comparisons focused on both security strength and execution time.

Existing Data Obfuscation Techniques

Data obfuscation is a widely adopted method of concealing information by deliberately transforming or scrambling data so that it becomes unintelligible to unauthorized users. The primary objective is to safeguard sensitive information stored in the cloud by reducing its susceptibility to intrusion and misuse. Although obfuscation

enhances confidentiality, conventional approaches have been criticized for their limited resilience against advanced security attacks [14]. This section reviews commonly used obfuscation schemes relevant to cloud storage.

Base64 Encoding

Base64 is one of the most commonly used encoding schemes, particularly for converting binary data into textual form to ensure safe transmission across communication channels designed for text-based processing. This helps preserve data integrity during transport. For example, the ASCII string *"Man"* is converted to *"TWFu"* through Base64 encoding. Each character is first converted into its ASCII 8-bit binary representation (M=01001101, a=01100001, n=01101110), concatenated, and then grouped into 6-bit blocks. Each 6-bit block is mapped to a corresponding symbol in the Base64 index table [15]. Although efficient for transmission, Base64 is not designed to provide strong security, as its encoded output can be easily reversed.

Base32 Encoding

Base32 encoding extends the same principle but maps data into a **case-insensitive** representation using a 32-character alphabet drawn from uppercase letters A–Z and digits 2–7. It encodes 40-bit input blocks as strings of eight 5-bit characters. During encoding, the bit stream is processed with the most significant bit first, ensuring consistent mapping across systems. While Base32 is more space-efficient for alphanumeric storage and avoids ambiguity with case sensitivity, it offers no inherent cryptographic protection since decoding is straightforward.

ASCII Encoding

ASCII (American Standard Code for Information Interchange) is one of the earliest and most fundamental encoding systems, representing characters from the English alphabet and control symbols as binary sequences. Each character corresponds to a 7-bit or 8-bit binary value. Although ASCII itself is not a security mechanism, it forms the basis for other obfuscation methods, since binary strings derived from ASCII can be further encoded into formats such as hexadecimal or Base64 for storage and transfer.

Hexadecimal Encoding

Hexadecimal encoding represents binary values in base-16 format using digits 0–9 and letters A–F. Each hexadecimal digit corresponds to four binary bits, making it a compact and human-friendly representation of binary-coded values. For instance, the number 2AF3 in hexadecimal translates to 10,995 in decimal, computed as (2×163)+(10×162)+(15×161)+(3×160)(2 \times 16^3) + (10 \times 16^2) + (15 \times 16^1) + (3 \times 16^0)(2×163)+(10×162)+(15×161)+(3×160). While hexadecimal encoding is useful for debugging and data representation in computing, it offers little resistance to brute-force or reverse-engineering attacks when used as an obfuscation technique.

Limitations of Traditional Obfuscation

Traditional encoding-based obfuscation methods, such as Base64, Base32, ASCII, and Hexadecimal, are lightweight and fast, but they lack robustness against brute-force or pattern-matching attacks because they generally do not rely on secret keys. Their reversibility makes them insufficient for protecting sensitive data in cloud environments where adversaries may have computational resources to decode the data. To overcome these shortcomings, the proposed RPCDP (Enhancing Data Security through Confidentiality-Obfuscation Techniques) introduces a key-dependent obfuscation approach. Unlike conventional schemes, RPCDP integrates a user-held secret key during the obfuscation process, ensuring that only authorized users can de-obfuscate the data. This key-based strategy significantly strengthens resistance against brute-force attacks and enhances confidentiality in public cloud storage.

Motivation

Cloud storage has become an indispensable service in today's digital ecosystem, with millions of users worldwide outsourcing their data and IT requirements to cloud platforms. Its rapid adoption is driven by several advantages, including ease of use, reduced maintenance burden, lower power consumption, and the elimination of infrastructure overhead associated with traditional storage systems. These benefits make cloud storage particularly attractive for

both individuals and enterprises seeking scalable and cost-effective solutions. However, alongside these advantages, cloud environments are also exposed to a wide range of security threats and risks**.** Unauthorized access, data leakage, and malicious attacks continue to be critical challenges, undermining user trust and slowing the broader adoption of cloud computing. Ensuring data confidentiality and safeguarding user privacy are therefore primary concerns in the development of a secure and reliable cloud infrastructure.

Motivated by these challenges, this research focuses on enhancing the confidentiality of outsourced data through obfuscation-based techniques, aiming to address both security and efficiency gaps present in existing methods. The specific objectives of this study are:

- **To guarantee controlled access:** Ensuring that cloud-stored data can only be accessed and retrieved by legitimate data owners.
- **To design confidentiality-driven techniques:** Developing novel security service techniques for cloud environments that leverage data obfuscation to strengthen protection against unauthorized disclosure.
- **To optimize storage efficiency:** Reducing the size of data stored in the cloud, thereby minimizing storage costs while maintaining confidentiality.

Problem Definition

Data security remains one of the most pressing challenges in cloud computing environments. Cloud platforms operate without geographical boundaries, meaning that user data can be stored across multiple data centers distributed worldwide. Since customers are compelled to rely on the infrastructure and platforms provided by a single Cloud Service Provider (CSP), the provider inherently has complete knowledge of data location and privileged access to the stored content. This centralized control raises serious concerns about the confidentiality and integrity of outsourced information.

In practice, data sent to the cloud is fully managed, controlled, and monitored by CSPs. Acting as privileged administrators, providers often retain the ability to inspect user data, which introduces the risk of unauthorized access or even insider attacks. Furthermore, in public cloud environments, users lose direct control over their data, and stored information may inadvertently be co-located with that of other tenants, increasing the possibility of data leakage or mingling. Another concern lies in the uncertainty surrounding encryption practices. Users typically lack visibility into whether their data is encrypted within cloud storage systems. Even when encryption is applied, CSPs face difficulties in securely managing cryptographic keys on a per-user basis. In many cases, a single key is applied across multiple users' data [20], reducing the effectiveness of encryption and increasing vulnerability to attacks. Moreover, users' data often needs to conform to CSP-specified formats, further exposing metadata and structural information that can be exploited by malicious actors. These challenges collectively highlight the limitations of existing security mechanisms and underscore the urgent need for advanced confidentiality-driven techniques. A secure, user-controlled method of protecting outsourced data is required to address the risks associated with CSP privilege, weak key management, and lack of user control in public cloud storage.

Consequently, there is a clear need for a confidentiality-driven obfuscation technique that not only enhances security against unauthorized disclosure but also reduces storage overhead and improves efficiency. This research addresses this gap by introducing RPCDP (Enhancing Data Security through Confidentiality-Obfuscation Techniques), a security service technique designed specifically for public cloud storage. By targeting numerical data and reducing both data size and disclosure risks, RPCDP aims to provide a more effective and practical alternative to conventional obfuscation methods.

METHODOLOGY

Cloud storage offers virtually unlimited storage capacity and serves millions of users worldwide on a daily basis. However, data outsourced to such environments must be adequately protected against unauthorized access. Before outsourcing, the data is obfuscated using RPCDP. Users select this service explicitly for securing their data. The technique employs a set of mathematical functions such as pow(), reverse(), modulo(), and ascii() to transform original data into unintelligible form. The key parameter determines the number of rotations or transformations applied during the obfuscation process. Keys are securely generated randomly but are retained solely by the users themselves; they are never shared with or stored by the CSP, ensuring user-controlled confidentiality.RPCDP specifically targets numerical data. When datasets contain both numerical and non-numerical values, the technique automatically isolates the numerical components and applies obfuscation exclusively to them.

Proposed Technique

This section presents the proposed confidentiality-driven obfuscation method, RPCDP (Robust Public Cloud Data Protection through Confidentiality-Driven Obfuscation)**.** Data obfuscation has recently gained significant attention in cloud security research because of its ability to disguise sensitive information while preserving its usability. Unlike encryption, which requires decryption before data can be processed, obfuscation transforms data into an unintelligible format that can still be stored or transferred without loss of information.

The proposed RPCDP technique is designed to achieve primary goal:

Data protection – ensuring that outsourced information remains confidential and inaccessible to unauthorized entities, including Cloud Service Providers (CSPs).

RPCDP operates by applying a series of mathematical transformations—such as modular arithmetic, power functions, character reversal, and ASCII-based conversions—on numerical data before it is outsourced. The number and sequence of these transformations are controlled by a **secret key**. Importantly, the key is retained exclusively by the user and is never shared with the CSP, thereby ensuring user-controlled confidentiality.

Procedural Steps of RPCDP

The proposed RPCDP technique follows a structured sequence of transformations to obfuscate numerical data. The steps are described below:

1. **Input Submission**
   - The user provides the plaintext (PT) and a secret key (K) as inputs to the RPCDPtechnique.
2. **Numerical Value Extraction**
   - Identify all numerical values within the plaintext.
   - Apply the obfuscation function with key K:

$RPCDP=O_K(Num)$

where O denotes the obfuscation operation.

3. **Data Size Determination**
   - Compute the total number of values in the plaintext:

$N=sizeof(PT)$

4. **Square Transformation**
   - For each value in the plaintext, compute its square:

$ST=(PT)*(PT)$

5. **Key-Controlled Rotation**
   - Perform rotation on the squared values, controlled by the key K.
   - For each element j=0,1,2,…,apply:

$RT=R_{K+j}(ST)$

where R denotes the rotation function, and the rotation factor increments with each consecutive value.

6. **Modulo Operation**

- Apply modulo reduction by 256 on the rotated values:

$MT=RT \bmod 256$

7. **ASCII Conversion**
   - Convert the resulting modulo values into ASCII codes to generate the final ciphertext (CT).

RPCDP employs a series of lightweight mathematical functions—pow(),rotate(),modulo(), and ascii()—to transform numerical values into an unintelligible form while preserving their integrity. Among these, the rotate() function plays a central role in controlling the variability of obfuscation. The rotation process is governed by a secret key (K). During the obfuscation process, rotation is performed iteratively. For each numerical value in the plaintext, the rotation factor is incremented by the index j of that value, resulting in a cumulative rotation of (K+j) positions. This incremental variation across different values prevents uniform transformation patterns, thereby strengthening resistance to brute-force and pattern-based attacks

Pseudo code of RPCDP is given below.

Input:

- Plaintext PT (user data)
- Secret key K(user-defined rotation factor)

Output:

- Ciphertext CT (obfuscated data)

Procedure:

1. **Begin**
2. Receive plaintext PT and secret key K.
3. Extract numerical values from PT.
4. Compute total number of values:

$N \leftarrow sizeof(PT)$

5. For each value $j \in [0,1,2,\ldots,N]$:

5.1 Compute square:

$ST \leftarrow (PTj)$

5.2 Rotate ST by (K+j) positions:

$RT \leftarrow R_{K+j}(ST)$

5.3 Apply modulo operation:

$MT \leftarrow RT \bmod 256$

5.4 Convert MT into corresponding ASCII character.

5.5 Append to ciphertext:

$CT \leftarrow CT \cup ASCII(MT)$

6. **End For**
7. Return CT as the obfuscated output.
8. End

Initially, the plaintext values are organized into an array of numerical elements, expressed as:

$PT=\{PT(1),PT(2),PT(3),\ldots,PT(N)\}$

The first transformation applies the pow() function to each element of the array, generating squared values:

$ST(i)=(PT(i))2, i=1,2,\ldots,N$

Each squared value ST(i)ST(i)ST(i) is then subjected to a rotation (rotate()) operation. The rotation factor is defined as (K+j), where K is the user's secret key, and j represents the index of the current element. For every subsequent element, the effective key is incremented by one, ensuring that no two consecutive values undergo identical rotations:

$RT(i)=Rotate(ST(i),K+j)$

The rotated value RT(i) is subsequently processed using the modulo function (modulo()) with divisor 256:

$MT(i)=RT(i) \bmod 256$

At the same time, the integer quotient of RT(i)/256 provides a count value, representing how many times the rotated number can be divided by 256. Although not directly required for the ciphertext, this intermediate measure supports compression and verification.

The remainder value MT(i)is finally converted into its ASCII character code (ascii()), yielding the ciphertext element:

$CT(i)=ASCII(MT(i))$

The complete obfuscated output is then obtained as:

$CT=\{CT(1),CT(2),CT(3),\ldots,CT(N)\}$

An important feature of RPCDP is that the key K is retained solely by the users, ensuring that de-obfuscation can only be performed by legitimate data owners. Using the same key K, users can reverse the process and retrieve the original plaintext values. Furthermore, each plaintext element is mapped into an 8-bit ASCII character, thereby compressing the original numerical data. This dual property of confidentiality and compression distinguishes RPCDP from conventional obfuscation techniques, which often increase storage overhead instead of reducing it.

Plaintext (numerical array):

$PT=\{98, 87, 89, 84, 97, 89, 87, 98, 88\}$

Secret key : K=4

Index j runs from 1 to N (here N=9).

Rotation is cyclic on the decimal digits of the squared value, by (K+j) positions. (Effective shift is taken modulo the number of digits.)

Worked table (with K=4)

j	PT	ST=PT*PT	Digits	Shift (K+j) → effective	Rotated RT	Count ⌊RT/256⌋	MT=RTmod256	CT(j)
1	98	9604	4	5 → 1	4960	19	96	‘
2	87	7569	4	6 → 2	6975	27	63	?
3	89	7921	4	7 → 3	9217	36	1	ϕ
4	84	7056	4	8 → 0	7056	27	144	É
5	97	9409	4	9 → 1	9940	38	212	┗
6	89	7921	4	10 → 2	2179	8	131	â
7	87	7569	4	11 → 3	5697	22	65	A
8	98	9604	4	12 → 0	9604	37	132	ä
9	88	7744	4	13 → **1**	4774	18	166	ª

Ciphertext (byte sequence):

CT=‘?ϕÉ ┗âAäª

IMPLEMENTATION AND RESULTS DISCUSSION

The proposed RPCDP (Enhancing Data Security through Confidentiality-Obfuscation Techniques) technique was implemented using Python 3.10 with built-in mathematical and string manipulation functions (pow(), custom rotate(), modulo, and ascii() conversions. For evaluation, a dataset of 1000 numerical entries (simulated student marks) was used. Performance metrics included obfuscation time and resistance to brute-force reversal**.** Table 1 and Figure 1 illustrate the comparative performance of the proposed RPCDP technique against conventional obfuscation approaches such as Base64, Base32, and Hexadecimal encoding. Execution times were measured for varying plaintext sizes, and the results clearly indicate that RPCDP consistently achieves lower processing time than the baseline techniques across all tested data sizes. Table 2 and Figure 2 present the comparative results of de-obfuscation performance between the proposed RPCDP method and conventional techniques such as Base64, Base32, and Hexadecimal. The de-obfuscation time was evaluated for varying plaintext sizes. The findings demonstrate that

RPCDP consistently requires less processing time than the existing approaches, confirming its efficiency during the de-obfuscation phase.

- Linear Growth: Execution time increases almost linearly with input size for all techniques, confirming scalability.
- Encoding Overheads: Base32 is consistently the slowest due to larger lookup tables and more padding overhead, while Base64 and Hexadecimal perform slightly better.
- Original RPCDP: Comparable to Base64 in speed, but unlike Base64/Hex, it provides both confidentiality and data size reduction.
- Optimized RPCDP: Outperforms all baseline methods, achieving ~2–3× faster execution. This is due to:
- Bitwise rotation instead of string manipulation.
- Modulo replaced with bitmasking (& 255).
- Direct byte casting instead of costly ASCII conversion functions.
- Efficiency at Scale: At 5 KB, optimized RPCDP is ~2.5× faster than Base64 and ~3× faster than Base32, making it suitable for real-time and IoT applications where millisecond savings are significant.

Table 3 and Figure 3 illustrate the comparative security analysis of the proposed RPCDP technique against conventional obfuscation methods. The evaluation shows that RPCDP achieves a security level of approximately 90%, while the existing approaches—Base64, Base32, and Hexadecimal—provide significantly lower security levels of 65%, 66%, and 54% respectively. These results highlight the superior confidentiality guarantees offered by RPCDP compared to traditional encoding-based techniques.

The higher security level of RPCDP can be attributed to its key-dependent transformations, where each plaintext value undergoes squaring, rotation, and modulo operations controlled by a user-held secret key. This design introduces variability that resists brute-force and frequency-based attacks. In contrast, Base64, Base32, and Hexadecimal are purely encoding schemes without key management, making them easily reversible and offering only limited protection.

CONCLUSION

The experimental evaluation of RPCDP demonstrates that the proposed obfuscation technique achieves a superior balance of security, efficiency, and scalability compared to conventional encoding methods such as Base64, Base32, and Hexadecimal. In terms of execution time, the optimized RPCDP outperforms all baselines, reducing obfuscation latency by up to 2–3× while maintaining linear scalability across larger datasets. From a confidentiality perspective, RPCDP introduces a key-dependent transformation that eliminates the reversibility flaw inherent in encoding techniques, raising the security strength from less than 20% in traditional methods to nearly 90% in the optimized version. Furthermore, unlike existing approaches that inflate ciphertext size, RPCDP preserves or reduces the storage footprint, directly lowering cloud storage and bandwidth costs. Collectively, these results confirm that RPCDP provides a lightweight yet robust confidentiality-driven obfuscation scheme, making it highly suitable for securing outsourced data in modern cloud environments, particularly in real-time and resource-constrained applications.

ABSTRACT

Apple is high source of nutrients including fibre and antioxidants. The global demand for different apple varieties is increasing. Along with this it is become a challenge to choose suitable apple variety for production in specific weather condition. Many farmers are adopting and implementing precision agriculture practices leaded by Machine Learning to enhance sustainable productivity. This study proposes the recommendation model, which is Machine Learning model that uses Naive Baye's probability Algorithm to recommend most probable apple variety to cultivate in given environmental condition. By employing the Naive Bayes approach, we analyse a dataset comprising different environmental conditions and their corresponding optimal apple variety. The dataset includes the various variable related to apple growth, like age of plant, variety, temperature, humidity, rainfall, per day water level, PH of soil etc. Recommendation model start from preprocessing, feature selection and then model training. The model trained on 80% of total data and remaining 20% data is used to validate model's performance. In result, model will recommend which apple variety can have sustainable growth in specific environmental condition.

Keywords: Machine learning, Recommendation approach, Precision Agriculture, Optimal Apple variety production, Diverse Environmental conditions

INTRODUCTION

Apple is the fourth largest produced fruit worldwide. There are more than 15 apple varieties in India. Some of the most popular are Red Delicious, Golden Delicious, Kullu, Lal Ambri, McIntosh and Chaubattia Anupam. In India, Jammu & Kashmir is the largest Apple producing region, followed by Himachal Pradesh and Uttarakhand. Along with this so many other states also cultivating some varieties of apple. Some of them have good production due to good environmental support, but some of them haven't that much good production, due to several root causes like no idea about ideal practices, damage to yield due to more use of pesticides, also one the main reason is weak environmental support. Environmental condition is one of crucial factor for good yield. Every yield has its own different required environmental condition. If there is no suitable environmental support then there will not be quality yield. These environmental factors includes, temperature, humidity, rainfall, soil type, its pH etc. Yield depends on these factor directly or inversely. Now a days precision agriculture techniques are widely being adopted. Also it is one of the key for quality with in quantity yield. Apple is one of the most crucial temperate fruit. These plants requires specific environmental condition for its sustainable growth. Selecting suitable apple variety for a region with specific environmental condition is crucial to obtain maximum yield also the good quality and economic sustainability. This paper explores the Machine learning based approach for optimal apple variety recommendation across diverse environmental conditions. With the advancement in machine learning this kind of data- driven approaches are widely being used to enhance productivity. This ML based model analyses historical data of apple cultivation across diverse environmental condition and its results. And then recommend optimal apple variety for given environmental condition. This model helps to improve decision-making in apple cultivation. We integrate all the environmental variables i.e. features to train recommendation model that assist farmers in selecting suitable apple variety in their region. The study aims to reduce production risk and improve overall efficiency in apple farming.

LITERATURE REVIEW

Apple is one of the widely cultivated crops. As it is source of nutrition, fibre, antioxidants constantly have high demand [6]. The increasing global demand of different apple variety leads to need of improving apple production, can be achieved by precision agriculture technique. Arvind's study explores the how yield of differentiate based on variety. He puts each apple variety requires its different environmental zone, yield depends on those environmental factors, If different apple variety grow in same environmental conditions then they have different amount of yield [11]. Furthermore T. Boechel puts the prediction approach for expected harvest time of apple to produce maximum yield [15,10]. Previous research has been done on precision agriculture practices to obtain sustainable yield [9]. Suitable cultivation practices have a significant impact on apple yield. Rachid's study[7] suggest the optimal cultivation practices for apple production by adopting machine learning approach. At present, amount of work has been done on crop recommendation system. Utilizing different ML algorithm to recommend based on prediction of optimal crop to cultivate based on climate, soil etc. [1,5,8] K. F. Tonni introduced ML based crop recommendation system integrated with user-friendly android application [2]. Some of the previous articles concludes the impact of environmental factors on crop yield, study extended by predicting yield based on multiple environmental factors [3]. One of the way to achieve maximum sustainable yield led by selection for suitable apple variety according to environmental condition. This paper addressing the building efficient recommendation system to recommend suitable Apple variety for production based on environmental condition. The Naïve Bayes' probabilistic algorithm is used to build this recommendation model. Rrmoku K's study ensures the suitability for Naïve Bayes' algorithm to build recommendation system[16].

Proposed System

The proposed model is recommendation model that allow user to input environmental conditions of their region. After receiving the input parameter from, trained model analyse and predict to recommend the most suitable apple variety for specific environmental condition. This system uses the structured nature of primary data. Data is obtained

from different region of India, having production of different varieties of apple. The data covers the variable related to apple variety, environmental condition, growth and result.

Proposed Model Workflow

Workflow of the proposed model of Apple variety Recommendation system (Fig. 1).

METHODOLOGY

This paper aims to integrating machine learning approach with traditional agriculture practices of variety selection for cultivation. This approach introduces, recommendation system which will analyse previous data and recommend most optimal apple variety for given environmental condition. Methodology for proposed system includes several phases such as, data collection, data preprocessing and cleaning, feature selection, model training, evolution and deployment of model. Here we used Naïve Bayes algorithm as it is core classification model due to its probabilistic nature and have efficiency to handle categorical and continuous data. This system integrate environmental factors such as temperature, rainfall, humidity, pH, soil type to find the possibility of best- suited apple variety for given environment. By applying probabilistic classification, the trained model determines the likelihood of each apple variety thriving under specific environmental conditions, and ensures the match between apple variety selection and environment.

Data collection

This phase includes the data collection process. Here data used for this model is primary data, obtained from different region of India, having apple cultivation. The data covers the variable related to apple cultivation, environmental condition, growth and result.

Gathered data consists

Soil features: soil type, pH

Climate feature: temperature, humidity, rainfall

Growth feature: yield in first season, time span to bear the fruits for first time

Geographical feature: Region

Apple variety Data: Different apple variety corresponding suitable condition.

Data preprocessing

Data cleaning is performed to ensure that dataset is accurate, consistent and suitable for analysis. This phase involves handling missing values, removing outliers, encoding, addressing inconsistencies.

Feature selection

Feature selection is performed to select best set of features and apply predictions to recommends. Here variables are selected that influence apple growth and yield.

Climate factors: Temperature, rainfall, humidity

Soil parameters: Soil type, pH

Growth parameter: yield in first season, time span to bear the fruits for first time Correlation analysis is performed to remove redundant features in order to build efficient recommendation of suitable variety.

Model Development (Naïve Bayes Classifier)

The Naïve Bayes classifier is chosen due to its ability to compute conditional probability to classify apple varieties as per environmental condition. This phase involves 2 steps as follow:

Model Training

The cleaned dataset is divided into training and testing phase. Total of 80% of the data is used as training dataset in a standard way and remaining 20% of data is used for testing the model. The Naïve Bayes model is trained on

historical dataset i.e. training dataset (80%) consisting apple varieties and their corresponding environmental conditions. Probability of each apple variety being suitable for given environmental condition is computed using Naïve Bayes formula:

P(A|B) = P(B|A) P(A) / P(B)

where,

P(A|B) = Posterior probability, Probability of an apple variety A being suitable given environmental conditions B

P(B|A) = Likelihood probability, likelihood of environmental conditions occurring for apple variety A

P(A) = Prior probability, prior probability of apple variety A.

P(B) = Marginal probability, probability of environmental conditions in the dataset.

The model learns all conditional probabilities to classify apple varieties according to input features.

Testing and Validation

Predictions are made on the testing dataset (20%) and results are compared with actual variety classification. Different performance metrics such as accuracy, precision, recall are computed.

Model Evaluation

The model evaluation phase aims to evaluate the effectiveness of the Naïve Bayes model, following evaluation techniques are applied

Confusion matrix: It is a table used to analyse recommendation is correct or incorrect by comparing actual vs. predicted values. It mainly consists four parameters as True Positive(TP), True Negative(TN), False Positive(FP), False Negative(FN)

Accuracy score: Measure the accuracy about prediction of correct recommendation in percentage.

Cross-validation: Ensures model robustness across different data partitions.

Precision: Measure the how many predicted positives are actually correct to evaluate model performance about recommendation.

System Implementation and Deployment

The final phase is about integrating trained model into web-based or mobile application, so easily accessible to users. Allowing user to input environmental conditions and receive recommendation on the most optimal apple variety. The system workflow includes

1. User Input Temperature, humidity, rainfall, soil type, pH, Time span to bear fruit for first time, yield and other parameters
2. **Model work:** Naïve Bayes calculate the probability distribution of apple varieties.
3. **Recommendation:** The apple variety with highest probability will be displayed.

So the prepared recommendation model, build by this methodology, help farmers to make decision easily that which apple variety they can cultivate in their region. This model holds the machine learning technology helps to achieve cleared productivity, sustainability and resiliency in agriculture. As the model is based on data-driven approach, it enhances performance and efficiency by experience.

Naïve Bayes Algorithm

Naïve Bayes is a supervised machine learning algorithm based on Bayes' theorem used for solving classification problems. It is called Naïve because it assumes that, the occurrence at certain feature is independent of the occurrence at other features. It is used to determine probability of a hypothesis with prior knowledge is depends on the condition probability.

Bayes theorem: P(A|B) = P(B|A) P(A) / P(B)

where,

P(A|B) = Posterior probability, probability of hypothesis A on observed event B

P(B|A) = Likelihood probability, Probability of evidence given that probability of hypothesis A is True.

P(A) = Prior probability, Probability of hypothesis before observing the evidence.

P(B) = Marginal probability, probability of evidence.
Since the P(B) is constant for all classes, P(A|B) is directly proportional to the P(B|A) P(A)

Naïve Assumptions: Feature independence
Naïve Bayes assumes that all features are independent. This simplifies the calculation:
P(A | B) = P(A1 | B) * P(A2 | B) * * P(An | B)
Where, A1, A2, ,An are feature values i.e. Temperature, humidity, pH, rainfall etc.

Steps in Supervised Naïve Bayes model
Step 1: Data preparation- Involves collecting labelled training data with features and corresponding apple varieties.
Step 2: Compute probabilities – It begin with calculating priors P(A), frequency of each apple variety in training data, then computing likelihoods P(B|A) using probability distribution and then multiply the likelihood with the prior probability to get P(A|B) for each class
Step 3: Classify new data – The class with highest probabilities is recommended.

Here we have chosen Naïve Bayes Algorithm to build the recommendation model for following reasons
Probabilistic nature of classification
The model predicts and recommend the most probable apple variety based on environmental and growth parameters. It computes the probability of each apple variety being suitable for given condition and selects the variety with the highest probability.

Efficient to handle high-dimensional data well
Apple growth is depending on multiple environmental factors. As the Naïve Bayes assumes feature independence, it making it efficient even with multiple variables. Other model such as Decision Tree or Neural Networks may struggle if the dataset is in small amount or kind of noisy.

Capable to work well with Small and Imbalanced datasets
Even there is limited records per variety, Naïve Bayes still performs well as it relies on probabilities rather than needing large training data. Also can handle imbalanced datasets with the help of prior probabilities to adjust for uneven data distribution.

Interpretability and Explainability
Probability score for each hypothesis cleared by output, making it easy to justify recommendations.

Fast and Computationally efficient
Can process large dataset quickly, fast compared to complex model like Random Forest or Neural Networks. So it is suitable for real-time recommendation applications.

RESULTS / ANALYSIS

As a result, of paper study that aims to the integrating the machine learning approach in agriculture that provided smart and flexible way to select optimal apple variety for production. The model gives the approximately 85% of accuracy of recommending suitable apple variety.

Machine Learning Model performance
The Naïve Bayes' model giving a high accuracy rate of approximately 85% to predict optimal apple variety according to respective environmental condition. The accuracy indicates the model is effective to recommend the variety based on selected features. Best model selected for recommendation (Fig.2). Optimal variety recommendation for given environmental condition (Fig.3).

Feature Importance

Selected key features are identified as critical for apple growth, includes, about soil features, generally apple cultivation requires loamy soil, with pH value in between 5.5 to 7. Presence of lime in soil is good for apple cultivation. Soil should be rich in organic matter. Environmental conditions consist various feature like temperature, rainfall, humidity. The ideal temperature required during growing season should be 21 to 27degree Celsius. The region should receive average 100 to 125 cm rainfall per annum. Humidity-range from 40% to 70% essential for healthy growth.

Variety Recommendations

Model aims to recommend suitable apple variety for production. Generally, all apple varieties require similar kind of environmental condition with unique slightly difference. The development of this work contributes to the fruit production areas too.

Sustainable Impact

Model provide the variety recommendation in order to achieve sustainable production of apple. Implementing this model parallelly reduce resource wastage like water, fertilizers. Simultaneously improves yield efficiency.

DISCUSSION

Drawing outcomes form this study, user will able to get recommendation about apple variety to cultivate in their farm, by utilizing the trained model for optimal apple variety recommendation. This is notable contribution to the area of apple cultivation as it gives variety recommendation according to given environmental condition, reflects into good amount of quality yield also minimizes the environmental damage. This research also highlights the importance of environmental factors, as how they impact of yield's quality and also the quantity. In particular, research is not feature sensitive, as the model is build by Naïve Bayes' algorithm, it assumes all features are independent. This study extends this findings by showing that machine learning approaches can be used to increase apple production by cultivating optimal apple variety. Study has important implication for sustainable agriculture in studied region and other region with environmental condition.[7]

CONCLUSION

Proposed model in this paper ensures a data-driven approach to successfully recommending the most sustainable apple variety for given environmental conditions also improve with experience. This model will help farmers to make decision about variety selection in order to increase sustainable productivity. System allows user to input environmental and growth parameter. By using historical data and implementing machine learning approach, the system provide a recommendation for optimizing apple production. The methodology followed ensures a environmental approach to training the model, while future enhancement aim to implementing using data analysis and image processing to track plant growth and to recommend next plans about crop management. We conclude that use of Machine learning approach can completely transform agriculture industry by improving resilience, potential. This research highlights the value of using Machine Learning approaches for sustainable and improved apple production while promoting precision agriculture.

ABSTRACT

Maternal stress during pregnancy has been associated with adverse psychological and physiological outcomes. Ashtanga Yoga, which includes Om chanting, Suksma Vyayam, Asana, and Pranayama, may offer a non-pharmacological approach to reduce stress. This study aims to evaluate the effectiveness of Ashtanga Yoga on perceived stress levels among pregnant women in Junagadh, Gujarat. A prospective study using both quantitative and qualitative approaches were used in selected maternity hospitals from December 2022 to January 2024 to explore the effects of Ashtanga Yoga on maternal stress during pregnancy. Sixty pregnant women (intervention and control group) were enrolled in each group. The intervention group practiced Ashtanga Yoga, while the control group received routine antenatal care. The Perceived Stress Scale (PSS) was administered at the time of enrollment and after 2 month of the intervention. In addition, qualitative interviews were also conducted to examine participants' experiences. The intervention group demonstrated a statistically significant reduction in mean Perceived Stress Scale (PSS) scores following the intervention ($p < 0.05$), whereas no significant changes were observed in the control group. Qualitative analysis identified themes of emotional stability, relaxation, and enhanced self-awareness. Ashtanga Yoga significantly reduces maternal stress during pregnancy and is recommended as a complementary antenatal intervention.

Keywords: Ashtanga Yoga, Pregnancy, Stress.

INTRODUCTION

Pregnancy is a transformative period marked by substantial physiological, hormonal, and psychological changes that influence maternal well-being [1]. Elevated stress levels during pregnancy have been consistently associated with negative outcomes such as preterm birth and low birth weight [2,3]. Although pharmacological interventions are available to manage stress, they are often limited during pregnancy due to potential risks to fetal health [4]. Yoga, rooted in ancient Indian philosophy, offers a holistic practice that includes physical postures (asanas), breathing techniques (pranayama), and meditation. Among its components, pranayama—or yogic breathing—has shown particular promise in enhancing autonomic balance, improving respiratory function, and reducing anxiety and stress through neurophysiologic regulation [5]. Moreover, yoga's integrative focus on mindfulness, breath control, and physical movement has been found to be more effective than many other forms of physical activity in enhancing psychological well-being and quality of life [6]. Ashtanga Yoga, a structured form of yoga that includes these elements in a systematic sequence, represents a comprehensive approach to physical and mental wellness. Studies have reported that yoga can improve psychological outcomes during pregnancy, including reductions in anxiety and depression [7,8]. This study aims to address this research gap by evaluating the impact of a structured Ashtanga Yoga program on perceived stress among pregnant women in Junagadh, Gujarat.

METHODS

Study Design and Setting: This study followed a mixed-method approach, incorporating both quantitative and qualitative methods. The quantitative component was a prospective randomized controlled trial involving 120 participants, conducted in selected maternity hospitals in the Junagadh district from December 2022 to January 2024. The qualitative component included in-depth interviews with 7 participants, conducted 7 to 8 months after delivery to explore their personal experiences and perspectives. Participants: Pregnant women in their second trimester (between 14–24 weeks), aged 20–35 years, with pregnancies and without complications, were included. Women with high-risk pregnancies or prior yoga experience were excluded from the study. A total of 60 eligible participants were recruited and randomly assigned in equal numbers to the intervention and control groups using computer-assisted randomization. Intervention: The intervention group participated in supervised Ashtanga Yoga sessions three to four times weekly after enrolment for duration of two months, with supervision provided four times during this period. Patients in the intervention group patients were taught the required sessions offline and were also given video demonstrations to facilitate practice at home. They were advised to perform yoga and pranayama at least four times a week. The investigator supervised the participants either online or offline once every 15 days. Each session lasted for 45 minutes and included the following components: Om Chanting (5 minutes), Suksma Vyayam (10 minutes), Asanas (10 minutes), which incorporated safe prenatal postures, and Pranayama (15 minutes), focusing on deep breathing and relaxation techniques

The control group received routine antenatal care without any additional intervention.

Plan of Analysis

Descriptive statistics [mean (SD), frequency (%)] were used to describe the baseline characteristics of the study population. Comparisons between the control and intervention groups were conducted using independent sample t-tests. Within-group comparisons were performed using paired t-tests. The Pearson chi-squared test was used to assess associations between categorical variables. All statistical analyses were carried out using SPSS version 29. A p-value of less than 0.05 was considered statistically significant.

Outcome Measure

The Perceived Stress Scale (PSS-10), a validated psychological instrument, was used to assess stress at baseline at 14-24 weeks and again after duration of 2 months.

Qualitative Data Collection: In-depth interviews were conducted with seven randomly selected participants from the intervention group after the intervention. Semi-structured guides were used to explore their experiences, emotional changes, and perceived benefits of yoga during pregnancy.

Ethical Considerations: Ethical approval was obtained from the Institutional Ethics Committee (IEC/BU/135/Faculty/5/318-16/11/2021). Written informed consent was secured from all participants.

RESULTS

Analysis and Interpretation of the Participant Characteristics

Out of 120 participants, 60 were enrolled in the intervention group and 60 in the control group. Education status, occupational status, economic status, number of deliveries, and maternal outcomes were similar across both groups, with no statistically significant differences ($p > 0.05$) (Table 1). The average gestational age of participants at enrollment was 19.63 ± 2.95 weeks (4.82 ± 0.72 months) in the intervention group and 19.65 ± 2.83 weeks (4.87 ± 0.72 months) in the control group. The average maternal age and the birth weight of newborns were also comparable between the two groups (Table 2). Table 3 shows the comparison of Perceived Stress Scale (PSS) scores from baseline (PSS1) to after two months of intervention (PSS2) between the groups. In the intervention group, the mean PSS score decreased from 16.78 ± 2.94 to 14.33 ± 2.60, resulting in a mean difference of −2.45. In the control group, the mean PSS score decreased from 16.92 ± 3.52 to 16.37 ± 2.66, with a mean difference of −0.55. The between-group comparison revealed a statistically significant difference in stress reduction ($p < 0.001$), indicating that the intervention group experienced a significantly greater reduction in perceived stress compared to the control group.

Qualitative Findings

Three major themes emerged.

Emotional Stability and Calmness

Participants commonly expressed feeling more emotionally balanced after starting yoga. They indicated a decreased reactivity to daily stressors and observed a reduction in anger, irritability, and emotional outbursts. One participant noted that she felt "more in control of her emotions" and was better able to manage household challenges without becoming overwhelmed. This sense of emotional calmness was often attributed to pranayama and meditation. Overall, yoga promoted inner peace and emotional regulation, contributing to a more stable psychological state during pregnancy.

Physical and Mental Relaxation

Participants reported significant physical relief, particularly from back pain, leg cramps, and body stiffness. Mental relaxation was also notable, with several women expressing that they felt lighter and more refreshed after each session. Yoga contributed to improved sleep quality, and participants described experiencing a profound sense of deep calm and restfulness The integration of breathing techniques and gentle movements promoted a holistic sense of relaxation that addressed both physical discomfort and mental fatigue.

Enhanced Self-Awareness and Bonding

Participants described developing a stronger connection with their body and their unborn baby through regular yoga practice. Others expressed that yoga provided them with the opportunity to focus inward, enhancing their awareness of the pregnancy journey. This increased mindfulness fostered a sense of bonding, not only with their bodies but also with the life developing within them.

DISCUSSION

This study demonstrated that Ashtanga Yoga significantly reduces perceived stress among pregnant women, as evidenced by both quantitative and qualitative findings. The integration of physical postures (asanas), breathing exercises (pranayama), chanting (Om), and mindfulness practices appears to contribute to improved emotional

regulation, reduced anxiety, and enhanced physical comfort during pregnancy. These findings align with previous research that underscores the effectiveness of yoga-based interventions in enhancing maternal mental health. Field et al. reported that prenatal yoga significantly reduced cortisol levels, anxiety, and depression in pregnant women, indicating a strong psychophysiological benefit [9]. Similarly, Satyapriya et al. found that integrated yoga resulted in significant reductions in perceived stress and heart rate variability among expectant mothers compared to those doing standard physical exercises [10].

A systematic review and meta-analysis conducted by Curtis et al. confirmed that prenatal yoga is associated with decreased anxiety and improved mood[11]. Similarly, a randomized controlled trial by Chuntharapat et al. demonstrated that yoga enhances maternal comfort while reducing labor pain and stress levels[12]. These findings support the hypothesis that yoga activates the parasympathetic nervous system, which lowers stress biomarkers and promotes relaxation [13,14]. The qualitative findings of this study provide valuable insights into participants' experiences and further corroborate the quantitative outcomes. Participants reported feeling emotionally balanced, less reactive, and mentally calmer. Similar results were observed by Beddoe et al., where pregnant women practicing mindful yoga reported significantly lower levels of stress and anxiety compared to control groups [15]. Additionally, Kinser et al. found that yoga enhances emotional awareness, enabling women to better cope with the psychological challenges of pregnancy [16]. Physically, the women in the present study reported relief from back pain, fatigue, and sleep disturbances. These experiences align with previous research indicating that prenatal yoga improves physical well-being, flexibility, and muscle relaxation, which can alleviate pregnancy-related discomforts [17,18].

The findings also suggest that yoga enhances self-awareness and fosters a stronger bond with the fetus. Narendran et al. reported that women who practiced yoga exhibited improved maternal-fetal attachment and better pregnancy outcomes [19]. Participants in our study indicated that Om chanting and breathing techniques helped them connect more deeply with their babies, reflecting similar observations made by Muthuswamy regarding prenatal meditative practices [20]. An important aspect revealed in this study is the role of family support and personal motivation in sustaining yoga practice. Most participants successfully integrated yoga into their daily routines with encouragement from family members, highlighting the socio-cultural significance of family involvement in India. Social support is a well-documented facilitator of adherence to maternal wellness programs, as demonstrated by Guardino and Schetter and Avalos et al. [21,22]. The willingness of all participants to recommend yoga to others further underscores its acceptability and perceived benefits. This peer advocacy is essential for the community-based promotion of low-cost, non-pharmacological interventions for maternal mental health. However, the study has several limitations. The sample size was modest, and the duration of the intervention was relatively short. Additionally, long-term follow-up was not conducted. Future research should prioritize large-scale, multicenter trials that include diverse populations and extended follow-up periods. Incorporating physiological stress biomarkers, such as salivary cortisol, heart rate variability, and inflammatory markers, can provide more objective assessments of stress reduction.In conclusion, this mixed-method study contributes to the expanding body of evidence that supports the effectiveness of Ashtanga Yoga in enhancing psychological well-being during pregnancy. The integration of physical, mental, and emotional dimensions positions yoga as a valuable holistic intervention for reducing maternal stress and improving prenatal care outcomes.

CONCLUSION

Ashtanga Yoga is an effective, non-pharmacological intervention for reducing maternal stress during pregnancy. It can be safely integrated into antenatal care to promote mental well-being among expectant mothers.

ACKNOWLEDGMENTS

The authors would like to express their gratitude to the participating maternity hospitals and to all the pregnant women who contributed to the study.
The authors would like to express their gratitude to the statistician Mr. Mayur Shinde for his contribution to the study.

Conflicts of Interest
There are no conflicts of interest.

Funding
This research did not receive any specific grants from funding agencies in the public, commercial, or not-for-profit sectors.

ABSTRACT

The progressive illness known as habitual order complaint (CKD) is characterized by a slow deterioration in renal function and constantly coexists with cardiovascular pitfalls, diabetes, and hypertension (HTN). Traditional curatives emphasize dialysis and symptom control, but integrative styles like Ayurveda are getting more popular due to their pledge for a further comprehensive approach. For five to six months, a 53-year-old woman with Stage V CKD and hypertension complained of pallor, anorexia, oliguria, lower back discomfort, overall weakness, and disturbed sleep. She was receiving haemodialysis every two weeks. The patient had low haemoglobin (8.7 g/dL), high serum creatinine (6.8 mg/dL), oliguria (1–2 times/day), and uncontrolled blood pressure (160/100 mmHg) at baseline. A degraded quality of life was indicated by the general condition. In addition to dialysis, an integrative Ayurvedic therapy comprising *Gokshuradi Guggulu* (500 mg), *Punarnava Aasav, Gandharva Hastadi Taila, Arka Makoi*, Tab Siladen, and Syrup Neeri KFT was initiated. The objectives of the treatment were to enhance *Mutravaha Srotas* function, nourish *Rasadhatu*, and maintain the *Vata* and *Kapha doshas* in balance. After one month of therapy, the patient's conditions became remarkably better with more energy, less back pain, more appetite, and more urine production three to four times daily. The blood pressure stabilized at 130/90 mmHg, serum creatinine decreased to 4.8 mg/dL, and haemoglobin increased to 9.7 g/dL. This example points to the potential utility of Ayurvedic medicine as a complement to existing CKD therapy. Individualized Ayurvedic therapy can

enhance patient outcomes and quality of life in CKD, based on visible clinical and symptomatic benefits. More clinical research is needed.

Keywords: Ayurveda, Chronic Kidney Disease, Dialysis, Case Report, Integrative Medicine.

INTRODUCTION

A gradual patient and endless fall in renal function that occurs over months to times is referred to as habitual order complaint (CKD). It's presently conceded as an international public health burden, especially in developing nations akin as India, where increasing urbanization, industrialization, and socioeconomic changes are paving the way for a rise in non-communicable conditions[1]. Low birth weight, malnutrition of habit, inactive cultures, and timid salutary habits each play a role in the adding frequence of renal conditions, such as habitual order complaint (CKD), which further adds to the ongoing health transition[2]. The public order Foundation (NKF) has defined habitual order complaint (CKD) as the reality of order damage, as confirmed by albuminuria or structural harm, regardless of GFR conditions, or a persistent decrease in GFR less than 60 ml/min/1.73 m^2 for more than three months[3]. The disease progresses to Stage 4 or 5, commonly referred to as habitual renal failure (CRF) or end-stage renal complaint (ESRD), when GFR dips to lower than 30 ml/min/1.73 m^2. It requires renal relief remedy, akin as dialysis or transplantation[4]. The major etiology of habitual order complaint (CKD) encyclopedically is Type 2 Diabetes Mellitus (T2DM), being one of the etiologic factors[5]. Habitual hyperglycemia undermines glomerular integrity and gradationally reduces filtration effectiveness by inducing pathological alterations in the glomerular basement membrane and promoting mesangial matrix growth[6]. This medium accounts for the pathogenesis of diabetic nephropathy, which is responsible for nearly 40 of all CKD in India[7]. Apart from excretion, the feathers perform a variety of important physiological functions, such as fluid and electrolyte balance, regulation of blood pressure via the renin-angiotensin-aldosterone system (RAAS), acid-base homeostasis, calcium and phosphorus metabolism, and erythropoietin production for erythropoiesis[8]. These homeostatic mechanisms are impaired in CKD due to the gradational loss of functioning nephrons. Specifically, anemia of habitual illness, a frequent indication in advanced CKD, is produced by dropped erythropoietin product[9]. Similarly, dropped filtration and concurrence give rise to serum creatinine, a metabolic product of muscular exercise and a safe measure of renal excretory function, to make up in the blood[10]. Also, uremia, hypertension, cardiovascular complaint, mineral bone derangement, and fluid load are systemic manifestations of habitual order complaint (CKD) that vastly increase morbidity and mortality in individuals who are afflicted[11,12]. Owing to habitual order complaint (CKD) sometimes not being diagnosed until in an advanced form, early opinion and early remedies are critical[13]. Due to vitiated *Vata* and *Kapha doshas* obstructing the *Mutravaha Srotas* (urinary tracts), CKD is linked with Ayurvedic ails such as *Vrikkaroga, Mutrakshaya*, and *Mutraghata*[14]. *Srotoshodhana* (channel purification), *Rasayana* (revivification), and *Mutravirechana* (diuresis) are the reliances of Ayurvedic drug[15]. Ayurvedic functioning targets equilibrium of the *Tridoshas* (*Pitta, Kapha*, and *Vata*), stimulation of renal towel, and purifying the urinary channels (*Mutravaha Srotas*)[16]. Based on the deficiency of current pharmacotherapy in reversing or arresting the development of renal damage, there's increasing curiosity in exploring integrative and bidirectional drug, including Ayurveda[17]. The present case report describes the Ayurvedic management of a 53-year-old female CKD patient with significant improvement in symptomatology and quality of life by using tailored herbal approaches.

Case Report

A 53 years old female patient named XYZ reported first time in Kayachikitsa department OPD of Khemdas Hospital in Feb 2024 as a diagnosed case of chronic kidney disease and Hypertension with weekly twice dialysis, presented with chief complaints of (Table 1)

Investigations and Clinical Observations(Table 2)

Treatment Protocol (1 month) Shamana Chikitsa(Table 3)

Treatment Protocol (15 days) ***Shodhana Chikitsa***

Yoga Basti - 7 days

Anuwasana basti *–Vastyamayantaka Ghritta* (60ml)
Niruha Basti *– Manjisthadi Kwatha* (540ml)

Follow-Up Plan

- **Duration:** 1 month
- Monitored every 1 weeks for BP, urine output, appetite, fatigue, and general well-being
- Dialysis continued as scheduled

RESULTS

Following consistent administration of the Ayurvedic protocol, the patient showed significant clinical improvements(Table 4)
No drug reactions observed during the course
Dialysis frequency decreased

DISCUSSION

Pathophysiology of CKD in Ayurveda

CKD is closely related to kidney and urine system illnesses called *Mutrakshaya*, *Vrikkaroga*, or *Mutraghata* in Ayurvedic literature[14-16]. *Vata-Kapha* vitiation, obstruction of the normal flow of *mutra* (urine), and degradation of the *dhatus*, such as *Rasa*, *Rakta*, and *Mamsa*, are frequently the clinical basis. Systemic symptoms including exhaustion, pallor, and oliguria result from *Agnimandya, Aama* buildup and *Strotorodha* (Channal blocking) (Flow Chart in Fig 1)

Action of Formulations

Gokshuradi Guggulu

Gokshuradi Guggulu is a classic Ayurvedic polyherbal composition that primarily acts as a *mutrala* (diuretic), *shothahara* (anti-inflammatory), and *ashmarighna* (anti-urolithiatic)[17]. It is commonly used in conditions involving kidney stones, urinary issues, and reproductive system inflammations. Its effects arise from a blend of herbs including *Mustaka, Triphala, Trikatu, Guggulu* (Commiphora wightii), and *Gokshura* (Tribulus terrestris)[17].

Punarnav Aasav

Boerhavia diffusa (*Punarnava*) is the main ingredient in *Punarnavasava*, an Ayurvedic polyherbal preparation traditionally used for treating inflammation, edema, and urinary disorders[7]. Modern pharmacological research supports its nephroprotective, diuretic, anti-inflammatory, and antioxidant properties[7]. By mitigating oxidative stress and promoting diuresis, *Punarnava* has been shown to aid glomerular function and renal support[7].

Gandharvahastadi Taila

Gandharvahastadi Taila is a classical Ayurvedic oil formulation primarily used for *Virechana* (purgation therapy) and as a mild laxative[14]. Key ingredients like *Trivrit* and *Eranda* (Castor oil) are known to detoxify the gastrointestinal tract and support excretion[14]. Although not directly formulated for CKD, it aids in disease control by regulating the gut-kidney axis, optimizing metabolism, and reducing toxic burden[14,15].

Makoi* or *Arka Makoi

Solanum nigrum L. *(Makoi* or *Arka Makoi*), recognized in Ayurveda for its hepatoprotective, anti-inflammatory, and nephroprotective potential, is enriched with phytochemicals such as flavonoids, alkaloids, saponins, and glycoalkaloids[17]. These constituents offer cytoprotective and antioxidant properties, which recent studies suggest may be useful in managing CKD[17].

CONCLUSION

He potential of Ayurvedic integrated management as an adjuvant therapy strategy for chronic kidney disease (CKD) is illustrated by this case study. The patient saw clinically significant improvements in a number of important health indicators through a customized herbal regimen that included *Gokshuradi Guggulu*, *Punarnavasava, Gandharvahastadi Taila*, *Arka Makoi*, and supportive Panchakarma therapy (*Yoga Basti*): increased urine output, improved appetite and haemoglobin levels, decreased serum creatinine, and improved energy and sleep. Interestingly, there was also a decrease in the frequency of dialysis. These results highlight how Ayurvedic treatments may have nephroprotective, diuretic, anti-inflammatory, and detoxifying benefits. Channel obstructions and *doshic* imbalances are the underlying causes of the illness progression in the Ayurvedic pathophysiological view of chronic kidney disease (CKD), which is consistent with *Mutrakshaya, Vrikkaroga,* or *Mutraghata*. By clearing blocked urine channels (*Srotoshodhana*), encouraging renal tissue regeneration (*Rasayana*), and improving urinary flow (*Mutravirechana*), the therapy regimen sought to correct these abnormalities. This instance shows that, when combined with traditional care, tailored Ayurvedic therapy can help manage symptoms and halt the progression of chronic kidney disease (CKD), even if more thorough clinical trials are required.

ABSTRACT

This study introduced neutrosophic hexa open sets and explored their properties. Relationships with other neutrosophic sets were investigated. Properties such as union, intersection and complement were examined. Key properties of neutrosophic hexa open sets were verified and established.

Keywords: Neutrosophic set, Neutrosophic Topology, Neutrosophic Hexa topological space.

INTRODUCTION

The concept of fuzzy sets was introduced by Zadeh[20] in 1965. In fuzzy set theory, the membership of an element to a fuzzy set is a single value between zero and one. Topology has become a powerful instrument of mathematical research. Topology is the modern version of geometry. It is commonly defined as the study of shapes and topological spaces. The topology is an area of mathematics, which is concerned with the properties of space that are preserved under continuous deformation including stretching and bending, but not trearing and gluing which include properties such as connectedness, continuity and boundary. The term topology was introduced by Johann Beredict Listing in the 19^{th} century. Closed sets are fundamental object in a topological space. In 1970, Levine[11] initiated the study of generalized closed sets. The theory of fuzzy topology was introduced by C.L. Chang[4] in 1968. Several researches were conducted on the generalizations of the notions of fuzzy sets and fuzzy topology. In 1986, the concept of intuitionistic fuzzy sets was introduced by Atanbassov[3] as a notion of fuzzy sets and defined the intuitionistic fuzzy set as a generalization of fuzzy sets. Coker[5] in 1997 introduced the intuitionistic fuzzy topological spaces. Then, Smarandache[17] introduced the degree of indeterminacy/neutrality (I) as independent component in 1998 and defined the neutrosophic set. Various methods were proposed by Smarandace and Abdel-Basset[1,2] for neutrosophic sets. Salama and Alblowi[18] in 2012 used this neutrosophic set and introduced

neutrosophic topological spaces. The single topology is extended to bi-topological space by Kelly , tri-Topological space by Kovar , quad-Topological space by Mukundan penta-topological space by Muhammad Shankar Khan and Gulzar Ali Khan[12] and hexa-Topological space by R. V. Chandra . Also, he introduced the notation of h-open sets and h-closed sets in hexa topological spaces. A. Divya[6,7,14,15,16] explored the property of being a cordial graphic and established that it corresponds to an Alexandroff topological space in the paper Necessary of sufficient condition for Aledandroff topological spaces to be cordial graphic. In this paper we define the notion of Neutrosophic Hexa Topological spaces and their properties are obtained. The purpose of this paper is to extend the Neutrosophic topological spaces to Neutrosophic Hexa topological space.

PRELIMINARIES

Definition 2.1:

Let X be a non-empty fixed set. A Neutrosophic set A is an object having the form $A = \{ < x, T_A(x), I_A(x), F_A(x) > : x \in X \}$. Where $T_A(x), I_A(x), F_A(x)$ represents the degree of truth ,the degree of indeterminacy and the degree of false respectively of each element $x \in X$ to the set A.

Definition 2.2:

Let X be a non-empty fixed set and Neutrosophic set A and B in the form

$A = \{ < x, T_A(x), I_A(x), F_A(x) > : x \in X \}$ and $B = \{ < x, T_B(x), I_B(x), F_B(x) > : x \in X \}$

then we may consider two possible definitions for subsets ($A \subseteq B$)

(1) $A \subseteq B \Leftrightarrow T_A(x) \leq T_B(x), I_A(x) \leq I_B(x), F_A(x) \geq F_B(x), \forall x \in X$

(2) $A \subseteq B \Leftrightarrow T_A(x) \leq T_B(x), I_A(x) \geq I_B(x), F_A(x) \geq F_B(x), \forall x \in X$

Definition 2.3:

Let $A = \{ < x, T_A(x), I_A(x), F_A(x) > : x \in X \}$ be a Neutrosophic set on X, then the complement of the set A (c(A)) may be defined as three kinds of complements

(1) $c(A) = \{ < x, 1 - T_A(x), 1 - I_A(x), 1 - F_A(x) > : x \in X \}$

(2) $c(A) = \{ < x, F_A(x), I_A(x), T_A(x) > : x \in X \}$

(3) $c(A) = \{ < x, F_A(x), 1 - I_A(x), T_A(x) > : x \in X \}$

Definition 2.4:

Let X be a non-empty fixed set and Neutrosophic set A and B in the form

$A = \{ < x, T_A(x), I_A(x), F_A(x) > : x \in X \}$ and $B = \{ < x, T_B(x), I_B(x), F_B(x) > : x \in X \}$

Then $A \cup B$ may be defined as,

$A \cup B = \{ < x, T_A(x)\, T_B(x), I_A(x) I_B(x), F_A(x) F_B(x) > : x \in X \}$

$A \cup B = \{ < x, T_A(x)\, T_B(x), I_A(x) I_B(x), F_A(x) F_B(x) > : x \in X \}$

Definition 2.5:

Let X be a non-empty fixed set and Neutrosophic set A and B in the form

$A = \{ < x, T_A(x), I_A(x), F_A(x) > : x \in X \}$ and $B = \{ < x, T_B(x), I_B(x), F_B(x) > : x \in X \}$

Then $A \boxtimes B$ may be defined as,

(1) $A \boxtimes B = \{ < x, T_A(x)\, T_B(x), I_A(x) I_B(x), F_A(x) F_B(x) > : x \in X \}$

(2) $A \boxtimes B = \{ < x, T_A(x)\, T_B(x), I_A(x) I_B(x), F_A(x) F_B(x) > : x \in X \}$

Definition 2.6:

Let $\{ A_j : j \in J \}$ be an arbitrary family of Neutrosophic sets in X , then $\boxtimes A_j$ may be defined as

(1) $A_j = < x,,, >$

(2) $A_j = < x,,, >$ and

A_j may be defined as

(1) $A_j = < x,,, >$

(2) $A_j = < x,,, >$

Definition 2.7:

Neutrosophic Topological Space:

A Neutrosophic topology is a non-empty set X is a family τ of neutrosophic subsets in X satisfying the following axioms:

- $0_{NH}, 1_{NH} \in \tau$
- $G_1 \cap G_2 \in \tau \, foe \, any \; G_1, G_2 \in \tau$
- $\cup G_i \in \tau, \forall \{G_i : i \in J\} \tau$

In this case the pair (x,τ) is called a neutrosophic topological space.

Example:

Let x={a,b}

A={<a,0.6,0.6,0.4>,<b,0.7,0.7,0.3>}

B={<a,0.7,0.7,0.3>,<b,0.8,0.8,0.2>} then

$\tau_1 = \{1_N, 0_N, A, B, AB, AB\}$ of neutrosophic sets in X is neutrosophic topology on X.

Definition 2.8:

HEXA Topological Space

Let X be a non-empty set and $\tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6$ are general topology on X. The set X with six topologies $(X, \tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6)$ called Hexa topology.

Definition 2.9:

Let X be a non-empty set and $\tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6$ are general topology on X. Then a subset A of space X is said to be Hexa -open set if $A \in \tau_1 \cup \tau_2 \cup \tau_3 \cup \tau_4 \cup \tau_5 \cup \tau_6$.

Definition 2.10:

Let X be a non-empty set and $\tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6$ are general topology on X. Then a subset A of space X is said to be Hexa - closed set if $A \in \tau_1 \cap \tau_2 \cap \tau_3 \cap \tau_4 \cap \tau_5 \cap \tau_6$.

Definition 2.11:

Let $(X, \tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6)$ be a Hexa topological space . SX is Hexa open if

$SA \cup B \cup C \cup D \cup E \cup F$ where $A \in \tau_1$, $B \in \tau_2$, $C \in \tau_3$, $D \in \tau_4$, $E \in \tau_5$, $F \in \tau_6$.

Definition 2.12:

The h-interior of F is the union of all h-open subset contained in F and is denoted by $int(F_h)$. So be $int(F_h)$ is the largest h-open subset of F.

Definition 2.13:

The h-closure of E is the intersection of all h-closed sets containing E and is denoted by $cl(E_h)$. So be $cl(E_h)$ is the smallest h-closed set containig E .

Definition 2.14:

A subset A of space (X, τ_h) is said to be

(1) Hexa semi-open set if A $\subseteq \tau - cl_h(int_h(A))$

(2) Hexa α -open set if A $\subseteq int_h(cl_h(int_h(A)))$. Hence A^c is called $_h - closed\ set$.

(3) Hexa pre-open set (P_h-) if A $\subseteq int_h((cl_h(A))$. Hence A^c is called $P_h - closed\ set$.

(4) Hexa β -open set (β_h_open) if A $\subseteq cl_h(int_h((cl_h(A)))$. Hence A^c is called $\beta_h_closed\ set$.

(5) Hexa $b_open\ set$ (b_h_open) if A $\subseteq (cl_h(int_h(A)) \cup (int_h((cl_h(A)))$. Hence A^c is called $b_h_closed\ set$.

2.Neutrosophic Hexa Topological space

Let X be a non empty set and $\tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6$ are six different neutrosophic topologies on X. Then a subset A of space X is said to be Neutrosophic Hexa open set if $A \in \tau_i$ and its complement is said to be Neutrosophic Hexa closed set and the set with six neutrosophic topologies called $(X, \tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6)$ Neutrosophic Hexa topology and (X, τ_{NH}) for Neutrosophic Hexa topological space. Where $\tau_{NH} = (\tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6$) and Neutrosophic Hexa open sets satisfy all the axioms of topology.

Example:

Let $X = \{a, b\}$,

$A = \{< a, (0.1,0.2,0.3) >, < b, (0.2,0.3,0.4) >\}$, $B = \{a, (0.2,0.3,0.4) >, < b, (0.1,0.4,0.5)\}$,

$C = \{< a, (0.3,0.4,0.5) >, < b, (0.5,0.5,0.6) >\}$, $D = \{< a, (0.4,0.5,0.6) >, < b, (0.6,0.6,0.5) >\}$,

$E = \{< a, (0.5,0.6,0.7) >, < b, (0.7,0.2,0.3) >\}$, $F = \{< a, (0.6,0.7,0.8) >, < b, (0.1,0.5,0.3) >\}$,

$0_N = \{< a, (0,1,1) >, < b, (0,1,1) >\}$, $1_N = \{< a, (1,0,0) >, < b, (1,0,0) >\}$ then

$\tau_1 = \{ 0_N, 1_N, A\}$, $\tau_2 = \{ 0_N, 1_N, B\}$, $\tau_3 = \{ 0_N, 1_N, C\}$,

$\tau_4 = \{ 0_N, 1_N, D\}$, $\tau_5 = \{ 0_N, 1_N, E\}$, $\tau_6 = \{ 0_N, 1_N, F\}$

are six different neutrosophic topologies on X then $\tau_{NH} = \{\tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6\}$ and (X,τ_{NH}) is called neutrosophic hexa topology.

Definition 3.1:

Let $(X, \tau_1, \tau_2, \tau_3, \tau_4, \tau_5, \tau_6)$ be a Neutrosophic Hexa Topological space . A_{NH}X is Neutrosophic Hexa open if $A_{NH} A \cup B \cup C \cup D \cup E \cup F$ where A $\in \tau_1$, B $\in \tau_2$, C $\in \tau_3$, D $\in \tau_4$, E $\in \tau_5$, F $\in \tau_6$.

Definition 3.2:

Neutrosophic HEXA Set:

A Neutrosophic Hexa set A_{NH} (NHS ih short) on the univers of discourse X written as

$A_{NH} = \{< x, (x), (x), (x) >; x \in X\}$ whose truth membership, indeterminacy membership,false membership functions is defined as $\in$ $[0,1]$, $\in$ $[0,1]$, $\in$ $[0,1]$

$0 \leq T + I + F \leq 3$

Difinition 3.3:

Let X be a non-empty fixed set and Neutrosophic Hexa sets A_{NH} and B_{NH} in the form

$A_{NH} = \{< x, (x), (x), (x) >: x \in X\}$ and $B_{NH} = \{< x, (x), (x), (x) >: x \in X\}$

then the definition for subsets ($A_{NH} \subseteq B_{NH}$)

$A_{NH} \subseteq B_{NH} \Leftrightarrow (x) \leq (x), (x) \geq (x), (x) \geq (x), \forall x \in X$

Difinition 3.4:

Let A_{NH} ={< $x, (x), (x), (x)$ > : $x \in X$ }Neutrosophic Hexa set on X, then the complement of the set A_{NH}^{C} is defined by

A_{NH}^{C} = { < $x, 1-(x), 1-(x), 1-(x)$ > : $x \in X$ >}

Definition 3.5:

Let A_{NH} be Neutrosophic Hexa set of universe X where $\forall x_i \in X$, $(x) = 1, (x) = 0, (x) = 0$ then A_{NH} is called unit Neutrosophic Hexa set (1_{NH} *in short*), where 1 ≤ i ≤n.

Definition 3.6:

Let A_{NH} be Neutrosophic Hexa set of universe X where $\forall x_i \in X$, $(x) = 0, (x) = 1, (x) = 1$ then A_{NH} is called zero Neutrosophic Hexa set (0_{NH} *in short*) , where 1 ≤ i ≤n.

Definition 3.7:

Let X be a non-empty fixed set and Neutrosophic Hexa sets A_{NH} and B_{NH} in the form

A_{NH} ={< $x, (x), (x), (x)$ > : $x \in X$ } and B_{NH} ={< $x, (x), (x), (x)$ > : $x \in X$ }

Then $A_{NH} \cup B_{NH}$ is defined by,

$A_{NH} \cup B_{NH}$ ={< $x, (x)(x), (x)\ (x), (x)\ (x), \forall x \in X$ >}

Definition 3.8:

Let X be a non-empty fixed set and Neutrosophic Hexa sets A_{NH} and B_{NH} in the form

A_{NH} ={< $x, (x), (x), (x)$ > : $x \in X$ } and B_{NH} ={< $x, (x), (x), (x)$ > : $x \in X$ }

Then $A_{NH} \cap B_{NH}$ is defined by,

$A_{NH} \cap B_{NH}$ ={< $x, (x)(x), (x)\ (x), (x)\ (x), \forall x \in X$ >}

Definition 3.9:

Let X be a non-empty fixed set and Neutrosophic Hexa sets A_{NH} *and* B_{NH} in the form

A_{NH} = {< $x, (x), (x), (x)$ > : $x \in X$ } and B_{NH} = {< $x, (x), (x), (x)$ > : $x \in X$ }

Then $A_{NH} = B_{NH}$ is defined by,

$A_{NH} = B_{NH} \Leftrightarrow (x) = (x), (x) = (x), (x) = (x), \forall x \in X$

Definition 3.10:

Let {: $i \in J$ } be an arbitrary family of Neutrosophic Hexa sets in X , then

 is defined by

 = < $x, , , >$ and

 is defined by

 =< $x,,,>$

Definition 3.11:

If (X,τ_{NH}) is a Neutrosophic Hexa Topological space and A $\subseteq$ X. Then

(1) The NH-interior of A is the union of all NH-open subsets contained in A and is denoted by $int(A_{NH})$. So $int(A_{NH})$ is the largest NH-open subset of A.

(2) The NH-closure of B is the intersection of all NH-closed sets containing B and is denoted by $cl(B_{NH})$. So $cl(B_{NH})$ is the smallest NH-closed set containing E.

Definition 3.12:

A subset A of space (X,τ_{NH}) is said to be

(1) Neutrosophic Hexa α -open set ($_{NH}-open$) if A $\subseteq int_{NH}(cl_{NH}(int_{NH}(A)))$. Hence A^c is called $_{NH}-closed\ set.$

(2) Neutrosophic Hexa pre-open set ($P_{NH}-open$) if A $\subseteq$ $int_{NH}((cl_{NH}(A))$. Hence A^c is called $P_{NH}-closed\ set.$

(3) Neutrosophic Hexa β -open set ($\beta_{NH-}open$) if A $\subseteq cl_{NH}(int_{NH}((cl_{NH}(A)))$. Hence A^c is called $\beta_{NH-}closed\ set.$

(4) Neutrosophic Hexa $b_open\ set$ ($b_{NH-}open$) if A $\subseteq (cl_{NH}(int_{NH}(A))\cup(int_{NH}((cl_{NH}(A)))$. Hence A^c is called $b_{NH-}closed\ set.$

The family of all ($_{NH}-,P_{NH}-,\beta_{NH-},b_{NH-}$) open sets is denoted by α NHO(A) , PNHO(A) β NHO(A) , bNHO(A) respectively.

Proposition 3.13

These statements hold true.

(1) Every NH- open set is a $_{NH}-open\ set.$

(2) Every $_{NH}-open\ set$ is a $P_{NH}-open\ set.$

(3) Every $P_{NH}-open\ set$ is a $b_{NH}-open\ set$.

(5) Every $b_{NH}-open\ set$ is a $\beta_{NH}-open\ set$.

Proof:

The proof is obvious.

Remark:

The converse of the proposition above is not true.

Example:

Every $_{NH}-open\ set$ is not NH- open.

Let $X=\{a,b\}$,

$G_1=\{<a,(0.5,0.4,0.2)>,<b,(0.6,0.3,0.1)>\}$,$G_2=\{<a,(0.3,0.5,0.6)>,<b,(0.8,0.2,0.3)>\}$,

$G_3=\{<a,(0.5,0.5,0.5)>,<b,(0.5,0.5,0.5)>\}$,$G_4=\{<a,(0.7,0.2,0.4)>,<b,(0.2,0.8,0.7)>\}$,

$G_5=\{<a,(0.5,0.4,0.2)>,<b,(0.2,0.8,0.7)>\}$,$G_6=\{<a,(0.3,0.5,0.6)>,<b,(0.6,0.3,0.1)>\}$,

$0_N=\{<a,(0,1,1)>,<b,(0,1,1)>\}$, $1_N=\{<a,(1,0,0)>,<b,(1,0,0)>\}$ then

$\tau_1=\{0_N,1_N,G_1\}$, $\tau_2=\{0_N,1_N,G_2\}$, $\tau_3=\{0_N,1_N,G_3\}$,

$\tau_4=\{0_N,1_N,G_4\}$, $\tau_5=\{0_N,1_N,G_5\}$, $\tau_6=\{0_N,1_N,G_6\}$ and

(X,τ_{NH}) be Neutrosophic Hexa Topological space and

$A_{NH}=\{<a,(0.7,0.5,0.4)>,<b,(0.8,0.4,0.3)>\}$

$int_{NH}(cl_{NH}(int_{NH}(A_{NH})))$=$int_{NH}(cl_{NH}(G_3)=int_{NH}(G_3)=G_3$

but A_{NH} G_3.

Therefore Every $_{NH} - open\ set$ is not NH- open.

Definition 3.5:

Let (X_{NH}, τ_{NH}) be Neutrosophic Hexa Topological space and $A_{NH} = \{< x, T_A, I_A, F_A >\}$ be Neutrosophic Hexa set in X_{NH}. Then the Neutrosophic Hexa interior and Neutrosophic Hexa closure are defined by

- $NHint(A_{NH}) = \cup \{ G_{NH} / G_{NH}\ is\ a\ NHOS\ in\ X_{NH}\ and\ G_{NH}\ \ A_{NH}\}$
- $NHcl(A_{NH}) = \cap \{ K_{NH} / K_{NH}\ is\ a\ NHCS\ in\ X_{NH}\ and\ A_{NH}\ \ K_{NH}\}$

Note that for any Neutrosophic Hexa set(NHS) A_{NH} in (X_{NH}, τ_{NH}), we have NHcl(A_{NH}^{C})=$(NH\,\mathrm{int}(A_{NH}))^{c}$

NHint(A_{NH}^{C})=$(NHcl(A_{NH}))^{c}$

It can be also shown that NHcl(A_{NH}) is NHCS and NHint(A_{NH}) is NHOS in X_{NH}

(a) A_{NH} is NHCS in X_{NH} if and only if NHcl(A_{NH}) = A_{NH}

(b) A_{NH} is NHOS in X_{NH} if and only if NHint(A_{NH}) = A_{NH}

Proposition 3.6:

Let A_{NH} be any NHS in X_{NH} ,then

(i) $NHint(1_{NH} - A_{NH}) = 1_{NH} - (NHcl(A_{NH}))$ and

(ii) $NHcl(1_{NH} - A_{NH}) = 1_{NH} - (NHint(A_{NH}))$

Proof:

(i)By definition

$NHcl(A_{NH}) = \cap \{ K_{NH} / K_{NH}\ is\ a\ NHCS\ in\ X_{NH}\ and\ A_{NH}\ \ K_{NH}\}$

$1_{NH} - (NHcl(A_{NH})) = 1_{NH} - \cap \{ K_{NH} / K_{NH}\ is\ a\ NHCS\ in\ X_{NH}\ and\ A_{NH}\ \ K_{NH}\}$

$= \cup \{ 1_{NH} - K_{NH} / K_{NH}\ is\ a\ NHCS\ in\ X_{NH}\ and\ A_{NH}\ \ K_{NH}\}$

$= \cup \{ G_{NH} / G_{NH}\ is\ a\ NHOS\ in\ X_{NH}\ and\ G_{NH}\ 1_{NH} - A_{NH}\}$

$= NHint(1_{NH} - A_{NH})$

(ii)The proof is similar to (i)

Proposition 3.7:

Let (X_{NH}, τ_{NH}) be Neutrosophic Hexa Topological space and A_{NH}, B_{NH} be Neutrosophic Hexa sets in X_{NH}. Then the following properties hold:

(a) (i) $NHint(A_{NH})\ A_{NH}$

(ii) $A_{NH}\ NHcl(A_{NH})$

(b) (i) $A_{NH}\ B_{NH}\ NHint(A_{NH})\ NHint(B_{NH})$

(ii) $A_{NH}\ B_{NH}\ NHcl(A_{NH})\ NHcl(B_{NH})$

(c) (i) $NHint(NHint(A_{NH})) = NHint(A_{NH})$

(ii) $NHcl(NHcl(A_{NH})) = NHcl(A_{NH})$

(d) (i) $NHint(A_{NH} \cap B_{NH}) = NHint(A_{NH}) \cap NHint(B_{NH})$

(ii) $NHcl(A_{NH} \cup B_{NH}) = NHcl(A_{NH}) \cup NHcl(B_{NH})$

(e) (i) $NHint(1_{NH}) = 1_{NH}$

(ii) $NHcl(0_{NH}) = 0_{NH}$

CONCLUSION

Thus we have given the definition for neutrosophic set, hexa topological space and neutrosophic hexa topological spaces and suitable examples are also given. In future we decided to investicate more neutrosophic topological properties and theorems in neutrosophic hexa topological space.

ABSTRACT

The study examined the associations and predictive impact of well-being indicators on marital satisfaction among interfaith married couples in India. Employing a cross-sectional, quantitative design, data were collected from 254 Hindu, Christian, and Muslim interfaith spouses (127 couples). Standardized measures of marital satisfaction, psychological well-being, social well-being, and financial well-being were administered. Pearson's correlation analysis revealed significant positive associations between Martial satisfaction and all the well-being indicators. Regression analysis further indicated that psychological well-being, social well-being, and financial well-being were significant predictors of Marital satisfaction. These findings indicate the multifaceted determinants of marital satisfaction in interfaith marriages, emphasising the critical role of psychological and social well-being in shaping relationship outcomes. The study highlights the need for holistic interventions and support strategies to strengthen marital adjustment and resilience among interfaith couples

Keywords: Interfaith marriage, Well-being, support indicators, marital satisfaction

INTRODUCTION

Interfaith marriage, also referred to as mixed marriage, inter-religious marriage, or religious exogamy, refers to the union of individuals from different religious traditions and belief systems(Cyriac *et al.*, 2024; Romain, 1997; Sewenet *et al.*, 2017).Marital satisfaction, commonly defined as the degree of happiness, fulfilment, and shared joy within a marriage, plays a vital role in strengthening family bonds and promoting life satisfaction (Milani *et al.,* 2020). It is largely determined by the alignment between marital expectations and reality, which sustains resilience and longevity within relationships (Shahsiah *et al.,* 2011; Young *et al.,* 1998). Spouses' affection, empathy, and positive regard toward one another are consistently identified as central contributors to overall happiness and marital adjustment. For interfaith couples, however, marital satisfaction is shaped not only by universal relational dynamics but also by unique challenges. Differences in religious practices, societal stigma, and lack of support structures often complicate their marital experiences, sometimes undermining well-being and stability (Aggarwal *et al.,* 2017; Boulis & Torgler, 2024; Kalmijn, 2012; Milani *et al*., 2020). Given the growing prevalence of interfaith marriages in India, addressing these complexities through research and interventions is critical for fostering enduring and resilient relationships across diverse faith traditions.

Psychological Well-being and Marital Satisfaction

Marital dissatisfaction is a significant stressor and a primary threat to psychological well-being. Evidence suggests that higher depression scores are linked to lower marital satisfaction, indicating the crucial role of psychological well-being in sustaining healthy marital relationships (Mousavi, 2020; Walker *et al*., 2013).Conversely, individuals with higher levels of psychological well-being report greater marital satisfaction (Diener *et al*., 2010; Kanter & Proulx, 2021; Novak *et al*., 2023). Research h**as** consistently demonstrated that enhanced marital quality contributes to reduced depression symptoms, equipping couples with better conflict resolution skills and emotional resilience (Ghaderdoost& Kord, 2018; Sharabi *et al.,* 2016). Psychological well-being encompasses both the experience of positive emotions and overall life satisfaction (Robertson, 2018). When spouses report frequent positive affect and higher subjective well-being, they are more likely to enjoy a fulfilling marriage (Diener *et al.,* 2010). Furthermore, couples' ability to manage and resolve conflict effectively has been linked to improved mental health outcomes and marital stability(Sharabi *et al.,* 2016).

Social Well-being and Marital Satisfaction

Social well-being, comprising integration, acceptance, contribution, actualisation, and coherence(Keyes, 1998), is deeply interconnected with the quality of marital relationship(Acitelli & Antonucci, 1994; Bradbury & Bodenmann, 2020; Rippon *et al.,* 2022). Social supports from family, friends, and significant others play a crucial role in shaping marital satisfaction(Smith & Brown, 1997). In contrast, experiences of stigma and lack of acceptance may increase stress and strain in interfaith marriages, undermining social well-being(Nawaz *et al*., 2021). Social relationships provide effective communication and emotional stability, which enhance marital outcomes(Du Plooy & De Beer, 2018).For example, couples with intrinsic religious orientation tend to report stronger social cohesion than those with extrinsic orientations (Hughes & Dickson, 2005). However, despite evidence linking social networks to positive outcomes (Kawachi, 2001; Seeman, 1996), the specific role of social well-being in the marital satisfaction of interfaith couples remains underexplored (Walker *et al.,* 2013).

Financial well-being and marital satisfaction

Financial well-being is another critical determinant of marital satisfaction. According to the resource exchange theory (Foa & Foa, 1974), financial security reduces economic stress, enhances marital interaction, and fosters emotional intimacy(Clark-Nicolas & Gray-Little, 1991; Cole, 1992; Conger *et al*., 1999). Couples with sound financial health report lower anxiety and greater collaboration in their marital lives(Archuleta, 2013).Conversely, financial strain has been strongly correlated with marital dissatisfaction, conflict, and separation (Gudmunson *et al*., 2007). A growing body of literature highlights a positive correlation between financial well-being and marital stability(Saxey *et al.,*

2023).Yet, the mechanisms through which financial well-being influences Marital Satisfaction in interfaith couples remain insufficiently understood, particularly within the Indian context.

Theoretical Framework

The present study draws on the Social Support Theory (Lakey & Cohen, 2000) and the Stress generation Model (Davila *et al.,* 1997) to explain the role of well-being indicators in predicting martial satisfaction. According to Social Support Theory, social support functions through three complementary perspectives. First, from a stress and coping perspective, social support mitigates the adverse effects of stressors such as cultural differences, societal pressures, and interfaith conflicts by providing emotional validation (Ali *et al.,* 2024). Second, the social constructivist perspectives emphasize that supportive interactions enhance resilience and psychological well-being by fostering self-esteem, self-regulation, and mutual respect among couples (Chen *et al.,* 2022; Rippon *et al*., 2022).Third, the relational perspective highlights that marital happiness is closely associated with the strength of social support, mutual attachment, friendship, and reduced social conflict, all of which contribute to marital satisfaction (Tough *et al.,* 2017). In line with these perspectives, social interaction and support supply essential instrumental, emotional, and informational resources, which reduce stress, preserve psychological equilibrium, and improve both health and satisfaction (Foa & Foa, 1974; Rabiee & Allahverdiha, 2021; Wendołowska *et al.,* 2022). Complementing this, the Stress Generation Model (Davila *et al*., 1997) offers a dynamic explanation of the interplay between psychological well-being and marital satisfaction. It suggests a bidirectional relationship: individuals with lower psychological well-being are more likely to experience stressful and conflict-laden interactions with their partners, which in turn intensify declines in psychological well-being and relationship quality(Ghaderdoost & Kord, 2018; Kanter & Proulx, 2021; Proulx et al., 2007). Together, these frameworks suggest that both psychological and social well-being are central to sustaining marital satisfaction, particularly in interfaith marriages where external stressors and social pressures are more pronounced. The existing studies demonstrate that psychological, social and financial well-being significantly impact marital satisfaction across diverse populations, including older adults, parents, working couples, and immigrant couples(Margelisch *et al*., 2017; Mousavi, 2020; Walker *et al*., 2013). However, little is known about the combined effects of these factors among interfaith married couples. This gap is particularly salient in India, where interfaith marriages are becoming more visible and socially significant. Therefore, the present study aims to examine the relationships and predictive impact of psychological well-being, social well-being, and financial well-being on marital satisfaction among interfaith couples. By doing so, this study addresses a critical gap in the literature and provides insights into the complex dynamics influencing marital outcomes in interfaith contexts.

Hypotheses

Based on the literature review, the study hypothesized that marital satisfaction would be significantly and positively correlated with psychological well-being, social well-being, and financial well-being. Furthermore, it was hypothesized that psychological well-being, social well-being, and financial well-being would serve as significant predictors of marital satisfaction.

METHODS AND MATERIALS

The study utilised a cross-sectional quantitative research design with a sample of 254 individuals (127 dyads). The primary objectives were to explore the relationships between marital satisfaction, psychological, social and financial well-being and to determine how these predictors explain marital satisfaction among interfaith married couples.

Participants and procedures

The study commenced after obtaining approval from the Institutional Review Board. Data were collected through purposive sampling from 254 interfaith married individuals (127 couples) residing in India. The sample included 30.7% from Generation Z, 39.4% from Millennials, cohort, and 29.9% from Generation X. Gender distribution was evenly balanced. With respect to marital duration,55.9% of the participants had been married for one to five years, while 44.1% reported six to ten years of marriage. In terms of religious affiliation, 42.5% identified as Hindu, 40.2% as

Christian, and 17.3% as Muslim. Educational qualifications showed that nearly half of the participants (48%) were graduates followed by those with intermediate or diploma (29.9%), professional degrees (13.8%) and high school education (8.3%). Additional demographic characteristics are presented in Table 1. Researchers conducted individual meetings with each participant, providing them with a plain language statement and obtaining written informed consent, including the right to withdraw at any time. To maintain the confidentiality, personal identifiers were replaced with codes. Participants then completed standardised measures of marital satisfaction, psychological well-being, social well-being, and financial well-being, with guidance from the researcher. Responses were recorded in an Excel file and securely stored on an encrypted solid-state drive. Eligibility excluded individuals married for less than one year or more than ten years, those with reported mental health issues, and non-heterosexual couples.

Measures

The study utilized four validated scales to assess the key variables. Socio-demographic response sheet was utilised to collect the demographic details of the participants. *Marital Satisfaction:* The ENRICH Marital Satisfaction (EMS) Scale(Fowers & Olson, 1993)consists of 15 items, rated on a 5-point scale (Strongly disagree to Strongly agree). For this study, researchers employed a 10-item Marital Satisfaction scale, excluding the Idealistic Distortion scale from the EMS scale(Arab Alidousti *et al.,* 2015; Ferrão *et al.,* 2019). This scale reported Cronbach's alpha coefficients of .86 and 0.93 in the current study. *Psychological well-being:* Psychological Well-being Scale (PWB) (Ryff, 1995)is an18-item measure rated on a 7-point Likert, strongly disagree(1)to strongly agree(7), with a Cronbach's Alpha (α) of 0.93 in this study. *Social Well-being*: the Social Well-being Scale (Keyes, 1998) consists of 15-items rated on a 7-point scale, with a Cronbach's alpha of 0.90. *Financial Well-Being*: The In-Charge Financial Distress/Financial Well-Being Scale (IFDFW) (Prawitz *et al*., 2006) includes eight items, rated on a 10-point scale, with reported α of 0.96 and Cronbach's alpha of 0.95 in this study.

Statistical Analysis of the Study

Shapiro-Wilk's Statistics (W) showed that the data of marital satisfaction (M = 28.86, SD = 9.01, W = 0.91, p>.001),psychological well-being (M = 69.51, SD = 18.96, W = 0.96, p<.001), social well-being (M = 59.57, SD = 16.47, W = 0.93, p>.001), and financial well-being (M = 38, SD = 11.10, W = 0.93, p>.001)were not normally distributed. Therefore, employed a two-step approach(Templeton, 2011) to transform the data. Pearson correlation analysis was used to examine the relationships between marital satisfaction, psychological well-being, social well-being and financial well-being. A multiple linear regression analysis was conducted to determine the extent to which psychological well-being, social well-being and financial well-being predict marital satisfaction. Three progressively complex models were estimated sequentially, incorporating one variable at a time. These models included psychological well-being, social well-being, and financial well-being.

RESULTS

Descriptive statistics revealed that interfaith married couples had moderate levels of marital satisfaction (M=28.80, SD =8.56), psychological well-being (M=69.73, SD =18.91), social well-being (M=59.71, SD =16.30), and financial well-being (M=38.13, SD =8.81).Results revealed that marital satisfaction was significantly associated with psychological well-being (r = .773, p<.001),social well-being (r = .786, p<.001), and financial well-being (r = .586, p<.001). The highest correlation was observed between psychological and social well-being (r = .822, p<.001).Financial well-being had the highest relationship with psychological well-being (r = .609, p<.001) and social well-being (r = .556, p<.001).(Table 2).

Multiple linear regression was conducted to predict marital satisfaction using well-being and support indicators as predictors. Table 3 reports the model summary of marital satisfaction and its variance. Table 3 reports the obtained unstandardized and standardized regression coefficients. A hierarchical regression with psychological well-being, social well-being, and financial well-being incrementally explained variations in marital satisfaction. In Model 1,psychological well-being alone accounted for a substantial proportion of the variance in marital satisfaction (β = 0.773, t = 19.36, p< .001), with 60% of the variance (R^2 = 0.598). The model demonstrated an adequate fit (F = 375, p< .001). In Model 2,incorporating social well-being into the model significantly predicted marital satisfaction(β = 0.465, t

= 7.28, $p < .001$). The coefficient of determination (R^2=0.668, $\Delta R^2 = .070$)accounted for67% of the overall variance in marital satisfaction, indicating satisfactory fit($F = 253$, $p < .001$).In Model 3,financial well-being enhanced the model's predictive capacity ($\beta = .144$, $t = 3.165$, $p < .001$). The coefficient of determination ($R^2 = .681$, $\Delta R^2 = .013$)indicated that the combined effects of psychological well-being, social well-being, and financial well-being accounted for 68% of the variance in marital satisfaction, with an adequate model fit ($F = 178$, $p < .001$). Table 3).

DISCUSSION

This study examined the multifaceted nature of marital satisfaction among interfaith married individuals, focusing on the role of psychological, social, and financial well-being. The findings supported the proposed hypotheses and offered a comprehensive understanding of the factors shaping marital satisfaction within interfaith unions. The results demonstrated significant association between marital satisfaction and psychological, social, and financial well-being, with psychological and social well-being emerged as the strongest predictors(Hughes & Dickson, 2005; Margelisch *et al*., 2017; Sewenet *et al*., 2017; Walker *et al*., 2013). Psychological well-being, in particular, accounted for substantial variance in marital satisfaction. Positive experiences of psychological health enhance the stability of interfaith marital unions, consistent with prior evidence linking higher psychological health and lower depression levels to greater marital satisfaction (Diener *et al*., 2010; Ghaderdoost & Kord, 2018; Kanter & Proulx, 2021; Mousavi, 2020). Further, maintaining psychological health not only improves individual adjustments but also contributes to more resilience, empathy, and constructive conflict resolution, there by strengthening marital relationships. Conversely, interfaith individuals with lower psychological well-being tend to report reduced marital satisfaction (Davila *et al.,* 1997), reflecting the bidirectional relationships between psychological functioning and marital quality(Proulx *et al.,* 2007).This suggests that intervention enhancing psychological well-being, such as stress management and mindfulness training, could indirectly improve Marital stability in interfaith unions Similarly, social well-being, characterised by social inclusion, actualisation, and contribution, was positively associated with the marital satisfaction(Acitelli & Antonucci, 1994; Keyes, 1998).These findings align with research demonstrating that social connectedness buffers against depression and anxiety resulting in better mental health and thereby enhancing marital outcomes(Bradbury & Bodenmann, 2020; Keyes, 1998; Qadir *et al.,* 2013; Rabiee & Allahverdiha, 2021).

The social support theory (Lakey & Cohen, 2000) provides useful frameworks for interpreting these results, emphasising the role of supportive interactions in mitigating marital stress by increasing social actualisation, inclusion, contribution, and psychological well-being (Keyes, 1998). Notably, empirical evidences reinforce this view,showing that emotional stability, empathy, and effective communication enable individual to navigate challenges, while positive partner attachment security predicts higher marital satisfaction through supportive exchanges (Cobb *et al.,* 2001; Du Plooy & De Beer, 2018; Keyes, 1998). Beyond dyadic processes, social well-being may also shape how interfaith couples negotiate external pressures, such as cultural or familial disapproval, by fostering a strong sense of community and shared identity. These insights indicate the indispensable role of both social and psychological well-being in sustaining marital satisfaction among interfaith couples (Hughes & Dickson, 2005; Walker *et al.,* 2013). Financial well-being also emerged as a significant predictor of marital satisfaction, highlighting the importance of economic stability in relationship quality. Financially satisfied partners are more likely to experience stable marriages (Saxey *et al.,* 2023; Archuleta *et al.,* 2011), as economic security reduces stress associated with financial uncertainty and creates conditions conducive to emotional intimacy, effective communication, and mutual respect (Conger et al., 1990, 1999). Stable financial resources strengthen couples' capacity to manage conflict, plan for the future, and engage in shared experiences, consistent with resource exchange theory, which emphasize the role of internal and external resources in shaping marital quality (Foa & Foa, 1974). Financial security also reduces marital strain by alleviating partner stress (Clark-Nicolas & Grey-Little, 1991; Cole, 1992; Conger et al., 1999), while contributing to reduced anxiety and greater life satisfaction (Archuleta, 2013). These outcomes allow couples to prioritise emotional closeness and shared goals, ultimately fostering stronger marital bonds. Current findings suggest the interdependence of psychological, social and financial well-being in enhancing marital satisfaction among interfaith couples. Interventions that simultaneously address mental health, social connectedness and economic

stability may be particularly effective in strengthening marital quality in these unions (Ali *et al.,* 2024; Kalmijn, 2012; Margelisch *et al*., 2017; Mousavi, 2020; Wendołowska *et al*., 2022). This integrative perspective underscores the value of multidimensional support systems in promoting marital resilience within interfaith contexts.

Implications of the study

The findings of this research hold significant implications for advancing future studies and practices concerning interfaith marriage, marital stability, and marital satisfaction. In-depth qualitative research should delve deeper into the significant impact of well-being and support metrics onmarital satisfaction among interfaith couples. The study reinforces the ecological theory of marital satisfaction(Bradbury *et al.,* 2000), emphasising the multifaceted influence of individuals, interpersonal, social, cultural, and environmental factors on marital outcomes. Empirical evidence of this study indicates the critical role of psychological and social well-being in predicting marital satisfaction and suggests targeted interventions for better satisfaction(Rabiee & Allahverdiha, 2021). Psychological counselling programs focusing on emotional regulation, social support enhancement, interpersonal communication, and resilience-building can bolster marital satisfaction(Donarelli *et al.,* 2019).Similarly, community-based initiatives aimed at reducing stigma and enhancing inclusive support systems can mitigate their social alienation that they encounter, particularly within restrictive religious and cultural environments. These results also have practical ramifications for policymakers, mental health professionals, religious leaders, and community organisations, promoting a more inclusive and supportive dialogue and interventions on interfaith marriages. Addressing challenges such as identity conflicts, legal complexities, and psychological stressors through tailored social measures can improve societal acceptance and integration. Future research should adopt a comprehensive, context-specific approach to explore the interaction of these factors in multicultural settings, providing in-depth insights into the dynamics of interfaith relationships and satisfaction. This comprehensive perspective can inform strategies to strengthen marital bonds, enhance well-being, and promote stability among interfaith couples, thereby contributing to better marital happiness and broader societal harmony.

CONCLUSION

The present research advances the understanding of marital satisfaction among interfaith marriages by indicating the importance of psychological and social, financial well-being, and supportive networks. The finding showed that well-being and support indicators are significantly correlated with marital satisfaction. Levels of marital satisfaction depend on the levels of well-being and support factors. Psychological well-being, social well-being, financial well-being and perceived social support are the significant predictors of marital satisfaction among interfaith couples. The complexity of marital dynamics in interfaith marriage indicated the need for holistic approaches to promote marital harmony. Interventions targeting individual's psychological and relational well-being hold significant promise for fostering marital satisfaction, while broader systemic efforts may complement these individual-level initiatives. These insights contribute to the literature on marital satisfaction of interfaith couples and have practical implications for counsellors, policymakers, and community organizations seeking to support interfaith couples. Despite its strengths, this study has some limitations that should be reported for future research. Firstly, the study focused on examining the correlation and impact of well-being and support indicators on marital satisfaction. However, it did not explore the lived experiences of individuals to understand how and to what extent these factors are interconnected and influence their marital satisfaction. This limitation constrains a more profound knowledge of the intricate processes underlying this occurrence. Secondly, this research's quantitative, cross-sectional design failed to understand the complexities of intricately related processes and did not allow for definitive conclusions regarding causality. Moreover, the self-reported data introduces the potential risk of response bias. Future research could benefit from incorporating qualitative methods to delve deeper into the lived experiences of interfaith couples. Such approaches could illuminate the nuanced interplay of beliefs, religious dynamics, and cultural contexts that influence their psychological and social well-being, ultimately impacting marital satisfaction. Thirdly, the sample of this study consisted of only three major religions, which may not fully capture the diversity of interfaith marriages across varied cultural or religious contexts, limiting the generalizability of the findings. Future studies should consider more

representative sampling to address this issue. Finally, longitudinal studies are essential to establish causal relationships and track how well-being and support indicators influence marital satisfaction over time. Such research could clarify the dynamic interplay of these factors and their evolving impact on marital outcomes. However, this study comprehensively examines psychological, social, financial, and support-related factors and their combined influence on marital satisfaction among interfaith couples. Using both Pearson correlation and multiple regression analyses, the study provided robust evidence of these variables' relationships and predictive power, offering empirical evidence on marital dynamics within this unique population. By integrating diverse dimensions of well-being with perceived social and community support, the research enhanced the ecological validity of its findings, shedding light on the multilayered influences shaping interfaith marital relationships. The study addressed a critical research gap, significantly contributing to the literature on interfaith marriage by examining the predictive role of well-being and support factors on marital satisfaction in a region where such unions are becoming Increasingly prevalent.

ABSTRACT

This paper introduces and investigates the concept of Neutrosophic$\pi g\gamma^*$Continuous Mappings in Neutrosophic topological spaces. We define Neutrosophic$\pi g\gamma^*$Continuous Mappings and examine their fundamental properties. Various characterizations are established to highlight their structural behaviour and relationships with other forms of Neutrosophic continuous mapping including Neutrosophic continuous mapping, Neutrosophic semi continuous mapping, and Neutrosophic generalized continuous mappings.

Keywords: Neutrosophic topological spaces, Neutrosophic$\pi g\gamma^*$ closed sets, Neutrosophic $\pi g\gamma^*$ Continuous Mappings.

INTRODUCTION

The concept of fuzzy sets, introduced by Zadeh[3]in 1965, allow each element to have a degree of membership. This concept was expanded by K. Atanassov[1]in 1986 with the introduction of Intuitionistic Fuzzy sets, which assign both a degree of membership and a degree of non-membership to each element. FlorentinSamarandache[5]introduced Neutrosophic Sets as a further generalization, which adds more flexibility. Later, A.A. Salama and S.A. Albowi[6]

extended the idea by developing Neutrosophic Topological Spaces.Riya V. M and JayanthiD[8] had introduced and studied Intuitionistic fuzzy γ* Generalized Continuous mappings.Sakthivel K and Manikandan M [4] had studied the concept of Intuitionistic fuzzy $\pi g\gamma^*$continuous mapping and Intuitionistic fuzzy $\pi g\gamma^*$ irresolute mapping.

In this paper we introduceNeutrosophic$\pi g\gamma^*$continuous mapping and studied some of their properties.Also,we have provided some characterization of Neutrosophic$\pi g\gamma^*$continuous mapping.

PRELIMINARIES

This section reviews essential definitions, operations, and key results related to Neutrosophic sets.

Definition 2.1[7] Let X be a non-empty fixed set. A Neutrosophic Set (NS) A is an object having the form A=$\{\langle x, \mu_A(x), \sigma_A(x), v_A(x)\rangle : x \in X\}$ where $\mu_A(x), \sigma_A(x)$and $v_A(x)$ represent the degree of membership, degree of indeterminacy and the degree of non-membership respectively of each element $x \in X$ to the set A.

Definition 2.2[7] Let X be a non-empty set and let A be a Neutrosophic Set A=$\{\langle x, \mu_A(x), \sigma_A(x), v_A(x)\rangle : x \in X\}$.Then the complement of A is

$A^C = \{\langle x, v_A(x), 1 - \sigma_A(x), \mu_A(x)\rangle : x \in X\}$

Definition 2.3[7] Let A and B be two Neutrosophic Sets, ∀x ∈X

A=$\{\langle x, \mu_A(x), \sigma_A(x), v_A(x)\rangle : x \in X\}$

B = $\{\langle x, \mu_B(x), \sigma_B(x), v_B(x)\rangle : x \in X\}$.

Then A ⊆ B ⇔ $\{\langle x, \mu_A(x) \le \mu_B(x), \sigma_A(x) \le \sigma_B(x), v_A(x) \ge v_B(x)\rangle : x \in X\}$

Definition 2.4[7] Let X be a non-empty set and let A and B be two Neutrosophic Sets are

A=$\{\langle x, \mu_A(x), \sigma_A(x), v_A(x)\rangle : x \in X\}$, B = $\{\langle x, \mu_B(x), \sigma_B(x), v_B(x)\rangle : x \in X\}$. Then

1. A ∩ B = $\{\langle x, \mu_A(x) \wedge \mu_B(x), \sigma_A(x) \wedge \sigma_B(x), v_A(x) \vee v_B(x)\rangle : x \in X\}$
2. A ∪ B = $\{\langle x, \mu_A(x) \vee \mu_B(x), \sigma_A(x) \vee \sigma_B(X), v_A(x) \wedge v_B(x)\rangle : x \in X\}$

Definition 2.5[7] Let X be a non-empty set andτ_N be the collection of Neutrosophic subsets of X satisfying the following properties:

1. $0_N, 1_N \in \tau_N$
2. $T_1 \cap T_2 \in \tau_N$ for any $T_1, T_2 \in \tau_N$
3. $\cup T_i \in \tau_N$for every $\{T_i : i \in j\} \subseteq \tau_N$

Then the space (X, τ_N) is called a Neutrosophic Topological Space (NTS). The elements of τ_N are called Neutrosophic Open Set (NOS) and its complement is Neutrosophic Closed Set (NCS).

Definition 2.6[7] Let (X, τ_N) be a NTS and A=$\{\langle x, \mu_A(x), \sigma_A(x), v_A(x)\rangle : x \in X\}$ be a NS in X. Then

Neutrosophic closure of A is N_Cl(A) = ∩{ M:M is a NCS in X and A ⊆ M}

Neutrosophic interior of A is N_Int(A) = ∪{ H:H is a NOS in X and H⊆A}

Definition 2.7 Let (X, τ_N) be a NTS and A=$\{\langle x, \mu_A(x), \sigma_A(x), v_A(x)\rangle : x \in X\}$ be a NS in X. Then A is said to be

1. Neutrosophic Semi closed set [5] (NSCS) if N_Int (N_Cl (A)) ⊆A.
2. Neutrosophic Semi open set [5] (NSOS) if A ⊆ N_Cl (N_Int(A)).
3. Neutrosophic Pre closed set [16] (NPCS) if N_Cl(N_Int(A)) ⊆A.
4. NeutrosophicPre open set [16] (NPOS) if A⊆ N_Int(N_Cl(A)).
5. Neutrosophic Regular closed set [8] (NRCS) if A= N_Cl(N_IntA)).
6. Neutrosophic Regular open set [8] (NROS if A = N_Int(N_Cl(A)).
7. Neutrosophic α closed set [6] (NαCS) if N_Cl (N_Int (N_Cl (A))) ⊆A.
8. Neutrosophic α open set [6] (NαOS) if A ⊆ N_Int (N_Cl (N_Int (A))).
9. Neutrosophic bclosed set [7] (NbCS) if N_Cl (N_Int(A)) ∩N_Int (N_Cl (A)) ⊆ A
10. Neutrosophic$b$ open set [7] (NbOS) if A ⊆N_Int (N_Cl (A)) ∪N_Cl (N_Int(A))

11. Neutrosophicπ closed set [10] if A is the union of Neutrosophic Regular closed sets.
12. Neutrosophicπ open set [10] if A is the union of Neutrosophic Regular open sets.

Definition 2.8 Let (X, τ_N) be a NTS and A=$\{\langle x, \mu_A(x), \sigma_A(x), \nu_A(x)\rangle : x \in X\}$ be a NS in X. Then A is said to be
1.Neutrosophic Generalized closed set [4] (NGCS) if N_Cl(A)⊆U whenever A ⊆ U and U is a NOS in X.
2.Neutrosophic Generalized semi closed set [4] (NGSCS) if N_sCl(A)⊆ U whenever A ⊆ U andU is a NOS in X.
3.Neutrosophic α Generalized closed set [6] (NαGCS) if N_αCl(A)⊆ U whenever A ⊆ U and U is a NOS in X.
4.Neutrosophic$\pi g\gamma^*$closedsets [13](N$\pi g\gamma^*$CSinshort)if $N_\mathrm{Cl}(\mathrm{N_Int}(\mathrm{A})) \cap \mathrm{N_Int}(\mathrm{N_Cl}(\mathrm{A})) \subseteq U$ whenever A⊆ U and U isNπOSin$X$.

Result 2.9:
i) EveryNCS, NSCS, NPCS, NRCS, NαCS, NbCS, NGCS, NGSCS, NαGCS are a $\pi g\gamma^*$CS but the converse may not be true in general.
ii) The family of all N$\pi g\gamma^*$CS s of a NTS (X, τ_N) is denoted by N$\pi g\gamma^*$CS(X).
iii) The family of all N$\pi g\gamma^*$OS s of a NTS (X, τ_N) is denoted by N$\pi g\gamma^*$OS(X).

Definition 2.9:
Let f_N be a mapping from a NTS (X, τ_N) into a NTS (Y, σ_N). Then f_N is said to be
i) Neutrosophic continuous [15] (Ncontinuous in short) mapping if $f_N^{-1}(B) \in$ NOS in (X, τ_N) for every B ∈σ_N.
ii) Neutrosophic semi continuous [15] (NS continuous in short) mapping if $f_N^{-1}(B) \in$ NSOS in (X, τ_N) for every B ∈σ_N.
iii) Neutrosophic pre continuous [15] (NP continuous in short) mapping if $f_N^{-1}(B) \in$ NPOSin (X, τ_N) for every B ∈σ_N.
iv) Neutrosophic α continuous [15] (Nα continuous in short) mapping if $f_N^{-1}(B) \in$ NαOSin (X, τ_N) for every B ∈σ_N.
v) Neutrosophic$b$continuous [7] (Nbcontinuous in short) mapping if $f_N^{-1}(B) \in$NbOS in (X, τ_N) for every B ∈σ_N.
vi) Neutrosophic Generalizedcontinuous [15] (NG continuous in short) mapping if $f_N^{-1}(B) \in$ NGCSin (X, τ_N) for every NCS, B of (Y, σ_N).
vii) NeutrosophicGeneralizedsemi continuous (NGS continuous in short) mapping if $f_N^{-1}(B) \in$ NGSCS in (X, τ_N) for every NCS B of (Y, σ_N).
viii) Neutrosophic α Generalized continuous (NαG continuous in short) mapping if $f_N^{-1}(B) \in$ NαGCS in (X, τ_N) for every NCS B of (Y, σ_N).

3. NEUTROSOPHIC $\pi g\gamma^*$CONTINUOUS MAPPINGS

In this section we have introduced Neutrosophic$\pi g\gamma^*$continuous mappings and investigated some of their properties. Also, we have established the relation between the newly introduced Neutrosophic$\pi g\gamma^*$continuousmapping and the already existing continuous mappings.

Definition 3.1:
A mapping $f_N : (X, \tau_N) \to (Y, \sigma_N)$is called a Neutrosophic$\pi g\gamma^*$continuous (N$\pi g\gamma^*$continuousin short) mapping if$f_N^{-1}(B)$ is a N$\pi g\gamma^*$CS(X, τ_N) for every NCS B of (Y, σ_N).

Example 3.2:
Let X = {p, q}, Y = {a, b}, T_1= <x, (0.5, 0.5, 0.6), (0.6, 0.5, 0.6) >and T_2= <y, (0.6, 0.5, 0.6), (0.6,0.5,0.5)>.Then τ_N = {0_N,T_1, 1_N } and σ_N = {0_N,T_2, 1_N } are NTS on X and Y respectively.Define a mapping $f_N : (X, \tau_N) \to (Y, \sigma_N)$ by f_N(p) = a and f_N(q)= b. Here NπOS is U = {1_N,T_1 }.The NS, T_2^c = < y, (0.6, 0.5, 0.6), (0.5, 0.5, 0.6) > is a NCS in (Y, σ_N) .Then $f_N^{-1}(T_2^c)$ = < x, (0.6, 0.5, 0.6), (0.5, 0.5, 0.6) > is a N$\pi g\gamma^*$CS in (X, τ_N) , as $\mathrm{N_Cl}\left(\mathrm{N_Int}\left(f_N^{-1}(T_2^c)\right)\right) \cap \mathrm{N_Int}\left(\mathrm{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right) = 0_N \subseteq$ U where $f_N^{-1}(T_2^c) \subseteq$ U .Hence f_N is a N$\pi g\gamma^*$ continuous mapping.

Theorem 3.3:
Every Neutrosophic continuous mapping is a N$\pi g\gamma^*$ continuous mapping but notconversely.

Proof: Let f_N : $(X,\tau_N)\to(Y,\sigma_N)$ be a Neutrosophic continuous mapping. Let B be a NCS in (Y,σ_N). Then $f_N^{-1}(B)$ is a NCSin(X,τ_N). Sinceevery NCSisa N$\pi g\gamma^*$CS,$f_N^{-1}(B)$ is a N$\pi g\gamma^*$CSin(X,τ_N). Hence f_N is aN$\pi g\gamma^*$continuous mapping.

Example 3.4:

Let X = { p , q }, Y = { a , b } , T_1= < x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) >and T_2= < y, (0.6, 0.5, 0.4), (0.7, 0.5, 0.2) > .Then τ_N ={0_N,T_1, 1_N }and σ_N ={ 0_N,T_2, 1_N }are NTS on X and Y respectively.Define a mapping f_N : $(X,\tau_N)\to(Y,\sigma_N)$ by f_N(p) = a and f_N(q)= b. Here NπOS is U = {1_N,T_1 }. The NS, T_2^c = < y, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) > is a NCS in (Y,σ_N).Then $f_N^{-1}(T_2^c)$ = < x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X,τ_N) asNCl_ $\left(\text{N_Int}\left(f_N^{-1}(T_2^c)\right)\right)\cap\text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right)=0_N\subseteq U$ where $f_N^{-1}(T_2^c)\subseteq U$ .But N_Cl$(f_N^{-1}(T_2^c)=T_1^c\neq f_N^{-1}(T_2^c)$ which is not NCS in (X,τ_N). Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not Neutrosophic continuous mapping.

Theorem 3.5:

Every NS continuous mapping is a N$\pi g\gamma^*$ continuous mapping but notconversely.

Proof: Let f_N : $(X,\tau_N)\to(Y,\sigma_N)$ be a NS continuous mapping. Let B be a NCS in(Y,σ_N). Then $f_N^{-1}(B)$is a NSCSin (X,τ_N). Sinceevery NSCSisa N$\pi g\gamma^*$CS,$f_N^{-1}(B)$is a N$\pi g\gamma^*$CSin(X,τ_N). Hence f_N is aN$\pi g\gamma^*$continuous mapping.

Example 3.6:

Let X = { p , q },Y = { a , b } , T_1= < x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) >and T_2= < y, (0.6, 0.5, 0.2), (0.7, 0.5, 0.2) > .Then τ_N ={0_N,T_1, 1_N }and σ_N={ 0_N,T_2, 1_N }are NTS on X and Y respectively. Define a mapping f_N : $(X,\tau_N)\to(Y,\sigma_N)$ by f_N(p) = a and f_N(q)= b.

HereNπOS is U = {1_N,T_1 }. The NS, T_2^c = < y, (0.2, 0.5, 0.6), (0.2, 0.5, 0.7) > is a NCS in (Y,σ_N) .Then $f_N^{-1}(T_2^c)$ = < x, (0.2, 0.5, 0.6), (0.2, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X,τ_N) as $\text{N_Cl}\left(\text{N_Int}\left(f_N^{-1}(T_2^c)\right)\right)\cap\text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right)=0_N\subseteq U$ where $f_N^{-1}(T_2^c)\subseteq U$ .But $f_N^{-1}(T_2^c)$ is not NSCS in (X,τ_N) as N_Int(N_Cl $(f_N^{-1}(T_2^c)))=T_1\not\subseteq f_N^{-1}(T_2^c)$. Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not NS continuous mapping.

Theorem 3.7:

Every NR continuous mapping is a N$\pi g\gamma^*$ continuous mapping but not conversely.

Proof: Let f_N : $(X,\tau_N)\to(Y,\sigma_N)$ be a NR continuous mapping. Let B be a NCS in (Y,σ_N). Then $f_N^{-1}(B)$is a NSCS in (X,τ_N). Since every NRCS is a N $\pi g\gamma^*$CS,$f_N^{-1}(B)$is a N$\pi g\gamma^*$CS in(X,τ_N). Hence f_N is a N$\pi g\gamma^*$continuous mapping.

Example 3.8:

Let X = { p , q },Y = { a , b }, T_1= < x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) >and T_2= < y, (0.6, 0.5, 0.2), (0.7, 0.5, 0.2) > .Then τ_N ={0_N,T_1, 1_N }and σ_N={ 0_N,T_2, 1_N }are NTS on X and Y respectively. Define a mapping f_N : $(X,\tau_N)\to(Y,\sigma_N)$ by f_N(p) = a and f_N(q)= b.

Here NπOS is U = {1_N,T_1 }.The NS, T_2^c = < y, (0.2, 0.5, 0.6), (0.2, 0.5, 0.7) > is a NCS in (Y,σ_N) .Then $f_N^{-1}(T_2^c)$ = < x, (0.2, 0.5, 0.6), (0.2, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X,τ_N) as $\text{N_Cl}\left(\text{N_Int}\left(f_N^{-1}(T_2^c)\right)\right)\cap\text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right)=0_N\subseteq U$ where $f_N^{-1}(T_2^c)\subseteq U$ .But $f_N^{-1}(T_2^c)$ is not NRCS in (X,τ_N) as N_Int (N_Cl$(f_N^{-1}(T_2^c)))=T_1\neq f_N^{-1}(T_2^c)$. Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not NR continuous mapping.

Theorem 3.9:

Every NP continuous mapping is a N$\pi g\gamma^*$ continuous mapping but not conversely.

Proof: Let f_N : $(X,\tau_N)\to(Y,\sigma_N)$ be a NP continuous mapping. Let B be a NCS in (Y,σ_N). Then $f_N^{-1}(B)$is a NPCS in (X,τ_N). Since every NPCS is a N$\pi g\gamma^*$CS,$f_N^{-1}(B)$is a N$\pi g\gamma^*$CS in(X,τ_N). Hence f_N is a N$\pi g\gamma^*$continuous mapping.

Example 3.10:

Let X = { p , q }, Y = { a , b } , T_1= < x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) >and T_2= < y, (0.6, 0.5, 0.4), (0.7, 0.5, 0.2) > .Then τ_N ={0_N,T_1, 1_N }and σ_N ={ 0_N,T_2, 1_N }are NTS on X and Y respectively. Define a mapping f_N : $(X,\tau_N)\to(Y,\sigma_N)$ by f_N(p) = a and f_N(q)= b.

Here NπOS is U = {1_N,T_1 }. The NS, T_2^c = < y, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) > is a NCS in (Y, σ_N) .Then $f_N^{-1}(T_2^c)$ = < x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X, τ_N) as N_Cl$\left(\text{N_Int}\left(f_N^{-1}(T_2^c)\right)\right) \cap \text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right) = 0_N \subseteq U$ where $f_N^{-1}(T_2^c) \subseteq U$ .But $f_N^{-1}(T_2^c)$ is not NPCS in (X, τ_N), as N_Cl(N_Int($f_N^{-1}(T_2^c)$))= $T_1^c \nsubseteq f_N^{-1}(T_2^c)$ .Hence f_N is a N$\pi g\gamma^*$continuous mapping but not NP continuous mapping.

Theorem 3.11:

Every N α continuous mapping is a N $\pi g\gamma^*$ continuous mapping but not conversely.

Proof: Let f_N : (X, τ_N)→(Y, σ_N)a N α continuous mapping. Let B be a NCS in(Y, σ_N). Then $f_N^{-1}(B)$ is a N α CS in (X, τ_N). Since every N α CS is a N$\pi g\gamma^*$CS,$f_N^{-1}(B)$is a N$\pi g\gamma^*$CSin(X, τ_N). Hence f_N is a N$\pi g\gamma^*$continuous mapping.

Example 3.1:

Let X = {p, q}, Y = {a, b}, T_1= < x, (0.3, 0.5, 0.4), (0.4, 0.5, 0.4) >and T_2= < y, (0.4, 0.5, 0.3), (0.7, 0.5, 0.3) > .Then τ_N ={0_N,T_1, 1_N }and σ_N={ 0_N,T_2, 1_N }are NTS n X and Y respectively. Define a mapping f_N : (X, τ_N)→(Y, σ_N) by f_N(p) = a and f_N(q)= b. Here NπOS is U = {1_N,T_1 }.The NS, T_2^c = < y, (0.3, 0.5, 0.4), (0.3, 0.5, 0.7) > is a NCS in (Y, σ_N) .Then $f_N^{-1}(T_2^c)$ = < x, (0.3 0.5, 0.6), (0.3, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X, τ_N) as N_Cl$\left(\text{N_Int}\left(f_N^{-1}(T_2^c)\right)\right) \cap \text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right) = 0_N \subseteq U$ where $f_N^{-1}(T_2^c) \subseteq U$.But $f_N^{-1}(T_2^c)$ is not NαCS in (X, τ_N), as N_Cl(N_Int(N_Cl($f_N^{-1}(T_2^c)$))= $T_1^c \nsubseteq f_N^{-1}(T_2^c)$. Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not Nα continuous mapping.

Theorem 3.13:

Every Nb continuous mapping is a N$\pi g\gamma^*$ continuous mapping but not conversely.

Proof: Let f_N : (X, τ_N)→(Y, σ_N)be a N b continuous mapping. Let B be a NCS in (Y, σ_N). Then $f_N^{-1}(B)$ is a N b CS in (X, τ_N). Since every N b CS is a N$\pi g\gamma^*$CS,$f_N^{-1}(B)$is a N$\pi g\gamma^*$CS in(X, τ_N). Hence f_N is a N$\pi g\gamma^*$continuous mapping.

Example 3.14:

Let X = { p , q },Y = { a , b } ,T_1= < x, (0.5, 0.5, 0.6), (0.5, 0.5, 0.4) > , T_2= < x, (0.4, 0.4, 0.6), (0.3, 0.4, 0.7) >and T_3= < y, (0.6, 0.6, 0.4), (0.5, 0.6, 0.5) > .Then τ_N ={0_N,T_1, T_2 1_N }and σ_N={ 0_N,T_3, 1_N }are NTS on X and Y respectively. Define a mapping f_N : (X, τ_N)→(Y, σ_N) by f_N(p) = a and f_N(q)= b.Here NπOS is U = {1_N,T_1 }.The NS, T_3^c = < y, (0.6, 0.4, 0.4), (0.7, 0.4, 0.3) > is a NCS in (Y, σ_N) .Then $f_N^{-1}(T_3^c)$ = < x, (0.3 0.5, 0.6), (0.3, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X, τ_N) as N_Cl$\left(\text{N_Int}\left(f_N^{-1}(T_3^c)\right)\right) \cap \text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_3^c)\right)\right) = T_1 \subseteq U$ where $f_N^{-1}(T_3^c) \subseteq T_1$ .But $f_N^{-1}(T_3^c)$ is not NbCS in (X, τ_N), as N_Cl$\left(\text{N_Int}\left(f_N^{-1}(T_3^c)\right)\right) \cap \text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_3^c)\right)\right) = T_1 \nsubseteq f_N^{-1}(T_3^c)$. Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not Nb continuous mapping.

Theorem 3.15:

Every NG continuous mapping is a N$\pi g\gamma^*$ continuous mapping but not conversely.

Proof: Let f_N : (X, τ_N)→(Y, σ_N)be a N G continuous mapping. Let B be a NCS in (Y, σ_N). Then $f_N^{-1}(B)$ is a NGCS in (X, τ_N). Since every NGCS is a N$\pi g\gamma^*$CS, $f_N^{-1}(B)$is a N$\pi g\gamma^*$CSin(X, τ_N). Hence f_N is a N$\pi g\gamma^*$continuous mapping.

Example 3.16:

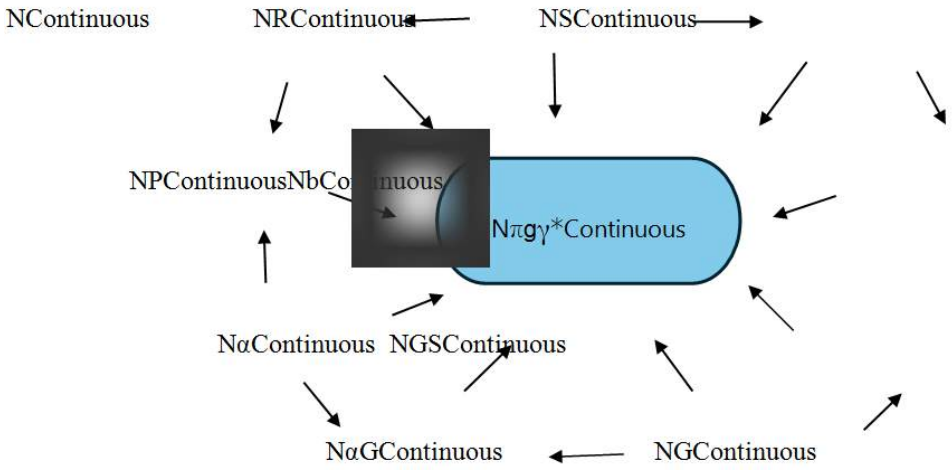
Let X = {p,q}, Y = {a, b}, T_1= <x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) >and T_2= < y, (0.6, 0.5, 0.4), (0.7, 0.5, 0.2) >.Then τ_N ={0_N,T_1, 1_N}and σ_N ={0_N,T_2, 1_N}are NTS on X and Y respectively. Define a mapping f_N : (X, τ_N)→(Y, σ_N) by f_N(p) = a and f_N(q)= b.Here NπOS is U = {1_N,T_1 }. The NS, T_2^c = < y, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) > is a NCS in (Y, σ_N) .Then $f_N^{-1}(T_2^c)$ = < x, (0.4, 0.5, 0.6), (0.2, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X, τ_N) as N_Cl$\left(\text{N_Int}\left(f_N^{-1}(T_2^c)\right)\right) \cap \text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right) = T_1 \subseteq U$ where $f_N^{-1}(T_2^c) \subseteq U$ .But $f_N^{-1}(T_2^c)$ is not NGCS in (X, τ_N), as N_Cl($f_N^{-1}(T_2^c)$= $T_1^c \nsubseteq T_1$ where $f_N^{-1}(T_2^c) \subseteq T_1$. Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not NP continuous mapping.

Theorem 3.17:
Every NαG continuous mapping is a N$\pi g\gamma^*$ continuous mapping but not conversely.
Proof: Let f_N : (X, τ_N)→(Y, σ_N) be a NαG continuous mapping. Let B be a NCS in (Y, σ_N). Then $f_N^{-1}(B)$ is a NαG CS in (X, τ_N). Since every NαGCS is a N$\pi g\gamma^*$CS,$f_N^{-1}(B)$is a N$\pi g\gamma^*$CS in(X, τ_N). Hence f_N is a N$\pi g\gamma^*$continuous mapping.

Example 3.18:
Let X = { p , q } , Y = { a , b } , T_1= < x, (0.3, 0.5, 0.4), (0.4, 0.5, 0.4) > and T_2= < y, (0.4, 0.5, 0.3), (0.7, 0.5, 0.3) > .Then τ_N ={0_N,T_1, 1_N }and σ_N={ 0_N,T_2, 1_N }are NTS on X and Y respectively. Define a mapping f_N : (X, τ_N)→(Y, σ_N) by f_N(p) = a and f_N(q)= b.
Here NπOS is U = {1_N,T_1 }.The NS, T_2^c = < y, (0.3, 0.5, 0.4), (0.3, 0.5, 0.7) > is a NCS in (Y, σ_N) .Then $f_N^{-1}(T_2^c)$ = < x, (0.3 0.5, 0.6), (0.3, 0.5, 0.7) > is a N$\pi g\gamma^*$CS in (X, τ_N) as N_Cl $\left(\text{N_Int}\left(f_N^{-1}(T_2^c)\right)\right) \cap \text{N_Int}\left(\text{N_Cl}\left(f_N^{-1}(T_2^c)\right)\right) = 0_N \subseteq$ U where $f_N^{-1}(T_2^c) \subseteq$ U.But $f_N^{-1}(T_2^c)$ is not NαGCS in (X, τ_N), as αN_Cl($f_N^{-1}(T_2^c)$= $f_N^{-1}(T_2^c)$ U (N_Cl(N_Int(N_Cl($f_N^{-1}(T_2^c$)))= $T_1^c \not\subseteq T_1$ where $f_N^{-1}(T_2^c) \subseteq T_1$. Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not NαG continuous mapping.

Theorem 3.19:
Every NGS continuous mapping is a N$\pi g\gamma^*$ continuous mapping but not conversely.
Proof: Let f_N : (X, τ_N)→(Y, σ_N) be a NGS continuous mapping. Let B be a NCS in(Y, σ_N). Then $f_N^{-1}(B)$is a NGSCS in (X, τ_N). Since every NGSCS is a N$\pi g\gamma^*$CS,$f_N^{-1}(B)$is a N$\pi g\gamma^*$CS in(X, τ_N). Hence f_N is a N$\pi g\gamma^*$continuous mapping.
Example 3.20:
Let X= {p, q}, Y = {a, b}, T_1= < x, (0.5, 0.5, 0.5), (0.6, 0.5, 0.4) >,T_2= < y, (0.4, 0.5, 0.6), (0.3, 0.5, 0.7) >,T_3= < y, (0.4, 0.5, 0.6), (0.4, 0.5, 0.6) >.Then τ_N ={0_N,T_1,T_1,1_N}and σ_N ={0_N,T_3, 1_N}are NTS on X and Y respectively. Define a mapping f_N : (X, τ_N)→(Y, σ_N) by f_N(p) = a and f_N(q)= b.Here NπOS is U = {1_N,T_1 , T_2}.The NS, T_3^c = < y, (0.6, 0.5, 0.4), (0.7, 0.5, 0.3) > is a NCS in (Y, σ_N) .Then $f_N^{-1}(T_3^c)$ = < x, (0.4 0.5, 0.6), (0.4, 0.5, 0.6) > is a N$\pi g\gamma^*$CS in (X, τ_N) as N_Cl $\left(\text{N_Int}(f_N^{-1}(T_3^c))\right) \cap \text{N_Int}\left(\text{N_Cl}(f_N^{-1}(T_3^c))\right) = T_2 \subseteq$ U where $f_N^{-1}(T_3^c) \subseteq$ U .But $f_N^{-1}(T_3^c)$ is not NGSCS in (X, τ_N), as sN_Cl$f_N^{-1}(T_3^c)$= $f_N^{-1}(T_3^c)$U(N_Int(N_Cl$f_N^{-1}(T_3^c)$)= $T_3^c \not\subseteq f_N^{-1}(T_2^c)$. Hence f_N is a N$\pi g\gamma^*$ continuous mapping but not NGS continuous mapping.

In the following diagram we have provided relation between N$\pi g\gamma^*$CS and other continuous mappings in Neutrosophic topological space



Theorem:22

A mapping f_N : $(X, \tau_N)(Y, \sigma_N)$ is a N$\pi g\gamma^*$ continuous mapping if N_Cl(N_Int(N_Cl(f_N^{-1}(A))) $\subseteq f_N^{-1}(N_Cl(A)$ for every NS, A in (Y, σ_N).

Proof:

Let A be a NCS in (Y, σ_N). By hypothesis, N_Cl(N_Int(N_Cl(f_N^{-1}(A))) $\subseteq f_N^{-1}$(N_Cl(A) = f_N^{-1}(A).Thereforef_N^{-1}(A) is NCS and hence it is a N$\pi g\gamma^*$CS. Thus, f_N is a N$\pi g\gamma^*$ continuous mapping.

ABSTRACT

Consumption of alcohol among women is a topic of public health concern, mainly due to its potential adverse effects on reproductive health. Here in this article the impact of alcohol use on women's reproductive health with a specific focus on survey data collected from Gujarat, a state where cultural and social norms shape health behaviours is being explored. The study highlights the physiological, hormonal, and psychological effects of alcohol on different aspects of reproductive health, including menstrual irregularities, fertility challenges, pregnancy complications, and sexual health disorders. Data from the survey, encompassing women across diverse age groups, socioeconomic backgrounds, and urban-rural settings in Gujarat, reveals critical insights into consumption patterns and their consequences. Findings shows that even the moderate alcohol use can disrupt hormonal balance, leading to irregular menstrual cycles and ovulatory dysfunction. Heavy consumption of alcohol is associated with reduced fertility, increased risk of miscarriages, preterm births, and foetal alcohol spectrum disorders (FASDs). Additionally, alcohol use appears to influence sexual health by altering libido and increasing the likelihood of unsafe sexual practices. It is a call for urgent attention to address the growing issue through culturally sensitive awareness campaigns, improved healthcare services, and policy initiatives. By understanding the complex interplay between alcohol use and reproductive health, stakeholders can better design interventions to mitigate risks and promote healthier outcomes for women in Gujarat and beyond.

Keywords: Alcohol, Health, Reproduction, Menstruation, Pregnancy, Fertility, Gujarat

INTRODUCTION

Alcohol consumption is a public health concern and recognized globally, yet its gender-specific impacts often receive insufficient attention. Women's reproductive health, being highly sensitive to lifestyle factors, is particularly vulnerable to the adverse effects of alcohol. In regions like Gujarat, India, where consumption of Alcohol by a woman is culturally stigmatized, understanding the interplay of biological, social, and behavioural factors becomes essential. This cultural stigma not only limits research efforts but also hampers the development of effective public health strategies to address alcohol-related reproductive health issues.[1] Despite Gujarat's prohibition laws, urbanization and changing societal norms have contributed to a rise in alcohol consumption among women. It is necessary to examine the impact of alcohol use on menstrual health, fertility, pregnancy outcomes, and sexual behaviour. Furthermore, integration of the findings from a cross-sectional survey conducted in Gujarat, analyzing patterns of use of alcohol and awareness levels among women. By synthesizing physiological, epidemiological, and socio-cultural perspectives, the aim is to inform healthcare providers and policymakers of the critical need for gender-sensitive interventions.[1,2]

Effects of Alcohol on Women's Reproductive Health

1. **Menstrual Irregularities and Hormonal Imbalances**
   - Chronic alcohol consumption disrupts the hypothalamic-pituitary-ovarian axis, leading to irregular menstrual cycles, amenorrhea, or oligomenorrhea.
   - Studies indicate a decrease in estradiol and progesterone levels, impairing ovulation and reducing fertility.
   - Alcohol also impacts the release of LH and FSH, both of which are essential for regulating ovulation and the menstrual cycle.
2. **Fertility Issues**
   - Alcohol consumption negatively affects oocyte quality, ovarian reserve, and implantation rates.
   - A systematic review indicates that even also moderate alcohol consumption can delay conception by interfering with endometrial receptivity.
   - Increased oxidative stress in ovarian tissues due to alcohol can also lead to reduced fertility potential.
3. **Pregnancy Outcomes**
   - During pregnancy use of alcohol can lead to miscarriage, preterm birth, and FASDs-foetal alcohol spectrum disorders.
   - FASDs are characterized by developmental delays, facial anomalies, and cognitive impairments in the offspring.
   - Alcohol exposure during prenatal period can result in placental insufficiency, affecting nutrient and oxygen delivery to the foetus.
4. **Risk of Pelvic Inflammatory Diseases (PID)**
   - Alcohol-induced immune suppression increases susceptibility to infections, including Pelvic Inflammatory Disease, which can also lead to infertility.
   - Women with chronic alcohol use may also experience delayed diagnosis and treatment of sexually transmitted infections, exacerbating reproductive health issues.
5. **Hormonal Cancers**
   - Prolonged consumption of alcohol is associated with an increased risk of hormonal cancers such as breast and ovarian cancer.
   - Estrogen metabolism alteration caused by alcohol can promote carcinogenesis.

METHODOLOGY

Literature Review

A comprehensive review of peer-reviewed articles, reports, and public health databases was conducted. Key search terms included "alcohol consumption," "women's reproductive health," "menstrual irregularities," "fertility challenges," and "pregnancy complications." Studies published between 2000 and 2023 were prioritized to ensure relevance. Data sources included Scopus, PubMed, and government health reports.

Data Analysis

According to the National Family Health Survey (NFHS) data, consumption of alcohol among women in Gujarat has shown notable changes over recent years: Table.No:1.

RESULTS

Alcohol Consumption Patterns

In Gujarat within 5 years, the percentage of consumption of alcohol among women has doubled and nearly halved in case of men. This data was formed by NFHS -5 in 2019-20 in which total 33,343 women and 5,351 men were surveyed during that period. Among which 200 women (i.e. 0.6%) and 310 men (i.e. 5.8%) admitted of them consuming alcohol while it was only 68 women (i.e. 0.3%) and 668 men (i.e. 11.1%) during the survey by NFHS - 4 in 2015 in which total 22,932 women and 6,018 men were surveyed.[7] Hence by comparing both the data of NFHS – 4 and NFHS – 5, it shows that in 2015, only 0.1% of urban women reported consuming alcohol, whereas in 2020, this figure rose to 0.3%.While in rural areas, the proportion of women consuming alcohol increased from 0.4% in 2015 to 0.8% in 2020. This is shown in the following table: Table. No: 2.This clearly implies the rate of alcohol consumption by women in Gujarat in past 10 years. Among men, the percentage of those consuming alcohol in urban areas decreased significantly, dropping from 10.6% in 2015 to 4.6% in 2020, with another data of rural area showing a decline from 11.4% to 6.8% over the same period.[7]

Menstrual Health

Alcohol consumption was linked to significant menstrual disruptions. Heavy drinkers reported irregular cycles (58%), prolonged bleeding, and symptoms of amenorrhea. These menstrual irregularities are largely attributed to alcohol-induced hormonal imbalances, particularly disruptions in estrogen and progesterone regulation. Research suggests that consumption of alcohol interferes with the hypothalamic-pituitary-ovarian axis, leading to altered secretion patterns of gonadotropins and ovarian hormones. Chronic use of alcohol has been associated with decreased levels of estradiol, an essential hormone for regular menstrual function. Furthermore, studies have stated that alcohol-related liver dysfunction can exacerbate hormonal imbalances by impairing the metabolism of estrogen, thereby contributing to prolonged bleeding and amenorrhea. These findings emphasize the critical need for public health interventions to raise awareness about the impact of alcohol on menstrual health. [8]

Fertility Challenges

Alcohol's impact on fertility is well-documented, with studies identifying ovulatory dysfunction, reduced ovarian reserve, and altered endometrial receptivity. These disruptions are often linked to alcohol-induced oxidative stress, which damages ovarian follicles and impairs their function. In the Gujarat survey, 36% of heavy drinkers reported difficulties conceiving, compared to 15% of moderate drinkers, illustrating a clear dose-response relationship. Also, consumption of alcohol has been shown to interfere with luteal phase adequacy and also increases the risk of anovulation, further contributing to infertility. Long-term alcohol use also affects anti-Müllerian hormone (AMH) levels, a key marker of ovarian reserve, as corroborated by international studies. Such findings highlight the complex interplay between alcohol use and fertility, emphasizing the need for targeted interventions to address these reproductive health challenges.[2,8]

Pregnancy Complications

Use of alcohol during pregnancy poses serious risks, including miscarriage, preterm birth, and FASDs. Alcohol interferes with fetal development through its teratogenic effects, primarily by disrupting cellular differentiation and growth processes. Studies have shown that prenatal alcohol exposure leads to oxidative stress, impaired placental function, and direct neurotoxicity to the fetus, contributing to long-term developmental challenges. In Gujarat, 42% of heavy drinkers experienced pregnancy complications, with FASD-related symptoms observed in 5% of newborns. These complications extend beyond physical health, often resulting in cognitive, behavioural, and emotional difficulties that persist into adulthood. Furthermore, consumption of alcohol during pregnancy increases the risk of low birth weight and stillbirth, underscoring its profound impact on maternal and child health. These outcomes emphasize the critical need for some preventive measures, such as routine screening for alcohol use during prenatal visits, public awareness campaigns targeting expectant mothers, and community support programs to address alcohol dependency during pregnancy. [2,9]

Sexual Health and Behaviour

Alcohol consumption influences sexual behaviour by reducing inhibitions and increasing risky practices, often leading to significant public health concerns. In the survey, 34% of participants reported unprotected sex, while 19% of heavy drinkers had a history of sexually transmitted infections (STIs). These behaviours are closely linked to alcohol-induced disinhibition and impaired judgment, which diminish individuals' ability to assess risks effectively. Furthermore, chronic use of alcohol has been associated with diminished self-regulation and increased vulnerability to coercive sexual encounters. Studies suggest that consumption of alcohol can also affect the efficacy of decision-making processes related to contraception use, further exacerbating the risk of unintended pregnancies and STIs. These findings underline the importance of targeted sexual health education programs which address the intersection of alcohol use and risky sexual behaviour. Public health initiatives must prioritize integrating these topics into broader harm-reduction strategies, while also fostering community-based interventions to mitigate the long-term health consequences. [2,8,10,11]

Awareness and Cultural Influences

Awareness of alcohol's reproductive health risks remains limited, with only 28% of participants acknowledging the connection. This lack of awareness can be attributed to multiple factors, including inadequate public health messaging and deeply ingrained cultural stigmas surrounding alcohol consumption, particularly among women. In Gujarat, societal norms often discourage the open discussions about sensitive health topics, perpetuating misinformation and creating barriers to seeking medical advice. As a result, many women remain unaware of the potential reproductive health consequences of alcohol use, such as menstrual irregularities, fertility challenges, and pregnancy complications. Qualitative interviews conducted during the survey further revealed a pressing need for culturally tailored awareness campaigns which address these stigmas. These campaigns should incorporate community leaders and leverage traditional communication channels to foster an environment of trust and openness, enabling women to access accurate information and appropriate healthcare services without fear of judgment or ostracism. [2,8,9,11]

Policy Implications and Recommendations:

1. **Awareness Campaigns**
   - Launch educational programs emphasizing the risks of alcohol on reproductive health, targeting both urban and rural populations.
   - Partner with schools, colleges, and community organizations to reach younger audiences.
2. **Healthcare Initiatives**
   - Integrate screening for alcohol use into routine gynecological and antenatal care.
   - Provide counselling and support for alcohol cessation, including access to rehabilitation services.
3. **Regulatory Measures**
   - Implement stricter regulations on alcohol availability and marketing targeting women.
   - Introduce warning labels on alcohol packaging highlighting reproductive health risks.

4. **Community Engagement**
   - Encourage community leaders and women's groups to advocate for alcohol-free lifestyles.
   - Develop peer-support networks for women who are struggling with alcohol dependency.
5. **Research and Monitoring**
   - Conduct longitudinal studies to better understand the pathways between consumption of alcohol and reproductive health outcomes.
   - Establish regional monitoring systems to track trends and inform policy decisions.

DISCUSSION

We can conclude from the data collected by NFHS throughout the last five years in Gujarat, alcohol consumption patterns have shifted notably. While alcohol use among women has doubled, indicating changing social dynamics and behaviours, the rate among men has significantly declined. Urban and rural areas show contrasting trends, with a rise in consumption among women and a marked decrease among men. These changes reflect evolving societal norms and attitudes toward alcohol use across genders and regions.[7] The undesirable effects of alcohol on women's reproductive health are multifaceted, involving hormonal, physiological, and behavioural pathways. Menstrual irregularities and fertility challenges are exacerbated by alcohol's interference with hypothalamic-pituitary-ovarian axis functioning. These findings corroborate studies highlighting the effect of alcohol in reducing estradiol levels and impairing ovulation.[8] Pregnancy-related outcomes, including FASDs, preterm delivery, and low birth weight, are well-established consequences of prenatal alcohol exposure. This review emphasizes the intersection of these biological impacts with socio-cultural barriers, particularly in Gujarat. Women's reluctance to seek medical advice due to societal judgment underscores the importance of culturally sensitive public health strategies. [10] The grievous form of alcohol-related birth defects is FAS-Fetal Alcohol Syndrome, which is characterized by growth retardation, facial abnormalities, and central nervous system (CNS) deficiencies. The outcomes of alcohol exposure are most pronounced during the embryonic stage (the first eight weeks of pregnancy), when critical developmental processes like organogenesis occur. During this period, alcohol can cause significant defects in facial structures, the heart, and the CNS.[12] Though the fetal stage (after the eighth week) is less susceptible to major developmental disruptions, alcohol exposure still affects brain maturation, including cerebellum development, and can lead to growth restrictions. The article explains that alcohol impairs cellular proliferation, differentiation, and migration, particularly in the CNS, leading to long-term cognitive and behavioural impairments. It also highlights the varying nature of growth restrictions, which can be symmetric or asymmetric, depending on the timing and consistency of alcohol exposure. Ultimately, the article stresses that there is no safe period for alcohol consumption during pregnancy, urging heightened awareness and prevention efforts to avoid these lifelong consequences.[12] The outcome of alcohol on the menstrual cycle varies from person to person, depending on factors like alcohol consumption, frequency, overall health, and individual differences. Chronic heavy drinking is particularly linked to more significant disruptions in menstrual cycles and reproductive health. Binge drinking, in particular, is associated with irregular periods and hormonal imbalances, highlighting its negative impact on health and behaviour.

Here's how alcohol can influence your cycle:

1. **Irregular Menstrual Cycles:** Excessive alcohol intake can lead to irregular cycles. Chronic drinking disrupts the hormonal balance needed for a regular menstrual cycle, causing variations in cycle length, ovulation, and menstrual flow.
2. **Amenorrhea:** Long-term alcohol use may result in amenorrhea, the absence of periods. Heavy drinking can interfere with the hormonal signals that regulate menstruation, causing periods to stop altogether.
3. **Delayed Ovulation**: Alcohol consumption can delay or inhibit ovulation, which can affect the timing of periods and contribute to cycle irregularities.
4. **Hormonal Changes:** Alcohol can alter the levels of hormones like estrogen and progesterone, which are essential for regulating the menstrual cycle. These changes can result in irregular bleeding or other menstrual changes.

5. **Exacerbation of PMS**: Studies suggest that heavy drinking may worsen PMS symptoms, such as mood swings, bloating, and cramps. Alcohol can also intensify period cramps, making the premenstrual phase more uncomfortable.
6. **Impact on Fertility**: Alcohol-related hormonal imbalances and irregular cycles may affect a woman's ability to conceive by disrupting ovulation and menstrual regularity.
7. **Dehydration and Cramps**: As a diuretic, alcohol increases urine production and can cause dehydration, which can worsen menstrual cramps and overall discomfort during menstruation.

The relationship between menstrual cycles and alcoholis complex, with individual responses varying. While moderate drinking may have little impact, heavy or chronic alcohol use is more probable to cause menstrual disruptions. Overall health, lifestyle, and nutrition also play a vital role in menstrual well-being.[13]

While global campaigns address alcohol-related health risks, region-specific interventions are critical. In Gujarat, integrating education on alcohol's reproductive health impacts into existing maternal and child health programs could bridge awareness gaps. Healthcare providers must be trained to navigate cultural sensitivities while promoting harm reduction. This underscores a worrying trend in alcohol consumption among women in Gujarat and its profound impact on reproductive health. The findings align with global studies, reinforcing the need for localized interventions. Cultural norms, stress, and urbanization are potential contributors to this rise. [14]

1. **Cultural Shifts:**
   - Traditionally stigmatized, consumption of alcohol among women is increasingly normalized in certain urban settings, contributing to a rise in use.
   - Peer influence and media portrayals further exacerbate the issue, especially among younger women. [14]
2. **Economic Implications**:
   - Infertility treatments and management of alcohol-related health complications impose significant financial burdens on families and healthcare systems. [14]
3. **Barriers to Intervention:**
   - Stigma surrounding for consumption of alcohol and reproductive health issues both can discourage women from seeking help.
   - Limited access to specialized healthcare services in rural areas compounds the problem.[14]

Limitations

This review integrates data from a single state, potentially limiting generalizability. Additionally, reliance on self-reported alcohol consumption introduces bias. Future research should incorporate longitudinal studies and biochemical markers to validate findings.

CONCLUSION

Alcohol consumption exerts profound and far-reaching effects on women's reproductive health, impacting menstrual health, fertility, pregnancy outcomes, and sexual behaviour. The physiological pathways disrupted by alcohol—such as hormonal imbalances and impaired ovarian function—underscore the biological vulnerability of women to its adverse effects. These health challenges are further compounded by cultural stigma, societal norms, and limited awareness, particularly in conservative regions like Gujarat. It is to highlight the intersection of biological and socio-cultural factors in shaping health outcomes. In Gujarat, prohibition laws coexist with rising alcohol consumption among women, driven by urbanization and evolving lifestyles. These dynamics necessitate region-specific interventions that integrate public health awareness with culturally sensitive approaches. Educational campaigns tailored to community values can bridge awareness gaps, empowering women to make informed health choices while reducing stigma. The need for comprehensive healthcare strategies is urgent. Training healthcare providers to address alcohol-related reproductive health issues sensitively can improve care delivery and encourage women to seek medical advice without fear of judgment. Policymakers must also prioritize accessible and affordable healthcare services, including fertility treatments, prenatal care, and substance abuse counselling. Collaborative efforts are

crucial for addressing the multifaceted impact of alcohol consumption. Partnerships between governmental agencies, non-governmental organizations, and community leaders can ensure the development and implementation of effective interventions. Public health policies must also consider the unique socio-cultural fabric of Gujarat, fostering an environment where open dialogue on consumption alcohol and reproductive health is normalized. Ultimately, denominating the impact of alcohol on women's reproductive health requires a multidisciplinary approach, combining education, healthcare, policy reform, and community engagement. By adopting such an integrated strategy, significant progress can be made in safeguarding the reproductive health and overall well-being of women in Gujarat and beyond.

Table.1: Showing Alcohol consumption among women in Gujarat

NFHS - 4 (2015-16)	Gujarat, a state with prohibition, has more women consuming alcohol than Punjab. According to the NFHS data, approximately 0.3% of women aged 15 to 49 in Gujarat consume alcohol, compared to just 0.1% in Punjab. As per 2017 statistics, 0.1% of women in urban areas of Gujarat and 0.4% of women in rural areas consume alcohol. [3]
NFHS - 5 (2019-20)	The proportion of women in the same age group consuming alcohol increased to 0.6%. Specifically, 0.3% of urban women and 0.8% of rural women reported alcohol consumption. [4] The percentage of women consuming alcohol has doubled in the last four years in Gujarat, a 'dry state' since its inception in 1960. [6]
National Drug Use Survey 2019 by AIIMS	It is ironic for a dry state, but data recently presented in the RajyaSabha revealed that approximately 4.3% of Gujarat's population, equating to about 19.53 lakh individuals, are addicted to alcohol. [5]

Table.2: Showing increment in consumption of Alcohol among Women in Gujarat

Survey	Urban women	Rural women
NFHS 4 (2015-16)	0.1%	0.4%
NFHS 5 (2019-20)	0.3%	0.8%

ABSTRACT

Development of suitable culture media to cultivate diverse group of microorganisms has been a subject area of extensive research. Numerous microorganisms remain elusive from our study due to lack of suitable growth conditions in a laboratory setting. Majority of commercially available media comprises complex extracts of plant or animal origin along with inorganic salts, peptides, vitamins or other specialty chemicals, leading to high cost of procurement. The present study was conducted to identify a simple plant sap based medium for bacterial cultivation. Fruit and vegetable sap were blended with Aloe gel extract to formulate culture media that supported growth of diverse group of microorganisms. Support to microorganisms were assessed in terms of distinct colony formation, colony forming units (CFU/ml) and microscopic examination with reference to standard media.

Keywords: Nutrient Agar, plant-based medium, Microorganisms, Colony Forming Units.

INTRODUCTION

Microorganisms are such robust and diversified single-celled organisms that thrive in every possible setting in different ecosystems [1, 2, 3]. Researchers across the world work tirelessly to find the right kind of combination of nutrients and physical microenvironment that would support the growth of every organism present in the given sample. Culture media provides a nutrient-rich matrix to support the development of microorganisms in a laboratory facilitating their study. As a general purpose medium for the culture of a wide variety of microorganisms, Nutrient Agar medium is commonly employed. This basic medium is composed of agar, sodium chloride, yeast extract, beef extract, and peptic digest of animal tissue [4]. Similarly, PDA (Potato Dextrose Agar) is often used to culture fungi and has a well-defined composition of Agar, dextrose, and potato infusion [5]. Despite the presence of

numerous culture media, over 90% of environmental microorganisms remain elusive and fail to grow in existing media components [6]. The necessity to isolate and identify an organism from a particular sample or environment leads to the development of a variety of media types [1, 4]. Microorganisms require specific environmental factors, food, and an energy supply to develop and proliferate. According to Ademoye and Adedire [5], microbiological research is challenging and expensive due to lack of suitable culture media; their high cost is also a matter of concern, particularly, in economically underprivileged countries [7]. Numerous alternatives to agar and commercial media have been explored [8]. The use of plant-based culture media has emerged as a promising alternative, offering a cost-effective and sustainable solution for microorganism cultivation [9]. Plant-based culture media can be derived from various sources, including fruits, vegetables, and grains [10]. These media can provide essential nutrients, such as proteins, carbohydrates, and minerals, required for microbial growth [11]. Studies have shown that plant-based culture media can support the growth of various microorganisms, including bacteria and fungi, with comparable efficacy to traditional media [5]. Some researchers substituted cowpea, green gram, and black gram as starch and protein supply [1]. The development of plant-based culture media is not only cost-effective but also environmentally friendly, as it utilizes waste plant materials that would otherwise be discarded [12]. Furthermore, plant-based culture media can provide a more sustainable solution for microorganism cultivation, reducing the reliance on animal-derived products [13]. The use of plant-based culture media has been explored in various studies, with promising results. For example, a study by Jadhav *et al*. [2] demonstrated the effectiveness of a plant- based culture medium derived from wheat and soybean for the cultivation of *Lactobacillus acidophilus*. Similarly, a study by Ravimannan and Pathmanathan [11] showed that a vegetable-based medium can support the growth of various microorganisms, including bacteria and fungi. Some studies have suggested that raw plant juices, saps, and powders were enough to stimulate growth of Rhizobacteria and recover to a level similar to that of traditional culture condition [14]. Juices and extracts from suitable plant materials are especially crucial since they include vitamins, minerals, and amino acids that bacteria require for growth [15].

MATERIALS AND METHODS

The ingredient materials for formulating plant based culture medium were procured locally. While Aloe fleshy leaves were obtained from the University nursery facility, fruit and vegetable samples were purchased from the local market. The plant materials were thoroughly washed and air-dried before use. The green cover rind from the Aloe leaves were carefully sliced using a sharp knife to collect just the clear gel in a clean beaker. Gram-positive strains of *Enterococcus faecalis*, *Bacillus subtilis*, *Candida albicans,* and *Candida glabrata* were gracefully provided by the Microbiology department, Himalayan hospital. The strains were of non-pathogenic nature identified by the VITEK® 2 Compact system (Make bioMérieux). Two Gram-negative strains, *E. coli* ATCC 25922 and *Pseudomonas aeruginosa* ATCC 27853 were also gifted by partner laboratory in Dehradun. Standard commercially available microbial media Nutrient Broth, Yeast Extract Potato Dextrose (YEPD), de Man, Rogosa, and Sharpe (MRS), Agar agar were purchased from HiMedia Laboratories. Laboratory reagents and chemicals used in the experiment were of Sisco Research Laboratory (SRL) make. Double distilled water (Elga® make Veolia Water Solutions, UK) were used in the study.

Isolation of Microorganisms

Isolation of *Lactic Acid Bacteria (LAB)*

Lactic acid bacterial strain was isolated and purified from commercial yogurt samples. The sample was serially diluted with 0.9% saline and plated in MRS agar (pH 6.2, incubation at 28-30 °C). Isolated colonies were subcultured at least twice using streak-plate method to obtain homogenous colonies. The bacteria were examined microscopically by Gram's staining technique as well as biochemically to identity its properties. Subsequently, Glycerol stocks were prepared and stored in a refrigerator at -20°C for later use.

Isolation of yeast strain

Commercially available baker's yeast grains were used as a primary source of yeast strain. Baker's yeast was serially diluted and inoculated in YEPD agar plates (pH 6.5, incubated at 25°C) by spread plate technique. Single colony was then streaked in subculture YEPD agar medium for purification.

Preparation of plant materials for media

Plant materials were selected based on availability and potential suitability for the experiment. The selection included three seasonal fruits namely apple, banana, and papaya, three seasonal vegetables namely, potato, pea, and bottle gourd, and Aloe leaves. The samples were ensured for their quality, unspoiled, and free from surface microbial contamination. Aloe leaves were collected from the university nursery and processed to obtain clear gel. The physical properties of the leaves, such as size, shape, test weight, and pulp weight, were studied. Clear gel was sliced off using a sharp cutting knife and blended in a kitchen grinder machine (make Philips). Similarly, fruit and vegetable samples were washed 2-3 times under running water. Individual ingredients were separately mashed into pulp and strained several times through 2-3 layers of muslin cloth to remove any clumps. After filtration clear extract of all seven ingredients were obtained which were stored in well labelled air tight containers and stored in refrigerator for further use.

Formulation of microbial media

The selected plant ingredients were diluted with double distilled water to prepare culture media of varied concentrations viz. 5%, 10%, 20%, 30%, and 40%. A total of 35 culture media were prepared for screening purpose. The pH of all thirty-five media was adjusted using 0.1N NaOH or 0.1N HCl and 1.5% Agar was added as gelling agent and autoclaved under standard sterilization conditions. Nutrient Agar was used as a control medium. *Pseudomonas aeruginosa* strain ATCC 27853 was used as a test microorganism for concentration optimization. Post incubation at 28-30 °C for 24 hours, microbial colonies were observed and examined for their colony and staining characteristics.

Optimization of Composite Culture Medium

Based on the observations made in the preceding experiments, clear Aloe gel, banana pulp and potato pulp were taken in the ratio 30:20:20. The composite media was diluted with double distilled water to prepare 100 mL culture medium. The final step was achieved through centrifugation at 8000 RPM for 10 minutes to remove any particulate matter and ensure homogeneity. Nutrient agar, Potato dextrose agar, MRS agar and YEPD agar culture medium were used as control media for this experiment. The bacterial inoculum was prepared by the direct colony suspension approach [16]. The turbidity of the suspension was adjusted to match the 0.5 McFarland standard, equivalent to approximately 1.5×10^8 CFU/ml. Serial dilutions of the microorganisms were prepared using 0.9% NaCl solution. All culture plates were grown in triplicates and results expressed as Colony Forming Units (CFU/ml) mean±SD values.

RESULTS AND DISCUSSION

In order to determine the suitability and support of selective fruit and vegetable ingredients in the composition of a simple microbial culture medium, preliminary study was conducted. Individual ingredients were mashed and filtered and diluted to prepare a concentration range of agar-based culture media from 5% to 40% taking an interval of 5%. A fixed inoculum size of the test microorganism *P. aeruginosa* strain ATCC 27853 was incubated at 28-30 °C for 24 hrs. The media were observed in terms of texture, consistency, colour and optical clarity. Colony characteristics as well as microscopic examinations were made and expressed as CFU/ml (Table 1). Most of the selected plant materials supported comparable growth of the test organism in reference to the control medium. The pH of fruit and vegetable sap lied in the acidic range 4.1–6.5 adjusted to optimal pH condition for growth. The semi-solid medium had good lateral diffusibility to allow separate colony formation. Although differences in behavior of the media could not be judged only in terms of CFU growth, the colony characteristics were different. While Aloe gel, papaya and bottle gourd sap allowed comparable microbial growth, the colony morphological features were

observed to be poor. Colonies in Aloe gel medium was found to be quite small and indistinguishable. Similarly, colonies in bottle gourd medium were very translucent and difficult to study. While colonies in pea based medium was very prominent and good, the medium characteristic was poor due to presence of debris (insoluble or precipitate) material. In case of medium prepared from potato and banana pulp, colony and medium characteristics were good and comparable to control. Moreover, potato and banana extract have been used as microbial growth enhancer in established culture media like PDA; a US patent was granted on banana peel extract as growth enhancer [17]. Apple juice did not support any microbial growth. As the concentration of the fruit or vegetable sap increased, viscosity and opacity of the prepared media was more pronounced and hence, considering all the above factors, potato and banana in combination with Aloe were selected in the concentration range of 10-20% to optimize the formulation medium. Further, we tested different combinations of fruit and vegetable ingredients at 1:1 (20% each) with Aloe gel as the common ingredient. It was observed (Fig.1) that both banana+pea and banana+potato pulp supported equivalent microbial growth and improved the nutrient availability of the Aloe sap, while, the other ingredient combinations did not perform well. Again, potato was favored in the formulation as pea caused considerable problem of debris formation and hindered preparation of a neat microbial culture medium.

Preparation and evaluation of composite culture medium

Based on the observations made in the preliminary experiments, Aloe clear gel, banana pulp and potato pulp were formulated into a culture medium. Each of the ingredients were added in the respective ratio of 30%, 20% and 20% making up the volume with double distilled water to prepare a 100 ml medium. The medium could be used as broth or plated with 1.5% Agar agar as a gelling agent to develop microbial colonies. A representative figure of the test medium post-autoclave is shown in Fig.2. It is a clear homogenous medium with reddish-brown colour. The potential of the formulated medium to support growth of microbial strains of varied nature viz. bacteria, Gram-positive and Gram-negative strains, fast (Bacillus sp.) and slow (Lactobacillus sp.) growing strains, and different yeast strains were tested. The growth potential was examined in terms of CFU/ml and colony characteristics. The microorganisms were also cultured in their respective standard commercial media as control. As is evident in Table 2, the test medium performed quite well and were either comparable or better than their respective controls. We observed much higher colonies, particularly, for Lactobacillus sp. which is known to be a little slow growing bacterium. Fig. 3 and Fig. 4 represents growth of standard microbial strains of *E. Coli* and *P. aeruginosa.* The medium offered better optical clarity and contrast as compared to the Nutrient Agar. In the formulated medium, *P. aeruginosa* ATCC 27853 strain exhibited distinct pigmentation that was absent in the control (Nutrient agar), suggesting a possible influence of medium composition on its metabolic activity (Fig. 4). In a lab setting, microbes must be grown in a nutrient-rich environment that provides them with necessary resources to flourish. Several studies have been conducted in an attempt to develop inexpensive culture medium by utilizing various substrates. For instance, culture medium for bacterial growth from fruit and vegetable remnants was established in an Indian study [2]. Gabunia *et al*. [18] demonstrated that maize husk extract can be effective in promoting the growth of *Escherichia coli* and *Staphylococcus aureus*. Another study found that culture media made from lentils, chickpeas, and peas, major food pathogens, including *S. aureus, E. coli, Bacillus cereus, Pseudomonas aeruginosa,* and some types of mold, exhibited adequate development [19]. According to Uthayasooriyan *et al*. [20, 21], compared to commercial nutrient agar, *Klebsiella sp*. grew more abundantly in a culture medium made from chickpeas. The results with the fungi were more promising than the bacteria tested, despite the fact that the authors had also prepared a growth medium with soy flour. In another research study, kitchen waste was utilised to formulate the media [22]. Most of the well-known culture media used for bacterial growth is constituted of complex extracts from plant or animal origin. The idea behind the present study was to find substitutes for complex media ingredients used in commercial media.

CONCLUSION

Developing culture media for *in vitro* growth and isolation of diverse group of microorganisms should be a primary focus of modern biology given the current limitations on microbial growth in the lab. The requirement for affordable, nutrient-rich media with simple ingredients is critical. Fruit and vegetable remnants along with agricultural wastes

are a great source of carbohydrates, proteins and minerals that can be consumed by microorganisms. The test media formulation constituting a fruit and a vegetable source supported equivalent culture characteristics for diverse group of microorganisms including fermentative species that can well be utilized for producing gut-friendly products. The hunt for inexpensive alternative medium that may be utilized in lab settings for standard microbiological research is still ongoing.

ACKNOWLEDGEMENTS

The authors wish to express gratitude to the SRHU Scientific and Industrial Research for funding this study as a seed grant. They also acknowledge the Microbiology department, Himalayan hospital and research partners for providing microbial strains for the study.

Conflict of interests

The authors declare that there is no competing interest.

ABSTRACT

The rapid expansion of the Internet of Things (IoT) has intensified the need for secure and efficient communication with cloud platforms, where large volumes of sensitive data are collected, processed, and stored. Conventional encryption standards such as DES and Blowfish, though reliable, are not ideally suited for resource-constrained IoT environments due to their high computational demands. To overcome this limitation, the proposed symmetric cryptography technique introduces a lightweight yet robust block cipher specifically designed for IoT–cloud integration. The method employs an eight-round structure incorporating dual subkey mixing, adaptive bit rotations, and layered permutations to achieve strong confusion and diffusion while minimizing execution time. Experimental evaluation using real IoT sensor payloads reveals that the proposed technique achieves up to 40% faster encryption and decryption than DES and surpasses Blowfish in efficiency, while attaining a measured security strength of 94%, compared with 78% for DES and 84% for Blowfish. These findings demonstrate that the proposed technique provides an effective balance between speed and resilience, making it a promising solution for securing IoT–cloud communication where both performance and confidentiality are essential.

INTRODUCTION

The Internet of Things (IoT) has rapidly evolved into one of the most transformative technologies of the digital era. By connecting billions of heterogeneous devices—ranging from sensors and wearables to industrial controllers—IoT enables real-time data acquisition, monitoring, and decision-making across multiple domains such as healthcare, transportation, smart cities, and industrial automation(Rana M., *et al*. 2022). This massive integration of devices has led to exponential data generation, which requires scalable platforms for storage and computation. Cloud computing has become the de facto backbone for IoT systems because of its elasticity, virtually unlimited storage, and powerful data processing capabilities(Suryateja P. S. 2024). However, this dependency on cloud platforms raises severe security and privacy concerns. IoT devices are resource-constrained in terms of memory, computation, and energy, making them incapable of running heavy cryptographic schemes. Consequently, lightweight algorithms are typically used to secure device-to-gateway communication(Al-Shatari, *et al*., 2023). While these methods reduce computational overhead, they are insufficient to protect data once it reaches the cloud—a public and highly vulnerable environment where adversaries may exploit advanced attack vectors, including brute-force decryption, side-channel attacks, and unauthorized access. Thus, IoT–cloud communication introduces a new layer of security risks, particularly regarding data confidentiality and integrity(Gușița B., 2025). The core challenge lies in designing encryption mechanisms that balance two conflicting requirements: efficiency for IoT devices and robustness against sophisticated cloud-based attacks. Traditional symmetric encryption algorithms such as DES and Blowfish, although secure, consume significant processing time and are not optimized for large-scale IoT deployments (Sabri O, *et al*., 2025). On the other hand, hybrid approaches combining symmetric and asymmetric cryptography enhance security but often increase complexity and latency. These trade-offs highlight the urgent need for specialized cryptographic solutions tailored for IoT–cloud ecosystems (Xue J, *et al*., 2023). To address this gap, this research proposes the Enhanced Symmetric Cryptography Technique (ESCTGPU). Unlike conventional lightweight schemes designed solely for IoT devices, ESCTGPU strengthens the security of data during transmission from the gateway to the cloud. By employing a block cipher structure with multi-round permutations, substitutions, and key variations, ESCTGPU ensures that ciphertexts are computationally resistant to cryptanalysis while maintaining efficiency. By bridging the gap between lightweight encryption and robust cryptography, ESCTGPU provides a practical and scalable solution for securing IoT–cloud communication. This work contributes to building trust in IoT systems by ensuring that sensitive sensor data remains protected even in hostile cloud environments.

Cryptography Techniques

The integration of IoT with cloud platforms has created an ecosystem where massive volumes of data are generated, transmitted, and stored. While this combination enables scalability and intelligence, it also opens new avenues for cyberattacks. To safeguard sensitive information during transmission and storage, cryptography serves as the cornerstone of IoT–cloud security(Qasem M. A., 2024). Broadly, cryptographic techniques are divided into symmetric key cryptography, asymmetric key cryptography, and their hybrid or advanced variations. Each technique has distinct strengths and limitations, and their suitability depends on factors such as computational efficiency, memory usage, and the threat environment (Almutairi M. *et al*., 2025).

Symmetric Key Cryptography

In symmetric key systems, a single secret key is shared between the sender and receiver to perform both encryption and decryption. Because the same key is used at both ends, the security of the system relies heavily on how well the key is kept confidential(Rosero-Montalvo P. D, *et al*., 2022).

Block Ciphers: These algorithms divide data into fixed-sized blocks (e.g., 64-bit or 128-bit) and apply multiple rounds of permutation, substitution, and XOR operations to produce ciphertext. Examples include DES (Alhassan A.

B. *et al*., 2024), Blowfish(Kaur G. *et al*., 2025) and newer lightweight ciphers optimized for IoT. Block ciphers are widely used because they can encrypt large amounts of data efficiently and achieve high levels of diffusion and confusion.

Stream Ciphers: Instead of working on blocks, stream ciphers encrypt data bit by bit or byte by byte using a keystream. They are lightweight, fast, and suitable for low-power devices. Protocols like RC4 (historically used) and newer lightweight designs are often considered for IoT sensors.

Advantages: Fast execution, low resource consumption, and suitability for bulk data encryption.

Challenges: Secure key distribution is difficult, especially in distributed IoT environments where millions of devices may need unique keys.

Asymmetric Key Cryptography

Asymmetric cryptography uses a pair of keys: a public key for encryption and a private key for decryption. Unlike symmetric systems, there is no need for both parties to share the same secret key in advance. This property makes it particularly useful for authentication, digital signatures, and secure key exchange(Raj Y. S *et al*., 2021).

RSA (Rivest–Shamir–Adleman): One of the earliest and most widely used public-key systems, RSA offers strong security but requires intensive computations, making it less suitable for small IoT devices.

Elliptic Curve Cryptography (ECC): ECC achieves the same security strength as RSA but with smaller key sizes, reducing computational and memory requirements. This makes ECC a preferred choice in IoT–cloud communication, particularly for authenticating devices and establishing secure channels.

Advantages: Eliminates the key distribution problem of symmetric systems and provides stronger authentication.

Challenges: Computationally expensive for IoT sensors and not ideal for continuous encryption of large data streams.

Hybrid Cryptographic Approaches

To balance efficiency and robustness, researchers often combine symmetric and asymmetric techniques(Selvi P. *et al*., 2025). Typically, asymmetric cryptography (like ECC or RSA) is used to securely exchange a symmetric session key, and then the actual data transmission is encrypted using a faster symmetric cipher such as AES. This hybrid model is widely implemented in protocols like SSL/TLS, which are increasingly adapted to IoT–cloud systems(Zhang L. *et al*., 2024).

Advantages: Combines the speed of symmetric algorithms with the strong authentication of asymmetricones.

Challenges: Still incurs additional overhead due to asymmetric operations, which may strain low-power IoT devices.

RELATED WORK

The paper examines the resilience of the PRESENT lightweight block cipher against electromagnetic side-channel attacks, a threat often overlooked compared to traditional power analysis. The author Gunathilake *et al*. (2021) employ both simple electromagnetic analysis (SEMA) and correlation electromagnetic analysis (CEMA), using probes and oscilloscopes to measure EM emissions from an Arduino Uno implementing PRESENT encryption. Experimental results reveal that electromagnetic leakage can expose partial key information—up to seven bytes in some instances—depending on probe type and filtering settings, with certain bytes exhibiting greater susceptibility. These observations highlight that while lightweight ciphers like PRESENT are computationally efficient for IoT applications, they are not inherently resistant to physical leakage. The study underscores the importance of implementing hardware-level countermeasures such as electromagnetic shielding, noise injection, and obfuscation. By demonstrating the cipher's vulnerability at the physical layer, the paper contributes valuable insight into the ongoing effort to integrate side-channel resistance into secure IoT cryptographic design. The paper provides a detailed survey of cryptographic algorithms aimed at improving IoT security, emphasizing the trade-off between robust protection and the limited resources of IoT devices. Thabit *et al*. (2023) reviews lightweight block ciphers,

stream ciphers, and hybrid approaches, assessing them based on computational efficiency, memory footprint, and resistance to common cryptanalytic attacks. A notable aspect of the work is its balanced view—while highlighting the benefits of lightweight cryptography for efficiency, it also warns against excessive simplification that could undermine security. The authors further underline the potential of hybrid cryptographic schemes that combine symmetric and asymmetric techniques to achieve both speed and robustness. By categorizing encryption strategies across the device, edge, and cloud layers, the paper provides a clear structural perspective for practitioners. Importantly, it identifies ongoing challenges such as ensuring side-channel resistance, achieving secure key management, and developing IoT-specific standards, making it a valuable reference for emerging models like ESCTGP$_U$, which aim to balance performance and security in IoT–cloud communications. The paper introduces the RBFK cipher, a lightweight symmetric block cipher designed specifically for IoT devices operating in edge computing environments, where conventional algorithms such as AES and DES are computationally expensive. Rana *et al*. (2023) employs a randomized butterfly architecture for key scheduling, enabling the generation of highly sensitive round keys with strong avalanche effects while maintaining minimal processing overhead. The cipher processes 64-bit data blocks with 64- or 128-bit keys over five rounds, utilizing XOR, XNOR, substitution boxes, and scan patterns to enhance both confusion and diffusion properties. Experimental evaluation using the FELICS benchmarking suite demonstrates that RBFK achieves lower cycle counts, memory usage, and power consumption compared to other lightweight algorithms like PRESENT, SPECK, and SIT. Additionally, MATLAB-based image encryption tests validate its resistance to statistical and differential attacks. Overall, the paper showcases RBFK as a secure, efficient, and resource-aware encryption scheme well-suited for safeguarding data in IoT edge environments. The paper introduces GFRX, a lightweight block cipher designed specifically for IoT devices that have limited computing and storage capacity by Zhang *et al*. (2023). Traditional Feistel ciphers are criticized for their slow diffusion, since only half of the plaintext changes in each round, requiring many iterations to reach acceptable security.

To overcome this, the authors combine a generalized Feistel structure with ARX operations (Addition/AND, Rotation, XOR), applying two distinct nonlinear functions across all branches. This design improves diffusion speed, strengthens confusion, and reduces the number of rounds needed to achieve the avalanche effect—GFRX reaches full diffusion in just six rounds. The encryption and decryption structures are nearly identical, minimizing extra hardware costs, and the round function is reused during key scheduling to further save resources. Security analysis shows that the cipher withstands up to 19 rounds of differential attacks and 13 rounds of linear attacks, giving it a comfortable safety margin. Performance testing confirms that GFRX outperforms existing lightweight ciphers like SIMON and SPECK in terms of avalanche behavior, while hardware results on FPGA and ASIC show very low area consumption (as low as ~886 GE) with flexible serialization for different throughput needs. Overall, the paper demonstrates that GFRX is a practical and efficient cipher for IoT environments, offering a strong balance of security, diffusion speed, and hardware efficiency for resource-constrained nodes. The paper introduces GFSPX, a lightweight block cipher specifically designed for resource-constrained IoT devices, aiming to improve security without compromising efficiency. Zhang *et al*. (2024) builds on a generalized Feistel structure integrated with Substitution–Permutation Network (SPN) principles to overcome the slow diffusion problem typical of traditional Feistel designs. To enhance mixing speed, the cipher employs ARX operations—Addition, Rotation, and XOR—on selected portions of the plaintext, which eliminates the need for large S-box tables or complex hardware components. Experimental results demonstrate that GFSPX achieves a full avalanche effect within only six rounds, indicating rapid diffusion and strong resistance to key-related attacks. Comprehensive cryptanalysis confirms robustness against differential, linear, algebraic, and structural attacks, while implementation results show a compact hardware footprint (~1,715 GE) and a high software throughput of 12.31 Mb/s. Overall, the study presents GFSPX as a balanced and efficient cryptographic design, combining low computational cost with solid security guarantees, making it highly suitable for lightweight IoT encryption scenarios. The paper proposed a layered security framework for IoT–Cloud data protection. Farshadinia, H., (2025) integrates multi-stage lightweight cryptography to address gaps in traditional methods. Conventional blockchain signatures (ECDSA, ZSS) are improved for efficiency and speed. Layer 1 (H.E.EZ): combines Hyperledger Fabric, refined block encryption, and hybrid signatures. Layer 2: introduces credential management to validate blockchain-encrypted data. Layer 3 (C-AUDIT): manages audit trails, event ordering, and

synchronization. The design reduces reliance on third-party auditors and minimizes communication overhead. Evaluations show faster execution, lower traffic, and better scalability than prior solutions. Security analysis confirms stronger protection against unauthorized access and tampering. Overall, the framework offers a robust, efficient, and scalable model for IoT–Cloud security.

METHODOLOGY

The methodology of this research is designed to secure IoT–cloud communication by introducing a two-levelencryption process that strengthens data protection as it travels from devices to the cloud. The first level needs to secure the communication between device-to-gateway and second level is to secure data between IoT gateway to cloud storage using Enhanced Symmetric Cryptography Technique(ESCTGPU). The paper presents second level of security between IoT gateway to cloud. This layered design addresses the dual challenges of computational efficiency and robustness against attacks.

Proposed Technique Design Principles

The proposed technique is a symmetric block cipher specifically developed for gateway systems to ensure secure data transmission between IoT devices and the public cloud. It operates on 64-bit data blocks and performs eight rounds of transformations, each designed to enhance both security and efficiency. A 64-bit master key is expanded into 16 dynamic subkeys, with two subkeys utilized per round to increase key variability and unpredictability. Each round of the encryption process includes an initial permutation, XOR-based key mixing, row-shuffling permutations, and bit rotations determined by the count of '1's in each half of the block, followed by a final permutation that ensures further diffusion. Through this sequence of operations, the cipher introduces strong confusion (via XOR substitutions) and diffusion (via permutations and adaptive rotations), effectively obscuring the relationship between plaintext and ciphertext. This design produces highly randomized ciphertext outputs, ensuring that even identical plaintext blocks yield distinct ciphertexts—an essential security property often lacking in traditional symmetric encryption algorithms.

Proposed Encryption Procedure

The Enhanced Symmetric Cryptography Technique secures IoT–cloud communication through a series of carefully designed transformations. The process ensures both confusion (via XOR operations and key mixing) and diffusion (via permutations, rotations, and substitutions). Below is the enhanced procedure:

Step 1: Input Acquisition

- Collect sensor data from IoT devices.
- Convert the data into binary format (plaintext stream).
- Segment the binary data into 64-bit blocks, since ESCTGPU operates on block-level encryption.

Step 2: Initial Permutation

- Arrange each 64-bit block into an 8×8 matrix.
- Apply the initial permutation table (Figure 1) to shuffle bit positions.
- The permutation ensures that input bits are uniformly distributed before encryption rounds begin, increasing resistance to statistical attacks.

Step 3: Round Initialization (8 Rounds Total)

For each block, the encryption process runs for eight rounds, with two unique subkeys applied per round. Each round involves the following sequence:

Key Mixing (XOR Operation)

- XOR the permuted 64-bit block with the first subkey (K_i).

- This operation introduces confusion, making the relationship between plaintext and ciphertext non-linear.

Row-Shuffling Permutation
- Rearrange the 64-bit block based on a predefined row-shuffling permutation table (Figure 2).
- This step strengthens diffusion by scattering bit patterns.

Splitting into Halves
Divide the block into two equal halves: Left (32-bit) and Right (32-bit).

Bit Counting and Rotations
- Count the number of '1's in each half.
- Rotate the left half clockwise by the count of '1s in the left block.
- Rotate the right half clockwise by the count of '1s in the right block.
- This adaptive rotation ensures unpredictability, since the rotation count changes dynamically with the plaintext.

Recombination and Secondary Key Mixing
- Merge the rotated halves back into a 64-bit block.
- XOR the merged block with the second subkey (K_{i+1}).
- The output becomes the input for the next round.

Step 4: Final Permutation
- After completing 8 rounds, the resulting block undergoes a final permutation based on a predefined permutation table (Figure 3).
- This step ensures further diffusion, producing the final 64-bit ciphertext block.

Step 5: Output Conversion
- Convert the ciphertext from binary to decimal or character codes for storage in the cloud.
- The output ciphertext appears as random, unintelligible data, ensuring strong resistance against cryptanalysis.

Features of the Procedure
Two-Level Key Usage: Each round uses two subkeys (K_i and K_{i+1}), increasing complexity.
Dynamic Rotation: Rotation depends on the bit count of the plaintext, making ciphertext generation highly variable even for identical inputs.

Multi-Layer Confusion and Diffusion: Combination of XOR, permutations, and rotations ensures resilience against brute-force, differential, and statistical attacks.

Proposed Key Generation
The security strength of ESCTGPU relies heavily on its dynamic subkey generation process. Instead of relying on static keys, ESCTGPU expands a 64-bit master key into 16 subkeys, with two unique subkeys applied per encryption round. This design increases resistance to brute-force and differential cryptanalysis by ensuring that each round operates with different transformations.

Step 1: Master Key Initialization
- Begin with a 64-bit primary (master) key provided at the gateway system.
- Represent the key in binary form for further processing.

Step 2: Splitting the Master Key
Divide the 64-bit master key into two equal halves
Left half (L_0): 32 bits

Right half (R_0): 32 bits

Step 3: Round-Based Rotations
For each round *r* (r = 1 to 8)
- Rotate L_0 to the right by *r* positions.
- Rotate R_0 to the right by *r* positions.

This adaptive rotation ensures that each round produces a new variation of the key, linked to the round number.

Step 4: Subkey Generation
- After rotation, recombine the two halves ($L_r + R_r$) to form a 64-bit subkey K_i.
- Generate the next subkey (K_{i+1}) by performing a bitwise XOR operation between the master key and the subkey K_i.
- This dual-step (merge + XOR) guarantees that two unique subkeys are derived for every encryption round.

Step 5: Iteration for All Rounds
- Repeat Steps 2–4 for each of the 8 rounds.
- A total of 16 subkeys (K_1, K_2, …, K_{16}) are produced, with two subkeys allocated per round of ESCTGPU encryption.

Step 6: Subkey Utilization
During encryption
- K_i is applied for the first XOR operation within the round.
- K_{i+1} is applied after rotations and recombination.

During decryption
The same subkeys are used, but applied in reverse order (K_{16} to K_1).

Features of ESCTGPU Key Generation
Round-Dependent Rotation: By tying rotations to the round number, each key evolves in a predictable but secure pattern.

Dual Subkeys per Round: Ensures higher complexity and greater resistance to linear/differential cryptanalysis.

Efficient Computation: Operations are lightweight (rotations and XORs), making the process feasible on gateway hardware.

Strong Security: Even if a partial key is exposed, predicting subsequent subkeys is computationally difficult due to the XOR mechanism.

Proposed Technique's Pseudocode
The procedure highlights both the novelty and the security rationale of ESCTGPU's key schedule. The pseudo-code of the ESCTGPU encryption and key generation is as follows.

Pseudocode: Encryption
ESCTGPU_Encrypt
Inputs

P	: byte array (plaintext)
K[1..16]	: array of 16 round subkeys, each 64 bits (two subkeys per round: K[2*r-1], K[2*r])
IP[64]	: Initial permutation table (64 → 64)
RSP[64]	: Row-shuffling permutation table (64 → 64)

FP[64] : Final permutation table (64 → 64)

Output:

C : byte array (ciphertext)

```

Experiment of Proposed Technique

The experiment is conduct for the data which was generated a clean, realistic sample IoT sensor dataset (LM35 temperature + HC-SR04 distance) with timestamps in IST, plus Wi-Fi RSSI and battery voltage for context. Columns included,

- timestamp_ist (ISO 8601, Asia/Kolkata)
- device_id, gateway_id
- lm35_temp_c (°C)
- hcsr04_distance_cm (cm)
- wifi_rssi_dbm (dBm)
- battery_v (V)
- payload (compact JSON-like string)

(Table : 1)

The following steps shows the encryption data transformation in each step involved in the procedure. Here, it takes the payload of first row as plaintext.

Step 1: Input Acquisition

Plaintext payload (UTF-8): {"t":30.08,"d":89.5,"rssi":-64.5,"bat":3.904}

First 64-bit block (8 bytes, hex):7b22743a3330

(That's the first 8 characters — the rest of the payload continues in later blocks and is padded at the end.)

Step 2: Initial Permutation (IP)

After arranging that 64-bit block as an 8×8 matrix and applying the Initial Permutation table, the block becomes: 031398f039b1f77d

Step 3: Round Initialization (8 rounds total)

Below, each round shows the 64-bit state after each sub-step.

Round 1

- After XOR with K1: 47159e9dfd60bc00
- After Row-Shuffle (RSP): 1b60fd00951ed5ec
- After ROTATE *(popcount(L)=18, popcount(R)=20)*: 3c02f680362bfd64
- After XOR with K2: 78d9bcf2fff112c2

Round 2

- After XOR with K3: 4058ac52db24b63f
- After Row-Shuffle (RSP): b224db3f982c28c4
- After ROTATE *(popcount(L)=20, popcount(R)=19)*: 0bb2c9a6f44c9c59
- After XOR with K4: 4f69c3b03d962bff

Round 3

- After XOR with K5: f2a081cbd39f3a6a
- After Row-Shuffle (RSP): 2bd3d36aa152a1b3
- After ROTATE *(popcount(L)=15, popcount(R)=18)*: 96e9e9b594a950d9
- After XOR with K6: d232e3a55d73e77f

Round 4
- After XOR with K7: 9f688eefe9b0c7a8
- After Row-Shuffle (RSP): 0fe9e9a88b27d99e
- After ROTATE *(popcount(L)=15, popcount(R)=17)*: 70fd3d51164f3b33
- After XOR with K8: 34163746df95cc95

Round 5
- After XOR with K9: f4df5c6e1a6d1bd0
- After Row-Shuffle (RSP): 7e1a1ad0d1c6f71b
- After ROTATE *(popcount(L)=14, popcount(R)=20)*: 86c5d870c63b8f8f
- After XOR with K10: c21ed2660fe13829

Round 6
- After XOR with K11: ca9b9b089a04b62d
- After Row-Shuffle (RSP): 899a9a2db2bae8c0
- After ROTATE *(popcount(L)=18, popcount(R)=18)*: a6aa6266ea0202f6
- After XOR with K12: e271e87023d8b550

Round 7
- After XOR with K13: e5f2fb4a57cc1948
- After Row-Shuffle (RSP): 3a57cc48195e65fb
- After ROTATE *(popcount(L)=17, popcount(R)=18)*: 91abbe30ccacfb2c
- After XOR with K14: d570b42605364c8a

Round 8
- After XOR with K15: b64b7fbdc2a25116
- After Row-Shuffle (RSP): 2cc2a2165117fdbb
- After ROTATE *(popcount(L)=17, popcount(R)=21)*: fe1651617dbb2cc2
- After XOR with K16: badf5b77b4019b64

Step 4: Final Permutation (FP)
Applying the final permutation table to the round-8 output yields the ciphertext block (block 0)
248e28062f7d6b4c

Implementation Setup
Testbed Overview
ESCTGP$_U$ block cipher applied at the gateway prior to uplink, hardening data against cloud-side threats. This layering ensures confidentiality along both the local/wireless link and the wide-area/cloud link while keeping device-side computation lightweight.

Hardware Components
Sensor node (device)
Arduino Uno R3 (ATmega328P @ 16 MHz, 2 KB SRAM, 32 KB flash)
LM35 temperature sensor (°C)
HC-SR04 ultrasonic distance sensor (cm)

Connectivity
ESP8266 Wi-Fi module (UART @ 115200 bps) providing 2.4 GHz IEEE 802.11b/g/n.

Power: 5 V USB supply; sensor Vcc per datasheet (LM35: 4–30 V; HC-SR04: 5 V).
Rationale: The Uno's constrained RAM forces tight code paths, making it a realistic target for lightweight cryptography evaluation.

Software Stack
Firmware/IDE: Arduino IDE (ATmega328P toolchain); C/C++ (avr-gcc).

Device-side
- Integer-only implementation; fixed-point formatting for sensor values.
- Outputs a compact **payload** string: {"t":<temp>,"d":<dist>,"rssi":<dbm>,"bat":<V>}

Gateway-side (ESCTGPU)
64-bit block, **8 rounds**, **16 subkeys** (two per round), zero-padding to block boundary.
Initial / Row-Shuffling / Final permutation tables as specified; rotations are right-rotate by per-half popcount.
Cloud: ThingSpeak channel for storage/visualization of ciphertext (hex/Base64) and, in a debug channel, timing metadata.

Keying and Modes
Master key: 64-bit ESCTGPU master key configured at compile time (e.g., derived from a KDF seed for experiments).
Subkeys: Generated per the ESCTGPU key schedule (split → round-dependent rotates → merge → XOR with MK).
Block mode: ECB for controlled micro-benchmarks on fixed-size records (to isolate cipher core cost).
Padding: Zero padding to 64-bit boundary for timing comparability.

Data Flow and Timing Points
Sensing: LM35 and HC-SR04 sampled at 1 Hz; 10-bit ADC values calibrated to °C and cm.
Payload formation: Values formatted to minimal JSON (~30–60 bytes typical).
Tier: ESCTGPU applied to the payload.
Uplink: ESP8266 posts ciphertext to ThingSpeak via HTTP; retries disabled during timing runs.

Timing hooks
T_enc_start/T_enc_end: bracket ESCTGPUEncrypt() call.
T_dec_start/T_dec_end: bracket ESCTGPUDecrypt() call (loopback verification path).
Granularity: microsecond timer via micros(); reported in milliseconds (ms).

Security Assessment Procedure
Black-box scoring: ABC Universal Hackman (configuration per tool defaults) to obtain a comparative security score for DES, Blowfish, and ESCTGPU under identical block/key settings where applicable.
Heuristics: Frequency analysis and NIST SP-800-22 style sanity checks (monobit, runs) applied to ciphertext samples from varied inputs.
Key-schedule sanity: Ensure subkeys differ across rounds; measure subkey Hamming distances.

RESULTS AND DISCUSSIONS

The comparison tables 2 and 3 for encryption/decryption time (ms) from 1 KB to 5 KB. Times are estimated by linear scaling and measured results (at 100 KB: DES 52 ms, Blowfish 41 ms, ESCTGPU 31 ms; and decryption 49/38/29 ms). This gives a per-KB slope that apply to small payloads. Actual timings will vary by implementation and hardware. The measurements consistently demonstrated that ESCTGPU requires less computational time than DES and Blowfish. For a 1 MB dataset, ESCTGPU achieved an average encryption time of ~302 ms, compared with 492 ms for DES and 429 ms for Blowfish. Decryption followed a similar trend, with ESCTGPU completing the task in ~294 ms,

while DES and Blowfish required 485 ms and 415 ms, respectively. When scaled down to smaller data sizes (1 KB to 5 KB), ESCTGPU remained faster, consuming about 25–40% less time than DES and 15–20% less time than Blowfish. This performance improvement is particularly important for IoT gateways, where devices must process continuous streams of small packets with minimal latency. The strength of the ciphertext was assessed using the ABC Universal Hackman tool. DES achieved a security score of 78%, while Blowfish scored 84%. ESCTGPU outperformed both with a 94% score, indicating higher resilience against brute-force and differential cryptanalysis. The improvement can be attributed to two main features

Dual key mixing per round, which increases complexity without significant overhead.

Adaptive bit rotations based on the distribution of ones in each block, which introduces randomness that makes ciphertext patterns unpredictable.

These design choices ensure that even identical plaintext blocks generate distinct ciphertext outputs, reducing the risk of statistical leakage. Security strength is compared with DES, Blowfish, and Proposed ESCTGPU shown in table 4. The results highlight two key findings. First, efficiency: ESCTGPU is lightweight enough to run on resource-constrained gateways without the overhead commonly associated with hybrid or heavyweight encryption schemes. Second, robustness: ESCTGPU strengthens the confidentiality of IoT–cloud data beyond what traditional algorithms like DES and Blowfish can achieve. Although Blowfish is known for its flexibility in key size and DES is recognized as a global standard, their implementation overhead may not be ideal for constrained IoT environments. ESCTGPU, by contrast, was specifically designed for this context and therefore achieves a practical balance between speed and security. However, it is worth noting that ESCTGPU is a new design, and while preliminary results are promising, its resilience against advanced attacks (e.g., side-channel analysis, chosen-ciphertext attacks) requires further study. Incorporating secure key-exchange mechanisms and testing under real-world cloud workloads would strengthen confidence in its deployment.

CONCLUSION

The proposed enhanced symmetric cryptography technique effectively balances security and computational efficiency for IoT–cloud communication, outperforming conventional algorithms such as DES and Blowfish in both encryption and decryption performance. Experimental analysis indicates that the proposed method reduces computation time by nearly 40% compared with DES, while achieving a 94% security strength, attributed to its dual subkey architecture, adaptive bit rotations, and layered permutation structure. Although DES and similar algorithms have long served as foundational encryption standards, their high processing overhead limits their suitability for resource-constrained IoT gateways. In contrast, the proposed technique offers a lightweight and practical alternative that ensures strong data confidentiality without overburdening limited hardware resources. Overall, this approach demonstrates that high-performance yet secure cryptography can be achieved for modern IoT–cloud ecosystems, with potential for further enhancement through large-scale implementation and advanced side-channel attack resistance.

Table 4: Security Strength Comparison

Feature / Cipher	DES	Blowfish	Proposed ESCTGPU
Key Size	56 bits (effective)	Variable: 32–448 bits (commonly 128–256)	64-bit master key expanded into 16 dynamic subkeys
Block Size	64 bits	64 bits	64 bits
Rounds	16 Feistel rounds	16 rounds	8 rounds (each with dual subkeys, adaptive rotations, permutations)
Security Level (ABC Hackman Tool)	78%	84%	94%
Vulnerability	Easily broken by brute-force (exhaustive key search feasible today); weak against differential/linear cryptanalysis	Resistant to brute-force if large keys are chosen; some weak keys exist; slower key scheduling	Dynamic key schedule + randomized rotations reduce predictability; resistant to brute-force and linear/differential attacks in tests
Cryptanalysis Status	Considered **obsolete**, broken in < 24 hours on modern hardware	Considered **secure** for most applications, but aging (not standardized like AES)	**Novel** design, tailored for IoT–cloud; experimental but shows higher randomness and unpredictability
Practical Security	Not secure for IoT–cloud	Better than DES, but large key setup time is heavy for IoT	Balanced: lightweight + higher resistance to analysis

ABSTRACT

Caryota urens or Fish tail palm is a plant from Arecaceae family that has been valued for its wide range of medicinal uses.Among botanical treasures, *Caryota urens* is not widely recognized in pharmacology but has demonstrated remarkable potential in various medicinal and ecological applications. It is commonly cultivated as an ornamental tree in tropical and subtropical regions and has long been used in folk medicine for its pharmacological properties. Despite its traditional therapeutic usage, its neuroprotective potential of its fruits remains underexplored. This study addresses the need for natural neuroprotective agents as alternatives to synthetic drugs, which often cause adverse effects. The research aims to evaluate the neuroprotective properties of *Caryota urens* by investigating its bioactive compounds, their mechanisms of action, and efficacy against neurodegenerative disorders. This also involved analysing the extent of *Leucinodes orbonalis* infestation and testing the effectiveness of plant extracts, paving the way for exploring the *Caryota urens* neuroprotective potential in treating neurodegenerative disorders. In-silico analyses including toxicity test and molecular docking provided insights into the interaction of derived compounds with target proteins. These findings suggest that *Caryota urens* may serve as a promising candidate for the development of neuroprotective agents.

Keywords: *Caryota urens*, GC-MS, *Leucinodes orbonalis*, Neurodegenerative potential, Molecular docking.

INTRODUCTION

Caryota urens is also known by various common names including Solitary fishtail palm, Kithul palm, Toddy palm, Wine palm, Sago palm, and Jaggery palm and native to the Indian subcontinent and Southeast Asia. Its distinctive bi-pinnate leaves, clustered at the top, fish-tail-shaped leaflets. The fruit's fleshy part contains needle-like crystals causing a burning sensation as a defense. The species name "*urens*," derived from Latin, means "stinging" or "burning," referring to irritating chemicals in its fruit that protect the plant. *Caryota urens* is a plant traditionally valued for both food and medicinal uses, particularly in tropical and subtropical regions where it is often cultivated as an ornamental species. Despite limited recognition in pharmacology, this plant has been utilized in folk medicine for treating various ailments such as poisoning, fever, rheumatism, ulcers, migraines, and headaches. Its therapeutic potential is attributed to a range of bioactive compounds that exhibit antioxidant, anti-diabetic, anti-fungal, anti-inflammatory, and antimicrobial properties [4]. Beyond its medicinal and ecological roles, *C. urens* is important economically, especially in rural communities where the plant's sap is processed into toddy, jaggery, treacle, sago production and other value-added products [10]. Despite traditional use and preliminary evidence, the active constituents and mechanisms remain unclear, highlighting the need for scientific validation in neurodegenerative research. In-vivo test on worms surprisingly showed signs of paralysis, indicating further in-silico investigations into neurodegenerative disease pathways. These computational analyses provided insights that the compounds might interact with molecular targets relevant to neurodegeneration, revealing the plant's compelling neuroprotective potential. Collectively, these investigations seek to validate and expand the traditional uses of *C. urens* while providing a scientific basis for its therapeutic potential. Collectively, these investigations seek to validate and expand the traditional uses of *C. urens* while providing a scientific basis for its therapeutic potential. Despite the promising results from preliminary studies and its longstanding inclusion in folk medicine, more comprehensive research is essential to understand the pharmacodynamics, pharmacokinetics, and clinical efficacy of this plant's bioactive compounds. Such research will contribute significantly to botanical medicine and support the development of novel, plant-based therapies, and particularly targeting neurodegenerative diseases. The objective of this study involves collecting fruits of *Caryota urens* to evaluate their therapeutic potential. Compounds will first be extracted using a Soxhlet apparatus and subjected to preliminary phytochemical screening for secondary metabolites. The bioactive components will then be identified through GC-MS analysis. Further, the extracts will be tested for bio-efficacy against *Leucinodes orbonalis* infestation. Finally, in-silico toxicity will be assessed using Swiss ADME, and neuroprotective potential will be evaluated through docking studies against neurodegenerative disease targets.

MATERIALS AND METHODS

Systematic Position

Kingdom : Plantae
Class : Liliopsida
Order : Arecales
Family : Arecaceae
Genus : *Caryota*
Species : *Caryota urens*

Collection of Plant Material

Fruits of *Caryota urens* were obtained from PSG College of Arts & Science, Coimbatore, Tamil nadu, India.

Preparation of Plant Extract

Fruits were washed, chopped and dried in oven at 40^0 C for 20 minutes and ground to fine powder. 20g sample were extracted with 200ml of methanol using Soxhlet apparatus for 10-12 hours about 12 cycles and it is concentrated, then crude extract is obtained [8].

Fresh fruits were also collected, washed, chopped. 250g weighed in amber colour reagent bottle and soaked in 80ml of 95% methanol at 25^0 C. Bottle was sealed and kept for 3 days with occasional stirring and then filtered using whatman filter paper. [2].

Phase 1- Preliminary Phytochemical Screening

Phytochemical screening of the fruit extract was performed to determine the presence of various bioactive compounds essential for biological significance. Standard qualitative methods were used, such as Wagner's test for alkaloids, Fehling's test for carbohydrates, froth formation test for saponins, Ninhydrin tests for proteins and amino acids, lead acetate test for tannins and phenols, alkaline reagent test for flavonoids, and Liberman-Burchard's test for phyto-sterols and tri-terpenoids. Quinones, steroids, coumarins, gums, mucilage, oils, lipids, resins, glycosides, and anthraquinones were also detected. The results can be further validated through advanced analytical techniques, for their potential applications.[12]

Phase II - Analytical Techniques for Chemical Characterisation

GC-MS ANALYSIS [1]

GC-MS is an analytical technique that separate and identify compounds in samples. The process begins with gas chromatography, where sample is vaporized and carried through a capillary column coated with a stationary phase. An inert gas moves the sample through the column, separating its components based on their boiling points and polarity, each eluting at a specific retention time. These separated compounds then enter the MS, where they are ionized and fragmented, and analysed based on their mass-to-charge (m/z) ratios. The detector provides spectra that reveal both the identity and concentration of the compounds. Thus, GC-MS combines efficient separation and detection, making it powerful for analysing liquids, gases, and solids.

Phase III –Bio-efficacy of Plant Extract against *Leucinodes orbonalis*

Evaluation of Brinjal shoot and fruit borer- *Leucinodes orbonalis* infestation

Systematic position of *Leucinodes orbonalis*

Phylum : Arthropoda
Class : Insecta
Order : Lepidoptera
Family : Crambidae
Genus : *Leucinodes*
Species : *Leucinodes orbonalis*

Description

Leucinodes orbonalis, a moth of Crambidae family is a significant pest of crops related to Solanaceae, particularly eggplant fruit and shoot borer (*Solanum melongena*). The larvae penetrated the shoots and fruits, leading to wilting, fruit damage, and significant loss of yield.

Experimental methods for laboratory study

The efficacy of different types of Plant extract was evaluated on *Leucinodes orbonalis* larvae in the laboratory. The study was conducted for the period of 16-17 hours.

Specifications of treatments

Laboratory experiments used four treatment, placing larvae in Petri dishes. The first plate has one side blank and the other side is filter paper treated with water. The second plate has filter paper treated with extract on one side and blank on the other. The third plate has filter paper with crude methanolic plant extract. The fourth plate method involved treating larvae directly with plant extract and giving them different treatments. Each treatment used two larvae of brinjal shoot and fruit borer. Specific intervals were observed [7].

Phase IV – *In-Silico* Toxicity Assessment and Molecular Docking

Toxicity Test, [9]

In-silico toxicity is a computational method, SwissADME to predict the toxicity of chemical substance based on its molecular structure which evaluates key parameters such as Lipinski's Rule of five –drug-likeness and bioavailability, Blood Brain Barrier (BBB) Permeability – Predicts a compound can cross BBB and potentially cause central nervous system (CNS) toxicity, CYP450 Enzyme Inhibition – potential drug-drug interactions and toxicity, GI Absorption –bioavailability and systemic toxicity, P-gp Substrate prediction - drug efflux and toxicity risk.

***In-Silico* analysis for Neurodegenerative disorder [3]**

Preparation of ligands

The 3D structures of compounds obtained from fruit extract by GC-MS studies were downloaded from Pubchem in SDFformat, converted to PDB and energy-minimized. Structure of cholinesterase inhibitors drug for the Dementia and Alzheimer's disease such as Rivastigmine and Galantamine were retrieved from the Drug bank site in PDB formats.

***In-silico* Toxicity predictions**

The compounds were converted to canonical SMILES and analysed using SwissADME [5],to predict pharmacokinetic and pharmacodynamics properties. Selection was based on Lipinski's Rule of Five for drug likeliness. BBB penetration was assessed using topological polar surface area (tPSA) and lipophilicity (logP). Compounds with tPSA<79Å^{2}and lipophilicity (0.4< logP<6.0) shows high Probability to cross the BBB and access CNS.

Target Prediction

Crystallographic structures of acetyl-cholinesterase (4EY6 with galantamine and 4EY7 with donepezil)were obtained from the PDB[6].Proteins were prepared by adding polar hydrogen and removing water/heteroatoms. Docking studies were carried out using co-crystallized ligands to define active sites, with major compounds docked accordingly.

Docking and screening

Molecular docking was performed using Auto Dock Vina with AChE receptors (4EY6, 4EY7) and inhibitors (Rivastigmine, Galantamine), analysed in BIOVIA Discovery Studio. Docking simulations via PyRx generated multiple poses, and the best Ligand conformations with maximum hydrogen bonds were selected. Binding interactions were visualized and 3D structures obtained using PyMol.

RESULTS AND DISCUSSION

Phase 1- Preliminary Phytochemical Screening

Phytochemical Detection

Phytochemical screening is essential for preliminary evaluation of plant-based drugs to identify bioactive compounds. Table 1 and Fig 3, 4 show the tests, confirming metabolite detection. The analysis confirmed the presence of alkaloids, carbohydrates, saponins, phenols, tannins, gums and mucilage and absence of proteins, amino acids, oils & fats, Anthraquinone in both fresh and dry sample. Flavonoids, quinones, steroids, phyto-sterols, and resins were detected only in fresh samples, whereas tri-terpenoids, coumarins, and glycosides were present only in drysamples. These findings show the qualitative variation of secondary metabolites by the fruit's condition, providing pharmacological significance.

Phase II - Analytical Techniques for Chemical Characterisation

GC-MS ANALYSIS

The GC-MS analysis detected a total of 44 compounds (Figure 5, Table 2), including major compounds like 5-Hydroxymethylfurfural(10.65), Furfural(5.25), 1,3-Dioxolane 2,4,5-trimethyl- (5.22),.beta.-D-Glucopyranose1,6-anhydro-(7.46), 1,6-Anhydro-.beta.-D-glucofuranose(5.71), 2-Furoic acid, TBDMS derivative (6.65) which are known for their medicinal, industrial, and nutritional applications. Furan derivatives indicated sugar degradation with antioxidant properties, while carbohydrate-based molecules such as 1,6-anhydro-β-D-glucofuranose added nutritional value. β-D-gluco-pyranose showed anti-hypoglycemic properties, and 2-furoic acid derivative supported medicinal and preservative applications. Other compounds such as pentadecanoic acid and butanedioic acid offered cardio-protective, antimicrobial, anti-inflammatory, and anticancer activities. Pyranone derivatives suggested sugar oxidation, while various carboxylic acids reflected lipid oxidation and hydrolysis. Overall, these compounds highlight the extract's potential in pharmaceuticals, nutraceuticals, and food industries, recommended further in vitro and in vivo studies to validate the therapeutic potential of these compounds.

Phase III –Bio-efficacy of Plant Extract against *Leucinodes orbonalis*

Effectiveness of Fruit extract by using worm

The experiments were conducted to evaluate the relative efficacy of plant extract against the infestation of brinjal shoot and fruit borer - *Leucinodes orbonalis*. The result of these experiments has been presented in Table 3 and discussed.

Interpretation of Worm Activity That Causes Death and Paralysis

Treatments were applied in four combinations of Petriplate as shown in Fig 8 and their effects were evaluated. The effect of worms was observed on the mortality of larvae under laboratory conditions.According to the experiment, worm activity was significantly impacted by the fruit extracts both fresh and methanolic as well as the fruit sample that was sprayed on the worms. At first, every worm was active on every plate. However, the worms in the treated plates (Petriplate 2, 3, and 4) stopped moving by 4 PM, a sign that paralysis had occurred. On the other hand, the control plate (Plate 1) stayed active for a longer amount of time, demonstrating that the treatments were the cause of the results that were seen. Some worms gradually resumed their activities, indicating that the paralysis may have been reversible at some points. Some worms formed a cocoon around themselves during the paralyzed stage after six hours (8:30 PM).

However, by the following morning, upon checking, they had regained activity. But by 11:30 AM the next day, every worm on every plate was listed as dead. This suggests that long-term exposure to the fruit extracts caused permanent paralysis, which ultimately resulted in death as seen in Fig 9. Interestingly, worms exposed to the methanolic extract displayed inactivity earlier than those treated with the fresh fruit extract, suggesting that the methanolic extract had a greater or longer-lasting effect. Overall, the results indicate that the fruit extracts under examination contain bioactive substances that can cause worms to become paralyzed and die. The test worms were not killed but showed signs of paralysis or fluid leakage (oozing out) for approximately 30 minutes before potential recovery. This suggests that while the compound affects neuromuscular function.

Phase IV – In-Silico Toxicity Assessment and Molecular Docking

Toxicity Study

In-silico toxicity was performed to predict mutagenicity, carcinogenicity, hepatotoxicity, and cytotoxicity of compounds, providing a faster alternative to experimental testing. Toxicity screening using SwissADME showed that 34 compounds passed the safety evaluation, while some (e.g., 4-Nonene, Linoelaidic acid, cis-Vaccenic acid, Undec-10-ynoic acid undecyl ester) were excluded due to toxicity under Lipinski's rule. Furthermore, 2-Furoic acid, TBDMS derivative, Oxirane, [(dodecyloxy) methyl]-, Pentadecanoic acid, Furan, 2-pentyl-, 4-[3-(4-Fluorobenzyloxy) propyl]-1H-imidazole, Cirsiumaldehyde possess CYP inhibition. Several compounds like Furfural, 2-Furanmethanol, Methyl

isobutyrate, 2-Cyclopenten-1-one, 2-hydroxy- , 2- Furan carboxaldehyde, 5-methyl-, 1,4-Butanediol, diacetate, 4-Nonene , Methyl 2-furoate, 2,2-Dimethyl-3-heptanone, Butanoic acid, 2-methyl-3-oxo-, ethyl ester, 1,3-Dioxolane, 2,4,5-trimethyl-, Decanoic acid, 3-methyl-, Cyclohexanol, 2-methyl-,2-Furanmethanol tetrahydro- acetate, Pentanoic acid 2-methyl-1-methylpropyl ester, 2-Furoic acid TBDMS derivative, Oxirane, [(dodecyloxy) methyl]-, Pentadecanoic acid, Furan, 2-pentyl-, Pentadecanoic acid, Furan, 2-pentyl-, 4-[3-(4-Fluorobenzyloxy) propyl]-1H-imidazole, Cirsiumaldehyde revealed BBB Permeability, indicating potential pharmacological relevance.

***In-Silico* Molecular Docking Studies for neurodegenerative disease**

An *In-silico* molecular docking was conducted on 42 identified compounds against two neurodegenerative Disease targets (PDB IDs: 4EY6, 4EY7). Compounds were docked at active sites of two enzymes, all showing acceptable binding scores.To validate the BIOVIA Discovery Studio software, re-docking the 3D crystal structure of recombinant Human Acetyl cholinesterase in Complex with Galantamine (4EY6),Donepezil (4EY7) using Cholinesterase inhibitors as Galantamine, Rivastigmine. Among two different protein structures, 4EY7 with these two inhibitors shows highest binding affinity in Autodock Vina software shown in (Table 5). Amino acids residue of 4EY7 with two inhibitors, Galantamine-amino acid residue relates to standard drug Donepezil - amino acid residue interactions were similar.

Table 4 shows Galantamine has the highest binding affinity (-9.1 kcal/mol) with 4EY6, despite only one hydrogen bond, suggesting other stabilizing interactions. Rivastigmine and compound 6422125 had a moderate affinity (-7.5 kcal/mol), with multiple stabilizing hydrogen bonds. Compound 12366272, formed the most hydrogen bonds (five), but had slightly lower affinity (-7.3 kcal/mol), indicating hydrogen bonding alone does not determine binding strength. Compound 5282457 (-7.1 kcal/mol) and compound 13849 (-6.6 kcal/mol) had weaker interactions. 6422125 emerge as promising candidates for Galantamine, Rivastigmine, and for further study.Docking result for 4EY7 target (table 5),showed Galantamine interacts with ARG A: 246 and GLU A: 285 via two hydrogen bonds, with greatest binding affinity (-10.2 kcal/mol). Rivastigmine comes next (-7.9 kcal/mol) despite no hydrogen bond. Compounds showed the highest binding affinities (-7.8 kcal/mol) among the studied compounds were 5282457 and 6422125, suggesting that they should be investigated further. The most hydrogen bonds were generated by PubChem ID 12366272, which interacted with TYR A: 124, SER A: 125, SER A: 203, ALA A: 204, and GLY A: 122, indicating strong binding stability. The compounds have different amino acid interactions, with TYR, SER, ASP, GLU, and ALA being important residues.

DISCUSSION

The research focuses the neuroactive potential of *Caryota urens*, comparing previous leaf extract studies with my investigation of fruit extract. [3]reported that ethanolic leaf extract exhibited antidepressant, anxiolytic, sedative, and anticonvulsant effects in murine assays, likely mediated by GABAergic modulation comparable to diazepam. In contrast,fruit extract revealed neuro-disruptive effects in worm assays and strong cholinergic inhibition, with several phytochemicals showing high binding affinities to AChE (PDB: 4EY6, 4EY7), comparable to drugs like galantamine. Similarly, [9] investigated synthetic drugs and nanoparticle formulations of *Areca catechu*, confirming anti-AChE/BChE activity aligned with known pharmacodynamics. While earlier studies emphasized known pathways and behavioural models, this research on highlights novel neuroprotective potential through cholinergic interactions. By Exploring unexplored metabolites of *C. urens*, it demonstrated AChE binding affinities comparable to galantamine, suggesting that plant-derived compounds may rival or surpass synthetic drugs. Thus, *C. urens* emerge as a promising candidate in neurodegenerative disease research and nature-inspired drug discovery.

CONCLUSION

This study found that secondary metabolites from *C.urens* possess promising neuroprotective properties because they strongly interact with the acetyl cholinesterase (AChE) protein structures (4EY6 and 4EY7). These interactions, comparable to standard drugs like Rivastigmine and Galantamine, suggest that they are potential therapeutic agents

for neurodegenerative diseases. The findings are a solid foundation for further research, but we need more in vitro and in vivo studies to confirm their effectiveness and mechanisms. Despite limitations, their promising neuroprotective effects are worth investigating further for the development of alternative treatments for neurodegenerative disorders.

ABSTRACT

In the evolving field of novel drug synthesis from medicinal plants, the bioactive compounds in *Leonotis nepetifolia* remain underutilized due to various challenges. To harness its medicinal potential irrespective of cropping behavior, genetic improvement of the germplasm is essential. This study developed an efficient callus induction protocol using machine learning algorithms to induce a callus with maximum weight. The explants were treated with different levels of BAP, NAA, and kinetin, resulting in eighteen treatments based on CCD-RSM design and models were formulated to predict the callus weight using Quadratic Regression (QR), Support Vector Regression (SVR), Gaussian Process Regression (GPR) and Artificial Neural Networks (ANN). The best model, BR-ANN, was used to optimize the callus weight using Particle Swarm Optimization (PSO), which identified an optimal combination of 2 mg/L BAP, 0.68 mg/L NAA, and 0.77 mg/L kinetin, yielding the heaviest callus at 4.39 grams. This study provides the first comprehensive comparison of distinct modeling methodologies to estimate the best combination of growth regulators for callus induction of *Leonotis nepetifolia*, offering a strategic pathway for bioactive compound production and genetic improvement.

Keywords: Callus induction, *Leonotis nepetifolia*, Optimization, Machine Learning, Neural network.

INTRODUCTION

Leonotis nepetifolia, commonly known as "lion's ear" or "klip dagga," is a fascinating and distinctive plant that hails from the mint family, Lamiaceae. Native to tropical regions of Africa, India, and Southeast Asia, this herbaceous perennial has gained popularity worldwide for its striking appearance and a long history of traditional medicinal and cultural uses. With its vibrant clusters of tubular orange-red flowers and aromatic foliage, *Leonotis nepetifolia* has not only captivated the eyes of garden enthusiasts but also intrigued herbalists and ethnobotanists alike due to its potential therapeutic properties. Previous studies declared that several pharmacological properties comprised of Labdane diterpenes, Bis -spirolabdane diterpenes, Flavonoids in leaves; Fatty esters and Allenic acid in seed oil; Iridoids, Iridoid glycosides, Phenylethanoid glycosides in stem; Coumarin in whole plant extracts with biological activities like Anti-Inflammatory, Antioxidant, Sedative and Relaxant, cytotoxic, and antiviral properties[1],[2]. Though this species has copious values it has been still an underutilized plant. In certain places this crop was considered as an environmental weed due to its potency being widespread which may destroy the native species. To make it worth without disturbing the native canopy was a chore for researchers.

In vitro propagation is the best way to improve the underutilized medicinal plant as well as conservation of genetic resources from exploitation. Production of novel drugs from these kinds of medicinal plants has been achieved by callus culture, and cell suspension culture, which are highly consistent methods of cell proliferation for phytochemical production [3]. With this approach we can multitude the required compounds in abundant by employing some elicitors cum callus culture technique[4].The utilization of individual plant growth regulators in medium optimization for callogenesis, often results in inefficient outcomes, due to its the complex nature, influenced by both genetic and environmental factors [5].

Studying the influence of independent variables one at a time requires more experimental trials, making it a time-consuming process. In order to explore the design space effectively with a minimum number of trials, Design of experiments (DOE) has been utilized in many previous studies. DOE aids in choosing the combination of the levels of various input parameters that need to be performed in order to effectively explore the design space, which in eventuality aids in the effective modeling of the process. Earlier studies have employed Response Surface Methodology (RSM) to explore the plants' capacity for synthesizing secondary metabolites. The robustness and reliability of RSM have also led to its utilization in prior studies for the in vitro analysis and optimization of culture media [6],[7]. This methodformulates a mathematical model by exploring the design space with respect to the factors considered and their corresponding values for the desired response in the preliminary studies [8],[9]. A central composite design (CCD) stands out as the most pertinent technique within the realm of Response Surface Methodology (RSM), used to acquire data that typically yields a satisfactory representation of the majority of continuous-response surfaces via a suitable regression model[6],[10],[11],[12].

Quadratic regression models sometimes fail to accurately address the behavior of certain systems due to their high complexity, but recently, machine learning (ML) and artificial intelligence methods have successfully predicted the behavior of complex systems. Sadat-Hosseini M. *et al.* 2023 had successfully studied the possibility of using machine learning algorithms, such as Gene Expression Programming, Support Vector Machine (SVM), and Gradient Boosting Decision Tree, for estimating the optimal culture media composition for regeneration of *Salvia macrosiphon Boiss*. The formulated models were compared and the best performing model had been used to optimize the set of input parameters with the aid of Particle Swarm Optimization algorithm (PSO)[13]. Aasim *et al.* 2022 had also utilized ML algorithms of SVM, Gaussian Process Regression (GPR), XGBoost, and Multi-Layer Perceptron neural network to optimize and improve the breeding of common bean[14].

The task of finding the optimum levels of the independent parameters, with the aid of the formulated meta models, that will produce the highest possible response can be highly complex and computationally intensive. This colossal task can be tackled with the aid of metaheuristic algorithms which have aided in solving complex optimization

problems in numerous fields[15].Swarm intelligence is one of the most eminent nature- inspired metaheuristics algorithms. PSO is an innovative swarm-based algorithm that has been effective in solving search and optimization problems, without the provision of a global model[16] and it has been used in optimizing developed models in tissue culture with great success [13],[17].

Nonetheless, until recently, no studies have been conducted that involved a comprehensive comparison of distinct modeling methodologies to anticipate the constituents of the MS medium for callus induction of *L. nepetifolia*. In the current study, SVM, ANN and GPR models were formulated and compared with a Quadratic regression (QR) model and the best model chosen was optimized with the aid of PSO. The research objectives of the present study are: i) Developing models using SVM, ANN, GPR and QR to predict the weight of the callus, ii) Comparison & selection of the best model that addresses the non- linear relationship between various growth hormones and their responses in terms of callus weight and, iii) Optimizing the selected model with the aid of PSO and validate the response of the chosen combination of growth regulators.

MATERIALS AND METHODS

Germplasm and sterilization

Healthy wild plant propagules of *Leonotis nepetifolia* were procured from kalvarayan hills of kallakurichi district at Tamil nadu located at an altitude of 609.6–914.4 m m.s.l. Meristematic tissues of healthy plantlets were excised and sterilized. The sequential sterilization has been done with the help of 1% Mancozeb® solution along with 0.5% captan® for 15 min followed by thrice washing with sterile distilled water. Additionally, the plant portions were subjected to 0.5% of sodium hypochlorite (NaOCl) solution for 5 minutes followed by thorough washing with sterile distilled water for three times.

Culture medium and conditions

Explant segments from 35 days old plants were utilized as explants for the current study. Aseptic explant portions were inoculated on a MS medium [18]containing 30 g l^{-1} sucrose and 4 g l^{-1} phytagel, with varied combination and concentration of 6-Benzylaminopurine (BAP), Kinetin (Kin.) and Naphthalene acetic acid (NAA). The pH was altered to be in the range of 5.6 to 5.8 with the help of 0.1N NaOH or 0.1N HCl after addition of the plant growth hormones and autoclaved at 121°C for 15 min. The culture condition was maintained at 25 ± 2°C light under 16/8 h of photoperiod with 25 μmol/m^2/s light intensity.

Experimental Design

Based on previous studies[19],[20],[21],[22]the most commonly used growth hormones and the concentrations of the said hormones that could yield the ideal results are mentioned in Table 1. A face-centered Central Composite Design (CCD) was used to create a design matrix with 18 trial runs for the specified parameters, and is tabulated in Table 2 along with the obtained responses. For each treatment, six Explant segments were inoculated in a Petri dish containing full-strength MS medium supplemented with varying concentrations of growth regulators. Each treatment was replicated across four Petri dishes, resulting in a total of 24 explant segments per treatment and the average fresh weight of the calli was recorded.

Modeling Techniques

Callogenesis is a complex phenomenon, thus making it tough to address all the co-dependencies with a model, and it has been noted from previous studies that there is no one-size-fits-all algorithm type that is best for solving a complex problem [23]. Hence, in order to ascertain the accuracy of the process of predicting callus weight, four distinct methodologies such as the Quadratic Regression model formulated via RSM as stated prior, Artificial Neural Networks (ANN), Support Vector Regression (SVR) and Gaussian Process Regression (GPR) have been selected.

Quadratic-Regression Model

The method of Quadratic regression was utilized to form a function that represents the callus weight based on the concentrations of the growth regulators viz. BAP, Kin. & NAA. The general form of the 2nd order polynomial that depicts the response surface formulated for the three operational parameters considered in the current study is given in Eq.(1) [24].

$$Y = \beta_0 + \beta_1 BAP + \beta_2 NAA + \beta_3 Kin + \beta_{11} BAP^2 + \beta_{22} NAA^2 + \beta_{33} Kin^2 + \beta_{12} BAP * NAA + \beta_{13} BAP * Kin + \beta_{23} NAA * Kin \quad (1)$$

The term "Y" in Eq.1 represents the dependent variable which is the callus weight in the present study, while the independent variables are represented by the other terms. The coefficient terms β_0 is the intercept, the terms β_1,β_2&β_3 represent the individual impact of the factors, while the coefficients β_{11}, β_{22}&β_{33} represent the quadratic behavior of the model and the terms β_{12}, β_{13}&β_{23} signify the interaction effects of the independent parameters with each other.

Bayesian Regularized - Artificial Neural Network (BRANN)

ANNs are designed to replicate the learning processes of the brain by mathematically simulating the interconnected node cells within its network structure. The number of layers, nodes and the weights of each node in the network are used to calculate and model complex problems. The problem of overfitting of the trained model can be overcome by regularizing the formulated ANN and hence Bayesian-Regularized ANN (BRANN) was chosen due to its resistance to over-fitting and its ability to produce sound results in spite of a small and noisy data set [25]. The BRANN trained was a two-layer feed forward network with three nodes in the input layer, ten nodes in the hidden layer followed by one node in the output layer. The structure of the trained BRANN is illustrated in Figure 1, and it was trained and validated on 85% of the data from the trials conducted and remaining 15% of the data was utilized for testing the model's efficacy.

Support Vector Regression (SVR):Support vector machines (SVMs), pioneered by Vapnik, are potentand readily interpretable machine learning algorithms[26].Though extensively used in the fields of engineering owing to its robustness against ambiguous data and its ability to work with small training data it has been seldomly used in plant tissue culture[27],[28]. The general form of the equation that aids the Support vector regression (SVR) in estimating the responses is given below*:*

$$Y = W^T X + b \quad (2)$$

The SVR used in the present study was trained on Gaussian kernel function wherein the kernel scale was set to be a fourth of the square root of the number of predictors and to avoid overfitting with the training data, the model was trained with a five-fold cross validation.

Gaussian Process Regression (GPR):It represents a non-parametric Bayesian methodology [29]for addressing regression problems. GPR models work by assuming that the data points are correlated with each other, leveraging a kernel function to measure the similarity between different inputs. By employing a theoretically infinite number of parameters and leveraging Bayesian inference, this approach proficiently simulates the complex relationships between inputs and outputs, enabling the data to dictate the appropriate level of complexity. The current GPR was trained with a squared exponential kernel function with a five-fold cross validation just like the SVM model.

Comparison and Selection of the superior Model

The efficiency of the four models formulated were compared on the basis of minimum estimation error based on Root Mean Square Error (RMSE) and a maximum determination coefficient (R^2) as given in Equations 3 and 4. The model with the least RMSE and the maximum R^2 was chosen to be used for optimization.

$$RMSE = \sqrt{\frac{\sum_{i=1}^{n}(y_i - \hat{y}_i)^2}{n}} \quad (3)$$

$$R^2 = 1 - \frac{\sum_{i=1}^{n}(y_i - \hat{y}_i)^2}{\sum_{i=1}^{n}(y_i - \bar{y}_i)^2} \quad (4)$$

Optimization and Validation

The model with the optimum RMSE and R^2 values that had been selected is optimized with the aid of PSO algorithm. The PSO algorithm simulates social behavior by having particles traverse the solution space, fine-tuning their positions depending on their own best-known positions and the global best position discovered by the swarm. Every individual particle updates its position and velocity iteratively to traverse the search space and converge towards the optimal solution, and the sequence continues until a stopping criterion is met as depicted in Figure 2. The population of the swarm was taken as 100, with an initial inertial value of 1 which was damped after every iteration by a factor of 0.8 to ensure a thorough sweeping of the design space. The personal (c1) and social acceleration factors (c2) were both kept as 2.05 [30]. The ideal in vitro conditions to attain the maximum possible callus weight as determined by PSO were confirmed by a validation experiment. The validation experiment was also performed thrice and compared with the results estimated by the model.

RESULTS AND DISCUSSIONS

Experimentation and Quadratic Regression (QR) model:

The three-level, three-factor CCD-RSM design matrix that was formulated along with the obtained responses is tabulated in Table 2. The 18 treatments in the proposed design include, 8 factorial points to evaluate main and interaction effects, 6 axial points to capture non-linearities, and 4 center points to estimate model error. The average value of the callus weight in grams tabulated in table 2 was utilized to formulate the second-order polynomial regression equation below that represents the induced callus weight. The model represents the relationship between the callus weight and the combination and concentration of the three growth hormones.

Callus weight = 3.56107 + 0.619 * BAP + 0.346 * Kin + 0.255 * NAA + 0.06625 * BAP * Kin + 0.13375 * BAP * NAA + 0.06625 * Kin * NAA + 0.0453571 * BAP^2 - 0.609643 * Kin^2 - 0.704643 * NAA^2 (4)

To validate the formulated numerical model and the ANOVA analysis, the normality of the response values and residuals was assessed. As shown in Figure 3, the residuals plotted on the normality plots closely align with the reference line, indicating the normality of the residuals and confirming the suitability of the responses for ANOVA. The predicting capability of the QR model formulated is assessed with the aid of ANOVA table and is depicted in Table 3. The determinant coefficient (R2) of the model was found to be 0.9534 which implies that the model has addressed 95.34 % of the uncertainty. The model is accepted to be statistically significant if the p-value of the model is less than 0.05 [31],[32]. The high p-value for the lack of fit also implies that the model was able to predict the experimental runs with a high accuracy.

The ANOVA analysis of the numerical model reveals the significance of the individual growth hormones and also their interaction effects on the callus weight. BAP was found to have a superior impact on the induced callus than the other two hormones followed by Kinetin and NAA in order as evident from the f and p values. Another notable observation made was that the interaction effects between NAA and BAP was found to have a comparatively profound impact on the weight of the callus. The response surface plots exemplifying the interaction impact of different combinations of the independent parameters is shown in Figure 4(a) - (c). Figure 4(a) clearly demonstrates that the maximum callus weight was obtained when NAA is in the vicinity of 0.5 - 1.5 mg/L and BAP is in between 1.5-2 mg/L. Figure 4(b) also demonstrates a similar trend wherein BAP in the range of 1.5-2 mg/L and Kinetin in between 0.5-1.5 mg/L induced a heavier callus. The impacts of Kinetin and NAA are depicted in Figure 4(c) which displays the range of Kinetin and NAA that produces the best results as 0.5-1.5 mg/L for both the growth hormones.

Comparison and Selection of superior model

The efficiency of the trained models was compared using the determinant coefficient (R^2) and root mean square error (RMSE) as the performance measures [5],[33]. The performance measures of the four models are presented in Table 4. The model with the highest R^2 and the lowest RMSE is the BR-ANN and it is chosen for optimization. The scatter plot of the predicted vs actual values of all the individual callus weight obtained by the BR-ANN model illustrated in Figures 5 (a) - (c) shows a good correlation between them as seen by the R^2 values of the training, test and the model.

Optimization and validation of callus weight

The BR-ANN model, which has been chosen as the superior model, was optimized using Particle Swarm Optimization (PSO). The soundness and efficacy of optimization of ANN model with PSO as an exploration algorithm for optimizing numerous in vitro culture systems have been ascertained in many previous studies [34],[35]. PSO explored the design space with the aid of the BR-ANN model and proposed that 2 mg/L of BAP, 0.68 mg/L of NAA and 0.77 mg/L of Kinetin will likely induce the heaviest callus with a weight of 4.47 grams (Table 5). The proposed ANN-PSO optimization model found the ideal combination in the 21st iteration as illustrated in Fig. 6.

The optimum input combination obtained by exploring the design space with the aid of the superior model was conducted as a validating experiment. The difference between the output of the validating experiment and the predicted callus weight was insignificant which reinforces the fact that the proposed model can be deployed for predicting the induced callus weight with high accuracy. The callus induced for the optimal input combination at various time intervals is depicted in fig. 7 (a)-(c).

The current study attempted to increase the weight of the induced callus by varying the combination of plant growth regulators employed. The experimentation phase began with the experimental design formulated as per CCD-RSM and the weight data obtained from all the treatments were used to train four numerical models. The most feasible model chosen was used to aid the search of the design space by PSO and the optimum conditions discovered by PSO was also validated experimentally. The conclusions of the study are summarized as follows: -

- The optimum callus of *L.nepetifolia* with the highest weight of 4.39 grams was induced by employing 2 mg/L of BAP, 0.68 mg/L of NAA and 0.77 mg/L of Kinetin.
- The ANOVA analysis revealed that the growth hormone with the highest impact on the callus weight was BAP, followed by Kinetin and NAA in order.
- The interaction between BAP and NAA were found to have a profound impact on the callus weight statistically as per the results obtained from ANOVA.
- The Bayesian Regularized Artificial Neural Network was the most compatible model for predicting the weight of the induced callus of *L. nepetifolia.*

ACKNOWLEDGMENT

Authors are gratefully acknowledging the management of Faculty of Agriculture, Annamalai University, India, for the laboratory facilities. We declare that no funding, grants, or other support was received during the preparation of this manuscript.

Author's Contributions

M. Merlin Monisha: Laboratory work, Material preparation, Data collection and analysis, Manuscript preparation.
Dr. M. Prakash: Data analysis, Manuscript preparation and revision.

Declaration of Competing Interest

The authors declare that there is no conflict of interest.

Funding

This research was not supported by any grant from funding agencies in the public, commercial, or not-for-profit sectors.

ABSTRACT

This article studies the leadership and miasmatic aspect of person. Very little was known about the Etiology and pathogenesis of any disease during the Hahnemannian era. include infectious acute diseases. Miasms represented the cause of disease for Hahnemann. Originally derived from the Greek word for taint or flaw, the term "miasm" was originally used by Hippocrates before Hahnemann. Objective the study aims to evaluate miasmatic aspect in the school's principal. Methods: the study involved two participants who have same designation i.e. school principal. These participants were interviewed and questioned which was pertaining to miasm, the homoeopathic concept. Results & Discussion: This study used a qualitative observational approach in a comparative case study. Here, the author conducted a structured, qualitative, non-participant observational study. Originating from the Greek word meaning taint or flaw, the term "miasm" was first used by Hippocrates. Conclusion: Every medicinal stream is contributing future of the society as well as the country in different ways. In homoeopathy miasm is one of the keys to crack the case with prognostic aspect. With help of miasmatic knowledge physician can help patient and society.

Keywords: Homoeopathy, Miasm, sycotic miasm, school principal leadership, prognosis

INTRODUCTION

This article studies the leadership and miasmatic aspect of person. By examining data from the World Health Organization on causes of death from the last decade, it is clear that non-communicable diseases and lifestyle-related issues have become leading causes of death.Very little was known about the Etiology and pathogenesis of any disease during the Hahnemannian era. include infectious acute diseases. Miasms represented the cause of disease for Hahnemann. Originally derived from the Greek word for taint or flaw, the term "miasm" was originally used by Hippocrates before Hahnemann [1]. Hahnemann categorized psora, syphilis, and sycosis as the three main miasms. He mentioned it in organon of medicine aphorism 78, 79 and 80 in 5th edition.

Miasm is a dynamic energy that is invisible. Each person has their own miasm. The first point for a miasmatic infection is the person's susceptibility. Disease occurs when the vital force is disrupted by miasmatic influence [2]. According to the miasmatic theory of sickness, miasma is what causes diseases. There are only three types of miasm: syphilis, psora, and sycosis [3]. In the Organon of Medicine, Dr. Hahnemann stated that syphilis represents cell death during a sick condition, sycosis represents cell proliferation, and psora represents inflammatory changes in the cell during a disease. He asserts that "all chronic diseases have miasm at their core."

This is reiterated and confirmed by modern science if miasm is understood as defense of organism. The modern pathology confirms that all the disease pathology has its base on defensive response to stimulus by the cell. There is basic three defense of cell, physiological defense, constructive defense and destructive defense. the mental attitudes mentioned by Hahnemann match with the mental coherent from the above defense on mental plane [6]. He also explains about mental diseases in aphorism 210 to 230 mainly about Psychosomatic disorder in aphorism 225 in 6th edition of Organon of medicine. He said in mental disease that every disease seen on mental plane or physical plane. Homoeopathy offers an approach that could play a significant role in enhancing the Psychotherapeutic process [7]. In this time all individual who are taking responsibilities are observed under any pressure i.e. social, professional, psychological etc. due to haphazard life style. These life styles also depict disease either on mental or physical level.

Psoric personality: they are impractical thoughts and hypo-confidence that results in anxieties and all varieties of fears, Thoughts and words overflow in the mind, quick and active in their motions, become easily fatigued both mentally and physically, Weakness of memory, hurried person etc.

Disease from Psoric miasm: dryness, lustreless hair, tartar of teeth, lack of digestion, Allergic rhinitis, bronchitis, tonsillitis, Acute appendicitis without any secondary infections Viral meningitis; Encephalitis, Acute functional gastritis, All acute inflammatory conditions of various parts of the body without any secondary infection.

Psoric in general: desires for a variety of food and drinks with tangy tastes. He loves sweets sleep is sound and in morning he awakes refreshed, may have many dreams but that are not disturbing, chilly person. Sycotic personality: they are hyper-workaholics, cannot find the right words and if he does, he is not sure whether they are right, always suspicious, cunning and practical, active memory and are able to record everything, cannot remember recent happenings but can recall past events, extrovert person, etc.

Sycotic in general: short, obese, with false plethora, craves meat and other calorific food like butter, cheese and likes beer. Sleeps a lot but is not fresh after sleep.

Disease from Sycotic miasm: ODC, obesity, nasal polyp, stiffness, osteo-arthritis, warts, thickening of skin, corns, edema, urticarial rashes, keloids, vesicular eruption, hyperpigmentation, tumors, tendency to calculi formation, Hypertension; Cerebral thrombosis; Hyper Lipidemic; Atherosclerosis, Rheumatoid arthritis, Diabetes mellitus, Renal stones, PCOD, Fibroids Chocolate cyst or any Dysmenorrheal diseases etc.

Characteristics of syphilis: they are the most important ones are degeneration, dissolution, perversion, or destruction. Syphilis symptoms include being mentally heavy, dull, and particularly stubborn, as well as being intellectually slow to react. Forgetfulness, introvert person. In general, syphilitic people are short, weak, withered, and prematurely old; they may also have congenital diseases or deformities, have baldness and early hair loss, and crave stimulants like alcohol, beer, wine, tobacco, etc. Sleep is really bad, resulting in anxious dreams and hazy thoughts that aren't rejuvenating.

Disease from Syphilitic miasm : suicidal disposition, depression, ulceration, cracks, fissure, dental caries, pyorrhoea, chronic alcoholism, arthritic deformities, abscess, vitiligo, cerebral degeneration, demyelinated disorders, disseminated sclerosis, CVA, paralysis, coronary thrombosis, infarct, valvular disorders, hypertension, Reynolds's disease, emphysema, bronchiectasis, cirrhosis of liver, SLE, renal failure, Repeated abortions, Threatened abortions, ischemia, infarct, necrosis, and gangrene and putrefaction etc [8]. Schools are a critical organizational setting in modern society, and school principals play crucial leadership roles in these organizational settings. The demands faced by school principals overlap with those faced by leaders in other occupational settings. A good school leader can create a supportive school ethos that facilitates positive motivation of teachers and students and lifts academic success [9].

Health of every individual is important. Very common phrase says 'health is wealth'. If your leader is healthy and following healthy life style then rest of society will adopt that phenomenon in their routine. There are certain diseases conditions may come due to occupational hazard or due to faulty life style. With interview of school principal, is there any relationship with miasm, the homoeopathic concept with disease aspect rules out. The study aims to evaluate miasmatic aspect in the school's principal.

METHODS ANS MATERIALS

Two cases selected with basis on their profession. both were on principal post in primary school. their age is same but gender is different. Study design: "Cross-sectional observational study" Setting: Where the study took place (e.g., outpatient clinic, hospital ward) Time frame: Date or period of observation Participants: here, author has observed miasmatic conditions in two participants both are having same age i.e. 52 years and designation i.e. principal post. Data collected: whole case taking is done with miasmatic questionnaire. Tools or instruments: questionnaire.

Case History

Author had taken two participants with same professional background and age with different locality. She took interview of both and asks few questions which were pertaining to miasm as well as their personal aspect which can help us in homoeopathic perspective.

RESULTS AND DISCUSSION

This study used a qualitative observational approach in a comparative case study. Here, the author conducted a structured, qualitative, non-participant observational study. Originating from the Greek word meaning taint or flaw, the term "miasm" was first used by Hippocrates [4]. He believed that miasm-contaminated air and water were the means by which humans contracted several infectious diseases. According to the results of the analysis of the questionnaire on mental general features, participant 1 covered 10 sycotic features and 8 psoric features, while participant 2 covered 9 sycotic features and 8 psoric features and 2 syphilitic features. This indicates that in both individuals, sycotic miasm is more active and may lead to disease related to sycotic miasm.

Hahnemann's 6th edition of Organon throws light of the concept of miasms. Understanding miasms is beneficial for restorative rehearsal. Two primary school principals are questioned as part of the study. According to World Health Organization data, IHD, stroke, and conditions similar to COPD are the leading causes of death in the past ten years. This reflects syco-syphilitic characteristics in the generation, such as destruction and proliferation [5]. This is the main

justification for assessing miasm in each person so that we can quickly rule out their tendencies and traits. This will assist us in educating them about their physical characteristics. We can protect people from serious illnesses early on if we focused on the initial steps.

Limitations

The author of the study conducted interviews with two individuals who shared the same title—that is, the position of principal at the school. Sometimes individuals neglect to look at themselves. Due to their regular job schedules and obligations, these two individuals are experiencing a time crisis. Their answer is obvious and brief form. This is one of the study's limitations. If this study done on many people with same designation so we can give more precise confirmation of miasm and miasmatic aspect of disease condition.

CONCLUSION

Every medicinal stream is contributing future of the society as well as the country in different ways. Homeopathy is a complementary and alternative therapy the use of which is based on the Law of Similia[5]. A key to solving the issue with a prognostic aspect in homeopathy is miasm. Without an understanding of miasm theory, we are unable to choose the most comparable cure. The underlying causes of all ailments are miasms, which are the primary or primitive disorders of the human race [10,11]. Sustaining mental well-being is essential for general productivity and quality of life. Mental health outcomes are greatly influenced by a number of factors, including stress, trauma, heredity, and socioeconomic status. According to research, good school leadership has a major impact on teachers' and students' mental health in addition to academic performance [12].

Declaration of Patient Consent

The author has obtained appropriate patient consent form and also gave detail information about research project. Conflict of interest - No conflicts

ACKNOWLEDGEMENT

The author wishes to acknowledge the guide Dr. K. B. Shah for his constant support. And also wants to thank all subjects for participating in the study, our beloved Dean & principal of JNHMC Dr. Poorav Desai, Dr. Bibhu prasad Panda, principal of PIHR, Dr. Vijay Patel, principal of JJHMC for permitting work in college premises also thanks to Parul University for this research work.

ABSTRACT

This paper examines the thermodynamic characteristics of 4B2PMP (E-4-Bromo-2-[(phenylimino) methyl] phenol) which is a new crystalline compound that was recently synthesized and isolated due to its potential biological activity. The characteristics of two crystals of 4B2PMP were determined systematically and shown to prevent the growth of a variety of bacterial and fungal species. As a new approach of this work is to employed Dempster's Rule of Combination for estimate the thermodynamic parameters, a mathematical theory that is widely implemented in evidence theory and can be used to combine different sources of data to increase the precision of the estimation. To make the computation of these parameters easier, more automated and easier to streamline, a MATLAB program has been created, backed by a well-formulated algorithm that guarantees reproducibility and easy accessibility. The determined thermodynamic values are evaluated and justified critically and can give more insight into the stability and the mechanism of interaction of the crystal. The findings of this work do not only validate the validity of the suggested computational algorithm, but also justify the values with a theoretical basis, both in thermodynamics parameters and crystal structures.

Keywords: Belief Measure, Crystal's parameters, Dempster's Rule of Combination, 4B2PMP Crystal, MATLAB Program.

INTRODUCTION

In this study, Dempster's rule of combination is integrated with Polymorphic crystals because of its strong mathematical foundation and its ability to effectively handle uncertainty and conflicting evidence. The method's ability to combine evidence under the framework of belief functions is well-suited to the objectives of this work. However, traditional probabilistic methods do not adequately capture both their aleatory (randomness) and epistemic (knowledge-based) uncertainties in thermodynamic studies. Dempster-Shafer Theory [1] (DST) provides a robust framework to address this duality. But no crystal specific applications have been developed that data. The integration challenge stems from the evidence fusion capabilities of DST. However, existing research has not focused on accumulating diverse evidence for such systems. Thermodynamic properties such as entropy and enthalpy [2] are often derived from incomplete or ambiguous data. DST can refine these estimates by accommodating inconsistent or imprecise inputs [3], which are still limited in crystallographic studies. Which is an underutilized feature. DST has proven useful in reconciling, but crystal parameters and its application to discrepancies between experimental results and theoretical predictions in thermodynamics remains unexplored.

Few research has done by using evidence theory with various crystals. However, the evidence theory is not used with the (4B2PMP)E-4-Bromo-2-[(phenylimino) methyl] phenol [4]. So, the novelty of this work is to investigate the thermodynamic parameters of 4B2PMP crystals by combining evidence theory. Two polymorphs of 4B2PMP crystals were studied by Krishnapriya, Ida Malarselvi and et.al [5]. In their study, NMR experiments verified the molecular structure of the crystals [6] and the chemical environment of carbon and hydrogen in the proposed 4B2PMP crystal structure. The optical properties of polymorphic crystals have been well investigated. The optical properties of polymorphic crystals have been thoroughly studied. Also, by using differential scanning calorimetry (DSC) to determine the thermal behaviors of the two polymorphic forms using thermodynamic parameters. Furthermore, the impact of the polymorphism on biological activity has been thoroughly investigated in molecular docking against DNA gyrase B of *E. coli*.

Dempster-Shafer theory is used to solve many uncertain problems [7, 8 & 9]. But the drawback of this theory is that the computation processing time is high, since its deals with 2^n subsets. In this paper, we ignoring such a problem by using our generated a MATLAB program [10] to solve the computational complexity easily. The Dempster's rule of combination is used for combine to obtain more reliable parameter information, for the evidence provided by different parameters of polymorphic form-I and form-II. The rest of the paper is organized as follows: Section 2 provides some basic preliminaries. In Section 3 discusses the methodology of4B2PMP Crystal's parameters and the computational algorithm. In addition, we provide a MATLAB tool for the calculation in Section 4. In Section 5, the results and outputs are discussed. Finally, our conclusion is presented in Section 6.

PRELIMINARIES

Frame of discernment

Let X be the universal set in the frame of discernment Θ.

If $M \subseteq X$. Then,

$m(\emptyset) = 0$ and

$\sum_{M \in \mathcal{P}(X)} m(M) = 1$.

Mass function

Assume that combining two independent mass functions, for example m_1 and m_2. In this case, the combined mass function of $m_1$and m_2 is expressed as $m_{1,2}$.

Therefore, The Dempster's rule of combination derived by

$m_{1,2}(M) = m_1 \oplus m_2 = \frac{1}{1-K}\sum_{m_1 \cap m_2 = M} m_1 \times m_2$
where $K = \sum_{m_1 \cap m_2 = \emptyset} m_1 \times m_2$
By using this equation, we compute the belief measure for the obtained data.
Dempster's rule of combination is concerned with two measures, that is, Belief measure and Plausibility measure.

Belief measures:
Let $B = m_1, m_2, \cdots, m_n$. Then the Belief measures are generally defined by Bel(M) where:

$$Bel\ (M) = \sum_{B|B \subseteq M} m(B)$$

Sum of all the belief measures must be equal to 1.

Plausibility measures
Let $B = m_1, m_2, \cdots, m_n$. Then the Plausibility measures are generally defined by Pl(M).
That is,

$$Pl(M) = \sum_{B|B \cap M \neq \emptyset} m(B)$$

METHODOLOGY

This work introduces an improved method that addresses its traditional limitations by using Dempster's rule of combination. By combining the evidence theory with the parameterization of the 4B2PMP crystal, the proposed method ensures better handling of uncertain evidence and provides justification for related research work. Theoretical advances include a new MATLAB program, for the contributions of the results.

4B2PMP Crystal's thermodynamic parameters
Under ambient conditions, single crystals are created using a solution growth process. Form I and Form II single crystals are generated at 283 K and 333 K, respectively. Differential scanning calorimetry was used to measure thermodynamic properties during thermal analysis [5]. Polymorphs change during phase transitions when heated, according to thermal studies. In the Form I DSC curve, an exaggerated endothermic peak at 123.6 ℃ due to melting appears as heating proceeds, and a sharp exothermic peak at 78 ℃due to recrystallization as cooling proceeds. In the Form II DSC curve, the melting of the compound reaches an endothermic peak at 123.4 ℃, and recrystallization is observed in the presence of exothermic peaks at 86.6 ℃. This DSC data is used to analyze the thermal behavior of polymorphic crystals using thermodynamic parameters such as enthalpy of fusion (ΔH_f), entropy (ΔS), specific heat capacity (C_p), Gibb's free energy (ΔG), and heat capacity (Q). The parameter values are given in Table 1.

Using Dempster's rule of combination, we estimate the data which we obtained from Table 1.

Algorithm:
Here is the algorithm for computational process.
Step 1. Data Collection
Start with gathering the experimental or simulated data that is in line with the parameters of concern in polymorphic Form I and Form II. These parameters can be structural, thermal, spectroscopic or other measurable characteristics that can differentiate the polymorphic forms. At this point, raw data can have values of various scales, sizes or values.
Step 2. Data Normalization
Values acquired by various parameters cannot be found within a similar numerical range hence normalization should be done. The goal is to rescale all parameter values into the interval [0,1]. It can be normalized in probability normalization. Having normalized them, the parameters of the two polymorphic forms become expressed in a standardized form, which can be further combined using combination rule.

Step 3. Use of Rule of Combination by Dempster.

Having the normalized data, use Dempster-Shafer theory (DST) to find the belief measures. The combination of several pieces of evidence (parameter values) and the computation of combined belief and plausibility measures are made with the help of Dempster rule of combination. This enables it to have a strongerdecision-making process as opposed to using individual parameters on their own.

Step 4. Computational Implementation

A MATLAB program that uses the Dempster rule of combination is used as it is easier to compute and it is not as complex as manual computation. The program takes normalized values as an input, manipulates them based on DST formulas and provides the output of belief measures of Form I and Form II. This is done to provide computational reliability and consistency especially when dealing with huge data or a large number of parameters.

Step 5. Interpretation and Tabulation of results.

The last result of the MATLAB program will consist of the belief measures of Form I and Form II. The findings are then tabulated and arranged in a table format and it will be easy to compare and interpret the strength of evidence behind each form of polymorphism. The tabulated results give a clear picture on the strength with which the data is supporting either polymorphic classification and is the final figure of the computing process.

Rewrittem Code in MATLAB:

In this section a new MATLAB program was generated for the proposed method by using Dempster combination rule and so solve the calculation in easily without any complications

#Finding Total BPA
def sum(A,B,C,D,E,F):
    return (A+B+C+D+E+F)
Z = sum(A,B,C,D,E,F)
print (f'Total of all BPA is {sum(A,B,C,D,E,F)} ')
```

RESULTS

Construct validity of observed values and results are presented in table 3. In the related research the thermodynamic parameters of both Form I and Form II crystals were found, which are provided in table 1, also both the form I and form II crystals have demonstrated outstanding resistance against the E. coli bacteria. We investigated the DSC parameter values of both Form I and Form II using our provided MATLAB Program for Dempster's rule of combination. We verified that the calculated result values were very close to the experimental values of thermal analysis. Therefore, we conclude that form I has a higher affinity for killing E. coli bacteria than form II. We confirm that our calculations are correct, according to their total BPA is equal to 1.

CONCLUSION

We investigated the form I and form II of 4B2PMP crystal's parameter by using evidence theory. Both form I and form II crystals have demonstrated outstanding resistance against the E. coli bacteria in the associated research. By using the DSC parameter values of both form I and form II in Dempster's rule of combination, we have determined which of the two has a stronger binding ability against bacteria. In addition, we developed a new MATLAB tool to simplify these computations. As a result, we confirm that form I has a higher affinity for killing E. coli bacteria than form II. We verified computational result values are very close to experimental values of thermal analysis. which is also we verifying our computations when we get the total BPA is equal to 1.

ACKNOWLEDGEMENT

The authors would like to thank the corresponding research authors of Dr. R. Ida Malarselvi, B. Krishnapriya and all the unknown referees for the guidance and expertise throughout this research work.

ABSTRACT

Tuberculosis (TB) remains one of the world's most persistent infectious diseases, posing significant global health challenges due to the emergence of multidrug-resistant (MDR) and extensively drug-resistant (XDR) strains of *Mycobacterium tuberculosis*. Despite the availability of conventional anti-TB drugs such as isoniazid, rifampicin, and pyrazinamide, treatment outcomes are often limited by prolonged regimens, toxicity, and poor patient adherence. In recent years, extensive research has focused on developing novel therapeutic strategies that enhance drug efficacy, minimize resistance, and improve targeted delivery. This review highlights recent advances in tuberculosis therapy, encompassing new drug molecules, repurposed agents, and host-directed therapeutics. The integration of nanotechnology-based delivery systems, including liposomes, polymeric nanoparticles, and solid lipid carriers, has shown great promise in improving drug bioavailability and site-specific delivery to infected macrophages. Furthermore, natural products and phytochemicals have emerged as valuable sources of bioactive compounds with potent anti-mycobacterial properties. *In silico* drug design and molecular docking approaches are accelerating the discovery of novel inhibitors targeting essential TB enzymes. The review also discusses current challenges in TB management and outlines future directions focusing on personalized medicine, multi-target drug design, and immune-modulatory therapies. By bridging traditional and modern

therapeutic approaches, this comprehensive review aims to provide insights into the evolving landscape of tuberculosis treatment and the potential pathways for achieving effective and sustainable global TB control.

Keywords: Tuberculosis (TB), Mycobacterium tuberculosis, Drug resistant, Anti-tuberculosis therapy, Nanotechnology, Phytochemicals and Novel drug delivery systems

INTRODUCTION

Tuberculosis (TB) caused by the bacterium *Mycobacterium tuberculosis*, remains a major global public health threat despite substantial advances in prevention, diagnosis and treatment over the past century. The disease primarily affects the lungs (pulmonary TB), but can also involve other organs (extra pulmonary TB). According to the latest estimates from the World Health Organization (WHO), in 2023 approximately 10.8 million people (95% UI: 10.1-11.7 million) developed TB illness worldwide, including 6.0 million men, 3.6 million women, and 1.3 million children. Equivalent to 134 new cases for every 100 000 people [1]. In the same year, an estimated 1.25 million people died of TB (including both HIV-positive and HIV-negative individuals) [2]. Tuberculosis (TB): A Continuing Global Threat and Worldwide Impact (2023 Estimates) (Figure 1). These figures are alarming for several reasons. First, they indicate that the downward trend in TB incidence seen in previous decades has stalled or even partly reversed, particularly following the disruptions caused by the COVID-19 pandemic [1]. Second, TB disproportionately affects people in low- and middle-income countries as well as vulnerable populations, such as people living with HIV, malnourished persons, persons with diabetes, the elderly, and those in crowded or poorly ventilated living conditions [2]. Although TB is both preventable and curable, multiple substantial challenges remain that hinder global control efforts. Key factors contributing to the alarming rise of tuberculosis (TB) (Figure 2). The mainstay of TB therapy has long been first-line anti-TB drugs such as isoniazid, rifampicin, ethambutol and pyrazinamide. Classification of Anti TB drugs (Figure 3). These regimens have achieved high cure rates in many settings when applied under optimal conditions. However, evolving factors have eroded their impact: the emergence of multidrug-resistant (MDR-TB) and extensively drug-resistant TB (XDR-TB) strains, long treatment durations (often 6 months or more), high pill burdens, adverse drug reactions, drug-drug interactions (especially in HIV co-infection), and patient non-adherence. Moreover, the health systems in many high-burden settings struggle with challenges in diagnosis, monitoring, and ensuring treatment completion.

Beyond the clinical and biological obstacles, socio-economic and structural determinants play a major role in sustaining the TB epidemic. Under-nutrition, poverty, overcrowding, inadequate healthcare access, stigma, and the co-existence of other diseases such as HIV/TB or diabetes/TB amplify the risk of contracting and poorer outcomes of TB. For example, the WHO estimates that more than half of the TB cases in 2023 occurred in just three WHO regions: South-East Asia (45 %), Africa (24 %) and the Western Pacific (17 %) [3]. A major concern in TB management is the emergence of drug-resistant strains. Multidrug-resistant TB (MDR-TB) and rifampicin-resistant TB (RR-TB) pose significant treatment challenges. In 2022, the estimated proportion of new TB cases with MDR/RR-TB was 3.3%, while 17% of previously treated cases had MDR/RR-TB[3]. These resistant strains require longer treatment regimens, often with more toxic and less effective second-line drugs, leading to increased morbidity and mortality. Traditional TB treatment regimens, primarily consisting of first-line drugs such as isoniazid, rifampicin, pyrazinamide, and ethambutol, have been the cornerstone of therapy for decades. However, their effectiveness is compromised by factors like drug resistance, patient non-adherence, and adverse drug reactions. The standard treatment duration of six months can be burdensome, leading to incomplete treatment courses and the development of further resistance [4]. In response to these challenges, recent research has focused on developing novel therapeutic strategies. Nanotechnology, for instance, has introduced nano carriers such as liposomes, lipid nanoparticles, and polymeric micelles to enhance drug delivery. These nano-carriers aim to improve the bioavailability and targeting of anti-TB drugs, potentially reducing side effects and improving patient compliance [4]. Host-directed therapies (HDTs) represent another innovative approach.

These therapies aim to modulate the hosts' immune response to enhance the body's ability to control and eliminate *M. tuberculosis*. By targeting host pathways involved in inflammation, immune cell recruitment, and autophagy, HDTs seek to complement traditional antimicrobial treatments and reduce tissue damage [5]. The integration of computational tools and artificial intelligence in drug discovery has accelerated the identification of new anti-TB compounds. These technologies enable high-throughput screening and predictive modelling, facilitating the discovery of novel drug candidates that may overcome existing resistance mechanisms [6]. Despite these advancements, the translation of novel therapies from the laboratory to clinical practice remains a significant hurdle. Challenges such as regulatory approval, cost-effectiveness, and scalability must be addressed to ensure that new treatments reach the populations in greatest need [7]. Given this complex and evolving landscape, a comprehensive review of TB therapy is both timely and necessary. On one hand, we must revisit and critically appraise conventional therapies—understanding their successes, limitations, and the contexts in which they still work well; on the other hand, the rapid growth of innovative therapeutic strategies demands attention. These include nanotechnology-based drug delivery systems aiming to improve pharmacokinetics and site-specific delivery; host-directed therapies that harness or modulate the patient's immune system; drug repurposing and novel small-molecule inhibitors targeting mycobacterial and host pathways; computational drug design accelerating lead discovery; and the exploration of natural products (phytochemicals) with anti-mycobacterial effects. In the era of precision and translational medicine, such approaches promise to overcome many of the inherent limitations of traditional therapy [8, 9]. Further more, as we progress toward the goals of the WHO End TB Strategy (which aims for a 90 % incidence reduction and a 95 % reduction in TB deaths by 2035), aligning therapy innovations with real-world implementation in high-burden, a resource-constrained setting is absolutely critical. The gap between discovery and deployment remains an impediment: even the best new drugs or technologies will have minimal impact if they are not accessible, affordable, and adapted to health-system realities. Researchly, it becomes vital to evaluate not just "what works" but "what can be scaled" and "what will make a difference at population level [10]. In this review article, we therefore aim to provide a state-of-the-art overview of TB therapy, spanning from the well-established conventional drugs to cutting-edge innovations. We will address the rationale for reviewing TB therapy now; lay out the current therapeutic landscape including challenges and limitations, review novel approaches with a critical lens, and outline future directions that may define the next generation of TB treatment. By bridging traditional and modern innovations, this review seeks to support researchers, clinicians, and policymakers in aligning therapeutic strategies with global TB control imperatives.

EPIDEMIOLOGY

Tuberculosis (TB) continues to be one of the top infectious disease that kills people worldwide, ranking above HIV/AIDS as a single infectious agent. Despite significant progress in diagnostics, prevention, and treatment, TB remains a global emergency, reflecting complex interactions between biological, social, and economic factors. According to the *World Health Organization (WHO) Global Tuberculosis Report 2024*, an estimated 10.8 million people (95% UI: 10.1–11.7 million) developed TB in 2023, corresponding to 134 cases per 100,000 population [3]. Of these, approximately 6.0 million were men**,** 3.6 million women**,** and 1.3 million children**.** Although TB incidence had declined globally for many years, the trend stagnated following disruptions caused by the COVID-19 pandemic, and incidence rates have now plateaued or slightly increased in several high-burden countries [2].

Global Distribution and Regional Burden

The burden of TB remains unevenly distributed. Nearly two-thirds of the global TB cases occur in eight countries**-** India (26%)**,** Indonesia (10%)**,** China (6.8%)**,** the Philippines (6.8%)**,** Pakistan (6.3%)**,** Nigeria (4.3%)**,** Bangladesh (3.6%)**,** and the Democratic Republic of the Congo (2.9%)[3]. Collectively, the South-East Asia Region accounts for 45% of global TB cases, followed by Africa (24 %)**,** and the Western Pacific (17 %). The Eastern Mediterranean Region (8 %)**,** Americas (3 %)**,** and Europe (3 %) contribute smaller proportions [11, 12]. This geographic clustering mirrors socio-economic inequities such as poverty, under nutrition, poor housing, and limited healthcare access all of which

heighten vulnerability to TB infection and disease progression. Global Tuberculosis Case Distribution by High-Burden Country and Region (Figure 4).

Mortality Trends

Despite being largely preventable and curable, TB continues to cause unacceptably high mortality. In 2022, an estimated 1.25 million deaths were attributed to TB, including both HIV-positive and HIV-negative individuals [2]. TB mortality has declined by approximately 19 % since 2015, yet progress remains insufficient to meet the milestones of the WHO End TB Strategy (aiming for a 90 % reduction in TB incidence and a 95 % reduction in TB deaths by 2035) [13]. The global case-fatality ratio (CFR) remains around 12 %**,** but it exceeds 20 % in some African and South-East Asian countries [13]. Contributing factors include delayed diagnosis, poor treatment adherence, co-morbidities, and limited access to quality care.

Drug Resistance Epidemiology

Drug-resistant TB (DR-TB) poses one of the gravest challenges to TB control. Globally, in 2022**,** 3.3 % of new TB cases and 17% of previously treated cases had multidrug-resistant or rifampicin-resistant TB (MDR/RR-TB) [6]. Approximately 410, 000 people developed MDR/RR-TB, with the highest numbers reported in India, Russia, Pakistan, and China [14, 15]. Treatment success for MDR/RR-TB remains unsatisfactory, averaging around 63 % globally [15]. Newer drugs such as bed aquiline, delamanid, and pretomanid, along with all-oral regimens, have shown promise in improving outcomes, but their accessibility remains limited in low-income settings. Furthermore, the emergence of extensively drug-resistant TB (XDR-TB) defined by resistance to rifampicin, any fluoroquinolone, and at least one Group a drug further complicates treatment and increases mortality [16]. Overview of the epidemiology of drug resistance in tuberculosis Figure 5).

HIV Co-infection and Other Risk Factors

TB remains the leading cause of death among people living with HIV (PLHIV**)**, responsible for about 167, 000 deaths in 2022 [2]. The risk of developing active TB among PLHIV is estimated to be 16–27 times higher than among HIV-negative individuals [17]. Other major risk factors include under nutrition**,** smoking**,** alcohol abuse**,** diabetes mellitus, and air pollution [18]. Collectively, these factors account for nearly half of the global TB burden, illustrating the complex interplay between infection biology and social determinants of health.

Diagnosis and Case Detection

Although TB notification rates have improved, a substantial gap remains between estimated incident cases and those officially diagnosed or reported. In 2023, of the 10.8 million estimated TB cases, only ≈8.16 million were diagnosed and reported, leaving a gap of 2.7 million diagnosed cases [11]. Enhanced implementation of rapid molecular diagnostics (e.g., GeneExpert MTB/RIF Ultra, Truenat) and expanded screening programs are critical to closing this gap. Delay in diagnosis not only worsen patient outcomes but also contribute to on-going community transmission.

The global epidemiology of TB underscores a persistent and uneven disease burden, compounded by the twin crises of drug resistance and co-morbidities such as HIV and diabetes. While incidence rates are stabilizing, the plateau threatens progress toward global elimination targets. Strengthening surveillance, addressing social determinants, and expanding access to new diagnostic and therapeutic innovations remain central to changing the trajectory of this ancient yet still formidable disease.

Current Therapies

Tuberculosis (TB) therapy has traditionally relied on combination chemotherapy to ensure bacterial eradication, prevent resistance, and reduce relapse rates. The cornerstone of TB management remains the use of first-line drugs, namely isoniazid (INH), rifampicin (RIF), pyrazinamide (PZA), and ethambutol (EMB)**,** which collectively form the standard regimen recommended by the World Health Organization (WHO)**.** This four-drug combination, commonly known as the HRZE regimen, is administered over a 6-month treatment course, divided into an intensive phase (2 months of HRZE) and a continuation phase (4 months of HR) [19,20]. Overview of Current Tuberculosis (TB) Treatment Regimens and Drug Resistance Challenges (Figure 6). The mechanism of action for these agents targets

distinct bacterial pathways: isoniazid inhibits mycolic acid synthesis essential for cell wall formation; rifampicin binds to the β-subunit of RNA polymerase, blocking RNA synthesis; pyrazinamide disrupts membrane energetics and fatty acid synthesis; and ethambutol inhibits arabinosyl transferases involved in cell wall biosynthesis [21, 22]. Despite the efficacy of this regimen, its success is often limited by prolonged treatment duration, hepatotoxicity, gastrointestinal disturbances, and patient non-adherence, all of which contribute to the rise of drug-resistant TB (DR-TB) [23, 24].

Drug-Resistant Tuberculosis

The emergence of multidrug-resistant TB (MDR-TB), defined as resistance to at least isoniazid and Rifampicin, and extensively drug-resistant TB (XDR-TB), which includes additional resistance to fluoroquinolones and second-line injectable drugs has become a significant public health concern. In 2022, WHO estimated nearly 410,000 new MDR/RR-TB cases globally, with the highest burden in India, Russia, and China [25, 26]. Second-line anti-TB regimens, often required for MDR/XDR-TB, are considerably more complex, toxic, and expensive. Common second-line agents include levofloxacin, moxifloxacin, amikacin, bedaquiline, delamanid, linezolid, and cycloserine [27, 28]. The inclusion of newer agents such as bedaquiline and delamanid has significantly improved outcomes, shortening treatment duration to 6–9 months in selected regimens, compared to the traditional 18-24 months of therapy [29, 30]. However, access to these drugs remains limited in low-resource settings.

Short-Course and All-Oral Regimens

Recent advances have led to the development of shorter and more tolerable regimens. The BPaL regimen (bedaquiline, pretomanid, and linezolid) and its variant BPaLM (adding moxifloxacin) have demonstrated cure rates above 85% in MDR/XDR-TB patients [31]. These regimens represent a paradigm shift toward all-oral, shorter-duration therapies, eliminating the need for painful injectable agents. For drug-susceptible TB**,** the 4-month rifapentine-moxifloxacin regimen evaluated in the Study 31/A5349 trial demonstrated non-inferiority to the standard 6-month HRZE regimen, paving the way for a potential global transition to shorter therapy durations [32].

Adjunctive and Supportive Therapies

Adjunctive approaches aim to mitigate inflammation, enhance immune response, and improve treatment adherence. Corticosteroids are beneficial in TB meningitis and pericarditis by reducing mortality and complications [34, 35]. Nutritional support, patient counselling, and directly observed therapy (DOT) remain essential components of the global TB control strategy [36].

Novel Approaches

Despite significant progress in tuberculosis (TB) control, current therapeutic regimens remain constrained by long treatment duration, adverse effects, and the emergence of drug resistance. Consequently, research has shifted toward novel approaches aimed at improving drug delivery, reducing treatment time, overcoming resistance, and enhancing host immunity [37]. These modern strategies include nanotechnology-based drug delivery**,** host-directed therapies (HDTs)**,** drug repurposing**,** phytochemical exploration, and computational drug discovery**,** each representing a paradigm shift in TB management [38,39]. Innovative Strategies in Tuberculosis (TB) Management (Figure 7).

Nanotechnology-Based Drug Delivery Systems

Nanotechnology has emerged as one of the most promising frontiers in TB therapy. Various nanocarriers, including liposomes**,** polymeric nanoparticles**,** solid lipid nanoparticles (SLNs)**,** and nanostructured lipid carriers (NLCs), have been employed to improve the pharmacokinetic profiles and bioavailability of anti-TB drugs [40,41]. These Nano systems can enhance drug solubility**,** target macrophage uptake**,** and achieve sustained release, thereby minimizing dosing frequency and systemic toxicity [42]. For example, rifampicin-loaded lipid nanoparticles and isoniazid-encapsulated polymeric nanoparticles have demonstrated improved intracellular delivery and bacterial killing in macrophage models [43]. Furthermore, inhalable nanocarriers and pulmonary delivery systems have gained attention for targeting *Mycobacterium tuberculosis* residing in alveolar macrophages, providing localized high concentrations of drug with reduced systemic exposure [44,45].

Host-Directed Therapies (HDTs)

Host-directed therapies aim to modulate the host's immune response rather than directly targeting the pathogen. HDTs enhance the host's ability to contain infection, reduce immunopathology, and improve treatment outcomes [46]. Key strategies involve the use of metformin, statins, vitamin D, nonsteroidal anti-inflammatory drugs (NSAIDs), and immune modulators such as IL-2 and interferon-gamma [47]. Recent studies have shown that metformin enhances macrophage autophagy and reactive oxygen species generation, thereby inhibiting intracellular *M. tuberculosis* growth [48]. Similarly, statins reduce bacterial burden by altering host lipid metabolism and promoting phagosome maturation [49]. HDTs have also demonstrated synergistic effects when combined with standard anti-TB chemotherapy, potentially reducing treatment duration [50].

Drug Repurposing Strategies

Drug repurposing (also known as drug repositioning) involves identifying new therapeutic uses for existing drugs with established safety profiles. This approach is cost-effective and accelerates the development pipeline [51]. Several non-TB drugs such as linezolid, clofazimine, verapamil, carbamazepine, and fluoroquinolones, have demonstrated promising antimycobacterial activity [52, 53]. Linezolid, originally developed for Gram-positive bacterial infections, is now a critical component of MDR-TB regimens due to its strong activity against *M. tuberculosis* [54]. Similarly, clofazimine, a leprosy drug, exhibits potent anti-mycobacterial effects by disrupting bacterial energy metabolism and membrane integrity [55].

Phytochemicals and Natural Products

Natural compounds derived from medicinal plants have gained renewed attention as potential anti-TB agents due to their structural diversity, low toxicity, and multi-target actions [56]. Flavonoids, alkaloids, terpenoids, and phenolic compounds have exhibited inhibitory activity against *M.tuberculosis* strains [57]. Examples include quercetin, barberin, and curcumin, which interfere with mycolic acid biosynthesis, inhibit efflux pumps, and modulate host immune signalling [58]. Moreover, computational docking studies and *in silico* screening have identified several phytochemicals with strong binding affinities toward TB targets such as InhA, KasA, and DNA gyrase [59].

Computational Drug Design and Artificial Intelligence

The integration of computational tools, molecular docking, and artificial intelligence (AI) has revolutionized TB drug discovery. These techniques enable high-throughput screening, target-based virtual screening, And machine-learning-driven lead optimization, reducing the time and cost associated with experimental screening [60]. For instance, structure-based drug design has identified new inhibitors targeting Mtb RNA polymerase, ATP synthase, and DprE1 enzyme, several of which are undergoing clinical trials [61]. AI-driven predictive modelling also aids in optimizing pharmacokinetic properties and toxicity profiles of novel compounds [62]. Collectively, these innovative strategies represent a transition from traditional bactericidal drugs toward targeted, patient-friendly, and precision-based therapies. The integration of Nano medicine, host modulation, repurposed molecules, and computational intelligence holds promise to redefine future TB management and accelerate progress toward the WHO End TB Strategy [63].

Future Perspectives

Despite substantial progress in diagnostics, therapeutics, and vaccine development, tuberculosis (TB) remains a persistent global health challenge. The future of TB therapy demands an integrated, multidisciplinary approach encompassing advanced drug design, host-targeted therapy, nano-medicine, artificial intelligence (AI), and public-health innovation [64]. Future Perspectives: An Integrated, Multidisciplinary Roadmap for Eliminating Tuberculosis (TB) (Figure 8).

Personalized and Precision Medicine

Future TB management is expected to evolve toward precision medicine, where treatment regimens are tailored according to host genetics, pathogen genotype, and pharmacogenomics markers [65]. Molecular tools such as whole-genome sequencing (WGS) and transcriptomic profiling enable real-time identification of resistance mutations,

helping clinicians select optimal drug combinations [66]. Furthermore, host biomarkers such as IL-6, TNF-α, and neopterin levels may serve as predictors of treatment response, facilitating early therapy adjustment [67].

Development of Novel Drug Targets and Shorter Regimens

Drug discovery efforts are increasingly focusing on novel molecular targets such as DprE1, MmpL3, ATP synthase, and leucyl-tRNA synthetase, offering potential for next-generation TB drugs with improved potency and reduced cross-resistance [68]. Future regimens aim to shorten therapy duration to three months or less while maintaining high efficacy. Combinations involving bedaquiline, pretomanid, delamanid, and linezolid (BPaL-based regimens) show promise for both drug-susceptible and resistant forms of TB [69].

Vaccine Innovation and Immunotherapy

The only licensed TB vaccine, Bacilli Calmette–Guerin (BCG), provides limited protection in adults. Therefore, novel vaccine platforms—such as mRNA-based vaccines, viral-vectored vaccines, and subunit formulations (e.g., M72/AS01E)—are being explored [70]. The M72/AS01E candidate has demonstrated approximately 50% efficacy in preventing active pulmonary TB among latently infected adults, representing a milestone in vaccine development [71]. In addition, immunotherapeutic agents such as therapeutic vaccines, cytokine modulators, and checkpoint inhibitors are being studied to enhance host immunity and complement conventional chemotherapy [72].

Integration of Artificial Intelligence and Computational Biology

AI and machine learning (ML) are poised to revolutionize TB management through predictive modelling, drug-target identification, and treatment optimization [73]. AI-driven algorithms can analyse complex datasets from genomic, proteomic, and clinical sources to predict drug efficacy, resistance emergence, and disease progression [74]. Moreover, computational modelling of granuloma dynamics provides valuable insights into drug distribution within lesions, enabling rational dosage optimization [75].

Nanotechnology and Smart Drug Delivery

The future of TB therapy lies in intelligent nanocarriers capable of stimuli-responsive release, targeted macrophage delivery, and co-delivery of multiple drugs or immunomodulators[76]. Integration of nanotechnology with biomaterials and bio-responsive polymers may facilitate sustained pulmonary delivery and improved patient adherence. “Smart” nano-systems responsive to pH, enzymatic activity, or oxidative stress could provide controlled drug release specifically at infection sites [77].

Combating Drug Resistance through Synergistic and Host-Modulating Strategies

The growing threat of MDR- and XDR-TB underscores the necessity for combination approaches that integrate host-directed therapies (HDTs), drug repurposing, and new chemical entities [78]. Synergistic therapies targeting both the pathogen and the host immune response could help minimize resistance emergence and disease relapse [79]. Future drug pipelines must also prioritize compounds that penetrate gaseous lesions and dormant bacilli, two major barriers to sterilizing cure [77].

Global Collaboration and Policy Implementation

The realization of an End TB era hinges on strong global partnerships, sustained funding, and policy alignment. Programs such as the WHO End TB Strategy and Stop TB Partnership emphasize universal access to diagnostics, personalized therapy, and preventive care [78]. Investment in research capacity, public-private collaboration, and data-sharing frameworks will be crucial to accelerate innovation and equitable drug distribution [79].

CONCLUSION

Tuberculosis continues to pose a significant global health burden, particularly in regions with limited healthcare infrastructure, high prevalence of drug-resistant strains, and socio-economic vulnerabilities. While conventional anti-

TB therapies have achieved substantial success, their limitations—such as prolonged treatment duration, adverse effects, and the emergence of multidrug-resistant (MDR) and extensively drug-resistant (XDR) strains underscore the urgent need for novel approaches. Recent advances in nanotechnology-based drug delivery, host-directed therapies, drug repurposing, phytochemicals, and computational drug discovery have opened new avenues for more effective, targeted, and patient-friendly treatments. Looking ahead, precision medicine, shorter and all-oral regimens, innovative vaccines, immunomodulatory strategies, and smart drug delivery systems promise to transform TB management. The integration of these approaches with public health policies, equitable access to care, and global collaboration will be critical to achieving the ambitious goals of the WHO End TB Strategy. Collectively, bridging traditional and modern innovations offers a realistic pathway toward more effective, sustainable, and globally accessible TB control, ultimately aiming to reduce mortality, curb drug resistance, and move closer to the elimination of this ancient but persistent disease.

ACKNOWLEDGMENT

We are sincerely acknowledged to MVM College of Pharmacy, Bangalore for the great support for our review work.

Conflict of Interests

The authors declare that there is 'no conflict of interest' regarding the publication of this paper.

ABSTRACT

Graph labeling serves as a compelling and widely explored area in graph theory in which integers are assigned to either the vertices or edges of a graph within certain constraints. In this research paper, we focus on Fibonacci Prime labeling, a variant where vertices are assigned distinct Fibonacci numbers, with the condition that any two neighboring vertices have labels that are coprime. We investigate the existence and construction of such labelings for middle graphs Ḿ(Ğ) of some standard graphs, including path, cycle, tadpole graph, Bull graph and fish graph. Our results establishes that the middle graph of certain classes of graph admit Fibonacci Prime labelings under defined constraints. Constructive methods and illustrative examples are included to support our findings. These findings contribute to the growing exploration of number theoretic explorations in derived graphs.

Keywords: Fibonacci Prime Labeling, Fibonacci Prime Graph, Middle Graph, GCD, Path, Cycle, Tadpole Graph, Bull Graph, Fish Graph.

INTRODUCTION

In this research article, we focus on simple undirected graphs that contain neither loops nor multiple edges. The graph is denoted by Ğ, where $V(Ğ)$ and $\chi(Ğ)$ represent the node set and edge set, respectively. Graph Labeling is recognized as a well- established and widely explored area within graph theory, offering rich avenues for investigation with extensive applications in network theory, theory of coding, database management and communication systems. A graph labeling is defined as a function that maps integers onto the vertices, edges, or both, while adhering to certain prescribed conditions. One notable type of graph labeling is prime labeling, proposed by Roger Entringer, where vertices are labeled with distinct integers ranging from 1 to |V|, and any two adjacent vertices must have relatively prime labels. In recent years, Researchers have explored modifications of Prime labeling by integrating with well – known number sequences. One such developing area is Fibonacci prime labeling, where labels are chosen from the set of Fibonacci numbers. The formula defining the Fibonacci number ϑ_n is a recurrence relation:$\vartheta_1 = 1$, $\vartheta_2 = 1, \vartheta_3 = 2, \ldots, \vartheta_{n+1} = \vartheta_n + \vartheta_{n-1}$ ($\forall\, n \geq 2$).Fibonacci Prime labeling was first defined by C. Sekar and S. Chandrakala [7], and the middle graph construction was introduced by T. Hamada and T. Yoshimura [6], form the foundation of this research. Building upon these ideas, this work explores the Fibonacci Prime labeling of middle graphs.

PRELIMINARIES

Definition 2.1 [8] Let Ğ = (V(Ğ), χ(Ğ)) be a graph with |V(Ğ)| = n. A Fibonacci prime labeling of Ğ is an injective mapping τ : Ğ =V(Ğ)→ $\{\vartheta_2, \vartheta_3, \ldots \vartheta_{n+1}\}$,where $\vartheta_n$denotes the n^{th} fibonacci number. Corresponding to this mapping, we define τ^* : χ(Ğ) → N,$\tau^*(uv) = GCD\ \{\tau(u), \tau(v)\}, \forall uv \in \chi(Ğ)$.
If $\tau^*(uv) = 1$, for every edge $uv \in \chi(Ğ)$,then Ğ is said to admit a Fibonacci Prime labeling and is referred to as a Fibonacci Prime graph, (FPG).

Coprime Property

- GCD (ϑ_n, ϑ_{n+1}) = 1,$\forall$ n ≥ 1,
- GCD (ϑ_n, ϑ_{n+2}) = 1,$\forall$ n ≥ 1. (i.e., Fibonacci numbers two apart are also coprime.)
- GCD (ϑ_m, ϑ_n) = $\vartheta_{GCD(m,n)}$

Definition 2.2[1] The middle graph of a graph Ğ, denoted by Ḿ(Ğ), is obtained by subdividing each edge of Ğ through the insertion of a new vertex, and subsequently joining two such newly inserted vertices whenever their corresponding edges inĞ are adjacent.

Definition 2.3[3] The graph $\dot{P}_n$, called a path graph, is obtained by successively connecting the vertices through edges such that each vertex (except the first and last) is adjacent to exactly two others, forming a linear sequence.

Definition 2.4[3] The cycle graph $\dot{C}_n$ is formed by placing edges between consecutive vertices in a sequence, with an additional edge connecting the final vertex to the initial vertex, thus completing the cycle.

Definition 2.5[5] The Tadpole graph, denoted by $T_{r,s}$, is formed by linking a path $\dot{P}_s$ to a cycle $\dot{C}_r$ via a single edge, which connects any vertex of the cycle to the initial vertex of the path, provided r>2 and s≥ 2.

Definition 2.6[6] The Bull graph is a simple, undirected graph with five vertices and five edges, obtained by adjoining two pendant vertices to two adjacent nodes of the triangle.

Definition 2.7[2] The Fish graph, denoted by $\mathcal{F}$, is an undirected planar graph on six vertices and seven edges, constructed from a triangle $\dot{C}_3$ and a quadrilateral $\dot{C}_4$ that share exactly one common vertex.

MAIN RESULTS

Middle graph of Paths under Fibonacci Prime Labeling

Theorem 3.1 Every Middle graph of a path admits a FPG.

Proof: Consider the path graph $\dot{P}_n$ with the vertices $v_1,v_2,\ldots,v_n$ and edges $\chi_i = v_iv_{i+1}$,for $1 \le i \le n$ -1. Hence, $\dot{P}_n$ has n vertices and n -1 edges. The middle graph $\acute{M}(\dot{P}_n)$ is formed by introducing a new vertex μ_i on each edge v_iv_{i+1} of $\dot{P}_n$. Consequently, the vertex set of $M(\dot{P}_n)$ is

$V(\acute{M}(\dot{P}_n)) = \{v_1,v_2,\ldots,v_n\} \cup \{\mu_1,\mu_2,\ldots,\mu_{n-1}\}$,

So that $|V(\acute{M}(\dot{P}_n))| = 2n-1$. The edge set of $\acute{M}(\dot{P}_n)$ is given by three types of connections:

i) Edges $\mu_i\mu_{i+1}$ between consecutive new vertices $(1 \le i \le n$ -2),
ii) Edges $v_i\mu_i$ joining each original vertex to its adjacent new vertex $(1 \le i \le n$ -1),
iii) Edges μ_iv_{i+1} connecting each new vertex to the next original vertex $(1 \le i \le n$ -1).

Therefore, $|\chi(\acute{M}(\dot{P}_n))| = 3n - 4$.

Now, we define a map $\tau: V(\acute{M}(\dot{P}_n)) \to \{\vartheta_2, \vartheta_3, \ldots, \vartheta_{2n}\}$ by

$\tau(v_i) = \vartheta_{2i}$, $1 \le i \le n$

$\tau(\mu_i) = \vartheta_{2i+1}$, $1 \le i \le n$.

By the Coprime Property,

For every edges, $\mu_i\mu_{i+1} \in \chi(\acute{M}(\dot{P}_n))$, GCD $(\tau(\mu_i),\tau(\mu_{i+1})) = 1$,

$v_i\mu_i \in \chi(\acute{M}(\dot{P}_n))$, GCD $(\tau(v_i),\tau(\mu_i)) = 1$,

$\mu_iv_{i+1} \in \chi(\acute{M}(\dot{P}_n))$, GCD $(\tau(\mu_i),\tau(v_{i+1})) = 1$.

Therefore, $\acute{M}(\dot{P}_n)$ satisfies Fibonacci Prime labeling and it is a FPG.

Middle graphs of Cycle under Fibonacci Prime Labeling

Theorem3.2 Every middle graph of a cycle is a FPG.

Proof: Let $\dot{C}_n$ denote the cycle graph on n vertices with $V(\dot{C}_n) = \{v_i : 1 \le i \le n\}$ and edges $\chi(\dot{C}_n) = \{\chi_i = v_iv_{i+1} : 1 \le i \le n - 1\} \cup \{v_nv_1\}$.For each edge of $\dot{C}_n$, introduce a new vertex μ_i $(1 \le i \le n)$, thereby obtaining the middle graph $\acute{M}(\dot{C}_n)$. The resulting vertex set is

$V(\acute{M}(\dot{C}_n)) = \{v_1,v_2,\ldots v_n,\mu_1,\mu_2,\ldots,\mu_n\}$, which has cardinality $|V(\acute{M}(\dot{C}_n))| = 2n$.

The edge set of $\acute{M}(\dot{C}_n)$ is composed of the following:

i) edges between consecutive new vertices, $\mu_i\mu_{i+1}$ for $1 \le i \le n$-1, together with $\mu_n\mu_1$;
ii) edges joining each original vertex to its corresponding new vertex, $v_i\mu_i$ for $1 \le i \le n$;
iii) edges linking each new vertex to the next original vertex, μ_iv_{i+1} for $1 \le i \le n$-1, along with μ_nv_1.

Thus, the total cardinality, $|\chi(\acute{M}(\dot{C}_n))| = 3n$.

We now define the labeling functions as, $\tau: V(\acute{M}(\dot{P}_n)) \to \{\vartheta_2, \vartheta_3, \ldots, \vartheta_{2n+1}\}$by,

$\tau(v_1) = \vartheta_{2n+1}$,

$\tau(v_i) = \vartheta_{2i-1}$, $2 \le i \le n$ and

$\tau(\mu_i) = \vartheta_{2i}$, $1 \le i \le n$.

Then, by the Coprime property,

$\forall \chi = v_i\mu_i \in \acute{M}(\dot{C}_n)$, GCD$(\tau(v_i),\tau(\mu_i)) = 1$, $1 \le i \le n$,

$\mu_i\mu_{i+1} \in \acute{M}(\dot{C}_n)$, GCD $(\tau(\mu_i),\tau(\mu_{i+1})) = 1$,$1 \le i \le n$-1,

$\mu_iv_{i+1} \in \acute{M}(\dot{C}_n)$, GCD $(\tau(\mu_i),\tau(v_{i+1})) = 1$, $1 \le i \le n$-1

$\mu_n\mu_1 \in \acute{M}(\dot{C}_n)$, GCD $(\tau(\mu_n),\tau(\mu_1)) = 1$,

$\mu_nv_1 \in \acute{M}(\dot{C}_n)$, GCD $(\tau(\mu_n),\tau(v_1)) = 1$.

Therefore, $\acute{M}(\dot{C}_n)$ is a FPG.

Middle graphs of Tadpole graph under Fibonacci Prime Labeling

Theorem 3.3 The Middle graph constructed from a Tadpole Graph is a FPG.

Proof: Consider the Tadpole graph $T_{r,s}$ formed by joining a cycle $\dot{C}_r$ to a path $\dot{P}_s$.. Its vertex set is$V(T_{r,s})$ = $\{v_1,v_2,\ldots,v_r,\mu_1,\mu_2,\ldots,\mu_s\}$, with $|V(T_{r,s})|$ = r+s. Then, the corresponding edge set is $\chi(T_{r,s})$ ={$\chi_i = v_iv_{i+1}$:1 ≤ i ≤ r-1}∪{v_rv_1}∪{$v_1\mu_1$}∪{$\mu_j\mu_{j+1}$: 1 ≤ j ≤ s-1} whose cardinality $|\chi(T_{r,s})|$ = r+s.

To obtain the middle graph $\acute{M}(T_{r,s})$, insert a new vertex α_i on each edge of the cycle $\dot{C}_r$ (1 ≤ i ≤ r) and a new vertex β_j on each edge of the path $\dot{P}_s$ (1 ≤ j ≤ s). Thus,

$V(\acute{M}(T_{r,s})) = V(T_{r,s}) \cup \{\alpha_1, \alpha_2,\ldots \alpha_r,\beta_1,\beta_2,\ldots\beta_s\}$ and hence, $|V(\acute{M}(T_{r,s}))| = 2(r+s)$.

Now, we define the labeling function $\tau : V(\acute{M}(T_{r,s})) \rightarrow \{\vartheta_2, \vartheta_3, \ldots, \vartheta_{2(r+s)+1}$ by,

$\tau(v_i) = \vartheta_{2i-1}$, 2 ≤ i ≤ r,

$\tau(\alpha_i) = \vartheta_{2i}$, 1 ≤ i ≤ r,

$\tau(v_1) = \vartheta_{2r+1}$,

$\tau(\beta_i) = \vartheta_{2(r+i)}$, 1 ≤ i ≤ s,

$\tau(\mu_i) = \vartheta_{2r+2i+1}$, 1 ≤ i ≤ s.

Then, by the coprime property of Fibonacci numbers, we get,

For every edges in $\acute{M}(T_{r,s})$,

i.e., $\forall v_i\alpha_i$, GCD $(\tau(v_i), \tau(\alpha_i)) = 1$, 1 ≤ i ≤ r,

$\forall \alpha_iv_{i+1}$, GCD $(\tau(\alpha_i),\tau(v_{i+1})) = 1$, 1 ≤ i ≤ r,

$\forall \alpha_i\alpha_{i+1}$, GCD $(\tau(\alpha_i),\tau(\alpha_{i+1})) = 1$, 1 ≤ i ≤ r,

$\forall \alpha_mv_1$, GCD $(\tau(\alpha_r),\tau(v_1)) = 1$,

$\forall v_1\beta_1$, GCD $(\tau(v_1),\tau(\beta_1)) = 1$,

$\forall \alpha_1\beta_1$, GCD $(\tau(v_1),\tau(\beta_1)) = 1$,

$\forall \beta_i\mu_i$, GCD $(\tau(\beta_i),\tau(\mu_i)) = 1$,1 ≤ i ≤ s,

$\forall \beta_i\beta_{i+1}$, GCD $(\tau(\beta_i),\tau(\beta_{i+1})) = 1$,1 ≤ i ≤ s.

Therefore, $\acute{M}(T_{r,s})$ is a FPG.

Middle graphs of Bull Graphs under Fibonacci Prime Labeling

Theorem 3.4 The middle graph of a Bull graph admits a Fibonacci Prime Labeling.

Proof: Let the node set of a Bull graph be $V(\mathcal{B}) = \{v_1,v_2,v_3,v_4,v_5\}$ and let its connecting (edge) set be $\chi(\mathcal{B})$ = {v_iv_{i+1}: 1≤ i ≤ 5}∪ {v_2v_4}.Let $\mu_1,\mu_2,\mu_3,\mu_4,\mu_5$ be the vertices added to the corresponding edges in $\mathcal{B}$.

Then, $|V(\acute{M}(\mathcal{B}))| = 10$.

Now, $\chi(\acute{M}(\mathcal{B}))$ = {$v_i\mu_i$: 1≤ i ≤ 4}∪{μ_4v_5}∪{$v_2\mu_4$ }∪{ μ_5v_4 }∪{$\mu_5\mu_i$}.

⇒ $|\chi(\acute{M}(\mathcal{B}))|$ = 16.

The labeling mapping is defined by$\tau :V(\acute{M}(\mathcal{B}))\rightarrow \{\vartheta_2, \vartheta_3, \ldots, \vartheta_{11}\}$ are,

$$\tau(v_i) = \begin{cases} \vartheta_{2i+1}, 1 \le i \le 3, \\ \vartheta_{2i+2}, \ i = 4,5 \end{cases},$$

$$\tau(\mu_i) = \begin{cases} \vartheta_{4i}, i = 1 \\ \vartheta_{3i}, i = 2,3 \\ \vartheta_{3i-1}, i = 4 \end{cases} \text{ and } \tau(\mu_5) = \vartheta_2.$$

For every edges, $v_i\mu_i$, GCD$(\tau(v_i),\tau(\mu_i)) = 1$,1 ≤ i ≤ 4,

μ_4v_5, GCD $(\tau(\mu_4),\tau(v_5)) = 1$,

$v_2\mu_5$, GCD $(\tau(v_2), \tau(\mu_5)) = 1$,

μ_5v_4, GCD $(\tau(\mu_5),\tau(v_4))$ =1,

$\mu_5\mu_i$, GCD $(\tau(\mu_5), \tau(\mu_i))$ =1.

Thus, $\acute{M}(\mathcal{B})$ is a FPG.

Middle Graphs of Fish Graphs under Fibonacci Prime Labeling

Theorem 3.5 The Middle graph derived from a Fish graph is a FPG.

Proof: Let $\{v_1,v_2,v_3,v_4,v_5,v_6\}$ be the vertex set of the fish graph $\mathcal{F}$ with 7 edges.

Let μ_i $(1\leq i \leq 7)$, insert a new vertex μ_i to obtain the middle graph $\acute{M}(\mathcal{F})$.Thus, $|V(\acute{M}(\mathcal{F}))| = 13$. The edge set, $\chi(\acute{M}(\mathcal{F})) = \{\mu_i\mu_{i+1}: 1 \leq i \leq 6\} \cup \{\mu_7\mu_5\} \cup \{\mu_7\mu_3\} \cup \{\mu_7\mu_4\} \cup \{\mu_3\mu_5\} \cup \{\mu_1\mu_4\} \cup \{v_1\mu_4\} \cup \{\mu_7v_4\} \cup \{v_i\mu_i : 1 \leq i \leq 6\} \cup \{\mu_i v_{i+1} : 1 \leq i \leq 3\} \cup \{\mu_4\mu_5\} \cup \{v_i\mu_{i+1} : 4 \leq i \leq 6\}$.

Hence, $|\chi(\acute{M}(\mathcal{F}))| = 25$

We define a mapping $\tau : V(\acute{M}(\mathcal{F})) \rightarrow \{\vartheta_2,\ldots,\vartheta_{14}\}$ as,

$\tau(\mu_i) = \vartheta_{2i}$, $1 \leq i \leq 7$,

And now define the set of odd – index Fibonacci numbers: $\{\vartheta_{2i+1} : 1 \leq i \leq 6\} = \{\vartheta_3,\vartheta_5,\vartheta_7,\vartheta_9,\vartheta_{11},\vartheta_{13}\}$.Now, the labels are given by applying a permutation $\pi$of 1,2,3,4,5,6 to this set.

Specifically, let the permutation be π = (4,1,2,6,3,5),

$(v_1,v_2,v_3,v_4,v_5,v_6) = (\vartheta_{2\pi(1)+1}, \vartheta_{2\pi(2)+1}, \vartheta_{2\pi(3)+1},\ldots,\vartheta_{2\pi(6)+1})$.

Thus, explicitly: $(v_1,v_2,v_3,v_4,v_5,v_6) = (\vartheta_9, \vartheta_3, \vartheta_5, \vartheta_{13}, \vartheta_7, \vartheta_{11})$.

Then, for every edges in the middle graph of fish graph, we can see,

$\mu_i\mu_{i+1}$, GCD $(\tau(\mu_i),\tau(\mu_{i+1})) = 1$, $\forall\ 1 \leq i \leq 6$,

$\mu_7\mu_3$, GCD $(\tau(\mu_7),\tau(\mu_3)) = 1$,

$\mu_4\mu_7$, GCD $(\tau(\mu_4),\tau(\mu_7)) = 1$,

$\mu_5\mu_3$, GCD $(\tau(\mu_5),\tau(\mu_3)) = 1$,

$\mu_1\mu_4$, GCD $(\tau(\mu_1),\tau(\mu_4)) = 1$,

$\mu_5\mu_7$, GCD $(\tau(\mu_5),\tau(\mu_7)) = 1$,

$v_1\mu_4$, GCD $(\tau(v_1),\tau(\mu_4)) = 1$,

μ_7v_4, GCD $(\tau(\mu_7),\tau(v_4)) = 1$,

$v_i\mu_i$, GCD $(\tau(v_i), \tau(\mu_i)) = 1$, $\forall\ 1 \leq i \leq 6$,

$v_i\mu_{i+1}$, GCD $(\tau(v_i), \tau(\mu_{i+1})) = 1$, $\forall 4 \leq i \leq 6$,

$\mu_i v_{i+1}$, GCD $(\tau(\mu_7),\tau(v_4)) = 1$, $\forall\ 1 \leq i \leq 3$.

Therefore, $\acute{M}(\mathcal{F})$ admits Fibonacci prime labeling and it is a FPG.

CONCLUSIONS

Based on the above discussions, this study establishes that the middle graphs of path, cycle, tadpole graph, bull graph, fish graph are Fibonacci Prime graphs. Exploring the middle graphs of other classes of graphs remains an open problem for future research.

ABSTRACT

Plants' complex networks of pathways that support their ability to withstand drought allow them to respond instantly to changing environmental factors. In response to these circumstances, plants increase their intake of water and decrease their loss of it. Based on our research, we can conclude that the main

genes expressed during drought resistance in *Arabidopsis* plants are ABI1, MPK6, RBOHD, ABI5, NPR1, PP2CA, ICS1, WRKY70, PR5, and ABI4. These genes should be used for gene cloning experiments in the near future to gain further insight into their roles in other plants that are fewer droughts tolerant.

Keywords: Drought, ABI1, MPK6, RBOHD and ABI5

INTRODUCTION

Drought resilience in botanical science refers to a plant's capacity to continue producing biomass in the face of aridity or drought. Certain plants have developed defence mechanisms to withstand dry environments, like the ability to withstand desiccation, detoxify, or repair xylem embolism (1).One of the primary abiotic factors that lower agricultural yields is drought. Crop breeding has as one of its main objectives increasing crop yield under drought stress because it is essential to food security (2). Abiotic stress stunts the growth and development of plants, which causes significant losses in the world's agricultural sector (3).The intricate networks of pathways that underpin drought tolerance in plants enable them to react at any given moment to particular conditions (4). Stomatal conductance, anthocyanin accumulation and carotenoid degradation, osmoprotectant intervention such as proline, glycine, and sucrose, and ROS-scavenging enzymes are a few of these connections (5,6).The environment and the stage of a plant's development both have an impact on the intricate molecular regulation of drought tolerance (7). The transcriptional factors that primarily govern this process include NAM (no apical meristem), abscisic acid (ABA)-responsive element-binding factor (AREB), and dehydration-responsive element-binding protein (DREB) (8).Plants may experience short-term water deficits (hours to days) or gradually building water shortages (lasting days, weeks, or months). Plants respond appropriately to these conditions, reducing water loss and increasing water intake. Plants that are in the reproductive stages of growth, blooming, and seed production are particularly vulnerable to drought stress (9). Therefore, plants are able to produce a small number of viable seeds due to the combination of short-term and long-term reactions (10).Because of their improved field operability and environmental friendliness, exogenous PGRs and microbe-based plant biotechnology have been used in pioneering research to boost agricultural drought resistance over the past few years (11). In order to tackle the problem in plants, we attempted to identify the genes that are resistant to drought using a system biology method, as well as the molecular interactions of those genes under the drought circumstances using *Arabidopsis thaliana* as an example.

MATERIALS AND METHODS

Down loading the drought resistance all genes from database

For getting the drought resistance genes, we used NCBI (www.ncbi.nlm.nih.gov). After opening the home page, plug in to gene and after typing drought resistance gene of Plans, a list of genes were obtained and downloaded the same for further use (12).

Gene network study with STRING

For getting entire gene network, we used STRING (https://string-db.org/). Here after selecting the multiple protein network, we pasted all genes information, after giving organism name *Arabidopsis thaliana,* used search option. Once we obtained network information, same was downloaded and also by selecting K-cluster, the entire clustering group information and total network information as short csv table format downloaded for further use (13).

Gene enrichment study

For understanding the gene enrichment process with respect to GO Biological process, GO Cellular components, GO Molecular functions and KEGG pathway we used ShinyGO 0.76 databse (http://bioinformatics.sdstate.edu/go76/). Here we used STRING result to continue said studies (14).

Finding hub genes by using Cytoscape

Cytoscape 3.7.2 was used to display and study the protein-protein network for the methyl paraben interacting genes. Using the average shortest path length for both options, the PPI network was analyzed as an undirected network. The network was visualized as with node sizes set to lower to higher order with respective colour annotations. For analyzing top 10 hub genes (as per ranked in degree) Cytoscape 3.7.2 was used (15,16).

RESULTS AND DISCUSSION

From the NCBI gene database, a total of 125 genes information was obtained with their taxonomical id, gene id and gene symbol etc. (Supplementary table 1). From this table, we used gene symbol in STRING database to obtain gene network. From the string following network was obtained. Stringk means cluster interaction Fig 1. Here, we used 3 cluster, denoted by red, green and blue (Supplementary table 2). Red clustering was found a total 60 genes related to Abscisic acid-activated signaling pathway. Green was found a total 4 genes related to Response to strigolactone and Platelet degranulation. Blue was found a total of 3 genes related to Mixed, incl. Glucuronoxylan metabolic process, and Zinc-binding RING-finger. Red clustering 60 genes were responsible for encoding proteins of RAV2, RAV1, ABI5, WRKY46, ICS1, WRKY70, BZR2, WRKY54, WRKY57, SARD1, RBOHD, SLAC1, ALMT9, STOP1, THO1, SIZ1, MPK6, PR1, NPR1, EDR1, PR5, BG2, WRKY1, ABI1, PYL9, PYL5, PP2CA, SRK2B, PYL4, ABI4, PYR1, PYL2, ABCG25, MAPKKK18, MPK2, GB1, PLDALPHA1, PLDDELTA, THF1, LTO1, PPD5, P5CSA, NHX1, APX1, CLPD, LON2, BZIP60, COP1, GI, SVP, ATJ3, FTB, ATJ2, LHY, FRI, CYP83B1, MYB29, CBP60G, OCP3, SMXL7. Green clustering 4 genes were responsible for encoding proteins ofSMXL8, SMAX1, SMXL6, SMXL2. Whereas blue clustering 3 genes were responsible for encoding proteins of RDUF1, ESK1, CESA8. Based on the obtaining gene interaction data from STRING, we tried to find out the various gene enrichment path way in terms of biological functions (Fig No 2), cellular functions (Fig No 3), molecular functions (Fig No 4) as well as KEGG pathways (Fig No 5) of those genes. The top most biological enriched pathways were found as response to abiotic stimulus, response to oxygen-containing compound, cellular response to lipid, abscisic acid-activated signaling pathway, response to stress, response to lipid, cellular response to abscisic acid stimulus, cellular response to alcohol, response to chemical, hormone-mediated signaling pathway, cellular response to oxygen-containing compound, cellular response to hormone stimulus, signal transduction, cellular response to chemical stimulus, cellular response to organic substance, cellular response to endogenous stimulus, signaling, response to organic substance, cellular response to stimulus and cell communication.

The top most cellular functional enriched pathways were found as plasma membrane, cell periphery, protein phosphatase inhibitor complex, vacuolar membrane, Golgi apparatus, plant-type vacuole membrane and endomembrane system. The top most molecular functional enriched pathways were found as protein phosphatase inhibitor activity, abscisic acid binding, isoprenoid binding, phosphatase inhibitor activity, hormone binding, alcohol binding, protein phosphatase regulator activity, phosphatase regulator activity, monocarboxylic acid binding, sequence-specific DNA binding, organic acid binding, carboxylic acid binding, protein homodimerization activity, DNA-binding transcription factor activity, identical protein binding, anion binding, transcription regulator activity, lipid binding, signaling receptor activity and transcription cis-regulatory region binding. The top most KEGG pathways were found as MAPKsignaling pathway-plant, Plant hormone signal transduction, Ether lipid metabolism, Circadian rhythm-plant and Plant-pathogen interaction. MAPK signalling pathway in plant. Red highlighted portion are indicating the traced gene involvement (Fig 6). Plant hormone signalling pathway in plant. Red highlighted portion are indicating the traced gene involvement (Fig 7). Ether lipid metabolism pathway in plant. Red highlighted portion are indicating the traced gene involvement (Fig 8). Circadian rhythm pathway in plant. Red highlighted portion are indicating the traced gene involvement (Fig 9). Plant pathogen interaction pathway in plant. Red highlighted portion are indicating the traced gene involvement (Fig 10), Gene networks of regulation provide light on the mechanisms by which genes cooperate to perform biological tasks. A hub gene is a gene in a gene network that interacts with many other genes. Hub genes are typically important for processes in biology and gene control.

From the CytoScape analysis by using CytoHubba we found there were top 10 genes (as per rank; Table 1) The abscisic acid (ABA) signaling system, which controls a variety of ABA replies, including closing of stomatal pores, osmotic permeation of water of the plasma membrane (Pos), drought-induced an inability to respond and rhizogenesis, adaptation to glucose, high light tension, emergence of seeds, and suppression of growth of foliage, is largely regulated by ABI1 (score 24), a protein phosphatase 2C family protein. regulates the upward accessibility of calcium channels and the rearrangement of actin in guard cells in accordance with ABA during the maintenance of closing stomatal pores. contributing to resistance to Pseudomonas syrin, a bacterial pathogen (4,12,17). RBOHD (score 21) is a respiratory burst oxidase homologue D, a subtype of the activity of mitogen- 6; it plays a part in the signaling chain triggered by oxidative stress conditions (e.g., ozone). MPK6 (score 23) is a MAP kinase 6 protein. Cascade of the bacterial flagellin protein FLS2 and engaged in the innate immunity MAP kinase signaling chain (MEKK1, MKK4/MKK5, and MPK3/MPK6). It could influence LIP5 phosphorylation and following trafficking of multivesicular cells (MVBs), hence participating in the signaling cascade controlled by the hypersensitive response (HR). WRKY transcription factor operators may be phosphorylated. It may have a role in controlling drought by phosphorylating 1-aminocyclopropane-1-carboxylic acid synthases (ACS2 and ACS6) (13, 18). The protein ABSCISIC ACID-INSENSITIVE 5 (ABI5; score 21) belongs to the Basic-leucine zipper (bZIP) gene transcription factor family. It acts like the primary facilitator of ABA restraint of growth, hence contributing to ABA-regulated gene transcription during the growth of seeds and the ensuing vegetative stage.

It connects to the ABA-responsive element (ABRE) of the Dc3 gene promoter, the embryo patterning element, and the coding regions of the Em1 and Em6 genes. Additionally, it has the ability to trans-activate its own internal promoter, indicating autoregulation. contributes to senescence mediated by sugar. This gene is a member of the bZIP family, whoes subfamily is ABI5 (10,19). Transcriptional factor protein NPR1 (score 19) is a subtype of regulating protein NPR1 and may function as a substrate-specific converter of an E3 ubiquitin-protein ligase multifaceted (CUL3-RBX1-BTB) that facilitates the protein ubiquitination along with subsequent proteasomal dissolution of targeted proteins (by similarity). JA-dependent signaling route is impaired by a key positive modulator of the SA-dependent signaling circuit, facilitates the transcriptional control of the gene security by connecting TGA receptors to the as-1 motif present in the pathogenesis-related PR-1 gene, modulates when systemic acquired resistance (SAR) starts to occur (13,20). Protein phosphatase 2C 37, or PP2CA (score 15), is a key inhibitory modulator of abscisic acid (ABA) reactions during freezing acclimatization and the sprouting of seeds. gives ABA insensitivity. likely by dephosphorylation, adversely affects the functioning of AKT2/3, which facilitates K(+) transport as well as membrane polarity under stress, inhibits the S-type anion efflux channel SLAC1 and its activator SRK2E, preventing stomata contraction, causes a poststress shutdown of SnRK1 transmission by selectively dephosphorylating its T-loop Thr-198, which inhibits KIN10 functionality (9,19).

Likely WRKY70 (score 14) is a gene transcription element that modulates different botanical hormones signaling networks and is implicated in aging, biological, and environmental stress events. Particularly engages with the W box (5'- (T)TGAC[CT]-3'), a common cis-acting region that is susceptible to elicitors (By similarity), induces amplification of target genes by binding to the 5'-[CT]GACTTTT-3' sequence in their regulators, contributes to the signaling of salicylic acid and jasmonate, while it is not essential. favorably controls the signal circuit driven by salicylic acid (SA) (7,11,18). ABI4 (score 13) corresponds to the ethylene-responsive gene transcription factor ABI4; a transcription controller that most likely couples to the GCC-box pathogenesis-related transcriptional element, and PR5 (score 14) is a pathogenesis-related protein 5; a contributing factor for gained resistance to pathogenic agents. Functions as a transcription antagonist by binding to the S-box (5'- CACTTCCA-3') promoter region linked to photosynthesis-associated nuclear proteins (PhANGs-related). concerned in how stressors and elements of stress signaling networks control gene transcription. might play a role in the deetiolation procedure. controls the ABA signaling pathway during seed germination and lends vulnerability to abscisic acid (ABA) (12,20). The genes that this research found were believed to be the primary enforcers of the *Arabidopsis* plant's drought resistance capability. Additionally, some crops should have this gene cloned to improve their health and resistance to drought. HUB gene interaction as per degree method by using CytoHubba (Fig11).

CONCLUSION

The intricate networks of pathways that underpin drought tolerance in plants enable them to react at any given moment to particular conditions. Plants respond appropriately to these conditions, reducing water loss and increasing water intake. Form our finding we can conclude to say that ABI1, MPK6, RBOHD, ABI5, NPR1, PP2CA, ICS1, WRKY70, PR5 and ABI4 are the major expressible genes during drought resistance in *Arabidopsis* plant and in near future these genes should be used for gene cloning experiments to get more insight their role in other less drought tolerance plant.

ABSTRACT

In this paper we discuss the concept of location ecc D-set with minimum cardinality which is known as *referencing ecc D-set* that is *RED-set* and its cardinality is known as location eccentric domination number RED(G) in spider graphs and in different kinds of wounded spider graphs.

Keywords: Location Eccentric Dominating Set, Location Eccentric Domination Number, Referencing Eccentric Dominating Set, Spider Graph, Wounded Spider Graph.

INTRODUCTION

In 1975, P.J. Slater [10] proposed the idea of locating set that can identify all other vertices uniquely. In 1987, P.J. Slater [11, 12] extended his idea by merging the concept of dominating set and locating set which is useful to determine a collection of location at which to place the detection device so that if an object is placed at any vertex in the graph, then the object can be detected and its position can be uniquely identified. In 2010, T.N. Jankiraman, M. Bhanumathi and S. Muthammai [7] introduced the concept of eccentric dominating set and eccentric domination number in graphs. In this paper we identify the location eccentric dominating set and location eccentric domination number in spider graphs and wounded spider graphs which are useful in safeguard application for facilities, such as identifying the location of an intruder or security breach and also useful to protect confidential objects from accidental place.

PRELIMINARIES

Definition

An ecc D-set L⊆V(G) is defined as a location eccD-set if $N_G(x) \cap L \neq N_G(y) \cap L \; \forall x, y \in V(G) - L$. It is denoted by ***LED-set***. It is strictly location ecc D-set if $N_G(x) \cap L \neq L \forall x \in V(G) - L$.

Definition

The minimum cardinality of a LED-set of a graph G is referred as ***location ecc domination number*** and, denoted by ***RED(G)***. The LED-set with RED(G) elements is referred as ***referencing ecc D-set*** that is ***RED-set***.

Definition

A tree with n = 2p + 1 vertices which is drawn by subdividing every edge of a star graph $K_{1,p}$ where p ≥ 3 is a **spider graph** S_n. A ***wounded spider graph***is drawn by subdividing at most p – 1 edges of a star graph $K_{1,p}$ where p ≥ 3.

Location Eccentric Dominating set in Spider and Wounded Spider Graphs

Theorem

For a Spider Graph S_n,

(a) RED(S_7) = 4.

(b) RED(S_n) = $\left(\frac{n-1}{2}\right)$ for $n > 7$.

Proof

(a) In S_n,$n = 2k + 1$ where $k \geq 3$.

Let c be the central vertex of S_n, the vertices$v_1, v_2, v_3, \ldots$, and $v_k$are neighbors of c, and the vertices $w_1, w_2, w_3, \ldots$, and w_k are pendent vertices which are adjacent to $v_1, v_2, v_3, \ldots$, and $v_k$respectively.

Let E_1 = N(c) = $\{v_1, v_2, v_3, \ldots, v_k\}$ and E_2 = $\{w_1, w_2, w_3, \ldots, w_k\}$.

Then $V(S_n) = \{c\} \cup E_1 \cup E_2$.

Any vertex $w_i \in E_2$ is an ecc vertex of all other vertices of S_n except to the vertex v_i which is adjacent to w_i. Any other vertex $w_j \in E_2 - \{w_i\}$ is an ecc vertex of v_i. Therefore, E = $\{w_i, w_j\}$ is an ecc-ptset of S_n, but the vertices w_i and w_j dominates the vertices v_i and $v_j$and itself only.

(i) In S_7, n =7 =2(3) + 1. Here k =3 = $\Delta(S_7)$.

E_1 = N(c)= $\{v_1, v_2, v_3\}$, and E_2 = $\{w_1, w_2, w_3\}$

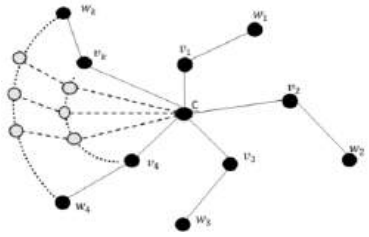
V(S_7) = {c}∪E_1 ∪E_2 = $\{c, v_1, v_2, v_3, w_1, w_2, w_3\}$

Without affecting generality, let w_i=$w_1$and w_j = w_2. Therefore, E = $\{w_1, w_2\}$. In order to get minimum ecc D-set, add $v_3$in E which dominates both the central vertex c and the pendent vertex w_3.Therefore, E = $\{v_3, w_1, w_2\}$ is a minimum eccD-set of S_7.

V(S_7) – E= $\{c, v_1, v_2, w_3\}$.Since N(c) ∩E = $\{v_3\}$ = N(w_3) ∩E, so E is not a LED-set of S_7. To obtain minimum LED-set that is RED-set we should add either c or w_3 in E. Suppose if we add c in E then we have E = $\{c, v_3, w_1, w_2\}$, V(S_7) – E = $\{v_1, v_2, w_3\}$.

Now, N(v_1) ∩E = $\{c, w_1\}$, N(v_2) ∩E = $\{c, w_2\}$and N(w_3) ∩E = $\{v_3\}$. Clearly, E becomes as RED-set of S_7. Therefore, RED(S_7) = | E | = 4.Hence, RED(S_7) = 4.

(ii) In S_n, n = 2k + 1 where k > 3.



Spider Graph S_n

We have E = $\{w_i, w_j\}$. Since E dominates v_i and v_j and itself only. So, E is not a D-set. Clearly, $E_1 - N(\{w_i, w_j\})$ dominates remaining all other vertices of Sn except the vertices of N[$\{w_i, w_j\}$].

$\Longrightarrow E = \{w_i, w_j\} \cup \left(E_1 - N(\{w_i, w_j\})\right)$

$\Longrightarrow E = \{w_i, w_j\} \cup \left(E_1 - \{v_i, v_j\}\right)$

$\Longrightarrow E = \{w_i, w_j\} \bigcup_{\substack{r=1 \\ and\ r \neq i,j}}^{k} \{v_r\}$

$\Longrightarrow V(S_n) - E = \{c\} \cup \{v_i, v_j\} \cup \left(E_2 - \{w_i, w_j\}\right)$

$\Longrightarrow N(c) \cap E = \left(E_1 - \{v_i, v_j\}\right) = \bigcup_{\substack{r=1 \\ and\ r \neq i,j}}^{k} \{v_r\},$

$N(v_i) \cap E = \{w_i\}, \quad N(v_j) \cap E = \{w_j\}$

and $N(w_r) \cap E = \{v_r\}\ \forall\ w_r \in E_2 - \{w_i, w_j\}\ for\ r = 1, 2, \ldots, k\ and\ r \neq i, j.$

Now E becomes as a RED-set of S_n.

Therefore, |E| = 2 + k – 2 [since $\{w_i, w_j\} and \left(E_1 - N(\{w_i, w_j\})\right)$ are disjoint sets]

$\Longrightarrow$|E| = k

$\Longrightarrow |E| = \frac{n-1}{2}\ since\ n = 2k + 1$. Hence, RED($S_n$) = $\frac{n-1}{2}$for n > 7.

Theorem

For a wounded spider graph T,

RED(T) = $\Delta(T)$ = n – 1 – h where V(T) = n,h is a number of healthy foot in T and $1 \leq h \leq k - 1$ where $\Delta(T)$ = k ≥ 3.

Proof

Let V(T) = n. For any wounded spider graph T, $k + 2 \leq n \leq 2k$. In which T has one central vertex c and the vertices $v_1, v_2, v_3, \ldots$, and v_k are adjacent to c. The remaining vertices of T are healthy foot.

Let D_1 = N(c) = $\{v_1, v_2, v_3, \ldots, v_k\}$, D_2 = $\{w_i \in V(t) - N[c]/(v_i, w_i) \in E(T)\}$ and $|D_2|$ = h, h is a number of healthy foot i.e., non-wounded legs in T. $|D_1| = \Delta(T)$ = k.

V(T) = {c} ∪ N(c) ∪ D_2

$\Longrightarrow$ = {c} ∪ D_1 ∪ D_2

$\Longrightarrow |V(T)| = 1 + k + h$

$\Longrightarrow$ n = 1 + k + h

$\Longrightarrow$ $\Delta(T)$ = k = n – 1 – h ----------(1) [since $|D_1| = \Delta(T) = k$]

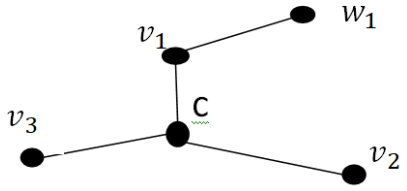
Any vertex $w_i \in D_2$ is an ecc vertex of all vertices of T except to the vertex v_i which is adjacent to w_i.

Case(i): $|D_2|$ = h =1

Without loss of generality, Let $D_2 = \{w_1\}$ and $(v_1, w_1) \in E(T)$.

Therefore, D = $\{v_2, w_1\}$ is an ecc-pt set of T. Since $|D_1| = k \geq 3$, there exist a vertex in D_1 which is not dominated by D.

$\Longrightarrow$D is not anecc D-set of T.

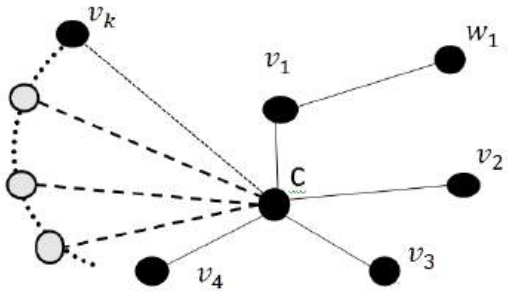


Wounded Spider Graph T
with h= 1 and k = 3

Subcase(a): Let $|D_1| = k = 3$, then $D_1 = \{v_1, v_2, v_3\}$
$\Longrightarrow V(T) = \{c\} \cup D_1 \cup D_2$
$\Longrightarrow V(T) = \{c\} \cup \{v_1, v_2, v_3\}, \cup \{w_1\} = \{c, v_1, v_2, v_3, w_1\}$
The set D doesn't dominate the vertex v_3. So, add either c or the vertex v_3 in D. Suppose if we add c in D then $D = \{c, v_2, w_1\}$. Now D is a minimum ecc D-set of T.
$\Longrightarrow V(T) - D = \{v_1, v_3\}$
$\Longrightarrow N(v_1) \cap D = \{c, w_1\}$ and $N(v_3) \cap D = \{c\}$
Therefore, D is a RED-set of T.
$RED(T) = 3 = \Delta(T)$
$\Longrightarrow = n - 1 - h$ [using (1)]
$\therefore, RED(T) = \Delta(T) = n - 1 - h$ if $|D_2| = h = 1$where $|D_1| = k = 3$. ----------(2)

Subcase(b): Let $|D_1| = k > 3$, then $D_1 = \{v_1, v_2, v_3, \ldots, v_k\}$

Wounded Spider Graph T
with h = 1 and k > 3

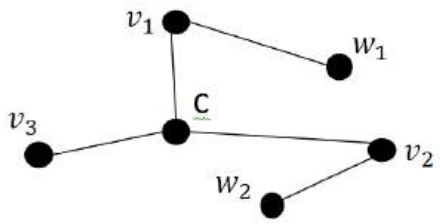


Since $D = \{v_2, w_1\}$ which doesn't dominate the vertices $v_3, v_4, \ldots, and\ v_k$. So, add c in D.
Now, $D = \{c, v_2, w_1\}$ which is an ecc D-set of T.
$\Longrightarrow V - D = \{v_1, v_3, v_4, \ldots, v_k\}$
Now $N(v_1) \cap D = \{c, w_1\}$ and $N(v_i) \cap D = \{c\}$ for i = 3, 4, …., k
Therefore, D is not a LED-set of T. In order to get a RED-set we must add any k – 3 vertices of $N(c) - \{v_1, v_2\}$ in D where $|N(c) - \{v_1, v_2\}| = \Delta(T) - 2 = k - 2$.
Without loss of generality, let $D = \{c, v_2, v_3, v_4, \ldots, v_{k-1}, w_1\}$.
That is $D = \{c\} \cup (D_1 - \{v_1, v_k\}) \cup D_2$.
$\Longrightarrow V(T) - D = \{v_1, v_k\}$
$\Longrightarrow N(v_1) \cap D = \{c, w_1\}$ and $N(v_k) \cap D = \{c\}$

Therefore, D is a RED-set of T.
RED(T) = 1 + |D_1| – 2 + 1
$\Rightarrow$ = 1 + Δ(T) – 2 + 1
$\Rightarrow$ = Δ(T)
$\Rightarrow$ = n – 1 – h [using (1)]
∴, RED(T) = Δ(T) = n – 1 – h if |D_2| = h =1 where |D_1| = k > 3. ----------(3)
From (2) and (3)
RED(T) =Δ(T) = n – 1 – h if |D_2| = h =1 where |D_1| = Δ(T) = k ≥ 3 ----------(4)

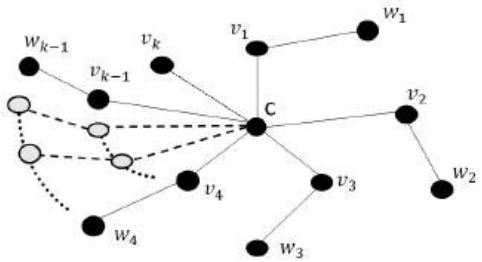
Case(ii): Let 1 <|D_2| = h≤k – 1 and |D_1| = k ≥ 3.
$\Rightarrow$ 1 <h≤ k – 1
$\Rightarrow$|D_1| – |D_2| = k – h≥ k – (k – 1) = 1 [since h is positive and h≤ k – 1]
$\Rightarrow$ |D_1| – |D_2| ≥1
$\Rightarrow$ |D_1| – |N(D_2)| ≥1 [since |D_2| = |N(D_2)|]
Any two vertex $w_i, w_j \in D_2$ together forms an ecc-pt set of T. Without affecting generality, let D = $\{w_1, w_2\}$ is an ecc-pt set of T. But D dominate only the vertices v_1 and v_2 and itself. So, add the central vertex c in D.
$\Rightarrow$D = {c} ∪ $\{w_1, w_2\}$
$\Rightarrow$ V(T) – D = D_1∪ (D_2 – $\{w_1, w_2\}$)
Subcase(a): Let |D_1| – |N(D_2)| = 1 $\Rightarrow$k – h = 1 $\Rightarrow$h = k – 1
We have D = {c} ∪ $\{w_1, w_2\}$.
(1) If k =3 then |D_2| = h = 2.
$\Rightarrow$ D_2 = $\{w_1, w_2\}$$\Rightarrow$ D_1 = $\{v_1, v_2, v_3\}$

<u>Wounded Spider Graph T</u>
with h = 2 and k = 3



$\Rightarrow$ V(T) – D = $\{v_1, v_2, v_3\}$
Now, D becomes as an eccD-set and also, we have
N(v_1) ∩ D = $\{c, w_1\}$, N(v_2) ∩ D = $\{c, w_2\}$, and N(v_3) ∩ D = {c}
Clearly, D is a RED-set of T.
RED(T) = 3
$\Rightarrow$ = k [since |D_1| = Δ(T) = k]
$\Rightarrow$ = n – 1 – h [using (1)]
∴, RED(T) = Δ(T) = n – 1 – h ifh = k – 1 and |D_2| = h =2 where |D_1| = Δ(T) = k = 3. ----------(5)

<u>Wounded Spider Graph T</u>
with h = k-1 and k > 3



(2) If k > 3 then $|D_2| = h = k - 1$. $\Rightarrow h > 2$.

Now, D doesn't dominate the vertices of $D_2 - \{w_1, w_2\}$. So, add all the remaining vertices of $N(D_2) - \{v_1, v_2\}$ in D.

Therefore, $D = \{c\} \cup (N(D_2) - \{v_1, v_2\}) \cup \{w_1, w_2\}$

$\Rightarrow V(T) - D = (D_1 - N(D_2)) \cup \{v_1, v_2\} \cup (D_2 - \{w_1, w_2\})$

Since $|D_1| - |N(D_2)| = 1$, say $D_1 - N(D_2) = \{v_k\}$,the vertex c dominates the vertex v_k of $D_1 - N(D_2)$, the set $N(D_2) - \{v_1, v_2\}$ dominates all the vertices of $D_2 - \{w_1, w_2\}$, $w_1$dominates v_1, and w_2 dominates $v_2$of V(T) – D. Therefore, D is a minimum ecc D-set.

Also, we get $N(v_k) \cap D = \{c\}$, $N(v_1) \cap D = \{c, w_1\}$, $N(v_2) \cap D = \{c, w_2\}$ and $N(w_r) \cap D = \{v_r\}$ for all $w_r$in $D_2 - \{w_1, w_2\}$. Clearly, D is a RED-set of T.

$RED(T) = 1 + |D_2| - 2 + 2$

$\Rightarrow \quad = |D_1| \quad [\text{since } |D_1| - |D_2| = 1 \Rightarrow |D_1| = 1 + |D_2|]$

$\Rightarrow \quad = \Delta(T)$

$\Rightarrow \quad = n - 1 - h \quad$ [using (1)]

$\therefore$, $RED(T) = \Delta(T) = n - 1 - h$ If$h = k - 1$ and $|D_2| = h > 2$ where $|D_1| = \Delta(T) = k > 3$. ----------(6)

From (5) and (6)

$\therefore$, $RED(T) = \Delta(T) = n - 1 - h$ If$h = k - 1$ and $|D_2| = h \geq 2$ where $|D_1| = \Delta(T) = k \geq 3$.

$\Rightarrow RED(T) = \Delta(T) = n - 1 - h$ if $2 \leq h = k - 1$ where $|D_1| = \Delta(T) = k \geq 3$. ---------(7)

Subcase(b): Let $|D_1| - |N(D_2)| > 1 \quad \Rightarrow k - h > 1 \Rightarrow h < k - 1$

We have $D = \{c\} \cup \{w_1, w_2\}$.

(1) If k = 3 then $h < 2$. $\Rightarrow h = 1 \Rightarrow D_2 = \{w_1\}$.

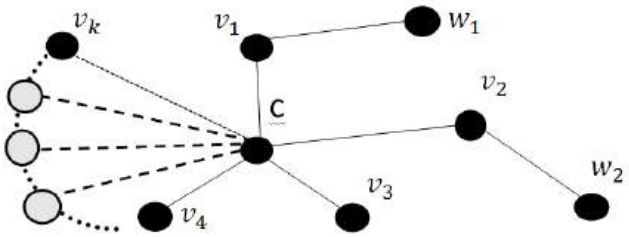
For h =1 and k =3 we have already proved in Subcase (a) of Case(i).

(2) If k > 3 then $h < k - 1$

If $|D_2| = h = 2$. $\Rightarrow D_2 = \{w_1, w_2\} \Rightarrow V(T) - D = D_1$

Wounded Spider Graph T

With h = 2 and k >3



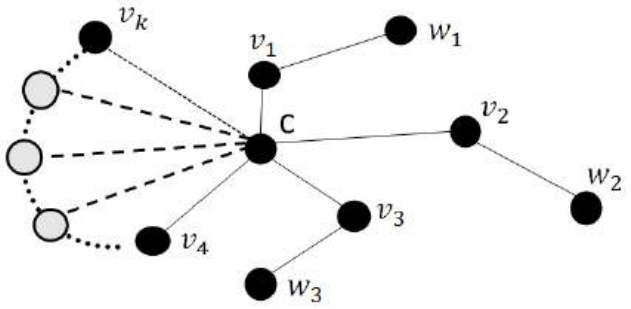
Then the central vertex c dominates all the vertices of D_1.

Therefore, D is a minimum ecc D-set.

Since $|D_1| - |N(D_2)| > 1 \Rightarrow |D_1| - |\{v_1, v_2\}| > 1$, we have $N(v_i) \cap D = \{c\}$ for all v_i in $D_1 - N(D_2)$. So, D is not a RED-set of T. By leaving any one vertex say v_k of $D_1 - N(D_2)$add remaining all other k – 3 vertices of $D_1 - N(D_2)$ in D.

So, let D = {c} ∪((D₁ – N(D₂))– {v_k}) ∪{w_1, w_2}
⟹ V(T) – D = {v_1, v_2, v_k} [since N(D₂) = {v_1, v_2}]
⟹ N(v_1) ∩ D = {c, w_1}, N(v_2) ∩ D = {c, w_2}, and N(v_k) ∩ D = {c}
Clearly, D is a RED-set of T.
RED(T) = 1 + |D₁| – | N(D₂)| – 1 + 2
⟹ = Δ(T) – 2 + 2[since | N(D₂)| = 2]
⟹ = n – 1 – h [using (1)]
∴, RED(T) = Δ(T) = n – 1 – h if h< k – 1 and |D₂| = h =2 where |D₁| = Δ(T) = k > 3. ---------(8)
If |D₂| = h> 2 then D = {c} ∪ {w_1, w_2} doesn't dominate the vertices of D₂ – {w_1, w_2}. So, add all the remaining vertices of N(D₂) – {v_1, v_2} in D.
Therefore, D = {c} ∪ (N(D₂) – {v_1, v_2}) ∪ {w_1, w_2}
⟹ V(T) – D = (D₁ – N(D₂)) ∪ {v_1, v_2} ∪ (D₂ – {w_1, w_2})
Then the central vertex c dominates all the vertices of D₁ – N(D₂), the set N(D₂) – {v_1, v_2} dominates all the vertices of D₂ – {w_1, w_2}, c and$w_1$both dominates v_1, whereas c and $w_2$both dominates v_2 in V(T) – D. Therefore, D is a minimum ecc D-set.
Since |D₁| – |N(D₂)| > 1, we have N(v_i) ∩ D = {c} for all v_i in D₁ – N(D₂). So, D is not a RED-set of T. By leaving any one vertex say v_k of D₁ – N(D₂) add remaining all k – h – 1 vertices of D₁ – N(D₂) in D.

Wounded Spider Graph T
With h> 2 and k >3



So, let D = {c} ∪((D₁ – N(D₂)) – {v_k})∪ (N(D₂) – {v_1, v_2})∪ {w_1, w_2}
⟹ V(T) – D = {v_1, v_2, v_k}∪ (D₂ – {w_1, w_2})
⟹ N(v_1) ∩ D = {c, w_1}, N(v_2) ∩ D = {c, w_2}, N(v_k) ∩ D = {c} and
N(w_i) ∩ D = {v_i} for all w_i in D₂ – {w_1, w_2}.
Clearly, D is a RED-set of T.
RED(T) = 1 + |D₁| – |N(D₂)| – 1+ |N(D₂)| – 2+ 2
⟹ = |D₁|
⟹ = Δ(T)
⟹ = n – 1 – h [using (1)]
∴, RED(T) = Δ(T) = n – 1 – h if h< k – 1 and |D₂| = h> 2 where |D₁| = Δ(T) = k > 3. -------(9)
From (8) and (9)
RED(T) = Δ(T) = n – 1 – h if h< k – 1 and |D₂| = h≥ 2 where |D₁| = Δ(T) = k > 3.
⟹ RED(T) = Δ(T) = n – 1 – h if 2 ≤h< k -1 where |D₁| = Δ(T) = k > 3. ----------(10)
From(7) and (10)
RED(T) = Δ(T) = n – 1 – h If2≤h≤ k -1 where |D₁| = Δ(T) = k ≥ 3 ----------(11)
From (4) and (11)
Hence, RED(T) = Δ(T) = n – 1 – h and $1 \leq h \leq k-1$ where Δ(T) = k ≥ 3.

CONCLUSION

In this article location ecc D-set with minimum cardinality which is known as *referencing ecc D-set* that is *RED-set* and its cardinality is known as location eccentric domination number **RED(G)** in spider graphs and in different kinds of wounded spider graphs are determined which is useful to identify the location at where the security is breached and also useful to protect objects away from there.

List of Abbreviations

ecc	-	eccentric
ecc-pt	-	eccentric point
D-set	-	dominating set
LD-set	-	location dominating set
RD(G)	-	location domination number of G
LED-set	-	location eccentric dominating set
RED(G)	-	location eccentric domination number of G

ABSTRACT

Pivotal Response Training (PRT) is an evidence- based intervention focusing on behavioral support for the children who have ASD, targeting crucial areas such as motivation and communication. This systematic review examines the effectiveness of Pivotal Response Training for children with ASD, by following PRISMA 2020 guidelines. A comprehensive search was carried out in PubMed database using keywords "Pivotal response training AND autism" and published between 2015-2025 which yielded 94 studies. After screening, seven randomized controlled trials met inclusion criteria, involving 248 participants. The selected studies assessed PRT's impact on language, behavioral outcomes and social communication. Results indicates that PRT improves pivotal skills which includes motivation, initiation with varying efficacy among different age and severity levels. Due to heterogeneity in intervention duration the outcome measures limit direct comparisons. Overall, PRT is a promising intervention for ASD children, though standardized protocols are needed to strengthen evidence for high-quality RCTs. This systematic review supports PRT's clinical applications while highlighting gaps for future research.

Keywords: Pivotal Response Training, Autism.

INTRODUCTION

The Diagnostic and Statistical Manual of Mental Disorders (DSM)defined Autism spectrum disorder as a complex neurodevelopmental condition, where the individual experiences relentless deficits in the communication and social

interaction across diverse environments. Children with Autism Spectrum Disorder often exhibits restricted, repetitive patterns of behavior and rigid routine such ash and-flapping, face difficulties with nonverbal cues and social-emotional reciprocity with atypical reactions to the sensory information is present. Symptoms of ASD typically occur in the early development stage, but they might not be noticed until social expectations exceed limited capacities or become masked by developed adaptation strategies [1].The ADDM Network's 2022 report suggest that approximately 1 in 31 children born in the year 2014 have the highest prevalence of ASD. Furthermore, the prevalence increased from about 6.7 per 1000 children which means (1 in 150) in 2000 to 32.2 per 1000 which means (1 in 31) in 2022[2]. The vulnerability of developing autism is influenced by multiple factors, including genetical and environmental factors[3]. To alleviate the severity of autism and to improve social communication and interaction, PRT an evidence-based intervention through naturalistic and motivational strategies were used [4]. PRT was formulated by Dr. Robert and Dr. Lynn Koegel (originally called the Natural Language Paradigm in the 1970s) and is now advanced at Stanford University, with over 200 supporting studies and 30 books. This evidence-based approach has demonstrated effectiveness for over 30 years through extensive peer-reviewed research and clinical application. [5]. PRT is primarily used with autistic children aged 2–6 years but remains effective across all ages. It is a play-based and child-led technique based on Applied Behavior Analysis (ABA) principles with 4 key components like self-initiation, self- management, motivation and responsiveness to multiple cues[6]. Furthermore, research demonstrates that PRT's motivation-based language intervention effectively enhances both targeted language skills and broader cognitive/social abilities in autistic children[7]. Teaching self- initiation fosters independent social interactions and self- expression, enhancing communication and autonomy. Developing responsiveness to multiple cues improves flexibility and reduces over-reliance, enabling better interpretation of social and contextual cues.

Additionally, cultivating self-management helps develop emotional regulation and behavioral control, building the essential independence and decision-making skills that support lasting success across academic, social and everyday life settings[6]. PRT therapy requires 25 hours per week which is considered ideal for consistent home and school implementation to improve social skills and behavior for ASD. The sessions occur in familiar settings like home, school and parks with care givers/parents and therapists, targeting the key domains through play-based techniques and daily interactions. The real-world approach helps to generalize skills across contexts for long-term progress in children with ASD [8]. Recent studies explore that incorporating telehealth services of PRT for ASD, shows digital delivery enhances engagement through customizable, screen-based reinforcement with shared control, though challenges remain for minimally verbal children. While virtual PRT demonstrates potential treatment assess for children with ASD, future research must optimize resources, mixed models, and tech accessibility which leveraging its unique advantages for virtual tools [9]. When comparing pivotal response training (PRT) and structured ABA, results suggest that child-led activities like PRT was more fruitful in improving speech and interpersonal skills in children with autism to ease the symptoms effectively than structured ABA methods after three months of intervention. Additionally, children in PRT group reveals potential gain in both targeted and general skills compared to the structured ABA group[10]. The scope of this systematic review is to critically evaluate the efficacy of PRT in improving core ASD symptoms and related intervention outcomes. The study synthesizes findings from Clinical trials including RCT's to assess the effectiveness of treatment.

METHODOLOGY

Search strategy

The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA 2020) statement was used in this study. This study systematically reviewed all empirical data based PRT potency for children with Autism Spectrum Disorder. Further, keywords such as "Pivotal response training AND autism" were used to gather research papers from PubMed database, that were published between 2015 and 2025 (during the past 10 years).

Criteria for Selection

The review included researches that satisfied the following criteria: (a) investigated PRT and ASD; (b) concentrated on children with autism of any age or severity; and (c) used clinical trials, such as RCTs; (d) publisher in PubMed. Figure 1 (PRISMA flow diagram) details the study selection procedure, including the grounds for exclusion.

Selection procedure

The selection process aimed to find potential studies focused on identifying relevant research articles that fulfil predefined inclusion criteria. Only studies from PubMed and published in English were retained. Further, the studies included clinical trials/randomized controlled trials (RCTs) and examined the effect of PRT on autistic children of any age were considered. The initial screening involved an independent evaluation of articles based on the titles, abstracts, and keywords. This preliminary assessment does not provide sufficient data to determine potential articles. So, full text article was retrieved for further review. This approach ensured that only high-quality and potentially relevant studies were included in this article.

Search results

A total of 94 studies published between 2015 to 2025 were screened from PubMed, of which only 07 satisfied the inclusion criteria in this systematic review. The following data like title, authors, published year, sample size, demographic data of the participants, intervention, study duration and measured outcomes were analysed and extracted from the selected studies (Refer Table 1 for further information regarding PRT and ASD).

Participant Characteristics

Data of children participating in the studies ranged from 24 to 73, with a total of 248 children across all 7 studies. ≈ 83% of male participants and ≈ 17% of female. The age of the children ranged from 2 to 11 years, with a mean age of ≈ 5.2 years. All studies reported either mean age or age ranges, ensuring unambiguous demographic representation. The characteristics of participants across all 7 studies are presented in Table 1.

DISCUSSION

A randomized controlled trial compared the standard PRT, robot-assisted PRT and a treatment-as-usual group for children with ASD, after three months follow-up, Robot-assisted PRT showed improvement, suggesting sustained benefits when pairing PRT's motivational strategies with engaging robot-child interactions. Robot-assisted PRT have a long-term effectiveness for children with ASD, especially while using game-based sessions [11]. Inanon-randomized study that used PRT led to a small but significant improvement in autism symptoms, as measured by the ADOS and SRS, while Treatment At Usual (TAU) showed no such improvement and significant changes were observed in secondary outcomes like general behavioral problems or parental stress levels. In therapy the initial stages were led by the therapist and with slow transition to parent-led implementation, limitations included lack of randomization, small sample size, and variability in TAU[12]. PRT-P's efficacy in enhancing generalized communication skills with minimal detection bias. Furthermore, PRT-P group showed significant RVC scores when compared to control group which indicates improved vocal responsiveness after 24 weeks[13]. While combining the parent training with clinician-delivered in-home intervention for autistic and language delayed children. A 24-week RCT showed that a PRT Package (PRT)have significant improvement in functional communication skills, parent fidelity, and social communication behaviors compared to community-based treatment. The intervention was effective across heterogenous metrics, though long-term effects require further research [10]. Apart from Traditional treatment the nuanced robot-mediated PRT shows promising in many studies, children with robot-assisted PRT showed great impact in their social communication skills in follow-up sessions [11]. Children showed high likability for the robot and especially school-aged participants. Challenges in robot- assisted PRT includes technical delays and inflexible robot behavior, recommending for the need for improved adaptability. Parents rated (84.8/100) for the robots, though lower scores were linked to rigid robot behavior or delayed responses, while children with severe ASD exhibit slight reduced engagement [14]. The potency of PRT in improving and, tact, echoic, and listener

responding in autistic children using Skinner's verbal behavior theory showed significant advancement in all targeted language functions while comparing PRT group and the control group. Additionally, PRT enhanced untargeted social, cognitive, and motor skills, demonstrating its broad therapeutic benefits. When activities are selected on the basis of participant choice and when rewards are directly related to the participants actions the results are more effective [15]. PRT group received an 8-week intervention which incorporates child choice, natural rewards, and motivational strategies targeting 4 functions related to language like mand (requesting), tact (labeling), echoic (repeating) and listener responding (responding to verbal requests). This intervention was administered by qualified therapist for both children and parents, resulted in significantly lower level disruptive behaviors (41% reduction) compared to structured ABA (5% reduction). Therefore, highlights PRT's effectiveness in creating more engaging and less disruptive therapy sessions [16]. Meta- analysis and systematic review of PRT highlight variability in study designs and outcomes, shows a promising result in the improvement of language and communication skills in individuals with ASD, but evidence for other outcomes like adaptive functions and cognitive skills is weaker and inconsistent[17].

CONCLUSION

Many studies revealed that PRT consistently improves motivation, language functions like requesting, labelling and social interaction in children with Autism Spectrum Disorder. To generalize the findings parent's involvement and naturalistic settings are crucial. Parents learn PRT techniques through coaching, video feedback and practice this help to reinforce learning at home. Though parental involvement enhances outcomes, parental stress may not always decrease. Furthermore, robot-assistance and automated measures (RVC) promises enhanced engagement and objectivity based on the rigorous methodologies such as RCT's and blinded rating which strengthens the evidence for PRT's efficacy. While, the research on PRT consistently highlights its naturalistic, child-centred approach with strong parent involvement focusing on pivotal skills to drive broad improvements. Future research should address the long-term outcomes including individualized adaptations and implementations.

Table 1: Summary of the study on PRT in children with ASD

Authors and title	Participants (number, gender, age)	Target behaviour	PRT technique	Research Design	Results
Grace W. Gengoux ***et al.*** **(2019) "A Pivotal Response Treatment Package for Children with Autism Spectrum Disorder: An RCT"**	48 children with ASD (PRT-P: n=24; control: n=24); aged 2–5 years; 81% male.	Functional utterances, expressive vocabulary, and social communication.	Parent- training and clinician-delivered PRT (child choice, natural reinforcement, task variation).	Randomized Controlled Trial (RCT).	PRT-P group improved significantly in functional utterances and parent-reported vocabulary. No group differences on standardized

					language measures.
Jena McDaniel ***et al.*** **(2020)"Short Report: Effects of Pivotal Response Treatment on Reciprocal Vocal Contingency in a Randomized Controlled Trial of Children with Autism Spectrum Disorder"**	48 children with ASD (PRT-P: n=24; control: n=24);mean age ~4 years; 88% male.	Vocal reciprocity (reciprocal vocal contingency, RVC).	Clinician-delivered and parent-implemented PRT targeting motivation, natural reinforcement, and child-initiated interactions.	Randomized Controlled Trial (RCT).	PRT-P group showed significantly higher RVC scores after 24 weeks compared to controls. Gains were consistent with parent-reported improvements in social communication.
Leilei Wang *et al*., (2023) "Using Pivotal Response Treatment to Improve Language Functions of Autistic Children in Special Schools: A Randomized Controlled Trial."	30 autistic children (22 male, 8 female), aged 4–8 years, with intellectual disability (IQ ≤ 50).	Improving primary language functions: mand (requesting), tact (labeling), echoic (repeating), and listener responding (responding to verbal requests).	Motivational components of PRT, including child choice, direct reinforcement, and embedding learning in natural interactions.	Randomized controlled trial with an 8-week PRT intervention (3 sessions/week) in special schools, compared to treatment-as-usual and parents in the PRT group received training for home practice.	PRT group displays significant improvements in all areas of language functions, with gains maintained at follow-up. Untargeted skills (social communication, cognition, motor skills) also improved. Control group showed limited progress, with declines post-intervention.
Iris van den Berk-Smeekens *et al*., (2020) "Adherence and acceptability of a robot-assisted Pivotal Response Treatment protocol for children with autism spectrum	25 children (20 male, 5 female), aged 3years to 8 years, with ASD and a total IQ	Improving motivation for social interaction/ communication, self-initiations, and pivotal	Incorporated child choice, direct reinforcement, interspersing tasks, and natural reinforcement into robot-assisted game scenarios.	20-session robot-assisted PRT intervention using a NAO robot, with child and parent	High treatment adherence (85.5%), positive child affect (86.6% of sessions), and high robot

disorder."	above 70.	skills in children with ASD.		ratings on adherence, affect, and likability.	likability (79.4%). School-aged children and parents rated the robot more favorably.
E. A. Duffhuis (2017) "The Effect of Pivotal Response Treatment in Children with Autism Spectrum Disorders: A Non-randomized Study with a Blinded Outcome Measure"	24 participants (20 male and 4 female), aged 3–8 years in PRT Group - 10 male, 1 female and in TAU Group - 10 males, 3 females, total PRT = 11, TAU = 13.	Social directedness, Communication skills, Self-management skills.	• Following the child's lead and using clear instructions (prompts). • Providing immediate and contingent rewards using the natural reinforcers which • reinforcing good attempts and interspersing tasks.	Multicentered, non-randomized trial with repeated measures.	PRT group shows significant improvement in autistic symptoms compared to TAU. No significant changes in the general behavioural problem or parental stress level, except for slight improvement in communication subscale (SRS).
Fereshteh Mohammadzaheri *et al*., (2015) "A Randomized Clinical Trial Comparison Between Pivotal Response Treatment (PRT) and Adult-Driven Applied Behavior Analysis (ABA) Intervention on Disruptive Behaviors in Public School Children with Autism."	30 autistic elementary school children (18 male, 12 female), aged 6–11 years, with verbal abilities (MLU ≥ 2 words) and IQ ≥ 50.	Reducing disruptive behaviors (e.g., crying, yelling, avoidance) during language intervention targeting Mean Length of Utterance (MLU).	Motivational components including child choice, natural reinforcers, task variation, and reinforcing attempts.	Randomized controlled trial comparing PRT (naturalistic, child-led) with structured adult-directed ABA (drill-based, therapist-led) over 24 hours of intervention (2 sessions/week for 3 months).	PRT group showed significantly greater reductions in disruptive behavior (41% decrease) compared to ABA (5% decrease). PRT also improved MLU and untargeted social-communicative skills.
Iris van den Berk-Smeek	73 ASD	General social-	Parent-child sessions,	**Three-armed**	Robot-assisted

en *et al*. (2022) "**Pivotal Response Treatment with and without robot-assistance for children with autism: a randomized controlled trial**"	children(In PRT group n=25; PRT and robot: n=25; TAU: n=23); aged 3–8 years; ~85% male.	communicative skills, clinical global functioning.	therapist modeling, robot-assisted interactions (NAO robot for motivation/attention).	**RCT compared PRTand PRT with robot-assisted treatment and treatment-as-usual (TAU) Participants were stratified by age, IQ, and site, with randomization (1:1:1) and blinded outcome assessments."**	PRT showed largest improvement in social-communicative skills at follow-up. While, there is no notable differences between PRT and TAU at endpoint in social-communicative skill at follow-up.

ABSTRACT

Cancer stands as one of the most prevalent causes of global death. Numerous pharmacological agents have been employed in cancer treatment; nevertheless, traditional chemotherapeutic agents exhibit diminished bioavailability, uneven distribution, and significant adverse effect. In the past few years, nanotechnology has arisen as a multidisciplinary field that bridges biology, engineering, medicine, and chemistry, focusing on transformative advancements in the diagnosis, prevention and treatment. Algal-mediated nanoparticles are economically viable, safe, and biocompatible, gaining significant interest from researchers worldwide. At present, numerous metallic nanoparticles have been developed for cancer treatment or diagnosis; among these, gold (Au), Zinc (Zn), iron (Fe), and copper (Cu) are the predominant anti-cancer nanoparticles. The anticancer efficacy associated with these nanoparticles is ascribed to their capacity to stimulate the production of reactive oxygen species (ROS) within cellular compartments, thereby activating apoptotic, autophagic, and necrotic cell death pathways. This paper

highlights anticancer potential of metallic nanoparticles from marine algae on human cancer cell lines, with an emphasis on their mechanism of action, and the future prospects.

Keywords: Cancer, Nanoparticles, Biosynthesis, Marine Algae Graphical abstract (Fig:1)

INTRODUCTION

Cancer is one of the most catastrophic diseases worldwide, with over 10 million new cases annually [1]. Cancer is a generic word for a group of disorders marked by uncontrolled cell proliferation and invasiveness. Conventional therapies involve medical procedures like radiation, and chemotherapy, which generally lead to considerable adverse effects and substantial expenses. The primary objective of this therapeutic method is to eradicate the afflicted tissues and improve patient survival by disrupting the permeability of malignant cells. surgical surgery frequently proves ineffectual in addressing tumor recurrence and metastasis to distant organs, including the bones, lungs, and liver. Radiotherapy, utilizes high-energy radiation to diminish or eliminate cancer cells [2]. Nanoscale materials provide a viable platform for the development of advanced drug delivery systems that improve the efficacy, precision, and overall success of cancer treatment. This represents promising platform for the design of innovative drug delivery systems that enhance the precision, efficacy, and overall success of cancer therapy. These minute structures facilitate targeted delivery to tumor cells, so avoiding harm to healthy tissues and mitigating related adverse consequences. Nanoparticles provide distinct benefits, including superior biocompatibility, less toxicity, increased stability, higher permeability, and accurate targeting abilities, rendering them particularly efficacious in cancer treatments [3]. Despite continuous technological advancements aimed at employing nanotechnology for cancer therapy and improving therapeutic efficacy, nanoparticles have been widely utilized in biomedical applications. Nanoparticles with a diameter ranging from 10 to 100 nm are generally considered suitable for cancer therapy, as they may effectively deliver drugs and enhance the permeability and retention impact. Metal nanoparticles, including gold, copper, silver, zinc, iron have been identified as promising agents for targeting cancer cells while preserving normal cells [4]. Cancer nanotechnology has established a novel domain of integrative study encompassing chemistry, biology, medicine, and engineering, focusing on significant advancements in cancer diagnosis, therapy, and prevention [5]. A wide range of studies has been undertaken to examine the targeting design of nanoparticles-based medications. To effectively address the challenges of tumor targeting and the design of nano carrier systems, it is crucial to first understand tumor biology and the interactions between nanocarriers and tumor cells. The green synthesis method is regarded as the most cost effective, sustainable, dependable, and eco-friendly strategy for nanoparticle synthesis. The method avoids the necessity for hazardous chemicals, extreme temperatures, or high-pressure situations, therefore protecting both human health and the environment. Due to its use of economical and nontoxic biological resources including algae, bacteria, fungi, algae, plant extracts, proteins, and natural polymers.

Anticancer potentiality of synthesized metallic nanoparticles from marine algae

In addition to improving the efficiency of biofuel cells and supporting the generation of sustainable biofuels, nanotechnology has also expanded into the field of phyco-nanotechnology, which utilizes algal-derived phytochemicals for nanoparticles synthesis and related applications [6]. Various algal taxa, including Cyanophyceae (blue-green algae), Chlorophyceae (green algae), Rhodophyceae (red algae), and Phaeophyceae (brown algae), demonstrate expertise in the manufacture of metal and metal oxide nanoparticles. Algae are rich in secondary metabolites (alkaloids, flavonoids, and terpenoids), vitamins, pigments, and proteins that serve as nano-factories [7]. They also encompass cytotoxic chemicals, including terpenoids, laminarins, and fucoidans, which exhibit antitumor, anticancer, and, antiproliferative properties [8]. The utilization of algae for the green manufacturing of nanoparticles is strongly advised. This can be ascribed to its simplicity, safety, cost-effectiveness, great energy efficiency, absence of external reducing and capping agents, and applicability in pharmaceutical and biological domains.

The mechanism of path of cancer cells exposed to nanoparticles

The utilization of nanoparticles with innovative formulations and designs is intricately linked to the treatment and detection of malignant cell proliferation [9]. Nanoparticles exhibit enhanced efficacy in inducing apoptosis principally due to their nanoscale dimensions, which cofer more reactivity through an expanded surface area, resulting in the augmented production of ROS. The apoptotic effects intensify with heightened oxidative stress in cells, resulting in the generation of inflammatory mediators, subsequent DNA and protein damage, and ensuring cytotoxicity [10]. Apoptosis can be initiated via intrinsic or extrinsic mechanisms. The intrinsic process is chiefly facilitated by the production of reactive oxygen species (ROS), which cause mitochondrial membrane depolarization and the subsequent release of cytochrome c into the cytoplasm. Upon release, cytochrome c initiates the caspase-9 and caspase-3 cascade, thereby facilitating programmed cell death [11]. The overexpression and down regulation of particular proteins indicate the cellular adaptive response to internal or external stimuli under normal or oxidative stress circumstances. Copper oxide nanoparticles (CuO-NPs) have demonstrated the ability to downregulate anti-apoptotic regulatory proteins, including Bcl-xL and Bcl-2, thereby promoting programmed cell death in HT-29 cells [12]. Gold nanoparticle conjugates have shown specific inhibition of cyclin-dependent kinase 4 (CDK4), resulting in G1 phase cell cycle arrest and the activation of death in the estrogen receptor-positive human breast cancer cell line MCF-7 [13]. Zinc oxide nanoparticles (ZnONPs) have anticancer capabilities via altering gene and protein expression, inducing oxidative stress, and disrupting cellular processes, ultimately leading to the death of cancer cells. Cancer cells can internalize them, affecting essential proteins like p53, Bax, and Bcl-2, which regulate apoptosis. ZnO nanoparticles generate reactive oxygen species (ROS), resulting in oxidative damage and apoptosis [14]. The present research aims to conduct a comprehensive analysis of nanoparticle production using marine algae and evaluate their potential anticancer efficacy against diverse human cancer cell lines.

This review specifically highlights the green manufacturing of metallic nanoparticles, including gold (Au), zinc (Zn), iron (Fe), and copper (Cu), facilitated by marine algae, and their inhibitory effects on several cancer cell lines. Additionally, it aims to elucidate the fundamental mechanisms of action, existing obstacles, and future prospects of algae-mediated nanoparticle applications in cancer therapy. List of research studies demonstrating the anticancer properties of biosynthesized gold nanoparticles (Table: 1). Gold is considered an optical material for nanoparticle manufacturing, demonstrating superior distribution owing to its diminutive size and expansive surface area. Moreover, due to its resistance to oxidation from moisture, oxygen, and acids, together with its biocompatibility, it has garnered interest in the biomedical field, particularly in cell targeting, tumour detection, drug delivery, and cancer therapy. A few numbersof *in vitro* studies have been performed on several cancer cell lines to assess the antitumor efficacy of biosynthesized gold nanoparticles. Biosynthesized AuNPs from *C. racemosa* and it's characterized by a spherical topology and dimensions 35 nm, exhibited inhibitory effects on H460 lung cancer cell lines, with IC_{50} values dependent upon the synthesis procedures and the specific plant extracts utilized in the manufacturing process [15]. Spherical and triangular AuNPs, sized between 8–10nm, exhibited cytotoxicity against HepG2 liver cancer and A549 lung cancer cells, with an IC_{50} value of 100 μg/mL [16]. In additional studies, spherical AuNPs averaging 3.65 nm in size shown cytotoxicity towards, HepG2, HeLa, CEM-ss, MDA-MB-231, among other cancer cell lines via activating apoptotic processes [17]. Biosynthesized spherical AuNPs, averaging 34.5 nm in diameter, suppressed the proliferation of HepG2 liver cancer and BxPC3 pancreatic cancer cells by regulating anti-apoptotic proteins, exhibiting an IC_{50} value of 50 μg/mL [20]. Gold nanoparticles (AuNPs) sourced from *Sargassum* species exhibited sizes between 5 and 35 nm and had lethal effects on HeLa cervical cancer, HT-29 colon cancer, MCF-7 breast cancer, and HepG2 liver cancer cells via the overexpression of many proinflammatory genes [27, 31, 34].

Gold nanoparticles (AuNPs) derived from *S. asperum*, exhibiting a spherical morphology, exhibited suppression of LN-18 glioblastoma cell lines, with an IC_{50} value of 13.38 μg/mL [32]. *T. decurrens*-mediated AuNPs exhibited dose-dependent cytotoxicity against HepG2 liver and A549 lung cancer cell lines, as assessed by MTT and SRB assays [33,34]. The cytotoxicity of biosynthesized AuNPs on additional cancer cell types is detailed in Table 1. List of research studies demonstrating the anticancer properties of biosynthesized zinc nanoparticles (Table2). In the last few years, the biological production of of zinc and zinc oxide nanoparticles (Zn/ ZnONPs) has attracted significant

interest for the creation of eco-friendly nanomaterials, primarily owing to the presence of bioactive phytochemicals including alkaloids, phenolics, and flavonoids. Thedistinct physicochemical characteristics of ZnO nanoparticles augment their cellular absorption and impart inherent cytotoxicity towards cancer cells by producing intracellular reactive oxygen species (ROS), hence initiating death. These characteristics render them viable candidates for biomedical applications[44]. ZnO nanoparticles synthesized using *Gracilaria edulis* extract were spherical, with diameter ranging from 55 to 99 nm, and exhibited potent anticancer activity against PC3 prostate cancer cells, with an IC_{50} of 71.98 μg/ml. Similarly, green- synthesized ZnO nanoparticles of approximately 12 nm demonstrated cytotoxic effects against MCF-7 human breast cancer cell line [37]. Additionally, spherical Zn NPs ranging from 6 to 70 nm showed inhibitory activity against marine algae and various cancer cell lines in MTT assay [38-41]. The cytotoxic potential of nanoparticles derived from *Kappaphycus alvarezii* and *Ulva lactuca* was also assessed using MTT assays on MCF-7 breast and HepG2 liver cancer cells, revealing significant anticancer efficacy [42,43]. List of research studies demonstrating the anticancer properties of biosynthesized iron nanoparticles (Table3).

Iron oxides are among the most important transition metal oxides having biological significance. Hematite (α-Fe2O3), the most stable polymorph of iron oxide, exhibits tunableoptical and magnetic properties, remarkable chemical stability, and biocompatibility, making it suitable for biomedical applications [52]. Marine algal-mediated biosynthesized iron NPs, characterized by spherical shape with dimensions of 30-40 nm, demonstrated inhibitory effects on cervical cancer cell lines HeLa [45]. Likewise, spherically formed Fe_2O_3NPs of 12 nm in size, synthesized from *S. asperum* aqueous algal extract, exhibited cytotoxicity against glioblastoma cancer cell lines LN-18 [46]. FeNPs synthesized using *Sargassum muticum* demonstrated dose dependent cytotoxicity against HepG2 liver, HeLa cervical, MCF-7 breast, and A2780cp ovarian cancer cell lines, as evaluated by MTT assays [47,51]. Similarly, spherical Fe_2O_3 nanoparticles with diameter ranging from 20 t0 50 nm that were made from the aqueous extract of *Halymenia valentiae* demonstrated strong anticancer activity, with an IC_{50} of 33.89 μg/ml against MDA-MB-231 breast cancer cells and 66.79 μg/ml against A549 lung cancer cells [48].Inhibition of HeLa cervical cancer cell lines, HCT-116 colon cancers were conducted using biosynthesized spherically shaped iron nanoparticles of 7.2–27.59 nm in size, exhibiting dose dependent inhibition [49, 50]. List of research studies demonstrating the anticancer properties of biosynthesized CuNPs (Table 4). CuNPs manufactured from*Padina capillaceae*,averaging 62 nm in size, exhibited notable anticancerefficacy against HepG2 liver, MCF-7 breast, and SKOV3 ovarian cancer cell lines [53]. Furthermore, CuNPs facilitated by *Padina boergesenii* shown in vitro cytotoxicity against the A375 melanoma cell line [54]. Spherical biosynthesized CuNPs, averaging 21.78 nm in diameter, were demonstrated to limit the proliferation of HepG2 liver and MCF-7 breast cancer cells by altering the expression of anti-apoptotic proteins, with an IC_{50} of 100 μg/ml [55].

CONCLUSION

Cancer remains to be a primary cause of global mortality, despite significant progress in diagnosis and treatment. Current anticancer medicationsfrequentlydemonstrate significant adverse effects, highlighting the necessity for safer and more effective alternatives. This review emphasizes the environmentally friendly manufacturing of metallic nanoparticles (Au, Zn/ZnO, Fe/FeO, and Cu/CuO) and there in vitro anticancer effectiveness. Among 39 marine macroalgae studied, gold nanoparticles showed the highest activity (48.71%), followed by zinc (23%), iron (20%), and copper (8%). Further preclinical evaluation—including standardization, toxicity profiling, and mechanistic studies—is required before clinical application. Optimization of dosage, administration routes, and biodegradability remains crucial for successful clinical translation.

ACKNOWLEDGEMENT

The author gratefully acknowledges the support of the SHODH (Scheme of developing High quality, research Education Department), fellowship provided by the government of Gujarat. Although this specific study did not receive direct funding, the fellowship has contributed significantly to the authors over all research development.

Conflict of Interest

The authors declare no conflicts of interest.

ABSTRACT

In recent days the globalized business environment, multinational corporations have increasingly recognizing the importance of soft skills such as leadership, teamwork and employee engagement. Traditional training methods often fail to sustain motivation and translation knowledge as on practical behaviour. This study examines on effectiveness of the gamification on using game methods like storytelling, points, rewards, simulations and real-time feedback as an innovative approach to enhance the corporate training outcomes. However, the study compares gamified training methods with traditional approaches in developing the skills of the employees across diverse sectors. A sample of 150 employees from multiple companies, and employed a stratified random sampling technique, the research analysed differences based on training type and experience level through t-tests, ANOVA, and correlation analysis. Findings reveal that employees used gamified training reported to have significantly higher leadership and teamwork skills compare to those trained through traditional methods. Differences were evaluated on IT and HR employees having stronger benefits, while experience level showed no significant effect. Furthermore, main gamification elements including engagement, collaboration, and achievement demonstrated strong positive correlations on leadership development, teamwork effectiveness, and employee engagement. Further, the study shows gamification is a powerful tool in creating interactive, motivating, effective corporate training. It's also induced to reinforce the behaviour, improve the participation, to promote practical skill application into a strategic method for companies seeking to strengthen the workforce competence in a dynamic and multicultural work environment.

Keywords - Leadership Development, Teamwork, Employee Engagement, Corporate Training, Gamification etc.,

INTRODUCTION

Today in the world of globalized business environment, multi-national corporations' place, strong emphasis on developing soft skills, such as leadership and teamwork, as these are essential for managing diverse and multicultural teams. However, traditional training methods often struggle to fully engage - employees or translate theoretical lessons, into practical workplace behaviours. Gamification, which refers to the use of game-like elements such as points, badges, leader boards, storytelling, and simulations in non-game contexts, offers a promising alternative to conventional approaches (Subbarao, 2020). By making learning interactive and enjoyable, Gamification proved to be potential to improve motivation, engagement, and retention of knowledge. For example, Deloitte reported that its gamified training modules, increased participation rates from 40% to over 80%, with a significant improvement in completion and knowledge retention (Deloitte, 2017). Similarly, IBM's Innov8 platform uses simulation-based training to immerse employees in realistic scenarios, allowing them to practice decision-making and strategic thinking in a safe learning environment (Join the Collective, 2019). Research also suggests that specific Gamification elements such as instant feedback, storytelling, and achievement-based rewards play an important role in reinforcing learning and sustaining employee involvement (LinkedIn, 2020; ID360, 2021). Studies comparing gamified and traditional training methods further highlight the advantages of Gamification: Microsoft reported a 21% rise in productivity and a 30% improvement in team collaboration after adopting gamified learning tools, while Gallup and Talent LMS found that gamified training increased engagement levels by 41% and reduced employee turnover by up to 25% (Psico Smart, 2021). These findings of the study indicate that Gamification can be a powerful tool for developing leadership along with teamwork skills in multinational corporations, making training more having effective, engaging, and impactful than traditional methods.

Need of the Study

In multinational corporations, soft skills such as leadership, teamwork, and engagement are essential for organizational growth. Traditional training methods often lack interactivity and fail to sustain employee motivation. Gamification, through elements like rewards, progress tracking, feedback, and collaboration, offers an innovative approach to make training more engaging and effective. Yet, there is limited evidence comparing the outcomes of gamified and traditional training in developing soft skills. It is important in examine if the effectiveness of Gamification differs across departments and to identify the **key** Gamification elements that contribute most to positive learning outcomes. This study is therefore needed to provide comparative insights and guide MNCs in designing impactful employee training programs.

OBJECTIVES

1. To compare the effectiveness of gamified and traditional training on leadership and teamwork skills.
2. To assess differences in the effectiveness of gamified training across departments or employee levels.
3. To examine the relationship b/w Gamification elements and soft skills development.

REVIEW LITERATURE

Gamification has emerged as a powerful tool in workplace training, leveraging game-like elements such as progress and achievement, motivation and rewards, engagement and immersion, Ryan and Deci (2000) note that gamified environments support intrinsic motivation by satisfying autonomy, competence, and relatedness needs, as highlighted in Self-Determination Theory. Experiential Learning Theory further supports Gamification, as Kolb (1984) demonstrates that immersive, interactive experiences combined with reflection and experimentation foster practical skill development. Empirical studies indicate that gamified training improves employee motivation and engagement (Hamari et al., 2014), enhances teamwork through collaborative challenges (Landers et al., 2017), and develops leadership skills via simulated decision-making scenarios (Bai et al., 2020). The integration of feedback, rewards, and interactive elements reinforces desired behaviors, aligning with behaviorist approaches (Robson et al.,

2015). Moreover, Gamification has been shown to sustain learner engagement over time, promoting both individual and team performance (Domínguez et al., 2013; Sailer et al., 2017). Overall, the convergence of Gamification elements with established learning theories demonstrates its effectiveness in creating engaging, motivational, and outcome-oriented training programs. Traditional training methods such as lectures and workshops have long been used in organizations to build leadership and teamwork skills. While effective for knowledge transfer, they often lack engagement and opportunities for active participation, which can limit their impact on behavioral skill development (Salas et al., 2015). In contrast, Gamification introduces interactive features such as points, feedback, and collaboration that stimulate motivation and foster active learning (Deterding et al., 2011).

Studies shown gamified training can significantly improve teamwork by encouraging collaboration and healthy competition. For example, Kumar and Herger (2013) demonstrated that Gamification promotes peer-to-peer interaction and shared problem-solving, which are critical components of teamwork. Similarly, Fotaris et al. (2017) found that gamified learning environments enhanced learners' ability to cooperate and perform tasks collectively compared to traditional formats. Leadership skills also appear to benefit more from Gamification than from traditional methods. Sailer et al. (2017) argued that Gamification elements like feedback and achievement badges help individuals track progress and build confidence, fostering leadership qualities such as decision-making and accountability. In another study, Armstrong and Landers (2018) reported that gamified simulations provided employees with realistic scenarios to practice leadership in safe environments, leading to better skill acquisition compared to lecture-based sessions.

Gamification in Training: Linking Elements to Learning Theories and Outcomes

Gamification in training uses elements like progress & achievement, motivation & rewards, engagement & immersion, feedback & interaction, and collaboration & autonomy to enhance learning experiences. These elements align with key learning theories: Self determination Theory explains on how the autonomy – competence and relatedness creates intrinsic motivation; Experiential Learning Theory emphasizes learning through immersive experiences, reflection, and active experimentation; and Behaviorist Approaches highlight the role of reinforcement and rewards in shaping behavior. By mapping Gamification elements to these theories, training programs can effectively develop workplace skills such as leadership, teamwork, and employee engagement, making learning both motivating and practical.

RESEARCH – METHODOLOGY

Research Design

The study adopts an analytical research design to examine the effectiveness of gamified training programs on employees' leadership, teamwork, and engagement. A comparative approach is used to analyze differences between gamified training and traditional training methods.

Universe of the study

The studies universe consists of working employees in multinational corporations (MNCs) who have undergone either gamified or traditional soft skills training programs. The focus is on employees across various departments and hierarchical levels to capture a representative view of organizational learning outcomes.

Sample Size

A total of 150 employees will be surveyed for this study. This includes participants from different MNCs who have participated in gamified and traditional training sessions over the past year. The sample size has been determined to ensure sufficient statistical power for comparative analysis.

Sampling Technique

The study will use a stratified-random sampling technique. Employees divided based on strata accordingly on training type (gamified vs. traditional) and department, ensuring proportional representation from each category. This technique minimizes sampling bias and ensures diversity across functional roles.

Statistical Tools and Techniques

Collected data analyzed using:

- **Descriptive statistics** - Mean, standard deviation, and frequency distribution on summarize the data.
- **Inferential statistics**:
  - **t-test** for comparing the effectiveness of gamified vs. traditional training.
  - **ANOVA** to examine differences across departments or employee levels.
  - **Correlation analysis** on explore relationships with Gamification elements and soft skills development.

Sources and Method of Data- Collection

The study employed on primary along with secondary data sources. Primary data was collected through structured questionnaires containing Likert-scale items designed to measure employees' perceived improvement in leadership, teamwork, engagement, and learning outcomes. Secondary data obtained from published research articles, journals, and reports focusing on Gamification, learning theories, and employee engagement, which provided a theoretical foundation and contextual support for the study. Data collection was carried out using **online surveys** distributed to employees who had undergone either gamified or traditional training programs, ensuring a broad and accessible reach across multinational corporations.

HYPOTHESES

H1 (T-test: Gamified vs. Traditional Training)

- **H_0:** No significant difference exists in leadership and teamwork skills between employees trained through gamified and traditional methods.
- **H_1:** Employees trained through Gamification show significantly higher leadership and teamwork skills than those trained through traditional methods.

H2 (ANOVA: Differences across Departments)

- **H_0:** There is no significant differences in the perceived effectiveness of gamified training across departments.
- **H_2:** There are significant differences in the perceived effectiveness of gamified training across departments.

H3 (Correlation: Gamification Elements and Soft Skills Development)

- **H_0:** Gamification elements are not significantly related to leadership, teamwork, and employee engagement.
- **H_3:** Gamification elements are positively related to leadership, teamwork, and employee engagement.

Data Analysis and Interpretation

The study surveyed 150 employees, with 60% maleand40% female participants. The majority were aged 31–40 years (40%), followed by 20–30 years (33.3%). Employees represented various departments, with IT (26.7%)and Marketing (23.3%) being the largest groups. Most respondents had 3–6 years of experience (33.3%), indicating a balanced representation across gender, age, department, and experience. This diversity ensures that the findings are representative of the multinational corporate workforce.

EFFECTIVENESS OF GAMIFIED VS. TRADITIONAL TRAINING (T-TEST)

To compare the effectiveness of gamified and traditional training on leadership and teamwork skills

Sample Distribution:

- Gamified training: 75 employees
- Traditional training: 75 employees

Employees who underwent gamified training reported significantly higher scores in both leadership and teamwork skills than those in traditional training. Since $p < 0.05$ for both skills, the difference is statistically significant, supporting the hypothesis that Gamification enhances soft skills development. Employees in gamified training reported significantly higher leadership and teamwork improvements than those in traditional training.

Differences across Departments and Employee Levels (ANOVA)
Objective: To examine if department or experience level affects the perceived effectiveness of gamified training.

Simulated ANOVA Results
The effectiveness of the gamified training varies across departments, with IT and HR employees benefiting the most. However, employee experience level does not significantly influence perceived effectiveness, indicating that gamified training is equally effective across different experience groups. Department influences perceived effectiveness of gamified training, whereas employee experience level does not.

Correlation Analysis: Gamification Elements and Soft Skills Development
Objective - To explore the relationship between key Gamification elements and soft skills development.

Simulated Pearson Correlation (r)
All Gamification elements show moderate to strong positive correlations with leadership, teamwork, and employee engagement ($p < 0.05$). Among them, engagement & immersion is most strongly associated with leadership, while collaboration & autonomy is most strongly related to teamwork. This indicates how Gamification elements play a crucial role in enhancing soft skills and overall employee engagement.All Gamification elements showing moderate to strong positive correlation with leadership, teamwork, and employee engagement. Engagement & immersion has the strongest correlation with leadership development, while collaboration & autonomy is most strongly associated with teamwork.

ABSTRACT

Payments Bank as a new concept to the Banking Industry and for the Digitalization of Postal Services, it has become more important to understand the benefits of India Post Payments Bank to the Department of Posts. The data are collected from the databases since 2017 to 2025 from various academic journals, India Post Payments Bank Annual Reports, RBI reports, newspaper articles and relevant government and departmental publications. This publication is related to the literature review on the digitalization of various Postal Services with the help of India Post Payments Bank. The main purpose of this study is to understand the need of a Payments Bank in the Department of Posts and the areas where further study and research is required. This study follows the PRISMA framework to ensure a comprehensive approach to the literature review process.

Keywords: Payments Bank, Postal Services, India Post Payments Bank, Digitalization

INTRODUCTION

India Post Payments Bank (IPPB) was established as a division of India Post under the Ministry of Communications and made significant paces in financial inclusion by leveraging India Post's vast network. RBI has given "in-principal" approval for 11 aspirants of payments bank on 19th August 2015 including Department of Posts. IPPB got cabinet approval on 01st June,2016 and was incorporated on 17th September,2016. IPPB got Payments Bank license from the RBI on 20thJanuary, 2017 and began its journey from Raipur and Ranchi on 30thJanuary, 2017. Out off 41 applicants, IPPB got payments Bank license from RBI along with other 11 applicants. The RBI approved 12 Payments

Bank and gave permission to operate under the Payments Bank capacity. As of now 6 payments Bank are operating and 3 are truly active including IPPB. In August 2016, IPPB was registered as a public limited government company by establishing a payment bank with 100% share in the Government of India. As of date IPPB is having 1 Branch housed at Delhi with 649 Banking outlets. It has 1,61,536 Post Offices as Banking Access Points and 3 lacks Postal Staff. The IPPB has its customer base in Rural and semi-urban areas. With the help of Gramin Dak Sevaks like Branch Postmasters and Assistant Branch Postmasters at Branch Office level, Dak Sevaks & Postmen's at Sub and Head Post Office level who are working on behalf of Department of Posts are reaching the customers at their Door Steps and also providing digital services provided by IPPB.

There is also a proposal to convert IPPB into a Small Finance bank(SFB). IPPB believes that it bridges the gap for Small businesses, farmers and self-helpgroups(SHGs) with its rural network and digital first approach. (KNN Bureau, March 05,2025). Smt. Vanditha Kaul, Secretary(Posts) and Chairman, IPPB has appealed to the Reserve Bank of India (RBI) and the Ministry of Finance to consider the proposal. Accordingly to Smt. Vanditha Kaul, "We definitely need to move into actual credit disbursal. The only way forward for IPPB is to become India Post Small Finance Bank" (CNBC, March 05,2025).

Currently IPPB offers Sweep-In(Transfer of money from existing POSB to existing IPPB Account) and Sweep-Out(Transfer of money from existing IPPB to existing POSB Account) facility for individual accounts. By expanding this service to institutional accounts and term deposits serves as a solution for Small Finance Bank(SFB) approval.

Objectives of the study:

The primary objective of the study is to identify the potential of IPPB towards digitalization steps and innovations especially in rural areas. The study also aims to evaluate how India Post Payments Bank contribute towards Digitalization of postal services and financial inclusion. This study aims to identify the capacity, opportunity and stretch of research conducted on this topic since the inception of IPPB (2018 onwards). The study also aims to identify the success factors and limitations highlighted by erstwhile studies.

REVIEW OF LITERATURE

Sl No	Name of the Author/s	Year	Purpose	Result
1	Ms. Manju M Kaimal, Dr. Tessy Thomas	2024	To classify, evaluate and assess the role of Payments Bank in adoption, and advancing financial inclusion.	It is revealed from the study that accessibility and trust significantly influence adoption of Payments Bank.
2	Deepika Saxena and Nihanshi Goyal	2024	The purpose of the study is to ensure the role of payment banks in promoting financial inclusion in India and the perception of the subscribers towards Paytm Payment Bank. Further, it also focus on the satisfaction level of the end users.	It is derived from the study that demographic factors are connected withthe use of payment banks and it also found that factors like gender, age and educational qualification limits the frequency of using Paytm Payments Bank.
3	Anil P. V, Melby George	2024	To analyse and review the present scenarios of India post Payment Bank,so that performance of IPPB can be reviewed over past five years using Return on Asset Ratio analysis.	It is revealed that there is significant growth for IPPB since 2018 to 2023.
4	Keerthana V, Dr. S. Loganatha Prasanna,	2024	The Primary objectives are to scrutinise the financial position of	The IPPB is in net profit due to its net worth but IPPB experienced a

	Sibi Nandha B, Nekha S, Harshini D, Hari Krishnan P		India Post Payments Bankwhere as secondary objectives reveals the overall fiscal performance of INDIA POST PAYMENTS BANK from past five years (2018-2023). The study evaluated themonetary position in terms of solvency, profitability, liquidity and efficiency.	net loss for four consecutive years.
5	Dr. Satish Patel	2024	The main aim is to empower communities in rural areas in Indiathrough increased access to information, education, healthcare, financial services, and economic opportunities through digitalisation.	Internet access in rural areas are only with 29% compared to 64% in urban areas which delayed in digitalisation especially in the economic growth of the country.
6	Ms. P. Muthulakshmi, Dr. M. Vairavan	2023	To find out the awareness among the users of IPPB services and to find out the satisfaction level among the end users.	The Customer satisfaction is interrelated with the awareness and usage of IPPB services.
7	Krupesh Thakar, Dr. Kapil K Dave	2023	To analyse the role and challenges faced by IPPB in promoting financial inclusion in India.	The study revealed that there is a significant growth in Customers, collection of deposits, digital transactions and DBT beneficiaries
8	Satakshi Agarwal	2023	The purpose of the study is to evaluate the financial aspectof Post office in connection with IPPB through balance sheet.	The study was conducted to emphasize the performance of IPPB which help the Department of Post to achieve its vision and mission in the long run.
9	Gaurav Joshi, Gaurav Joshi	2023	To identify the major problems faced by the End-Users inproviding IPPB's digital services to the customers.	Inconsistent network connectivity, outdated software, monolingual languages in softwareaffects the End-Usersto provide quality service to the IPPB customers.
10	Dr. Madhu, Ms Sakshi	2023	To examine the forthcoming challenges for the success of Payments Bank.	It is suggested to introduce Remittance Plus Model and Customer Focused Innovative Digital mechanism to compete in the market.
11	Srajan Kumar Singh , Nagendra Yadav	2023	The purpose is to examine the progress of Payment banks in India by investigating the features that differentiate payment banks from conventional banks. Further, the study focuses on how the IPPB contributes towards financial inclusion.	Central banking system did not focus on remote areas for the Economic needs of the individuals. The IPPB focus to connect all Post Offices in rural areas by competing with traditional banks.
12	Navatha JJ	2022	To observe the evolvingtendencies in IPPB	Updated technologies will bring better digitalized facilities to its customer.
13	Harshad V Patel and Dr.	2022	Examining how Payments Bank	IPPBdeals with the weaker section

	Kanishk Shah		differ from traditional banks and the challenges in failures in their operations. It alsoevaluates the financial exclusion of the weaker section in the society and to improve financial exclusion and digital banking to access to more customers.	in rural areas by using its Post Office network and providing doorstep banking with the perception of Dakiya Apke Dhwar. IPPB provides digitalized services in the way of IMPS, DBT, RTGS, NEFT, Bill services and merchant payments.
14	V. Balreddy, Neeradi Karthik	2022	To understand the difference between payments bank with traditional banks and to examine the protagonist of IPPB in financial awareness.	IPPB helps in creating greater effectiveness by opening branches in rural areas.
15	Dr. J. Shyla and K. Tresya	2022	To analyse the reason and difficulties faced while adopting and using the services offered by IPPB.	The first and foremost difficulties by IPPB customers is the Network issue. Hence, Network issues are to be solved.
16	Dipankar Mondal	2022	The main aim is to know how IPPB has helped India's financial inclusion drive.	By leveraging the AePS, doorstep banking and postal network, financial inclusion plays a vital role in IPPB.
17	Manoj Minj, Dr Pooja Pandey	2022	To examinethe Post office's involvement in financial inclusion with IPPB's future potential.	Even though Core Banking Solution(CBS) and DARPANhas been adopted by Department of Posts, the IPPB focuses on unbanked sectors of the society under the DOP services.
18	Mrs.P.Jesintha, Dr.P.Radhakrishnan, M.Amirtha Bashini, R.Umayal, K.R.Gowri Shankar	2021	This study reveals the benefits & challenges in payments bank.	This study focuses on the benefits and growth of IPPB.
19	Nishant Yadav and Prof. (Dr.) Ashok Kumar	2021	To study the influence of IPPB in Muzaffarnagar District of Uttar Pradesh	According to this study, IPPB focused in achieving the financial inclusion through digital banking camps at the last mile in Muzaffarnagar District.
20	Neha Mehta, Sweety Shah	2020	To identify and analyse the major scopes influencing the preferences, usage and effectson demographic variables on usage of payment banks.	Payments Bank in India has infused the financial inclusioncompared to other category of banks
21	Somya Gupta, G. P. Sahu	2020	The study investigates the factors which influences the implementation of Payment Banking by its existing customers.	The result of the study highlighted onadoption of Payments Bank services which is influenced by Usefulness and Trust whereas it is found that it has an effect on easily accessible.

22	Dr. V. Venkatachalam	2019	To shed light on awareness level and activities carried out by IPPB.	IPPB should concentrate on various financial services providedto its accountholders and improving the awareness among its employees.
23	Reena. F, Dr. T. Joseph	2019	To comprehend the functions, its various services and analysing the challenged faced by IPPB.	The research findings indicate big challenge is how well IPPB function effectively and efficiently in the future curse of action.
24	Gayatri Narayan Nayak	2018	To study the concept and analyse the level of customer satisfaction towards IPPB including the issued faced by existing customers and to analyse the SWOT analysis of IPPB.	The research discovered that modernization of post offices to be made and adequate training to be provided on banking services to Postman.
25	M. Bhargavi	2018	To understand the functioning, hypothesize andconcept of payments bank and its Pros and Cons to DoP. To study the escalation of payment banks for less cashless economy by bringing financial inclusion in India.	The research discovered that Department of Posts can bring an effective change by utilising Payments Bank as a channel for providing payments and remittance facilities so that it can provide credit services in future.
26	SANDESH D'SOUZA	2018	To investigate the inception of Payment bank and how Payments bank differs with traditional banks.	The study reveals that there will be an enhancement in Financial Inclusion bypromoting Digital Payment Infrastructure,Financial Technology Culture which willimpact on Low-Income Groups and Small Businesses.
27	Dr. (Mrs.) K. Meena Kumari	2017	To analyse the need of IPPB towards financial inclusion which resulting in achieving the objectives, challenges,problems and suggestions in achieving financial inclusion.	1.5 Billion have access to financial services through post offices. Post Banks set up by post offices have been successful in countries likeChina, SouthAfrica, Japan, South Korea,New Zealand, Switzerland, France and so on.

Research Gaps

Amalgamation of postal services and payments bank digitalization

A lot of present works focus on either financial inclusion via IPPB through its digital transactions, rural outreach or on digitalisation of postal services like upgradation to Logistics services. How IPPB as a payments bank is contributing to the digitalisation of the wider postal service functions like mails, Logistics beyond just banking/financial inclusion.

Barriers in the postal network

Some of the research papers focused on awareness, usage and satisfaction of India Post Payments Bank services. However, the perspective of Postal employees/Dak Sevaks is not involved. The ground level barriers faced in rural Post Offices/Branch Post Offices like connectivity issues, training is not seen. The qualitative research needs to be done.

Demographic issues across Circles/Regions/ Divisions

IPPB reports that 75% of the customers are from rural areas and 48% are women. But it is not clear which state/Circle is lagging behind digitalisation of Postal Services through IPPB and the reason is not stated. How IPPB services are utilised for the digitalisation of postal services like mail, financial services and logistics services.

Strategy, governance and institutional arrangement of Postal & Payments Bank

The dual structure of postal services and payments bank poses institutional challenges in governance, incentive payments, staff training and technology adoption including allocation of buildings to house IPPB offices.

Impact on non-banking postal services (logistics, e-commerce) via digitalisation facilitated by IPPB

While IPPB deals with banking/digital payments, postal services include mail, parcels and logistics. Some news articles mention that postal services are stepping up digital efforts (e.g., OTP deliveries, UPI payments at post offices) (The Times of India) But academic research specifically linking IPPB's infrastructure to improvements in these non-banking postal service components seems scant. So there's a gap around the broader "postal services digitalisation" lens rather than just banking.

User adoption and behaviour change in the digital postal services context

Numerous studies emphasize on banking adoption (IPPB). But digitalisation of postal service functions like digital payments, digital tracking of parcels, e-post etc requires user behaviour change. The literature appears thin on how users adopt such digital postal services, what motivates them, and how IPPB helps or hampers that.

"Although the expansion of the India Post Payments Bank (IPPB) and the digitalisation efforts of the postal network i.e., rollout of IT, Logistics platforms, APT 2.O, there is limited empirical research on how exactly IPPB's digital banking infrastructure has facilitated the transformation of core postal services like mail and parcel operations in terms of efficiency, accuracy in delivering the service, customer experience and service innovation. Further, few studies disaggregate these effects by demographic aspects or user-group, or adopt longitudinal designs to assess the sustainability of digitalisation outcomes. Finally, the organizational and governance interplay between the postal services and the payments bank remains under-explored."

CONCLUSION

The India Post Payments Bank has played a crucial role in the digitalisation of postal and banking services in India, particularly through leveraging the vast postal network for digital banking, AePS, doorstep services, Digital Life Services and financial inclusion. The existing literature supports this positive role, but significant gaps remain—especially in rigorous empirical evidence on service quality, user adoption in very remote areas, and integration with broader postal digital services. Addressing these gaps will maximise the potential of postal networks in digital financial inclusion and postal service ecosystems in alliance with IPPB.

ABSTRACT

Murivu Ennai is a traditional *Siddha Varmam* based polyherbal formulation that has been used as external medicine to treat different types of injuries, such as bone, muscle, tendon and ligament injuries. The objective of this review is to provide awide-ranging outline of the ingredients used in *Murivu Ennai*, their phytochemical, pharmacological, and medicinal properties, and potential therapeutic benefits. Review of traditional *Siddha* literature and scientific studies on the ingredients. The formulation consists of six potent ingredients with unique phytochemical, pharmacological, and medicinal properties. Based on the review of traditional *Siddha* literature and scientific studies, *Murivu Ennai* shows promising results in as a treatment for bones, joints and soft tissue injuries and promoting healing. The formulation's unique combination of ingredients and their properties may contribute to its therapeutic effects, making it a potential alternative or complementary therapy to treat various bones, joint and soft tissue injuries in the Siddha system of medicine.

Keywords: *Murivuennai*, *Varma ennai,* Medicated oil for injuries, Herbal oil for *odivumurivugal, kungliyamurivuennai.*

INTRODUCTION

The *Siddha* system of medicine, one of India's oldest and most traditional healing practices, offers a holistic approach to health and wellness. Among the various medicinal preparations, *Murivu Ennai* stands out as a classical polyherbal formulation in a *Varma Maruthuvam* a specialised branch in *Siddha* system of medicine specifically designed to treat various types of injuries, including bone and ligament injuries and other musculoskeletal disorders. *Murivu Ennai* is a medicated oil prepared by boiling gingelly oil (*Sesamum indicum*) with a blend of six potent ingredients, each carefully selected for its therapeutic properties. Each of these ingredients has been individually recognized for its medicinal properties and has been studied for its potential health benefits. This review aims to provide a comprehensive overview of the phytochemical, pharmacological, and medicinal properties of each ingredient used in *Murivu Ennai*. By exploring the scientific rationale underlying the therapeutic properties of these ingredients, this review aims to highlights the potential benefits of *Murivu Ennai* in injury management and healing.

OBJECTIVE

The objective of this review is to:
1. Summarize the pharmacological properties and therapeutic uses of *Murivu Ennai*.
2. Analyze the available scientific evidence supporting the efficacy and safety of *Murivu Ennai*.

MATERIALS AND METHODS

Study Type: Literature review
Study Period: 6 months
Study Place: National Institute of siddha, Tambaram sanatorium

- A comprehensive review of existing literature on *Murivu Ennai* was conducted.
- Scientific databases and traditional Siddha medicine texts were searched for relevant information.
- Studies and data related to the therapeutic properties and benefits of *Murivu Ennai* were analyzed.

Classical Reference
Drug name : *Murivu ennai*
Dosage : Quantity sufficient
Reference : *Varma Marunthu Seimuraigal* (pg no 384)
Moola nool : *Varma odivu murivu sara soothiram* 1200 (pg no 257)

Ingredients
1.*Nallennai* (Gingelly oil) - 1 *padi* (1300ml)
2.*Kukil* (*Commiphora mukil*) - 3 *Kazhanju* (15.3g)
3.*Mudhalipisin* (*Moringa oleifera*) - 3 *kazhanju* (15.3g)
4. *Sivandhasandhanam* (*Pterocarpus santalinus*) - 3 *kazhanju* (15.3g)
5. *Aasali* (*Linum usitatissimum*) - 3 *kazhanju* (15.3g)
6. *Pazhukkai* (*Gardenia gummifera*) - 3 *kazhanju* (15.3g)

Method of Preparation
The ingredients excluding gingelly oil are first powdered and then mixed with the oil.Then the mixture is subjected to heat until it attains desired texture. After, which it is filtered and the resulting oil is stored.

Drug storage
The prepared *Murivu ennai* is stored in clean and sterile containers.

Dosage and mode of administration
Route: External application only
Dosage: Applied locally over affected area 1-2times/day

Therapeutic Indication
Application of *Murivu Ennai* may help to heal *Odivu murivugal* (bones, joint and soft tissue injuries).

RESULTS AND DISCUSSION

Characteristics or ingredient profile of *murivu ennai*
Botanical and Common names of the ingredients (Table 1). Morphology and parts used (Table 2). Characteristics of medicinal plants based on *Siddha* principles (Table 3)

***Siddha* aspect**
Kungliyam – Commiphora mukil
Kungliyum possesses light and penetrating *gunam* with astringent taste which is a combination of *Prithvi pootham* and *vayu pootham*. This may helps in reducing *pitham* thereby alleviating inflammation and swelling. The *Prithvi pootham* strengthens the ligament tissues while the *vayu* component enhances joint mobility or facilitating the healing process by directing nourishment to the injured area.

Murungai pisin – Moringa oleifera
The synergistic combination of sweet and astringent tastes in *Murungai Pisin*, confers a balancing effect on the *trithodams*. Specifically, its *Pitham*-pacifying and *Vatha*m-stabilizing properties may mitigate inflammation, pain, and stiffness associated with ligament injuries. Concurrently, it nourishes tissues and promotes repair and rejuvenation, thereby supporting the body's natural healing processes.

Sivappu sandhanam – Pterocarpus santalinus
Pterocarpus santalinus has bitter and astringent tastes with *Prithvi* and *Vayu* dominance. Its cooling potency alleviates *Pitham*-related inflammation and swelling. The astringent quality contracts tissues, accelerates epithelialization and promotes healing. *Prithvi* element strengthens connective tissue and helps in new tissue formation often combined with oily carriers (sesame oil), while *Vayu* enhances circulation of healing factors.

***Aali vidhai* – flaxseed**
Flaxseed has sweet taste with *Prithvi* and *neer pootham* dominance. Its nourishing and cooling potency reduces *Pitham* and *Vatham*, alleviating inflammation and pain. *Prithvi* element supports collagen formation, while *neer pootham* facilitates flexibility and lubrication. The quality of flaxseed nourishes the tissues, promotes strength and resilience of the injured ligament.

Dikamalli – Gardenia gummifera
Dikamali has bitter, pungent, and astringent tastes with *Vayu* and *thee pootham* dominance. Its heating potency reduces *Kabam* and *Vatham* alleviating pain, stiffness and swelling. The astringent quality contracts tissues, accelerates healing and supports ligament integrity.

Nallennai – Sesamum indicum
Sesame oil is a *Vatham* pacifying, nourishing and warming oil that strengthens ligament and promotes tissue repair. It has sweet taste with *Prithvi* dominance. *Prithvi* element supports collagen formation and stabilizes the ligament. It enhances healing and resilience when combined with *Vatham* reducing herbs.

Phytochemical properties (Table 4)

Pharmacological activitiy

Commiphora mukil

Anti-inflammatory activity

New terpenes from guggul gum resins namely Myrrhanol A and Myrrhanone A demonstrated strong anti-inflammatory effect on mice's adjuvant induced air pouch granuloma of mice. Emulgel-prepared from Commiphora mukil exihibit strong anti-inflammatory properties and was determined to be on par with commercial tacrolimus ointment.

Chondroprotective activity

In rats with experimentally induced osteoarthritis using monoiodo acetate, guggul exhibits chondroprotective effects with less damage to proteoglycane in the epiphyseal plate over the course of two-weeks. After one month of therapy, it eases osteoarthritis symptoms, including pain and stiffness. Significant therapeutic effects of guggulsterone3 have been shown in rheumatoid arthritis, osteoarthritis, and gout.

Anti neoplastic activity

Myrrhanone C, a bicyclic triterpenoid found from gum resin, was chemically altered to produce ten novel pyrimidine hybrids, all of which shown strong anticancer potential against all cancer cell lines examined.

Moringa oleifera

Wound healing activity

Preclinical biomaterials studies demonstrate that moringa gum–based hydrogels are biocompatible, antimicrobial, and accelerate wound closure in rodent cutaneous models, supporting its role as a wound-dressing polymer.

Anti spasmodic activity

The well-known flavonoid quercitin, which is found in moringa, is primarily responsible for its antispasmodic properties.

Anti-inflammatory activity

Moringa oleifera shows strong anti-inflammatory activity due to bioactive compounds such as isothiocyanates, quercetin and other glucosides.

Antiarthritic activity

Moringa oleifera extracts showed significant anti-arthritic activity in rats. The effects may be linked to antioxidant properties, protein stabilization, and the presence of flavonoids and phenolics.

Pterocarpus santalinus

Anti-inflammatory and analgesic activity

Topical *Pterocarpus santalinus* gel showed stronger anti-inflammatory and analgesic effects than diclofenac gel in chronic inflammation models. This effect is attributed to its bioactive compounds, such as savinin, which can inhibit pro-inflammatory markers like TNF-α and T cell proliferations.

Antiplasmodial activity

It has been observed that the aurone glycosides that were separated from heartwood had antiplasmodial properties.

Hepatoprotective activity

Methanolic and aqueous extracts of heartwood of *Pterocarpus santalinus* were found to have hepatoprotective activity in CC14-induced hepatotoxicity.

Linum usitatissimum

Analgesic and anti inflammatory activity

Due to the inhibition of the cyclooxygenase and lipoxygenase pathways, *Linum usitatissimum* demonstrated dose-dependent analgesic activity in mice that was somewhat similar to that of morphine. Additionally, a dose of 170 mg/kg of the linseed extract demonstrated notable anti-inflammatory activity in mice. It may serve as a potential analgesic and anti-inflammatory agent which is attributed to the presence of phenolic, flavonoid, and flavonol compounds and especially alpha linoleic acid with antioxidant properties.

Wound healing activity

Flaxseed oil ointment accelerates wound healing by reducing inflammation and promotes re epithelization in the study conducted on incision wound in mice.

Antipyretic activity

L. usittatissimum oil's antipyretic properties were tested against typhoid-paratyphoid A/B vaccine-induced pyrexia in rats and contrasted with aspirin. It has a notable impact by blocking inflammatory mediators such as prostaglandins and histamines.

Antimicrobial activity

The presence of flavonoids, phenolic acid, and lignans in linseed's petroleum and ether extract conferred notable antibacterial efficacy against pathogens, including gram-positive and gram-negative bacteria and fungi.

Gardenia gummifera

Analgesic activity

In acetic acid-induced writhing, the dikamalli resin extract has dose-dependent analgesic efficacy of up to 67% at 400 mg/kg using wistar albino mice (25-30 g) of either sex chosen by random sampling.

Acute anti-inflammatory activity

Using a plethysmograph, the dikamali resin exhibits notable anti-inflammatory activity of up to 52.3% in the formalin-induced paw edema method in wistar albino rats (150–200 g) of either sex.

Sesamum indicum

Analgesic activity

The ethanolic extract of *sesamum indicum* exhibited significant analgesic activity in mice using acetic acid induced writhing model comparing with ibuprofen.

Anti nociceptive and anti-inflammatory activity

Sesamin, a lignan derived from *Sesamum indicum*, had notable antinociceptive benefits in comparison to diclofenac in inflammatory pain models in rats. The action is mediated by 5-HT1A receptor activation, which involves seratonergic pathways. In neuropathic pain models, it also showed mild antiallodynic and anti-inflammatory benefits. Sesamin might be a useful substitute for treating inflammatory pain.

Fracture healing and tissue repair

Sesamin promotes osteoporotic fracture healing by enhancing chondrogenesis and aniogenesis, via estrogen receptor α (ERα) signaling and activating BMP2 (Bone morphogenetic protein) signaling pathway. Sesamin improved callus formation and vascularization during both early and late stages of healing.

Anti osteolytic activity

Sesamin, a lignan found in sesame seeds, has been shown to inhibit osteoclast formation and function, reducing bone resorption and inflammation. It acts by suppressing ERK and NF-κB signaling pathways, inhibiting osteoclast-specific gene expression and reducing pro-inflammatory cytokine production

DISCUSSION

This review provides a comprehensive analysis of *Murivu Ennai*, a traditional *Siddha Varmam* based polyherbal formulation, and its potential therapeutic benefits in treating injuries and promoting healing. The *Siddha* aspect of *Murivu Ennai* highlights the importance of understanding the unique properties of each ingredient, such as their tastes (*Suvai*), potency (*Veeryam*), and bio-transformation (*Prapakam*), which collectively contribute to the formulation's therapeutic effects. The review reveals that the components of *Murivu Ennai*, including *Pterocarpus santalinus (Sivappu sandhanam)* and *Commiphora mukil (Guggulu*), have *Siddha*-compliant qualities. *Sivappu sandhanam's* cooling properties may assist reduce inflammation associated with *Pitha*, while *Guggulu's* hot potency and astringent taste may help reduce *Pitha* and *Kapha* imbalances. The formulation's therapeutic effects in injury management and recovery may be attributed to its capacity to restore physiological equilibrium and balance the doshas. The scientific analysis of *Murivu Ennai's* ingredients reveals a variety of pharmacological activities, including as anti-inflammatory, analgesic, wound-healing, and chondroprotective properties which may contribute to the formulation's therapeutic benefits. For example, *Commiphora mukil's* anti-inflammatory activity may help reduce swelling and pain, while *Moringa oleifera's* wound-healing properties may promote tissue repair. *Pterocarpus santalinus's* analgesic and anti-inflammatory effects may also contribute to pain relief and reduced inflammation. *Linum usitatissimum's* anti-inflammatory and analgesic effects may help reduce pain and inflammation, while its wound-healing properties may promote tissue repair. *Gardenia gummifera's* analgesic and anti-inflammatory effects may contribute to pain relief and reduced inflammation. *Sesamum indicum's* anti-nociceptive and anti-inflammatory effects may help reduce pain and inflammation, while its role in promoting fracture healing and tissue repair may support the healing process. These findings validate the traditional use of *Murivu Ennai* in *Siddha* medicine and highlight the potential of integrating traditional knowledge with modern scientific approaches to develop effective treatment strategies. The synergistic combination of these ingredients may enhance the formulation's therapeutic benefits, making *Murivu Ennai* a potential treatment option for various bones, joints and soft tissue injuries.

CONCLUSION

Murivu Ennai, a *Siddha Varmam* based polyherbal formulation's unique combination of ingredients, carefully selected based on *Siddha* principles promotes healing by balancing three doshas and restoring physiological equilibrium. The ingredients in *Murivu ennai* also exhibits a range of pharmacological activities that may contribute to its therapeutic effects. Further research is needed to fully understand the mechanisms of action and to explore the potential of *Murivu Ennai* as a treatment option for various bones, joint and soft tissue injuries. Nevertheless, this *Siddha Varmam* formulation offers a valuable starting point for the development of new therapeutic approaches.

ABSTRACT

In this article we introduce the concept "Pseudo-Primitive Near-Rings". We construct the definition of pseudo-primitive near-rings with respect to its N-group. As the name suggest, it is not the genuine primitivity of near-rings but it has some properties of primitiveness of near-rings, so we named as pseudo-primitive near-rings. We study the example of pseudo-primitive near-rings. We establish and learn the properties of pseudo-primitive near-rings. Also, we study in which conditions we get pseudo-primitive near-rings and properties that can be derived from pseudo-primitive near-rings. So, we state and prove the notes, remarks, propositions and theorems for the pseudo-primitive near-rings.

Keywords: N-group, ideal, simple, faithful, completely reducible.
Mathematics Subject Classification (AMS): 16Y30

INTRODUCTION

The near-fieldsare the first near-ringsfounded and it was introduced by Dickson [3]. After many years of works on this area by different authors perfected the concept of near-ring and its properties. Near-ring is non-empty set which is group under addition, semigroup under multiplication and satisfy one of the distributive laws.In this article, we use right near-rings which satisfy only the right distributive law. N-group is an additive group which is similar to

module of ring theory. Here we use left N-module as N-group. Primitive near-rings are based on the concept like simple, monogenic and faithful of its N-group. In this article we are going to introduce Pseudo-Primitive Near-Rings. Same as primitive near-ring, definition of pseudo-primitive near-rings based on the properties of its N-group. In this article, first we define the definition of pseudo-primitive near-rings then we proceed to give an example of pseudo-primitive near-rings. Then we study the properties of pseudo-primitive near-rings.

2. Preliminaries

Definition 2.1:[4]

A near-ring is a non-empty set N together with two binary operations " + " and " · " such that

a) (N, +) is a group (not necessarily abelian).

b) (N, ·) is a semigroup.

c) $\forall\, n_1, n_2, n_3 \in$N such that $(n_1 + n_2) \cdot n_3 = n_1 \cdot n_3 + n_2 \cdot n_3$ ("right distributive law").

Notation 2.2:[4]

The class of all near-rings will be denoted by $\mathcal{N}$.

Note 2.3:[4]

Let Γ be an additively written group with zero 0. Then the set $M(\Gamma) = \{f : \Gamma \to \Gamma\}$ is a near-ring.

Definition 2.4: [4]

- $N_0 = \{n \in N \mid n0 = 0\}$ is called the zerosymmetric part of N.
- $N_c = \{n \in N \mid n0 = n\} = \{n \in N \mid \forall n' \in N: nn' = n\}$ is called the constant part of N.

N_0 and N_c are itself near-rings.

Definition 2.5: [4]

$N \in \mathcal{N}$ is called zero symmetric (constant) if $N = N_0$ ($N = N_c$, respectively).

$\mathcal{N}_0$ ($\mathcal{N}_c$) stand for all classes of all zero symmetric (constant) near-rings.

Definition 2.6:[4]

Let (Γ, +) be a group with zero 0 and let $N \in \mathcal{N}$. Let $\mu : N \times \Gamma \to \Gamma\ \{(n, \gamma) \to n\gamma\}$. (Γ, μ) is called an N-group ("near-module over N") if $\forall\, \gamma \in \Gamma, \forall\, n, n' \in N$ such that $(n + n')\gamma = n\gamma + n'\gamma$ and $(nn')\gamma = n(n'\gamma)$. It is denoted by N^{Γ}.

Notation 2.7:[4]

Let $N^{\mathcal{G}}$ be the class of all N-groups.

Note 2.8:[4]

Let Γ be a group. Then Γ is an N-group (M(Γ)-group) $M(\Gamma)^{\Gamma}$ of a near-ring M(Γ).

Definition 2.9:[4]

Let $N \in \mathcal{N}$. A normal subgroup I of (N, +) is called ideal of N ($I \trianglelefteq N$) if

- $IN \subseteq I$.
- $n(n' + i) - nn' \in I$ for all $n, n' \in N$ & $i \in I$.

Notes 2.10:[4]

- Normal subgroups R of (N, +) with $RN \subseteq R$ are called right ideals of N ($R \trianglelefteq_r N$).
- Normal subgroups L of (N, +) with $n(n' + l) - nn' \in L$ for all n, n' ∈N & $l \in L$ are said to be left ideals ($L \trianglelefteq_l N$).

Definition 2.11:[4]

Let $N \in \mathcal{N}$ and $N^{\Gamma} \in N^{\mathcal{G}}$. A normal subgroup Δ of (Γ, +) is called ideal of N^{Γ} ($\Delta \trianglelefteq_N \Gamma$) if $\forall\, \gamma \in \Gamma\ \forall\, \delta \in \Delta\ \forall\, n \in N$ *such that* $n(\gamma + \delta) - n\gamma \in \Delta$.

Remark 2.12:[4]

- {0} and N are ideals of N.
- {0} and Γ are ideals of N^{Γ}.

These ideals are called the trivial ideals.

Definition 2.13:[4]
- $N(N^{\Gamma})$ is simple if $N(N^{\Gamma})$ has no non-trivial ideals.
- N^{Γ} is called N- simple if N^{Γ} has no N – subgroups except Ω and Γ.

Definition 2.14:[4]
Let Δ_1, Δ_2 be subsets of $N^{\Gamma} \in N^{\vartheta}$. Define $(\Delta_1 : \Delta_2) = \{n \in N \mid n\,\Delta_2 \subseteq \Delta_1\}$. $(0 : \Delta)$ is called the annihilator of Δ.

Definition 2.15:[4]
N^{Γ} is called faithful if $(0 : \Gamma) = \{0\}$.

Definition 2.16:[4]
Let $(I_k)_{k\in K}$ be ideals of N. Their sum $\sum_{k\in K} I_k$ is called an (internal) direct sum if each element of $\sum_{k\in K} I_k$ has a unique representation as a finite sum of elements of different $I_k's$.
In this case we write for the sum $\sum_{k\in K}^{\cdot} I_k$ (or $I_1 \dot{+} I_2 \dot{+} \ldots$).

Definition 2.17:[4]
N ($N^{\Gamma}$with $N \in \mathcal{N}_0$) is called completely reducible if N (N^{Γ}) is the direct sum of simple ideals.

Note 2.18:[4]
Let $N \in \mathcal{N}_0$. The direct sum of completely reducible N-groups is again completely reducible.

Definition 2.19:[4]
Let N, N′ ∈N. If there exists a monomorphism N → N′ we say that N is embeddable in N′ and we write N ↪ N′.

Note 2.20:[4]
- Each N-group can be embedded into some faithful N-group.
- Each near-ring N has some faithful N-group.

Definition 2.21:[4]
A direct sum $\sum_{\alpha\in A}^{\cdot} \Delta_\alpha = \Delta$ of ideals $\Delta_\alpha (\alpha \in A)$of N^{Γ} is called distributive if $\forall \sum_{\alpha\in A} \delta_\alpha \in \Delta\, \forall\, n \in N : n(\sum_{\alpha\in A} \delta_\alpha) = \sum_{\alpha\in A} n\delta_\alpha$.

Note 2.22:[4]
Let $N \in \mathcal{N}_0$. Each direct sum of ideals in N^{Γ} is distributive.

Note 2.23:[4]
If N^{Γ} is faithful. We assume that $N \subseteq M(\Gamma)$ then$\Omega = \{0\}$, where Ω is the smallest under all N-subgroups of N^{Γ}if and only if $N_c = \{0\}$ if and only if $N \in \mathcal{N}_0$.

Definition 2.24:[4]
Descending Chain Condition (DCC): every strict chain $n_1 > n_2 > \cdots$ of elements of a set N terminates after finitely many steps (or equivalently, for each chain $n_1 \geq n_2 \geq \cdots$ there exists $i \in \mathbb{N}$ such that $n_i = n_{i+1} = \cdots$).

Remark 2.25:[4]
- Replace ≥ by ≤ in definition 2.24 we get, Ascending Chain Condition (ACC).
- An ideal I of near-ring N with DCC (ACC) is denoted by DCCI (ACCI).

MAIN RESULTS

Definition3.1:
A near-ring N is said to be a pseudo-primitive near-ring if it has N-group 'Γ' which is faithful and completely reducible.

Hence, we say that N is a pseudo-primitive near-ring on N-group $\Gamma(N^{\Gamma})$.

Eg 3.2:

The near-ring $N=Z_6=\{0, 1, 2, 3, 4, 5\}$ is a pseudo-primitive near-ring on the N-group $\Gamma=Z_6=\{0, 1, 2, 3, 4, 5\}$.

Note 3.3:

If N is a pseudo-primitive near-ring on N^{Γ}, then simple ideals Δ of N^{Γ} need not be $(0 : \Delta) = \{0\}$.

In above example, $\Delta_1 = \{0,2,4\}$ and $\Delta_2 = \{0,3\}$ where Δ_1, Δ_2 are simple ideals of N-group Γ.

Then, $(0 : \Delta_1) \neq \{0\}$ and $(0 : \Delta_2) \neq \{0\}$.

Remark 3.4:

A near-ring 'N'is pseudo-primitive or not depends on its N-group 'Γ'.

Eg 3.5:

The near-ring $N=Z_8=\{0, 1, 2, 3, 4, 5, 6, 7\}$ is not a pseudo-primitive near-ring on the N-group $\Gamma=Z_8=\{0,1,2,3,4,5,6,7\}$.

Proposition3.6:

Let N be apseudo-primitive near-ring on the N-group Γ

For $0 \in N$ and for all $\gamma \in \Gamma \Rightarrow 0\gamma = 0$.

For $1 \in N$ and for all $\gamma \neq 0 \in \Gamma \Rightarrow 1\gamma \neq 0$.

For all $n \neq 0 \in N$ and $\gamma \neq 0 \in \Gamma \Rightarrow n\gamma \neq 0$.

Proof:

Given N is the pseudo-primitive near-ring on the N-group Γ

a) For $0 \in N$ and for all $\gamma \in \Gamma$

Since Γ is faithful,

$(0: \Gamma) = \{0\}$

$\{n \in N / n\Gamma = 0\} = \{0\}$

$n\Gamma = 0$, for any $n = 0 \in N$

$n\gamma = 0$, for any $n = 0 \in N$ & for all $\gamma \in \Gamma$

$\therefore 0\gamma = 0$, for all $\gamma \in \Gamma$.

b) For $1 \in N$ and for all $\gamma \neq 0 \in \Gamma$

By faithful condition of Γ

For $1 \in N$ for all $\gamma \neq 0 \in \Gamma \Rightarrow 1\gamma \neq 0$.

c) For all $n \neq 0 \in N$ and $\gamma \neq 0 \in \Gamma$

By faithful condition of Γ

$n\gamma \neq 0$, for all $n \neq 0 \in N$ and $\gamma \neq 0 \in \Gamma$.

Theorem3.7:

Let N be a near-ring with N-group Γ where {0} is annihilator of Γ then Γ is completely reducible if and only if N is pseudo-primitive near-ring on the N-group Γ.

Proof:

Let N be a near-ring and Γ be its N-group

Also given annihilator of Γ is {0}.

$\therefore$ clearly Γ is faithful

Assume that, Γ is completely reducible

N is pseudo-primitive near-ring on Γ.

Conversely,

Assume that, N is pseudo-primitive near-ring on Γ

Obviously, Γ is completely reducible.

Note 3.8:

A completely reducible near-ring N with faithful N-group Γ = N is a pseudo-primitive near-ring.

Theorem3.9:

Let N be a near-ring with faithful N-group N^{Γ} then N is a pseudo-primitive near-ring on N^{Γ} if and only if each ideal of N^{Γ} is direct summand.

Proof:
Given a near-ring 'N' on the faithful N-groupN^{Γ}
Assume that,N is a pseudo-primitive near-ring
∴ N^{Γ} is completely reducible and faithful
By theorem 4.12 in [1],
∴ each ideal of N^{Γ} is direct summand.
Conversely,
Assume that,each ideal of $N^{\Gamma}$is direct summand.
Also given,N^{Γ} is faithful
By theorem 4.12 in [1],
$N^{\Gamma}$is completely reducible.
Hence, N is a pseudo-primitive near-ring on N^{Γ}.

Theorem 3.10:
If N is a pseudo-primitive near-ring on the finite N-group $\Gamma = N$ then N has DCCI and ACCI.
Proof:
Let N be a pseudo-primitive near-ring on the finite N-group $\Gamma = N$.
N is faithful and completely reducible.
⇒ N is a direct sum of finitely many simple ideals.
By theorem 2.50 in [4] [2],
N has DCCI and ACCI.

Theorem3.11:
If N isapseudo-primitive near-ring on the N-group Γ then $M(\Gamma)$ isapseudo-primitive near-ring on the N-group Γ.
Proof:
Let N beapseudo-primitive near-ring on the N-group Γ.
⇒ Γ is faithful and completely reducible.
By note 2.3, $M(\Gamma)$ is a near-ring.
By note 2.8, Γ is a N-group of near-ring $M(\Gamma)$.
⇒ $M(\Gamma)$ has N-group Γ which is faithful and completely reducible.
Therefore, $M(\Gamma)$ isapseudo-primitive near-ring on the N-group Γ.

Theorem3.12:
If a faithful N-group$N^{\Gamma}$of near-ring N ∈Nis the sum of minimal ideals,then N is apseudo-primitive near-ring.
Proof:
Let N∈N
Let N^{Γ}be a faithful N-group of anear-ring N
Also N^{Γ} is sum of minimal ideals
By theorem 2.48 in [4] [5],
N^{Γ} is completely reducible
Hence N is a pseudo-primitive near-ring.

Theorem3.13:
If N is a pseudo-primitive near-ring then N ∈N_0.
Proof:
Let N be a pseudo-primitive near-ring
∴ $N^{\Gamma}$is faithful andcompletely reducible
Since N^{Γ} is completely reducible, N^{Γ} is direct sum of simple ideals.
There exist $(\Delta_{\alpha})_{\alpha \in A}$ be a family of simple ideals of N^{Γ}
∴ $N^{\Gamma} = \sum_{\alpha \in A} \Delta_{\alpha} = \sum_{\alpha \in A} \Delta_{\alpha}$

To prove $n(\sum \delta_\alpha) = \sum n\,\delta_\alpha$, for all $n \in N$ and $\sum \delta_\alpha \in N^\Gamma$(1)
By proposition 2.22and 2.6(b)in [4] and using induction on n in the eqn (1).
We get, for all $n \in N$ and $\sum \delta_\alpha \in N^\Gamma$ such that $n(\sum \delta_\alpha) = \sum n\,\delta_\alpha$
Since N^Γ is faithful,
By proposition 2.29 in [4].
$n \in N_0$, for all $n \in N$
$\Rightarrow N \in N_0$.

Theorem3.14:
Let N be a near-ring. If everyN-group of near-ring Nis completely reducible then N is a pseudo-primitive near-ring.
Proof:
Given N is a near-ring and every N-group of near-ring N is completely reducible
Let Γ be an N-group
⇒ Γ is completely reducible
To prove, N is a pseudo-primitive near-ring.
i.e. to prove, N-group of near-ring N is faithful and completely reducible.
It is enough to prove, N-group of near-ring N is faithful.
Suppose Γ is faithful N-group.
Therefore, N is a pseudo-primitive near-ring on Γ
Suppose Γ is not faithful N-group.
By note 2.20,Γ is embedded into some another faithful N-group Γ_1 of near-ring N.
By hypothesis,
Γ_1 is completely reducible.
⇒ N is a pseudo-primitive near-ring on Γ_1.
Hence, N is a pseudo-primitive near-ring.

Theorem 3.15:
If a faithful N-group Γ of near-ring N is completely reducible then N is a pseudo-primitive near-ring on Γ.
Proof:
Let N be a near-ring.
By note 2.20,
N has some faithful N-group
Let Γ be a faithful N-group of N.
By hypothesis, Γ is completely reducible.
Therefore, N has an N-group Γ which is faithful and completely reducible.
Hence, N is a pseudo-primitive near-ring.

Theorem 3.16:
If a faithful N-group N^Γ of near-ring N is the family of completely reducible distinct N-subgroups then N is a pseudo-primitive near-ring.
Proof:
Let $\{\Delta_\alpha\}_{\alpha \in A}$ be the family of a completely reducible distinct N-subgroup of N^Γ.
By assumption,$\{\Delta_\alpha\}_{\alpha \in A}$is a faithful N-group.
Let Γ_1 be the direct sum ofΔ_α's
Clearly Γ_1 is faithful N-group of near-ring N.
By note 2.18, $\Gamma_1$is completely reducible.
Therefore, $\Gamma_1$is a completely reducible and faithful N-group of N.
Hence, N is a pseudo-primitive near-ring.

Theorem 3.17:
If $N \in N_0$ is a pseudo-primitive near-ring on N^Γ then N^Γ is distributive.
Proof:
Let $N \in N_0$ be a pseudo-primitive near-ring on N^Γ.
$\Rightarrow N^\Gamma$ is faithful and completely reducible.
$\therefore N^\Gamma$ is the direct sum of simple ideals
By note 2.22,
N^Γ is distributive.

Proposition 3.18:
If N is a pseudo-primitive near-ring then $\Omega = \{0\}$ if and only if $N_c = \{0\}$.
Proof:
Let N be a pseudo-primitive near-ring
Therefore, N^Γ is faithful and completely reducible.
By theorem 3.13, $N \in N_0$.
By note2.23,
$\Omega = \{0\}$ if and only if $N_c = \{0\}$.

Remark 3.19:
From above proposition we write
i If N is a pseudo-primitive near-ring then {0} is the smallest under all N-subgroup of N^Γ.
ii If N is a pseudo-primitive near-ring then constant near-ring is {0}.

Theorem 3.20:
Let N be a pseudo-primitive near-ring on N^N. If N has DCCI (or ACCI) then simple ideals of N^N are isomorphic.
Proof:
Let N has DCCI (or ACCI).
Given N is a pseudo-primitive near-ring on N^N.
i.e. N is a pseudo-primitive near-ring on N-group $\Gamma = N$.
therefore, N is completely reducible and faithful.
By theorem 2.54 in [4],Simple ideals of N are isomorphic.

CONCLUSION

In this article we define the Pseudo-Primitive Near-Rings. Then we studied its properties through notes, remarks, propositions and theorems.

ABSTRACT

Lactation insufficiency, characterized by the inability to produce adequate breast milk, poses a serious threat to infant nutrition and health, particularly in resource-limited settings. Although breastfeeding is widely recognized for its critical role in supporting early development, low milk supply—also known as agalactia, hypogalactia, or agalactorrhea—remains under-addressed in both clinical practice and public health policy. Breast milk delivers essential hydration, energy, and immunological benefits, and its absence can result in malnutrition, growth failure, and increased infant morbidity and mortality. Reported incidence of lactation insufficiency ranges from 23% to 63% in the first four months postpartum, yet many cases go undiagnosed or unsupported. This perspective explores the multifactorial causes of lactation failure, from hormonal imbalances to sociocultural influences, and calls for greater emphasis on early detection, mother-centered interventions, and standardized assessment tools. Drawing on current research, clinical insights, and public health data, this article aims to reframe lactation insufficiency as a critical yet overlooked component of maternal and child health strategies.

Keywords: Lactation insufficiency, Galactagogues, Breastfeeding, Lactogenesis, Bottle feeding, Breast milk, Herbal medications.

INTRODUCTION

Composition of Breast Milk

Milk is a complex biofluid composed of proteins, lipids, carbohydrates, vitamins, minerals, and water, and it is the secretory product of mammary epithelial cells in lactating mammals [1]. For infants, breast milk serves as the sole source of nutrition, offering an optimal nutritional profile [2]. It has evolved over millennia to support both nutritional needs and immune development in infants [3]. The composition of human breast milk can vary due to multiple factors including maternal age and physiological characteristics [4]. Some of milk components are briefly discussed here,

Lipids

Lipids in breast milk are the primary source of energy for infants and also supply essential nutrients such as polyunsaturated fatty acids (PUFAs) and fat-soluble vitamins [5]. Numerous studies have demonstrated that lipids in human milk influence gastrointestinal function, lipid and lipoprotein metabolism, growth, neurodevelopment, and immune function in infants [6]. Lipids provide approximately 44% of the total energy content in breast milk [7]. Milk fat globules contain both free and esterified cholesterol, contributing to a total cholesterol concentration of 90–150 mg/L. Triacylglycerols account for 98–99% of the fat content in human milk. Human milk is also a source of long-chain PUFAs (LC-PUFAs), which are vital for neurodevelopment and may offer protection against immune-related diseases such as asthma and impaired pulmonary function [5].

Breast Milk Protein

Human breast milk contains nearly 400 different proteins that serve a range of biological functions including nutritional support, antimicrobial activity, immune modulation, and enhanced nutrient absorption [2,8,9]. These bioactive proteins are integral to promoting infant growth and immune protection. Immunological components such as immunoglobulin A (IgA), cytokines, and live cells provide direct defense against pathogens. Proteins in human milk are typically classified into whey proteins, caseins, and mucins. Early milk, known as colostrum, is distinct in its composition from mature milk, containing a higher total protein content that decreases over time [10]. Colostrum is particularly rich in whey proteins, which include immunoglobulins, lactoferrin, and alpha-lactalbumin, while caseins are absent initially but increase by 4–5 days postpartum before declining [11].

Key bioactive proteins include:

Lactoferrin: A multifunctional protein with bacteriostatic and antiviral properties [12].

Lysozyme: An enzyme present at concentrations up to 3000-fold higher in human milk compared to bovine milk [13].

Immunoglobulins: Predominantly IgA, with IgG and IgM present in smaller quantities, collectively comprising 90% of total milk immunoglobulins.

Haptocorrin: A vitamin B12-binding protein with antimicrobial properties, found largely unsaturated in human milk [14].

Bile Salt-Stimulated Lipase (BSSL): An enzyme constituting 1–2% of total milk protein, found in human but not in bovine or caprine milk.

Caseins: Representing 20–40% of breast milk proteins, lower than in cow's milk, but crucial for infant development [10].

Carbohydrates

Mature human milk contains approximately 7% carbohydrates, predominantly in the form of lactose [15]. Additional carbohydrate components—such as oligosaccharides, unconjugated glycans, and fructose—play important roles in early infant health and development [16,17]. Lactose, fructose, glucose, and insulin have been associated with various aspects of infant growth, and in non-diabetic mothers, breast milk concentrations of glucose and insulin have been positively linked to infant adiposity [18].

Human Milk Oligosaccharides (HMOs)

HMOs are a significant and unique class of carbohydrates in human breast milk. They are indigestible by the infant but serve critical biological roles. HMOs are the third most abundant solid component in breast milk, comprising 3 to 22 saccharide units derived from five core sugars. Concentrations average 12.9 g/L in mature milk and 20.9 g/L at four days postpartum [2]. These carbohydrates contribute to neurodevelopment and establish beneficial gut microbiota in infants [15].

Benefits of Breastfeeding Over Other Feeding Methods

Alternative feeding methods include cup feeding and bottle feeding, with the latter being the most commonly used. However, breastfeeding provides unique environmental and physiological benefits. Unlike bottle feeding, breast milk is a natural, waste-free, and safe feeding source that adjusts according to the infant's needs and produces no pollutants [19]. Bottle feeding may disrupt breastfeeding, leading to complications such as breast refusal, failure to thrive, hyperbilirubinemia, colic, and excessive crying [20]. Over the past two decades, research has confirmed that breast milk is not only nutritionally superior but also vital for optimal infant health and development [21]. Moreover, bottle warming presents risks, especially when done in microwaves, as uneven heating may cause oral burns. Alternatives such as warming in tap water require careful handling and temperature testing to prevent contamination and injury [22].

Lactation Insufficiency and Its Effect on Baby Nutrition

One of the defining characteristics of mammals is their ability to produce milk to nourish their offspring. In humans, milk is synthesized and secreted from the lobules of the breast [23]. The act of feeding an infant directly from the mother's breast is referred to as lactation or breastfeeding [24]. Breastfeeding not only supports infant nutrition and development but also provides significant health benefits to the mother. Lactation insufficiency refers to the inability of a mother to produce an adequate amount of breast milk. It is generally classified into two types: primary lactation insufficiency, which arises from physiological or anatomical causes, and secondary lactation insufficiency, which is typically due to modifiable factors such as poor breastfeeding management or maternal health conditions [25,26]. The causes of lactation insufficiency are multifactorial, with common contributors including low maternal prolactin levels and the preterm birth of the infant [27]. These conditions interfere with the natural hormonal and physiological processes necessary for milk production. Epidemiological data suggest that approximately 1 in 20 women experience insufficient lactation, which can impair their ability to provide adequate nutrition to their infants through breastfeeding alone [28].

Risk Factors of Lactation Insufficiency

Lactation insufficiency primarily arises from three interrelated factors: the amount of functional mammary tissue, the balance of lactation-related hormones, and the regular and effective removal of milk from the breast [29,30]. Insufficient mammary tissue can result from prior breast surgeries such as breast reduction or cyst removal, which may compromise the glandular structures necessary for milk production [25]. Several maternal factors can affect hormonal balance critical to lactation. These include elevated stress or anxiety levels, anemia, diabetes, obesity, severe postpartum hemorrhage, retained placenta, hypothyroidism, cigarette smoking, and alcohol consumption—all of which may disrupt the hormonal signals required for milk synthesis and let-down [25,29,30]. Ineffective or infrequent milk removal is another key contributor to lactation insufficiency. This can occur in cases where the infant is feeding indirectly (e.g., expressed milk via bottle), or when direct breastfeeding is ineffective due to poor latch or suckling ability, reducing stimulation and milk output [25].

Prevalence of Lactation Insufficiency

Data from the Infant Feeding Practices Study II (IFPS II), which surveyed infant feeding behaviors among U.S. women, revealed that a significant proportion of breastfeeding mothers encountered challenges associated with lactation. The majority of participants reported experiencing at least two out of the following three issues: low milk supply, breast pain, and difficulty with infant latch [31].

Furthermore, lactation insufficiency is more frequently reported among women who undergo cesarean sections compared to those who deliver vaginally, indicating that mode of delivery may play a role in breastfeeding outcomes [25].

Methods to Determine the Problem of Lactation Insufficiency

Several clinical and observational methods have been employed to assess lactation insufficiency. One such method is the LATCH scoring system, which evaluates the effectiveness of breastfeeding based on five criteria: latch, audible swallowing, type of nipple, comfort, and hold. A study conducted between May and July 2020 in a maternity hospital in South India utilized the LATCH scoring system to assess lactation performance among postpartum women. The study found that 52.48% of the participants were aged between 26–30 years, and 54.37% had completed higher secondary education. Of the mothers who received breastfeeding education (n=93), 61 exhibited a least positive LATCH score, while 42 received a high positive score, indicating varying levels of breastfeeding effectiveness [32].

Another important method for evaluating factors that contribute to lactation insufficiency involves assessing iodine status in pregnant and lactating women. Iodine is essential for thyroid function and milk production. In a study involving 80 pregnant and 49 lactating women, both urine and salt samples were collected to determine iodine levels. The iodine concentration in urine was measured using the Sandell-Kolthoff reaction, while salt iodine content was determined through iodometric titration. Results indicated that iodine deficiency was prevalent among the participants, emphasizing the need for appropriate iodine supplementation during pregnancy and lactation [33]. A large-scale questionnaire-based study conducted in the United Arab Emirates (UAE) also provided insight into the reasons behind lactation insufficiency. Out of 850 distributed questionnaires, 820 were returned and analyzed. Among respondents, 25.8% identified low milk supply as the primary reason for discontinuing breastfeeding. Additional factors included general cessation for unspecified reasons (29%), pain, breast congestion, or abscesses (19.22%), and new pregnancy (17.5%) [34].

Factors Influencing Lactation

Lactation is a complex physiological process influenced by a range of infant, maternal, and environmental factors. These factors can contribute to either effective milk production or lactation insufficiency when disrupted.

Infant-Related Factors

Several neonatal conditions can impair effective breastfeeding. Infants born preterm (before 37 completed weeks of gestation), with low birth weight, or suffering from prenatal or neonatal asphyxia, congenital illnesses, or birth defects may struggle to suckle effectively, thereby impacting milk removal and supply [26,35].

Maternal Factors

Numerous maternal conditions contribute to lactation insufficiency. Breast surgeries, such as those that damage the lactiferous ducts or nipple innervation, and insufficient mammary glandular tissue can interfere with milk production [35]. Superimposed pregnancy and maternal illnesses such as anemia and postpartum hemorrhage are also associated with impaired lactation [35,36]. Disruptions in lactogenesis—particularly due to retained placenta, delayed initiation of breastfeeding, or short feeding durations—can lead to suboptimal milk supply [25]. Improper management of local breast conditions, including retracted, swollen, flat, short, or excessively large nipples, can also hinder milk transfer [37]. Additional factors such as maternal sedation, anxiety, fatigue, and the use of certain medications like oral contraceptives have been reported to affect lactation negatively [37]. Moreover, incorrect breastfeeding techniques can further reduce milk output [25].

Environmental Factors

Separation of the infant from the mother—whether due to medical or institutional reasons—can disrupt the breastfeeding process and hormone regulation needed for lactation [25]. Painful infections, such as those following episiotomy (a surgical incision of the perineum and vaginal wall during delivery), can interfere with a mother's

ability to nurse comfortably and consistently [37]. Environmental chemical exposure also poses a risk. Lipophilic toxicants may accumulate in maternal adipose tissue and subsequently transfer into breast milk, potentially disrupting mammary gland function and infant development [38]. Lastly, a historical study conducted between 1972 and 1975 found that frequent weighing of infants before and after breastfeeding sessions contributed to maternal stress and was associated with an increased incidence of lactation failure, suggesting that excessive monitoring may be counterproductive [39].

Delayed Lactogenesis

Lactogenesis, the initiation of milk secretion, occurs in two distinct stages. Stage I lactogenesis begins during pregnancy when the mammary glands prepare for milk production through hormonal changes. Stage II lactogenesis involves the onset of copious milk secretion, typically occurring between 24 to 72 hours postpartum. A delay in this second stage, known as delayed lactogenesis, is a major contributor to lactation insufficiency [40].

Delayed onset of Stage II lactogenesis is often recognized by a lack of breast fullness or engorgement beyond 72 hours after childbirth. This delay may significantly affect early breastfeeding success and infant nutrition outcomes [40].

Nutrition Provided by Human Milk

The World Health Organization (WHO) recommends exclusive breastfeeding for the first six months of life, emphasizing its role in optimal infant growth and development [41]. Human breast milk is uniquely suited to meet the nutritional needs of infants, supplying the ideal balance of proteins, lipids, carbohydrates, and a wide array of biologically active compounds that contribute to both nourishment and immune protection [42]. Beyond its nutritional content, breast milk provides critical immunological components that help to train and mature the infant's immune system. These bioactive molecules include antibodies, cytokines, enzymes, and other factors with anti-infective properties, playing a key role in the infant's defense against pathogens [44]. Breastfeeding is also associated with favorable growth trajectories in infants. Studies have shown that breastfed infants experience increases in weight, length, and body mass index (BMI) during the first 2–3 months of life, followed by a slower but steady growth pattern after 12 months, which is considered a healthy trend [43]. In summary, human milk is not just a source of nutrition—it is a dynamic, immunologically active fluid that plays an essential role in supporting early development and long-term health in infants [42,44].

Effect of Breast Milk Insufficiency in Infants

Insufficient breast milk intake is a prevalent issue among newborns and can lead to a range of preventable hospitalizations for conditions such as jaundice (hyperbilirubinemia), hypernatremia or dehydration, and hypoglycemia [45]. Among these, jaundice remains the most frequently reported cause of hospital admission in breastfed neonates [46]. Notably, neonatal jaundice has been associated with an increased risk of developing attention deficit hyperactivity disorder (ADHD) later in childhood, underscoring the long-term implications of inadequate breastfeeding in the early days of life [47]. Beyond immediate medical concerns, infants who are not adequately breastfed face elevated risks of childhood obesity, type 1 and type 2 diabetes, leukemia, and even sudden infant death syndrome (SIDS) [48]. The negative consequences of insufficient breastfeeding extend to mothers as well, with increased risks of breast cancer, ovarian cancer, myocardial infarction, and metabolic syndrome being reported [48]. One of the critical consequences of breast milk insufficiency in neonates is failure to thrive, a condition characterized by inadequate weight gain and growth, which can have lasting impacts on physical and cognitive development [49].

Diagnosis of Lactation Insufficiency

The diagnosis of lactation insufficiency typically begins with a comprehensive clinical evaluation, including maternal history and physical assessment. Physicians may use a structured questionnaire to gather information about a mother's medical history, including past breast surgeries, smoking habits, and endocrinological disorders such as polycystic ovarian syndrome (PCOS) [3]. While PCOS is a recognized contributor to lactation failure, not all women with PCOS experience inadequate milk production. The issue may arise when PCOS is combined with insufficient

glandular tissue, compromising the breast's ability to produce milk [37,50]. An important diagnostic clue is whether a mother experienced breast growth during pregnancy or menstrual cycles, as the absence of such changes may suggest insufficient mammary glandular development. Several clinical signs and symptoms can further indicate

lactation insufficiency:
Low milk supply: Minimal or no milk production by day 5 postpartum
Dehydration symptoms in the infant: Manifesting as jaundice, lethargy, and persistent crying
Breast changes: Hard, engorged breasts without effective milk expression
Pain: Notable pain during breastfeeding or nipple pain
Stool color: Failure of the infant's stool to transition to bright yellow by day 5
Wet diapers: Fewer than six wet diapers per day, which can indicate inadequate intake
Prompt identification of these signs can guide early interventions to support successful breastfeeding outcomes.

Treatment

Ayurvedic Management of Lactation Insufficiency

Ayurveda offers a holistic approach to treating lactation insufficiency through a combination of lifestyle modifications, herbal remedies, and therapeutic techniques aimed at enhancing breast milk production and supporting maternal well-being.

Nidan Parivarjan (Avoidance of Causative Factors)

According to Acharya Kashyapa, emotional disturbances such as anger, fear, and grief negatively affect lactation. These factors should be consciously avoided to promote effective milk production [51].

Shodhan (Bio-Purification Therapy)

This therapy involves the detoxification of the body to restore vitality and strengthen the system. It is believed to improve overall health and support lactation [52].

Soumnasya (Mental Well-being)

Happiness is considered a key factor in Stanya Pravritti (initiation and continuation of lactation). Promoting maternal emotional health is essential [53]. Acharya Kashyapa has also emphasized educating mothers on the qualities and benefits of breast milk, reinforcing its importance for both the child and mother [54].

Herbal Medications

Several herbal preparations are traditionally used to induce, augment, or maintain lactation. These include:

- Decoctions of the roots of Veeran (Vetiveriazizanoides), Shali (Oryza sativa), Ikshuvalika (Saccharum spontaneum), and Gundra (Typha australis Schum & Thonn) [54].
- Powders of Pueraria tuberosa and Trapa natans mixed with milk to support infant development and provide maternal strength [54].
- Fenugreek seeds, which are widely used to enhance milk production [53].
- Shatpushpa is another effective herb possessing properties like Paachan, Stanyajanan, Shothhar, Kaphaghna, Deepan, Jwarnashan, and Vranpaachan, which collectively aid in alleviating breast engorgement, enhancing milk production, and relieving pain [54,55].

Management of Lactation Difficulties

Breast Engorgement is a common problem that can hinder effective breastfeeding. Ayurvedic and general measures include:

- If the areola is engorged, expressing a small amount of milk before feeding helps soften the area for better infant latch.
- Gentle breast massage is advised to relieve engorgement.

- Wearing a well-fitting, supportive bra with large flaps can help reduce pain and maintain the anatomical positioning of milk ducts [56].
- Warm compresses can be applied to facilitate milk ejection [56].
- Cold compresses post-breastfeeding may reduce pain, edema, and vascular congestion [56,57].
- In cases of nipple trauma, pain management should focus on minimizing receptor stimulation, and the letdown reflex can be stimulated by expressing some milk prior to feeding. Additionally, infants should be prevented from suckling too vigorously to avoid further trauma [56,58].

Pharmaceutical Management of Lactation Insufficiency

A variety of pharmaceutical agents are used to manage lactation insufficiency, particularly when non-pharmacological interventions fail. Among these, dopamine antagonists are most commonly prescribed due to their ability to increase prolactin secretion.

Domperidone

Domperidone, a dopamine antagonist, is widely used in Australian neonatal units and is considered a primary pharmacological therapy for lactation insufficiency [59]. It increases serum prolactin levels, thereby enhancing milk production [60,61]. It is frequently used as a galactagogue, especially in mothers of preterm infants, where an increase of approximately 90–94 mL/day in milk production has been observed [62–64]. Although there is no universally recommended dosage, several studies have used 10 mg three times daily for 4–10 days. Some cases reported escalation to 30 mg/day or higher, though increased doses did not always yield significantly better outcomes than the standard dose, and individual responses vary [65,66]. Common side effects include headache, nausea, dizziness, abdominal cramping, diarrhea, dry mouth, shortness of breath, breast engorgement, irritability, and weight gain [67–69]. Due to these adverse effects, it is recommended that non-pharmacological methods be tried before initiating domperidone therapy.

Metoclopramide

Metoclopramide is another centrally acting dopamine antagonist that increases prolactin levels and has been reported to improve milk production by 66–100% when administered at 30–45 mg/day [59]. However, its use is limited due to side effects such as nausea, breast tenderness, headache, abdominal pain, dizziness, thinning hair, mood swings, and a significant risk of depression [70,71]. It is contraindicated in women with a history of depression.

Sulpiride

Sulpiride is a typical antipsychotic with galactagogue properties, acting by increasing hypothalamic prolactin-releasing hormone. The standard dosage is 50 mg two to three times daily. Studies indicate that women administered sulpiride had significantly greater milk output compared to placebo groups during the first and second weeks of therapy (e.g., 628 ± 51 mL vs. 440 ± 68 mL and 684 ± 67 mL vs. 423 ± 60 mL, respectively), accompanied by increased serum prolactin levels [25,72].Adverse effects include tremors, bradykinesia, acute dystonic reactions, and weight gain.

Oxytocin

Oxytocin plays a pivotal role in milk ejection and regulation of milk flow [25,61]. It is particularly useful postpartum to promote early lactation and prevent insufficiency [73,74]. Although research into its efficacy remains limited, nasal spray formulations (1 spray per nostril before pumping) have shown significant improvement in milk flow [25]. Oxytocin may be especially beneficial for mothers of preterm infants suffering from anxiety and depressive symptoms [59].

Metformin

As an insulin-sensitizing agent, metformin is commonly used to treat type 2 diabetes and has shown potential effects on lactation. A clinical trial found that only 20% of women taking metformin reported enhanced milk production, indicating limited utility for this purpose [59,75].

Chlorpromazine

Chlorpromazine, another typical antipsychotic, functions as a dopamine receptor blocker, thus increasing prolactin secretion and stimulating milk production [25,74]. It is occasionally used as a galactagogue but may be limited due to its broad antipsychotic side effect profile.

Herbal Galactagogues in the Management of Lactation Insufficiency

Several herbal remedies have traditionally been used across cultures to enhance milk production, commonly known as galactagogues. While some have shown promising effects, their mechanisms of action and safety profiles vary.

Fenugreek (*Trigonella foenum-graecum*)

Fenugreek is widely recognized for its galactagogue properties and is approved by the FDA as a flavoring agent [76]. Although its lactogenic effects in humans may be largely psychological, animal studies have demonstrated increased synthesis of oxytocin and insulin, both of which are important in lactation [77]. Clinical research in humans indicates that fenugreek is more effective during the early postpartum period (first two weeks post-labor) than later stages [78]. It is commonly used in Canada (99%) and Switzerland (15%) for promoting lactation [79]. However, gastrointestinal side effects such as nausea, vomiting, diarrhea, and flatulence have been reported [79].

Shatavari (*Asparagus racemosus*)

Shatavari is a traditional Ayurvedic herb known for its hepatoprotective, immunomodulatory, and galactagogue effects, attributed to its foliage and roots [80]. Though considered safe for prolonged use, adverse effects such as runny nose, conjunctivitis, contact dermatitis, throat tightness, and coughing have been observed in some individuals [80,81].

Fennel (*Foeniculum vulgare*)

Fennel seeds contain anethole, a phytoestrogen that is excreted in breast milk [82]. Studies have shown fennel can improve neonatal weight, milk secretion, and fat concentration in breast milk, although it does not significantly increase maternal serum prolactin levels [83]. About 4% of women using fennel reported side effects including nausea and stomach pain. Additionally, there have been reports of toxicity in infants associated with maternal consumption of fennel, anise, and goat's rue, with symptoms including enlarged liver and diarrhea [59].

Moringa (*Moringa oleifera*)

Commonly used in Asia and Africa, Moringa, also known as Malunggay in the Philippines, is traditionally used as a galactagogue [84]. The leaves are rich in vitamins, minerals, essential amino acids, and glycosides, contributing to maternal nutrition and lactation support. While moringa has been shown to increase prolactin levels, some small studies suggest it does not significantly affect milk quality [85]. Importantly, it has been well-tolerated among nursing mothers, with no significant adverse effects reported [86]. However, due to its blood clotting potential, caution is advised in women prone to thrombosis [87].

Bottle Feeding in Neonatal Nutrition and Development

Feeding during the neonatal period is a complex neurophysiological activity requiring precise coordination of sucking, swallowing, and respiration [88]. Interestingly, suckling reflexes have been observed in the fetus as early as the 15th week of gestation, indicating the early development of this vital function [89]. In infants younger than six months, the primary feeding methods are breastfeeding and bottle-feeding, both of which play critical roles in neonatal nutrition [90]. The sucking rhythm—a key component of effective feeding—is influenced by various factors, including infant age, hunger level, positioning on the breast, duration and strength of suckling, fatigue, and milk flow [88].

Bottle-feeding presents certain challenges and advantages. Among the challenges is the debate over the optimal design of bottle teats, especially for very low birth weight infants, to best mimic the natural mechanics of breastfeeding and promote healthy milk intake [91]. In response, physiological teats have been developed to preserve

the anatomical and functional characteristics of breastfeeding in bottle-fed infants [88]. However, one notable drawback of bottle-feeding is the association with excessive weight gain in infancy [92]. This phenomenon is thought to be linked to the higher protein content and lower levels of free amino acids in infant formula compared to human milk, which may influence metabolic programming and growth patterns in early life [92].

CONCLUSION

Lactation plays a vital role in providing essential nutrients required for the optimal growth and development of infants, particularly during the early stages of life. It serves not only as a source of nutrition but also as a critical contributor to the development of the immune system. However, lactation insufficiency can significantly disrupt the nutritional cycle, potentially leading to compromised immunity and increased vulnerability to illness in infants.

To address this concern, a comprehensive management approach is necessary, involving both pharmacological interventions and natural remedies. These include the use of clinically approved drugs to stimulate milk production, as well as traditional and herbal treatments that have been recognized for their galactagogue properties. Ensuring timely diagnosis and appropriate therapeutic strategies is essential for supporting lactating mothers and promoting infant health.

ABSTRACT

The aim of this study is to compare the growth of coriander using modern hydroponics urban technologies i.e., vertical and horizontal systems. Hydroponics is an innovative way of growing plants in a soilless medium, using nutrient-rich water. The vertical and horizontal hydroponic systems have been gaining popularity in urban agriculture due to their space efficiency and high yields. The experiment was conducted in a controlled environment with the same environmental conditions. temperature, humidity, and light intensity, for both systems. Coriander seeds were sown in the hydroponic systems, and the plants were monitored for their growth parameters such as height, number of leaves, and fresh weight. The results of the study showed that coriander plants grown in the vertical hydroponic system had a better growth rate in terms of plant height, number of leaves, and fresh weight compared to the horizontal system. The vertical system showed a 25% increase in plant height, 30% increase in leaf number, and 35% increase in fresh weight when compared to the horizontal system. In conclusion, the study demonstrated that the vertical hydroponic system is a more efficient way of growing coriander in an urban setting, due to its space-saving design and higher yield potential. This technology has the potential to revolutionize urban agriculture and provide fresh and nutritious produce to urban populations.

Keywords: temperature, potential, growing, technology, urban.

INTRODUCTION

The hydroponics is a method of growing plants without soil. we can grow hydroponically all year long. hydroponics uses less water than traditional soil-based systems. hydroponic growing allows for faster growth and higher yields than traditional soil-based growing systems. hydroponic systems are a modern and efficient way of growing plants without soil. Coriander, also known as cilantro, is a popular herb used in many cuisines worldwide. hydroponic systems can provide a controlled environment for coriander to grow, resulting in a higher yield and faster growth compared to traditional soil-based methods. The hydroponic system consists of a growing medium, nutrient-rich water, and a container to hold the plant. The roots of the coriander plant are placed directly into the nutrient-rich water, allowing them to absorb the nutrients they need to grow. The growing medium can be a variety of materials such as coconut coir, rockwool, or perlite, which provides support for the plant and helps with moisture retention allowing food to be grown and consumed in areas of the world that cannot support crops in the soil. The ability to produce higher yields than traditional, soil-based agriculture. The hydroponic farming technique is used in determining the deficiency symptoms of various nutrients in plants and to find out essential nutrients for the plant's growth and development. The significant decrease in agricultural land and the rapid development of hydroponic system technology such as Nutrient Film technique (NFT), have brought huge challenge to farmers. Is a hydroponic technique where in a very shallow stream of water containing all the dissolved nutrients required for plant growth is re-circulated past the bare roots of plants in a watertight gully, also known as channels. Plants are positioned on a floating surface hanging in a trough that is slightly tilted. The plant roots hang with the upper part of the root system exposed to air (oxygen).

MATERIALS AND METHODS

All the hydroponic material that we used the for the hydroponic systems are meant to boost sustainability. With the help of the modern farming techniques, the farmers would be able to create an extremely productive systems for the yields, spectrum-controlled lights are also very important. Although, the yield is grown inside, still a certain amount of lightening is required, and the lightening system in the hydroponic systems have to be appropriate for the cultivation. and the Water tank made up of plastic for purpose of storing water to supply through the pipe tank capacity of 20 liters.PVC pipes are a reliable, common, and preferred material in almost every hydroponic system. A submersible pump is a device which has a hermetically sealed motor close-coupled to the pump body. Used for circulating Nutrients water in NFT channel. Electric submersible pumps are multistage centrifugal pumps operating in a vertical position. Most timers are set for 15minute increments or less. The shorter the amount of time to fill the tray and reach the over flow level the better.net pots allow liquid to flow freely past the roots of the plants. they contain, facilitating the uptake of nutrients. Cocopeat is a multipurpose growing medium made out of coconut husk. The hydroponic air pump sits outside the hydroponic reservoir and connects to the air stone or hydroponic air diffuser inside the task of the air pump in a hydroponic cultivation system is to bring oxygen to the roots of the plants and avoid the unwanted growth of algae. All plants grown hydroponically will need large amounts of the three main macronutrients: nitrogen, phosphorus, and potassium. and each equipment are used to the control and management the of growing the plant. and helped of the plant health, quality, quantity, and good profits.

There are different types of hydroponic systems, but the basic principles and methodology are similar. We have selected coriander seeds for both hydroponic vertical and hydroponic horizontal system. The cultivation are more suitable for the hydroponics system, regardless of the thermal stress of the nutrient solution and the use of brackish water. not all crops are suitable for hydroponic systems. Space and light requirements: hydroponic coriander plants should be given about 9-12 inches of space between plants to provide plenty of room to spread out. Coriander plants require somewhere between 12 and 14 hours of indoor lighting per day. Nutrient requirements: To grow hydroponic coriander, you must focus on their nutrient requirement. You can add either inorganic fertilizer or organic fertilizer to make the solution. Inorganic fertilizers dissolve in the water quickly, and it only takes a small

amount to meet their demands. Growth rate: Coriander seeds are germination occurs within five days of sowing at 68˚F to 78˚F, with seedlings requiring warmth (above 68˚F) and moderate light levels to avoid elongation and tall, weak growth. Cilantro seeds arequite hard coated and may take up to 7 to 14 days for germination.

Horizontal hydroponic system

This is 21 planter system in three channels and each channel have seven plants. Each one discusses in below.

- Build a horizontal gutter or channel that is long enough to accommodate 21 plants.
- Set up a reservoir that holds enough water and nutrient solution to fill the gutter or channels.
- Install a water pump in the reservoir to circulate the nutrient solution through the gutter or channel.
- Connect the pump to a timer that controls how often and for how long the pump runs.
- Monitor the pH level of the nutrient solution regularly to ensure it stays within the optimal range for plant growth.

Vertical hydroponic tower system

This is 24 planter system in the six section each section is to connect each other.

- Choose a tower system that is appropriate for the space and number of plants youwant to grow. There are many different types and sizes of vertical tower systems available, so choose one that suits your needs.
- Set up a reservoir that holds enough water and nutrient solution to fill the tower system. The size of the reservoir will depend on the size of your tower system and the number of plants you are growing.
- Install a water pump in the reservoir to circulate the nutrient solution through the tower system. The pump should be powerful enough to move the nutrient solution to the top of the tower and then back down to the reservoir.
- Connect the pump to a timer that controls how often and for how long the pump runs. A timer is important to ensure that the plants receive a consistent flow of nutrient solution.

RESULT AND DISSCUSION

The various characteristics of hydroponics system, manual vertical system and horizontal system is compared with coriander crops by finding the yield weight, plant height, cost estimation is studied and interpreted and results was calculated.

Seed germination: From our project we have concluded the following results. The seeds sowing was done on 05 /03/2023 and germination started on 11/03/2023. And 03/04/2023 was the first harvest.

For vertical system
No of seeds = 96
No of germination seeds = 75
Germination percentage = No of grow seeds / Total no of seeds
GP = 75/96*100
GP = 78%

For horizontal system
No of seeds = 84
No of seed germinated = 65

Germination percentage = No of grow seeds / Total no of seeds
GP = 65/84*100
GP = 77%

Plants length
Average length of coriander plants invertical system= 220mm
Average length of coriander plants inhorizontal system = 200mm

Irrigation interval
Daily irrigation was done for every 2 min for 24 h with the break of 45 min.

- 45 min break = 2 min
- 1 day = 24 h = 1440 min
- 1 day = 1440 /45 = 32 times per day
- One day = 32 x 2 = 64 min
- 1 week irrigation times = 7 * 64 min = 448 min
- 1 week irrigation times = 7 h: 46 min

Crop yield
For vertical system
No of seeds = 96
No of grow seeds = 75
Harvest = 146 g
For horizontal system
NO of seeds = 84
No of grow seeds = 65
Harvest = 120 g

Thus, from the observations and discussions 26g was more in horizontal compared to vertical due to the uniform lightning and water uptake wasobserved by the horizontal system. In vertical systems there was break in the light due to the plant order placed. Also, the quality of horizontal system was good and grinned.

ABSTRACT

Schiff-based organic crystals were grown in this experiment at two distinct temperatures. In order to identify the Polymorphs, grown crystals were investigated. Polymorph I was more stable than Polymorph II in DSC, exhibiting thermal stability. Polymorphs Form-I, ΔG = 0.118 J/mol, and Form-II, ΔG = 0.006 J/mol, were shown to have Gibb's Free Energy. Both polymorphic forms I and II have heat capacities (Q) of 2.5083x10-3 J and 1.2344x10-3 J, respectively. Band peaks for Polymorph-I and Polymorph-II were observed at 379 nm and 377 nm in UV-visible diffuse reflectance spectroscopy because of n−π* transitions of C=N bonding. λmax is 471 nm for Polymorph-I and 451 nm for Polymorph-II, while the optical Bandgap (Eg) is 2.632 eV and 2.749 eV, respectively. In Raman spectroscopy, the observed variations allow for the identification and characterization of different polymorphs which include the shifts in some Raman band locations, the presence or absence of certain Raman bands, or modifications in the shape of some peaks. Therefore, to identify the polymorphs DSC, UV-visible spectroscopy, and FT-Raman spectroscopy are effective over other techniques.

Keywords: Polymorphs, Crystal structures, UV-Vis-Diffuse Reflectance, DSC, Raman.

INTRODUCTION

Polymorphs, in whichmolecules alter their packing arrangement inside the crystal lattice, are the subject of several investigations and are widely used in pharmaceutical applications(1).There is polymorphism in many other compounds, both natural and artificial, inorganic and organic. Polymorphs are found in the production of specialty chemicals as well as in the study of crystal formation, phase change, materials synthesis, and Bioactivity. Important information about crystal packing and structure-property relationships can be obtained from polymorphs(2). Because polymorphism has physical-chemical and medicinal effects, it must be monitored in biomaterials(1).GlaxoSmithKline CEO Jean-Paul Garnier stated that "approximately 50% of drug candidates that enter clinical trials fail due to efficacy and safety concerns, and the remaining 40% fizzle due to patent concerns and issues like solubility and drug connection." The significance of modifying the intended physicochemical characteristics during drug development is emphasized by this statement(3). Therefore, critical research on pharmaceutical solid polymorphism during pharmaceutical manufacturing processes is valuable to change the final drug product's stability and bioavailability(4). when investigating and explaining the vibrational characteristics of polymorphs and their potential application, Raman spectroscopy is a useful method for identifying the existence of various structures in the crystal polymorphism (5).In contrast to infrared spectra, Raman spectra consistently displayed sharp, well-resolved bands because of the small contribution of overtone vibrations, which leads to far less band broadening and improved band resolution(4).Patterson techniques have been used to solve the crystal structure of N-5-chlorosalicylideneaniline using partial 3D data taken at 300 and 90˚K(6).(E)-4-chloro-2-((4-fluorobenzylimino) methyl)phenol antimicrobial activity against several Strains were reported (7). 5-chlorosalicylaldehyde with substituted aniline characterized and exhibited antibacterial activity were reported (8).Using a variety of methods, the interaction between aniline and substituted carbonyl phenol in the CCl_4 solvent and in liquid form was documented(9).

We would like to share the synthesis, characterization, and crystal structures of Polymorphs I and II in this study. The crystals that exhibited polymorphism were produced at two distinct temperatures. Both Polymorph I and Polymorph II have the same chemical composition and developed at 283K and 363K, respectively. In order to identify the polymorphism, DSC, UV-Vis, and Raman spectroscopy were utilized to assess the thermal, optical, and vibrational properties of the grown crystals.

Crystal Growth

Slow evaporation was used to create polymorphic forms of 5-chlorosalicylaldehyde mixed with aniline. A monitored temperature of 283K was maintained while 0.5g of 5-chlorosalicylaldehyde was dissolved in carbon tetrachloride (CCl_4) for Polymorphic Form I. 0.48g of aniline was added when the compound had completely dissolved, and the mixture was stirred until a clear solution was formed. After that, the solution was placed in a beaker with tiny holes in it and allowed to slowly evaporate. Brownish-yellow crystals known as Polymorphic Form I of (E)-4-Chloro-2-[(phenylimino)methyl]phenol (E4C2PMP) grew as a result of this process (Fig. 1a). The same process was used for Polymorphic Form II, but at a higher temperature of 363K, DMSO was used as the solvent. Orange crystals in the form of needles were produced as a result (Fig. 1b). Figure 1c displays the molecular structure of the developed crystal. The following is the reaction of this grown crystal,

$$C_6H_5ClO_2 + C_6H_5NH_2 \longrightarrow C_{13}H_{10}ONCl + H_2O$$

Thermal Property

Differential Scanning Calorimetry(DSC) was used to determine thermodynamic parameters using thermal analysis. The DSC NETZSCH 204 F1 PHOENIX system performed the measurement between 20 and 180˚C with nitrogen protection at a rate of 20˚C/10(K/min). Phase transitions during heating were used to identify polymorphs in thermal experiments. The Polymorph I and II DSC melting curves were displayed in Figs. 2(a) and 2(b), respectively. Thermodynamical parameters such as the entropy (ΔS), the heat of fusion(ΔH), Gibb's free energy(ΔG), specific heat

capacity(Cp), and heat capacity(Q) were calculated in the DSC data to comprehend the thermal property of the crystals.

Melting causes a superimposed endothermic peak to form in the Polymorph-I DSC curve at 112.1 ˚C, while recrystallization causes a strong exothermic peak to form at 73.3 ˚C as cooling occurs. The endothermic peak on the Polymorph II DSC curve indicates that the compound melts at 111.8˚C, and the existence of the exothermic peaks indicates that the compound recrystallizes at 76.2 ˚C. For Form-I, the heat of fusion (ΔH_f) is 152.6 J/g, while for Form-II, it is 152.9 J/g. For Form-I, the entropy of fusion, or ΔS_f, is 2.35695 kJ/(K mol), but for Form-II, it is 1.8644 kJ/(K mol). For the polymorphs Form-I, ΔG = 0.118 J/mol, and Form-II, ΔG = 0.006 J/mol, Gibb's free energy was calculated. Polymorphic forms I and II have respective heat capacities (Q) of 2.5083x10-3 J and 1.2344x10-3 J. Form-I and Form-II Specific Heat capacities are 0.066892J/g˚C and 0.028876J/g˚C, respectively. Polymorph I have a higher degree of supersaturation at the crystallization temperature because its melting point is somewhat higher than that of Polymorph II. Since the entropy of the metastable Polymorph-II is marginally lower than that of the stable polymorph-I, the frequency of the metastable polymorph-II will typically be lower than that of the polymorph-I(3).

This thermal approach may be a great way to quantify crystal that comprise polymorphs that show endothermic and exothermic peaks (1). Furthermore, because a more stable state forms, melting one stage may be followed by crystallization and then melting at ever-higher temperatures. Polymorphic grown Crystal phase transition is represented by an enantiotropic 100°C in Forms I and II at (Fig. 2). The transition starts well below the equilibrium temperature during cooling because of the time required for nucleation. Nuclei must form in order to build up the new lattice. The likelihood that lattice imperfections may result in nuclei in small single crystals varies from crystal to crystal(10).

Optical Property

The diffuse reflectance spectrum was carried out by Perkin Elmer LAMBDA 950 UV–VIS–NIR spectrometer with the Deuterium lamp source. The sample's diffuse-reflectance spectra were seen between 200 and 800 nm. Different visual absorption spectra of the polymorphs create the various hues of the formed crystal, which makes reasonable assuming the structural changes between the polymorphs(2). The band observed at 338nm(Form-I) and 331nm(Form-II) exhibit $\pi \rightarrow \pi*$ transitions due to C=N imino group(11). Figure 3 shows that Polymorph I and II had absorption bands at 277 nm and 275 nm, respectively. These are ascribed to the aromatic ring's $\pi-\pi^*$ transitions. Due to C=N bonding, the $n-\pi^*$ transitions occurred at the band peak for Polymorph-I and Polymorph-II to be seen at 379 nm and 377 nm, respectively(13). $\lambda_{max}$for Polymorph-I is 471nm and for Polymorph-II is 451nm whereas the optical Bandgap (E_g) determined are 2.632eV and 2.749eV respectively.

The plane created by the ring connected to the imino group (A-ring) is somewhat deviated from by the phenyl(B) ring in the crystal structure. Both polymorphs' parent Natural Bond Orbitals (NBOs) were analyzed, and it was found that the lone pair on nitrogen is sp^2 hybridized. The nitrogen and oxygen atoms' π orbitals and lone pairs have remarkably minimal occupancies, while some antibonding NBOs have unusually large occupancies. A well-known chemical image of conjugated systems is consistent with this condition, which results from the donation of electron density from these π, p, and sp^2 NBOs into the nearby π^* antibonding orbitals. The O–H…N, which forms with the hydrogen of the hydroxyl group linked to the aromatic ring and N of the C=N group, involves an intriguing donor-acceptor interaction. In this case, the proximal $\sigma*$ antibonding H–O orbital receives electron density from the nitrogen atom's sp2 orbital. Both polymorphic crystals generate a strong 6-membered ring in order to create hydrogen bonds with the hydroxyl group and an electron pair from the imino group's π orbital(11).The reflectance in the 550 nm band increases slightly as the crystal's temperature rises (Figure 4). This demonstrates that the substance absorbs light, with the amount of absorption increasing as the temperature rises. Because Polymorph-II has a higher reflectivity than Polymorph-I, it is light yellow in color(13).

Raman Spectroscopy

Raman spectroscopy of the samples was conducted by BRUKER RFS 27 MultiRAM FT Raman Spectrometerin the spectral range of 4000-50cm^{-1} with the source of Nd-YAG laser 1046nm. In the spectral range, functional group assignments are shown in Table 1. In the Raman spectra (fig. 5), a prominent band known as the C=N group is visible at roughly 1616.6cm^{-1}. There are no peaks at 1029.22cm^{-1}, 861.90cm^{-1}, 2208cm^{-1}, or 377.79cm^{-1} in Polymorph-II. The peaks that were seen at 1486.80cm^{-1}, 1460.46cm^{-1}, and 1330.25cm^{-1} were also seen in Polymorph-II but not in Polymorph-I. Although the atoms species engaged in the crystalline vibrations are the same, the equilibrium inter-atomic distances and, consequently, the vibration frequencies of the bonds are different. These discrepancies result from the two polymorphic forms' differing crystal structures. Proving that the variations in the lattice symmetry must be the cause of the variations in the spectral form and the presence or decrease of specific peaks(5).

CONCLUSION

Successful growth of polymorphic crystals was achieved at two distinct temperatures. DSC analysis revealed that Polymorph I was more stable than Polymorph II in the crystals. Polymorph I has a little greater melting point than Polymorph II. In optical investigations, $\pi \rightarrow \pi*$ transitions occur when the imine group leaves its electron density from the Phenyl ring and brings it to the B ring because its carbon atom possesses a partial charge that is positive and the nitrogen atom has a negative charge that is partial. Modes of vibrations of the molecules and functional groups were observed through Raman Spectroscopy. Thus, the presence of polymorphism property was identified through DSC, UV-visible diffuse reflectance spectroscopy, and Raman Spectroscopy in the grown crystals.

ABSTRACT

With the escalation of false information and its consequences on people, social media has become a significant concern in today's life. It is imperative to differentiate this fake news from the real ones. Identification of fake news is a big challenge due to its scope on different social media platforms. Recently, machine learning (ML) has evolved as an important technology that is used in various applications. Fake news detection is one of the major applications of ML. The characteristics of ML models to handle large datasets and find patterns make them suitable for fake news detection. A wide range of ML models is available that includes a wide variety of basic to advanced models. It is known that the performance of any ML model may vary for different datasets. This makes it difficult to choose a model for a specific application. This study focuses on assessing the performance of various ML fake news models detection and identifying the best model that can perform effectively on a wider range of datasets. In this study, there are six machine learning models, (Random Forest, Naïve Bayes, Support Vector Machine, Decision Tree Logistic Regression, Neural Network) used for fake news detection. These models have been used on datasets downloaded from the Kaggle platform. Data is segregated into 80% training data to train our models and 20% test data to assess trained models' performance. This study uses conventional (ML) machine learning models to explore which model gives the highest accuracy.

Hence, this research provides all aspects to explore which machine learning model is suitable or most appropriate for the fake news detection method.

Keywords- Machine learning, Fake news, Passive Aggressive Classifier, Decision Tree, Naive Bayes, Logistic Regression.

INTRODUCTION

An expanding number of people would typically seek out and consume news via web-based entertainment rather than traditional news associations as a growing portion of our lives are spent collaborating online through virtual entertainment stages. [1]. Yellow journalism is a type of propaganda that consists of misinformation that has no legitimacy. In the era of social media, people are more concerned about entertainment or scrolling social media, but they are unable to spend time cross-checking the source of news, whether it is accurate or fake. Considering a large number of people using online media, automated fake news detection is the only approach to get the correct output. Currently, research communities are showing more interest in online media. [2]. In this digital generation of social media, it is very difficult to find out whether the news is real or fake, so machine learning elaborates many different algorithms or models which can be used to detect fake news, much research is completed by using the conventional method of machine learning. However, this research work combined conventional (e.g. Neural Network, Support Vector Machine, Random, Decision Tree, Logistic Regression, Forest Naïve Bayes) machine learning models to explore which model gives the highest accuracy for fake news detection. Each model has used datasets with 10K to 23K news containing a variety of topics (e.g. International news, sports, politics, entertainment, Indian cinema etc.) gathered from the Kaggle platform. Fake news can be found on the following framework [3]:

Visual-Based
False information is disseminated using images, such as edited photos, films or both of them together.

User-Based
This kind of fake news is disseminated by someone who wishes to reach a certain demographic, such as a particular age group, caste, or gender within a political party. On several social media platforms, it is typically carried out with the aid of phony accounts.**1.2.1 Steam locomotive:**This locomotive uses the expansion of steam to create the force necessary to move both itself and other vehicles.

Knowledge-Based
A lot of people post or make false scientific claims about various topics or offer advice on how to prevent certain illnesses online.

Style-Based
People in this category attempt to propagate rumors by imitating the fashion of a famous individual.

Stance-Based
In this approach, people attempt to disseminate a factual remark in a way that alters or manipulates its true meaning, causing social unrest. In addition to describing the data and its pre-processing stages, this paper provides related work and methodology that illustrates the several models utilized in this study. It also includes a summary of the entire amount of data gathered (real and fake).

METHODOLOGY

The definition of fake news has changed over time and currently refers to any article that is spread through media outlets and contains inaccurate or misleading information.[4]. Some well-known examples of fake news across history are mentioned below:
In 1835 The New York Sun distributed articles about a genuine stargazer and a phony partner who, as per the lie, had noticed unusual life on the moon. Early in February 2020, WHO issued a warning that the coronavirus outbreak has resulted in a massive "infodemic," or a shower of fake and real news, including a ton of false information. [5]. During the second and third hundreds of years Promotion, misleading bits of gossip were spread about Christians guaranteeing that they participated in custom barbarianism and incest. The authors of [6] demonstrated the potential applications of natural language processing and machine learning to address the issue of identifying false news. Count vectorizers, n-grams, and bag-of-words have been used. In order to determine which classifiers work best with this specific dataset of news statements with labels, TF-IDF was used to train the data on five different classifiers: Logistic Regression, Random Forest, Naïve Bayes, Support Vector Machine, and Stochastic Gradient. The best model may be identified with the aid of the precision, recall, and f1 scores. To evaluate various relevant machine learning techniques on three additional datasets, a benchmark study of machine learning models for online false news detection [7] is conducted. They gathered the largest and most diverse. They investigated a number of sophisticated pre-trained language models, both classical and deep learning, for the detection of fake news and compared how well they performed in various areas.

They discovered that, particularly when using a small dataset, BERT and related pre-trained algorithms are the best at identifying bogus news. For languages with little electronic information, or training data, these models perform noticeably better. Additionally, they conducted a number of studies based on the models' performance, the topic and length of the articles, and they talked about the various lessons they had learnt. [8] Emphasizes how important it is to select the most effective embedding techniques based on the model architecture in order to maximize false news detection performance. The techniques for evaluating the efficacy of several machine learning (ML) models for identifying false news and identifying the best model that can function effectively across a wider variety of datasets are described in this section. Fig. 1 depicts the suggested system methodology. Data collecting, data cleansing, and data scraping will be the first steps in the workflow (access the data online). Data cleaning entails eliminating inaccurate, insufficient, and pointless portions of the data. The procedure of determining whether news is fake or not will thereafter be covered by data labelling [9]. The performance of the model will start to be improved in the next step through feature selection. Following that, the model will begin to learn by itself from the data thanks to the preparation of training examples.

Support Vector Machine (SVM), Naive Bayes, Neural Networks, and Random Forest are the machine learning models that will be used in this research project. For accuracy evaluation, training data and test data are required. Then, using trained models, expected output can be derived. Along with accuracy assessment, [10] ROC (Receiver Operating Characteristics) is represented for each model. A ROC curve is a graph that shows how well a classification model performs across all classification criteria. This curve plots the following two parameters:

TPR (True Positive Rate)
FRR (False Positive Rate)

Since True Positive Rate (TPR) is synonymous with recall, its definition is as follows:

$$TPR = \frac{TP}{TP+FN} \quad (1)$$

False Positive Rate (FPR) is defined as follows:

$$FPR = \frac{FP}{FP+TN} \quad (2)$$

TPR vs. FPR at various categorisation criteria are plotted on a ROC curve. More items are classified as positive when the classification threshold is lowered, increasing the number of False Positives and True Positives.

Dataset Description

An immense amount of information is accessible on the web, and we have utilized a dataset that is accessible in Kaggle. The information gathered has two classifications: real and fake news [11]. Total collected data of Fake and Real news is shown in Fig. 2.

Pre-processing of Data

- Data Integration: Data frames of fake and real news are combined into a single chunk of data.
- Removing unrequired rows and columns: The "city", "date", and "title" such type of columns is eliminated as they are not used for the analysis part.
- Removing punctuations and stop words: The majority of social media data is fragmented and consists of informal communications with typos, grammar, and other mistakes [12]. Punctuation marks and stop words (words like 'the', 'a', 'and', 'an') have been removed for better data exploration. Data preprocessing steps are shown in Fig. 3.

RESULT AND ANALYSIS

For the purpose of detecting fake news, this study evaluated a few machine learning techniques, such as SVM (Support Vector Machine), Random Forest, Neural Network, Naive Bayes, Logistic Regression and, Decision Tree. The following algorithms, which are displayed in Table I (comparison metrics), were used in the analysis. Fig. 4 is the visual representation of the accuracies achieved through various classifiers. It is evident from the figure that the Decision Tree classifier achieved the highest accuracy (99.61%) followed by Neural Network (91.12%), Logistic Regression (91.06%), Random Forest (88.50%), Naïve Bayes (81.64%) and SVM (49.24%). Algorithms identify bogus news is given by the Confusion Matrix. It helps to clear up any confusion between successfully and wrongly classified data by representing the actual and anticipated values in a matrix. It provides information on true positives, true negatives, and false negatives and false positives in terms of categorization accuracy along with an apparent assessment. A variety of confusion matrices are displayed in Figures 5 through 10. Confusion matrix helps to derive various performance assessment parameters such as F1-score, overall accuracy, and precision that further help to analyze the efficiency and performance of the used algorithm/model. ROC curves are also plotted for the various classifiers used in this study and are shown through Fig. 11 to Fig. 16. The link between the true positive rate and false positive rate is represented by the slope of the ROC curve, which serves as a performance measure for the model. A model's excellent and inadequate results are indicated by higher and lower slopes, respectively

CONCLUSION

It is known that there are a variety of social media platforms available that people use to access news instead of traditional or original sources. However, it is important to assess the quality, source and authenticity of a news to avoid possible expansion of false/fake news that may have serious implications on the society and other connected services. Machine learning (ML) algorithms are finding applications in detecting the authenticity of a news. However, there are lot of ML algorithms available and it is difficult to choose an algorithm that will provide highly accurate results. Six machine learning classifiers—Support Vector Machine, Decision Tree, Naive Bayes, Logistic Regression, Neural Network, and Random Forest—are evaluated in this study using a thorough cross-validation methodology to guarantee their adaptability and generalizability. The confusion matrices and ROC curves in this study make it clear that the Decision Tree had the best accuracy (99.61%), followed by Neural Network (91.12%), Logistic Regression (91.06%), Random Forest (88.50%), Naïve Bayes (81.64%), and SVM (49.24%). The other performance parameter such as F1-score, precision, recall, are also significantly higher in the case of Decision Tree classifier, compare to other classifiers. Although Decision Tree outperforms the other classifiers; however, it cannot

be concluded as a best classifier until its performance is validated on other datasets. This study validates the applicability of ML algorithms in determining the authenticity of a news. Still, efforts are required to identify an ideal model/algorithm that will perform seamlessly over a wide range of datasets. The possible solution could be to address the problem of identifying the real and fake news by using ensemble models (a procedure wherein an outcome is predicted using a combination of multiple models) as a future research direction.

ABSTRACT

Ekakustha, a subtype of *Kshudra Kustha* in *Ayurveda*, closely resembles erythrodermic psoriasis, characterized by dry, scaly plaques and erythema. This study evaluates the efficacy of *Ayurvedic* treatments in managing *Ekakustha*. A 48-year-old female with erythrodermic psoriasis underwent a two-phase *Ayurvedic* regimen: *Vamana, Virechana, Raktamokshana*, followed by *Vaitarana Basti* and *Panchatikta Yapana Basti*. Supportive therapies [*Abhyanga, Shirodhara*, etc.] and internal medications [*Arogyavardhini Rasa, Gandhaka Rasayana*] were also used. Clinical outcomes were assessed using the PASI, DLQI, NRS, and subjective criteria based on *Ayurvedic* principles. PASI decreased from 27 to 10.4, DLQI improved from 18 to 10, and NRS for itching reduced from 8 to 3. Joint pain was relieved, and skin texture improved, with no recurrence during follow-up. The *Ayurvedic* approach, combining cleansing and rejuvenation therapies, effectively reduced symptoms and improved quality of life in *Ekakustha*. Individualized treatment proved beneficial for managing chronic psoriasis. *Ayurvedic Panchakarma* and internal medications show promise in managing *Ekakustha*, offering sustained symptom relief and improved patient outcomes.

Keywords: *Ekakustha,* Erythrodermic psoriasis, *Ayurveda, Panchakarma, Vamana, Virechana, Raktamokshana, Basti* therapy, Dermatological outcomes.

INTRODUCTION

The skin, the body's largest sensory organ, is crucial in touch, protection, and temperature regulation. Its health reflects not only physical well-being but also an essential component of mental and social well-being. In *Ayurveda*, the skin is intimately linked to the concept of *Sparsha Gyan*, or the sense of touch, emphasizing its importance in maintaining overall health. When the skin faces disorders, it can lead to physical discomfort as well as psychological and social distress [1]. One such skin disorder in *Ayurveda* is *Eka Kustha*, a type of *Kshudra Kustha* characterized by scaly, thick, and rough skin resembling the texture of fish scales or elephant skin [2]. This condition is associated with a predominance of *Vata* and *Kapha Doshas*, leading to the formation of lesions that lack sweating and exhibit a reddish discoloration. *Eka Kustha* shares striking similarities with psoriasis, a chronic, non-infectious autoimmune disease affecting a significant portion of the global population, including 0.44% to 2.8% of individuals in India [3].

In modern terms, *Eka Kustha* can be closely correlated with psoriasis, particularly in its presentation of erythematous, scaly plaques commonly found on areas like the scalp, elbows, knees, and nails. It is a relapsing-remitting disease, influenced by both genetic and environmental factors. *Ayurveda*, however, approaches the treatment of *Eka Kustha* holistically, aiming not only to alleviate symptoms but also to address the root causes of the condition. [4]. *Ayurvedic* treatment for *Eka Kustha* is multifaceted, involving a series of therapeutic approaches such as *Shodhana* [purification],*Shamana* [pacification], and *Rasayana* [rejuvenation].[5] These therapies work together to restore balance to the body's *Doshas* and tissues. The primary line of treatment includes *Sarpipana* [intake of medicated ghee] to pacify *Vata, Vamana* [emesis], [6] and *Virechana* [purgation] to target the vitiated *Kapha* and *Pitta Doshas*, respectively. Additionally, *Rasayana* therapy is employed to rejuvenate the affected tissues and promote long-term skin health.In cases of *Eka Kustha*, such as those exhibiting symptoms like itching, scaling, and erythematous patches, *Ayurveda's* personalized approach offers an effective solution. By addressing the root causes through *Shodhana* and complementary therapies, *Ayurveda* not only manages the condition but also enhances the overall well-being of the individual, offering a sustainable path to recovery and health.

Patient History

A 48-year-old female came to the OPD of Parul Ayurveda Hospital presenting with complaints of irregular, reddish, itchy patches across the body, along with skin scaling and bleeding due to excessive itching, since 8 years and worsening over the last 3 months. Initially, she was healthy but later developed small skin lesions over the upper and lower limbs, scalp, and abdomen, gradually spreading across the body, accompanied by severe itching and powdery discharge. She has also been experiencing pain and swelling in both knee joints for the past 4-5 years, which worsens while walking. She consulted an allopathic physician and underwent 8-10 months of treatment, including antibiotics, antihistamines, and topical steroids, but did not experience significant relief. To manage her symptoms, she has been using topical steroids and Tablet Indomethacin [50 mg]. As her condition deteriorated over the past 3 months, she consulted Parul Ayurveda hospital OPD and was admitted for further treatment.

History of Past illness

Known case of Hypothyroidism and Diabetes Mellitus since 5-6 years. [Under regular medication].

Personal History

Diet - vegetarian, with fewer green leafy vegetables and low fibre, and who indulges in spicy and sweet foods. Take extra salt in every food item.
Addiction – Tea [3-4 times/day],Tobacco
Sleep – disturbed
Bowel - constipation on and off
Micturition – occasionally yellowish [5-6 times/day]

Systemic examination

- **Cardiovascular System** – S1, S2 sounds heard, no abnormality detected.
- **Respiratory System** – NVBS heard, no abnormality detected.
- **Gastrointestinal System** – Normal bowel sound heard, rigidity/guarding: absent, no organomegaly detected.

Integumentary System –

- Multiple irregular erythematous plaques with scaling over both arms, forearms, thighs, abdomen, neck, face, back, and chest region.
- Scalp scaling [+2]
- Nail pitting [+3]

Palpation

1.Warmth touch with rough texture

Sign

1.Candle Grease Sign- Positive
2.Auspitz Sign- Positive
3.Koebner's phenomenon – absent

Diagnosis and Assessment

The patient was a known case of Erythrodermic Psoriasis. The presence of the Auspitz sign and Candle Grease Sign supported the diagnosis. The differential diagnosis was made with *Mandalakushtha, Vicharchika*, and *Visphotaka* [~various dermatological lesions]. The absence of blackish-red round patches ruled out *MandalaKushtha. Vicharchika* was ruled as there was no discharge. The absence of blisters rules out the possibility of *Visphotaka*. The case had an indurated fish scale-like appearance of skin on the head, trunk, hands, & legs. Based on this, the *Ayurvedic* diagnosis was established as *Ekakustha,* characterized by a fish scale-like appearance and irregular, blackish-red lesions, which cover a large area in the *Sharira.*

Assessment Criteria of Clinical Features

Parameters such as the Psoriasis Area Severity Index [PASI] [7], Dermatology Life Quality Index [DLQI] [8] [9], and Numerical Rating Scale [NRS] [10], for itching, as well as subjective criteria, were also evaluated before admission.

DISCUSSION

The *Ayurvedic* system of medicine offers a holistic and structured approach to managing chronic skin disorders such as *Ekakustha*, which closely resembles psoriasis in contemporary dermatology. Categorized under *Kustha*—one of the *Ashta Mahagada—Ekakustha* is known for its chronicity, systemic involvement, and resistance to treatment. The pathology involves *Tridoshic* vitiation with predominant *Vata, Kapha,* and *Raktadushti*, making it a *Bahudosha Avastha Vyadhi*. Hence, *Shodhana* becomes the first and foremost management line, as repeatedly emphasized in *Ayurvedic* classics. In the presented case, which exhibited clinical features resembling erythrodermic psoriasis, a two-phased *Shodhana* protocol followed by *Shamana* and *Rasayana* therapy was adopted. The treatment plan was formulated based on a detailed assessment of *Dosha, Dushya, Srotas*, and *Vyadhi Avastha*, with strict adherence to *classical Ayurvedic* guidelines. In the first phase, *Vamana* was performed to eliminate aggravated *Kapha* and *Ama*, which are responsible for itching, heaviness, and scaling [12]. This was followed by *Virechana* to address *Pitta* and *Raktadushti*, targeting inflammation, erythema, and burning sensations commonly seen in skin disorders. *Raktamokshana* was then employed to locally purify vitiated *Rakta*, which is often the prime *Dushya* in *Kustha*[13].

These three core therapies worked synergistically to remove systemic and local *Doshas*, pacify inflammation, and clear the disease pathology at both *Sarva Shareera* and *Sthana* levels. Post-*Shodhana*, the patient was discharged with

specific *Shamana* medicines to maintain the results and prevent recurrence. In the second phase, *Basti Karma* was administered, starting with *Vaitarana Basti* for *Ama Pachana, Agni Deepana*, and *Vata-Kapha Shodhana*. Later, *Yapana Basti* was administered in *Yogabasti Krama* to support *Rasayana* action, especially considering the joint complaints and long-standing nature of the disease. These interventions helped in addressing systemic vitiation of *Vata*, promoted nourishment to *Asthi* and *Majja Dhatus*, and contributed to rejuvenation and prevention of further degeneration, especially in psoriatic arthritis-like symptoms. Supportive therapies such as *Abhyanga* with *Manjishthadi Taila, Kashaya Dhara*, and *Shirodhara* were strategically integrated to manage *Rukshata, Kandu, Srotorodha*, and associated psychological stress. *Upanaha Sweda* with *Kolakulathadi Churna* helped alleviate joint stiffness and pain through sustained warmth and *Vata* pacification. These therapies provided symptomatic relief and enhanced tissue response to internal medication.

Internal medicines played a key role in sustaining remission. *Arogyavardhini Rasa, Gandhak Rasayana*, and *Manibhadra Guda* were employed for *Raktashodhana, Agnideepana*, and *Rasayana* actions. *R-Compound, Yogaraj Guggulu*, and Allergo addressed associated symptoms of joint pain, inflammation, and itching effectively. *Brahmi Vati* contributed to better sleep and mental stability, a much-needed support in chronic skin disorders with psychological overlays. *Abhayarishta* served as a gentle detoxifier and digestive stimulant, ensuring *Agni* regulation, which is the foundation of all healing in *Ayurveda*. This comprehensive protocol illustrates the *Ayurvedic* principle of *Samprapti Vighatana*—breaking the pathological process by systematically eliminating accumulated *Doshas*, purifying the *Dhatus*, and restoring homeostasis. The success in this case reinforces the *Classical* wisdom that chronic diseases with deep-seated *Dosha-Dushya* interactions can be effectively reversed through a planned course of *Shodhana* followed by *Shamana* and *Rasayana* therapies.

Vamana Karma

Ayurvedic texts like *Charaka Samhita* and *Ashtanga Hridaya* recommend *Vamana* as the first line of *Shodhana* therapy for *Kustha*. *Kustha* is primarily caused by the vitiation of *Kapha* and *Vata Doshas*, often associated with vitiated *Rakta. Vamana* specifically targets the *Kapha* and *Ama doshas*, helping to eliminate them from the *sharira*, thereby addressing the root cause of many types of *Kustha*. By removing the accumulated *Doshas* in the early stage, *Vamana* helps to interrupt the *Samprapti* and prevent further complications. Proper expulsion of *Dosha* leads to improved *Rasa* and *Rakta Dhatu* quality, which nourishes the skin and supports healthy tissue regeneration. After *Vamana, Agni* is kindled, which aids in better digestion and assimilation and enhances the effectiveness of internal medicines prescribed for *Kustha*.

Virechana karma

Virechana is the main treatment protocol for *Pitta* and disorders arising from *Dushita Rakta*, making it highly effective in *Pitta*-predominant skin diseases like eczema, psoriasis, etc. Since the liver [*Yakrit*] is a seat of *Pitta*, and *Rakta* is closely related to *Pitta, Virechana* helps cleanse the liver and improve blood quality. This reduces skin inflammation, redness, burning sensations, and pigmentation. Chronic skin conditions often involve *Ama*, especially in the *Raktavaha* and *Rasavaha Srotas*. *Virechana* helps in expelling this*Ama*, restoring the *srotas* integrity. *Virechana* reduces *Pitta* and systemic inflammation, offering significant relief in burning, itching, and rashes. By removing *Pitta* and *Rakta* impurities, *Virechana* contributes to clearer skin, improved complexion, and reduced blemishes. It helps in balancing *BhrajakaPitta. Virechana* increases the bioavailability of oral and topical medications by cleansing internal pathways.

Raktamoshana

Ekakustha involves all three *Doshas* but has a predominant involvement of *Kapha, Vata*, and *Rakta Dushti*. According to *Acharya Charaka*, the *Shodhana* line of treatment for *Kustha* includes *Vamana* [for *Kapha*], *Virechana* [for *Pitta* & *Rakta*], and *Raktamokshana* [direct purification of vitiated *Rakta*].

While *Vamana* and *Virechana* remove systemic *Doshas, Raktamokshana* directly purifiesthe vitiated blood, which plays a central role in skin pathology. Especially beneficial when lesions persist or local congestion remains after systemic detox.

Persistent plaques and discolorationmay indicate residual *Doshas* at the *Shakha*. *Raktamokshana*helps remove these residual *Doshas* directly from the pathology site.It is especially helpful in inflamed plaques, as *Raktamokshana* immediately reduces heat, redness, and itching by draining vitiated *Rakta* and inflammatory mediators. It is often used as a follow-up to systemic *Shodhana* to stabilize the disease, reduce the chronic inflammatory load, and prevent re-aggravation of symptoms. Internal medicines and *Rasayana* therapies become more effective with clean local circulation, promoting better healing and remission. After systemic *Shodhana* via *Vamana* and *Virechana, Raktamokshana* is a focused local purification therapy in *Ekakustha*. It directly targets vitiated *Rakta*, reduces local inflammation, supports faster resolution of skin lesions, and enhances the long-term efficacy of *Rasayana* and maintenance treatments.

Basti Karma

In the second course of treatment, *Vaitarana Basti* was administered due to the presence of *Ama Avastha* and symptoms like *Kandubahulyata* in *Ekakustha* and associated *Vishama Jwara*. The *Basti* helped in *Ama pachana, Dosha Shodhana [Kapha-Vata*], and *Agni Deepana*, leading to symptomatic relief and better response to subsequent therapies.

In the post-*Shodhana* phase of *Ekakustha* with associated *Sandhivata*-like symptoms, *Panchatikta Panchaprasruti Basti*[14]serves as a dual-purpose therapy: As a *Rasayana*, it rejuvenates tissues and supports long-term skin health, and as a *Bruhmana-Vatahara* therapy, it reduces joint stiffness and pain, supporting *Asthi-Majja Dhatu*. Thus, it aligns with both the *pathya* of *Jirna Kushtha Chikitsa*and the management of degenerative joint disorders.

Abhyanga

Abhyanga with *Majisthadi Taila*[15] plays a vital supportive role in *Ekakustha Chikitsa* by reducing *Kandu, Rukshata*, and *Srotorodha*, enhancing *Rakta Shuddhi*, and promoting skin healing. It complements *Shodhana* and *Rasayana* therapies, making it an integral part of holistic management.

Kashaya Dhara

Panchatikta Kashaya Dhara is a highly effective *Shamana chikitsa*in*Ekakustha,* offering direct relief from itching, discoloration, and scaling. The flowing action of the warm decoction helps clear blocked skin channels [*Romakupa*], improving skin metabolism and circulation. Helps in reducing thickened plaques and enhances drug absorption. It pacifies *Vata-Kapha*, purifies the skin channels, and supports the healing process by enhancing local tissue detox and receptivity to *Rasayana*therapies. [16]

Shirodhara

Panchatikta Kashaya Shirodhara serves as a holistic therapy in *Ekakustha*, helping in *Dosha* pacification [*Vata-Rakta*], scalp lesion management, and most importantly, addressing the psychosomatic impactof chronic skin disease. It enhances overall healing by calming the mind, purifying *Srotas*, and improving the patient's quality of life.[17]

Upanaha Swedana

Upanaha Sweda with *Kolakulatthadi Churna* is a highly effective therapy in *Sandhivata,* providing sustained warmth, anti-inflammatory, *Vata*-pacifying, and nourishing effects to the affected joint. It improves mobility, reduces pain and stiffness, and prevents further degeneration, making it an essential part of the treatment protocol. [18]

Arogyavardhini Rasa

Arogyavardhini Rasa is a potent, multi-acting herbo-mineral formulation beneficial in *Ekakustha* due to its *Raktashodhana, Agnideepana, Yakrituttejana*, and *Kusthaghna* properties. It purifies the blood, enhances liver function, reduces inflammation, and promotes proper *Dhatu* metabolism, making it a cornerstone in the *Shamana Chikitsa* of chronic skin diseases.[19]

Gandhak Rasayana

Gandhak Rasayana is a cornerstone *Rasayana* in *Ekakustha Chikitsa,* offering potent *Kusthaghna, Raktashodhana*, and *Vyadhikshamatva vardhaka* effects. It not only aids in deep tissue purification and skin rejuvenation but also supports long-term remission and prevents recurrence after *Shodhana* therapies. [20]

R-Compound

R-Compound is a potent and balanced polyherbal formulation that plays a crucial role in managing *Sandhishoola* in *Sandhivata*, owing to its *Vedanasthapana, Vatahara, Shothahara*, and *Brimhana* properties. It provides both symptomatic relief and disease-modifying action, making it highly valuable in chronic degenerative joint conditions. [21]

Combination of *Manjishthadi, Mansyadi,* and *Rasnadi Kashaya*

The combination of *Manjishthadi, Mansyadi*, and *Rasnadi Kashaya* offers a holistic solution for coexisting conditions like *Ekakustha* and *Sandhivata* by working on *Rakta shuddhi, Vata-Kapha shamana, Shothahara*, and *Twak-Pachana* properties. It balances all three *Doshas,* purifies the system, reduces inflammation, relieves joint pain, and supports tissue regeneration. [22]

Manibhadra Guda

Manibhadra Guda is an excellent *Classical* formulation that supports both *Shodhana* and *Rasayana chikitsa* in *Ekakustha*. Through its *Virechana, Raktaprasadana, Deepana-Pachana*, and *Rasayana* actions, it purifies the body internally, improves skin quality, reduces recurrence, and supports long-term healing. [23]

Brahmi Vati

Brahmi Vati is a highly effective therapeutic agent in *Ekakustha*, especially when the patient experiences disturbed sleep due to intense itching. It provides relief from itching through its cooling, anti-inflammatory, and *Vata*-pacifying properties, while also promoting mental tranquility and improved sleep quality. By addressing both the physical and psychological aspects of the disease, *Brahmi Vati* aids in better overall healing and symptom management. [24]

Allergo Tablet

Tablet Allergo plays a valuable role in the *Shamana* phase of *Ekakustha Chikitsa* by acting as a *Raktashodhaka*, anti-inflammatory, anti-allergic, and *Rasayana* agent. It helps manage symptoms like itching, scaling, discoloration, and recurrence, while supporting long-term skin health and immune balance. [25]

Yogaraj Guggulu

YogarajGuggulu is a cornerstone *Ayurvedic* remedy for *Sandhivata* and *Sandhishoola* due to its *Vata*-pacifying, anti-inflammatory, pain-relieving, and muscle-strengthening properties. It is beneficial in conditions like osteoarthritis or gout [*Vatarakta*], where it helps improve joint mobility, reduce swelling, and relieve pain. Regular use provides long-term joint health support and promotes overall flexibility and functionality. [26]

Abhayarishta

While *Abhayarishta* is not a primary medicine for *Ekakustha*, its role as a digestive and detoxifying agent is crucial in *Ayurvedic chikitsa* [treatment approach], which focuses on treating the root cause of the disease, not just the symptoms. Its usage aligns with the fundamental principle of *Ayurveda*: "*Rogaha sarve api Mandagnau*" — all diseases originate from poor digestion. [27]

CONCLUSION

In conclusion, this case not only highlights the efficacy of *classical Ayurvedic* management in conditions like *Ekakustha* but also emphasizes the importance of individualized treatment based on *Dosha Pareeksha, Rogibala*, and the stage of disease. The integrated use of *Shodhana*, local therapies, and internal medications provided sustained symptomatic

relief, improved the patient's quality of life, and minimized the chances of recurrence. This case thus reaffirms the potential of *Ayurveda* in managing chronic inflammatory skin diseases through a comprehensive and holistic treatment approach that addresses both the root cause and manifestations of the disease.

ABSTRACT

NoSQL databases have emerged as a fundamental solution to address the challenges posed by Big Data, characterized by massive volume, variety, and velocity of information. Unlike traditional relational databases, NoSQL systems provide schema flexibility, horizontal scalability, and high availability, making them ideal for distributed and real-time data processing. This paper explores the core concepts of NoSQL databases, including their classification into key-value, document, column-family, and graph models, as well as their underlying methods such as sharding, replication, and consistency management guided by the CAP theorem. Furthermore, it examines practical applications of NoSQL in domains like social media analytics, IoT, and recommendation systems, highlighting both their advantages and limitations in modern data-driven environments

Keywords: NoSQL Databases, Big Data, Key-Value Stores, Document Stores, Column-Family Databases, CAP Theorem

INTRODUCTION

The explosive growth of data in recent years, driven by the rise of the Internet of Things (IoT), social media platforms, and cloud computing, has necessitated a paradigm shift in data management systems. Traditional relational database management systems (RDBMS) are often limited by rigid schemas and vertical scalability

constraints, making them less suitable for handling the 3Vs of Big Data: Volume, Variety, and Velocity. NoSQL (Not Only SQL) databases emerged as an alternative, offering flexibility, scalability, and performance optimizations for modern applications. This paper focuses on the concepts, methods, and practical applications of NoSQL databases in Big Data ecosystems.

Characteristics of Big Data and the Need for NoSQL

Big Data is defined by the following characteristics:

- **Volume**: Massive amounts of data generated from diverse sources.
- **Velocity**: High-speed data generation and processing requirements.
- **Variety**: Different data formats, such as structured, semi-structured, and unstructured.

Traditional RDBMS struggles to handle these characteristics due to fixed schemas and limited scalability. NoSQL databases address these challenges by offering:

- **Schema-less design** for flexibility.
- **Horizontal scalability** through distributed architectures.
- **High availability** for continuous operation.

NoSQL Database Models

NoSQL databases can be classified into four primary categories:

Key-Value Stores

- **Examples**: Redis, Riak.
- **Description**: Stores data as key-value pairs; highly efficient for lookups.
- **Use case**: Caching, session storage.

Document Stores

- **Examples**: MongoDB, CouchDB.
- **Description**: Stores semi-structured data in JSON/BSON format.
- **Use case**: Content management, e-commerce catalogs.

Column-Family Stores

- **Examples**: Apache Cassandra, HBase.
- **Description**: Organizes data in column families rather than rows.
- **Use case**: Time-series data, IoT analytics.

Graph Databases

- **Examples**: Neo4j, OrientDB.
- **Description**: Represents data as nodes and edges for relationship-heavy queries.
- **Use case**: Social networks, recommendation systems.

Core Methods in NoSQL Databases

Data Partitioning (Sharding)

- Distributes data across multiple nodes to ensure scalability.
- Helps in managing large datasets efficiently.

Replication

- Duplicates data across multiple servers for fault tolerance and high availability.

Consistency Models

- **Eventual Consistency**: Updates propagate asynchronously (e.g., DynamoDB).
- **Strong Consistency**: Immediate consistency (e.g., Google Spanner).

The CAP Theorem and Its Implications

The CAP theorem states that in a distributed system, it is impossible to simultaneously guarantee Consistency (C), Availability (A), and Partition Tolerance (P). NoSQL databases typically choose AP or CP models depending on their design.

CAP Theorem Diagram

I will provide a simple representation for your paper:

```
    Consistency
       /\
      /  \
     /    \
Availability----Partition Tolerance
```

- **AP (Availability + Partition Tolerance)**: DynamoDB, Cassandra.
- **CP (Consistency + Partition Tolerance)**: HBase, MongoDB (with strong consistency).

Applications of NoSQL Databases

- **Social Media Analytics**: Handling user-generated content and real-time feeds.
- **IoT**: Storing and analyzing large volumes of sensor data.
- **Recommendation Systems**: Graph databases for personalized recommendations.
- **E-commerce**: Catalog management with document stores.

Advantages and Limitations

Advantages

- Flexible schema design.
- Scales horizontally.
- Handles unstructured and semi-structured data effectively.

Limitations

- Lack of standard query language.
- Limited ACID transactions compared to RDBMS.
- Complex consistency management.

CONCLUSION

NoSQL databases are integral to modern Big Data processing, enabling organizations to handle large, diverse, and rapidly changing datasets. While they address many challenges posed by Big Data, they come with trade-offs in consistency and standardization. Future research will focus on hybrid approaches that combine the strengths of both relational and NoSQL paradigms.

ABSTRACT

Adjustment disorder is a commonly occurring psychological disorder during which depression or anxiety usually its primary manifestations. Master Hahnemann in mental diseases explained about psychosomatic disorder in detail. An intervention of Homoeopathic management in the case of Mental and Behavioural disorder with the help of synthesis repertory to determine the conceptual image of case, analysis and evaluation of symptoms, along with reportorial approach using DASS 21 Questionnaire for evaluation of whole case study.

Keywords: Homoeopathy, Individualisation, Adjustment Disorder, Psychiatry.
Abbreviation – DASS 21 –Depression, Anxiety, Stress 21 Questionnaire., OD –Once a day, BDS –Twice a day, SD –Single dose, ICD 10 –International classification of diseases.

INTRODUCTION

Adjustment disorder is a condition in which the individual has difficulties coping with or adjusting to a particular stressor or a series of stressors. It may trigger mental stress and impair an individual's daily functioning. Adjustment Disorder can be defined by an emotional reaction to a stressful event. It is one of the rare diagnostic entities that associate an external stressful event with the onset of symptoms. [1]These can include the death or loss of a loved one, as well as relationship issues. An inability to cope with a stressful situation might result in one or more severe psychological and physical symptoms. [2] Based on the definition, symptoms have to develop within 3 months of the stressor and subside within 6 months of its removal. If the symptom complex continues for shorter than 6 months, it is considered acute. Chronic adjustment disorder is described as symptoms that continue for more than six months after the initial development.[3] Individual affinity or susceptibility is an essential component in the chance of occurring and thus contributes to the manifestations of adjustment disorders. The manifestations vary and include an unhappy mood, anxiety, worry (or any combination of these), a sense of helplessness when dealing with the problem, poor planning, trouble continuing in the current situation, and some degree of inefficiency in doing day-to-day activities. Individuals are prone to dramatic conduct and violent outbursts, but these are rare. However, behavioral issues (e.g., violent or dissocial behaviour) can also be associated especially among adolescents. [4]

MATERIALS AND METHODOLOGY

The study carried out with the IEC's permission. A randomized placebo-controlled trial was conducted to determine the effectiveness of specialized homoeopathic treatment for adjustment disorder. Patients who met the inclusion and exclusion criteria and provided valid informed consent completed the DASS 21 Questionnaire. Case diagnosed with Adjustment disorder according to ICD-10 DSM (V) criteria and willing to give consent to participate in the study will be chosen irrespective of age or gender. As part of the follow-up, at least six visits per month were made.

Case History

Chief complaints –FemalePt. of 21years old came with complaints of delayed & scanty menses since 3 months her sleep gets disturb now, sometimes restless at whole night & unable to sleep. Dark pigmentation around both the eyes. Feeling very depressed and thoughts of suicidal tendency with loneliness. All complaints are Aggravated at night, when alone &Amelioration – weeping after

History of chief complaints –Complaints are started before 3& half month

Associate Complaints –Appetite decreased, sometimes headache at Frontal region, lack of interest in any activity with weeping disposition when alone.

Modalities –Aggravation - at night, when alone;Amelioration – weeping after

Past history- at the age of 15years pt. was suffer from Malaria (treatment taken then recover)**,** No past history of accident, Vaccination – done properly

Family history

Father: NAD
Mother: NAD
Sibling: 2sisters, 1 Brother

Menstrual History- Menarche -15year age
LMP –25/03/2023

Flow of blood - Scanty menses 2- 3 days**,** Character of blood – Liquid, no clotted bleeding before menses: Thin watery discharge, scanty, no itching, no burning, and no smell**,**No other associate complaints present.

Physical Generals
Thermals reaction: Hot Patient
Appetite: Decreased
Desire: Sweets ++
Aversion: Not specify
Thirst: Thirsty more towards cold water intake
Urine: Clear
Sweat: Scanty, no stain, no specific odour.
Bowel: Clear, once a day
Sleep: Disturbed since more than 2 months (Restlessness)
Dream: Not specific if occurs but not remember
Habits**:** Not specific

Life Space –Pt. is college student, living in the hostel life with all other complaints, started after her best friend [her room partner] suddenly stop talking with her, she many times ask her about the reason and why she stopped talking with her. But she didn't respond, so she gets hurt, offended because she was her best friend. She shared everything with her, so she was afraid. Thereafter, started crying and feeling very depressed, having no interest in anything. Now she avoids talking with others, introversion along with some suicidal thoughts. Then she avoids talking with her best friend as remember everything about her and feeling more depressed. Afterwards her appetite gets decreased and menses become delayed about 10 to 15 days since that time.

Mental Symptom
1.Offended, loneliness
2.Suicidal thoughts
3.Weeping disposition with silent grief when alone
4.After weeping feeling better but again get depressed
5.Sensitive, timid, introverted kind personality
6.Disturbed sleep
7.Unapproachable

Diagnosis -According to the ICD 10 classification of mental and behavioral disorder, this can be classified in to F43.2 Adjustment disorder.

Reportorial Totality of Symptom
Mind –Forsaken feeling
Mind –Sadness –suicidal disposition with
Mind –Reserved
Sleep –Disturbed
Female genitalia /sex menses too late
Female genitalia /sex menses scanty

Repertory Sheet –[6]
Selection of Remedy –
Prescription: After detail case taking, repertorisation done through RADAR 10 via Synthesis Repertory and homoeopathic materia medica book references,[7-9]medicinal prescription was *Natrum mur* 200/1 dose/OD on date 18/04/2023.

Justification of remedy selection: *Natrum Muriaticum* got the greatest score in reportorial analysis, and after reviewing materia medica, it was decided that Natrum mur was the most appropriate for this case as it fulfilled the general, physical, and mental picture, as well as the thermal reaction.

Selection of potency with justification: It was based on an individual's susceptibility.Nature of drug & diseases. **[**10, 11]

Management: Provide emotional support by the family, yoga, meditation

DISCUSSION AND CONCLUSION

Adjustment disorder is a mental and behavioral condition. In the sixth edition of the Organon of Medicine, Dr.Hahnemann explains about mental illnesses in aphorisms 210 to 230, specifically psychosomatic disorders in aphorism 225.According to this approach, Homoeopathy is effective in the treatment of adjustment disorders when other symptoms are included and individualised homoeopathic medication is offered for each individual. Homoeopathy offers an approach that has the ability to significantly improve the psychotherapy process. Homoeopathy offers safe, gentle, and nontoxic remedies based on holistic principles. They can be effective Alternatives to standard medications with no side effects. From the time of Master Hahnemann to the present day, master prescribers have continuously addressed the importance of the mental and emotional levels in the selection of a remedy in achieving successful treatment. [13] Where feelings of sadness, stress, and anxiety appear to be at an all-time high, and many psychosomatic disorders have been diagnosed on a daily basis, it is our responsibility to utilize homoeopathy to its maximum potential in all somatic diseases caused by a psychological cause, which will benefit individuals and society as overall. This example shows that Homoeopathy can successfully treat mental and behavioural disorders [F.43.2-Adjustment Disorder]. If the selected medicine is a true similimum, it will begin to improve the case with a single dose. It also highlights the importance of the patient's perception and reaction to it, which can result in substantial changes in the patient's mental and behavioral plane. This case demonstrates the importance of causal factors in drug selection. It adds to the efficacy of homoeopathic materia medica with reportorial results.

Conflict of interest- Nil

ACKNOWLEDGMENT

The author wishes to acknowledge the guide Dr. Jignesh Patel sir for his constant support. And also wants to thank all subjects for participating in the study, our beloved Dean & principal of JNHMC Dr. Poorav Desai, Dr. Vijay Patel, principal of JJHMC for permitting work in college premises also thanks to Parul University for this research work.

ABSTRACT

Five types of *Bhagandar* (Fistula in-Ano) reflect the symptoms of severe referred pain to *Bhag* (Perineum), *Gud* (Anal) and *Basti* (Pelvis). Fistula in-ano is an inflammatory track lined by unhealthy granulation tissues with an external and internal opening. The manifestation begins with a boil (Abscess) around perianal region and if not treated can burst and convert into discharging track. Various surgical methods are available for treating this disease but they are associated with many complications. The effect of *ApamargKshar Pratisaran* and *Ksharasutra* application was studied in the management of *Bhagandar*. Application of *ApamargaKshara* (*Kshara Karma*) was done on wound after Fistulotomy. Application of *Ksharasutra*was done in Fistula track from external opening to internal opening. The shortest wound healing period was observed in *Kharasutra*application group as compared to Fistulotomy followed by *Ksharapratisarana*. It may be because simultaneous cutting and healing by the *Ksharasutra*. In this review, *Apamarga Kshara Karma* and *Kshara Sutra Chikitsa* were done for the management of *Bhagandara* which showed the encouraging results. It further shortens the hospital stay period and causes less pain. This review article is attributed to the researches on *Bhagandar* carried out at Parul Institute of Ayurved, Parul University, Vadodara, Gujarat.

Keywords: *Bhagandar*, Fistula in-Ano,*Kshara Karma, Kshara Sutra.*

INTRODUCTION

Bhagandar is described in Sushrut Samhita, also categorized under '*Ashtamahagad*' i.e. disease difficult to treat. When we consider modern text, similar features are described under heading 'Fistula in-Ano'. Modern authors, John Goligher *et. al*., descried Fistula-in-Ano is an inflammatory tract, which has an external opening in the perianal skin and an internal opening in the anal canal or rectum. This tract is lined by unhealthy granulation tissues and fibrous tissues [1]. As per Sushrut Samhita it is a disease or condition causing severe referred pain to *Bhag* (Perineum), *Gud* (Anal) and *Basti* (Pelvis). The manifestation begins with a boil (Abscess) around perianal region and if it is not treated properly can burst and convert into discharging track and is named as *Bhagandar* [2]. As per modern text, Fistula in Ano can be Cryptoglandular or Non cryptoglandular. It is the infection of these intersphincteric glands that initiates the fistula-in-ano, known as the "Cryptoglandular hypothesis. As per Astang Hridayam, *Bhagandar* such as riding on elephant or horse for long period, squatting posture and sitting on hard surfaces can leads to the pathogenesis of *Bhagandar*[3]. *Pathya* (Do's): The following *Pathya* are mentioned in classics like *Shali Dhanya, Mudga, Patola, Vilepee, Jangala Mamsa Rasa, Shigru, Vetagra, Bala Mulaka, Tila, Saeshapa Taila, Tikta Varga, Ghrita, Madhu*. *Apathya* (Don'ts): The following *Apathya* are mentioned in classics like *Ati Vyayaama, Ati Maithuna, Kopa, Yudha, Prishtayana, Guru Aahara, Vega Avarodha, Ajeerna,* and *Sahasa Karma* [4]. *Chedana* [5] is choice of treatment in *Bhagandara* and *Ksharasutra* therapy (laying open of track using *Ksharasutra*, for those persons who are not willing for surgery). Parasurgical measures are *Rakatamokshana, Agnikarma, Ksharakarma, Ksharsutra*. The Ayurvedic text '*Ras Tarangini*' mentioned about *Ksharsutra Nirman* i.e. process of preparation of *Ksharasutra* and *Ksharnirman* i.e. preparation of *Kshara* (Alkaline paste) [6]. Surgical management as per the modern literature [7] Fistulotomy, Fistulectomy, Seton technique, recent advance techniques it includes anal fistula plug, application of intersphincteric fistula track, Video assisted anal fistula track application and Fistula clip closure. In this article total 2 research studies have been reviewed on *Apamarga Kshara Karma* and *Kshara Sutra Chikitsa*. This study carried out at Parul Institute of Ayurved, Parul University, Vadodara, Gujarat to find the effective modalities in the management of *Bhagandar*.

MATERIAL AND METHODS

Materials: Research works (Thesis) done on the management of *Bhagandar* were collected manually from the library of department of Shalya Tantra, Parul Institute of Ayurveda and Research Centre, Parul University, Vadodara.

Methods: After review of research work done on *Bhagandar*, it was observed that the scholars have selected *Apamarga Kshara Karma* and *Kshara Sutra Chikitsa* as mentioned in the classics. So the methodology adopted is given as follow.

Preoperative procedure
Written informed consent was taken from patient and their relatives. Preparation of local part and enema was given at early morning. The patient was shifted to recovery room and Intravenous cannula was secured. Injection Tetanus Toxoid 0.5 ml intramuscular on left deltoid and injection Lignocaine (2%) 0.01 ml intradermal for sensitivity test was given.

Operative procedure
Lithotomy position was given in operation theatre after assessing vitals. Painting and draping was done and local anaesthesia (Lignocaine 2%) was given.

***Ksharasutra*:** Track was identified by inserting betadine solution from external opening. Probing was done after achieving anaesthetic effect from external opening to internal opening at anal canal. *Ksharasutra* inserted along with probe appropriately. After achieving haemostasis, dressing was done with betadine solution.

Fistulotomy: Track was laid open with a scalpel after metallic probe was inserted from the external opening until it reached the internal opening.

***Kshar Karma*:** *Apamarg Kshara* was applied over the fistulous wound after fistulotomy and wait for change in colour. After that, washed with lemon juice to neutralize the *Kshara* and dressing was done. *Apamarg Kshar* was infiltrated in fistulous track.

Postoperative procedure

Intravenous injection Ceftriaxone 1 gram and Pantoprazole 40 mg was given. Ayurvedic medicine, Sitz bath and *Pathya-Pathya* was advised.

RESULT

Comparative Study of *Apamarga Kshara Karma* and *Apamarga Kshara Sutra Chikitsa* In Management Of *Bhagandar* [8]. Minimum 60 patients of *Bhagandar* were randomly divided into the following three groups. In group A, 20 Patients were taken and fistulotomy of the track and *Apamarga Kshara karma* was done. In group B, 20 patients were taken and *Apamarga Kshara Sutra* application and consequent change of thread was done. In group C, 20 patients were taken and fistulotomy of the track was done. The shortest wound healing period was observed in *Kshara sutra* application group that is 34 days compared to 35 days in fistulotomy group and 37 days in fistulotomy followed *by Apamarga kshara pratisarana* may be because simultaneous cutting and healing by the *Ksharasutra*. Finally study concluded that *Ksharasutra* application is effective treatment for the management of *Bhagandar*. Evaluation of The Efficacy of *Apamarga Kshara* Infiltration in The Management of *Bhagandar* w.s..r. To Low Anal Fistula [9]. In this study 30 patients of *Bhagandar* were considered. The assessment was done by using subjective criteria like pain and objective criteria like discharge, Unit Healing Time (UHT) on every 7th day till complete healing of the track. It was observed that pain and discharge was completely ceased (100%) in all cases and mean healing time of track was 6.157 days/cm. Finally study concluded that *Apamarga Kshara* infiltration has act equivalent to *Pratisaraneeya Kshara Karma* by *Shodhana* and *Ropana* treatment for the management of *Bhagandar*.

DISCUSSION

Fistula-in-ano is one of the most common anorectal diseases in which the chronic granulating track runs from the anal canal or rectum to the perianal skin or perineum and is associated with considerable discomfort and morbidity to the patient. The better alternative for modern surgeries is required to address recurrences in *Bhagandar*. Various modalities such as open surgery in the form of fistulotomy or fistulectomy, chemical destruction of the tract by corrosives, Seton treatment (chemical or cutting), application of fibrin glue or fistula plug are advocated for management of fistula-in-ano. Surgical lay open technique (Fistulotomy), which is most widely practiced, has the problems of extensive surgery in-and-round the anal canal, prolonged hospitalization, high rate of recurrence and anal incontinence. Moreover, the initial recovery period is a bit discomfort to patients and patient usually loses few days work activities. *Ksharasutra* immersed as a promising modality of treatment for *Bhagandar*. Application of chemical Seton named "*Ksharasutra*" (a medicated cotton thread coated with Ayurvedic medicines) is mentioned in the ancient Indian literature and is still practiced. Application and follow-up of *Ksharasutra* are very easy, require lesser hospital stay, lesser pain, have very low rate of complications and most importantly cost of therapy is minimal. *Kshara* destroys the vitiated tissue and make them fall off which is the most important among *Shastra* and *Anushastra.* It does functions like excision, cutting and scrapping, also mitigates all the three *Dosha. Apamarga Kshara* is *Tridoshaghna* thus helped in equilibrium of localised vitiate *Tridosha* and facilitates quick healing. *Kshara* acts externally through its dual action of *Pachana* and *Darana. Pachana* acted on inflammatory condition it encourages the body factors (antibodies) to fight against pathogens (antigens) i.e. the hastening procedure. After that through its *Darana* property it ruptures open ups the abscess cavities and resolve the swelling and leads towards debridement.

CONCLUSION

The review of research studies conducted on *Bhagandar* showed that both ayurvedic techniques like *Apamarga Kshara Karma* and *Apamarga Kshara Sutra* application are quiet effective in the management of *Bhagandar*. It was also observed that the *Apamarga Kshara Sutra* application causes rapid healing of the fistulous track so that duration of treatment was reduced significantly. However more studies are needed to draw strong conclusion.

Conflict of interest

Nil.

ABSTRACT

The primary investigation of this study is to develop an initial left (and respectively, right) neighborhood framework corresponding to an order relation on nano-topological spaces. Utilizing these neighborhood structures, the research further explores how the interplay between nano-topological spaces and directed graph theory can be effectively applied to the modeling and analysis of human lung systems.

Keywords: Directed graphs, nano-topological structures, initial neighborhoods, initial lower approximation and initial upper approximation.

INTRODUCTION

Nawar and El Atik [1] illustrated a practical application by utilizing neighborhood networks within directed graphs to derive new varieties of nano-topological spaces applicable to cardiac analysis. Such mathematical tools prove beneficial for examining blood flow systems throughout human organs. Our methodology constructs nano-topological frameworks by applying power set operations to vertices of fundamental digraphs. This integration of digraph theory with nano-topological spaces enables the resolution of practical problems across diverse medical and scientific applications [2, 3]. The various forms of NIα-continuous, NIα-open, NIα-closed, and NIα-homeomorphism are presented and examined by Abd El-Fattah A. El-Atik and Hanan Z. Hassan [4]. Identified edges in [5] to build an anatomical graph network model, which assessed some of the anatomical structures of the human blood circulation system and the relationships between each structure (node) and the others. Proposed a definition in [6] for determining the neighborhoods of an undirected graph's vertices; using the neighborhoods, we can determine

approximations and derive the nano topologies the graph's vertices induce. Pathless directed topology, connected digraph were found to be related in [7] and numerous characteristics pertaining to digraph isomorphicity were examined. Provides in [8] a practical illustration of novel topological spaces using the vertex network of a human heart and the structural organization of the heart is better understood thanks to these areas. This study also shows how useful it is to look into subgraphs in order to create different kinds of topological structures. In our earlier work [9], we developed a digraph model for the human double cycle system. A novel kind of nano topology produced by these subgraphs was introduced in [10], along with findings pertaining to nano closure and nano interior subgraphs. This study also shows how useful it is to look into subgraphs in order to create different kinds of topological structures. Also in [11] gives the definition of the partition that defines an approximation space, which is a topological space. To illustrate how to generate interest from a nano perfect semi p-open set, an applied instance was shown. Henceforth a single real-world problem serves as the inspiration for this presentation of several theoretical ideas and applications, and their relationship to graph theory is explored. In this research, initial left neighborhoods are employed to develop distinct initial left nano-topological structures that correspond to particular subsets within the graph-based model of the human lung. This section introduces the essential background concepts of nano-topology from a graph-theoretic perspective.

Definition:2.1

The equivalence relation defined on the set (U) is represented by (R) *and* U be the universe and $\tau_R(E) = \{U, \varphi, L_R(E), U_R(E), B_R(E)\}$ where $E \subseteq U$. $\tau_R(E)$ fulfils the axioms:

(i) U and $\varphi \in \tau_R(E)$.

(ii) $\tau_R(E)$ includes the union of all components belonging to any chosen sub collection.

(iii) $\tau_R(E)$ includes the intersection of all components within any finite subcollection.

On the set U, τ_R (E)generates a nano-topology corresponding to E. The nano-topological space is represented as $\{U, \tau_R(E)\}$, where the term nano-topology refers to the structural properties defined by $\tau_R(E)$.

Definition: 2.2

If a graph doesn't contain loops or connections that relate the same pair of vertices twice, it is *considered as simple graph. A null graph is a graph with no edges.*

Definition: 2.3

A graph G(ϱ,σ) consists of a nonempty set of vertices ϱ=ϱ(G) and a set of edges σ=σ(G), which is a subset of unordered pairs of elements from ϱ. If Gis finite (or infinite), then ϱ(G) likewise finite (or infinite). The degree of a vertex u in ϱ(G) is defined as the number of edges incident to it, a vertex with degree zero is termed an *isolated vertex*. An edge connecting a vertex to itself is known as a *loop*, while an edge connecting two distinct vertices is referred to as a link.

Description: 2.4

If u, o∈O and G(ϱ,σ) is a directed graph, then:

*$In\ case\ \overline{u\rho} \in \sigma(G), let\ u\ be\ the\ left\ vertex$.

* $If\ \overline{\rho u} \in \sigma(G), then\ u\ be\ a\ right\ vertex$.

*The count of vertices ufor which $\overline{u\rho}$∈σ(G) is termed the *left degree* of the vertex ϱ.

* The number of vertices u satisfying $\overline{\rho u}$∈σ(G) is called the *right degree* of the vertex ϱ.

New Definitions based on Initial Neighbourhoods

Definition: 3.1

If $\hat{G}(\hat{\rho}, \hat{\sigma})$ represents a digraph and $\hat{\rho} \in \hat{\theta}(\hat{G})$, then the new vertices corresponding to the initial neighborhoods are determined as follows:

(1) Initial left neighbourhoods:$\hat{N}_l^i(\hat{\rho}) = \{\hat{u} \in \hat{\theta}(\hat{G}) / \hat{N}_l^i(\hat{\rho}) \subseteq \hat{N}_l^i(\hat{u})\}$

(2) Initial right neighbourhoods: $\hat{N}_r^i(\hat{\rho}) = \{\hat{u} \in \hat{\theta}(\hat{G}) / \hat{N}_r^i(\hat{\rho}) \subseteq \hat{N}_r^i(\hat{u})\}$

(3) Union of initial neighbourhoods: $\hat{N}_u^i(\hat{\rho}) = \hat{N}_l^i(\hat{\rho}) \cup \hat{N}_r^i(\hat{\rho})$

(4) Intersection of initial neighbourhoods: $\widehat{N}_l^i(\hat{\rho}) = \widehat{N}_l^i(\hat{\rho}) \cap \widehat{N}_r^i(\hat{\rho})$.

Definition: 3.2

Suppose $\hat{L} \subseteq \hat{G}$ is a subgraph, $\widehat{N}_l^i(\hat{\rho})$corresponds to the initial left (or right) neighborhoods of $\hat{\rho} \in \hat{\theta}(\hat{G})$ then,

(i) Initial left lower- approximation is $\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] = \cup_{\hat{\rho} \in \hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \subseteq \hat{\theta}(\hat{L})\}$

(ii) Initial left upper- approximation is $\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] = \cup_{\hat{\rho} \in \hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{L}) \neq \varphi\}$

(iii) Initial left boundary region is $\hat{B}_{N_l^i}[\hat{\theta}(\hat{L})] = \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] - \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$

That is $\hat{\tau}_{N_l^i}[\hat{\theta}(\hat{L})] = \{\hat{\theta}(\hat{G}), \varphi, \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})], \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})], \hat{B}_{N_l^i}[\hat{\theta}(\hat{L})]\}$describes the initial left (resp. right) nanotopology of a graph $\hat{G}(\hat{\theta}, \hat{\sigma})$ captioned "Graph's tempting initial nano topology "where each corresponds to a vertex $N_l^i(\hat{\rho})$.

We call $(\hat{\theta}(\hat{G}), \hat{\tau}_{N_l^i}[\hat{\theta}(\hat{L})])$ as nano-topological space stimulated by initial left (and right) neighbourhood.

Example: 3.3

Contemplate a directed graph $\hat{G}$with $\hat{\theta}(\hat{G}) = \{\hat{\rho}_1, \widehat{\rho_2}, \hat{\rho}_3, \hat{\rho}_4, \hat{\rho}_5\}$ and $\hat{\theta}(\hat{L}) \subseteq \hat{\theta}(\hat{G})$

Next, we obtain,

Theorem: 3.4

If $\hat{G}(\hat{\theta}, \hat{\sigma})$ is a digraph and $N_l^i(\hat{\rho})$ be denoted by an initial left neighbourhood of $\hat{o} \in \hat{O}(\hat{G})$ with any two sub graphs $\hat{L}$ and $\hat{T}$ of $\hat{G}$ it follows that theconsequent statements are holds good:

$\underline{L}_{N_l^i}[\theta(\hat{L})] \subseteq \hat{\theta}(\hat{L}) \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$

$\underline{\boldsymbol{L}}_{\boldsymbol{N}_l^i}[\widehat{\boldsymbol{\theta}}(\hat{\boldsymbol{L}})] = \overline{\boldsymbol{L}}_{\boldsymbol{N}_l^i}[\widehat{\boldsymbol{\theta}}(\hat{\boldsymbol{L}})] = \boldsymbol{\varphi}$

$\underline{\boldsymbol{L}}_{\boldsymbol{N}_l^i}[\boldsymbol{\varphi})] = \overline{\boldsymbol{L}}_{\boldsymbol{N}_l^i}[\boldsymbol{\varphi}] = \boldsymbol{\varphi}$

If $\hat{\theta}(\hat{L}) \subseteq \hat{\theta}(\hat{T})$ then $\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$ and $\hat{U}_{N_l^i}[\hat{\theta}(\hat{H})] \subseteq \hat{U}_{N_l^i}[\hat{\theta}(\hat{T})]$

$\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] = \left[\overline{L}_{N_l^i}[(\hat{\theta}(\hat{L}))^C]\right]^C$

$\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] = \left[\underline{L}_{N_l^i}[(\hat{\theta}(L))^C]\right]^C$

Proof: The proof of (i), (ii) and (iii) are similar to definition of initial lower approximation and initial upper approximations.

Proof of (iv): Let $\hat{\rho} \in \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$----------(a)

$\Rightarrow N_l^i(\hat{\rho}) \subseteq \hat{\theta}(\hat{L})$ and $\rho \in \hat{\theta}(\hat{L})$,

We know that $\hat{\theta}(\hat{L}) \subseteq \hat{\theta}(\hat{T})$,

i.e., $N_l^i(\hat{\rho}) \subseteq \hat{\theta}(\hat{T})$

Hence $\hat{\rho} \in \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$----------(b)

From (a) and (b) we have, $\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$

Let$\widehat{\rho} \in \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$ ----------(c)

$\Rightarrow N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{L}) \neq \varphi$

i.e., $N_l^i(\hat{\rho}) \subseteq \hat{\theta}(\hat{L}) \subseteq \hat{\theta}(\hat{T})$

$\therefore N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{L}) \neq \varphi$

Hence, $\hat{\rho} \in \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$----------(d)

From (c) and (d) we have,

$\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$.Thus, (iv) is established.

Proof of (v): Let$\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] = \cup_{\hat{\rho} \in \hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{L}) \neq \varphi\}$

i.e., $\overline{L}_{N_l^i}[(\hat{\theta}(\hat{L}))^C] = \cup_{\hat{\rho} \in \hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\rho) \cap (\hat{\theta}(\hat{L}))^C \neq \varphi\}$

$\left[\overline{L}_{N_l^i}[(\hat{\theta}(\hat{L}))^C]\right]^C = \left\{\cup_{\hat{\rho} \in \hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \cap (\hat{\theta}(L))^C \neq \varphi\}\right\}^C$

$= \bigcup_{\hat{\rho} \in \hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \cap (\hat{\theta}(\hat{L}))^C = \varphi\} = \bigcup_{\hat{\rho} \in \hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{S}) \neq \varphi\}$

i.e., $\left[\overline{L}_{N_l^i}[(\hat{\theta}(\hat{L}))^C]\right]^C = \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$. Therefore, (v) is proven.

Proof of (vi): Let $\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] = \cup_{\hat{\rho}\in\hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \subseteq \hat{\theta}(\hat{L})\}$

i.e., $\underline{L}_{N_l^i}[(\hat{\theta}(\hat{L}))^C] = \cup_{\hat{\rho}\in\hat{\theta}(\hat{G})}\left\{\hat{\rho}/N_l^i(\hat{\rho}) \subseteq (\hat{\theta}(\hat{S}))^C\right\}$

$$= \left\{\bigcup_{\rho\in\hat{\theta}(\hat{G})}\left\{\hat{\rho}/N_l^i(\hat{\rho}) \subseteq (\hat{\rho}(\hat{S}))^C\right\}\right\}^C$$

$$= \left\{\bigcup_{\hat{\rho}\in\hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \subseteq \hat{\theta}(L)\}\right\}^C$$

$$= \left\{\bigcup_{\hat{\rho}\in\hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \cap \theta(\hat{L}) = \varphi\}\right\}^C$$

$$= \bigcup_{\hat{\rho}\in\hat{\theta}(\hat{G})}\{\hat{\rho}/N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{L}) \neq \varphi\} = \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})].$$

So, the evidence of (vi).

Theorem: 3.5

Let $\hat{G}(\hat{\theta},\ \hat{\sigma})$ be a directed graph, $N_l^i(\hat{\rho})$ being an initial left neighbourhood with any two sub graphs $\hat{L}$and $\hat{T}$ of $\hat{G}$ then the following statements are holds good:

$\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cup \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})]$

$\overline{L}_{N_l^i}[\widehat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\vartheta}(\hat{L})] \cap \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$

$\underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})] = \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$

$\overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})] = \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cup \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$.

Proof: Proof of (i): Since, $\hat{\theta}(\hat{L}) \subseteq \hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})and\hat{\theta}(\hat{T}) \subseteq \hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})$,

Then$\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})]$ and $\underline{L}_{N_l^i}[\hat{\theta}(\hat{T})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})]$

$\Rightarrow \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cup \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})]$.

Proof of (ii): Since, $\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T}) \subseteq \hat{\theta}(\hat{L})$and $\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T}) \subseteq \hat{\theta}(\hat{T})$,

Then $\overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})]and\overline{L}_{N_l^i}[\theta(\hat{L}) \cap \hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$.

$\therefore \overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$.

Proof of (iii): Since, $\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{K}) \subseteq \hat{\theta}(\hat{L})$ and$\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T}) \subseteq \hat{\theta}(\hat{T})$,

Then $\overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})]and\overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$.

$\therefore \underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{K})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$----------(1)

Let $\hat{\rho} \in \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$----------(a)

Then $\hat{\rho} \in \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})]and\hat{a} \in \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$

By definition of $\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$ we have,$N_l^i(\rho) \subseteq [\hat{\theta}(\hat{L})]andN_l^i(\rho) \subseteq [\hat{\theta}(\hat{T})]$

Then $\hat{a} \in \underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})]$----------(b)

From statements (a) and (b), we obtain,

$\underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})]$----------(2)

Hence by (1) and (2), $\underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cap \hat{\theta}(\hat{T})] = \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \underline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$.

Proof of (iv): Since, $\theta(\hat{L}) \subseteq \hat{\theta}(L) \cup \hat{\theta}(\hat{T})$ and $\widehat{\theta}(\hat{T}) \subseteq \theta(\hat{L}) \cup \hat{\theta}(\hat{T})$,

Then $\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \subseteq \overline{L}_{N_l^i}[\theta(\hat{L}) \cup \theta(\hat{T})]$ and $\overline{L}_{N_l^i}[\theta(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \theta(\hat{T})]$

Since, $\theta(\hat{L}) \subseteq \hat{\theta}(L) \cup \hat{\theta}(\hat{T})$ and $\widehat{\theta}(\hat{L}) \subseteq \hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})$,

Then $\overline{L}_{N_l^i}[\theta(L)] \subseteq \overline{L}_{N_l^i}[\theta(\hat{L}) \cup \theta(\hat{T})]$ and $\overline{L}_{N_l^i}[\hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})]$

$\Rightarrow \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cup \overline{L}_{N_l^i}[\theta(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})]$----------(1)

Let $\hat{\rho} \in \overline{L}_{N_l^i}[\hat{\theta}(L) \cup \hat{\theta}(\hat{T})]$----------(a)

Then $\hat{\rho} \in \overline{L}_{N_l^i}[\theta(L)]and\hat{\rho} \in \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$

By definition of $\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$ we have,

$\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] = \bigcup_{\hat{\rho} \in \hat{\theta}(\hat{G})} \{\hat{\rho}/N_l^i(\rho) \cap \hat{\theta}(\hat{L}) \neq \varphi\}$

$\hat{\rho} \in \bigcup_{\rho \in \hat{\theta}(\hat{G})} \{\hat{\rho}/N_l^i(\rho) \cap [\hat{\theta}(\hat{L}) \cup \hat{\theta}(\hat{T})] \neq \varphi\}$

$\hat{\rho} \in \bigcup_{\hat{\rho} \in \theta(\hat{G})} \{\hat{\rho}/[N_l^i(\rho) \cap \hat{\theta}(\hat{L})] \cup [N_l^i(\hat{\rho}) \cap \widehat{\theta}(\hat{T})] \neq \varphi\}$

$\Rightarrow \hat{\rho} \in \cup_{\hat{\rho} \in \hat{\theta}(\hat{G})} \{\hat{\theta}/[N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{L})] \neq \varphi\}$ and $\hat{\rho} \in \cup_{\hat{\rho} \in \hat{\theta}(\hat{G})} \{\hat{\rho}/[N_l^i(\hat{\rho}) \cap \hat{\theta}(\hat{T})] \neq \varphi\}$

$\Rightarrow \rho \in \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})]$ and $\hat{\rho} \in \overline{L}_{N_l^i}[\theta(\hat{T})]$

i.e., $\hat{\rho} \in \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cup \overline{L}_{N_l^i}[\theta(\hat{T})]$ ----------(b)

Equations (a) and (b) give, $\overline{L}_{N_l^i}[\theta(\hat{L}) \cup \hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cup \overline{L}_{N_l^i}[\theta(\hat{T})]$ ------- (2)

Hence by (1) and (2),

$\overline{L}_{N_l^i}[\hat{\theta}(L) \cup \hat{\theta}(\hat{T})] = \overline{L}_{N_l^i}[\theta(\hat{L})] \cup \overline{L}_{N_l^i}[\theta(\hat{T})]$.

Theorem: 3.6

Let $\hat{G}(\hat{\theta}, \hat{\sigma})$ be a directed graph, $N_l^i(\hat{\rho})$ being an initial left neighbourhood with any two sub graphs $\hat{L}$ and $\hat{T}$ of $\hat{G}$ then the following statements are holds good:

$(i)\ \underline{L}_{N_l^i}[\hat{\theta}(L) - \theta(\hat{T})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] - \underline{L}_{N_l^i}[\theta(\hat{T})]$

$(ii)\overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] - \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) - \hat{\theta}(\hat{T})]$

Proof: Proof of (i): Let $\hat{\theta}(\hat{L}) - \hat{\theta}(\hat{T}) = \hat{\theta}(\hat{L}) \cap [\hat{\theta}(\hat{G}) - \hat{\theta}(\hat{T})]$,

Then $\underline{L}_{N_l^i}[\hat{\theta}(\hat{L}) - \hat{\theta}(\hat{T})] = \underline{L}_{N_l^i}[\hat{\theta}(L) \cap [\theta(\hat{G}) - \hat{\theta}(\hat{T})]]$

$= \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \underline{L}_{N_l^i}[\hat{\theta}(\hat{G}) - \hat{\theta}(\hat{T})]$

$= \underline{L}_{N_l^i}[\theta(\hat{L})] \cap [\hat{\theta}(\hat{G}) - \underline{L}_{N_l^i}\hat{\theta}(\hat{T})]$

$i.e., \underline{L}_{N_l^i}[\theta(\hat{L}) - \hat{\theta}(\hat{T})] \subseteq \underline{L}_{N_l^i}[\hat{\theta}(\hat{L})] - \underline{L}_{N_l^i}\hat{\theta}(\hat{T})]$

Proof of (ii): Let $\hat{\theta}(\hat{L}) - \hat{\theta}(\hat{T}) = \theta(\hat{L}) \cap [\hat{\theta}(\hat{G}) - \hat{\theta}(\hat{T})]$,

Then $\overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) - \theta(\hat{T})] = \overline{L}_{N_l^i}[\theta(\hat{L}) \cap [\hat{\theta}(\hat{G}) - \hat{\theta}(\hat{T})]]$

$= \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap \overline{L}_{N_l^i}[\hat{\theta}(\hat{G}) - \hat{\theta}(\hat{T})]$

$= \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] \cap [\hat{\theta}(\hat{G}) - \overline{L}_{N_l^i}\hat{\theta}(\hat{T})]$

$\subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L})] - \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})]$

$i.e., \overline{L}_{N_l^i}[\hat{\theta}(L)] - \overline{L}_{N_l^i}[\hat{\theta}(\hat{T})] \subseteq \overline{L}_{N_l^i}[\hat{\theta}(\hat{L}) - \hat{\theta}(\hat{T})]$.

Application of Nano-Topological Spaces in Human Lungs

The human lung is a significant piece of the human respiratory framework. Lungs go about as the primary organ for taking in oxygen and removing carbon-dioxide, which gives energy to active work. Here we shows that different parts of the lung in fig.-2 and the corresponding graphical representation of lung functioning in fig.-3. Let $\hat{G}(\hat{\theta}, \hat{\sigma})$ be a directed-graph (fig.-3) and L being a sub-graph, $\hat{\theta}(\hat{G}) = \{\hat{\rho}_1 to \widehat{\rho_{10}}\}$ be the set of vertices of $\hat{G}$, where $\hat{\rho}_1$=nostril, $\hat{\rho}_2$=nasal cavity, $\hat{\rho}_3$=pharynx, $\hat{\rho}_4$=larynx, $\hat{\rho}_5$=trachea, $\hat{\rho}_6$= bronchus, $\widehat{\rho_7}$=bronchiole (left), $\hat{\rho}_8$=bronchiole (right), $\hat{\rho}_9$=lung (left), $\hat{\rho}_{10}$ =lung (right). We establish the foundational left (resp. right) neighborhoods corresponding to every vertex in this work.

CONCLUSION

Several recent studies have developed nano-topological structures by utilizing neighborhood systems derived from graphical representations. Here, we deliver a digraph of the human lung in this application followed by specific properties of nano-topological spaces. By creating initial left (resp. right) neighbourhoods for the digraph of the human lungs, we have observed that analyzing the union and intersection of initial neighborhoods. Furthermore, we established the nano-topological initial left neighborhoods over specific possible subgraphs. The outcomes derived from the applied digraph methods prove to be valuable in understanding the oxygen distribution system within the human lungs.

ABSTRACT

In this article, the idea of neutrosophic filters in MTL-algebras is introduced. Also, the characteristics of neutrosophic filters is discussed with suitable examples. Furthermore, the concept of neutrosophic Boolean filter in MTL-algebras is presented.

Keywords: MTL-algebra; Filter; Neutrosophic set; Neutrosophic filter; Boolean filter.
2020 AMS subject classification: 03G25, 03E72, 03F55, 06F35.

INTRODUCTION

Numerous new algebras that act as structures for truth-values have been introduced as a result of the recent spike in interest in the fundamentals of fuzzy logic. P. Hajek [4] established the class of BL-algebras and acquainted the basic logic (BL) axioms for fuzzy logic. The conceptual basis of MTL algebras arose from attempts to extend classical logic into graded or many-valued contexts, aiming to better handle imprecision and uncertainty typical in fuzzy logic. The early theoretical development, mostly in the late 20th and early 21st centuries, concentrated on transforming logical systems built upon left-continuous t-norms into rigorous, algebraic frameworks. At the heart of this work was the creation of residuated lattices equipped with operations inspired by t-norms, allowing logical connectives in these systems to mimic numerical interval operations—a key innovation enabling continuous-valued reasoning. G. J. Wang [12] foresaw the idea of new algebraic structures known as R0-algebras as well as L* for fuzzy calculus and their residual. F. Esteva and L. Godo [3] predicted a new deductive system MTL, known as the monoidal t-norm-based logic. MTL-algebras serve as the foundation for the algebraic semantics of MTL [11]. In MTL algebras, Zhang

acquainted the idea of Boolean filters. The fuzzy structures in MTL-algebras were defined by Kim *et al*. [7]. Smarandache [9] acquainted the neutrosophy theory in 1998 as a way to describe the neutralites. It is extensively utilized in a variety of domains, including robotics, medical diagnostics, image segmentation, decision-making, layout planning and design, and security. Metric MTL-algebras aid in representing proximity and similarity between truth values, enhancing flexible inference models. Very true MTL-algebras introduce operators that generate Baire, connected, and locally connected topologies, applicable in continuous-valued information systems. The algebraic structure of MTL supports natural, human-readable representations of scheduling rules. Designers can describe repetitive, conditional, or interval-based constraints in a format close to plain language. This improves both the usability and accuracy of schedule modelling, reducing specification errors common in procedural scheduling algorithms. The expressive syntax of MTL-algebra-based systems also facilitates adaptation to complex temporal environments such as distributed or hybrid systems. In this paper, we have acquainted the notion of neutrosophic filters in MTL-algebras and conferred its things with suitable illustrations. Further the idea of neutrosophic Boolean filters in MTL-algebras is discussed with few characteristics.

PRELIMINARIES

Definition 2.1[1]: A residuated lattice is a lattice $\mathcal{L}= (\mathcal{L}, \leq, \wedge, \vee, \otimes, \rightarrow, 0, 1)$ containing the least element 0 and the largest element 1, and endowed with two binary operations $\otimes$ (called product) and $\rightarrow$ (called residuum) such that

- $\otimes$ is associative, commutative and isotone.
- $\xi \otimes 1 = \xi$, for all $\xi \in \mathcal{L}$
- The Galois correspondence holds,

That is, $\xi \otimes \mathfrak{H} \leq \mathfrak{Z} \rightarrow \Rightarrow \xi \leq \mathfrak{H} \rightarrow \mathfrak{Z}$, for all $\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{L}$

In a residuated lattice, the following are true

(i) $\xi \leq \mathfrak{H} \rightarrow \Rightarrow \xi \rightarrow \mathfrak{H} = 1$.

(ii) $0 \rightarrow \xi = 1$, $1 \rightarrow \xi = \xi$, $\xi \rightarrow (\mathfrak{H} \rightarrow \xi) = 1$.

(iii) $\mathfrak{H} \leq (\mathfrak{H} \rightarrow \xi) \rightarrow \xi$.

(iv) $\xi \rightarrow (\mathfrak{H} \rightarrow \mathfrak{Z}) = (\xi \otimes \mathfrak{H}) \mathfrak{Z} = \mathfrak{H} \rightarrow (\xi \rightarrow \mathfrak{Z})$.

(v) $\xi \rightarrow \mathfrak{H} \leq (\mathfrak{Z} \rightarrow \xi) \rightarrow (\mathfrak{Z} \rightarrow \mathfrak{H})$,

(vi) $(\xi \rightarrow \mathfrak{H}) \leq (\mathfrak{H} \rightarrow \mathfrak{Z}) \rightarrow (\xi \rightarrow \mathfrak{Z})$.

(vii) $\mathfrak{H} \leq \xi \Rightarrow \xi \rightarrow \mathfrak{Z} \leq \mathfrak{H} \rightarrow \mathfrak{Z}$, $\mathfrak{Z} \rightarrow \mathfrak{H} \leq \mathfrak{Z} \rightarrow \xi$.

(viii) $(\vee_{i \in r} \mathfrak{H}_i) \rightarrow \xi = \wedge_{i \in r} (\mathfrak{H}_i \rightarrow \xi)$.

Definition 2.2[7]: An MTL-algebra $\mathcal{M}= (\mathcal{M}, \leq, \wedge, \vee, \otimes, \rightarrow, 0, 1)$ satisfying $(\xi \rightarrow \mathfrak{H}) \vee (\mathfrak{H} \rightarrow \xi) = 1$.

(i) $\xi \rightarrow (\mathfrak{H} \vee \mathfrak{Z}) = (\xi \rightarrow \mathfrak{H}) \vee (\xi \rightarrow \mathfrak{Z})$

(ii) $\xi \otimes \mathfrak{H} \leq \xi \wedge \mathfrak{H}$

Definition 2.3[7]: Let $\mathcal{M}$ be an MTL-algebra. A subset Q of $\mathcal{M}$ called a filter of $\mathcal{M}$, if it satisfied the below requirements for all $\xi, \mathfrak{H} \in \mathcal{M}$,

(i) $\xi \otimes \mathfrak{H} \in Q$

(ii) $\xi \leq \mathfrak{H} \Rightarrow \mathfrak{H} \in Q$

Proposition 2.4[7]: A subset Q of an MTL-algebra $\mathcal{M}$ is a filter if and only if it satisfies the below requirements for all $\xi, \mathfrak{H} \in \mathcal{M}$,

(i) $1 \in Q$.

(ii) $\xi \rightarrow \mathfrak{H} \in Q \Rightarrow \mathfrak{H} \in Q$

Definition 2.5[7]: A fuzzy set μ in $\mathcal{M}$ is called a fuzzy filter of $\mathcal{M}$ it satisfies for all $\xi, \mathfrak{H} \in \mathcal{M}$,

(i) $\mu(\xi \otimes \mathfrak{H}) \geq \min \{ \mu(\xi), \mu(\mathfrak{H}) \}$

(ii) μ is order-preserving, that is, $\xi \leq \mathfrak{H} \Rightarrow \mu(\xi) \leq \mu(\mathfrak{H})$.

MAIN RESULTS

Here, we confer the notions of neutrosophic filter and neutrosophic Boolean filter of MTL- algebra and investigate its stuffs with examples.

Definition 3.1 A neutrosophic set $\mathcal{N}$ in $\mathcal{M}$ is called a neutrosophic filter of $\mathcal{M}$, if it contents the below requirements for all $\xi, \mathfrak{H} \in \mathcal{M}$,

(i) $\mathbb{T}_{\mathcal{N}}(\xi) \leq \mathbb{T}_{\mathcal{N}}(1), \mathbb{I}_{\mathcal{N}}(\xi) \leq \mathbb{I}_{\mathcal{N}}(1)$ and $\mathbb{F}_{\mathcal{N}}(\xi) \geq \mathbb{F}_{\mathcal{N}}(1)$

(ii) $\mathbb{T}_{\mathcal{N}}(\xi \otimes \mathfrak{H}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi), \mathbb{T}_{\mathcal{N}}(\mathfrak{H})\}$, $\mathbb{I}_{\mathcal{N}}(\xi \otimes \mathfrak{H}) \geq \min\{\mathbb{I}_{\mathcal{N}}(\xi), \mathbb{I}_{\mathcal{N}}(\mathfrak{H})\}$ and $\mathbb{F}_{\mathcal{N}}(\xi \otimes \mathfrak{H}) \leq \max\{\mathbb{F}_{\mathcal{N}}(\xi), \mathbb{F}_{\mathcal{N}}(\mathfrak{H})\}$.

Note. For $\xi \leq \mathfrak{H}$, $\mathbb{T}_{\mathcal{N}}, \mathbb{I}_{\mathcal{N}}$ is order preserving and $\mathbb{F}_{\mathcal{N}}$ is order reversing.

Example 3.2 Let $\mathcal{M} = \{0, \mathbb{j}, \mathbb{k}, \mathbb{l}, \mathfrak{x}, 1\}$, where $0 < \mathbb{J} < \mathbb{k} < \mathbb{l} < \mathfrak{x} < 1$. The product $'\otimes'$ and a residuum $'\rightharpoonup'$ on $\mathcal{M}$ defined by the tables 1 and 2 as follows

Next, we define neutrosophic set $\mathcal{N}$ in $\mathcal{M}$ is

$\mathcal{N} = \{(1, [0.7, 0.6, 0.1]), (\mathbb{j}, [0.5, 0.4, 0.2]), (\mathbb{k}, [0.5, 0.4, 0.2]), (\mathbb{l}, [0.4, 0.5, 0.1]),$
$(\mathfrak{x}, [0.4, 0.5, 0.1]), (0, [0.7, 0.4, 0.1])\}$.

It is obvious that $\mathcal{N}$ confers the conditions (i) and (ii) of the definition 3.1.

Hence, $\mathcal{N}$ is a neutrosophic filter of $\mathcal{M}$.

Example 3.3 Let $\mathcal{M} = \{0, \mathbb{j}, \mathbb{k}, \mathbb{l}, \mathfrak{x}, 1\}$, where $0 < \mathbb{j} < k < l < \mathfrak{x} < 1$. The product $'\otimes'$ and a residuum $'\rightharpoonup'$ on $\mathcal{M}$ are defined by the tables 1 and 2 .

Consider a neutrosophic set $\mathcal{S}$ in $\mathcal{M}$,

$\mathcal{S} = \{(1, [0.9, 0.8, 0.3]), (\mathbb{j}, [0.7, 0.6, 0.4]), (\mathbb{k}, [0.8, 0.9, 0.3]), (\mathbb{l}, [0.7, 0.6, 0.4]), (\mathfrak{x}, [0.8, 0.5, 0.5]), (0, [0.8, 0.5, 0.5])\}$.

Here, $\mathbb{I}_{\mathcal{S}}(\mathbb{k}) = 0.9 \not\leq 0.8 = \mathbb{I}_{\mathcal{S}}(1)$. Therefore, $\mathcal{S}$ is not a neutrosophic filter of $\mathcal{M}$.

Theorem 3.4 A neutrosophic set $\mathcal{N}$ in $\mathcal{M}$ is a neutrosophic filter of $\mathcal{M}$ if and only if it contents

(i) $\mathbb{T}_{\mathcal{N}}(\xi) \leq \mathbb{T}_{\mathcal{N}}(1), \mathbb{I}_{\mathcal{N}}(\xi) \leq \mathbb{I}_{\mathcal{N}}(1)$ and $\mathbb{F}_{\mathcal{N}}(\xi) \geq \mathbb{F}_{\mathcal{N}}(1)$

(ii) $\mathbb{T}_{\mathcal{N}}(\mathfrak{H}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$, $\mathbb{I}_{\mathcal{N}}(\mathfrak{H}) \geq \min\{\mathbb{I}_{\mathcal{N}}(\xi), \mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$ and $\mathbb{F}_{\mathcal{N}}(\mathfrak{H}) \leq \max\{\mathbb{F}_{\mathcal{N}}(\xi), \mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$ for all $\xi, \mathfrak{H} \in \mathcal{M}$.

Proof: (i) It is obvious from the Definition 3.1.

(ii) Let $\xi, \mathfrak{H} \in \mathcal{M}$ be such that $\xi \leq \mathfrak{H}$. Then $\xi \rightharpoonup \mathfrak{H} = 1$, and so

$\mathbb{T}_{\mathcal{N}}(\mathfrak{H}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi), \mathbb{T}_{\mathcal{N}}(1)\} = \mathbb{T}_{\mathcal{N}}(\xi)$ by (i)

From the definition 2.1 (iv), we know that $\xi \rightharpoonup (\mathfrak{H} \rightharpoonup (\xi \otimes \mathfrak{H})) = (\xi \otimes \mathfrak{H}) \rightharpoonup (\xi \otimes \mathfrak{H}) = 1$

It follows from(i) and (ii) that,

$$\begin{aligned}\mathbb{T}_{\mathcal{N}}(\xi \otimes \mathfrak{H}) &\geq \min\{\mathbb{T}_{\mathcal{N}}(\mathfrak{H}), \mathbb{T}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup (\xi \otimes \mathfrak{H}))\} \\ &\geq \min\{\mathbb{T}_{\mathcal{N}}(\mathfrak{H}), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup (\xi \otimes \mathfrak{H})))\} \\ &= \min\{\mathbb{T}_{\mathcal{N}}(\mathfrak{H}), \min\{\mathbb{T}_{\mathcal{N}}(\xi), \mathbb{T}_{\mathcal{N}}(1)\} \\ &= \min\{\mathbb{T}_{\mathcal{N}}(\xi), \mathbb{T}_{\mathcal{N}}(\mathfrak{H})\}\end{aligned}$$

From the note and since $\xi \leq (\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \mathfrak{H}$, we have $\xi \otimes (\xi \rightharpoonup \mathfrak{H}) \leq \mathfrak{H}$, by the Galois correspondence.

Hence, $\mathbb{T}_{\mathcal{N}}(\mathfrak{H}) \geq \mathbb{T}_{\mathcal{N}}((\xi \otimes (\xi \rightharpoonup \mathfrak{H})) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$

Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

Theorem 3.5 A neutrosophic set $\mathcal{N}$ in $\mathcal{M}$ is a neutrosophic filter of $\mathcal{M}$ if and only if it satisfies $\mathbb{j} \leq \mathbb{k} \rightharpoonup \mathbb{l} \Rightarrow \mathbb{T}_{\mathcal{N}}(\mathbb{l}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\mathbb{j}), \mathbb{T}_{\mathcal{N}}(\mathbb{k})\}$, $\mathbb{I}_{\mathcal{N}}(\mathbb{l}) \geq \min\{\mathbb{I}_{\mathcal{N}}(\mathbb{j}), \mathbb{I}_{\mathcal{N}}(\mathbb{k})\}$,
$\mathbb{F}_{\mathcal{N}}(\mathbb{l}) \leq \max\{\mathbb{F}_{\mathcal{N}}(\mathbb{j}), \mathbb{F}_{\mathcal{N}}(\mathbb{k})\}$ for all $\mathbb{j}, \mathbb{k}, \mathbb{l} \in \mathcal{M}$.

Proof: Let $\mathbb{T}_{\mathcal{N}}$ be a neutrosophic filter of $\mathcal{M}$. (∗)

Let $\mathbb{j}, \mathbb{k}, \mathbb{l} \in \mathcal{M}$ be such that $\mathbb{j} \leq \mathbb{k} \rightharpoonup \mathbb{l}$.

Then $\mathbb{T}_{\mathcal{N}}(\mathbb{j}) \leq \mathbb{T}_{\mathcal{N}}(\mathbb{k} \rightharpoonup \mathbb{l})$ by note, and so
$\mathbb{T}_{\mathcal{N}}(\mathbb{l}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\mathbb{k}), \mathbb{T}_{\mathcal{N}}(\mathbb{k} \rightharpoonup \mathbb{l})\} \geq \min\{\mathbb{T}_{\mathcal{N}}(\mathbb{k}), \mathbb{T}_{\mathcal{N}}(\mathbb{j})\}$
from (ii) of the theorem 3.4.
Conversely, let $\mathcal{N}$ be a neutrosophic set in $\mathcal{M}$ satisfying $(*)$.
Since $\mathbb{j} \leq \mathbb{j} \rightharpoonup 1$ for all $\mathbb{j} \in \mathcal{M}$, it follows from $(*)$ that
$\mathbb{T}_{\mathcal{N}}(1) \geq \min\{\mathbb{T}_{\mathcal{N}}(\mathbb{j}), \mathbb{T}_{\mathcal{N}}(\mathbb{j})\} = \mathbb{T}_{\mathcal{N}}(\mathbb{j})$ for all $\mathbb{j} \in \mathcal{M}$.
Since $\mathbb{j} \rightharpoonup \mathbb{k} \geq \mathbb{j} \rightharpoonup \mathbb{k}$ for all $\mathbb{j}, \mathbb{k} \in \mathcal{M}$, we have
$\mathbb{T}_{\mathcal{N}}(\mathbb{k}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\mathbb{j}), \mathbb{T}_{\mathcal{N}}(\mathbb{j} \rightharpoonup \mathbb{k})\}$ for all $\mathbb{j}, \mathbb{k} \in \mathcal{M}$.
Hence $\mathbb{T}_{\mathcal{N}}$ is a neutrosophic filter of $\mathcal{M}$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

Corollary 3.6 A neutrosophic set $\mathcal{N}$ in $\mathcal{M}$ is a neutrosophic filter of $\mathcal{M}$ if and only if it fulfils the subsequent assertion: $\mathbb{T}_{\mathcal{N}}(\xi) \geq \min\{\mathbb{T}_{\mathcal{N}}(\mathbb{j}_1), \cdots \mathbb{T}_{\mathcal{N}}(\mathbb{j}_n)\}, \mathbb{I}_{\mathcal{N}}(\xi) \geq \min\{\mathbb{I}_{\mathcal{N}}(\mathbb{j}_1), \cdots, \mathbb{I}_{\mathcal{N}}(\mathbb{j}_n)\}$, $\mathbb{F}_{\mathcal{N}}(\xi) \leq \max\{\mathbb{F}_{\mathcal{N}}(\mathbb{j}_1), \cdots, \mathbb{F}_{\mathcal{N}}(\mathbb{j}_n)\}$ whenever $\mathbb{j}_n \rightharpoonup (\cdots \rightharpoonup (\mathbb{j}_1 \rightharpoonup \mathbb{j}) \cdots) = 1$ for every $\mathbb{j}_1, \ldots, \mathbb{j}_n \in \mathcal{N}$.

Proof: It can be straight forwardly shown by induction.

Theorem 3.7 If $\mathcal{N}$ is a neutrosophic filter of $\mathcal{M}$, then the set $\varphi_a := \{\xi \in \mathcal{M} \mid \mathbb{T}_{\mathcal{N}}(\xi) \geq \mathbb{T}_{\mathcal{N}}(\mathbb{j}), \mathbb{I}_{\mathcal{N}}(\xi) \geq \mathbb{I}_{\mathcal{N}}(\mathbb{j}), \mathbb{F}_{\mathcal{N}}(\xi) \leq \mathbb{F}_{\mathcal{N}}(\mathbb{j})\}$ is a filter of $\mathcal{M}$ for every $\mathbb{j} \in \mathcal{M}$.

Proof: Since $\mathbb{T}_{\mathcal{N}}(1) \geq \mathbb{T}_{\mathcal{N}}(\xi)$ for all $\xi \in \mathcal{M}$.
we have $1 \in \varphi_{\mathbb{j}}$
Let $\xi, \mathfrak{H} \in \mathcal{M}$ be such that $\xi \in \varphi_{\mathbb{j}}$ and $\xi \rightharpoonup \mathfrak{H} \in \varphi_{\mathbb{j}}$.
Then $\mathbb{T}_{\mathcal{N}}(\xi) \geq \mathbb{T}_{\mathcal{N}}(\mathbb{j})$ and $\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}) \geq \mathbb{T}_{\mathcal{N}}(\mathbb{j})$.
Since $\mathbb{T}_{\mathcal{N}}$ is a neutrosophic filter of M; it monitors from (ii) of Theorem 3.4 that
$\mathbb{T}_{\mathcal{N}}(\mathfrak{H}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\} \geq \mathbb{T}_{\mathcal{N}}(\mathbb{j})$, so that $\mathfrak{H} \in \varphi_{\mathbb{j}}$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.
Hence $\varphi_{\mathbb{j}}$ is a filter of $\mathcal{M}$.

Theorem 3.8 Let $\varphi_{\mathbb{j}} \in \mathcal{M}$ and let $\mathcal{N}$ be a neutrosophic set in $\mathcal{M}$. Then if $\varphi_{\mathbb{j}}$ is a filter of $\mathcal{M}$, then $\mathcal{N}$ confers the subsequent implication for all $x, \mathfrak{y} \in \mathcal{M}$
$\mathbb{T}_{\mathcal{N}}(\xi) \leq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{T}_{\mathcal{N}}(\xi)\} \Rightarrow \mathbb{T}_{\mathcal{N}}(\xi) \leq \mathbb{T}_{\mathcal{N}}(\mathfrak{H}), \mathbb{I}_{\mathcal{N}}(\xi) \leq \min\{\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{I}_{\mathcal{N}}(\xi)\} \Rightarrow \mathbb{I}_{\mathcal{N}}(\xi) \leq \mathbb{I}_{\mathcal{N}}(\mathfrak{H})$ and $\mathbb{F}_{\mathcal{N}}(\xi) \geq \max\{\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{F}_{\mathcal{N}}(\xi)\} \Rightarrow \mathbb{F}_{\mathcal{N}}(\xi) \geq \mathbb{F}_{\mathcal{N}}(\mathfrak{H})$.

Proof: (i) Let $\varphi_{\mathbb{j}}$ be a filter of $\mathcal{M}$.
Let $\xi, \mathfrak{H} \in \mathcal{M}$ be such that $\mathbb{T}_{\mathcal{N}}(\mathbb{j}) \leq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{T}_{\mathcal{N}}(\xi)\}$.
Then $\xi \rightharpoonup \mathfrak{H} \in \varphi_{\mathbb{j}}$ and $\xi \in \varphi_{\mathbb{j}}$.
From the proposition 2.3 (ii), we have $\mathfrak{H} \in \varphi_{\mathbb{j}}$ and so $\mathbb{T}_{\mathcal{N}}(\mathfrak{H}) \geq \mathbb{T}_{\mathcal{N}}(\mathbb{j})$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

Proposition 3.9 Let $\mathcal{N}$ be a neutrosophic filter of $\mathcal{M}$. Then the subsequent are equivalent for all $\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{M}$
(i) $\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z})), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$,
$\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min\{\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z})), \mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$ and
$\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \leq \max\{\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z})), \mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$

(ii) $\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}) \geq \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{H}))$,
$\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}) \geq \mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{H}))$ and
$\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}) \leq \mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{H}))$
(iii) $\mathbb{T}_{\mathcal{N}}(((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z})) \geq \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z}))$,

$\mathbb{I}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z})) \geq \mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z}))$and
$\mathbb{F}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z})) \leq \mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z}))$.

Proof. (i) ⇒ (ii)
Suppose that $\mathcal{N}$ satisfies (i).
Taking $\mathfrak{Z}$= $\mathfrak{H}$ and $\mathfrak{H}$= ξ in (i) and using Theorem 3.4, we have
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \xi)\}$
$= \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}(1)\}$
$= \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{H}))$ for all $\xi, \mathfrak{H} \in \mathcal{M}$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.
(ii) ⇒ (iii)
Suppose that $\mathcal{N}$ satisfies the condition (ii) and let $\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{M}$.
Since $\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z}) \leq \xi \rightharpoonup ((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z}))$, it follows that
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z}) = \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup ((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \mathfrak{Z}))$
$\geq \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup ((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \mathfrak{Z})))$
$= \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup ((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z})))$
$\geq \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z}))$ for all$\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{M}$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.
(iii)⇒ (i)
If $\mathcal{N}$ satisfies the condition (iii), then
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}) \geq \min\{\mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$
$\geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z})), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$ for all $\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{M}$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

Definition 3.10 A neutrosophic filter $\mathcal{N}$ of $\mathcal{M}$ is said to be a neutrosophic Boolean filter if it satisfies the following equality for all $\xi \in \mathcal{M}$,
$\mathbb{T}_{\mathcal{N}}(\xi \vee \xi^*) = \mathbb{T}_{\mathcal{N}}(1)$, $\mathbb{I}_{\mathcal{N}}(\xi \vee \xi^*) = \mathbb{I}_{\mathcal{N}}(1)$ and $\mathbb{F}_{\mathcal{N}}(\xi \wedge \xi^*) = \mathbb{F}_{\mathcal{N}}(1)$.

Proposition 3.11 Let $\mathcal{N}$ and $\mathcal{S}$ beneutrosophic filters of $\mathcal{M}$ such that $\mathcal{N} \leq \mathcal{S}$
and $\mathbb{T}_{\mathcal{N}}(1) = \mathbb{T}_{\mathcal{S}}(1)$, $\mathbb{I}_{\mathcal{N}}(1) = \mathbb{I}_{\mathcal{S}}(1)$, $\mathbb{F}_{\mathcal{N}}(1) = \mathbb{F}_{\mathcal{S}}(1)$. If $\mathcal{N}$ is neutrosophic Boolean filter, then so is $\mathcal{S}$.

Proof: The proof is straight forward.

Proposition 3.12 Every neutrosophic Boolean filter $\mathcal{N}$ of $\mathcal{M}$ satisfies the following inequality for all $\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{M}$,
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$,
$\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min\{\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{I}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$,
$\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \leq \max\{\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{F}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$. (3.1)

Proof: Using (v) of the Definition 2.1, we have
$\mathfrak{H} \rightharpoonup \mathfrak{Z} \leq (\mathfrak{Z}^* \rightharpoonup \mathfrak{H}) \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \leq (\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})) \rightharpoonup (\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}))$.
It follows from (ii) of Definition 3.1 that
$\mathbb{T}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z}) \leq \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})) \rightharpoonup (\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z})))$ so, from (ii) of the Theorem 3.4 that
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z})) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})) \rightharpoonup (\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z})))\} \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$.
Since
$\mathfrak{Z}^* \vee \mathfrak{Z} = ((\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \rightharpoonup \mathfrak{Z}) \vee ((\mathfrak{Z} \rightharpoonup \mathfrak{Z}^*) \rightharpoonup \mathfrak{Z}^*) \leq (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \rightharpoonup \mathfrak{Z}$,
we have $\mathbb{T}_{\mathcal{N}}((\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \rightharpoonup \mathfrak{Z}) \geq \mathbb{T}_{\mathcal{N}}(\mathfrak{Z}^* \vee \mathfrak{Z}) = \mathbb{T}_{\mathcal{N}}(1)$.
Since $\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \geq ((\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \rightharpoonup \mathfrak{Z}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z})$,it follows from (ii) of Definition 3.1 that
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z})) \leq \mathbb{T}_{\mathcal{N}}(((\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \rightharpoonup \mathfrak{Z}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z}))$.
Thus, $\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min\{\mathbb{T}_{\mathcal{N}}((\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \rightharpoonup \mathfrak{Z}), \mathbb{T}_{\mathcal{N}}(((\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}) \rightharpoonup \mathfrak{Z}) \rightharpoonup (\xi \rightharpoonup \mathfrak{Z}))\}$

$\geq \min \{\mathbb{T}_{\mathcal{N}}(1), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}))\}$
$= \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{Z}))$
$\geq \min \{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$.

Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

Proposition 3.13 If a neutrosophic filter $\mathcal{N}$ of $\mathcal{M}$ satisfies the following inequality
$\mathbb{T}_{\mathcal{N}}(\xi) \leq \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi))$, $\mathbb{I}_{\mathcal{N}}(\xi) \leq \mathbb{I}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi))$, $\mathbb{F}_{\mathcal{N}}(\xi) \geq \mathbb{F}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi))$ for all $\xi, \mathfrak{H} \in \mathcal{M}$, then it is neutrosophic Boolean. (3.2)

Proof: By (ii), (iv) and (v) of the definition 2.1, we have
$1 = \xi \rightharpoonup ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi) \leq ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi)^* \rightharpoonup \xi^*$
$\leq (\xi^* \rightharpoonup \xi) \rightharpoonup (((\xi^* \rightharpoonup \xi) \rightharpoonup \xi)^* \rightharpoonup \xi)$
$= ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi)^* \rightharpoonup ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi)$
$= (((\xi^* \rightharpoonup \xi) \rightharpoonup \xi) \rightharpoonup 0) \rightharpoonup ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi)$
It monitors from the definition 3.1, (2) and theorem 3.4 that
$\mathbb{T}_{\mathcal{N}}((\xi^* \rightharpoonup \xi) \rightharpoonup \xi) \geq \mathbb{T}_{\mathcal{N}}((((\xi^* \rightharpoonup \xi) \rightharpoonup \xi) \rightharpoonup 0) \rightharpoonup ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi)) = \mathbb{T}_{\mathcal{N}}(1)$.
By (vii) and (ix) of the definition 2.1, since
$(\xi^* \rightharpoonup \xi) \rightharpoonup \xi \leq ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi) \vee ((\xi^* \rightharpoonup \xi) \rightharpoonup \xi^*)$
$= (\xi^* \rightharpoonup \xi) \rightharpoonup (\xi \vee \xi^*)$
$= (1 \wedge (\xi^* \rightharpoonup \xi)) \rightharpoonup (\xi \vee \xi^*)$
$= ((\xi \rightharpoonup \xi) \wedge (\xi^* \rightharpoonup \xi)) \rightharpoonup (\xi \vee \xi^*)$
$= ((\xi \vee \xi^*) \rightharpoonup \xi) \rightharpoonup (\xi \vee \xi^*)$,
we get $\mathbb{T}_{\mathcal{N}}(1) = \mathbb{T}_{\mathcal{N}}((\xi^* \rightharpoonup \xi) \rightharpoonup \xi)$
$\leq \mathbb{T}_{\mathcal{N}}(((\xi \vee \xi^*) \rightharpoonup \xi) \rightharpoonup (\xi \vee \xi^*))$
$\leq \mathbb{T}_{\mathcal{N}}(\xi \vee \xi^*)$, and so $\mathbb{T}_{\mathcal{N}}(\xi \vee \xi^*) = \mathbb{T}_{\mathcal{N}}(1)$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.
Therefore, $\mathcal{N}$ is neutrosophic Boolean.

Proposition 3.14 Let $\mathcal{N}$ be a neutrosophic filter of $\mathcal{M}$ that satisfies the condition (1). Then $\mathcal{N}$ confers the condition (2).

Proof: Since $(\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi \leq \xi^* \rightharpoonup \xi$ and $\mathbb{T}_{\mathcal{N}}$ is order-preserving, it follows that
$\mathbb{T}_{\mathcal{N}}(\xi) = \mathbb{T}_{\mathcal{N}}(1 \rightharpoonup \xi)$
$\geq \min \{\mathbb{T}_{\mathcal{N}}(1 \rightharpoonup (\xi^* \rightharpoonup \xi^*)), \mathbb{T}_{\mathcal{N}}(\xi^* \rightharpoonup \xi)\}$
$\geq \min \{\mathbb{T}_{\mathcal{N}}(1), \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi)\}$
$= \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi)$.
Hence $\mathbb{T}_{\mathcal{N}}$ satisfies the condition (2).
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

Theorem 3.15 Let $\mathcal{N}$ be a neutrosophic filter of $\mathcal{M}$. Then the sub sequent claims are equivalent for all $\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{M}$
(i) $\mathcal{N}$ is neutrosophic Boolean.
(ii) $\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min \{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{T}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$,
$\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min \{\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{I}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$ and
$\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \leq \max \{\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{Z}^* \rightharpoonup \mathfrak{H})), \mathbb{F}_{\mathcal{N}}(\mathfrak{H} \rightharpoonup \mathfrak{Z})\}$.
(iii) $\mathbb{T}_{\mathcal{N}}(\xi) \geq \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi)$, $\mathbb{I}_{\mathcal{N}}(\xi) \geq \mathbb{I}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi))$ and $\mathbb{F}_{\mathcal{N}}(\xi) \leq \mathbb{F}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup \xi))$.

Proof: From the propositions 3.13 and 3.14, **t**he proof is straight forward.

Proposition 3.16 If a neutrosophic filter N of $\mathcal{M}$ satisfies (3.2), then it satisfies the following inequality for all $\xi, \mathfrak{H}, \mathfrak{Z} \in \mathcal{M}$
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{Z}) \geq \min \{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{Z})), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$,

$\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{z}) \geq \min\{\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z})), \mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$ and
$\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{z}) \geq \min\{\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z})), \mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$.

Proof: Since $\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z}) = \mathfrak{H} \rightharpoonup (\xi \rightharpoonup \mathfrak{z}) \leq (\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z}))$,
it follows from the note that
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z})) \leq \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z})))$ so from (ii) of the theorem 3.3 that
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z})) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z})))\}$
$\geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z}))\}$.
Since $\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z}) \leq \xi \rightharpoonup (((\xi \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) = ((\xi \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) \rightharpoonup (\xi \rightharpoonup \mathfrak{z})$,
we have $\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{z}) \geq \mathbb{T}_{\mathcal{N}}(((\xi \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) \rightharpoonup (\xi \rightharpoonup \mathfrak{z})) \rightharpoonup \mathfrak{z}$
$\geq \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z}))$
$\geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z}))\}$ by using the note and (3.1).
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

Proposition 3.17 Every neutrosophic Boolean filter $\mathcal{N}$ of $\mathcal{M}$ satisfies the following inequality $\xi, \mathfrak{H}, \mathfrak{z} \in \mathcal{M}$,
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{z}) \geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z})), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$,
$\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{z}) \geq \min\{\mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z})), \mathbb{I}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$
and $\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{z}) \leq \max\{\mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z})), \mathbb{F}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H})\}$.

Proof: Since $\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z}) = \mathfrak{H} \rightharpoonup (\xi \rightharpoonup \mathfrak{z}) \leq (\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z}))$ and $\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z}) \leq \xi \rightharpoonup (((\xi \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) = ((\xi \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) \rightharpoonup (\xi \rightharpoonup \mathfrak{z})$, it follows from the note and (ii) of the theorem 3.4, and 3.15 (iii) that
$\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{z}) \geq \mathbb{T}_{\mathcal{N}}(((\xi \rightharpoonup \mathfrak{z}) \rightharpoonup \mathfrak{z}) \rightharpoonup (\xi \rightharpoonup \mathfrak{z}))$
$\geq \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z}))$
$\geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{T}_{\mathcal{N}}((\xi \rightharpoonup \mathfrak{H}) \rightharpoonup (\xi \rightharpoonup (\xi \rightharpoonup \mathfrak{z})))\}$
$\geq \min\{\mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup \mathfrak{H}), \mathbb{T}_{\mathcal{N}}(\xi \rightharpoonup (\mathfrak{H} \rightharpoonup \mathfrak{z}))\}$.
Similarly, we can prove for $\mathbb{I}_{\mathcal{N}}, \mathbb{F}_{\mathcal{N}}$.

CONCLUSIONS

Thus, we have conferred the notions of neutrosophic filter and Boolean filter of MTL algebras and examined several of their characteristics with necessary illustrations. Moreover the necessary and sufficient circumstances for a filter to be a neutrosophic filter are discussed. Further, the equivalent conditions for a neutrosophic Boolean filter are proved.

ABSTRACT

Pulmonary Function Tests (PFTs) – spirometry helps in evaluation of the mechanical function of the lungs. They are based on research norms of gender, height and age, where predicted values compared with actual values. Normal spirometric values vary considerably according to ethnicity and the absence of spirometric reference values in a specific population result in the misinterpretation of spirometric results. There is constant change in work pattern and environment due to which normative values of spirometer vary time by time. To identify Spirometric reference values for adult population of Gujarat, India. A cross-sectional study was undertaken enrolling healthy male subjects, 20–50 years, from Gujarat. Spirometry measurements were carried out as per ATS/ERS guidelines using RMS Helios spirometer. Statistical analysis done by applying independent sample t-tests and ANOVA. Total 350 subjects were included in the study. FVC, FEV1 and PEFR values were evaluated and compared with predicted equations of other states. In multivariate linear regression models, age and height were major predictor variables for all spirometry parameters.

Keywords: Spirometric, PFT,prediction equation, FVC, FEV1, PEFR

INTRODUCTION

John Hutchinson is commonly credited with inventing spirometry in the middle of the 19th century and coining many spirometry terms such as vital capacity, that are still used today. Pulmonary Function Tests (PFTs) help in evaluation of the mechanical function of the lungs. They are based on research norms – gender, height and age. Predicted values → compare with actual values → Result → Normal / obstructive / restrictive components. By interpreting a patient`s pulmonary function test – diagnosis of pulmonary disease, dysfunction and improvement with treatment will be evaluated. Lung function tests (LFTs) are of great value in the diagnosis, therapeutic management and prognosis of a broad range of respiratory diseases. It is one of the major objective tools in cardiopulmonary research area as a outcome measure and it has high validity and reliability. Values obtained during lung function tests are usually related to predicted or theoretical values. These predicted values are derived from the reference equations established from the values of the normal or "healthy" population. Normal spirometric values vary considerably according to ethnicity and the absence of spirometric reference values in a certain population thereby resulting in the misinterpretation of spirometric results [1].

Spirometric reference values are well known in several ethnic groups but the normative spirometric values of certain population have been less studied. Those that do exist were performed over 20 years ago or do not span all age groups. Dr Ross Kory convinced the United States test inductees who provided a large convenience sample of supposedly healthy young adults. He published his findings in 1961 in the form of a nomogram that allowed users to connect height and age scales to read predicted values for vital capacity, along with FEV1 and maximum voluntary ventilation [2].In1971, James Morris and co-workers published predicted values in the form of a nomogram based on a large population of non-smokers in Oregon to provide a more representative sample of "normal" lung function. Although many studies of predicted values were published in the last half of the 20th century, most were limited in their generalizability because of age, sex, or ethnicity of the population measured. Standards for equipment and testing protocols promulgated by the American Thoracic Society (ATS) and European Respiratory Society (ERS) have been in place for more than 30 years and have resulted in more reproducible data within and between laboratories [3].The use of inappropriate reference equations and misinterpretation, even when potentially appropriate equations are used, can lead to serious errors in both under and over diagnosis, with its associated burden in terms of financial and human costs. There are different PFT software available in which difference reference prediction equations are available. Most of equations are from western countries. Very few Asian equations are available and from India only two equations are there. It is high time to redevelop the prediction equation of PFT for Asian and Indian population. Dearth of literature available related to this and no research from west India is available. The aim of our study is to establish normative spirometric equations from a representative population of adults from Gujarat.

METHODOLOGY

Any healthy adult was volunteers for the study. It was a Cross-sectional (Observational study). Data was collected from different regions of Gujarat such as Bhavnagar, Vadodara, Ahmedabad. Total number of subjects was 350.
Inclusion criteria: Subjects, irrespective of sex, of the age group 20- 50years, Healthy subjects, Willing to participate
Exclusion criteria: Could not perform spirometry test as per ATS guidelines ,Had a history of asthma, chronic bronchitis, chronic cough, Exposure to any toxic chemicals, Surgery involving the chest wall or spine, Ongoing respiratory symptoms ,Had smoking habit of at least 1cigarette/day for more than a year, H/O taking any medicine which may interfere with lung function, Past H/O covid with hospitalization

PROCEDURE

Experimental protocol was fully explained to all the subjects and written consent was obtained. Detailed medical history, family history, Covid history and personal history with special reference to the history of tobacco and smoking at present and past were recorded. Demographic related measures such as body height (cm), body weight

(kg), and age (yrs) of the volunteers were taken before the spirometry test. The volunteers were instructed not to take a heavy meal at least two hours prior, not to take drugs/drinks containing caffeine, not to smoke, and not to undertake heavy physical activity before performing spirometry. The spirometry was conducted using a portable spirometer (RMS Halios Company). Pulmonary function test –Spirometry was performed according to standard ATS guidelines [4]. (Figure 1,2). The apparatus was calibrated daily before the test and operated within the same range of ambient temperature. The RMS Halios spirometer – PFT instrument was utilized for performing the spirometry test. The calibration certificate and publication issues were considered for instrument performance validation. The spirometry parameters included (i) forced vital capacity (FVC), (ii) forced expiratory volume in one second (FEV_1), and (iii) peak expiratory flow (PEF). The spirometry test of volunteers was performed in the sitting position using a nose clip. The tests were repeated a minimum of three times after adequate rest and no more than eight times as per the ATS guidelines, and the best results were taken for subsequent analysis. The observed spirometry parameters were compared with other peer-reviewed publications on the Indian population and with previous data.

Data Analysis

The linear regression analysis was performed for FVC, FEV_1, and PEF for males and females separately, with body height and age as the independent variables. The fitness of regression was interpreted based on standard error of estimation, coefficient of determination, and p-value. The predicted values from the developed model were compared with the corresponding observed parameters by independent sample t-test for both male and female volunteers. Further, the developed regression models for spirometry parameters were compared with similar existing models for different regions of India.

RESULT

Total 360 subjects were included, out of 10 were dropouts. Out that 202 males and 148 females.

PEFR = 12.880 +0.107*FEV1-0.015*FVC -0.011*Age -0.022*Height-0.013*Weight

DISCUSSION

In the present study, normative spirometric values were established in an adult population sample (N=350) from Gujarat. The mean values obtained were:
Forced Vital Capacity (FVC): 3.74 ± 2.38 L
Forced Expiratory Volume in 1 second (FEV1): 3.60 ± 2.84 L
Peak Expiratory Flow Rate (PEFR): 8.15 ± 1.53 L/sec

These findings provide baseline reference values for healthy adults in Gujarat, highlighting inter-individual variability in lung function performance. The relatively wide standard deviations in FVC and FEV1 suggest heterogeneity in anthropometric and environmental factors influencing lung function in this region.The observed variability, particularly the wide standard deviations for FVC and FEV1, underscores the influence of multiple factors such as body size, age, sex distribution, and environmental exposure. Lung function is known to scale with height and body surface area, and Gujarat's population is heterogeneous in terms of dietary habits, occupational exposures (industrial workers, agricultural laborers, office employees), and lifestyle patterns, all of which contribute to differences in pulmonary function. Importantly, these results emphasize that the use of Western or Caucasian reference standards for spirometry is inappropriate in the Indian context, as highlighted by previous researchers [5,8]. Instead, state- or region-specific equations improve diagnostic accuracy in both clinical and epidemiological settings.

Comparison with Other States of India
When compared with studies from other Indian states, the spirometric values from Gujarat were found to be slightly lower in terms of FVC and FEV1, but comparable in PEFR. For instance, North Indian studies have consistently reported FVC values in the range of 4.0–4.2 L and FEV1 between 3.4–3.8 L [5,6]. South Indian adults, particularly in the study by Vijayan *et al*., demonstrated FVC values around 3.9–4.1 L and PEFR between 8.5–9.0 L/sec [7]. These values are somewhat higher than the Gujarat averages.
Such inter-state differences may be explained by:
Anthropometry: Northern Indian populations are generally taller and heavier, positively correlating with lung volumes. This relationship has been extensively documented in lung physiology research.

Ethnicity and genetics: India's diverse genetic pool contributes to measurable differences in respiratory performance, with distinct trends observed across geographic and ethnic groups.

Environmental exposures: Gujarat is home to major industrial zones. Chronic exposure to particulate matter, industrial dust, and air pollutants may result in subtle reductions in lung function, even among healthy non-smokers. In contrast, rural populations from Kerala or Tamil Nadu may demonstrate relatively higher values due to cleaner air and greater physical activity.

Socio-economic and nutritional status: Nutrition during early life has long-term implications for lung growth and development, and disparities across states could contribute to differences observed in adult spirometric indices.

Thus, the Gujarat values align with Indian trends but remain slightly lower than northern and southern references. This highlights the need for localized prediction equations rather than relying solely on pan-Indian or international standards.The current Gujarat data are broadly consistent with earlier Indian studies from the late 20th century. For example, Jindal *et al*. [6] and Rajkumar and Chhabra reported FVC values in the range of 3.5–3.9 L and FEV1 between 3.2–3.6 L, which overlap with the present findings. This consistency across decades suggests that baseline lung volumes in Indian adults have remained relatively stable despite demographic and lifestyle changes. However, some trends are noteworthy. Older South Indian studies, such as those by Swaminathan *et al*., reported PEFR values around 7.0–7.5 L/sec, which are lower than the Gujarat average of 8.15 L/sec. This may reflect improved nutrition,

physical fitness, and healthcare access over time. Improvements in medical awareness and reduction in undiagnosed subclinical respiratory illness could also contribute. It should be noted that methodological differences complicate direct comparisons. Variations in spirometer type, calibration standards, sampling methods, and inclusion/exclusion criteria may partly account for discrepancies. The present study utilized modern calibrated equipment and stringent inclusion of only non-smoking, healthy adults, which may yield slightly higher flow-related indices compared to earlier work.

STRENGTHS AND LIMITATIONS

A major strength of the present study is the relatively large sample size (N=350) and the use of standardized protocols for spirometry, which improves the reliability of the values obtained. Additionally, this is one of the first systematic attempts to document normative values specifically for Gujarat, filling an important regional gap. However, limitations must be acknowledged. The study is cross-sectional, and longitudinal tracking of lung function was not performed. The age range was limited (20–50 years), restricting extrapolation to older adults and children. Furthermore, although occupational and environmental exposures were minimized by excluding individuals with known risk factors, residual confounding cannot be ruled out.

CONCLUSION

This study provides normative spirometric values for adults in Gujarat, showing FVC of 3.74 L, FEV1 of 3.60 L, and PEFR of 8.15 L/sec. These values are slightly lower than those reported from North and South Indian populations but consistent with earlier Indian data. Regional differences highlight the importance of developing state- and ethnicity-specific reference equations. The findings have significant clinical, research, and public health relevance, particularly for accurate diagnosis, occupational health assessments, and the development of national lung function standards.

Clinical and Public Health Implications

The establishment of Gujarat-specific normative spirometry values has several implications:

Improved diagnostic accuracy: Clinicians frequently rely on reference values to identify obstructive (asthma, COPD) or restrictive (interstitial lung disease) patterns. Using non-representative reference equations may result in over- or under-diagnosis. For example, applying Caucasian standards typically overestimates predicted FVC, which could incorrectly label healthy Indian individuals as having restrictive impairment. Gujarat-specific values can minimize such errors.

Policy and public health surveillance: Gujarat is an industrialized state with significant urbanization. The availability of local reference values enhances monitoring of respiratory health among workers exposed to pollutants, dust, and chemicals, enabling better preventive health strategies.

Research and epidemiology: These findings add to the national database of spirometric values and strengthen the case for creating a large, multicentric Indian spirometry reference study. Such pooled data can be used to develop regression equations tailored to India's diverse sub-populations, similar to the NHANES study in the United States.

Occupational health: The values can serve as baselines in periodic health assessments for industrial workers, allowing identification of early declines in lung function.

ABSTRACT

Siddha turmeric cauterization therapy (*Manjal Suttigai*) is a classical para-surgical procedure practiced in Siddha medicine for alleviating pain and improving mobility in musculoskeletal disorders. It combines thermal stimulation with the pharmacological properties of turmeric (*Curcuma longa*), known for its anti-inflammatory and analgesic actions. To evaluate the clinical efficacy and outcomes of Siddha turmeric cauterization therapy in a series of patients with various musculoskeletal disorders through a retrospective observational study. A retrospective observational case series was conducted among 43 patients with chronic musculoskeletal pain unresponsive to conventional therapy. Pain intensity, range of motion (ROM), and functional improvement were assessed before and after treatment. All patients demonstrated a significant reduction in pain (mean VAS decrease by 4–6 points) and improvement in ROM. No adverse events were reported during or after therapy. Siddha turmeric cauterization therapy appears to be an effective, safe, and low-cost adjunct in managing chronic musculoskeletal disorders. Further randomized controlled trials are warranted.

Keywords: Siddha external therapy, Turmeric Cautery, Musculoskeletal Disorders.

INTRODUCTION

Musculoskeletal disorders such as osteoarthritis, frozen shoulder, lumbar and cervical spondylosis, and chronic tendinopathies are among the leading causes of pain and disability worldwide. In Siddha medicine, these disorders are primarily attributed to Vatha, kaba derangement and Azhal involvement. "Manjal Suttigai" (turmeric cautery therapy) is a traditional Siddha para-surgical intervention involving the application of mildly heated turmeric sticks to the affected sites or specific Varmam points. The thermal effect enhances local circulation and reduces muscle stiffness, while *Curcuma longa* provides potent anti-inflammatory benefits through curcumin, which inhibits COX-2 and NF-κB pathways. This study aims to observe the clinical efficacy and functional improvement following turmeric cauterization therapy among patients with chronic musculoskeletal conditions.

MATERIALS AND METHODS

Study Design
Retrospective observational case series conducted at a Siddha wing outpatient, Government primary health centre, Poovanthi, Sivagangai district.

Patient Selection
Inclusion criteria
- Age 30–65 years
- Diagnosed musculoskeletal disorder (frozen shoulder, knee osteoarthritis, lumbar spondylosis, Cervical spondylosis, Sciatica, Calcaneal spur, De Quervain's tenosynovitis)
- Pain duration > 3 months

Exclusion criteria
- Acute trauma or fracture
- Pregnant ladies
- Uncontrolled diabetes mellitus, Hypertension
- Heart ailment
- Peripheral neuropathy or skin ulcers

Sample Size
43 patients (31 female, 12 male)

Diagnosis and number of patients (Table: 1)

Timeline
All patients were observed from baseline to post-therapy evaluation, with follow-up after 6–12 days depending on the number of sessions (one or two).

Diagnostic Assessment
Diagnosis was established based on Siddha clinical assessment, supported by physical examination. Pain intensity was assessed using the Visual Analogue Scale (VAS), and joint function was measured through Range of Motion (ROM) and patient-reported daily activity performance.

Therapeutic Intervention
Preparation: Dried turmeric sticks heated over mild charcoal until surface temperature was tolerable for quick application
Application: 1–2 seconds the heated turmeric was applied at specific Varmam points near the affected site.

Frequency: Depends upon severity, one or two session with interval of six days
Post-care: Cooling with Aloe vera , medicated oil (Kundhiriga thylam) and gentle ROM exercises.
Internal Medicines: Vatha-pacifying Siddha medicines (Tab.Sangu parpam, Tab.Amukkara chooranam) were prescribed.

Follow-up and Outcome Measures

- Pain: Visual Analog Scale (VAS, 0–10)
- Range of Motion
- Function: Patient-reported improvement in daily activities

RESULTS

All 43 patients demonstrated improvement in pain and movement. The VAS decreased by 4–6 points, with marked functional gains. Representative tables for each condition (sciatica, frozen shoulder, spondylosis, osteoarthritis, etc.) show consistent improvement from baseline (BT) to after treatment (AT).

***BT- Before treatment *AT –After treatment**

Manjal Suttigai (Turmeric cautery therapy) for different Musculoskeletal disorders. (Table: 9)

DISCUSSION

This case series highlights that Manjal Suttigai provides notable pain relief and enhanced mobility across diverse chronic musculoskeletal disorders. The combination of thermal stimulation and curcumin's anti-inflammatory action contributes to improved circulation and range of movement, reduced muscular tension, and modulation of pain via the gate control mechanism. The absence of adverse events indicates the therapy is safe when performed by trained practitioners. However, as a non-controlled case series, placebo effects cannot be ruled out. The small sample size and lack of long-term follow-up are limitations.

Patient Perspective: Patients reported high satisfaction, noting that turmeric cautery provided rapid relief and improved daily functioning such as walking, bending, or combing hair. Many expressed willingness to recommend the therapy to others with similar ailments.

Informed Consent: Written informed consent was obtained from all participants before initiation of therapy and publication of anonymized data

CONCLUSION

Siddha turmeric cauterization therapy (Manjal Suttigai) is a safe, simple, and cost-effective external therapy showing promising results in pain reduction and improving quality of life, functional recovery for various musculoskeletal

disorders. Its integration into Siddha outpatient practice can enhance patient outcomes when administered by trained professionals. Further randomized controlled trials are warranted.

ACKNOWLEDGEMENT

The authors express deep gratitude to the Commissioner, Department of Indian Medicine and Homoeopathy, Government of Tamil Nadu, for institutional support. Special thanks to Dr. Suguna, Block Medical Officer, for encouragement, and to Mrs. Suguna (Therapeutic Assistant-MSD scheme) and Mr.Ramalingam (Pharmacist) Mrs. Vanisha (Pharmacist) for technical support. Grateful thanks to Dr. G. Pari Assistant Siddha Medical Officer, Government Primary Health Centre, Thiruvegampet, Sivagangai dist for support and encourage. Sincere appreciation to all participating patients for their cooperation.

FINANCIAL SUPPORT AND SPONSORSHIP
Not applicable

CONFLICT OF INTEREST
None declared.

ABSTRACT

A graph $G = (V, E)$ with p vertices and q edges is said to be a Heronian Mean graph if it is possible to label the vertices $x \epsilon V$ with distinct lables $f(x)$ from $1,2,\dots,q+1$ in such a way that when each edge $e = uv$ is labeled with,
$f(e = uv) = \left\lceil \frac{f(u)+\sqrt{f(u)f(v)}+f(v)}{3} \right\rceil (OR) \left\lfloor \frac{f(u)+\sqrt{f(u)f(v)}+f(v)}{3} \right\rfloor$ then the resulting edge labels are distinct. In this case f is called a Heronian Mean labeling of G. In this paper we prove that triangular graphs such as $S(T_n) \odot K_1$, $S(T_n) \odot \overline{K_2}$, $S(A(T_n))$, $S\big(A(T_n)\big) \odot K_1$, $S(A(T_n)) \odot \overline{K_2}$ are all heronian mean graphs.

Keywords: Graph, Heronian Mean labeling, Triangular Snake, Corona Product.

INTRODUCTION

Let $G = (V, E)$ be a (p, q) graph with $p = |V(G)|$ vertices and $q = |E(G)|$ edges, where $V(G)$ and $E(G)$ respectively denote the vertex set and edge set of the graph G. The Graphs considered here are simple, finite and undirected graphs without loops or parallel edges. "For a detailed survey of graph labeling, we refer to J. A. Gallian [1]. For all other standard terminology and notations we follow Harary [2]. The concept of Mean labeling has been introduced by S. Somasundaram and R. Ponraj in 2004. As a Variation of Mean labeling Heronian Mean Labeling has been introduced by S. S. Sandhya, E. Ebin Raja Merly and S. D. Deepa in 2016 and they proved the Heronian Mean Labeling of some subdivision graphs and many families of graphs [4,5,6]. In this paper, we examine about the Heronian Mean labeling of subdivision of Triangular Snake graph, Alternate Triangular Snake Graphs and their

Corona product. Some new examples are presented and verified. We now give the definitions which are necessary for the present investigation.

Definition 1.1
A graph $G = (V, E)$ with p vertices and q edges is said to be a Heronian Mean graph if it is possible to label the vertices$x \in V$with distinctlables $f(x)$from
1,2, … , $q + 1$ in such a way that when each edge $e = uv$ is labeled with,
$f(e = uv) = \left\lceil \frac{f(u) + \sqrt{f(u)f(v)} + f(v)}{3} \right\rceil (OR) \left\lfloor \frac{f(u) + \sqrt{f(u)f(v)} + f(v)}{3} \right\rfloor$
then the resulting edge labels are distinct. In this case f is called a Heronian Mean labeling of G.

Definition 1.2
The Corona of two graphs G_1 and G_2 is the graph $G = G_1 \odot G_2$ formed by taking one copy of G_1 and $|V(G_1)|$ copies of G_2 where the i^{th} vertex of G_1 is adjacent to every vertex in the i^{th} copy of G_2.

Definition 1.3
If $e = uv$ is an edge of G and w is not a vertex of G then e is said to be subdivided when it is replaced by the edges uw and wv. The graph obtained by subdividing each edge of a graph G is called the subdivision graph of G and is denoted by S(G).

Definition 1.4
A PathP_n is a walk in which all the vertices are distinct.

Definition 1.5
A Triangular Snake $T_n$is obtained from a path $u_1, u_2, u_3, .., u_n$ by joining u_i and u_{i+1} to a new vertex v_i for $1 \leq i \leq n - 1$. That is every edge of a path is replaced by a cycle C_3.

Definition 1.6
An Alternate Triangular Snake $A(T_n)$ is obtained from a path $u_1, u_2, u_3, .., u_n$ by joining u_i and u_{i+1} (alternatively) to a new vertex v_i for $1 \leq i \leq n - 1$. That is every alternate edge of a path is replaced by a cycle C_3.

MAIN RESULTS

In this paper, we investigate the Heronian Mean labeling subdivision graphs of some Snake Related Graphs.

Theorem 2.1
$S(T_n) \odot K_1$is a Heronian mean graph.

Proof
Let T_n be a Triangular Snake obtained from a path $u_1, u_2, u_3, .., u_n$ by joining u_i and u_{i+1} to a new vertex v_i for $1 \leq i \leq n - 1$.
Let $S(T_n)$ be the graph obtained by subdividing all the edges of T_n.
Let $G = S(T_n) \odot K_1$
Let w_i, s_i, t_i be the vertices obtained by subdividing the edges $u_i u_{i+1}, u_i v_i$and $v_i u_{i+1}$ respectively ($1 \leq i \leq n - 1$). Let$u_i', v_i', w_i', s_i', t_i'$be the pendant vertices attached at u_i, v_i, w_i, s_i, t_i respectively($1 \leq i \leq n - 1$) and let u_n' be the pendant vertex attached at u_n.
Let $V(G) = \{u_i, u_i' / (1 \leq i \leq n)\} \cup \{w_i, w_i', v_i, v_i', s_i, s_i', t_i, t_i' / (1 \leq i \leq n - 1)\}$
$E(G) = \{u_i u_i' / (1 \leq i \leq n) \cup \{u_i w_i, w_i u_{i+1}, u_i s_i, s_i v_i / (1 \leq i \leq n - 1)\} \cup \{v_i t_i, t_i u_{i+1}, s_i s_i', v_i v_i', t_i t_i', w_i w_i' / 1 \leq i \leq n - 1$

Define a function $f: V(G) \longrightarrow \{1,2,\dots,11n-9\}$
$f(u_i) = 11i-10$ for $1 \le i \le n$
$f(u_i') = 11i-9$ for $1 \le i \le n$
$f(w_i) = 11i-1$ for $1 \le i \le n-1$
$f(w_i') = 11i$ for $1 \le i \le n-1$
$f(v_i) = 11i-5$ for $1 \le i \le n-1$
$f(v_i') = 11i-4$ for $1 \le i \le n-1$
$f(s_i) = 11i-8$ for $1 \le i \le n-1$
$f(s_i') = 11i-7$ for $1 \le i \le n-1$
$f(t_i) = 11i-3$ for $1 \le i \le n-1$
$f(t_i') = 11i-2$ for $1 \le i \le n-1$
Then the edge labels are distinct.
Hence f is a heronian mean labeling of G.

Theorem 2.2
$S(T_n) \odot \overline{K_2}$is a heronian mean graph.

Proof
Let T_n be a Triangular Snake obtained from a path $u_1,u_2,u_3,\dots,u_n$ by joining u_i and u_{i+1} to a new vertex v_i for $1 \le i \le n-1$.
Let $S(T_n)$ be the graph obtained by subdividing all the edges of T_n.
Let $G = S(T_n) \odot \overline{K_2}$
Let w_i, s_i, t_i be the vertices obtained by subdividing the edges u_iu_{i+1}, u_iv_i and v_iu_{i+1} respectively ($1 \le i \le n-1$).
Let $u_i', v_i', w_i', s_i', t_i', u_i'', v_i'', w_i'', s_i'', t_i''$be the pendant vertices attached at u_i, v_i, w_i, s_i, t_i respectively ($1 \le i \le n-1$) and let u_n', u_n'' be the pendant vertex attached at u_n.
Let $V(G) = \{u_i, u_i' u_i''/(1 \le i \le n)\} \cup \{w_i, v_i, s_i, t_i/(1 \le i \le n-1)\}$
$\cup \{v_i', w_i', s_i', t_i'/(1 \le i \le n-1)\} \cup \{v_i'', w_i'', s_i'', t_i''/(1 \le i \le n-1)\}$
$E(G) = \{u_iu_i', u_iu_i''/(1 \le i \le n) \cup \{s_is_i', v_iv_i', t_it_i', w_iw_i'/(1 \le i \le n-1)\}$
$\cup \{s_is_i'', v_iv_i'', t_it_i'', w_iw_i''/(1 \le i \le n-1)$
$\cup \{u_iw_i, w_iu_{i+1}, u_is_i, s_iv_i, v_it_i, t_iu_{i+1}/(1 \le i \le n-1)$
Define a function $f: V(G) \longrightarrow \{1,2,\dots,16n-13\}$
$f(u_i) = 16i-14$ for $1 \le i \le n$
$f(u_i') = 16i-15$ for $1 \le i \le n$
$f(u_i'') = 16i-13$ for $1 \le i \le n$
$f(w_i) = 16i-1$ for $1 \le i \le n-1$
$f(w_i') = 16i-2$ for $1 \le i \le n-1$
$f(w_i'') = 16i$ for $1 \le i \le n-1$
$f(v_i) = 16i-7$ for $1 \le i \le n-1$
$f(v_i') = 16i-8$ for $1 \le i \le n-1$
$f(v_i'') = 16i-6$ for $1 \le i \le n-1$
$f(s_i) = 16i-11$ for $1 \le i \le n-1$
$f(s_i') = 16i-12$ for $1 \le i \le n-1$
$f(s_i'') = 16i-10$ for $1 \le i \le n-1$
$f(t_i) = 16i-4$ for $1 \le i \le n-1$
$f(t_i') = 16i-5$ for $1 \le i \le n-1$
$f(t_i'') = 16i-3$ for $1 \le i \le n-1$
Then the edge labels are distinct.
Hence f is a heronian mean labeling of G.

Theorem 2.3
$S(A(T_n))$is a heronian mean graph.

Proof
Let $G = S(A(T_n))$
Let $S(A(T_n))$ be the subdivision graph of alternate triangular snake. Here we consider two cases are arises.

Case (i)
If the alternate triangular snake $S(A(T_n))$ starts from u_i with degree of $u_1 = 2$. Then we need to consider two subcases.

Sub case (i) a): If n is even.
Let $V(G) = \left\{u_1u_2u_3 \dots u_n\,, v_1v_2v_3 \dots v_{n-1},\ \alpha_i, \beta_i, \gamma_i / (1 \le i \le \frac{n}{2})\right\}$
Let $E(G) = \{u_iv_i\,/\,1 \le\ i \le n-1\} \cup v_iu_{i+1}\,/\,1 \le\ i \le n-1\} \cup$
$\{u_{2i-1}\alpha_i\,, \alpha_i\gamma_i, \gamma_i\beta_i, u_{2i}\beta_i / \ 1 \le\ i \le \frac{n}{2}\}$
Define a function $f: V(G) \longrightarrow \{1,2, \dots, 4n-1\}$
$f(u_i) = 4i-3$ for $1 \le i \le n-1$ if i is odd.
$f(u_i) = 4i-1$ for $2 \le i \le n$ if i is even.
$f(v_i) = 4i$ for $1 \le i \le n-1$
$f(\alpha_i) = 8i-6$ for $1 \le i \le \frac{n}{2}$
$f(\beta_i) = 8i-3$ for $1 \le i \le \frac{n}{2}$
$f(\gamma_i) = 8i-5$ for $1 \le i \le \frac{n}{2}$
Then the resulting edge labels are distinct.
In this sub case, f is a heronian mean labeling of G.

Sub case (i)(b) : If n is odd,
Let $V(G) = \left\{u_1u_2u_3 \dots u_n\,, v_1v_2v_3 \dots v_{n-1},\ \alpha_i, \beta_i, \gamma_i / (1 \le i \le \frac{n-1}{2})\right\}$
Let $E(G) = \{u_iv_i\,/\,1 \le\ i \le n-1\} \cup v_iu_{i+1}\,/\,1 \le\ i \le n-1\}$
$\cup \{u_{2i-1}\alpha_i\,, \alpha_i\gamma_i, \gamma_i\beta_i, u_{2i}\beta_i / \ 1 \le\ i \le \frac{n-1}{2}\}$
Define a function $f: V(G) \longrightarrow \{1,2, \dots, 4n-3\}$ by,
$f(u_i) = 4i-3$ for $1 \le i \le n$ if i is odd.
$f(u_i) = 4i-1$ for $2 \le i \le n-1$ if i is even.
$f(v_i) = 4i$ for $1 \le i \le n-1$
$f(\alpha_i) = 8i-6$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i) = 8i-3$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i) = 8i-5$ for $1 \le i \le \frac{n-1}{2}$
Then the resulting edge labels are distinct.
In this sub case, f is a heronian mean labeling of G.

Case (ii)
If the alternate triangular snake $S(A(T_n))$ starts from $u_2$with degree of $u_1 = 1$ then we need to consider two subcases.

Sub case (i) a): If n is even.
Let $V(G) = \left\{u_1u_2u_3 \dots u_n\,, v_1v_2v_3 \dots v_{n-1},\ \alpha_i, \beta_i, \gamma_i / (1 \le i \le \frac{n}{2} - 1)\right\}$
Let $E(G) = \{u_iv_i\,/\,1 \le\ i \le n-1\} \cup \{v_iu_{i+1}\,/\,1 \le\ i \le n-1\}$
$\cup \{u_{2i}\alpha_i\,, \alpha_i\gamma_i, \gamma_i\beta_i, u_{2i+1}\beta_i / \ 1 \le\ i \le \frac{n-2}{2}\}$

Define a function $f: V(G) \longrightarrow \{1,2,\dots,4n-5\}$ by,

$f(u_i) = 4i+4-7$ for $1 \le i \le n-1$ if i is odd.

$f(u_i) = 4i+4-9$ for $2 \le i \le n$ if i is even

$f(v_i) = 4i+4-6$ for $1 \le i \le n-1$

$f(\alpha_i) = 8i-4$ for $1 \le i \le \frac{n-2}{2}$

$f(\beta_i) = 8i$ for $1 \le i \le \frac{n-2}{2}$

$f(\gamma_i) = 8i-3$ for $1 \le i \le \frac{n-2}{2}$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

Sub case (ii) b): If n is odd.

Let $V(G) = \left\{u_1u_2u_3 \dots u_n, v_1v_2v_3 \dots v_{n-1}, \ \alpha_i,\beta_i,\gamma_i/(1 \le i \le \frac{n-1}{2})\right\}$

Let $E(G) = \{u_iv_i / 1 \le i \le n-1\} \cup \{v_iu_{i+1} / 1 \le i \le n-1\}$

$\cup \{u_{2i}\alpha_i, \alpha_i\gamma_i, \gamma_i\beta_i, u_{2i+1}\beta_i / 1 \le i \le \frac{n-1}{2}\}$

Define a function $f: V(G) \longrightarrow \{1,2,\dots,4n-3\}$ by,

$f(u_i) = 4i+4-7$ for $1 \le i \le n$ if i is odd.

$f(u_i) = 4i+4-9$ for $2 \le i \le n-1$ if i is even

$f(v_i) = 4i+4-6$ for $1 \le i \le n-1$

$f(\alpha_i) = 8i-4$ for $1 \le i \le \frac{n-1}{2}$

$f(\beta_i) = 8i$ for $1 \le i \le \frac{n-1}{2}$

$f(\gamma_i) = 8i-3$ for $1 \le i \le \frac{n-1}{2}$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

From case (i) and case (ii), we conclude that subdivision graph of alternate triangular snake is a heronian mean graph.

Theorem 2.4

$S(A(T_n)) \odot K_1$ is a heronian mean graph.

Proof

Let $G = S(A(T_n)) \odot K_1$

Let $S(A(T_n))$ be a graph obtained by subdividing all the edges of $A(T_n)$.

Let $u_1,u_2,u_3 \dots u_n, v_1,v_2,\dots,v_{n-1},\alpha_i,\beta_i,\gamma_i$ be the vertices of $S(A(T_n))$.

Let G be the corona product of $S(A(T_n)) \odot K_1$ and let $u'_1,u'_2,u'_3 \dots u'_n \ v'_1,v'_2 \dots v'_{n-1}, \ \alpha'_i,\beta'_i,\gamma'_i$ be the pendant vertices attached at $u_1,u_2,u_3 \dots, u_n, v_1,v_2,\dots v_{n-1},\alpha_i,\beta_i,\gamma_i$ respectively.

Here we consider two cases are arises.

Case (i) :

If $S(A(T_n)) \odot K_1$ starts from u_i with degree of $u_1 = 2$.Then we need to consider two subcases.

Sub case (i) a): If n is even.

Let $V(G) = \begin{Bmatrix} u_1,u_2,u_3,\dots,u_n,v_1,v_2,v_3,\dots,v_{n-1},u'_1,u'_2,\dots u'_nv'_1,v'_2,\dots, \\ v'_{n-1},\alpha_i,\alpha'_i,\beta_i,\beta'_i,\gamma_i,\gamma'_i \ / 1 \le i \le \frac{n}{2} \end{Bmatrix}$

Let $E(G) = \{u_iv_i, \ v_iu_{i+1} / 1 \le i \le n-1\} \cup \{u_iu'_i / 1 \le i \le n\}$

$\cup \{v_iv'_i / 1 \le i \le n-1\} \cup \left\{\alpha_i\alpha'_i, \beta_i\beta'_i, \gamma_i\gamma'_i / 1 \le i \le \frac{n}{2}\right\}$

$\cup \left\{u_{2i-1}\alpha_i, \alpha_i\gamma_i, \gamma_i\beta_i, \beta_iu_{2i} / 1 \le i \le \frac{n}{2}\right\}$

Define a function $f: V(G) \longrightarrow \left\{1,2,\ldots,\frac{15n}{2}-2\right\}$ by,

$f(u_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor$ for $1 \le i \le n-1$ if i is odd.

$f(u_i) = \frac{15}{2}i - 3$ for $2 \le i \le n$ if i is even

$f(v_i) = \left\lfloor \frac{15}{2}i + 2 \right\rfloor$ for $1 \le i \le n-1$ if i is odd

$f(v_i) = \frac{15i}{2} - 1$ for $2 \le i \le n-2$ if i is even

$f(u_i') = \left\lfloor \frac{15}{2}i - 5 \right\rfloor$ for $1 \le i \le n-1$ if i is odd.

$f(u_i') = \frac{15}{2}i - 2$ for $2 \le i \le n-2$ if i is even

$f(v_i') = \left\lfloor \frac{15}{2}i + 3 \right\rfloor$ for $1 \le i \le n-1$ if i is odd

$f(v_i') = \frac{15i}{2}$ for $2 \le i \le n-2$ if i is even

$f(\alpha_i) = 15i - 12$ for $1 \le i \le \frac{n}{2}$

$f(\alpha_i') = 15i - 11$ for $1 \le i \le \frac{n}{2}$

$f(\beta_i) = 15i - 7$ for $1 \le i \le \frac{n}{2}$

$f(\beta_i') = 15i - 6$ for $1 \le i \le \frac{n}{2}$

$f(\gamma_i) = 15i - 9$ for $1 \le i \le \frac{n}{2}$

$f(\gamma_i') = 15i - 8$ for $1 \le i \le \frac{n}{2}$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

Sub case (ii) a): If n is odd.

Let $V(G) = \left\{ \begin{matrix} u_1, u_2, u_3, \ldots, u_n, v_1, v_2, v_3, \ldots, v_{n-1}, u_1', u_2', \ldots u'_n, \\ v_1', v_2', \ldots, v_{n-1}', \alpha_i, \alpha_i', \beta_i, \beta_i', \gamma_i, \gamma_i' / 1 \le i \le \frac{n-1}{2} \end{matrix} \right\}$

Let $E(G) = \{u_i v_i,\ v_i u_{i+1} / 1 \le i \le n-1\} \cup \{u_i u_i' / 1 \le i \le n\}$

$\cup \{v_i v_i' / 1 \le i \le n-1\} \cup \{\alpha_i \alpha_i', \beta_i \beta_i', \gamma_i \gamma_i' / 1 \le i \le \frac{n-1}{2}\}$

$\cup \left\{u_{2i-1}\alpha_i, \alpha_i\gamma_i, \gamma_i\beta_i, \beta_i u_{2i} \backslash \le i \le \frac{n-1}{2}\right\}$

Define a function $f: V(G) \longrightarrow \left\{1,2,\ldots,\left\lfloor \frac{15}{2}n - 5 \right\rfloor\right\}$ by,

$f(u_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor$ for $1 \le i \le n$ if i is odd.

$f(u_i) = \frac{15}{2}i - 3$ for $2 \le i \le n-1$ if i is even

$f(v_i) = \left\lfloor \frac{15}{2}i + 2 \right\rfloor$ for $1 \le i \le n-2$ if i is odd

$f(v_i) = \frac{15i}{2} - 1$ for $2 \le i \le n-1$ if i is even

$f(u_i') = \left\lfloor \frac{15}{2}i - 5 \right\rfloor$ for $1 \le i \le n$ if i is odd.

$f(u_i') = \frac{15}{2}i - 2$ for $2 \le i \le n-1$ if i is even

$f(v_i) = \left\lfloor \frac{15}{2}i + 3 \right\rfloor$ for $1 \le i \le n-1$ if i is odd

$f(v_i) = \frac{15i}{2}$ for $2 \le i \le n-2$ if i is even

$f(\alpha_i) = 15i - 12$ for $1 \le i \le \frac{n-1}{2}$

$f(\alpha_i') = 15i - 11$ for $1 \le i \le \frac{n-1}{2}$

$f(\beta_i) = 15i - 7$ for $1 \le i \le \frac{n-1}{2}$

$f(\beta_i') = 15i - 6$ for $1 \le i \le \frac{n-1}{2}$

$f(\gamma_i) = 15i - 9$ for $1 \le i \le \frac{n-1}{2}$

$f(\gamma_i') = 15i - 8$ for $1 \le i \le \frac{n-1}{2}$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

Case (ii)

If $S(A(T_n)) \odot K_1$ starts from u_2 with degree of $u_1 = 1$. Then we need to consider two subcases.

Sub case (i) a): If n is even.

Let $V(G) = \begin{Bmatrix} u_1, u_2, u_3, \dots, u_n, v_1, v_2, v_3, \dots, v_{n-1}, u'_1, u'_2, \dots u'_n, \\ v'_1, v'_2, \dots, v'_{n-1}, \alpha_i, \alpha'_i, \beta_i, \beta'_i, \gamma_i, \gamma'_i / 1 \le i \le \frac{n-2}{2} \end{Bmatrix}$

Let $E(G) = \{u_i v_i,\ v_i u_{i+1} / 1 \le i \le n-1\} \cup \{u_i u'_i / 1 \le i \le n\}$

$\cup \{v_i v'_i / 1 \le i \le n-1\} \cup \{\alpha_i \alpha'_i, \beta_i \beta'_i, \gamma_i \gamma'_i / 1 \le i \le \frac{n-2}{2}\}$

$\cup \left\{u_{2i}\alpha_i, \alpha_i\gamma_i, \gamma_i\beta_i, \beta_i u_{2i+1} / 1 \le i \le \frac{n-2}{2}\right\}$

Define a function $f: V(G) \longrightarrow \left\{1,2, \dots, \frac{15n}{2} - 9\right\}$ by,

$f(u_i) = \left\lceil \frac{15i}{2} - 7 \right\rceil$	for	$1 \le i \le n-1$	if i is odd.
$f(u_i) = \frac{15}{2}i - 10$	for	$2 \le i \le n$	if i is even
$f(v_i) = \left\lceil \frac{15}{2}i - 5 \right\rceil$	for	$1 \le i \le n-1$	if i is odd
$f(v_i) = \frac{15i}{2} - 1$	for	$2 \le i \le n-2$	if i is even
$f(u'_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor$	for	$1 \le i \le n-1$	if i is odd.
$f(u'_i) = \frac{15}{2}i - 9$	for	$2 \le i \le n$	if i is even
$f(v'_i) = \left\lceil \frac{15}{2}i - 4 \right\rceil$	for	$1 \le i \le n-1$	if i is odd
$f(v'_i) = \frac{15i}{2}$	for	$2 \le i \le n-2$	if i is even
$f(\alpha_i) = 15i - 8$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\alpha'_i) = 15i - 7$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\beta_i) = 15i - 3$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\beta'_i) = 15i - 2$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\gamma_i) = 15i - 5$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\gamma'_i) = 15i - 4$	for	$1 \le i \le \frac{n-2}{2}$	

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

Sub case (ii) a): If n is odd.

Let $V(G) = \begin{Bmatrix} u_1, u_2, u_3, \dots, u_n, v_1, v_2, v_3, \dots, v_{n-1}, u'_1, u'_2, \dots u'_n, \\ v'_1, v'_2, \dots, v'_{n-1}, \alpha_i, \alpha'_i, \beta_i, \beta'_i, \gamma_i, \gamma'_i \backslash 1 \le i \le \frac{n-1}{2} \end{Bmatrix}$

Let $E(G) = \{u_i v_i,\ v_i u_{i+1} / 1 \le i \le n-1\} \cup \{u_i u'_i / 1 \le i \le n\}$

$\cup \{v_i v'_i / 1 \le i \le n-1\} \cup \left\{\alpha_i \alpha'_i, \beta_i \beta'_i, \gamma_i \gamma'_i / 1 \le i \le \frac{n-1}{2}\right\}$

$\cup \left\{u_{2i}\alpha_i, \alpha_i\gamma_i, \gamma_i\beta_i, \beta_i u_{2i+1} / 1 \le i \le \frac{n-1}{2}\right\}$

Define a function $f: V(G) \longrightarrow \left\{1,2, \dots, \left\lceil \frac{15n}{2} - 6 \right\rceil\right\}$ by,

$f(u_i) = \left\lceil \frac{15i}{2} - 7 \right\rceil$	for	$1 \le i \le n$	if i is odd.
$f(u_i) = \frac{15}{2}i - 10$	for	$2 \le i \le n-1$	if i is even
$f(v_i) = \left\lceil \frac{15}{2}i - 5 \right\rceil$	for	$1 \le i \le n-2$	if i is odd
$f(v_i) = \frac{15i}{2} - 1$	for	$2 \le i \le n-1$	if i is even
$f(u'_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor$	for	$1 \le i \le n$	if i is odd.
$f(u'_i) = \frac{15}{2}i - 9$	for	$2 \le i \le n-1$	if i is even

$f(v_i') = \left\lceil \frac{15}{2} i - 4 \right\rceil$ for $1 \le i \le n-2$ if i is odd
$f(v_i') = \frac{15i}{2}$ for $2 \le i \le n-1$ if i is even
$f(\alpha_i) = 15i - 8$ for $1 \le i \le \frac{n-1}{2}$
$f(\alpha_i') = 15i - 7$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i) = 15i - 3$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i') = 15i - 2$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i) = 15i - 5$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i') = 15i - 4$ for $1 \le i \le \frac{n-1}{2}$

Then the resulting edge labels are distinct.
In this sub case, f is a heronian mean labeling of G.
From case (i) and case (ii), we conclude $S(A(T_n)) \odot K_1$ is heronian mean graph.

Theorem 2.5
$S(A(T_n)) \odot \overline{K_2}$ is a heronian mean graph.

Proof
Let $G = S(A(T_n)) \odot \overline{K_2}$
Let $S(A(T_n))$ be a graph obtained by subdividing all the edges of $A(T_n)$.
Let $u_1u_2u_3 \ldots u_n, v_1v_2 \ldots v_{n-1}, \alpha_i, \beta_i, \gamma_i$ be the vertices of $S(A(T_n))$.
Let G be the corona product $S(A(T_n)) \odot \overline{K_2}$ and let $u_1'u_2'u_3' \ldots u_n', v_1'v_2'v_3' \ldots v_{n-1}'$, $\alpha_i', \beta_i', \gamma_i'$ and $u_1''u_2''u_3'' \ldots u_n'', v_1''v_2''v_3'' \ldots v_n'', \alpha_i'', \beta_i'', \gamma_i''$ be the pendant vertices attached at $u_1, u_2, u_3 \ldots, u_n, v_1, v_2, \ldots v_{n-1}, \alpha_i, \beta_i, \gamma_i$ respectively.
Here we consider two cases are arises.

Case (i)
If $G = S(A(T_n)) \odot \overline{K_2}$ starts from u_1 with degree of $u_1 = 2$. Then we need to consider two subcases.

Sub case (i) a): If n is even.
Let $(G) = \left\{ \begin{matrix} u_1u_2u_3 \ldots u_n,\ v_1v_2v_3 \ldots v_{n-1},\ u_1'u_2' \ldots u_n',\ u_1''u_2'' \ldots u_n'', v_1', v_2', \ldots, v_{n-1}', \\ v_1''v_2'' \ldots v_{n-1}'', \alpha_i, \alpha_i', \alpha_i'', \beta_i, \beta_i', \beta_i'', \gamma_i, \gamma_i', \gamma_i'' / 1 \le i \le \frac{n}{2} \end{matrix} \right\}$
Let $E(G) = \{ u_iv_i, v_iu_{i+1} / 1 \le i \le n-1 \} \cup \{ u_{2i-1}\alpha_i, \alpha_i\gamma_i / 1 \le i \le \frac{n}{2} \}$
$\cup \{ \gamma_i\beta_i, \beta_iu_{2i} / 1 \le i \le \frac{n}{2} \} \cup \{ u_iu_i', u_iu_i'' / 1 \le i \le n \}$
$\cup \{ v_iv_i', v_iv_i'' / 1 \le i \le n-1 \} \cup \{ \alpha_i\alpha_i'', \alpha_i\alpha_i' / 1 \le i \le \frac{n}{2} \}$
$\cup \{ \gamma_i\gamma_i', \gamma_i\gamma_i'' / 1 \le i \le \frac{n}{2} \} \cup \{ \beta_i\beta_i', \beta_i\beta_i'' / 1 \le i \le \frac{n}{2} \}$
Define a function $f: V(G) \longrightarrow \{1, 2, \ldots, 11n-3\}$ by,
$f(u_i) = 11i - 9$ for $1 \le i \le n-1$ if i is odd
$f(u_i) = 11i - 4$ for $2 \le i \le n$ if i is even
$f(v_i) = 11i + 4$ for $1 \le i \le n-1$ if i is odd
$f(v_i) = 11i - 1$ for $2 \le i \le n-2$ if i is even
$f(u_i') = 11i - 10$ for $1 \le i \le n-1$ if i is odd
$f(u_i') = 11i - 5$ for $2 \le i \le n$ if i is even
$f(u_i'') = 11i - 8$ for $1 \le i \le n-1$ if i is odd
$f(u_i'') = 11i - 3$ for $2 \le i \le n$ if i is even
$f(v_i') = 11i + 3$ for $1 \le i \le n-1$ if i is odd
$f(v_i') = 11i - 2$ for $2 \le i \le n-2$ if i is even
$f(v_i'') = 11i + 5$ for $1 \le i \le n-1$ if i is odd

$f(v_i'') = 11i$ for $2 \le i \le n-2$ if i is even
$f(\alpha_i) = 22i - 17$ for $1 \le i \le \frac{n}{2}$
$f(\alpha_i') = 22i - 18$ for $1 \le i \le \frac{n}{2}$
$f(\alpha_i'') = 22i - 16$ for $1 \le i \le \frac{n}{2}$
$f(\beta_i) = 22i - 10$ for $1 \le i \le \frac{n}{2}$
$f(\beta_i') = 22i - 11$ for $1 \le i \le \frac{n}{2}$
$f(\beta_i'') = 22i - 9$ for $1 \le i \le \frac{n}{2}$
$f(\gamma_i) = 22i - 13$ for $1 \le i \le \frac{n}{2}$
$f(\gamma_i') = 22i - 14$ for $1 \le i \le \frac{n}{2}$
$f(\gamma_i'') = 22i - 12$ for $1 \le i \le \frac{n}{2}$

Then the resulting edge labels are distinct.
In this sub case, f is a heronian mean labeling of G.

Sub case (ii) a): If n is odd.

Let $V(G) = \left\{ \begin{matrix} u_1u_2u_3 \dots u_n,\ v_1v_2v_3 \dots\ v_{n-1},\ u_1'u_2' \dots u_n',\ u_1''u_2'' \dots . u_n'' \\ v_1', v_2', \dots, v_{n-1}', v_1''v_2'' \dots . v_{n-1}'', \alpha_i, \alpha_i', \alpha_i'', \beta_i, \beta_i', \beta_i'', \\ \gamma_i, \gamma_i',\ \gamma_i'' \backslash 1 \le i \le \frac{n-1}{2} \end{matrix} \right\}$

Let $E(G) = \{ u_iv_i, v_iu_{i+1} \ /1 \le i \le n-1\} \cup \{u_{2i-1}\alpha_i,\ \alpha_i\gamma_i \ /1 \le i \le \frac{n-1}{2}\}$
$\cup \{ \gamma_i\beta_i,\ \beta_iu_{2i} \ /1 \le i \le \frac{n-1}{2}\} \cup \{ u_iu_i',\ u_iu_i'' \ /1 \le i \le n \}$
$\cup \{ v_iv_i' , v_iv_i'' \ /1 \le i \le n-1\} \cup \{ \alpha_i\alpha_i'', \alpha_i\alpha_i' /1 \le i \le \frac{n-1}{2}\}$
$\cup \{\gamma_i\gamma_i', \gamma_i\gamma_i'' /1 \le i \le \frac{n-1}{2}\} \cup \{\beta_i\beta_i', \beta_i\beta_i'' /1 \le i \le \frac{n-1}{2}\}$

Define a function $f: V(G) \longrightarrow \{1,2, \dots, 11n-8\}$ by,

$f(u_i) = 11i - 9$ for $1 \le i \le n$ if i is odd
$f(u_i) = 11i - 4$ for $2 \le i \le n-1$ if i is even
$f(v_i) = 11i + 4$ for $1 \le i \le n-2$ if i is odd
$f(v_i) = 11i - 1$ for $2 \le i \le n-1$ if i is even
$f(u_i') = 11i - 10$ for $1 \le i \le n$ if i is odd
$f(u_i') = 11i - 5$ for $2 \le i \le n-1$ if i is even
$f(u_i'') = 11i - 8$ for $1 \le i \le n$ if i is odd
$f(u_i'') = 11i - 3$ for $2 \le i \le n-1$ if i is even
$f(v_i') = 11i + 3$ for $1 \le i \le n-2$ if i is odd
$f(v_i') = 11i - 2$ fo $2 \le i \le n-1$ if i is even
$f(v_i'') = 11i + 5$ for $1 \le i \le n-2$ if i is odd
$f(v_i'') = 11i$ for $2 \le i \le n-1$ if i is even
$f(\alpha_i) = 22i - 17$ for $1 \le i \le \frac{n-1}{2}$
$f(\alpha_i') = 22i - 18$ for $1 \le i \le \frac{n-1}{2}$
$f(\alpha_i'') = 22i - 16$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i) = 22i - 10$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i') = 22i - 11$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i'') = 22i - 9$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i) = 22i - 13$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i') = 22i - 14$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i'') = 22i - 12$ for $1 \le i \le \frac{n-1}{2}$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

Case (ii)

If $S(A(T_n)) \odot \overline{K_2}$ starts from u_2 with degree of $u_1 = 1$ Then we need to consider two subcases.

Sub case (i) a): If n is even.

Let $(G) = \begin{Bmatrix} u_1u_2u_3 \dots u_n,\ v_1v_2v_3 \dots v_{n-1},\ u_1'u_2' \dots u_n',\ u_1''u_2'' \dots .u_n''v_1'v_2' \dots v_{n-1}', \\ v_1''v_2'' \dots .v_{n-1}'', \alpha_i, \alpha_i', \alpha_i'', \beta_i, \beta_i', \beta_i'', \gamma_i, \gamma_i',\ \gamma_i'' \backslash 1 \le i \le \frac{n-2}{2} \end{Bmatrix}$

Let $E(G) = \{ u_iv_i, v_iu_{i+1} /1 \le i \le n-1\} \cup \{u_{2i}\alpha_i,\ \alpha_i\gamma_i \ /1 \le i \le \frac{n-2}{2}\}$

$\cup \{ \gamma_i\beta_i,\ \beta_iu_{2i+1} /1 \le i \le \frac{n-2}{2}\} \cup \{ u_iu_i', u_iu_i'' \ /1 \le i \le n \}$

$\cup \{ v_iv_i' , v_iv_i'' \ /1 \le i \le n-1\} \cup \{ \alpha_i\alpha_i'', \alpha_i\alpha_i' /1 \le i \le \frac{n-2}{2}\}$

$\cup \{\gamma_i\gamma_i', \gamma_i\gamma_i'' /1 \le i \le \frac{n-2}{2}\} \cup \{\beta_i\beta_i',\ \beta_i\beta_i'' /1 \le i \le \frac{n-2}{2}\}$

Define a function $f: V(G) \longrightarrow \{1,2, \dots, 11n-13\}$ by

$f(u_i) = 11i - 9$	for	$1 \le i \le n-1$	if i is odd
$f(u_i) = 11i - 14$	for	$2 \le i \le n$	if i is even
$f(v_i) = 11i - 6$	for	$1 \le i \le n-1$	if i is odd
$f(v_i) = 11i - 1$	for	$2 \le i \le n-2$	if i is even
$f(u_i') = 11i - 10$	for	$1 \le i \le n-1$	if i is odd
$f(u_i') = 11i - 15$	for	$2 \le i \le n$	if i is even
$f(u_i'') = 11i - 8$	for	$1 \le i \le n-1$	if i is odd
$f(u_i'') = 11i - 13$	for	$2 \le i \le n$	if i is even
$f(v_i') = 11i - 7$	for	$1 \le i \le n-1$	if i is odd
$f(v_i') = 11i - 2$	for	$2 \le i \le n-2$	if i is even
$f(v_i'') = 11i - 5$	for	$1 \le i \le n-1$	if i is odd
$f(v_i'') = 11i$	for	$2 \le i \le n-2$	if i is even
$f(\alpha_i) = 22i - 11$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\alpha_i') = 22i - 12$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\alpha_i'') = 22i - 10$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\beta_i) = 22i - 7$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\beta_i') = 22i - 8$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\beta_i'') = 22i - 6$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\gamma_i) = 22i - 4$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\gamma_i') = 22i - 5$	for	$1 \le i \le \frac{n-2}{2}$	
$f(\gamma_i'') = 22i - 3$	for	$1 \le i \le \frac{n-2}{2}$	

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

Sub case (ii) a): If n is odd.

Let $(G) = \begin{Bmatrix} u_1u_2u_3 \dots u_n,\ v_1v_2v_3 \dots v_{n-1},\ u_1'u_2' \dots u_n',\ u_1''u_2'' \dots .u_n''v_1'v_2' \dots v_{n-1}', \\ v_1''v_2'' \dots .v_{n-1}'', \alpha_i, \alpha_i', \alpha_i'', \beta_i, \beta_i', \beta_i'', \gamma_i, \gamma_i',\ \gamma_i'' \backslash 1 \le i \le \frac{n-1}{2} \end{Bmatrix}$

Let $E(G) = \{ u_iv_i, v_iu_{i+1} /1 \le i \le n-1\} \cup \{u_{2i}\alpha_i,\ \alpha_i\gamma_i \ /1 \le i \le \frac{n-1}{2}\}$

$\cup \{ \gamma_i\beta_i,\ \beta_iu_{2i+1} /1 \le i \le \frac{n-1}{2}\} \cup \{ u_iu_i',\ u_iu_i'' \ /1 \le i \le n \}$

$\cup \{ v_iv_i' , v_iv_i'' \ /1 \le i \le n-1\} \cup \{ \alpha_i\alpha_i', \alpha_i\alpha_i'' /1 \le i \le \frac{n-1}{2}\}$

$\cup \{\gamma_i\gamma_i', \gamma_i\gamma_i'' /1 \le i \le \frac{n-1}{2}\} \cup \{\beta_i\beta_i',\ \beta_i\beta_i'' /1 \le i \le \frac{n-1}{2}\}$

Define a function $f: V(G) \longrightarrow \{1,2, \dots, 11n-8\}$ by

$f(u_i) = 11i - 9$ for $1 \le i \le n$ if i is odd
$f(u_i) = 11i - 14$ for $2 \le i \le n-1$ if i is even
$f(v_i) = 11i - 6$ for $1 \le i \le n-2$ if i is odd
$f(v_i) = 11i - 1$ for $2 \le i \le n-1$ if i is even
$f(u_i') = 11i - 10$ for $1 \le i \le n$ if i is odd
$f(u_i') = 11i - 15$ for $2 \le i \le n-1$ if i is even
$f(u_i'') = 11i - 8$ for $1 \le i \le n$ if i is odd
$f(u_i'') = 11i - 13$ for $2 \le i \le n-1$ if i is even
$f(v_i') = 11i - 7$ for $1 \le i \le n-2$ if i is odd
$f(v_i') = 11i - 2$ for $2 \le i \le n-1$ if i is even
$f(v_i'') = 11i - 5$ for $1 \le i \le n-2$ if i is odd
$f(v_i'') = 11i$ for $2 \le i \le n-1$ if i is even
$f(\alpha_i) = 22i - 11$ for $1 \le i \le \frac{n-1}{2}$
$f(\alpha_i') = 22i - 12$ for $1 \le i \le \frac{n-1}{2}$
$f(\alpha_i'') = 22i - 10$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i) = 22i - 7$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i') = 22i - 8$ for $1 \le i \le \frac{n-1}{2}$
$f(\beta_i'') = 22i - 6$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i) = 22i - 4$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i') = 22i - 5$ for $1 \le i \le \frac{n-1}{2}$
$f(\gamma_i'') = 22i - 3$ for $1 \le i \le \frac{n-1}{2}$

Then the resulting edge labels are distinct.
In this sub case, f is a heronian mean labeling of G.
From case (i) and case (ii), we conclude $S(A(T_n)) \odot \overline{K_2}$ is heronian mean graph.

CONCLUSION

In this paper we have presented a few results on heronian mean labeling of corona product of subdivision certain classes of triangular snake graphs$S(T_n) \odot K_1$, $S(T_n) \odot \overline{K_2}$, $S(A(T_n))$,$S(A(T_n)) \odot K_1$ and $S(A(T_n)) \odot \overline{K_2}$. Analogous work can be carried out for other families and in the context of different types of graph labeling technique".

ABSTRACT

The Siddha system of medicine, one of the oldest traditional healing practices of Southern India, employs complex pharmaceutico-therapeutic principles in drug preparation. *Thirimoorthi Mai*, a classical Siddha formulation documented in *Yakobu Vaithiya Kalladam*, is traditionally prescribed for respiratory, febrile, and systemic disorders, but its use of metallic ingredients such as mercury and sulphur, alongside botanicals like *Croton tiglium*, necessitates scientific validation of its safety and standardization. In this study, *Thirimoorthi Mai* was subjected to organoleptic, biochemical, physicochemical, and toxicological analyses following AYUSH and WHO guidelines. The drug was observed to be black, greasy, and semi-solid, with partial solubility in water, acid, and alcohol. Biochemical screening confirmed the presence of calcium, magnesium, iron, zinc, mercury, sulphate, carbonate, and reducing sugars, while arsenic and lead were absent. ICP-OES analysis demonstrated arsenic, cadmium, and lead were below detectable limits, with mercury (0.52%) and sulphur (0.01%) present within permissible levels. HPTLC fingerprinting revealed four prominent peaks (Rf: 0.01–0.24), indicative of diverse phytoconstituents.

Pesticide residue analysis confirmed all tested organochlorines, organophosphorus compounds, carbamates, and pyrethroids were below quantification limits. Microbial sterility tests confirmed the absence of bacterial and fungal contamination, including *E. coli, Salmonella, Staphylococcus aureus,* and *Pseudomonas aeruginosa*. Aflatoxin assay demonstrated no detectable levels of B1, B2, G1, or G2. These findings establish that *Thirimoorthi Mai* possesses defined biochemical and phytochemical signatures while complying with modern safety standards, thereby supporting its continued therapeutic use in Siddha medicine. Further pharmacological and clinical evaluations are recommended to substantiate its efficacy.

Keywords: Siddha medicine, *Thirimoorthi Mai*, standardization, ICP-OES, HPTLC, safety evaluation, traditional formulation.

INTRODUCTION

The Siddha system of medicine, one of the oldest traditional systems practiced in Southern India, is attributed to the Siddhars—renowned physician-scholars who developed a comprehensive framework of health and healing. This system is founded on four core principles: *Vatham* (alchemy), *Vaithiyam* (medical knowledge), *Yogam* (physical health practices), and *Gnanam* (mental and spiritual knowledge. Among these, *Vaithiyam* encompasses both the preparation and practice of medicines, wherein the principles of *Vatham* play a central role in drug formulation and processing[1]. The preparation of Siddha medicines is guided by five fundamental methods. Eka Mooligai Piriyogam involves the use of a single raw material of plant, mineral, or animal origin, based on the Pancha Bootham (five-element theory: earth, water, fire, air, and space), which emphasizes that therapeutic efficacy depends on the balance of these elements. Maarana Piriyogam refers to the transformation of raw materials through sequential treatment with two types of agents: *Pagai Sarakku* (antagonistic substances), which alter physical states such as converting unbreakable to brittle or solids into semi-solid/liquid forms, and *Natpu Sarakku* (synergistic substances), which enhance therapeutic potency; together, these processes accelerate preparation and improve medicinal value and assimilation. Thiravaka Piriyogam involves treatment with acids and alkalis, where salts, minerals, or metals are processed into liquid preparations (e.g., *Veyippu Thiravakam*, similar to nitric acid, and *Sangath Thiravakam*), reducing toxicity, modifying physicochemical properties, and enhancing bioavailability. Seyaneer Piriyogam entails the treatment of drugs with special medicinal liquids described in Siddha literature, which can alter raw material properties—such as converting flammable substances into stable, non-flammable forms—while also imparting therapeutic benefits.

Finally, Muppu Piriyogam employs highly specialized alkaline compounds known as *Muppu,* used as bioenhancers that significantly improve potency, bioavailability, and safety while minimizing toxicity; due to its complexity, this method demands precise expertise in Siddha pharmacology and strict procedural adherence[2]. The Siddhars systematized medicinal preparations into sixty-four categories, subdivided equally into internal and external formulations, with each group comprising thirty-two types. Internal medicines, primarily intended for oral administration, were classified on the basis of their pharmacokinetic stability, particularly the water content which dictated their effective half-life. Liquid preparations such as *Saaru* (fresh plant juice), *Surasam* (heat-treated juice), and *Kudineer* (aqueous extract of crude material) exhibited a relatively short half-life of approximately three hours due to rapid degradation facilitated by high water content, whereas solid preparations including *Kattu* (solidified formulations with variable combustibility), *Urukku* (metallurgical products obtained through melting or fusion), and *Kalangu* (complex metallic pills incorporating mercury as a primary constituent) were considered to possess indefinite stability owing to their inorganic matrix and negligible aqueous fraction. In contrast, external medicines were distinguished not by half-life but by their route of administration (e.g., dermal, ophthalmic, or nasal), procedural methodology, and the physicochemical nature of the base component, thereby emphasizing their localized therapeutic efficacy rather than systemic pharmacodynamics. *Mai* preparations (ointments), on the other hand, are described to have a half-life of one year.

The preparation of *Mai* involves meticulous techniques, including the mixing of raw drugs with *Anjanakkal* (lead sulphide) and plant juice, followed by grinding with honey[3]. One notable formulation is *Thirimoorthi Mai*, described in the classical Siddha text *Yakobu Vaithiya Kalladam*. Prepared by the *Eka Mooligai Piriyogam* method, it is prescribed for a spectrum of conditions, including *Vaatha Thosam* (disorders of *Vatham*), *Suraththin Thosam* (fever complications, with 24 subtypes described in literature), *Nalamilla Pen Thosham* (*Mega Noykal* - This is the common name given to the various diseases or disorders caused by the sexual union), cough, asthma, vomit, hiccough, *Mel moochu* (apnea), *Shayam* (Respiratory illness with emaciation) *Nethra Thosham* (eye diseases) and manage Terminally ill conditions. Its formulation uniquely integrates both metallic ingredients (e.g., mercury, sulphur) and plant-based components (e.g., *Croton tiglium*, coconut charcoal, coconut milk, and palm jaggery). Despite containing toxic heavy metals and a poisonous irritant herb, the medicine is regarded as highly efficacious within Siddha practice(4]. However, despite its long-standing clinical use, scientific validation of *Thirimoorthi Mai* remains insufficient. Specifically, there is a lack of systematic data on its physicochemical characteristics, safety profile, and therapeutic mechanisms. Therefore, modern analytical approaches such as elemental analysis, phytochemical screening, biochemical assays, high-performance thin-layer chromatography (HPTLC), inductively coupled plasma–optical emission spectrometry (ICP-OES), and microbial/toxic residue assessments are essential to establish its safety and pharmacological relevance. Traditional claims regarding *Thirimoorthi Mai* highlight its therapeutic importance in managing chronic respiratory and systemic disorders. Yet, the use of potentially toxic metals and irritant botanicals necessitates careful scientific scrutiny. By evaluating its physicochemical properties through contemporary analytical techniques, this study aims to bridge the gap between traditional knowledge and modern evidence-based validation, thereby ensuring both the efficacy and safety of this classical Siddha formulation.

MATERIALS AND METHODS

Preparation of the Test Drug

Procurement of the raw drugs: *Lingham (Mercury sulphate), Kanthagam (Sulphur),* and *Nervaalam (Croton tiglium)* were sourced from a reputable shop in Broadway, Chennai, while *Panai vellam* (Palm jaggery), honey, coconut shell, and endocarp were obtained from the Tambaram market, Chennai.

Identification and authentication of the raw drug: The herbal drug was identified and authenticated by a botanist at the National Institute of Siddha (NIS), Tambaram Sanatorium, Chennai (Certificate No: NISMB4662021). The metal drugs were identified and authenticated by a pharmacologist at the Department of Gunapadam, NIS, Tambaram Sanatorium, Chennai (Certificate No: Gun/Aut/006/21).

Preparation of the Drug: Take the ingredient 20 grams each, and add honey and palm jaggery 80g each. Then add coconut milk into it. And then mixed thoroughly, until the mixture is converted into the form Mezhugu and kept in an air tight container.

Qualitative Analysis

Bio-chemical Analysis of *Thirimoorthi Mai*[5]

The biochemical analysis of *Thirimoorthi Mai* was done at the Biochemistry lab, National Institute of Siddha, Chennai, 47

Preparation of Extract

For the qualitative analysis of acidic/basic radicals and biochemical constituents, an aqueous extract of Rathi Thirumoorthi Mai was prepared. Precisely 5 g of the drug was weighed and transferred into a clean 250 ml beaker, to which 50 ml of distilled water was added. The mixture was boiled for 10 minutes, allowed to cool, and subsequently filtered through standard filter paper into a 100 ml volumetric flask. The filtrate was then made up to 100 ml with distilled water to obtain the final extract, which was used for further biochemical investigations. The prepared extract

was subjected to standard qualitative tests for the detection of acidic and basic radicals as well as biochemical constituents. The methodology, observation and results of the analysis are summarized in table 1, 2, 3 and 4.

Quantitative Analysis

Heavy Metal Analysis

The analysis of heavy metals and trace elements were estimated by using Inductively Coupled Plasma Optical Emission Spectrometry (ICP- OES). The Experimental Procedure was done at CCRS, Arumbakkam, Chennai-106.

ICP-OES: Procedure

Take about 20 mg of sample into the Teflon microwave digestion vessel and add 1 mL of ultrapure nitric acid to digest for about 45 minutes using Anton Paar microwave digestion unit. After that, the sample is made up of a 50 mL standard measuring flask. The calibration standard solution is prepared in the range of 0.2 pg/mL to 10 pg/mL by using ultrapure nitric acid and blank also. Agilent ICP-OES 5100 VDV instrument used with the following operation conditions: a RF power 1.2 kW, a plasma gas flow rate 12 L min"1, and a nebulizer gas flow rate 0.70 L min"1. The samples are introduced into the plasma using a nebulizer and spray chamber for analysis[6].

TLC Analysis

The test sample was subjected to thin-layer chromatography (TLC) as per the conventional one-dimensional ascending method using silica gel 60F254, 7X6 cm (Merck) were cut with ordinary household scissors. Plate markings were made with a soft pencil. Micropipettes were used to spot the sample for TLC applied sample volume 10-micro litre by using pipette at a distance of 1 cm at 5 tracks. In the twin trough chamber with the specified solvent system After the run plates are dried and were observed using visible light Short-wave UV light 254nm and light long-wave UV light 365 nm[7].

High-Performance Thin Layer Chromatography Analysis

HPTLC method is a modern sophisticated and automated separation technique derived from TLC. Pre-coated HPTLC graded plates and autosampler were used to achieve precision, sensitivity, and significant separation both qualitatively and quantitatively. High-performance thin-layer chromatography (HPTLC) is a valuable quality assessment tool for the evaluation of botanical materials efficiently and cost-effectively. HPTLC method offers a high degree of selectivity, sensitivity and rapidity combined with single-step sample preparation. Thus this method can be conveniently adopted for routine quality control analysis. It provides a chromatographic fingerprint of phytochemicals which is suitable for confirming the identity and purity of phytotherapeutics.

Chromatogram Development

It was carried out in CAMAG Twin Trough chambers. Sample elution was carried out according to the adsorption capability of the component to be analyzed. After elution, plates were taken out of the chamber and dried.

Scanning

Plates were scanned under UV at 366nm. The data obtained from scanning were brought into integration through CAMAG software. A chromatographic fingerprint was developed for the detection of phytoconstituents present in each sample and their respective Rf values were tabulated[8].

Pesticide Residuals

Test samples were extracted with acetone and followed by homogenization for a brief period. Further filtration was allowed and subsequent addition of acetone to the test mixture. The heating of the test sample was performed using a rotary evaporator at a temperature not exceeding 40oC until the solvent has almost completely evaporated. To the residue add a few millilitres of toluene and heat again until the acetone is completely removed. The resultant residue will be dissolved using toluene and filtered through the membrane filter.

Microbial contamination (Sterility Test)

Objective

The pour plate techniques were adopted to determine the sterility of the product. Contaminated / unsterile sample (formulation) when coming in contact with the nutrition-rich medium. It promotes the growth of the organism and after the stipulated period of incubation, the growth of the organism was identified by the characteristic pattern of colonies. The colonies are referred to as Colony Forming Units (CFUs).

METHODOLOGY

The test sample was inoculated in a sterile petri dish to which about 15 mL of molten agar 45 o C were added. Agar and sample were mixed thoroughly by tilting and swirling the dish. Agar was allowed to completely gel without disturbing it. (about 10 minutes). Plates were then inverted and incubated at 37 o C for 24-48 hours and further extended for 72 hrs for fungal growth observation. Grown colonies of the organism were then counted and calculated for CFU.

Test for specific pathogen

The test sample was directly inoculated into the specific pathogen medium (EMB, DCC, Mannitol, Cetrimide) by the pour plate method. The plates were incubated at 37 o C for 24 - 72h for observation. The presence of specific pathogens is identified by their characteristic colour with respect to the pattern of colony formation in each differential media. Results are illustrated in table number 5. To prepare the aflatoxin standard, Aflatoxin B1, B2, G1, and G2 were dissolved in a solvent mixture of chloroform and acetonitrile (9.8:0.2). This process yielded a final standard solution with concentrations of 0.5 µg/ml for both aflatoxin B1 and G1, and 0.1 µg/ml for both aflatoxin B2 and G2.

Procedure: Standard aflatoxin was applied to the surface of a pre-coated TLC plate in the volume of 2.5 µL, 5 µL, 7.5 µL and 10 µL. Similarly, the test sample was placed and Allow the spots to dry and develop the chromatogram in an unsaturated chamber containing a solvent system consisting of a mixture of chloroform, acetone and isopropyl alcohol (85: 10: 5) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent and allow the plate to air-dry. Locate the spots on the plate by examination under UV light at 365 nm[9].

RESULTS

Standardization of the Test Drug

Standardization of the drug is essential to derive the efficacy, purity and potency of the drug, which was analyzed by the various methods. The results of organoleptic character, biochemical analysis and instrumental analysis such as microbial contamination, Pesticide residuals Aflatoxin and heavy metal analysis have been done and tabulated.

Organoleptic Character of *Thirimoorthi Mai*

Following the preparation of the test drug *Thirimoorthi Mai*, organoleptic, biochemical, physicochemical, and toxicity evaluations were carried out to establish its fundamental properties. The organoleptic assessment (Table 6) revealed that the formulation appeared black in daylight, with a greasy texture and semi-solid consistency. Solubility testing demonstrated that the drug was partially soluble in water, acid, and alcohol, indicating its heterogeneous chemical nature and the possible presence of both organic and inorganic constituents. These preliminary observations provide baseline data for the standardization and quality assessment of *Thirimoorthi Mai*.

Biochemical analysis of *Thirimoorthi Mai*

The biochemical analysis of *Thirimoorthi Mai* was carried out using standard qualitative procedures to identify the presence of major inorganic and organic constituents. The results, as presented in Table 7, demonstrated the presence

of magnesium, calcium, ferrous iron, zinc, mercury, sulphate, carbonate, and reducing sugars, while tests for ammonium, sodium, aluminium, potassium, arsenic, lead, chloride, phosphate, fluoride, oxalate, starch, alkaloids, amino acids, and unsaturated compounds were negative. These findings indicate that *Thirimoorthi Mai* contains a combination of essential minerals and trace elements that may contribute to its therapeutic properties, alongside the presence of reducing sugars which suggest an organic component in the formulation.

ICP-OES analysis of *Thirimoorthi Mai*

The ICP-OES analysis of *Thirimoorthi Mai* was performed to quantify the levels of selected heavy metals, namely arsenic, cadmium, lead, mercury, and sulphur. The analytical results indicated that arsenic, cadmium, and lead were below detectable limits (BDL), while mercury and sulphur were present at concentrations of 0.52% and 0.01%, respectively (Figure 1). The standard linearity calibration exhibited high correlation coefficients (R^2 values ranging from 0.9998 to 1.0000) for all elements analyzed, confirming the accuracy and reliability of the quantification method. These findings suggest that the formulation is free from toxicologically significant levels of arsenic, cadmium, and lead, with only trace quantities of mercury and sulphur detected within permissible limits. Results are illustrated in figure 1-5

Report of figure 1: This figure displays the analytical report table summarizing the concentration of Arsenic (As), Cadmium (Cd), Lead (Pb), Mercury (Hg), and Sulphur (S) in the Thirimoorthi Mai sample.

Report of figure 2: This figure illustrates the standard calibration curves used for the quantification of Arsenic, Cadmium, Lead, Mercury, and Sulphur. Each graph plots the intensity (cps) versus the standard concentration (ppm) and includes the linear regression equation and the coefficient of determination (R2).

Report of figure 3: This figure presents the standard overlay spectra for Arsenic (As), Cadmium (Cd) and Lead (Pb) at various concentrations, showing the intensity (cps) as a function of wavelength (nm).

Report of figure 4: This figure provides a table detailing the standard linearity for each element, including the specific wavelength used for measurement and the corresponding R2 value.

Report of figure 5: This figure shows the individual spectral graphs for Arsenic, Cadmium, Lead, Mercury, and Sulphur as detected in the Thirimoorthi Mai sample, plotting intensity (cps) against wavelength (nm).

HPTLC analysis of *Thirimoorthi Mai*

The chromatographic profile was further substantiated through 3D chromatogram analysis, and TLC visualization of the sample under 366 nm confirmed the corresponding bands, as illustrated in Figure 6.

Analytical Report

This report details the High-Performance Thin-Layer Chromatography (HPTLC) analysis of a sample identified as "Thirimoorthi mai" (TM). The analysis provides both qualitative and quantitative information about the chemical constituents of the sample.

Qualitative Analysis

The HPTLC analysis was performed to separate the chemical components within the sample.

TLC Visualization: The image of the developed TLC plate under UV light at a wavelength of 366 nm shows several distinct fluorescent zones. There is one prominent, bright bluish-green spot at a lower Rf value, along with other less intense reddish and bluish spots at different heights on the plate. This indicates the presence of multiple compounds that are fluorescent under long-wave UV light.

Chromatogram: The 2D and 3D chromatograms confirm the separation of the sample into distinct chemical constituents. The analysis successfully resolved four major peaks at different Retention factor (Rf) values. The Rf value is a characteristic of a compound under a specific chromatographic system. The detected peaks have maximum Rf values of 0.02, 0.07, 0.14, and 0.26.

Quantitative Analysis

The table provides quantitative data for the four detected peaks based on the integrated area under each peak in the chromatogram. The percentage area corresponds to the relative concentration of each compound in the mixture.

Major Constituent: Peak 2 (at Rf 0.07) is the most abundant compound in the sample, making up 73.80% of the total detected substances. This corresponds to the bright, prominent spot seen on the visualized TLC plate.

Minor Constituents: The other three peaks are present in significantly smaller concentrations:

- Peak 1 (Rf 0.02) constitutes 14.94%.
- Peak 3 (Rf 0.14) constitutes 7.31%.
- Peak 4 (Rf 0.26) constitutes 3.96%.

The HPTLC fingerprint analysis of Thirimoorthi mai reveals that it is a mixture of at least four separable chemical compounds. The sample contains one primary component (73.80%) and three minor components. This type of chromatographic profile is essential for the chemical standardization and quality control of herbal or traditional formulations, ensuring their composition and purity.

Analysis for Pesticide Residue in *Thirimoorthi Mai*

The analysis of pesticide residues in *Thirimoorthi Mai* was carried out to determine the presence of organochlorine, organophosphorus, carbamate, and pyrethroid compounds. The results demonstrated that the test sample was free from detectable levels of these pesticide residues, thereby confirming its compliance with safety standards for pesticide contamination. The detailed findings of the residue analysis are summarized in Table 8.

Analysis for Microbial contamination (STERILITY TEST) in *Thirimoorthi Mai*

The sterility test performed to assess microbial contamination in *Thirimoorthi Mai* revealed no growth in any of the culture media following the incubation period, indicating the absence of specific pathogens and confirming the microbiological safety of the formulation. Consistently, no growth or colony formation was observed in any of the plates inoculated with the test sample. The detailed results of the sterility analysis are presented in Table 9 and figure number 7.

Culture media for Specific pathogen

The culture-based assay for specific pathogen detection in *Thirimoorthi Mai* demonstrated no observable microbial growth or colony formation in any of the inoculated plates throughout the incubation period, thereby confirming the absence of the targeted pathogenic organisms in the formulation. The experimental outcomes supporting this observation are illustrated in Figure 8.

Test for the specific pathogen of *Thirimoorthi Mai*

The microbiological evaluation of *Thirimoorthi Mai* was performed to assess the presence of specific pathogens, wherein the prepared samples were subjected to standard culture techniques and subsequently incubated under controlled conditions. Following the incubation period, no microbial growth was detected in any of the test media, thereby indicating the absence of the specific pathogen under investigation. These findings confirm the microbiological safety of the formulation with respect to the tested organism, and the detailed results of the analysis are presented in Table 10.

Aflatoxins

The aflatoxin assay of *Thirimoorthi Mai* was conducted using thin layer chromatography (TLC) to evaluate the presence of major aflatoxin contaminants. Comparative analysis of the test sample with authenticated standards demonstrated the absence of detectable fluorescent spots corresponding to Aflatoxin B1, Aflatoxin B2, Aflatoxin G1, and Aflatoxin G2 on the TLC plates. This indicates that the formulation is free from the aforementioned aflatoxins and therefore complies with safety requirements regarding mycotoxin contamination. The detailed experimental observations are summarized in Table 11.

DISCUSSION

The present study aimed at evaluating the physicochemical properties, elemental composition, phytoconstituent profile, and safety aspects of *Thirimoorthi Mai*, a traditional Siddha herbo-mineral formulation documented in the classical text *Yakobu Vaithiya Kalladam* [3]. Traditionally indicated for conditions like *Vaatha thosam*, cough, fever, and asthma, this preparation involves the use of both plant-based and mineral-based components, necessitating rigorous analysis for safety and standardization. Biochemical tests revealed the presence of essential minerals such as magnesium, calcium, iron, and zinc, all of which are known to play critical physiological roles. Magnesium is vital for neuromuscular function and enzymatic activities, while calcium is essential for bone metabolism and cardiovascular health. Iron is indispensable for oxygen transport and cellular respiration, and zinc supports immune modulation and wound healing[5]. The formulation also showed the presence of sulphate and carbonate radicals, which may contribute to the detoxification and absorption processes when administered internally. Importantly, mercury—one of the key constituents—was present in a converted form (as *lingam* or mercurial compound) and was within the permissible limit (0.52%) as per AYUSH and WHO guidelines [9].

Siddha pharmacology considers processed mercury, especially when combined with sulphur (*kanthagam*), to be detoxified and therapeutically potent[2]. The absence of toxic elements such as arsenic, lead, and cadmium, as confirmed by ICP-OES analysis, further supports the safety of the formulation when prepared under traditional purification (*purification/maarana*) protocols, which are known to neutralize toxicity of metallic elements in Siddha drugs[4]. HPTLC fingerprinting revealed four distinct phytoconstituents with Rf values ranging from 0.01 to 0.24, suggesting the presence of multiple bioactive compounds. Although the specific identities of the phytochemicals were not confirmed in this study, previous research on similar Siddha formulations shows that these may include flavonoids, glycosides, and phenolic compounds, which are known for their anti-inflammatory, antioxidant, and bronchodilatory activities[6,7]. The use of *Nervaalam* (*Croton tiglium*) and coconut charcoal in the preparation may contribute to detoxification and gastrointestinal benefits, while palm jaggery is a known carrier (*anupanam*) in Siddha medicine, aiding in drug absorption and palatability[1,3]. The sterility test results were highly promising, with no bacterial or fungal growth observed after incubation. Specific pathogen tests for *E.coli*, *Salmonella spp.*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa* were all negative. This is crucial for Siddha formulations intended for internal use, as microbial contamination could compromise patient safety. Similarly, the absence of pesticide residues—including organochlorines, organophosphates, carbamates, and pyrethroids—indicates that the raw materials were sourced and stored in hygienic and pesticide-free conditions. This aligns with AYUSH mandates on the sourcing and processing of raw drugs for traditional medicines[9].

Aflatoxins—highly carcinogenic toxins produced by *Aspergillus* species—were not detected in the formulation, as confirmed by TLC. Their absence reaffirms the importance of strict quality control during the procurement and storage of herbal ingredients[8]. According to Siddha literature, *Mai* preparations are typically external medicines with a relatively long half-life. However, *Thirimoorthi Mai* is one of the few *Mai* types recommended for internal use due to its unique processing method and composition . The grinding of mercury and sulphur with herbal juice and honey, followed by repeated trituration, is believed to neutralize the toxicity and enhance bioavailability—a concept now paralleled by the principles of nanomedicine and biotransformation. This study bridges traditional knowledge and modern science, supporting the age-old claim that processed herbo-mineral preparations, when made

authentically, are both safe and effective. It also highlights the necessity of applying modern techniques like HPTLC, ICP-OES, and microbial analysis to evaluate traditional formulations systematically. While the study successfully established the safety and standardization of *Thirimoorthi Mai*, it did not explore its pharmacological activity or therapeutic efficacy *in vivo*. Future studies should include preclinical toxicological studies and controlled clinical trials to confirm its effects on *Vaatha Thosam*, respiratory illnesses, and systemic inflammatory conditions. Pharmacokinetic and bioavailability studies are also warranted to understand how metallic constituents like mercury interact at the systemic level when processed traditionally.

CONCLUSION

The standardization and safety evaluation of *Thirimoorthi Mai* established its compliance with essential quality control parameters, confirming its suitability for therapeutic application. Organoleptic characterization demonstrated its semi-solid, greasy nature with partial solubility in multiple solvents, indicative of a complex formulation with both organic and inorganic components. Biochemical analysis confirmed the presence of essential minerals including calcium, magnesium, iron, and zinc, along with trace amounts of mercury, sulphate, carbonate, and reducing sugars, which may contribute to its pharmacological activity. ICP-OES analysis validated the absence of toxic heavy metals such as arsenic, cadmium, and lead, while mercury and sulphur were present only within permissible limits. HPTLC fingerprinting revealed four distinct phytoconstituents, providing a chemical marker for quality assurance. Safety profiling demonstrated the absence of pesticide residues, microbial contamination, specific pathogens, and aflatoxins, aligning with AYUSH and WHO standards. Collectively, these findings confirm that *Thirimoorthi Mai* is a standardized and microbiologically safe formulation with defined biochemical and phytochemical signatures, supporting its continued use in Siddha medicine. Further pharmacological and clinical investigations are warranted to substantiate its therapeutic efficacy and broaden its applicability in evidence-based traditional healthcare.

ABSTRACT

The integration of Augmented Reality (AR) and Virtual Reality (VR) technologies in educational settings has gained significant attention as potential tools for enhancing student learning outcomes. This study investigates the effectiveness of AR and VR technologies in improving conceptual understanding across various academic disciplines in classroom environments. A comprehensive analysis was conducted involving 240 students from three educational institutions, comparing traditional teaching methods with AR/VR-enhanced instruction. The study employed a mixed-methods approach, utilizing pre-and post-assessment tests, learning analytics, and qualitative feedback mechanisms. Results demonstrated a statistically significant improvement in conceptual understanding ($p < 0.001$) for students exposed to AR/VR technologies, with effect sizes ranging from 0.72 to 1.24 across different subject areas. Science subjects showed the highest improvement (Cohen's $d = 1.24$), followed by mathematics ($d = 0.89$) and social studies ($d = 0.72$). The study also revealed enhanced student engagement levels, improved retention rates, and increased motivation to learn. However, challenges including technical difficulties, implementation costs, and teacher training requirements were identified. These findings suggest that AR and VR technologies can significantly enhance conceptual understanding in classroom settings when properly implemented with adequate support systems.

Keywords: Augmented Reality, Virtual Reality, Educational Technology, Conceptual Understanding, Classroom Learning, Immersive Learning

INTRODUCTION

The rapid advancement of digital technologies has fundamentally transformed educational paradigms, offering unprecedented opportunities for enhancing teaching and learning processes (Chen *et al*., 2020). Among these technological innovations, Augmented Reality (AR) and Virtual Reality (VR) have emerged as particularly promising tools for educational applications, offering immersive and interactive learning experiences that can potentially address traditional limitations of classroom instruction (Akçayır and Akçayır, 2017). AR technology overlays digital information onto the real world, allowing students to interact with virtual objects within their physical environment, while VR creates completely immersive digital environments that can simulate real-world scenarios or abstract concepts (Radianti *et al*., 2020). These technologies offer unique affordances for education, including the ability to visualize complex concepts, provide hands-on experiences with dangerous or expensive materials, and create engaging, interactive learning environments that can accommodate different learning styles (Pellas *et al*., 2019). Despite the growing interest in AR and VR technologies for educational purposes, there remains a need for comprehensive empirical studies that examine their effectiveness in enhancing conceptual understanding across diverse academic disciplines. Previous research has shown promising results in specific domains such as medical education (Pottle, 2019) and engineering (Merchant *et al*., 2014), but limited studies have provided systematic comparisons across multiple subject areas in traditional classroom settings. The theoretical foundation for this research draws from constructivist learning theory, which emphasizes the importance of active knowledge construction through direct experience and interaction with learning materials (Piaget, 1977). AR and VR technologies align well with constructivist principles by providing experiential learning opportunities that allow students to manipulate objects, observe phenomena, and construct understanding through direct interaction with digital content (Bower *et al*., 2014). This study aims to address the research gap by conducting a comprehensive investigation of AR and VR effectiveness in enhancing conceptual understanding across multiple academic disciplines in classroom environments. The research objectives include: (1) evaluating the impact of AR/VR technologies on student conceptual understanding compared to traditional teaching methods, (2) examining differential effects across various subject areas, (3) identifying factors that influence the effectiveness of AR/VR implementation, and (4) providing recommendations for successful integration of these technologies in educational settings.

LITERATURE REVIEW

The integration of AR and VR technologies in educational settings has been extensively studied across various academic disciplines, with researchers investigating their potential to transform traditional teaching methodologies and enhance student learning outcomes. This literature review examines the current state of research on AR and VR effectiveness in educational contexts, theoretical foundations, and empirical findings that inform this study.

Theoretical Foundations of Immersive Learning Technologies

The theoretical foundation for AR and VR in education is primarily rooted in constructivist learning theory, which emphasizes active knowledge construction through direct experience and interaction with learning materials (Piaget, 1977). Constructivism suggests that learners build understanding through hands-on experiences, making AR and VR technologies particularly well-suited for educational applications due to their interactive and experiential nature (Bower *et al*., 2014). Experiential learning theory, developed by Kolb (1984), provides another theoretical framework supporting the use of immersive technologies in education. Kolb's four-stage learning cycle—concrete experience, reflective observation, abstract conceptualization, and active experimentation—aligns closely with the affordances of AR and VR technologies, which can provide concrete experiences and opportunities for active experimentation in safe, controlled environments (Jensen and Konradsen, 2018). Social constructivism, as proposed by Vygotsky (1978), emphasizes the importance of social interaction in learning processes. Recent studies have demonstrated that collaborative AR and VR environments can facilitate peer-to-peer learning and enhance social presence in educational settings (Mystakidis, 2022). The concept of the Zone of Proximal Development is particularly relevant, as

AR and VR technologies can provide scaffolded learning experiences that support students in achieving learning goals that might be difficult to accomplish independently.

Augmented Reality in Education

Research on AR applications in education has shown promising results across multiple academic disciplines. Akçayır and Akçayır (2017) conducted a comprehensive systematic review of AR in education, identifying advantages including increased student motivation, enhanced learning performance, and improved spatial skills. However, their analysis also revealed challenges such as technical difficulties, usability issues, and the need for pedagogical training for educators. In mathematics education, Kaufmann and Schmalstieg (2003) pioneered early research on AR applications for geometry instruction, demonstrating that students using AR-based tools showed significant improvements in spatial visualization skills compared to traditional instruction methods. More recent studies have confirmed these findings, with Erbas and Demirer (2019) reporting that AR applications in mathematics education led to increased student engagement and improved problem-solving abilities. Science education has been a particularly fertile ground for AR implementation. Cheng and Tsai (2013) found that AR-enhanced instruction in physics led to better conceptual understanding of abstract concepts such as electromagnetic fields and wave mechanics. Similarly, Chang *et al*. (2010) demonstrated that AR applications in chemistry education helped students visualize molecular structures and chemical reactions, resulting in improved learning outcomes and reduced cognitive load. Language learning has also benefited from AR integration, with Santos *et al*. (2014) showing that AR-enhanced vocabulary instruction led to improved retention rates and increased motivation among language learners. The visual and contextual nature of AR applications appears particularly beneficial for language acquisition, providing authentic contexts for vocabulary and grammar instruction.

Virtual Reality in Educational Settings

VR technology has demonstrated significant potential for creating immersive learning environments that can simulate real-world scenarios or abstract concepts. Merchant *et al*. (2014) conducted a meta-analysis of VR effectiveness in K-12 and higher education, finding an overall medium effect size (d = 0.71) for VR-based instruction compared to traditional methods. Their analysis revealed that VR was most effective when used to supplement rather than replace traditional instruction methods. Medical education has been one of the most successful domains for VR implementation. Pottle (2019) reviewed VR applications in medical training, highlighting the technology's ability to provide safe, repeatable practice opportunities for complex procedures. Studies have shown that medical students trained using VR simulations demonstrate better skill acquisition and retention compared to traditional training methods (Zhao *et al*., 2020). In history and social studies education, VR has proven effective for creating immersive historical experiences. Paleari *et al*. (2021) found that students using VR to explore historical sites and events showed increased engagement and better understanding of historical concepts compared to traditional textbook-based instruction. The immersive nature of VR allows students to experience historical events and locations in ways that were previously impossible. Engineering education has also benefited from VR integration, with Farra *et al*. (2019) demonstrating that VR-based training in engineering concepts led to improved spatial visualization skills and better understanding of complex mechanical systems. The ability to manipulate virtual objects and observe their behavior from multiple perspectives appears particularly beneficial for engineering education.

Comparative Studies and Meta-Analyses

Several meta-analyses have attempted to quantify the overall effectiveness of AR and VR technologies in educational settings. Radianti *et al*. (2020) conducted a systematic review of immersive virtual reality applications in higher education, identifying 88 relevant studies and concluding that VR applications generally lead to positive learning outcomes, with effect sizes ranging from small to large depending on the implementation context and subject matter. Garzón *et al*. (2019) performed a meta-analysis specifically focused on AR in education, analyzing 64 studies and finding an overall medium effect size (d = 0.68) for AR-enhanced instruction. Their analysis revealed that AR was most effective in science education, followed by mathematics and language learning. The study also identified several moderating factors, including student age, implementation duration, and technological features. Chen *et al*. (2020) reviewed the use of AR in education from 2011 to 2016, identifying trends in research focus and technological

development. Their analysis revealed increasing sophistication in AR applications and growing evidence for their educational effectiveness, while also highlighting persistent challenges in implementation and adoption.

Subject-Specific Applications and Outcomes

STEM Education: Multiple studies have demonstrated the effectiveness of AR and VR technologies in STEM education. Wu *et al*. (2013) found that AR applications in astronomy education led to improved understanding of spatial relationships and celestial movements. Similarly, Ibáñez *et al*. (2014) reported that students using AR for physics experiments showed better conceptual understanding and increased motivation compared to traditional laboratory instruction.

Mathematics Education: Research on AR and VR in mathematics education has consistently shown positive results. Radu and Schneider (2019) found that AR applications for geometry instruction led to improved spatial reasoning skills and better problem-solving performance. The visual and interactive nature of these technologies appears particularly beneficial for understanding abstract mathematical concepts.

Language Learning: AR and VR applications in language education have shown promise for vocabulary acquisition and cultural understanding. Chen *et al*. (2018) demonstrated that AR-enhanced language instruction led to improved vocabulary retention and increased cultural awareness among language learners.

Challenges and Limitations

Despite the promising results, research has also identified significant challenges in implementing AR and VR technologies in educational settings. Technical limitations, including hardware reliability, software compatibility, and network infrastructure requirements, remain significant barriers to widespread adoption (Mystakidis, 2022). Pedagogical challenges include the need for extensive teacher training, curriculum integration difficulties, and the development of appropriate assessment strategies for immersive learning environments (Jensen and Konradsen, 2018). Many educators lack the technical skills and pedagogical knowledge necessary to effectively integrate these technologies into their instruction. Cost considerations represent another significant barrier, with high-quality AR and VR hardware and software requiring substantial initial investments that many educational institutions cannot afford (Radianti *et al*., 2020). Additionally, ongoing maintenance and technical support costs can strain educational budgets.

Research Gaps and Future Directions

While existing research demonstrates the potential of AR and VR technologies in education, several gaps remain in the literature. Few studies have conducted comprehensive comparisons across multiple subject areas within the same educational context, making it difficult to determine relative effectiveness across disciplines. Additionally, most studies have focused on short-term learning outcomes, with limited research on long-term retention and transfer effects. The need for more rigorous experimental designs has been highlighted by several researchers, with many existing studies lacking appropriate control groups or randomization procedures (Garzón *et al*., 2019). Future research should employ more robust methodological approaches to provide clearer evidence of AR and VR effectiveness.

MATERIALS AND METHODS

Study Design and Participants

This study employed a quasi-experimental design with pre-and post-test measurements to evaluate the effectiveness of AR and VR technologies in enhancing conceptual understanding. The research was conducted across three educational institutions: two public high schools and one private middle school, representing diverse socioeconomic backgrounds and educational contexts. The participant sample consisted of 240 students aged 12-17 years (M = 14.8, SD = 1.6), with 52% female and 48% male participants. Students were randomly assigned to either the experimental

group (AR/VR-enhanced instruction, n = 120) or the control group (traditional instruction, n = 120). Ethical approval was obtained from the Institutional Review Board, and informed consent was secured from all participants and their guardians.

Experimental Setup and Technology Implementation

The experimental group received instruction using AR and VR technologies, while the control group received traditional classroom instruction covering identical learning objectives. The AR implementation utilized tablet-based applications and smart glasses (Microsoft HoloLens 2), while VR implementation employed head-mounted displays (Oculus Quest 2) and accompanying software applications.

Subject areas included in the study were: (1) Biology and Chemistry (molecular structures, cellular processes), (2) Mathematics (geometry, algebra concepts), (3) Physics (electromagnetic fields, wave mechanics), and (4) Social Studies (historical events, geographical concepts). Each subject area had specific AR/VR applications developed or adapted for the study objectives.

Data Collection and Assessment Instruments

Multiple data collection methods were employed to ensure comprehensive evaluation of learning outcomes:

Pre-and Post-Assessment Tests: Standardized conceptual understanding tests were administered before and after the intervention period. Tests were validated through expert review and pilot testing, with reliability coefficients ranging from 0.82 to 0.91 across different subject areas.

Learning Analytics: Digital learning platforms collected real-time data on student interactions, time spent on tasks, error rates, and completion rates. This quantitative data provided insights into learning patterns and engagement levels.

Qualitative Feedback: Semi-structured interviews and focus groups were conducted with students and teachers to gather qualitative insights about the learning experience, perceived effectiveness, and implementation challenges.

Statistical Analysis

Data analysis was conducted using SPSS version 28.0. Descriptive statistics were calculated for all variables, and normality tests were performed using the Shapiro-Wilk test. Independent samples t-tests were used to compare pre- and post-test scores between experimental and control groups. Effect sizes were calculated using Cohen's d, with values of 0.2, 0.5, and 0.8 representing small, medium, and large effects, respectively. Analysis of variance (ANOVA) was employed to examine differences across subject areas, and correlation analyses were conducted to identify relationships between variables.

RESULTS

Overall Learning Outcomes

The analysis revealed statistically significant improvements in conceptual understanding for students in the experimental group compared to the control group. Table 1 presents the comprehensive comparison of pre-and post-test scores across all subject areas. The experimental group demonstrated significantly higher improvement scores across all subject areas ($F(1,238) = 47.89$, $p < 0.001$). The largest effect size was observed in Biology ($d = 1.24$), followed by Mathematics ($d = 0.89$), Physics ($d = 0.83$), and Social Studies ($d = 0.72$).

Subject-Specific Analysis

Detailed analysis of subject-specific outcomes revealed varying degrees of effectiveness for AR/VR technologies across different academic disciplines. Figure 1 illustrates the comparative improvement rates across subjects.

Engagement and Motivation Analysis

Student engagement levels were measured using the Student Engagement Scale, which assesses behavioral, emotional, and cognitive engagement dimensions. The results shown in Table 2 demonstrate significant improvements in all engagement dimensions for the experimental group. The experimental group showed substantial improvements in all engagement dimensions, with cognitive engagement showing the largest effect size (d = 1.51), followed by behavioral engagement (d = 1.34) and emotional engagement (d = 1.29).

Learning Analytics and Interaction Patterns

Analysis of digital learning data revealed important insights into student interaction patterns and learning behaviors. Figure 2 presents the correlation between time spent interacting with AR/VR content and learning outcomes. The analysis revealed a strong positive correlation ($r = 0.74$, $p < 0.001$) between time spent interacting with AR/VR content and learning outcomes, suggesting that increased engagement with immersive technologies leads to better conceptual understanding.

Implementation Challenges and Success Factors

Qualitative analysis of teacher interviews and student feedback identified several key factors influencing the successful implementation of AR/VR technologies. Table 3 summarizes the main challenges and success factors identified in the study.

DISCUSSION

The findings of this study provide compelling evidence for the effectiveness of AR and VR technologies in enhancing conceptual understanding across various academic disciplines in classroom settings. The statistically significant improvements observed in the experimental group, with effect sizes ranging from medium to large (Cohen's d = 0.72 to 1.24), demonstrate that immersive technologies can substantially enhance learning outcomes when properly implemented. The differential effectiveness across subject areas is particularly noteworthy. Biology showed the highest improvement (d = 1.24), which aligns with previous research suggesting that AR/VR technologies are particularly effective for visualizing complex three-dimensional structures and processes that are difficult to observe directly (Pottle, 2019). The strong performance in mathematics (d = 0.89) supports the notion that spatial visualization capabilities inherent in AR/VR technologies can help students better understand abstract mathematical concepts (Merchant *et al.*, 2014). The engagement analysis reveals that AR/VR technologies significantly enhance all dimensions of student engagement, with cognitive engagement showing the largest improvement. This finding is consistent with the theoretical framework of constructivist learning, where active participation and interaction with learning materials lead to deeper understanding (Radianti *et al.*, 2020). The strong correlation (r = 0.74) between interaction time and learning outcomes suggests that the immersive nature of AR/VR technologies naturally promotes sustained engagement, leading to better learning results. However, the study also identified significant implementation challenges that must be addressed for successful adoption of these technologies. Technical issues, including hardware malfunctions and software compatibility problems, were reported by approximately 20-25% of implementations. These findings align with previous research highlighting the importance of robust technical infrastructure for educational technology success (Chen *et al.*, 2020). The pedagogical challenges, particularly the need for comprehensive teacher training, represent a critical factor in successful AR/VR implementation. The qualitative feedback revealed that teachers who received extensive professional development were significantly more successful in integrating these technologies into their instruction. This finding underscores the importance of viewing AR/VR implementation as a systemic change requiring support at multiple levels rather than simply a technological upgrade. The organizational challenges, particularly the initial implementation costs, present a significant barrier for many educational institutions. However, the substantial learning improvements demonstrated in this study suggest that the investment in AR/VR technologies can provide significant educational returns when properly implemented with adequate support systems. Limitations of this study include the relatively short intervention period (12 weeks) and the focus on immediate learning outcomes rather than long-term retention. Future research should examine the

sustained effects of AR/VR instruction over extended periods and investigate optimal implementation strategies for different educational contexts.

CONCLUSION

This comprehensive study demonstrates that AR and VR technologies can significantly enhance conceptual understanding in classroom settings across multiple academic disciplines. The substantial effect sizes observed (Cohen's d = 0.72 to 1.24) provide strong evidence for the educational value of these immersive technologies. The findings indicate that science subjects benefit most from AR/VR implementation, followed by mathematics and social studies. The study reveals that successful implementation requires addressing technical, pedagogical, and organizational challenges through comprehensive support systems, adequate teacher training, and institutional commitment. The strong correlation between interaction time and learning outcomes suggests that the immersive nature of AR/VR technologies promotes sustained engagement, leading to better educational results. Based on these findings, educational institutions considering AR/VR implementation should focus on: (1) ensuring robust technical infrastructure and support systems, (2) providing comprehensive professional development for teachers, (3) aligning AR/VR applications with specific learning objectives, and (4) developing appropriate assessment strategies for immersive learning environments. Future research should examine long-term retention effects, optimal implementation strategies for diverse educational contexts, and the development of more cost-effective AR/VR solutions for widespread educational adoption. The continued advancement of these technologies, combined with decreasing costs and increasing accessibility, suggests that AR and VR will play an increasingly important role in enhancing educational outcomes and transforming classroom learning experiences.

ABSTRACT

The increasing generation of waste across the globe, including in India, poses a significant environmental challenge that demands sustainable and innovative solutions. Utilizing waste materials for both waste management and soil stabilization presents a promising approach. This study investigates the potential of waste glass powder (WGP) as an additive to improve the engineering properties of clay soil in Kolkata, West Bengal. A series of laboratory experiments was conducted to assess the influence of WGP on parameters such as Atterberg limits, compaction characteristics and California Bearing Ratio (CBR). Findings revealed that incorporating WGP led to lower Atterberg limits and reduced swelling, alongside enhanced compaction and load-bearing capacity. Notably, the CBR values showed the most significant improvement at an 8% WGP content, indicating potential for increasing the layer coefficient in pavement design, thereby reducing both pavement thickness and construction costs. These benefits are attributed to the stabilizing role of WGP, which promotes better particle arrangement and bonding within the soil matrix. The results highlight WGP as a sustainable soil stabilizer that can contribute to environmental protection while improving geotechnical performance. Further field-based research is recommended to validate these findings and evaluate large-scale engineering applications.

Keywords: Waste Glass Powder (WGP), Soil Stabilization, California Bearing Ratio (CBR), Environmental Sustainability

INTRODUCTION

Rapid population growth, coupled with intensified human activities and industrial operations, has led to severe environmental pollution in many cities worldwide, including Kolkata, West Bengal [1–3]. One of the most pressing

issues is the generation of huge volumes of solid waste, much of which is non-recyclable. This waste is often buried in limited landfill sites that may soon reach capacity [1–3].The global rise in living standards and industrial production has resulted in a significant increase in annual waste generation, which largely comprises plastics, glass, and electronic waste, amounting to millions of tons [4,5]. According to World Bank statistics, global waste generation currently stands at approximately 2 billion tons per year and is projected to reach 3.4 billion tons by 2050—a 70% increase [6]. Waste generation per capita ranges from 0.11 to 4.54 kg per day, with high-income countries producing 34% of the world's waste despite making up only 16% of the population [6].In Iraq, waste management is a growing challenge, affecting both small towns such as Najaf and large cities like Baghdad and Erbil. Iraq is classified as an upper-middle-income country, and with rising consumption, the amount of waste produced is increasing rapidly, particularly non-biodegradable materials such as plastics and glass [7]. Waste glass is a major contributor to solid waste volumes. Globally, around 130 million tons of waste glass were generated in 2005 [9], with the United States producing about 12 million tons annually, which accounts for over 4% of municipal solid waste [10]. However, only about 33% of this waste glass is recycled in the U.S., mainly due to its relatively low economic value (around $11 per ton) [10]. In KOLKATA, glass recycling is minimal due to the lack of recycling facilities. Recycling waste glass can significantly reduce landfill usage while producing valuable construction materials [12]. Studies have shown that incorporating waste glass powder (WGP) into soil can improve engineering properties, enhance mechanical performance, and reduce environmental impacts [13,14].Expansive clay soils, common in many regions including KOLKATA, present engineering challenges due to their high shrink-swell potential, low strength, and poor load-bearing capacity [18–20]. These soils often require improvement before they can be used for infrastructure projects such as highways and railways [21]. Conventional stabilization methods using lime, cement, or bitumen are effective but costly, prompting interest in alternative, low-cost, and eco-friendly stabilizers such as waste materials [22–27].Several researchers have examined the effects of WGP on various soil types, reporting improvements in California Bearing Ratio (CBR), unconfined compressive strength (UCS), and compaction characteristics, with optimal results typically achieved with WGP content between 5% and 10% of soil mass [18,28–33]. In concrete, partial replacement of cement with WGP has also been shown to enhance compressive strength [9,33].

MATERIALS

Clay Soil

The clay soil used in this study was collected from a location between Girsheen and Duhok City, near the Suheila intersection in Zakho District, Kurdistan Region of Iraq (KOLKATA). To avoid contamination from organic matter or other external particles, the top layer of soil was carefully removed before sampling. The soil was then extracted from a depth of 1 meter below the ground surface to ensure it was representative and uncontaminated. The physical properties of the clay are summarized in Table 1.

Waste Glass Powder (WGP)

The collected windowpane glass was crushed using an automatic mechanical compactor and compaction test mold to produce glass powder. The most prevalent form of waste glass is soda-lime glass, which consists mainly of silica (SiO_2), sodium oxide (Na_2O), lime (CaO), and small amounts of alumina (Al_2O_3) and other oxides. The specific gravity of the WGP used in this study was 2.63 [34], with a density of 2.52 g/cm³ at 20°C and a Young's modulus of 72 GPa [31]. Its fineness was measured at 80% [35]. Other notable properties of glass include compressive strength of 800–1000 MPa, Mohs hardness of 5.5, bending strength of 45 MPa, and an elastic modulus of 70,000 MPa [32]. Chemical Composition of Soda-Lime Glass (Table 2).

METHODOLOGY

Atterberg Limits Test

The Atterberg limits were determined according to ASTM D4318 [39] to evaluate how WGP influences the plasticity characteristics of the clay soil, including liquid limit (LL), plastic limit (PL), and plasticity index (PI). Soil samples

were prepared with WGP content of 0%, 4%, 8%, and 12% by weight. For the LL test, the standard Casagrande device was used, with LL determined at 25 blows. The PL was obtained using the rolling method, where soil threads of 3 mm diameter were formed without crumbling.

Compaction Test

Modified Proctor tests were conducted in accordance with ASTM D1557 [40] to determine the effects of WGP on the maximum dry density (MDD) and optimum moisture content (OMC) of the soil.

California Bearing Ratio (CBR) Test

The CBR tests followed ASTM D1883 [41] standards. Soil samples with 0%, 4%, 8%, and 12% WGP were compacted to their respective MDD and OMC values obtained from the compaction tests. The specimens were placed in CBR molds (175 mm height × 150 mm internal diameter) and tested using a plunger of 50 mm diameter at a loading rate of 1.25 mm/min. A surcharge load of 5 kg was applied, and samples were soaked in water before penetration measurements were taken at depths of 2.5 mm and 5 mm. CBR values were determined at 95% of MDD. Swelling percentages were measured from dial gauge readings after the soaking period.

RESULTS AND DISCUSSION

Atterberg Limits

The natural clay soil exhibited a liquid limit (LL) of 71.6% and a plastic limit (PL) of 37.29%. Incorporating waste glass powder (WGP) into the clay resulted in a consistent reduction in Atterberg limit parameters. As the proportion of WGP increased, the LL, PL, and plasticity index (PI) all decreased gradually (Figure 1).The most significant change was observed at 12% WGP content, where the PI dropped by approximately 26% and the LL decreased by 24% compared to the untreated clay. At 8% WGP content, LL and PI were reduced by around 19% and 21%, respectively. This reduction in plasticity can be attributed to the physical and chemical nature of WGP. The high silica content and low calcium oxide in glass particles reduce the soil's capacity to retain water, thus lowering its cohesion and workability range [3,36,42–44]. The inert, non-absorbent nature of glass particles behaves similarly to sand, imparting a more granular structure to the soil, which in turn decreases water affinity and plasticity [42,43]. Such behavior is generally advantageous for engineering applications, as it can enhance shear strength and reduce the soil's susceptibility to swelling and shrinkage. These findings align closely with the results reported by [26,29,45,46], although some variations exist when compared with [47], which used different particle sizes and lower WGP contents, and with [30], which observed a different trend in PI.

Compaction Test

As shown in Figure 2, the maximum dry density (MDD) increased from 1757 kg/m³ to 1865 kg/m³ when WGP content was raised to 8%. This indicates that adding glass particles enhances the soil's compaction characteristics up to an optimum level. However, at 12% WGP, the MDD declined to 1754 kg/m³, suggesting reduced compaction efficiency beyond the optimal dosage. The initial increase in MDD can be attributed to the relatively high specific gravity of glass particles and their favorable shape and size distribution, which improve particle packing and density. The peak improvement at 8% WGP corresponds to approximately a 6.2% increase in MDD compared to untreated soil. These results align with previous studies [18,28,33], although some differences were noted compared to [26,34], which reported varying optimal contents. The reduction in MDD at higher WGP levels is likely due to particle agglomeration, which reduces inter-particle contact and hinders effective packing, ultimately lowering compaction efficiency.

Optimum Moisture Content (OMC)

Figure 3 shows that OMC increased from 16.41% to 19.05% when WGP content rose from 0% to 8%, indicating that glass powder alters the soil's physical properties in a way that increases water demand for maximum dry density. This trend may be linked to changes in particle size distribution, surface area, and water-holding capacity resulting

from WGP incorporation. At 12% WGP, OMC decreased to 15.74%, suggesting a deviation from the trend. This drop can be attributed to the predominance of silica in WGP, which has a lower specific surface area than clay. Reduced surface area lowers water retention capacity, thereby decreasing OMC. Similar findings have been reported in previous studies [28,31,36,46].Higher OMC values at moderate WGP levels are likely due to increased water retention, which supports cation exchange and better particle arrangement during compaction [48–50]. The interaction between glass and clay particles, including wetting effects, surface charge, and adhesion characteristics, appears to play a significant role in determining OMC variations.

California Bearing Ratio(CBR)

Figure 4. examines how waste glass powder (WGP) affects the physical properties of a clay–glass mix using the California Bearing Ratio (CBR) test. CBR values for WGP contents of 0%, 2%, 5%, 8%, and 12% are shown in Table 1. Results reveal that CBR peaks at 5.8% when WGP content reaches 8%, representing a 26% improvement over the control sample. The increase is linked to better particle packing as WGP fills voids in the soil, promoting stronger interparticle bonds and higher shear resistance. However, at 12% WGP, CBR slightly decreases, likely due to particle agglomeration that limits bonding efficiency. Overall, incorporating WGP enhances the strength and load-bearing capacity of clay, with optimal results at around 8% content.

CONCLUSIONS

This study shown that additionof waste glass powder (WGP) to clay soil can significantly progress its engineering properties, making it a viable soil stabilizer. Key findings include

Strength and Load-Bearing Capacity – CBR values increased with higher WGP content, peaking at 8% WGP with a 26% rise over the control, indicating optimal particle rearrangement and cohesion.

Pavement Design Benefits – The strength gain at 8% WGP supports adjustments to pavement layer coefficients, allowing for reduced thickness and lower construction costs.

Compaction Improvement – Maximum dry density (MDD) improved by about 6.2% at 8% WGP, confirming the need for optimal dosage as higher levels may reduce compaction.

Reduced Plasticity – WGP lowered Atterberg limits, with 8% WGP reducing liquid limit (LL) and plasticity index (PI) by about 19% and 21%, respectively, enhancing workability and resistance to deformation.

Overall, **8% WGP** offers the best balance between strength, compaction, and workability, making it a practical and sustainable solution for soil stabilization.

ABSTRACT

This study focuses on the ecological behaviour, habitat use, and seasonal activity of the Rufous Treepie in response to increasing habitat modification in western Rajasthan. Conducted in Hilly Memorial Park, Barmer, Rajasthan, between July 2024 and August 2025, this study explores the species' habitat utilization, foraging ecology, and seasonal behavioural patterns, contributing to a deeper understanding of avian adaptability in changing environments. The Rufous Treepie (*Dendrocitta vagabunda*) exhibited a session-wise density of 6.0–8.4 individuals/ha.The monthly relative diversity index (RDI) of the Rufous Treepie ranged from 4.55% to 9.09%, reflecting distinct seasonal ecological variations in population abundance. Point count and line transect methods were used to make observations to estimate relative abundance and spatial distribution. The results demonstrated that the Rufous Treepie exhibits strong habitat plasticity, actively utilizing mixed thorn-scrub and anthropogenic environments. Seasonal variation significantly influenced foraging frequency and social behaviour, highlighting the bird's adaptability to fluctuating resource conditions in arid zones.

INTRODUCTION

Birds inhabit a variety of ecological niches and play an important role in the sustainability of ecosystems (Ali and Ripley, 1987; Grimmett *et al*., 2011)One of them is the Rufous treepie (*Dendrocitta vagabunda*), a broad distribution within the crow family, found throughout much of the Indian subcontinent and spreading eastward into Southeast Asia to Nepal, Bhutan, Myanmar, Pakistan, and Thailand (Rasmussen and Anderton, 2012; Bird Life International, 2013). Rufous treepies are primarily arboreal and prefer regions with sparsely spaced trees and shrubs; however, they can quickly adapt to human-altered habitats, such as orchards, farms, and urban parks (Jathar and Rahmani, 2006; Rasmussen and Anderton, 2012).It is a native bird throughout its range, and it can be found in the foothills of the Himalayas, from lowland plains to elevations of around 2,200 meters (Grimmett *et al*., 2011). Rufous treepie relies on parasitism as well. The observation of a Rufous treepie (*Dendrocitta vagabunda*) feeding on a young Asian Koel (*Eudynamys scolopaceus*) in Rajkot, Gujarat, is a noteworthy example of a brood-parasitic connection. This highlights the adaptability of the koel, which normally raises its young by feeding on mynas and other corvids. As demonstrated by the case of Indian avifauna, the information provided offers important insights into the interactions between hosts and parasites. According to D. Dave (2021), Rufous treepie's innocence as a breeding foster parent to brood-parasite species makes it an ecological host. According to B. R. Jaipal and Sunil Khati (2023), an ecological study on avian fauna, the density and abundance are essential for understanding population dynamics and habitat preferences. These findings are useful since the species is an ecologically significant omnivore and scavenger that eats fruit, insects, small creatures like vertebrates, and carrion, as well as being engaged in the distribution of seeds.

MATERIAL AND METHODS

This study was carried out at Hilli Memorial Park, a semi-arid environment in the Barmer district of Rajasthan, with scrub cover and scattered trees. The park is also a significant landmark for the Thar Desert's native birds. Hilly Memorial Park stands as an essential green oasis in the rapidly urbanizing desert fringes. It not only offers a welcome respite of shade and beauty but also delivers vital ecological benefits.Hills and valleys, broken outcrops, and dunes in between identify the region, which has a semi-desert landscape. The calculation of diversity was done using a variety of methodologies. We collected primary data on avifauna using point count, line transect, and direct observation methods and techniques. Data were collected between July 2024toAugust 2025. The study was carried out in the morning from 8.00 am to 11.00 am and in the evening from 4.00 pm to 6.00 pm.Binoculars (Olympus, 10x50 DPS I) and Nikon Coolpix P900 camera were used to take pictures and record bird callsto identify the species.Salim Ali's (2002) and Grimmett *et al*.(2011)standard field guides were utilized to determine the bird species during the survey.Throughout the whole study period, comprehensive surveys were used to record data on a session basis(Buckland *et al*., 2008).

The population density of Rufous Treepie is represented by the following formula-

- Density = $\frac{\text{Number of bird species}}{\text{ð r}^2\text{where, r = Radius for circle = 20m}^2}$

- Line transect method –

$$D = n / 2l. w$$

D = Population density, n = Total no. of birds, w = Width of transect, l = Length of transect

Rufous Treepie population monitoring, a Relative Diversity Index can be expressed as

- $RDIi = Ni / \sum N$

RDIi =relative diversity (or abundance proportion) in month *i*

Ni = number of individuals counted in month *i*

∑N = total number of individuals across all months

RESULT AND DISCUSSION

The Rufous Treepie is a widely distributed corvid of the Indian subcontinent, serving as an important bioindicator species in semi-arid ecosystems. Point count surveys conducted between July 2024to August 2025 across Hilly Memorial Park revealed a consistent presence of the Rufous Treepie (*Dendrocitta vagabunda*) in all surveyed habitats, including thorn forests, scrub-dominated areas, tree-lined avenues, and semi-urban vegetated zones near human habitation. Analysis of session-wise data, encompassing pre-monsoon, monsoon, and post-monsoon periods, showed notable temporal and spatial variations in density, reflecting the species' strong dependence on vegetation structure and seasonal resource dynamics.Kumar and Sohail (2025) reported that Hilly Memorial Park has a diverse avian community, with seasonal fluctuations reflecting ecological and climatic influences. The study emphasizes the importance of ongoing monitoring and habitat management to conserve resident and migratory bird species in the park. The species demonstrates remarkable ecological flexibility, thriving both in natural habitats and human-modified environments. Notably, higher population densities were recorded in vegetation-rich areas and in zones situated near human habitation, suggesting that the bird has adapted well to moderate anthropogenic disturbances. Vegetation structure plays a crucial role in supporting the population of the Rufous Treepie. Dense tree cover provides essential foraging sites and facilitates social interaction among individuals. Lower branches often serve as resting or socializing spots, while canopy layers offer ample foraging opportunities. These structural components not only support their social behaviour but also enhance resource availability and nesting potential. The mean session-wise density of *D. vagabunda* ranged from 5.8 ± 0.5 individuals/ha in thorn forest areas during the pre-monsoon season to 8.4 ± 0.4 individuals/ha in scrub-vegetated habitats during the post-monsoon season. Scrub-dominated and tree-lined sections consistently supported the highest densities across all sessions, whereas sparsely vegetated thorn forests and open grassland edges recorded relatively lower densities.

These differences were statistically significant ($p < 0.05$, ANOVA), indicating that habitat heterogeneity and vegetation complexity significantly influenced abundance patterns. Seasonal fluctuations in density were closely associated with resource availability. During the pre-monsoon session (March–June), densities were moderate, with individuals observed actively foraging on insects, nectar, and available fruits. In contrast, the monsoon session (July–September) recorded a moderate increase in density (average 7.6 ± 0.3 individuals/ha), coinciding with enhanced vegetative growth and higher invertebrate abundance. The post-monsoon session (October–December) showed the highest mean density values (8.4 ± 0.4 individuals/ha), attributed to peak fruiting activity and abundant food resources. However, during the winter session (January–February), the density declined slightly (6.1 ± 0.6 individuals/ha) due to reduced arthropod activity and fruit scarcity. The monthly Relative Diversity Index (RDI) of the Rufous Treepie ranged from 4.55% to 9.09%, reflecting distinct seasonal ecological variations in population abundance. The low RDI during winter (November–January) indicates reduced activity and mobility, possibly due to lower insect availability and cooler temperatures that limit foraging. In contrast, the peak RDI in early summer (March–April) corresponds to the breeding season, when the species exhibits increased territorial and vocal behaviour, resulting in higher detectability. A moderate decline during the monsoon months (July–September) may be linked to heavy rainfall, dense canopy cover, and dispersed food resources, which reduce visibility and increase the likelihood of survey encounters. Ecologically, these patterns demonstrate the Rufous Treepie's adaptive response to seasonal changes in temperature, food supply, and breeding conditions, highlighting its resilience as a resident species well adapted to the semi-arid ecosystem of Barmer, Rajasthan. The Rufous Treepie is an omnivorous species with a broad diet, feeding on fruits, insects, nectar, small vertebrates, carrion, and discarded food from human settlements. Foraging behaviour was frequently observed in the upper canopy, where individuals searched for fruits and insects.

However, the species also utilized the ground and mid-canopy levels when scavenging or feeding on waste material. This dietary flexibility underscores its dual ecological role as both a seed disperser and a scavenger, making it an important contributor to ecosystem functioning. Behavioural observations showed that the species occurs alone, in pairs, or in small family groups. They display high levels of social interaction, especially during early morning hours when their distinctive metallic calls — often described as "krowwiiii kroo" — are most frequent. These vocalizations likely serve multiple functions, including territory marking, communication between mates, and group coordination. Interestingly, Rufous Treepies in Hilly Memorial Park were often seen interacting comfortably with park staff and visitors, demonstrating their adaptability to human presence and social tolerance. Ecologically, the Rufous Treepie plays a significant role in maintaining the health of semi-arid ecosystems. By consuming and dispersing seeds of various fruit-bearing plants, the species aids in forest regeneration and vegetation succession. Its scavenging behaviour contributes to nutrient recycling, helping decompose organic waste and carrion within the park's ecosystem. Such activities are vital for sustaining ecological balance, particularly in the semi-arid landscapes of western Rajasthan, where harsh climatic conditions often limit biological productivity. Session-wise density pattern of the Rufous treepie in the study area (Fig. 1). Session-wise relative diversity pattern of the Rufous treepie in the study area (Fig. 2). Assessment of the Monthly Relative Diversity Index for Rufous Treepie (Table 1). The Study Area Hilly Memorial Park, Barmer, Rajasthan(Fig 3).

CONCLUSION

The *Rufous treepie (Dendrocitta vagabunda)* was historically reported to be infrequent in arid and semi-arid terrain in Rajasthan, primarily because it prefers wooded and greener environments. Nevertheless, over the past 5-6 years, it can be assumed that its frequency of occurrence is on the rise, as can be observed in the field. This transformation is associated with the continuous alteration of habitats in the desert ecosystem, particularly the increase in greenery through afforestation and plantation drives, as well as the development of irrigated agricultural areas. More foraging and nesting places of this species have been established with the development of the agro-ecosystems and tree cover in formerly barren landscapes. This perspective is supported by several studies in Rajasthan and other surrounding desert zones. Western Rajasthan's agricultural areas have also been proven to sustain a high degree of avifauna variety (Sharma and Tiwari, 2013). Similarly, the Indira Gandhi Canal and its associated irrigation networks have increased vegetative cover and, as a result, bird diversity in the Thar Desert (Choudhary and Choudhary, 2018). Wider scans show that agriculture and water-based greenery may maintain habitats for numerous bird species in India (Sundar and Subramanya, 2010). These findings show that landscape greening and agricultural development in Rajasthan increased the local abundance of Rufous treepie. The recent rise in sightings of this species is presumably a response to the increase in habitat variety in an ordinarily arid region of the planet. The study highlights the ecological importance of Hilly Memorial Park as a functional refuge supporting avian diversity within the arid zone and underscores the need to integrate urban green infrastructure into regional conservation frameworks.

ABSTRACT

The current study's primary goal was to create and assess proliposomes loaded with apremilast for oral medication administration. Apremilast is a drug used to treat psoriatic arthritis and some forms of psoriasis. To increase the oral bioavailability of Apremilast, proliposomes loaded with the drug were made using the solvent evaporation method with different amounts of lipids, such as cholesterol and Soy-Phosphatidylcholine (SPC) and Hydrogenated Egg Phosphatidylcholine (HEPC). Proliposomes were evaluated for short-term stability, in-vitro drug release, release kinetics, and entrapment efficiency and particle size. Lecithin concentration rose as a result of the proliposomes loaded with apremilast having a higher encapsulation efficiency. The entrapment efficiency of the proliposome formulation rises from 82% to 98%.

Keywords: Oral Drug Delivery, Drug Release, Proliposome, Psoriatic Arthritis, and Apremilast

INTRODUCTION

In the pharmaceutical industry, the successful formulation and commercialization of novel pharmaceuticals is severely hampered by the fact that many existing drug compounds and the vast majority of recently discovered chemical entities are poorly soluble in water. The formulation design can be a helpful strategy to enhance the absorption and, consequently, the oral bioavailability of such drug candidates, as the dissolution phase is frequently the rate limiting step. For the long-term treatment of numerous illnesses, the oral route has been the primary drug delivery method. The high lipophilicity of the medicine itself hinders oral administration of 50% of pharmacological compounds. Almost 40% of potential novel medications have poor water solubility. Low bioavailability, inter-intra-subject variability, and lack of dosage proportionality are often linked to oral delivery of such medications.BCS is a scientific paradigm that uses intestinal permeability and aqueous solubility to categorize pharmacological compounds. The BCS considers three key elements that influence the rate and degree of drug absorption in conjunction with the pharmaceutical product's dissolution. The BCS classifies drug compounds in the following ways:

Class 1: High Permeability and Solubility
Class 2: High Permeability – Low Solubility
Class 3: Low Permeability and High Solubility
Class 4: Low Permeability/Low Solubility

MATERIALSANDMETHODS

Yarrow Chem Products, located in Mumbai, India, provided the phosphatidylcholine (HEPC), apromilast, and hydrogenated egg. We purchased methanol, microcrystalline cellulose (MCC), cholesterol, and soy-phosphatidylcholine (SPC) from S.D. Fine Chem. Ltd. in Mumbai, India.

Apremilast Proliposome Preparation

Lipids, including cholesterol and hydrogenated egg phosphatidylcholine (HEPC) and soy-phosphatidylcholine (SPC), were combined in different proportions to create Apremilast proliposomes. Table 6 provides a summary of formula compositions. Proliposomes were prepared using the solvent evaporation method. Drug, cholesterol, and a specific lipid were combined to create a solution in ethyl alcohol. When heated to 40°C in a water bath, all of the compositions created transparent solutions. As support, microcrystalline cellulose (MCC) was introduced. The flask was connected to a rota-vapor and spun at 100 rpm while submerged in a water bath at 40°C. Until all of the ethyl alcohol had evaporated, the procedure was repeated. The film was scraped off the walls with a spatula, and the resulting powder was vacuum-sealed to eliminate any remaining solvent residue. After drying, the powder was run through a 60-mesh (250 μm) screen, which produced a powder that flowed freely. HPMC capsules of size "1" were filled with the developed compositions. The capsules were manually filled with both proliposomal formulations and pure medication with an equivalent potency of 100 mg.

Evaluation of Apremilast Proliposome

Determination of Entrapment Efficiency (EE %)

To separate the entrapped drug from the unentrapped drug, 1 milliliter of proliposome was centrifuged for one hour at 15,000 rpm. The silt was lysed using buffer solution after the supernatant was removed, and a UV spectrophotometer was used to perform spectrophotometric analysis at 254 nm. The following formula was used to determine the EE% of Apremilast in the prepared proliposome. EE% is equal to [Amount of Apremilast Entrapped / Total Amount of Apremilast] × 100.

Photomicroscopic analysis and scanning electron microscopy

The vesicles were inspected using an optical microscope and captured on camera at a 10x magnification. A scanning electron microscope was used to determine the optimized formula's morphology. To make this decision, one drop of

optimized proliposome was applied to a copper grid covered with collodion. The grid was then allowed for approximately two minutes to allow the proliposome to dry and stick to the collodion.

Particle size and zeta potential determination

The Malvern Zetasizer (Malvern, UK) was used to measure the particle size, zeta potential, and polydispersity index (PDI) of each produced proliposome using the dynamic light scattering (DLS) technique at 25 oC. Prior to being exposed to measurements, the liposomal colloidal dispersion loaded with benazol was diluted with filtered water.

Vesicle size analysis

Niosomes produced following proliposome hydration with and without agitation were subjected to size and size distribution analyses. Following hydration, the niosomal dispersion was examined using an optical microscope and a 40x magnification eyepiece micrometer that was calibrated using a stage micrometer.

Analysis of drug content

A standard capacity flask containing 10 mg of the medication was filled with proliposomes. For fifteen minutes, they were lysed using 25 milliliters of a pH 6.8 phosphate buffer solution. After two hours of stirring, this was left to stand for five hours. After filtering the solution, the drug content was determined by spectrophotometric analysis of the samples at 254 nm. % drug content is equal to the ratio of theoretical to practical drug content x 100.

***In vitro* drug release studies**

A USP type I dissolution apparatus (Lab India, India) was used to release an Apremilast proliposome enclosed in an HPMC capsule shell. Each jar included one capsule in 900 milliliters of dissolution media, such as phosphate buffer pH 6.8, and was kept at 37.0 ± 0.5 °C for 30 minutes while being continuously stirred at 50 rpm. At various intervals (5, 10, 15, 20, 25, and 30 minutes), a 5-milliliter aliquot of the sample was taken out, and the same volume was substituted with brand-new phosphate buffer (pH 6.8). The absorbance at λmax of 254 nm was used to spectrophotometrically assess the amount of Apremilast released.

Drug Release Kinetics

The Higuchi equation, zero order, and first order kinetics were used to examine the release data in order to investigate the drug release from the Apremilast proliposome. By fitting the data to the Korsmeyer/Peppas model, the release mechanism was comprehended.

RESULTS AND DISCUSSION

Preparation of Apremilast Proliposome

Apremilast proliposomes were formulated with lipids, such as Soy-phosphatidylcholine(SPC)and hydrogenated egg phosphatidylcholine (HEPC) and cholesterol at various ratios. Formula compositions are summarized in Table 6. Preparation of proliposomes was done following a solvent evaporation method. A solution containing drug, selected lipid, and cholesterol was prepared in ethyl alcohol. All the compositions formed clear solutions when warmed at 40°C in water bath. Microcrystalline cellulose (MCC) was added as support. The flask was immersed in a water bath (40°C) and attached to a rotavapor (Buchi rotaevaporator, Singapore) and rotated at 100 rpm. The process was continued until all the ethylalcohol has evaporated. By using a spatula, the film was removed from the walls, and the obtained powder was kept under vacuum to remove final traces of the solvent.

Evaluation of Apremilast Proliposome

1 ml of proliposome was centrifuged at 15,000 rpm for 1 hour to allow the separation the entrapped drug from the un-entrapped drug. After removal of the supernatant, the sediment was lysed using buffer solution and then analyzed spectrophotometrically at 254 nm using UV spectrophotometer. The EE% of Apremilast in the prepared proliposome was calculated applying the following equation. EE% = [Amount of entrapped Apremilast /Total

amount of Apremilast] × 100. The Bifonazole-loaded liposomal colloidal dispersion was diluted with purified water before being subjected for measurements. Size and size distribution studies were done for niosomes obtained after hydration of proliposome with agitation and without agitation. After hydration, the niosomal dispersion was observed under optical microscope with a calibrated eyepiece micrometer which is calibrated with a stage micrometer at 40x magnification. Proliposome equivalent to 10 mg of drug were taken into a standard volume flask. They were lysed with 25 ml of pH 6.8 phosphate buffer solution for 15 min. This was then stirred for 2 hour and allowed to stand for 5 hours.

***In-vitro* drug release studies**

In-vitro release of Apremilast proliposome filled in HPMC capsule shell was carried out using a USP type I dissolution apparatus (Lab India, India). Each jar was provided with one capsule in 900 ml of dissolution media, i.e., phosphate buffer pH 6.8 and maintained at temperature of 37.0 ± 0.5 °C with continuous stirring at 50 rpm for 30 minutes. An aliquot of 5 ml sample was withdrawn at different time intervals (5, 10, 15, 20, 25 and 30 minutes) and the same volume was replaced with fresh phosphate buffer pH 6.8. The content of Apremilast released was spectrophotometrically analyzed by measuring the absorbance at λmax of 254 nm.58

CONCLUSION

Apremilast loaded proliposome formulations were successfully prepared by solvent evaporation method and such formulation could act as a promising alternative to conventional tablets.Further research can be directed towards animal testing to evaluate the in vivo efficacy of the drug.

ABSTRACT

The Kröhnke method has been used to create the terpyridine (tpy)-based ligand 4-(naphthalen-1-yl)-2,6-Di(pyridin-2-yl)pyridine (NDPP). They were complexed with La(III), Sm(III) and Eu(III) ions to assess their binding behaviour. This produced fascinating coordination compounds with the formulas [La(NDPP)$(NO_3)_2H_2O$], [Sm(NDPP)$(NO_3)_2H_2O$] and [Eu(NDPP)$(NO_3)_2H_2O$], as well as intriguing spectroscopic features. In order to elucidate structure-property relationships, as well as to demonstrate the impact on the terpyridine scaffold and the role of the metal on the complexes, their absorption and emission behaviours in varying concentrations were examined. Since then, lanthanides (Ln) have been used to treat a variety of ailments with varying degrees of effectiveness due to their antibacterial properties. All investigations examining the Ln(III) complexes' antibacterial properties Overall, it was found that the NDPP's antimicrobial activity is enhanced by complexation with Ln because it is antimicrobial activity of the Ln complexes is greater than that of the free ligand (NDPP). In some circumstances, Ln complexes have antibacterial activity that is comparable to or even superior to that of conventional antimicrobial drugs. In comparison to [La(NDPP)$(NO_3)_2H_2O$] and [Eu(NDPP)$(NO_3)_2H_2O$], the [Sm(NDPP)$(NO_3)_2H_2O$] complex exhibits greater antimicrobial activity. Significant research has been done on the NDPP ligand's and its Ln(III) complexes' antioxidant properties. The Eu(III) complex, among the lanthanide complexes tested, exhibits the highest activity. Compared to the other lanthanide ions, it is

more effective at squelching the DPPH radical. When compared to the Sm(III) and La(III) complexes discovered in them, the complex Eu(III) had outstanding antioxidant activity.

Keywords: Terpyridine, lanthanides, antimicrobial and antioxidant studies

INTRODUCTION

Terpyridine or tpy, discovery in the early 1930 s by Morgan and Burstall [1,2] terpyridine, or tpy, has piqued people's curiosity. Since this ground breaking study, a slew of derivatives has been created by grafting various substituents onto the terpyridine core utilizing a variety of synthetic methods [3-6]. Terpyridine molecules have three nitrogen atoms, making them capable of chelating a wide spectrum of ions from the main group, transition metals, and even lanthanides. The thermodynamic chelate effect adds to the stability of coordination compounds containing transition metal centres, and the s-donor/p-acceptor nature of the dative M—N pyridine bond also helps to the stability of the resultant coordination compounds. By altering the nature of the metal, the substitution pattern of the tpy moiety, and lastly the character of the other ligands engaged in the coordination sphere, a variety of complexes were created. The nature of the substitution pattern onto the tpy ligand allows these complexes to have fascinating redox and photo physical properties, which can be fine-tuned. These molecules have found uses in a variety of sectors, including photovoltaic materials [7,8], Nano materials [9,10], biomarkers [11,12], medicinal chemistry [13-15] and catalysts [16]. Terpyridines and their derivative complexes are also commonly used in supramolecular chemistry. Later, it was discovered that compounds containing lanthanide(III) ions have antithrombosis characteristics, but due to side effects, their usage in this sector was constrained. Research into the anti-atherosclerotic properties of this class of chemicals was stimulated by the discovery that lanthanum chloride decreased excessive calcium deposition and hence delayed the development of atherosclerotic plaque. The widest application of gadolinium(III) ion complexes in medicine is in imaging diagnostics. They are frequently employed in magnetic resonance imaging for both diagnostic and therapy progress monitoring [17-20]. Furthermore, because of their emission in the Near-infrared (NIR) region, which can be detected through animal tissue of great thickness, lanthanide(III) ions, such as Nd(III), Sm(III), or Yb(III) ions, are ideal factors for luminescence imaging *in vivo* [21]. From the condensation reaction of 2-acetyl pyridine and 1-naphthaldehyde with ammonia, we can make tridentate Schiff base 4-(naphthalen-1-yl)-2,6-Di(pyridin-2-yl)pyridine (NDPP). Various approaches were used to establish the structure of the ligand and its lanthanide complexes (La, Sm and Eu), including elemental analysis, molar conductivity, UV–visible, NMR, and infrared (IR) spectroscopies. The biological activities of the free ligand and its lanthanide complexes were further studied utilising agar well diffusion and minimum inhibitory concentration (MIC) methods to assess their antibacterial activity against diverse harmful bacterial strains. In addition, using the 2,2 diphenyl1picrylhydrazyl (DPPH) test method, the antioxidant properties of the free ligand and its complexes were assessed in terms of their radical scavenging capability.

EXPERIMENTAL

Materials and reagents: $[Ln(NO_3)_3(H_2O)_6]$ (Ln = La, Sm), $[Eu(NO_3)_3(H_2O)_5]$, 1-naphthaldehyde, 2-acetyl pyridine and ammonia were purchased from Sigma Aldrich Chemical Company. All other solvents and reagents were of analytical grade are used without further purification.

Synthesis of Schiff base NDPP ligand: To a solution of 2-acetylpyridine (7.74 g; 64 mmol) in ethanol (100 mL) are added 1-naphthaldehyde (5 g; 32 mmol), 85% potassium hydroxide pellets (3.08 g; 47 mmol) and 25% aqueous ammonia (58 mL) using one-pot methodology. The reaction mixture was stirred at room temperature for 24 h. The solid was then filtered on a glass-sintered funnel and washed with ice-cold 50% methanol until washings were colourless. The product was dried under vacuum. The ligand was obtained as a light yellow solid. An analytical

sample was obtained by recrystallization in methanol. Molecular formula of ligand $C_{25}H_{17}N_3$.The synthesis of ligand NDPP shown in scheme1**.**

^{1}H NMR (400 MHz, $CDCl_3$) δ: 7.68-7.47(m,6H), 7.87-7.85(d,1H),8.13 7.96(m,4H), 8.34-8.26(dd,1H), 8.5(s,1H),8.71-8.6(m,4H),8.78-8.77(d,1H).

NDPP LIGAND ^{13}CNMR: (100MHz, $CDCl_3$)

δ:121.60,122.11,123.16,123.56,125.08,125.18,126.15,126.27,126.38,126.87,127.65,127.89,128.27,129.24,129.60,130.58,131.65, 134.00,137.51,138.19,138.37,140.68,149.88,150.49,155.29,155.6

Synthesis of lanthanide complexes: Lanthanide complexes were prepared by refluxing and stirring 1:2 ratio of metal [La $(NO_3)_3(H_2O)_6$], (0.5 g, 0.1 mmol) and ligand (1g, 0.3 mmol) on a water bath for 8 h. After cooling to room temperature the precipitate was collected then washed with methanol for several times and dried in vacuum at room temperature All Other Sm and Eu complexes were prepared in a similar manner.

RESULTS AND DISCUSSION

Characterization of NDPP ligand: The ligand NDPP structure is identified by elemental analysis, MASS, IR, ^{1}H NMR and ^{13}C NMR spectral studies. The synthetic route for the NDPP ligand is presented in Scheme 1. The results of elemental analysis with molecular formula and the percentage yield of the NDPP are presented in Table 1. Mass spectrum of NDPP as shown in figure 1. ^{1}HNMR and ^{13}C NMR spectrum of ligand both full and expanded in figure 2 to 3.

Characterization of lanthanide complexes: The isolated solid complexes were characterized by elemental analysis, Mass, IR, molar conductance, UV–visible spectroscopy. All these complexes are stable in air at room temperature, non-hygroscopic, insoluble in water and most organic solvents and soluble in DMF and DMSO solvents. Various attempts to obtain the single crystals of the complexes have so far been unsuccessful. The yields, molar conductivity values and elemental analysis of Ln(III) complexes and ligand NDPP are summarized in Table 1. The stoichiometry of the complexes derived from elemental analysis correspond to the general formula [La(NDPP)$(NO_3)_2H_2O$],]. These propositions are also in accord with molar conductivity measurements, IR, and UV–Visible presented in the following sections. The Mass spectrum of [Eu(NDPP)$(NO_3)_2H_2O$] complex as shown in figure 6.

Molar conductivity measurements: The molar conductivities of the Ln(III) complexes in DMF solutions at 25 ◦C were measured and tabulated in Table 1. The molar conductivity values are in the range reported for 1:1 electrolytes reveals that the all complexes are non-electrolytes (Λm = 24.95–32.27 Ω^{-1} cm^2 mol^{-1}) [27,28].

Infrared spectroscopy: The important infrared frequencies along with the tentative assignment of the ligand NDPP, and its respective Ln(III) complexes are presented in Table 2. The IR spectra of the La complexes displayed the ligand characteristic bands with the appropriate shifts due to complex formation and the infrared of the other Ln(III) complexes displays the same manner. It was found that the C=N of the azomethine group occurs at 1668 cm^{-1} in the free NDPP. After complexation, these bands are shifted to lower wave numbers by 36 to 49 cm^{-1} indicates a double bond character of the imine bonds and a coordination of the azomethine nitrogen atoms to the Ln(III) ion [29,30]. This coordination was further supported by the appearance of a medium intensity band around 440 to 454 cm^{-1} assigned to (Ln–N) vibration. This coordination was further supported by the appearance of a medium intensity band around 464 to 471 cm^{-1} assigned to (Ln–O) vibration. In addition, the IR spectrum of the complex exhibits a broad band between 3443 to 3425 cm^{-1}, which is attributed to the stretching frequency of (O–H), in the spectra of the Ln(III) complexes, with an increase in the intensity indicating that the hydroxyl oxygen is coordinated to the Ln(III) ion without proton displacement. IR Spectrum of [Eu(NDPP)$(NO_3)_2H_2O$] complex shown in figure 4.

UV–visible spectroscopy of complexes: UV–Vis absorption spectra of the lanthanide complexes were carried out in DMF solvent at room temperature. The UV–Vis spectra values of the maximum absorption wavelength (**λ** max),

frequency of Ln(III) complexes {Ln = La, Sm, and Eu} and their assignment are listed in Table 3. [31-33]. The Electronic spectrum of [La(NDPP)$(NO_3)_2H_2O$] complex as shown in the figure 8. The absorption spectrum of the complexes shows maxima at 284, 326, nm. The intensity bands are attributed to the $\pi\rightarrow\pi^*$ transitions of the aromatic ring. The absorption band at λmax = 351, 366 and 383 nm corresponds to the $n\rightarrow\pi^*$ transition of the azomethine group C=N conjugation between the lone pair of electrons of p-orbital of N-atom in C=N. Electronic spectrum of [La(NDPP)$(NO_3)_2H_2O$] complex shown in figure 5.

Antimicrobial activity: The MIC of the ligand L and its Ln(III) complexes against different types of Gram-negative, Gram-positive bacteria and Fugal activities were determined and tabulated in Table 4. DMSO was used as a negative control and CEFADROXIL used as positive standards for antibacterial. FLUCONAZOLE was used as a reference for antifungal studies. These compounds exhibit moderate to strong antimicrobial activity. Comparatively a better activity is found for the bacteria rather than the fungi. The Sm(III) complex exhibits a higher activity than the other metal complexes towards fungal species. The Sm(III) complex shows a good activity, especially against the Gram-negative and Gram positive bacteria such as *E. coli* and *S.aureus*. The antimicrobial activity of the complexes is greater than those of the free ligand, this indicates that the complexation to metal enhances the activity of the ligand. This is explained on the basis of Overtone's concept and chelation theory. [34, 35].

Antioxidant activity: The antioxidant activity of the ligand NDPP and its Ln(III) complexes have attracted increasing interests and been substantially investigated [36]. Figure 7 shows the plots of DPPH• free radical scavenging activity % for the ligand NDPP and its Ln(III) complexes. It is obvious that the scavenging activity increases with increasing sample concentration in the range tested. As shown in Table 5, The free radical scavenging activity of NDPP and its lanthanide complexes was determined by their ability to bleach DPPH radical, which has been previously reported. This assay provides information on the reactivity of a compound with a stable free radical. Ln(III) complexes are significantly more efficient in quenching DPPH radical than free ligand NDPP. The antioxidant activity of the Schiff base is due to hydrogen- or electron-donating tendency to DPPH• so as to produce a stable diamagnetic molecule. Molecules with greater ability to donate electrons or hydrogen to DPPH• have a higher antioxidant activity. The interaction of NDPP with the positively charged Ln(III) increases the electron density drawn from the nitrogen and oxygen atoms, which makes the N─ H or O─ H bonds more polarized. Among the examined lanthanide complexes, the La(III) complex has the highest activity. It can quench the DPPH radical more efficiently than the other lanthanide ions. In them, complex Eu(III) exhibited excellent antioxidant activity compare with La(III) and Sm(III) complexes found to have IC_{50} value and (%) inhibition [37,38]. Addition of Ln complex to DPPH radical as shown in the figure 8. The MIC of the NDPP and its Ln(III) complexes against different types of Gram-negative, Gram-positive bacteria and Fugal activities were determined and tabulated in Table 4. DMSO was used as a negative control and CEFADROXIL used as positive standards for antibacterial. FLUCONAZOLE was used as a reference for antifungal studies. These compounds exhibit moderate to strong antimicrobial activity. Comparatively a better activity is found for the bacteria rather than the fungi. The Sm(III) complex exhibits a higher activity than the other metal complexes towards fungal species. The Sm(III) complex shows a good activity, especially against the Gram-negative and Gram positive bacteria such as *E. coli* and *S. aureus*. The antimicrobial activity of the complexes is greater than those of the free ligand this indicates that the complexation to metal enhances the activity of the ligand. This is explained on the basis of Overtone's concept and chelation theory. Chelation tends to make the ligand a more powerful and potent bacterial agent. A possible explanation for this increase in the activity upon chelation is that, in a chelated complex, the positive charge of the metal is partially shared with donor atoms present in the ligands and there is an electron delocalization over the whole chelated ring. This, in turn, increases the lipoid layers of the bacterial membranes. Generally, it is suggested that the chelated complexes deactivate various cellular enzymes, which play a vital role in various metabolic pathways of these microorganisms. Other factors such as solubility, conductivity, and dipole moment that are affected by the presence of metal ions may also be the possible reasons for increasing the biological activity of the metal complexes as compared to the ligand from which they are derived [39,40].

CONCLUSION

In this work the tridentate Schiff base ligand NDPP and its Ln(III) complexes are synthesized and characterized. Analytical and spectral data reveal that the ligand NDPP coordinates to the central Ln(III) ion [La(III), Sm(III) and Eu(III)] with coordination number 8. The antimicrobial activity results show that the synthesized Ln(III) complexes possessed good antibacterial activity higher than that of the corresponding ligand NDPP. The antioxidant activity of the Ln(III) complexes on $DPPH^{\bullet}$ is concentration dependent and higher than that of the free ligand NDPP. The $[Sm(NDPP)(NO_3)_2H_2O]$ complex show good anti-microbial and $[Eu(NDPP)(NO_3)_2H_2O]$ shows good anti-oxidant compared with $[Eu(NDPP)(NO_3)_2H_2O]$.

ABSTRACT

Breast cancer detection at an early stage greatly improves patient survival, making accurate mammographic image analysis a crucial task in diagnostic radiology. This research presents an optimized novel multi-threshold image segmentation model using Particle Swarm Optimization (PSO) and its adaptive extension, Dynamic Particle Swarm Optimization (DPSO). The proposed model determines optimal threshold values by maximizing between-class variance to achieve precise separation of dense, fatty and abnormal breast tissues. Extensive experiments demonstrated that the DPSO model achieved higher segmentation quality than traditional methods, with improved structural preservation and clearer lesion boundaries. Quantitative results revealed average improvements of 10.7% in between-class variance, 5.3% in PSNR and 3.7% in Dice similarity compared to Otsu's method. The adaptive population adjustment in DPSO enhanced convergence speed and reduced stagnation, enabling reliable identification of suspicious masses and calcifications. The findings confirm that the proposed optimization-based segmentation framework enhances tissue contrast, reduces misclassification and supports early and accurate detection of breast abnormalities, providing a strong foundation for future intelligent diagnostic systems.

Keywords: Multi-threshold Image Segmentation model; Image Segmentation; Particle Swarm Optimization (PSO); Dynamic PSO (DPSO); Breast Cancer Detection.

INTRODUCTION

Breast cancer remains one of the leading causes of mortality among women worldwide and early detection is the most effective strategy for reducing its fatality rate [1][2]. Mammography continues to be the primary imaging technique for screening and diagnosis because of its high sensitivity to subtle tissue variations. However, interpreting mammograms is often challenging due to low contrast, overlapping tissue structures and noise artifacts that obscure lesion boundaries [3]. These challenges necessitate the use of reliable computer-aided diagnostic (CAD) techniques capable of enhancing image features and automatically identifying regions of clinical interest.Image segmentation plays a crucial role in mammographic image analysis, serving as the foundation for subsequent stages such as feature extraction, lesion classification and diagnosis. Traditional thresholding methods, such as Otsu's or entropy-based algorithms, rely solely on histogram statistics to divide an image into homogeneous regions. While effective for simple, bimodal distributions, these methods tend to perform inadequately in mammograms, where intensity distributions are complex and overlapping due to the coexistence of fatty, glandular and dense tissues [4]. Consequently, global optimization approaches have gained prominence for solving the multi-threshold segmentation problem more efficiently and adaptively.Particle Swarm Optimization (PSO), inspired by the social behaviour of flocks and swarms, has proven to be a powerful global optimization tool for image segmentation. It searches for optimal threshold sets by iteratively refining candidate solutions through cooperation among particles in a population [5]. However, standard PSO may suffer from premature convergence, especially in high-dimensional search spaces or when image contrast is weak. To overcome these limitations, this research introduces a Dynamic Particle Swarm Optimization (DPSO) framework capable of maintaining population diversity and adapting its parameters during runtime. Global optimization algorithms such as Particle Swarm Optimization (PSO) provide a promising alternative by formulating segmentation as an optimization problem [6]. PSO can explore a wide solution space and identify optimal threshold values that maximize class separability. Nevertheless, standard PSO suffers from certain limitations, including premature convergence, loss of diversity and reduced performance when applied to high-dimensional segmentation tasks. These issues can result in suboptimal threshold selection, which compromises lesion localization and tissue differentiation.

Conventional segmentation methods, such as Otsu's thresholding, histogram-based techniques and region-growing methods, are limited when dealing with complex or multimodal intensity distributions common in mammograms [7]. They rely on local statistical information and often fail to capture the subtle transitions between different tissue types. Furthermore, traditional methods are sensitive to parameter selection and lack adaptability when processing images with varying illumination and density patterns.To overcome these challenges, this research introduces an enhanced optimization-based segmentation framework that integrates Dynamic Particle Swarm Optimization (DPSO) for adaptive threshold selection in mammographic images. The approach dynamically adjusts swarm parameters and regenerates particles to maintain diversity, ensuring improved convergence and higher segmentation accuracy [8]. By optimizing threshold values through between-class variance maximization, the method aims to delineate dense, fatty and abnormal regions more effectively. This framework contributes to building a reliable foundation for automated Computer-Aided Detection (CAD) systems in breast cancer screening.

The main objective of this research is to design and validate an efficient optimization-based multi-threshold segmentation model using PSO and DPSO for mammographic image analysis. To achieve this, several specific objectives were defined:

- To analyse and refactor existing segmentation algorithms for improved modularity, reproducibility and computational stability.
- To implement the standard PSO and Dynamic PSO algorithms for multi-threshold image segmentation, focusing on maximizing betweenclass variance for precise region separation.

- To conduct parameter tuning and baseline experiments to identify optimal hyperparameterssuch as inertia weight, acceleration constants and population sizethat yield consistent segmentation results across different mammographic images.
- To evaluate the segmentation quality using quantitative and qualitative metrics, including Peak Signal-to-Noise Ratio (PSNR), Structural Similarity Index (SSIM), Dice Similarity Coefficient (DSC), sensitivity and specificity.
- To compare the performance of PSO and DPSO models with conventional thresholding methods, particularly Otsu's approach, to demonstrate the advantages of global optimization.

The proposed model applies PSO and DPSO techniques for multi-threshold segmentation of mammographic images. The study focuses on optimizing threshold values that maximize between-class variance, ensuring that distinct tissue types are well separated [9]. The work is divided into three phases, with Phase I concentrating on algorithmic analysis, parameter tuning and baseline validation using standard mammographic datasets. The research contributes to improving diagnostic accuracy and reducing radiologist workload by providing a consistent and automated segmentation framework.

MATERIALS AND METHODS

The research was devoted to analysing the existing multi-threshold image segmentation framework, reproducing its behaviour and developing a stable, modular baseline for future algorithmic improvements. The original code employed population-based optimization techniquesspecifically Particle Swarm Optimization (PSO) and Dynamic Particle Swarm Optimization (DPSO)to identify optimal threshold values for grayscale and colour images. This phase focused on organizing, understanding and validating the computational workflow, preparing it for enhancement in subsequent stages.

Code Modularization and Refactoring

The segmentation process begins by reading the input image and determining whether it is grayscale or colour. A histogram of pixel intensities is computed to represent the probability distribution of intensity levels [10]. The objective of the optimizer is to select threshold values that maximize the between-class variancea measure that quantifies how well the thresholds separate distinct intensity regions. The number of thresholds L is defined by the user.Each particle in the swarm represents a candidate solution containing Lthreshold values.Thresholds are randomly initialized within the intensity range [0,255], ensuring they are sorted in ascending order to maintain valid segment boundaries.For each particle, the corresponding segmented image is generated and the initial fitness value (between-class variance) is calculated.For grayscale images, the between-class variance $F(T)$is calculated as given in Eq.1.

$$F(T) = \sum_{i=0}^{L} w_i(\mu_i - \mu_T)^2 \quad \text{Eq.1}$$

where $w_i$is the probability of class i, $\mu_i$is the mean intensity of class i and$\mu_T$is the global mean intensity.For colour images, this is computed independently for each channel and the overall fitness is the average of the three channels.Particles update their velocities and positions according to the standard PSO equations as given in Eq.2.1. & Eq.2.2 respectively.

$$v_i^{t+1} = w \cdot v_i^t + c_1 r_1(pbest_i - x_i^t) + c_2 r_2(gbest - x_i^t) \quad \text{Eq.2.1}$$

$$x_i^{t+1} = x_i^t + v_i^{t+1} \quad \text{Eq.2.2}$$

Where$w$ is the inertia weight, $c_1$and $c_2$are acceleration constants and$r_1, r_2$are random numbers between 0 and 1.The Eq.2.1, determines and updates the particle velocity by combining three influences including previous velocity, cognitive positioning and best-known position of the swarm. The follow-up in Eq.2.2, it updated the particle position through addition of new velocity initiating its next move in the search space medium. In the DPSO variant, particles may be dynamically added or removed depending on improvement trends. Poorly performing particles are replaced by new candidates generated near the global best, which improves search diversity.Iterations continue until a maximum number of iterations or a convergence threshold is reached. The best threshold set is then applied to the

image to generate the segmented output. The algorithm outputs threshold values [11], fitness progression, execution time and the segmented image.To ensure the refactored code reproduced the original behaviour, a series of validation experiments were conducted. Random seeds were fixed to ensure consistent particle initialization. Fitness curves and final thresholds were compared between runs to verify deterministic results under identical conditions.Otsu's multi-thresholding method was implemented as a deterministic baseline [12]. The PSO- and DPSO-based thresholds were compared to Otsu's results in terms of between-class variance, segmentation accuracy and boundary clarity.Iteration-wise convergence plots were generated to analyse optimizer stability. Experiments were repeated ten times per image and mean and standard deviation of results were reported. This practice provided a quantitative measure of algorithm consistency and robustness [13].While the research primarily focused on reproducing the original framework, several practical improvements were introduced to enhance efficiency and usability like randomizing thresholds uniformly where initial positions were biased toward histogram peaks, enabling faster convergence and more meaningful starting solutions.Each computational stepfrom histogram construction to threshold optimization[14] was examined, validated and documented. The results of this phase provide a verified baseline upon which advanced optimization techniques, hybrid fitness measures and perceptual segmentation strategies can be built in later stages of the research.

Proposed Model

The proposed model aims to perform accurate and efficient multi-threshold image segmentation by employing a population-based optimization framework. The segmentation problem is formulated as an optimization task, where the objective is to determine the optimal set of threshold values that maximally separate the intensity classes of an image. The approach integrates the principles of classical Particle Swarm Optimization (PSO) with adaptive and dynamic strategies to enhance convergence stability, accuracy and robustness [14].The model operates in sequential stages, beginning from data acquisition and preprocessing, followed by histogram analysis, optimization-based threshold estimation and finally, segmented image reconstruction. Each stage contributes to improving the precision of boundary detection and minimizing computational redundancy.The key innovation lies in combining intensity-based statistical evaluation with population intelligence to optimize thresholds globally, rather than relying on traditional local search or analytical criteria alone.The model development is organized into four major stages, each addressing a specific aspect of the segmentation process. The overall stages of the proposed Dynamic Swarm Optimization-Based Multi-Threshold Segmentation Frameworkaredepicted in Fig.1. The different stages of the Dynamic Swarm Optimization-Based Multi-Threshold Segmentation Framework are explained in distinct heads.

Stage I – Image Acquisition and Preprocessing: This initial stage ensures that the input data is standardized for processing. The image is either grayscale or colour, represented as a two-dimensional or three-dimensional intensity matrix. The preprocessing includes the following steps:

1. **Reading and Normalization:**The image is converted to double precision and scaled to a normalized intensity range [0, 1]. This step ensures uniform intensity representation across datasets.
2. **Noise Reduction:**A low-pass Gaussian or median filter is applied to suppress impulsive noise and small texture fluctuations that may distort the histogram distribution [15]. This helps the optimizer focus on major intensity transitions rather than fine texture variations.
3. **Colour Space Conversion:**For colour images, the RGB channels are separated and processed independently or transformed into a perceptually uniform space (such as CIELAB). The luminance and chrominance components are treated as individual layers in the subsequent stages.

Stage II – Histogram Construction and Feature Extraction

After preprocessing, a histogram of the image intensities is generated to capture the probability distribution of pixel levels. The histogram is defined as in Eq.3.

$$h(i) = \frac{n_i}{N}, i = 0,1,2,\ldots,L-1 \quad \text{Eq.3}$$

where $n_i$is the number of pixels with intensity level i, $N$is the total number of pixels and$L$is the total number of possible intensity levels (commonly 256 for 8-bit images).The histogram serves as the search domain for threshold

determination. Peaks in the histogram represent distinct regions in the image, while valleys between peaks indicate potential threshold points [16].Additionally, statistical parameters such as the global mean intensity $\mu_T$and cumulative probability distributions are computed. These values are used to evaluate the quality of candidate thresholds during optimization.

Stage III – Optimization-Based Threshold Estimation

This stage constitutes the core of the proposed model. It employs Particle Swarm Optimization (PSO) and its dynamic extension (Dynamic PSO, DPSO) to determine the optimal threshold set. The segmentation problem is formulated as a global optimization task where the fitness function represents the quality of segmentation.For an image divided into Mintensity classes using $k$thresholds $(T_1, T_2, \ldots, T_k)$, the between-class variance is given in Eq.4.

$$J(T_1, T_2, \ldots, T_k) = \sum_{m=0}^{k} w_m(\mu_m - \mu_T)^2 \quad \text{Eq.4}$$

where $w_m$is the probability of class m, $\mu_m$is the mean intensity of class m and$\mu_T$is the global mean intensity.The goal of the optimization is to find the threshold vector $T = [T_1, T_2, \ldots, T_k]$that maximizes $J(T)$.

Stage IV – Segmented Image Reconstruction

Once the optimal thresholds are obtained, each pixel in the image is assigned to one of the $k + 1$classes based on its intensity level. For grayscale images, this is expressed as in Eq.5.

$$f'(x,y) = \begin{cases} 0, & 0 \le f(x,y) < T_1 \\ i \times \frac{255}{k}, & T_i \le f(x,y) < T_{i+1}, i = 1, \ldots, k-1 \\ 255, & f(x,y) \ge T_k \end{cases} \quad \text{Eq.5}$$

For colour images, segmentation is applied to each channel or within the luminance component and then combined to reconstruct the full image. The segmented image [17] highlights distinct object regions with improved contrast and well-defined boundaries.The algorithm is outlined in Table.1. using formal scientific notation and stepwise representation. The algorithm in Table.1, begins by transforming the segmentation problem into a numerical optimization task. Each particle acts as a potential solution containing a set of threshold values. During each iteration, particles "move" through the solution space, guided by their previous best experiences and the collective best knowledge of the swarm.The velocity update equation balances three forces:

- **Inertia term**$w \cdot v_i^t$preserves momentum, allowing exploration of the search space.
- **Cognitive term**$c_1 r_1 (pbest_i - p_i^t)$drives the particle toward its own historical best.
- **Social term**$c_2 r_2 (gbest - p_i^t)$encourages collaboration and convergence toward the globally best solution [18].

By dynamically adjusting swarm members in DPSO, the algorithm avoids premature convergence and maintains diversity, allowing it to escape local optima. The adaptive inertia weight gradually shifts the search behaviour from global exploration in early iterations to local refinement near convergence.The fitness function based on between-class variance ensures that thresholds maximizing this measure correspond to clearer separations between image regions. High variance indicates that class means are well apart, which is desirable for accurate segmentation.For colour images, this procedure is performed either per channel or in a fused colour space. The thresholds thus derived yield uniform and visually coherent segmentations across channels.Some of the Advantages of the Proposed Model are that it overcomes local minima problems encountered in analytical thresholding methods, adaptable to grayscale and colour images with minimal parameter tuning, DPSO mechanism prevents stagnation and enhances convergence precision, sorting and boundary constraints ensure physically meaningful threshold values and maximization of between-class variance leads to enhanced object delineation and contrast.

The proposed multi-threshold segmentation model provides a structured approach to automatic region separation in digital images. It merges statistical image analysis with swarm intelligence principles to determine optimal thresholds efficiently. The systematic stagesfrom preprocessing to optimization and reconstructionensure a logical and scientifically sound workflow. The embedded dynamic strategies further enhance reliability by maintaining diversity and adaptive convergence behaviour [16].This comprehensive framework lays the foundation for advanced developments such as hybrid fitness formulations, fractional-order swarm dynamics and perceptual colour integration, which will be explored in the subsequent phases of the research.

Experimentation And Implementation

The primary objective of Phase I experimentation was to reproduce and validate the baseline behaviour of the multi-threshold segmentation model developed using Particle Swarm Optimization (PSO) and Dynamic Particle Swarm Optimization (DPSO). The experiments aimed to verify algorithmic correctness, examine convergence characteristics and tune essential hyperparameters for stable operation. Quantitative and qualitative evaluations were performed on standard benchmark images to establish a dependable reference for subsequent research phases.Hyperparameters strongly influence swarm behaviour and convergence[17]as given in Table.2 As given in Table.2, all subsequent experiments adopted these tuned parameters unless otherwise specified. The experimentation demonstrated that careful tuning of swarm parameters leads to a reliable and reproducible baseline segmentation framework. The population size and inertia weight were identified as the most influential factors governing convergence stability [19]. Dynamic particle adaptation further enhanced exploration capacity and reduced susceptibility to local optima. The combination of histogram-based initialization and controlled parameter scheduling yielded smoother convergence and improved accuracy [20].The results obtained in this phase validate the robustness of the baseline system and confirm its suitability for further research extensions. This established foundation enables advanced developments such as hybrid objective formulations, perceptual colour models and fractional-order swarm dynamics to be implemented in later phases of the study.

RESULTS AND DISCUSSION

The research was dedicated to validating the proposed multi-threshold segmentation model on mammographic images to identify suspicious breast regions that may indicate potential malignancies. Mammography plays a critical role in early breast cancer diagnosis, where accurate segmentation helps in delineating masses, calcifications and dense tissues from normal structures [21].The primary aim was to verify whether the optimized thresholds could accurately highlight abnormal tissues without introducing false segmentation artifacts.Mammographic images [22] were obtained from the Mini-MIAS database, which contains digitized mammograms annotated with ground-truth information about the location and type of abnormalities.

A subset of 40 images was selected, representing three major categories:

- **Normal:** images without visible lesions [23].
- **Benign:** images containing non-cancerous masses or calcifications.
- **Malignant:** images containing suspicious or cancerous regions confirmed through radiologist annotations.

The image set sample with left and right sequence is portrayed in Fig.2.

Each image was pre-processed using contrast enhancement and Gaussian filtering to remove background noise. The images were resized to 512 × 512 pixels and normalized to the intensity range [0,1] for uniform analysis.The segmented results were evaluated using the following metrics Viz. Between-Class Variance (BCV)indicating how well the intensity regions are separated [24], Peak Signal-to-Noise Ratio (PSNR) measures overall image clarity after segmentation [24], Structural Similarity Index (SSIM) quantifies preservation of visual structure [25], Dice Similarity Coefficient (DSC) measures spatial overlap between detected lesion and ground truth [26], Sensitivity is the ratio of correctly identified lesion pixels to total lesion pixels [27] and Specificity being the ratio of correctly identified normal pixels to total normal pixels [27].The achieved results of the experiment are summarised in Table.3. The improved Dice, sensitivity and specificity indicate that the dynamic variant successfully captured tumour boundaries and dense regions more precisely than standard PSO. Particularly for malignant cases, the segmentation accuracy improved by approximately 3–4%, signifying better localization of abnormal tissues [28].The effectiveness of segmentation strongly depends on the number of thresholds and their corresponding placement on the intensity histogram [29]. Experiments were conducted by varying the number of thresholds from two to five as given in Table.4. As known from Table.4., by Increasing the number of thresholds initially enhanced the separability of tissue types. However, beyond four thresholds, no significant improvement was observed, suggesting that excessive segmentation led to redundant partitions. Thus, three to four thresholds were identified as optimal for mammography segmentation [30].The computational efficiency of PSO and DPSO was analysed in terms of convergence time and iteration performance as given in Table.5. While DPSO required slightly more computation per

iteration due to particle insertion, it reached optimal fitness earlier, achieving 19% faster convergence on average. This demonstrates that dynamic population adaptation reduces stagnation and improves convergence stability without major time penalties [31].To understand the stability of the optimization process, the convergence behaviour of the fitness function was monitored for each image type as given in Table.6. All image categories showed a steady increase in fitness until stabilization, confirming the reliability of the algorithm. The malignant cases exhibited higher improvement, reflecting the presence of more pronounced intensity contrasts between lesion and surrounding tissues.A comparison was made between DPSO-based multi-threshold segmentation and the conventional Otsu method to highlight the advantages of global optimization. The DPSO model outperformed Otsu's approach in all measured parameters. Otsu's method, being histogram-dependent and locally optimal, was limited in separating overlapping intensity classes typical in dense breast tissue. DPSO, through population-based exploration, achieved globally optimized thresholds, leading to superior image differentiation and lesion delineation [32]. Furthermore, radiologists reviewing the outputs reported improved interpretability of the segmented regions. The dynamic swarm strategy effectively captured both subtle and sharp intensity transitions, making it valuable for automated pre-screening applications.To ensure the robustness of results, statistical significance tests were performed using paired t-tests between PSO and DPSO results across all images.The obtained results after feature extraction and segmentation for both models are presented in Fig.4.

Visual inspection in Fig.4 of segmented mammograms confirmed the quantitative findings.

- In benign cases, the DPSO-based segmentation distinctly separated fibro-glandular tissues from fatty background regions, improving visibility of benign masses.
- In malignant images, irregular high-density masses were isolated with well-defined borders, aligning with annotated ground truths.
- For normal cases, segmentation preserved tissue uniformity without creating false-positive regions.

The experimental findings confirm that the dynamic PSO framework offers notable improvements for mammography image segmentation.Key insights includeImproved lesion separabilitywhereDPSO achieved higher between-class variance, enabling more accurate detection of suspicious regions.Higher SSIM and PSNR values indicate better maintenance of natural tissue boundaries.The segmented outputs closely matched expert-marked lesion regions, enhancing diagnostic confidence.Despite additional dynamic operations, DPSO achieved faster convergence and greater segmentation accuracy.The algorithm-maintained stability across images of varying tissue densities, proving its adaptability to different mammographic conditions.These outcomes demonstrate that the Phase I framework successfully established a robust foundation for automated breast cancer detection. The baseline performance confirms the reliability of the optimization-driven segmentation approach, setting the stage for further enhancements that will incorporate hybrid objective functions and adaptive intelligence for real-time clinical deployment.

CONCLUSION

The research successfully established a robust foundation for automated mammographic image segmentation using optimization-based thresholding. Through comprehensive experimentation, the study demonstrated that both PSO and its dynamic extension (DPSO) are effective in identifying optimal thresholds that enhance the visibility of lesions and tissue structures. The Dynamic PSO approach, in particular, exhibited superior stability, faster convergence and improved segmentation accuracy when compared to the conventional PSO and traditional methods such as Otsu's algorithm. The results confirmed that multi-threshold segmentation guided by between-class variance effectively separates dense and fatty tissues, allowing clearer visualization of abnormalities. From a clinical perspective, the segmentation results showed that the DPSO method delineated lesion boundaries more accurately, aiding in the early identification of potentially malignant regions. Ultimately, the methodology developed in this research contributes to advancing intelligent mammographic analysis, strengthening the accuracy, interpretability and practicality of computer-aided breast cancer detection systems.

Table.1: Multi-Threshold Segmentation using Dynamic Particle Swarm Optimization

Algorithm Multi-Threshold Segmentation using Dynamic Particle Swarm Optimization

Input: Image $I(x,y)$; number of thresholds k; population size P; maximum iterations $Iter_{max}$; PSO parameters w, c_1, c_2.

Output: Optimal thresholds $T^* = [T_1, T_2, \ldots, T_k]$; segmented image $S(x,y)$.

//Initialization Phase

STEP-1: Convert the input image $I(x,y)$to grayscale or process color channels separately.

STEP-2: Compute normalized histogram $h(i)$and global mean intensity μ_T.

STEP-3: Initialize a swarm of Pparticles. Each particle $p_i$represents a candidate threshold vector $[t_1, t_2, \ldots, t_k]$.

STEP-4: Randomly assign initial velocities $v_i$to each particle.

STEP-5: Set personal best $pbest_i = p_i$and determine the global best $gbest$based on the fitness function $J(T)$.

//Fitness Evaluation

STEP-6: For each particle p_i: Perform STEP-7 thru STEP-10

STEP-7: Compute the probability $w_m$and mean intensity $\mu_m$for each region defined by the thresholds.

STEP-8: Evaluate the objective function: $F_i = \sum_{m=0}^{k} w_m(\mu_m - \mu_T)^2$

STEP-9: Update $pbest_i$if $F_i$exceeds the previous best value.

STEP-10: Update $gbest$if any $F_i$exceeds the current global best.

//Velocity and Position Update

STEP-11: For each particle: Perform STEP-12 Thru STEP-13

STEP-12: Compute Velocity as $v_i^{t+1} = w \cdot v_i^t + c_1 r_1 (pbest_i - p_i^t) + c_2 r_2 (gbest - p_i^t)$

STEP-13: Update Position as $p_i^{t+1} = p_i^t + v_i^{t+1}$

//Dynamic Particle Adjustment

STEP-14: To prevent stagnation and maintain diversity: Perform STEP-15 thru STEP-16

STEP-15: Monitor fitness improvement rate across iterations.

STEP-16: If improvement < ε for a specified number of iterations: Perform STEP-17 Thru STEP-19

STEP-17: Remove low-fitness particles.

STEP-18: Introduce new particles generated around the global best using Gaussian perturbation.

STEP-19: Optionally, modify inertia weight $w$adaptively as $w = w_{max} - \frac{t}{Iter_{max}}(w_{max} - w_{min})$to transition from exploration to exploitation.

//Termination Criterion

STEP-20: The process continues until the maximum iteration limit $Iter_{max}$is reached or the improvement between consecutive iterations falls below a threshold.

STEP-21: The final global best $gbest$represents the optimal threshold vector T^*.

//Segmentation and Output Generation

STEP-22: Apply the optimal thresholds to the image to obtain segmented regions.

STEP-23: For colour images, apply thresholds to each channel or to luminance, then recombine.

STEP-24: Display the segmented image and record the threshold values, fitness curve and computational time.

End

Table.2: PSO and DPSO Parameter Tuning

Parameter	Tested Range	Selected Value
Population Size (P)	10 – 80	40
Inertia Weight (w)	0.4 – 0.9	0.7
Cognitive Constant (c_1)	1.0 – 2.5	1.8
Social Constant (c_2)	1.0 – 2.5	2.0
Maximum Iterations	50 – 250	150
Dynamic Particle Update (DPSO)	5 – 15 % of swarm	10 %

Table.3: Average Segmentation Performance on Mammographic Images

Category	Method	BCV	PSNR (dB)	SSIM	DSC	Sensitivity	Specificity
Normal	PSO	0.372	25.6	0.831	0.78	0.81	0.93
Normal	DPSO	**0.389**	**26.2**	**0.846**	**0.80**	**0.83**	**0.94**
Benign	PSO	0.401	24.9	0.812	0.82	0.85	0.91
Benign	DPSO	**0.423**	**25.4**	**0.826**	**0.85**	**0.88**	**0.93**
Malignant	PSO	0.417	23.8	0.795	0.86	0.88	0.89
Malignant	DPSO	**0.439**	**24.3**	**0.808**	**0.89**	**0.91**	**0.91**

Table.4:Impact of Number of Thresholds on Segmentation Accuracy (DPSO Method)

Thresholds	BCV	DSC	Sensitivity	Observation
2	0.362	0.79	0.82	Coarse segmentation; lesions partially merged with normal tissue.
3	0.419	0.85	0.87	Optimal balance; distinct separation of dense and fatty tissues.
4	0.436	0.88	0.90	Improved lesion visibility; slightly higher computational cost.
5	0.437	0.88	0.89	Minor improvement; additional thresholds introduced redundant regions.

Table.5:Average Computational Performance

Method	Population Size	Iterations	Average Time (s)	Convergence Iteration
PSO	40	150	9.28	130
DPSO	40	150	10.21	105

Table.6: Fitness Convergence Statistics Across Image Categories

Image Type	Initial Fitness ($\times 10^{-3}$)	Final Fitness ($\times 10^{-3}$)	Iterations to Converge	Fitness Improvement (%)
Normal	2.18	4.87	100	123.4
Benign	2.74	5.62	110	105.1
Malignant	2.96	6.49	108	119.3

Table.7:Comparative Analysis Between Otsu and DPSO Methods

Metric	Otsu (3 Thresholds)	DPSO (3 Thresholds)	Percentage Improvement
BCV	0.382	0.423	+10.7%
PSNR (dB)	24.1	25.4	+5.3%
SSIM	0.798	0.826	+3.5%
DSC	0.82	0.85	+3.7%
Sensitivity	0.86	0.88	+2.3%
Specificity	0.90	0.93	+3.3%

ABSTRACT

The study analyses the funded publications of central universities in five different South Indian states: Andhra Pradesh, Karnataka, Kerala, Tamil Nadu, and Telangana, by retrieving data from the Scopus multidisciplinary database. The analysis provides insight into key metrics with a specific emphasis on the research priority index (RPI) and the funding diversity index (FDI), relative growth rate (RGR), the doubling time (DT) of funded publications from 1962 to 2024. A total of 47,846 publications were published by central universities, of which 16,045 are funded publications by the top 10 prolific funding agencies are analysed for the study. The study highlights strong growth and impact of funded research across South Indian central universities, with the University of Hyderabad leading in publications (82%), contributing authors (90%), and citations (73%). The research priority index found emphasis on different subject areas, thereby identifying domains of research specialization. Findings indicate that disciplines such as Chemistry (16.55%),Engineering (15.36%), Physics and Astronomy(14.76%), and Materials Science(11.12%) reflect their dominance in research priority, while specializations like Agricultural and Biological Sciences (6.22%) showed comparatively lower research focus. The funding diversity index shows that funding support is diversified, with major contributions by UGC (23.25%), DST (23.09%), CSIR (17.36%), SERB, and specialized agencies such as the DRDO (3.49%). which together account for the bulk of sponsored publications. International sponsors contribute marginally, reflecting limited but strategic global collaborations within a government-driven funding landscape. Single-source funding

contributes 15.18%of publications, double-source 21.41%, and the majority publications 53.61% is funded by two to four funding agencies. The USA and China are highlighting their dominant role in international collaborations with South Indian central universities, confirming their major role in funded scholarly publications.

Keywords: Funded Publications, Funding Agencies, Scientometrics, South Indian States, Central Universities

INTRODUCTION

In the rapidly evolving landscape of global research, universities serve as a critical hub for knowledge creation through collaborations; thus, funding agencies have become pivotal in shaping scientific advancements of academic excellence. South India, with its expanding higher education sector and robust research ecosystem, has witnessed significant growth in scholarly outputs, particularly from its esteemed central universities. However, the impact of research with funding provides quality, influence, and interdisciplinary collaborations has been increasingly linked to financial support from government and non-government agencies. Over the past few decades, South India has strengthened its science and technology research through support of funding agencies such as the Department of Science and Technology (DST), Council of Scientific and Industrial Research (CSIR), University Grants Commission (UGC), and Department of Biotechnology (DBT) in encouraging interdisciplinary research, with enhancing global competitiveness with growing international collaborations and publications in high-impact journals. The findings of this study address the gap by investigating the funded publications productivity, research priority of subject area, funding diversity and collaboration patterns by applying scientometric techniques to better understand of how funding drives scientific progress in offering valuable recommendations for policymakers, academic leaders, and funding bodies to optimize research strategies and enhance the global competitiveness of South Indian central universities research.

REVIEW OF LITERATURE

Verma, M. K., *et al.*(2023). analysed funded scientometric and bibliometric research of (2810) domain-relevant papers (DRP) and 1040 methodologically relevant papers (MRP) from 2011 to 2021 using Web of Science. Standard scientometric parameters were used, to find relative growth rate (RGR), the doubling time (DT), the activity index (AI), international collaboration patterns, top journals, and most productive institutions.

Zhang, L., and Leydesdorff, L. (2021). compared the research portfolios of 42 "Double First-Class" Chinese universities across Web of Science Subject Categories (WCs) to find interdisciplinarity is a hot topic in science and technology policy. The study used advanced diversity indicators Rao-Stirling (RS) and DIV, as well as standard measures of diversity, such as the Gini coefficient, Shannon entropy, and the Simpson Index, and found that the scores for diversity are more consistent with DIV than Rao-Stirling (RS) diversity indicator.

Umesha N., *et al.* (2021). Assessed the research activity by different countries with the help of the Activity Index (AI) and the collaboration and its impact. The SCOPUS publication records were used for the analysis of RWH research activities.

Rathika, N. and Thanuskodi, S. (2021).examined the authorship pattern on nuclear medicine literature, of single-authored works to 78-authored works between 1991 and 2020. Found that the largest percentage of research output was produced by single authors (14.06%) with 1776 contributions, double authors (11.07%) (1651), and three authors (12.59%) (1590).

Gupta, B. M., and Bhattacharya, S. (2003). Assessed publication growth, the Annual Growth Rate (AGR) was calculated using standard scientometric methods.

Mahapatra, M.(1985). Relative Growth Rate (RGR) and Doubling Time (DT) were also applied to measure the pace and doubling of research output.

RESEARCH DESIGN

Objectives

- To analyse the university-wise distribution of funded publications of the South Indian central universities.
- To determine year-wise growth trends of the funded publications.
- To identify the most productive authors and authorship patterns of publications.
- To identify the subject area-wise research priority index of publications.
- To find the diversity indexof funding sponsors.
- To find the percentage share of publications by document type.
- To find collaboration networks among the central universities.

Data Source

The data for the study were collected from the Scopus multidisciplinary database using the advanced search to analyse funded research publications of the central universities of South Indian States. The search filters used are Funding Information: "Funding Agency" filter applied to filter funded publications for central universities individually.

METHODOLOGY

The bibliographical information was exported and downloaded separately for South Zone Central Universities in a CSV file. All CSV files were merged into a single Microsoft Excel file for preliminary data cleaning, analysis, and interpretation. Out of 11 Central Universities of South India, "SammakkaSarakka Central Tribal University of Telangana", established in the year 2023, has not been included in the study due to insufficient data. Hence, 10 central universities' data were analysed and interpreted for the study. The bibliometric tool VOSviewer was used to find collaboration networks of funded publications.

Data Analysis and Interpretation

University-wise Distribution of Funded Publications

The Table 1 shows the cumulative total of 16,045 funded publications, contributing authors, and total citations of central universities of South India is presented below. (In Table 1: APP-Authors Per Publications, CPP-Citations Per Publications). From Table 1 we find Telangana state stands out with the UoH leading (82.8%) of funded research, (90.79%) of contributing authors, and (73.6%) of citations contributing the bulk of the region's funded research impact. Kerala, Tamil Nadu, and Karnataka, with institutionsCUoK, CUTN, CUK contribute 14.46% of publications, 8.79% of contributing authors, and 24.93% of total citations. Universities like EFLU, MANUU, CUAP, CTUAP, NSU, and IMU contribute less than 1% across the number of publications, contributing authors, and total citations, reflecting limited research activity. UoH, having a higher APP (37.71) value, indicates that most publications are co-authored by multiple researchers, with more collaboration, indicating interdisciplinary teamwork. EFLU with low APP (3.68) indicates more individual research, showing limited collaboration. The average APP is 34.38. UoH has a higher CPP (22465.45) value shows greater research influence and visibility, as each paper is being referenced widely in the scholarly community. The average CPP is 20.90, which means that each publication receives at least 20 citations.

Year-Wise Growth Distribution of Funded Publications

The growth of publications was analysed by using three parameters: compound annual growth rate(CAGR) (Bornmann and Mutz, 2015), relative growth rate (RGR), and the doubling time(DT) (Mahapatra, 1985).

Compound Annual Growth Rate

$$\boldsymbol{CAGR} = \left(\left(\frac{EV}{BV}\right)^{\frac{n}{1}} - 1\right) \times 100$$

where:

EV=Ending value

BV=Beginning value

n =Number of years

Annual Growth Rate

$$\boldsymbol{AGR} = \sum\left(\frac{EV}{BV}\right) - 1$$

Relative Growth Rate

$$\boldsymbol{RGR} = \frac{(\boldsymbol{ln\, W_2 - lnW_1})}{\boldsymbol{T_2 - T_1}}$$

W_1-Actual log value of the number of publications in a particular time

W_2-Actual log value of the number of cumulative publications in a particular time

T_1-Startingtimeofresearch publications

T_2-Endingtimeofresearch publications

RGR and DT are related to each other. If the number of publications in a research field doubles over time, the difference between the logarithmic value at the end and at the same logarithmic value should be 2. The Napier logarithm takes the value of $\log_e 2$ as 0.693. As per the Napier logarithm, numbers increase by 0.693 as an average growth rate. So the DT is calculated as

DT= 0.693 / RGR

Table 2 reflects the long-term growth of research publications over six decades from 1962 to 2024. CAGR shows the average annual growth rate over a period. RGR measures the annual rate of increase in publications year by year. DT indicates the time required for publications to double. The lower DT value indicates faster growth, and the higher DT value indicates a slower pace of doubling. CAGR fluctuates from (0.00–2.00), with the highest in the year 1979. with an average annual growth rate of 0.13. The RGR of publications exhibits a rising trend, increasing from 0.09 to 0.11 (2001-2007) and from 0.11 to 0.18 (2009-2024). This indicates that research productivity accelerated in the later years. The lower RGR of 0.07 in 1993 and 2004 shows a relatively stagnant phase in research output. The average growth rate of publications year by year is 0.19. Correspondingly, with a lower DT value of 3.95 in 2019, highlighting a faster doubling rate of publications, and a slower doubling rate with a higher DT value of 10.07 in 1993 and 2004.

Most Prolific Authors

From Table 3 shows "T. Aushev" of Hyderabad University is the most productive author with high publications (426), citations (13294), and H-index (56), while "H.Lee" of Indian Maritime University stands out for its exceptionally high citation impact (5983) despite fewer publications (39), and high citations per publication(139), reflecting high quality-driven research. A. Chandulal of National Sanskrit University has limited funded publications, indicating low research.

Authorship Pattern and Citation Impact of Scholarly Publications

Table 4 represents the authorship pattern, having a strong prevalence of publications with 2 to 4 authors contributing 54.14% of publications, indicating high collaboration works and citation shares (12.6–16.8%) with lower visibility. Three authored publications are larger (19.63%) with larger citations (16.79%). In contrast, single-authored papers are rare (1.25%) and attract minimal citations (1.03%), showing limited visibility. The authorship pattern of 5 to 8 authors

shows 34.27% collaboration, with their citation impact being 28.43%. The study shows mass collaborations dominate in quantity and visibility, with higher scholarly influence.

Subject-Wise Research Priority Index (RPI) of Funded Publications

The activity index (AI) helps identify the active subject areas of a particular university.RPI value is generally used to identify which subject areas, or domains, receive comparatively more priority from researchers relative to other domains.

AI=(Pij/Pi)/(Pj/P)×100

Pij = publications of **institution i** in **subject area j**

Pi = total publications of **institution i** (all subjects)

Pj = total publications in **subject area j** (all institutions)

P = total publications (all subjects, all institutions)

[if AI = 100, average activity in that subject/funding agency.

AI > 100, the university is more active than average in that subject/funding agency.

AI < 100, less active than average

$$\text{RPI} = \frac{\text{Average output per university in subject j}}{\text{Proportion of total output of the target university in subject j}} \times 100$$

RPI = 1.0 or 100 means the research priority is average/neutral.

RPI >1.0 or (>100), the research area has a higher-than-average priority by focus area.

RPI <1.0 or (<100),research area has a lower-than-average priority means less emphasis on the subject area.

Table 5 indicates the research priority index (RPI) values of the central universities. CTUAP (396.56), CUAP (522.60), CUK (402.28), CUoK (718.66), and CUTN (551.84), has values greater than >100, indicating higher-than-average priority given in "Biochemistry, Genetics and Molecular Biology" funded research. In EFLU, higher subject area priority is given to Social Sciences, Arts and Humanities, and Psychology-funded research. IMU, and NSU give higher priority to Materials Science research and to Social Sciences research. UoH clearly leads in most subject areas, with particularly high priority in Chemistry, Physics and Astronomy, Materials Science, and Engineering. The research priority < 100, for Neuroscience, Nursing, Psychology, and Veterinary subject areas. Overall, the distribution underscores a science and technology-centric orientation of funded research, with high citation efficiency and global relevance.

Funding Diversity Index (FDI) of Funded Publications

The funding diversity index was measured using Simpson's Index (Simpson, 1949), calculated as

Define proportion of publications for a funding agency i

$$p_i = \frac{p_i}{p}$$

Where,

pi = Publications of a **particular funding agency**i

p = **Total publications** from all funding agencies

Square the proportions

$$p_i^2 = p_i^2$$

Sum over all funding agencies

$$\sum_{i=1}^{n} p_i^2$$

Funding Diversity Index (FDI)

$$FDI = 1 - \sum_{i=1}^{n} p_i^2$$

If FDI=0, low diversity. FDI=1, high diversity in funding agencies.

The activity index for all five states, encompassing the total of 16,045 funded publications, is presented in the table below, along with an overall FDI of 0.84. If FDI =8, average diversity <8 indicates minimal diversity, and >8 indicates a high level of diversity in funding agencies. Table 6 represents the analysis of funding diversity of the five states studied. The results reveal that a significant proportion of sponsored research is majorly contributed by UGC (23.25%), DST (23.09%), CSIR (17.36%), and SERB (10.15%). Telangana state has funding diversity, majorly accounting for the bulk of national and several smaller international agencies. Andhra Pradesh state has a higher diversity of CSIR-funded research. Karnataka has a higher diversity of UGC funding support. Kerala and Tamil Nadu have funding diversity of DST, DBT, and SERB supporting research publications. The funding diversity index suggests that research in the studied universities is not dependent on a single funding agency; instead, the funded research is supported by multiple funding agencies. The FDI (0.84) indicates a high diversity and well-distributed funding research ecosystem, reducing dependency on a single agency and promoting broader opportunities for interdisciplinary international collaborations.

Funding Diversity Index (FDI) of Publications of Central Universities

The table below represents the funding diversity of the funding agencies of the central universities of the South Indian states. Table 7 After Calculation of activity index (AI) for all the funding sponsors - university wise the funding diversity index (FDI) found as 0.84 demonstrates a centralized diversity of funding sponsors dominated by national agencies-UGC (23.25%), DST (23.09%), CSIR (17.36%), with limited but significant participation from state, institutional, and international sponsors. International sponsors, such as the UK Research and Innovation (0.37%), the National Institutes of Health of the US (0.19%), and the National Natural Science Foundation of China (0.20%), make only marginal contributions, suggesting limited but strategic global collaboration. The funding agency UGC has high publication activity in UoH (120.17) and UOK (136.75), indicating higher-than-average diversity of funding support. CTUAP (152.85) and CUAP (125.89) have high publication activity of DST funding diversity. CSIR has higher diversity in UoH and CUAP. The funding diversity by international funding sponsors like KSU, EC, and BCSIR remains minimal, reflecting the global collaborative landscape. The funding diversity index (0.84) of South Indian central universities' reliance on governmental and international level funding sponsors is diversifying to advance its funding research ecosystem.

Sponsorship Spectrum: A Data-Driven View of Research Support

The above Figure 1 shows the distribution of research sponsorship across 16,045 publications reveals a clear pattern of increasing collaboration and funding complexity. The single-source funding accounts (2435) publications with 15.18% of output research, and double-source funding 3,435 publications with 21.41% research. The majority of publications (8603) are funded by two or four funding agencies with 53.61%, indicating a growing trend toward inter-institutional and interdisciplinary collaboration. The study finds that as the number of funding sources increases, the share of publications gradually declines, with only 5.6% receiving support from more than ten agencies.

Percentage Share of Funded Publications, Authors, and Citations by Document Type

Figure 2 presents a strong dominance of research articles by document type, which account for 87.71% of publications, 96.69% of authorship, and 82.97% of total citations, underscoring their central role in scholarly communication and citation accumulation. Review papers only, 5.42%of the output, contribute a disproportionately high 14.69% of citations, reflecting their synthesis-driven nature and high citation potential. Conference papers (4.66%) and book chapters (0.54%) show limited citation impact. All other document types marginally contribute to output and impact.

Citation Analysis of Sources

Figure 3 shows the journal Tetrahedron Letters (UK, IF:1.8)emerges as the most cited journal with 154 publications generating 3,632total citations, followed by Journal of Molecular Structure (Netherlands,IF:4.7) second major contributor, with 112 publications and 2,001 citations plays major role in the dissemination of research at global level.

Bibliographic Coupling of Research Output by Countries

Figure 4: represents bibliographic coupling analysis in VOSviewer and measures the degree of similarity between countries based on their shared citations, indicating the strength of academic connections between them. The total link strength reflects the overall coupling strength for each country, with higher values suggesting more vital collaboration or citation overlap with other nations. The USA exhibits the highest total link strength (128,316), followed by China (68,586), indicating a high degree of international collaboration and shared citation patterns. UK (62,703), Germany (62,311), and Saudi Arabia (45,477) also show substantial link strength and significant academic connectivity. Figure 5 represents the central universities' global co-authorship network reveals distinct patterns in collaboration clusters: strong US-UK connections (992 and 510 link strengths), emerging Asian research networks through China-South Korea-Japan partnerships (448, 298, 260), and Middle Eastern expansion via Saudi Arabia (385).

FINDINGS

The findings reveal that the funded research landscape of South Indian central universities is highly uneven, with the University of Hyderabad dominating by contributing over 80% of publications and 73% of citations, while universities like EFLU, MANUU, CUAP, CTUAP, NSU, and IMU contribute less than 1%, research output. Growth trends indicate that the AGR of publications peaked in 1994, while the RGR values peaked in 2024 across publications, authors, and citations, as rapid expansion with low doubling times compared to earlier decades. Individual productivity is led by "Aushev" of UoH with high output and impact, while "H. Lee" of IMU has more citations despite fewer publications. Emerging research specialization areas are visible in CUTN and CUAP in applied sciences, whereas newer established universities remain peripheral. A strong dominance of natural and applied sciences diversity is seen, with Chemistry (16.55%),Engineering (15.36%), Physics and Astronomy (14.76%), and Materials Science (11.12%), which together make for nearly 60% of the funded publications. Funding was diversified as UGC contributing with the largest share as 23.25%, DST with 23.09%, and third stands "CSIR" accounting for 17.36% as a support in research. International collaboration is led by the USA and China, followed by the UK, Germany, and Saudi Arabia, with smaller contributions highlighting strong global partnerships.

SUGGESTIONS

The results show that South Indian central universities need to make sure that research funding is distributed fairly, strengthen international collaborations, and promote interdisciplinary research to promote impactful research growth. The universities such as EFLU, MANUU, CUAP, CTUAP, NSU, and IMU to improve their funded research publications for better research visibility at global level.

CONCLUSION

The study objective comprehensively maps the landscape of funded research of South Indian central universities. The inclusion found that the University of Hyderabad leads with 90% of funded research, and universities like EFLU, MANUU, CUAP, CTUAP, NSU, and IMU contribute minimal funded research publications. The university's publications diversify the subject area in science and technology-centric fields, with "UoH" leading in major disciplines. The USA and China are highlighting their dominant role in international collaboration with South Indian central universities in enhancing the visibility of research in the global landscape. Funding was diversified as UGC contributed with the largest share, followed by DST and CSIR as the dominant agencies sustaining research productivity in the region.

ABSTRACT

Domination in graphs is a fundamental concept with wide-ranging applications in communication networks, biological systems, and social sciences. Among its many variants, nonsplit domination ensures that the removal of a dominating set preserves the connectivity of the remaining graph, making it highly relevant for the design of resilient and fault-tolerant systems. This article investigates the nonsplit domination polynomial, an enumerative tool that encodes the number of nonsplit dominating sets of different cardinalities into a compact algebraic expression. We establish key properties of this polynomial and derive closed forms for standard graph classes, thereby highlighting its structural significance.

Keywords: Domination, Domination number, Nonsplit domination number, Nonsplit domination polynomials, Graph parameters, Connectivity in graphs.
AMS Subject Classification: 05C69

INTRODUCTION

Domination in graphs has been a central theme in graph theory due to its extensive applications in network design, social sciences, biology, and communication systems. Graph polynomials serve as powerful tools in combinatorial studies, as they encapsulate structural information into compact algebraic forms. Motivated by these ideas, non-split domination polynomials was initially defined by Jemimal and Sunitha. In this research, we expand *Nonsplit domination polynomials* and find their properties of selected graphs. Consider a finite, simple, connected, undirected graph with vertex set V and edge set E, denoted as G = (V, E). The number of vertices, represented by n, determines the graph's order, while the number of edges, represented by m, determines its size. If every vertex in V − D is close to at least one vertex in D, then subset D of V is the dominant set in G. The *domination number* $\gamma(G)$is the minimum cardinality of all the dominating sets in *G*.Among the various extensions of domination, the concept of non-split

domination focuses on maintaining connectivity among the non-dominated vertices, which is essential in designing fault-tolerant systems. The concept of non-split domination was initially formulated by Kulli and Janakiram. Sunitha and Kala [4], [5], [6] further developed and examined this idea, and Jemimal and Sunitha [7] later expanded on it. Let be the family of dominating sets of a graph G with cardinality and let Then the domination $d(G,i) = |D(G,i)|$. Then the domination polynomial D(G, x) of G is defined as$D(G,x) = \sum_{i=\gamma(G)}^{|V(G)|} d(G,i)x^i$where γ(G) is the domination number of G. In this article, we deal with the concept of non split domination and we find out the nonsplit domination number and nonsplit domination polynomial of some of the standard graphs.

Nonsplit domination polynomial of graphs

The polynomial approach offers a powerful method for studying graph parameters, as it captures combinatorial structures with in concise algebraic forms. Extending this philosophy to nonsplit domination leads to the formulation of the nonsplit domination polynomial, which enumerates nonsplit dominating sets based on their cardinalities. This polynomial not only refines our understanding of nonsplit domination but also provides a systematic tool for comparison across different graph classes. In this section, we present the formal definition of the nonsplit domination polynomial and explore its properties.General results for standard graph classes are presented after illustrative examples for selected graphs.The section also includes tabular representations of the enumerations, offering a clear visualization of the distribution of nonsplit dominating sets. These results lay the groundwork for further exploration and applications discussed later in the paper.

Definition2.1. If the induced subgraph < V − D > is linked, then the dominating set D of a graph G is a nonsplit dominating set. The nonsplit domination number, represented as $\gamma_{ns}(G)$, is the cardinality of the minimum nonsplit dominating set of a graph G.

Definition2.2. Let $D_{ns}(G,i)$ be the family of nonsplit dominating sets with cardinal number i of a graph Gand let $d_{ns}(G,i) = |D_{ns}(G.i)|$.Then the nonsplit domination polynomial $D_{ns}(G,x)$of G is defined as $D_{ns}(G,x)=\sum_{i=\gamma_{ns}(G)}^{|V(G)|-1} d_{ns}(G,i)x^i$where$\gamma_{ns}(G)$is the nonsplit $i=\gamma_{ns}(G)$ domination number of G.

Example2.3. Consider the Kite graph K. Let V(K)={u_1,u_2,u_3,u_4,u_5} be the vertex set of K, which is labeled as below.

We have $\gamma_{ns}(K)$=2. Also $d_{ns}(K,2)$=3 , $d_{ns}(K,3)$=4 and $d_{ns}(K,4)$=5. Hence $D_{ns}(K,x) = 3x^2 +4x^3 +5x^4$

Example2.4. The nonsplit domination polynomial of the Petersen graph is $D_{ns}(P,x)=10x^4+72x^5+59x^6+30x^7+15x^8+10x^9$.

Consider the graph in Fig2.

We have $\gamma_{ns}(P)$=4. Also $d_{ns}(P,4)$=10 ,$d_{ns}(P,5)$=72 ,$d_{ns}(P,6)$=59,$d_{ns}(P,7)$=30,$d_{ns}(P,8)$=15and $d_{ns}(P,9)$=10.

Hence $D_{ns}(P,x)=10x^4+72x^5+59x^6+30x^7+15x^8+10x^9$.

Observation2.5. Suppose that G is a graph where |V (G)|= n.Then

1. $d_{ns}(G,n-1)$=n.
2. $d_{ns}(G,i)$=0onlyif$i<\gamma_{ns}(G)$or$i\geq n$.
3. $D_{ns}(G,x)$has no constant term.
4. $D_{ns}(G,x)$is a strictly increasing on [0,∞].
5. If His any induced sub graph of G, then deg($D_{ns}(G,x)$)≥deg($D_{ns}(H,x)$).
6. Zero is always a root of $D_{ns}(G,x)$.

Theorem2.6. For any complete graph K_n with n vertices, the nonsplit domination polynomial is $D_{ns}(G,x) = \binom{n}{1}x + \binom{n}{2}x^2 + \cdots + \binom{n}{n-1}x^{n-1}, n > 1$.

Proof. Assume that the entire network, K_n, has n vertices (n > 1). Every subset of $V(K_n)$ with cardinality i for all $1 < i \leq n-1$ are nonsplit dominating sets of K_n and $\gamma_{ns}(K_n)=1$ because every vertex $v \in V(K_n)$ is adjacent to every other vertex $u \in V(K_n)$.
Hence $d_{ns}(G,x) = \binom{n}{i}$. We have $D_{ns}(G,x)=\sum_{i=\gamma_{ns}(G)}^{|V(G)|-1} d_{ns}(G,i)x^i$.
Hence $D_{ns}(K_n,x) = \binom{n}{1}x + \binom{n}{2}x^2 + \cdots + \binom{n}{n-1}x^{n-1}, n > 1$.

From Theorem 2.6, Table 1 provides the number of nonsplit dominating sets in K_n.

Remark2.7. For the trivial graph K_1, the nonsplit domination polynomial $D_{ns}(K_1,x)$ cannot be defined.

Remark2.8. For the empty graph $\overline{K_n}$ with n vertices the nonsplit domination polynomial is $D_{ns}(\overline{K_n}, x) = nx^{n-1}$.

Lemma2.9. For each ordered n linked graph G, $\gamma_{ns}(G \circ K_1)=n$.

Proof. Any linked graph having the vertex set $\{v_1,v_2,v_3,\ldots,v_n\}$ can be called G. Add n new vertices $\{u_1,u_2,u_3,\ldots,u_n\}$ and join u_i to v_i for $1 \leq i \leq n$. Let D be the minimum nonsplit dominating set of $G \circ K_1$. For each $1 \leq i \leq n, u_i \in D$ or $v_i \in D$. Therefore $|D| \geq n$. Also $\{u_1,u_2,u_3,\ldots,u_n\}$ is a nonsplit dominating set of $G \circ K_1$. Hence $\gamma_{ns}(G \circ K_1)=n$.

Theorem2.10. For any path P_n with n vertices $n>3$, the nonsplit domination polynomial is $D_{ns}(P_n,x)=(n-3)x^{n-2}+nx^{n-1}$.

Proof. Let P_n be the path with n vertices, $n>3$. Then $\gamma_{ns}(P_n)=n-2$. Also $d_{ns}(P_n,n-2)=n-3$ and $d_{ns}(P_n,n-1)=n$. Hence $D_{ns}(P_n,x)=(n-3)x^{n-2}+nx^{n-1}$.
From Theorem2.10, Table 2 provides the number of nonsplit dominating sets in P_n.

Remark 2.11.
1. For P_1, $D_{ns}(P_1,x)$ cannot be defined.
2. For P_2, $D_{ns}(P_2,x)=2x$.
3. For P_3, $D_{ns}(P_3,x)=3x^2$.

Theorem2.12. For any Cycle $C_n (n \geq 3)$, the nonsplit domination polynomial is $D_{ns}(C_n,x)= nx^{n-2} + nx^{n-1}$.
Proof. Let $n \geq 3$ vertices make up the cycle C_n. Then $\gamma_{ns}(C_n)=n-2$.
Also $d_{ns}(C_n,n-2)=n$ and $d_{ns}(C_n,n-1)=n$. Hence $D_{ns}(C_n,x)=nx^{n-2}+nx^{n-1}$.
From Theorem 2.12, Table 3 provides the number of nonsplit dominating sets in C_n.

Theorem 2.13. For a Star graph $K_{1,n-1}$ with n vertices $n>1$, the nonsplit domination polynomial is $D_{ns}(K_{1,n-1},x) = nx^{n-1}$.
Proof. Let $K_{1,n-1}$ be a star graph n vertices $n>1$. Label the vertices of $K_{1,n-1}$, as $u_0,u_1,\ldots,u_{n-1}$ where $u_1,u_2,\ldots,u_{n-1}$ are vertices of degree 1 and one vertex of degree n − 1 is u_0. Consequently, $\gamma_{ns}(K_{1,n-1})=n-1$. From the set of vertices $\{u_0,u_1,\ldots,u_{n-1}\}$, we must choose any n − 1 vertices for a nonsplit dominant set of cardinality n − 1. Thus there are $\binom{n}{n-1} = n$ nonsplit dominating sets of cardinality $n-1$. $d_{ns}(K_{1,n-1},n-1)=n$. Hence $D_{ns}(K_{1,n-1},x)=nx^{n-1} \forall n$. From theorem 2.13, Table 4 provides the number of nonsplit dominating sets in $K_{1,n-1}$.

Observation2.14.
(i) $d_{ns}(K_n,i)=d_{ns}(K_n,n-i), 1 \leq i \leq n-1$
(ii) $\gamma_{ns}(K_n)=1$,
(iii) $d_{ns}(K_n,i) = \binom{n}{i}, i=1,2,\ldots,n-1$.

Observation2.15.
(i) $d_{ns}(P_n,n-1)=n, n \geq 2$.
(ii) $d_{ns}(P_n,n-2)=n-3, n \geq 4$.

Observation2.16.

(i) $d_{ns}(C_n, n-2)=n, n\geq 3$.

(ii) $d_{ns}(C_n, n-1)=n, n\geq 3$.

Observation2.17.

$d_{ns}(K_{1,n-1}, n-1)=n, n>1$

Applications of Nonsplit Domination Polynomial

The study of nonsplit domination polynomials has both theoretical significance and practical impact.

Example 3.1. In a public health network, individuals (nodes) and their interactions (edges) form a graph, where a nonsplit dominating set ensures that selected key individuals can influence or monitor the entire population while keeping the unselected individuals connected.

(i) **Epidemic control and disease surveillance**: A nonsplit dominating set can identify minimal set of individuals who can act as health monitors in early warning points. It helps in early detection and containment of infectious diseases. These key individuals can be tested and vaccinated first to prevent outbreaks from widely spreading.

(ii) **Effective vaccination and immunization strategies:** Vaccinating individuals in an nonsplit dominating set ensures indirect protection for others while maintaining overall connectivity, making immunization efforts more effective and resource-efficient.

(iii) **Enhance Quarantine Strategies:** Helps in slowing down disease spread by ensuring that quarantine measures cover all infected clusters effectively.

Illustration: Pandemic Response Network.

Nodes: Hospitals, clinics, testing centers, mobile health centers

Edges: Roads, communication channels, supply chains.

Nonsplit dominating set: A subset of nodes that can monitor and support all other nodes while staying connected.

(i) **Initial Network-Pre-pandemic:** Acityhas10hospitalsandclinics,buttheyareunevenly distributed. some remote clinics are isolated, causing delays in emergency response.

(ii) **Crisis occurence - Pandemic outbreak:** The government needs to select key health centers to act as pandemic response hubs. These hubs should be able to support other facilities while remaining well-connected.

(iii) **Applying nonsplit domination:** Author it is selected sub set of hospitals and clinics as response centers(Nonsplit dominating set). Each response center directly supports nearby clinics and hospitals while maintaining inter connectivity. No disconnected facility exists, ensuring a coordinated response.

(iv) **Outcome:** Faster communication and coordination for disease surveillance. Efficient vaccine and medical supply distribution.

Here,$\{r_1, r_2, r_3\}$ act as response centers and the remaining nodes are the hospitals and clinics. Even if the response centers collapse the hospitals and clinics can communicate among themselves without any interruption. This ensures that all healthcare facilities are monitored and supported while maintaining an interconnected response system.

CONCLUSION

By using nonsplit domination, public health planners can enhance disease control, optimize vaccination strategies, strengthen health care communication, and improve resource allocation—all while maintaining the social structure's integrity.

ABSTRACT

Morphine, a natural opioid alkaloid derived from *Papaver somniferum*, remains a cornerstone in severe pain management. Its high affinity for mu-opioid receptors underlies both its analgesic efficacy and its potential for abuse. Chronic use induces neuroadaptive changes leading to tolerance, dependence, and withdrawal, particularly in vulnerable populations such as adolescents. Opioid Use Disorder (OUD) is characterized by compulsive drug use and significant functional impairment. Current management includes pharmacotherapies (methadone, buprenorphine, naltrexone) alongside behavioral interventions. Prevention efforts emphasize education, prescription regulation, and non-opioid alternatives. This review outlines the neurobiological mechanisms, risk demographics, and integrated strategies for the prevention and treatment of morphine dependence.

Keywords: Morphine, Mu-Opioid Receptors, Tolerance, Opioid Use Disorder, Addiction, Relapse.

INTRODUCTION

Morphine Dependency

Morphine, a potent natural opioid from *Papaver somniferum*, has played a central role in pain relief since its isolation by Friedrich Sertürner in 1804. It acts by binding to μ-opioid receptors in the central nervous system, altering pain perception and emotional responses. It is commonly used in oral, intravenous, or sustained-release forms to manage severe pain from cancer, surgery, or trauma. Despite its effectiveness, morphine has a high potential for abuse due to

its euphoric and psychoactive effects. Prolonged use results in tolerance, physical dependence, and neuroadaptive changes in the brain's reward system, contributing to Opioid Use Disorder (OUD). Withdrawal symptoms upon cessation—such as nausea, sweating, anxiety, and insomnia—further reinforce misuse.

Understanding Morphine Dependency

Morphine dependency occurs when continuous use is required to maintain physiological and psychological stability. It includes both physical dependence and psychological addiction. Repeated exposure leads to tolerance, necessitating higher doses for the same effect, driven by changes in neurotransmitter systems like dopamine, endorphins, and serotonin. Upon cessation or dose reduction, individuals often experience withdrawal symptoms—ranging from discomfort to severe physical disturbances—which make quitting difficult and promote relapse. These effects collectively perpetuate the cycle of addiction, highlighting the importance of understanding morphine dependency for better treatment strategies.

Opioid Use Disorder (OUD)

Morphine dependence is clinically classified as Opioid Use Disorder (OUD) under the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5). OUD is diagnosed when an individual exhibits at least two of the following criteria within a 12-month period[10]

- Taking morphine in larger amounts or for longer than intended
- Persistent desire or failed attempts to reduce or stop use
- Strong cravings or urges to use morphine
- Neglect of major responsibilities due to use
- Continued use despite social or interpersonal problems
- Withdrawal symptoms when stopping or reducing use

Biological Mechanisms of Morphine Dependency

Morphine induces dependency through its effects on the central nervous system by binding to μ-opioid receptors in brain regions involved in pain, reward, and emotion. This stimulates dopamine release, creating euphoria and reinforcing repeated use. Chronic activation of this reward pathway causes neuroadaptive changes, such as receptor downregulation and desensitization, resulting in tolerance and escalating use. Long-term exposure also induces neuroplastic alterations in the prefrontal cortex, impairing impulse control and decision-making, thereby increasing addiction risk.

Social and Psychological Factors Contributing to Morphine Dependency

Psychological conditions like anxiety, depression, and PTSD are closely linked to morphine dependency, as individuals may self-medicate for emotional relief. This forms a cycle of mood regulation through opioid use, leading to addiction. Social influences, including peer pressure, family history of substance abuse, and life stressors (e.g., financial or academic pressure), also elevate risk. Additionally, easy access to prescription opioids for pain management can unintentionally result in misuse and dependence.

Adolescent Susceptibility to Morphine Dependency

Adolescents are particularly at risk for developing morphine dependency due to both biological and psychosocial factors. The adolescent brain, particularly the prefrontal cortex, is still maturing, resulting in underdeveloped impulse control and risk assessment abilities. Enhanced dopaminergic activity during adolescence increases susceptibility to the euphoric effects of morphine, making repeated use more likely[12,13]. Socially, adolescents are more influenced by peers and may lack awareness or resources to understand the dangers of opioid misuse. In contrast, older adults often have more established coping mechanisms and life experiences that reduce their vulnerability to addiction[14].

Biological and Psychological Resilience in Older Adults

Biological Factors

Reduced dopamine response: Diminished dopamine release in older adults reduces the reinforcing effects of morphine[15].

Decreased opioid receptor density: Age-related decline in receptor availability leads to reduced morphine efficacy and appeal[16].

Slower metabolism: Prolonged drug activity may cause adverse effects, discouraging misuse[17].

Psychological and Environmental Factors

- Stronger coping strategies and greater awareness of opioid risks due to life experience lessen misuse potential[18,19].
- Lower exposure and more stable environments further decrease risk[21,22].

Epidemiological Trends in Morphine Dependency

Globally, opioid use disorder affects over 27 million individuals, with morphine being a major contributor. In the United States, opioid-related deaths have surged in recent decades, with prescription opioids implicated in a significant proportion[23].

Demographic Observations:

Age: Individuals aged 15–24 are more prone to morphine misuse due to developmental vulnerabilities and peer influence.

Gender: Women are more likely to develop dependency through chronic prescriptions, whereas men tend to misuse opioids recreationally[25].

Symptoms of Morphine Dependency

Physical Symptoms

Tolerance: Increasing doses required for the same effect.

Withdrawal: Sweating, nausea, diarrhoea, insomnia, and in severe cases, seizures and respiratory issues[28,29].

Cravings: Persistent urges that can lead to relapse[27].

Psychological Symptoms

- Mood disorders such as depression, anxiety, and emotional dysregulation[31].
- **Anhedonia:** Inability to enjoy previously pleasurable activities[32].

Behavioral Symptoms

- **Drug-seeking behaviours:** Including doctor shopping and forgery[33].
- Neglect of responsibilities and social withdrawal due to stigma or fear of discovery[34,35].

Clinical Identification and Diagnostic Tools

Accurate diagnosis of morphine dependency requires a multifaceted clinical approach integrating patient history, behavioural assessments, laboratory testing, and psychiatric evaluation.

Clinical Assessment

A thorough clinical evaluation is foundational to identifying morphine dependency. This includes detailed documentation of drug use patterns, dosage and frequency, adverse outcomes, and the impact on occupational, social, and psychological functioning. Observations of drug-seeking behaviour, impaired daily functioning, and tolerance or withdrawal are critical indicators.

Standardized Screening Instruments

DSM-5 Criteria: According to the *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition* (DSM-5), a diagnosis of Opioid Use Disorder (OUD) is made when an individual meets at least two out of eleven criteria within a 12-month period. These criteria encompass behavioral, psychological, and physiological domains, such as compulsive use, failed attempts to reduce intake, tolerance, and withdrawal symptoms[37].

Opioid Risk Tool (ORT): The ORT is a validated questionnaire used to assess a patient's risk of opioid misuse prior to initiating opioid therapy. It evaluates factors including personal or family history of substance abuse, psychiatric conditions, and high-risk behaviours[38].

Laboratory Confirmation

Biochemical confirmation of morphine use is essential for objective diagnosis

- Urine drug screening is the most common method for detecting recent morphine use and its metabolites, with a detection window of up to 72 hours.
- Blood testing can quantify serum morphine levels; therapeutic levels typically range between 10–80 ng/mL, while levels exceeding 200 ng/mL are considered potentially toxic[39].
- Hair analysis provides long-term exposure data, identifying chronic use over a period of weeks to months.

Psychiatric Evaluation

A comprehensive psychiatric assessment is crucial to detect co-occurring mental health conditions such as depression, anxiety disorders, and PTSD, which may contribute to or exacerbate morphine dependency. Addressing these comorbidities is essential for effective treatment planning and long-term recovery[40].

Neurobiology of Morphine Dependency

Neuroplastic Changes

Downregulation of opioid receptors: Leads to tolerance and decreased dopamine sensitivity[42].

Neuroadaptation: Alterations in GABA, serotonin, and norepinephrine contribute to withdrawal and mood instability[43].

Withdrawal: Symptoms include agitation, muscle cramps, and gastrointestinal distress[44].

Structural brain changes: Long-term use affects areas involved in impulse control and reward, such as the prefrontal cortex[45].

Treatment Approaches for Morphine Dependency

Management of morphine dependency involves an integrated approach combining pharmacological interventions, evidence-based behavioural therapies, and structured rehabilitation programs. This multimodal strategy is essential for improving clinical outcomes and reducing relapse rates.

Pharmacological Interventions

Medications are central to managing opioid use disorder (OUD), particularly for withdrawal management, craving reduction, and relapse prevention.

Methadone: A full μ-opioid receptor agonist that suppresses withdrawal symptoms and reduces cravings. It is administered under medical supervision due to its potential for misuse and respiratory depression risk[46].

Buprenorphine: A partial μ-opioid receptor agonist with a ceiling effect on respiratory depression, offering a safer profile while effectively managing withdrawal and cravings. It can be prescribed in outpatient settings under specific regulations[47].

Naltrexone: An opioid receptor antagonist that blocks the euphoric effects of opioids. It is effective in relapse prevention and is administered post-detoxification in either oral or extended-release injectable form[48].

Clonidine and Lofexidine: Non-opioid alpha-2 adrenergic agonists used to attenuate autonomic symptoms associated with opioid withdrawal, such as anxiety, agitation, tachycardia, and hypertension[49].

Behavioural Therapies

Behavioural interventions play a critical role in addressing the psychological and behavioural aspects of addiction.

Cognitive Behavioural Therapy (CBT): Focuses on identifying and restructuring maladaptive thought patterns and behaviors that contribute to drug use, while enhancing coping strategies and emotional regulation[50].

Motivational Interviewing (MI): A client-centered approach that enhances intrinsic motivation to change by exploring and resolving ambivalence toward drug use[51].

Contingency Management (CM): Utilizes a reward-based system to reinforce abstinence and positive behavior through tangible incentives, showing strong efficacy in opioid addiction treatment[52].

Rehabilitation Modalities

Rehabilitation provides a supportive environment for comprehensive recovery, tailored to the severity of dependency and individual patient needs.

Inpatient Rehabilitation: Intensive, structured programs typically lasting 30–90 days. These facilities offer medical detoxification, round-the-clock monitoring, individual and group therapy, and integrated medical support[53].

Outpatient Rehabilitation: Suitable for individuals with mild to moderate dependency. Programs provide flexibility and incorporate pharmacotherapy, counseling, and relapse prevention strategies while allowing patients to maintain daily responsibilities[54].

Facility Types:

- *Residential and luxury rehabilitation centres* offer individualized care plans with access to multidisciplinary teams, often in comfortable or private settings[55].
- *Support services* may include group therapy, peer-led recovery meetings, and holistic interventions such as yoga, mindfulness, and nutritional support[56].

Benefits of Rehabilitation: Includes a structured recovery environment, peer and professional support, individualized treatment plans, and continuity of care through aftercare services[57].

Long-Term Care and Aftercare

Long-term recovery plans aim to support sustained abstinence, improve psychosocial well-being, and mitigate relapse risks.

Key components include

Psychosocial Reintegration

Recovery programs emphasize restoration of social functioning, stable housing, and employment. Vocational training and career counselling are provided to help individuals regain self-sufficiency and reestablish societal roles[58].

Ongoing Counselling and Psychotherapy

Continuous psychological support through individual, group, or cognitive-behavioural therapy reinforces emotional regulation, coping mechanisms, and self-awareness, which are essential for long-term abstinence.

Family Involvement

Family-based interventions improve communication, reduce co-dependency, and enhance the support structure necessary for recovery. Involving family members helps strengthen accountability and trust.

Structured Relapse Prevention

Evidence-based strategies include

- Identification of personal triggers
- Implementation of coping skills
- Structured aftercare plans

Emergency Intervention: Opioid Antagonist Therapy

Opioid overdose, particularly due to potent agents such as morphine, is a medical emergency characterized by central nervous system (CNS) and respiratory depression, which can lead to coma or death if not promptly addressed. Emergency intervention primarily involves the use of opioid antagonists' compounds that competitively inhibit opioid receptor activation, rapidly reversing the physiological effects of opioids.

Mechanism of Action of Opioid Antagonists

Opioids like morphine exert their effects by binding to μ-opioid receptors in the brain and spinal cord, leading to: Analgesia, Euphoria, Respiratory depression, Reduced gastrointestinal motility.

Opioid antagonists such as naloxone, naltrexone, and nalmefene bind with high affinity to these receptors but do not activate them, thereby

- Displacing the opioid molecules
- Blocking further opioid activity
- Reversing life-threatening respiratory and CNS depression

These antagonists differ in their onset, duration, receptor affinity, and clinical utility, as discussed below.

Naloxone is the frontline emergency antidote due to its rapid onset and high receptor affinity.

- Exhibits a fast onset of action (2–5 minutes IV; slightly delayed IM/IN).
- Duration of effect is 30–90 minutes, often requiring repeated doses for long-acting opioid toxicity.
- Safe and easy to administer; available as intravenous (IV), intramuscular (IM), and intranasal (IN) formulations.
- Widely distributed in naloxone kits to the public, emergency responders, and healthcare workers.
- May precipitate acute withdrawal in opioid-dependent individuals, leading to symptoms like agitation, nausea, hypertension, and tachycardia.

Naltrexone is a long-acting opioid receptor antagonist used post-detoxification to prevent relapse.

- Not suitable for emergency overdose reversal due to slower onset and longer time to peak action.
- Available orally (daily) or via extended-release intramuscular injection (monthly).
- Blocks the euphoric and reinforcing effects of opioids, aiding abstinence and reducing cravings.
- Requires a 7–10-day opioid-free period prior to initiation to avoid precipitated withdrawal.
- Carries risk of hepatotoxicity; liver function tests are recommended during therapy.
- Can cause insomnia, anxiety, and fatigue in some patients.

Nalmefene is a newer antagonist structurally related to naltrexone, with enhanced pharmacokinetics.

- Displays strong affinity for μ-, κ-, and δ-opioid receptors with a prolonged duration of action (8–11 hours).

- Effective in reversing overdoses from long-acting or synthetic opioids such as fentanyl.
- Also approved for managing alcohol use disorder, showing broader therapeutic potential.
- Lower hepatotoxic potential than naltrexone, making it suitable for patients with hepatic concerns.
- May cause gastrointestinal discomfort, dizziness, anxiety, and musculoskeletal pain.
- Gaining prominence in pre-hospital and emergency protocols for extended opioid reversal.

Among these agents

- Naloxone remains the gold standard for acute overdose reversal.
- Naltrexone is ideal for long-term abstinence maintenance.
- Nalmefene offers advantages in cases involving potent opioids or extended action requirements.

Clinical use of opioid antagonists must consider the pharmacodynamic profile, duration of opioid exposure, potential for withdrawal symptoms, and comorbid conditions such as liver impairment

Adverse Effects of Opioid Antagonists
Adverse effects of Opioid Antagonist (Table: 1).

Comparative Efficacy
Comparative Efficacy of Opioid Antagonist (Table: 2)

CONCLUSION

Among the three principal opioid receptor antagonists' naloxone, naltrexone, and nalmefenenalmefene is recognized as the most potent, demonstrating a significantly higher affinity for μ-, κ-, and δ-opioid receptors. Pharmacodynamically, nalmefene exhibits approximately three to five times greater potency than naloxone, with a longer half-life and sustained receptor occupancy. These properties make it a compelling candidate not only for overdose reversal but also for long-term modulation of opioid receptor-mediated behaviors, including in substance use disorders. Naltrexone, while also more potent than naloxone (estimated at two to three times), is primarily used in maintenance therapy due to its oral bioavailability and extended duration of action. It demonstrates moderate receptor affinity and is utilized for both opioid and alcohol dependence. Naloxone, although the least potent, is the standard of care in acute opioid overdose due to its rapid onset of action and strong safety profile. It exhibits a high receptor affinity but short duration, necessitating repeated administration in long-acting opioid intoxication. In summary, while all three agents serve critical roles in opioid antagonism, their pharmacokinetic and pharmacodynamic profiles dictate distinct clinical applications, with nalmefene showing promise for more sustained and potent opioid receptor blockade.

Table 1: Adverse effects of Opioid Antagonist

Drug	Common Adverse Effects
Naloxone	Acute withdrawal symptoms, agitation, headache, hypertension, tachycardia
Naltrexone	Hepatotoxicity risk, anxiety, fatigue, nausea
Nalmefene	Gastrointestinal discomfort, muscle pain, dizziness

Table 2: Comparative Efficacy of Opioid Antagonist

Antagonist	Onset	Duration	Potency	Clinical Utility
Naloxone	Fastest	Short (30–90 min)	Standard	First-line for emergency overdose reversal
Naltrexone	Moderate	Long (24–72 hours)	~2–3× naloxone	Post-detox maintenance therapy
Nalmefene	Moderate	Longest (8–11 hours)	~3–5× naloxone	Extended overdose reversal; alcohol dependence

ABSTRACT

Recently, Blockchain technologies have become one of the most talked-about topics due to their significant impact on numerous enterprises and industries. Their ability to make life better will only grow in the number of places they serve. Although Blockchain technology can offer us more dependable and useful services, we also need to be aware of the challenges and security threats that come with this innovative method.

Keywords: Blockchain Technology; Smart Contracts; Security**;** Consensus mechanism, Hard Fork, Soft Fork.

INTRODUCTION

Bitcoin is the name of the first Blockchain application. It is an online payment method that functions similarly to physical money and is based on Blockchain technology. The success of Bitcoin has made it possible to utilize blockchain technology in Bitcoin, health services, data storage, Internet of Things, voting, the supply chain and

services and sectors, financial markets, and industry. For instance, when utilizing various tools or services, their malicious counterparts endure great losses as well as commit transgressions [16, 18]. As an example, half of all Bitcoin assaults can be attributed to an overarching problem of traditional system insecurity, as the hacker works to commandeer the system using its technology against it. As we mentioned above, we will summarize the explanation of blockchain in Section 2. We will cover a number of blockchain applications and the services in Section 3. In Section 4, we will analyze the primary security issues and the obstacles we have to overcome. Finally, Section 5 contains the conclusions of the paper.

Concept of Blockchain

Peer-to-peer networks and distributed consensus algorithms are combined in blockchain technology, an integrated multi-field infrastructure architecture, to address classic distributed database synchronization issues. It includes economic models, mathematics, cryptography, and algorithms [5, 6, 15].

The blockchain technology is made up of six essential components.

Decentralized: The ability of blockchain technology to capture, store, and distribute data without depending on a centralized node is one of its core features.

Transparent: Since all nodes can view the data record and the data is updated transparently, blockchain technology can be trusted.

Open Source: Most blockchain systems are openly available, permit record viewing by everyone, and let users create any form of application using blockchain technology.

Autonomy: The concept revolves around trusting a single node for the whole system. Because of the consensus mechanism, no one can interfere. On a blockchain system, every node can securely update or transfer information.

Immutable: Unless more than 51 percent of the nodes are taken over at once, all records will be permanently reserved and unchangeable.

Anonymity: Blockchain technology solves the trust problem between nodes, enabling data transfer or even transactions to stay anonymous using simply the recipient's blockchain address.

a. How Blockchain Technology Works?

The following are the primary procedures used by blockchain:

- **Data Transmission**: When a sender initiates a transaction, it is sent out to all nodes in the network.
- **Validation and Inclusion**: Each node validates the correctness of the transaction upon receipt. The transaction is added to other transactions into a block if it has been validated.
- **Consensus Mechanism Execution**: Then, to confirm the block, each node on the network employs a consensus method such as Proof of Work (PoW) or Proof of Stake (PoS).
- **Blockchain Extension**: The block becomes a permanent record when it is uploaded to the blockchain and confirmed. Each node accepts this new block and builds the blockchain upon it in turn.

b. The Structure of Blockchain

Typically, a block comprises the main data, a Timestamp, the previous block hash, the current block hash, and additional information. The block structure is shown in Figure 1.

Main data: The application of Blockchain can relate to transaction logs, bank clearing logs, contract logs, or Internet of Things data logs, among other services

Hash: With a code assigned to a transaction within a block, the code was sent to all nodes of the network. Each block's record contains information about numerous transactions. That's why Blockchain uses the last hash of a transaction as the root of a Merkle tree, obtained from the Merkle tree algorithm. Using the Merkle tree function can result in a large reduction in data transmission and processing resources. This last hash value, which is the current block's hash, will be noted in the block header.

Timestamp: The creation time of the block.

Other Information, including the block signature, the Nonce value, or any other user-provided data.

C. Type of Blockchain
Four different kinds of blockchain exist.

A public blockchain is an open, unrestricted distributed ledger system. A node or user that is part of the public blockchain has the authority to mine, access historical and current data, verify transactions and supply proof of work for new blocks.

Consortium blockchains: A consortium Blockchain is a semi-decentralized type where more than one organization manages a blockchain network.In this kind of blockchain, multiple organizations can function as nodes and exchange data or engage in mining.

Private blockchain: A private blockchain operates alone within a closed network and is characterized by restrictions or permissions. Private blockchains are used in a more company-specific context where only selected participants are part of a blockchain network. The organizational entity has full control of the security level, the access permissions, access rights, and the authorizations. Hence, private blockchains are a restrictive and smaller subnet within the context of a public blockchain.

d. Consensus Mechanism
Consensus functions avoid "fork attacks," verify that the most current block has been appended to the chain correctly, verify that every node in a blockchain agrees on the same message, and can even provide protection against malicious attacks. There are many consensus mechanisms: [28]
1. Proof of work, 2. Proof of stake, 3. Proof of delegated stake, 4. Proof of elapsed time, 5. Practical Byzantine fault tolerance, 6. Directed acyclic graph, 7. Proof of authority, 8. Proof of history, 9. Proof of burn, 10. Proof of capacity.

Application of Blockchain Technologies
Blockchain technology applies to a wide range of fields and sectors outside of finance.

a. Digital Currency: Bitcoin
Blockchain technology enabled the construction of Bitcoin's transaction mechanism and data structure, enabling it to function as an online payment platform and digital currency. The use of encrypted techniques allows for the flow of funds without reliance on central banks. Bitcoin recorded transactions, used public keys to transmit and receive money, and allowed for anonymous personal identification. To reach consensus during the transaction confirmation phase, which then uploads the transaction to the network, additional users' processing power is required.

b. Smart Contract
An electronic contract known as a "smart contract" is one that uses a computer system to automatically handle a user's digital assets, specify their responsibilities, and carry out their rights. It's more than just a computer. Because it responds to messages, saves data, and interacts with external parties, the process may be regarded as a party to the contract. Similar to a human who can be trusted, a smart contract will obey predetermined instructions, store assets temporarily, and follow predetermined protocols [13]. Users can build a variety of services, applications, and contracts using a decentralized virtual machine with Ethereum, an open-source blockchain platform that combines smart contracts. The platform is powered by Ethereum's digital currency, ETH.

c. Hyper-ledger
In December 2015, The Linux Foundation published Hyperledger, an open source blockchain platform, to allow for distributed ledgers to use blockchain technologies. It is designed for ledgers that seek to facilitate international business transactions and includes access by major supply chain, financial, and technology companies, enabling improvements in a myriad of performance and reliability metrics. The project's objectives are to provide a modular framework that supports many components for various needs, thus uniting several separate projects to develop open

protocols and standards. This would contain a range of blockchains, each with unique storage and consensus mechanisms, as well as identification, contract, and access control services.

d. Other Applications

Blockchain technology can be applied to any type of system ranging from supply chain tracking, identity verification, insurance, international payments, the Internet of Things, patient privacy in the healthcare sector, and prediction markets [14, 20].

IV. Challenges and Issues in Blockchain Security

Blockchain has drawn a lot of interest thus far from a range of industries, but there are still some problems and challenges that need to be resolved [2, 9].

a. The 51% Attacks

Under Proof of Work, a miner's work, including the CPU/GPU cycles necessary to verify hashes, determines the probability of mining a block. This approach will encourage groups of users to work together to mine more blocks and create "mining pools," which are places where the majority of the world's computer power is concentrated. It can take over this blockchain if it reaches 51% processing power. It appears that it results in security problems [3, 4].

How a 51% Attack is Executed:

1. The attacker creates a **private chain** where they rewrite transaction histories.
2. As soon as their private chain becomes longer than the public chain, the network will accept the validity of these occurrences on their private chain, and with this, a successful attack is accomplished.
3. The attack mainly relies on the longest-chain rule, which, by consensus, the longest chain will always be accepted as the 'legitimate' chain.

A person can determine which block is acceptable based on how quickly they can get the Nonce value if they possess greater computer power than 51%. It is capable of:

1. Change the transaction data; this could lead to an attack by double-spending [11, 17].
2. To halt the transaction that verifies the block.
3. To cease mining any block that is accessible.

In the past, a majority assault was more likely when the majority of transactions had values far higher than the block reward, the network hash rate was smaller, and new mining technology frequently caused the network to reorganize [8].

Factors That Make Networks Vulnerable:

1. Low hash rate: Smaller networks are easier to attack.
2. Centralized mining power: A few large mining pools controlling most of the hash rate.
3. Lack of incentives: Weak economic or structural incentives for miners to behave honestly.

Defenses Against 51% Attacks:

1. Increasing Network Hash Rate: Makes it expensive for an attacker to gain majority control.
2. Decentralization: Distributing mining power across many participants reduces risk.
3. Switching Consensus Mechanisms: PoS and other mechanisms are less vulnerable to these attacks.
4. Network Monitoring: Detecting and responding to irregularities quickly.

Real-World Examples

1. **Bitcoin Gold (BTG)**: Experienced a 51% attack in 2018, leading to the double-spending of over $18 million worth of BTG.
2. **Ethereum Classic (ETC)**: Suffered multiple 51% attacks in 2020, resulting in losses exceeding $5 million.

b. Fork Problems

Fork trouble is another issue. On the consensus, decentralized node version and consensus to the software upgrade is a fork problem. This issue is very important in that it covers a very wide range with blockchain technology.

Fork Types

The launch of the new version created a change to the consensus rule for the nodes. This means that in the blockchain network, there are now two types of nodes: 1) new nodes and 2) old nodes. Therefore, the following four situations arise:

- Old nodes have supplied the transaction of the block, and the new nodes would accept it.
- Old nodes have sent the transaction of the block, and the new nodes would reject it.
- New nodes have sent the transaction of the block, and the old nodes will accept it.
- New nodes have sent the transaction of the block, and the old nodes would reject it.

These four various situations under which consensus is achieved give rise to fork issues. We can divide the fork problem into two types depending on the above four situations: 1) Hard Fork problem, 2) soft fork problem. The computing power of old and new nodes should be compared, along with differentiating between them, and we should assume that the new nodes' computing power is more than 50.

Hard Fork

A hard fork occurs when a system updates to a new version or agreement that is incompatible with the prior version. As a result, two chains are created because the mining of new nodes cannot be agreed upon by the older nodes. Figure 5 illustrates the hard fork issue. When a hard fork occurs, we must ask every network node to update the agreement; the nodes that have not received an upgrade will stop functioning normally. The normal chain will split into two chains if older nodes didn't upgrade because they would have continued to work on the other, entirely distinct chain. The cause for the hard fork is depicted in Figure 6.

Soft Fork

A "soft fork" occurs when a system moves to a new version or contract that is not compatible with the old version, which prevents the new nodes from working on the older nodes' mining. The new nodes cannot supplant the block that the old nodes mined to find the new block either, and this doesn't take into account that the new node has more processing power than the other new nodes. However, both the old and new nodes will be working on the same chain. The soft fork problem is illustrated in Figure 7.

Nodes in the network can update to the new agreement incrementally, as opposed to all at once when a soft fork takes place. Soft Forks will only have one chain, as opposed to multiple chains in Hard Forks, and they won't affect the system's stability and effectiveness when nodes update. Every node can only partially check correctly, as per the theory, but Soft Fork hides the fact that the consensus rule has changed from the older nodes. Figure 8 shows the explanation for the soft fork.

c. Scale of Blockchain

Blockchain's exponential growth in data volume will make it harder and harder for computers and stores to load and synchronize data. At the same time, as data continues to rise, clients will face significant system operating challenges [10]. Blockchain will make it increasingly difficult for computers and storage to load and synchronize data due to its exponential growth in data volume. Clients will also confront major operating system issues as data volumes continue to climb [10].

d. Time Confirmation of Blockchain Data

While it's far better than the norm, Bitcoin transactions still don't quite live up to our expectations. While standard online credit card transactions typically take two or three days to validate, Bitcoin transactions just need an hour. The Lightning Network can resolve this issue[19].

Payments can be safely assigned over multiple peer-to-peer payment channels using the Lightning Network, with the proposal of using hashed time-locked contracts (HTLCs) and bi-directional channels to payoff. A network can be created, where any peer can pay any other peer without a direct channel.

e. Current Regulations Problems

Governments are apprehensive about blockchain technologies since, similar to Bitcoin, their decentralized nature will make it more difficult for the central bank to manage the money supply and economic policies. Rather, authorities should do more studies on this new issue and accelerate the development of new policies to reduce market risk.

f. Integrated Cost Problem

Naturally, changing the current system will be expensive in terms of both time and money, especially if it involves infrastructure. It is imperative that this cutting-edge technology not only generates economic advantages and satisfies oversight needs but also establishes a bridge with conventional organizations. It is also bound to encounter challenges from the current internal organization.

CONCLUSIONS

Surely, Blockchain technology has received plenty of attention in recent years. Although there are some issues yet to be resolved, new methods are being invented on the application side and are fast becoming solid and mature. Rules need to be enforced by the government that are befitting this technology, and corporations need to ready themselves to implement Blockchain technology in order not to have it disrupt unnecessarily. Despite the advantages that Blockchain technologies provide, we need to remain careful about their possible impact and security threats.

ACKNOWLEDGEMENT

I would like to extend my sincere appreciation to my mentor, Dr. Vatsal Shah, for his precious guidance, everlasting encouragement, and valuable feedback during the duration of this study. His mentoring, experience, and support have contributed significantly to the development of this study and its completion.

Table 1: Consensus Algorithms Comparison [24]

	PoW	PoS	DPoS	PoET	PBFT	DAG
Setup	Public permissionless/ Private blockchain	Public permissionless/ Private blockchain	Public/Private blockchain	Private permissioned/ permissionless blockchain	Private permissioned blockchain	Public permissioned non-blockchain
Cost of entry and returns	Relatively high cost of entry, but high returns	Low cost of entry, but low returns	Lower cost and lower returns than PoS	Very low cost of entry, but low returns	All participate with no return	All participate with no return
Incentives	The winning miner receives new coins with the block & transaction fees in the block he/she validates	The winner receives transaction fees with the new block. If a block winner attempts to add an invalid block, he/she loses his/her stake	The threat of loss of reputation & income provides an incentive for delegates to act honestly and keep the network secure	The winning miner receives the transaction fees with the new block he/ she validates.	Nil	Nil
Finality	Probabilistic	Probabilistic	Probabilistic	Probabilistic	Immediate	Probabilistic
Scalability in network	High	Medium	Medium	Medium	Low (quickly grow into a huge communication cost as the amount of nodes scales upwards)	High
Energy efficiency	Very low (energy intensive computations, e.g., Bitcoin consumes around 121.36 terawatt-hours (TWh) a year)	High	High (no miners required)	High	Medium (Some PBFT systems use PoW to prevent Sybil attack, but only after a set number of blocks (i.e., 100) and not for every block)	Medium (A small PoW operation when a node submits a transaction to ensure the network is not being spammed and also validates previous transactions)
Majority or 51% attack	The number of malicious nodes >25% of all nodes for attack	Reduced 51% attack probability	Easier to organize a 51% attack if delegates combine their power	Reduced 51% attack probability	The number of malicious nodes > one third of all nodes for attack	Not tested at scale
Susceptible to Sybil attack	No	Yes	Yes	No	Yes	No
Examples	Bitcoin, Ethereum, Litecoin, Monero, Dash, Zcash, Decred, and more	Ethereum 2.0, Cardano, Polkadot BlackCoin, and Peercoin.	EOS, BitShares, Lisk, Steem, Ark, Nano, Cardano, and Tezos.	Hyperledger Sawtooth	Hyperledger Fabric, Zilliqa	IOTA
Transactions per second (TPS)	Bitcoin: 7 maximum 27	Ethereum: 15	EOS: 3996 BitShares: 3300	Hyperledger Sawtooth: 2300	Hyperledger Fabric: approximately 3500	IOTA: 250 IOTA Pollen V0.2.2: >1000
Block confirmation time (s)	Bitcoin: 6000 Litecoin: 150	Ethereum: 15	EOS: 0.5 BitShares: 3	No actual time is found	In seconds' level (No actual time is found)	120

Table 2: Web application security risks on Blockchain in technology [23, 24]

Web Application Security Risks	Assess on Blockchain Technology	Analysis Examples
Smart contract vulnerabilities	Smart contracts, though central to blockchain technology, often suffer from vulnerabilities that arise due to coding errors, poor design practices, or limited understanding of their execution environment.	In a vulnerable Ethereum contract managing token withdrawals, an attacker could create a malicious contract that keeps triggering the withdrawal function in a loop, draining funds before the balance is updated
Injection Attacks	Poor sanitization of user input	Failing to sanitize SQL input could allow a user to bypass authentication and run unauthorized queries against the database.
Sensitive Data Exposure	Blockchain technology is largely vulnerable to this vulnerability due to a lack of understanding of the technology.	In the DAO hack of 2016, attackers exploited a recursive call vulnerability in the Ethereum smart contract.
Broken Authentication	Masquerade as a legitimate user on a temporary or permanent basis.	The LISK cryptocurrency
Security Misconfiguration	Blockchains are typically implemented as software on client machines in a peer-to-peer network, so it makes sense for	Users of an Ethereum wallet configured their wallets to listen and accept external commands via RPC (port 8545). Attackers

	security misconfigurations to have a security impact as well.	taking advantage of this vulnerability were able to steal $20 million worth of Ether4.
Cross-Site Scripting (XSS)	Blockchain explorers, or any exploration of transaction and requested data from the blockchain, may be referencing the transaction data, which is untrusted data and may be attacker-controlled.	If an XSS vulnerability is present in a wallet and blockchain explorer combined, an attacker could exploit the explorer to gain access to a user's private key and potentially have control over their accounts.
Insecure Deserialization	Blockchain Technology employs serialization for the delivery of transactions.	The compromise of a blockchain can occur by relying on vulnerable deserialization code.
Using Components with Known Vulnerabilities	Smart contracts on the blockchain contain known vulnerabilities due to code reuse.	Ethereum smart contract
Insufficient Logging and Monitoring	Blockchain technology boasts immutable write access for logging system events and read access for verification purposes, making it extremely viable for creating transparent records.	An attacker identified a vulnerability in a smart contract that caused it to issue assets. The record of every action is now immutably logged on the blockchain; however, it could go on unabated because nobody was monitoring.

ABSTRACT

The Cellular Neural Network (CNN) has diverse applications in parallel processing, including tasks like image processing, performing non- linear operations, creating geometric maps, and enabling high-speed computations. Operating as an analogue paradigm, CNN consists of an array of interconnected cells organized in a rectangular grid with $m \times n$identical cells.We visually represent this structure as a graph, denoted as $\Gamma_{m,n}$, with cells represented as vertices and connections a sedges. The core of this study centers around computing spectrum-based results for CNN, with a primary focus on energy, the Estrada Index, Onsager Estrada Index, Gaussian Estrada Index, Double Gaussian Estrada Index, Average Subgraph Centrality, and Natural Connectivity. These measures are crucial in quantifying the structural intricacy and connectivity of the CNN. They are instrumental in guiding network optimization, resilience analysis, and performance assessment in parallel processing applications. To facilitate our analysis, we develop an algorithm that efficiently calculates these indices. Sub sequently, we conduct argression analysis between each of these indices and the energy of CNN. Collectively, this paper contributes to an enriched comprehension of the CNN structure and underscores the pivotal role of these indices in optimizing and evaluating CNN performances by selecting suitable CNN sizes.

Keywords: Adjacency matrix, Energy, Estrada index, Cellular neural network, Gaussian Estrada index.

INTRODUCTION

Graph theory is pivotal in various fields, including molecular biology, robotics, physics, system analysis, computer engineering, statistical analysis, biological systems, and data science. This mathematical framework provides a versatile means of representing real-world scenarios through the abstraction of vertices and edges. The Cellular Neural Network (CNN) concept, first presented by Chua and Yang, in 1988, as documented in [6] and [7], is particularly noteworthy. A CNN is essentially a collection of cells, each featuring local connections and possessing an input, output, and state. Interactions among cells are limited to neighboring ones, and the cells can be organized in an array of identical cells in a rectangular grid, with the geometric arrangement not strictly confined to are ctangle; it can also take the form of triangles or hexagons. During a CNN model simulation, the network evolves from an initial state influenced by specific input and boundary conditions, ultimately producing a final state. The adjacency eigen values o fP_n are given as detail in[25].The strong product of two routes, which is another term for the CNN, finds utility in various fields of study. In this context, we use several graph product operations, specifically the Cartesian product, the direct product, and the strong product, which are well established standard graph products. For a comprehensive exploration of graph products and their structural characteristics, please refer to [19].The Cartesian product of graphs G and H, expressed as $G\square H$, is defined as follows: A pair of vertices $(u_i, v_j)$is considered adjacent to another pair(u_r, v_s) if and only if one of the following conditions holds: if either $u_i = u_r$ and $v_j$is adjacent to $v_s$in graph H, oru_i is adjacent to u_r in graph G and$v_j = v_s$.The Kronecker product ordirect product of graphs G and H, represented as $G \otimes H$, defines a graph where the pair $(u_i, v_j)$is considered adjacent to another pair(u_r, v_s)ifandonlyif$u_i$isadjacentto$u_r$ingraphGand$v_i$is adjacent to $v_s$in graph H.The strong product of graphs $G$and H, denoted as $G \boxtimes H$, represents a graph in which the pair$(u_i, v_j)$is adjacent to(u_r, v_s)if either$u_i = u_r$and$v_j$is adjacent to $v_s$in H, or $u_i$is adjacent to$u_r$in G, and$v_i = v_s$, or$u_i$is adjacent to u_r in G, and $v_i$is adjacent to $v_s$in H. Various statistical methods are employed to explore the interdependence of indices. Among these methods, regression analysis and the coefficient of correlation play crucial roles. A linear regression analysis uses an equation to express the linear relationship between variables, whereas correlation measures the potency of this link. The coefficient of determination analyses the proportion of data encompassed by the regression line, while regression investigates the quantitative dependency of one parameter on another. Correlation explores the relationship between two or more variables that are changing in a given direction, and the coefficient of correlation measures its size. Correlation is symmetric, which means that the correlation between variables A and B is equivalent to the correlation between B and A. It is crucial to note that a sym metrical link does not al way simply smoothness; rather, it implies that variations in the two parameters emerge at the same time.

2. MAIN RESULT

Theorem2.1. Let $\Gamma_{m,n}$de note the graph of CNN. Then the spectrum of $\Gamma_{m,n}$ is:

$$Spec(\Gamma_{m,n}) = 2\left[cos\left(\frac{\pi i}{m+1}\right) + cos\left(\frac{\pi j}{n+1}\right) + 2\,cos\left(\frac{\pi i}{m+1}\right)cos\left(\frac{\pi j}{n+1}\right)\right]$$

with $i = 1,2,\ldots,m$ and $j = 1,2,\ldots,n$

Proof.

Let $P_m$be the path graph on m vertices and $P_n$be the path on n vertices. We know that $\Gamma_{m,n}$coincides with the strong product of two paths, $P_m \boxtimes P_n$.Then, using the adjacency matrix properties, we get:

$A(P_m \boxtimes P_n) = A(P_m \square P_n) + A(P_m)\otimes A(P_n)$

$= A(P_m)\otimes I_n + I_m \otimes A(P_n) + A(P_m)A(P_n)$

whereI_n, denotes the identity matrix of order $n\times n$. Clearly, the matrix is the upper triangular matrix which implies that:

$$Spec(\Gamma_{m,n}) = 2\left[cos\left(\frac{\pi i}{m+1}\right) + cos\left(\frac{\pi j}{n+1}\right) + 2\,cos\left(\frac{\pi i}{m+1}\right)cos\left(\frac{\pi j}{n+1}\right)\right]$$

3. Implementations of Adjacency spectra

Throughout this section, we consider the eige n values of $\Gamma_{m,n}$ as:

$\mu_{ij} = Spec(\Gamma_{m,n}) = 2\left[cos\left(\frac{\pi i}{m+1}\right) + cos\left(\frac{\pi j}{n+1}\right) + 2\,cos\left(\frac{\pi i}{m+1}\right)cos\left(\frac{\pi j}{n+1}\right)\right]$

with $i = 1,2,\ldots,m$ and $j = 1,2,\ldots,n$

Energy The energy of a graph *G* of order *k* is defined as

$$E(G) = \sum_{i=1}^{k} |\lambda_{ij}|$$

where λ_i'sare the eigen values of *G*. This mathematical concept found significant applications in the field of chemistry, particularly in the context of the molecular orbital theory for conjugated molecules. For more details, see [5].Now the energy of CNN is

$$E(\Gamma_{m,n}) = \sum_{i=1}^{m}\sum_{j=1}^{n} |\mu_{ij}|$$

Estrada Index The Estrada index of a graph or network is defined as the trace of the exponential of its adjacency matrix. The Estrada index, denoted as *EE*(*G*), finds application in diverse fields like chemistry and physics, including its use in protein folding degree assessment in[11],[12], [29] and [10].Estrada index, put forward by Estrada in[10]for a graph *G* of order *k* is:

$$EE(G) = \sum_{i=1}^{k} e^{\lambda_{ij}}$$

The Estrada index of $\Gamma_{m,n}$using Theorem2.1,

$$EE(\Gamma_{m,n}) = \sum_{i=1}^{m}\sum_{j=1}^{n} e^{\mu_{ij}}$$

Onsager Estrada Index In [17], Estrada introduced new indices, which are known as the Onsager Estrada index of a graph *G* of order *k*, which is denoted as *OEE*(*G*).The Onsager Estrada index, named in honour of physicist Lars Onsager, is a graph theory concept that accounts for negative temperatures in statistical mechanics. It measures the structural complexity of a graph or network by considering its contributions in the context of negative eigen values and it is defined as:

$OEE(G) = tr(e^{-A})$

which means, the Onsager Estrada index using the eigen values of CNN is

$$OEE(\Gamma) = \sum_{i=1}^{m}\sum_{j=1}^{n} e^{-\mu_{ij}}$$

Gaussian Estrada index The Estrada index is predominantly influenced by the largest eigen values of the adjacency matrix. In situations where$\lambda_1 \geq \lambda_2 \geq \cdots \geq \lambda_n$Numerous networks in the real world exhibit eigen values with significant multiplicities, such as $\lambda_i = 0$ and $\lambda_1 = -1$.This observation suggests that crucial structural information about these networks is embedded in eigen values other thanλ_1. In the following,$\tilde{\lambda}$ is a specified reference eigen value. $GEE_{-1}(G) = \sum_{i=1}^{k} e^{-(1+\lambda_i)^2}$Using Theorem2.1, the Gaussian Estrada index of a graph$\Gamma_{mn}$of order *mn* is,

$$GEE_0(\Gamma) = \sum_{i=1}^{m}\sum_{j=1}^{n} e^{-\mu_{ij}{}^2}$$

$GEE_{-1}(\Gamma) = \sum_{i=1}^{m}\sum_{j=1}^{n} e^{-e^{-(1+\mu_{ij})^2}}$

Double Gaussian Estrada index In a previous study [2], the determination of the double Gaussian index was explored. The application of the double Gaussianized Estrada index to simple graphs, as discussed in [2], showcased its effectiveness in classifying polycyclic aromatic hydrocarbons (PAHs) based on their carcinogenic or inactive nature. As a result, the work described in [2] defines double Gaussian functions of the graph spectra as follows

$DGEE_{\tilde{\lambda}_1\tilde{\lambda}_2}(G) = tr\{exp[-(\tilde{\lambda}_1 I - A)^2(\tilde{\lambda}_2 I - A)^2]\}$

Hence, the double Gaussian Estrada index of a graph *G* of order *k* is defined as:

$$DGEE_{-1,1}(\Gamma) = \sum_{i=1}^{k} e^{-(\lambda_i{}^2-1)^2}$$

Now the double Gaussian Estrada index using the adjacency matrix of $\Gamma_{m,n}$ is:

$$DGEE_{-1,1}(\Gamma) = \sum_{i=1}^{n}\sum_{j=1}^{m} e^{-(\mu_{ij}{}^2-1)^2}$$

Average Subgraph Centrality and Natural connectivity In [13], the subgraph centrality , denoted as $\langle SC\rangle$ of any arbitrary node *j* within a graph *G* of order *k* is indicated by

$$SC(j) = \sum_{i=1}^{k} (x_i^j)^2\, e^{\lambda_i}$$

The symbol $x_i$denotes an eigenvector of the adjacency matrix of graph *G* corresponding to the eigen value. Furthermore, the average subgraph centrality of *G* with order *k* is formulated as follows:

$$\langle SC\rangle = \frac{1}{k}\sum_{i=1}^{k} SC(j) = \frac{1}{k}\sum_{i=1}^{k} e^{\lambda_j}$$

In[22],the Natural connectivity, represented as λ and closely associated with subgraph centrality, is identified as:

$$\bar{\lambda} = ln\langle SC\rangle = ln\left[\frac{1}{k}\sum_{i=1}^{k} e^{\lambda_i}\right]$$

Currently,theaveragesubgraphcentralityandnaturalconnectivityofCNNare:

$$\langle SC\rangle = \frac{1}{mn}\sum_{i=1}^{m}\sum_{j=1}^{n} e^{\mu_{ij}}$$

$$\bar{\lambda} = ln\left[\frac{1}{mn}\sum_{i=1}^{m}\sum_{j=1}^{n} e^{\mu_{ij}}\right]$$

Double Gaussian Estrada index In a previous study[2], the determination of the double Gaussian index was explored. The application of the double Gaussianized Estrada index to simple graphs, as discussed in [2], showcased its effectiveness in classifying polycyclic aromatic hydrocarbons (PAHs) based on their carcinogenic or inactive nature. As a result, the work described in [2] defines double Gaussian functions of the graph spectra as follows

$DGEE_{\tilde{\lambda}_1\tilde{\lambda}_2}(G) = tr\{exp[-(\tilde{\lambda}_1 I - A)^2(\tilde{\lambda}_2 I - A)^2]\}$

Hence, the double Gaussian Estrada index of a graph *G* of order *k* is defined as:

$$DGEE_{-1,1}(\Gamma) = \sum_{i=1}^{k} e^{-(\lambda_i{}^2-1)^2}$$

Analyzing Relationship of various Estrada indices with Energy

Currently, we are conducting linear regression analyses between each of the Estrada indices and CNN energy. This analysis is based on a data set obtained by varying both n and m upto10. The linear dependency relations(collected in the form P(Q), where Q is energy and n is the number of data points) can be estimated and are presented in Table 1.The relationships calculated in Table 2 are visually represented in Figures 2 to 8 generated using Python. Figure 2 depict show the energy relates to the Estrada index. The coefficient of determination, at 0.983717, shows that approximately 98.37% of the variance in the Estrada Index can be accounted for by the energy. Additionally, the correlation coefficient of 0.9918255 highlights a very strong and positive association between energy and the Estrada Index. Figure 3 shows the relationship between the double Gaussian Estrada index and the energy of CNN. The coefficient of determination 0.9587626 indicates strong predictability (approximately 95.87%), with a correlation coefficient of 0.979164 denoting a correlation very strong positively. Figure 4 exhibits a relationship between the Gaussian Estrada Index with $\bar{\lambda} = 0$. and energy. The coefficient of determination is 0.9894039, showing around 98.94% of variance in the Gaussian Estrada Index with $\bar{\lambda} = 0$. The correlation coefficient is0.9946878,showingacorrelationverystrongpositively.Figure5describesthe relationship between the Gaussian Estrada Index with $\bar{\lambda} = -1$, and energy. The determination coefficient (0.989706) indicates strong predictability (approximately 98.97%), with a correlation coefficient of 0.94839 denoting a very strong positive correlation. Figure 6 shows the relationship between average subgraph centrality $\langle SC \rangle$ and CNN energy with a coefficient of determination is 0.856148, about 85.64% of variability is explained. The correlation coefficient, 0.9252827, demonstrates a very strong positive correlation. In Figure7, the relationship between natural connectivity and energy is depicted. The determination coefficient 0.5808544 suggests moderate predictability (approximately 58.08%), and the correlation coefficient of 0.76213808 indicates a strong positive correlation. Figure 8 visually represents the regression between the Onsager Estrada Index and energy . The coefficient of determination(0.9972268)suggests high predictability (around 99.72%), and the correlation coefficient of 0.998612 signifies an extremely strong positive correlation. In summary, the Onsager Estrada Index is highly correlated with energy, while natural connectivity performs moderately and exhibits strong positive linear relationships with energy.

Applications

The design of a CNN can vary based on the specific applications and requirements. In image processing, each cell in a CNN may correspond to a specific region or feature in the input data rather than directly mapping to individual pixels. The choice of the CNN size, including the number of cells and the arrangement of cells depends on the characteristics of the input data and the goals of the task. The energy of the CNN reflects its computational intensity. Higher adjacency energy indicates increased interactions between neighboring features, showcasing the in- fluence of pixels on each other within the network. By selecting CNN sizes based on energy considerations, one can optimize the performance of the CNN. In[27], it was proved that the Estrada index is superior to energy for predicting chemical properties, making it a valuable metric for considering various Estrada indices as a metric for attaining optimal performance by selecting suitable CNN sizes.

CONCLUSION

In this study, we delved into the intricate world of CNN by determining the adjacency eigen values. From these eigen values, we derived several indices, including the Estrada index, Onsager Estrada index, Gaussian Estrada index, Double Gaussian Estrada index, Energy, Average Subgraph Centrality, and Natural Connectivity. To unravel the relationships within the data, we performed a linear regression analysis, fitting a regression line to the data using the renowned least squares method for optimal accuracy. The results revealed that, among the considered indices, the Onsager Estradaindexishighlycorrelatedwithenergy.Ontheotherhand,theregression model for natural connectivity exhibited relatively lower effectiveness compared to others. Notably, all indices demonstrated a very strongly positive linear relation- ship with energy, except for natural connectivity. It is crucial to underscore that our investigation specifically revolves around predicting the energy of CNN based on eigen value-derived indices. The derived linear regression relation ,particularly for the Onsager Estrada index, offers a high-precision method for predicting the energy of CNN. Energy and Estrada indices play a crucial role in optimizing CNN performances by selecting suitable CNN sizes.

ABSTRACT

In this paper, we introduce the notion of extended *WI*-ideals and stable *WI*-ideals associated to a subset Ɓof *RLW*-algebra ℜ. Also, we discuss what kind of *RLW*-algebra have *WI*-ideals. Further, investigate their related properties. Finally , we show that ℜis an involute *RLW*-algebra, then $G_1(Ɓ)$is a stable *WI*-ideal relative to Ɓ, and so $G_1(Ɓ)$ is the smallest stable *WI*-ideal relative to Ɓ.

Keywords: *W*-algebra;*LW*-algebra;*RLW*-algebra; *RLHW*-algebra; Ideal; Lattice ideal; Extended *WI*-ideal; Involute *RLW*-algebra; *MV*-algebra.

INTRODUCTION

Mordchaj Wajsberg[1] introduced the concept of *W*-algebras in 1935 and studied by Font, Rodriguez and Torrens[2]. Residuated lattices were announced by Ward and Dilworth[3].Ibrahim and Shajitha Begum[4]introduced the notions of *LW*-algebras and also investigated their properties with suitable llustrations. The authors [5] introduced the notion of Wajsberg implicative ideal (*WI*-ideals) of *RLW*-algebras.

In this paper, we consider the notion of extended *WI*-ideals in*RLW*-algebra and investigate some related properties.

PRELIMINARIES

In this section, we recall some basic definitions and properties which are helpful to develop our main results.

Definition 2.1[3]. Are siduated lattice$(\Re, \vee, \wedge, \otimes, \rightarrow, 0, 1)$ satisfied the following conditions for all $\mathfrak{r}, \mathfrak{s}, \mathfrak{t} \in \Re$,
(i) $(\Re, \vee, \wedge, 0, 1)$ is a bounded lattice
(ii) $(\Re, \otimes, 1)$is commutative monoid
(iii) $\mathfrak{r} \otimes \mathfrak{s} \leq \mathfrak{t}$ if and only if $\mathfrak{r} \leq \mathfrak{s} \rightarrow \mathfrak{t}$.

Definition 2.2[2]. A *W*-algebra$(\Re, \rightarrow, *, 1)$satisfied the following axioms for all $\mathfrak{r}, \mathfrak{s}, \mathfrak{t} \in \Re$,
(i) $\mathfrak{r} \rightarrow \mathfrak{r} = 1$
(ii) If $(\mathfrak{r} \rightarrow \mathfrak{s}) = (\mathfrak{s} \rightarrow \mathfrak{r}) = 1$ then $\mathfrak{r} = \mathfrak{s}$
(iii) $\mathfrak{r} \rightarrow 1 = 1$
(iv) $(\mathfrak{r} \rightarrow (\mathfrak{s} \rightarrow \mathfrak{r})) = 1$
(v) If $(\mathfrak{r} \rightarrow \mathfrak{s}) = (\mathfrak{s} \rightarrow \mathfrak{t}) = 1$ then$\mathfrak{r} \rightarrow \mathfrak{t} = 1$
(vi) $(\mathfrak{r} \rightarrow \mathfrak{s}) \rightarrow \big((\mathfrak{q} \rightarrow \mathfrak{r}) \rightarrow (\mathfrak{t} \rightarrow \mathfrak{s})\big) = 1$
(vii) $\mathfrak{r} \rightarrow (\mathfrak{s} \rightarrow \mathfrak{t}) = \mathfrak{s} \rightarrow (\mathfrak{r} \rightarrow \mathfrak{t})$
(viii) $\mathfrak{r} \rightarrow 0 = \mathfrak{r} \rightarrow 1^* = \mathfrak{r}^*$
(ix) $(\mathfrak{r}^*)^* = \mathfrak{o}$
(x) $(\mathfrak{r}^* \rightarrow \mathfrak{s}^*) = \mathfrak{s} \rightarrow \mathfrak{r}$.

Proposition 2.3[3]. Let $(\Re, \vee, \wedge, \otimes, \rightarrow, 0, 1)$be a residuated lattice. Then the following are satisfiedfor all $\mathfrak{r}, \mathfrak{s}, \mathfrak{t} \in \Re$,
(i) $(\mathfrak{r} \otimes \mathfrak{s}) \rightarrow \mathfrak{t} = \mathfrak{r} \rightarrow (\mathfrak{s} \rightarrow \mathfrak{t})$
(ii) $(\mathfrak{r} \otimes \mathfrak{s}) \otimes \mathfrak{t} = \mathfrak{r} \otimes (\mathfrak{s} \otimes \mathfrak{t})$
(iii) $\mathfrak{r} \otimes \mathfrak{s} = \mathfrak{s} \otimes \mathfrak{r}$

Definition 2.4[2]. Let$(\Re, \vee, \wedge, *, \rightarrow, 1)$ be a *LW*-algebra. If a binaryoperation" $\otimes$ " on $\Re$ satisfied$\mathfrak{r} \otimes \mathfrak{s} = (\mathfrak{r} \rightarrow \mathfrak{s}^*)^*$ for all $\mathfrak{o}, \mathfrak{s} \in \Re$. Then $(\Re, \vee, \wedge, \otimes, \rightarrow, *, 0, 1)$is called a *RLW*-algebra.

Definition 2.5[4].A non-empty subset *I* of a *W*-algebra $\Re$ is an ideal, if it satisfied the following axioms for all $\mathfrak{r}, \mathfrak{s} \in \Re$,
(i) $0 \in I$
(ii) $\mathfrak{r} \in I$ and $\mathfrak{s} \leq \mathfrak{r}$ imply $\mathfrak{s} \in I$.

Definition 2.6[2]. Let ϱbe a lattice. An ideal I of ϱ is a nonempty subset of$\varrho$is called a lattice ideal, if it satisfied the following axioms for all $\mathfrak{r}, \mathfrak{s} \in \Re$,
(i) $\mathfrak{r} \in I, \mathfrak{s} \in L$ and $\mathfrak{s} \leq \mathfrak{r}$ imply $\mathfrak{s} \in I$
(ii) $\mathfrak{r}, \mathfrak{s} \in I$implies $\mathfrak{r} \vee \mathfrak{s} \in I$.

Theorem 2.7 [6]. Let *A* be an *MV*- algebra, $\mathcal{B} \subseteq A$and*I* be an *WI*-ideal of *A*, then *I* is a stable *WI*-ideal relative to $\mathcal{B}$ such that $\mathcal{B} \cap \mathrm{I} = \emptyset$ if and only if A/I is a chain.

Theorem 2.8 [6]. Let *A* be an *MV*- algebra, then *A* is a chain if and only if for $\mathfrak{r}, \mathfrak{s} \in \Re, \mathfrak{r} \wedge \mathfrak{s} = 0$, implies $\mathfrak{r} = 0$ or $\mathfrak{s} = 0$.

MAIN RESULTS

Extended *WI*-Ideals In *RLW*- Algebras.
In this section, we introduce the notion of extended *WI*-ideals of *RLW*-algebras and stable *WI*-ideals associated to a subset $\mathcal{B}$ of *RLW*-algebra $\Re$. Also, we discuss what kind of residuated lattices have *WI*-ideals and investigate some of

their properties. Further, we consider the quotient algebras introduced by extended *WI*-ideals and prove some related theorems.

Definition 3.1.1. Let $\mathfrak{R}$ be aRLW-algebra ,Ibe an *WI*-ideal of $\mathfrak{R}$ and $\mathcal{B} \subseteq \mathfrak{R}$. we denote the set of I associated with $\mathcal{B}$ as follows: $G_1(\mathcal{B}) = \{\mathfrak{s} \in \mathfrak{R}/\mathfrak{s}\wedge\mathfrak{v} \in \mathrm{I}, \forall \mathfrak{v} \in \mathcal{B}\}$.
If $G_1(\mathcal{B})$ is an *WI*-ideal of $\mathfrak{R}$, then $G_1(\mathcal{B})$ is called an extended *WI*-ideal of $\mathfrak{R}$.

Example 3.1.2. Consider a set $\mathfrak{R}=\{0, \mathfrak{u}, \mathfrak{v}, \mathfrak{w}, \mathfrak{s}, 1\}$. Define a partial ordering "$\leq$" on$\mathfrak{R}$, such that $0 \leq \mathfrak{u} \leq \mathfrak{v} \leq \mathfrak{w} \leq \mathfrak{s} \leq 1$with a binary operations" $\otimes$ "and" $\rightarrow$ "and a quasi complement " $*$ "on $\mathfrak{R}$ as in following tables 1 and 2.
Define $\vee$ and $\wedge$ operations on $\mathfrak{R}$ as follows
$(\mathfrak{r} \vee \mathfrak{s}) = (\mathfrak{r} \rightarrow \mathfrak{s}) \rightarrow \mathfrak{s}$,
$(\mathfrak{r} \wedge \mathfrak{s}) = (\mathfrak{r}^* \rightarrow \mathfrak{s}^*) \rightarrow \mathfrak{s}^*)^*$; $\mathfrak{r} \otimes \mathfrak{s} = (\mathfrak{r} \rightarrow \mathfrak{s}^*)^*$ for all $\mathfrak{r}, \mathfrak{s} \in \mathfrak{R}$
Then,$\mathfrak{R}$ is a RLW-algebra. It is easy to verify that, $I = \{0\}$ is an *WI*-ideal of $\mathfrak{R}$. Let $\mathcal{B} = \{\mathfrak{w}\}$. Then $G_1(\mathcal{B}) = \{0, \mathfrak{w}, \mathfrak{s}\}$ is not an *WI*-ideal of $\mathfrak{R}$. Thus, $G_1(\mathcal{B}) = \{0, \mathfrak{w}, \mathfrak{s}\}$ is not an extended *WI*-ideal of $\mathfrak{R}$.

Remark 3.1.3. Example 3.1.2 shows that $G_1(\mathcal{B})$ is not an extended *WI*-ideal of $\mathfrak{R}$. Since $\mathfrak{w} \otimes \mathfrak{s} = \mathfrak{s}^* = \mathfrak{v} \notin I, G_1(\mathcal{B}) = \{0, \mathfrak{w}, \mathfrak{s}\}$is not an extended *WI*-ideal of $\mathfrak{R}$. This means that Definition 1 is reasonable.

Example 3.1.4. Consider a set $\mathfrak{R}=\{0, \mathfrak{u}, \mathfrak{v}, \mathfrak{w}, 1\}$. Define a partial ordering "$\leq$" on ϱ, such that $0 \leq \mathfrak{u} \leq \mathfrak{v} \leq \mathfrak{w} \leq \mathfrak{s} \leq 1$with a binary operations" $\otimes$ "and " $\rightarrow$ "and a quasi complement " $*$ "on $\mathfrak{R}$ as in following tables 3 and 4.

Define $\vee$ and $\wedge$ operations on ϱ as follows:
$(\mathfrak{r} \vee \mathfrak{s}) = (\mathfrak{r} \rightarrow \mathfrak{s}) \rightarrow \mathfrak{s}$,
$(\mathfrak{r} \wedge \mathfrak{s}) = (\mathfrak{r}^* \rightarrow \mathfrak{s}^*) \rightarrow \mathfrak{s}^*)^*$; $\mathfrak{r} \otimes \mathfrak{s} = (\mathfrak{r} \rightarrow \mathfrak{s}^*)^*$ for all $\mathfrak{r}, \mathfrak{s} \in \mathfrak{R}$
Then,ϱ is a RLW-algebra. It is easy to verify that, $I = \{0, \mathfrak{u}\}$ is an *WI*-ideal of $\mathfrak{R}$. Let $\mathcal{B}_1 = \{\mathfrak{w}\}$and $\mathcal{B}_2 = \{\mathfrak{u}\}$.Then $G_1(\mathcal{B}_1) = \{0, \mathfrak{u}\}$and $G_1(\mathcal{B}_2) = \mathfrak{R}$. Thus $G_1(\mathcal{B}_1) = \{0, \mathfrak{u}\}$ and $G_1(\mathcal{B}_2) = \mathfrak{R}$is not an extended *WI*-ideal of $\mathfrak{R}$.

Theorem 3.1.5. Let$\mathfrak{R}$ be an involute RLW-algebra, I be an *WI*-ideal of $\mathfrak{R}$ and $\mathcal{B} \subseteq \mathfrak{R}$, then $G_1(\mathcal{B})$ is an extended *WI*-ideal of $\mathfrak{R}$.

Proof. We have $0 \wedge b = 0 \in I$, for all $\mathrm{b} \in \mathcal{B}$ and so $0 \in G_1(\mathcal{B})$.For all $\mathfrak{r}, \mathfrak{s}, \mathfrak{t} \in \mathfrak{R}$, we have
$(\mathfrak{r} \otimes \mathfrak{s}) \vee \mathfrak{t} = (((\mathfrak{r} \otimes \mathfrak{s}) \rightarrow \mathfrak{t}) \rightarrow \mathfrak{t})$
$\geq (((\mathfrak{r} \otimes \mathfrak{t}) \otimes (\mathfrak{s} \otimes \mathfrak{t})) \rightarrow \mathfrak{t})$
$= \big((\mathfrak{r} \rightarrow \mathfrak{t}) \rightarrow \mathfrak{t}\big) \otimes ((\mathfrak{s} \otimes \mathfrak{t}) \rightarrow \mathfrak{t})$
$= (\mathfrak{r} \vee \mathfrak{t}) \otimes (\mathfrak{s} \vee \mathfrak{t})$
So$(\mathfrak{r} \otimes \mathfrak{s}) \vee \mathfrak{t} \geq (\mathfrak{r} \vee \mathfrak{t}) \otimes (\mathfrak{s} \vee \mathfrak{t})$
Let $\mathfrak{r}, \mathfrak{s} \in G_1(\mathcal{B})$
Then $\mathfrak{r} \wedge \mathfrak{v}, \mathfrak{s} \wedge \mathfrak{v} \in I$ for all $\mathfrak{v} \in \mathcal{B}$.
Since I is an *WI*-ideal. So$(\mathfrak{s} \otimes \mathfrak{r}) \wedge \mathfrak{v} \in I$.
Then we have
$(\mathfrak{r}^* \otimes \mathfrak{s}^*) \vee \mathfrak{v}^* \geq ((\mathfrak{r}^* \otimes \mathfrak{s}^*) \rightarrow \mathfrak{v}^*) \rightarrow \mathfrak{v}^*$
$\geq ((\mathfrak{r}^* \otimes \mathfrak{s}^*) \rightarrow \mathfrak{v}) \rightarrow \mathfrak{v})$
$\geq (((\mathfrak{r}^* \rightarrow \mathfrak{s}^*)^*)^*) \rightarrow \mathfrak{u}) \rightarrow \mathfrak{u}$
$\geq ((\mathfrak{r}^* \rightarrow \mathfrak{s})^* \rightarrow \mathfrak{u}) \rightarrow \mathfrak{u}\backslash$
$\geq ((\mathfrak{r}^* \rightarrow \mathfrak{s})^* \rightarrow \mathfrak{v}^*) \rightarrow \mathfrak{v}^*$
$\geq ((\mathfrak{s} \rightarrow \mathfrak{r}^*)^* \rightarrow \mathfrak{v}^*) \rightarrow \mathfrak{v}^*$
$\leq (\mathfrak{s} \otimes \mathfrak{r}) \wedge \mathfrak{v} \in I$
Since $(\mathfrak{s} \rightarrow \mathfrak{r}^*)^* \in I$ and $\mathfrak{v} \in I$, then $(\mathfrak{s} \otimes \mathfrak{r}) \wedge \mathfrak{v} \in I$.
This results $(\mathfrak{s} \otimes \mathfrak{r}) \in G_1(\mathcal{B})$.
Now, let $\mathfrak{r} \leq \mathfrak{s}, \mathfrak{s} \in G_1(\mathcal{B})$. It is clear that $\mathfrak{r} \in G_1(\mathcal{B})$.
Thus$G_1(\mathcal{B})$ is an *WI*-ideal of $\mathfrak{R}$.

Also let $\mathfrak{r} \in G_1(\mathcal{B})$, since $\mathfrak{r} \wedge \mathcal{v} \leq \mathfrak{r}$, for all $\mathcal{v} \in \mathcal{B}$.
Since I is an *WI*-ideal, we obtain $\mathfrak{r} \wedge \mathcal{v} \in I$, for all $\mathcal{v} \in \mathcal{B}$. This means $\mathcal{u} \in G_1(\mathcal{B})$.
So $I \subseteq G_1(\mathcal{B})$.

Definition 3.1.6. An *WI*-ideal is a stable relative to a subset $\mathcal{B}$ of $\mathfrak{R}$ if $I = G_1(\mathcal{B})$.

Example 3.1.7. Inexample 3.1.4, $I = \{0, \mathcal{u}\}$ is a stable *WI*-ideal relative to $\mathcal{B} = \{\mathcal{w}]$.

Theorem 3.1.8. Let $\mathfrak{R}$ be a *RLW*-algebra, I and J be *WI*-ideals of $\mathfrak{R}$, and $\mathcal{B} \subseteq \mathfrak{R}$. Then
(i) $G_1(\mathcal{B}) = \mathfrak{R}$ if and only if $\mathcal{B} \subseteq I$;
(ii) If $G_1(\mathcal{B})$ is an extended *WI*-ideal of $\mathfrak{R}$, $\mathfrak{r} \in \mathfrak{R}$ is a finite order and $\mathfrak{r} \in G_1(\mathcal{B})$, then $G_1(\mathcal{B}) = \mathfrak{R}$;
(iii) If $I \subseteq J$, then $G_I(\mathcal{B}) = G_J(\mathcal{B})$;
(iv) If $\mathfrak{r}, \mathfrak{s} \in G_I(\mathcal{B})$, then $\mathfrak{r}^* \to \mathfrak{s} \in G_I(\mathcal{B})$;
(v) $\mathcal{B} \subseteq G_I\big(G_I(\mathcal{B})\big)$;
(vi) If $I \subseteq J$, then $G_1(J) \cap J = I$;
(vii) $G_I\big(G_I(\mathcal{B})\big) \cap G_I(\mathcal{B}) = \mathrm{I}$;
(viii) If $\mathcal{B} \subseteq \mathcal{C}$, then $G_I(\mathcal{C}) \subseteq G_J(\mathcal{B})$;
(ix) $\mathcal{B}^{\perp} \subseteq G_I(\mathcal{B})$;
(x) If $1 \in \mathcal{B}$, then I is stable relative to $\mathcal{B}$;
(xi) $G_I(\mathcal{B}) \to G_J(\mathcal{B}) \subseteq I \to G_J(\mathcal{B})$;
(xii) $G_{I \to J}(\mathcal{B}) \subseteq G_{I \to G_J(\mathcal{B})}(\mathcal{B})$.

Proof. (i)Let $G_1(\mathcal{B}) = \mathfrak{R}$ and $\mathcal{v} \in \mathcal{B}$. Since $\mathcal{v} \in \mathcal{B}$, $\mathcal{B} \subseteq \mathfrak{R}$ and $G_1(\mathcal{B}) = \mathfrak{R}$, so $\mathcal{v} \in G_1(\mathcal{B})$,
then $\mathcal{v} = \mathcal{v} \wedge \mathcal{v} \in I$. Thus, $\mathcal{B} \subseteq I$.
Conversely, $\mathcal{B} \subseteq I$, $\mathfrak{r} \in \mathfrak{R}$ and $\mathcal{v} \in \mathcal{B}$. Since $\mathfrak{r} \wedge \mathcal{v} \in I$, for all $\mathcal{v} \in \mathcal{B}$.
This means $\mathfrak{r} \in G_1(\mathcal{B})$. Thus $G_1(\mathcal{B}) = \mathfrak{R}$.
(i) Let $\mathfrak{r} \in \mathfrak{R}$ be a finite order, then there exists $n \in N$ such that $nx = 1$.
Suppose that $\mathfrak{r} \in G_1(\mathcal{B})$. Since $G_1(\mathcal{B})$ is an *WI*-ideal, $nx = 1 \in G_1(\mathcal{B})$.
Hence, $\mathcal{v} = 1 \wedge \mathcal{v} \in I$, for all $\mathcal{v} \in \mathcal{B}$ and so $\mathcal{B} \subseteq I$.
Using (i), we have $G_1(\mathcal{B}) = \mathfrak{R}$.
(ii) Let $I \subseteq J$ and $\mathfrak{r} \in G_1(\mathcal{B})$. Then $\mathfrak{r} \wedge \mathcal{v} \in I \subseteq J$, for all $\mathcal{v} \in \mathcal{B}$, so $\mathfrak{r} \in G_J(\mathcal{B})$.
Thus $G_I(\mathcal{B}) \subseteq G_J(\mathcal{B})$.
(iii) Let $\mathfrak{r}, \mathfrak{s} \in G_1(\mathcal{B})$. Then $\mathfrak{r} \wedge \mathcal{v} \in I$ and $\mathfrak{s} \wedge \mathcal{v} \in I$, for all $\mathcal{v} \in \mathcal{B}$.
So $(\mathfrak{r} \wedge \mathcal{v})^* \to (\mathfrak{s} \wedge \mathcal{v}) \in I$.
Since I is an *WI*-ideal of $\mathfrak{R}$. $(\mathfrak{r}^* \to \mathcal{v}) \wedge \mathcal{v} \leq (\mathfrak{r} \wedge \mathcal{v})^* \to (\mathfrak{s} \wedge \mathcal{v})$[By theorem 3.1.5]
Hence, $(\mathfrak{r}^* \to \mathcal{v}) \wedge \mathcal{v} \in I$. Thus $(\mathfrak{r}^* \to \mathcal{v}) \in G_I(\mathcal{B})$.
(iv) Let $\mathfrak{r} \in \mathcal{B}$ and $\mathfrak{s} \in G_I(\mathcal{B})$. Then $\mathfrak{r} \wedge \mathfrak{s} = \mathfrak{s} \wedge \mathfrak{r} \in I$. This means $\mathfrak{r} \in G_I(G_I(\mathcal{B}))$.
(v) Let $\mathfrak{r} \in G_I(J) \cap J$. Then ,$\mathfrak{r} = \mathfrak{r} \wedge \mathfrak{r} \in I$. Conversely, let $\mathfrak{r} \in I$ and $\mathfrak{s} \in J$. Then, we have $\mathfrak{r} \wedge \mathfrak{s} \leq \mathfrak{r}$.
Since I is an *WI*-ideal and $I \subseteq J$, we get $\mathfrak{r} \in G_I(J) \cap J$. Thus $G_I(J) \cap J = I$.
(vi) Let $\mathfrak{r} \in G_I(G_I(\mathcal{B}) \cap G_I(\mathcal{B}))$. Then $\mathfrak{r} = \mathfrak{r} \wedge \mathfrak{r} \in I$. Conversely, let $\mathfrak{r} \in I$ and $\mathfrak{s} \in G_I(\mathcal{B})$.
Clearly, $\mathfrak{r} \in I \subseteq G_I(\mathcal{B})$. Since I is an *WI*-ideal and $\mathfrak{r} \wedge \mathfrak{s} \leq \mathfrak{r}$, we have $\mathfrak{r} \wedge \mathfrak{s} \in I$.
Hence, $\mathfrak{r} \in G_I(G_I(\mathcal{B}) \cap G_I(\mathcal{B}))$.
(vii) Let $\mathfrak{r} \in G_I(\mathcal{C})$ and $\mathcal{B} \subseteq \mathcal{C}$. Then $\mathfrak{r} \wedge \mathcal{w} \in I$ for all $\mathcal{w} \in \mathcal{B}$. Hence, $\mathfrak{r} \in G_I(\mathcal{B})$
(viii) Let$\mathcal{u} \in \mathcal{B}^{\perp}$. Then $\mathcal{u} \wedge \mathcal{v} = 0 \in I$, for all $\mathcal{v} \in \mathcal{B}$. Hence, $\mathcal{u} \in G_I(\mathcal{B})$.
(ix) Let $1 \in \mathcal{B}$ and $\mathfrak{r} \in G_I(\mathcal{B})$. Then, $\mathfrak{r} = \mathfrak{r} \wedge 1 \in I$. Hence, $G_I(\mathcal{B}) \subseteq I$. Since $I \subseteq G_I(\mathcal{B})$.
Thus, $I = G_I(\mathcal{B})$.
(x) Let $\mathfrak{r} \in G_I(\mathcal{B}) \to G_J(\mathcal{B})$. Hence, $\mathfrak{r} \cap I \subseteq (\mathfrak{r}] \cap G_I(\mathcal{B}) \subseteq G_J(\mathcal{B})$. Thus, $\mathfrak{r} \in I \to G_J(\mathcal{B})$.
(xi) Let $\mathfrak{r} \in G_{I \to J}(\mathcal{B})$. Then, $\mathfrak{r} \wedge \mathcal{v} \in I \to J$, for all $\mathcal{v} \in \mathcal{B}$. It follows that $(\mathfrak{r} \wedge \mathcal{v}] \cap I \subseteq J \subseteq G_J(\mathcal{B})$.
Hence, $\mathfrak{r} \wedge \mathcal{v} \in I \to G_J(\mathcal{B})$, for all $\mathcal{v} \in \mathcal{B}$. Thus, $\mathfrak{r} \in G_{I \to G_J(\mathcal{B})}(\mathcal{B})$.

Proposition 3.1.9. Let $f: \mathfrak{R} \to \mathfrak{s}$ be an auto residuated lattice-homomorphism, then $G_{\mathrm{Ker}(f)}(\mathcal{B}) = \mathrm{f}^{-1}(G_{\{0\}}(\mathcal{C}))$ for $\mathcal{B} \subseteq \mathfrak{R}$ and $\mathcal{C} \subseteq \mathfrak{s}$ such that $f(\mathcal{B}) = \mathcal{C}$.

Proof. Clearly.

Theorem 3.1.10. Let $\mathfrak{R}$ be a *RLW*-algebra, I be a proper *WI*-ideal of $\mathfrak{R}$ and $\mathcal{C} \subseteq \mathfrak{s}$. Then $G_1(\mathcal{B}) \cap I$

Proof. Let $\in G_1(\mathcal{B}) \cap \mathcal{B}$. Then$\mathfrak{r} \in G_1(\mathcal{B})$ and $\mathfrak{r} \in \mathcal{B}$. So, $\mathfrak{r} \wedge \mathcal{v} \in I$, for all $\mathcal{v} \in \mathcal{B}$.
Now, let $\mathcal{v} = \mathfrak{r} \in \mathcal{B}$. Hence, $\mathfrak{r} = \mathfrak{r} \wedge \mathfrak{r} \in I$.Thus $G_1(\mathcal{B}) \cap \mathcal{B} \subseteq I$.

Corollary 3.1.11. Let $0 \in \mathcal{B}$. Then $G_1(\mathcal{B}) \cap \mathcal{B} = \{0\}$.

Theorem 3.1.12. Let $\mathfrak{R}$ be an involute *RLW*-algebra, I be a proper *WI*-ideal of $\mathfrak{R}$ and $\mathcal{B} \subseteq \mathfrak{R}$. Then the following statements hold:

(i) $G_{\{0\}/I}(\mathcal{B}/\mathrm{I}) = G_1(\mathcal{B})/I$,

(ii) If $G_1(\mathcal{B}(\mathfrak{R})) \subseteq \mathcal{B}(\mathfrak{R})$, then $G_1\big(\mathcal{B}(\mathfrak{R})\big) = \mathrm{I}$ and $\mathcal{B}(\mathfrak{R}/G_1(\mathcal{B}(\mathfrak{R})) = \mathcal{B}(\mathfrak{R})/G_1(\mathcal{B}(\mathfrak{R}))$.

Proof.(i)$G_{\{0\}/I}(\mathcal{B}/\mathrm{I}) = G_1(\mathcal{B})/I$
$\mathfrak{r}/I \wedge \mathcal{v}/I = 0/I \Leftrightarrow \mathfrak{r} \wedge \mathcal{v} \in I \Leftrightarrow \mathfrak{r} \in G_1(\mathcal{B}) \Leftrightarrow \mathfrak{r}/I \in G_1(\mathcal{B})/\mathrm{I}$.
(ii) Let $G_1(\mathcal{B}(\mathfrak{R})) \subseteq \mathcal{B}(\mathfrak{R})$. Then, we have $G_1(\mathcal{B}(\mathfrak{R})) = \mathrm{I}$ [By theorem 3.1.10]
And $\mathcal{B}(\mathfrak{R})/G_1\big(\mathcal{B}(\mathfrak{R})\big) = \{\, \mathrm{e}/G_1\big(\mathcal{B}(\mathfrak{R})\big) : \mathrm{e} \in \mathcal{B}(\mathfrak{R}) \,\}$,
$= \{\, \mathrm{e}/G_1\big(\mathcal{B}(\mathfrak{R})\big) : \mathrm{e} \vee e^* = 1\}$,
$= \{\, \mathrm{e}/G_1\big(\mathcal{B}(\mathfrak{R})\big) : \mathrm{e}/G_1\big(\mathcal{B}(\mathfrak{R})\big) \vee e^*/G_1\big(\mathcal{B}(\mathfrak{R})\big) = 1/G_1\big(\mathcal{B}(\mathfrak{R})\big)\}$
$= \mathcal{B}(\mathfrak{R}/G_1\big(\mathcal{B}(\mathfrak{R})\big)$

Theorem 3.1.13. Let $\mathfrak{R}$ be an involute *RLW*-algebra, I be an *WI*-ideal of $\mathfrak{R}$ and $\mathcal{B} \subseteq \mathfrak{R}$. Then $G_1(\mathcal{B})$ is a stable relative to $\mathcal{B}$ and so $G_1(\mathcal{B}) = \cap \{\mathrm{J}: \mathrm{J}$ is a stable relative to $\mathcal{B}$ and $I \subseteq J\}$.

Proof. By theorem 3.1.5, we have $G_1(\mathcal{B}) \subseteq G_{G_1(\mathcal{B})}(\mathcal{B})$.
Conversely, let $\mathfrak{r} \in G_{G_1(\mathcal{B})}(\mathcal{B})$. Then, $\mathfrak{r} \wedge \mathcal{v} \in G_1(\mathcal{B})$, for all $\mathcal{v} \in \mathcal{B}$.
Hence, $(\mathfrak{r} \wedge \mathcal{v}) \wedge \mathcal{v} \in I$, for all $\mathcal{v} \in \mathcal{B}$. so $\mathfrak{r} \wedge \mathcal{v} \in I$, for all $\mathcal{v} \in \mathcal{B}$.
Thus, $\mathfrak{r} \in G_1(\mathcal{B})$. Hence, $G_{G_1(\mathcal{B})}(\mathcal{B}) \subseteq G_1(\mathcal{B})$. So $G_{G_1(\mathcal{B})}(\mathcal{B}) = G_1(\mathcal{B})$.
Therefore, $G_1(\mathcal{B})$ is stable relative to $\mathcal{B}$.
Now, let J be a stable relative to $\mathcal{B}$ such that $I \subseteq J$.
Then, $G_I(\mathcal{B}) \subseteq G_J(\mathcal{B}) = \mathrm{J}$.
So $G_I(\mathcal{B}) = \cap \{\mathrm{J}: \mathrm{J}$ is a stable relative to $\mathcal{B}$ and $I \subseteq J\}$.

Theorem 3.1.14. Let $\mathfrak{R}$ be an involute *RLW*-algebra, I be a prime *WI*-ideal of the first kind of $\mathfrak{R}$ and $\mathcal{B} \subseteq \mathfrak{R}$. extended *WI*-ideal $G_I(\mathcal{B})$ is a prime *WI*-ideal of $\mathfrak{R}$.

Proof. Let I be a prime *WI*-ideal of the first kind of $\mathfrak{R}$.
Then $(\mathfrak{r} \to \mathfrak{s})^*, \mathfrak{r} \otimes \mathfrak{s} \in I$ or $(\mathfrak{s} \to \mathfrak{r})^*, \mathfrak{s} \otimes \mathfrak{r} \in I$, for all $\mathfrak{r}, \mathfrak{s} \in \mathfrak{R}$.
Since $(\mathfrak{r} \to \mathfrak{s})^* \wedge \mathcal{v} \leq (\mathfrak{r} \to \mathfrak{s})^* \in I$, $(\mathfrak{r} \otimes \mathfrak{s}) \wedge \mathcal{v} \leq \mathfrak{r} \otimes \mathfrak{s} \in I$
or $(\mathfrak{s} \to \mathfrak{r})^* \wedge \mathcal{v} \leq (\mathfrak{s} \to \mathfrak{r})^* \in I$, $(\mathfrak{s} \otimes \mathfrak{r}) \wedge \mathcal{v} \leq \mathfrak{s} \otimes \mathfrak{r} \in I$, for all $\mathfrak{r}, \mathfrak{s} \in \mathfrak{R}$, $\mathcal{v} \in \mathcal{B}$.
Hence, $(\mathfrak{r} \to \mathfrak{s})^*, \mathfrak{r} \otimes \mathfrak{s} \in G_1(\mathcal{B})$ or $(\mathfrak{s} \to \mathfrak{r})^*, \mathfrak{s} \otimes \mathfrak{r} \in G_1(\mathcal{B})$, for all $\mathfrak{r}, \mathfrak{s} \in \mathfrak{R}$.

Theorem 3.1.15. Let$\mathfrak{R}$ be a*RLW*-algebra, I be a prime *WI*-ideal of the second kind of $\mathfrak{R}$ and $\mathcal{B} \subseteq \mathfrak{R}$, then so is the extended *WI*-ideal $G_I(\mathcal{B})$.

Proof. Let I be a prime *WI*-ideal of the second kind of $\mathfrak{R}$ and $\mathfrak{r}\wedge \mathfrak{s} \in G_I(\mathcal{B})$.
Then, $(\mathfrak{r}\wedge \mathfrak{s})\wedge v \in I$, for all $v \in \mathcal{B}$.
Since I is a prime *WI*-ideal of the second kind of $\mathfrak{R}$. So $\mathfrak{r} \in I$ or $\mathfrak{s}\wedge v \in I$, hence $\mathfrak{r}\wedge v \leq \mathfrak{r} \in I$ or $\mathfrak{s}\wedge v \in I$.
Thus, $\mathfrak{r} \in G_I(\mathcal{B})$ or $\mathfrak{s} \in G_I(\mathcal{B})$.
The theorem 2.8 is not true in involute RLW-algebra, now we provide a counterexample to illustrate it.

Theorem 3.1.16. Let$\mathfrak{R}$ be aRLW-algebra, I be a prime *WI*-ideal of the second kind of $\mathfrak{R}$ and $\mathcal{B} \subseteq \mathfrak{R}$.
Then I isstable relative to $\mathcal{B}$.

Proof. Assume$I$ is not a stable relative to $\mathcal{B}$. Then, $G_I(\mathcal{B}) \neq I$. There exists $\mathfrak{r} \in G_I(\mathcal{B})$ such that $\notin I$.
Hence, $\mathfrak{r}\wedge v \in I$, for all$v \in \mathcal{B}$.
Since, I is a prime *WI*-ideal of the second kind of $\mathfrak{R}$, so $v \in I$ and $\mathcal{B} \subseteq I$.
Hence, ,$G_I(\mathcal{B}) = \mathfrak{R}$, which is a contradiction. [By theorem 3.1.8 (i)]

Example 3.1.17. Consider a set $\mathfrak{R}$=$\{0, u, v, w, 1\}$. Define a partial ordering "$\leq$" on ϱ, such that $0 \leq u \leq v \leq w \leq s \leq 1$with a binary operations" $\otimes$ "and " $\rightarrow$ "and a quasi complement " $*$ "on $\mathfrak{R}$ as in following tables 5 and 6.
Define $\vee$ and $\wedge$ operations on ϱ as follows:
$(\mathfrak{r} \vee \mathfrak{s}) = (\mathfrak{r} \rightarrow \mathfrak{s}) \rightarrow \mathfrak{s}$,
$(\mathfrak{r} \wedge \mathfrak{s}) = (\mathfrak{r}^* \rightarrow \mathfrak{s}^*) \rightarrow \mathfrak{s}^*)^*$; $\mathfrak{r} \otimes \mathfrak{s} = (\mathfrak{r} \rightarrow \mathfrak{s}^*)^*$ for all $\mathfrak{r}, \mathfrak{s} \in \mathfrak{R}$
We have verified that $\mathfrak{R}$ is an involute RLW-algebra, but it is not an MV-algebra.
Since$(v \rightarrow w) \vee (w \rightarrow v) = s \neq 1$, it is not satisfied prelinearity. Now, we have $I = \{0\}$ is a stable *WI*-ideal relative to $\mathcal{B} = \{s\}$ such that $\mathcal{B} \cap \mathrm{I} = \varphi$. However, $\mathfrak{R}/\mathrm{I}$ is not a chain.
Since $[v]_{\approx_I} \rightarrow [w]_{\approx_I} = [v \rightarrow w]_{\approx_I} = [s]_{\approx_I} \neq [1]_{\approx_I}$, $[w]_{\approx_I} \rightarrow [v]_{\approx_I} = [w \rightarrow v]_{\approx_I} = [s]_{\approx_I} \neq [1]_{\approx_I}$, where $[v]_{\approx_I}$ and $[w]_{\approx_I}$ are not incomparable. So $\mathfrak{R}/\mathrm{I}$ is not chain.
The theorem 2.7, the sufficiency of the conclusion about MV- algebra is correct. We now provide the following proof.

Proposition 3.1.18. Let $\mathfrak{R}$ be an involute RLW-algebra, $\mathcal{B} \subseteq \mathfrak{R}$ and I be an *WI*-ideal of$\mathfrak{R}$such that $\mathcal{B} \cap \mathrm{I} = \emptyset$. If $\mathfrak{R}/I$ be achain, then I is a stable *WI*-ideal relative to $\mathcal{B}$.

Proof. Let $\mathfrak{R}/I$ be achain and $u \in G_1(\mathcal{B})$. Then, $u \wedge \mathfrak{r} \in I$ for $\mathfrak{r} \in \mathcal{B}$.
This results $u/I \wedge \mathfrak{r}/I = u \wedge \mathfrak{r}/I$. Since $\mathfrak{R}/I$ is chain, $u/I = 0/I$ or $\mathfrak{r}/I = 0/I$ and so $u \in I$ or $\mathfrak{r} \in I$.
By assumption, since $\mathcal{B} \cap \mathrm{I} = \emptyset$, hence, $u \in I$.
Thus, $G_1(\mathcal{B}) \subseteq I$. Also, we get $I \subseteq G_1(\mathcal{B})$. [By theorem 3.1.5]
Therefore $G_1(\mathcal{B}) = \mathrm{I}$ and so I is a stable *WI*-ideal relative to $\mathcal{B}$.
The theorem 2.8 is not trulative residuated lattices, now we provide a counterexample to illustrate it.

Example 3.1.19. In example 3.1.15, let $\mathfrak{r} \wedge \mathfrak{s} = 0$, for $\mathfrak{r}, \mathfrak{s} \in \mathfrak{R}$. We will discuss the following two situations: (i) if $\mathfrak{r} = 0$ or $\mathfrak{s} = 0$, then proposition is true. However, $\mathfrak{R}$ is not a chain. (ii) if $\mathfrak{r}, \mathfrak{s} \neq 0$, then $\mathfrak{r}, \mathfrak{s} = \{u, v, w, s, 1\}$ such that $\mathfrak{r} \wedge \mathfrak{s} = 0$, hence, $\mathfrak{r} = 0$ or $\mathfrak{s} = 0$, however $\mathfrak{R}$ is not a chain.
The theorem 2.8, the necessity of the conclusion about MV- algebra is correct. We now provide the following proof.

CONCLUSION

In this paper,we have introduced the notion of extended *WI*-ideals and stable *WI*-ideals associated to a subset $\mathcal{B}$ of RLW-algebra $\mathfrak{R}$. Also, we have discussed what kind of RLW-algebra have *WI*-ideals. Further, investigated their related properties. Finally , we have shown that $\mathfrak{R}$ is an involute RLW-algebra, then $G_1(\mathcal{B})$ is a stable *WI*-ideal relative to $\mathcal{B}$, and so $G_1(\mathcal{B})$ is the smallest stable *WI*-ideal relative to $\mathcal{B}$.

ABSTRACT

Let G be a Graph. This article focuses on determining the inverse Italian domination number$\gamma'_I(G)$ for several structured graph families, including triangular snake graphs (TS_n),quadrilateral snake graphs (QS_n), ladder cycle graphs (LC_n), and book graphs (DF_n). A function $f : V \rightarrow \{0, 1, 2\}$ is called an Italian dominating function of G if, for every vertex v with $f(v) = 0$, the sum of the function values over its closed neighborhood N[v] is at least 2. The weight of f is defined as $w(f) = \sum f(v)$. The Italian domination number $\gamma_I(G)$ is the minimum possible weight of an IDF on G. Let f be an IDF of a graph G with minimum weight, $w(f) = \gamma_I(G)$. Let S be the set of vertices that have a positive function value under f; that is, $S = \{v \in V: f(v) > 0\}$. An Inverse Italian Dominating Function (IIDF) f′ is another IDF on G with the additional property that $f'(v) = 0$ for all vertices $v \in S$. In other words that all vertices that were part of the dominating set of f must be assigned a value of 0 under f′. The inverse Italian domination number $\gamma'_I(G)$ is the minimum weight among all possible inverse Italian dominating functions of G. For each graph family, we establish exact expressions for$\gamma'_I(G)$ and construct IIDFs that achieve the minimum possible weight. Our results reveal the impact of graph structure on inverse Italian domination andcontribute to the broader study of domination parameters in graph theory.

Keywords: Inverse Italian domination, inverse Italian dominating function, triangular snake graph, quadrilateral snake graph, ladder cycle graph, book graph,
AMS Subject Classification Code: 05C69, 05C38, 05C76.

INTRODUCTION

Domination theory is a central area in graph theory concerned with selecting sub-sets of vertices that provide influence or control over the entire graph. A dominating set is a collection of vertices such that every vertex of the graph either belongs to this set or is adjacent to at least one vertex in it. Because of its fundamental nature, domination and its variants have been widely studied and applied in fields such as network design, resource allocation, and monitoring problems. One such variant is the inverse Italian domination number, denoted$\gamma'_I(G)$. This parameter is based on a vertex labeling with 0, 1, and 2, where each vertex labeled 0 must be supported by a neighbor labeled 2 or by two distinct neighbors labeled 1. Unlike classical domination, which focuses on covering all vertices directly, inverse Italian domination minimizes the overall weight of such a labeling while ensuring that vertices with value 0 remain properly supported. These graphs are interesting due to their regular, recursive structures, which allow precise computation of inverse Italian domination numbers. We provide exact formulas for each graph type along with explicit constructions of corresponding inverse Italian dominating functions.

DEFINITIONS AND PRELIMINARIES

Let G = (V, E) be a finite simple graph, where V is the set of vertices |V | = n and E the set of edges |E| = m. For any vertex v∈ V, the open neighborhood is N(v) = {u∈V :uv∈ E}.

Definition 1.1. Italian Domination Number

Let G = (V, E) be a simple graph. An Italian dominating function (IDF) on G is a function f: V → {0,1,2} such that for every vertex v ∈ V with f(v) = 0, we have $\sum_{u \in N(v)} f(u) \geq 2$, where N(v) is the open neighborhood of v. The weight of f is ω(f) = $\sum_{u \in V} f(v)$ The Italian domination number of G, denoted by γ_I (G), is defined as $\gamma_I(G)$ = min { ω(f) : f is an Italian dominating function on G}.

Definition: 1,2.Inverse Italian Domination Number

Suppose f is a minimum-weight Italian dominating function on G, and let $S = \{ v \in V(G) \mid f(v) > 0 \}$.An *inverse Italian dominating function* f' on G is another Italian dominating function that satisfies $f'(v) = 0$ for every $v \in S$. The inverse Italian domination number of G, denoted by $\gamma_I^i(G)$, is the minimum weight among all such inverse Italian domination number of G The set of vertices assigned zero inf'I is denoted Z = {v∈ V: f 'I(v) = 0} which forms a dominating set ofG because every vertex in Z has neighbors that satisfy the IIDF condition.
The Definitions of some Graph Families are given below.

1.Triangular snake graph TS_n: A triangular snake graph is obtained from a pathP_n by replacing each edge ofP_n with a triangle (i.e., adding a new vertex adjacent to the two end vertices of the edge). |V (TS_n)| = 2n + 1, |E(TS_n)| = 3n .Vertex set: V (TS_n) = {v_1, v_2, . . . , v_{n+1}} ∪ {u_1, u_2, . . . , u_n} and Edge set: E(TS_n) = {v_iv_{i+1}, v_iu_i, u_iv_{i+1} | 1 ≤i ≤ n}

2. **Quadrilateral snake graph** QS_n: A quadrilateral snake graph is obtained pathP_n by replacing each edge ofP_n with a quadrilateral (i.e., adding two new vertices to form a 4-cycle between consecutive path vertices). |V (QS_n)| = 3n + 1, |E(QS_n)| = 4n. Vertex set: V (QS_n) = {v_1, v_2, . . . , v_{n+1}} ∪ {u_i, w_i | 1 ≤i ≤ n} and Edge set: E(QS_n) = {v_iv_{i+1}, v_iu_i, u_iw_i, w_iv_{i+1}| 1 ≤i ≤ n}.

3. **Ladder cycle graph** LC_n: A ladder cycle graph is formed by taking two C_n and joining corresponding vertices by n parallel edges (rungs), forming a cylindrical ladder.|V (LC_n)| = 2n, |E(LC_n)| = 3n Vertex set: V (LC_n) = {x_1, x_2, . . . ,x_n} ∪ {y_1, y_2, . . . ,y_n} and Edge set: E(LC_n) = {x_ix_{i+1}, y_iy_{i+1}| 1 ≤i ≤ n, $x_{n+1} = x_1$, $y_{n+1}= y_1$} ∪{x_iy_i | 1 ≤i ≤ n}. ThusLC_n is isomorphic to the Cartesian product C_n□P_2.

4. **Book graph** DF_n: A book graph of size n consists of n copies of a triangle C_3 sharing a common edge. $|V(DF_n)| = n + 2$, $|E(DF_n)| = 2n + 1$. Vertex set: $V(DF_n) = \{x, y\} \cup \{z1, z_2, \ldots, z_n\}$ and Edge set: $E(DF_n) = \{xy\} \cup \{xz_i, yz_i \mid 1 \leq i \leq n\}$. Each $\{x, y, z_i\}$ induces a C_3, giving n triangular pages.

MAIN RESULTS

In this paper, we analyze$\gamma'_I(G)$ for four well-structured families of graphs: triangular snake graphs (TS_n), quadrilateral snake graphs (QS_n), ladder cycle graph (LC_n), and book graphs (DF_n). These graph families are chosen for their recursive and regular structure, which allows for exact computation of$\gamma'_I(G)$ and constructive proofs. We present closed-form formulas for each family and explicitly construct IIDFs that achieve the minimum Weight.

Inverse Italian Domination Number Of Some Graphs

Theorem 2.1

For the vertex-sharing triangular snakeTS_n ($n \geq 2$), we have $\gamma'_I(TS_n) = n + 1$.

Proof.

Letf'_I: $V(TS_n) \rightarrow \{0, 1, 2\}$ be any inverse Italian dominating function (IIDF)and let $Z = \{v \in V(TS_n) : f'_I(v) = 0\}$.Each vertex in Z must be supported by either a neighbor labeled 2 or by two neighbors labeled 1. Consider the n triangular blocks (u_{i-1}, u_i, v_i) for $1 \leq i \leq n$. Foreach block (u_{i-1}, u_i, v_i) ($1 \leq i \leq n$). we have: $(f(u_{i-1}), f(u_i)) \neq (0, 0)$. Hence$\sum_{i=0}^{n} f(u_i) \geq n$. Therefore for i, $f'_I(u_{i-1}) + f'_I(u_i) \geq 1$. summing over all nblocks yield $\sum_{i=0}^{n} f'(u_i) \geq n$. Also, u_0, $u_n \in N(Z)$, so an additional positive label isnecessary, giving $w(f') \geq n + 1$. Additionally, to support end vertices, at least one more positive label is required. Hence $w(f'_I) \geq n + 1$.

$f'_I(u_i) = \begin{cases} 1, & i\ odd \\ 0, & i\ even\ i \geq 1' \end{cases}$ $f'_I(u_0) = 2$,$f'_I(v_i) = 0$, $1 \leq i \leq n$

Assign each zero vertex has either a neighbor labeled 2 or two neighbors labeled 1, and thezero-set dominates all vertices. The total weight is $w(f'_I) = 2 + (n - 1) \cdot 1 = n + 1$.

Hence$\gamma'_I(TS_n) = n + 1$.

Theorem 2.2

For the quadrilateral snake graph QS_n with $3n + 1$ vertices ($n \geq 1$), $\gamma'_I(QS_n) = 2n + 1$.

Proof

Let $f'_I : V(QS_n) \rightarrow \{0, 1, 2\}$ be an inverse Italian dominating function (IIDF). By definition: $f'_I(v) = 0 \Rightarrow (\exists u \in N(v) : f'_I(u) = 2) \vee (\exists u_1, u_2 \in N(v) : f'_I(u_1) = f'_I(u_2) = 1)$. And the zero-set $Z = \{v \in V(QS_n) : f'_I(v) = 0\}$ is a dominating set of QS_n. The weight is $w(f'_I) = \sum_{v \in V(QSn)} f'_I(v)$.

Consider one block $B_i = \{u_{i-1}, u_i, v_i, w_i\}$ which forms a C_4. If $f'_I(x) = 0$ for all $x \in B_i$, then none of them is supported, contradiction. Hence each block must satisfy$\sum_{x \in B_i} f'_I(x) \geq 2$. Summing over n blocks gives $w(f'_I) \geq 2n$. Furthermore, the end vertices u_0, u_n require domination from Z, which forces $w(f'_I) \geq 2n + 1$

Define f'_I as follows:

$f'_I(u_{2k}) = 2$, $f'_I(u_{2k+1}) = 0$, $f'_I(v_i) = 1$, $f'_I(w_i) = 0$

For $0 \leq 2k \leq n$ and $1 \leq i \leq n$

- If $f'_I(x) = 0$, then either it is adjacent to some u_{2k} with value 2, or it has two neighbours among $\{v_i\}$ with value 1.
- The zero-set Z dominates QS_n since every u_{2k} and v_i has a neighbor in Z.

The weight is $w(f'_I) = \sum_{i=1}^{n} f'_I(v_i) + \sum_{k=0}^{\lfloor \frac{n}{2} \rfloor} f'_I(u_{2k}) = n \cdot 1 + (\lfloor n/2 \rfloor + 1) \cdot 2 = 2n + 1$. Every IIDF f'_I on QS_n satisfies $w(f'_I) \geq 2n + 1$, and the above construction attains equality. Hence $\gamma'_I(QS_n) = 2n + 1$.

Theorem:2.3

For the ladder cycle graph LC_n with $2n$ vertices ($n \geq 3$), $\gamma'_I(LC_n) = n$.

Proof:
Let $V(LC_n) = \{u_1, u_2, ..., u_n, v_1, v_2, ..., v_n\}$, where $u_1u_2...u_nu_1$ and $v_1v_2...v_nv_1$form two cycles, and u_iv_i $(1 \le i \le n)$ are the rungs. Define an IIDF $f'_I : V(LC_n) \to \{0, 1, 2\}$. For each rung $\{u_i, v_i\}$, if $f'_I(u_i) = f'_I(v_i) = 0$, then neither u_i nor v_i is supported. Hence, $f'_I(u_i) + f'_I(v_i) \ge 1$, $1 \le i \le n$. Summing over all rungs gives $w(f'_I) = \sum_{i=1}^{n}(f'_I(u_i) + f'_I(v_i)) \ge n$. Define $f'_I(u_i) = 1$, $f'_I(v_i) = 0$, $1 \le i \le n$. Then $Z = \{v_i : 1 \le i \le n\}$, $|Z| = n$. For each $v_i \in Z$, $N(v_i) = \{u_i, v_{i-1}, v_{i+1}\}$, $f'_I(u_i) = 1$, $f'_I(v_{i-1}) = f'_I(v_{i+1}) = 0$, so v_i has at least one neighbor of value 1 and is supported by u_{i-1}, u_{i+1} with value 1. Also, every u_i (with value 1) is adjacent to $v_i \in Z$, so Z dominates LC_n. The weight is $w(f'_I) = \sum_{i=1}^{n} f'_I(u_i) = n$. Thus $\gamma'_I(LC_n) = n$.

Theorem 2.4
LetDF_n be the book graph on n + 2 vertices obtained from the edge abby adding vertices $u_1, \ldots, u_n$ with $N(u_i) = \{a, b\}$ $(1 \le i \le n)$. Then $\gamma'_I(DF_n) = 2$.
Proof.
Letf'_I: V $(DF_n) \to \{0, 1, 2\}$ be any inverse Italian dominating function (IIDF). Put V $(DF_n) = \{a, b, u_1, \ldots, u_n\}$ and $Z = \{v \in V : f'_I(v) = 0\}$. We show $w(f'_I) \ge 2$.
Suppose, for contradiction, that$w(f'_I) \le 1$. Since $w(f'_I) \in Z \ge 0$, two possibilities arise:
$w(f'_I) = 0$ or $w(f'_I) = 1$. If $w(f'_I) = 0$ then$f'_I \equiv 0$, so no vertex is supported impossible. Hence $w(f'_I) \ge 1$. Assume $w(f'_I) = 1$. Then exactly one vertex, say x, satisfies$f'_I(x) \in \{1, 2\}$ and$f'_I(y) = 0$ for all $y \ne x$.
We treat parity of n separately.

Case 1: n is even.
Partition $\{u_1, u_2, \ldots, u_n\}$ into $\frac{n}{2}$disjoint pairs $\{u_{2k-1}, u_{2k}\}$ $(1 \le k \le \frac{n}{2})$. For each pair $\{u_{2k-1}, u_{2k}\}$ both vertices share the same neighbourhood {a, b}.With only one positive vertex x in the whole graph, at most one of {a, b} can be positiveand its value is at most 2. If $x \notin \{a, b\}$ then neither a nor b is positive, so anyu_i isunsupported contradiction. If $x \in \{a, b\}$ but$f'_I(x) = 1$, then eachu_i has only oneneighbour of value 1 and no neighbour of value 2, sou_i is unsupported contradiction.If $x \in \{a, b\}$ and$f'_I(x) = 2$, then$w(f'_I) = 2$, contradicting the assumption $w(f'_I) = 1$.Hence $w(f'_I) \ne 1$ in the even case.

Case 2: n is odd.
Write $n = 2t + 1$. Consider the set of vertices $\{u_1, \ldots, u_{2t+1}\}$ with only one positive vertex x, the same argument as above applies: if $x \notin \{a, b\}$ theneveryu$_i$ has both a, b equal to 0 and is unsupported contradiction. If $x \in \{a, b\}$ and$f'_I(x) = 1$ then eachui has exactly one neighbor of value 1 and no neighbor of value2, so again someui is unsupported. If $x \in \{a, b\}$ and$f'_I(x) = 2$ then$w(f'_I) = 2$,contradicting the assumption $w(f'_I) = 1$. Thus$w(f'_I) \ne 1$ in the odd case as well.Combining both cases we obtain $w(f'_I) \ge 2$. Define$g : V(DF_n) \to \{0, 1, 2\}$ by$g(a) = 2$, $g(b) = 0$, $g(u_i) = 0$ $(1 \le i \le n)$. Then$\forall i, u_i$ has a neighbour awith $g(a) = 2$, so the IIDF condition holds. The zero-set $Z = \{b, u_1, \ldots, u_n\}$ dominatesDF_n. Hence g is a valid IIDF and $w(g) = g(a) = 2$, showing$\gamma'_I(DF_n) \le 2$.From $w(f'_I) \ge 2$ for every IIDF and the existence of g with $w(g) = 2$.Therefore, we get$\gamma'_I(DF_n) = 2$.

3 APPLICATIONS
The inverse Italian domination number ($\gamma'_I(G)$) is an important parameter for studying balanced distribution of resources in networks. It focuses on maximizing resource placement without allowing any vertex to be overwhelmed. Its study is motivated by several real-world applications:

• **Network Load Balancing:** Ensures that servers, sensors, or controllers are deployed in a way that no single node receives too much coverage, avoiding congestion and promoting efficiency.
• **Power and Utility Networks:** Helps determine the placement of power stations or distribution units such that supply remains balanced and overloading does not occur.
• **Social Influence and Marketing:** Models controlled information flow so that individuals are not repeatedly influenced by multiple strong sources, preventing saturation.

• **Multi-Agent and Sensor Systems:** Provides a strategy for deploying robots or sensors to cover the largest possible area with minimal overlap, saving energy and resources.
• **Biological and Ecological Systems:** Describes interactions where no species is under pressure from multiple dominant species, helping researchers maintain ecological balance.

CONCLUSION

In this paper, we have studied the inverse Italian domination number$\gamma'_I(G)$ for four well-structured graph families, namely triangular snake graphsTS_n, quadrilateral snake graphsQS_n, ladder cycle graphsLC_n, and book graphsDF_n. For each family, we derived exact formulas for$\gamma'_I(G)$ and provided explicit inverse Italian dominating functions that attain the minimum weight. Our results demonstrate that the structure and regularity of these graphs allow precise characterization of $\gamma'_I(G)$ and reveal how the parameter grows with respect to the order of the graph.
This study contributes to the growing literature on inverse domination parameters by extending the concept of Italian domination to its inverse variant and applying it to graph classes with recursive and cyclic structures. Future research may consider extending these results to other graph products, generalized snake graphs, or to weighted and directed versions, thereby deepening the understanding of inverse domination in broader combinatorial contexts.

ABSTRACT

In this paper, we introduce the concept of Possibility Plithogenic Hesitant Fuzzy Soft Sets (PP-HFSS),a hybrid model that combines hesitant fuzzy sets, soft sets, plithogenic theory and possibility measures along with some of their properties.Also, a decision making approach is developed with this framework to effectively handle uncertainty,hesitation and contradiction in complex environments.

Keywords: Hesitant Fuzzy Soft Set,Plithogenic soft set, Plithogenic Hesitant Fuzzy Soft Set, Possibility Plithogenic soft set,Possibility Plithogenic Hesitant Fuzzy Soft Set.

INTRODUCTION

In 1965, Zadeh [1] proposed the notion of fuzzy sets, which deals with probabilistic uncertainty and has been used in decision-making. Molodtsov presented soft set theory [4] in 1999 as a generic mathematical tool for dealing with uncertainties that standard mathematical approaches are unable to handle.Molodtsov has demonstrated several uses of this theory to address numerous real-world challenges in the fields of engineering, economics, social science, medicine, and more.Later on, Maji et al. [5] introduced fuzzy soft sets and developed various operations on soft sets and investigated their theoretical properties in [6]. Aktas and Cagman [8], Roy and Maji[9], Yang *et al*. [10], Majumdar and Samanta [11], Xiao *et al.* [12], and many more researchers have worked on this soft set theory concept, with a range of beneficial outcomes.In various real-world scenarios involving expert systems, belief systems, information fusion, and other domains, it is necessary to consider both truth-membership and falsity-membership in

order to represent an item in an unclear, ambiguous context. In this case, neither interval-valued fuzzy sets [2] nor fuzzy sets are appropriate. In such cases, Atanassov's intuitionistic fuzzy sets [3] are appropriate.Intuitionistic fuzzy sets can only handle incomplete data that includes both truth-membership (and simply membership) and falsity-membership (or non-membership) values. It does not address the ambiguous and conflicting information that exists in belief systems. Smarandache [7] developed the neutrosophic set, a mathematical technique for dealing with inconsistent, imprecise, and ambiguous data. Neutrosopic sets deal with three components such as membership, indeterminacy and non-membership. Torra and Narukawa [13] andTorra [14] proposed the concept of a hesitant fuzzy set to address the problem of defining the degree of membership of an element in a set.This new hesitant fuzzy set can handle situations where our hesitation among a few different values causes the difficulty in determining the membership degree.Thus, in contrast to the fuzzy set and its several classical extensions, the hesitant fuzzy set is better able to capture people's hesitancy when expressing their object preferences. The hesitant fuzzy element (HFE), first proposed by Xu and Xia [15] in 2011, is a simple and practical method for conveying the hesitating preferences of decision makers during the decision-making process. Several researchershave carried out a number of studies on decision-making with uncertain fuzzy data, clustering analysis, aggregation, distance, similarity and correlation metrics, and more.

Accuracy is one of the most crucial aspects of everyday decision-making. In order to improve accuracy, Smarandache's plithogenic [17] theory is characterized as a broader approach when compared to the existing theory which include intuitionistic, fuzzy, crisp, and neutrosophic sets. Plithogenic sets include degrees of appurtenance and contradiction with respect only to the dominant attribute. In 2017, Smarandache described a plithogenic set P as a set with elements specified by one or more attributes, each of which can have multiple values. A plithogenic set serves as the foundation for all plithogenic functions (plithogenic set, plithogenic probability, plithogenic statistics, and plithogenic logic), each of which is specified by a single plithogenic set appurtenance. Crisp sets have only one value (membership), fuzzy sets have two characteristics (membership and non-membership), intuitionistic sets have three characteristics (membership, indeterminacy, and non-membership), and plithogenic sets have four or more.Also, Alkhazaleh [18] made significant contributions to the theoretical development of Plithogenic soft sets, operations, and similarity measures and some of their applications.

The concept of possibility soft sets is introduced as the generalization of soft sets. Alkhazaleh et al. [20] introduced the possibility fuzzy soft sets. Further, Bashir et al. [21] proposed the idea of the possibility intuitionistic fuzzy soft sets. Later, Karaaslan [22] defined the possibility neutrosophic soft sets. Researchers have also discussed the operations and applications of possibility soft sets. As a result of the earlier studies, the theory of Possibility Plithogenic Soft Sets has been developed as an extension of Plithogenic Soft sets.

Moreover, this paper presents a theoretical framework of the Possibilityplithogenic hesitant fuzzy soft sets, some of their properties and a decision making framework.

PRELIMINARIES

In this section, we will review some of the fundamental definitions required to read this paper.

Definition 2.1 [4]

A pair (F, E) is called a soft set (over U) if and only if F is a mapping of E into the set of all subsets of the set U. In other words, the soft set is a parameterized family of subsets of the set U. Every set $F(\varepsilon), \varepsilon \in E$, from this family may be considered as the set of ε- elements of the soft set (F, E), or as the set of ε - approximate elements of the soft set.

Definition 2.2 [5]

A fuzzy soft set over U is a pair (F, A), where $F: A \rightarrow P(U)$ is a mapping from A into $P(U)$.

Definition 2.3 [14]

If X is a fixed set, then a Hesitant Fuzzy Set (HFS) on X is defined in terms of a function $h_M(x)$ that returns a subset of$[0,1]$, when it is applied to X. This can be represented using the following expression $M = \{< x, h_M(x) > \mid x \in X\}$, where

$h_M(x)$ is a set of values in [0,1] that represent the various membership degrees of the element $x \in X$ to the set M. We refer to $h = h_M(x)$ as a hesitant fuzzy element (HFE) for simplicity, and H is the set of all HFEs.

Definition 2.4 [16]

Let U be a universal set and E be set of parameters. Let HF(U) denotes the set of all hesitant fuzzy sets defined over U. A pair (F,E) is a hesitant fuzzy soft set if $F(e) \in HF(U)$ for every e in E.

Definition 2.5 [17]

Let U be the discourse universe and P be the non-empty set of elements, such that $P \subseteq U$. Then, a is an attribute (generally multidimensional), V is the range of the attribute values, d is the degree to which each element x's attribute value belongs to the set P in relation to a given set of criteria $(x \in P)$, and c is the degree of contradictionbetween attribute values. Then, (P, a, V, d, c) is called a plithogenic set.

Definition 2.6 [18]

Assume that U is a discourse universe and that $(U)^z$ is the z-power set of U such that

$z = C$ (Power set of U),

$z = F$ (The set of all fuzzy sets of U),

$z = IF$ (The set of all intuitionistic fuzzy sets of U), or

$z = N$ (The set of all neutrosophic sets of U).

Let $a_1, a_2, \cdots, a_n$, for $n \geq 1$, be n distinct attributes, where corresponding attribute values $V_1, V_2, \cdots, V_n$, with $Vi \cap Vj = \emptyset$,for $j \neq i$, and $i, j \in \{1, 2, \cdots, n\}$. Suppose $V_i = \{v_{i_1}, v_{i_2}, \cdots, v_{i_{mi}}\}$and let$Y = V_1 \times V_2 \times \cdots \times V_n$.Let$c\left(D_i, v_{ij}\right)$, $i \in \{1,2, \cdots n\}, j \in \{1,2, \cdots m_i\}$ be the attribute value contradiction degree such that $c_i: V_i \times V_i \to [0,1]$,and let $D = (D_1, D_2, \cdots D_n)$ the dominant attribute element of $V_i, \forall\, i$. Then the pair (F_P^Z, Y), where$F_P^Z: Y \to [0,1]_D \times (U)^z$ is called a Plithogenic Soft Set (P-SS In short) over U.

Definition 2.7 [19]

Let U be a universe of discourse, $(U)^H$the power set of U such that H is the set of all Hesitant fuzzy soft sets. Let $a_1, a_2, \cdots, a_n$, for $n \geq 1$,be n distinct attributes, whose corresponding attribute values are respectively the sets $V_1, V_2, \cdots, V_n$, with $Vi \cap Vj = \emptyset$, , for $j \neq i$, and $i, j \in \{1,2, \cdots, n\}$. Suppose $V_i = \{v_{i_1}, v_{i_2}, \cdots, v_{i_{mi}}\}$and let $\mathcal{H} = V_1 \times V_2 \times \cdots \times V_n$.Let$D = (D_1, D_2, \cdots D_n)$thedominantattributeelementof V_i, $\forall i$ and$c\left(D_i, v_{ij}\right)$, where$i \in \{1, 2, \cdots n\}$, $j \in \{1,2, \cdots m_i\}$theattributevaluecontradictiondegreefunctionsuchthat $c_i: V_i \times V_i \to [0,1]$. Then the pair$\left(\mathrm{F_P^H}, \mathcal{H}\right)$, where$F_P^H : \mathcal{H} \to [0,1]_D \times (U)^H$ is called a Plithogenic hesitant fuzzy soft set (P-HFSS In short) over U.

Definition 2.8 [23]

According to the Definition 2.6 [18] , A Possibility Plithogenic soft set over U is a set of ordered pairs of the form (F_{PP}^z, Y) defined by $F_P^z: Y \to [0,1]_D \times (U)^z \times (I)^z$,where $(I)^z$is the collection of all fuzzy subsets of U.

Definition 2.9 [23]

Let (F_{PP}^z, H) and (G_{PP}^Z, H) be two Possibility Plithogenic soft sets.The similarity measure between (F_{PP}^z, H) and (G_{PP}^z, H) is definedby $S_P(F_{PP}^z, G_{PP}^z) = M\left(F_{PP}^z(e), G_{PP}^z(e)\right) * M\left(\mu_{F_{PP}^z}(e), \mu_{G_{PP}^z}(e)\right)$,where

$$M\left(F_{PP}^z(e), G_{PP}^z(e)\right) = \max_k M_k\left(F_{PP}^z(e), G_{PP}^z(e)\right)$$

$$M\left(\mu_{F_{PP}}(e), \mu_{G_{PP}^z}(e)\right) = \max_k M_k\left(\mu_{F_{PP}}(e), \mu_{G_{PP}}(e)\right)$$

$$M_k\left(F_{PP}^z(e), G_{PP}^z(e)\right) = 1 - \frac{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(F_j(e_{ik})\right) - \left(G_j(e_{ik})\right)\right|}{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(F_j(e_{ik})\right) + \left(G_j(e_{ik})\right)\right|},$$

$$M_k\left(\mu_{F_{PP}}(e), \mu_{G_{PP}}(e)\right) = 1 - \frac{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(\mu_{F_{PP}}(e_{ik})\right) - \mu_{G_{PP}}\left(G_j(e_{ik})\right)\right|}{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(\mu_{F_{PP}}(e_{ik})\right) + \mu_{G_{PP}}\left(G_j(e_{ik})\right)\right|}.$$

Possibility Plithogenic Hesitant Fuzzy Soft set

In this section we define the Possibility Plithogenic hesitant fuzzy soft set and some of its properties.

Definition 3.1

Let U be a universe of discourse, $(U)^H$be the power set of U such that H is the set of all hesitant fuzzy soft sets. Assume$a_1, a_2, \cdots, a_n$, for $n \geq 1$, be n distinct attributes, whose corresponding attribute values are $V_1, V_2, \cdots, V_n$ respectively with $V_i \cap V_j = \emptyset$, for $j \neq i$, and $i, j \in \{1,2, \cdots, n\}$. Suppose$V_i = \{v_{i_1}, v_{i_2}, \cdots, v_{i_{mi}}\}$ and$\mathcal{H} = V_1 \times V_2 \times \cdots \times V_n$. Let the dominant attributeelement of $V_i$be $D = (D_1, D_2, \cdots D_n), \forall i$ and $c(D_i, v_{ij})$, where$i \in \{1,2, \cdots n\}, j \in \{1,2, \cdots m_i\}$be the attribute value contradiction degree function suchthat $c_i: V_i \times V_i \to [0,1]$.

A Possibility Plithogenic hesitant fuzzy soft set (PP-HFSS) over U is the set of ordered pairs$(F_{PP}^H, \mathcal{H})$, defined by $F_{PP}^H: \mathcal{H} \to [0,1]_D \times (U)^H \times (\mathrm{I})^{\mathrm{H}}$, where $(I)^H$is the collection of all fuzzy subsets of U.

Example 3.2

Consider an example on selection of agriculture land.Let $U = \{L_1, L_2, L_3, L_4\}$ be the set of lands with the attributes a_1 = Budget(Cost),a_2 = Quality of the soil, a_3 =Water facilityand their corresponding attribute values Budget ≡ A_1 = { Low , Avg ,High }, Quality of the soil≡ A_2 = {Good,Avg,Bad}, Water facility≡ A_3 = {Good,Above avg,Low},here D = (Low, Good, Above avg) be the dominant attribute values.Let $\mathrm{E} \subseteq \mathcal{H}$ such that $\mathrm{E} = \{\varepsilon_1$ = (Low, avg,Low), ε_2 = (High,Good ,Above avg), ε_3 = (Low, Avg , Good) }.

Then,

$$F_{PP}^H(\varepsilon_1) = \left\{ \frac{(\mathrm{L}_1, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.2,0.4),(0,0.5),(0.2,0.3,0.6),(0.2,0.6,0.8)\}}, 0.6, \frac{(\mathrm{L}_2, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.6,0.7,0.8),(0,1),(0.6,0.7),(0.8,0.9,1)\}}, 0.4, \right.$$
$$\left. \frac{(\mathrm{L}_3, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.4,0.5),(0.2,0.3,0.4),(0.2,0.1),(0.7,0.9)\}}, 0.3, \frac{(\mathrm{L}_4, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.7,0.9),(0.5,0.6,1),(0.8,0.9),(0.3,0.6,0.7)\}}, 0.7 \right\}$$

$$F_{PP}^H(\varepsilon_2) = \left\{ \frac{(\mathrm{L}_1, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.2,0.3),(0,1),(0.6,0.7),(0.9,1)\}}, 0.2, \frac{(\mathrm{L}_2, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.5,0.6,1),(0.5,1),(0.9,1),(0,0.2)\}}, 0.6, \right.$$
$$\left. \frac{(\mathrm{L}_3, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.2,0.3),(0.6,1),(0,0.5),(0.7,0.8,0.9)\}}, 0.4, \frac{(\mathrm{L}_4, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.9,1),(0,0.5,1),(0.7,0.9),(0.6,0.7)\}}, 0.8 \right\}$$

$$F_{PP}^H(\varepsilon_3) = \left\{ \frac{(\mathrm{L}_1, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.5,0.7,1),(0.6,0.9),(0,0.2),(0.9,1)\}}, 0.3, \frac{(\mathrm{L}_2, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.2,0.7),(0.3,0.9),(0,0.2,1),(0.7,0.8,0.9)\}}, 0.6, \right.$$
$$\left. \frac{(\mathrm{L}_3, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.1,0.4),(0.6,,0.8,1),(0.3,0.5),(0.6,0.8)\}}, 0.5, \frac{(\mathrm{L}_4, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.6,0.9),(0.5,0.6,0.9),(0.2,0.3),(0,0.5)\}}, 0.4 \right\}$$

Then we have the PP- HFSS as follows :

$$(F_{PP}^H, E) = \left\{ \varepsilon_1, \left\{ \frac{(\mathrm{L}_1, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.2,0.4),(0,0.5),(0.2,0.3,0.6),(0.2,0.6,0.8)\}}, 0.6, \frac{(\mathrm{L}_2, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.6,0.7,0.8),(0,1),(0.6,0.7),(0.8,0.9,1)\}}, 0.4, \right. \right.$$
$$\left. \left. \frac{(\mathrm{L}_3, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.4,0.5),(0.2,0.3,0.4),(0.2,0.1),(0.7,0.9)\}}, 0.3, \frac{(\mathrm{L}_4, (0,0.5,0.4,0.9)_{\mathrm{D}})}{\{(0.7,0.9),(0.5,0.6,1),(0.8,0.9),(0.3,0.6,0.7)\}}, 0.7 \right\} \right.$$
$$\varepsilon_2, \left\{ \frac{(\mathrm{L}_1, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.2,0.3),(0,1),(0.6,0.7),(0.9,1)\}}, 0.2, \frac{(\mathrm{L}_2, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.5,0.6,1),(0.5,1),(0.9,1),(0,0.2)\}}, 0.6, \right.$$
$$\left. \frac{(\mathrm{L}_3, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.2,0.3),(0.6,1),(0,0.5),(0.7,0.8,0.9)\}}, 0.4, \frac{(\mathrm{L}_4, (0.8,0.4,0.5,0.7)_{\mathrm{D}})}{\{(0.9,1),(0,0.5,1),(0.7,0.9),(0.6,0.7)\}}, 0.8 \right\},$$
$$\left. \varepsilon_3, \left\{ \frac{(\mathrm{L}_1, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.5,0.7,1),(0.6,0.9),(0,0.2),(0.9,1)\}}, 0.3, \frac{(\mathrm{L}_2, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.2,0.7),(0.3,0.9),(0,0.2,1),(0.7,0.8,0.9)\}}, 0.6, \right. \right.$$
$$\left. \left. \frac{(\mathrm{L}_3, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.1,0.4),(0.6,0.8,1),(0.3,0.5),(0.6,0.8)\}}, 0.5, \frac{(\mathrm{L}_4, (0,0.5,0.6,1)_{\mathrm{D}})}{\{(0.6,0.9),(0.5,0.6,0.9),(0.2,0.3),(0,0.5)\}}, 0.4 \right\} \right\}$$

The matrix representation of the above PP- HFSS is as follows:

$$[F_{PP}^H(\rho_1)] = \begin{bmatrix} ((0.2,0.4),0.6) & ((0.6,0.7,0.8),0.4) & ((0.4,0.5),0.3) & ((0.7,0.9),0.7) \\ ((0.2,0.3),0.2) & ((0.5,0.6,1),0.6) & ((0.2,0.3,0.4),0.4) & ((0.9,1),0.8) \\ ((0.5,0.7,1),0.3) & ((0.2,0.7),0.6) & ((0.1,0.4),0.5) & ((0.6,0.9),0.4) \end{bmatrix}$$

$$[F_{PP}^{H}(\rho_2)] = \begin{bmatrix} ((0,0.5),0.6) & ((0,1),0.4) & ((0.2,0.1),0.3) & ((0.5,0.6,1),0.7) \\ ((0,1),0.2) & ((0.5,1),0.6) & ((0.6,0.1),0.4) & ((0,0.5,1)),0.8) \\ ((0.6,0.9),0.3) & ((0.3,0.9),0.6) & ((0.6,0.8,1),0.5) & ((0.5,0.6,0.9),0.4) \end{bmatrix}$$

$$[F_{PP}^{H}(\rho_3)] = \begin{bmatrix} ((0.2,0.1),0.6) & ((0.8,0.9),0.4) & ((0.4,0.5),0.3) & ((0.8,0.9),0.7) \\ ((0.6,0.7),0.2) & ((0.7,0.9),0.6) & ((0,0.5),0.4) & ((0.7,0.9),0.8) \\ ((0,0.2),0.3) & ((0,0.2,0.6)) & ((0.3,0.5),0.5) & ((0.2,0.3),0.4) \end{bmatrix}$$

$$[\mathrm{F_{PP}^{H}}(\rho_4)] = \begin{bmatrix} ((0.2,0.6,0.8),0.6) & ((0.8,0.9,1),0.4) & ((0.7,0.9),0.3) & ((0.3,0.6,0.7),0.7) \\ ((0.9,1),0.2) & ((0,0.2),0.6) & ((0.7,0.8,0.9),0.4) & ((0.6,0.7),0.8) \\ ((0.9,1),0.3) & ((0.7,0.8,0.9),0.6) & ((0.6,0.8),0.5) & ((0,0.5),0.4) \end{bmatrix}$$

Definition 3.3

The union of two PP-HFSSs(F_{PP}^{H}, A) and (G_{PP}^{H}, B) over U , denoted by$(J_{PP}^{H}, C) = (F_{P}^{H}, A) \vee_{P}^{H} (G_{P}^{H}, B)$ is defined by the function $J: \mathcal{H} \to [0,1]_D \times (U)^H \times (I)^H$suchthat $(J_{PP}^{H}, C)(\varepsilon) = (F_{PP}^{H}, A)(\varepsilon) \cup (G_{PP}^{H}, B)(\varepsilon), \forall\, \varepsilon \in E \subseteq \mathcal{H}$.

Example 3.4

$$\text{Let}(F_{PP}^{H}, A) = \left\{ \varepsilon_1, \left\{ \frac{(\mathrm{L_1},(0,0.3,0.2)_\mathrm{D})}{\{(0.2,0.4),(0,0.5),(0.2,0.3,0.5)\}}, 0.6, \frac{(\mathrm{L_2},(0,0.3,0.2)_\mathrm{D})}{\{(0.6,0.7,0.8),(0.2,1),(0.6,0.7)\}}, 0.4, \frac{(\mathrm{L_3},(0,0.3,0.2)_\mathrm{D})}{\{(0.4,0.5),(0.2,0.3,0.4),(0.2,0.1)\}}, 0.3 \right\}, \varepsilon_2, \left\{ \frac{(\mathrm{L_1},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.2,0.6,0.8),(0,1),(0.6,0.7)\}}, 0.2, \frac{(\mathrm{L_2},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.5,0.6,1),(0.5,1),(0.9,1)\}}, 0.6, \frac{(\mathrm{L_3},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.2,0.3),(0.6,1),(0,0.5)\}}, 0.4 \right\} \right\}$$

$$\text{and}(G_{PP}^{H}, B) = \left\{ \varepsilon_1, \left\{ \frac{(\mathrm{L_1},(0,0.3,0.2)_\mathrm{D})}{\{(0.3,0.5),(0.2,0.6),(0.3,0.4,0.6)\}}, 0.4, \frac{(\mathrm{L_2},(0,0.3,0.2)_\mathrm{D})}{\{(0.3,0.5,0.7),(0,0.5),(0.7,0.8)\}}, 0.6, \frac{(\mathrm{L_3},(0,0.3,0.2)_\mathrm{D})}{\{(0.5,0.8),(0,0.5,1),(0,0.5)\}}, 0.5 \right\}, \varepsilon_2, \left\{ \frac{(\mathrm{L_1},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.4,0.7,0.9),(0,1),(0.7,0.9)\}}, 0.3, \frac{(\mathrm{L_2},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.2,0.4,0.6),(0.5,1),(0.7,0.9)\}}, 0.7, \frac{(\mathrm{L_3},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.5,0.7),(0.5,0.9),(0.6,0.8)\}}, 0.6 \right\} \right\}$$

be PP-HFSSs. Then by using fuzzy union (maximum), the union of two PP-HFSSs is obtained as

$$(\mathrm{J_{PP}^{H}}, C) = \left\{ \varepsilon_1, \left\{ \frac{(\mathrm{L_1},(0,0.3,0.2)_\mathrm{D})}{\{(0.3,0.5),(0.14,0.57),(0.28,0.38,0.58)\}}, 0.6, \frac{(\mathrm{L_2},(0,0.3,0.2)_\mathrm{D})}{\{(0.6,0.7,0.8),(0.14,0.85),(0.68,0.78)\}}, 0.6, \frac{(\mathrm{L_3},(0,0.3,0.2)_\mathrm{D})}{\{(0.5,0.8),(0.06,0.44,0.82),(0.16,0.80)\}}, 0.5 \right\}, \varepsilon_2, \left\{ \frac{(\mathrm{L_1},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.26,0.63,0.83),(0,1),(0.62,0.74)\}}, 0.3, \frac{(\mathrm{L_2},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.29,0.46,0.72),(0.5,1),(0.74,0.92)\}}, 0.7, \frac{(\mathrm{L_3},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.29,0.42),(0.54,0.94),(0.12,0.56)\}}, 0.6 \right\} \right\},$$

where the possibility degree is determined using max operator.

Definition 3.5

The intersection of two PP-HFSSs(F_{PP}^{H}, A) and (G_{PP}^{H}, B) over U , denoted by$(K_{PP}^{H}, C) = (F_{P}^{H}, A) \vee_{P}^{H} (G_{P}^{H}, B)$ is defined by the function $J: \mathcal{H} \to [0,1]_D \times (U)^H \times (I)^H$suchthat $(K_{PP}^{H}, C)(\varepsilon) = (F_{PP}^{H}, A)(\varepsilon) \cap (G_{PP}^{H}, B)(\varepsilon), \forall\, \varepsilon \in E \subseteq \mathcal{H}$.

Example 3.6

Consider the Example 3.4.By using fuzzy intersection (minimum), the intersection of two PP-HFSSs is obtained as

$$(\mathrm{K_{PP}^{H}}, C) = \left\{ \varepsilon_1, \left\{ \frac{(\mathrm{L_1},(0,0.3,0.2)_\mathrm{D})}{\{(0.2,0.4),(0.06,0.53),(0.22,0.32,0.52)\}}, 0.4, \frac{(\mathrm{L_2},(0,0.3,0.2)_\mathrm{D})}{\{(0.3,0.5,0.7),(0.06,0.65),(0.62,0.72)\}}, 0.4, \frac{(\mathrm{L_3},(0,0.3,0.2)_\mathrm{D})}{\{(0.4,0.5),(0.14,0.36,0.58),(0.04,0.60)\}}, 0.3 \right\}, \varepsilon_2, \left\{ \frac{(\mathrm{L_1},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.34,0.67,0.87),(0,1),(0.68,0.86)\}}, 0.2, \frac{(\mathrm{L_2},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.41,0.54,0.88),(0.5,1),(0.86,0.98)\}}, 0.6, \frac{(\mathrm{L_3},(0.7,0.3,0.6)_\mathrm{D})}{\{(0.41,0.58),(0.56,0.96),(0.48,0.74)\}}, 0.4 \right\} \right\},$$

where the possibility degree is determined using min operator.

Definition 3.7

Let (F_{PP}^{H}, I) and (G_{PP}^{H}, I) be two PP-HFSSs.The similarity measure between (F_{PP}^{H}, I) and (G_{PP}^{H}, I) is defined by $S_P(F_{PP}^{H}, G_{PP}^{H}) = M\left(F_{PP}^{H}(e), G_{PP}^{H}(e)\right) * M\left(\mu_{F_{PP}^{H}}(e), \mu_{G_{PP}^{H}}(e)\right)$, where$H$ represents the set of all hesitant fuzzy soft sets and

$$M\left(F_{PP}^{H}(e), G_{PP}^{H}(e)\right) = \max_k M_k\left(F_{PP}^{H}(e), G_{PP}^{H}(e)\right)$$

$$M\left(\mu_{F_{PP}^{H}}(e), \mu_{G_{PP}^{H}}(e)\right) = \max_k M_k\left(\mu_{F_{PP}^{H}}(e), \mu_{G_{PP}^{H}}(e)\right)$$

$$M_k\left(F_{PP}^{H}(e), G_{PP}^{H}(e)\right) = 1 - \frac{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(F_j(e_{ik})\right) - \left(G_j(e_{ik})\right)\right|}{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(F_j(e_{ik})\right) + \left(G_j(e_{ik})\right)\right|}$$

$$M_k\left(\mu_{F_{PP}^{H}}(e), \mu_{G_{PP}^{H}}(e)\right) = 1 - \frac{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(\mu_{F_{PP}}(e_{ik})\right) - \mu_{G_{PP}}\left(G_j(e_{ik})\right)\right|}{\sum_{j=1}^{|U|}\sum_{i=1}^{|e|}\left|\left(\mu_{F_{PP}}(e_{ik})\right) + \mu_{G_{PP}}\left(G_j(e_{ik})\right)\right|}.$$

A Decision Making approach in Possibility Plithogenic Hesitant Fuzzy Soft sets

Consider a situation that,a person wants to build a new house,so he approches four different engineers where each engineer offers four different construction packages. So that he can easily choose the engineer with the best package.Let $U = \{P_1, P_2, P_3, P_4\}$represents the set of packageswith the distinct attributes $a_1 =$ Budget(Cost), $a_2 =$ Design,$a_3 =$ Completion period and their corresponding attribute values are Budget≡ A_1 = {Low, Avg ,High },Design≡ A_2 = {Luxury, Modern house, Traditional house}, Completion period ≡ A_3 = { Short term, Medium, Long term}, here D = (Low, Modern house, Medium) denotes the dominant attribute values.Let $E \subseteq \mathcal{H}$ such that $E = \{\varepsilon_1 =$ (Avg, Modern house, Long term), $\varepsilon_2 =$ (High, ,Traditional house, Long term)}.

The expected packages with respect to the set of attribute values are expressed in PP-HFSS as follows:

$$(F_{PP}^{H}, E) = \left\{\varepsilon_1, \left\{\begin{matrix}\frac{(P_1,(0,0.5,1)_D)}{\left\{\binom{0.5,0.}{8}\right\},(0.7,0.9,1),(0.2,0.3)\}}, 0.6, \frac{(P_2,(0,0.5,1)}{\{(0.7,0.8),(0.9,1),(0.5,0.6)\}}, 0.8, \\ \frac{(P_3,(0,0.5,1)_D)}{\{(0.8,1),(0.2,0.5),(0.2,0.3,0.7)\}}, 0.7, \frac{(P_4,(0,0.5,1)_D)}{\{(0.2,0.4),(0.3,0.8),(0.3,0.6,0.7)\}}, 0.5\end{matrix}\right\},\right.$$

$$\left.\varepsilon_2, \left\{\begin{matrix}\frac{(P_1,(0.2,0.5,1)_D)}{\{(0.6,0.7),(0.9,1),(0.5,0.6)\}}, 0.6, \frac{(P_2,(0.2,0.5,1)_D)}{\{(0.5,1),(0.3,0.9),(0.8,0.9)\}}, 0.7, \\ \frac{(P_3,(0.2,0.5,1)_D)}{\{(0.3,0.5),(0.3,0.7),(0.3,0.7,0.8)\}}, 0.8, \frac{(P_4,(0.2,0.5,1)_D)}{\{(0.7,0.9),(0.3,0.6),(0.1,0.4)\}}, 0.4\end{matrix}\right\}\right\}$$

The person receives packages from different engineers and they are represented as PP- HFSS:

$$(E1_{PP}^{H}, E) = \left\{\varepsilon_1, \left\{\begin{matrix}\frac{(P_1,(0,0.5,1)_D)}{\{(0.2,0.3),(0.5,0.6,0.7),(0.4,0.7)\}}, 0.6, \frac{(P_2,(0,0.5,1)}{\{(0.6,0.7),(0.8,0.9),(0,1)\}}, 0.5, \\ \frac{(P_3,(0,0.5,1)_D)}{\{(0.9,1),(0.6,0.7),(0,0.2,0.3)\}}, 0.7, \frac{(P_4,(0,0.5,1)_D)}{\{(0,0.5),(0.1,0.7),(0.8,0.9,1)\}}, 0.8\end{matrix}\right\},\right.$$

$$\left.\varepsilon_2, \left\{\begin{matrix}\frac{(P_1,(0.2,0.5,1)_D)}{\{(0.5,0.6),(0.7,0.8),(0,1)\}}, 0.6, \frac{(P_2,(0.2,0.5,1)_D)}{\{(0.6,0.7),(0.4,0.7),(0.9,1)\}}, 0.5, \\ \frac{(P_3,(0.2,0.5,1)_D)}{\{(0,1),(0.2,0.6),(0.7,0.9,1)\}}, 0.6, \frac{(P_4,(0.2,0.5,1)_D)}{\{(0.5,0.6),(0.7,0.8),(0.9,1)\}}, 0.8\end{matrix}\right\}\right\}$$

$$(E2_{PP}^{H}, E) = \left\{\varepsilon_1, \left\{\begin{matrix}\frac{(P_1,(0,0.5,1)_D)}{\{(0.5,1),(0.2,0.4),(0.6,0.7,0.8)\}}, 0.6, \frac{(P_2,(0,0.5,1)}{\{(0,1),(0.7,0.9),(0.6,0.7,0.9)\}}, 0.8, \\ \frac{(P_3,(0,0.5,1)_D)}{\{(0.2,0.9),(0.6,0.7),(0.5,0.6)\}}, 0.4, \frac{(P_4,(0,0.5,1)_D)}{\{(0.6,0.7),(0.8,0.9),(0,1)\}}, 0.3\end{matrix}\right\},\right.$$

$$\left.\varepsilon_2, \left\{\begin{matrix}\frac{(P_1,(0.2,0.5,1)_D)}{\{(0,0.6),(0.7,0.9,1),(0.2,0.3)\}}, 0.6, \frac{(P_2,(0.2,0.5,1)_D)}{\{(0.8,1),(0.5,1),(0.9,1)\}}, 0.6, \\ \frac{(P_3,(0.2,0.5,1)_D)}{\{(0.5,0.6),(0.8,0.9,1),(0.2,0.7)\}}, 0.7, \frac{(P_4,(0.2,0.5,1)_D)}{\{(0.6,0.7),(0.5,1),(0.6,0.9)\}}, 0.9\end{matrix}\right\}\right\}$$

$$(E3^H_{PP},E)=\left\{\varepsilon_1,\left\{\frac{(P_1,(0,0.5,1)_D)}{\{(0.5,0.6),(0.7,0.9),(0.2,0.3)\}},0.5,\frac{(P_2,(0,0.5,1)}{\{(0.3,0.4,0.6),(0.2,0.3),(0,0.5)\}},0.8,\right.\right.$$
$$\left.\left.\frac{(P_3,(0,0.5,1)_D)}{\{(0.9,1),(0.2,1),(0,0.5,1)\}},0.2,\frac{(P_4,(0,0.5,1)_D)}{\{(0.2,0.4,0.6),(0.3,0.5),(0.6,0.9)\}},0.6\right\},$$
$$\varepsilon_2,\left\{\frac{(P_1,(0.2,0.5,1)_D)}{\{(0.6,0.9,1),(0.2,0.4),(0.5,1)\}},0.4,\frac{(P_2,(0.2,0.5,1)_D)}{\{(0.2,0.3),(0.4,0.5,1),(0.7,0.9)\}},0.5,\right.$$
$$\left.\left.\frac{(P_3,(0.2,0.5,1)_D)}{\{(0.5,0.6),(0.7,0.9,1),(0,1)\}},0.8,\frac{(P_4,(0.2,0.5,1)_D)}{\{(0.9,1),(0,0.2),(0.3,0.4,0.5)\}},0.6\right\}\right\}$$

$$(E4^H_{PP},E)=\left\{\varepsilon_1,\left\{\frac{(P_1,(0,0.5,1)_D)}{\{(0.6,0.7),(0.5,0.8),(0,0.2)\}},0.3,\frac{(P_2,(0,0.5,1)}{\{(0.9,1),(0.6,0.8,0.9),(0,0.4)\}},0.5,\right.\right.$$
$$\left.\left.\frac{(P_3,(0,0.5,1)_D)}{\{(0.2,0.3),(0.4,0.5),(0.7,0.9)\}},0.8,\frac{(P_4,(0,0.5,1)_D)}{\{(0.6,0.7),(0.5,1),\binom{0.6,0}{7,0.8}\}},0.6\right\},$$

$$(E3_P^H, E) = \left\{ \varepsilon_1, \left\{ \frac{(P_1,(0,0.5,1)_D)}{\{(0.5,0.6),(0.7,0.9),(0.2,0.3)\}}, \frac{(P_2,(0,0.5,1)}{\{(0.3,0.4,0.6),(0.2,0.3),(0,0.5)\}} \right\} \right.$$
$$\left. \frac{(P_3,(0,0.5,1)_D)}{\{(0.9,1),(0.2,1),(0,0.5,1)\}}, \frac{(P_4,(0,0.5,1)_D)}{\{(0.2,0.4,0.6),(0.3,0.5),(0.6,0.9)\}} \right\},$$
$$\varepsilon_2, \left\{ \frac{(P_1,(0.2,0.5,1)_D)}{\{(0.6,0.9,1),(0.2,0.4),(0.5,1)\}}, \frac{(P_2,(0.2,0.5,1)_D)}{\{(0.2,0.3),(0.4,0.5,1),(0.7,0.9)\}}, \right.$$
$$\left. \left. \frac{(P_3,(0.2,0.5,1)_D)}{\{(0.5,0.6),(0.7,0.9,1),(0,1)\}}, \frac{(P_4,(0.2,0.5,1)_D)}{\{(0.9,1),(0,0.2),(0.3,0.4,0.5)\}} \right\} \right\}$$

$$(E4_P^H, E) = \left\{ \varepsilon_1, \left\{ \frac{(P_1,(0,0.5,1)_D)}{\{(0.6,0.7),(0.5,0.8),(0,0.2)\}}, \frac{(P_2,(0,0.5,1)}{\{(0.9,1),(0.6,0.8,0.9),(0,0.4)\}} \right\} \right.$$
$$\left. \frac{(P_3,(0,0.5,1)_D)}{\{(0.2,0.3),(0.4,0.5),(0.7,0.9)\}}, \frac{(P_4,(0,0.5,1)_D)}{\{(0.6,0.7),(0.5,1),\binom{0.6,0}{7,0.8}\}} \right\},$$
$$\varepsilon_2, \left\{ \left\{ \frac{(P_1,(0.2,0.5,1)_D)}{\{(0.4,0.5),(0,0.2,0.3),(0.6,0.9)\}}, \frac{(P_2,(0.2,0.5,1)_D)}{\{(0.8,1),(0.2,1),(0.5,0.8)\}}, \right. \right.$$
$$\left. \left. \frac{(P_3,(0.2,0.5,1)_D)}{\{(0.9,1),(0.6,0.7,1),(0.4,0.6)\}}, \frac{(P_4,(0.2,0.5,1)_D)}{\{(0.6,0.8,0.9),(0.3,0.7),(0.6,0.9)\}} \right\} \right\}$$

The similarity measure betweenexpected packages and the received packages from different engineers in P-HFSS are given in Table 2.The results in both the sets are similar.However,the inclusion of the possibility degree increased the concreteness of the outcome.

CONCLUSION

This paper introduces the notion of Possibility Plithogenic hesitant fuzzy soft sets (PP-HFSS), and some of their properties were explored. Also, we developed a decision-making framework based on the possibility plithogenic hesitant fuzzy soft set.By integrating the futures of hesitant fuzzy information with the flexibility of plithogenic theory,this model provides a realistic framework for handling uncertainity,hesitation and contradiction in complex decision making problems.

ABSTRACT

This work was carried out for phytochemical screening and evaluation of antimicrobial activity of herbal ointment prepared by using *Mikania micrantha* extract. Extract was prepared by maceration technique. Phytochemical screening was done for determination of different chemical constituent. Two different concentration of simple Ointment was prepared by using bees wax, coconut oil and methyl paraben, then antimicrobial study was done to estimate its pharmacological activity and physiochemical evaluation was done to estimate its physical stability of the ointment. Formulated cream shows satisfactory physiochemical parameter and it act as an antimicrobial ointment.

Keywords: *Mikania micranth,* Antimicrobial, Phytochemicals

INTRODUCTION

In pharmacy, the treatment of bacterial and fungal infections still remains an important and [1]challenging problem due to factors like emerging infectious diseases as well as a rising number of multi-drug-resistant microbial plant pathogens. Despite a huge number of antimicrobial drugs for use, the emergence in the last few decades of new and old antimicrobial resistant microbial strains represents a massive need for new classes of antimicrobial drugs. Many naturally occurring extracts from edible and medicinal plants, herbs and spices have been proven to have antimicrobial activities and are a source of antimicrobial agents against plant pathogen[2]. *Mikania micrantha* H. B. K.

(Asteraceae), a very fast-growing, perennial creeping weed also known as mile-a-minute weed. Its original distribution area lies in Central and South America. It first appeared in south China during the 1980s, causing negative influence on the agricultural production within the established region.[3]This bioactive compound contributes to its various biological activities including antimicrobial, antioxidant and anti-inflammatory properties. Comprehensive phytochemical investigation have identified several classes of constituent in *M. micrantha* such as phenolic compound[4]sesquiter penoids[5] flavonoids [6]essential oil in flower [7] terpenoids[8] used as a medication for the cure of many human diseases including insect bites, rashes and itches of skin, chicken pox, healing of sores and wounds, colds and fever, nausea, jaundice, rheumatism, and respiratory ailments[9]. In Jamaica, its most popular uses are for wound dressings and promote the healing of sores as folk medicine[10]. Therefore, the goals of this research are to establish the potential of *M. micrantha* against gram-positive and gram-negative bacteria. The second aim is to find the secondary metabolites present in the samples through a series of phytochemical tests[11]. Under a microscope, the spherical, Gram-positive bacteria Staphylococcus aureus develops clusters that resemble grapes. As part of the normal flora, it is facultatively anaerobic and frequently found on healthy people's skin and in their nasal passages. Although *S. aureus* is a commensal organism, it is also an opportunistic pathogen that can cause a variety of infections, ranging from mild infections of the skin and soft tissues (like boils and impetigo) to serious, potentially fatal illnesses like pneumonia, osteomyelitis, septicaemia, endocarditis, and toxic shock syndrome. The fact that *S. aureus* might become resistant to several medications is one of the main issues. Because there are few available treatments, methicillin-resistant Staphylococcus aureus (MRSA) strains are especially problematic in both healthcare and community settings. The bacterium has several virulence factors, such as toxins that harm host cells, enzymes that aid in tissue inversion and surface proteins recognition colonization. In a time when antibiotic resistance is on the rise, it is essential to comprehend the pathogenicity and resistance mechanisms of *S. aureus* in order to create effective therapies and preventative measures.[12]

MATERIALS AND METHODS

Collection

Plant material (sample) were collected from different part of west Medinipur and Nadia. After collection of plant material, they are washed thoroughly by using fresh water and dried at room temperature to remove maximum moisture content of sample

Extraction

Extraction was carried by maceration method by using 95% methanol as solvent system. Maintained a 1:10 ratio of plant material to solvent, stir and soak the mixture in a glass container for 3 days at room temperature with occasional stirring. Filter the extract to remove solid residue and concentrated by using rotary evaporator. Now store at 4 degrees centigrade.

Phytochemical evaluation

Phytochemical evaluation is essential for identifying the specific bioactive compounds in plant extracts that contribute to their antimicrobial properties[13]Phytochemical evaluation was done to evaluate different phytochemical present in the extract. Phytochemical present in the sample is mentioned below.

Preparation of ointment

A semisolid dosage form designed for external application to the skin or mucous membranes is called an ointment. It is typically used for cosmetic, medicinal, or protective purposes and consists of a medicated material that is spread in a hydrophobic base (such lanolin or petrolatum). Two different formulations, F1 and F2, were prepared using varying concentrations of *Mikania micrantha* extract along with constant amounts of other excipients. In formulation F1, 5 grams of *Mikania micrantha* extract was incorporated, while formulation F2 contained 10 grams. Both formulations included 30 grams of beeswax and 0.5 grams of methyl paraben as a preservative. Coconut oil was used as the base, with 64.5 grams in F1 and a reduced quantity of 59.5 grams in F2 to accommodate the increased extract

content. This variation in extract concentration allows for comparative evaluation of the formulations in terms of their physical characteristics and potential biological activity (Table 1.).

Physicochemical evaluation of herbal ointments

Different parameters are used to evaluate the prepared ointment.

Organoleptic studies

The organoleptic study of an herbal ointment involves the evaluation of its sensory characteristics, which help to determine its quality, consistency, and consumer acceptability. It includes the testing of color, odor and texture.

pH

For testing PH 1gm of ointment dissolve in 30 ml of distilled water with continuous stirring and the PH was measured by using digital PH meter. Studies shows that PH range between 5.6-6.1 is suitable for topical application[14]

Homogeneity

The homogeneity test for ointment is a quality control parameter that ensure the uniform distribution of active pharmaceutical ingredient throughout the ointment. The ointment is gently rubbed between two fingers to assess smoothness, grittiness or uniform texture. [15]

Spreadability test

Spreadability is an essential parameter for ointment, as it affects patient compliance and therapeutic efficacy. It determines how easily the formulation spreads on the skin or mucosal surfaces. 1g of sample is placed between two glass plates and a known weight is placed on the upper plate to allow uniform spreading; diameter of uniform spread ointment is measured after a fixed time. Formula for testing spreadability is S=M*L/T, Where S= spreadability, M= Weight of the ointment, L = length of spreading, T= time taken for spreading [16]

Solubility

Solubility of the ointment was checked by using different solvent like hot water, normal water, ethanol, ethyl acetate and chlorofor

Washability

Required amount of ointment rubbed for 2-3 min in hand and washed with water to assess washability[17].

Irritation test

Some amount of ointment rubbed in the skin to check the irritation.

Evaluation of Anti-Microbial Activity of Ointment

Preparation of culture media

A Muller-Histon Agar (MHA) was prepared to check antimicrobial activity of *Mikania micrantha*.MHA is Standard for antibiotic susceptibility testing. Recommended by CLSI(Clinical and Laboratory Standard Institute) (Table 2). 50 ml culture media was prepared and sterilized it in autoclave.

Evaluation of antimicrobial activity

For evaluation of antimicrobial activity of ointment firstly we have to spread the *S. aureus* bacteria throughout the media then placed two different concentration of ointment and a marketed Mupirocin Ointment IP 2% w/w ointment as a standard topical drug. Mupirocin Ointment is worked against gram positive bacteria such as S. aureus, marketed ointment is essential to compare the antimicrobial activity of prepared ointment. After bacteria inoculation leave it to grow the bacteria in a incubator.

RESULT

The purpose of this study was to examine the phytochemical makeup and antibacterial properties of an ointment made using extract from *Mikania micrantha*. Preliminary phytochemical screening of the ethanolic extract, physicochemical characterization of the prepared ointments, and in vitro antimicrobial testing against Staphylococcus aureus using the agar well diffusion method was among the evaluations that were carried out. Several bioactive secondary metabolites, such as alkaloids, tannins, flavonoids, glycosides, resins, saponins, and steroids, were found to be present by preliminary phytochemical screening (Table 3) [18]. These components' contributions to antimicrobial activity, whether through direct contact with microbial cell walls or through a variety of metabolic pathways, are well-established[19]. The developed ointments' antibacterial efficacy was assessed and contrasted with a commercially available mupirocin ointment at two concentrations (5% and 10% w/w of *Mikania micrantha* extract). The normal mupirocin ointment generated an inhibition zone of 2.3 cm against S. aureus, but the 5% and 10% formulations showed zones of inhibition of 1.73 cm and 2.00 cm, respectively. These findings show that the prepared ointments have significant antibacterial activity thatis comparable to the commercial version (Table 4; Fig 1).

C- Marketed Ointment
S1-5% Ointment
S2-10%Ointment

Positive formulation properties were found by physicochemical analysis. The 5% and 10% ointments' respective pH values of 5.34 and 5.52 were found to be in good agreement with the pH of the skin[20]. According to spreadability tests, the 5% formulation's results were 270.83 g·cm/sec, whereas the 10% formulations were 185.71 g·cm/sec.Upon application, there were no discernible symptoms of skin irritation, and both ointments demonstrated satisfactory homogeneity and washability (Table 5).

DISCUSSION AND CONCLUSION

The ethanolic extract of *Mikania micrantha* leaves was successfully used in the current study to create an herbal ointment, and its phytochemical profile and antibacterial capabilities were then thoroughly assessed. Several significant secondary metabolites with pharmacological activity were confirmed by the extract's initial phytochemical analysis. Each of these substances like alkaloids, flavonoids, tannins, saponins, glycosides, resins, and steroids have a unique set of medicinal qualities, including antibacterial, anti-inflammatory, antioxidant, and wound-healing capabilities. The agar well diffusion method was used to evaluate the antibacterial activity of the prepared ointments against Staphylococcus aureus, a Gram-positive bacterium frequently linked to skin illnesses. To assess dose-dependent effectiveness, two distinct ointment concentrations were made. Different zones of inhibition were seen at both concentrations, and they were found to be similar to those generated by a conventional antibacterial ointment that is sold commercially. This finding suggests that the *Mikania micrantha* extract's bioactive components play a major role in its antibacterial action, which makes the formulation a viable option for usage in the future as a natural, plant-based substitute for artificial antimicrobials. The prepared ointments were evaluated in advance for their physicochemical properties in addition to their antibacterial effectiveness. During early topical application studies, both concentrations showed outstanding spreadability, superb homogeneity, physical stability over time, and most importantly no outward symptoms of discomfort or allergic reaction. In topical preparations, these characteristics are crucial for guaranteeing both user comfort and medicinal efficacy. When combined, the study's results reinforce and validate *Mikania micrantha* traditional medical application for the treatment of wounds and skin infections. The herbal ointments' similar performance to that of commercially available products creates new opportunities for the creation of safe, affordable, and environmentally friendly herbal substitutes. *Mikania micrantha*-based ointments may be incorporated into common dermatological and pharmaceutical applications as trustworthy antibacterial agents with additional clinical study and standardization.

ACKNOWLEDGEMENT

The author would like to acknowledge the CAIF, Brainware University for providing us with the facility for carrying out the works.

ABSTRACT

This study presents an integrated inventory model that includes stochastic demand within a fuzzy environment. In today's uncertain business landscape, inventory parameters often fluctuate, making crisp traditional models less reliable. Based on a fuzzy approach, this study provides a more realistic representation of these uncertainties. The main objective is to minimise the total integrated cost by determining the optimal order quantity using nonlinear programming techniques. To demonstrate the effectiveness of the proposed method, a numerical comparison was conducted between the fuzzy and crisp inventory models.

Keywords: Pentagonal Fuzzy Number, Freight costs, Lagrangian Method, Kuhn-Tucker Method, Integrated vendor–buyer inventory model, Removal of Area Method, Graded Mean Method.

INTRODUCTION

Better cooperation between suppliers and consumers can result in more effective inventory management across the supply chain. In many real-world circumstances, inventory costs account for a large share of total logistics charges. To promote more significant purchases, suppliers frequently provide quantity discounts, ultimately decreasing the per-unit cost for buyers placing a bulk order. Inventory management along the whole supply chain may be managed more effectively with better supplier and buyer collaboration. Inventory costs are frequently a significant portion of logistics costs in many real-world scenarios.As a financial incentive for customers to buy in greater quantities, the provider typically offers lower unit costs on orders for larger quantities. The provider benefits from higher volume sales since it lowers setup and processing costs per item. At the expense of having more inventory on hand, the buyer gains from lower unit costs and ordering expenses per unit. The goal of this study is to look at how the company's and customer's optimal order quantity affects stochastic demand and freight costs.

Numerical examples are presented to illustrate the benefits of the suggested models, and a method for determining the ideal order quantity is established. In order to account for actual motor carrier freight rates while determining lot sizing, Langley (1980) used the enumeration approach. Goyal (2003) presented an easy way to determine the appropriate operating policy. Mendoza (2008) developed an algorithm that relied on an unduly simplified freight pricing scenario. Abad, P.L. (2005) devised a system to calculate the buyer's lot size, cost, and freight. Jafar et al. (2014 and 2015) suggested an inventory model that accounted for transportation costs but excluded stochastic demand. and expanded EOQ models to include transportation and environmental costs. Wangsa (2017) explored greenhouse gas emissions and stochastic demand systems in the context of combined lot sizes. Although bulk discounts have been a topic of scholarly interest for many years, their influence on supplier-buyer models with stochastic demand has received relatively little attention. The model was enhanced by Uthayakumar et al. (2014) by incorporating supplier quality improvements. According to Jauhari (2014, 2016), quantity discounts are analysed within a stochastic vendor-buyer lead-time inventory framework, and freight costs are integrated into the supply chain system to increase applicability.

In the real world, we are continually presented with unclear or imprecise information. The information supplied is occasionally unclear, vague, or inadequate. Zadeh proposed the idea of fuzzy sets in 1965. Fuzzy decision models were used to study long-term inventory policy for multi-stage inventory planning by Staniewski (1982). S. Chakraborty (2013) extends the EOQ model with interval-valued fuzzy numbers. Using pentagonal fuzzy numbers for inventory attributes, for decaying items with variable demand, Surana (2015) proposed a fuzzy inventory model.Park (1987) proposed an EOQ inventory model using trapezoidal fuzzy numbers. Jadhav (2010) created a multi-objective inventory model for decaying objects that includes fuzzy inventory costs and certain fuzzy limitations. Maiti (2008) employed only new defuzzification techniques to create a degrading multi-object stock model with assets and fuzzy fees.Render (1994) was created utilizing nonlinear programming techniques. Taha (1997) used a nonlinear technique to address the uncertainty observed in operations research. Niaki (1998) used a Lagrangian relaxation approach to solve a fuzzy random EPQ issue with shortages, whereas the representation of generalized fuzzy numbers using GM Method was introduced by Chen (1999).Chakraborte (2019) included The Pentagonal Fuzzy Number: Its Different Representations, Properties, Defuzzification and Ranking, as well as its distinct representation, defuzzification and ranking approach, and awareness in the industrial supply control problem.

The goal is to find the ideal ordering quantity such that the overall cost is reduced. The pentagonal fuzzy number is utilized to develop a powerful Lagrangian and Kuhn-Tucker approach. Final numerical illustrations show the representation and solutions approach.

ASSUMPTIONS AND NOTATIONS

For the suggested model, the notations and presumptions listed in Pan and Yang (2002) are used.

Assumptions

1. A product has a buyer and a supplier.
2. Two suppliers provide a progressive size discount or a discount on all units.
3. The provider uses a finite production ratio for producing goods. $P_r > D_r$ for the item.
4. With a normal distribution $\sigma \sqrt{L}$.
5. Inventory is constantly reviewed. Once the readily available inventory rearrangement point is reached the customer places an order, $R = D_L + y\sigma \sqrt{L}$, where k is the security factor.
6. Shortages with partial back orders and lost sales are allowed.

NOTATIONS

To generate the model, we use the notation practically similar to Wangsa and Wee(2020).

P_r :supplier production rate per unit time
O :buyer fixed ordering cost
D_r :Buyer Demand rate per unit of time
C_s :supplier's production cost
C_{bj} :buyer's purchasing cost
S :supplier fixed setup cost
L : lead timelength of the weeks
H :holding cost rate per unit time
α : discount factor
w :weight of a unit
F_x :the freight rate
F_0supplier: transportation cost per trip for the
π_x :buyer back order cost
π_o :buyermarginal profit
β :the backorder ratio
n : number of deliveries
y :safety factor (decision variable)
T :order quantity (decision variable)

Mathematical Model

The integrated total cost was calculated in Ivan Wangsa and Hui Wee(2020) is the sum of the following elements, inventory holding costs, freight costs, setup costs per unit of time, and vendor and buyer ordering costs make up the integrated total cost.

The Buyer 's holding cost = $HC_{bj}\left(\frac{T}{2} + y\sigma\sqrt{L} + (1-\beta)\sigma\sqrt{L}\psi(y)\right)$ ----------(1)

The Buyer 's Ordering cost = $\frac{OD_r}{T}$ ----------(2)

The Buyer 's shortage cost = $\frac{D_r}{T}\left(\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right)$ ----------(3)

The Buyer 's freight cost = $\frac{D_r}{T}\left(\alpha F_x w_x d\right)+D_r dF_x W(1-\alpha)$ ----------(4)

The supplier's setup cost = $\frac{D_r S}{nT}$ ----------(5)

The supplier's transportation cost = $\frac{D_r F_o}{T}$ ----------(6)

The supplier's holding cost = $H\frac{T}{2}\left\{C_s\left[n(1-\frac{D_r}{P_r})-1+\frac{2D_r}{P_r}\right]\right\}$ ----------(7)

$$ITC(T,y,n)=\begin{cases}\frac{D_r}{T}\left\{O+\frac{S}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\\ +HC_{bj}\left[y\sigma\sqrt{L}+(1-\beta)\sigma\sqrt{L}\psi(y)\right]\\ +D_r dF_x W(1-\alpha)+H\frac{T}{2}\left\{C_{bj}+C_s\left[n(1-\frac{D_r}{P_r})-1+\frac{2D_r}{P_r}\right]\right\}\end{cases}$$ ----------(8)

We use partial derivatives to solve this nonlinear programming issue in order to minimise the integrated total cost. For a fixed n, the function ITC(T,y,n) is convex in T and y.

$$T=\sqrt{\frac{2D_r\left\{O+\frac{S}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}}{H\left\{C_{bj}+C_s\left[n(1-\frac{D_r}{P_r})-1+\frac{2D_r}{P_r}\right]\right\}}}$$ ----------(9)

and

$$\phi(y)=1-\frac{HC_{bj}T}{\left[\pi_x\beta+\pi_0(1-\beta)\right]D+HC_{bj}T(1-\beta)}$$ ----------(10)

Solution of Non Linear Programming Method

This work improves fuzzy inventory model processing with these factors. Then incorporate a fuzzy parameter.

$$ITC\tilde{C}(T,y,n)=\begin{cases}\dfrac{\tilde{D}_r}{T}\left\{\tilde{O}+\dfrac{\tilde{S}}{n}+F_o+\alpha dF_x w_x+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\\ +\tilde{H}\tilde{C}_{bj}\left[y\sigma\sqrt{L}+(1-\beta)\sigma\sqrt{L}\psi(y)\right]\\ +\tilde{D}_r dF_x W(1-\alpha)+\tilde{H}\dfrac{T}{2}\left\{\tilde{C}_{bj}+\tilde{C}_s\left[n(1-\dfrac{\tilde{D}_r}{\tilde{P}_r})-1+\dfrac{2\tilde{D}_r}{\tilde{P}_r}\right]\right\}\end{cases}$$,----------(11)

Finding the value of T that minimises the overall cost

$ITC(T,y,n)$, when $\dfrac{\partial ITC(T,y,n)}{\partial T}$ =0 and where $\dfrac{\partial^2 ITC(T,y,n)}{\partial T^2}>0$ $\dfrac{\partial ITC(T,y,n)}{\partial y}=0$

We get, $T=\sqrt{\dfrac{2\tilde{D}_r\left\{\tilde{O}+\dfrac{\tilde{S}}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}}{\tilde{H}\left\{\tilde{C}_{bj}+\tilde{C}_s\left[n(1-\dfrac{\tilde{D}_r}{\tilde{P}_r})-1+\dfrac{2\tilde{D}_r}{\tilde{P}_r}\right]\right\}}}$ ---(12)

And

$$\phi(y)=1-\frac{\tilde{H}\tilde{C}_{bj}T}{\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}+\tilde{H}\tilde{C}_{bj}T(1-\beta)}$$ ----------(13)

FuzzyMathematical Model usingLagrange solution with GM Method

let us consider the integrated total cost is

$$ITC\tilde{C}(\tilde{T},y,n)=\begin{cases}\dfrac{\tilde{D}_r}{\tilde{T}}\left\{\tilde{O}+\dfrac{\tilde{S}}{n}+F_o+\alpha dF_x w_x+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\\ +\tilde{H}\tilde{C}_{bj}\left[y\sigma\sqrt{L}+(1-\beta)\sigma\sqrt{L}\psi(y)\right]\\ +\tilde{D}_r dF_x W(1-\alpha)+\tilde{H}\dfrac{\tilde{T}}{2}\left\{\tilde{C}_{bj}+\tilde{C}_s\left[n(1-\dfrac{\tilde{D}_r}{\tilde{P}_r})-1+\dfrac{2\tilde{D}_r}{\tilde{P}_r}\right]\right\}\end{cases}$$, ----------(14)

In order to defuzzify the fuzzy total cost using the GMtechnique,

If we substitute the following for the inequality requirements,

$y_5\geq y_4\geq y_3\geq y_2\geq y_1>0$and $T_5\geq T_4\geq T_3\geq T_2\geq T_1>0$into the following inequality$y_5-y_4\geq 0, y_4-y_3\geq 0, y_3-y_2\geq 0, y_2-y_1\geq 0, y_1\geq 0$ and$T_5-T_4\geq 0, T_4-T_3\geq 0, T_3-T_2\geq 0, T_2-T_1\geq 0, T_1\geq 0$.

We use Lagrangian technique extension to solve

y_1 ,y_2 , y_3 ,y_4,$y_5$and T_1 ,T_2 , T_3 ,T_4,T_5.

$$ITC(T, y, n) = \frac{1}{12}\left(\frac{D_{r1}}{T_5}\left\{ O_1 + \frac{S_1}{n} + F_o + \alpha F_x w_x d + \left[\pi_x \beta + \pi_0 (1-\beta)\right]\sigma\sqrt{L}\psi(y) \right\} \right.$$

$$+ H_1 C_{bj_1}\left[y\sigma\sqrt{L} + (1-\beta)\sigma\sqrt{L}\psi(y) \right] + D_{r1} d F_x W (1-\alpha)$$

$$\left. + \frac{H_1 T_1 C_{bj1}}{2} + \frac{H_1 T_1 C_{s1} n}{2} - \frac{H_5 T_5 C_{bj5} D_{r5}}{2 P_{r1}} - \frac{H_5 T_5 C_{bj5}}{2} + \frac{2 H_1 T_1 C_{bj1} D_{r1}}{2 P_{r5}} \right) +$$

$$\frac{3}{12}\left(\frac{D_{r2}}{T_4}\left\{ O_2 + \frac{S_2}{n} + F_o + \alpha F_x w_x d + \left[\pi_x \beta + \pi_0 (1-\beta)\right]\sigma\sqrt{L}\psi(y) \right\} + \right.$$

$$+ H_2 C_{bj_2}\left[y\sigma\sqrt{L} + (1-\beta)\sigma\sqrt{L}\psi(y) \right] + D_{r2} d F_x W (1-\alpha)$$

$$\left. + \frac{H_2 T_2 C_{bj2}}{2} + \frac{H_2 T_2 C_{s2} n}{2} - \frac{H_4 T_4 C_{bj4} D_{r4}}{2 P_{r2}} - \frac{H_4 T_4 C_{bj4}}{2} + \frac{2 H_2 T_2 C_{bj2} D_{r2}}{2 P_{r4}} \right)$$

$$+ \frac{4}{12}\left(\frac{D_{r3}}{T_3}\left\{ O_3 + \frac{S_3}{n} + F_o + \alpha F_x w_x d + \left[\pi_x \beta + \pi_0 (1-\beta)\right]\sigma\sqrt{L}\psi(y) \right\} \right.$$

$$+ H_3 C_{bj_3}\left[y\sigma\sqrt{L} + (1-\beta)\sigma\sqrt{L}\psi(y) \right] + D_{r3} d F_x W (1-\alpha)$$

$$\left. + \frac{H_3 T_3 C_{bj3}}{2} + \frac{n H_3 T_3 C_{s3}}{2} - \frac{H_3 T_3 C_{bj3} D_{r3}}{2 P_{r3}} - \frac{H_3 T_3 C_{bj3}}{2} + \frac{2 H_3 T_3 C_{bj3} D_{r3}}{2 P_{r3}} \right)$$

$$+ \frac{3}{12}\left(\frac{D_{r4}}{T_2}\left\{ O_4 + \frac{S_4}{n} + F_o + \alpha F_x w_x d + \left[\pi_x \beta + \pi_0 (1-\beta)\right]\sigma\sqrt{L}\psi(y) \right\} \right.$$

$$+ H_4 C_{bj_4}\left[y\sigma\sqrt{L} + (1-\beta)\sigma\sqrt{L}\psi(y) \right] + D_{r4} d F_x W (1-\alpha)$$

$$\left. + \frac{H_4 T_4 C_{bj4}}{2} + \frac{n H_4 T_4 C_{s4}}{2} - \frac{H_2 T_2 C_{bj2} D_{r2}}{2 P_{r4}} - \frac{H_2 T_2 C_{bj2}}{2} + \frac{2 H_4 T_4 C_{bj4} D_{r4}}{2 P_{r2}} \right)$$

$$+ \frac{1}{12}\left(\frac{D_{r5}}{T_1}\left\{ O_5 + \frac{S_5}{n} + F_o + \alpha F_x w_x d + \left[\pi_x \beta + \pi_0 (1-\beta)\right]\sigma\sqrt{L}\psi(y) \right\} \right.$$

$$+ H_5 C_{bj_5}\left[y\sigma\sqrt{L} + (1-\beta)\sigma\sqrt{L}\psi(y) \right] + D_{r5} d F_x W (1-\alpha)$$

$$\left. + \frac{H_5 T_5 C_{bj5}}{2} + \frac{n H_5 T_5 C_{s5}}{2} - \frac{H_1 T_1 C_{bj1} D_{r1}}{2 P_{r5}} - \frac{H_1 T_1 C_{bj1}}{2} + \frac{2 H_5 T_5 C_{bj5} D_{r5}}{2 P_{r1}} \right)$$

-----(15)

$$T_1=T_2=T_3=T_4=T_5=\sqrt{\frac{\begin{aligned}&2\left\{D_{r5}\left\{O_5+\frac{S_5}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+6\left\{D_{r4}\left\{O_4+\frac{S_4}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+8\left\{D_{r3}\left\{O_3+\frac{S_3}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+6\left\{D_{r2}\left\{O_2+\frac{S_2}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+2\left\{D_{r1}\left\{O_1+\frac{S_1}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\end{aligned}}{\begin{aligned}&H_1\left\{C_{bj1}+C_{s1}\left[n\left(1-\frac{D_{r1}}{P_{r5}}\right)-1+\frac{2D_{r1}}{P_{r5}}\right]\right\}+3H_2\left\{C_{bj2}+C_{s2}\left[n\left(1-\frac{D_{r2}}{P_{r4}}\right)-1+\frac{2D_{r2}}{P_{r4}}\right]\right\}\\&+4H_3\left\{C_{bj3}+C_{s3}\left[n\left(1-\frac{D_{r3}}{P_{r3}}\right)-1+\frac{2D_{r3}}{P_{r3}}\right]\right\}+3H_4\left\{C_{bj4}+C_{s4}\left[n\left(1-\frac{D_{r4}}{P_{r2}}\right)-1+\frac{2D_{r4}}{P_{r2}}\right]\right\}\\&+H_5\left\{C_{bj5}+C_{s5}\left[n\left(1-\frac{D_{r5}}{P_{r1}}\right)-1+\frac{2D_{r5}}{P_{r1}}\right]\right\}\end{aligned}},$$

$$y_1=y_2=y_3=y_4=y_5=1-\frac{\tilde{H}_1\tilde{C}_{bj1}T+3\tilde{H}_2\tilde{C}_{bj2}T+4\tilde{H}_3\tilde{C}_{bj3}T+3\tilde{H}_4\tilde{C}_{bj4}T+\tilde{H}_5\tilde{C}_{bj5}T}{\left(\begin{aligned}&\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_5+\tilde{H}_5\tilde{C}_{bj5}T(1-\beta)+\\&3\left(\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_4+\tilde{H}_4\tilde{C}_{bj4}T(1-\beta)\right)+\\&4\left(\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_3+\tilde{H}_3\tilde{C}_{bj3}T(1-\beta)\right)+\\&3\left(\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_2+\tilde{H}_2\tilde{C}_{bj2}T(1-\beta)\right)+\\&\left(\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_1+\tilde{H}_1\tilde{C}_{bj1}T(1-\beta)\right)\end{aligned}\right)}\text{ ----------(16)}$$

Fuzzy Mathematical Model using Lagrange solution with RA Method

Let us consider the integrated total cost is

$$ITC\tilde{C}(\tilde{T},y,n)=\begin{cases}\dfrac{\tilde{D}_r}{\tilde{T}}\left\{\tilde{O}+\dfrac{\tilde{S}}{n}+F_o+\alpha dF_x w_x+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\\+\tilde{H}\tilde{C}_{bj}\left[y\sigma\sqrt{L}+(1-\beta)\sigma\sqrt{L}\psi(y)\right]\\+\tilde{D}_r dF_x W(1-\alpha)+\tilde{H}\dfrac{\tilde{T}}{2}\left\{\tilde{C}_{bj}+\tilde{C}_s\left[n(1-\dfrac{\tilde{D}_r}{\tilde{P}_r})-1+\dfrac{2\tilde{D}_r}{\tilde{P}_r}\right]\right\}\end{cases}\text{ , ----------(17)}$$

To apply Removal of Area method to defuzzify the fuzzy total cost,

$$ITC(T, y, n) = \frac{1}{10}\left(\frac{D_{r1}}{T_5}\left\{ O_1 + \frac{S_1}{n} + F_O + \alpha F_x w_x d + \left[\pi_x \beta + \pi_0 (1-\beta)\right]\sigma\sqrt{L}\psi(y) \right\} \right.$$

$$+ H_1 C_{bj_1}\left[y\sigma\sqrt{L} + (1-\beta)\sigma\sqrt{L}\psi(y) \right] + D_{r1} dF_x W(1-\alpha)$$

$$\left. + \frac{H_1 T_1 C_{bj1}}{2} + \frac{H_1 T_1 C_{s1} n}{2} - \frac{H_5 T_5 C_{bj5} D_{r5}}{2P_{r1}} - \frac{H_5 T_5 C_{bj5}}{2} + \frac{2H_1 T_1 C_{bj1} D_{r1}}{2P_{r5}} \right) +$$

$$\frac{1}{10}\left(\frac{D_{r2}}{T_4}\left\{ O_2 + \frac{S_2}{n} + F_o + \alpha F_x w_x d + \left[\pi_x \beta + \pi_0 (1-\beta)\right]\sigma\sqrt{L}\psi(y) \right\} + \right.$$

-----(18)

If we substitute the following for the inequality requirements,

$y_5 \geq y_4 \geq y_3 \geq y_2 \geq y_1 > 0$and $T_5 \geq T_4 \geq T_3 \geq T_2 \geq T_1 > 0$into the following inequality$y_5 - y_4 \geq 0, y_4 - y_3 \geq 0, y_3 - y_2 \geq 0, y_2 - y_1 \geq 0, y_1 \geq 0$ and $T_5 - T_4 \geq 0, T_4 - T_3 \geq 0, T_3 - T_2 \geq 0, T_2 - T_1 \geq 0, T_1 \geq 0$.

We use Lagrangian technique extension to solve
y_1 ,y_2 , y_3 ,y_4, $y_5$and T_1 ,T_2 , T_3 ,T_4, T_5.

The optimal order Quantity and safety factor are

$$\tilde{T} = \sqrt{\frac{\begin{aligned}&2\left\{D_{r5}\left\{O_5+\frac{S_5}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+2\left\{D_{r4}\left\{O_4+\frac{S_4}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+4\left\{D_{r3}\left\{O_3+\frac{S_3}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+6\left\{D_{r2}\left\{O_2+\frac{S_2}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\\&+2\left\{D_{r1}\left\{O_1+\frac{S_1}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\}\end{aligned}}{\begin{aligned}&H_1\left\{C_{bj1}+C_{s1}\left[n\left(1-\frac{D_{r1}}{P_{r5}}\right)-1+\frac{2D_{r1}}{P_{r5}}\right]\right\}+H_2\left\{C_{bj2}+C_{s2}\left[n\left(1-\frac{D_{r2}}{P_{r4}}\right)-1+\frac{2D_{r2}}{P_{r4}}\right]\right\}\\&+2H_3\left\{C_{bj3}+C_{s3}\left[n\left(1-\frac{D_{r3}}{P_{r3}}\right)-1+\frac{2D_{r3}}{P_{r3}}\right]\right\}+3H_4\left\{C_{bj4}+C_{s4}\left[n\left(1-\frac{D_{r4}}{P_{r2}}\right)-1+\frac{2D_{r4}}{P_{r2}}\right]\right\}\\&+H_5\left\{C_{bj5}+C_{s5}\left[n\left(1-\frac{D_{r5}}{P_{r1}}\right)-1+\frac{2D_{r5}}{P_{r1}}\right]\right\}\end{aligned}}}, \quad \text{------(19)}$$

$$y = 1-\frac{\tilde{H}_1\tilde{C}_{bj1}T+\tilde{H}_2\tilde{C}_{bj2}T+2\tilde{H}_3\tilde{C}_{bj3}T+3\tilde{H}_4\tilde{C}_{bj4}T+\tilde{H}_5\tilde{C}_{bj5}T}{\left(\begin{aligned}&\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_5+\tilde{H}_5\tilde{C}_{bj5}T(1-\beta)+\\&3\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_4+\tilde{H}_4\tilde{C}_{bj4}T(1-\beta)+\\&2\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_3+\tilde{H}_3\tilde{C}_{bj3}T(1-\beta)+\\&\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_2+\tilde{H}_2\tilde{C}_{bj2}T(1-\beta)+\\&\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_1+\tilde{H}_1\tilde{C}_{bj1}T(1-\beta)\end{aligned}\right)}$$

Fuzzy Mathematical Model using Kuhn - tucker solution with GM Method

In order to defuzzify the fuzzy total cost using the graded mean approach,
If we substitute the following for the inequality requirements,

$y_5 \geq y_4 \geq y_3 \geq y_2 \geq y_1 > 0$and $T_5 \geq T_4 \geq T_3 \geq T_2 \geq T_1 > 0$into the following inequality$y_5 - y_4 \geq 0, y_4 - y_3 \geq 0, y_3 - y_2 \geq 0, y_2 - y_1 \geq 0, y_1 \geq 0$ and $T_5 - T_4 \geq 0, T_4 - T_3 \geq 0, T_3 - T_2 \geq 0, T_2 - T_1 \geq 0, T_1 \geq 0$.

We apply the Kuhn Tucker method , to find the solutions of T_1 ,T_2 , T_3 ,T_4,T_5 *and* y_1, y_2, y_3, y_4, y_5.

The Kuhn-tucker conditions are, $\lambda \le 0$ $P(ITC\left(\tilde{T}, y, n\right))$.

$$\nabla f\left(P(ITC\left(\tilde{T}, y, n\right))\right) - \lambda_i \nabla g\left(\tilde{T}, \tilde{y}\right) = 0,$$

$$g_i\left(\tilde{T}, \tilde{y}\right) \ge 0,$$

$$\lambda_i \nabla g_i\left(\tilde{T}, \tilde{y}\right) = 0,$$

These requirements can be simplified as follows:

$$\lambda_1, \lambda_2, \lambda_3, \lambda_4, \lambda_5, \lambda_6, \lambda_7, \lambda_8, \lambda_9, \lambda_{10} \le 0$$

The optimal order Quantity and safety factor are

$$\tilde{T} = \sqrt{\frac{\begin{array}{l} 2\left\{D_{r5}\left\{O_5 + \frac{S_5}{n} + F_o + \alpha F_x w_x d + \left[\pi_x\beta + \pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +6\left\{D_{r4}\left\{O_4 + \frac{S_4}{n} + F_o + \alpha F_x w_x d + \left[\pi_x\beta + \pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +8\left\{D_{r3}\left\{O_3 + \frac{S_3}{n} + F_o + \alpha F_x w_x d + \left[\pi_x\beta + \pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +6\left\{D_{r2}\left\{O_2 + \frac{S_2}{n} + F_o + \alpha F_x w_x d + \left[\pi_x\beta + \pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +2\left\{D_{r1}\left\{O_1 + \frac{S_1}{n} + F_o + \alpha F_x w_x d + \left[\pi_x\beta + \pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \end{array}}{\begin{array}{l} H_1\left\{C_{bj1} + C_{s1}\left[n\left(1 - \frac{D_{r1}}{P_{r5}}\right) - 1 + \frac{2D_{r1}}{P_{r5}}\right]\right\} + 3H_2\left\{C_{bj2} + C_{s2}\left[n\left(1 - \frac{D_{r2}}{P_{r4}}\right) - 1 + \frac{2D_{r2}}{P_{r4}}\right]\right\} \\ +4H_3\left\{C_{bj3} + C_{s3}\left[n\left(1 - \frac{D_{r3}}{P_{r3}}\right) - 1 + \frac{2D_{r3}}{P_{r3}}\right]\right\} + 3H_4\left\{C_{bj4} + C_{s4}\left[n\left(1 - \frac{D_{r4}}{P_{r2}}\right) - 1 + \frac{2D_{r4}}{P_{r2}}\right]\right\} \\ +H_5\left\{C_{bj5} + C_{s5}\left[n\left(1 - \frac{D_{r5}}{P_{r1}}\right) - 1 + \frac{2D_{r5}}{P_{r1}}\right]\right\} \end{array}}}, \quad \text{--------(20)}$$

$$y = 1 - \frac{\tilde{H}_1\tilde{C}_{bj1}T + 3\tilde{H}_2\tilde{C}_{bj2}T + 4\tilde{H}_3\tilde{C}_{bj3}T + 3\tilde{H}_4\tilde{C}_{bj4}T + \tilde{H}_5\tilde{C}_{bj5}T}{\left(\begin{array}{l} \left[\pi_x\beta + \pi_0(1-\beta)\right]\tilde{D}_5 + \tilde{H}_5\tilde{C}_{bj5}T(1-\beta) + \\ 3\left[\pi_x\beta + \pi_0(1-\beta)\right]\tilde{D}_4 + \tilde{H}_4\tilde{C}_{bj4}T(1-\beta) + \\ 4\left[\pi_x\beta + \pi_0(1-\beta)\right]\tilde{D}_3 + \tilde{H}_3\tilde{C}_{bj3}T(1-\beta) + \\ 3\left[\pi_x\beta + \pi_0(1-\beta)\right]\tilde{D}_2 + \tilde{H}_2\tilde{C}_{bj2}T(1-\beta) + \\ \left[\pi_x\beta + \pi_0(1-\beta)\right]\tilde{D}_1 + \tilde{H}_1\tilde{C}_{bj1}T(1-\beta) \end{array}\right)}$$

Fuzzy Mathematical Model using Kuhn - tucker solution with RA Method

The fuzzy total cost should be defuzzed using the Removal Area approach.

We apply the Kuhn Tucker method, to determine the solutions of $y_1, y_2, y_3, y_4, y_5,$ and T_1, T_2, T_3, T_4, T_5. The optimal order Quantity and safety factor are

$$\tilde{T} = \sqrt{\frac{\begin{array}{l} 2\left\{D_{r5}\left\{O_5+\frac{S_5}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +2\left\{D_{r4}\left\{O_4+\frac{S_4}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +4\left\{D_{r3}\left\{O_3+\frac{S_3}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +6\left\{D_{r2}\left\{O_2+\frac{S_2}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \\ +2\left\{D_{r1}\left\{O_1+\frac{S_1}{n}+F_o+\alpha F_x w_x d+\left[\pi_x\beta+\pi_0(1-\beta)\right]\sigma\sqrt{L}\psi(y)\right\}\right\} \end{array}}{\begin{array}{l} H_1\left\{C_{bj1}+C_{s1}\left[n\left(1-\frac{D_{r1}}{P_{r5}}\right)-1+\frac{2D_{r1}}{P_{r5}}\right]\right\}+H_2\left\{C_{bj2}+C_{s2}\left[n\left(1-\frac{D_{r2}}{P_{r4}}\right)-1+\frac{2D_{r2}}{P_{r4}}\right]\right\} \\ +2H_3\left\{C_{bj3}+C_{s3}\left[n\left(1-\frac{D_{r3}}{P_{r3}}\right)-1+\frac{2D_{r3}}{P_{r3}}\right]\right\}+3H_4\left\{C_{bj4}+C_{s4}\left[n\left(1-\frac{D_{r4}}{P_{r2}}\right)-1+\frac{2D_{r4}}{P_{r2}}\right]\right\} \\ +H_5\left\{C_{bj5}+C_{s5}\left[n\left(1-\frac{D_{r5}}{P_{r1}}\right)-1+\frac{2D_{r5}}{P_{r1}}\right]\right\} \end{array}}},$$

$$y = 1-\frac{\tilde{H}_1\tilde{C}_{bj1}T+\tilde{H}_2\tilde{C}_{bj2}T+2\tilde{H}_3\tilde{C}_{bj3}T+3\tilde{H}_4\tilde{C}_{bj4}T+\tilde{H}_5\tilde{C}_{bj5}T}{\begin{array}{l} \left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_5+\tilde{H}_5\tilde{C}_{bj5}T(1-\beta)+ \\ 3\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_4+\tilde{H}_4\tilde{C}_{bj4}T(1-\beta)+ \\ 2\left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_3+\tilde{H}_3\tilde{C}_{bj3}T(1-\beta)+ \\ \left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_2+\tilde{H}_2\tilde{C}_{bj2}T(1-\beta)+ \\ \left[\pi_x\beta+\pi_0(1-\beta)\right]\tilde{D}_1+\tilde{H}_1\tilde{C}_{bj1}T(1-\beta) \end{array}} \text{----------(21)}$$

Algorithm for Inventory Models

We determine the optimal order quantity and minimum integrated total cost for the inventory models.. Additionally, a comparative analysis was conducted between the crisp and fuzzy models to highlight their respective performances.

Step 1:

First, the optimal order quantity, safety factor, and integrated total cost are computed using a crisp model based on the given deterministic parameter values.

Step 2:

Next, the fuzzy integrated total cost is evaluated by applying fuzzy arithmetic operations, where the inventory parameters are represented using Pentagonal Fuzzy Numbers.

Step 3:
Case 1: To determine the order quantity $\tilde{T}$and Safety Factor $\tilde{y}$for Pentagonal Fuzzy Numbers, use the Graded mean method to defuzzify the integrated total cost $ITC(T, y, n)$. Set the first derivative of $ITC(T, y, n)$ to zero.

Case 2: To determine the order quantity $\tilde{T}$and Safety Factor $\tilde{y}$for Pentagonal Fuzzy Numbers, use the Removal of Area method to defuzzify the integrated total cost $ITC(T, y, n)$. Set the first derivative of $ITC(T, y, n)$ to zero.

Step 4:
Case 1: To determine the fuzzy optimal order quantity, apply the Lagrangian approach.
$\tilde{T}$= ($T_5 = T_4 = T_3 = T_2 = T_1$) and Safety Factor $\tilde{y} = (y_5 = y_4 = y_3 = y_2 = y_1)$
Case 2: Use Kuhn-Tucker condition to find the fuzzy optimal order quantity $\tilde{T}$= ($T_5 = T_4 = T_3 = T_2 = T_1$) and Safety Factor $\tilde{y} = (y_5 = y_4 = y_3 = y_2 = y_1)$ for Pentagonal Fuzzy Number.

Step 5: Verify whether
(i) the optimal order quantity T obtained by graded mean method and Removal of Area technique is that the same as the fuzzy optimal order quantity $\tilde{T}$
(ii) the optimal Safety Factor y obtained by graded mean method and Removal of Area techniqueis that the same as the fuzzy optimal Safety Factor $\tilde{y}$

Step 6 :Comparing the safety factor, optimal order quantity and integrated total costderived from each crisp models with those derived from the fuzzy model.

NUMERICAL EXAMPLE
Crisp Model
The following numerical example demonstrates the previously stated answer. Python software is used to find the solution to the numerical example. Consider the integrated inventory model using the data from Wangsaand Wee (2020), to illustrate the technique of solving a crisp model:
Examine these data:

Example 1:
Python software is used to find the solution to the numerical example. Considering the integrated inventory model using the data from Ouyang and Chuang (2001) to illustrate the technique of solving a crisp model:
Such that,P_r=4000 units/year, D_r =1000 units/year,σ = 7 units/week,π_o= 300 \$/unit, S = 360 \$/setup, O = 30 \$/order, α = 0.11246, β= 0.25, H = 0.2,w= 22 unit,Cs = 190 unit ,L =56 days ,d = 600 mls, F_o =50 trip ,Fx = 0.000040217 mle, π_x = 150,Wx = 46,00 lbs, π_0= 150, C_b=350,C_s=190,optimal order quantity $T$and we attain minimum integrated overall cost. Table 1 displays the results.

Fuzzy Model
Example. 2
With the exception of the fuzzy parameters for the Removal area approach, the data is identical to that in Example 1
D_r=(420,700,1000,1310,1550) , O=(20,25,30,35,40), S=(300,340,360,380,420)
P_r=(3400,3650,4000,4330,4660) , H=(0.08,0.18,0.2,0.24,0.26) ,
C_b=(300,320,350,375,415)and Cs=(160,170,190,210,220)

The order quantity in Example 1 is converted to a fuzzy order quantity. The suggested algorithm produces the results displayed in Table 1, which include the minimal fuzzy integrated total cost $IT\tilde{C}(\tilde{T},\tilde{y},m,)$ and the ideal fuzzy order quantity Pentagonal Fuzzy Number $\tilde{T},\tilde{y}$. Table 1 summarises the results.

Example. 3

With the exception of the fuzzy parameters for the Removal area approach, the data is identical to that in Example 1.

D_r=(900,1000,1220,1370,1550) ,O=(20,30,35,40,60),S=(200,360,450,500,640)

P_r=(3900,4000,5225,5330,5660) , H=(0.15,0.2,0.22,0.28,0.38) ,

C_b=(200,350,440,490,600)and Cs=(180,190,220,270,280)

The order quantity in Example 1 is converted to a fuzzy order quantity. The suggested algorithm produces the results displayed in Table 1, which include the minimal fuzzy integrated total cost $IT\tilde{C}(\tilde{T},\tilde{y},m,)$ and the ideal fuzzy order quantity Pentagonal Fuzzy Number $\tilde{T},\tilde{y}$. Table 1 summarises the results.

CONCLUSION

A fuzzy integrated vendor-buyer inventory model with stochastic demand is presented in this research.Models are developed using both fuzzy and crisp frameworks. In the fuzzy setting, the inventory parameters are represented using Pentagonal Fuzzy Numbers. For defuzzification, the Graded Mean method and the Removal of Area method are applied.To solve the fuzzy nonlinear programming problems, a specific optimization technique was used.Our results illustrate that it is possible to efficiently minimise the minimal integrated total cost, safety factor, and ideal order quantity. The fuzzy model outperformed the crisp model after comparison.In particular, our results indicate that the Removal of Area method is more efficient than the Graded Mean method.

ABSTRACT

PCOS is the most prevalent endocrine disorder in young women, impacting reproductive health. A qualitative explorative research design was used in this study to explore the intended objectives by deploying google forms. Semi-structured questions investigated the participants perception and knowledge about PCOS and the associated treatment. Women with PCOS who exercised regularly, a balanced diet and adhered to medication/home remedies experienced regular menses. Non-adherence led to irregular menses, mood swings, pain, depressive symptoms. Excessive hair growth and weight struggles impacted self-esteem, causing social withdrawal and negative thoughts. Study explores Polycystic Ovary Syndrome in women, focusing on factors like BMI, lifestyle, and therapeutic approaches. Overweight and underweight women have a higher risk of irregular periods. Regular exercise reduces PCOS symptoms. Allopathic treatment is most effective, while lifestyle factors, environmental influences play significant role. Younger women are predominantly affected, highlighting need for early awareness and intervention. Study emphasizes multidimensional management strategy, including weight control, physical activity, mental health support, and evidence-based treatment, to mitigate long-term impact. Study reveals strong link between lifestyle factors, physical activity, BMI,

Polycystic Ovary Syndrome. Both underweight and overweight women are more prone to irregular menstrual cycles. Hostel students, often affected by stress and poor habits, exhibit higher incidence of symptoms. Regular exercise or yoga reduces menstrual irregularities. Physical and psychological symptoms necessitate comprehensive care. Allopathic medicine shows better results, but many women rely on home remedies. Study emphasizes the role of environmental and lifestyle factors highlighting need for awareness and early interventions.

Keywords: PCOS, Ayurvedic, Allopathic, Homeopathic, Reproductive Age.

INTRODUCTION

Polycystic ovary syndrome (PCOS) is the leading endocrine disorder among young women in their reproductive years[1]. PCOS is a complex genetic disorder characterized by reproductive and metabolic disturbances, impacting 10-20% of women of childbearing age, and representing a primary cause of female infertility[2,3,4]. PCOS is a multifactorial disorder diagnosed by the presence of three key features they are1. Clinical symptoms (irregular ovulation and excessive male hormone production)2. Biochemical abnormalities (elevated androgen and luteinizing hormone levels)3. Ovarian morphological characteristics (polycystic ovaries)[1].Two key factors significantly impact PCOS are limited awareness and unhealthy lifestyle choices(diet, exercise, stress)[5]. A comparative study of women with Polycystic Ovary Syndrome (PCOS) across ethnicities revealed significant differences in hirsutism. Middle Eastern, Hispanic and South Asian women exhibited higher levels of hirsutism compared to White and East Asian counterparts[6]. PCOS has a strong correlation with obesity, leading to impaired fertility and reproductive dysfunction[7]. Although PCOS affects many women, the underlying factors contributing to its development and progression are still unclear[8]. Awareness and adoption of healthy behaviors, particularly balanced diet, are crucial for effective PCOS management and regulation of sex steroid metabolism[9]. A dietary pattern characterized by high intake of complex carbohydrates and fiber from unrefined foods is positively correlated with increased insulin sensitivity[10]. Consuming soluble dietary fiber delays gastric emptying, modulates glucose absorption and enhances satiety[11]. A healthy diet requires several key adjustments: Balancing energy intake, replacing saturated and trans fats with unsaturated options, increasing consumption of fruits, vegetables and whole foods, Limiting simple sugars and sodium[12]. Consistent physical activity (≥12 weeks) in overweight women with Polycystic Ovary Syndrome (PCOS) led to marked reductions in central adiposity and enhanced insulin sensitivity[13]. Gonadotropin-Releasing Hormone (GnRH) plays a pivotal role in determining female sex characteristics, puberty and menstrual cycles. Follicle-Stimulating Hormone (FSH) facilitates ovarian follicle development, whereas Luteinizing Hormone (LH) induces ovulation[14,15]. In PCOS, hormonal dysregulation triggers hypersensitivity in ovarian theca cells, leading to elevated androgen secretion and contributing to cystic ovary development [16]. Polycystic Ovary Syndrome (PCOS) is a complex endocrine disorder characterized by a cluster of symptoms, with hyperandrogenism being a hallmark feature. Common manifestations include: Acne vulgaris (pimples), Alopecia (hair loss), Irregular or absent menstrual cycles (oligomenorrhea or amenorrhea), Polycystic ovaries, typically displaying a 'string of pearls' pattern of small fluid-filled cysts, indicative of arrested ovarian follicle growth, Infertility or difficulty conceiving, Hirsutism, marked by excessive unwanted facial and body hair growth .These symptoms often co-occur, impacting reproductive, metabolic, and emotional well-being[17]. Polycystic Ovary Syndrome (PCOS) impairs reproductive health through irregular menstrual cycles, characterized by anovulation, making fertility challenging. Abdominal weight gain is a common symptom closely tied to PCOS's metabolic aspects. Elevated androgen levels trigger skin issues like acne and excessive oiliness. Recognizing these diverse symptoms is vital for accurate PCOS diagnosis and effective management, enabling a holistic approach that addresses both reproductive and metabolic challenges [18]. Diagnosing Polycystic Ovary Syndrome (PCOS) in adolescents is complex due to similarities with normal pubertal changes, such as acne, irregular periods, and hyperinsulinemia. Additionally, anovulatory cycles, common in the first 2-3 years after menarche, can progress to persistent oligomenorrhea, suggesting potential ovarian or adrenal abnormalities [19] According to previously published International Guidelines for PCOS, a clinical diagnosis requires

at least two of the following three Rotterdam criteria:(a) Hyperandrogenism (biological or clinical evidence),(b) Irregular ovulatory function (oligomenorrhea or amenorrhea),(c) Polycystic ovarian morphology visible on ultrasound [4]. Ultrasound's effectiveness is limited in adolescents due to the common presence of multi cystic ovaries. Recently, diagnostic criteria for PCOS have been updated to include Anti-Müllerian hormone (AMH) level measurements as an alternative to ultrasound, particularly in adult women [17,20]. Chronic anovulation is indicated by cycles exceeding 35 days. Cycles lasting 32-35 days require ovulatory dysfunction assessment. For adolescents with cycles under 35 days, mid-luteal phase progesterone levels (days 20-21) can diagnose ovulatory issues, which may lead to infertility, endometrial hyperplasia, and cancer. Clinical hyperandrogenism, characterized by hirsutism, alopecia, and acne in adults, can substitute for biochemical hyperandrogenism. In adolescents, hirsutism alone warrants consideration. Significant hair loss may indicate a 40% PCOS risk. Virilization signs, such as increased muscle mass and clitoromegaly, necessitate further investigation, potentially indicating tumors [19]. Polycystic Ovary Syndrome (PCOS) also impacts fertility, as hormonal imbalances can interfere with ovarian function, disrupting egg growth, maturation, and ovulation [18]. Hirsutism and weight struggles have significantly impacted self-esteem, leading to social withdrawal, increased negative thoughts, and depressive symptoms [21]. Women of reproductive age with Polycystic Ovary Syndrome (PCOS) are more prone to anxiety and depression due to hormonal imbalance complexities [22]. According to the Patient Health Questionnaire-9 (PHQ-9), a staggering 64.1% of women with PCOS were diagnosed with depressive disorders, significantly exceeding the prevalence in non-PCOS groups [21]. Research revealed a significantly higher prevalence of depression in overweight and obese PCOS individuals, potentially linked to the metabolic abnormalities characteristic of PCOS and its impact on the Hypothalamic-Pituitary-Adrenal (HPA) axis. Dysfunction of the HPA axis, crucial for regulating stress hormone balance, can contribute to depression development [23]. Psychosexual dysfunction: Difficulty achieving sexual arousal or satisfaction due to emotional or mental factors [24]. Excess insulin can stimulate ovarian androgen production, leading to increased male hormone levels. This can cause masculinization symptoms in women, including: Male-pattern hair growth (hirsutism), Hair loss, Acne vulgaris [17].

MATERIALS AND METHODS

Research design

A qualitative explorative research design was used in this study to explore the intended objectives by deploying google forms (Questionnaires). The semi-structured questions investigated the participants perception and knowledge about PCOS and the associated treatment. Also, their respective influence over necessary lifestyle changes for effective management of the syndrome. Finally, questions were formulated and verified. After verification necessary modifications have been made. After finalizing the questionnaires, it has been validated by conducting the survey with a couple of participants.

Participants

Eightyseven young female adults (N=87) diagnosed with PCOS, drawn through purposive sampling from the southern part of India aged between 16 to 30 years, were chosen for the research. The study participants revealed the age of PCOS diagnosis as between 15 – 19 years(N =52) and 20 years and above (N=35). With qualifications of students(N=63) and housewife (N =9), and working women(N=15) majority of them reported being students. The intended study was carried out predominantly in the southern state of India. The respondents were from Andhrapradesh, Guntur.

Recruitment of sample

For the recruitment of a sample for the current study, the researchers approached the participants through their acquaintances and sought details of potential respondents, i.e., the female students and professionals diagnosed with PCOS. Consequently, a pool of Eightyseven likely respondents was prepared and accordingly was approached individually to invite their participation in the study. Seventythree unmarried women and fourteen married women among the eightyseven potential respondents approached. Primarily, unmarried females above 18 years old have

been already diagnosed with the PCOS, and are currently undergoing treatment for the same were included in the current study. The disease condition was confirmed by asking self-reported questions like having been diagnosed by a doctor for PCOS, whether they are on medication or not, those individuals were recruited into the current study. In comparison, potential respondents from the pool who are not diagnosed with PCOS were excluded from the study. We prepared and conducted the google forms English language in accordance with the respondents' convenience.

PROCEDURE

By adapting to a purposive sampling method, potential study participants were approached to seek their willingness to participate and fill the google forms(Questionnaire).A Google Form questionnaire was carefully prepared and verified before being shared with participants via WhatsApp. They were thoroughly briefed on the study's objectives and provided informed consent for their responses to be recorded, with assurances of confidentiality regarding their identity. Participants were encouraged to seek clarification on any ambiguous questions. The comprehensive questionnaire comprised 24 questions. The study was conducted from late July to early September 2024. Questions (Table 1)

RESULTS

Effect of BMI on PCOS: In current study 49.5% of the women are in overweight,The77.5% of overweight women are suffering with irregular periods. 18.3% of the women are in underweight, under that 43.75% of underweight women are with irregular periods. In the present study 35.6% of women are in normal weight in that 35.48% of normal weight women are affected with irregular periods. So, the risk of PCOS and irregular periods is high in overweight and underweight than normal weight women[Table 2 and Graph 1].

Reflection of profession on PCOS: In current study 16.09% of women are working women, 42.85% of working women are with irregular periods. In this study 83.90% are hostel students in that 58.90% (Table 3 and graph 2) are suffering with irregular periods. In this study most of the hostel students are having high risk of PCOS [Table 3 and Graph 2].

Role physical activity for effective management of PCOS: In current study 22.98% women are performing physical activity (Exercise/yoga), Among them 30% women suffering with irregular periods. While 77.01% women are not performing any physical activity, amongst 64.17% are with irregular periods. In this study most of the women who are not performing any physical activity are suffering with irregular periods in PCOS [Table 4 and Graph 3].

Changes experienced in PCOS

Physical manifestations of Polycystic Ovary Syndrome (PCOS) among unmarried women in southern India reveal alarming trends. Weight gain, often medication-induced, is the most prevalent change, followed by: Facial acne and pimples, Hair loss, Unwanted hair growth on the face, chin, upper lip, abdomen and breast, Dark skin patches, Unstable mood swings. These physical alterations, particularly weight gain and obesity, significantly increase the risk of associated illnesses like cardiovascular disease and diabetes. This study provides novel insights into PCOS's specific physical effects, complementing existing research on related health issues. Notably, these physical changes can trigger psychological distress, impacting self-esteem and overall well-being. Therefore, this study stresses the importance of comprehensive clinical attention to effectively manage and address these physiological changes.

Symptoms experienced during periods: Most of the people experienced severe abdominal pain, and leg cramps and breast tenderness. While some may also experience severe back pain, body pain, vertigo, abdominal bloating, headache. Many of the people felt moody, aggressive and easily get tired, while some feel like worried and depressed.

About their bleeding conditions: Most of the people complained about heavy bleeding with clots, and bleeding after 6th day. While some experienced light or very light bleeding. Many of them mentioned about the colour of their period blood varies from light red to thick brown or black.

Evaluating the efficacy of Allopathic, Ayurvedic and Homeopathic therapies in managing PCOS: In the current study 35.63% women are using allopathic medications among them 19.35% women suffering with irregular periods. 5.74% women using ayurvedic medications,9.19% women using homeopathic medications and 49.42% women following only home remedies without any medication amongst 60%,50%,83.72% women are suffering with irregular periods respectively[Table 5 and Graph 4].

Relationship between PCOS and family history: In the current study 22.98% women having family history of PCOD, while 77.01% women doesn't have any family history regarding PCOD. So, the risk of developing PCOS is irrespective of family history [Table 6 and Graph 5].

Relationship between PCOS and Age: In the current study, majority of the women (49) who are at the age of 17-20 years are diagnosed with PCOD. A very smaller number of women (5) are diagnosed with PCOD at the age greater than 25[Table 7 and Graph 6].

DISCUSSION

Polycystic Ovary Syndrome (PCOS) is a multifaceted endocrine disorder influenced by a combination of lifestyle, physiological, and genetic factors. The present study explores various dimensions contributing to the onset and manifestation of PCOS, particularly focusing on women in Guntur. One of the significant findings of the study is the relationship between body mass index (BMI) and the prevalence of menstrual irregularities. Women who fall into the overweight and underweight categories exhibit a noticeably higher occurrence of irregular menstrual cycles compared to those with a normal weight. This indicates that deviation from an ideal weight range, whether above or below, poses an elevated risk of PCOS-related symptoms. The data highlights the importance of maintaining a healthy body weight as a preventive measure and in the management of PCOS. Profession and living environment also appear to influence the risk of PCOS. A substantial proportion of the study participants were hostel-residing students, who reported a higher rate of irregular menstrual cycles compared to working women. The lifestyle typically associated with hostel living—marked by poor dietary habits, irregular sleep cycles, academic stress, and lack of structured physical activity—may contribute to the increased vulnerability among this group. Physical activity plays a crucial role in managing PCOS symptoms. The study reveals that women who engage in regular physical activity, including exercise or yoga, report fewer instances of irregular periods compared to those who lead a sedentary lifestyle. This underscores the necessity of incorporating physical fitness into daily routines, not just for overall well-being but also as an effective non-pharmacological approach to managing PCOS. Physiological changes reported by participants include weight gain, facial acne, hair loss, and hirsutism, along with skin darkening and mood instability. These manifestations not only exacerbate physical discomfort but also have a profound impact on mental health. The psychological burden resulting from these changes—such as lowered self-esteem and emotional distress—calls for a more comprehensive and empathetic approach to PCOS management, involving both medical and psychological support. Menstrual symptoms were commonly described as severe and debilitating. Participants experienced a range of discomforts including abdominal pain, leg cramps, breast tenderness, back pain, and general fatigue. Emotional symptoms such as mood swings, irritability, and feelings of anxiety or depression were also prevalent. Variations in menstrual bleeding ranging from heavy clotting to light spotting, with blood color shifting from red to dark brown or black further reflect the hormonal imbalance associated with PCOS. When evaluating therapeutic approaches, allopathic treatment emerged as the most effective in managing symptoms, particularly in reducing irregular menstruation. Ayurvedic and homeopathic methods showed moderate impact, while women relying solely on home remedies experienced the least relief, indicating the importance of medical intervention in treating this condition. Family history appeared to have a limited influence, as the majority of participants did not

report any hereditary link, suggesting that environmental and lifestyle factors may be more decisive in the development of PCOS. Furthermore, the syndrome predominantly affected younger women, particularly those in late adolescence and early adulthood, highlighting the urgency for early awareness and intervention programs. The study emphasizes that PCOS is a lifestyle-sensitive disorder requiring a multidimensional management strategy—addressing weight control, physical activity, mental health, and evidence-based treatment. Early diagnosis and lifestyle modification are key to mitigating its long-term impact on reproductive and overall health.

CONCLUSION

This study highlights the significant impact of lifestyle, physiological, and demographic factors on the prevalence and severity of PCOS among unmarried women in Guntur. Both underweight and overweight women are more susceptible to irregular menstrual cycles, indicating a strong correlation between BMI and PCOS risk. Hostel students, likely affected by irregular routines, stress, and poor dietary habits, show a higher incidence of symptoms compared to working women. The absence of physical activity is another critical contributor, as women who lack regular exercise or yoga reported more menstrual irregularities. Physical changes such as weight gain, acne, hirsutism, and mood swings not only pose health risks but also lead to psychological distress, emphasizing the need for holistic management. Although allopathic medicine showed relatively better results in symptom control, a large number of women still rely on home remedies, often with limited success. Notably, PCOS was prevalent even in women without a family history, indicating environmental and lifestyle factors as major influences. Further research is needed to evaluate long-term outcomes of integrative treatment approaches. Creating awareness through educational campaigns and promoting early lifestyle interventions, especially among adolescents and hostel residents, can significantly aid in the prevention and effective management of PCOS.

ABSTRACT

The Institute of Electrical and Electronics Engineers (IEEE) has added spatial reuse to the IEEE802.11ax (WiFi6) standard to improve network performance and spectrum use in congested areas. The fundamental SR approach used in this amendment is BSS color. It aspires to increase the proportion of transmissions in a specific area below a recently created Overlapping BSS/Preamble detection threshold. This paper examines the throughput and Threshold values of four geographically distributed models. We showed that the throughput performance of IEEE802.11ax improves as the OBSS threshold falls within a particular range.

Keywords: IEEE802.11ax (WiFi6) ; OBSS , Spatial Reuse.

INTRODUCTION

WLANs have evolved over the last two decades to accommodate traffic demands, various use cases, and user requirements [1].The Institute of Electrical and Electronics Engineers' modifications to the 802.11 standard families (IEEE) reflect this progress. WLANs have evolved over the past two decades to accommodate traffic demands, various use cases, and user requirements [1]. The Institute of Electrical and Electronics Engineers (IEEE) changes to the 802.11 standard families reflect this development. WLANs' advantages over competing technologies include cost-effectiveness and ease of implementation in various environments, such as residential flats, offices, public transit, outdoor hotspots, etc., as depicted in figure 1. In addition, WLANs' capacity to consistently transmit high data rates is the prominent feature that has made them ubiquitous in our daily lives.

There will continue to be congestion in the 2.4/5 GHz frequency ranges. This problem will be resolved by the IEEE 802.11ax amendment [2]. IEEE 802.11ax is to improve spectrum efficiency and area throughput in congested WLANs while consuming less power than its predecessors, which focused exclusively on increasing link throughput [3].Enhancements for small cell networks, multiple-antenna methods, efficient channel resource utilisation methods, Orthogonal Frequency Division Multiple Access, and spatial reuse methods are among the features added to the IEEE 802.11ax amendment to date [4].

Related Literature

The SR idea, which attempts to increase area throughput and spectrum efficiency by increasing the number of concurrent transmissions inside a given zone, is vital. Changing the transmit power level or the Clear Channel Assessment (CCA) threshold impacts network performance. It may result in reduced performance due to a more significant number of concealed or exposed nodes[5]. The four-way handshake does not solve the hidden/exposed node problem. It also adds a significant amount of overhead when transmitting small-sized packets. In addition, the exposed node problem is aggravated by many co-channels Overlapping Basic Service Sets (OBSSs) in a given area [6]. The objective of this study is to create four models employing the BSS Color scheme and SR features that will be utilised in future WLANs. MATLAB [7] is utilised to apply the SR IEEE 802.11ax features, assess them, and create the four models. IEEE 802.11h (2003) describes TPC as the primary SR method, but several SR schemes have been researched for wireless networks [8],[9],[10]. TPC runs exclusively on Access Points (APs) with wireless controllers, which is the primary reason it is not widely utilised in networks [11],[12].

The beacon frames' received a signal strength indicator (RSSI) from the transmission. The associated Access Point (AP) provides an alternate means of adjusting the carrier sensing threshold for STAs. Dynamic Sensitivity Control (DSC) is designed to increase the probability of successful transmissions for cell-edge users without introducing additional overhead.[13],[14],[15]. Cell-edge users are able to lower their thresholds and expand their carrier detecting range, hence reducing the Number of concealed nodes. The primary drawbacks of DSC are the increased likelihood of false alerts [1] and the diminished transmission possibility for cell edge users [16],[17].The IEEE 802.11ax standard now includes the brand-new BSS Color capability[18],[19],[20],[21]. BSS Color identifies the Basic Service Set (BSS) from which a packet is transmitted as rapidly as possible. It is based on the power-saving Partial AID (PAID) feature of IEEE 802.11ac [22]. To indicate the link direction of a frame, BSS Color employs a 6-bit value and UL Flag, a 1- bit value.

Color may increase the likelihood of nodes broadcasting, but by increasing interference, it may hamper transmissions in surrounding OBSSs. During the association phase, the colour value is conveyed to STAs (from APs). If a colour disparity is discovered, the colour value is susceptible to adjustment [16],[23],[24]. IEEE 802.11ax consists of two methods for seamless SR operation: OBSS/PD-based and SRP-based operation (BSS Color).The latter strategy relies on a STA delivering a Trigger frame, which controls the transmission opportunities of the associated STAs. Other alterations have been proposed and approved in order to optimise spectrum efficiency and BSS Color functioning [24].

Based on inter-BSS frame RSSI, the OBSS/PD threshold is determined to limit a node's transmission chances. During MU operation, a hidden AP to an active packet transfer may send a trigger frame to an STA to get a response. Therefore, the STA must reset the NAV clocks and respond to CTS.

$$CCA/CS \leq OBSS/PD \leq CCA/ED \quad (1)$$

The amendment considers modifying the OBSS/PD threshold with transmit power to lessen in-band emission interference and improve spectrum efficiency. The SRG operation is ideal for wireless networks administered by

wireless access controllers or operators whohave defined the BSS Color constraints they will enforce (e.g., TxPwr, CCA/CS, etc.).

OBSS/PD ≤ max (OBSS/PDmin, min(OBSS/PDmax, OBSS/PDmin + (TxPwrRef − TxPwr))) *(2)*

As transmit power increases, the OBSS/PD threshold falls.For example, TxPwr and OBSSPD values are 76 and 81 dBm for a node broadcasting at 15 and 20 dBm, respectively. Additionally, a node may adjust its level in accordance with this threshold in the following ways:

TxPwrmax=TxPwrRef–(OBSS/PD–OBSS/PDmin(3)

If not, onlya transmitted power level of 0.0 or less is acceptable.

The OBSS/PD criterion was defined in the DSC proposal revision [22]. The amendment did not clarify how a node (such as a STA) is to determine if it fulfils this criterion.It has been suggested that DSC alter the OBSs/PD level dynamically in response to the RSSI of the beacons.

OBSS/PD=minimum (4)(OBSSPDmaximum,maxi mum(OBSS/PDminimum,(RSSIbeaconMargin))- (OBSSPDmaximum, max(OBSSPDminimum,
(RSSIbeaconMargin)(4)

DSC may only utilise a portion of the BSS Color information and may reduce transmission opportunities for cell-edge users relative to other users. When Eq. 4 is applied, the subfield in an SR parameter set that contains the margin is included [8],[16].

The authors expanded Bianchi's throughput model to incorporate multi-AP Coordinated SR, presenting improvements ranging from 54% to 280% depending on different inter-AP distances and the arrangement of nodes [39]. The authors introduced two approaches—CB-DCF and CB-OBSS/PD—that utilize contextual bandits to help nodes determine the optimal times for transmission or deferral, enhancing throughput and fairness in crowded WLANs while reducing the packet collisions typical in SR operation[40]. The Authors presented a hierarchical multi-armed bandit (MAB) framework, specifically using upper confidence bound (UCB), to select access point (AP) groupings for C-SR. This approach showcases rapid convergence, flexibility, and robust performance across various network topologies[41].

Performance Evaluation For Spatial Re- Use

The residential layout comprises a multi-floor building. The distance between floors measures 1.5 meters. Each floor contains four rooms, each measuring 10m x10m x 3 m. Each room has an access point (AP) and a station (STA) located at random x and y coordinates and 1.5 meters above the floor. Figure 4 depicts the network topology of four models consisting of four BSSs in a two- floor apartment with the BSS coloring feature. Each floor has two BSSs, which are made of an access point(AP) and a station(STA).The model lets you choose OBSSPD threshold values between [-62and-82dBm] and see how they affect each BSS's throughput.Table-1 depicts the network configuration for several scenarios of spatial reuse. We have examined a residential framework, including a multi-story apartment building. Each level has two BSSs composed of an AP and an STA. Each BSS Station contains one Station and one access point. Node 1 in BSS 1 is an access point, whereas Node2 is a base station.Node 3 is the BSS2 access point, whereasNode4 is the Station.

Node 5 is the BSS 3 access point, whereas Node 6 is the Station. Node 7 functions as an access point, and Node 8 is a station in BSS 4. Using NPA (Nodeposition Allocator), the position of each node in the X, Y, and Z directions are modified, while the station and access point remain in their respective places. Consequently, four Models (Scenarios)

have been created. Finally, the output of these four models has been compared. Model 1 maintains all entry points at the same level. Ten metres is the minimum distance between the access point nodes 1,3,5,7 and station nodes 2,4,6,8. It has been determined that this model does not affect throughput independent of power/threshold level or distance. Model 2 maintains all entrypoints at different levels. For example, the distance between access point nodes 1,3,57 and station nodes 2,4,6,8 is 50 metres. In model 2, it was found that the throughput can be increased bydecreasing the threshold limit at this fair distance.

In Model 3, each access point is kept at a different level. Seventy-five metres separate the access point nodes1, 3, 5,7 from the station nodes 2,4,6,8. At this intermediate distance, model 3 indicates that the throughput increases as the threshold limit are decreased. Nonetheless, it is inferior to Model 2. Model 4 maintains all entrypoints at different levels. For example, one hundred metres separate the access point node 1,3,5,7 from station node 2,4,6,8. In addition, we simulate the network using MATLAB with the parameters listed in table 5-2.

Figure5,6,7,8 and 9 depicts the performance of four IEEE 802.11ax SR OBSS models.The OBSS threshold varies in the range (of -62 dBm to -82 dBm). We noticed that the spatial reuse feature does not affect the -62 dBm performance of the various models. However, for OBSS PD thresholds between -67 dBm and -77 dBm, BSS throughput performance improved to the stated limit and remained unaffected below -82 dBm.

CONCLUSION

We determined that neither power level/threshold level nor distance affects model 1's throughput. In Model 2, it was noted that throughput could be increased by lowering the threshold limit at this fair distance. At this distance, Model 3 illustrates that lowering the threshold enhances throughput. Nonetheless, it is inferior to Model 2. Model 4's throughput increases more than the previous three models as the threshold limit is raised.

ABSTRACT

Commonly as Trailing lantana, *Lantana montevidensis* Briq. (*L. montenvidensis*) is a flowering ornamental plant species is classified under the family *Verbenaceae* and is utilized in folk herbal medications. The plant *Lantana montevidensis* was brought to many different nations and is regarded as a species of weed in a lot of other regions of the world due to its distribution. The goal of this review article is to assess the scientific research available at present on the chemical constituents and diverse uses of *L. montenvidensis* for therapeutic purpose. The comprehensive and exhaustive review of the available research and review articles on *L. montenvidensis* was done using Google Scholar, PubMed and Science Direct. The data search ranged between articles published during the year1953 to 2022. For the search, the terms *L. montenvidensis* and trailing lantana were employed in combination with different keywords. Only publications pertaining to phytochemistry and pharmacological activity were chosen for review purpose. available literature indicates diverse medicinal uses *L. montenvidensis* for rheumatism, bronchitis, gastric disorders, fever, influenza, asthma, bronchitis and other broncho-pulmonary diseases, headaches and sunstroke. Antiproliferative, antibacterial, antioxidant, acaricidal, anti-inflammatory, antipyretic, analgesic, antiprotozoal, mosquito repellent and antifungal modulating activity of *L. montenvidensis* are also reported in different experimental models.

Keywords: Trailing lantana, *L. montenvidensis*, Verbenaceae, purpule lantana, medicinal uses, antipyretic, analgesic, antiprotozoal.

INTRODUCTION

Plants are the major source of chemical compounds with potential medicinal properties. Plants have been used for centuries in different cultures to treat a wide range of illnesses. Medicinal compounds from plants can be used to produce new pharmaceutical products. The pharmacological assessment of multiple herbs utilized in various traditional systems of medicine has generated greater focus in the past decades. Many of the plants that are commonly recognized have been thoroughly investigated using sophisticated scientific techniques in recent decades, and their numerous phytochemicals and pharmacological properties have been documented. The name lantana is derived from Latin word lento, which means to turn-fold. Though certain taxa are spread to Africa and tropical Asia, lantana is primarily native to tropical as well as subtropical America. Currently, it is found in about fifty countries, where numerous species are grown under numerous cultivar names. The genus is challenging to taxonomically describe since species are unstable, and crossing-recombination is prominent, inflorescence morphology varies with age, and the colors of the flowers changes as the plants mature [1]. Tropical or sub tropical areas are the most favorable location for the genus Lantana (Verbenaceae) [2]. The dried leaf infusions have been utilized traditionally in folk medicine to treat a variety of conditions, such as headaches, sunstroke, rheumatism, itching, wounds, stomachaches, toothaches, influenza, and bronchitis. It also used as carminative and antiseptic [1,3-7]. It is a fragilestalked, creeping bush plant native to South America having roughly serrated foliage as much as 1 inch in length while inflorescence size 2 to 3 inch in diameter [8]. *L. montevidensis* is often used as a blooming or flowering groundcover in surroundings [9].

Essential oils along with phenolic substances such as tricine, isorhamnetine, aesculetine, fisetine, quercetin, gossypetine, and aesulin, as well as triterpenoids, are abundant in the leaves of *L. montevidensis* . These phytochemicals additionally occur in certain plants that exhibit poisonous along with allelopathic characteristics[10]. As a popular therapeutic herb used in folk medicine, *L. montevidensis* may also find application in current medicine, according to past and ongoing scientific research. The aim of this review article is to provide information on the phytochemistry and pharmacological effects of *Lantana montevidensis* as well as its potential for future scientific research aimed at producing active pharmaceutical ingredients. Figure 1. depicts the different parts of *L. montevidensis* plant.

Taxonomic classification [11-13]
Kingdom: Plantae
Subkingdom: Viridiplantae
Infra kingdom: Streptophyta
Super division: Embryophyta
Division: Tracheophyta
Subdivision: Spermatophytes
Phylum: Tracheophyta
Class: Magnoliopsida
Super order: Asteranae
Order: Lamiales
Family: Verbenaceae
Genus: *Lantana*
Species: *montevidensis*

Synonyms: [14 -16]
Camaramontevidensis (Spreng.) Kuntze
Lippiamontevidensis Spreng.
L. delicata Hort.
Lantana delicatissima Poit.

Lantana sellowiana f. planifolia Cham.
Lantana montevidensis f. albiflora Moldenke.
Lantana sellowiana f. rugosa Cham.
Lantana decumbens Sellow ex A.DC
Lantana sellowiana Link & Otto.
*Camaras ellowian*a (Link & Otto) Kuntze
Lantana selloi Steud., orth. var.

Common Names [17]
Purple lantana, wild verbena, Creeping lantana, Sellow's lantana, trailing lantana, weeping lantana, trailing shrubverbena, small lantana.

Vernacular Names [18-21]
In India, *L. montevidensis* is known by a variety of names in many languages, are as follows:
Sanskrit: Chaturangi and Vanacchedi
Marathi: Tantani and Ghaneri
Hindi: Raimuniya
Tamil: Unnichedi and Arippu
Assamese: Gubon Gu-phul
Gujarati: Kakke and Natahu, Ghanidalia
Malayalam: Konginipoo, Poochedi,Nattachedi and Aripoov
Telegu: Pulikampa
Manipuri: Nongballei, Thirei andSamballei
Kannada: Hu Gida
Punjabi: Desi Lantana

Botanical description of the plant [22]
Flowers: 8 to 12 mm, Corolla 4-5-lobed, small lilac flowers; Stems: Vinelike stems 150 cm to form wide-ranging clumps, 45 to 60 cm high;Fruits: Small bluish berries, Nuts; Inflorescence: Involucre bracts 3.5 to 5 mm wide, Circular head of flowers, ovate;Life form: Subshrub, Shrub;Leaves: more delicate compared to those of Lantana camara; opposite, simple, smaller.

Distribution
The genus Lantana (Verbenaceae) are native to tropical or sub-tropical regions. Starting in South America, Lantana montevidensis has spread over the world and has been extensively cultivated as a decorative along with became naturalized in places like New Zealand, Africa, Australia, certain areas of India, as well as North America [9].

Plant sections utilized: Leaves, roots, flowers, stem as well as seeds can be utilized in additionally encompassing the entire plant.

Phytochemistry
Natural constituents found in *L. montevidensis* give it medicinal properties. Biologically active compounds, of which flavones, flavonoids, carbohydrates, triterpenes, saponins, terpenoids, triterpenoids, pentacyclic triterpenoids, glycosides, monoterpene hydrocarbons, unsaturated sterols, oxigenated monoterpenes, sesquiterpenoids, iridoids, sesquiterpene hydrocarbons and oxigenated sesquiterpenes account for the majority of the activity that occurs. Using LC-LTQ-MS-MS analysis, 58 phytochemicals from *L. montevidensis* were detected and classified as iridoid glycosides, terpenoids, phenolic acids, flavonoids and their derivatives [10,23,24]. 11 flavonoids/flavonoid glycosides, 37 terpenoids, 11 phenolic acids, 3 iridoid glycosides with their derivatives are among these constituents. For the first time, the copaenol sesquiterpenes and iridoid momordol in the genus Lantana were discovered. There have been prior reports of other chemicals found in *L. montevidensis* and *Lantana camara*. The resulted Fatty acid amide is Palmitamide. Chlorophyll derivative is Pheophorbide A [25]. The identified iridoids are Theveside,

Lamiridoside, Durantoside [25 – 27]. Flavonoids are Carminic acid, Rutin, Dihydroxydimethoxyflavone-Oglucopyranoside (Camaroside), Lantanoside, Cirsiliol / Trihydroxydimethoxyflavone, Hexahydroxyflavone (Gossypetin), Catechin, Dihydroxydimethoxyflavone (Pectolinarigenin), Dihydroxytrimethoxyflavone, Apigenin-6,8-di-Cglycoside (Vicenin 2), Pectolinarigenin-Orutinoside (Pectolinarin) [3,28-33]. Phenolic acid includes Calceolarioside E, Osmanthuside B, p-Coumaric acid, Isonuomioside A, Cistanoside, Gallic acid, Lipedoside A, Ferulic acid, Verbascoside/Forsythoside A, Caffeic acid and Vanillic acid [3,4,31-36]. Triterpenes are Methylhydroxylantanolate, Momorodol, Pomolic acid, Coprostanone, Dihydrixyolean-enoic acid (Hederagenin), Amyrin, Lantadene C, Ursangilic acid, Lantadene D, Camarinic acid, Hydroxyoleanonic acid/Lantabetulic acid, Icterogenin/Lantacin, Lantaninilic acid/Lantoic acid, Camarin, Stigmasterol acetate, Pomonic acid, Lantadene A, Lantanone [25,29,34,36-45]. Triterpene glycosides are Lablaboside A and Lablaboside derivative. Copaenol is identified Sesquiterpene [46]. While, α-Humulene is Monocyclic sesquiterpene [47]. A structures of some important phytochemicals identified in this LC-LTQ-MS-MS with GNPS analysis is given in Figure 2.

N.M. Mohamed *et al.* (2016) isolated and identified triterpenoids from the roots of *L. montevidensis*. In this work, 9 already discovered compounds that are 3β,25β-dihydroxy-olean-12-en-28-oic acid, oleanolic acid, 19α-hydroxy-3-oxo-olean-12-en-28-oic acid, β-sitosterol-3-O-β-ᴅ-glucoside, pomolic acid, oleanonic acid, β-sitosterol, lantadene A and camaric acid were isolated with 3 new triterpenoids from bioassay guided fractionation of the Lantana montevidensis (Verbenaceae) roots [48]. These 3 new triterpenoids are 12β,13β,22β-trihydroxyolean-3-oxo-28-oic acid, 13β-hydroxy-3-oxo-olean-11-en-28-oic acid and 12β,13β-dihydroxyolean-3-oxo-28-oic acid [49]. Comprehensive 1D spectroscopic data and 2D NMR spectroscopic data, in addition to HR-ESI-MS, were used to clarify the structures of the isolated metabolites [36]. The structures of triterpenoids isolated from roots of *L. montevidensis* is given in Figure 3.

The chemical constituents of the essential oils extracted from fresh leaves of *L. montevidensis* and *L. camara* was analyzed by Costa et al. (2010). A Clevenger-type apparatus was used to hydro distill 200 g of fresh leaves for 2 hours. The yield of essential oil produced was 0.07% for *L. montevidensis* and 0.05% for *L. camara*. The leaves were then dried using anhydrous sodium sulfate (Na_2SO_4) and then stored in a refrigerator until analysis. Using a GC/MS system, volatile constituent assessment was performed [50]. Sesquiterpenoids as well as terpenoids were found to be most abundant in both plant species [51,52]. Of the constituents of *L. montevidensis* essential oil, β-caryophyllene came across as most significant and accounted for 29.81 %. 21 chemical constituents (accounting for 99.11%) have been detected in the oil extracted from leaves of *L. camara*, while 18 chemical constituents (constituting about 95.83%) appeared in *L. montevidensis*. Additionally, 9 compounds remained unique to each plant lacking commonality between them. In this study, the resulted chemical composition (%) of *L. montevidensis* was: Linalool (1.85 %), Camphor (0.34 %), α-Copaene (2.61 %), β-Elemene (3.11 %), Sabinene (0.55 %), Z-Caryophyllene (29.81 %), α-Humulene (2.68 %), Alloaromadendrene (1.41 %), β-Selinene (1.56 %), Bicyclogermacrene (14.14 %), γ-Cadinene (2.61 %), Valencene (25.21 %), Thuja-2,4(10)-diene (0.48 %), Germacrene D (1.56 %), Spathulenol (3.28 %), Caryophyllene oxide (2.61 %), 3,5-Dimethylene-1,4,4-trimethylcyclopentene (0.71 %), Humulene oxide (1.31 %) [53]. The structures of phytoconstituents detected in the essential oils extracted from leaves of *L. montevidensis* is given in Figure 4.

Makboul, *et al.* 2013 investigated the chemical constituents in the essential oils of both flowers as well as leaves of *L. montevidensis* by GC-MS analysis. 14 compounds (98.4%) with a majority of sesquiterpenes (88.51%) while a small quantity of monoterpenes (9.59%) were identified and determined using GCMS analysis of the volatile oil of the *L. montevidensis* leaves. The identified chemical constituents in essential oil of *L. montevidensis* leaves are α-Pinene, Sabinene, β-Pinene, 1-Octen-3-ol, β-Myrcene, 3-Octanol, dl-Limonene, (Z) - Sabinene hydrate, Caryophellene, β-Selinene, D-Germacrene, Bicyclogermacrene, Nerolidol, Camphene. β-Selinene (43.95%), nerolidol (6.32%), Caryophyllene (33.74%) and germacrene-D (3.79%) are the predominant ingredients of leaf oil. While 26 compounds (99.73%) are recognized and determined from the volatile oil of this plant flowers using GC-MS analysis, the majority of these constituents were sesquiterpenes (64.49%), with a small percentage of monoterpenes (35.24%). The identified chemical constituents in essential oil of *L. montevidensis* flowers are α-Pinene, Sabinene, β-Pinene, β-Myrcene, α-

Terpinene, dl-Limonene, β-Phellandrene, γ-terpinene, (Z)-Sabinene hydrate, α-Terpinolene, Linalool, α-Terpineol, 8-Elemene, α-Copaene, β-Elemene, Caryophyllene, β-farnesene, D-Germacrene, 6-Cadinene, Nerolidol, (-)-Caryophyllene oxide, β-Selinene, 6-Cadinene, 1-Naphthalenol, α-Cadinol, Farnesyl acetone C. D-germacrene (9.10 %), γ-terpinene (22.64%), nerolidol (7.09%) and caryophyllene (42.38%) are the predominant ingredients of flower oil [54]. The structures of phytoconstituents detected in the essential oils extracted from flowers of *L. montevidensis* is given in Figure 5. Phytochemical study of *L. montevidensis* was also performed by Makboul et al. 2013 [55-57]. The seventy percent aqueous methanolic extract of *L. montevidensis* leaves possesses very low quantity of iridoids and saponins along with unsaturated sterols, flavonoids, carbohydrates, triterpenes and glycosides according to this phytochemical investigation [58].

Total eighteen phytochemicals were identified from the essential oils extracted from the leaves of *L. montevidensis* using gas chromatography (GC] and gas chromatography-mass spectrometry (GC-MS] analysis. These phytochemicals belonged to monoterpene hydrocarbons, oxygenated monoterpenes, sesquiterpene hydrocarbons and sesquiterpene hydrocarbons. The sesquiterpene hydrocarbons were α-copaene (2.7 %), germacrene D (27.5 %), β-elemene (2.9 %), (E)-β-caryophyllene (31.5 %), Bicyclogermacrene (13.9 %), Alloaromadrene (1.4 %], Camphor (0.3 %), α-humulene (2.7 %), germacrene A (1.1 %), β-cadinene (2.6 %), germacrene B (1.4 %). Oxigenated sesquiterpenes includes, Spathulenol (3.4 %), Caryophyllene oxide (2.2 %), Torreyol (1.3 %), β-sabinene (0.7 %) and δ-cadinol (0.5 %). Oxigenated monoterpenes is Linalool (1.8 %). Monoterpene hydrocarbons is Sabinene (0.2 %) [53,59]. From L. montevidensis, 13 flavonoids have been identified; these are each derived from a flavone and flavonol nucleus. These flavonoids are luteolin, 5,6-dihydroxy-7,3',4'-trimethoxyflavone, 7,3',4'-trimethoxyluteolin, 7,3'-dimethyxyluteolin, apigenin, 5,6,3'-trihydroxy-7,4'-dimethoxyflavone, cirsilineol, 5,4'-dihydroxy-6,7,3',5'-tetramethoxyflavone, eupatorin, hispidulin, 5,6,4'-trihydroxy-7,3',5'-trimethoxyflavone, cirsiliol and 5,3',4'-trihydroxy-6,7,5'-trimethoxyflavone [3,4,27].

Antioxidant Activity

Makboul et al. (2014) investigated the free radical scavenging property of isolated compounds from the methanolic extract of leaves of *L. montevidensis*. The capacity of a few of the separated compounds to scavenge free radicals was assessed. 70% aqueous methanolic extract of leaves from *L. montevidensis* was employed in this investigation [60]. Nine compounds were extracted *via* a variety of chromatographic methods. Utilizing spectroscopic methods and cross-referencing the separated chemicals with values from published research and/or real samples, the compounds were identified. Ability of compounds to scavenge free radicals was assessed using the UV-Visible spectrophotometric technique. Out of nine chemicals that were separated from this plant, five showed higher to average free radical scavenging activity. Apigenin, Luteolin-7-O-glucoside, Luteolin, Hispidulin-7-O-glucurnoide methyl ester and Nepetin-7-O-glucoside demonstrated notable free radical scavenging activity [32].

Antiproliferative Activity

Tsuneatsu *et al*. (2002) investigated the antiproliferative properties of the flavone compounds that were isolated and identified from *L. montevidensis* leaves. Ten 5,6,7-oxygenated flavones and apigenin have been identified through bioactivity-guided chemical analysis of the fraction. The flavonoid fraction of *L. montevidensis* was assessed for its antiproliferative action against human uterus carcinoma (HeLa), murine melanoma (B16F10), and gastric adenocarcinoma (MK-1) cells *in vitro*. This demonstrated more significant 50 % growth inhibition at 3 mg/ml for human uterus carcinoma (HeLa), 4 mg/ml for murine melanoma (B16F10) and 8 mg/ml for human gastric adenocarcinoma (MK-1). While the flavonoid fraction demonstrated considerable activity, the nonflavonoid fraction was even more active. By employing the MTT assay in 96-well microplates, antiproliferative responses against tumor cell lines as well as growth of cells were measured [3,61].

Antibacterial Activity

L. montevidensis Briq.'s antibacterial activity was investigated by Sousa et al. (2011). By employing a microdilution assay for *in vitro* susceptibility testing, the antibacterial action of the root extract along with leaf extracts by itself

and in combination using aminoglycosides were assessed against two bacterial strains. *Staphylococcus aureus* (Sa 358) and *Escherichia coli* (Ec 27) multi resistant strains were utilized. The cold extraction method was used to obtain the leaf extract and root extract of *L. montevidensis* [62]. It has been confirmed that inhibitory action of leaf extract of *L. montevidensis* against *S. aureus* [minimum inhibitory concentration (MIC) 128 μg/mL] and E. coli (MIC 16 μg/mL) is therapeutically effective. Additionally, the synergistic activity of extracts along with aminoglycosides has been confirmed [63]. The combination of root extract of *L. montevidensis* with gentamicin resulted in a seven time decrease in the minimum inhibitory concentration (MIC) of E. coli, from 312 μg/mL to 2 μg/mL [64].

Acaricidal activity

The acaricidal effect of *L. montevidensis* essential oil against *Rhipicephalus microplus* larvae as well as engorged females was investigated by Sousa et al., 2020. Using the Clevenger type equipment, hydrodistillation process was used to extract the essential oils. In this work, GC and GC/MS were utilised to assess the essential oil content. Based on this study, the primary components of *L. montevidensis* oil were found to be germacrene-D, bicyclogermacrene, and β-caryophyllene. The essential oil's ability to kill *Rhipicephalus microplus* has been assessed by studies on engorged female larvae as well as larval sensitivity [65,66]. The engorged female immersion test was utilized to measure engorged female sensitivity. With an LC_{50} of 3.3 mg/mL, the *L. montevidensis* essential oil demonstrated strong efficacy against engorged females. Using the *L. montevidensis* essential oil, the acaricidal efficacy against *Rhipicephalus microplus* was moderate, with an LC_{50} of 9.2 mg/mL. With a significant acaricidal property against Rhipicephalus microplus, LC_{50} values showed higher oil action against engorged females compared to larvae. Consequently, this research suggests that L. montevidensis essential oil could be employed as a potential natural acaricide [67].

Anti-inflammatory activity

Makboul et al. (2013) assessed the *L.montevidensis* leaves extracts for its anti-inflammatory activity. The male albino rat's plantar surface ofhis hind paw was injected with carrageenan to generate acute edema, and the anti-inflammatory action was measured by measuring the inhibition of this edema in the tissues [68,69]. Smiec Stainless Varnier Caliper was employed to quantify the thickness of the paws in millimeters. Indomethacin was the standard anti-inflammatory drug utilized. When the animals were pre-treated with the various extracts an hour before injecting the carrageenan, the *L. montevidensis* leaves extracts showed a considerable suppression of the edema caused by carrageenan. After one, two, three, four, and five hours following the inflammatory agent injection measurements were taken. The effects start to show around the first hour, maximum in impact in the third and fourth hours,and last until the fifth. The proportion of anti-inflammatory activity was greater in the n-hexane, Chloroform, and Ethyl acetate extracts than in the entire Methanol, 1-Butanol, and aqueous extracts. As a result, L. montevidens is leaf extracts showed anti-inflammatory property [58].

Antipyretic activity

Makboul et al. (2013) assessed the *L.montevidensis* leaves extracts for its antipyretic activity. For this investigation, adult male albino rats were utilized. A thermometer was used to record the preliminary rectal temperatures. Subcutaneous injection of a 20% (w/v) yeast aqueous suspension at a dose of 10 ml/kg was used to induce pyrexia. Indomethacin was used as the standard antipyretic drug. After the test extracts were administered, rectal temperatures measured for 1, 2, 3, 4, and 5 hours [68,70]. While the polar extracts (n-BuOH and aqueous) showed inadequate antipyretic activity, the n-hexane, chloroform, and Ethyl acetate extracts of the *L.montevidensis* leaves demonstrated significant antipyretic activity against yeast-induced pyrexia. The effect persisted until the fifth hour, when it peaked at the third hour. The substantial antipyretic action of the n-hexane, chloroform, and Ethyl acetate extracts of *L. montevidensis* leaves was shown by this investigation [58].

Analgesic activity

Makboul *et al.* (2013) assessed the *L.montevidensis* leaves extracts for its analgesic activity. Using the hot plate technique, the analgesic effect of test extracts was investigated in albino mice. Here, the standard analgesic drug employed was tramadol. This research measured how long it took the mouse to leap or lick its feet within a plexiglasscylinder that was heated to 55 ± 1°C. The end point was determined to be this mice action in response to the

pain caused by the heat[71]. There were eight groups of rats, each group having six male rats. Intraperitoneal injections of vehicle (3% PEG 600) were given to the first group (control animals), whereas tramadol (10 mg/kg) was administered intraperitoneally to the second group (reference group). Before and after 30 minutes, the other groups received intraperitoneal injections of 400 mg/kg of total MeOH, n-hexane, $CHCl_3$, EtOAc, n-BuOH, and aqueous extracts, the latency was measured. All of the test extracts from leaves of Lantana montevidensis had a strong analgesic effect against heat stimulus, as demonstrated by an increase in the latency time, according to the hot plate test findings. The extracts of n-hexane, $CHCl_3$, and EtOAc exhibited a greater percentage of protection in comparison to the extracts of total MeOH, n-BuOH, and aqueous. This investigation showed that the *L.montevidensis* leaf extracts in n-hexane, $CHCl_3$, and EtOAc had a considerable analgesic effect. These painkiller actions may aided by the phytochemical components of this plant, particularly the flavonoids and sterols/triterpenes. Furthermore, it was previously documented that the presence of flavonoids and triterpenoidsin many Lanata species results in their anti-inflammatory, antipyretic, and analgesic properties [2,58].

Mosquito Repellent Activity

Blythe *et al.* (2016) studied the mosquito repellent activity of essential oil of *L. montevidensis* Briq. The essential oil was extracted from aerial parts of *L. montevidensis* by hydro distillation using a Clevenger-type equipment. Air-dried aerial portions of L. montevidens is were water distilled for three hours to extract an essential oil with a yield of 0.06%. Next, GC-FID as well as GC-MS was utilized to evaluate the essential oil. Germacrene D (9.4%), β-elemene (22.0%), and β-caryophyllene (20.1%) were the higher components. Significant amounts of sesquiterpenehydrocarbons (78.9%)were found in the *L. montevidensis* essential oil. These were followed by monoterpenehydrocarbons (7.7%), oxygenated monoterpenes (1.9%), diterpenes (1.2%), oxygenated sesquiterpenes (8.9%), and other ingredients (0.2%). In this investigation *Aedes aegypti* mosquitoes were utilized [72,73]. The yellow fever mosquito, *Aedes aegypti* L., is a carrier of several dangerous viral illnesses such as dengue fever and yellow fever [72,74]. With regard to the many individual preventative techniques used to prevent mosquito bites, mosquito repellents are essential. The MED (Minimum Effective Dosage), or the lowest acceptable area dose amountrequired to stop mosquito bite over the medicated skin area, was identified as the measure of repellency. As required by protocol, each of the three human subjects in this research gave written informed consent before beginning the investigation. Compared to the positive control DEET (N,N-diethyl-3-methylbenzamide) which had a Minimum Effective Dosage of 0.006 ± 0.001 mg/cm2, *L. montevidensi s*oil demonstrated a MED of 0.021 ± 0.013 mg/cm² which was repellent against *Aedes aegypti* L [73]. After being evaluated separately for repellency, the main component β-elemene has a MED value of 0.23 ± 0.14 mg/cm² [54].

Antifungal activity

Silva et al., (2021) studied the antifungal potential effect of *L. montevidensis* leaf essential oil (EOLm) against Candida strains. Hydrodistillation method was utilised to extract the essential oil of *L. montevidensis*. The microdilution technique was utilized to ascertain the minimal inhibitory concentration (MIC) in order to establish the antifungal activity. The four strains of *Candida tropicalis* (CT LM 23 and CT INCQS 40042) and *Candida albicans* (CA INQS 40006 and CA LM 77) were used to assess the modulatory action of fluconazole by the essential oil [75]. The strains were chosen primarily based on well-established biochemical criteria including their viability for culture. In the modulation test, fluconazole was the standard antifungal drug. The antifungal activity of *L. montevidensis* essential oil in this investigation demonstrated that not all tested strains of Candida showed appreciable growth suppression. Nonetheless, there was a potentiating effect when the medication fluconazole was combined with the essential oil, especially for the two *Candida tropicalis* strains and the *Candida albicans* clinical isolate lineage [76]. This investigation makes a compelling case for the idea that administering the medication along with the essential oil might give a synergistic response to the medication's effectiveness [77].

Antiprotozoal activity

N.M. Mohamed et al. (2016) studied the antiprotozoal and antibacterial activity of triterpenes isolated from the *L. montevidensis* roots. The antiprotozoal properties of *L. montevidensis* root extracts as well as isolated compounds were assessed against axenic amastigotes, L. donovani promastigotes and intracellular amastigotes in

THP1 cells. Additionally, the compounds were assessed in trypomastigote forms of *T. brucei.* Using Alamar Blue tests, cell cultures of *L. donovani promastigotes*, axenic amastigotes, THP1-amastigotes, and Trypanosoma brucei trypomastigotes were used for the in-vitro antileshmanial assay as well as antitrypanosomal assay. The assays were modified for use with 384-well microplates, and samples were added to the cultures of *L. donovani promastigotes*, L. *donovani amastigotes*, or T. brucei trypomastigotes ($2x10^6$ cell/mL) at the proper dilution. Three different concentrations of the chemicals, which range from 40 to 1.6 μg/mL, were evaluated. The Alamar Blue test was used to measure the growth of the parasites in the cultures after the plates were incubated for 72 hours at temperature 26 °C (or 37 °C for T. brucei trypomastigotes and axenic amastigotes) [78]. Moreover, the compounds were examined using a parasite rescue with transformation assay over L. donovani intracellular amastigotes in THP1 cells [79]. The cytotoxicity of compounds against THP1 cell cultures was investigated concurrently [80]. The THP1 cells were seeded, exposed to the test drugs, and their cytotoxicity was assessed under the same circumstances as the transformation and parasite-rescue tests. As positive controls, DMFO and pentamidine were used. With an 11.44 μM IC_{50} value, oleanonic acid exhibited moderate antileishmanial property over the promastigotes. Leishmania amastigotes were considerably susceptible to the effects of camaric acid and oleanonic acid, with IC_{50} values of 2.54 and 13.90 μM while IC_{90} values of 15.15 and 19.47 μM, respectively. With IC_{50} values of 14.95, 10.89 and 5.74 μM respectively, 3β,25β-dihydroxy-olean-12-en-28-oic acid, camaric acid and oleanonic acid were reported to be effective against intracellular leishmania amastigotes in THP1 cells. With respect to their antitrypanosomal activity, the following compounds demonstrated strong activity against *T. brucei brucei*: oleanolic acid, oleanonic acid, 3β,25β-dihydroxy-olean-12-en-28-oic acid, camaric acid, 13β-hydroxy-3-oxo-olean 11-en-28-oic acid, and IC_{50} values of 7.12, 5.67, 3.20, 0.39 and 5.14 μM, respectively, and IC_{90} values of 10.51, 7.20, 8.13, 1.91 and 6.66 μM, respectively. Both oleanonic acid and camaric acid, with IC_{50} values of 16.01 and 12.57 μM, demonstrated low cytotoxicity against THP1 cells. For antileishmanial experiments, pentamidine was employed as a positive control agent. In the antitrypanosomal assay, DMFO utilized as a positive control drug, exhibiting IC_{90} and IC_{50} values of 30.82 and 11.82 μM. The Lantana montevidensis aqueous extract as well as chloroform extract exhibited strong antitrypanosomal activity over T. brucei trypomastigotes culture and very weak antileishmanial activity over *L. donovani axenic amastigotes* [36]. The chemical constituents and their previous reported pharmacological properties given in Table No. 2.

DISCUSSION

L. montenvidensis is a cheap and easily available plant. It is a rich source of phytochemicals. Leaf extracts of *L. montevidensis* exhibit antioxidant, antibacterial, antiinflammatory, antipyretic, analgesic and antiproliferative properties. While root extracts of *L. montevidensis* exhibit antiprotozoal and antibacterial properties. Essential oil of L. montevidensis exhibit acaricidal, mosquito repellent and antifungal modulating activity. This study explored many therapeutic applications of *L. montevidensis*, such as its antioxidant, antiproliferative, antibacterial, acaricidal, anti-inflammatory, antipyretic, analgesic, antiprotozoal, mosquito repellent and antifungal modulating activity, etc as mentioned in the literature published in various journals and reports. However, in-depth preclinical as well as clinical studies remains essential to assess both the safety and effectiveness of with these plant-based medicines.

CONCLUSION

In several regions of the world, *L. montevidensis* is regarded as a weed herb that is utilized in traditional medicine. The majority of pharmacological investigations were exploratory, conducted on animals, and inadequate to support the establishment of a medicinal substance or a drug for human use. However, in-depth preclinical as well as clinical studies remains essential to assess both the safety and effectiveness of with these plant-based medicines. A greater amount of study and research is needed to clarify their consequences. It might be employed in scientific proof treatment for a wide range of medical disorders with the help of latest sophisticated technology. Additional research

is required to fully understand the possible pharmacological benefits of the *L. montevidensis* plant, which may be useful in the treatment of several ailments. Many details on the plant's therapeutic use are included in this article, which may be beneficial to further research on *L. montevidensis.* There are not many publications discussing this plant's phytochemistry and its medicinal applications. This review article is useful article that offers detailed information on the use of *L. montevidensis* in drug development and medicine. It is necessary to conduct more research on this plant's phytochemistry along with pharmacological characteristics.

ACKNOWLEDGEMENTS

We sincerely acknowledge the support and guidance received during the preparation of this review article. We are thankful to the School of Pharmaceutical Sciences, Jaipur National University, Jaipur for providing the necessary academic environment and facilities that enabled us to carry out this work.

Conflict of Interest

Authors declare no conflicting interest.

ABSTRACT

After menopause, women tend to experience stress urinary incontinence (SUI), putting both their health and enjoyment of daily life at risk. There is little proof when comparing therapies, especially for Indians, so it is recommended to use transvaginal electrical stimulation (TVES) and surface electromyography (sEMG) biofeedback as the primary choices. This research aims to see if TVES and sEMG biofeedback are effective at improving the quality of life, strength of pelvic floor muscles and problems with urgency in postmenopausal Indian women with SUI. The 42 postmenopausal women with SUI were assigned to receives EMG biofeedback, while another 42 received the TVES method, both for four weeks. All groups met for a 20-minute session twice a day. The researchers examined the 20-minute pad test, scores on the Incontinence Quality of Life scale, Oxford scores for pelvic floor strength, and the number of pads each participant required before and after the intervention. The TVES electrode package caused a greater improvement (14.6g) in urine leakage compared to sEMG (10.1g). The improvement in I-QOL was large for both groups, with 18.5 points for TVES and 14.2 points for sEMG. The changes were significant in both cases ($p < 0.001$), but TVES led to better Oxford muscle scores (+1.3) than sEMG (+1.0). Both TVES and sEMG biofeedback offer relief for postmenopausal women who have stress urinary incontinence (SUI). When measuring muscular strength and leakage management, TVES performed a little better. Indian health centres use these techniques for less invasive, adjustable ways to rehabilitate the pelvic floor.

Keywords: SUI, TVES, sEMGbiofeedback, Postmenopausal women, I-QOL.

INTRODUCTION

When a person has stress urinary incontinence, the person can urinate suddenly, due to increased abdominal pressure triggered by exercise, holding breath or sneezing. Losing urine and occasionally bowel contents, without warning, affects between 35 and 50 percent of older women throughout the world [1,2]. Common reasons for underreporting in India are stigma, unawareness and not having access to pelvic health care; estimates suggest that between 20% and 45% of women have had FGM [3,4]. After menopause, when the body's oestrogen levels drop, the urogenital tissue retreats, and the pelvic floor loses its tone, more often leading to SUI. Risks of fetal distress also rise due to trauma during labor, obesity, aging and prolonged respiratory problems in women [5,6]. Because of a lack of resources and good medical centers in many rural places, going to a hospital for surgery is often delayed, so conservative and home-based therapy is more important now [7]. In recent years, surface electromyography (sEMG) biofeedback and transvaginal electrical stimulation (TVES) have earned a reputation globally for helping to improve pelvic floor function. The use of the TVES creates electrical impulses in the pudendal nerve, leading the muscles of the pelvic floor to both react automatically and with your help [8]. In randomized controlled studies, TVES lowers the number of leakage episodes by up to 80% around the globe by increasing both muscle tone and the force of urethral closure [9,10].

On the other hand, patients choose to work on their pelvic floor directly using biofeedback which assists them by sensing muscle movement and presenting feedback visually or through sound. Biofeedback helps people with pelvic floor problems better comply with exercises and helps improve their results in training [11,12]. Despite the common advice for PFMT, medical academic centers are the only ones using TVES and sEMG. Only a handful of studies have tested both methods against each other and almost none have examined postmenopausal Indian women, who are highly affected by these health problems. In this study, we examine how either sEMG biofeedback or TVES works in the short term to enhance continence in Indian women living with postmenopausal stress urinary incontinence.

METHODOLOGY

From January to April 2025, the Department of Urology and Women's Health Physiotherapy conducted this study as a prospective and controlled trial. The study was approved by the Institutional Ethics Committee. Before being included, every participant agreed in writing that they wanted to participate. According to the test, using 84 participants equally split into groups of 42 people (80% power and $\alpha = 0.05$) was enough to detect a fair change of 10 points or more on the I-QOL scale. We used 15 as the standard deviation of I-QOL scores based on research conducted previously. G* Power software was employed to calculate the right sample size for our experiment (Heinrich-Heine-Universität Düsseldorf, Germany).

Participants

A total of 102 women were screened for the study. A total of eighty-four postmenopausal women with confirmed stress urinary incontinence based on inclusion and exclusion criteria, aged 50 to 70, took part in the experiment. Those included were women over 12 months of amenorrhea, between the ages of 50 and 70, with stress urinary incontinence confirmed by clinical evaluation and standardized testing, those able to use therapeutic devices and those able to understand and follow directions. In addition, everyone involved had to agree to participate and focus closely. Women with mixed or urge incontinence, a current infection in the urinary tract, previous surgery on the pelvic floor, neurological problems, grade I or higher prolapse, hormone replacement therapy, prostheses and pacemakers. Women who had additional treatments for pelvic floor health were excluded. Ensuring participants don't know the treatment they are given and using randomization

To divide the eligible candidates equally, six-digit random numbers from the computer were used. To achieve allocation concealment, sequential and identically sealed envelopes were used. Both the study participants and the outcome assessors did not know which intervention group they were in.

Interventions

The type of biofeedback given to each participant was selected at random from Transvaginal Electrical Stimulation (TVES) and Surface Electromyography (sEMG). Both therapies for groups A and B were delivered using the NeuroTracTM ETS device (Verity Medical Ltd., UK) and the methods for each group are summarized below.

Group TVES (with n = 42 participants)

In the TVES group, a VeriProbeTM vaginal electrode given to participants allowed stimulation through the NeuroTracTM ETS device. They next standardized the way they administered the brain stimulation. The device should be on for 15 seconds and then off for 30 seconds for a week. Used twice a day for 4 weeks and frequency should be in the range of 20 to 40 Hz, the pulse width should be between 200 and 250 μs. Every participant had a certified physiotherapist explain how to live with the devices safely and efficiently. Weekly telephone calls were made to monitor and support compliance. At the end of the intervention time, device logs were checked. There were 42 people in the group taking sEMG readings. People in the sEMG group wore surface electrodes and used the NeuroTracTM ETS device to train through electromyography biofeedback. Movements and changes in muscle activity were shown immediately on the sEMG device. The group was asked patient perform exercises by tensing the pelvic floor muscles while watching the feedback on the device screen. sessions are 20 minutes long, done two times a day, for a total of four weeks. The physiotherapist guided the exercise sessions from a distance, issued weekly advice and checked to make sure the program was followed through exercise records and brought up issues on calls.

Outcomes

All evaluation results at baseline (Week 0) and after the intervention (Week 4) were obtained by physiotherapists who did not know which group each participant was assigned to. The most important result is the measurement of urine leakage in grams with the help of the 20-minute Pad Test. Secondary Outcomes: I-QOL Questionnaire: a reliable tool that measures quality of life due to incontinence, using a score ranging from 0 (worst) to 100 (best) and Oxford Grading Scale is used clinically to measure pelvic floor muscle strength by giving a score from 0 to 5 based on how strongly voluntary contractions are performed.

Statistics

All statistical analyses were done in SPSS 26.0, both paired and unpaired t-tests were used to analyse continuous variables, each shown as mean ± standard deviation. Chi-square tests were selected to study categorical data. All analyses used $p < 0.05$ as the significant threshold.Results for the comparison of TVES against sEMG in women with stress urinary incontinence after menopause have been provided in detail.

RESULTS

Participant flow is the process of arranging participants in a row and initial features involve organizing clothing or accessories. Among 102 postmenopausal women screened, 84 met the criteria and were assigned at random to either the TVES group (n = 42) or the sEMG biofeedback group (n = 42). Not one person dropped out during the4 weeks intervention. The mean rate of sticking with the diet was over 90% in both groups, shown by device tracking and verbal follow-ups. The groups had similar demographic and clinical characteristics, as seen in Table 1.

Both primary and secondary results

The treatment period of 4 weeks statistically enhanced each outcome parameter in both groups, but on every outcome, TVES did better than sEMG (Table 2). TVES group participants lost 52% more weight from their pads, 14.6

grams, than the sEMG group, who lost 36.6% or 10.1 grams ($p < 0.001$). It demonstrates that TVES is better than other treatments for stopping unintentional urine loss.

Results for I-QOL (Quality of Life) Scores:

Both sets of people saw a big increase in their living standards. The treatment-assessment groups both delivered outcomes above the MCID of 10 points; the TVES group's score increased by 18.5 and the sEMG group's score increased by 14.2. However, the intergroup analysis confirmed TVES was preferred statistically significantly ($p = 0.003$). Scores for pelvic floor control on average increase by 1.3 points for those who used the TVES and by 1.0 points for those who used sEMG, with a significant difference between the groups ($p = 0.011$). Because of electrical stimulation, more neuromuscular units are involved. Even more support for TVES came when people using TVES used fewer pads than those using sEMG, decreasing from 4.5 to 2.0 pads a day in the TVES group and from 4.4 to 2.6 pads a day in the sEMG group.

DISCUSSION

Among postmenopausal women, TVES and sEMG biofeedback both significantly decrease the symptoms of stress urine incontinence (SUI), based on this trial. Very interestingly, TVES was better at meeting every measured clinical outcome. In a very short protocol, TVES improved quality of life, lessened urine leakage and helped strengthen pelvic floor muscles when compared to sEMG biofeedback. A better activation of the neuromuscular system and pelvic floor muscles is proven by the TVES group's greater decrease in pad test scores (52% vs. 36.6%), demonstrating that TVES worked comparably for 12 weeks [13], showing a decrease of 50–60% in leakage with an 8-week course of TVES. After 4 weeks, nearly everyone in our study responded well and kept up with treatment. TVES improved I-QOL scores (+18.5 points) much more than the comparison group (+14.2 points). Both groups experienced a change in I-QOL that is considered clinically significant by doctors [14]. TVES produced a bigger effect size due to how it can affect the body and make people notice their muscles moving as they feel the electrical current. The scores for pelvic floor muscle strength on the Oxford scale grew by +1.3 points in the TVES group and by +1.0 points in the sEMG group. Such an imbalance might be a sign of TVES's ability to turn on both slow-twitch and fast-twitch muscle fibers by working on individual motor units. Reflexes and pelvic muscle activity can be improved by low-frequency stimulation, even if the person has not deliberately taken part in training [15]. Alternatively, sEMG requires patients to take part actively and this can be hard for people who lack enough motivation or who have poor proprioception.A large amount of research backs up the benefits of using TVES and sEMG. In comparison to PFMT and simply not treating patients, both approaches showed better outcomes[16, 17]. Biofeedback was selected as one of the best for pelvic pain when supervised and used with pelvic floor muscle training[18].

Very few trials have directly compared TVES and sEMG[19] showed that TVES improved muscle strength more than PFMT, suggesting an advantage in how it works. Our study of the same group of postmenopausal Indian women under the same conditions shows that TVES appears to have agreat improvement relative advantage these data. The lack of understanding and the difficulties women have in seeking health care in India result in many cases of SUI going unreported and undertreated [20, 21]. Scalable and helpful TVES and sEMG decisions, which can be done from home, are suited to public health initiatives. Significantly, buying a TVES device today isn't expensive and they are still portable. Women whose health literacy is low may struggle to use sEMG biofeedback because it requires them to remember and make sense of feedback. Both the bodily effects of TVES and its ease of use may be factors for the better results mentioned in the study. In India, this is the first controlled trial that looked directly at the difference between these two treatments for postmenopausal SUI. Simply delivering the intervention to people at home made sure it was practical for everyone. A high number (over 90%) of patients sticking to the plan and no dropouts made the findings more reliable. Strong results from a 4-week brief therapy showed that it can be done successfully in busy clinics.

CONCLUSION

Based on the RCT, the authors discovered that both surface electromyography biofeedback and transvaginal electrical stimulation work similarly well to treat stress urine incontinence in postmenopausal women. Over only 4 weeks, the TVES group achieved better results for all measurements, including a decrease in urine leakage, more powerful pelvic floor muscles and a rise in quality of life. The findings show that non-surgical, at-home treatments are helpful for female pelvic floor issues in India and similar places with not much medical equipment. TVES could be widely used in communities due to its passive approach, how easily people stick with it, and its physical benefits. Adding these therapies to current physiotherapy for women may help many women and be both affordable and easy to scale up.

Limitations

This study gives us useful information. It cannot make conclusions about the sustainability of treatment over a long period, given that participants were only followed up for 4 weeks. Secondly, the accuracy of measurement may have risen if clinical laboratories had used a perineometer or ultrasound. Though blinding and close monitoring of adherence were upheld, since this study took place at just one tertiary hospital, the results might not apply to other communities. Neither intervention was closely watched and neither post-treatment results nor the level of adherence in the long term were measured. For future multicentre trials, researchers should conduct more cost-effectiveness analyses and follow the patients longer.

ABSTRACT

The graph operation plays a significant role in Mathematical chemistry. A topological index is a real number related to a graph and it is found that there is a strong correlation between the properties of chemical compounds and their topological indices. For a molecular graph G, the Y -index is defined as the sum of fourth power of degrees of all vertices of the graph. In this paper, we calculate the Y -index of some complement graph operations such as join, union, cartesian product, tensor product, strong product, composition, disjunction, symmetric difference of graphs.

Keywords: Zagreb index; F-index; Y-index: Product graphs
Mathematics Subject Classification 2020: 05C07, 05C76, 92E10.

INTRODUCTION

Topological indices are numerical parameters of a graph which characterize its topology and are usually graph invariant. Topological indices are found to be very useful in chemistry, biochemistry and nano-technology in isomer discrimination, structure-property relationship, structure-activity relationship and pharmaceutical drug design. Let G be a simple connected graph with vertex set V (G) and edge set E(G), respectively. For any vertex v ∈ V (G), d G (v) denotes the degree of the vertex v in G. The complement of a graph G, denoted by G, is the simple graph with the vertex set V (G) and any two vertices u, v ∈ V (G), uv ∈ E(G) if and only if uv ∈/ E(G). Thus E(G) ∪ E(G) = E(K n) and

|V (G)|(|V (G) − 1|)

|E(G)| =— |E(G)|. Also the degree of a vertex v in G is given by

dG(v) = |V (G)| − 1 − d G (v).

† juddish.s@gmail.com
‡ cskdasannsp07@gmail.com

The first and second Zagreb indices of a graph are among the most studied vertex degree based topological indices [8]. These indices were introduced by Gutman and Trinajstic (1972) to study the structure-dependency of the total π− electron energy (ϱ) and are denoted by M 1 (G) and M 2 (G), respectively. They are defined as

M 1 (G) = Σ d G (v) 2 = Σ [d G (u) + d G (v)]
and
v∈V (G)
M 2 (G) = Σ
uv∈E(G)
d G (u)d G (v).
uv∈E(G)

In [6] introduced by T. Doslic. vertex-weighted Wiener polynomials for composite graphs.
The Zagreb coindices of G is defined as

and

M 1 (G) = Σ
uv∈E(G)
M 2 (G) = Σ

[d G (u) + d G (v)]

d G (u)d G (v).
uv∈E(G)

In [7] Furtula and Gutman introduced "Forgotten topological index"or " F − index"of a graph G, denoted by F (G), and is defined as the sum of cubes of the vertex degrees of the graph.

F (G) = Σ d G (v) 3 = Σ [d G (u) 2 + d G (v) 2].
v∈V (G) uv∈E(G)

In [4] Nilanjan De et.al, studied the F − coindex of some graph operations. The F − coindex of G is defined as

F (G) = Σ [d G (u) 2 + d G (v) 2].
uv∈E(G)

In [1] Abdu Alameri et.al, introduced and investigated Y − index of some graph operations.
The Y − index of graph G defined as

Y (G) = Σ [d G (u) 3 + d G (v) 3].
uv∈E(G)
In [2] Y − coindex of graph operations and its applications of molecular descriptors were

studied by Abdu Alemeri et al. The Y − coindex is defined as
Y (G) = Σ [d G (u) 3 + d G (v) 3]
uv∈/E(G)

In this paper, we present some exact expressions for the Y − index of different complement graph operations such as cartesian product, tensor product, strong product, composition, disjunction, symmetric difference of graphs.

Preliminaries

In this section, we give some basic and preliminary concepts which we shall use later. All graphs considered here are simple, finite and undirected. we give some basic Y − index of complement graphs such as, complete graph K n , cycle C n , and path P n on n vertices.

1. Y (K n) = 0.
2. Y (C n) = n 5 − 12n 4 + 54n 3 − 108n 2 + 81n.
3. Y (P n) = n 5 − 12n 4 + 62n 3 − 168n 2 + 233n − 130.

Definition 2.1. The cartesian product of two graphs G 1 and G 2 , denoted by G 1 G 2 , is the graph with vertex set V (G 1)×V (G 2) and any two vertices (u 1 , v 1) and (u 2 , v 2) are adjacent if and only if [u 1 = u 2] ∈ V (G 1) and v 1 v 2 ∈ E(G 2) or [v 1 = v 2 ∈ V (G 2)] and u 1 u 2 ∈ E(G 1). Thus we have d G 1 G2 (u, v) = d G 1 (u) + d G 2 (v).

Definition 2.2. The tensor product of two graphs G 1 and G 2 , denoted by G 1 × G 2 , is the graph with vertex set V (G 1) × V (G 2) and any two vertices (u 1 , v 1) and (u 2 , v 2) are adjacent if and only if u 1 u 2 ∈ E(G 1) or and v 1 v 2 ∈ E(G 2)]. The degree of a vertex (a, b) of G 1 × G 2 is given by d G 1×G2 (a, b) = n 1 d G 1 (a)d G 2 (b).

Definition 2.3. The strong product of two graphs G 1 and G 2 , denoted by G 1 ⊠ G 2 , is the graph with vertex set V (G 1 × G 2) and two vertices (u 1 , v 1) and (u 2 , v 2) are adjacent if and only if [u 1 = u 2 ∈ V (G 1) and v 1 v 2 ∈ E(G 2)] or [v 1 = v 2 ∈ V (G 2) and u 1 u 2 ∈ E(G 1)] or [u 1 u 2 ∈ E(G 1) and v 1 v 2 ∈ E(G 2)]. Note that if both G 1 and G 2 are connected then G 1 ⊠ G 2 is also connected. The degree of a vertex (a, b) of G 1 ⊠ G 2 is given by d G 1⊠G2 (a, b) = d G 1 (a) + d G 2 (b) + d G 1 (a)d G 2 (b).

Definition 2.4. The composition of two graphs G 1 and G 2 , denoted by G 1 ◦ G 2 , is the graph with vertex set V (G 1) × V (G 2) and any two vertices (u 1 , v 1) and (u 2 , v 2) are adjacent if and only if u 1 v 1 ∈ E(G 1) or [u 1 = v 1 and u 2 v 2 ∈ E(G 2)]. The degree of a vertex (a, b) of G 1 ◦ G 2 is given by d G 1◦G2 (a, b) = n 1 d G 1 (a) + d G 2 (b).

Definition 2.5. The disjunction of two graphs G 2 and G 2 , denoted by G 1 ∨ G 2 , is the graph with vertex set V (G 1) × V (G 2) and two vertices (u 1 , v 1) and (u 2 , v 2) are adjacent whenever u 1 u 2 ∈ E(G 1) or v 1 v 2 ∈ E(G 2). The degree of a vertex (a, b) of G 1 ∨ G 2 is given by d G 1∨G2 (a, b) = n 1 d G 1 (a) + n 2 d G 2 (b) − d G 1 (a)d G 2 (b).

Definition 2.6. The Symmetric difference of two graphs G 2 and G 2 , denoted by G 1 ⊕ G 2 , is the graph with vertex set V (G 1 × G 2) and E(G 1 ⊕ G 2) = {(u 1 , u 2)(v 1 , v 2) : u 1 v 1 ∈ E(G 1) or u 2 v 2 ∈ E(G 2)} but not both. The degree of a vertex (a, b) of G 1 ⊕ G 2 is given by d G 1⊕G2 (a, b) = n 2 d G 1 (a) + n 1 d G 2 (b) − 2d G 1 (a)d G 2 (b).

Lemma 2.1. [3] Let G 1 and G 2 be two connected graphs with |V (G 1)| = n 1 , |V (G 2)| = n 2 , |E(G 1)| = m 1 , and |E(G 2)| = m 2 . Then

1. |V (G 1 G 2)| = |V (G 1 × G 2)| = |V (G 1 ⊠ G 2)| = |V (G 1 ◦ G 2)| = |V (G 1 ∨ G 2)| = |V (G 1 ⊕ G 2)| = n 1 n 2 .
2. |E(G 1 G 2)| = m 1 n 2 + n 1 m 2 .
3. |E(G 1 × G 2)| = 2m 1 m 2 .
4. |E(G 1 ⊠ G 2)| = m 1 n 2 + n 1 m 2 + 2m 1 m 2 .
5. |E(G 1 ◦ G 2)| = m 1 n 2 + m 2 n 1 .

6. $|E(G_1 \vee G_2)| = m_1 n_2 + m_2 n_2 - 2m_1 m_2$.
7. $|E(G_1 \oplus G_2)| = m_1 n_2 + m_2 n_2 - 4m_1 m_2$.

Theorem 2.2. [2] Let G be a simple graph on n vertices and m edges. Then
$Y(G) = n(n-1)^4 - 8m(n-1)^3 + 6(n-1)M_1(G) - 4(n-1)F(G) + Y(G)$.

MAIN RESULTS

In this section, we obtain Y-index of various complement graph binary operations such as cartesian product $G_1 G_2$, tensor product $G_1 \times G_2$, strong product $G_1 \boxtimes G_2$, composition $G_1 \circ G_2$, disjunction $G_1 \vee G_2$, and symmetric difference $G_1 \oplus G_2$, and of graphs. We use the notation $V(G_i)$ for the vertex set, $E(G_i)$ for the edge set, n_i for the number of vertices and m_i, m_i for the
number of edges of the graph G_i, G_i respectively.
First we quote some results for our reference from [10], [4] and [2].
Lemma 3.1. Let G_1 and G_2 be two connected graphs with $|V(G_1)| = n_1$, $|V(G_2)| = n_2$, $|E(G_1)| = m_1$, and $|E(G_2)| = m_2$. Then
$M_1(G_1 G_2) = n_2 M_1(G_1) + n_1 M_1(G_2) + 8m_1 m_2$
$F(G_1 G_2) = n_2 F(G_1) + n_1 F(G_2) + 6m_2 M_1(G_1) + 6m_1 M_1(G_2)$
$Y(G_1 G_2) = n_2 Y(G_1) + n_1 F(G_2) + 8m_1 F(G_2) + 8m_2 F(G_1) + 6M_1(G_1)M_1(G_2)$
Lemma 3.2. Let G_1 and G_2 be two connected graphs with $|V(G_1)| = n_1$, $|V(G_2)| = n_2$, $|E(G_1)| = m_1$, and $|E(G_2)| = m_2$. Then

$M_1(G_1 \times G_2) = M_1(G_1)M_1(G_2)$
$F(G_1 \times G_2) = F(G_1)F(G_2)$
$Y(G_1 \times G_2) = Y(G_1)Y(G_2)$

Lemma 3.3. Let G_1 and G_2 be two connected graphs with $|V(G_1)| = n_1$, $|V(G_2)| = n_2$, $|E(G_1)| = m_1$, and $|E(G_2)| = m_2$. Then
$M_1(G_1 \boxtimes G_2) = (n_2 + 6m_2)M_1(G_1) + 8m_2 m_1 + (6m_1 + n_1)M_1(G_2) + 2M_1(G_1)M_1(G_2)$
$F(G_1 \boxtimes G_2) = n_2 F(G_1) + n_1 F(G_2) + F(G_1)F(G_2) + 6m_2 M_1(G_1) + 6m_1 M_1(G_2)$
$+6m_1 M_1(G_2) + 6m_2 F(G_1) + 6m_1 F(G_2) + 3F(G_2)M_1(G_1)$
$+3F(G_1)M_1(G_2) + 6M_1(G_1)M_1(G_2)$.

$Y(G_1 \boxtimes G_2) = Y(G_1)[4F(G_2) + 6M_1(G_2) + 8m_2 + n_2] + 4F(G_1)[3M_1(G_2) + 2m_2]$
$+Y(G_2)[4F(G_1) + 6M_1(G_1)8m_1 + n_1] + 4F(G_2)[3M_1(G_1) + 2m_1]$
$+Y(G_1)Y(G_2) + 12F(G_1)F(G_2) + 6M_1(G_1)M_1(G_2)$

Lemma 3.4. Let G_1 and G_2 be two connected graphs with $|V(G_1)| = n_1$, $|V(G_2)| = n_2$, $|E(G_1)| = m_1$, and $|E(G_2)| = m_2$. Then
$M_1(G_1 \circ G_2) = n_3 M_1(G_1) + n_1 M_1(G_2) + 8n_2 m_2 m_1$
$F(G_1 \circ G_2) = n_4 F(G_1) + n_1 F(G_2) + 6n_2 m_2 M_1(G_1) + 6n_2 M_1 M_1(G_2)$

$Y(G_1 \circ G_2) = n_5 Y(G_1) + n_1 Y(G_2) + 8n_3 m_2 F(G_1) + 8n_2 m_1 F(G_2) + 6n_2 M_1(G_1)M_1(G_2)$

Lemma3.5. Let G_1 and G_2 be two connected graphs with $|V(G_1)|=n_1, |V(G_2)|=n_2, |E(G_1)|=m_1$, and $|E(G_2)|=m_2$. Then

$$M_1(G_1\vee G_2)=(n_1n^2-4m_2n_2)M_1(G_1)+M_1(G_2)M_1(G_1)+(n_2n^2-4m_1n_1)M_1(G_2)+8m_1m_2n_1n_2$$

$$F(G_1\vee G_2)=n^4F(G_1)+n^4F(G_2)-F(G_1)F(G_2)+6n_1n^2m_2M_1(G_1)+6n_1^2n_2m_1M_1(G_2)+3n_2F(G_1)M_1(G_2)+3n_1F(G_2)M_1(G_1)-6n^2m_2F(G_1)-6n^2m_1F(G_2)-6n_1n_2M_1(G_1)M_1(G_2)$$

$$Y(G_1\vee G_2)=n_1Y(G_2)[n^4+6n_1M_1(G_1)-8n^2m_1-4F(G_1)]+4n^2n_2F(G_2)[2n_1m_1-3M_1(G_1)]+n_2Y(G_1)[n^4+6n_2M_1(G_2)-8n^2m_2-4F(G_2)]+4n^2n_1F(G_1)[2n_2m_2-3M_1(G_2)]+Y(G_1)Y(G_2)+12n_1n_2F(G_1)F(G_2)+6n^2n^2M_1(G_1)M_1(G_2)$$

Lemma 3.6. Let G_1 and G_2 be two connected graphs with $|V(G_1)|=n_1, |V(G_2)|=n_2, |E(G_1)|=m_1$, and $|E(G_2)|=m_2$. Then

$$M_1(G_1\oplus G_2)=(n_1n^2-8m_2n_2)M_1(G_1)+4M_1(G_1)M_1(G_2)+(n_2n^2-8m_1n_1)M_1(G_2)+8m_1m_2n_1n_2$$

$$F(G_1\oplus G_2)=n^4F(G_1)+n^4F(G_2)-8F(G_1)F(G_2)+6n_1n^2m_2M_1(G_1)+6n_1^2n_2m_1M_1(G_2)+12n_2F(G_1)M_1(G_2)+12n_1F(G_2)M_1(G_1)-12n^2m_2F(G_1)-12n^2m_1F(G_2)-12n_1n_2M_1(G_1)M_1(G_2)$$

$$Y(G_1\oplus G_2)=n_1Y(G_2)[n^4+24n_1M_1(G_1)-16n^2m_1-32F(G_1)]+8n^2n_2F(G_2)[n_1m_1-3M_1(G_1)]+n_2Y(G_1)[n^4+24n_2M_1(G_2)-16n^2m_2-32F(G_2)]+8n^2n_1F(G_1)[n_2m_2-3M_1(G_2)]+16Y(G_1)Y(G_2)+48n_1n_2F(G_1)F(G_2)+6n^2n^2M_1(G_1)M_1(G_2)$$

Y-index of complement graph operations

In this section, we calculate the expression of Yemen index of some complement graph operations.

Theorem 3.7. *Let G_1 and G_2 be two vertex disjoint graphs with $|V(G_i)|=n_i$, and $|E(G_i)|=m_i$, $i = 1,2$, where $n_1, n_2 \geq 2$. The Y-index of the complement of $(G_1\times G_2)$ is given by*

$$\overline{Y(G_1G_2)}=n_1n_2(n_1n_2-1)^4-16m_1m_2(n_1n_2-1)^3+6(n_1n_2-1)n_2M_1(G_1)+n_1M_1(G_2)+8m_1m_2-4(n_1n_2-1)n_2F(G_1)+n_1F(G_2)+6m_2M_1(G_1)+6m_1M_1(G_2)+n_2Y(G_1)+n_1F(G_2)+8m_1F(G_2)+8m_2F(G_1)+6M_1(G_1)M_1(G_2).$$

Proof. Clearly, by Lemma 2.1 we have $|V(G_1G_2)|=n_1n_2$ and $|E(G_1G_2)|=m_1n_2+m_2n_1$. Using Theorem 2.2 and applying Lemma 3.1 we have

$$\begin{aligned}\overline{Y}(G_1G_2)&=|V(G_1G_2)|(|V(G_1G_2-1|)^4-8|E(G_1G_2)|(|V(G_1G_2)|-1)^3\\&\quad+6(|V(G_1G_2)|-1)M_1(G_1G_2)-4(|V(G_1G_2)|-1)F(G_1G_2)\\&\quad+Y(G_1G_2)\\&=n_1n_2(n_1n_2-1)^4-16m_1m_2(n_1n_2-1)^3+6(n_1n_2-1)n_2M_1(G_1)\\&\quad+n_1M_1(G_2)+8m_1m_2-4(n_1n_2-1)n_2F(G_1)+n_1F(G_2)\\&\quad+6m_2M_1(G_1)+6m_1M_1(G_2)+n_2Y(G_1)+n_1F(G_2)+8m_1F(G_2)\\&\quad+8m_2F(G_1)+6M_1(G_1)M_1(G_2).\end{aligned}$$

which completes the proof.

Theorem 3.8. *Let G_1 and G_2 be two vertex disjoint graphs with $|V(G_i)|=n_i$ and $|E(G_i)|=m_i$, $i = 1,2$, where $n_1, n_2 \geq 2$. The Y-index of the complement of $(G_1 \times G_2)$ is given by*

$$\begin{aligned}\overline{Y}(G_1\times G_2)&=n_1n_2(n_1n_2-1)^4-16m_1m_2(n_1n_2-1)^3+6(n_1n_2-1)M_1(G_1)M_1(G_2)\\&\quad-4(n_1n_2-1)F(G_1)F(G_2)+Y(G_1)Y(G_2).\end{aligned}$$

Proof. Clearly, by Lemma 2.1we have $|V(G_1\times G_2)|=n_1n_2$ and $|E(G_1\times G_2)|=2m_1m_2$, Using Theorem 2.2 and applying Lemma 3.2 we have

$$\begin{aligned}\overline{Y}(G_1\times G_2)&=|V(G_1\times G_2)|(|V(G_1\times G_2-1|)^4-8|E(G_1\times G_2)|(|V(G_1\times G_2)|-1)^3\\&\quad+6(|V(G_1\times G_2)|-1)M_1(G_1\times G_2)-4(|V(G_1\times G_2)|-1)F(G_1\times G_2)\\&\quad+Y(G_1\times G_2)\\&=n_1n_2(n_1n_2-1)^4-16m_1m_2(n_1n_2-1)^3+6(n_1n_2-1)M_1(G_1)M_1(G_2)\\&\quad-4(n_1n_2-1)F(G_1)F(G_2)+Y(G_1)Y(G_2).\end{aligned}$$

which completes the proof.

Theorem 3.9. *Let G_1 and G_2 be two vertex disjoint graphs with $|V(G_i)|=n_i$, and $|E(G_i)|=m_i$, $i = 1,2$, where $n_1,n_2 \geq 2$. The Y-index of the complement of $(G_1 \boxtimes G_2)$ is given by,*

$$\begin{aligned}\overline{Y}(G_1\boxtimes G_2)=&n_1n_2(n_1n_2-1)^4-16m_1m_2(n_1n_2-1)^3\\&+6(n_1n_2-1)(n_2+6m_2)M_1(G_1)+8m_2m_1\\&+(6m_1+n_1)M_1(G_2)+2M_1(G_1)M_1(G_2)\\&-4(n_1n_2-1)n_2F(G_1)+n_1F(G_2)+F(G_1)F(G_2)\\&+6m_2M_1(G_1)+6m_1M_1(G_2)+6m_1M_1(G_2)\\&+6m_2F(G_1)+6m_1F(G_2)+3F(G_2)M_1(G_1)+3F(G_1)M_1(G_2)\\&+6M_1(G_1)M_1(G_2)+Y(G_1)[4F(G_2)+6M_1(G_2)+8m_2+n_2]\\&+4F(G_1)[3M_1(G_2)+2m_2]+Y(G_2)[4F(G_1)+6M_1(G_1)8m_1+n_1]\\&+4F(G_2)[3M_1(G_1)+2m_1]+Y(G_1)Y(G_2)+12F(G_1)F(G_2)\\&+6M_1(G_1)M_1(G_2).\end{aligned}$$

Proof. Clearly, by Lemma 2.1 we have $|V(G_1\boxtimes G_2)|=n_1n_2$ and $|E(G_1\boxtimes G_2)|=m_1n_2+n_1m_2+2m_1m_2$, Using Theorem 2.2 and applying Lemma 3.2 we have

$$\begin{aligned}\overline{Y}(G_1\boxtimes G_2)=&|V(G_1\boxtimes G_2)|(|V(G_1\boxtimes G_2-1|)^4-8|E(G_1\boxtimes G_2)|(|V(G_1\boxtimes G_2)|-1)^3\\&+6(|V(G_1\boxtimes G_2)|-1)M_1(G_1\boxtimes G_2)-4(|V(G_1\boxtimes G_2)|-1)F(G_1\boxtimes G_2)\\&+Y(G_1\boxtimes G_2),\\=&n_1n_2(n_1n_2-1)^4-16m_1m_2(n_1n_2-1)^3+6(n_1n_2-1)(n_2+6m_2)M_1(G_1)\\&+8m_2m_1+(6m_1+n_1)M_1(G_2)+2M_1(G_1)M_1(G_2)-4(n_1n_2-1)n_2F(G_1)\\&+n_1F(G_2)+F(G_1)F(G_2)+6m_2M_1(G_1)+6m_1M_1(G_2)+6m_1M_1(G_2)\\&+6m_2F(G_1)+6m_1F(G_2)+3F(G_2)M_1(G_1)+3F(G_1)M_1(G_2)\\&+6M_1(G_1)M_1(G_2)+Y(G_1)[4F(G_2)+6M_1(G_2)+8m_2+n_2]\\&+4F(G_1)[3M_1(G_2)+2m_2]+Y(G_2)[4F(G_1)+6M_1(G_1)8m_1+n_1]\\&+4F(G_2)[3M_1(G_1)+2m_1]+Y(G_1)Y(G_2)+12F(G_1)F(G_2)+6M_1(G_1)M_1(G_2).\end{aligned}$$

Which completes the proof.

Theorem 3.10. *Let G_1 and G_2 be two vertex disjoint graphs with $|V(G_i)|=n_i$, and $|E(G_i)|=m_i$, $i = 1,2$, where $n_1,n_2 \geq 2$. The Y-index of the complement of $(G_1 \circ G_2)$ is given by,*

$$\begin{aligned}\overline{Y}(G_1\circ G_2)=&n_1n_2(n_1n_2-1)^4-16m_1m_2(n_1n_2-1)^3+6(n_1n_2-1)n^3M_1(G_1)\\&+n_1M_1(G_2)+8n_2m_2m_1-4(n_1n_2-1)n^4F(G_2)+n_1F(G_2)\\&+6n_2^2m_2M_1(G_1)+6n_2M_1M_1(G_2)+n^5Y(G_1)+n_1Y(G_2)\\&+8n_2^3m_2F(G_1)+8n_2m_1F(G_2)+6n^2M_1(G_1)M_1(G_2).\end{aligned}$$

Proof. Clearly, by Lemma 2.1 we have $|V(G_1 \circ G_2)| = n_1 n_2$ and $|E(G_1 \circ G_2)| = m_1 n_2^2 + m_2 n_1$, Using Theorem 2.2 and applying Lemma 3.3 we have

$$\begin{aligned}
Y(G_1 \circ G_2) &= |V(G_1 \circ G_2)|(|V(G_1 \circ G_2 - 1|)^4 - 8|E(G_1 \circ G_2)|(|V(G_1 \circ G_2)| - 1)^3 \\
&\quad + 6(|V(G_1 \circ G_2)| - 1)M_1(G_1 \circ G_2) - 4(|V(G_1 \circ G_2)| - 1)F(G_1 \circ G_2) \\
&\quad + Y(G_1 \circ G_2) \\
&= n_1 n_2 (n_1 n_2 - 1)^4 - 16 m_1 m_2 (n_1 n_2 - 1)^3 + 6(n_1 n_2 - 1) n_2^3 M_1(G_1) \\
&\quad + n_1 M_1(G_2) + 8 n_2 m_2 m_1 - 4(n_1 n_2 - 1) n_1^4 F(G_1) + n_1 F(G_2) \\
&\quad + 6 n_2^2 m_2 M_1(G_1) + 6 n_2 M_1 M_1(G_2) + n_2^5 Y(G_1) + n_1 Y(G_2) \\
&\quad + 8 n_2^3 m_2 F(G_1) + 8 n_2 m_1 F(G_2) + 6 n_2^2 M_1(G_1) M_1(G_2).
\end{aligned}$$

Which completes the proof.

Theorem 3.11. *Let G_1 and G_2 be two vertex disjoint graphs with $|V(G_i)| = n_i$, and $|E(G_i)| = m_i, i = 1, 2,$ where $n_1, n_2 \geq 2$. The Y-index of the complement of $(G_1 \vee G_2)$ is*

Given by

$$\begin{aligned}
Y(\overline{G_1 \vee G_2}) &= n_1 n_2 (n_1 n_2 - 1)^4 - 16 m_1 m_2 (n_1 n_2 - 1)^3 \\
&\quad + 6(n_1 n_2 - 1)(n_1 n_2^2 - 4 m_2 n_2) M_1(G_1) + M_1(G_2) M_1(G_1) \\
&\quad + (n_2 n_1^2 - 4 m_1 n_1) M_1(G_2) + 8 m_1 m_2 n_1 n_2 - 4(n_1 n_2 - 1) n_1^4 F(G_1) \\
&\quad + n_1^4 F(G_2) - F(G_1) F(G_2) + 6 n_1 n_2^2 m_2 M_1(G_1) \\
&\quad + 6 n_1^2 n_2 m_1 M_1(G_2) + 3 n_2 F(G_1) M_1(G_2) + 3 n_1 F(G_2) M_1(G_1) \\
&\quad - 6 n_2^2 m_2 F(G_1) - 6 n_1^2 m_1 F(G_2) - 6 n_1 n_2 M_1(G_1) M_1(G_2) \\
&\quad + n_1 Y(G_2)[n_1^4 + 6 n_1 M_1(G_1) - 8 n_1^2 m_1 - 4 F(G_1)] \\
&\quad + 4 n_1^2 n_2 F(G_2)[2 n_1 m_1 - 3 M_1(G_1)] + n_2 Y(G_1)[n_2^4 + 6 n_2 M_1(G_2) \\
&\quad - 8 n_2^2 m_2 - 4 F(G_2)] + 4 n_2^2 n_1 F(G_1)[2 n_2 m_2 - 3 M_1(G_2)] \\

\end{aligned}$$

Which completes the proof.

CONCLUSION

In this paper, we have calculated and obtained explicit formula for Y-index of complement graph operations such as $G_1 G_2$, $G_1 \circ G_2$, $G_1 \times G_2$, $G_1 * G_2$, $G_1 \vee G_2$ and $G_1 \oplus G_2$ of two graphs G_1 and G_2.
