ABSTRACT

The essentiality of Artificial Intelligence has revolutionized in recruitment and talent acquisition, in transforming traditional human resource practices on data-driven, efficient, and into the strategic processes. AI-driven tools have such predictive analytics to resume-screening algorithms, and also chatbot-based candidate interactions which significantly improved hiring process, its accuracy, and decision-making qualities. Subsequently, the growing dependence on these intelligence raises ethical concerns relating to fairness, on data privacy, and to the algorithmic bias, careful examination of its overall impact. The need for this study arose from the increasing digitalization on HR functions and its necessity to evaluate on whether AI has genuinely enhancing the recruitment outcomes or merely automates existing biases. This research adopts a descriptive and analytical approach, collecting primary data from 150 HR professionals across IT, manufacturing, and service sectors through and structured questionnaire. Descriptive statistics and correlation analysis were employed to explore the relationship between AI adoption and recruitment performance. The findings indicate a strong positive association between the implementation of AI tools and recruitment efficiently, including faster candidates screening, improved hiring quality, and enhanced the engagement of the candidate. The study concludes that while AI substantially improves recruitment effectiveness and supports data driven decision-making, it must be complementing the human overall view ethical standards to ensure fairness, inclusivity, and long-term sustainability in HR practices.

Keywords: Artificial Intelligence, Digitalization, Recruitment, Talent Acquisition, Efficiency.

INTRODUCTION

In recent years, Artificial Intelligence (AI) has moved from being a futuristic ideal to a central lever in India's recruitment and talent acquisition landscape. As companies grapple with rapidly evolving market demands, skill gaps, and pressure to hire faster yet more effectively, AI tools are being leveraged to both streamline HR processes and enhance the quality of hiring decisions. AI's role is especially pronounced in tasks such as resume screening, automated short listing, predictive analytics to assess candidate success, Chat-bot based interactions, and bias mitigation, allowing HR professionals to shift focus toward strategic, relationship-oriented aspects of recruiting. Several recent trends illustrate the growing impact of AI in Indian recruitment. First, there has been explosive growth in AI/ML job roles, with some reports showing a 42% increase in AI-related jobs over two years, coupled with projected additional growth in 2025. Second, organisations are increasingly prioritising AI to optimise recruitment processes, with 42% of companies in a recent survey identifying it as a top talent strategy for 2025. Third, there is a shift toward quality over speed in hiring investments are being made into tools and platforms that help find better-fit candidates rather than simply filling positions quickly.

Other trends include the increasing demand for fresher's with AI or adjacent skills, reflecting recognition that early talent pipelines must adapt to the AI era. Also, HR technology that includes AI features is showing measurable benefits from improved candidate experience to higher employee retention demonstrating that the investment in AI isn't just about cost or time saving, but also about long-term value. In sum, AI is reshaping recruitment in India by pushing companies toward more data-driven, scalable, and fairer hiring practices. As AI tools become more capable and affordable, their adoption is likely to grow, and with it, new challenges around ethics, bias, skill training, and candidate expectations will come to the forefront.

REVIEW LITERATURE

AI-Driven Recruitment and Talent Management in India (2024–2025)

The integration of Artificial Intelligence (AI) into recruitment and talent management processes has emerged as a transformative force across industries. Indian firms, particularly in the IT and services sector, are at the forefront of adopting AI-driven tools to enhance efficiency, accuracy, and scalability in hiring. Tata Consultancy Services (TCS) has been a leading example of this trend. According to its *White Paper (2024/2025)*, TCS reports that AI-enabled resume screening, short listing, and candidate sourcing have the potential to reduce time-to-hire by nearly 50% when implemented end-to-end. The company has begun embedding AI within its staffing processes and vendor solutions to streamline recruitment. However, the success of such initiatives largely depends on a well-defined AI roadmap and the quality of training data. Over-automation without human oversight may lead to unintended consequences, including loss of nuanced candidate evaluation (TCS, 2025). Infosys, in its *Perspective on Generative AI and Talent (2024/2025)*, emphasises the growing need for AI-aware recruitment and re-skilling strategies. The company advocates for a shift toward *skills-first hiring* to attract and retain talent in the age of automation. Infosys leverages AI-powered tools to assess graduate applicants and design personalised learning journeys. Nevertheless, a persistent gap between recruiters' technical understanding and their ability to assess complex AI-related competencies poses risks of false positives and negatives during selection (Infosys, 2025).

Industry-wide studies further support these corporate experiences. *Insight Global's "AI in Hiring" (2024/2025)* survey revealed near-universal adoption of AI in at least one stage of recruitment such as screening, scheduling, or skill assessment. Yet, the study underscores that human judgment remains indispensable, as high reliance on AI can create a misleading sense of fairness in hiring outcomes (Insight Global, 2025). The ethical dimension of AI in recruitment has been highlighted by *Reuters* through Amazon's early experimental recruiting tool (2018), which demonstrated bias against women due to historical data patterns. This case remains a significant cautionary precedent for Indian firms deploying similar systems, illustrating the risks associated with biased or unrepresentative training data (Reuters, 2018).

In India, job platforms like *Naukri.com* have incorporated AI to enhance relevance scores, improve job descriptions, and facilitate candidate matching *(Naukri, 2023–2025).* These tools allow recruiters to efficiently triage large volumes of applications, especially during campus drives. However, algorithmic prioritisation often side lines atypical but high-potential candidates, and the opacity of AI-driven matching raises concerns about transparency (Recruiter Zone, 2025). The *LinkedIn Workplace Learning & Economic Graph (2024–2025)* reports a global rise in "skills-first" hiring, with AI competencies among the most sought-after. While this trend has spurred up skilling investments, India faces a persistent shortage of AI talent, resulting in aggressive competition and wage inflation (LinkedIn, 2025). The *World Economic Forum (2025)* echoes similar observations, recommending a hybrid approach that balances automation with human touch points to sustain fairness and candidate experience.

From a policy perspective, *NITI Aayog* and *The Times of India (2025)* highlight India's structural talent gap, emphasising the need for greater AI education and doctoral training to secure long-term domestic expertise. This policy gap affects recruitment strategies across technology sectors. Furthermore, reports by *Reuters (2025)* on AI-driven automation in customer service illustrate how generative AI displaces routine jobs, compelling recruiters to account for automation risks and re-skilling needs. Non-IT sectors are also witnessing adoption. *Flipkart* and *MakeMyTrip* have leveraged AI for hyper local talent sourcing, semantic search, and internal mobility mapping (Mint, 2025; TOI, 2025). Yet, these organisations face challenges in maintaining quality-of-hire and managing complex cross-functional integrations involving HR, legal, and technology teams. In parallel, *TCS*'s 2025 retraining initiatives demonstrate large-scale re-skilling commitments reportedly retraining over 100,000 employees annually to align with evolving AI capabilities (The Federal, 2025). However, such programmes are costly, and immediate hiring needs may still outpace retraining outcomes. Consulting insights from *Deloitte (2024–2025)* show that enterprises increasingly deploy AI in talent analytics covering predictive attrition and internal mobility though privacy concerns and opaque decision models persist (AMS, 2025). Complementary data from *LinkedIn's Global Talent Trends* and *Naukri Job Speak (2024–2025)* indicate surging demand for AI and machine learning roles in India, alongside a renewed emphasis on "human skills" such as creativity and judgment. Nonetheless, assessing these soft skills at scale remains a major limitation of current AI systems. Employers also report challenges onboarding fresh graduates who, while numerous, often lack the depth required for high-skill AI roles (Storyboard18, 2025).

Need of the Study

The increasing adoption of Artificial Intelligence (AI) in recruitment and talent acquisition across the various sectors highlights the urgent need to understand its real impact on organizational effectiveness. While AI tools are widely promoted for improving hiring speed, accuracy, and fairness, empirical evidence on their practical outcomes remains limited. Organizations vary in digital readiness, and many still struggle with ethical concerns, data privacy, and bias in algorithmic decision-making. This study is needed to evaluate how AI influences recruitment efficiency, quality of hire, and candidate experience, especially in a diverse labour market like India's where both large corporations and small enterprises are adopting technology at different scales. The findings will help HR professionals, policymakers, and technology developers design recruitment systems that are not only efficient but also ethical, transparent, and inclusive.

Objectives of the Study

1. **To examine the level of AI adoption** in recruitment and talent acquisition practices across different sectors.
2. **To assess the impact of AI adoption on recruitment efficiency** among organizations using AI-driven tools and systems.
3. **To evaluate the relationship between AI adoption, recruitment efficiency, and quality of** recruitment process.
4. **To determine whether recruitment efficiency differs significantly** across varying levels of AI adoption.

RESEARCH METHODOLOGY

Research Design

The study employs a descriptive and analytical research design to examine the role of Artificial Intelligence (AI) in recruitment and talent acquisition among Indian organizations. The design enables a systematic analysis of how AI adoption influences recruitment efficiency, quality of hire, and candidate experience.

Method

A survey method is adopted for primary data collection, supported by structured questionnaires distributed among HR professionals, recruitment managers, and talent acquisition specialists. Secondary data are obtained from HR analytics reports, corporate publications, and peer-reviewed journals focusing on AI applications in human resource management.

Universe of the Study

The universe of the study comprises Indian organizations that have adopted or are actively experimenting with AI-driven recruitment systems**.** This includes sectors such as Information Technology (IT), Banking and Financial Services (BFSI), Manufacturing, Consulting, and E-commerce**.**

Sample Size and Sampling Technique

A sample of 150 respondents was selected using a stratified random sampling technique**.** The strata were formed based on organizational size (large enterprises, medium firms, and start-ups) and industry sector to ensure diverse representation. Respondents include HR professionals, recruitment leads, and decision-makers directly involved in AI-enabled recruitment.

Statistical Tools and Tests Used

The collected data will be analysed using **SPSS** and **MS Excel**. Statistical methods applied include:

- **Descriptive Statistics** (mean, percentage, standard deviation) to summarize data.
- **Correlation Analysis** to identify relationships between AI usage and recruitment outcomes.
- **Chi-square Test** to assess associations between organizational characteristics and AI adoption levels.

Limitations of the Study

1. The study is confined to Indian organizations, and results may not generalize to other economies.
2. Reliance on self-reported data may involve bias or exaggeration of AI benefits.
3. The study primarily includes formal-sector organizations; informal and micro-enterprises are underrepresented.
4. The rapid evolution of AI technologies may cause findings to become time-sensitive.
5. Limited publicly available secondary data specific to AI adoption metrics in Indian recruitment systems.

Data Analysis and Interpretation

Table 1 Demographic Profile of Respondents

Gender Distribution

As shown in Table 1, the majority of respondents are male (60%)**,** while female participants account for 36.7%**,** and 3.3% identify as others**,** indicating a moderate level of gender diversity among the surveyed professionals. This gender distribution reflects the current composition of the AI-integrated recruitment landscape, where male dominance is slightly higher, especially in IT and technology-driven industries. However, the increasing representation of females signifies the growing inclusivity in HR technology adoption and recruitment analytics roles.

Age Group

A majority (43.3%) of respondents belong to the 31–40 years age group, followed by 33.3% in the 21–30 years range. This indicates that mid-career professionals and younger HR practitioners form the primary respondents' individuals who are either directly implementing or adapting to AI tools in recruitment. This age profile is crucial, as they represent the digitally competent workforce most exposed to technological transformations in HR functions.

Years of Experience

Respondents with 5–10 years of experience (46.7%) dominate the sample, followed by those with less than 5 years (26.7%). This suggests that the study captures perspectives from professionals with significant recruitment and HR exposure, who are likely to have witnessed the transition from traditional to AI-enabled hiring.

Industry Representation

The respondents come from multiple sectors IT (36.7%), BFSI (23.3%), Manufacturing (20%), and Start-ups/E-commerce (20%). IT and BFSI sectors, being early adopters of automation, offer insights into advanced AI usage, while manufacturing and start-ups provide contrast by showing emerging adoption trends and practical challenges.

Organizational Size

Respondents belong to organizations of varying sizes Large (46.7%), Medium (33.3%), and Small (20%). Larger organizations, with structured HR departments and high recruitment volumes, are more likely to invest in AI-based applicant tracking systems (ATS) and predictive analytics tools. Medium and small firms, on the other hand, reflect resource-based challenges but also agility in AI experimentation. This diversity strengthens the study's investigation of how organizational capacity influences the effectiveness of AI in recruitment.

Correlation Analysis

- **H_0 -** There is no significant relationship between AI adoption level and recruitment efficiency.
- **H_1 -** There is a significant positive relationship between AI adoption level and recruitment efficiency.

Correlation Matrix (Pearson Correlation)

The above Table 3 depicts the Correlation Matrix on Recruitment Efficiency (RE) and AI Adoption (AIA) show a strong positive correlation (0.80), implying that organizations with higher AI usage report faster and more efficient recruitment. Quality of Hire (QoH) and Organizational Readiness (OR) have a strong positive relationship (0.70), suggesting that readiness in infrastructure and HR capability enhances hiring quality. Candidate Experience (CE) is positively correlated with both AI adoption (0.70) and recruitment efficiency (0.65), showing AI tools can improve applicant satisfaction if implemented properly. Ethical Concerns (EC) are negatively correlated with all positive outcomes, highlighting that bias, transparency, and privacy concerns can undermine the perceived benefits of AI in recruitment.

Chi-Square Test

- **H_0:** There is no significant association between industry type and the adoption of AI-based recruitment tools.
- **H_1:** There is a significant association between industry type and the adoption of AI-based recruitment tools.

Table 4.Chi-Square test

The Table 4 reveals that AI Adoption vs. Recruitment Efficiency ($\chi^2 = 60.42$, $p < 0.001$), reveals a strong relationship between the level of AI usage and the efficiency of recruitment processes. This suggests that organizations employing AI technologies such as automated resume screening, candidate ranking, and predictive analytics tend to achieve faster and more efficient hiring outcomes. Similarly, AI Adoption vs. Quality of Hire ($\chi^2 = 55.30$, $p < 0.001$), shows a significant association, indicating that AI-enabled recruitment tools help in identifying better-suited candidates, thereby improving the quality of new hires. This finding reinforces the growing confidence among HR professionals

that AI enhances decision accuracy in candidate selection. Subsequently Ethical Concerns vs. Recruitment Efficiency ($\chi^2 = 40.12$, $p < 0.001$), demonstrates a significant negative relationship, meaning that increased ethical concerns such as bias in algorithms or lack of transparency tend to lower the perceived efficiency of AI systems. This aligns with existing literature cautioning that over-reliance on algorithms without proper oversight can hinder fairness and trust in recruitment outcomes.

Overall, the results emphasize that while AI adoption contributes positively to efficiency and quality, ethical considerations remain a critical moderating factor influencing the success of AI-based recruitment in Indian organizations.

RECOMMENDATIONS

Develop a structured AI recruitment strategy Organizations should establish clear policies outlining where and how AI tools should be integrated into the recruitment pipeline to ensure transparency and accountability.

Enhance ethical governance frameworks HR departments must implement bias detection systems, algorithm audits, and data protection protocols to maintain fairness and build trust in AI-driven decisions.

Capacity-building for HR professional's Continuous training and up skilling programs should be introduced to help recruiters interpret AI-generated insights effectively and make balanced human AI decisions.

Promote inclusivity through AI Developers and HR teams should collaborate to ensure AI tools promote diversity by using inclusive datasets and bias-free screening algorithms.

Encourage AI adoption among small and medium enterprises (SMEs) Government and industry bodies could offer subsidies or shared AI platforms to help SMEs benefit from intelligent recruitment technologies at a lower cost.

Continuous performance evaluation of AI systems Organizations should periodically assess AI tools for accuracy, efficiency, and ethical compliance, ensuring that the technology evolves in alignment with organizational and employee needs.

Integrate human touch in the final stages of recruitment While AI can optimize early screening, final hiring decisions should retain human judgment to balance empathy, cultural fit and organizational values.

ABSTRACT

Autism is one of the main concern of pediatrics in the present era. This neurodevelopmental disorder of unknown etiology begins in early childhood. Autism Spectrum Disorders (ASDs) are mainly characterized by impairments in 3 domains: communication, social interaction and repetitive behaviours. The features of Autism are much similar to that of *Unmadam*(disease of mind characterized by mental confusion etc.), a disease condition mentioned in Ayurvedic classics. Due to various etiological factors, the conjunction between *Atma* the self) and Manas(mind) is disrupted resulting in the vitiation of *Manovaha srotas*(channels of consciousness that flow through mind). Along with this, the vitiation of three *doshas* (*Vata, Pitta,*and *Kapha*) will end up in the manifestation of *Unmada*. *Manovaha sroto-dushti* together with *Tridosha dushti* the basic cause of Childhood Autism. Western medicine and research have seemingly stalled in respect to the management of autism however early intervention and behavioral therapies have shown improvement to some extent. The present study describes a case of childhood autism visited at Parul Ayurved Hospital, Baroda,Gujrat. Child was diagnosed clinically and has been treated with Ayurvedic interventions, *Panchakarma* therapies and diet modification. Child has got relief symptomatically after 3 settings of 15 days each. Case study briefly explained Ayurvedic concepts regarding childhood autism and Ayurvedic treatment protocols in autistic disorder.

Keywords: Autism spectrum disorder, *Manovaha stroto dushti, Unmad,* Ayurveda, Management, *Panchakarma*

INTRODUCTION

Autism is a neurodevelopmental condition whose cause is unknown[1]. The cardinal features of Autism are impairment of social interaction, communication and imagination, and restricted interests and repetitive behavior. Childhood autism has its manifestations usually at around 18-24 months of age and is well established by 3 years of age[2].It is the world`s third most common developmental disorder, so to spread awareness every year 2nd April is marked as Worlds Autism Day[3].Latest survey by Autism and Developmental Disabilities Monitoring (ADDM) Network of Centre for Disease Control and Prevention (CDC) suggest a 15% increase in prevalence that 1 in every 59 children are being identified with Autistic Spectrum Disorder in the United States and is about 4 times more common among boys than in girls. These statistics calls for the urgency of evaluating this condition in scientific backgrounds. The exact cause of Autism is unknown. The exact cause of ASD is still under research. However, results from twin and family studies provide evidence for a strong genetic contribution, with multiple loci potentially involved. Investigations of non-heritable factors suggest that environmental influences may also be etiologically important, and neuro-pathologic and biomarker studies provide compelling evidence for a prenatal origin. As per Ayurvedic classics, *Garbhopaghatakara* bhavas (the prenatal factors which harm the product of conception) are considered as major etiological factors in its causation. Though there are numerous references of psychological disorders in Ayurveda classics, there is no description of exact clinical condition mimicking ASD. Hence, ASD can be classified as an *Anukta Vyadhi* as per Ayurveda principles and upon understanding its pathophysiology, management is made based upon involvement of *Doshas, Dushya, Dhatu, Mala, Agni, Srotas, Adhishthana, Nidana Panchaka, Doshaja Prakriti, Rogi Pareeksha, Roga Pareeksha,* and *Manasa Prakriti*. The nearest similarity of autism with Ayurvedic diagnosis is *Unmada* (Insanity). The *Lakshanas* (features) described in *Unmada* with are a mixture of features of *Vata, Pitta and Kapha* singularly or collectively are even seen in Autism. Upon keen consideration of etiopathogenesis involved in ASD, there is a need of medications and *Panchakarma* procedures which can target the higher centers of brain in order to manage the core features of ASD. Ayurveda systems of medicine possess wealth of single herbs, formulations and *Panchakarma* procedures that can efficiently address the ever increasing prevalence of ASD.

Etiopathogenesis of Autism as per Ayurveda

As per Ayurvedic classics, the acquisition of knowledge takes place by a sequence of events where the conjunction of *Atma* (soul / the self), *Manas* (mind), *Indriya* (sense organ), *Indriyartha* (object of perception) happens in the order. *Atma* (the self) is responsible for the cognition, and *Manas* is the substratum of *Indriyas* (sense organs) to perceive *Indriyartha* (object of perception). The factors responsible for the mental constitution of the fetus are *satwa* (mind) of mother and father, the objects of hearing, actions of the pregnant mother and past deeds. In children with Autism, the conjunction between *Atma* and *Manas* is disrupted. i.e.; *Manovaha-sroto-dusti* (vitiation of channels of consciousness that flows through mind) along with *Tridosha dusti* (vitiation of three doshas) is the characteristic feature of Childhood Autism. As per Ayurvedic classics, the same etiopathology is explained in the context of *Unmada* (Disease of mind characterized by mental confusion etc.).

The characteristic features of *Unmada* as per Ayurvedic classics are

Manovibhrama **(perversion of mind) -**Due to this, the subject does not think about such matters which are worth thinking, and he/she also indulge in thinking about the matters which he/she is not supposed to think about.

Budhi vibhrama **(perversion of intellect) -**Due to this, the subject understands the eternal things as non-eternal and advantageous as disadvantageous.

Samjnajnana vibhrama (impaired sensory perception).

Smruti vibhrama (impairment of memory).

Bhakti vibhrama(abnormal desires)

Sheela vibhrama(inappropriate manners and behaviors)

Chesta vibhrama (abnormal activities)

Achara vibhrama (loss of learned skills) By analyzing the etiopathology and clinical features of Autism, it can be included under the broad spectrum of Unmada. In this case report, the Ayurvedic view of etio-pathogenesis of Childhood Autism along with its treatment principles are discussed

MATERIALS AND METHODS

All relevant Ayurvedic and modern science literature along with journals and various internet databases were critically analyzed along with clinical experiences in managing Autism.

Case Report

Personal data and presenting complaints

A seven year-old male child was presented in hospital with the complaints of poor eye contact, impaired socialization and communication, making a particular repeating sound, unaware of the situations of danger like fire, vehicles on road and hyperactivity. He was Hindu by religion and was the fourth child born to a middle-class, literate, consanguineous parents.

History of present illness

The child was the fourth offspring of consanguineous parents, the age of mother at the time of gestation was 28 years. There was no history of abortions. Blood group of Mother was A-Positive and that of Father was B-Positive, and the baby was A-Positive. A fullterm normal delivery was done. The baby cried soon after birth, and birth weight was 3.0 Kg. The mother and baby were discharged from hospital on the third day after delivery. No other significant post-natal events were reported. As some time passed away, parents noticed the delay in child's developmental milestones. i.e.; the child has not attained the social smile and he was found to be repeatedly making a particular noise, also not aware of the relations like mother, father and other relatives for that they visited a hospital and done all the investigations like vision tests and hearing tests, Karyotyping and MRI Brain. MRI report suggested delayed myelination in both cerebral hemispheres. The child was identified to have deficient IQ level and so was undergoing education in special school.

History of past illness

No any significant past history was happened.

Developmental History

Delay in Gross motor, Fine motor, and Social and Language skills were noted.

Milestones and age of attainment

Gross motor:

Head control: 4th month
Turning over: 5th month
Sit with support: 6th month
Sit without support: 7th month
Crawling: 8th month
Stands with support: 10th month
Walking without support: 2 years

Fine motor

Grasping, Self-feeding, Buttoning: Not properly attained
Drawing: Not attained

Social milestones
Social smile: Not attained
Responds to name: Not attained
Indicates his wants: Not attained
Dry by day: Attained
Dry by night: Attained
Dresses unassisted: Not attained

Language
Dada, Mummy: Not attained
Small sentences: Not attained
Story telling: Not attained

Immunization History
The child was immunized as per schedule without fail.

Dietetic History
The child was exclusively breastfed up to 6 Months. Weaning started at 6 months with ragi, banana, various fruit juices etc. and he was breastfed till 4 years of age. Now the child takes regular meal including rice, chapati, dal and fruits etc.

Family History
There was a history of consanguineous marriage of mother and father. No other relevant family history.

Personal History
Diet was vegetarian and child had moderate appetite. Bowels and micturition were normal. But toilet-training was not attained and so had complaints of soiling of pants. Sleep was Sound. The child had a habit of making a peculiar sound repeatedly. Allergies of any kind was not reported.

General Examination
On general examination, the child was Hyperactive, not responding to name, making a peculiar sound repeatedly, with lack of socialization and communication, having a normal posture, moderate built and nourishment. Vital signs and Anthropometry were within normal limits.

Head to foot Examination
The head-shape and size appeared normal with no frontal bossing. The Fontanels were closed by 1 ½ year of age, and were non-pulsatile and normal. Hypopigmentation of hair was noted. Normal eyes, low-set ears and normal nasal bridge. Dentition was normal. Neck, Skin, Limbs, Chest, Spine, Abdomen and Genitalia were normal.

Ashtasthana Pareeksha
Nadi: *Vata-Pitta*
Mootram: *Prakrutam*(Normal quantity and normal color)
Malam: *Pinditham with Pandu-sweta varnam*
Jihwa: Normal*, Anupaliptam*
Sabdam: speech not attained
Sparsham: *Snigdha Shit*
Drik: *Prakrut*
Akriti: *Vata-Paittika*

Systemic Examination

On systemic examination it was noted that no any abnormalities seen in Respiratory, Cardiovascular, Gastro-intestinal, and Urogenital system. CNS was affected. On the basis of domain of Developmental Functions of the child, Appearance and behavior were noted as Hyperactive, Inattentive child, making a particular sound repeatedly, and with poor socialization and communication. A lack of memory and Intelligence was noted. Impairment in both verbal and non-verbal communication was noted. The child was conscious with no delusion, Illusion and Hallucination and he was oriented to time and place. The Cranial Nerves, Motor system, Reflexes, Sensory system and gait were normal.

Ahara: *Abhyavaharana-Pravara; Jarana-Pravara*

Assessment of Disease

Autism Treatment Evaluation Checklist score (ATEC)

The Autism Treatment Evaluation Checklist (ATEC) was developed by Bernard Rimland and Stephen M. Edelson of the Autism Research Institute. The ATEC is a one-page form designed to be completed by parents, teachers, or caretakers. It consists of 4 subscales namely Speech/Language Communication with 14 items, Sociability with 20 items, Sensory/ Cognitive. Awareness with 18 items and Health/Physical/Behavior with 25 items. Questions in the first three subscales are scored using a 0–2 scale. The fourth subscale, Health/Physical/Behavior, is scored using a 0–3 point scale. The scores from each subscale are combined in order to calculate a Total Score, which ranges 0–179 points. A lower score indicates a lower severity of ASD symptoms. This questionnaire is designed to measure the changes in severity of ASD in response to treatment.

Indian Scale for Assessment of Autism (ISAA)

ISAA is an objective assessment tool for persons with autism which uses observation, clinical evaluation of behaviour, testing by interaction with the subject and also information supplemented by parents or caretakers in order to diagnose autism. ISAA consists of 40 items rated on a 5-point scale ranging from 1 (never) to 5 (always). The 40 items of ISAA are divided under six domains as given below. Domain-I Social Relationship and Reciprocity, Domain-II Emotional Responsiveness, Domain-III Speech - Language and Communication, Domain-IV Behaviour Patterns, Domain-V Sensory Aspects, Domain-VI Cognitive Component

Follow up Remarks and Result

Evaluation of treatment outcome using Autism Treatment Evaluation Checklist (ATEC) (Table No: 1). Evaluation of treatment outcome using Indian Scale for Assessment of Autism (ISAA) (Table No: 2)

Treatment protocol

***Shaman* therapy**

Shaman therapy in autism include internal medications which decreases the progression of disease. Shaman therapy rejuvenates the body's core functions, restores equilibrium, and revives the system harmed during any illness or any disorder. It includes the following medication

1.Tab Aurokid plus* 1 tab BD with *Brahmi ghrit*
2.*Saraswatarisht* 5 ml BD with equal quantity of water
3.Tab. *Smrutisagar ras* 1 tab BD with warm water
***Note:** Aurokid plus Tablet is a propriatory medicine of Parul Ayurved Pharmacy, Parul University. Having contents of *Swarna Bhasma, Rajata Bhasma,* and *Sitopaladi churna,* and other herbal drugs.

***Shodhan* therapy**
Shodhan therapy refers to the detoxification of body for the prevention of disease. According to Ayurveda all diseases are due to dosha imbalance that cause Amam or toxins to buildup and spread within the body. Detoxification techniques therefore focus on isolation and elimination of these harmful entities. This creates favourable environment in the body for the improvement of patient's overall health
1. ***Nasya* with *Brahmi ghrit* :** 2 drops at morning*(pratimarsh*)
2.*Shirodhara* with *Mansyadi kwath* for 15-20 min

Mode of action of drugs (Table no: 3)

RESULT AND DISCUSSION

In the present case study, a 7-year-old male child diagnosed with Autism Spectrum Disorder (ASD) underwent Ayurvedic interventions including Shaman and Shodhan therapies. Assessment of the treatment's effectiveness was done using the Autism Treatment Evaluation Checklist (ATEC) and the Indian Scale for Assessment of Autism (ISAA) before and after the treatment course.

ATEC Outcomes
A notable reduction was observed in all four domains—Speech/Language/Communication, Sociability, Sensory/Cognitive Awareness, and Health/Physical/Behavior. The total ATEC score reduced from 100 to 85, indicating significant symptomatic improvement, particularly in sociability and health/behavioral domains.

ISAA Outcomes
Similarly, the ISAA score decreased from 125 to 113, suggesting a positive response to Ayurvedic management. Improvement was seen in key domains such as Social Relationship and Reciprocity, Speech and Communication Aspects. However, Behavior Patterns cognitive components remained unchanged, showing the complexity of this domain and the need for long-term therapy.
The therapeutic approach in Ayurveda focuses on balancing *Tridoshas* and restoring normal function of *Manovaha Srotas,* aligning with the concept of *Unmada* as a close analogue to autism. The child was treated with

- *Shaman* therapy (tab Aurokid plus,*Saraswatarishta and Smrutisagar Ras*), which acted as *Medhya Rasayanas*, promoting memory, cognitive function, and neuroprotection.
- *Shodhan* therapy included *Nasya* with *Brahmi Ghrita* and *Shirodhara* with *Mansyadi Kwath*, targeting higher cerebral centers through transnasal and topical routes.

The *Nasya Karma*, especially with *Brahmi Ghrita*, helped in enhancing cognitive capacity by delivering lipophilic herbal formulations directly to the brain via the olfactory route. *Shirodhara*, a deeply relaxing therapy, possibly reduced the child's hyperactivity and improved emotional responsiveness by modulating the HPA axis and balancing Vata dosha. The case suggests that Ayurvedic intervention can be a promising complementary strategy in managing core features of ASD, especially in domains of communication, sociability, and sensory integration. However, limitations such as lack of a control group, reliance on subjective parental reporting, and short follow-up period must be acknowledged. This study opens avenues for more extensive, controlled clinical trials on Ayurvedic treatments for ASD, incorporating both behavioral metrics and neurophysiological parameters.

CONCLUSION

This case study highlights the promising role of Ayurvedic intervention in the holistic management of Autism Spectrum Disorder (ASD). The therapeutic approach, based on the principles of *Manovaha Srotas dushti*, *Tridosha imbalance*, and the Ayurvedic concept of *Unmada*, demonstrated measurable improvement in the child's symptoms, as evident from reductions in both ATEC and ISAA scores. Ayurvedic therapies—including *Shaman* (*Saraswatarishta, Smrutisagar Ras*) and *Shodhan* procedures (*Nasya* with *Brahmi Ghrita* and *Shirodhara* with *Mansyadi Kwath*)—provided positive outcomes, especially in enhancing social interaction, emotional responsiveness, cognitive awareness, and sensory integration. The child also showed moderate gains in speech and language, though behavioral rigidity remained unchanged, indicating the need for prolonged, sustained treatment. This study reinforces the relevance of Ayurvedic treatments as a safe, individualized, and holistic approach in managing neurodevelopmental disorders like ASD. However, larger clinical studies with standardized tools, long-term follow-up, and interdisciplinary integration are needed to validate and expand upon these findings. Ayurveda, when applied with a scientific outlook, holds great potential as a complementary therapy to improve the quality of life in children with autism and support their functional development.

Table No: 1: Evaluation of treatment outcome using Autism Treatment Evaluation Checklist (ATEC):

Parameters for Evaluation	ATEC Score	
	Before treatment	After treatment
Speech/Language/Communication	25	23
Sociability	26	20
Sensory/ Cognitive awareness	26	25
Health/ Physical/ Behaviour	23	17
Total score	100	85

Table No: 2: Evaluation of treatment outcome using Indian Scale for Assessment of Autism (ISAA):

Parameters for Evaluation	ISAA Score	
	Before treatment	After treatment
Social Relationship and Reciprocity	30	28
Emotional Responsiveness	15	12
Speech Language and Communication	30	25
Behaviour Patterns	20	18
Sensory Aspects	20	20
Cognitive Component	10	10
Total score	125	113

Table no: 3: Mode of action of drugs

Drug	Action
Tab Aurokid plus	*Swarna Bhasma, Rajata Bhasma, Sitopaladi churna,* and herbal drugs with anti-inflammatory action, nootropic properties and many other therapeutic effetcs are all included in *Aurokid plus* Tablets. *Swarna Bhasma* has been scientifically proven to have free-radical scavenging activity; in an animal study, it significantly lowers the whole brain AChE activity of both young and old mice when compared to the corresponding control group. It also helps to improve memory and cognition function, which are primarily compromised in epilepsy patients[1]. Gao *et al*.[2] proved that gold in nano-size particle has protective effects against Parkinson's disease. They showed that gold nanocluster inhibits the aggregation and fibrosis of α-synuclein in cell culture study(α-Synuclein protofibrils disrupt cellular homeostasis and mediate neuronal death via intracellular targets)[3]. It is thought that the nanoparticles in colloidal gold have an impact on the electrical charges generated in neurons. It enhances the normal synaptic communication that taking place between the neurons. This enhancement is believed to be responsible for the increased brain functions[4] which is affected in most cases of epilepsy. Inhibited prostaglandin synthesis, two epidermal enzymes, acid phosphatase and tryptophangyl t-RNA synthetase, were also inhibited by gold nanoparticles[5] also describes anti-inflammatory action of Swarna bhasma[6]. *Swarna Bhasma is Vrishya, Brimhana, Medhya, Hridya, Balya, Rasayan, Vajikarana, Smritiprada, Tridoshaghna, Yogavahi, Chakshusya, Ojovridhhikara etc.* by all this karma of *Swarna Bhasma* it acts as a neuroprotective and neuronal regeneration activity is also seen. *Rajata Bhasma* having Anti-inflammatory, Anti-microbial and anti-oxidant[7] activity helps in *Apasmara*. Various karma (actions) of *Rajata Bhasma* mentioned are *Balya, Rasayana, Medhya, Daahahara , Ayushya , Ojo Vardhaka, Vayah sthapaka* etc[8] and by this *karma* it is useful in *Smritinasha, Unmada, Apasmara, Nidranasha, Vatarogas,* etc[9]. . By virtue of its *Smritivardhaka* and *Medhyakara* properties, it might have shown the significant result on Memory Scale subtests. Additionally, it has been claimed that by stimulating the enzymes responsible for producing H 2 S, silver nanoparticles reduce neurotoxicity and inflammation in the brain[10]. All AgNPs concentrations are showing better ABT radical scavenging activity. Further, AgNPs showed effective antibacterial action against both gram negative and gram positive bacteria and anti-proliferative activity toward A549 human lung cancer (CCL-185) and MCF-7 human breast cancer (HTB-22) cell lines[11]. *Sitopaladi churna* acts as an anti-inflammatory, anti-oxidant, anti-allergic and immuno-modulatory effects. Effect of *Sitopaladi churna* on mast cells degranulation was studied by administering the *churna* in rats is reported. In animal study, Antihistaminic and anti-inflammatory activity of *Sitopaladi churna* extract is also reported[12]. According to the data, Sitopaladi churna reacts with hydrogen donors in extract antioxidant principles, reducing the radical to its corresponding hydrazine[13]
Saraswatarisht	Enhances cholinergic neurotransmission, improving memory and cognitive function. Scavenges free radicals and suppresses inflammation, protecting neurons from oxidative damage. Modulates NMDA receptor signaling via D-serine, supporting synaptic plasticity and avoiding excitotoxicity. Inhibits DLK, a kinase linked to neurodegeneration—offering a potential disease-modifying mechanism.Interacts with cholinergic receptor pathways, through active phytochemicals, enhancing overall neural signaling[18 19]. *Saraswatarista* is having the components with actions like *Medhya Rasayana,* antistress, adaptogenic, CNS depressant, hypnotic, anxiolytic, and sedative actions[20 21].
Smrutisagar ras	*Smrutisagar ras* helps in neuroprotective, nootropic, and antioxidant actions that help preserve memory and reduce oxidative stress and amyloid-β deposition in the brain[22]. It improves cognitive, Anxiety and sleep quantity[23].
Bramhi ghrit	*Brahmi ghrit* significantly acts in memory and learning enhancement[24]. *Ghrita* contains DHA, an omega 3 long chain polyunsaturated fatty acid, which are high concentration in brain cells too. *Ghrita* is known to have antioxidant property which acts upon the deteriorating brain cells and

	repair them[25]. *Ghrit* improves *Medha* and *Buddhi* (cognitive functions), which helps with cognitive impairment. *Ghrita* is regarded as the best among *chaturvidhaSneha Dravyas (Ghrita, Taila, Vasa,* and *Majja*). It is a *Rasayana Dravya* and promotes memory and Intelligence when consumed regularly[26 27].
Mansyadi kwath	*Mansyadi kwath* contains *Jatamansi*(*Nardostachys jatamansi*), *Ashwagandha* (*Withania somnifera*), *Khurasani Ajwain* (Chinese henbane, *Hyoscyamus niger*) All three herbs contain bioactive compounds which Scavenge free radicals, Reduce neuroinflammation, Support overall neuronal health. This supports long-term cognitive and emotional balance.it is traditionally used for memory improvement and neuroprotection,it helps in relieving stress and anxiety[28 29]. It also posseses anti-depressant activity[30].

ABSTRACT

Bioactive metabolites represent a diverse class of compounds derived from natural sources, offering significant therapeutic potential in addressing chronic diseases, antimicrobial resistanceand health optimization. This comprehensive review explores the origins, biological activities, extraction, purification and applications of these metabolites. Recent discoveries highlight novel metabolites, such as 2-furoic acid from endophytic fungi for nematocidal activity and streptoseomycin from marine bacteria for antibacterial effects, underscoring their role in drug development. Conventional extraction methods, including solvent-based techniques like maceration and Soxhlet, are contrasted with advanced green approaches such as supercritical fluid extraction, ultrasound-assisted extraction and microwave-assisted extraction, which enhance yield, sustainability, and purity while minimizing environmental impact. Purification strategies, encompassing high-performance liquid chromatography, gas chromatography and ion-exchange chromatography, ensure high-purity isolates for pharmaceutical and biotechnological

uses. Factors influencing efficiency, such as solvent polarity, temperature, matrix characteristics, and optimization tools like response surface methodology are critically analyzed. The global market for bioactive metabolites, valued at USD 40 billion in 2022 and projected to reach USD 55 billion by 2028, is driven by rising chronic illnesses and biotechnological advancements. This review emphasizes the need for sustainable sourcing and innovative technologies to harness these compounds for safer therapeutics, nutraceuticals, and cosmetics, bridging traditional knowledge with modern science for improved human wellness.

Keywords: Secondary Metabolites, Natural Products, Pharmacological Applications, Green Extraction, Biotechnology, Sustainable Sourcing

Graphical Abstract(Figure 1)

INTRODUCTION

Bioactive metabolites are fascinating class of compounds that have garnered significant attention owing to their promising biological activities. Numerous valuable metabolites are naturally produced by plants, microbes and marine organisms that exhibits various therapeutic potential including anti-aging, antioxidant, anti-cancer, protection against DNA damage properties. A promising avenue for the development of novel therapeutic agents is offered by the marine environments which is a rich reservoir of novel bioactive compounds due to its unique conditions and extensive biodiversity [1]. Microbes produce special secondary metabolites in response to environmental stressors that exhibits for biotechnological and pharmaceutical applications [2]. Seaweeds are attracting the interest of scientists because of their bioactive chemicals and their antiviral, antitumor, anti-inflammatory and antilipidemic characteristics [3]. Extracts from seaweed, humic substances, protein hydrolysates, amino acids, plant extracts and beneficial microorganisms have become important bio-stimulants and bioprotectants due to their beneficial effects on plant growth and their capacity to mitigate the negative effects of various abiotic and biotic stressors. Investigating the bioactive metabolites of marine algae has turned up a wealth of substances with a wide range of biological activity [4]. Naturally derived bioactive metabolites are gaining greater significance because of their unique modes of action and fewer adverse effects especially in light of the increase in resistance to synthetic medications. Numerous of these substances have shown promise in the treatment of complicated illnesses as for example, omega-3 fatty acids from fish and algae offer cardiovascular protection whereas paclitaxel which is derived from Taxus species is a well-known chemotherapeutic drug[5].

Bioactive metabolites are also essential for immunosuppression, antibacterial treatment and neuroprotection [6]. For instance, cyclosporine, which comes from Tolypocladiuminflatum is frequently used to stop organ transplant rejection whereas resveratrol promotes neuronal survival and it is found to be useful in neurodegenerative diseases [7]. The importance of natural sources in drug development and therapeutic breakthroughs is highlighted by the fact that over 50% of approved medications come from them. Modern medicine will continue to use these metabolites because of the large-scale and sustainable production which is made possible by biotechnology breakthroughs like synthetic biology and microbial fermentation [8]. In order to create safer and more efficient treatment options, the investigation of bioactive metabolites will continue to be crucial as research advances. The growing need for safe and efficient treatments in a variety of industries is fuelling the dynamic and quickly changing global market for bioactive metabolites with therapeutic activity. This market which was valued at around USD 40 billion in 2022 is expected to increase at a compound annual growth rate (CAGR) of 6.5% from 2023 to 2028, reaching almost USD 55 billion. The increasing incidence of chronic illnesses like diabetes and cancer, the move towards natural goods in medicines, nutraceuticals, cosmetics, technological developments like high-throughput screening, synthetic biology and CRISPR are some of the major growth drivers [9]. The global market for bioactive metabolites is divided into segments as per its application and source. Plants account for the largest portion of sources because of their long history of usage in medicineas demonstrated by substances like curcumin and paclitaxel.

Due to fermentation technologies that generate vital compounds like statins and penicillin, microbes have emerged as a rapidly expanding category. Marine life fills a new need by providing special bioactive substances made from algae and sponges. The pharmaceutical industry leads in terms of applicability, concentrating on the development of drugs for chronic illnesses whereas the nutraceutical industry is expanding quickly as a result of growing consumer interest in immune-boosting substances like resveratrol [10]. The demand for bioactive components like tea tree oil and aloe vera that have anti-aging and skin-care properties is also rising in the cosmetics sector [11]. Due to substantial R and D expenditures and a robust pharmaceutical infrastructure, North America dominates the market for bioactive metabolites. Europe follows next owing to their favourable regulatory environments for natural products. The fastest-growing market is in the Asia-Pacific area which is being driven by the merger of traditional medicine and rising healthcare systems. Due to the vast biodiversity, Latin America, the Middle East and Africa have enormous potential but they face sustainability issues [12]. Pharmaceutical behemoths like Novartis, Pfizer and Merck are important participants which pay a huge contribution on developing drugs for natural products whereas BASF and DSM are experts in nutraceuticals. Businesses such as Ginkgo Bio-works use synthetic biology to maximise the production of metabolites. Collaborations between academics and industry help bioprospecting and commercialisation initiatives even more [13]. Advances in biotechnology and the growing demand for natural therapies are expected to propel the market's steady rise. Crucial elements influencing the growth of future includes cross-sector cooperation, sustainability and ethical sourcing. The transforming influence of paclitaxel, penicillin, and statins is demonstrated by success stories and the COVID-19 pandemic has increased interest in immune-supporting nutraceuticals. Unlocking innovations in wellness and healthcare will require striking a balance between innovation and sustainability [14]. This review provides a comprehensive understanding of the biological metabolites and their therapeutic potential with a special emphasis on its extraction process.

Recent discoveries of new metabolites

Recent discoveries of metabolites with therapeutic potential have significantly advanced drug development, particularly from microbial and marine sources. Endophytic fungi, such as *Dactylellinahaptotyla* and *Chaetomium globosum*, have yielded compounds like 2-furoic acid and flavipin, demonstrating nematocidal and anticancer activities, respectively, by targeting specific physiological pathways like nematode disruption and NF-κB-mediated apoptosis. Marine-derived bacteria, including *Streptomyces* and *Bacillus* species, have produced metabolites such as streptoseomycin and micrococcin P3, which exhibit potent antibacterial and antibiofilm properties through mechanisms like cell wall synthesis inhibition and quorum sensing disruption. Additionally, fungal metabolites like lasiodiplactone A and thielavins A, J, K from *Lasiodiplodia theobromae* and other endophytes show promise in anti-inflammatory and antidiabetic applications by inhibiting key enzymes like COX-2 and α-glucosidase. These findings, detailed in table 1 underscore the vast potential of novel metabolites in addressing diverse health challenges, from infectious diseases to chronic conditions.

Extraction Methods of Metabolites of Biological Origin

Extraction is the critical process of isolating these metabolites from complex biological matrices—such as plant tissues, fungal mycelia, bacterial cultures, or marine sediments—while preserving their chemical integrity and bioactivity. Dating back to ancient practices like herbal infusions, as noted in biochemical histories, extraction has evolved to meet modern demands for efficiency, purity, scalability, and sustainability. Ineffective extraction risks low yields, degradation, or contamination, compromising applications like drug discovery or metabolomics-based biomarker identification [18]. The choice of method impacts yield, purity, and environmental footprint. Traditional solvent-based methods, while effective, often rely on toxic organic solvents, posing environmental and health risks [19, 20]. In contrast, green extraction principles—emphasizing renewable solvents, energy efficiency, and waste minimization—align with sustainable biomass valorization [16]. Seasonal variations and storage conditions, as seen in *Terminalia ivorensis*, significantly alter phytochemical profiles [21]. Recent advancements integrate metabolomics using tools like FT-ICR-MS for precise metabolite identification and ion-exchange chromatography with mass spectrometry for purification [18, 22]. This explanation elaborates on extraction methods sub-topic wise, detailing principles, procedures, applications, advantages, limitations, and optimizations, supported by recent literature [23].

Conventional Extraction Methods: Conventional methods rely on basic physicochemical principles like solubility and diffusion, offering accessibility and simplicity but often suffering from inefficiencies, high solvent use, and environmental concerns [13, 15, 24].

Solvent Extraction Techniques: Solvent extraction leverages the differential solubility of metabolites in polar or non-polar solvents to isolate them from biological matrices. Sub-variants include maceration, percolation, and Soxhlet extraction, each suited to specific sources and compound classes. Maceration involves soaking finely ground biological material (e.g., plant leaves, fungal biomass) in a solvent such as water, ethanol, methanol, or their mixtures at ambient or slightly elevated temperatures (20-40°C) for hours to weeks. The process relies on diffusion driven by concentration gradients, where metabolites dissolve into the solvent via osmosis. Mechanical agitation (e.g., stirring, vortexing) or sequential extractions with solvents of increasing polarity (hexane for terpenoids, ethyl acetate for flavonoids) enhance yield and enable fractionation. Maceration is ideal for thermolabile compounds like polyphenols from red seaweeds [13] or antifeedant bioactives from Penicillium sp. for pest control against Spodoptera litura. Its simplicity and low cost make it suitable for lab-scale studies, but drawbacks include prolonged extraction times (risking microbial growth), high solvent consumption (100-500 mL/g sample), and incomplete recovery of bound metabolites [15]. Optimizations include pH adjustment (e.g., acidic for alkaloids to form soluble salts) or pre-treatment with enzymes to disrupt cell walls. For instance, maceration has been used to extract dietary polyphenols with antioxidant effects for disease management. In practice, the method requires careful solvent selection based on metabolite polarity and matrix type, with ethanol-water blends (70:30) often optimal for phenolics [21].

Percolation improves efficiency by passing fresh solvent continuously through a packed bed of powdered material in a percolator, a conical vessel that facilitates solvent flow. The dynamic setup maintains a concentration gradient, extracting metabolites faster than static maceration (2-12 hours). It's effective for plant-based compounds like Apocynaceae phytochemicals with antidiabetic activity or marine natural products for drug development. Yields can be 20-40% higher than maceration due to solvent renewal, and it's scalable for industrial applications. However, channeling (uneven solvent flow) and the need for post-filtration to remove particulates reduce efficiency [21]. Recent studies apply percolation to fungal endophytes, yielding therapeutic compounds like antimicrobials. Solvent choice (e.g., methanol for polar alkaloids) and particle size (<1 mm) are critical for maximizing surface area and contact [13].
Soxhlet extraction, developed in 1879, is a semi-continuous method where the sample is placed in a porous thimble within a heated apparatus; solvent vaporizes, condenses, percolates through the sample, and siphons back after filling, recycling the solvent [14, 15]. Operating at boiling points (e.g., 65°C for methanol), it achieves near-complete extraction of lipids, carotenoids, or terpenoids over 6-24 hours [24]. It's widely used for pomegranate phenolics with health benefits [15] and Trichoderma metabolites with antimicrobial properties [23]. The continuous solvent cycling ensures high yields (up to 90-95% recovery), and automation reduces labor. However, high temperatures risk degrading heat-sensitive compounds (e.g., volatile oils), and the use of organic solvents like chloroform poses toxicity risks [20]. Green adaptations employ ethanol or supercritical CO2 [16]. Limitations include high energy consumption (200-500 W) and long durations, making it less sustainable than modern methods [15].

Distillation Techniques: Distillation methods isolate volatile metabolites like essential oils, monoterpenes, or aromatics by vaporizing and condensing them based on boiling points [8, 19].Steam distillation passes steam through the biological material in a still, volatilizing metabolites that co-distill with water vapor, then condense into a receiver where oils separate by density. It avoids direct boiling, reducing thermal degradation, and is ideal for marine polyphenolsor plant essential oils with antimicrobial properties for cosmetics. The process takes 3-6 hours, yielding 0.5-5% oil by weight. Hydrodistillation, a variant, immerses the material in boiling water, generating steam in situ, suitable for robust fungal or algal matrices [13]. Both methods are water-based, aligning with green principles, but consume significant water (10-50 L/kg) and energy (500-1000 W) [16]. Limitations include hydrolysis of esters, oxidation of volatiles, and emulsion formation requiring demulsifiers [15]. Vacuum distillation lowers boiling points, preserving sensitive compounds [21]. Applications include biosurfactants for environmental bioremediation.

Advanced and Green Extraction Techniques: Advanced techniques integrate physical, chemical, or biological aids to enhance speed, selectivity, yield, and sustainability, reducing solvent use by 50-90% and time from hours to minutes [12, 16]. These align with the 12 green extraction principles: renewable feedstocks, safe solvents, energy efficiency, and waste minimization [16].Supercritical Fluid Extraction (SFE)employs supercritical fluids, typically CO2, which at its critical point (31°C, 74 bar) exhibits gas-like diffusivity and liquid-like solvency, penetrating matrices and dissolving metabolites [16, 24]. The setup includes a high-pressure pump, extraction vessel, and separator; CO2 extracts metabolites in 15-60 minutes, then depressurizes, leaving no residue. Co-solvents like ethanol (5-15%) enhance polarity for compounds like flavonoids. SFE excels for non-polar to mid-polar metabolites, such as bacterial carotenoids for food/pharma applications or marine micronutrients [24].

It's used for Trichoderma bioactives and pomegranate phenolics [15, 23]. Advantages: solvent-free extracts, tunable selectivity (via pressure 100-500 bar, temperature 40-60°C), and eco-friendliness (CO2 is recycled). Yields can exceed Soxhlet by 10-30% for lipids [24]. Limitations: high equipment costs ($100,000-$1M), limited polarity range without modifiers, and scalability issues for polar glycosides [13]. Hybrid SFE-UAE systems improve yields for fungal endophytes. Ultrasound-Assisted Extraction (UAE)uses ultrasonic waves (20-100 kHz) to induce cavitation: microbubbles form, implode, and generate localized pressures (1000 atm) and temperatures (5000 K), disrupting cell walls for rapid metabolite release [21]. A probe or bath sonicates the sample-solvent slurry (5-30 min), typically with aqueous ethanol (30-70%) [13]. UAE enhances yields by 20-50% over maceration, reduces solvent use, and is ideal for fungal antimicrobials endophytic bioactives or Apocynaceae phytochemicals. Applications include antifeedant compounds from Penicillium and dietary polyphenols. Pros: non-thermal (preserves thermolabile compounds), green (water-based solvents), and scalable. Cons: prolonged sonication generates free radicals, degrading antioxidants, and equipment maintenance is needed [15]. Optimizations include pulse modes (e.g., 5s on/off) and temperature control (<60°C) [16, 21]. UAE outperforms MAE for certain phenolics in red seaweeds [13].Microwave-Assisted Extraction (MAE)applies microwave energy (2.45 GHz) to heat polar solvents and matrices dielectrically, causing molecular rotation, friction, and cell rupture [15, 16].

Open (atmospheric) or closed (pressurized, 2-10 bar) systems extract in 30 seconds to 15 minutes with solvents like methanol-water (50:50) [13]. MAE excels for flavonoids mitigating food toxins [10], marine natural products [8], or red seaweed compounds, yielding 2-3 times more than maceration. In pomegranate, MAE optimizes phenolic extraction [15]. Advantages: rapid, uniform heating, low solvent (10-50 mL/g), and green potential with aqueous systems. Disadvantages: overheating risks (degrading glycosides), uneven heating in large samples, and equipment costs ($10,000-$50,000) [21]. Hybrid MAE-UAE enhances versatility for fungal endophytes.Pressurized Liquid Extraction (PLE), or accelerated solvent extraction, uses high pressure (100-200 bar) and temperature (50-200°C) to keep solvents liquid, enhancing penetration and solubility [13, 16]. Automated systems cycle solvent (e.g., ethanol-water) through a sample cell, extracting in 5-20 minutes with 10-50 mL [15]. PLE is ideal for polar metabolites like polyphenols [6] or algal bioactives achieving high purity and yields (80-95%). Pros: automation, low solvent/waste, and fast. Cons: thermal degradation at high temperatures and safety concerns with high-pressure systems [13, 21]. It's applied to Terminalia phytochemicals and fungal endophytes. Enzyme-Assisted Extraction (EAE)employs enzymes like cellulases, pectinases, or proteases to hydrolyze cell wall components (cellulose, pectin, proteins), releasing bound metabolites [20]. The sample is incubated with enzymes (1-4 hours, 40-60°C, pH 4-6) before solvent extraction [13].

EAE boosts yields 30-100% for glycosylated compounds like flavonoids or plant toxic proteins [20]. It's used for Apocynaceae extracts and marine polyphenols. Advantages: specificity, mild conditions, and eco-friendliness. Limitations: enzyme costs ($10-100/kg), specificity requirements, and potential allergenicity [16]. Hybrid EAE-UAE/MAE systems enhance efficiency [15].Ionic liquids (ILs, e.g., imidazolium salts) and deep eutectic solvents (DES, e.g., choline chloride-urea) are tunable, non-volatile solvents for green extraction [16, 19]. The sample is mixed with IL/DES, heated/stirred (30-60°C, 30-120 min), and separated via centrifugation. Natural DES (NADES, e.g., glucose-fructose) mimic cellular environments, enhancing solubility of polyphenols [13, 21]. Applications include

dietary polyphenols and biosurfactants. Pros: high efficiency, recyclability, and low toxicity. Cons: high viscosity and purification challenges [15]. Yields for phenolics can be 10-20% higher than ethanol-based methods [16].

Purification and Isolation Methods

Purification and isolation of metabolites from crude biological extracts are pivotal for obtaining high-purity compounds (>95%) suitable for structural characterization, bioactivity assays, pharmaceutical development, and commercial applications. These processes separate target metabolites—such as alkaloids, flavonoids, terpenoids, or biosurfactants—from complex matrices containing impurities like lipids, proteins, pigments, and polysaccharides. The choice of method depends on the metabolite's physicochemical properties, including polarity, charge, molecular weight, and stability, with modern techniques leveraging high-throughput, precise, and automated systems to address the chemical diversity of secondary metabolites from plants, fungi, bacteria, and marine organisms. Historical approaches, such as fractional crystallization, were labor-intensive and low-yield, but recent advancements integrate chromatography, spectroscopy, and computational tools for enhanced efficiency and scalability.

Liquid Chromatography (LC), particularly high-performance liquid chromatography (HPLC), is the gold standard for metabolite purification. HPLC employs columns packed with stationary phases like silica, C18 reversed-phase, or ion-exchange resins, using mobile phase gradients (e.g., methanol-water with 0.1% trifluoroacetic acid) to separate compounds based on hydrophobicity, size, or charge. For instance, reversed-phase HPLC isolates non-polar terpenoids or polyphenols in 10-60 minutes, with UV-Vis or mass spectrometry (MS) detectors identifying peaks at nanogram sensitivity. Preparative HPLC scales up for gram-scale isolation, using larger columns (10-50 mm diameter, flow rates 5-100 mL/min), as applied to fungal endophytic compounds with anticancer potential [11, 12]. Challenges include solvent consumption (liters per run) and column fouling, mitigated by pre-filtration or guard columns, reducing matrix effects by 70-90% [13]. Gradient optimization and column regeneration enhance reproducibility [14].Gas Chromatography (GC)targets volatile metabolites like essential oils or monoterpenes, vaporizing samples for separation on capillary columns (e.g., DB-5, 30 m) coupled with MS (GC-MS) for structural elucidation [15, 16]. GC-MS achieves picogram-level detection, ideal for analyzing bacterial carotenoids [17], but non-volatile compounds require derivatization (e.g., silylation), adding complexity [18].

Thin-Layer Chromatography (TLC) serves as a rapid scouting tool, spotting extracts on silica plates developed with solvent systems (e.g., hexane-ethyl acetate), visualized via UV or chemical stains like anisaldehyde for terpenoids [19, 20]. TLC guides fraction selection for subsequent HPLC, reducing analytical time by 50% [21].Ion-Exchange Chromatography (IEC) isolates charged metabolites, using anion-exchange (e.g., DEAE-cellulose) or cation-exchange (e.g., CM-cellulose) resins to bind ions, eluting with salt gradients (NaCl 0.1-1 M) or pH shifts [22, 23]. IEC-MS is critical for amino acid-derived metabolites in medical research, offering high specificity [24].Size-Exclusion Chromatography (SEC) separates based on molecular size using porous gels like Sephadex or Superdex, ideal for peptides or polysaccharides from microbial sources, with yields up to 80% [25, 26]. Solid-Phase Extraction (SPE) pre-purifies extracts via cartridges (C18, silica), selectively eluting metabolites to remove 80-90% of matrix impurities before HPLC, as used for lipid metabolites in extracellular vesicles for diagnostics [27, 28].Affinity Chromatography exploits specific interactions, such as lectin columns for glycoproteins or immobilized metal affinity for tagged proteins, though less common for natural metabolites due to specificity requirements [29].

Counter-Current Chromatography (CCC), a liquid-liquid partitioning method, avoids solid supports, using biphasic solvents (e.g., hexane-water) for gentle separation of marine polyphenols, achieving >90% purity without adsorption losses [30, 31]. Flash Chromatography scales up purification with automated systems, processing 10-100 g of extract rapidly, suitable for industrial isolation [32].Nuclear Magnetic Resonance (NMR) confirms structures post-fractionation, resolving stereoisomers via 2D-NMR (COSY, HSQC) [33, 34]. Mass Spectrometry (MS), especially LC-MS/MS, provides molecular weights and fragmentation patterns with sub-ppm accuracy, crucial for complex plant metabolomes [35, 36]. Multidimensional chromatography (2D/3D-LC) resolves co-eluting isomers, increasing peak capacity by 10-fold, as in fungal secondary metabolites [37]. Bioassay-guided fractionation prioritizes active fractions, streamlining drug discovery [38]. Challenges include equipment costs ($50,000-$500,000 for HPLC-MS) and method

development time, addressed by automated fraction collectors and AI-driven peak analysis [39, 40]. These methods collectively ensure high-purity isolates for applications from nutraceuticals to therapeutics [41].

Factors Influencing Extraction Efficiency

Extraction efficiency, encompassing yield (mg/g biomass), purity, and bioactivity retention, is determined by a complex interplay of physicochemical, biological, and operational factors. Optimizing these can increase yields by 20-80% while preserving metabolite integrity, critical for downstream applications like metabolomics or pharmaceutical production [42, 43]. Suboptimal conditions may lead to degradation (e.g., oxidation of flavonoids) or low recovery (10-30% losses), necessitating tailored protocols [44, 45].

Solvent Properties: Polarity governs solubility; polar solvents (water, methanol, ethanol) extract hydrophilic compounds like polyphenols, while non-polar solvents (hexane, dichloromethane) target lipophilic terpenoids [46, 47]. Ethanol-water mixtures (70:30) optimize broad-spectrum extraction, increasing yields by 30-50% for plant or fungal matrices [48, 49]. pH adjustments enhance selectivity: acidic pH (2-4) protonates alkaloids for organic phase solubility, while basic pH (8-10) deprotonates phenolics [50, 51]. Ionic strength, via salts like NaCl, promotes "salting out" of hydrophobic biosurfactants, improving recovery by 15-25% [52].

Extraction Parameters: Temperature accelerates diffusion but risks degrading thermolabile compounds; maintaining <60°C in UAE or MAE preserves antioxidants like pomegranate phenolics [53]. High pressure (100-200 bar in PLE) enhances solvent penetration, boosting yields by 20-50% for dense matrices [55, 56]. Extraction time balances completeness and stability: short durations (5-30 min in UAE) suit volatiles, while longer times (hours in maceration) extract bound glycosides [57, 58]. Agitation (500-1000 rpm) or sonication increases mass transfer by disrupting boundary layers, enhancing diffusion coefficients by 2-3 times [59].

Matrix Characteristics: Moisture content affects extraction; drying to <10% prevents hydrolysis, as in fungal endophytes [60, 61]. Metabolite localization (intracellular vs. extracellular) dictates pre-treatments; enzyme digestion (cellulases) increases yields by 50% for bound fungal metabolites [62]. Interfering substances like tannins form complexes, reducing yields by 10-20%, mitigated by polyvinylpyrrolidone (PVP) addition [63, 64]. Particle size (<1 mm) maximizes surface area, improving extraction efficiency by 15-30%, but ultrafine powders cause clogging [65, 66].

External Conditions: Seasonal variations alter metabolite content; summer-harvested plants like *Terminalia ivorensis* yield 20-40% more phenolics due to UV-induced biosynthesis [67, 68]. Storage at 4°C, dark, and dry conditions preserves volatiles, with vacuum sealing reducing degradation by 90% [69, 70]. Biological variability, such as microbial strain differences, requires tailored protocols, as in gut metabolite extraction [71].

Optimization Tools: Response surface methodology (RSM) models variables (e.g., solvent ratio, temperature) to maximize yields, achieving >80% efficiency via factorial designs [72, 73]. Pre-treatments like freeze-drying or microwave drying enhance accessibility, while desalination is critical for marine matrices to reduce osmotic interference [74]. Efficiency is quantified as: yield = (extracted amount / total amount) × 100, with standardized protocols reducing variability in metabolomics studies [75]. Neglecting these factors leads to inconsistent results, underscoring the need for precision in method design.

CONCLUSION

Bioactive metabolites, derived from diverse natural sources such as plants, microbes, marine organisms, and fungi, represent a cornerstone of therapeutic innovation and sustainable health solutions. This review has illuminated their profound biological activities, including antimicrobial, anticancer, anti-inflammatory, and neuroprotective effects, as exemplified by recent discoveries like 2-furoic acid from endophytic fungi for nematocidal applications and

streptoseomycin from marine bacteria for combating bacterial resistance. These compounds underscore the untapped potential of nature's biodiversity in addressing global health challenges, from chronic diseases to antimicrobial resistance, with over 50% of approved drugs tracing their origins to natural products. Advancements in extraction and purification methodologies have revolutionized their isolation, transitioning from conventional solvent-based techniques like maceration and Soxhlet extraction—effective yet environmentally burdensome—to green alternatives such as supercritical fluid extraction, ultrasound-assisted extraction, and microwave-assisted methods. These innovations enhance yield, purity, and sustainability by minimizing solvent use, energy consumption, and waste, while preserving bioactivity. Purification strategies, including HPLC, GC-MS, and ion-exchange chromatography, ensure high-purity isolates essential for pharmaceutical and biotechnological applications. Factors influencing efficiency, such as solvent polarity, temperature, matrix characteristics, and optimization tools like response surface methodology, highlight the need for tailored protocols to maximize outcomes. The global market for bioactive metabolites, valued at USD 40 billion in 2022 and projected to reach USD 55 billion by 2028, is propelled by rising chronic illnesses, biotechnological progress, and consumer demand for natural therapeutics in nutraceuticals and cosmetics. However, challenges like sustainable sourcing, ethical bioprospecting, and scalability persist. Bridging traditional knowledge with modern science through interdisciplinary collaborations and technologies like synthetic biology will be pivotal. Future research should prioritize eco-friendly practices, comprehensive metabolomics, and clinical validations to unlock safer, more efficacious treatments, fostering human wellness and environmental harmony in an era of health optimization.

Table 1: Therapeutic potential of recently discovered metabolites

Biological Source	Metabolite Name	Therapeutic Activities	Mechanism of Action	Reference
Dactylellina haptotyla (endophytic fungus)	2-Furoic acid	Nematocidal	High nematicidal activity against Meloidogyne incognita, reduces root galls on tomatoes (LD50 55.05 μg/mL after 48h) by disrupting nematode physiology.	[15]
Monascus purpureus and *Aspergillus oryzae* (fermentative fungi)	Monaspin B	Antileukemic, anti-inflammatory, neuroprotective	Potent antiproliferative activity against HL-60 cells (IC_{50} 160 nM), reduces WBC, lymphocyte, and neutrophil counts in vivo via modulation of inflammatory pathways.	[15]
Inonotus obliquus (medicinal mushroom)	2α-Hydroxy-inotodiol (2α-HI)	Neuroprotective	Mitigates oxidative stress and apoptosis in SH-SY5Y cells via Nrf2, BDNF/TrkB/ERK/CREB signaling pathways, enhancing antioxidant defenses.	[15]
Neosartorya fischeri (marine fungus)	Sartorypyrone E	Neuroprotective	Inhibits ROS accumulation and calcium ion influx, reducing glutamate-induced cell death in HT22 cells by stabilizing cellular homeostasis.	[15]
Bipolaris maydis (plant pathogen fungus)	Ophiobolin-type sesterterpenoids	Immunosuppressive	Enhances phagocytosis, cytokine production, and antioxidant activity, potentially modulating immune responses for immunosuppressive therapies.	[15]
Aspergillus fumigatus (opportunistic pathogen)	Gliotoxin	Self-protection, antifungal	Regulated by MpkA, contributes to fungal virulence by inducing apoptosis in host cells via ROS generation.	[15]

Penicillium griseofulvum (soil fungus)	Griseofulvin analogues	Anti-inflammatory	Suppresses inflammatory mediators like NO and prostaglandins by inhibiting NF-κB pathway.	[15]
Streptomyces seoulensis A01 (marine bacterium)	Streptoseomycin	Antibacterial	Effective against various bacteria (MICs 2-64 μg/mL), disrupts bacterial cell wall synthesis.	[15]
Streptomyces sp. CB02980 (marine-derived)	Pyrroloformamides C and D	Antibacterial	Moderate activity against S. aureus, MRSA, E. coli, K. pneumoniae by interfering with bacterial DNA replication.	[16]
Streptomyces sp. CMN-62 (marine)	Anthranosides A, B, and C	Antiviral	Anthranoside C inhibits influenza A H1N1 (IC50 171 μM) by blocking viral entry and replication.	[16]
Microbulbifer sp. DC3-6 (marine bacterium)	Bulbimidazoles A, B, and C	Antibacterial	Active against Kocuriarhizophila and S. aureus, likely targeting bacterial protein synthesis.	[16]
Aspergillus sp. (marine-derived)	Dehydroxychlorofusarielin B	Antibacterial	Effective against MRSA and MDR S. aureus by disrupting bacterial membrane integrity.	[16]
Marine-derived Streptomyces	Elasnin	Antibiofilm	Inhibits biofilm formation by quorum sensing disruption, used in marine antifouling coatings.	[16]
Marine-derived *Bacillus stratosphericus*	Micrococcin P3	Antibiotic	Targets bacterial ribosome, inhibiting protein synthesis in Gram-positive bacteria.	[16]
Lasiodiplodia theobromae (endophytic from *Acanthus ilicifolius*)	Lasiodiplactone A	Anti-inflammatory, antidiabetic	Inhibits NO production (IC50 23.5 μM) and α-glucosidase (IC50 29.4 μM) by suppressing inflammatory enzymes.	[16]
Botryosphaeria sp. SCSIO KcF6 (endophytic from Kandeliacandel)	Botryosphaerin B	Anti-inflammatory	Inhibits COX-2 (IC50 1.12 mM), reducing prostaglandin synthesis.	[17]
Trichoderma sp. Xy24 (endophytic from *Xylocarpus granatum*)	Cyclonerodial B	Anti-inflammatory	Suppresses NO in BV2 microglia by modulating NF-κB pathway.	[17]

Endophytic fungal isolate MEXU 27095	Thielavins A, J, K	Antidiabetic	α-Glucosidase inhibition (IC50 15.8-23.8 μM), delaying carbohydrate absorption.	[17]
Mycosphaerellanawae ZJLQ129 (endophytic from Smilax china)	(−)Mycousnine enamine	Immunosuppressive	Inhibits T-cell proliferation by blocking CD25 and CD69 expression, suppressing immune activation.	[17]
Chaetomium globosum (endophytic)	Flavipin	Anticancer	Targets NF-κB, inducing apoptotic cell death in cancer cells.	[17]

ABSTRACT

The real problem in aquaculture industry is the disease outbreak caused due to bacteria, leading to mass mortality and economic loss. Since many conventional approaches such as use of antibiotics and disinfectants have only had a limited success in prevention or cure of aquatic diseases. Heavy use of antibiotics for control of bacterial infections has been proven to have environmental and human health hazards. Moreover, the frequent use of biocides, is leading to the rapid development of resistant strains. As a control strategy, quorum quenching was put to action and became very effective in disease inhibition. It is the process of disrupting communicating signaling molecules between bacteria. Many higher plants are naturally known to have gained defense mechanism by producing antagonistic compounds against these bacterial signals. This review aims to collect review from past twenty years and discuss the different quorum sensing inhibitors isolated from plant origin.

Keywords: Quorum Sensing, Phytochemicals, AHLs, Mimics.

INTRODUCTION

Infection carried on by fungus, viruses, bacteria, and parasites are a major source of disease and mortality worldwide. In recent decades, the susceptibility of bacteria and fungi to antibiotics has increased, while the pace at which new medicines are discovered has been progressively declining (Silver, 2011). Even after antibiotics were discovered, bacteria have managed to evolve resistance to them through a variety of methods. As a result, scientists have been looking for substitutes for traditional antibiotics. Many factors contribute to the emergence of resistant bacterial species, including the overuse of antibiotics in the treatment of bacterial diseases and their use in animal feed as a growth stimulant (Marshall, 2011). Due to the ineffectiveness of traditional antibiotics in managing biofilms, there is an urgent need for alternative treatment strategies. In bacterial communication and cell density-associated behavior control, tiny diffusible signal molecules are synthesized and sensed as they enter and exit cells across the membrane (Teplitski, 2000).

Given that quorum sensing is essential for the virulence and survival of bacteria, antimicrobial medications that function as QS inhibitors (QSI) to impede and reduce QS-dependent microbial pathogenicity may find new and useful targets in this signaling system (Hentzer and Givskov, 2003; Rasmussen and Givskov, 2006). Inhibitors cause disruptions to quorum sensing by a variety of mechanisms, including preventing the manufacture of signaling molecules by LuxI synthase, suppressing the activity of enzymes that produce AHL, secreting enzymes that degrade signals, or by means of signal disruptors or signal mimics to target the LuxR signal receptor (Zhang and Dong, 2004). When AHL binds to any member of the LuxR family of a receptor proteins, QS-target genes are induced to be expressed (Figure: 1.1). Typical bacterial disease activities include antibiotic production, biofilm formation, bioluminescence, competence, mobility, plasmid conjugal transfer, and the expression of critical virulence proteins are all regulated by AHL- mediated QS mechanisms (Cui, *et.al.,* 1995). Finding a novel strategy to interfere with this signaling pathway especially with LuxI and LuxR genes will pave a way for discovery of anti-biofilm therapeutics. Drugs with such property will increase the susceptibility of biofilm towards antibiotics and it will only affects bacterial density, the risk of occurring resistant strains is minimal (Skogman,*et.al.,*2016).

Exploration of QS Inhibitors in Higher Plants

The kingdom of plants has long served as a source of medicinal products and continues to play a major role in the advancement of modern medicines (Cragg, *et.al.,* 1997). Many earlier research have solely looked at the antibacterial properties of medicinal herbs, either for traditional use-validation or drug development objectives (Cowan, 1999; Wallace, 2004). Because of their many secondary metabolites, including flavonoids, saponin glycosides, terpenoids, phenols, alkaloids, anthraquinones, and sesquiterpenoids (Fig: 1.2) among others, plants have been utilized in conventional medicine. Due to their capacity to create QS inhibiting or QS mimic substances, which lessen the pathogenic capacity of bacteria, plants have advanced to protect themselves against bacterial infections. Plants are known to flourish in situations with higher concentrations of bacteria (Koh, *et.al.,* 2013, Nazzaro, *et.al.,* 2013). This review article shows (Table: 1.1) the data gathered in reference with identification of quorum sensing inhibitors isolated from higher plants over the period of 2001 to 2024. Short description about widely studied phytochemicals such as flavonoids, terpenoids, phenols and other phytochemicals were also discussed.

Flavonoids

Among the many vital secondary metabolites found in the kingdom of plants are flavonoids. Since the turn of the 20th century, flavonoids' potential to promote health have been the subject of much investigation (Vikram, *et.al.,*2011). Flavonoids are well known for its variable benefits such as synergistic effects with drugs, natural alternative to antibiotics and bactericidal or bacteriostatic ability (Bazzocchi, *et.al.,* 2014). It has already been determined that many flavonoids act as quorum sensing inhibitors by disrupting key binding receptors of DNA by reducing its virulent factors and further minimizing the occurrence of disease (Nazzaro, *et.al.,* 2013; Ta and Arnason, 2015). There are many research analyzed that proves flavonoids as potential quorum sensing inhibitors. Vasavi, *et.al.,* (2014) observed revealed the flavonoid fraction of *Psidium guajava* leaves contained quercetin and quercetin-3-O-

arabinoside, which prevented *C. violaceum* from producing violacein. Extracts of citrus, according to HPLC and MS research, was found to be rich in O- glycosylated flavanones that shown anti-biofilm properties against the human enteropathogen *Y. enterocolitica* (Truchado, *et.al.,*2012). Flavonoids from citrus were established for their capacity to stop quorum sensing using *Vibrio harveyi* reporter assay. Among the tested flavonoids, naringenin, kaempferol, quercetin and apigenin were effective antagonists of cell–cell signalling. Furthermore, these flavonoids repressed the biofilm establishment in *V. harveyi* (Vikram, *et.al.,* 2011). Flavonoids are one of the main component of plant phytochemical and will serve a chance to serve as a key to detect lead components for anti-pathogenic drug discovery, a critical requirement to counter the effects of pathogenic bacteria.

Terpenoids

Terpenoids are diverse group of phyto-compounds present in plants that serves a crucial role in defence mechanism. According to recent research terpenoids has been serving as a propitious platform for identification of various quorum sensing inhibitory compounds (Sharma, *et.al.,* 2020). In accordance with insights from literature data, wide reange of terpenoids possess quorum sensing inhibitory property by blocking the production of autoinducers, interfering with receptors or by disrupting the gene eading to effective quorum sensing inhibition (Bouyahya, *et.al.,* 2022) . Numerous plants contain ursolic acid, a pentacyclic triterpene acid having a wide range of pharmacological actions, such as antimicrobial, antifungal, anti-inflammatory, and antioxidant capabilities (Ren, *et.al.,* 2005). NMR studies by Rasamiravaka, *et.al.,*2017, showed that terpenoids cassipourol, β- sitosterol, and α-amyrin were shown to impair *Pseudomonas aeruginosa* ability to form biofilms in *Platostoma rotundifolium* crude plant extract. The distinct terpenoids exhibit a broad spectrum of inhibitory actions, indicating a multifaceted mode of operation that targets *P. aeruginosa* virulence systems, hence endorsing the plant species' extensive anti-infectious use. *In vitro* and *in silico* studies done by Bodede, *et.al.,*2018, on unique diterpenes (ent-kaur-15-ene-18-ol, ent-kaur-15-ene-18,20-diol) identified from *S. nigrescens* shows a promising antibioflim property in *C.violaceum*.

Phenols

Many phenolic compounds such as resveratrol, rosmarinic acid and curcumin have been reported to possess inhibitory property of bacterial signaling by binding to its surface binding protein that activates the responsible gene or by degrading the signaling molecule. A study by Vijendra Kumar, *et.al.,* (2014) reports that phenolic compounds identified from ginger viz. shogaol, zingerone and gingerol, have displayed good inhibition against *Chromobacterium violaceium* and *Pseudomonas aeruginosa*. Rosmarinic acid is a polyphenol complex that naturally occurs in lemon balm mint, rosemary, sage, and sweet basil among other members of the Lamiaceae family. Vattem, *et.al.,*(2007) investigated the efficacy of Rosmarinic acid in inhibition of AI signaling compounds in bacteria *Escherichia coli* and *Pseudomonas aeruginosa* and found that it stopped swarming of pathogenic bacteria mediated by quorum sensing. The ability of curcumin was studied by Rudrappa, (2008) on the pathogenicity of *Pseudomonas aeruginosa* which showed reduced virulency by down-regulation of toxin proteins, quorum sensing, and biofilm forming genes.

Other Phytochemicals

Gamma-aminobutyric acid (GABA) is a four-carbon non-protein amino acid that acts as a defense compound, which makes plants respond to biotic and abiotic stress conditions. A study by Chevrot, *et.al.,*(2006), on GABA mediated inactivation of homoserine lactone quorum sensing signal produced by *A. tumefaciens*, thereby interfering with its virulence on plants. Brackman, *et.al.,* (2008) studied the effect of cinnamaldehyde and its substitutes for their ability to interact with AI-2 quorum communication and found that it did by downregulating the DNA-binding capacity of LuxR. Niu, *et.al.,* (2006) investigated the ability of cinnamaldehyde (CA) on transcription from selected quorum sensing target promoters and low concentrations of CA were functional at inhibiting two types of acyl homoserine lactone mediated and also autoinducer-2 mediated Quorum Sensing. Furocoumarins, is a class of organic compounds produced by several plants as a natural chemical defense mechanism against predators such as fungi, bacteria, and insects. Furocoumarins isolated from grapefruit showed 95% inhibition of AI-1 and AI-2 in *vibrio harveyi* serving as source to develop bacterial interfering mechanism targeting microbial cell communication processes (Girennavar, *et.al.,* 2008). Salicylic acid is involved in initiation of plant defense mechanism associated with stress factors. SA specifically downregulated the expression of the *Agrobacterium* virA/G two-component regulatory system that firmly

controls the expression of the vir regulon. SA also helped in inhibiting the bacterial N-acylhomoserine lactone (Yuan, *et.al.,* 2007).

CONCLUSION

Research relevant to finding quorum quenching molecules from higher plant sources will provide opportunity to discover novel drugs in pharmaceutical sector. Such discovery will be very helpful for sustaining economic loss due to mortality caused by disease outbreak and emergence of resistant strains is unlikely. This review gives an overall information regarding different quorum sensing inhibitors from plant source studied for the past two decades and its implications with different pathogenic bacteria. Although studies involved in quorum quenching pathways has not yet widely explored. Thus development of drug in this field required a mechanistic perspective of how the quorum system works and understanding of its molecular pathways. Therapeutic plants are commonly ingested by humans, so the active compounds from plants that inhibit quorum sensing (QS) are likely to be safe and cause little to no toxicity to human cells. This makes them promising candidates for developing new anti-quorum sensing agents as alternatives to existing therapeutic treatments.

Table: 1.Review of Quorum Sensing Inhibitory Compounds from Higher Plants

S.No.	Bacteria species	Plant Species	Impact	References
1.	*Chromobacterium violaceum, Escherichia coli, Pseudomonas aeruginosa-*	*Rosa rugosa*	Inhibition of swarming motility and biofilm formation	Zhang, *et.al.,* 2002
2.	*Burkholderia cepacia*	*Terminalia chebula*	Reduction of biofilm	Huber, *et.al.,* 2003
3.	*Escherichia coli*	*Psoralea corylifolia*	Inhibition of biofilms formation.	Girennavar, *et.al.,* 2008
4.	*Chromobacterium violaceum*	*Moringa oleifera*	Reduction of biofilm	Singh, *et.al.,*2009
5.	*Pseudomonas aeruginosa*	*Combretum albiflorum*	RhlR- and LasR-based inhibition	Vandeputte, *et.al.,* 2010
6.	*Chromobacterium violaceum, Pseudomonas aeruginosa*	*Ocimum sanctum, Ananas comosus, Musa paradisiaca, Manilkara zapota*	Inhibition violacein and biofilm formation	Musthafa, *et.al.,* 2010
7.	*Chromobacterium violaceum, Pseudomonas aeruginosa*	*Panax ginseng*	Suppression of LasA and LasB production. Down-regulation of AHLs molecules production.	Song, *et.al.,* 2010
8.	*Chromobacterium violaceum*	*Hemidesmus indicus, Holarrhena antidysenterica, Mangifera indica, Psoralea corylifolia, Punica granatum*	Inhibit QS regulated violacein production	Zahin, *et.al.,* 2010
9.	*Vibrio harveyi*	*Cinnamomum verum*	Reduction of biofilm	Brackman, *et.al.,* 2011
10.	*Staphylococcus epidermidis*	*Commiphora leptophloeos, Pityrocarpa moniliformis Bauhinia acuruana*	Biofilm and virulence inhibition	Trentin, *et.al.,* 2011
11.	*Chromobacterium violaceum Pseudomonas aeruginosa*	*Terminalia catappa*	Inhibition of QS controlled violacein production and biofilms maturation.	Taganna, *et.al.,* 2011

12.	*Chromobacterium violaceum, Pseudomonas aeruginosa*	*Areca catechu*	Interference with violacein production and swarming motility.	Koh, *et.al.,* 2011
13.	*Chromobacterium violaceum*	*Piper bredemeyeri, Piper Brachypodom, Piper bogotence*	Inhibition of violacein production.	Olivero, *et.al.,* 2011
14.	*Chromobacterium violaceum, Pseudomonas aeruginosa*	*Myristica cinnamomea*	Inhibited pyocyanin production and biofilm formation	Chong, *et.al.,* 2011
15.	*Chromobacterium violaceum, Pseudomonas aeruginosa*	*Panax notoginseng*	Down regulation of AHLs molecules and violacein inhibition	Nyila, *et.al.,* 2012
16.	*Pseudomonas aeruginosa*	*Horseradish*	QS inhibition	Jakobsen, *et.al.,* 2012
17.	*Chromobacterium violaceum, Pseudomonas aeruginosa*	*Amphypterygium adstringens*	Inhibition of violacein	Castillo-Juárez, *et.al.,* 2013
18.	*Escherichia coli Pseudomonas aeruginosa*	*Buchanania lanzan*	Reduction of biofilms formation.	Pattnaik, *et.al.,* 2013
19.	*Pseudomonas aeruginosa*	*Brassica oleracea*	Suppress LasR	Ganin, *et.al.,* 2013
20.	*Pseudomonas sp., Alteromonas sp., Gallionella sp.*	*Cocos nucifera*	Inhibition of biofilms formation and EPS production	Viju, *et.al.,* 2013
21.	*Pseudomonas aeruginosa*	*Sclerocarya birrea*	Reduction of swarming, motility, and virulence factors production	Sarkar, *et.al.,* 2014
22.	*Chromobacterium violaceum Escherichia coli*	*Cecropia pachystachya*	Inhibition of QS	Brango-Vanegas, *et.al.,* 2014
23.	*Staphylococcus epidermidis, Proteus mirabilis, Pseudomonas aeruginosa, Escherichia coli*	*Hibiscus sabdariffa*	Inhibition of biofilm	Hisham, *et.al.,* 2014
24.	*E.coli*	*Allium kurrat, Eruca sativa*	QS activity inhibition	Abbas, *et.al.,* 2014
25.	*E.coli*	*Melia dubia*	Quorum quenching activity	Adline Princy, *et.al.,* 2014
26.	*Candida albicans Streptococcus sp.*	*Schinus terebinthifolius Croton urucurana*	Anti-adherent activity	Barbieri, *et.al.,* 2014
27.	*Candida sp.*	*Myrtus communis*	anti-biofilm property	Cannas, *et.al.,* 2014
28.	*E.coli*	*Allium sphaerocephalon*	Biofilm formation, swarming and swimming motility	Ceylan, 2014
29.	*Pseudomonas sp. Staphylococcus sp.*	*Rosmarinus officinalis*	Attenuated bioflim	Ceylan, 2014
30.	*Staphylococcus aureus*	*Teucrium polium*	Anti-biofilm activity	Elmasri, *et.al.,* 2014

31.	*Streptococcus mitis, Streptococcus mutans Streptococcus sanguinis*	*Salvadora persica*	Anti-biofilm activity	Fatin-Majdina, *et.al.,* 2014
32.	*Streptococcus mutans*	*Vitis vinifera*	Suppression in cell density	Zhao, *et.al.,* 2014
33.	*Candida sp.*	*Zuccagnia punctata*	Inhibits biofilm formation	Gabriela, *et.al.,* 2014
34.	*Staphylococcus aureus*	*wheat bran*	Anti-biofilm activity	González-Ortiz, *et.al.,* 2014
35.	*Staphylococcus aureus, E. coli, C. albicans*	*Psidium guajava*	Biofilm inhibition	Gupta, *et.al.,* 2014
36.	*C. difficle*	*Manuka honey*	Deplete bioflims	Hammond, *et.al.,* 2014
37.	*C.albicans*	*Azadirhacta indica*	anti-biofilm effect	Karthick, *et.al.,* 2014
38.	*Candida sp.*	*Curcuma longa*	Antibiofilm activity	Packiavathy, *et.al.,* 2014
39.	*Escherichia coli Staphylococcus aureus*	*Ginkgo biloba*	Anti-biofilm effect	Lee, *et.al.,* 2014
40.	*Candida albicans*	*Anadenanthera colubrina*	Antiproliferative activity	Lima, *et.al.,* 2014
41.	*S.mutans, Enterobacte faecalis*	*Withania somnifera*	Inhibition of Exopolysaccharide production, biofilm formation	Somayaji, *et.al.,* 2014
42.	*S.aureus*	*Hamamelis virginiana*	Biofilm inhibition	Pereira, *et.al.,* 2014
43.	*K.pneumoniae*	*Morinda tinctoria*	Biofilm inhibition	Satish Kumar, *et.al.,* 2014
44.	*K.pneumoniae*	*Cupressus sempervirens*	Biofilm inhibition	Selim, *et.al.,* 2014
45.				
46.	*P.gingivalis*	*Streblus asper*	Biofilm inhibition	Taweechaisupapong, *et.al.,* 2014
47.	*E.faecalis, L. fermentum, L.salivarius, A.actinomycetemcomitans, P.gingivalis, Prevotella intermedia, P.nigrescens, F. nucleatum, Tanerella forsythia, Candida spp.*	*Artocarpus lakoocha*	Biofilm inhibition	Teanpaisan, *et.al.,* 2014
48.	*P.aeruginosa*	*Allium sativum*	Pyocyanin , Biofilm formation, Twitching motility, Flagella motility inhibition	Vadekeetil, *et.al.,* 2014
49.	*S.sanguinis, S.sobrinus*	*Punica granatum*	Biofilm inhibition	Vahid-Dastjerdi, *et.al.,* 2014

50.	*S. aureus, B. cereus, L. monocytogenes, S. aureus*	*Hakea sericea*	Eradicated the biofilm	Luís, *et.al.,* 2014
51.	*Actinomyces oris, Fusobacterium nucleatum, Streptococcus oralis, Streptococcus mutans Veillonella dispar*	*Vitis vinifera*	Biofilm inhibition	Muñoz-González, *et.al.,* 2014
52.	*Serratia marcescens*	*Syzygium aromaticum*	Virulence, biofilm and swarming inhibition	Aswathy, *et.al.,* 2014
53.	*Escherichia coli, Proteus mirabilis, Serratia marcescens*	*Arctium lappa*	Reduced prodigiosin, swarming motility, and cell surface hydrophobicity	Rajasekharan, *et.al.,* 2015
54.	*Acinetobacter baumannii*	*Glycyrrhiza glabra*	Diminution of biofilms formation	Bhargava, *et.al.,* 2015
55.	*Chromobacterium violaceum Pseudomonas aeruginosa*	*Nymphaea tetragona*	Inhibition of violacein production, swarming motility,	Hossain, *et.al.,* 2015
56.	*Pseudomonas aeruginosa Aeromonas hydrophila*	*Trigonella foenum*	Biofilm and virulence factors inhibition	Husain, *et.al.,* 2015
57.	*Pseudomonas aeruginosa, Aeromonas hydrophila*	*Mentha piperita*	Biofilm and virulence factors inhibition	Husain, *et.al.,* 2015
58.	*Chromobacterium violaceum Pseudomonas aeruginosa*	*Ferula asafetida, Dorema aucheri*	Pyocyanin, pyoverdine, Elastase, biofilm production and decrease QS dependent genes	Sepahi, *et.al.,* 2015
59.	*Escherichia coli*	*Punica granatum*	Biofilm formation and motility hindered	Yang, *et.al.,* 2016
60.	*Pseudomonas aeruginosa*	*Citrus reticulata*	Inhibit QS autoinducer production and elastase activity.	Luciardi, et.al., 2016
61.	*Pseudomonas aeruginosa*	*Vaccinium oxycoccos*	LasR/RhlR genes inhibited	Maisuria, *et.al.,* 2016
62.	*Pseudomonas fluorescens*	*Thymus vulgare*	Suppressed bacterial motility and AH production	Myszka, *et.al.,* 2016
63.	*Chromobacterium violaceum, Agrobacterium tumefaciens*	*Vernonia blumeoides*	Inhibition of violacein production and signal synthesis	Aliyu, *et.al.,* 2016

64.	*Chromobacterium violaceum,Pseudomonas aeruginosa*	*Centella asiatica*	Inhibition of violacein, swarming motility, and biofilms formation	Vasavi, *et.al.,* 2016
65.	*Chromobacterium violaceum, Aeromonas hydrophila, Serratia marcescens*	*Rubus rosaefolius*	Inhibition of violacein, swarming motility, and biofilms formation	Oliviera, *et.al.,* 2016
66.	*A. baumannii*	*Eucalyptus globulus, Eucalyptus radiate*	QS inhibition	Luís, *et.al.,* 2016
67.	*Staphylococcus sp., Bacillus sp., Enterococcus sp., Salmonella sp., Vibrio sp.*	*Scutellaria oblonga*	Significant reduction in biofilms	Rajendran, *et.al.,* 2016
68.	*Chromobacterium violaceum*	*Citrus maxima*	Inhibit violacein production	Liu, *et.al.,* 2017
69.	*Salmonella typhimurium, S. aureus, P. aeruginosa*	*Amomum tsaoko*	Reduction of biofilm formation	Rahman, *et.al.,* 2017
70.	*P. aeruginosa, Staphylococcus aureus*	*Rumex alveolatus*	Prevented biofilm formation	Korkorian, *et.al.,* 2017
71.	*Chromobacterium violaceum, P. aeruginosa, A. hydrophila*	*Mangifera indica*	Violacein, elastase, protease, chitinase, EPS, swarming motility, and biofilm inhibition	Husain, *et.al.,* 2017
72.	*Chromobacterium violaceum, P. aeruginosa, A. hydrophila*	*Allium cepa*	Violacein, elastase, protease, chitinase, EPS, swarming motility, and biofilm inhibition	Al-Yousef, *et.al.,* 2017
73.	*S. aureus*	*Schinus terebinthifolia*	Inhibition of toxin production	Muhs, *et.al.,* 2017
74.	*Pseudomonas aeruginosa*	*Andrographis paniculata*	Anti-QS and anti-inflammatory activities	Banerjee, *et.al.,* 2017
75.	*P. aeruginosa*	*Pistacia atlantica*	Inhibition of biofilm and pyocyanin and LasR protein	Kordbacheh, *et.al.,* 2017
76.	*Vibrio harveyi*	*Piper betle*	decreased exopolysaccharides production	Srinivasan, *et.al.,* 2017
77.	*Staphylococcus aureus, Salmonella Typhimurium, Pseudomonas aeruginosa*	*Illicium verum*	swarming motility, QS and biofilm inhibition	Rahman, *et.al.,* 2017
78.	*Pseudomonas aeruginosa*	*Platostoma rotundifolium*	Inhibition of biofilm without affecting the viability of bacteria	Rasamiravaka *et.al.,* 2017

79.	*Pseudomonas aeruginosa*	*Allium sativum*	Elastase, pyocyanin, biofilm, and swarming motility inhibition	Li, *et.al.,* 2018
80.	*Chromobacterium violaceum*	*Carum copticum*	QS inhibition	Snoussi, *et.al.,* 2018
81.	*Chromobacterium violaceum*	*Tribulus terrestris*	Maximum QS quenching activity	Vadakkan, *et.al.,* 2018
82.	*Pseudomonas aeruginosa*	*Syzygium jambos*	Anti-QS efficacy	Rajkumari, *et.al.,* 2018
83.	*C. violaceum*	*Senegalia nigrescens*	Violacein inhibition	Bodede, *et.al.,* 2018
84.	*Streptococcus pneumoniae*	*Thymus daenensis, Satureja hortensis, Origanum vulgare*	QS inhibition	Sharifi, *et.al.,* 2018
85.	*E. coli, B. subtilis*	*Origanum compactum*	Biofilm inhibition	Bouyahya *et.al.,* 2019
86.	*P. aeruginosa*	*Coffee arabica*	LasI and lasR are downregulated	Jamalifar, *et.al.,* 2019
87.	*Salmonella typhimurium*	*Satureja sahendica*	Decrease the expression of QS associated gene (sdiA)	Sharchi, *et.al.,* 2020
88.	*Chrobacterium violaceum*	*Bergenia ciliata*	Anti-Quorum Sensing activity	Srivastava, *et.al.,* 2020
89.	*Aeromonas hydrophila*	*Curcuma longa*	Inhibited bacterial biofilm formation, swimming, and swarming motility	Tanhay, *et.al.,* 2020
90.	*S. aureus*	*Coriander sativum*	Decreased bacterial adhesion and subsequent biofilm formation	Molina, *et.al.,* 2020
91.	*Pseudomonas aeruginosa*	*Berginia ciliata, Clematis grata, Clematis viticella*	Biofilm inhibition	Alam, *et.al.,* 2020
92.	*C. albicans, S. aureus, E. coli*	*Annona senegalensis*	Reduced bacterial swarming and swimming motilities	Tamfu, *et.al.,* 2020
93.	*Morganella morganii*	*Camellia sinensis*	AHL inhibition	Guzman, *et.al.,* 2020
94.	*Pseudomonas aeruginosa*	*Musa acuminata*	las and rhl suppression	Vijayakumar, and Ramanathan, 2020
95.	*Pseudomonas spp.*	*Artemisia dracunculus*	Anti-quorum sensing and anti-proteolytic activity	Sobieszczańska, *et.al.,* 2020
96.	*Pseudomonas psychrophila*	*Piper nigrum*	Reduced QS autoinducer	Tomaś, *et.al.,* 2021
97.	*Pseudomonas aeruginosa*	*Cinnamomum verum*	Significant lowering of the virulence	Alva, *et.al.,* 2021

ABSTRACT

Diabetes Mellitus is the most alarming chronic disease in the present era . Many People of diabetes were not able to diagnose the disease until they land up with the complications and some people with diabetes does not have the knowledge to manage the disease leading to other chronic diseases .The primary insight is to evaluate the complete description of the diabetes mellitus right from definition to management with different system of medicines along with the dietary management . Modern Medicine, Ayurveda, Yoga, Siddha, Unani, Homoeopathy(AYUSH), Naturopathy systems of medicine were mainly taken in to consideration for evaluation. Both physical and psychological parameters leading to the Diabetes Mellitus can be managed with these systems of medicine. Self Monitoring of the body with the reliable parameters will be helpful in early diagnosis of Disease leading to eradicate the prevalence of the disease. Regular assessment of the glucose levels and insulin secretion levels in the body with clinical tests helps to manage the complications of the disease In the Diabetic patients. On an end note Regulation and management of the diabetes is a challenging task for any system of medicine. By contingent research studies on the development of the formulations and by awareness programmes is the only viable solution to cease the Diabetes disease.

Keywords: Diabetes mellitus, Pancreas, Modern medicine, Ayurveda, Unani, Homoeopathy.

INTRODUCTION

Diabetes Mellitus is the chronic ailment occurs when the pancreas does not produce enough amount of Insulin or when the body does not use the enough amount of insulin produced by the beta cells of pancreas. It is characterized by sustained increase blood sugar levels. The word diabetes is derived from the Greek word "Diabainein" and the latin meaning of the word is "Sweetened with Honey". It is also called as TYPE II Diabetes. It compiles of Small Blood vessels (Micro vascular) and large blood vessels (Macro vascular) Diseases[1].

Management of Diabetes through various system of Medicine
Modern Medicine
General Management of Diabetes in Modern Medicine is as Follows (Table 1)

Recent Advantages in oral medication(Table:2)
Along With these drugs various Poly formulated medications were available. Rapid , intermediate and long Acting insulin dosage are also given Depending up on the blood sugar levels[7-10].

Ayurveda
In Ayurveda diabetes mellitus is called as Madhumeha.
Treatment : The principles in the treatment of a diabetic patient is classified as follows .

Sthulya (Obese): The treatment is mainly based up on the reduction of excess fat
a). Shodhana (purification process), b)Apatarpana - reduction in body weight by diet and Vyayama (exercise)

Krusha (Asthenic): This type of treatment is mainly based on increasing stamina and vitality usage of tonics (brumhana) diet etc.. and the patient should never be Starvated excessively

Drugs 1. Single formulations
Guduchi swarasa (*Tinospora cardifolia*) – 10ml twice a day with honey
Amalaki Curna (*Phyllanthus emblica*) – 6 gm twice a day with honey
Karavellaka Phala Curna (*Momordia charantia*) – 3 gm twice a day with water

Compound preparations
1. T. Chandraprabha, 500 mg twice a day with water/milk
2. T. Vasant kusumakara Ras, 125 mg twice a day with Honey
3. Brihat vangeswara Rasa, 125 mg twice a day with Ajadugdha/Godugdha
4. Nisamalaki Vati, 500 mg trice a day with Triphala Kasaya
5. T. Mehari Ras (Vangabhasma, parada bhasma and Rasasindura) - 125 mg twice a day with Ajadugdha/Godugdha.
6. T. Meghanada Rasa - 125 mg twice a day with Ajadugdha/Godugdha
7. Mauktika kamadugha, 125 mg twice a day with Ajadugdha/Godugdha
8. Praval bhasma, 100 mg twice a day
9. Mehmudgara 125 mg twice a day
10. T. Suvarnamalini vasant ras 125 mg once a day
11. Tarakeshwara Rasa 125mg twice a day with Ajadugdha/Godugdha
12. T. Suvarna vangaraja, 125 mg twice a day
13. T. Arogyavardhini, 500 mg twice a day
14. Trivanga bhasma, 100 mg twice a day
15. T. Apurvamalini vasanta, 100 mg twice a day

Medicated Ghee 1. Dhanvantara ghrita 5 to 10 gm/day 2. Dadimadya ghrita 5 to 10 gm/day 3. Sinhamrita ghrita 5 to 10 gm/day

Avaleha 1. **Saraleha**: (Bhavaprakash): Decoction of asana (*Pterocarpus marsupium*), khadira, babbula and bakula (Mimusops elengi). During boiling add tamra and loha and powders of amalaki, danti, lodhra and priyangu. This is useful for all types of Prameha. Dose: 3to 5 mg / day.

Gokshuradyavaleha (Bhavaprakash): Decoction of gokshura and during boiling add trikatu, nagakeshara, cinnamon, ela, jatipatra and vamshalochana. This is useful in all types of Pramehas. Dose: 3to 5 mg / day.

Kwatha (decoction) (1)Darvi, Surahwa, Triphala, Musta. (2)Triphala, darvi, Vishala, Musta. Composition of the above two decoctions are same except for one drug. The first contains Surahwa (Devadaru) and the second contains Vishala. Vishala is drastic purgative and so can be used in constipated persons.

Diet: The role of ahara and vihara are equally important in diabetes to control blood sugar level to prevent complications of this disease.

Yoga

Yoga is the ancient originated system in India more than 5,000 years ago. Through yoga one can harmonize and balances the body soul and mind. It is useful in the management of various lifestyle diseases, including Diabetes Mellitus. Surya namaskar (sun salutation), Asanas (yoga postures), Pranayama (yogic breathing), Bandha (lock), Aum/Om chanting, Sudarshan kriya, Dhyan (meditation), yoga nidra (yogic sleep), Mudras (gestures) are the different types of yoga practices.

shuddhi kriya : Kapalbhati (frontal brain purification), Agnisar kriya (stimulating the digestive fire), Vaman dhauti (stomach cleansing), shankhaprakshalana (intestine cleansing), Laghu shankhaprakshalana (short cleansing).

Pranayama : Anulom vilom (alternate nostril breathing), Chandra bhedan (left nostril breathing) , Surya bhedan (right nostril breathing), Bhastrika (bellows breath), Bhramari (humming bee breath) , Sheetali/Sitkari (cooling breath)

Lock: bandha Uddiyan bandha (abdominal lock)

Hand gestures: mudras Linga mudra, surya mudra, prana mudra, apan mudra, gyanmudra and Meditation on manipur chakra (solar plexus)

Surya namaskar Yoga postures and asanas

Standing postures : Trikonasan (triangle pose), Tadasan (palm tree pose), Tiryak tadasan (bent palm tree pose), Veerasan (warrior pose)

Seated poses: Vakrasan (spinal twist), Ardhamatsyendrasan (seated spinal twist) ,Mandukasan (frog pose), Ushtrasan (camel pose), Paschimottanasan (seated forward bend), Yoga mudra (forward bend)

Prone poses : Bhujangasan (cobra pose), Dhanurasan (bow pose), Naukasan (boat pose) Makarasan (crocodile pose)

Supine poses : Pavanmuktasan (wind releasing pose), Supta vajrasana (supine thunderbolt pose), Setubandhasan (bridge pose) , Matsyasan (fish pose) , Shavasan (corpse pose)

Inversions: Sarvangasan (shoulder stand), Halasan (plough pose)[16-20].

Beneficial Effects of Yoga Practices on Type 2 Diabetes Mellitus(Table 3).

Unani

In Unani Diabetes word derived from Greek Word Ziabetus given in Eberes papyrus, in 1550 BC. Eberes papyrus possess description of various diseases including a polyuric state resembling Ziabetus Shakri. Aretaeus was the first to use the term "Ziabetus" which means "to run through" or "Siphon" and provided the exact description of the symptoms of Ziabetus for the first time.After Arestaeus , Jalinoos described Ziabetus as a rare disease, and referred it as" Diarrhoea Urinosa [Diarrhoea of urine]"and "Dipsakos [thirsty disease].

Single Drugs in Unani System with Anti-diabetic property(Table 4).

Compound Unani formulations used in Unani system of medicine Commonly used formulations for diabetes are Qurse Dhayabitus, Itrifal kishneezi, Qurse Tabasheer, Qurse Dhayabitus Kafoori, Jawarish Amla, Safoof Gilo, Safoof Banslochan, Qurse Marjaan, Qurse Marwareed, Khameera Abresham Alwi Khan, Safoof Sandal, Qurse Gulnar, Majun Masikul Baul Haar, Jawarish Zaroni, Habbe Ayarij, Dawaul Misk Talkh, Sharbate Afsanteen, Sharbat e Bazoori, Jawarish Jalinoos, Sharbate Abresham,Jawarish Zeera, Roghane Qusht, Roghan Pista, Roghane Badam, Ma-us-shaeer, Sharbate Anar tursh, Sharbat e Humaz, Qurse Kafoor, Qurse Tabasheer, Qurse Ziabetus, Safoof Dhayabitus, Safoof Sandal Dhayabitus wala, Safoof hindi,Shikanjbeen asli, and Qurse Dhayabitus, Qurse Tabasheer, Qurse Tabasheer Gulnari, Qurse Dhayabitus,Qurse Tabasheer mulaiyan, Qurse Tabasheer Kafoori, Qurse Tabasheer, Qurse Tabasheer Kafoori mulaiyan, Qurse Tabasheer, Qurse Tabasheer qabiz, Qurse Tabasheer mulaiyan Qurse Tabasheer[21-25], Present marketed Unani anti- diabetic formulations(Table 5).

Siddha

In siddha system of medicine diabetes mellitus possess various names such as neerizivunoi (neer means urine and izhivu means excessive discharge), madhumegam (madhu means sweet and megam means venereal disease) and neerperukkal noi (polyuric condition). Siddha system of medicine is claimed to alleviate the root cause of the diseases by maintaining the ratio of tridoshas; Vatham, Pitham and Kapham.Siddhars, fathers of Siddha system of medicine grouped the diabetes mellitus under Pitha disorders of "Mega" disease. Mega disease means excessive discharge of urological secretions and excretions from the body. Diabetes is characterized with polydipsia (Atash-e-Mufrit) and polyuria (Kasrat-e-Baul).

Causes of diabetes (Zayabetus)

1.Infaalat-e-Nafsania(psychological function) eg. Stress, anxiety,strain, and tension.
2.Soo-e-Mijaz-e-Kuliya- Overeating, Excessive use of alcohol.

Anti-diabetic formulations in siddha system of medicine

The formulations mentioned below are anti-diabetic Siddha preparations which are widely using clinically currently.

1. Diab-eaze. 2 capsules two or three times a day
2. Dolabi tablets. 1-2 tablets should be taken 30 minutes before meal twice daily
3. Herbo diabecon. One capsule twice a day with milk.
4. Gurmar capsules. 1 capsule twice daily before meals with water
5. Neem capsules. 1 capsule twice daily after meals with water
6. Fenugreek capsules Take 2 capsules twice daily after meals with water
7. Safoof- e- ziabetes- dulabi. Take 2 capsules twice daily after meals with water
8. Qurs tabasheer. 5gmtwice a day
9. Jawarish zarooni sada. 10 gm twice a day
10. Hoodiab capsules. 1 Capsule each thrice a day
11. Madhugamini diabetes powder. 5 gm powder twice a day with water
12. Brahmi capsule 1 capsule twice daily with water at mealtime
13. Qurs kushta baiza murgh 2 tablets with butter and a glass of milk.

14. Diabetic care tablets 2 tablets twice a day after meal
15. Qurs kushta zamarrud 1 tablet in morning
16. Garlitab 2 tablets twice a day after meal
17. Qurs ziabitus 2 tablets each time twice a day with 250 ml of whey
18. Jawarish mastagi10 gm in the morning and evening with 125 ml water
19. Triphala churnam -1-3gm with water, honey or ghee, 2-3 times per day after food
20. Madhumega churnam 1 -2 capsules/ tablets or 1 teaspoonful of MC twice a day
21. Seenthil churnam **:** For children 250 mg to 1.5 gm and for adult 1 gm to 3gm of SC twice daily after meal with ghee or warm water is advisable
22. Abraka chenduram 65-130 mg of AC should be taken along with 4 gm of mixture of Tanner cassia (4 parts), *Withania somnifera* root (4parts) and seeds of Cuminum cyminum (1part) with cow's butter milk twice daily
23. Rasa chenduram dose of 50-100 mg once in a day for 10 days along with sufficient amount of honey or ghee after food
24. Avarai kudineer churnam 5gms of Avarai kudineer churnam should be boiled in 300ml of water and reduced the quantity to 30 ml and consumed it twice daily
25. Nilavembu kudineer 10gm of Nilavembu kudineer should take with palm candy

Homoeopathy

According to Homoeopathic system of medicine patient should be treated constitutionally. Main objective to treat the Diabetes mellitus patient is to treat him constitutionally along with proper diet control and regular exercise. Primary aim is to regulate the blood sugar level along with subjective and objective sphere of the patient. Prevention and management of Diabetes in Homoeopathy System of Medicine Top Single Homoeopathy medicines for Diabetes Mellitus(Table 6). These single Homoeopathy were available in the form of various potencies prepared with proportion of different scales Top homoeopathy pharmaceutical formulations by GMP Approved Companies(Table 7). Note : Dosage of single and poly pharmacy formulations should be given according to the Nature of the disease, Susceptibility of the patient, Age and sex of the patient[29]

Naturopathy

Naturopathy is the drug free system of medicine that treats the human body with panchamahaboot (Earth, Water, fire, Sky and Air) . Diabetes In Naturopathy is Managed by Sunbath (Helio therapy), Nutritional Diet, Exercises, Mud therapy, Hydrotherapy, Colour Therapy, Massage Therapy, Bath therapy, Fasting therapy, Behavioural therapy, Magnet therapy, Acupuncture, Acupressure, Cupping therapy, Aroma therapy, Iridology, Remedial Massage, Soft Tissue Manipulation, Pack Treatment, Thermal Therapy, Nerves Stimulation Therapy and Herbal Therapy

CONCLUSION

Diabetes Mellitus is the most prevalent chronic disease globally. Management of this disease is a challenging task in medical field inspite of many research studies. Physical, Mental and Diet and Regimen parameters are the only vital way to eradicate the complications of the disease. On an end note if necessary one can may take the help of other system of medicine to control the disease progress.

Table. 1: General Management of Diabetes in Modern Medicine is as Follows

CLASS	MEDICATIONS	MODE OF ACTION
Megalitinides	Repaglinide, Nateglinide	Stimulates Insulin Release
Biguanides	Metformin	Inhibits Hepatic Glucose release
Sulfonylureas	Glibenclamide, Glipizide, Gliclazide, Glimepiride	Stimulates Insulin Release
Alpha Glucose Inhibitors	Acarbose, Miglitol, Voglibose	Inhibits carbohydrate Absorption in the gut
Thiazolidinediones	Pioglitazone	Improves insulin sensitivity
Dipeptidyl Peptidase inhibitors	Vidagliptin, Sitagliptin, Saxagliptin, Linagliptin.	Stimulates Glucose induced insulin Response
Dopamine Agonists	Bromocriptine	Hypothalamic Dopamine Release

Sodium Glucose Co Transport 2 inhibitors (SGLT2)	Dapagliflozin, Canagliflozin, Empagliflozin, Ipragliflozin	Inhibits SGLT2 Receptors and reduces glucose re absorption
Quinine Derivatives	Hydroxychloroquine	affinity of insulin receptor.

Table. 2: Recent Advantages in oral medication

CLASS	MEDICATIONS	MODE OF ACTION
Glucose like peptide-1 Analogs	Albuglutide, Dulaglutide, Lixisenatide, Taspoglutide	Potentiate Insulin Secretion
Dipeptidyl Peptidase -4 inhibitors	Alogliptin, Dutogliptin, Melogliptin.	Potentiate Insulin Secretion
Inositol Derivatives	D-Chiro-Inositol	Insulin Receptor Activator
Peoxisome Proliferator-activated Receptor Agonists	Balaglitazone, Rivoglitazone, Pioglitazone, Mitoglitazone	Activates PPAR Receptors Agonists.

Table. 3: Beneficial Effects of Yoga Practices on Type 2 Diabetes Mellitus

Sr.No	Yoga Practice	Effects
1.	Surya Namaskar	Stimulates the insulin secretion and reduces the hip circumference through glycaemic Control.
2	Yoga asana Forward bend Backward bend Twisted poses Inversions	1. Rejuvenates of pancreatic cells and Improves blood supply to muscles 2. Enhances insulin receptor expression in the muscles 3. Has positive effects on glucose utilization and fat redistribution in type 2 diabetes 4. Massages and pressurizes the pancreas, stimulating insulin secretion
3	Yoga nidra	Improved symptom score, reduction of fasting blood glucose and postprandial blood glucose levels
4	"Aum" chanting	Stabilizes the brain, removes negative thoughts, increases energy, improves mind and body relaxation within minutes of practice.
5	Mindfulness	Better sleep, greater relaxation,
6	Manipur chakra	Positive effects on sugar levels
7	Dhyan (meditation)	Produces psychological effects such as fast reactions to stimuli
8	Hasta mudras	Promote deep relaxation and eliminate stress , Boost metabolic rates, promote weight loss, and reduce sugar levels
9	Pranayama (regulated breathing)	1. Augment cerebral blood flow 2. Soothing and calming effect on the mind, improves mental and physical health .
10	Shuddhi kriya cleansing processes	1. Abdominal pressure created during exhalation improves the efficiency of β-cells of the pancreas 2. Helps in the production of insulin and controlling glucose levels in the blood. 3. Marked reduction in fasting and post-prandial blood sugar levels

Table. 4: Single Drugs in Unani System with Anti-diabetic property

1. Tukh-e-hayaat(*Withania coagulans*)	11. Kishneez-e-khushk(*Coriandrum*.Linn)
2. Hulba(*Trigonellafoenum-graecum*)	12. Shooneez(*Nigella sativa*)
3. Maghz-e-neem(*Azadirachta indica*)	13. Sat-e-Gilo(*Tinospora cordifolia* Meirs)
4. Darchini(*Cinnamomum zeylanicum*)	14. Gurmarbooti(Gymnema Sylvestre),
5. Chiraita(*Swertia chirata*)	15. Lahsun(*Allium sativum*)(Garlic)I
6. Tukhm-e-konch(*Mucuna pruniens)*	16. Giloy(*Tinospora cordifolia*)
7. Karelakhushk(*Momorda charantia*)	17. Tulsi(*Ocimum sanctum*)
8. Asghand(*Withania somnifera*)	18. Babool(*Acacia arabica*)
9. Jamun(*Syzygium cuminu*)	19. Pyaz(*Allium cepa*)
10. Bael(*Aeglemarmelos Correa*)	20. Turmeric(*Curcuma Longa*)

ABSTRACT

This paper presents a fuzzy matrix-based model for the diagnosis of chronic diseases such as diabetes, heart disease, and cancer. The methodology uses triangular fuzzy numbers to represent the uncertainty in symptom severity reported by patients. Using a series of matrix operations including addition, subtraction, and max–min composition fuzzy relationships between patient symptoms and diseases are evaluated. The model is tested using real matrix values extracted from an actual thesis, providing meaningful diagnostic outcomes. The final decision is made based on fuzzy threshold interpretation, showing the practical potential of fuzzy logic in medical diagnosis.

Keywords: Fuzzy Logic, Triangular Fuzzy Number, Chronic Disease, Medical Diagnosis, Max-Min Composition, Fuzzy Matrix.

INTRODUCTION

The diagnosis of chronic diseases presents significant challenges for healthcare systems, primarily due to the uncertainty and variability in patient-reported symptoms. Many conditions, including diabetes, heart disease, and cancer, share overlapping clinical indicators that can be ambiguous or only partially expressed by patients. Conventional diagnostic approaches, which often rely on crisp or binary logic, struggle to accommodate such

imprecision. This limitation can delay diagnosis or lead to inaccurate treatment recommendations, particularly in cases where early symptom presentation is subtle. Fuzzy set theory, first proposed by Zadeh in 1965, offers a mathematical means to represent and reason with imprecise information by assigning degrees of membership between 0 and 1. Within this framework, fuzzy matrices enable the modeling of relationships between symptoms and diseases in a way that reflects real-world uncertainty. Triangular fuzzy numbers, in particular, provide a concise yet expressive representation of symptom intensity by defining lower, most probable, and upper bounds. These properties make them well-suited for medical domains, where symptom severity is rarely absolute and often subject to patient interpretation. While fuzzy logic has been applied in medical diagnosis for decades, much of the existing work either focuses on single diseases or employs general fuzzy membership functions without fully exploring the advantages of triangular fuzzy relational matrices. Moreover, many prior studies have not demonstrated step-by-step computational transparency, limiting their adaptability in clinical decision support systems. The present work addresses these gaps by developing a triangular fuzzy relational matrix model tailored for the diagnosis of multiple chronic diseases. The proposed approach combines theoretical rigor with practical interpretability, enabling both accurate disease prediction and clear justification for each diagnostic outcome

LITERATURE REVIEW

Research on fuzzy logic in medical diagnosis has progressed through several methodological stages, each aimed at improving the handling of uncertainty in clinical decision-making.

Foundational Fuzzy Models in Diagnosis

One of the earliest applications of fuzzy set theory in healthcare was presented by Sanchez (1979), who introduced fuzzy relational models linking symptoms to diseases. This work demonstrated that diagnostic conclusions could still be drawn even when patient data was incomplete or imprecise. The decision-making principles of Bellman and Zadeh (1970) provided the theoretical basis for such applications by formalizing reasoning in environments where truth values are partial rather than binary. Although these foundational studies established the viability of fuzzy diagnosis, their membership structures were relatively simple and did not fully capture variations in symptom severity.

Enhancements for Representing Greater Uncertainty

Subsequent research expanded the expressive capability of fuzzy models. Meenakshi and Kaliraja advanced the concept of interval-valued fuzzy matrices, enabling a range-based representation of symptom–disease relationships rather than a single crisp value. Similarly, Baruah extended Sanchez's model using fuzzy soft sets, increasing flexibility in representing complex medical knowledge. These improvements allowed richer modeling but often came at the cost of increased computational complexity, making them less suitable for settings where transparent, step-by-step calculations are essential.

Alternative Fuzzy Approaches in Healthcare

Other researchers explored alternative fuzzy paradigms to address diagnostic uncertainty. Edward Samuel and Balamurugan applied intuitionistic fuzzy sets, which assign both membership and non-membership values, providing dual perspectives on symptom relevance. Ganesh Kumar and Srinivasan (2016) combined fuzzy logic with intelligent medical systems to support automated diagnosis. While these approaches expanded the theoretical toolkit, many offered limited methodological transparency or lacked application to multiple overlapping diseases, which is a common challenge in real clinical scenarios.

The Chronic Diseases

Chronic diseases are long-lasting conditions that typically progress slowly and require ongoing medical attention. Accurate diagnosis is crucial for timely intervention and management. Traditional diagnostic methods often struggle

with uncertain, vague, or incomplete patient data. Fuzzy set theory provides a suitable mathematical framework to address such uncertainty.

D_1: Diabetes
A chronic condition affecting blood sugar regulation. Symptoms include increased thirst, frequent urination, fatigue, and blurred vision.

D_2: Heart Disease
Encompasses various heart-related conditions including coronary artery disease. Symptoms often include chest pain, shortness of breath, and irregular heartbeat.

D_3: Cancer
A group of diseases involving abnormal cell growth. Symptoms vary widely but can include fatigue, weight loss, and persistent pain or swelling.

Preliminaries
Triangular fuzzy number matrix

In fuzzy mathematics, a triangular fuzzy number (TFN) is a form of fuzzy number represented by a triplet (a, b, c), where 'a' represents the smallest possible value, 'b' is the most probable or expected value, and 'c' is the largest possible value. This structure allows for a simple yet effective way to model uncertainty, especially in systems involving human interpretation and linguistic vagueness. A triangular fuzzy number matrix is a matrix in which each element is defined as a triangular fuzzy number. Let the matrix be A = (aij) of order m×n, then each aij is a TFN represented as ($aijL$, $aijM$, $aijU$), where:

- $aijL$ = Lower boundary of the fuzzy estimate
- $aijM$ = Most likely estimate (mode)
- $aijU$ = Upper boundary of the fuzzy estimate

This format is particularly suitable for modelling imprecise data in fields like medical diagnosis, where symptom severity often varies between individuals.

Addition and subtraction operation on triangular fuzzy number matrix
In fuzzy arithmetic, addition and subtraction of triangular fuzzy numbers is performed component-wise. Let A = (aij) and B = (bij) be two TFN matrices of the same order m × n. Then

Addition Rule
A + B($aij + bij$) = ($aijL + bijL$, $aijM+bijM$, $aijU+bijU$)

Subtraction Rule
A - B($aij- bij$) = ($aijL - bij$U, $aijM−bij\ M$, $aijU-bij$L)
These operations preserve the TFN format, ensuring that the resulting values remain valid representations of fuzzy quantities.

Multiplication operation on triangular fuzzy number matrix
Multiplying two triangular fuzzy matrices involves combining fuzzy numbers according to specific arithmetic rules that preserve uncertainty. Let A be a matrix of order m×p and B of order p×n, where both matrices consist of triangular fuzzy numbers. The resulting matrix C = A · B is defined by-
Let A = (aij)mxp and B = (bij)pxn be two triangular fuzzy number matrices. Then the Multiplication Operation:
A(.)B = (cij)mxn, where (cij) = or $\sum_{k=1}^{p} a_{ik}\ b_{kj}$ i = 1,2,.....m and j = 1,2,.....n

Each multiplication and summation must be carried out using fuzzy multiplication rules which involve evaluating the minimum and maximum of resulting bounds. Special care is taken to maintain the triangular form in each resulting element.

Max-min composition on fuzzy membership value matrices

Max-min composition is a fundamental concept in fuzzy set theory used for combining fuzzy relations. Given two fuzzy membership matrices A (of order m×p) and B (of order p×n), their composition C (of order m×n) is computed as:

Let Fmndenote the set of all m×n matrices over F. Elements of Fmnare called as fuzzy membership value matrices.

For A = (aij) ϵFmxp and B = (bij) ϵFpxn the max-min product A(.)B = (supk[{inf{aik; bkj}}]) ϵFmxn.

Maximum operation on triangular fuzzy number

To determine the maximum of two triangular fuzzy numbers a = (a^L, a^M, a^U) and b = (b^L, b^M, b^U), the operation is defined as:

max(a, b) = (max(a^L, b^L), max(a^M, b^M), max(a^U, b^U))

This method produces a new triangular fuzzy number that encompasses the upper values of both inputs, useful in determining dominant or critical fuzzy parameters.

Arithmetic mean (AM) for triangular fuzzy number

The arithmetic mean (AM) of a triangular fuzzy number (a, b, c) is computed using the formula:

AM = (a + b + c) / 3.

This average serves as a crisp representative value for ranking or comparison of fuzzy outputs, particularly in decision-making scenarios.

Medical Diagnosis Under Fuzzy Environment

Let S represent a set of symptoms associated with specific illnesses. P is a group of patients, and D is a group of diseases. The triangular fuzzy number matrix's components are described as

A = (aij)mxl where (aij) = ($aijL$, $aijM$, $aijU$) is the $ijth$ element of A, 0≤ $aijL$≤ $aijM$≤ $aijU$≤ 10. Here $aijL$ is the lower bound, $aijM$ is the moderate value and $aijU$ is the upper bound.

PROCEDURE

Step 1

Using F as a mapping and F: D → (S) as a set of all triangular fuzzy sets of S, create a triangular fuzzy number matrix (F,D) over S. The fuzzy occurrence matrix, often known as the symptom-disease triangular fuzzy number matrix, is represented by $R0$.

Step 2

Create a new triangular fuzzy number matrix ($F1$, S) over P, with $F1$ being a mapping denoted by $F1$: S → F (P). The patient symptom triangular fuzzy number matrix, represented by the symbol Rs, is used to represent this matrix.

Step 3

Convert the elements of triangular fuzzy number matrix into its membership function as follows: Membership function of (aij)= (aijL, aijM, aijU) is defined as

$\mu_{aij} = \left(\frac{a_{ijL}}{10} \leq \frac{a_{ijM}}{10} \leq \frac{a_{ijN}}{10}\right)$,if $0 \leq \frac{a_{ijL}}{10} \leq \frac{a_{ijM}}{10} \leq \frac{a_{ijN}}{10} \leq 1$

Now the matrix $R0$ and Rs are converted into triangular fuzzy membership matrices namely ($R0$)m and (Rs)mem.

Step 4

Compute the following relation matrices.

- $R1$ = ($R0$)m (.)(Rs)mem it is calculated using [3.4].

- $R2 = (Rs)m.$ (.)(J(-)($R0$)mem), where J is the triangular fuzzy membership matrix in which all entries are (1, 1, 1). (J(-)($R0$)mem) is ($R0$)mem and it is called as non symptom-disease triangular fuzzy membership matrix.
- $R3$ = (J(-)(Rs)mem)(.)($R0$)mem, where (J(-)(Rs)mem) is the complement of Rs and it is called as non patient symptom triangular fuzzy membership matrix.
- $R2$ and $R3$ are calculated using subtraction operation and 3.5.
- $R4 = \max\{R2, R3\}$. It is calculated using 3.6
- The elements $R2,2,R3$, $R4$ of is of the form $yij = (yijL, yijM, yijU)$ where $0 \le yijL \le yijM \le yijU \le 1$.
- $R5 = R1$ (-)4. It is calculated using subtraction operation. The elements of $R5$ is of the form $Zij = (zijL, zijM, zijU) \in [-1, 1]$ where $zijL \le zijM \le zijU$.

Step 5:
Interpret the $R6 = AM(Zij)$ matrix. For each patient (row), select the maximum score across all diseases. This value suggests the most likely disease. Threshold values may be applied for decision boundaries (e.g., score ≥ 0.35 = strong match). This final step enables real-world clinical conclusions to be drawn from fuzzy computations.

Note: This procedure has been adapted from the fuzzy diagnosis model proposed by [2] Sanchez and further developed by [1] Porchelvi. All mathematical operations follow standard fuzzy logic rules using triangular fuzzy number representations.

MAIN RESULT

Suppose there are three patients P_1 , P_2, and P_3 in a hospital. Each patient reports a combination of the following five symptoms
S_1: Fatigue,S_2: Weight Loss,S_3: Shortness of Breath,S_4: Chest Pain
S_5: Frequent Urination

Let the possible diseases associated with these symptoms be
D_1: Diabetes, D_2: Heart Disease,D_3: Cancer

Symptom Scales and Fuzzy Triangular Interpretation
Each symptom is rated on a scale of 0 to 10, where 0 indicates absence and 10 represents maximum observed severity. For fuzzy matrix modeling, each value is converted into a triangular fuzzy number (L, M, U) to capture uncertainty and variation. The following table defines the clinical interpretation of each symptom and its corresponding fuzzy encoding(Table:1). The objective is to determine the most probable disease for each patient using fuzzy relational matrices and triangular fuzzy numbers. The analysis will be conducted by forming a Patient-Symptom matrix (R_s) and a Disease-Symptom matrix (R_o), followed by applying fuzzy matrix operations to compute the final diagnosis.

Step 1: We consider the set S = $\{S_1, S_2, S_3, S_4, S_5\}$ as universal set where $S_1, , S_2, S_3, S_4,$ andS_5 represent the symptoms fatigue,Weight Loss ,Shortness of Breath, Chest Pain and Frequent Urination respectively and the set D = $\{D_1, D_2, D_3\}$ where $D_1, D_2 and D_3$ represent the parameters Diabetes ,Heart Disease and Cancer respectively. Suppose that

$$F(D_1) = \begin{bmatrix} < e_1, (7, 8.5, 10) >, < e_2 (8, 9, 10) >, < e_3, (3, 4, 6) >, < e_4 (2, 3.5, 5) >, \\ < e_{5,} (9, 9.5, 10) > \end{bmatrix}$$

$$F(D_2) = \begin{bmatrix} < e_1, (5, 6, 7) >, < e_2 (4, 5, 6) >, < e_3, (6, 7, 8) >, < e_4 (7, 8.5, 10) >, \\ < e_{5,} (3, 4, 5) > \end{bmatrix}$$

$$F(D_3) = \begin{bmatrix} < e_1, (4, 5.5, 7) >, < e_2 (6, 7.5, 9) >, < e_3, (5, 6, 7) >, < e_4 (4, 5, 6) >, \\ < e_{5,} (2, 3.5, 5) > \end{bmatrix}$$

The triangular fuzzy number matrix (F,D) is a parameterized family F(D_1) , F(D_2) and F(D_3) of all triangular fuzzy number matrix over the set S and are determined from expert medical documentation. Thus the triangular fuzzy number matrix (F,D) represents a relation matrix R_0 and it gives an approximate description of the triangular fuzzy number matrix medical knowledge of the two diseases and their symptoms given by
Disease-Symptom Matrix ($\boldsymbol{R_0}$)

$$\begin{matrix} \\ S_1 \\ S_2 \\ S_3 \\ S_4 \\ S_5 \end{matrix}\begin{matrix} \begin{matrix} D_1 \end{matrix} \\ \begin{pmatrix} (7,8.5,10) \\ (8,9,10) \\ (3,4,6) \\ (2,3.5,5) \\ (9,9.5,10) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} D_2 \end{matrix} \\ \begin{pmatrix} (5,6,7) \\ (4,5,6) \\ (6,7,8) \\ (7,8.5,10) \\ (3,4,5) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} D_3 \end{matrix} \\ \begin{pmatrix} (4,5.5,7) \\ (6,7.5,9) \\ (5,6,7) \\ (4,5,6) \\ (2,3.5,5) \end{pmatrix} \end{matrix}$$

Step 2: Again we take P = {P_1, P_2 , P_3} as the universal set where , P_2 and P_3 represent patients respectively and S = {S_1,S_2,S_3,S_4,S_5} } as the set of parameters. Suppose that,

$F_1(S_1) = [< P_1, (7,8,9) >, < P_2(4,5.5,7) >, < P_3, (5,6.5,8) >]$
$F_1(S_2) = [< P_1, (6,7,8)) >, < P_2(7,8,9) >, < P_3, (3,4.5,6) >]$
$F_1(S_3) = [< P_1, (4,5,6) >, < P_2(5,6,7) >, < P_3, (6,7,8) >]$
$F_1(S_4) = [< P_1, (2,3.5,5) >, < P_2(3,4,5)) >, < P_3, (7,8.5,10) >]$
$F_1(S_5) = [< P_1, (8,9,10) >, < P_2(2,3.5,5) >, < P_3, (3,4,5) >]$

The triangular fuzzy number matrix (F_1, S) is another parameterized family of triangular fuzzy number matrix and gives a collection of approximate description of the patient-symptoms in the hospital. Thus the triangular fuzzy number matrix (F_1, S) represents a relation matrix R_s called patient-symptom matrix given by

Patient-Symptom Matrix $\boldsymbol{R_s}$

$$\boldsymbol{R_s} = \begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix}\begin{matrix} \begin{matrix} S_1 \end{matrix} \\ \begin{pmatrix} (7,8,9) \\ (4,5.5,7) \\ (5,6.5,8) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_2 \end{matrix} \\ \begin{pmatrix} (6,7,8) \\ (7,8,9) \\ (3,4.5,6) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_3 \end{matrix} \\ \begin{pmatrix} (4,5,6) \\ (5,6,7) \\ (6,7,8) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_4 \end{matrix} \\ \begin{pmatrix} (2,3.5,5) \\ (3,4,5) \\ (7,8.5,10) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_5 \end{matrix} \\ \begin{pmatrix} (8,9,10) \\ (2,3.5,5) \\ (3,4,5) \end{pmatrix} \end{matrix}$$

Step3
$(\boldsymbol{R_0})_{mem}$ **Membership Matrix**

$$(\boldsymbol{R_0})_{mem} = \begin{matrix} \\ S_1 \\ S_2 \\ S_3 \\ S_4 \\ S_5 \end{matrix}\begin{matrix} \begin{matrix} D_1 \end{matrix} \\ \begin{pmatrix} (0.7,0.85,1.0) \\ (0.8,0.9,1.0) \\ (0.3,0.4,0.6) \\ (0.2,0.35,0.5) \\ (0.9,0.95,1.0) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} D_2 \end{matrix} \\ \begin{pmatrix} (0.5,0.6,0.7) \\ (0.4,0.5,0.6) \\ (0.6,0.7,0.8) \\ (0.7,0.85,1.0) \\ (0.3,0.4,0.5) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} D_3 \end{matrix} \\ \begin{pmatrix} (0.4,0.55,0.7) \\ (0.6,0.75,0.9) \\ (0.5,0.6,0.7) \\ (0.4,0.5,0.6) \\ (0.2,0.35,0.5) \end{pmatrix} \end{matrix}$$

$(\boldsymbol{R_s})_{mem}$ **Membership Matrix**

$$(\boldsymbol{R_s})_{mem} = \begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix}\begin{matrix} \begin{matrix} S_1 \end{matrix} \\ \begin{pmatrix} (0.7,0.8,0.9) \\ (0.4,0.55,0.7) \\ (0.5,0.65,0.8) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_2 \end{matrix} \\ \begin{pmatrix} (0.6,0.7,0.8) \\ (0.7,0.8,0.9) \\ (0.3,0.45,0.6) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_3 \end{matrix} \\ \begin{pmatrix} (0.4,0.5,0.6) \\ (0.5,0.6,0.7) \\ (0.6,0.7,0.8) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_4 \end{matrix} \\ \begin{pmatrix} (0.2,0.35,0.5) \\ (0.3,0.4,0.5) \\ (0.7,0.85,1.0) \end{pmatrix} \end{matrix}\quad \begin{matrix} \begin{matrix} S_5 \end{matrix} \\ \begin{pmatrix} (0.8,0.9,1.0) \\ (0.2,0.35,0.5) \\ (0.3,0.4,0.5) \end{pmatrix} \end{matrix}$$

Step 4: **Computing the following relation matrices**

$\boldsymbol{R_1} = (\boldsymbol{R_0})_{mem} \cdot (\boldsymbol{R_s})_{mem}$

$$\begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix} \begin{pmatrix} D_1 & D_2 & D_3 \\ (0.8, 0.9, 1.0) & (0.5, 0.6, 0.7) & (0.6, 0.7, 0.8) \\ (0.7, 0.8, 0.9) & (0.5, 0.6, 0.7) & (0.6, 0.75, 0.9) \\ (0.5, 0.65, 0.8) & (0.7, 0.85, 1.0) & (0.5, 0.6, 0.7) \end{pmatrix}$$

$\boldsymbol{R_2}$ **= $(\boldsymbol{R_s})_{mem}$. (.)(J(-)$(\boldsymbol{R_0})_{mem}$)**

$$\begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix} \begin{pmatrix} D_1 & D_2 & D_3 \\ (0.4, 0.5, 0.5) & (0.5, 0.6, 0.7) & (0.5, 0.65, 0.8) \\ (0.4, 0.6, 0.7) & (0.4, 0.5, 0.6) & (0.3, 0.45, 0.6) \\ (0.5, 0.65, 0.8) & (0.3, 0.45, 0.6) & (0.4, 0.5, 0.6) \end{pmatrix}$$

$\boldsymbol{R_3}$ = (J(-)$(\boldsymbol{R_s})_{mem}$)(.)$(\boldsymbol{R_0})_{mem}$

$$\begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix} \begin{pmatrix} D_1 & D_2 & D_3 \\ (0.4, 0.4, 0.5) & (0.5, 0.65, 0.8) & (0.4, 0.5, 0.6) \\ (0.5, 0.65, 0.8) & (0.5, 0.6, 0.7) & (0.4, 0.5, 0.6) \\ (0.5, 0.6, 0.7) & (0.4, 0.5, 0.6) & (0.4, 0.55, 0.7) \end{pmatrix}$$

$\boldsymbol{R_4}$ **= max{$\boldsymbol{R_2}$, $\boldsymbol{R_3}$}**

$$\begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix} \begin{pmatrix} D_1 & D_2 & D_3 \\ (0.4, 0.5, 0.5) & (0.5, 0.65, 0.8) & (0.5, 0.65, 0.8) \\ (0.5, 0.65, 0.8) & (0.5, 0.6, 0.7) & (0.4, 0.5, 0.6) \\ (0.5, 0.65, 0.8) & (0.4, 0.5, 0.6) & (0.4, 0.55, 0.7) \end{pmatrix}$$

$\boldsymbol{R_5}$ **= $\boldsymbol{R_1}$ (-)$\boldsymbol{R_4}$**

$$\begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix} \begin{pmatrix} D_1 & D_2 & D_3 \\ (0.3, 0.4, 0.6) & (-0.3, -0.05, 0.2) & (-0.2, 0.05, 0.3) \\ (-0.1, 0.15, 0.4) & (-0.2, 0.0, 0.2) & (0.0, 0.25, 0.5) \\ (-0.3, 0.0, 0.3) & (0.1, 0.35, 0.6) & (-0.2, 0.05, 0.3) \end{pmatrix}$$

Step 5

$\boldsymbol{R_6}$ = AM($\boldsymbol{Z_{ij}}$)

$$\begin{matrix} \\ P_1 \\ P_2 \\ P_3 \end{matrix} \begin{pmatrix} D_1 & D_2 & D_3 \\ 0.4 & -0.05 & 0.05 \\ 0.15 & 0.0 & 0.25 \\ 0.0 & 0.35 & 0.05 \end{pmatrix}$$

Row′ i= Maximum of i^{th} row

$$\begin{matrix} P_1 \\ P_2 \\ P_3 \end{matrix} \begin{pmatrix} 0.05 \\ 0.25 \\ 0.35 \end{pmatrix}$$

RESULTS AND DIAGNOSIS OUTPUT

So, we could say

- $P_1$is confirmed diabetic.
- P_3 has strong indication of heart disease.
- P_2 may have cancer, but further investigation is needed.

Graphical Diagnosis Network

A fuzzy diagnosis network graph illustrates the relationships between patients and diseases based on R_6 .The darken edges denotes the strong confirmation of disease to the patient(Fig.1).

Let's define a simple, clear diagnosis threshold interpretation(Table:2).

DISCUSSION

The model allows for flexible and realistic diagnosis interpretation using fuzzy mathematics. Even when patients do not understand fuzzy logic, their inputs can be processed effectively using this system. The results demonstrate how fuzzy thresholds provide interpretable outputs. The model is sensitive to variations in symptom input, and future improvements may involve incorporating real clinical data or expert validation.

CONCLUSION

A fuzzy matrix-based diagnostic system was presented using real matrices extracted from research. The system successfully handles symptom uncertainty and produces interpretable disease diagnosis results. The model is suitable for further development into a clinical decision support tool upon integration with real patient datasets and physician guidance. This study successfully demonstrates the use of triangular fuzzy matrices to aid in the diagnosis of chronic diseases such as Diabetes, Heart Disease, and Cancer. By combining fuzzy set theory with real-world symptom modelling, a method was developed that:

- Handles uncertainty and vagueness in symptom data
- Offers a transparent scoring system for disease likelihood
- Supports clinical decision-making, especially in low-resource settings
- Uses patient-specific symptom profiles to identify the most probable disease

The final results, obtained through matrix operations ($R1$ to $R6$), show that fuzzy logic can offer a more human-like and flexible way to model diagnosis compared to traditional binary systems. The diagnosis network graph further enhances interpretability, offering visual insights into patient-disease associations.

FUTURE WORK

This research opens multiple avenues for further development:

- Integration with real clinical data to validate the model with actual hospital patient records.
- Expansion of the model to include more diseases and symptoms for broader applicability.
- Development of a weighted symptom system where each symptom's contribution varies by disease.
- Implementation of the model into a clinical decision-support tool (mobile app or web interface).
- Incorporation of machine learning for automated tuning of fuzzy membership functions.
- Integration with AI-based health chatbots for triage and remote diagnosis support.

Table. 1: The following table defines the clinical interpretation of each symptom and its corresponding fuzzy encoding.

Symptom	Clinical Meaning (0–10 Scale)	Fuzzy Value (L, M, U)
S1. Fatigue	0 = no fatigue, 10 = extreme exhaustion	(6, 7.5, 9)
S2. Weight Loss	0 = no loss, 10 = rapid unexplained loss	(7, 8.5, 10)
S3. Shortness of Breath	0 = normal, 10 = severe breathlessness	(4, 5.5, 7)
S4. Chest Pain	0 = none, 10 = persistent sharp pain	(2, 4, 6)
S5. Frequent Urination	0 = normal, 10 = hourly/uncontrolled urination	(8, 9, 10)

Table. 2: Let's define a simple, clear diagnosis threshold interpretation

R_6 value	Interpretation	Diagnostic Action
≥ 0.35	Strong match	Confirm disease
0.20-0.34	Moderate match	Need more test
0.10-0.19	Weak possibility	Possible mild symptoms
< 0.10	Not likely	No confirmation

ABSTRACT

Cardiovascular disease (CVD) is the leading cause of morbidity and mortality in individuals with type 2 diabetes mellitus (T2DM). Although several cardiac biomarkers have been studied, a single natriuretic peptide marker may not be sufficient to predict cardiovascular risk in patients with T2DM. Therefore, this study explored the association between natriuretic peptides and cardiovascular risk using the United Kingdom Prospective Diabetes Study (UKPDS) 10-year risk stratification tool. To evaluate the association between natriuretic peptides (MR-proANP and NT-proBNP) and cardiovascular risk in patients with T2DM. A prospective observational study was conducted for 1 year in a tertiary care hospital, enrolling 250 patients with T2DM based on predefined inclusion and exclusion criteria. Data were collected from all participants, and cardiovascular risk was assessed using the UKPDS 10-year risk engine. Among the 250 patients, a significant correlation was observed between natriuretic peptides, CVD, and UKPDS risk scores. Notably, UKPDS score were found to be >31 consisting (95.60%) patients and the least were found to be 18-31 consisting (4.40%) patient. This study reveals the significant Association between NT pro BNP vs MR pro ANP (P <0.001). Elevated natriuretic peptide levels were significantly associated with higher cardiovascular risk in patients with T2DM. Integration of natriuretic peptide assessment with the UKPDS risk engine may improve early risk prediction and aid in preventive strategies for CVD in this high-risk population.

Keywords: Cardiovascular risk, Type-2 Diabetes Mellitus, Natriuretic Peptides (NT-Pro BNP, MR-Pro ANP), UK Prospective Diabetes Study (UKPDS).

INTRODUCTION

Cardiovascular diseases (CVDs) remain the leading cause of morbidity and mortality worldwide, accounting for nearly one-third of all global deaths[1]. The burden is disproportionately higher in low- and middle-income countries, including India, where CVD has emerged as the primary cause of death among adults aged 25–69 years[2]. Recent data indicate that the age-standardized mortality rate for CVD in India (282 per 100,000) exceeds the global average (233 per 100,000), with myocardial infarction and stroke contributing to the majority of deaths[3,4]. Notably, South Asians develop CVD almost a decade earlier than their Western counterparts, often during the most economically productive years of life[5]. Type II diabetes mellitus (T2DM) is a major non-communicable disease strongly associated with an increased risk of CVD. Nearly three-quarters of patients with T2DM die from cardiovascular complications[6]. Pathophysiological mechanisms underlying this association include hyperglycemia, insulin resistance, endothelial dysfunction, chronic inflammation, and oxidative stress, which collectively accelerate atherosclerosis and vascular remodeling [7,8]. In addition, T2DM exacerbates traditional risk factors such as hypertension, obesity, and dyslipidemia, further amplifying cardiovascular risk[9]. India carries one of the highest burdens of diabetes globally, with a prevalence of approximately 7.8% among adults[10]. According to the International Diabetes Federation, over 415 million adults were affected by diabetes worldwide in 2015, with India contributing a significant share[11]. This dual epidemic of diabetes and CVD not only threatens public health but also imposes a heavy economic burden due to premature mortality and loss of productivity[12].

Given this close interplay between diabetes and CVD, early risk assessment and preventive strategies are critical. Traditional cardiovascular risk factors remain important, but emerging evidence suggests that biomarkers such as natriuretic peptides (NT-proBNP, MR-proANP), high-sensitivity C-reactive protein (hs-CRP), and cardiac troponins can provide additional prognostic value in diabetic populations[13,14]. Furthermore, validated clinical tools such as the United Kingdom Prospective Diabetes Study (UKPDS) risk engine have been developed to predict 10-year CVD risk in patients with T2DM. A reduction in HbA1c by 0.9% has been associated with a 14% lower risk of myocardial infarction, underscoring the role of glycemic control in reducing cardiovascular complications[15,16]. Cardiovascular disease (CVD) risk prediction represents an increasing clinical challenge in the treatment of diabetes. The biomarkers reflecting different disease mechanisms to identify clinically useful markers of risk for cardiovascular events in patients with the risk of type 2 diabetes (T2D) [17,18]. The use of biomarkers are firmly established for the assessment of cardiovascular disease [19, 20] Gender is a risk for the development of heart failure (male>female) among T2DM. The biomarkers which identify clinically useful markers of risk for cardiovascular events in patients with the risk of T2D [21, 22]MR pro ANP are novel biomarkers associated with patient's prognosis in acute coronary syndrome [23,24]The level of the inactive N-terminal fragment of pro–brain (B-type) natriuretic peptide (BNP) is a strong predictor of mortality among patients with coronary artery syndromes. On this burden, present study is designed to assess the significant role of prognostic cardiac markers in T2DM. Therefore, systematic assessment of cardiovascular risk in T2DM patients is essential for optimizing preventive interventions and improving long-term outcomes. This study focuses on evaluating cardiovascular risk in type II diabetes patients, highlighting both clinical risk prediction models and the role of emerging biomarkers.

AIM AND OBJECTIVES

The main aim of study is to assess the cardiovascular risk in Type-II Diabetes patients

Primary Objective

To assess the correlation MR- pro ANP and NT Pro-BNP as a prognostic biomarker for cardiovascular risk in patients with type II diabetes

Secondary Objectives
To evaluate the risk of Cardiovascular disease in patients with type II diabetes

MATERIALS AND METHODS

Our study is a prospective observational study involving type II diabetic patients with CVD, conducted for 1 year and involving a sample size of 250 patients. The study was conducted at the Tertiary Care Hospital. Institutional approval has been taken to conduct this study (Ref.no.PSG/IHEC/2022/Appr/Exp/102)

Eligibility criteria
Inclusion criteria: both males and females over 18 years old. All the type II diabetic patients with CVD and those who have natriuretic peptide test(MR-pro ANP, NT-pro BNP).

Exclusion criteria: age below 18 years old, patients with type-I diabetes, pregnant women, and patients who were not willing to participate were excluded.

Study Tools
- Patient Data Collection Form
- Informed Consent form
- UKPDS CHD-10 years risk score

Data collection and design: Data were collected using a pre-structured patient data collection form based on inclusion and exclusion criteria. The following parameters were taken for the observation: lipid profile, blood sugar (FBS, PPBS, RBS, and HbA1C), levels of natriuretic peptides (MR-pro ANP, NT-pro BNP), 2DEchocardiography, history or events of CVD, patient demographic details, etc. The collected data were correlated based on the objective of the study. 10 years of cardiovascular risk assessment were performed using the UK Prospective Diabetes Study (UKPDS) tool.

Measurement of biomarkers. All blood samples were collected in plastic tubes containing ethylene diaminetetra acetic acid, and plasma was stored at 70°C in plastic freezer vials. MR-proANP and MR-proADM were measured with an automated sandwich chemiluminescence immunoassay on the KRYPTOR System

Statistical analysis: Data were entered into Microsoft Excel and SPSS 23.00 Version was used for the statistical analysis. Descriptive statistics, the Mann-Whitney U test, and the Pearson correlation were used to identify the correlation relationship between two variables and the strength of that relationship. Strobe flow chart (Figure 1)

RESULTS

A total of 250 patients were included in the study conducted at a tertiary care hospital during the study period.In our study Population 169(67.5%) were male and 81(32.5%) were female patients. Based on the duration of diabetes mellitus we found that high prevalence in the 5–10 year range (55.4%): This suggests that most patients are in the mid-phase of diabetes, reflecting when symptoms, complications, or routine screenings often lead to diagnosis and active management. Moderate percentage in the 11–15 year range (21.7%): This indicates a significant portion of long-term patients, which aligns with the chronic nature of diabetes and the effectiveness of treatment in prolonging life. Smaller group with >20 years duration (14.9%): Over decades, diabetes-related complications (e.g., cardiovascular disease, nephropathy) might reduce survival, leading to fewer patients in this category. Low proportion in the 16–20 year range (6.7%): This dip might suggest higher attrition due to complications or a gap in diagnosis and follow-up care during this period. Few recent diagnoses (1.8%): A small percentage of cases less than 5 years old could point to underdiagnosis, delayed onset, or fewer new cases in the population being studied.

UKPDS 10 years CVD risk (Figure 2)
The graph illustrates that the highest UKPDS score were found to be >31 consisting (95.60%) patients and the least were found to be 18-31 consisting (4.40%) patient.

Association of NT pro BNP and MR pro ANP (Figure: 3)
Scatter plot showing the Pearson's correlation between mid-regional pro-atrial natriuretic peptide (MR-proANP) and N-terminal pro-B-type natriuretic peptide (NT-proBNP).

Comparison of markers (Figure 4)
(A)Receiver-operating characteristic curves for B-type natriuretic peptide (BNP) (green line), N-terminal pro–B-type natriuretic peptide (NT-proBNP) (red line), and mid-regional pro-atrial natriuretic peptide (MR-proANP) (blue line) for detecting acute heart failure. (B) Spearman's correlation between BNP and MR-proANP. AUC area under the curve; CI confidence interval.

Association of cardiac markers with variables (Risk factors) (Table 1)
Cumulative incidence plot of incident cardiovascular events according to CVD (Figure 5)
Follow up MR pro ANP (baseline to 1 year). Follow up (baseline to 1 year).
Cumulative incidence plot of incident cardiovascular events according to MR pro ANP levels. The plot likely shows two curves (Kaplan-Meier style), representing the cumulative incidence of cardiovascular events over time for individuals with low versus high Mid-Regional pro-Atrial Natriuretic Peptide (MR-proANP) levels.

CVD Risk stratification
Our study reports an HR of 1.5 (95% CI: 1.2–1.8, $p < 0.05$) for cardiovascular disease in diabetic patients, this means diabetics have a 50% higher risk of cardiovascular diseases.

DISCUSSION

Cardiovascular disease (CVD) remains the leading cause of mortality among individuals with type 2 diabetes mellitus (T2DM), accounting for nearly three-quarters of deaths in this population. Natriuretic peptides, particularly N-terminal pro–B-type natriuretic peptide (NT-proBNP) and midregional pro–atrial natriuretic peptide (MR-proANP), are well-established biomarkers of cardiac dysfunction and have been increasingly recognized for their prognostic value in T2DM patients with or without CVD. Previous studies have highlighted their clinical significance. Jesper Jensen *et al*. (2020) demonstrated that MR-proANP is a valuable biomarker for identifying heart failure (HF) in outpatients with T2DM. Importantly, elevated MR-proANP levels were associated with an increased risk of cardiovascular events in patients with heart failure with preserved ejection fraction (HFpEF), supporting its prognostic utility in this subgroup. Similarly, Caterina Sujana *et al*. (2021) reported that both NT-proBNP and MR-proANP were inversely associated with incident T2DM in populations free from CVD, although this inverse relationship was attenuated in the presence of established cardiovascular disease. In our study, we observed that elevated NT-proBNP and MR-proANP levels were strongly associated with increased cardiovascular risk in patients with coexisting T2DM and CVD. These findings are consistent with existing literature that supports the inclusion of natriuretic peptides in CVD risk stratification. Furthermore, our results emphasize that while many cardiac biomarkers are indicative of late-stage disease, natriuretic peptides may serve as earlier markers of subclinical cardiovascular dysfunction in high-risk diabetic populations. The United Kingdom Prospective Diabetes Study (UKPDS) risk engine has also been established as a useful tool for estimating 10-year coronary heart disease (CHD) risk in patients with T2DM.

Nebojsa Kavaric *et al*. (2018) employed the UKPDS risk algorithm but found no correlation between high-sensitivity C-reactive protein (hs-CRP) and CVD prediction, underscoring the limitations of inflammatory biomarkers. UKPDS incorporates factors such as age, sex, duration of diabetes, HbA1c levels, blood pressure, lipid profiles, smoking

status, and presence of atrial fibrillation to predict cardiovascular risk. All the above data of our defined samples had been seeded in UKPDS risk estimator and the CVD 10 years risk was obtained. The UKPDS Risk Engine correlates strongly with cardiovascular risk by integrating multiple diabetes-related factors that contribute to endothelial dysfunction, plaque formation, and arterial damage. This mechanistic approach helps predict the likelihood of heart disease risk in type 2 diabetes patients. In contrast, our findings highlight the predictive relevance of natriuretic peptides, which demonstrated stronger associations with both glycemic status and cardiovascular risk.

CONCLUSION

This study underscores the prognostic significance of natriuretic peptides in T2DM patients at risk of CVD. Elevated levels of NT-proBNP and MR-proANP were positively associated with cardiovascular risk, supporting their role as early-stage biomarkers. Incorporating these peptides into risk assessment models could enhance early detection and intervention strategies, potentially reducing long-term cardiovascular complications in T2DM. Additionally, the UKPDS risk engine remains a promising tool for estimating 10-year CVD risk, complementing biomarker-based approaches. Further longitudinal studies are warranted to establish natriuretic peptides as integral components of routine cardiovascular risk prediction in T2DM populations.

Conflict of Interest

The authors declare that there is no conflict of interest.

ACKNOWLEDGEMENT

We would like to thank the Parul University and the management for the fullest support.

ABSTRACT

Due to their dynamic topology and resource constraints, Mobile Ad Hoc Networks (MANETs) face significant challenges in optimizing energy consumption, and hence, efficient data transmission. A Hybrid Swarm Intelligence Based Energy Efficient Routing Protocol (HSIEERP) is proposed to improve the routing efficiency in MANETs by integrating Enhanced BAT Algorithm (EBAT) with Adaptive Sparrow Search Algorithm (ASSA). The proposed hybrid approach takes advantage of the echolocation-based exploration of the BAT algorithm and the adaptive foraging behaviour of the Sparrow Search Algorithm to optimize routing paths, reduce energy consumption and hence extend the network's lifetime. EBAT component improves convergence speed and escapes from local optima while ASSA increases the adaptability by changing search strategies according to network environment. It has been found from extensive simulations that HSIEERP outperforms traditional routing protocols and other swarm intelligence based methods in terms of energy efficiency, packet delivery ratio, end to end delay and network lifetime. The results of this paper show the potential of hybrid swarm intelligence approaches in solving the routing problems of MANETs.

Keywords: MANETs, Swarm Intelligence, Energy-Efficient Routing, Enhanced BAT Algorithm, Adaptive Sparrow Search Algorithm, Hybrid Optimization

INTRODUCTION

MANETs are self-configuring networks where mobile nodes communicate without a fixed infrastructure. Energy-efficient routing is critical due to the limited battery capacity of nodes. Traditional routing protocols such as AODV, ACO and PSO do not effectively consider energy constraints, leading to premature node failures. Swarm intelligence-based met heuristic approaches have emerged as promising solutions for optimizing routing decisions. This paper introduces a hybrid approach combining EBA for global optimization and ASSA for adaptive exploration and exploitation. Mobile Ad Hoc Networks (MANETs) are decentralized networks of mobile devices that communicate wirelessly without relying on any pre-existing infrastructure or centralized management. The dynamic nature of these networks, characterized by frequent changes in topology due to the mobility of nodes, presents significant challenges in terms of routing and energy efficiency. These challenges are particularly critical in resource-constrained environments, where the battery life of nodes directly impacts the overall network performance and lifetime. Swarm Intelligence (SI), inspired by natural processes and behaviours observed in social organisms like birds, ants, and bees, has emerged as an effective method for solving optimization problems, including those encountered in MANETs. Among the most promising SI techniques are the Bat Algorithm (BAT) and Sparrow Search Algorithm (SSA). These algorithms mimic the foraging behaviour of Bats and sparrows, respectively, to find the best solution to optimization problems. Due to their inherent capabilities of exploration and exploitation, these algorithms have shown considerable potential in optimizing routing protocols for energy-efficient communication in MANETs. This paper presents a Hybrid Swarm Intelligence-Based Energy-Efficient Routing Protocol for MANETs that combines the strengths of the Enhanced Bat Algorithm (BAT) and the Adaptive Sparrow Search Algorithm (SSA). The proposed hybrid protocol aims to optimize the routing process by considering multiple factors, including energy consumption, path stability, throughput, and packet delivery ratio (PDR). By leveraging the global search capabilities of BAT and the local search adaptability of SSA, the hybrid algorithm efficiently identifies the most energy-efficient routing paths while minimizing end-to-end delay and packet loss.

Sonia Sharma, proposed DSR routing protocol that is not suitable for large and dynamic networks due to high overhead. VeepinKumar, proposed Hybrid ACO and PSO This increased complexity can lead to longer route discovery times. Prasun Das, suggested AODV, suitable for the dynamic network but consumed more bandwidth. Patel, J.; El-Ocla, H, proposed GA- AMODV routing protocol that provides uneven energy distribution, poor routing decisions. Taj-AldeenNaserAbdali, proposed OPSO and LAR Protocl can increase the control overheadand energy consumption during the optimization process. B. Kameswara and RaoA.S.N.Chakravarthy, suggested Hybrid K-means-PSO-AODV that may not always find the global optimum solution. Manmohan Sharma, proposed Energy Efficient Routing Protocol AODV and EMAODV that provides the shortest path. However, it consumes a large amount of bandwidth and extra routing overhead. K. Shankar, Proposed AODV, DSR TORA routing protocol not suitable for complexity, control overhead, scalability issues, and lack of battery-aware load balancing. Rangaraj Jayavenkatesan, proposed ACO and FDPSO added complexity may cause delays in route discovery and increase the processing time for optimizing the energy-efficient path. V Selvi, proposed ACO and PSO the convergence rate of ACO and PSO is typically slow, especially in highly dynamic environments. Shahram Jamali, The performance of BPSO heavily depends on the proper tuning of its parameters, such as inertia weight, acceleration coefficients, and swarm size. If these parameters are not correctly adjusted, the algorithm may suffer from issues like slow convergence, premature stagnation, or failure to find optimal solutions. Alireza Sajedi Nasab, the proposed PSO-based multicast routing protocol may not adapt quickly enough to these changes Several swarm intelligence-based routing protocols have been proposed for MANETs, including Ant Colony Optimization (ACO), Particle Swarm Optimization (PSO), and Hybrid Genetic Algorithms. However, these methods suffer from slow convergence, local optima entrapment, and high computational overhead. The BAT Algorithm, inspired by echolocation, and the Sparrow Search Algorithm

(SSA), inspired by predator-prey behaviour, has demonstrated strong optimization capabilities. However, their standalone performance is limited by either premature convergence or excessive exploration. The proposed hybrid model aims to address these limitations. Chronological summary of references used in the literature review (Table 1)

Problem Statement

Mobile Ad Hoc Networks (MANETs) face major difficulties due to their instability. These networks have nodes that move around and often use devices powered by batteries, so they don't have much energy to work with. This means using energy and sending data are key to how well MANETs work and how long they last. Traditional methods of routing data often fail to handle these problems, which may cause energy waste, frequent data packet loss, and reduced system speed. Energy efficiency plays a key role since batteries power nodes in a MANET. The use of power affects both how long individual nodes last and how well the network performs as a whole. Dynamic Topology: When nodes move, it often changes the network layout, which means making tricky routing choices. This leads to paths that don't work well and longer delays from start to finish. Packet delivery and credibility: To make a MANET work well, it's crucial to send data packets to where they need to go with the shortest possible wait time. Regular protocols often have trouble keeping high packet delivery rates (PDR) when networks grow larger and nodes move more. Network Lifespan: A key challenge in MANETs involves making the network last as long as possible while ensuring reliable communication. If one or more nodes run out of power, it can mess up the whole network. This paper tackles the need for a smarter, more flexible routing protocol. It should be able to save energy, deliver more packets, cut down on delays, and make the network last longer even with all the challenges that come with MANETs always changing. The study puts forward the Hybrid Swarm Intelligence-Based Energy-Efficient Routing Protocol (HSIEERP). This protocol brings together the Enhanced BAT Algorithm (EBA) and the Adaptive Sparrow Search Algorithm (ASSA). The goal is to fix these issues and boost how well MANETs work overall.

PROPOSED METHODOLOGY

The Hybrid Swarm Intelligence-Based Energy-Efficient Routing Protocol (HSIEERP) integrates the Enhanced BAT Algorithm (EBA) with the Adaptive Sparrow Search Algorithm (ASSA) to optimize routing in Mobile Ad Hoc Networks (MANETs). This hybrid approach leverages the strengths of both algorithms to improve route discovery, minimize energy consumption, and enhance overall network performance.

Key Components of HSIEERP

Enhanced BAT Algorithm (EBA): EBA is used to improve convergence speed and avoid local optima in route optimization. The key enhancements in EBA include echolocation-based exploration, which simulates bat echolocation to dynamically identify the most energy-efficient paths. Dynamic Frequency Tuning: Modifies the search frequency according to how dense the nodes are to improve flexibility. Balance Between Local and Global Search: Keeps the right mix of local and global search to prevent results from settling too.

Enhanced Bat Algorithm Formula

The Enhanced Bat Algorithm (EBA) utilizes the following key formulas:

Velocity Update: $v_i(t+1) = \alpha v_i(t) + \beta\,(x_i(t) - x_g(t)) + \gamma(r - 0.5)$

Position Update

$x_i(t+1) = x_i(t) + v_i(t+1)$

Loudness Update

$A_i(t+1) = A_i(t) \cdot \exp(-\alpha t)$

Algorithm 1 Enhanced BAT Algorithm

1: Initialize bat population $X_i (i = 1,2,...,n)$
2: Define pulse frequency f_i at each bat
3: Initialize velocities v_i and loudness A_i
4: Define pulse rate r_i
5: **while** stopping criterion is not met **do**
6:**for** each bat i **do**
7: Generate new frequency f_i and update velocity v_i using:

$$v_i^{t+1} = v_i^t + (X_i^t - X_*) f_i \quad (1)$$

8: Update position X_i:

$$X_i^{t+1} = X_i^t + v_i^{t+1} \quad (2)$$

9: **if** rand $> r_i$ **then**
10: Select a solution among the best solutions
11: Generate a local solution around the selected best solution
12: **end if**
13: **if** rand $< A_i$ and $f(X_i)$ is improved **then**
14: Accept the new solution
15: Reduce loudness A_i and increase pulse rate r_i:

$$A_i^{t+1} = \alpha A_i^t, \quad r_i^{t+1} = r_i^0 (1 - e^{-\gamma t}) \quad (3)$$

16: **end if**
17: **end for**
18:Rank the bats and update the global best solution
19: **end while**
20: Return the best solution found

Adaptive Sparrow Search Algorithm (ASSA)

ASSA enhances the adaptability of routing by dynamically adjusting search strategies based on network conditions. The main features of ASSA include Adaptive Foraging Behaviour: Mimics sparrow search behaviour to optimize path selection under varying MANET conditions. Leader-Follower Mechanism: Distinguishes between active and passive nodes to distribute energy consumption efficiently. Randomized Escape Mechanism: Prevents stagnation by introducing random mutations in routing paths.

Adaptive Sparrow Search Algorithm (ASSA) Formula

Position Update Formula

The position of the sparrow is updated in two phases: exploration and exploitation. The basic formula for updating the position of sparrows is:

$x_i(t + 1) = x_i(t) + \alpha \cdot \text{rand} \cdot (x_{best} - x_i(t))$ (1)

Where:

- $x_i(t)$ is the position of the i^{th} sparrow at time t,
- α is a random number that controls the step size,
- rand is a random number between [0, 1],
- x_{best} is the best position found by the sparrows so far.

Exploration Phase

In the exploration phase, sparrows perform a random search in the search space. The position update is given by:

$x_i(t + 1) = x_i(t) + \beta \cdot \text{rand} \cdot (x_{worst} - x_i(t))$ (2)

Where:

- x_{worst} is the worst position in the population,
- β is another random factor that controls the exploration behavior.

Exploitation Phase

In the exploitation phase, sparrows focus on refining their positions toward the best-found solution. The position update is given by:

$x_i(t+1) = x_i(t) + \gamma \cdot \text{rand} \cdot (x_{best} - x_i(t))$ (3)

Where

$\gamma$is a random factor for refining the search around the best solution.

Algorithm 2: Adaptive Sparrow Search Algorithm (ASSA)

1. Initialize population of sparrows $X_i(i = 1,2,...,n)$
2. Set maximum iterations and initialize parameters
3. **while** stopping criterion is not met **do**
4. Calculate fitness values for all sparrows
5: Identify producers and scroungers based on fitness
6: **for** each producer **do**
7: Update position using adaptive strategy:

$$X_i^{t+1} = X_i^t e^{-\lambda t} + \alpha R \quad (1)$$

8: **end for**
9: **for** each scrounger **do**
10: Follow producers or perform random walk:

$Xit+1 = Xit + eta|Xbest - Xit|R$ (2)

11: **end for**
12: Introduce awareness factor to avoid local optima:

$A = e^{-\gamma t}$ (3)

13: Update best solution found so far
14: **end while**
15: Return the best solution found

HSIEERP Routing Process

Network initialization is each node initializes its energy level and establishes neighbor relationships. A control packet exchange determines node density and mobility characteristics. Route Discovery Using EBA is a source node that applies echolocation-based exploration to determine the shortest and most energy-efficient routes. Routes with lower energy consumption and higher reliability are selected for initial transmission. Route Optimization Using ASSA Sparrow search principles refines routing paths based on real-time network conditions. Leader-follower mechanisms adjust routing dynamically, ensuring load balancing. Escape strategies prevent local stagnation and improve adaptability. Data Transmission and Route Maintenance data packets are transmitted through optimized routes. Nodes monitor energy levels and adapt routing strategies using ASSA when necessary. Broken or inefficient links trigger re-optimization.

Algorithm 3: HSIEERP Routing Protocol

1. **Input**
2. Network topology (nodes, positions), initial energy levels, mobility characteristics, source, and destination nodes
3. **Output**
4. Optimized routing path with minimal energy consumption and high reliability
5. **Step 1: Network Initialization**
6. Each node initializes its energy level and position
7. Nodes exchange control packets to establish neighbour relationships
8. Each node gathers network density and mobility characteristics
9. **Step 2: Route Discovery Using EBA (Echolocation-based Exploration)**
10. for each source node *S* do
11. *S* broadcasts echolocation signals to neighbors to discover potential paths

12. for each neighbor node N_i of S do
13. Calculate the energy cost $E_{S,Ni}$ for transmission to N_i
14. Calculate link reliability $R_{S,Ni}$ based on distance, signal strength, and congestion
15. **end for**
16. Rank neighbors based on:
17. Lower energy cost $E_{S,Ni}$ and higher reliability $R_{S,Ni}$
18. Select the next hop node N_{next} with the lowest energy cost and highest reliability
19. If destination node is reached, stop; otherwise, continue until destination is found
20. **end for**
21. **Step 3: Route Optimization Using ASSA (Adaptive Sparrow Search Algorithm)**
22. Initialize parameters for ASSA:
23. Population size P, Max iterations T, Leader-follower ratio r, Energy threshold ϵ
24. Initialize population of sparrows (nodes) with random routes
25. for iteration $t = 1$ to T do
26. for each sparrow (node) i do
27. Evaluate fitness of sparrow i based on:
28. fitness(i) = $E_i + \alpha \cdot (1 - R_i)$, where α is a weight for reliability
29. **end for**
30. Rank sparrows by fitness (lower fitness is better)
31. Select leader sparrow L (best fitness) and follower sparrows $F_1, F_2, \ldots, F_{P-r}$
32. for each follower F_j do
33. Update position (route) of F_j using leader L's position:
34. $X_{Fj}(t+1) = X_L(t) + \beta \cdot (X_{Fj}(t) - X_L(t))$
35. :where β is a random factor for diversity in the solution
36. **end for** 2
37. Apply escape strategy for sparrows with poor fitness:
38. for each sparrow i with fitness greater than threshold ϵ do
39. $X_i(t+1) = X_i(t) + \gamma \cdot (X_{random} - X_i(t))$
40. where X_{random} is a randomly chosen position to explore new paths
41. **end for**
42. Update positions of all sparrows (nodes) and re-evaluate their fitness
43. If an optimal route is found (fitness ¡ threshold), stop; otherwise, continue to next iteration
44. **end for**
45. **Step 4: Data Transmission and Route Maintenance**
46. for each data packet do
47. Transmit data packets through the optimized route

Simulation and Performance Evaluation

Simulation Setup

Try different simulation tools to set up a MANET, such as NS-2, NS-3, OPNET, NETSIM, GloMoSim, and QualNet. The simulator you choose depends on the type of network and the supported protocols. This research uses NS-3.29 to check how MANET routing protocols perform. NS-3.29 is open-source software written in C++ and OTCL.The simulation looks at node densities of 60, 80, 100, 120, 140 160 180, and 200. At first, nodes are scattered in a 1000m × 1000m square area for simulation and move based on the Random Waypoint mobility model. The traffic model sticks to Constant Bit Rate (CBR). The performance valuation depends on key metrics; among these are energy consumption, packet delivery ratio (PDR), end-to-end delay, throughput, and network lifetime.

Performance Metrics

Energy Consumption: Objective: Measure the energy usage of nodes in the network. Factors Influencing Energy Consumptions are Transmission and reception of packets. Idle state of the nodes. The number of active nodes and their movement. Metrics are Energy consumption can be calculated by summing the energy used by each node over time.

Packet Delivery Ratio (PDR)

Mobile Ad hoc Network (MANET), the packet delivery ratio (PDR) is a key metric used to estimate the potency and reliability of the network. It reflects how well data is delivered between mobile nodes that are constantly on the move

Formula

The Packet Delivery Ratio (PDR) is given by

$$PDR = \frac{Nreceived}{Nsent}$$

Where:

- $N_{received}$ is the number of packets successfully received by the destination.
- N_{sent} is the total number of packets sent by the source.

End-to-End Delay

Mobile Ad Hoc Network (MANET), end-to-end delay refers to the total time a data packet takes to travel from the source node to the destination node, considering all delays involved in the process.

End-to-End Delay Formula

The end-to-end delay $D_{end-to-end}$ in a network is given by:

$D_{end-to-end} = D_{transmission} + D_{propagation} + D_{queuing} + D_{processing}$

Where:

Transmission delay: $D_{transmission} = \frac{L}{R}$,

Propagation delay: $D_{propagation} = \frac{d}{s}$,

Queuing delay: $D_{queuing}$(depends on network traffic),

Processing delay: $D_{processing}$(time to process the packet at each node).

Throughput

Throughput in a Mobile Ad Hoc Network (MANET) refers to the rate at which data is successfully transmitted from the source node to the destination node over a network in a given period of time. It is typically measured in bits per second (bps) or kilobits per second (kbps) and serves as an indicator of the network's capacity to carry traffic.

Formula

The throughput T is given by

$$T = \frac{Nreceive \times L}{Ttotal}$$

Where

- $N_{received}$ is the number of packets successfully received by the destination.
- L is the size of each packet (in bits).
- T_{total} is the total time taken for the transmission.

Alternatively, throughput can also be expressed as

$$T = \frac{B}{Ttotal}$$

Where

- B is the total number of bits transmitted.

- T_{total} is the total time taken for the transmission.

Network Lifetime

Network Lifetime in a Mobile Ad Hoc Network (MANET) refers to the duration of time the network remains operational and capable of supporting communication between nodes before a significant portion of the network becomes unusable. Essentially, it is the time from the moment the network starts operating until it can no longer maintain the required communication due to depleted resources (like battery power) or broken connectivity (due to mobility or other factors).

SIMULATION RESULTS

Energy Consumption

The results From Fig. 1, it is clear that the proposed HSIEERP protocol consumes 35% less energy compared to AODV, ACO, and PSO routing protocols, making it significantly more energy-efficient. The lower energy consumption in HSIEERP is likely due to its advanced optimization techniques, which ensure more effective energy use, balanced load distribution, and efficient path selection. This energy efficiency directly contributes to extended network lifetime and improved overall performance in Mobile Ad Hoc Networks (MANETs).

Packet Delivery Ratio (PDR)

The results from Fig. 2, it is evident that the PDR of HSIEERP is significantly higher than that of AODV, ACO, and PSO, showing an improvement of 20% across all network sizes. This enhanced packet delivery ratio demonstrates that HSIEERP is much more efficient and reliable in terms of successfully transmitting packets across the network. The improvements in PDR can be attributed to the optimized routing and energy-efficient techniques used in HSIEERP, which help in maintaining stable and reliable communication links as the network grows.

End-to-End Delay

The results from Fig. 3, it is clear that HSIEERP outperforms AODV, ACO, and PSO in terms of End-to-End Delay (E2ED), achieving lower delays across all network sizes. The improved E2ED performance in HSIEERP can be attributed to its optimized routing paths and efficient use of energy, ensuring faster and more reliable packet delivery. This makes HSIEERP a more effective solution for Mobile Ad Hoc Networks (MANETs), where low latency is crucial for maintaining high performance in dynamic, mobile environments.

Throughput

The results from Fig. 4 clearly show that HSIEERP achieves better throughput than AODV, ACO, and PSO as the number of nodes increases. The superior throughput of HSIEERP can be attributed to its optimized routing protocols that effectively balance energy efficiency and data transmission, leading to more stable and reliable communication in larger networks. As a result, HSIEERP proves to be a more efficient and scalable routing solution for Mobile Ad Hoc Networks (MANETs), especially as network size grows.

Network Lifetime

The results from Fig. 5 clearly show that the proposed HSIEERP protocol significantly improves network lifetime when compared to AODV, ACO, and PSO. The extended network lifetime is a direct result of the balanced load distribution feature of HSIEERP, which optimizes energy consumption and ensures that the network can sustain communication even as the number of nodes increases. This makes the protocol particularly suitable for large-scale and long-duration applications in Mobile Ad Hoc Networks (MANETs).

CONCLUSION

This paper introduces a new approach called the Hybrid Swarm Intelligence-Based Energy-Efficient Routing Protocol (HSIEERP). It combines the Enhanced BAT Algorithm (EBA) with the Adaptive Sparrow Search Algorithm (ASSA) to make routing better in Mobile Ad Hoc Networks (MANETs). By using the best parts of both algorithms, HSIEERP makes routing more efficient, uses less energy, and helps networks last longer. The EBA's echolocation-based search helps find solutions faster and avoids getting stuck in local best options. Meanwhile, the ASSA's adaptive foraging behavior allows the system to change based on what's happening in the network. In-depth testing shows that HSIEERP performs better than regular routing methods and other swarm intelligence-based systems when it comes to saving energy, delivering packets, reducing delays, and making networks last longer. These findings highlight how mixing different swarm intelligence techniques can help solve MANET problems. Looking ahead, researchers could make HSIEERP even better by using machine learning to predict routes and fine-tune settings. This could help the system handle fast-changing networks more and on a larger scale.

ABSTRACT

Inflammatory Bowel Disease (IBD), which includes Crohn's disease and ulcerative colitis, is a long-term inflammatory condition of the gastrointestinal tract with no clear cause. It arises from a complex interaction of environmental, genetic, microbial, and immune factors. Crohn's disease can impact any area of the digestive tract, but ulcerative colitis only affects the colon and rectum. Diagnosis involves endoscopy, imaging, lab tests, and stool analysis. Treatment aims to reduce inflammation by involving anti-inflammatory drugs, immunosuppressants, biologics, antibiotics and dietary support. Advances in targeted drug delivery systems and nanomedicine have improved treatment precision and reduced side effects. Recently, artificial intelligence has shown promise in enhancing diagnosis, disease monitoring and personalized treatment planning, especially in pediatric IBD cases.

Keywords: Inflammatory Bowel Disease, Crohn's disease, drug delivery systems, artificial intelligence

INTRODUCTION

Inflammatory bowel disease (IBD) is a chronic inflammatory illness that has no known cause. IBD consists of ulcerative colitis (UC) and Crohn's disease (CD), which are considered distinct entities. Although it is idiopathic, there are two main causes of IBD: environmental and genetic factors. The immune system relies on the gastrointestinal tract, where this disease is commonly found, and the innate and adaptive immune systems interact with gut bacteria in a state of homeostasis [1].CD can disrupt any part of the intestine, but it typically affects the colon, perianal area, terminal ileum, and cecum. On the other hand, UC affects the rectum and can affect the entire colon or only a portion of it. Transmural inflammation, thicker submucosa, fissuring ulceration, and granulomas were histologically observed in CD, where as UC only shows mucosal and submucosal inflammation together with cryptitis and crypt abscesses[2]. Therearenumerousassays,radiographicanalyses,stoolandbloodtestsaccessible forassessing the disease severity. Amino salicylates, Immunomodulators and corticosteroids aidin managing and treating illness. In particular, the drugs are designed to reduce colon inflammation and symptoms [3].The development of second-generation agents with enhanced drug delivery, better efficacy and reduced adverse effects has been made possible by the significant difficulty of delivering drugs to the right location or sites along the gastrointestinal tract [4].

Epidemiology

New Zealand has four prevalence studies with a pooled IBD prevalence rate of 310 per 100,000 people, according to a recent systematic review. This combined rate is comparable to Canterbury's first population-based IBD prevalence research, which in 2005 reported a prevalence of 308 per 100,000 people. A 2019 Australian administrative general practice-based study, on the other hand, found the greatest prevalence rate yet in Oceania with 653 cases per 100,000 people [5].This investigation aimed to ascertain the point occurrence of IBD, CD, UC, and IBDU in Canterbury as of January 1, 2024. Additional objectives included describing the features of Canterbury's IBD patients, comparing them to data gathered in 2005, two decades ago and analyzing Canterbury's place in the IBD epidemiological model [5].

Etiology

IBD's precise etiology is uncertain. IBD is thought to be caused by a combination of four variables, including a genetic component, an environmental cause, a gut bacterialim balance and an immune response that is not pertinent. In individuals with IBD, the immune system misinterprets harmless substances in the stomach for foreign substances and attacks leading to inflammation. [6].

Pathophysiology

In the pathogenesis of IBD, the intestinal immune system plays a significant role. Microorganisms or antigens cannot enter the bloodstream through the closed intercellular connections of the gut epithelium. Either severe inflammation or a significant breakdown in barrier function causes these junctions to be compromised in IBD. Paneth cells secrete α-defensins, which have natural antibacterial properties while goblet cells produce mucus as an additional defense mechanism. By exposing the body to additional intestinal germs and allowing the epithelium to continue to degrade, excessive inflammatory responses exacerbate inflammation. A persistent characteristic of UC is mucosal inflammation, which leads to bleeding, ulceration, edema and electrolyte loss. The inflammation in UC usually starts in the rectum and progresses steadily to the proximal colon. One characteristic of CD is skip lesions. About 20% of patients with UC have rectum-only illness. Pancolitis affects 15% of people. As the illness progresses, the colon becomes stiffer and shorter, and it resembles a "lead pipe" on a barium enema due to the absence of haustral markings. CD can affect any portion of the gastrointestinal tract, resulting in strictures, inflammation, or fistula formation. All layers of the intestines are transmurally affected by Crohn's disease. In the later stages of the disease, the mucosa will appear cobblestone-like due to the linear ulcers between the normal mucosa. Crohn's disease primarily affects the colon and ileum, with just 5% of cases affecting the gastroduodenal regions. Although the

rectum is mostly unaffected by Crohn's disease, anorectal complications including fistulas and abscesses are common [7].

Clinical Presentation

IBD symptoms vary from person to person and might change over time. Bloody stools, diarrhea, cramps, frequent bowel movements, stomach aches are the most typical symptoms of CD and UC. Signs and symptoms of IBD might also include weight loss, exhaustion and appetite. IBD is exemplified by periods of remission with few or no symptoms and periods of active disease (flares) with symptoms present[8].

Diagnosis

Different diagnosis methods are available to assess the disease's stage and severity. This helps doctors find and identify the inflammation. The following is a discussion of the techniques.

Endoscopy

Capsule endoscopy

Capsule endoscopy is a wireless, minimally invasive technique that allows direct vision of the whole colon and small intestine. Patients with active disease benefit more from enteric video capsule endoscopy than Ileo colonoscopy because it can view both the small and large intestines. Patients with active disease benefit more from enteric video capsule endoscopy than Ileo colonoscopy because it can view both the small and large intestines [9].

Colonoscopy and Sigmoidoscopy

This method involves using a colonoscope or sigmoidoscope to inspect the colon. This procedure can be used to observe and determine the ulcer or edema. The instruments are camera-equipped [10].

Laboratory Test

Blood test

The diagnosis and screening of CD and UC involve haemoglobin, platelet count, C-reactive protein (CRP), albumin and erythrocyte sedimentation rate (ESR) [11].

Imaging

X-ray computed tomography and magnetic resonance imaging

The intestinal portion can be thoroughly examined by these magnetic scans, allowing for the detection of abdominal problems such as fistulas, abscesses, blockage and bleeding. It does not include other illnesses that produce symptoms connected to IBD, such as appendicitis.Before the test, the patient may receive an intravenous contrast injection or typically consume an oral contrast. In order to assess individuals suffering from inflammatory bowel illness, magnetic resonance imaging (MRI) enterography offers the advantages of non-invasive active inflammation detection and superior soft tissue contrast [12].

Plain film and barium X-ray (follow-through and enema)

Large and minor intestinal perforations can be found using plain X-rays. The size and location of the lesion are shown by a barium X-ray. Additionally, the passage of a viscous, chalky liquid barium through the digestive system is tracked [13].

Stool Analysis

To assess the illness's severity and to pinpoint the microbiological pathogen that is responsible. IBD is associated with gut microbial changes, or gut dysbiosis. The gut microbiota receives nitrogen from bacteria that produce urea. Proteobacteria species predominate and dysbiosis is caused by the biota used for amino acid production [14].

Management and Treatment

Anti-inflammatory and immunomodulator drugs:

Maintaining remission and lowering inflammation are the primary goals of this disease's management. Anti-inflammatory medications such as5-aminosalicylic acids and corticosteroids as well as immunomodulators like natalizumab, infliximab, adalimumab, mercaptopurine, azathioprine and methotrexate, can achieve this. In order to control the immune system, these substances effectively elicit a Th2-mediated reaction that reduces inflammation caused by Th1. By suppressing the immune system, this medication prevents the release of substances that cause inflammation.

Antibiotics

Inflammatory bowel disease has a complicated pathophysiology that includes interactions between environmental and genetic variables. One approach is the prescription of an antibiotic that targets and kills Gram, such as oral vancomycin without gentamicin. Anaerobic and negative microorganisms that could cause or worsen symptoms of IBD [15].

Anti diarrheal and laxatives

A clinical sign of IBD is diarrhea, which is frequently accompanied by urgency, stomach pain, and faecal incontinence. Impaired water and salt absorption in the inflammatory colon is the underlying pathophysiology. Therefore, using antidiarrheal medications to reduce diarrhea and enhance patient comfort is one strategy for controlling IBD symptoms [16].

Special diet

In cases of significant weight loss, a gastroenterologist may recommend a specialized diet administered through a feeding tube. To ensure proper gastrointestinal function during surgical procedures, food particles must not accumulate or obstruct the digestive tract. In severe cases, or when other treatments fail, the colon may need to be surgically removed. If only the affected portion of the intestine is excised, the healthy sections can typically be reconnected. However, if the entire colon is removed, the surgeon creates a permanent abdominal opening called an ileostomy, through which stool is passed into an external collection bag.

Lifestyle modifications

In certain IBD situations, home treatments have also proven to be beneficial. There is no proof that any particular diet can cause IBD, but it has been shown that avoiding dairy products, eating fewer meals, staying hydrated, and taking multivitamins and mineral supplements can help. Additionally, it has been demonstrated that stress reduction, quitting smoking, relaxationand breathing techniques are helpful [17].

Traditional Treatments of IBD

Amino Salicylates

Sulfasalazine, a prodrug compound, was the first amino salicylate used to treat IBD. It is composed of sulfa pyridine and 5-aminosalicylic acid,also referred to as mesalamine, connected by a diazo bond. Following oral treatment, the active medication, 5-aminosalicylic acid, and the metabolized sulfa pyridine are released into the colon. Amino salicylates work by blocking the Nuclear Factor Kappa B and lipoxygenase pathways, as well as the synthesis of Interleukin-1 and Tumor necrosis factor. Sulfasalazine is recommended for patients with mild to moderately active ulcerative colitis. Although 2–2.4 g/day is the ideal dosage, combination therapy with glucocorticoids is recommended for more severe cases of colitis. These medications are used orally and are recommended to increase the rate of remission in UC and CD [16].

Corticosteroids

Since1950s, corticosteroids have been used as anti-inflammatory drugs for IBD. Notably, the hydrocortisone, methylprednisolone, and prednisone that make up the first generation of corticosteroids constitute a legitimate therapeutic intervention, either in isolation or in conjunction with mesalamine. Although prednisone administered

parenterally or orally in an emergency showed good efficacy. Budesonide and beclomethasone dipropionate have been developed as second-generation therapies because of the short treatment duration of first-generation therapy. When applied topically or taken orally, these medications can reduce adverse effects by going through first-pass metabolism, which renders derivatives inactive. It has been approved to treat UC with beclomethasone dipropionate [17].

Immunomodulators

Similar to cyclosporin, tacrolimus is a macrolide antibiotic that is better absorbed when taken orally; in cases with severe UC, it can also be given intravenously[18].

Monoclonal antibodies

The development of biological therapeutics has transformed traditional IBD treatments by making use of a novel mode of action that targets specific inflammatory pathways. These treatments, which are listed in **Table 1,** are predicated on the ability of monoclonal antibodies to target and suppress the main cytokines implicated in inflammatory processes, integrins and TNF-α.These treatments are recommended because they can directly affect the disease's primary mechanism and enhance clinical remission [19].

TNF-α inhibitor

A recombinant human Immunoglobulin G1 called adalimumab was authorized by the US Food and Drug Administration for the treatment of IBD in 2003, following infliximab. Compared to infliximab, it has a longer half-life of 10–13 days and is taken intramuscularly. Headaches, nausea, respiratory infections and injection site responses are common side effects. Blocking TNF-α reduces immune activation in the intestinal lining, thereby reducing inflammation [20].

Integrin Blockers

A humanized monoclonal IgG1 antibody called Vedolizumab prevents the heterodimer α4β7 integrin from attaching itself to the MAdCAM-1. This lowers the inflammation without completely inhibiting the immune system by reducing the migration of immune cells into the stomach. In 2014, the FDA gave approval for the induction and remission of UC and CD [20]. It is administered intravenously and has not been linked to a higher risk of serious infections, such as clostridial infection, sepsis, tuberculosis, or Listeria meningitis [21].

DRUG DELIVERY SYSTEMS

Developing drug delivery systems (DDSs) could be a promising treatment approach for IBD in order to circumvent the first-pass passage of traditional medicines and their quick chemical or enzymatic degradation. Additionally, they emphasize the benefit of reducing the frequency of administration and extending the retention period of treatments in inflammatory tissues. Few trials havebeenconductedtocreatenoveloralDDSthattargettheIBD-affectedcolon.Patient's strong acceptance of oral delivery and the reduction of associated adverse effects are the main factors in this decision [22].

General features of DDS in the IBD:

According to the literature, DDS were created with the pathophysiological characteristics of the inflammatory intestinal tissue and taking advantage of certain processes that mediate DDS characteristics like size, charge, or pH [23]. Small nanoscale delivery systems, typically between 10 and 200 nm in size, exploit the enhanced permeability and retention(EPR)effect to achieve size-mediated targeting [24]. In the context, the enhanced passage capability of intestinal walls, which are inflamed, is defined by excessive vascular leakage to promote passive nanoparticle deposition and subsequently improve immune cell uptake. Studies have shown that orally administered micro- and nanoparticles aggregate and permeate the submucosal layer in a size-dependent manner in an experimental model of UC. [25]. A combination of cationic and anionic nano systems was employed to effectively target charged molecules in the inflamed intestine. The negatively charged glycoproteins that are prevalent in the intestinal mucosa of IBD patients might interact with cationic nanoparticles (NPs). On the other hand, by attaching to positively charged

proteins, anionic nanoparticles can improve mucus interaction [26]. Other studies of the mucosa of the GI tract used chitosan-based drug delivery devices with their cationic surfaces [27, 28]. In the case of formulations that are negatively charged, Jubeh *et al*. showed that the charged liposomes ability to interact with the inflammatory intestinal mucosa is connected with their surface charge with anionic liposomes exhibiting a two-fold higher adhesion capability [29]. In the ligand-targeted drug delivery method, specialized compounds that specifically target cell adhesion molecules and receptors including mannose receptor, folate receptor, transferrin receptor, macrophage galactose lectin and glycoproteins are conjugated to the drug delivery surface Such as CD44, CD98, and F4/80, as well as the peptide transporter PepT1, which is upregulated in immune cells and colon epithelia [30]. Enzyme- and pH-responsive DDSs are formulations specifically designed to regulate the release of loaded drugs in reaction to specific ambient pH or colon microbiota secreted enzymes. [31,32]. The pH- and time-dependent approach has shown notable benefits due to its potential to facilitate increased bioavailability in the colon by enabling drug buildup and maintaining sustained drug release over an extended period [33].

Antibody-Loaded DDS

To study the oral administration of infliximab, Wang *et al*. created self-assembling nanoparticles of Phosphoethanolamine-N-[methoxy (polyethylene glycol)-2000], 1,2-distearoyl-sn-glycero-3 (DSPE-PEG2k) and tannic acid. Nanoparticles were able to preserve the antibody and transport to the precise site without undergoing unintended degradation by releasing infliximab at the site of inflammation [34]. Using a ternary nanocomposite carrier, Kim *et al*. also suggested infliximab administration, which demonstrated efficacy in treating colitis in a mouse model of IBD. By using self-cross linking technology and cross-linkers that react to reactive oxygen species (ROS), Li and colleagues created an oral nanocomplex with an infliximab-formed nano-core to illustrate redox-mediated targeting. Due to the high expression of a particular hyaluronic acid receptor on the surface of colon-inflamed cells, hyaluronic acid was utilized to change the exterior core in order to increase the target selectivity and antibody stability in an acidic environment. This nanocomplex overcomes the drug's decreased activity at the specific site and the risk of adverse effects [35]. In order to combat inflammation in an acute murine model of UC, Shrestha *et al*. also successfully encapsulated an anti-TNF-α monoclonal antibody in PEGylated PLGA-based nanoparticles for oral administration. This alternative treatment was developed to reduce undesired interactions with biological tissues and prolong blood circulation time [36].

Artificial Intelligence in IBD

Histological applications in IBD

The digitalization of whole slide images (WSIs) and the application of deep learning techniques to extract underlying features or information from them made it possible for automated analysis of histopathology images to emerge. artificial intelligence is currently not very helpful in prognostic models based on his to pathological analysis of IBD samples.[37]

Artificial intelligence in IBD Pediatric Patients

After testing and training various machine learning models to categorize disease subtypes, it was discovered that unsupervised models were unable to discern between CD and UC. However, four new subcategories with varying levels of colonic involvement were found using hierarchical clustering. Three supervised machine learning modelsone for endoscopic data, one for histological data, and one for mixed endoscopic and histological data were used to classify patients. The top classifier's accuracy rose when it was evaluated on a separate group of 48 cases. In an investigation including 749 kids with IBD, Birimberg-Schwartz *et al*. [38] developed and validated criteria to standardize how different IBD subtypes are classified. They created a diagnostic test with 80% sensitivity and 84% specificity. CART-based modeling enabled accurate classification of UC, CD, and IBDU within the IBD spectrum with 78% sensitivity and 94% specificity, as well as CD from IBDU and UC. Dhaliwal *et al*. [39] created an algorithm to identify particular patterns in baseline endoscopic, radiographic, and histological data to distinguish between UC and CD phenotypes in 74 pediatric IBD patients. Using the entire dataset, the authors first trained a random forest (RF) classifier, which identified the seven most crucial variables for accurate classification. The model successfully classified 97% of the 58 patients. Among the selected features, four were endoscopic (skip lesions, ≥5 small distinct

ulcers in the colon, ileitis with moderate caecum and relative patchiness) and three were histological (granulomas, patchy crypt distortion and patchy chronic inflammation). After that, the classifier was then tested on 15 previously unseen patients and verified using the seven best attributes they had chosen. They achieved 100% accuracy in patient classification. However, in children under six, IBD-like histological features may indicate a primary immunodeficiency-related monogenic disorder [40]. In order to distinguish between the UC and CD phenotypes in 74 children with IBD, a novel strategy to provide individualized care for patients with pediatric-onset ulcerative colitis was described by Liu *et al.* in 2024[41]. This predicts how a patient will react to specific treatments by combining machine learning algorithms with digital histopathology-based historical traits. The model they developed obtained an accuracy of 0.90 and an AUROC of 0.89 by choosing a subset of 18 historic features. Even though these findings show that the model can correctly categorize pediatric patients, further work is required to eliminate potential racial, gender, and socioeconomic biases before the model can be consistently used in clinical practice.

AI for Evaluating IBD Severity

As previously stated, in order to determine the severity of IBD, the pathologist must evaluate both anomalies in . mucosal structure and inflammatory traits during endoscopic examination. The capacity of AI tools to classify histological lesions and assess the severity of the disease has been investigated in this field. An artificial neural network (ANN) was trained by Matalka *et al*. in 2013 [42] to create an automated system that could identify and categorize architectural abnormalities in mucosal crypts. The study involved intestinal samples from 130 participants, comprising 87 cases of IBD with varying severity and 43 healthy controls (HC). To facilitate crypt localization, the histology pictures underwent segmentation and filtering. A probabilistic neural network (PNN) effectively categorized samples into four types depending on the level of architectural distortion: normal, mild, moderate, and severe. After training, the classifier diagnosed 116 out of 118 samples, reaching a 98.31% accuracy rate on average. During the testing process, 100% of healthy tissue, 92.31% of IBD grade I, 90% of IBD grade II, and 100% of IBD grade III were identified. Non-linear multimodal imaging was used by Pradhan *et al.* [43] in 2019 to track biomolecular changes in the crypt and mucosa, among other tissue sites. With the use of a deep learning network called Signet, the crypt and mucosa areas were accurately divided. This model's Performance was compared to a traditional machine learning approach that uses basic pixel classification. Following training, the Signet system achieved an overall F1 score of 0.75, outperforming the conventional approach. This score, which is the harmonic mean of recall and precision, is especially helpful when assessing classification models that exhibit class imbalance.Peyrin-Biroulet*et al*. [44] recently employed an automated image analysis technique and machine learning techniques to analyze 200 UC patients to assess the effectiveness of four separate his to pathologists' evaluations compared to the AI system. The collection of images was divided into test and training sets, and the intraclass correlation coefficient (ICC) was used to compare measurements made manually by pathologists with those made by AI. The scientists discovered a strong correlation with ICC values of89.33and87.20. Multivariate analysis and neural network models (NNET) were used by Klein *et al*. [45] to examine colon samples from CD patients who had clinical follow-up for at least five years after the biopsy in 2017 to forecast the clinical phenotype to guide treatment choices based on illness behavior (B1 inflammatory, B2 structuring, and B3 penetrating both internal and perianal). In the test, the NNET model achieved an accuracy of 81.6% in differentiating between B1 and B2 phenotypes across the training and testing sets. It also successfully predicted the requirement for surgery with 86% precision in the training set and 100% accuracy in the testing set. However, its performance declined when it came to differentiating between B1 and B3 phenotypes, achieving 70% accuracy in the training set and 78% accuracy in the testing set. The first study using Deep learning Histological imaging analysis to forecast postoperative CD recurrence and associated histological characteristics was published by Kiyokawa *et al*. [46]. Fifty-five WSIs were examined by their model from surgical specimens from isolated 68 patients and showed a high area under the receiver operating characteristic curve (AUROC of 0.995), indicating that mast cell infiltration and adipocyte shrinkage are significant histological features linked to disease recurrence.

CONCLUSION

The gastrointestinal system contributes to nutrient absorption and digestion. with its complex processes being susceptible to various disorders. Inflammatory Bowel Disease, which comprises ulcerative colitis and Crohn's disease, represents a significant challenge due to its chronic nature and potential complications such as starvation, colon cancer, weight loss and bowel movements. While conventional treatments like amino salicylates, corticosteroids and immunomodulators have shown efficacy, they have limitations. The advent of biology in the 1990s marked a significant advancement, offering targeted therapies that improve treatment Outcomes by focusing on key inflammatory mediators such as TNF-α, integrins and cytokines. Monoclonal antibodies have further enhanced the management of IBD by reducing relapses, hospitalizations, and the need for surgical interventions. This review highlights the current understanding of IBD, including its causes, clinical presentations, diagnostic approaches, complications, and management strategies. It also highlights the evolving state of IBD therapies, underscoring the need for ongoing research to improve treatment out comes and quality of life. The integration of artificial intelligence into the his to pathological analysis of gastrointestinal inflammation advances in diagnostics

ACKNOWLEDGEMENTS

ABSTRACT

The rapid addition of Ai chatbots, particularly ChatGPT, into academic work has converted learning while raising serious concerns for creativity, cultural diversity, and critical thinking. Survey findings reveal that nearly all students depend on ChatGPT for assignments and queries, fostering dependence that risks eroding independent analysis and promoting intellectual sluggishness. Moreover, chatbot-generated content often imitates cultural biases, creating uniform narratives that threaten to substitute diverse traditions with homogenized global monoculture. To address these jeopardies, this study introduces the I-DEEL instructional methodology, a five-step framework intended to promote responsible and creative AI use. The framework guides students to: Identify Ideas (produce insights before consulting Ai), Discuss and Debate (exchange varied viewpoints), Evaluate and Examine (critically evaluate sources with cultural sensibility), Enhance Understanding (reproduce and contextualize knowledge), and Learn Creativity (create original, culturally rooted work). By adopting I-DEEL, educators can transform chatbot use into a constructive practice that fosters originality, safeguards cultural perspectives, and sustains critical engagement. Rather than swapping human thought, AI becomes a tool for elevating intellectual growth and preserving diverse academic traditions.

Keywords: AI chatbots, Critical Thinking, Cultural Diversity, I-DEEL Methodology.

INTRODUCTION

The rapid rise of AI chatbots like ChatGPT has fundamentally reformed the educational landscape, enabling prompt access to information and scaffolding students' academic responsibilities with unprecedented ease. Yet, this technological progression comes with a complex interplay of benefits and drawbacks. While chatbots engrave learning and reduce fences to academic success, they have also fostered an atmosphere in which student creativity, independent thought, and deep reading are often negotiated. Survey evidence shows a significant portion of students report weakened writing skills, less frequent participation in class deliberations, and a tendency to postpone when relying on chatbots for answers. These leanings not only risk stifling individual intellectual growth but also threaten the preservation of unique cultural traditions as AI tools often dominate linguistic and cultural norms. The peril of monoculture becomes acute as educational experiences become homogenized and context-specific knowledge dwindles, undermining students' connection to their heritage and narratives. Furthermore, excessive dependence on Ai can foster a passive learning mentality, impede critical analysis, and diminish problem solving abilities. To counter these risks, this paper introduces the I-DEEL methodology: an instructional framework for teachers to ignite creativity, embed cultural perspectives, and promote original thought. I-DEEL encourages inquiry -driven tasks, experiential learning, diverse content selection, and active engagement strategies, positioning educators as cultural stewards in today's AI-enhanced classrooms.

REVIEW OF LITERATURE

The Evolution of Educational Technology

Educational technologies, from simple calculators to intellectual tutoring systems, have always flickered debates about their impact on learning. How ever, the arrival of informal AI signifies a qualitative leap: chatbots now create entire essays, solve assignments, and response nuanced questions. Several studies validate that students are increasingly dependent on chatbots, often at the expenditure of personal engagement with academic material (Reis &Gama,, 2024; Mitra & Rana, 2023)

Consequences for Creativity and Cognitive Skills

Frequent dependence on chatbots can stifle sovereign thought and brainstorming (Medium, 2023; Nature, 2024). The automation of idea generation often aids students to "consume" information passively rather than create actively, which leads to deteriorating skills in problem -solving, critical analysis, and the ability, which leads to deteriorating skills in problem solving, critical analysis, and the ability to synthesize varied viewpoints (Shrivastava et al., 2024)

Cultural Homogenization and Bias

Chatbots, trained primarily on globalised and often Western-centric datasets, replicate and intensify cultural biases. Content created by such models tends to standardize narratives and weaken the nuances of local traditions languages and histories, as noted by researchers,, this positions an existential threat to cultural diversity in academic treatise (Spektor, 2023; UNESCO, 2024).

The Indian Context

India's rich didactic traditions like from the gurukul system to contemporary classrooms emphasize dialogue, community learning, and the celebration of multiple perspectives (Mitra & Rana, 2023). Recent survey data, taken for this research, however, portrays a dramatic shift: ChatGPT and similar tools are now a monotonous part of academic work students, menacing the survival of these traditions.

METHODOLOGY

Survey Design

This study involved over 500 college students from various institutes across India. Participants answered to a survey with eight key prompts focused on chatbots usage rate of recurrence, its impact on writing, reading, participation, thinking skills, and attitudes toward procrastination, related to AI dependence.

Data Analysis

Quantitative survey data were coded and lay open to statistical analysis. Quantitative responses were examined thematically, revealing intuitions related to creativity, cultural fidelity, and cognitive engagement.

Findings Summary

Visual Summary

The below bar chart exemplifies key percentages from the survey results related to ChatGPT usage and its perceived influences on students:

ChatGPT usage often or sometimes: 9%
Writing skills improvement:40%
Writing skills worsened: 20%
Negative impact on thinking skills: 35%
Decline in reading frequency: 50%
Agreement on procrastination: 70%

DISCUSSION

Intellectual Stagnation and Homogenization

The findings confirm deep anxieties over intellectual stagnation produced by excessive AI use. Students more and more bypass critical stages of problem- solving and creative exploration, settling a replacement for ready-made answers. This phenomenon is worsened by cultural homogenization: as chatbots produce uniform content, the diversity of local voices, perspectives, and traditions is muted.

Cultural Bias and the Erosion of Identity

AI's fundamental training data replicate global and predominantly Western biases. In the Indian academic context, this results in the thinning of indigenous knowledge, metaphors, and creative idioms, raising alarm over the loss of cultural identity in student productivities. The uniformity of chatbot- generated material lurks not only the richness of Indian thought but also the plurality essential for vibrant global scholarship.

The Changing Role of Teachers

Teachers now face the dual challenge of integrating technology while counterattacking its reductionist tendencies. A new academic stance is needed, one that neither rejects nor blindly accepts AI but contextualizes it within traditional dialogic and creative methods.

The I-DEEL Instructional Methodology

The I-DEEL Instructional methodology is a structured, five-step pedagogical framework planned to address challenges in education posed by excessive dependence, an addition on AI tools like Chatbots. Its mission is to preserve creativity, cultural diversity, and critical thinking by guiding students to actively engross with knowledge rather than passively consuming AI-generated information.

Identity Ideas

Students first articulate their academic challenges and produce initial insights before consulting AI. This step boosts brainstorming and idea-mapping rooted in local experiences and knowledge, nurturing originality and personal connection to the subject matter. It safeguards that students develop their own thinking first, cultivating creativity and independent thought.

Discuss and Debate

Students then participate in peer dialogue and debate to explore viewpoints. This enables communication skills such as listening, persuasion, and argumentation. Teachers moderate to guarantee incorporation of culturally relevant viewpoints, thereby enriching the discourse and promoting intercultural understanding.

Evaluate and Examine

Critical assessment skills are advanced by training students to evaluate information critically, concentrating on cultural sensitivity and recognising bias in chatbot-generated content. This seep also encourages fact-checking and tracing knowledge from Indian intellectual traditions and literature, grounding learning in the cultural context and augmenting epistemic vigilance.

Enhance Understanding

Learners polish their knowledge through reflection, making acquaintances with their community's heritage and personal history. Reflective writing and journalising exercise help excavate learning by allowing students to internalize and contextualize newly developed concepts, fostering meaningful and sustainable intellectual growth.

Learn Creatively

Finally, students produce original projects fusing personal, cultural, and academic insights. This step requires diversity in thought styles, references, and creative expression, binding AI as a tool intellectual augmentation rather than a shortcut. It encourages innovation and the continuation of various traditions in academic work. Educational Significance The I-DEEL methodology initiates the tendency of AI tools to weaken critical thinking and cultural inspiration by employing students' active intellectual engagement at its core. It alters AI from dependence to a collaborative assistant that improves students' creativity, critical thinking, cultural awareness, and reflective learning. This method bring into line with modern pedagogical technology aids to amplify human judgement and cultural diversity rather than homogenize ideas.

Connections to Contemporary pedagogy

I-DEEL aligns with confirmed teaching strategies such as active learning, constructivist approaches, collaborative discussions, and culturally responsive pedagogy. By integrating critical assessment of AI content and linking academic work to confined cultural contexts, it supports learners autonomy and intercultural competence, vital 21stcentury skills in education. This method supports academicians in designing lesson plans that ignite creativity and preserve cultural richness amid technological integration. In summary, the I-DEEL instructional procedure provides a comprehensive, culturally agreed framework that fosters creativity, critical thinking, and diverse viewpoints in the age of AI, guaranteeing a holistic and enriched learning experience.

Recommendations for Educators

Teachers should

- Design lesson plans that incorporate mandatory brainstorming segments prior to AI consultation.
- Use classroom debates and peer review to stimulate multiplicity in thought.
- Incorporate noticeable modules on cultural bias in Ai, guiding students to diagnose and compensate for algorithmic limitations.
- Assess creativity and originality in assignments and projects, rewarding cultural references and novel elucidations.

Educational Institutions Should:

- Offer workshops on responsible AI use, highlighting the preservation of cultural identity.
- Support cross-disciplinary associations to infuse local knowledge into technology platforms.

Limitations and Future Research

While the survey's extensiveness offers valuable insights, longitudinal studies are needed to assess the lasting influence of I-DEEL on creativity and cultural preservation. Further research is indispensable to adapt the framework to other disciplines beyond the humanities, as well as to examine its effectiveness across diverse age groups.

CONCLUSION

AI chatbots have irrefutably changed the academic site, granting students unprecedented access to information and support. This transformation, though, comes with significant risks: the loss of creative engagement, the flattening of cultural diversity, and the threat of intellectual stagnation. Without interference, there is a real danger that the richness of individual voices and traditions will dissipate, replaced by an Ai-dominated global monoculture. The I-DEEL procedures offers a pragmatic, culturally sensitive response. By guiding students through structured stages of creative and critical engagement, educators can bond AI's strengths while conserving the vibrancy of local traditions and original though. Teachers must embrace a new role not just as knowledge transmitters but as guardians of creativity and cultural diversity in an age of intelligent technologies.The suture of education requires not just technological adaptation, but thoughtful stewardship, ensuring that, from gurukul to Google, the journey of learning remains fundamentally human.

Table.1: Findings Summary

Aspect	Key points
Dependence on chatbots	Approximately 9% of students used ChatGPT often or sometimes for academic purposes such as writing answers, understanding topics and completing assignments.
Writing and Critical Thinking	Over 40% reported improvement in writing skills, about 20% noted deterioration mainly due to originality concerns, and more than 35% sensed a negative impact on thinking skills.
Cultural Diversity Impact	Many students felt AI-generated content lacked cultural nuances, raising concerns about promoting a monoculture in academic expression.
Participation and Reading Habits	Participation in class showed mixed trends; nearly half of students experienced a decline in reading full texts, preferring summaries and direct answers.
Risk of Procrastination	A majority agreed that heavy reliance on ChatGPT could immediacy of AI assistance.

ABSTRACT

The purpose of the current paper is to examine how e-Human Resource Management (e-HRM) system using Artificial Intelligence would promote environmental sustainability in Information Technology (IT) Firms in Bangalore, India. Namely, we seek to learn how are they contributing to reducing the carbon footprint and making business greener by automation, data-based insights and decision-making tools. It draws upon qualitative data of in-depth interviews with HR representatives and sustainability managers from IT companies. It attempts to understand how they perceive AI-oriented e-HRM systems and environmental sustainability, what are their experiences concerning them, and according practices. Information is collected through semi-structured interviews Interpretation is informed by a thematic coding and pattern identification method. The results suggest that AI-powered e-HRM systems have a substantial role in environmental conservation through resource consumption, energy efficiency for HR activities and eco-friendly behavior in employee engagement. Major discoveries are decreased use of paper, the kick associated with tracking HR activity carbon footprints, and automating of day to day HR tasks that help cut in resource usage. This study offers added value through a fresh outlook into the convergence of AI-influenced HR practices and environmental sustainability in the IT sector in Bangalore. Its originality is, therefore, that it identifies how this extended use of AI in HR contributes particularly to the promotion of a green business environment – an under-researched dimension within the broader sustainability literature.

Keywords: AI-based e-HRM, Environmental sustainability, IT companies, Automation, Carbon footprint, Green HR practices.

INTRODUCTION

Environmental sustainability has received much attention in recent years, especially when it comes to business operations and organizational strategies (Gao & Chen, 2022). Enterprises across the planet are increasingly realizing their responsibility in curbing carbon footprints and heralding eco-friendly practices. The role of the Information Technology (IT) and more specifically the Indian IT companies located in Bangalore is unique as it has greater stakes while contributing to sustainability solutions through extensive technology-based practices (Vijay & Rathi, 2021). These enterprises are drawing on digital instruments to cut carbon use, streamline processes and tackle waste. Artificial intelligence-based e-Human Resource Management (e-HRM), for example, is an instrumental mechanism that uses computer algorithms and automation to enhance human resources. This integration would contribute toward environmental sustainability by using resources more economically and by establishing eco-friendly HRM. Artificial intelligence e-HRM: The application of artificial intelligence for carrying out human resource functions like recruitment, performance management, training and employee engagement (Pillai, 2019) By bringing automation to the repetition tasks and predicting HR trends, as well as optimising processes, it reduces total impact of such functions on the environment (Kiran & Kaur, 2020). AI based platforms in HR can also result in higher accuracy, lesser dependency on physical documentation and dependence on digital mode of communication that contribute to HRs carbon footprint equation (Singh *et al*., 2021). Prior to the current stand-point of green operations, there existed companies in Bangalore (being an IT hub) who had also enhanced their reasonableness on environment practices (Iyer & Rao, 2023). These firms are not only following usual CSR but also implementing green technology in their operations (Ravi & Kumar, 2018). One of such options includes AI-enabled e-HRM though few research has investigated its role for environmental sustainability. This study aims to fill this gap by analyzing the influence of AI in HR practices with special reference to sustainability performance among IT firms. Literature review shows that AI has been well explored in terms of business efficiency and innovation (Liu *et al.,* 2020); however, little research investigates the contributions of HR -AI to environmental sustainability (Harrison & Lee, 2017). This research gap underlines the exigency for more research examining how AI HR tools can contribute to greening initiatives and promoting an eco-friendly work atmosphere. The purpose of this paper is to respond to the emergent call and contribute to emerging literature through highlighting AI-enabled e-HRM system as an enabler for environmental sustainability. By focusing on practices in Bangalore among IT companies, the paper contributes a regional and sectoral specific perspective to the broader discussion on AI and sustainability.

LITERATURE REVIEW

AI-based e-HRM Systems

The use of AI and ML technology has been wedging its way into HR, turning mainstream HR on its head. Artificial Intelligence (AI) e-HRM systems can automate, process data analysis and support decision-making that generate efficiencies in the organization as a whole (Liu *et al.,* 2020).

Environmental Sustainability in IT Companies

The term sustainability in business has transformed over the last twenty years through IT companies working towards being green and reducing their carbon footprints. In these organizations, adoption of AI technologies has been acknowledged to be a key driver for the greenness potentially attained (Vijay & Rathi, 2021).

Green HR Practices

Definition of green HR practices Green HR practices refer to the policies and activities that are designed to minimize the impact of an organization on the environment. Such activities include moderation of resource usage, greening employee behavior and green IT initiatives (Singh et al., 2021). Artificial intelligence (AI) driven e-HRM systems play a key role in these initiatives by automating mundane tasks and enabling monitoring of sustainability metrics (Pillai, 2019).

The Role of AI in Environmental Impact Reduction

It is believed that in practical environmental protection, AI may help to improve energy utilization and resource management. In HR, AI has helped in decreasing the use of paper and reducing material due to waste through better operations (Iyer & Rao, 2023). AI is even able to predict sustainability trends in the future and enable HR departments to adopt green strategies quite efficiently.

Barriers to Implementing AI in HR

AI brings with its own set of challenges in HR. Barriers such as resistance to change, worries about data privacy and initial costs have been highlighted in the literature (Kiran & Kaur, 2020). Such hurdles can impede AI system adoption in certain organizations particularly those located in developing nations like India.

AI and Green Business Practices

A surge of recent research has highlighted the application potential of AI towards the promotion of green business operations. For example, AI may provide aid in enabling companies monitor carbon footprint; waste and control energy consumption with smarter processes as well as predictive analytics (Harrison & Lee 2017).

Sustainability Initiatives in Indian IT Companies

In India, several IT firms have started discussing sustainability issues and implemented energy efficient technologies at their office premises to reduce carbon foot print (Ravi & Kumar, 2018). However, in these days of digitalization and artificial intelligence (AI) they incorporating digital HR systems into their operations to save paper and streamline HR processes.

The Future of AI in Green HR

The future of AI in HR has a sustainability objective. As artificial intelligence development progresses, it will play a more pivotal role in realizing green HRM by facilitating big data analytics, automation and decision making (Gao & Chen, 2022).

Impact of AI on Employee Engagement and Sustainability

In addition to efficiency, e-HRM systems with AI play a role in employee engagement and sustainability. By bringing in real time feedback for employees and making them engage in sustainable behavior with personalized rewards and recognition, AI raises a culture of green workplace (Pillai, 2019).

Challenges in Measuring Sustainability in HR

A difficulty in the incorporation of sustainability inta HR practices is the ability to assess its effectiveness. AI is here to offer the capabilities, that is essential for calculating the carbon footprints, monitoring resource utilization including HR activities and overall scrutiny of environmental implications on HR operations (Liu *et al.,* 2020).

Conceptual framework

Research Gap

Considering the increasing significance of sustainability in business, surprisingly little research has been done on how AI-enabled e-HRM systems can influence environmental sustainability in IT organizations and especially in Bangalore. While the potential for AI to boost HR efficiency has been discussed enough, little attention has been paid to its direct impact on environmental sustainability applications. The findings that the literature reviewed does not address how AI can minimize HR's carbon footprint and resources use in HR process further supports these observations. Moreover, barely any empirical studies are available that specify how AI driven HR tools may help achieve sustainability goals within an organization. This study attempts to address these knowledge gaps by doing the qualitative investigation on how AI is used in HR for fostering Green business practices in the IT industry of Bangalore.

Research Objectives

1. To investigate the influence of AI driven e-HRM systems on environmental sustainability at IT companies in Bangalore.
2. To ascertain the individual green HR practices enabled by AI-powered HR systems.
3. To identify the obstacles and barriers of IT sectors in adopting AI powered e-HRM system to sustain.

METHODOLOGY

The purpose of this paper was to critically examine the potential role of AI based e-HRM systems towards propagating environmental sustainability among IT firms spanning Bangalore. As the study is qualitative and exploratory in nature to attempt to learn from the participants' experiences, perceptions and insights, this section outlines the methodology used to collect and analyze data**.**

Participants/Sample

The sample included 200 IT companies employees working in Bangalore and the purposive sampling technique was used for drawing a sample of them. Inclusion criteria applied to the participants were:

- HR professionals, sustainability management and decision-making roles responsible for adoption or use of AI-based HR tools.
- A mix of Large and mid-sized IT companies to get a panoptic view on AI adoption and sustainability practices.
- Participants needed to be familiar with AI-powered HR tools like recruitment automation systems, performance management solutions and AI-based training platforms.

Out of the 200 individuals involved, 150 were HR professionals and the other 50 had a job as manager or leader within sustainability teams directly connected or responsible for green initiatives driven by AI in capabilities of HR.

The sample was composed of respondents from a variety of companies (15 large company and 5 mid-size companies), operating in the IT industry, contributing to a wide array in terms of size, operational intricacy and AI maturity.

Data Collection

Data were mainly obtained by semi-structured interviews, enabling in-depth exploration of Participants' perceptions, experiences and insights. Interviews occurred over a three-month period and followed an interview guide based on the underpinning themes of:

1. AI-based e-HRM systems adoption: Respondents were questioned whether their HR processes included AI tools and if yes, how they have helped in order to protect the environment up to some extent.
2. Sustainability Impact: There were questions on the impact of AI adoption on the use of paper, energy, as well as employee participation in sustainability programs.
3. Challenges: Participants reported challenges to adopt and utilize AI tools for sustainable work such as staff opposition, data privacy worries and system integration.

4.Future prospects: We learned what AI could mean for sustainability in the future and how HR can help build a green workplace.

The interviews were held face-to-face or by videoconferencing and the duration varied from 45 to 60 minutes. Interviews were conducted after obtaining verbal consent and transcribed for analysis.

Data Analysis

Qualitative data collected through interviews was analysed using a thematic analysis technique. The following steps were taken:

1. Familiarization with Data: Transcripts were read and re-read to become increasingly familiar with the data, generating initial ideas and themes.
2. Coding: Key phrases, sentences and points specifically related to AI as well as sustainability and HR practices were highlighted during the analysis process, before coding them on qualitative data analysis software (e.g., NVivo). Codes were assigned to emerging themes such as "resource optimization," "paper reduction," and "employee resistance."
3. Development of Themes: Related codes were sorted into broader themes. These issues were subsequently organized into higher-level concepts like “Impact of AI on Sustainability” and “Barriers to Adoption of AI”.
4. Identification of patterns: Patterns throughout the themes were recognized to perceive the most significant determinants of adopting AI and its influence on sustainability. The most common themes were checked against the background literature for confirmatory validation and to find new insights.
5. Triangulation: bTo increase the validity of the findings, triangulation was employed by comparing interview data with secondary data, including industry reports and relevant case studies.

Ethical Considerations

The principles of ethics were applied throughout the study. The following ethical principles were adhered to:

- Informed Consent: All participants were informed of the study purpose and that their participation was entirely voluntary; they could withdraw from involvement at any time without penalty. Informed written consent was obtained prior to the interviews.
- Confidentiality: confidentiality has been maintained during collection of data and in presentation of findings.
- Data Security: interview recordings and transcripts were saved in secured way which kept accessible only for the research purpose.

Limitations

While the study offers valuable insights, there are a few limitations to note:

- **Sample Bias:** There was a predominance of HR professionals and sustainability managers from IT companies among the study sample, so conclusions should be drawn with caution and could have limited generalisability to different sectors or non-IT industries.
- **Self-Reported Data:** The study depends on participants interview reporting of their experience and perception that may suffer from biases including social desirability and recall bias.
- **Generalizability:** Since the sample selected for the study is exclusively IT companies in Bangalore, it might not be generalized to other regions or industries, particularly those where AI adoption rates are less.

Data Analysis Tools

The qualitative analysis of data was conducted using the NVivo software. The use of NVivo enabled expeditious coding, data analysis and theme recognition. The information was systematically presented so that themes pertaining to AI adoption and sustainability consequences were all self-evident, and could be compared across participant categories. This methodology section outlines the process of data collection and analysis used to explore the role of AI-based e-HRM systems in promoting environmental sustainability. The triangulation of a strong sampling procedure, theme analysis and literature review and ethical perspectives enhances the validity and reliability of results.

RESULTS

Table 1: Frequency of Themes Identified in Participant Responses Regarding AI's Role in Sustainability Interpretation: A majority of respondents (85%) stressed the resource optimization role that can be played by AI-based e-HRM systems, with paper reduction and energy efficiency as important results as well, proving that AI tools equitable with sustainability. Table 2: Challenges Faced by IT Companies in Implementing AI-based e-HRM for Sustainability Interpretation: Most often encountered challenge is "Employee Resistance", meaning that organizations must invest in training and change management to mitigate resistance for AI adoption. Data privacy remains a concern for over half of the companies surveyed. Table 3: Impact of AI-based e-HRM on Employee Sustainability Practices Interpretation: The results indicate paper usage and energy consumption have decreased in post-implementation, and significantly increased in employee engagement with sustainability programs, showing a positive impact of AI on sustainability metrics. Table 4: Correlation between AI-based e-HRM Adoption and Environmental Sustainability Outcomes Interpretation: High positive correlations suggest that firms which adopt AI in HR have a higher likelihood than their competitors of realizing better ecological outcomes by cutting down paper usage, saving on energy and higher participation from staff in environmentally friendly activities. Table 5: Descriptive Statistics of Employee Engagement in Sustainability Practices Interpretation: Average engagement in sustainability programs is high at 63.4%, but there is a large dispersion. This indicates that the strategies employed to engage people in sustainable programs can be varied according to different companies. However they all seem to work. Table 6: Factor Analysis of Sustainability Practices in AI-based e-HRM Systems Interpretation: The factor analysis affirms AI-driven Resource Optimization and Employee Engagement and Motivation as the primary driver of sustainable development, with paperless operations and energy efficiency also contributing significantly. Table 7: Chi-Square Test Results for Association Between AI Adoption and Sustainability Practices Interpretation: Large p-values indicate that firms adopting AI may expect fewer waste. This causes both reduced energy usage and higher levels of recycling benefitting the working poor in industries as a whole or even global economy. Table 8: T-Test Results for Comparison of Sustainability Metrics Before and After AI Implementation Interpretation: The t-test results show that changes in paper use, energy consumption and employee involvement are all statistically significant post-implementation of AI-based e-HRM systems. Table 9: Participant Perceptions on the Future of AI-based e-HRM and Sustainability Interpretation: Most of the participants think that e-HRM based on AI has a positive influence on sustainability. But we also can see that getting people ready for such technology is not credible and will cause problems.

DISCUSSION

The findings from this study contributes that How AI HR systems can make a contribution to ecologically sustainable development in IT companies around Bangalore. According to our results this new type of system has had a significant positive effect on sustainability metrics such as total paper use reduced, more energy efficient operations and workers initiating actions to improve environmental outcomes. The findings are also in line with previous research which had focused on the potential of Artificial Intelligence to automate some HR processes and lighten firms' environmental footprint. (E.g., Smith & Williams, 2023; Kiran & Kaur, 2022) Specifically, the results suggest reduced paper usage and energy consumption are two environmental benefits of introducing AI into HR as expected; this supports that digital transformation in HR business processes can be taken into line with sustainability goals. (Patel & Gupta, 2024) One of the major areas of our study discovering is resource optimization. With 85% of all respondents mentioning AI's capacity to help HR processes become more streamlined, time and resource consumption is reduced. Such conclusions are backed up by research from Sharma et al. (2022) on AI-enhancement of operational efficiency in different sectors continues as a linchpin in achieving sustainable outcomes. In addition, AI-driven platforms like recruitment automation or performance management products were particularly successful in minimizing resource wastage. This result jibes with studies by Mehta & Rani (2023), who have found that digitization of human resources significantly lowers carbon footprints also by erasing physical paperwork. However, the study also identified several challenges that may stand in the way of e-HRM systems using AI. according to the survey's

results, these are employee resistance (65%) and worries over data privacy too (55%) These challenges are consistent with research from Singh and Kumar (2021) which found that reluctance to change and privacy concerns are two significant obstacles to AI penetration in any organization. By the same token, what prevents them from making technological advancements which might bring about sustainable business practices. If people generally have a negative attitude to purchasing environmentally friendly cleaning products, then despite all efforts at education, it might still stay as such. What organizations need is thorough preparation followed by clear direction when they find themselves sitting in front of one big green screen. Moreover, the strong need for employee training courses (75%) reinforces the findings of Reddy and Rao (2020), who stressed that if HR staff are to be able such AI tools to promote sustainable development. The positive correlation between AI adoption and sustainability outcomes is unmistakable However, the chi-square and t-test results showed that AI adoption is strongly associated with reductions in paper usage and energy consumption. This confirms that AI-driven e-HRM systems usher in sustainable practices using modern technology. As organizations move ever more towards sustainability, HR departments are likely to become one of green business practice's least fault-prone linchpins. Whether they will work well in technology-heavy sectors goes without saying- whether those are equipment rental or IT.

Implications

This research has some practical implications for the employees of IT businesses and for national policies. First, companies should invest in change management and employee training programmes in order to stimulate movement from resistance to acceptance of AI-driven HR systems Companies should also attach great importance to data security so as to placate public concerns in this area. These are currently a major barrier as matters stand and will probably continue to be unless they are effectively dealt with (Kiran & Kaur, 2022). By facing up to and overcoming these challenges, businesses can cultivate cultures of sustainability while strengthening HR as well. Secondly, the study implies that if AI incorporated in the human resources sector, that it might greatly benefit the environment. And If a company based in IT could use AI tools such as automatic computing of employment, performance management, and virtual education platforms, then it is for them to practice green. HR departments should help rank and staff those AI systems that make it easier to implement green programs, for increased employee participation may further entail green initiatives (Patel & Gupta, 2024). According to the research, policymakers might think about providing incentives for businesses in which AI serves as a way to go green, because this would help bring about much clearer transition toward ecological business practices. Finally, the study points out that there's never any resting on one's laurels when it comes to AI-based HR systems: Sustainability objectives must be maintained and further developed. This may mean periodically inspecting paper usage rates, energy consumption levels or staff participation metrics in order to coat-tail public accountability criteria sets for sustainable developments.

CONCLUSION

Finally, the study recommends AI-based e-HRM systems. It was noted that AI tools cut its customers' paper bills by some 30% and have cut overall energy usage. Therefore, more staff are involved in sustainable behavior. However, To fully harness the power of AI in HR, problems like staff resistance and data privacy concerns must also be resolved. Future research will explore the long-term sustainability effects of AI into HR and scope out for other potential applications in this industry.

ABSTRACT

The present study aimed to enhance gastric retention and improve the bioavailability of Clopidogrel bisulphate through the development of an effervescent gastro-retentive drug delivery system. Floating tablets were formulated via direct compression using hydrophilic polymers such as HPMC K4M, HPMC K100M, Karaya gum, and Xanthan gum and effervescent agents comprising sodium bicarbonate and citric acid to impart buoyancy. A total of eight formulations (F1–F8) were prepared and systematically evaluated for pre-compression parameters, post-compression physical characteristics, swelling behavior, buoyancy properties, in vitro drug release, and drug-excipient compatibility via FT-IR spectroscopy. Among all formulations, F8 formulation containing 70 mg of xanthan gum exhibited superior performance, characterized by the shortest floating lag time (29 ± 0.08 s), highest swelling index (29.39 ± 0.11%), and extended floating duration (>24 h). In vitro release studies revealed sustained drug release up to 93.65% over 6 hours, with release kinetics best fitting the Higuchi model, indicating a diffusion-controlled mechanism. FT-IR analysis confirmed the absence of significant drug–excipient interactions.
The optimized formulation demonstrated robust mechanical integrity and uniform drug content, highlighting its potential as an effective gastro-retentive delivery systemfor Clopidogrel bisulphate.

Keywords: Clopidogrel bisulphate, Effervescent floating tablets, Xanthan gum, *In-vitro* evaluation.

INTRODUCTION

Solid oral dosage forms such as powders, pills, capsules, and tablets widely utilized in pharmaceutical therapy and are collectively referred to as solid unit dosage forms. Among these, tablets are the most commonly employed due to their convenience, stability, and cost-effectiveness. A tablet is a solid unit prepared by compressing one or more active pharmaceutical ingredients (APIs) along with suitable excipients; they can vary significantly in shape, size, and weight depending on the intended dose and therapeutic use (Shanu B. et al., 2024). Despite recent advancements in drug delivery technologies, such as microspheres, nanoparticles, and other novel systems, tablet manufacturing continues to dominate the pharmaceutical market. This is largely due to ongoing innovations in formulation techniques and excipient selection, which have enhanced drug stability, improved therapeutic efficacy, and minimized adverse effects (Bharat P. et al., 2012). However, tablets particularly those administered via the oral route must overcome physiological challenges that can limit their effectiveness. These include variability in gastric emptying time, short gastrointestinal (GI) transit duration, and limited drug absorption in the upper part of the small intestine. Such factors can significantly influence the bioavailability and therapeutic performance of orally administered drugs. To address these limitations, research has focused on the development of gastro-retentive drug delivery systems that prolong gastric residence time, thereby enabling more consistent drug absorption and improved clinical outcomes (Sachin R. et al., 2009)

Mechanism of floating effervescent tablets

After administration, the effervescent floating dosage form swells upon contact with gastric fluid and gradually releases the drug without breaking apart. The reaction with gastric fluid produces effervescence by releasing CO_2 gas, causing the tablet to float as the fluid enters it (Maniyar M et al., 2019).

MATERIALS AND METHODS

Clopidogrel bisulphate was kindly supplied from IOL chemicals and pharmaceutical limited, Punjab, India. Xanthan gum supplied by Research lab fine industries, Mumbai, India, and HPMC K4M was supplied by SD fine chem Ltd, Hyderabad, India. Sodium bicarbonate and Citric acid were supplied by Merck specialities Pvt Ltd, Mumbai, India. All chemicals were of analytical grade and distilled water was used throughout the experimental studies.

PREPARATION OF FLOATING EFFERVESCENT TABLETS OF CLOPIDOGREL BISULPHATE

Clopidogrel bisulphate floating matrix tablets each containing 98 mg were prepared using direct compression method by effervescent approach. HPMC K4M, HPMC K15M and xanthan were used as polymers at varying concentrations (20%, 25%, 30% w/w), Sodium bicarbonate at concentration 15% w/w was optimized as gas generating floating agent with 30% w/w SMCC HD90 (silicified microcrystalline cellulose) as diluent. The required quantities of drug, polymers and other ingredients were accurately weighed and mixed geometrically with each of the polymer and passed through sieve No. 16. These powder blends were then compressed into tablets using multi multi-station punching machine using 8 mm punch.

Pre compression Parameters: Before compression process powder was subjected to pre compression parameters such as angle of repose, bulk density, tapped density, carr's index and hausner's ratio.

Post compression Parameters: After compression tablets were subjected to tablet thickness and diameter, weight variation test, content uniformity, hardness, friability, dissolution test, swelling index, buoyancy lag time, duration of buoyancy, and release kinetics. The optimised formulation is characterized by FT-IR.

Tablet thickness and diameter: The Thickness and diameter of the tablet is a very important characteristic in reproducing appearance. Some filling equipment utilises the counting mechanism to get uniform thickness.

Randomly 10 tablets were taken from each formulation and the thickness and diameter was determined with a vernier calliper (Mitutoyo, Japan) (Srinivas L et al., 2019).

Weight variation test: To assess uniformity in tablet weight, twenty tablets were randomly selected from each batch and individually weighed using an electronic balance (Shimadzu). The procedure followed standard official guidelines. The individual weights were compared against the average tablet weight, and the variation for each tablet should not exceed ±2% of the mean value.

Content uniformity: Three tablets from each formulation were crushed using a mortar and pestle. An amount of powder equivalent to 75 mg of clopidogrel bisulphate was accurately weighed and mixed with 20 ml of methanol, followed by sonication for 15 minutes. The mixture was then diluted to volume using a hydrochloric acid buffer solution with pH 2.0. The resulting solution was filtered through a 0.45 µm membrane filter and further diluted with the same buffer. The drug content was analyzed using a UV spectrophotometer at 240 nm (Shimadzu, UV 1700, Japan), and the average value from three replicates was calculated (Sanjeeveni D et al., 2018).

Hardness: Tablet hardness is a critical parameter to ensure the tablet can withstand mechanical stress during manufacturing, packaging, transport, and patient handling. Various devices such as the Monsanto tester, Strong-Cobb tester, Pfizer tester, Erweka tester, and Schleuniger tester are commonly used to evaluate tablet hardness.

Friability: Friability testing determines a tablet's resistance to abrasion. It is performed using a Roche friabilator, which consists of a plastic drum attached to a rotating apparatus set at 25 rpm for 100 revolutions. Twenty pre-weighed tablets are placed in the drum, rotated, and then reweighed after cleaning. For conventional tablets, the acceptable weight loss due to friability should be within 0.5–1.0%.
The friability (F) is expressed by
F= W initial-W final / W initial x100

Dissolution test:
The in vitro drug release was evaluated using a USP Type II (paddle) dissolution apparatus under sink conditions, operated at 50 rpm and maintained at a temperature of 37 ± 0.5 °C. The dissolution medium consisted of 900 mL of 0.1 N hydrochloric acid. Samples were collected at specific time intervals over 6 hours, with the withdrawn volume replaced by fresh medium. The collected samples at different intervals were analysed at 284 nm using a double beam UV spectrophotometer (Lab India UV 3200) (Rizwana K et al., 2017).

Swelling index: The swelling behaviour of the tablets was determined in triplicate, tablets were weighed individually and placed in a glass beaker, containing 200 ml of 0.1 N HCl, placed in a water bath at 37 ºC ± 0.5 ºC. At fixed time intervals, the tablets were removed and the excess surface liquid was carefully removed using tissue paper. The swollen tablets were then re-weighed. The percentage swelling Index (SI) was calculated using the formula(Moumita Bet al., 2013).
(SI%) =Wfinal -WInitial/Wfinal x100

Buoyancy lag time: The floating lag time (FLT) is determined by taking three tablets randomly and placing them in a beaker containing 200 mL of 0.1 N HCl with a temperature maintained at 37±0.5 ºC using a water bath. The time required for the tablet to rise from the bottom of the beaker to the surface and float was determined.

Duration of buoyancy: The total floating duration, that is, the time during which the tablet remains buoyant, was recorded to be the Floating Lag Time (FLT)and the duration of time in which the tablet constantly floated is called Total floating time (Shweta A et al., 2005).

Release kinetics: *In vitro* drug release data was subjected to mathematical models like zero order, first order, Higuchi, Hixson Crowell, Korsmeyer and Peppas to investigate the release pattern of formulated batches (Swain RP et al., 2016).

Characterization of Clopidogrel Bisulphate Effervescent Floating Tablets

Fourier Transform Infrared Spectroscopy (FT-IR) Studies

A composite group of tablets was crushed in a mortar and placed in the path (beam) of IR radiation of the ATR facility for drug characterization. Scan the standard clopidogrel bisulphate (API) from 400 to 4000cm^{-1} and 1 cm^{-1} resolution using (Bruker alpha, FT- IR with ATR, Lab India) FT-IR with ATR facility. The similar spectrum was also taken for placebo tablets as well as for optimised clopidogrel bisulphate effervescent floating tablets. Compare the spectra of clopidogrel bisulphate effervescent floating tablet formulation and placebo tablets with standard clopidogrel bisulphate (API) (Pavankumar K et al., 2019).

RESULTS AND DISCUSSIONS

In this present study Clopidogrel bisulphate effervescent floating tablets were developed to treat and prevent blood clots in certain cardiovascular conditions. Eight Clopidogrel bisulphate effervescent floating formulations were prepared using various concentrations of gel forming polymers like HPMC K 10M, HPMC K4M, Karaya gum,Xanthan gum (swelling and rate controlling polymer), sodium bicarbonate (gas releasing agents), citric acid (acidifying agent) and SMCC in various ratios Table 1 shows Formulation of Effervescent floating tablets of Clopidogrel bisulphate.

Standard graph of Clopidogrel bisulphate in 0.1N HCl Clopidogrel bisulphate has maximum absorbance at 220 nm. The standard graph of clopidogrel bisulphate in 0.1NHCl was plotted by taking the concentration range from 3.75µg/ml to 18.75µg/ml. The calibration curve for clopidogrel bisulphate in 0.1N hydrochloric acid was linear from 3.75µg/ml to 18.75µg/ml with R^2>0.9998. Table 2 shows Standard graph of Clopidogrel bisulphate 0.1NHCl and Figure 1 shows Standard graph of clopidogrel bisulphate 0.1N HCl.

Pre Compression parameters

The powder flow properties can be accessed from angle of repose, Carr's index, and Hausner's ratio. Results for powder formulations are represented in Table 3. Results indicate an angle of repose between 30.3±0.13 to 31.7±0.14, assuring that the flow properties were good for all the formulations. Apart from this, Carr's index and Hausner's ratio were 10.71±0.12 to 15.3±0.13% and 1.11±0.24 to 1.18±0.15 respectively for all the eight formulations and showed good mixing, flowability, and compressibility.

Post compression parameters

The prepared tablets from each formulation are white, circular, odourless that were analysed for thickness, diameter, weight variation, hardness, friability, buoyancy lag time, duration of buoyancy, swelling index, *in vitro* dissolution and drug content and showed in tables 4 and table 5**.** The diameter and thickness of all the tablet formulations were almost uniform. The average weight of the tablet in all formulations ranged from 251±0.12 mg to 264±0.04 mg. All the tablets formulated in this study met the USP needs for weight variation (USP 31) and in all the formulations had <2% deviation**.** The hardness of the tablets ranged from 3.9±0.02 kg/cm^2 to 4.5±0.03 kg/$cm^{2,}$ which indicated good mechanical strength during compression. The percentage friability for all eight formulations ranged from to 0.26±0.10% to 0.42±0.08% demonstrating the friability was within the acceptable limits (USP 31), indicating that the tablets are not brittle and can handle without difficulty.

All the formulations were checked for drug content uniformity. The uniformity of drug results was good among various batches of tablets, and the percentage of drug content for all formulations ranged from 99.16±0.08% to.

99.84±0.13% The results also indicated acceptable and uniform dispersion of drugs in all tablet formulations shown in Table 4.

***In-vitro* buoyancy studies:** In-vitro buoyancy studies were performed to evaluate the duration of buoyancy and buoyancy lag time in the presence of various rate-controlling polymers. The buoyancy lag time varied from 29±0.08sec to >99±0.03 sec for all the eight formulations and the duration of buoyancy varied from ≥8±0.23hr to ≥24±0.04hr. F8 formulation exhibited a short buoyancy lag time of 29±0.08 sec as well as a high swelling index of 29.39±0.11%. Xanthan gum is a natural, swellable, sustainable polymer having first order drug release. When this natural xanthan gum is present along with sodium bicarbonate and citric acid, upon influx into the stomach, carbon dioxide is released, causing effervescence and the formulations were floating in the stomach, thereby improving the bioavailability of the drug with substantial benefits; further drug wastage was reduced. *In vitro* buoyancy study data is represented in Figure 2 and Table 5.

Swelling index

The hydration ability of the formulation may have a significant effect on tablet buoyancy and release kinetics. The swelling behaviour of a tablet depends on the swellable polymers present in the formula. The formulations F1 and F2 have 42mg and 70mg of HPMC K100M. An increase in the concentration of HPMC K100M showed an increase in the viscosity of the gel layer and an increase in the time for water to reach the inner core of the tablet. F1and F2 formulations showed swelling indices of 2.01±0.03% and 2.06±0.12% respectively. Formulations of F3 and F4 showed swelling indices of 2.21±0.13% and 2.98±0.13%. Formulations F5 and F6 showed swelling indices of 16.6±0.14% and 18.7±0.05% respectively. The Formulation F7 and F8 showed swelling indices of 20.8±0.12% and 29.39±0.11%. The formulation F8 showed the highest swelling index of 29.39±0.11% among all eight formulations and contained 70mg of xanthan gum per tablet. It is observed that as the percentage of xanthan gum in the formulation is increased, the swelling rate of formulations increases, as shown in Table 5.

***In-vitro* Dissolution Studies**

In vitro dissolution studies of all the floating effervescent tablet formulations of clopidogrel bisulphate were carried out in 0.1NHCl in 900ml up to 24 h. At different time intervals, the cumulative percent drug release was calculated. The *in vitro* drug release data of all formulations from F1 to F8 was tabulated in Table 6. The percent cumulative drug release verse time in hours was plotted and was shown in Figure 3. Formulations F1and F2 had HPMC K100M at 42mg and 70mg, while formulations F3 and F4 were prepared by using HPMC K4M at 42mg and 70mg. Formulations F5 and F6 were prepared by using karaya gum at 42mg and 70mg, respectively. Cumulative percent release for 24 h for F1 to F8 ranges from 96.23±0.06% to 99.87±0.03%. Among all eight formulations, F8 showed the maximum percentage of drug release 99.87±0.03 % within 24 hours. As the concentration of xanthan gum increases in formulations show ed greater release for prolonged periods at higher rates. Hence F8 formulation containing xanthan gum at 70 mg was optimized formulation.

Application of Release Rate Kinetics to Dissolution Data

From the *in vitro* dissolution studies, the optimised formulation F8 was further tested for the mechanism of drug release kinetics. The data were fitted into Zero order, first order, Higuchi, and Korsmeyer Peppas mathematical models to study the drug release mechanism. The drug release mechanism was inferred to be first order and non-Fickian diffusion in the sense that drug release was independent of the concentration of drug, and the mechanism of drug release in F8 was due to swelling or relaxation of the polymer chain.Figure 4 shows Release kinetic models of optimised formulation F8. Table 7 shows mathematical kinetic model applied to *in vitro* release data of F8.

Characterization of Clopidogrel Bisulphate Effervescent Floating Tablets Fourier Transform Infrared Spectroscopy (FT-IR) Studies: FTIR spectra clopidogrel bisulphate effervescent floating tablets, Placebo tablets and clopidogrel bisulphate standard were shown in Figure 5 shows the significant all peaks of clopidogrel bisulphate were present in the entire spectrum obtained between drug and excipients. The FTIR spectra showed that there are no significant changes in chemical integrity of drug formulation.

CONCLUSION

Clopidogrel bisulphate effervescent floating tablets were formulated via direct compression using varying concentrations of HPMC K100M, HPMC 4M, Karaya gum, and Xanthan gum. Among the eight formulations developed (F1–F8), formulations containing Xanthan gum demonstrated superior buoyancy properties, characterized by minimal floating lag time, and sustained floatation exceeding 24 hours, along with a higher swelling index indicative of enhanced hydration and polymer relaxation. Formulation F8, comprising 70 mg of Xanthan gum, was identified as the optimal formulation due to its excellent buoyancy, swelling behavior, and sustained drug release. FT-IR analysis confirmed the absence of drug–excipient interactions in F8, while in vitro drug release studies showed a controlled release profile over 24 hours. Kinetic modeling indicated that the drug release followed first-order kinetics and was governed by a non-Fickian diffusion mechanism. These findings suggest that Xanthan gum is a promising polymer for developing gastro-retentive floating tablet systems with prolonged buoyancy and sustained drug release.

ABSTRACT

The rapid integration of financial technology (Fintech) into investment products has transformed how customers access, evaluate, and manage their financial portfolios. This analytical study examines customer preferences and behavioral trends towards fintech-enabled investment services in commercial banks across Bengaluru. The research focuses on identifying key determinants influencing adoption decisions, including perceived usefulness, ease of use, trust, digital literacy, and regulatory awareness. A structured questionnaire was administered to a representative sample of bank customers, and the data were analyzed using SPSS to evaluate correlations, regression patterns, and factor dimensions influencing adoption. The findings reveal that digital convenience, transparency, and security significantly shape customer perceptions, while demographic factors such as age, income, and education moderate behavioral intent. The study also highlights emerging challenges in regulatory alignment and data security that impact long-term trust. The results contribute to a deeper understanding of how fintech innovations reshape investment behavior and offer actionable insights for banks to design customer-centric digital investment strategies.

Keywords: Fintech adoption; customer behavior; investment products; digital finance; commercial banks; behavioral trends; SPSS analysis; Bengaluru; financial innovation; customer preferences.

INTRODUCTION

The financial services industry has undergone a paradigm shift with the advent of financial technology (Fintech), which has redefined how customers interact with banking and investment services. Fintech has introduced

innovations such as robo-advisory platforms, algorithm-driven portfolio management, and mobile-based investment applications that have streamlined processes and enhanced accessibility. As a result, traditional banks are increasingly integrating digital technologies to offer innovative investment products aimed at improving customer experience and expanding market reach. In this evolving landscape, understanding customer preferences and behavioral trends toward fintech-enabled investment products has become critical for financial institutions seeking to remain competitive and relevant. Bengaluru, often referred to as the "Silicon Valley of India," has emerged as a hub for financial technology adoption due to its technologically inclined population, growing middle class, and strong banking infrastructure. The convergence of technology and finance in this region presents an ideal context to study how customers perceive and adopt fintech-based investment products. Despite the proliferation of such offerings, customer acceptance is influenced by several behavioral and perceptual factorstrust, perceived usefulness, digital literacy, and regulatory awareness being among the most prominent. These factors collectively shape decision-making and investment intent in a digital ecosystem. Fintech integration into investment products not only enhances convenience and efficiency but also introduces complexities related to cybersecurity, data privacy, and regulatory compliance. Customers today evaluate investment options not merely on financial returns but also on the safety, transparency, and user-friendliness of digital platforms. Hence, banks must not only innovate technologically but also ensure that their fintech-driven investment solutions align with customer expectations and behavioral patterns.

From an academic perspective, previous studies have focused primarily on fintech adoption in payment systems and lending, with limited emphasis on its influence within the investment domain. This study bridges that gap by empirically analyzing customer preferences and behavioral trends specific to fintech-enabled investment products in commercial banks across Bengaluru. By employing analytical tools such as correlation and regression analysis, the research aims to uncover relationships between demographic variables, behavioral attributes, and adoption levels.

The findings are expected to provide valuable insights for both academicians and practitioners. For banks, they can inform strategies to enhance digital investment services, build customer trust, and foster long-term engagement. For policymakers, the results can aid in understanding the regulatory and infrastructural factors that either promote or hinder fintech adoption in the investment landscape. Ultimately, this study contributes to the growing body of knowledge on fintech adoption behavior, emphasizing the intersection of technology, trust, and customer psychology in shaping the future of investment services.

Literature Review

The adoption of financial technology (Fintech) in investment products has transformed the structure and dynamics of the banking and finance ecosystem. Researchers have emphasized that fintech innovations, through digital interfaces, have democratized investment access, improved transparency, and altered traditional investment behavior. According to Lee and Shin (2018), fintech acts as a disruptive force enabling banks to offer investment products that are faster, cheaper, and more customer-centric. They noted that fintech-driven investment tools significantly influence consumer decision-making, especially in markets where technology penetration is high. Similarly, Vives (2019) argued that fintech enhances operational efficiency and financial inclusion by integrating innovative technologies such as blockchain, artificial intelligence, and big data analytics into investment platforms. Customer adoption behavior toward fintech is largely determined by perceived usefulness and ease of use, as posited by the Technology Acceptance Model (TAM). Chuang et al. (2020) found that trust and perceived ease of use strongly influence customers' willingness to engage with digital investment platforms. Moreover, Gomber *et al.* (2018) highlighted that customers are more likely to adopt fintech-based investment tools when they perceive tangible financial benefits, such as reduced transaction costs or better portfolio customization. Trust remains a central determinant of fintech adoption. Alalwan *et al.* (2020) established that trust mediates the relationship between technological attributes and actual usage behavior in digital financial services. In investment contexts, customers display higher trust in fintech solutions when transparency, data protection, and regulatory compliance are evident. Suryono *et al.* (2021) further emphasized that continuous technological innovation without parallel regulatory frameworks could hinder customer confidence, particularly in developing economies like India. The behavioral dimension of fintech adoption extends beyond technological readiness. Kou *et al.* (2021) suggested that socio-demographic variables such as income, education, and age play vital roles in moderating fintech adoption behavior. Their study revealed that younger, tech-savvy customers exhibit higher adaptability toward fintech investment

platforms compared to older age groups. Similarly, Ryu (2018) found that social influence and perceived risk significantly shape the behavioral intention to invest through fintech platforms. Customer satisfaction and perceived security are also significant predictors of adoption. Singh and Srivastava (2020) observed that fintech applications offering personalized advice and reliable transaction security positively impact customer satisfaction levels in banking investment services. Arner *et al*. (2020) stated that satisfaction and trust develop progressively as customers interact more frequently with digital platforms, creating a feedback loop that encourages sustained usage. The integration of artificial intelligence and data analytics has enhanced personalization in investment decision-making. Chen *et al.* (2022) noted that algorithmic-based advisory services (robo-advisors) have redefined customer experience by providing real-time, data-driven investment recommendations. These innovations have particularly influenced urban investors who value efficiency and digital autonomy. Zavolokina *et al*. (2020), however, cautioned that excessive automation could alienate customers preferring human interaction, suggesting that a hybrid model combining technology with personal advisory might yield optimal outcomes. In the Indian context, Aithal and Varambally (2021) revealed that fintech adoption in investment products has gained momentum due to improved digital infrastructure and government initiatives promoting financial literacy. Yet, regulatory uncertainty and lack of awareness remain key barriers. Mishra and Bhagat (2022) found that fintech adoption among Indian investors is primarily driven by perceived convenience and digital trust, while security and data privacy concerns act as deterrents. Sengupta and Roy (2023) extended this argument by emphasizing that robust cybersecurity policies and transparent grievance mechanisms enhance customer loyalty in fintech-based investment platforms. Finally, the convergence of fintech and behavioral finance indicates a shift from traditional investment motives to technology-driven decision-making. Huang and Zhang (2023) identified that customers' psychological traitssuch as risk aversion and innovation openness significantly affect fintech investment adoption. Likewise, Raina and Thomas (2024) observed that customers perceiving fintech as an enabler of control and empowerment demonstrate greater willingness to adopt such products. Overall, the literature underscores that fintech-driven investment adoption is not merely a technological phenomenon but a multidimensional construct encompassing behavioral, psychological, and regulatory aspects. However, empirical evidence on customer preferences and behavioral trends in the context of Indian commercial banks especially in technology-forward regions like Bengaluru remains limited. This gap necessitates the present analytical study, which examines customer behavior, satisfaction, and regulatory perceptions concerning fintech-enabled investment products.

Objectives of the Study

1. To analyze the adoption trends of fintech-enabled investment products among customers of commercial banks in Bengaluru.
2. To identify and evaluate the key behavioralfactorssuch as trust, perceived usefulness, and ease of usethat influence customer preferences toward fintech-driven investment platforms.
3. To examine the relationship between demographic variables (age, income, education, and occupation) and customer adoption of fintech-based investment products.
4. To assess the impact of fintech innovations on customer satisfaction, trust, and investment decision-making behavior.
5. To suggest strategic recommendations for commercial banks to enhance customer engagement and optimize fintech integration in investment products.

Hypotheses of the Study

H1 – Fintech Adoption Trends

- **H_0:** There is no significant relationship between customer awareness of fintech innovations and their adoption of fintech-enabled investment products.
- **H_1:** There is a significant relationship between customer awareness of fintech innovations and their adoption of fintech-enabled investment products.

H2 – Behavioral Factors Influencing Preferences

- **H_0:**Behavioral factors such as trust, perceived usefulness, and ease of use do not significantly influence customer preferences toward fintech-driven investment products.
- **H_2:**Behavioral factors such as trust, perceived usefulness, and ease of use significantly influence customer preferences toward fintech-driven investment products.

H3 – Demographic Influence

- **H_0:** Demographic variables such as age, income, education, and occupation have no significant influence on the adoption of fintech-based investment products.
- **H_3:** Demographic variables such as age, income, education, and occupation have a significant influence on the adoption of fintech-based investment products.

H4 – Impact on Satisfaction and Trust

- **H_0:** Fintech innovations in investment products do not have a significant impact on customer satisfaction and trust.
- **H_4:** Fintech innovations in investment products have a significant impact on customer satisfaction and trust.

H5 – Strategic Implications

- **H_0:** There is no significant relationship between fintech adoption and the effectiveness of customer engagement strategies in commercial banks.
- **H_5:** There is a significant relationship between fintech adoption and the effectiveness of customer engagement strategies in commercial banks.

RESEARCH METHODOLOGY

The present study adopts an analytical and descriptive research design to investigate customer preferences and behavioral trends toward fintech-enabled investment products offered by commercial banks in Bengaluru. The research focuses on understanding how behavioral factors, demographic attributes, and technological perceptions influence the adoption and satisfaction levels of customers using fintech-driven investment platforms. Both primary and secondary data were utilized to achieve the research objectives. Primary data were collected through a structured questionnaire designed on a five-point Likert scale, covering variables such as trust, perceived usefulness, ease of use, customer satisfaction, regulatory perception, and adoption intention. The questionnaire was distributed to a carefully selected sample of respondents representing customers of major commercial banks operating in Bengaluru, including both public and private sector institutions. A sample size of 130 respondents was determined using a convenience sampling method, ensuring representation across various demographic segments such as age, income, education, and occupation. The collected data were systematically coded and analyzed using the Statistical Package for the Social Sciences (SPSS) to generate descriptive and inferential insights. The statistical tools employed include descriptive statistics (mean, standard deviation, frequency distribution), reliability analysis (Cronbach's Alpha), correlation analysis, multiple regression analysis, and ANOVA tests to evaluate the formulated hypotheses.

Secondary data were sourced from academic journals, research databases, annual reports of commercial banks, RBI publications, and fintech industry reports to strengthen the theoretical foundation and contextual understanding. The study's analytical framework draws upon established theories such as the Technology Acceptance Model (TAM) and Innovation Diffusion Theory (IDT) to explain customer adoption behavior toward fintech investment platforms.

Ethical considerations were maintained throughout the study by ensuring respondent confidentiality and voluntary participation. The findings derived from statistical analysis are expected to offer significant insights into customer behavior and provide actionable strategies for banks to enhance customer engagement and trust through fintech innovations. This methodological approach ensures both quantitative rigor and contextual relevance, making the study analytically robust and academically credible.

Data Analysis and Interpretation

The data collected from 130 respondents were analyzed using the Statistical Package for the Social Sciences (SPSS). The analytical approach involved descriptive statistics, reliability analysis, correlation, and regression to examine relationships among fintech adoption, customer behavior, satisfaction, and demographic factors. The following sections present the key findings and their interpretations.

Descriptive Statistics

Interpretation

The descriptive statistics indicate that respondents exhibit high agreement toward the usefulness and ease of using fintech-enabled investment platforms. The mean value of 4.12 for Perceived Usefulness reflects strong recognition of fintech's role in improving investment decisions. Similarly, a mean of 4.22 for Adoption Intention shows customers' willingness to adopt digital investment products. The standard deviations, ranging between 0.63 and 0.74, suggest moderate variation, indicating that the majority of respondents share similar views. Trust and satisfaction levels also remain positive, demonstrating that fintech platforms are perceived as reliable and convenient by users. This implies that commercial banks have successfully positioned fintech-based investment tools as user-friendly and efficient, especially among tech-savvy customers in Bengaluru. The overall high mean values affirm a favorablebehavioral trend toward fintech-driven investment services.

Reliability Analysis (Cronbach's Alpha)

Interpretation

The Cronbach's Alpha coefficients, ranging between 0.803 and 0.872, demonstrate a high level of internal consistency among the items measuring each construct. Since all values exceed the recommended threshold of 0.7 (Nunnally, 1978), the scale used for data collection is considered reliable. This reliability ensures that the responses obtained are consistent and accurately reflect the underlying constructs of fintech adoption behavior. The slightly higher reliability for Adoption Intention (0.872) indicates strong coherence among responses related to customer willingness to use fintech-enabled investment products. Thus, the measurement model used in this study is statistically sound and suitable for subsequent inferential analysis.

Correlation Analysis

Interpretation

The correlation results reveal statistically significant positive relationships among all variables. The highest correlation is observed between Customer Satisfaction and Adoption Intention ($r = 0.655$), indicating that as customer satisfaction increases, the likelihood of adopting fintech-based investment platforms also rises. Similarly, Perceived Usefulness ($r = 0.651$) and Trust ($r = 0.627$) show strong associations with adoption behavior, confirming that customers who find fintech services beneficial and trustworthy are more inclined to invest through such platforms. The inter-construct correlations are moderately strong (ranging from 0.53 to 0.65), implying that while the constructs are related, each retains distinct conceptual meaning. These results validate that fintech adoption behavior is multifaceted, combining technological perceptions, emotional trust, and experiential satisfaction.

Regression Analysis

Dependent Variable: Adoption Intention (AI)

Independent Variables: Perceived Usefulness (PU), Ease of Use (EOU), Trust (TR), Customer Satisfaction (CS)

Interpretation

The regression analysis demonstrates a strong explanatory power ($R^2 = 0.692$), meaning that approximately 69.2% of the variance in adoption intention is explained by the four independent variablesperceived usefulness, ease of use, trust, and customer satisfaction. The F-statistic (52.741, $p < 0.001$) confirms that the model is statistically significant. All independent variables have positive and significant coefficients ($p < 0.05$), suggesting that they contribute meaningfully to fintech adoption. Among these, Perceived Usefulness ($\beta = 0.298$) and Customer Satisfaction ($\beta = 0.273$) exert the strongest influence on adoption intention, followed by Ease of Use ($\beta = 0.214$) and Trust ($\beta = 0.195$). This implies that when customers perceive fintech investment tools as beneficial, user-friendly, and trustworthy, their intention to adopt these platforms substantially increases. The results affirm hypotheses H_{11}, H_{12}, and H_{14}, indicating significant behavioral drivers of adoption.

ANOVA – Demographic Influence

Interpretation

The ANOVA results indicate statistically significant differences in fintech adoption behavior across all demographic categories, as p-values for all factors are below 0.05. The F-value for income (5.028) suggests that income level plays a particularly crucial role in shaping adoption decisions higher-income individuals demonstrate greater acceptance of fintech investment products due to higher risk tolerance and technological familiarity. Similarly, age and education influence adoption, with younger and more educated respondents showing stronger engagement with digital investment platforms. The findings validate Hypothesis H_{13}, confirming that demographic characteristics significantly affect fintech adoption patterns among bank customers in Bengaluru.

FINDINGS AND CONCLUSION

Key Findings

High Level of Fintech Adoption:

The analysis revealed that a majority of respondents have a strong inclination toward adopting fintech-enabled investment products. The mean score of 4.22 for adoption intention indicates that customers perceive digital investment platforms as convenient, accessible, and efficient. This trend highlights the growing comfort and trust of Bengaluru's banking customers in digital investment solutions.

Behavioral Factors as Core Drivers:

The regression analysis confirmed that perceived usefulness, customer satisfaction, trust, and ease of use significantly influence adoption behavior. Among these, perceived usefulness and customer satisfaction emerged as the most dominant predictors, demonstrating that customers are more likely to adopt fintech platforms when they find them beneficial and reliable.

Strong Internal Reliability of Constructs:

The Cronbach's Alpha values (ranging from 0.803 to 0.872) confirmed the high internal consistency of the measurement items, validating the robustness of the questionnaire and the stability of respondents' opinions. This statistical soundness strengthens the credibility of the findings.

Significant Correlation Between Constructs:

Correlation analysis revealed positive and significant relationships among all constructs, particularly between customer satisfaction and adoption intention ($r = 0.655$). This underscores that satisfied customers are more willing to continue using and recommending fintech investment products.

Demographic Variations Influence Adoption:

ANOVA results showed significant differences across age, income, education, and occupation, confirming that demographic factors substantially shape fintech adoption behavior. Younger and higher-income groups displayed a greater inclination toward fintech investments, while middle-aged and older customers exhibited caution due to limited digital familiarity.

Trust and Security Remain Critical:

Although trust levels were high, qualitative responses indicated ongoing concerns regarding data privacy and cyber security. Customers expect banks to ensure transparency, safeguard personal data, and maintain regulatory compliance to reinforce long-term trust.

Regulatory and Awareness Challenges:
Secondary data review suggests that limited awareness of fintech regulations and lack of standardized investor protection measures can hinder adoption. Customers often rely on institutional reputation when deciding whether to invest digitally, indicating the need for policy-level clarity.

Strategic Scope for Banks:
The results emphasize that commercial banks must blend technological innovation with customer relationship management to sustain fintech adoption. Strategies focusing on digital literacy programs, personalized fintech offerings, and real-time advisory support can further enhance customer confidence and market penetration.

CONCLUSION

The study concludes that fintech-enabled investment products have gained considerable traction among customers of commercial banks in Bengaluru, primarily due to their perceived convenience, efficiency, and accessibility. The empirical findings affirm that behavioral factors such as perceived usefulness, trust, and satisfaction significantly influence customer preferences and adoption decisions. Moreover, demographic characteristics such as age, income, and education play an important moderating role in shaping these behavioral trends. The statistical results, particularly the regression model explaining 69.2% of the variance in adoption behavior, highlight that customer-centric fintech innovations have become key determinants of investment choices in the digital era. However, the sustainability of fintech adoption depends on maintaining customer trust, ensuring robust security frameworks, and promoting awareness about digital investment mechanisms. From a managerial perspective, commercial banks should focus on developing user-friendly, transparent, and secure fintech platforms while reinforcing customer engagement through personalized financial solutions. Regular digital literacy initiatives, transparent grievance handling systems, and collaboration with regulatory bodies can strengthen consumer confidence. In conclusion, fintech-driven investment innovations are not merely technological advancements but strategic tools reshaping customer relationships and redefining the investment landscape. Bengaluru's case demonstrates that when technology, trust, and customer-centricity intersect, fintech adoption becomes not just inevitablebut transformative.

ABSTRACT

The next generation of the corporate world has arrived. With the changing global environment the participation of Genz in the workplace is increasing day by day. This entry of Generation Z in the organizations has bought an unexpected need for transforming the workspace and the traditional HRM practices. This new generation bring with them a bundle of expectation from mental health wellbeing to a shift to flexible culture. This shift has enlarged the Hr practices from policy making to focusing on the wellbeing of the employee. This paper studies the changes required to meet the expectations of the new generation in the workplaces including the modifications required in the areas of employee engagement, Job satisfaction and employee well-being .Where the millennials were more emphasized towards their career growth and completion of tasks given within the deadlines. The Gen's are more emphasized towards the flexibility. The paper aims to have a theoretical study of how the organizations is having a drastic change from millennial dominated workplace to genz influenced working environment. It explores the challenges that the Hr's are facing with the new generation in the process of recruiting, retaining and motivating them to work in the organization. It also focus on how Genz could bring positive reforms in the working place and enhance the organization the be future ready. This study would come with a conclusion that understanding genz is lot more important than just merely following a generational trend but it is a crucial step in building a sustainable organization.

Keywords: Well being, Employee engagement, millennials, HRM Practices, Work life balance

INTRODUCTION

Genz a new generation getting in to the world of corporate. The next millennium generation which is also Known as Genz are the people born between 1997-2012. Genz being one of the largest generation followed by millennium is now all set to enter the corporate as this people has reached the age group of 21-25. According to the page executiveGenz are more concerned with ethics and the work life balance given in the work place before deciding the company to join or not. This next gen has completely different set of values and their expectation from the work space. They are more focused towards attaining work life balance and mental health while working in the organization.According to the reports of Johns Hopkins University, we can expect 30% of these generation workforce in the organizations by the year 2030.This generation has its own boundaries and is connected more to the remote world when compared to the previous gen. They believe in generating new ideas and give the work place a new look and better growth while keeping in priority their mental health and wellbeing This shift in the work place is challenging the traditional HRM practices and paving a way for a upgraded HRM practices by redefining the traditional practices like employee engagement, leaderships styles and making the workplace more translucent then in the previous generation.

REVIEW OF LITERATURE

Zahra, Y., Handoyo, S., & Fajrianthi, F.,(2025) in their study" A comprehensive overview of Generation Z in the workplace: insight from a scoping review" in the paper has identified that the four primary themes for genz to retain in a work place would include the job expectations, the technological role and the significance of the leadership style that the organization is using. They also found that the workplace should prioritize flexibility and adopt the modern digital tools and also trainee there leaders and mangers about the values of genz. Furthermore they have suggested that a study should be done on the cross culture and its long term impact on the work place in the new generation. Muchtar A.,(2025) in his paper "HRM in the age of genz: Balancing flexibility wellbeing and productivity" studies that the organizations should redesign the traditional human resource management strategies and should make flexibility as a non- negotiable instrument of it. Later he says that wellbeing is not just a supplementary word but a central element of the HRM and the focus should be given for the mental wellbeing and inclusive work environment. Further it is said that to increase in the organizational qualitative measure such as creativity, collaboration and innovation should be given importance and to conclude the researcher has focused on the requirement of adaptive leadership and continuous digital innovation for building an organization of trust and empowerment. Shokeen M.,(2025) in her paper "Employee well- being and mental health programs in corporations" has used the primary data of 150 employees across various sectors to know about the current status of how employee wellbeing is effecting the working of the organizations. In her analysis she has stated that India is still in the transitional stage in terms of mental health evolution. According to her the genz and younger millennials are more likely to use the wellness resource and expect more emotional support as employment values. The study is limited to the white collar professionals of urban area and didn't include the blue collar or the rural area which could have influenced on the results of the paper. Dayal M.,(2024) in her study"Work life balance and psychological capital amongst women: genz and millennials" discuss in the paper that psychological capital plays a crucial role in the improvement of the work life balance and highlights that it plays a vital role in promoting a better work life balance between the generations. According to this study millennials reliably high level of psychological capital, wellbeing and work life balance compared to the new generation. This study limits only to the women employees of both the generations.

Objective of the study

The study aim to explore how the entry of the new generation in the field of corporate bought a revolution in the organizational culture and on the traditional HRM practices. As the generation Z enters in the corporate world they are some different set of expectations from the organization in the field of employee wellbeing and change of the organization culture. Further the study also includes the leadership style that can be followed for retaining and motivating the genz employees. It tells the need for well-being, mental health and work life balance in the new gen. It

also explains the roles of technology and the working conditions, hybrid working play in the productivity and engagement of them. Additionally the paper also highlights the challenges faced by the traditional HRM practices in the new gen and to redesign the culture and the HRM plans to fit in this gen. Finally the study aims to suggest measures to move the organization culture to employee centric and increasing the employee engagement in the new gen workforce.

METHODOLOGY

The present paper is basically based on the qualitative analysis of the previously published materials. The study follows the descriptive and conceptual design. This paper motive is to find how the organizational culture and the policies of HRM in the work place is changing with the entry of the new generation the world of corporate with the help of the secondary data collected from various published research papers, journals, articles and online data base. Since the research doesn't lie on any direct data collection or any sort of field work. It is primarily dependent on the secondary data collected and the findings are majorly based on the theoretical lens to suggest whether the corporate should undergo redesigning of the culture in terms of flexibility, leadership style, employee centric environment and the steps that can be taken for sustainable work place.

Traditional HRM Practices

The traditional HRM was majorly policy centered where the Hr would primarily focus on making the policies rules and administrative tasks. The traditional HRM Practices includes long working hours, strict rules and regulations in the organization and the communication between the higher authority and the lower employees was formal and had a hierarchy to be followed. According to the Osumare "Traditional HRM provides a structured cost-effective approach to basic employee management". The employee engagement and the communication between employee and the manager was limited and merely followed one way of communication and had a very formal communication were employee had very little contribution in the part of decision making. The training program were majorly aiming at the development of job related skills more than the personal growth. According to the HR tutorials the traditional hrm had three major approaches: Administrative, Paternalistic and Bureaucratic approach. Where in the Administrative approach had its aim at policy making, maintaining the compliance and record keeping. The Paternalistic approach had a view of making organization as a family and provide the employees with care for hoping loyalty in the exchange. The Bureaucratic approach focused on making hierarchy, making standard procedures and decision making side. These three together played a critical role in the working of traditional HRM.

Genz: The new workforce

According to the forbes "Generation Z are born roughly between the 1997 and 2012 has now started dominating the work place. Their oldest members are now turning in to their 20's and early 30's. They are also the first generation based on the digital era. The gen z all over the world has come up with new set of expectations and employee values. This generation expect proper health wellbeing, flexibility and hybrid model from the work place. If the organization fails to meet the expectation of the new gen they are likely to have high employee turnover in the organization. According to the Deloitte Global Gen Z and Millennial survey found that 86% of the Gen Z is their sense of purpose to stay in the organization is the job satisfaction. This Gen attain their job satisfaction when the organization provides the employee with the mental health wellbeing and inclusivity. Unlike the millennials the genz don't work for long shifts and the traditional hierarchy practices. They like to be get valued and participate in the process of decision making by providing valuable insights in the process of decision making. They are also the first generation to have strong technological knowledge as they are born in a digital era. Where they use technology to work fast and efficiently rather than using the traditional working methods. Due to which they are chances of innovation and growth in the work place. These gen people are highly skilled in using the digital tools and online collaborations. Furthermore according to the 2023 pew research revealed that 70% of Gen Z prioritize working for the organizations with the strong ethical background even if their salary in low. They seek the organizations which are employee centric and are focusing towards the organizations which takes initiative in the growth of their employees and their

career. Despite this these generation have a high amount of employee turnover rate. According to the Deloitte' 2023 survey 49% of Gen Z would quit they job within the span of 2 years if they are dissatisfied with the values of the company and the of work life balance.

The Need for Redesigning Organizational Culture

Every generation gets a new set of expectations by their arrival in the work force but the shift that the gen Z bring is noticeable and is how the organisations are shifting from the purpose driven to employee driven. The need to redesign the organisation culture is not just a choice but a necessity with every new gen Z employee getting in to the work place. The traditional 9 to 5 grid the concept of fixed timings rigid rules strict hierarchy is no more a motivational factor in the new gen. They feel that using this rigid structure will limit the innovation and individuality in the job place. Genz who are also the technological generation use digital tools to make the work simple and to increase the productivity in the work place. While this generation are highly skilled in using the technology which paves the way to do innovation, creativity in the employees which will also lead to the increase in the productivity. Redesigning the organisational culture is nothing but moving from the traditional 9 to 5 grid to a flexibly and remote working conditions. Moving from the traditional and rigid HRM policies to concentrating on the employee wellbeing, mental health and employee growth. This generation doesn't like much interference of the manager in the tasks and like to do it in their own way in which they can show case their creativity. They expect open communication channel and believe in giving their suggestions in the decision making process and also want to give feedbacks on the works they do.

Leadership Style in Gen Z era

Under the new gen z is a task for the leaders. In the generation where the employees quit just via a text message leadership has gone far from just leading and guiding to coaching them. In this new generation the leaders should be trained in a opening to the collaboration, flexibility. Here the leader should also act as mentor to them where he guide them and keep empathy and transparency in their relation. They encourage feedbacks, guidance rather then they annual performance report. They belive in open communication rather than in hierarchy. They leader should aligning the values of the organisation with the employee value and also focus on the development of employee growth by promoting diversity and ethical behaviour. While the emphasis is more on some medical terms called as anxiety, panic attacks, digital burnout, FOMO, etc are no longer an uncommon words but an important aspect for employee retention in the workplace. They believe in making the mental health a propriety. The leader should take initiative for maintaining their mental health and wellbeing.

Challenges of HR Professionals

Hr professions are facing a series of unique challenges from attracting a talent to retain the talent in the organization as gen Z always look for continuous improvement and their personal growth. The Hr should plan the policies that can align with the personal growth of the employee. Another challenge faced is making the working environment flexible and hybrid while genz are not found of the typical 9 to 5 grid they demand flexible working and a hybrid working environment where they can working according to their ease. Furthermore Hr are facing challenge in turning the work place from traditional to whole of a digital platform. As the new gen are also the ones who are more connected to the technology and digital tools. Were these gen people use technology and the digital platform to ease their work, make creative outcomes and innovation in the work place Additionally, HR professions are facing growing challenge in maintain the mental wellbeing and the digital burnouts of these gen. A gen were anxiety, stress, panic attacks are treated as a very serious issue the HR's should take initiatives to maintain their mental health by doing some wellness programs, counselling and some wellness policies to increase the productivity in the work place. To add on employee engagement is also becoming a challenge where in the digital era it is difficult to build interpersonal relationship and team bonding in the organization culture. So Hr should take innovative steps to increase the team bonding and interaction between the employees in a digital era. Lastly promoting diversity, inclusivity and ethical behavior in the organizational culture is become important in the organizations as they tend to loss the interest in the organization if the work place doesn't reflect fairness and justice with its employees.

Positive side of Genz in work place

Genz being the first generation with of technologically driven they easily adopt any new digital tool which comes us. They embrace the digital transformation and in case of any changes in the technology they are open to accept it. On the other hand they have bought awareness among the organizations about the employee wellbeing earlier the generation who only focused on job security over their personal health due to the raise of genz's are now considering wellbeing also a core value of HR and the organization. Later when it come to the work they try to do the work in many different ways instead of using the traditional way which will foster to innovation and creativity in the organizations. Finally this gen people believe in open communication in the organization they want to give their opinion and point of view in the decision making process of the organizations and meetings which will lead to the increased employee engagement in the organization. Over all genz in the work place has not only redefined the organization working but also inspired the organization in becoming more flexible, employee centric and align the organization culture with the employees goals and has increased the innovation in the organization.

Findings and Suggestions

According to the present study the entry of gen Z in the world of corporate has bought some significant changes in it.

Change in the work Culture

As genz entered in the corporate there was a change in the organization culture from the traditional 9 to 5 grid to the hybrid and remote working which gave the employees the flexibility to work from any location and can collaborate with any person round the globe.

Adaptive in technology

Genz being the first generation with highly digital fluent. They can easily adapt any changes in the technology and will also help in terms of innovation in the platform of technology.

Employee wellbeing

Unlike the previous generation who were more towards job security and career development. Genz prefer mental wellbeing in the work place. With their entry in the workplace the organizations have started giving importance to the mental wellbeing in the organization.

Challenges of HR

With the entry of Genz it has become difficult for the HR's to gain the attention of the employees in terms of recruitment and selection the new gen employees are more focused towards the type of organization culture and flexibility before entering into the organization. Even after entering the organization it is very difficult for the HR's to retain these employees if their values are not meet in the workplace as they tend to switch the organization very easily.

Suggestions

Based on the findings the HR's should focus on shifting the organizations 9 to 5 grid into a flexible culture where the employees can work from their location that can help in work life balance. While the traditional model focused on hierarchy and strict organizational roles on the other hand genz want open communication culture in the work place so the HR can take steps in making the organization more flexible and poses open communication culture. Further as the new gen is more concerned towards their wellbeing the Hr can take initiative and bring wellness programs and some counselling sessions in the organizations. To add on these are more fond of the technology and digital platform so the organizations can start inserting more digital tools in the work place as they can adapt it easily and the frame for innovation and creativity can be given in the workplace.

Limitations

The present study is purely based on the secondary data got from the recent publications in the platforms like google scholar and scopus. The research don't have any direct or primary data involved in it. It solely relies on the paper

publications and the articles gone through. As a result the findings are truly based on the theoretical study and the papers published. Further researchers can extend their study by collection of direct data or primary data with the working genz's in the corporate to gain a deeper knowledge about the subject.

CONCLUSION

The study concludes that genz at the work place is having a prompt impact on reshaping the organization culture from the rigid structure of 9 to 5 to a flexible working culture. They are also have a strong significance in the workplace for shifting for work centric to people centric. This new gen is also fond of the technology as a result if there is any change in the technology these people can adapt it easily. Lastly if the organizations want to sustain in this new gen the organizations should be flexible, dynamic in nature and should take initiatives in maintaining the wellbeing of the employees and also should try to bring new digital tools in the workplace to foster the creativity and innovation. To conclude with genz's are not just redesigning the workplace but also bringing new means for innovation and growth in the organisation.

ABSTRACT

Piriformis syndrome is a neuromuscular condition characterized by pain in the gluteal region and lower limb, often due to compression or irritation of the sciatic nerve by a contracted piriformis muscle. Physiotherapeutic interventions, such as Short-Wave Diathermy (SWD), Interferential Therapy (IFT), and stretching exercises, are commonly employed for pain relief and functional recovery. To compare the effectiveness of SWD versus IFT when combined with stretching exercises in reducing pain associated with piriformis syndrome among young adult university students. A randomized experimental study was conducted among 40 university students aged 17–24 years diagnosed with piriformis syndrome based on a combination of clinical history, physical examination (Freiberg's sign (pain with passive internal rotation of the extended hip), and Beatty's maneuver (pain during active abduction in side-lying)and exclusion of other causes of sciatic pain. Participants presented with unilateral deep gluteal pain that often radiated along the posterior thigh, aggravated by prolonged sitting, stair climbing, or hip movement. The participants were divided into two groups: Group A received SWD combined with stretching exercises, while Group B received IFT combined with stretching. Both groups showed significant pain reduction; however, Group A (SWD + stretching) demonstrated a greater improvement with a mean reduction of 4.2 points on the Visual Analogue Scale (VAS), compared to a 2.2-point reduction in Group B (IFT + stretching). The superior outcomes in the SWD group may be attributed to its deep tissue heating effects, which enhance circulation, reduce muscle spasm, and promote healing. While both SWD and IFT combined with stretching are effective in managing piriformis syndrome, SWD

appears to offer greater pain relief in young adults. These findings support the inclusion of SWD as a preferred modality in physiotherapeutic management protocols for piriformis syndrome.

Keywords: Piriformis syndrome, short wave diathermy, IFT, VAS scale, stretching exercises

INTRODUCTION

Piriformis syndrome is a neuromuscular condition characterized by deep buttock pain, numbness, and tingling radiating down the posterior thigh—symptoms that often mimic sciatica (Smith and Prather, 2020). It occurs when the piriformis muscle, a small muscle located deep in the buttock, compresses or irritates the sciatic nerve, often due to hypertrophy, spasm, inflammation, trauma, or muscle overuse (Fishman and Dombi, 2008; Probst *et al*., 2019). A thorough understanding of piriformis anatomy and its anatomical variations is essential, as in approximately 17% of individuals, the sciatic nerve passes through the muscle, increasing the risk of compression (Boyajian-O'Neill *et al*., 2008). Accurate diagnosis involves a detailed patient history, physical examination using provocation tests such as the FAIR, Pace, and Freiberg tests, and the exclusion of lumbar disc herniation or hip pathology via MRI or MR neurography (Papadopoulou *et al*., 2022). MRI-based measurements such as piriformis muscle cross-sectional area (PMCSA) have demonstrated strong diagnostic utility, with recent findings identifying a cut-off point of 611 mm^2 with 75% sensitivity and specificity (Awan *et al*., 2024). Among various physiotherapy interventions, Interferential Therapy (IFT) has been shown to significantly reduce pain when combined with hip muscle strengthening in patients with piriformis syndrome (Pavithra *et al*., 2024). Similarly, Short-Wave Diathermy (SWD), due to its deep heating capacity, has been reported to enhance circulation, reduce muscle spasms, and improve function when combined with muscle energy techniques or stretching exercises (Vijayan and Pavithra, 2019; Solberg and White, 2021). This study investigates the comparative effects of SWD vs. IFT, each combined with stretching, in young adults with piriformis syndrome.

METHODOLOGY

This experimental study was conducted among young adult students at Galgotias University, with the objective of comparing the effects of Short wave Diathermy (SWD) versus Interferential Therapy (IFT) when combined with stretching exercises in managing piriformis syndrome. Ethical approval was obtained from the Institutional Ethics Committee, and informed consent was secured from all participants prior to inclusion.

Inclusion criteria: Participants were eligible if they were aged between 17 and 24 years, diagnosed clinically with piriformis syndrome based on classical symptoms (deep buttock pain radiating along the posterior thigh) and positive outcomes on at least two of the following physical tests: Freiberg's sign and Beatty's manoeuvre. All participants had a baseline Visual Analogue Scale (VAS) pain score of 4 or higher, indicating moderate to severe discomfort.

Exclusion criteria: Students were excluded if they had any history of lumbar disc herniation, hip joint pathology, prior hip or spine surgery, neurological conditions (e.g., multiple sclerosis), infectious or inflammatory disorders, pregnancy, or if they were undergoing any current pharmacological or invasive treatment for lower back or sciatic pain.

PROCEDURE

A total of 40 participants were randomly divided into two equal groups (n=20). Group A received Short Wave Diathermy (SWD) combined with stretching exercises, while Group B received Interferential Therapy (IFT) combined with the same stretching protocol. Treatment was administered five days per week for two consecutive weeks.

- SWD was delivered in continuous mode at a frequency of 27.12 MHz for 15 minutes, targeting the gluteal region.
- IFT was administered using a medium frequency current of 4,000 Hz, modulated at 100 Hz, applied over the piriformis area for 20 minutes.

Both groups performed a standardized set of piriformis-targeted stretching exercises, which included

Figure-of-Four Stretch – To externally rotate the hip and elongate the piriformis muscle in a supine position (Ferber *et al*., 2015).

Pigeon Pose Stretch – A yoga-based posture that provides a deep gluteal and piriformis stretch while in a prone position (Sullivan *et al*., 2020).

Seated Piriformis Stretch – Performed in a chair, crossing one leg over the opposite knee and leaning forward (Boyajian-O'Neill *et al*., 2008).

Seated Spinal Twist – Targets the lower back and deep hip rotators, enhancing mobility and reducing sciatic nerve irritation (Fishman and Dombi, 2008).

Each stretch was held for 30 seconds, repeated three times per session, with adequate rest in between. Sessions were supervised by a trained physiotherapist to ensure consistency and safety. Pain intensity was measured using the VAS before and after the two-week intervention. Statistical analysis was performed using paired and unpaired t-tests to compare within and between groups, with significance set at $p < 0.05$. From the table – 1, the Results of the paired t-test indicated a statistically significant reduction in pain as measured by VAS in both Group A (Short Wave Diathermy and stretching) and Group B (Interferential Therapy and Stretching Exercises). In Group A, the mean VAS score reduced from 7.1 to 2.9 with a mean difference of 4.2 ($p < 0.001$), showing a large effect of short-wave diathermy in alleviating pain. In Group B, the VAS score decreased from 6.7 to 4.5 with a mean difference of 2.2 ($p < 0.001$), indicating a significant but comparatively lower effect. These findings of this study suggest that while both interventions are effective in reducing pain in young adults with piriformis syndrome, short wave diathermy yields a greater pain reduction compared to stretching exercises alone. Pre and Post test analysis of Group A and Group B (Figure: 1). The bar graph represents the comparison of pre-test and post-test scores for Group A and Group B. Group A received Short wave Diathermy (SWD) and stretching. The vertical axis shows the score levels, presumably on a pain or functional scale (such as VAS or ODI), while the horizontal axis indicates the time points: before and after the intervention. From the graph, it is evident that the pre-test score for Group A was around 8, indicating a higher level of pain or disability before the treatment. In contrast, the post-test scores significantly decreased to approximately 4, reflecting a noticeable improvement following the SWD intervention. This reduction suggests that the therapy was effective in alleviating the condition being treated, likely leading to enhanced functional ability or pain relief. The visual contrast between the tall pre-test and shorter post-test bars clearly highlights the therapeutic benefit of SWD in Group A. In the comparison of pre-test and post-test scores for Group B, which underwent IFT and stretching exercises as the intervention the pre-test score in Group B was approximately 7, reflecting a relatively higher level of pain or impairment before the intervention. After the course of treatment, the post-test score reduced to about 5, signifying a moderate improvement in the condition. This decline in score suggests that SWD and stretching exercises of Group A were beneficial in reducing symptoms, compared to Group B (IFT and stretching).

DISCUSSION

The results of the present study clearly demonstrate that the combination of Short Wave Diathermy (SWD) with stretching exercises is more effective in reducing pain associated with piriformis syndrome than Interferential Therapy (IFT) combined with stretching. Both groups showed significant improvements in pain as assessed by the Visual Analogue Scale (VAS); however, the reduction in pain was notably greater in the group that received SWD. These findings are consistent with previous research indicating that SWD offers deeper tissue heating, promoting vasodilation, improving local circulation, decreasing muscle spasm, and accelerating tissue healing (Awan *et al*., 2024). The deep thermal effect of SWD likely enhances the elasticity of the piriformis muscle and reduces compression on the sciatic nerve, thereby offering greater relief (Sharma *et al*., 2023). In contrast, IFT, while beneficial in modulating pain through its electrical stimulation mechanism, may not penetrate as deeply or induce the same

level of muscular relaxation, especially in deep-seated muscles like the piriformis (Kumar *et al*., 2023). This difference in physiological effect may explain the smaller reduction in VAS scores observed in Group B.Furthermore, studies have shown that combining SWD with targeted stretching routines such as the Figure-of-Four stretch, Pigeon pose, and Seated spinal twist leads to faster improvements in flexibility and neural decompression (Verma *et al*., 2022; Singh *et al*., 2021). The synergy between heat and elongation techniques appears to amplify neuromuscular adaptation and pain modulation, a factor that may be less pronounced with IFT (Rao *et al*., 2024). Recent reviews also confirm that SWD is increasingly recognized as a non-invasive and effective adjunct therapy for deep muscular pain, particularly when paired with individualized physiotherapy interventions (Thomas *et al*., 2023; Banerjee *et al*., 2022). The current findings further reinforce the view that SWD has a superior clinical outcome in treating myofascial and neuropathic pain syndromes like piriformis syndrome. Therefore, the combination of SWD and stretching not only provides statistically significant improvement but also offers clinically relevant pain relief in young adults with piriformis syndrome. This protocol may be recommended as a first-line physiotherapeutic intervention to accelerate recovery and restore function in this population.

Limitations of the Study

One of the main limitations of this study was the short duration of the intervention, which may not fully reflect long-term outcomes or recurrence of symptoms associated with piriformis syndrome. Additionally, the sample size was relatively small and restricted to a specific age group (young adults), which limits the generalizability of the findings to broader populations, including older adults or those with chronic neurological conditions.

Future Scope of the Study

Future studies could explore the long-term effectiveness of SWD and stretching protocols over extended follow-up periods and assess whether improvements are sustained or require maintenance therapy. There is also scope to include other complementary therapies such as dry needling, cupping, or core strengthening to evaluate their synergistic effects in managing piriformis syndrome.

CONCLUSION

In conclusion, the combination of Shortwave Diathermy and targeted stretching exercises was found to be more effective than Interferential Therapy with stretching in reducing pain associated with piriformis syndrome. These results suggest that SWD, as a deep heating modality, can significantly enhance muscle relaxation and neural decompression when paired with appropriate flexibility routines. Given the increasing incidence of lower back and gluteal pain among young adults, especially due to sedentary lifestyles, this protocol presents a non-invasive, cost-effective, and clinically beneficial approach for physiotherapeutic management of piriformis syndrome.

ABSTRACT

This study investigates how green marketing affects the production industry's adoption of eco-friendly and sustainable practices. It looks at how consumer behavior, business reputation, and operational choices towards sustainability are affected by eco-friendly marketing tactics. The study's analysis of primary and secondary data demonstrates how well green marketing works to persuade businesses to use eco-friendly technologies, cut waste, and lessen their environmental impact. According to the research, including green marketing improves brand value and competitiveness while also making a substantial contribution to long-term economic and environmental sustainability. As one of the main causes of environmental deterioration, the production sector is essential to solving ecological issues. Conventional production methods frequently use non-renewable resources, produce waste, and consume large amounts of energy. However, businesses have been prompted to reconsider their approaches due to the transition towards sustainable production, which is being pushed by both consumer demand and governmental forces. Green marketing serves as a link between corporate expansion and environmental responsibility, enabling businesses to demonstrate their dedication to sustainability while preserving their competitiveness.

Keywords: Green Marketing, Sustainability, Eco-Friendly Practices, Production Industry, Consumer Behavior

INTRODUCTION

Sustainability has arisen as a major issue in today's business environment, as companies face more pressure to limit their environmental impact. The production sector, in particular, contributes significantly to environmental issues such as waste generation, pollution, and excessive resource consumption. To solve these concerns, many organizations have turned to green marketing, which is a strategic approach that includes environmental responsibility into marketing and production methods. Green marketing emphasizes the use of sustainable strategies to reduce environmental impact and promote eco-friendly products. The primary purpose of green marketing is to enhance customer awareness of the need of purchasing eco-friendly products and to encourage producers to employ eco-friendly practices throughout their supply chains. This includes using renewable energy, lowering carbon emissions, using recyclable packaging, and producing things that are safe for the environment and people. As a result, green marketing relates business prosperity to environmental sustainability. Furthermore, with the growing demand for eco-friendly products around the world, sustainability has become a competitive advantage. Consumers today prefer companies that demonstrate a genuine commitment to environmental sustainability. As a result, green marketing increases client loyalty and trust while also enhancing a company's public image. This transformation fosters long-term economic growth, resource efficiency, and industrial innovation while preserving environmental balance. This study investigates the impact of green marketing on eco-friendly and sustainable production processes.

REVIEW OF LITERATURE

Green marketing in the digital age: A systematic literature review. Sustainability

Chen, G. (2024) compiles a decade of study on green marketing, with a focus on digital platforms. The analysis concludes that digital tools (social media, digital labelling, and online eco-communication) raise consumer environmental awareness and make green claims more visible, but they also increase scrutiny and the possibility of perceived greenwashing if the claims are unverifiable. This study exposes the limitations in empirical work quantifying firm-level operational changes directly induced by digital green marketing campaigns, and it asks for greater research relating online green communication to quantitative production-side sustainability results.

Green marketing horizon: Industry sustainability through eco-innovation and green communication.

Chen, G. (2024) Chen (2024) Research analyses how green marketing, paired with eco-innovation, promotes production firms' long-term performance. The study found that organizations that combine substantial eco-innovation (process or product modifications) with transparent green marketing had better sustainability performance and stakeholder trust than firms that rely solely on promotionalpromises. The author advocates for legislative and management attention on merging green marketing with practical industrial improvements in order to avoid superficial "green image" consequences.

Supply chain green manufacturing and green marketing: Network externalities and consumer green preferences

He, B. (2023)connects retailers' green marketing tactics with manufacturers' green manufacturing decisions across supply chain nodes using an evolutionary game model. The findings show that coordinated adoption of green manufacturing and green marketing is encouraged by significant consumer green preferences and positive network externalities, resulting in improved economic and environmental outcomes for the entire supply chain. Understanding the system-level incentives that encourage producing industries to adopt eco-friendly practices when marketing signals and consumer desires coincide is made easier with the help of this study.

Research GAP

There is still little knowledge about how these marketing strategies actually affect sustainable production processes in industries, despite the fact that many research have examined the role of green marketing in influencing customer behavior and improving brand image. Instead of integrating green marketing with supply chain management, technical innovation, and operational sustainability, the majority of current research concentrates on the promotional and customer perception components of green marketing. Furthermore, there aren't enough empirical studies

looking at how well green marketing techniques work over the long run to provide quantifiable environmental results. In order to close this gap, this study examines how green marketing promotes sustainable transformation and eco-friendly practices in the production sector.

Statement of The Problem

Environmental deterioration induced by industrial activity has recently become a major concern around the world. The manufacturing industry is under increasing pressure to implement sustainable and environmentally friendly methods. Although green marketing has evolved as a successful method of promoting environmental responsibility, many businesses continue to use it as a branding tool rather than incorporating it into their core production processes. However, there is inadequate research to determine how green marketing strategies affect sustainable production processes, resource conservation, and customer attitudes towards ecologically responsible products. As a result, it is criticalto investigate the actual impact of green marketing in encouraging sustainable and eco-friendly practices in the manufacturing business.

Objectives of The Study

- To examine how green marketing tactics affect the production industry's promotion of sustainable practices.
- To evaluate how consumers perceive eco-friendly items in connection to green marketing.
- To assess how green marketing might improve an organization's competitiveness and reputation.
- To determine the obstacles production companies encounter when putting green marketing techniques into practice.

Hypotheses

1.H0:Green marketing does not significantly influence the adoption of sustainable and eco-friendly methods in the manufacturing business.
2.H1:Green marketing encourages sustainable and eco-friendly industrial techniques.
3.H0:Green marketing does not significantly impact consumer opinion of eco-friendly items.
4. H1: Green marketing tactics impact consumer perception of eco-friendly items.

METHODOLOGY

This study uses a descriptive and analytical research design to investigate the relationship between green marketing and sustainable production practices.

• Data collection involved both primary and secondary sources. Structured questionnaires were issued to members of the production industry, marketing executives, and consumers to collect primary data. Secondary data were compiled from journals, research publications, reports, and databases such as Scopus, Web of Science, and Research gate.

• A sample of 100 respondents from production enterprises and eco-conscious customers was used for the study.
•Purposive sampling was employed to choose knowledgeable participants.
•The data was analyzed using statistical tools like correlation, regression analysis, and descriptive statistics to test hypotheses.

Limitations of The Study

- Respondents' opinions may be skewed due to social desirability when discussing environmental issues; the study is restricted to a certain number of production enterprises and may not represent all industries;
- This study may not adequately represent the technological or policy aspects of sustainability because it primarily concentrates on the marketing component.
- The extent of data collecting was restricted by time and resource limitations.

Findings

•According to the study, green marketing has a big impact on businesses' adoption of sustainable production methods like eco-friendly packaging, energy efficiency, and waste reduction.

•Customers see companies that show a sincere dedication to environmental sustainability favorably.

• Green marketing improves competitive advantage, consumer loyalty, and brand reputation.

However, many companies face barriers such as high implementation costs, lack of awareness, and limited government incentives for green initiatives.

Suggestions

• Rather than using green marketing as a promotional approach, businesses should include it into their overall company plan.

• Incentives, training, and recognition for sustainable business practices should be offered by governments and trade associations.

• Businesses should spend money on research and development to develop environmentally friendly technology and lower production costs.

• Through awareness efforts, consumers should be informed about the long-term advantages of encouraging the use of green products.

CONCLUSION

The study comes to the conclusion that green marketing is essential to promoting environmentally friendly and sustainable practices in the manufacturing sector. Businesses can lessen their ecological impact and improve their brand image and profitability by coordinating marketing efforts with environmental goals. Growing consumer demand for sustainable products presents businesses with ethical and tactical chances to implement real green marketing strategies. Building a greener, more accountable, and competitive industry thus requires incorporating sustainability into marketing and production decisions.

ABSTRACT

Leadership is as old as human life. Leadership has been defined as 'the process in which an individual influences the group of people to achieve a common objective'. Leadership is not a trait, but it is the behavior of an individual. A leader exhibits a good attitude and high self-confidence. He works hard towards the goal but never becomes aggressive for it. A leader develops their qualities by constant self-study, training, assessment, and absorbing positive aspects of life. We can always control our reaction, but we can never control the situation. In addition to having a good response, a leader assists other group members in seeing the positive aspects of situations. The researchers identified openness to experience, general self-efficacy, conscientiousness, intellect, extraversion, and adjustment as qualities of a good leader. These attributes were separated by Henry Fayol into five categories: experience, education, morality, mentality, and physicality. Stogdill categorised leadership traits under six headings: situation, status, responsibility, achievement, involvement, and ability. Energizing leaders who exhibit trust in their team members, provide them with recognition, and give them constructive feedback create a great workplace culture. Leaders who are able to foster a great workplace culture and communicate with their team members well have a tendency to unleash their potential, enabling them to enhance their skills and careers. Additionally, leaders may guide their teams towards successful outcomes and create a sense of fulfilment and accomplishment by setting clear and attainable goals. Leadership has proven to be a rapidly developing subject for scholars and practitioners all over the world. This paper focus on the

concept of leadership, role of the leaders in corporate, significance of leadership styles, leadership qualities and styles of Indian corporate leaders and other related themes.

Keywords: Individual, Aggressive, Qualities, Positive, Attributes, Workplace, Career, Goals, Motivation and Developing.

INTRODUCTION

Leadership is the power of one person or a group of individuals to direct and influence members or followers of an organization, society or team. Leadership usually is a quality associated with a title, seniority or rank in the hierarchical system. But it's a quality anyone can possess or acquire, even with no leadership roles. It's a skill that can be developed which, when practiced over time, gets enhanced. Leadership is an important element of the directing function of management. Wherever, there is an organized group of people working towards a common goal, some type of leadership becomes essential.Successful leaders are essential to an organization's ability to convey its mission, vision, and goals, bring team members together around them, and then accomplish those goals. These skills are particularly crucial during emergencies.Empowering leaders who show trust in their team members, offer recognition, and provide constructive feedback foster a positive work culture. Leaders who can create a collaborative environment and effectively communicate with their team members tend to unlock their potential, helping them grow their skills and careers. Furthermore, having clear and achievable objectives can help leaders to steer their teams towards successful outcomes while generating a sense of fulfillment and accomplishment.An organization's ability to compete depends on its leadership since it fosters innovation and change. The most successful executives nurture fresh ideas from within their organisation, recruit creative thinkers, and monitor shifting trends in their sector. Parker Follet. "The power of leadership is the power of integrity. The leader stimulates what is best in us; he unites and concentrates what we feel only gropingly and scatteringly. He/She is a person who gives form to the uncoarctate energy in every man. The individual who inspires me to do great things, rather than the one who actually accomplishes them, is the one who has the biggest influence on me".

LITERATURE REVIEW

Hogan (2019) asserts that a humble leader who pays attention to his staff is an effective leader. He or she will be prepared to own up to their error and be willing to modify the plan of action if necessary.O. Victor conducted a study in 2019 to investigate the different salient characteristics of a successful leader. According to the study, some of the most important traits are neutrality, accessibility, honesty, dependability, dignity, and a playful attitude towards work. Rudolf P. (2016) studied the traits of a good leader and how they help the organisation. The study found that in order to accomplish the organization's cherished goals, a leader must be able to persuade and convince the team members to go above and beyond.An effective leader should be someone who is honest, integral, confident, committed, resilient, emotionally intelligent, and strongly aligned with the organization's vision and mission, according to a recent study by Radhika Kapoor on Characteristics of Effective Leadership (2020).According to Ngodo (2008), leadership is a type of guidance that an individual can provide to a group of people. He manages affairs in a way that will affect the conduct of another individual or group. According to him, leadership is a two-way social influence process whereby superiors and followers work together to accomplish organisational objectives. According to research by Al Khajeh (2018) on leadership and organisational performance, an organization's ability to perform at a high level depends heavily on its leadership. Leadership style ensures that employees have the tools they need to complete their work and links job performance to valuable rewards, which helps the organisation accomplish its current goals more efficiently. A leadership style, according to Armstrong (2012), is the method by which managers carry out their leadership role. According to some, this is a specific action a leader takes to inspire staff members to accomplish a specific organisational goal. Leadership is thought to have a significant impact on an organization's performance, employee commitment, and job satisfaction. Effective leadership techniques, according to some

researchers, inspire and support workers to be competitive (Bhargavi & Yaseen, 2016).Vasileva & Datta (2020) discovered that democratic leadership is the most popular style. According to Purcell *et al.* (2004), organisations that integrate people, processes, and organisational performance are increasingly viewed as having intangible assets such as leadership style, culture, skills and competence, and motivation."

RESEARCH METHODOLOGY

The research study is a conceptual study. This study relies primarily on secondary data. Secondary data is gathered from a variety of sources, including books, journals, magazines, and reports, as well as new research papers published on various websites, research articles, research journals, e-journals, etc. As a result, the trueness of the data is determined by the accuracy of the source.

Objective Of The Study

1.To understand the concept of Leadership.
2.To analyze the status and role of good leader in Business Entity.
3.To know the significance of leadership styles in the employee performance.
4.To highlight the qualities and techniques of an effective leader in management.
5.To highlight the styles and qualities of Indian business entity leaders.

What is Leadership?

Leadership is a vital role in any organization. It involves defining the direction of a team and communicating it to people, motivating, inspiring and empowering them to contribute to achieving organizational success. Leadership is vital to the achievement of individuals, groups, and organizations. It involves varied skills, traits, and styles that enable others to lead and inspire them towards shared purposes. As the business world keeps changing, so does the definition of leadership — evolving to accommodate the needs and pressures of a changing world.Leadership is more than merely having a formal position of power — it means having the capacity to influence, inspire, and motivate others. Good leaders recognize the importance of cooperation and teamwork, creating a climate conducive to open communication, trust, and respect.

Definition's of Leadership

According to Mc Farland (1969), "Leadership is a process of interpersonal influence by which executive or manager influence the activities of others in choosing and attaining given goal". "Koontz O' Donnell (1984) observes: "Leadership means influencing people to follow the achievement of common goals. It is the ability to exert interpersonal influence by means of communication towards the achievement of goals". According to the Encyclopaedia of Social Sciences, "Leadership is a relation function between individual and group around some common interest and behaving in a manner directed or determined by them". Chester James and Orlando comment: "Leadership is a social influence process in which the leader seeks the voluntary participation of subordinates in an effort to reach organisational objectives". Theo Haimann, observes: "Leadership can be defined as the process by which an executive imaginatively directs, guides and influences the work of others in choosing and attaining specified goals by mediating between individual and organisation in such a manner that both will obtain maximum satisfaction". According to Relph M Stogdill, "Leadership is a process of directing and influencing the task related activities of group members" Peter F Drucker, "Leadership is not making friends and influencing people, i.e., salesmanship. It is the lifting of man's visions to higher sights, the raising of man's personality beyond its normal limitations"

What Makes a Great Leader?

Great leadership is distinguished from good leadership by a number of characteristics, such as the following:
1. Powerful yet grounded visions.
2.Effective and transparent communication.

3. Flexibility, creativity, and adaptability.
4. Sincerity.
5. Persistence.
6. Adaptability.
7. Empathy and emotional intelligence.
8. Authenticity.
9. Cooperative.
10. A strong sense of passion.
11. Equity
12. Cultural sensitivity.
13. Expertise and knowledge.
14. Making strategic and visionary decisions.
15. Encourage, empower, inspire, and persuade.

People are inspired by great leaders, who push them to go above and beyond to accomplish their objectives and the objectives of their organisations. Former US President Dwight D stated, "Leadership is the art of getting someone else to do something you want done because he wants to do it,".

Characteristics of Leadership

An analysis of the definitions cited above reveals the following important characteristics of leadership:

1. It is the power of one to influence others. It is a process of influence, in which a leader guides the behaviour of members towards goal achievement.
2. Leadership cannot thrive in vacuum. Leadership is present when there are two or more individuals. It is a relationship between two or more individuals.
3. It seeks to create a change in the other person's behavior since it is a process of influence, which is applied by the leaders.
4. There are interpersonal relationships between followers and leaders indicated due to leadership.
5. It is applied for the realisation of common organisational goals.
6. It is a constant process.
7. It is extremely situational since the leaders have to behave based on the situation.
8. It is an authority-dominated process, i.e., a leader must have sufficient power so that he can influence the followers' behavior.

Types of Leaders or Leadership Styles

The phrase "leadership style" describes a leader's basic behavioural pattern as seen by those around him. Every leader establishes a pattern for how he responds to followers or subordinates in different circumstances. The leader's philosophy, personality, and experience all influence their leadership style. It also depends on the conditions that exist within an organisation and the kinds of followers that it has. Leaders can be divided into the following categories based on their attitudes and patterns of behaviour:

Laissez-Faire

A laissez-faire leader does not have direct supervision of employees and does not give regular feedback to employees under his control. Highly trained and experienced employees who do not need direct supervision come under the laissez-faire style of leadership. But not all employees fall into that category. That style of leadership discourages the production of supervised employees. The laissez-faire style generates no leadership or supervision activities from managers, thus resulting in poor production, absence of control and rising costs.

STRENGTHS	WEAKNESS
1. It enables team members to optimize their own leadership abilities. 2. It gives the individuals with the most experience to	1. It undermines the leadership role of the leader within the team. 2. It minimizes the group cohesiveness.

excel. 3. It sets up the atmosphere of independence. 4. It fosters team members to try new things. 5. It enables individual teams to build their own atmosphere. 6. It creates more personal satisfaction for the work being accomplished. 7. It gives the leader to be strategic with their capabilities.	3. It transforms the manner in which responsibility is delegated within the group. 4. It enables leaders to shirk leadership. 5. It is a leadership style that employees are likely to misuse. 6. It may be hard to adjust to changing circumstances. 7. It provides loopholes for employee lawsuits. 8. It builds silos.

Autocratic

Managers with an autocratic leadership style can decide without consulting anyone else. Supervisors have complete control over their staff and enforce their wishes. The decisions made by autocratic leaders are never contested. Autocratic leadership is used in nations like North Korea and Cuba. Employees who need close supervision benefit from this leadership style. Creative staff members who enjoy working in teams hate this management approach.

STRENGTHS	WEAKNESS
1. It makes decision-making quick and easy. 2. It makes communication better in general. 3. Productivity is increased. 4. It successfully manages crisis situations. 5. It lowers worker stress. 6. The team's inexperience is countered.	1. Micromanagement frequently results from it. 2. There is no sense of professional ownership derived from it. 3. The culture of the workplace is shaped by the leader. 4. A system of dependence is established. 5. A lack of trust is created.

Participative

Participatory leadership, sometimes referred to as the democratic leadership style, encourages team members' and peers' opinions but leaves the final decision-making to the participative leader. Because workers contribute to the decision-making process, participatory leadership raises employee morale. It gives them the impression that their views are important. When an organisation needs to make changes, the participative leadership style makes it easier for employees to accept those changes because they are involved in the process. When businesses have to make a decision quickly, this approach works well.

STRENGTHS	WEAKNESS
1. It is a style of leadership that can be practiced by anyone. 2. It assists in the resolution of complicated problems. 3. It develops relationships based on teams. 4. It makes honesty an utmost priority. 5. It enhances the applicable knowledge of the team. 6. It provides team members with an overview of the larger picture. 7. It generates greater levels of job satisfaction.	1. It has the capacity to generate disharmony if it is inaccurately applied. 2. It has the potential to get leaders into fence-sitting. 3. It will never be a true consensus. 4. It cannot provide a clear definition of leadership. 5. It does not always provide a positive result.

Transactional

Transactional leadership is a management approach that emphasises rewarding employees for their efforts in order to inspire subordinates and accomplish immediate objectives. Using a system of conditional rewards for success and penalties for failure, leaders establish clear expectations and goals while upholding the current organisational structure and order. Employee motivation is mainly achieved through external rewards like cash or recognition, as opposed to relying on internal passion or long-term goals. Transactional leaders oversee subordinates by using their official position and authority to make sure that directives are followed and performance is tracked. Transactional

leadership is perfect for handling repetitive duties and guaranteeing reliable, excellent performance in a planned environment.

STRENGTHS	WEAKNESS
1. It can successfully inspire group members to increase output. 2. It establishes attainable objectives for people of all levels. 3. It clears up misunderstandings in the chain of command. 4. It boosts productivity while cutting expenses. 5. The procedure is easy to follow. 6. It establishes an easy-to-follow system. 7. It gives employees the freedom to select the incentives they wish to obtain.	1.Individuality is removed from the production process. 2. It restricts what can be done in terms of innovation. 3. More followers are produced than leaders. 4. It frequently emphasises penalties over benefits. 5. It doesn't value empathy at all. 6. Some people are not inspired to be more productive by it.

Transformational

A leader that practices transformational leadership inspires and motivates their teams to accomplish positive change by developing a compelling vision and encouraging a sense of purpose and ownership. This method encourages creativity, moral behaviour, and a dedication to common objectives above self-interest, with an emphasis on both individual and group development. Leaders give support and growth opportunities to their team members based on their individual needs and development. By promoting originality, creativity, and fresh perspectives, they enable followers to solve issues and support the growth of the company. Transformational leaders inspire and foster trust among their followers by setting a strong example through their own actions and dedication.

STRENGTHS	WEAKNESS
1. Transformational leadership reduces turnover expenses. 2. It is a leadership style which involves the entire person. 3. Transformational leaders initiate and facilitate change. 4. New corporate visions can be rapidly developed. 5. Transformational leaders generate enthusiasm. 4. It promotes continuous learning and development. 5. Transformational leaders are effective communicators. 6. It rapidly transforms low-morale environments. 7. Transformational leaders know relationships. 8. It is a leadership style which emphasizes significantly ethics. 9. Transformational leaders pose the significant questions. 10. This leadership style boasts about what it has produced. 11. Transformational leaders try to stay away from coercion. 12. Individuals are treated as persons.	1. Transformational leaders are capable of creating negative consequences. 2. There needs to be constant communication. 3. Constant and regular feedback is necessary. 4. Transformational leaders don't have followers who share their beliefs. 5. Transformational leaders may take risks that could cause disruptions. 6. Employee burnout may result from it. 7. Individual needs are a common focus for transformational leaders. 8. This leadership style may emphasize dishonesty. 9. Not all transformational leaders pay close attention to details.

Qualities of Good Leader

A successful leader gets his followers to do what he wants. The quality of leadership he can offer will determine this. To be effective, a leader needs to have a few fundamental traits. Many authors have listed various attributes that a person should have in order to be a successful leader.

A good leader possesses the following attributes, among others:

1. Honesty	12. Creativity
2. Good communication	13. Enthusiasm
3. Responsibility	14. Solving problems
4. Collaboration and compassion	15. Impact
5. Self-awareness	16. Flexibility
6. Making decisions	17. Compassion
7. Empowerment	18. Adaptability
8. Growth mindset	19. Respect
9. Patience	20. Delegation
10. Optimism	21. Learning agility
11. Openness	22. Gratitude

PROCESS OR TECHNIQUES OF EFFECTIVE LEDERSHIP

Effective leadership employs the following strategies:

1. Before introducing any significant changes to the policies and lines of action, the group should be consulted.
2. In order to achieve shared goals, he should try to cultivate his subordinates' voluntary cooperation.
3. He ought to use his power to carry out the policies as needed. His subordinates should receive clear, comprehensive, and understandable instructions from him.
4. He needs to give his followers more self-assurance and zeal.
5. He ought to pay attention to what his subordinates have to say and respect their emotions.
6. He needs to communicate clearly.
7.He should follow the principle of motivation.

How to Become A Better Leader

With the rise in remote work and the increased focus on employee touch points like diversity, equity, and inclusion, the workplace has undergone significant change in recent years. To help people become better leaders, they can improve a number of leadership traits: Be more self-aware. Excellent leaders understand their strengths, weaknesses and impact on the people they are leading. They lead by example and set a good standard of behavior. One way to be more self-aware is to ask for feedback from those individuals. Improve communication skills. The leader must be effective and concise in communication; they also need to listen effectively. Communication must be open, honest and transparent. This includes the establishment of clear objectives and expectations, as well as the provision of regular feedback to staff members. Bond with team members. Bonds create trust, understanding and relationships that are essential for effective leadership. Great leaders should learn about the personality and potential of their team members. Promote growth. Great leaders support their own, their colleagues' and their employees' or followers' individual and professional development. Promoting growth deepens bonds and trust between leaders and team members, and results in what teams can achieve. Be receptive to change. Change is unavoidable in business; being receptive to it and allowing new ideas and thinking from team members can serve to make leaders better. Develop positive attitudes. Meeting adversity and adversity situations head-on with positive solutions and encouragement is an excellent way to demonstrate and enhance problem-solving skills. Find opportunities for growth. Effective leaders find opportunities for ongoing improvement and learning. This might be going to conferences, developing a mentor and reading leadership books.

Importance of Leadership In Management

The value of leadership in any group effort is too apparent to be exaggerated. Wherever, there exists a systematized group of individuals striving for a common purpose, some form leadership becomes unavoidable. Lawrence A. Appley stated that the time had arrived to replace the term leadership for management. Although the issue of leadership has existed since the beginning of recorded history, it has gained more attention in recent decades as a result of the high level of specialisation, the complexity of production techniques, and social changes in contemporary organisations. A good dynamic leader is likened to a 'dynamo generating power' which electrifies and energizes the whole group so that almost miracles can be performed. Success of an enterprise is dependent to a large degree, on good leadership. Importance of leadership can be attributed from the following:

It Improves Motivation And Morale:

By dynamic leadership managers are able to enhance the motivation and morale of their subordinates. An effective leader affects the attitude of an individual in such a way that he works voluntarily towards the attainment of enterprise objectives.

It Serves As A Driving Force Behind Teamwork:

Leadership is an impelling force to group efforts. It takes the group to a greater performance through its continuous striving and influence on human relations.

It Works As An Aid To Authority:

The application of authority cannot always yield desired outcomes. Leadership works as an aid to authority by inspiring, influencing and stimulating action.

It Is Required At All Levels Of Management

Leadership is a crucial aspect at each management level since without leadership no management can deliver the desired outcomes.

It Provides The Basis For Co-Operation

A good leadership enhances the understanding among the subordinates and the management and encourages their co-operation.

Organizational Culture Leadership And Performance

Effective leadership and organizational culture are both necessary for successful organizations. These two factors are interconnected; an organization's principles and leadership style will always be a reflection of its creator or founders, who establish the organization's cultural characteristics. The way the organization is led will also be impacted by the culture as it develops. The leader will be shaped by this new culture, which will also affect his behavior. It's a continuous process where the founder/leader both forms and produces the organization, and the organization (and its culture) shapes him. The performance of the organization will be influenced by the extent to which the employees share the culture's values and how closely they correspond with the values that are suggested in the business strategy. Great leaders can use the organizational culture to their advantage and change it to follow their vision. Culture and leadership are always intertwined because leaders provide the context and tools to develop culture and an organization and value orchestration and change as they apply to culture. Norms come into existence and change with interest, responses to crises by leaders, and to whom they are interested in attracting for their organizations. The characteristics of an organization's culture are influenced and developed by leadership and adopted by followers. An organizational culture is typically formed out of an ideal cultural schema that exists in the minds of founders. Therefore, success or failure of the organization is directly related to, the leadership style and the importance of the founder's beliefs, values, to the contemporary opportunities and constraints facing the organization at a certain period of time. Leadership style has an impact on performance since performance is not possible without a leadership style that can adapt to the changes and challenges of the environment, that can motivate the employees, and that encourages employees to take more ownership for their work. Ratan Tata serves as the chairman of Tata Sons; he always keeps his eye out for opportunities from any misfortunes that presented themselves. "A hundred years from now, I would hope that the Tata's are much larger than it is today; more importantly, I hope the Tata Group is regarded as the best in India, best in the way in which we operate, best in the products we make, and the

best in our value systems and ethics. And I hope a hundred years from now, we will have spread our wings far beyond India."

The Leadership Continuum

He is slightly more on the Democratic side.

"There has been a certain independence and delegation involved. An independent view has been taken and a fair degree of - indeed total - autonomy has been given to individual companies." -Ratan N. Tata

Ratan Tata's attributes include

1. Thought leadership
2. Man of ideas
3. Communicate effectively
4. Bold and aggressive
5. A hands-off style of leadership
6. Man of integrity
7. Selfless leader
8. Conduct of Leadership

Ratan Tata is exhibiting delegating leadership. Although he participates in decision-making, the process and accountability have been delegated to the MDs of each individual firm. Each company in the group has its own unique goals and plans, so it is free to make its own decisions.

Leadership Grid

Each company in the Tata Group is led by a dedicated individual who achieves the objectives of their separate companies and Ratan Tata falls under the team management category of the leadership grid.

CONCLUSION

Management is about getting things done. Leadership is about achieving goals by creating directions for a business and inspiring employees to take initiative and make the right decisions. Leader is the ability to build up confidence and zeal among people and to create an urge in them to be led. To be a successful leader, a manager must possess qualities of foresight, drive, initiative, self-confidence and personal integrity. Different situations may demand different types of leadership. Enterprise leaders need the skills to motivate, lead and influence others. Enterprise seeks to hire individuals who can assume leadership roles and contribute to the long-term expansion of the company. Its management and training programmes help to provide employees with the skills necessary to lead others. Leadership requires being strategically focused and applying behavioural techniques to build commitment and attain the best work from your people. One approach to describe a good dynamic leader is as a "dynamo generating energy" that charges and engages the entire group to the point where near miracles may be accomplished. An organization's ability to succeed is largely dependent on its leadership.

ABSTRACT

The current work examines the phytochemical profiling and fundamental radical analysis of *Musa acuminata* flower extract to assess its potential therapeutic properties and elemental makeup. Fresh flowers were gathered, dried in the shade, ground into a powder, and then extracted using the maceration procedure. The extract was first tested for the presence of several bioactive chemicals and then for basic radicals. The findings indicated the existence of significant secondary metabolites, including alkaloids, flavonoids, tannins, saponins, terpenoids, and phenolic compounds, recognized for their antioxidant and antibacterial capabilities. The basic radical analysis showed that there were important elements including calcium, magnesium, and iron, but no harmful heavy metals were identified. These results indicate *that Musa acuminata* flower extract contains substantial phytochemical ingredients and mineral content that validate its traditional application in herbal medicine. The research establishes a solid foundation for subsequent pharmacological and nanoparticle synthesis studies utilizing *Musa acuminata* flower extract.

Keywords: *Musa acuminata*, Phytochemical screening, Basic radical analysis, Flower extract, Bioactive compounds.

INTRODUCTION

Plants are a plentiful source of bioactive chemicals that have a wide range of medicinal and pharmacological effects. Phytochemical analysis examines these chemicals and gives us useful information about the chemical makeup of plant extracts, which may help them work as medicine. Alkaloids, flavonoids, tannins, saponins, terpenoids, phenols, and glycosides are all types of phytochemicals that help protect the body from pathogens and oxidative stress. They are also linked to antioxidant, antimicrobial, and anti-inflammatory effects [1-2]. Phytochemical profiling of plant extracts aids in the identification of secondary metabolites via qualitative and quantitative analysis, establishing a scientific foundation for their traditional therapeutic applications [3]. Preliminary phytochemical screening uses simple colorimetric tests to find main chemical groups. More complex methods, like UV-Vis, FTIR, HPLC, and GC-MS, are used to get more information [4]. Along with phytochemical profiling, fundamental radical testing (elemental analysis) is just as vital for figuring out what inorganic parts are in the plant materials. Basic radicals are metal ions like calcium, magnesium, iron, zinc, copper, lead, and bismuth. Depending on how much of them there are, they can be helpful or harmful [5]. Finding these components gives us information about the plant's nutritional or toxicological qualities. For basic radicals, qualitative testing use conventional inorganic analysis with wet chemistry methods such flame tests, precipitation processes, and color change observations [6]. A whole picture of the plant's biochemical makeup can be seen by combining phytochemical and basic radical analyses. Such studies are essential for corroborating ethnomedicinal assertions, guaranteeing safety, and fostering the advancement of herbal formulations with specified chemical profiles [7-8].

***Musa acuminata* (Fig:1).**
Botanical synopsis of *Musa acuminata*
Name in Science: *Musa acuminata* Colla
Family: Musaceae
Typical names: Acuminata banana and wild banana.
Growth habit: *Musa acuminata* is a large, herbaceous perennial plant that grows quickly. Because of its tall pseudostem, it frequently resembles a tree.
Flower colours: White to yellowish-White

Benefits of *Musa acuminata*
Musa acuminata (banana plant) is an important fruit crop and a useful medicinal plant that has many health and nutritional benefits. Traditional medicine and functional food formulations use almost every part of the plant, including the fruit, peel, flower, pseudostem, and leaves [9]. The flowers of *Musa acuminata* contain a lot of bioactive phytochemicals, like flavonoids, tannins, phenols, alkaloids, and saponins, that are very good at fighting diabetes, inflammation, and bacteria [10]. They are traditionally employed to address menstruation disorders, ulcers, diabetes, and infections, attributed to their capacity to regulate blood glucose levels and improve insulin sensitivity [11]. The fruit has a lot of carbs, vitamins (particularly B6 and C), minerals like potassium and magnesium, and fiber, which is healthy for your heart and digestive health [12]. Regular eating helps keep the balance of electrolytes and lower high blood pressure since it has a lot of potassium and not much salt. The peel and pseudostem extracts have antioxidant and wound-healing capabilities, and more and more people are looking into them for use in cosmetics and medicine. Traditionally, people utilize the juice from the pseudostem to treat urinary tract infections and kidney stones [13]. *Musa acuminata* also has promise for treating wastewater and making nanoparticles. Its flower and peel extracts can be used as natural reducing and stabilizing agents in green synthesis processes [14]. These eco-friendly methods show that the plant is important for more than just food and medicine; it can also be used in sustainable nanotechnology. In general, *Musa acuminata* is a useful plant for food, medicine, and industry. This makes it an essential species for both traditional medicine and current scientific research.

MATERIALS AND METHODS

Gathering Plants and Making Flower Extract

We got fresh *Musa acuminata* flowers from the area around here that were in good health. The flowers that were picked were cleaned well with running tap water to get rid of dust and other dirt, and then rinsed with distilled water. The flowers were then dried in the shade at room temperature for a few days until all the moisture was gone. The flowers were used to grind into a fine powder, which was then put in an airtight container for later use. To make the extract, a certain amount of flower powder was put in a beaker with distilled water, the mixture was boiled and left to cool. After extraction, the solution was filtered using Whatman No.1 filter paper to get rid of any solid particles. We collected the filtrate and the concentrated extract was kept in a refrigerator at 4°C until it could be looked at again.

Qualitative analysis of secondary metabolites

Test for flavonoids

To the aqueous solution of the extracts 10% ammonia solution id added and is heated. The production of fluorescence yellow is positive for flavonoids.

Test for tannins

To 5ml of extract few drops of neutral 5% ferric chloride solution was added. The production of dark green colour indicates the presence of tannins.

Test for Saponins

0.5mg of extract was vigorously shaken with few ml of distilled water. The formation of frothing is positive for saponins.

Test for steroids

2ml of extract with 2ml of chloroform and 2ml of concentrated H_2SO_4 are added, the appearance of red colour and yellowish green fluorescence indicates the presence of steroids.

Test for phenol

To 5ml of extract 3ml of 10% lead acetate solution was added and mixed gently. The production of bulky white precipitate is positive for phenols.

Test for alkaloids

To about an ml of extract few drops of wagner's reagent was added. Reddish brown precipitate indicates presence of alkaloids.

Test for triterpenoids

To 10mg of extracts 1ml of chloroform is added and is mixed to dissolve it. 2ml of concentrated H_2SO_4 is added followed by 1ml of acetic anhydride formation of reddish violet colour is positive for the presence of triterpenoids.

Test for terpenoids

3ml of the extract was taken and 1ml of chloroform and 1.5ml of concentrated H_2SO_4 are added along the sides of the tube. The reddish brown colour in the interface is considered positive for the presence of terpenoids.

Test for glycoside

To 2ml of filtrate 3ml of chloroform is added and shaken the chloroform layer is separated and 10% ammonia solution was added. The pink colour indicates the presence of glycosides.

Test for quinones
To 1ml of extract, alcoholic KOH is added the presence of red to blue colour indicates the presence of quinones.

Test for anthraquinones
To 5ml of extract, few ml of Conc.H_2SO_4 was added and 1ml of diluted ammonia was added to it. The appearance of rose pink confirms the presence of anthraquinones.

Quantitative Analysis of Basic Radicals
Test for ammonium
To the test solution add NaOH and Nessler's reagent, reddish brown precipitate is obtained.

Test for strontium
To the plant extract, add NH4OH and sodium rhodizonate, a brown spot obtained.

Test for magnesium
Magneson reagent and NaOH were added to the leaf extract, blue precipitate is obtained.

Test for calcium
To the plant extract add NH4OH and ammonium oxalate, a white precipitate is obtained.

Test for barium
Acetic acid and sodium rhodizonate were added to the leaf extract, a brown spot is obtained.

Test for manganese
Conc. HNO3, sodium bismuthate and water were added to the leaf extract a pink colour appears.

Test for nickel
To the plant extract add dimethyl glyoxime and NH4OH, a scarlet red precipitate obtained.

Test for aluminium
To the leaf extract add dil. HCL, aluminon reagent and ammonium carbonate is added. A bright red precipitate is obtained.

Test for cobalt
To the plant extract add potassium thiocyanate, blue colour appears.

Test for iron
Add potassium ferrocyanide to the leaf extract, Prussian blue colour appears.

Test for zinc
Add potassium ferrocyanide to the plant extract, white precipitate appears.

Test for lead
To the plant extract add KI, a yellow precipitate obtained.

Test for bismuth
To the plant extract add NH4OH to excess, white or pale blue precipitate appears and dissolves to a deep blue solution.

Test for copper
Cupron reagent and NH4OH were added to the plant extract, green colour appears.

Test for cadmium
To the plant extract add dil. HCL, water and H2S gas is passed. Yellow precipitate obtained.

RESULTS AND DISCUSSION

Phytochemical analysis
The initial phytochemical analysis of *Musa acuminata* flower extract identified several bioactive components, including alkaloids, flavonoids, tannins, phenols, terpenoids, saponins, and glycosides, whereas steroids and anthraquinones were not detected. It is known that these phytochemicals have antioxidant, antibacterial, anti-inflammatory, and anticancer properties. The extract's high levels of flavonoids and phenolic compounds suggest that it could be a natural source of antioxidants. Tannins and alkaloids, on the other hand, give the extract antibacterial and pain-relieving characteristics, respectively. Qualitative analysis of secondary metabolites (Table.1).

Basic Radicals
The fundamental radical analysis revealed the existence of crucial elements such as calcium (Ca^{2+}), magnesium (Mg^{2+}), and iron (Fe^{3+}), which are necessary for physiological tasks including enzyme activation, bone formation, and oxygen transfer. The extract was safe for medicinal usage because it did not contain any toxic heavy metals like lead (Pb^{2+}), or bismuth (Bi^{3+}). The results of both phytochemical and elemental analyses show that *Musa acuminata* flower extract is a good source of secondary metabolites and important minerals. This supports its traditional uses in herbal medicine and suggests that it could be useful for pharmacological and green synthesis purposes. Quantitative Analysis of Basic Radicals (Table.2).

CONCLUSION

The current investigation validates that the floral extract of *Musa acuminata* encompasses a diverse array of bioactive phytochemical components, including alkaloids, flavonoids, tannins, saponins, terpenoids, and phenols. These components are recognized for their potent antioxidant and therapeutic capabilities, corroborating the conventional application of this plant in herbal medicine. The fundamental radical analysis showed that the plant has important minerals like calcium, magnesium, and iron, which make it even more nutritious and useful for medicine. The extract is safe for possible biological uses because it doesn't contain any hazardous heavy metals.The findings indicate that *Musa acuminata* flower extract is a significant natural source of phytochemicals and critical elements. This study establishes a scientific basis for its prospective utilization in pharmaceutical formulations and as a green reducing agent in the manufacture of metal oxide nanoparticles.

ABSTRACT

β-Glucosidases (β-D-glucoside glucohydrolases) are present in plants, fungi, mammals and also in microorganisms. Plant β-glucosidases play an important role in defense against pests, phytohormone activation, lignifications and cell wall catabolism. The tamarind seed during germination produces β-glucosidase. In the present study, NaCl at 1.0 M concentration was ideal for the extraction of β-glucosidase enzyme. The enzymeβ-glucosidase was extracted, isolated and purified employing various biochemical techniques. Fractional precipitations was carried out using chilled acetone since it gave good result with an excellent recovery. The acetone precipitation fraction (30-80 %) activity was resolved into a two peaks(CMS – I and CMS – II) of β-glucosidase activity on CM – Sepharose column. The CMS – II fraction containing β-glucosidase activity was subjected gel filtration on Sephadex G – 100. The electrophoretic analysis of β-glucosidase showed two protein bands on SDS – PAGE.The molecular weight of β-glucosidase was found to be in the region of 58.4 and 59.1 kDa as determined by gel-filtration and SDS – PAGE, respectively and the preparation contained a minor protein as impurity as determined by SDS – PAGE.

Keywords : β-glucosidase, CM – Sepharose, Sephadex G – 100, molecular weight, electrophoretic analysis.

INTRODUCTION

β-Glucosidases (β-D-glucoside glucohydrolases; EC 3.2.1.21) occur in plants, fungi, mammals and microorganisms [1] and are subject of much recent research due to the key role these enzymes play in biological processes and potential biotechnological applications. Plant β-glucosidases play an important role in defense against pests [2], phytohormone activation [3][4][5][6][7], lignifications[8] and cell wall catabolism [9]. One of the best understood functions of ß-glucosidases in plants is the hydrolysis of the cyanogenic glucosides (cyanogenesis). In this case, the enzyme and substrate occur in different subcellular compartments and come into contact with each other only after tissue disruption by pathogens or herbivores. As a result, the cyanogenic glucoside is hydrolyzed, releasing toxic hydrogen cyanide (HCN) [10].

The present investigation is aimed at extracting β-glucosidases from *tamarind seeds during germination.* Isolation and purification by ion exchange chromatography and gel filtration has been described. Methods for determination of purity (polyacrylamide electrophoresis, SDS – PAGE, zymogram analysis) as well as molecular weight (SDS – PAGE and gel filtration) have been reported.

MATERIALS AND METHODS

Chemicals : All Chemicals used in this study were of analytical grade.Acrylamide, N, N'–methylene bisacrylamide, Sephadex G – 200 (40 – 120 μ), Blue dextran – 2000, CM – sepharose (0.84 meq/g ; medium), Coomassie brilliant blue R-250, p–nitrophenyl–β–D–glucoside,Cytochrome C(12.4 kD), Lysozyme (17.5 kD), Chymotrypsin (21.6 kD), Carbonic anhydrase (29.0 kD), Bovine Serum Albumin (66.0 kD), Haemoglobin (67.0 kD), and Blue dextran (2,000 kD) were purchased from Sigma Chemical Company, St.Louis, MO, U.S.A. Ovalbumin (45.0 kD), Glyceraldehyde-3-phosphate dehydrogenase (36.0 kD), Carbonic anhydrase (29.0 kD), were obtained from Fermentas.

Plant Material : The seeds of *Tamarindus indica* were collected using random sampling technique (RST) from local areas of Bangalore district, Karnataka State, India. After dehulling the fruits, equal samples of seeds were combined to give one bulk population sample from which sub samples were taken. The seed samples were dried in the sunlight for 24 hrs. After removing immature and damaged seeds, the matured seeds were washed under tap water, dried and stored in refrigerator until further use.

Extraction of enzyme

A 20 % extract of the 25th day endosperm was prepared in 100 ml of 10 mM sodium acetate buffer pH 5.6 containing 1.0 M NaCl by blending in a mixer for 5 mins and centrifuged at 10,000 rpm for 20 mins at 4°C. The supernatant was used for fractional precipitation of the enzyme.

Protein assay

Protein content was determined according to the method of Lowry with bovine serum albumin as standard [11].

Enzyme assay

β-glucosidase assay is based on the measurement of the amount of p-nitrophenol formed from the substrate p-nitrophenyl-β-D-glucoside [12]. The reaction was initiated by adding 0.25 ml of the enzyme extract to 0.75 ml of 1.2 mM p-nitrophenyl-β-D-glucoside in 10 mMacetatebuffer, pH 5.6. The reaction mixture was incubated at 37° C for 30 mins. The reaction was stopped by the addition of 4.0 ml of 0.1 M sodium hydroxide. The amount of p-nitrophenol liberated was measured at 440 nm. One enzyme unit corresponds to 0.5 μmoles of ρ-nitrophenol/min.

Purification of β-glucosidase

Fractional precipitation

The above crude extract was subjected to the fractional precipitation by a) Addition of ammonium sulfate and b) Addition of chilled acetone.

Ammonium sulfate fractionation

Ammonium sulfate fractionation was carried out by adding the small amount of powdered ammonium sulfate to crude extract by constant stirring over magnetic stirrer at 4° C to obtain 0 - 30% saturation. The solution allowed to stand for 30 mins at 4° C followed by centrifugation at 10,000 rpm for 20 mins. The pellet obtained was dissolved in 5 ml of 10 mM sodium acetate buffer pH 5.6. The supernatant was collected and subjected to 30 - 80 % ammonium sulphate fractionation as described above, followed by centrifugation at 10,000 rpm for 20 mins. The pellet was dissolved in 10 mM sodium acetate buffer pH 5.6. The fractions (0 - 30% and 30 - 80%) were dialyzed against 10 mM sodium acetate buffer pH 5.6 for 8 hours, with two changes in the buffer. The dialysate was centrifuged at 10,000 rpm for 20 mins to remove the insoluble residue and the supernatant was used for assay of β-glucosidase and protein content.

Acetone fractionation

Acetone precipitation was carried out by adding chilled acetone to the crude extract to get 0 - 30 %, 30 - 60 % and 60 - 80 % fractions. The solution was immediately centrifuged at 10,000 rpm for 20 mins. The pellets obtained in each case was dissolved in 5 ml of 10 mM sodium acetate buffer pH 5.6 and centrifuged at 10,000 rpm for 10 mins to remove the insoluble residues. The supernatants were collected in each case and β-glucosidase activity and protein content were determined. Acetone fractionation was used for further studies since good yields were obtained compared to ammonium sulphate fractionation.

Polyacrylamide Gel Electrophoresis (PAGE)

Disc gel electrophoresis was carried out essentially according to the method of [13]. The samples suitably diluted with (100 ug protein) with 20% sucrose containing bromophenol blue, were loaded on to each sample well and subjected to electrophoresis in cold (4^0 C) applying a current of 2 m A /sample well for 4 hours.

Staining for protein

The gel was stained with 0.1% Coomassie Brilliant BlueR-250, destained using acetic acid :methanol : water (1 :4 : 5) to visualized the protein bands.

CM – Sepharose Ion Exchange Chromatography

CM – sepharose was repeatedly washed until the washings were free from acid and alkali. The CM – sepharose was then washed with 50 mM, acetate buffer pH 5.6 and was packed into column (12 x 1.0 cm) under gravity at room temperature. After packing, the column was equilibrated with two volumes of the start buffer at a flow rate of 25 ml/hr. The upper surface of the CM-sepharose was protected by filter paper. The 30 - 80 % acetone fraction was loaded onto the column and the column washed with two bed volumes of start buffer. The bound proteins were eluted with stepwise increase in the ionic strength (0.3 M and 0.5 M NaCl). Fractions of 5 ml were collected. β-glucosidase activity was eluted with 0.3 M (CMS – I fraction) and 0.5 M NaCl (CMS – II fraction) solution. The CMS – fractions were analyzed by PAGE and SDS – PAGE.

Sephadex G-100 Gel-filtration chromatography

Sephadex G – 100 was equilibrated with 10 mM sodium acetate buffer, pH 5.6 and packed into a column under gravity (600 mm X 10 mm). The column was equilibrated with two bed volumes of 10 mM sodium acetate buffer, pH 5.6 at a flow rate of 10 ml/hr. The CM – Sepharose fraction, CMS – II containing β-glucosidase activity was concentrated by 80 % acetone precipitation. The precipitates obtained were dissolved separately in 2.0 ml of 10 mM sodium acetate buffer pH 5.6. The CMS – I and CMS – II fractions were subjected to gel permeation chromatography separately using Sephadex G – 100. The proteins were eluted with start buffer and fractions of 2 ml were collected.

The Sephadex – fraction of the enzyme was analyzed by PAGE and SDS – PAGE. Sephadex fraction of β-glucosidase showed more than one protein band both in PAGE and SDS – PAGE.

Sodium dodecylsulphate – Polyacrylamide Gel Electrophoresis (SDS – PAGE)

SDS – PAGE (10 %) both in the presence and absence of β – mercaptoethanol was carried out by the method of Laemmli [14]. The gel solution contained 7.5 ml of separating gel buffer (45.5 g of tris buffer and 1 g of SDS dissolved in 200 ml, pH was adjusted to 8.8 with HCl and made up to 200 ml); 15.0 ml of acrylamide-bisacrylamide solution (73 g acrylamide and 2 g of N, N-methylene bis acrylamide), 1.5 ml of TEMED and 7.5 ml water. This solution was poured into glass plates over layered with water to get uniform surface and allowed to polymerize for 30 mins at room temperature. After polymerization, the water layer was removed carefully and spacer gel was added. This was allowed to polymerize for 30 mins then the enzyme obtained from preparative gel electrophoresis was subjected to SDS-PAGE.

Molecular weight determination by gel – filtration on Sephadex G – 100

The gel-filtration using Sephadex G – 100 column (1.0 cm X 60 cm) was carried out as described previously. The marker proteins (1 - 2 mg) and purified β-glucosidase (1 mg) were (dissolved in 10 mM, acetate buffer pH5.6) loaded onto the column separately and were eluted with the same buffer at the flow rate of 10 ml per hr. Fractions of 2 ml were collected. The marker proteins used were cytochrome *C* (12,400 Da), lysozyme (17,500 Da), chymotrypsin (21,600 Da), carbonic anhydrase (29,000 Da), bovine serum albumin (66,000 Da). Blue dextran (2,000,000) was used to determine the void volume (V_O). The marker proteins and the purified β-glucosidase were detected by measuring absorbance at 660 nm by the method of Lowry's and that of β-glucosidase by determining the activity with p–nitrophenyl–β–D–glucosideas described previously.

RESULTS AND DISCUSSION

β-Glucosidases has E.C. No.3.2.1.21 and it represents a group of ubiquitously expressed, hydrolytic enzymes, which catalyze the hydrolysis of β-*O*-glucosidic linkages between β-D-glucose and an aglycone or another sugar. β-Glucosidases also exhibit similar specificity for a β-glucoside substrate, but with distinct specificities for the aglycone linked to the glucosyl group [1], suggesting their diverse biological functions. In plants, β-glucosidases are implicated in growth regulation, stress response, cellobiose degradation, lignification, and defence [2]. They are the key enzymes in the release of aromatic compounds from glucosidic precursors present in fruits and fermentating products. Indeed, many natural flavor compounds, such as monoterpenols, C-13 norisoprenoids, and skimate-derived compounds, accumulate in fruits as flavorless precursors linked to mono- or diglycosides and require liberation by enzymatic or acidic hydrolysis [15][16].

In the present study, 25th day old seeds were collected and were further extracted for purification of β-glucosidase. All the purification procedures were performed at 4-10°C unless otherwise stated. Fractional precipitations were carried out by addition of chilled acetone andby the addition of powdered ammonium sulfate. On the other hand, chilled acetone fractionation gave good results with an excellent recovery. In case of rye, the glucosidase activity was precipitated when the pH of the crude enzyme extract was adjusted to 5.0, in contrast to maize and wheat glucosidase activities which remain in the supernatants [17].In the present work, chilled acetone fractionation was chosen for partial purification. The acetone precipitation fraction (30-80 %) activity was resolved into two peaks (CMS – I and CMS – II) of β-glucosidase activity on CM – Sepharose column. The elution profile is shown in Fig 1. The pIs of maize, wheat, and rye glucosidases were 5.2, 5.1–5.6 and 4.9–5.1, respectively.The rye glucosidase may be more hydrophobic than the glucosidases of maize and wheat. On the Mono Q chromatogram, several peaks of DIBOAGlc and DIMBOA-Glc glucosidases were detected, and the elution profile of both activities were almost identical. The result indicated that rye has several isozymes of β-glucosidase and there is little difference in their activities for DIBOA-Glc and DIMBOA-Glc [17].

The CMS – II fractions containing β-glucosidase activity was subjected to gel filtration on Sephadex G – 100 (Fig 2). The results of the Superdex-200 column chromatography and SDS–PAGE analysis indicated that the glucosidases of rye were oligomers with molecular masses of 300 kDa consisting of 60 kDa monomers. All the glucosidase isozymes separated on the Mono Q chromatogram were also shown to be oligomers of 60-kDa polypeptides with native molecular mass of 300 kDa. The electrophoretic analysis of the crude and chilled acetone fraction employing cationic system revealed two protein bands on SDS – PAGE of β-glucosidase (Fig 4). The molecular weight of β-glucosidase was found to be in the region of 58434 and 59186 Da as determined by gel-filtration (Fig 3) and SDS – PAGE (Fig 5) and the preparation contained a minor protein as impurity as shown by SDS – PAGE.

The peak fractions of CMS – I and CMS – IIwere pooled separately and analyzed by PAGE.In case of maize, glucosidase is a homodimer of 60-kDa polypeptides and is encoded by a highlypolymorphic locus. This causes maize hybrid lines to show a few activity bands on native–PAGE gels [18]. The locus encoding the glucosidase and the polymorphism of the glucosidase has not been reported for rye. However, since the rye glucosidase is an oligomer and consists of only 60-kDa polypeptides, the several bands on a native–PAGE gel may be caused by a similar mechanism. The glucosidases from wheat have also been shown to have several isozymes that can be clearly separated on native–PAGE [17]. Although wheat glucosidases are comprised of two different subunits, 60- and 58-kDa polypeptides, these electrophoretic multiplicities and the similar native molecular masses may indicate that the glucosidases from both plants resemble each other.

Many β-glucosidases contain either identical or nonidentical subunits. The number of subunits varies from 2 to 10 (or more) depending on the enzyme. For instance, a 60 kDa coniferin-hydrolyzing β-glucosidase from lodgepole pine has two non-identical subunits with molecular weight of 28 and 24 kDa[19]. The furostanol glycoside 26-O-β-glucosidase from Costus speciosus is a 110 kDa protein with two subunits with molecular weight of 54 and 58 kDa[20]. Furthermore, the isoflavone hydrolyzing β -glucosidase from chickpea has apparent molecular weight of 125–135 kDa with two identical subunits of 68 kDa.

However, the molecular weight of β-glucosidase isolated from the germinated tamarind seeds was found to be in the region of 58.43 and 59.18 kDa as determined by gel-filtration and SDS – PAGE (Fig.4, Fig 5) respectively but the preparation contained a minor protein as impurity as shown by SDS – PAGE. *The enzyme* β-glucosidases obtained from agricultural products such as *the seeds of Tamarind is a heat stable enzyme and can be commercially exploited to produce the enzyme.* β-glucosidases of Tamarind seeds have been examined as a new source for producing these, β-glucosidases a member of glycosyl hydrolases. The kinetics of Tamarind seed β-glucosidase for the hydrolysis p–nitrophenyl–β–D–glucoside are in similar order of magnitude to those of other plant enzymes [21][22][23][24][25][26].

CONCLUSION

β-glucosidases profile during the germination of the tamarind seeds revealed that 1.0M NaCl was apt for the extraction of enzyme with high activity. NaCl at 1.0 M concentration was ideal for the extraction of both β-galactosidase and β-glucosidase enzymes.The enzyme β-glucosidase were extracted, isolated and purified employing various biochemical techniques. Fractional precipitations were carried out using chilled acetone since it good result with an excellent recovery. The acetone precipitation fraction (30-80 %) activity was resolved into two peaks (CMS – I and CMS – II) of β-glucosidase activity on CM – Sepharose column. The peak fractions of CMS – I and CMS – II were pooled separately and analyzed by PAGE. The CMS – I and CMS – II fractions containing β-glucosidase activity was subjected to gel filtration on Sephadex G – 100. The molecular weight of β-glucosidase was found to be in the region of 58.4 and 59.1 kDa as determined by gel-filtration and SDS – PAGE, respectively and the preparation contained a minor protein as impurity as shown by SDS – PAGE.

ACKNOWLEDGEMENT

The study was supported by UGC under UGC – Major Research Project (2010 – 2012) New Delhi. ABSTRACT

Trust calibration—the alignment between human trust and the actual reliability of artificial intelligence (AI)—is a critical determinant of effective human–AI collaboration. While prior research has explored trust formation and misuse within single cultural contexts, cross-cultural variations in trust calibration remain under examined. This study presents a large-scale empirical investigation into how cultural factors influence trust calibration in human–AI decision support systems (DSS). We conducted controlled experiments with 600 participants from three culturally distinct regions (North America, East Asia, and Western Europe), using AI-assisted decision tasks in medical diagnosis, financial forecasting, and ethical judgment. Trust behaviors were measured through dynamic interaction logs, self-reported confidence ratings, and objective performance outcomes. Results reveal significant cross-cultural differences in both initial trust and adaptive recalibration following AI errors. Participants from collectivist cultures exhibited higher initial trust but slower recalibration, whereas those from individualist cultures demonstrated greater skepticism yet faster alignment with system reliability. Using a novel Trust Calibration Index (TCI), we quantitatively model these behaviors and identify predictive cultural dimensions—particularly uncertainty avoidance and power distance—as key moderators. The findings contribute to the design of culturally adaptive AI systems that foster appropriate trust levels, enhancing safety, accountability, and user satisfaction in global AI deployments

Keywords: Trust calibration—the alignment between human trust and the actual reliability of artificial intelligence (AI)—is a critical determinant of effective human–AI collaboration.

INTRODUCTION

The rapid integration of artificial intelligence (AI) into decision-making processes has transformed domains ranging from healthcare and finance to transportation and security. As AI systems increasingly assume advisory or collaborative roles, their effectiveness depends not only on algorithmic accuracy but also on the quality of human–AI interaction. Central to this interaction is the concept of trust calibration—the degree to which a human user's trust in an AI system corresponds to the system's actual reliability. Poorly calibrated trust can result in overreliance, where users accept erroneous AI recommendations, or underreliance, where users disregard accurate guidance. Both extremes undermine decision quality and may erode confidence in AI technologies at large. Previous research on human–AI trust has largely focused on trust formation, interface design, and the effects of system transparency. However, trust calibration—how individuals adjust their trust dynamically in response to AI performance—remains underexplored, particularly in cross-cultural contexts. Cultural psychology has long established that cognitive styles, perceptions of authority, and attitudes toward uncertainty differ significantly across societies. These cultural variations can profoundly influence how users interpret and respond to AI behavior. For example, individuals from collectivist cultures may exhibit higher baseline trust in institutional or authoritative systems, whereas those from individualist cultures may approach AI advice more critically. Despite such theoretical expectations, empirical evidence quantifying these effects across cultures remains limited. To address this gap, the present study investigates how cultural factors shape trust calibration in human–AI decision support systems (DSS). We conduct an empirical study involving participants from North America, East Asia, and Western Europe, representing diverse cultural orientations. Participants engaged in decision-making tasks in three domains—medical diagnosis, financial forecasting, and ethical reasoning—while interacting with AI systems of varying reliability. Using behavioral data, self-reported trust ratings, and performance outcomes, we introduce a novel Trust Calibration Index (TCI) to quantitatively capture how trust evolves over time and across contexts. By comparing trust calibration patterns across cultural groups, this research aims to identify both universal and culture-specific dynamics in human–AI trust relationships. The findings contribute to the theoretical understanding of trust as a dynamic and culturally contingent construct, while offering practical implications for designing AI systems that promote appropriate trust across global user populations. Ultimately, this study advances the goal of developing culturally adaptive AI systems—technologies that not only perform reliably but also align with the social and cognitive expectations of diverse human users.

REVIEW OF LITERATURE

Origins and conceptualizations of trust in automation

The study of trust in automated systems traces a clear lineage from interpersonal- and organizational-trust theory into human-factors and HCI research. Seminal work by Lee and See framed trust in automation as an attitude that influences reliance in situations of uncertainty and vulnerability; they emphasized that appropriate reliance depends on the perceived performance, process, and purpose of the automation. This framework established trust as dynamic and context-dependent, rather than a static trait, and laid the groundwork for research into design features that promote *appropriate* reliance. SAGE Journals+1

From trust formation to trust calibration

Research has moved beyond describing antecedents of trust to investigating *trust calibration*—the alignment between a user's trust and an automation's objective reliability. Calibration is important because miscalibrated trust leads to two error types: overreliance (accepting incorrect AI advice) and underreliance (rejecting correct advice). Empirical work has explored how interface transparency, explanations, error framing, and performance histories affect users' moment-by-moment trust adjustments. Reviews and meta-analyses highlight a proliferation of calibration interventions (e.g., confidence displays, explanations, performance summaries), but they also note inconsistent operationalizations of trust and a heavy reliance on short laboratory tasks. ACM Digital Library+1

Measuring trust and calibration: behavioral, subjective, and hybrid approaches

Measurement remains a central methodological challenge. Traditional approaches use self-report scales (e.g., Trust in Automation scales), but behavioral measures—such as conformity to AI recommendations, override rates, and interaction logs—are increasingly used to capture calibration dynamics. Recent psychometric work has aimed to validate AI-specific trust scales across applications, while other studies recommend multi-modal measurement combining subjective ratings, behavioral choices, and performance outcomes to capture calibration more robustly. Despite progress, no single standardized metric has been universally adopted, and few studies provide temporally granular indices that map trust trajectories against objective reliability. Frontiers+1

Human–AI decision support systems: domain differences and evaluation frameworks

Human–AI decision support systems (DSS) vary widely by domain (medical diagnosis, finance, legal review, aviation, etc.), and domain characteristics strongly shape trust dynamics. For example, high-stakes, time-pressured environments amplify sensitivity to errors; domains with strong professional expertise (e.g., clinicians) show different calibration patterns than lay users. Recent reviews call for domain-agnostic evaluation frameworks that combine outcome metrics (accuracy, decision quality), process metrics (decision time, information seeking), and subjective trust measures to allow cross-domain comparisons and to assess the degree to which systems foster symbiotic rather than purely automated interaction modes. arXiv+1

Cultural influences on trust in technology

Cultural values shape cognitive styles, perceptions of authority, risk tolerance, and social norms—factors that plausibly influence how people form and adjust trust in AI. Hofstede-inspired dimensions (individualism–collectivism, power distance, uncertainty avoidance) have been used to explain cross-national differences in technology acceptance and institutional trust. Empirical cross-cultural work on AI has found that national culture correlates with baseline attitudes toward automation and with acceptance of AI decision-making, but studies are often limited to survey-based acceptance measures rather than dynamic calibration during interactive tasks. Research that specifically tests how cultural dimensions moderate trust *adjustment* after AI errors is still sparse. DIVA Portal+1

Recent advances (2023–2025) and emerging methods

From 2023 onward, the literature shows intensified interest in: (a) validated, domain-general trust instruments for AI; (b) behavioral-log based metrics and time-series analyses of trust trajectories; and (c) design interventions that communicate uncertainty and enable human override. Several 2024–2025 reviews synthesize these developments and call for larger, more representative samples and cross-cultural comparisons to ensure global applicability of calibration strategies. At the same time, nascent proposals for composite indices (combining behavior, confidence, and outcome alignment) point toward operational tools for quantifying calibration—yet empirical cross-cultural validation of such indices is limited. ScienceDirect+1

Gaps in the literature motivating the present study

Three interconnected gaps emerge from the review:

1. **Dynamic, quantitative metrics for trust calibration:** While many studies discuss calibration conceptually, few operationalize it with a robust, temporally sensitive index that links trust trajectories to objective system reliability across tasks and error profiles. (Measurement work is improving, but uptake is inconsistent.) Frontiers
2. **Cross-cultural empirical evidence under interactive conditions:** Most cross-cultural AI studies rely on surveys or between-subject snapshot designs. There is limited experimental work that tracks how users from different cultural backgrounds *update* trust in response to identical AI behaviors during interactive DSS tasks. DIVA Portal
3. **Domain-comparative studies that preserve ecological validity:** Existing work often focuses on a single domain or uses low-stakes tasks. Comparative studies across clinically relevant, financial, and ethical judgment tasks are needed to test whether culture×domain interactions systematically shape calibration patterns. arXiv

METHODOLOGY

Research Design

This study employed a mixed-methods, cross-cultural experimental design to investigate trust calibration in human–AI decision support systems (DSS). The design was structured to examine how participants from culturally diverse regions adjust their trust in AI systems of varying reliability across multiple decision domains. Quantitative measures captured trust alignment and task performance, while qualitative measures explored subjective reasoning behind trust adjustments.

Participants

A total of **600 participants** were recruited from three culturally distinct regions:

- **North America (n = 200)**
- **East Asia (n = 200)**
- **Western Europe (n = 200)**

Inclusion criteria required participants to be 18 years or older, fluent in the experiment language, and without professional experience in AI system development. Participants were recruited via online research panels and local academic networks, ensuring diverse age, gender, and educational backgrounds. Cultural orientation was additionally assessed using a Hofstede-based survey to capture individual variations in power distance, individualism–collectivism, and uncertainty avoidance.

Experimental Tasks

Participants engaged in three domain-specific decision-making tasks, each designed to represent real-world decision contexts with moderate complexity:

1. **Medical Diagnosis:** Participants reviewed patient symptom profiles and were asked to select the most probable diagnosis with AI assistance.
2. **Financial Forecasting:** Participants predicted stock market trends based on historical data and AI-generated forecasts.
3. **Ethical Judgment:** Participants evaluated moral dilemmas and chose the most ethically appropriate action with AI recommendations.

Each AI system provided **recommendations of variable reliability** (70%, 85%, and 95% accuracy levels) and was designed to include occasional errors to trigger recalibration opportunities.

Procedure

1. **Pre-task survey:** Participants completed demographic questions and a cultural orientation survey.
2. **Training phase:** Participants received standardized instructions on using the AI-assisted interface and completed practice trials to familiarize themselves with the system.
3. **Experimental trials:** Participants completed 30 trials per domain (10 per reliability level), with the order of domains and reliability levels randomized to minimize order effects.
4. **Post-task survey:** After each domain, participants reported their **subjective trust, confidence, and perceived AI reliability**.
5. **Debriefing:** Participants were informed about the AI accuracy manipulation and completed a short reflective questionnaire on their trust behavior.

Measures

Trust Calibration

A Trust Calibration Index (TCI) was developed to quantify alignment between participant trust and AI reliability. The TCI integrates:

- **Behavioral compliance:** Frequency of following AI recommendations.
- **Subjective confidence:** Self-reported trust ratings (1–7 Likert scale) after each trial.

- **Performance outcomes:** Correctness of final decisions.

TCI values range from -1 (complete miscalibration) to +1 (perfect calibration), allowing comparison across participants, tasks, and cultures.

Cultural Dimensions

Individual-level scores on Hofstede dimensions were collected via a standardized survey instrument, capturing individualism–collectivism, power distance, and uncertainty avoidance. These scores were used as moderators in regression and mixed-effects analyses.

Task Performance

Objective metrics included:

- Accuracy of decisions relative to correct outcomes.
- Decision response times per trial.
- Number of AI overrides (when participants disregarded AI advice).

Subjective Measures

Participants completed self-report items on:

- Perceived AI reliability and competence.
- Confidence in own decisions.
- Perceived ease of use and cognitive load.

Data Analysis

1. **Descriptive statistics:** Calculated mean, standard deviation, and distributions of TCI scores across cultures and domains.
2. **Mixed-effects modeling:** Evaluated effects of AI reliability, cultural dimensions, and domain on trust calibration over time, with random intercepts for participants to account for repeated measures.
3. **Time-series analysis:** Tracked trial-by-trial trust adjustments to capture dynamic recalibration patterns.
4. **Moderation analysis:** Tested whether individual-level cultural orientation moderated the relationship between AI reliability and trust calibration.
5. **Exploratory qualitative analysis:** Thematic coding of post-task reflections to interpret behavioral patterns and domain-specific perceptions of AI reliability.

Ethical Considerations

The study was approved by the Institutional Review Board (IRB) at the lead institution. All participants provided informed consent and were informed of their right to withdraw at any point. Data were anonymized, and all analyses complied with GDPR and relevant privacy regulations.

Results / Findings

Descriptive Statistics

Across all participants (N = 600), the mean Trust Calibration Index (TCI) was 0.62 (SD = 0.21), indicating generally moderate-to-high alignment between participant trust and AI reliability. However, substantial variability was observed across cultural groups and domains:

Cultural Group	Mean TCI	SD
North America	0.59	0.22
East Asia	0.66	0.19
Western Europe	0.61	0.21

- East Asian participants showed slightly higher overall calibration than North American and Western European participants.

- Across domains, ethical judgment tasks exhibited the lowest average TCI (M = 0.55), suggesting greater difficulty in aligning trust with AI reliability in morally ambiguous contexts.

Dynamic Trust Calibration Patterns

Time-series analyses of trial-by-trial trust revealed distinct cultural patterns in recalibration:

- **East Asian participants** exhibited higher initial trust in AI recommendations but slower adjustments following errors, particularly in early trials (first 5–7 trials).
- **North American participants** showed lower initial trust but faster recalibration, quickly aligning trust with actual AI reliability after observing errors.
- **Western European participants** demonstrated intermediate patterns: moderate initial trust with gradual calibration over trials.

Graphical analysis (Fig. 1) illustrates these trajectories, showing that while all groups improved calibration over repeated trials, the slope and timing of adjustment differed by culture.

Effects of AI Reliability and Domain

A **mixed-effects model** tested the impact of AI reliability, domain, and cultural group on TCI:

- **AI Reliability:** Higher AI accuracy led to significantly higher TCI ($\beta = 0.48$, $p < 0.001$). Participants adjusted trust proportionally to observed performance.
- **Domain:** Ethical judgment tasks were associated with lower calibration ($\beta = -0.11$, $p = 0.002$) compared to medical diagnosis tasks.
- **Interaction Effects:** A significant culture × AI reliability interaction ($\beta = 0.09$, $p = 0.01$) indicated that cultural background moderated how participants updated trust in response to AI errors. East Asian participants were less sensitive to small changes in reliability compared to North Americans.

Role of Cultural Dimensions

Individual-level Hofstede scores revealed systematic moderators of trust calibration:

- **Uncertainty Avoidance:** Higher scores predicted slower recalibration ($\beta = -0.12$, $p = 0.01$), consistent with a preference for stable, predictable advice.
- **Power Distance:** Higher scores were associated with greater baseline trust in AI ($\beta = 0.15$, $p < 0.001$), particularly in East Asian participants.
- **Individualism–Collectivism:** Collectivist orientation correlated with higher initial trust but lower sensitivity to AI errors ($\beta = -0.10$, $p = 0.03$).

These results suggest that both group-level and individual-level cultural factors shape dynamic trust behaviors in human–AI collaboration.

Task Performance and Calibration

Across domains, higher TCI correlated with higher decision accuracy ($r = 0.47$, $p < 0.001$), confirming that well-calibrated trust positively impacts outcomes. Domain-specific correlations:

- Medical Diagnosis: $r = 0.53$
- Financial Forecasting: $r = 0.44$
- Ethical Judgment: $r = 0.38$

Decision times were inversely related to calibration in financial and ethical tasks (faster decisions when trust was well-aligned), suggesting that trust calibration reduces cognitive conflict and deliberation time.

Qualitative Insights

Post-task reflections revealed patterns consistent with quantitative findings:

- East Asian participants often emphasized "following the AI as an authority", even after observing errors.
- North American participants reported "double-checking recommendations", reflecting a more skeptical and adaptive approach.

- Ethical tasks elicited hesitation across all cultures, with participants reporting difficulty in evaluating AI reasoning in morally ambiguous situations.

DISCUSSION

Overview of Findings

This study investigated how trust calibration in human–AI decision support systems varies across cultures, domains, and individual-level cultural orientations. Using a novel Trust Calibration Index (TCI), we found that:

1. Trust calibration exhibits **distinct cultural patterns**: East Asian participants demonstrated high initial trust but slower recalibration, North Americans showed lower initial trust with faster adjustment, and Western Europeans displayed intermediate behaviors.
2. **Task domain matters**: Ethical judgment tasks produced the lowest calibration, highlighting challenges in morally ambiguous decisions.
3. **Cultural dimensions moderate trust behaviors**: Uncertainty avoidance slowed recalibration, power distance increased baseline trust, and collectivism elevated initial trust while reducing sensitivity to errors.
4. **Calibration improves performance**: Higher TCI correlated with greater decision accuracy and faster response times, underscoring the practical value of appropriately calibrated trust.

These findings provide a nuanced view of trust as a dynamic, culturally contingent construct, supporting prior theoretical frameworks while extending them across multiple decision domains.

Interpretation of Cross-Cultural Differences

The observed differences align with cultural psychology and technology acceptance theories:

- **East Asian participants:** Higher initial trust and slower recalibration reflect cultural tendencies toward authority respect and risk aversion. In contexts where AI is perceived as a credible expert, users may maintain trust even in the presence of errors.
- **North American participants:** Lower initial trust and rapid recalibration suggest individualist skepticism and proactive error detection, consistent with prior research emphasizing critical evaluation of advice in low power-distance cultures.
- **Western European participants:** Intermediate behaviors indicate a balanced approach, combining cautious trust with adaptive adjustment based on observed reliability.

These patterns highlight that trust is not a universal psychological response to AI reliability but is shaped by culturally informed cognitive and social heuristics.

Domain Effects and Cognitive Load

Ethical judgment tasks exhibited the lowest calibration, reflecting the inherent ambiguity and lack of objectively correct answers. Participants reported increased cognitive conflict and reliance on personal values when AI guidance contradicted intuition. In contrast, medical diagnosis and financial forecasting tasks, with more measurable outcomes, facilitated more straightforward recalibration. This suggests that domain characteristics interact with cultural norms to influence trust dynamics, and that designing AI explanations tailored to domain complexity may improve calibration.

Implications for AI System Design

The findings have several practical implications:

1. **Culturally adaptive AI interfaces:** Designers should consider regional and individual differences in trust dynamics. For example, providing explanations and uncertainty cues may help East Asian users recalibrate more quickly.
2. **Dynamic trust monitoring:** Implementing real-time indicators of user–AI alignment could support recalibration, particularly in ethically ambiguous or high-stakes domains.

3. **Training interventions:** Educating users about AI limitations and reliability can promote appropriate trust, especially in domains where overreliance poses safety risks.
4. **Cross-cultural deployment strategies:** Organizations deploying AI globally should account for variations in baseline trust and recalibration speed, avoiding one-size-fits-all trust-building mechanisms.

Theoretical Contributions

This study contributes to theory in several ways:

- **Extending trust calibration research:** By quantifying trial-by-trial trust adjustments using the TCI, we provide a replicable, quantitative framework for assessing dynamic calibration across populations.
- **Integrating culture into human–AI interaction models:** Empirical evidence demonstrates that cultural dimensions such as uncertainty avoidance and power distance systematically influence trust alignment, reinforcing the need to incorporate sociocultural variables into human–AI trust theories.
- **Domain-general validation:** By comparing three distinct decision domains, this work highlights the interplay of domain complexity and cultural factors in shaping trust, offering guidance for generalizable models of human–AI collaboration.

Limitations

Several limitations warrant consideration:

1. **Artificial task settings:** Despite efforts to create realistic decision scenarios, laboratory tasks may not fully capture the stakes and contextual pressures of real-world environments.
2. **Limited cultural representation:** While the study included three major regions, other cultural contexts (e.g., Latin America, Middle East, Africa) were not examined.
3. **Short-term calibration assessment:** Trust recalibration was observed over a single session; longitudinal studies are needed to evaluate sustained calibration over extended interaction periods.
4. **AI reliability manipulation:** The study used controlled accuracy levels, which may differ from the variability of real-world AI systems.

Future Research Directions

Building on these findings, future research should:

- Conduct longitudinal studies to examine how trust calibration evolves over repeated, real-world interactions.
- Expand to broader cultural samples to validate the generalizability of cultural moderation effects.
- Investigate explanation strategies and uncertainty communication to accelerate recalibration in slow-adjusting populations.
- Explore adaptive interfaces that dynamically adjust guidance or transparency based on real-time user trust.

CONCLUSION

This study set out to examine how cultural differences influence trust calibration in human–AI decision support systems (DSS) across multiple domains. By introducing the Trust Calibration Index (TCI) as a dynamic and quantitative measure, we were able to capture the nuanced interplay between user trust, AI reliability, and cultural orientation. Our findings reveal that trust calibration is not a uniform process but is deeply shaped by cultural context. East Asian participants exhibited high initial trust but slower recalibration following AI errors, while North American participants demonstrated lower baseline trust yet faster alignment with AI reliability. Western European participants showed moderate and adaptive trust responses. These cross-cultural differences underscore that trust in AI is mediated by culturally grounded factors such as power distance, uncertainty avoidance, and collectivism–individualism. The study also found that domain characteristics significantly affect calibration, with ethically ambiguous tasks producing the lowest alignment between trust and performance. Moreover, well-calibrated trust correlated strongly with higher decision accuracy and efficiency across all groups, emphasizing the importance of fostering appropriate—not excessive—trust in AI systems. From a practical standpoint, these results highlight the

need for culturally adaptive AI designs that incorporate transparent explanations, uncertainty cues, and adaptive feedback mechanisms to support users' trust recalibration. Organizations deploying AI globally should avoid one-size-fits-all strategies and instead tailor system design and training materials to local trust norms and cognitive preferences. Theoretically, this research extends existing models of human–AI trust by integrating cultural psychology and dynamic measurement approaches, offering a more comprehensive understanding of how trust evolves over time. Methodologically, the TCI provides a replicable tool for future research on dynamic trust adjustment. Future work should explore longitudinal studies of trust calibration over extended use, expand to diverse cultural contexts, and investigate AI-driven adaptive trust mechanisms that respond to users' real-time behavior. In conclusion, the study demonstrates that achieving optimal human–AI collaboration requires more than improving AI accuracy—it requires aligning technology design with human trust dynamics across cultures. By quantifying and contextualizing trust calibration, this research contributes a foundational step toward globally trustworthy and culturally responsive AI systems.

ABSTRACT

The aviation industry is a high-demand and safety-critical sector where employees are expected to maintain strong physical, cognitive, and emotional performance. For female aviation employees, the postpartum transition represents a significant life phase that can alter work capabilities and influence long-term career decisions. This study aims to examine the impact of postpartum challenges on the performance and retention of female employees in the aviation industry. A mixed-method research design was adopted, collecting primary data from 120 postpartum female aviation professionals through structured questionnaires and interviews. Statistical analysis revealed a noticeable decline in performance after returning from maternity leave, particularly in emotional stability, cognitive focus, and work pace. Reduced job efficiency and increased intents to leave were found to be significantly influenced by work-family conflict, sleep disturbance, and postpartum stress. According to the survey, companies who provide childcare assistance, flexible scheduling, extended leave, and sympathetic management techniques see increases in employee retention and satisfaction. The results show that postpartum transition significantly and in multiple ways affects the outcomes of women in the aviation sector. Long-term retention, employee wellness, and performance recovery in the aviation industry depend on strengthening HR support services and creating reintegration plans tailored to the industry.

Keywords: Postpartum Transition, Female Workforce, Aviation Industry, Performance, Retention, Work–Family Conflict, Organizational Support.

INTRODUCTION

High operating demands, strict safety regulations, and a 24 / 7 workforce are characteristics of the aviation sector. Women's contributions in a variety of roles, such as flight crew, ground operations, engineering, and management, have grown in importance as the industry continues to grow internationally. Women in aviation still face distinct difficulties despite progress in gender inclusiveness, especially during significant life events like childbirth and postpartum adjustment. The postpartum transition is a vital stage during which women undergo physical healing, emotional ups and downs, hormonal shifts, and fresh care giving duties. These elements can affect their capacity to manage work responsibilities alongside personal health. For women employed in high-stress, safety-sensitive fields like aviation, this phase frequently introduces heightened challenges such as inconsistent work hours, travel obligations, and restricted options for flexible working conditions. Consequently, postpartum difficulties can adversely affect job performance, productivity, workplace involvement, and overall mental well-being Additionally, systems that support employees in the work place such as maternity leave benefits, childcare options, and compassionate management approaches are crucial for mothers returning to work post-childbirth. Insufficient support can lead to greater stress, diminished job performance, and a higher likelihood of turnover among female staff. As a result, retaining employees has become a significant human resource issue within aviation companies, especially as they aim to keep talented and experienced women in their workforce. Grasping the impact of postpartum transition on female workers is vital for both the career development of women and the maintenance of organizational sustainability within the aviation industry. Current literature emphasizes problems like work-family conflict, postpartum depression, insufficient flexible work arrangements, and the stigma related to maternity leave. Nevertheless, there has been little research focused on how these postpartum-related elements affect performance results and retention choices in aviation settings. This study seeks to examine how postpartum transition affects the performance and retention of female workers in the aviation sector, while recognizing organizational strategies that foster a supportive workplace atmosphere. The results of this research could aid aviation stakeholders in formulating inclusive HR policies, fostering employee well-being, improving job satisfaction, and reinforcing long-term workforce stability.

Problem Statement

Even with the increasing involvement of women in the Aviation Sector, numerous female workers encounter considerable difficulties during the Postpartum adjustment period when resuming their jobs after giving birth. The challenging physical and emotional aspects of postpartum recovery, along with the high-pressure, urgent, and safety-focused nature of aviation work, could negatively affect their job performance. Insufficient organizational support like minimal maternity benefits, absence of flexible hours, inadequate childcare options, and stigmatization at work can exacerbate work-life conflict These difficulties can lead to diminished productivity, decreased engagement, and heightened turnover intentions among postpartum women in the workforce. Nonetheless, there is minimal empirical research that directly investigates how postpartum experiences influence women's performance and retention in the aviation sector. This lack of comprehension prevents aviation organizations from creating efficient HR policies and support systems necessary to maintain a competent female workforce. Consequently, it's essential to investigate the connection between postpartum transition, employee performance, and retention in aviation, as well as to determine the organizational practices necessary for facilitating the successful reintegration of female employees into the work place.

LITERATURE REVIEW

Postpartum transition: psychological and function a limp acts

The postpartum transition is a complex process that encompasses physical recovery, emotional adaptation, and renegotiation of roles as women return to work after giving birth. Research indicates that this timeframe can significantly affect women's health, work ability, and job choices, establishing it as an essential period for exploring performance and retention. Recent systematic reviews emphasize that the return-to-work experience is influenced by

maternal health (such as postpartum depression and fatigue), the needs of the infant, and the demands and resources of the workplace Physical recovery (pain, fatigue, sleep disruption) and mental-health challenges (postpartum depression and anxiety) are strongly associated with reduced concentration, increased absenteeism, and lowered self-rated performance after childbirth. Longitudinal and cross-sectional studies find that postpartum mental health symptoms predict poorer self-rated health and difficulties in the initial months after return, which can translate into measurable declines in productivity and task performance especially in demanding, safety-sensitive roles. A large body of research links work–family conflict following childbirth to increased stress, lower job satisfaction, and elevated turnover intentions. Classic and contemporary studies indicate that when organizational demands clash with care giving responsibilities, returning mothers are more likely to consider leaving the workforce or reduce hours choices that directly affect retention statistics. Meta-analytic and longitudinal evidence also shows that the quality and length of parental leave and access to supportive policies moderate this relationship. Employer supports paid maternity leave, flexible scheduling, phased returns, lactation facilities, child-care support, and mental-health resources consistently emerge as protective factors that improve return-to-work outcomes. Research demonstrates that paid leave is associated with higher rates of continued employment and earlier, healthier returns; flexible arrangements and on-site or subsidized childcare reduce absenteeism and increase retention; and explicit manager support reduces perceived stigma and boosts engagement. Employer investment in postpartum care is increasingly framed as both a wellbeing imperative and a retention strategy. Key gaps remain relevant to your study focus: (a) limited empirical research that explicitly examines postpartum transition effects in aviation-specific samples (pilots, cabin crew, ground operations); (b) a paucity of longitudinal, objective-performance studies linking postpartum physiological/psychological variables to operational performance metrics; (c) inconsistent measurement of "retention" (intention vs. actual turnover) and little consensus on optimal timing/duration for phased returns or role reassignments in safety-critical contexts.

These gaps justify targeted study within aviation to produce actionable HR policy recommendations. Collectively, the literature supports a theoretical model in which postpartum health and caregiving demands interact with workplace resources (policies, manager support, role flexibility) to influence intermediate outcomes (work–family conflict, wellbeing), which in turn affect job performance and retention. For aviation, the model must incorporate regulatory and operational constraints that mediate how supports are implemented. Your study can contribute by testing this model in aviation, using both subjective and objective performance/retention measures, and by evaluating which organizational practices most effectively support mothers without compromising safety or operational readiness. (TORRES, 2024)Paper focused on health and labor economics detailing the "motherhood penalty": increased turnover, delayed promotions, and reduced wages for mothers. While not focused specifically on aviation, it establishes a solid theoretical and empirical connection between postpartum transitions and retention results that can be relevant in aviation settings Examines how motherhood affects women's attitudes, feelings and behaviours at work. While not aviation-specific, the themes align with transition to motherhood and its career effects. (Koskinen, 2024)Qualitative interviews with mothers who fly; investigates issues related to scheduling conflicts, fatigue, breastfeeding/childcare difficulties, and views on employer assistance. Directly related to postpartum transition experiences in an initial population. (Smaller sample yet abundant qualitative information.) (al., 2024)Qualitative research examining pilots' wellbeing; participants indicate family–work conflicts and stressors related to postpartum when relevant. Important to link postpartum transition to security, health, and retention in safety-sensitive positions (al C. e., 2024)Examines gender disparity, wage differences, and advantages for organizations in boosting female participation. Presents both empirical and conceptual reasons that are valuable for explaining the importance of postpartum-friendly policies concerning operational sustainability and employee retention. (al. L. G.-L., 2023)Qualitative study exploring how professional women manage identity work when transitioning into motherhood across global contexts. Focuses more on identity, less on retention or industry-specific outcomes. (Heissel, 2024)Uses detailed longitudinal data (U.S. Marines) to quantify how parenthood (especially for women) affects job-performance, training, promotions. Highly relevant for performance and retention; albeit not aviation industry. (al D. C., 2011)Investigates working mothers post-childbirth, organizational factors, health and subsequent turnover. Relevant to performance and retention (via turnover) in postpartum phase.

Research Gap

Limited industry-specific research (especially aviation)

A significant portion of the literature on returning to work after childbirth is based in general corporate, healthcare, or public-service environments. There are a limited number of thorough studies in fields with distinct operational traits like aviation (unpredictable hours, travel, high-stakes tasks). For instance, a study on breastfeeding among naval aviators revealed that 88% of participants experienced challenges related to the flying conditions. The aviation context includes particular requirements (e.g., shift work, regulations affecting pregnant/returning employees, heightened vigilance and safety demands), so general findings might not apply directly. Thus, there is a lack of clarity regarding how the postpartum transition occurs in aviation roles, the effects on job performance, and the patterns of employee retention.

Objectives

1. To investigate how postpartum transition affects the job performance of female workers in the aviation sector.
2. To examine the connection between postpartum difficulties (physical, mental, and work–family conflict) and the retention of women employees in aviation.
3. To determine the support systems offered by organizations (maternity benefits, adaptable work arrangements, role modifications, childcare support) to female employees in aviation after childbirth.
4. To assess how workplace support impacts performance enhancement and decreases turnover intentions in postpartum aviation workers.
5. To evaluate employee views and experiences concerning returning to aviation positions following childbirth.

RESEARCH METHODOLOGY

Research Design

The research will utilize a descriptive and analytical approach to investigate the impact of postpartum transition on job performance and retention for women working in the aviation sector. Both quantitative and qualitative methods will be employed to obtain more profound understanding of employee experiences and company policies.

Research Approach

A combination of methods will be employed:

Quantitative: To assess performance, obstacles encountered, assistance obtained, and retention plans.

Qualitative: To gather personal experiences, emotional difficulties, and workplace reintegration problems using open-ended questions and interviews.

Population and Sample

- Population: Women working in aviation who have experienced the postpartum phase (crew members, ground personnel, management staff, safety/security personnel, etc.).
- Sampling Method: Deliberate sampling to guarantee the inclusion of employees who have postpartum experience.
- Sample Size: Around 100 respondents for survey data and 10–15 individuals for interviews.

Data Collection Methods

Secondary Data

Aviation regulations, human resources handbooks, scholarly articles, government employment standards, and earlier studies on postpartum employment issues.

Data Analysis and Interpretation

The data collected from 120 postpartum female aviation employees through a structured questionnaire has been analyzed using descriptive statistics and inferential techniques. The objective was to understand how postpartum transition influences performance and retention in aviation workplaces.

Findings of the Study

The research uncovers multiple important insights related to the effects of postpartum transition on the performance and retention of female workers in the aviation sector: Numerous female workers noted a short-term decrease in physical endurance, concentration levels, and task productivity following their return from maternity leave. Safety-sensitive aviation positions, like cabin crew and ground operations, exhibited more significant performance difficulties because of physical and regulatory requirements. Cognitive strain from disrupted sleep and emotional stress impacted decision-making and concentration. Postpartum anxiety, stress, and worries about separation directly affected job commitment and self-assurance. Workers dealing with postpartum depression reported greater burnout and absenteeism risks. Juggling shift responsibilities, travel plans, and childcare led to heightened turnover intentions

CONCLUSION

The postpartum phase signifies an essential transition for women working in aviation, where the responsibilities of childbirth and motherhood merge with the high-stress, safety-focused environment of aviation jobs. The results of this research indicate that postpartum difficulties both mental and physical significantly affect work performance, particularly in positions that demand ongoing vigilance, unpredictable hours, and considerable physical exertion. Work–family conflict was identified as a major factor leading to lower commitment and heightened turnover intention among postpartum workers. In the absence of sufficient childcare resources, adaptable work options, and modifications in roles, numerous women contemplate taking career breaks or leaving their jobs, leading to a loss of talent in the aviation industry. The research additionally emphasizes that organizational backing and managerial comprehension serve as vital facilitators for effective workforce reintegration. Workers who obtain empathy-focused support from managers, organized reintegration initiatives, and available maternity perks show faster performance recovery and enhanced job satisfaction, resulting in better retention. In summary, the study determines that the postpartum period significantly affects the performance and long-term career sustainability of women in aviation. Improving organizational support systems and customizing HR policies for postpartum requirements are crucial for enhancing employee wellbeing, maintaining workforce diversity, and boosting operational efficiency in the aviation sector.

ABSTRACT

Time series forecasting is a crucial task in data analysis, enabling the prediction of future trends and patterns. This paper provides a comprehensive overview of implementing time series forecasting using Python, covering various techniques and libraries. We discuss the implementation of traditional and statistical models, as well as modern machine learning approaches. The paper serves as a practical guide for implementing time series forecasting in Python, providing a foundation for further exploration and application in various fields.

Keywords: Time Series Forecasting, Traditional Models, Machine Learning Approaches.

INTRODUCTION

Time series forecasting - just the mention of it can send shivers down the spines of even the most seasoned data analysts! But trust me, it's not as scary as it sounds. In fact, time series forecasting is an incredibly powerful tool that can help us unravel the mysteries of the past, make sense of the present, and even predict the future. Think about it - every day, we're bombarded with data from all directions. Sensor readings, stock prices, weather patterns, social media trends... the list goes on and on. And hidden within all this noise is a treasure trove of valuable insights, just waiting to be uncovered. That's where time series forecasting comes in. By analyzing these temporal patterns and trends, we can gain a deeper understanding of the underlying dynamics that drive our world. Want to predict the next big stock market crash? Time series forecasting can help. Need to optimize your supply chain to meet fluctuating demand? You guessed it - time series forecasting is the answer. But here's the thing: time series forecasting isn't just about predicting the future. It's also about understanding the past and present. By analyzing historical data, we can identify patterns and anomalies that can inform our decisions today. And by monitoring real-time data, we can respond quickly to changes in the market, the environment, or society. So, how do we do it? Well, that's where Python comes in. As one of the most popular programming languages around, Python has an amazing ecosystem of libraries and tools that make time series forecasting a breeze. From traditional statistical models like ARIMA and exponential smoothing, to modern machine learning approaches like LSTM and Prophet, Python's got you covered. In this paper, we'll take a comprehensive look at the world of time series forecasting using Python. We'll explore the basics of time series analysis, discuss the strengths and weaknesses of different techniques, and dive into the implementation details using popular Python libraries. Whether you're a seasoned data scientist or just starting out, this paper aims to provide a practical guide to getting started with time series forecasting using Python.

Time Series Forecasting

The process of projecting future values of a time series from its historical behaviour is known as time series forecasting. A collection of data points measured at regular intervals, like hourly, daily, weekly, monthly, or annual, is called a time series. In many disciplines, such as business, finance, economics, weather forecasting, and healthcare, time series forecasting is an essential activity. Organisations may enhance their overall performance, optimise resources, and make well-informed decisions by examining and modelling the patterns and trends found in time series data. Time series forecasting techniques can be broadly classified into statistical methods, machine learning methods, and hybrid methods, each with its strengths and limitations.

Python

Python is a high-level, interpreted programming language that is increasingly being used in web development, automation, machine learning, data analysis, scientific computing, artificial intelligence, and more. Python was developed in the late 1980s by Guido van Rossum and is renowned for its readability, versatility, and simplicity. While Python's sophisticated features and vast library make it a popular choice for seasoned developers and data scientists, its simplicity and ease of use make it a great language for novices.

Why Python in Time Series Forecasting?

Python's like the secret sauce for time series forecasting it just makes everything better! Its simplicity and flexibility let us experiment with different models and techniques without getting bogged down in code. Plus, with libraries like pandas, NumPy, and scikit-learn, we've got a whole arsenal of tools at our fingertips. And let's not forget about the community Python's got one of the most active and supportive groups out there, so we're never stuck on a problem for long. Whether we're total newbies or seasoned pros, Python's got our backs. We can easily whip up a quick script to test out a new idea or build a complex forecasting system that'll make our colleagues green with envy. And when we're stuck, just hitting up the Python forums or Reddit, and we'll have a solution in no time. All of this combined makes Python the go-to choice for time series forecasting it's like the ultimate forecasting sidekick! It's the perfect wingman to help us navigate the wild world of time series data and come out on top with accurate predictions and a sense of accomplishment. Plus, with Python, we can focus on the fun stuff like exploring new

datasets, testing out different models, and visualising our results without getting bogged down in tedious coding tasks. By leveraging Python's power, we can unlock new insights, drive business value, and take our forecasting skills to the next level. With its versatility, scalability, and ease of use, Python is the perfect catalyst for our time series forecasting endeavours. As we continue to push the boundaries of what's possible with time series forecasting, Python will undoubtedly remain our trusted companion every step of the way.

Python Toolbox for Time Series Forecasting

Unlock the superpower of time series forecasting! We've complied a curated list of Python libraries. These tools will facilitate the development of accurate models, insightful data visualisations and novel research contributions.

Pandas Your Data Superhero: Pandas is the ultimate data manipulation library. It's ridiculously powerful and makes handling time series data a breeze.

NumPy The Math Magician: NumPy is like a math genius. It's all about efficient numerical computations, which is perfect for time series analysis.

Matplotlib and Seaborn Data Visualization Rockstars: These two libraries are like the dynamic duo of data visualization. They'll help you create stunning visualizations to make sense of your time series data.

Statsmodels The Stats Guru: Statsmodels is like the stats expert in the room. It's got a ton of time series models, from simple to advanced, to help you make sense of your data.

Scikit-learn The Machine Learning Master: Scikit-learn is like the machine learning superhero. It's got a wide range of algorithms for classification, regression, and more, which is perfect for time series forecasting.

TensorFlow and Keras The Deep Learning Dynamos: These two libraries are like the deep learning powerhouses. They'll help you build and train neural networks for time series forecasting.

Prophet The Forecasting Pro: Prophet is like the forecasting expert. It's a open-source software that's specifically designed for time series forecasting.

Time to put our toolbox to work! Next up, we'll show how to harness the power of these libraries to build robust forecasting models. From installation to implementation, we'll guide every step of the way, so we can start building those time series forecasting skills and become rockstar forecasters! We'll start with the basics of data preprocessing and then move on to more advanced topics.

Python Installation and Implementation

Python is a powerful and versatile programming language that has become a cornerstone of data science and scientific computing. To harness its capabilities for time series forecasting, we need to install and set up Python. In this section, we'll explore how to install Python using Google Colab, a free online platform that provides a ready-to-use Python environment. We'll then delve into implementing Python for time series forecasting, covering the essential libraries, data preparation, and modeling techniques.

Installation

Installing Python is a breeze, and we're going to make it even easier by using Google Colab. The good news is that we don't need to install anything on our local machine. Google Colab is a free online platform that lets us write and execute Python code right in our browser. To get started, we simply head to the Google Colab website and sign in with our Google account. Once we're logged in, we click on the "New Notebook" button to create a new notebook. This opens up a blank notebook where we can start writing Python code. Google Colab comes with Python pre-installed, so we don't need to worry about installing anything. We can start importing libraries and writing code right away. Plus, Google Colab offers a ton of free resources, including GPUs and TPUs, which can help speed up our code. So, Google Colab is an awesome way for us to get started with Python without needing to install anything on our local machine.

Importing Libraries

To perform time series forecasting, we need to import various libraries that provide data manipulation, visualization, statistical modeling, machine learning, and deep learning capabilities. The following code imports the necessary libraries to get started with time series forecasting. Libraries (Figure 1)

Implementation

Time series forecasting is a big deal in many industries, from finance to healthcare. To get started, we'll break down three key approaches:

Traditional methods:

We'll kick off with simple, yet effective traditional methods like Naive Approach, Moving Average, and Exponential Smoothing. Traditional Methods (Figure 2). These codes provide a general structure for each method. You can modify and fine-tune them according to your specific requirements.

Statistical Models

Next up, we'll explore statistical models like ARIMA, SARIMA, and Prophet, which bring more accuracy and reliability to the table. Statistical Models (Figure 3). These codes provide a basic structure for each method. Note that these are simplified implementations and might not be as robust or efficient as modern libraries like *stats models* or *pykalman*.

Modern Machine Learning Approaches

Finally, we'll dive into modern machine learning techniques like LSTM, GRU, and CNN, which can uncover complex patterns in time series data. Modern Machine Learning Approaches (Figure 4). These codes provide a basic structure for building LSTM, GRU, and CNN models for time series forecasting. We'll need to adjust the hyper parameters (e.g., `n_units`, `n_epochs`, `n_batch`, `n_filters`, `n_kernel`) based onour specific dataset and problem.

RESULTS

This code calculates the RMSE for each forecasting model and displays the results in a table. We'll need to replace `actual_values` and `forecast_values` with the actual values and forecast values generated by each model.

CONCLUSION

In conclusion, time series forecasting is a game-changer for making informed decisions in various fields. This paper has provided a comprehensive overview of implementing different techniques in Python, from traditional methods to modern machine learning approaches. With this knowledge, we can tackle complex forecasting tasks and uncover hidden patterns in data. Whether predicting stock prices, weather patterns, or demand for a product, these methods enable us to make accurate predictions and stay ahead of the curve. Now, we have a solid foundation to drive insights and inform decisions in our respective domains.

ABSTRACT

According to data from recent research conducted in India, the general prevalence of epilepsy is 3.0-11.9/1,000 population, and the incidence is 0.2-0.6/1,000 population annually[1]. The disease and its management have a significant negative influence on the afflicted person's quality of life, as well as their ability to pursue employment, education, and social recognition. In Ayurveda, the similar presentation is named as 'Apasmara' has been described along with its genesis, symptoms, diagnosis and course of treatment. The basis of available data is the clinical finding only. Aim and Objective: The purpose of this study is to evaluate the effectiveness of Ayurvedic treatment in managing Apasmara WSR-related epilepsy. Setting: Kaumarbhritya- OPD and IPD, Parul Institute of Ayurveda, Parul University, Vadodara, Gujarat, India. Method: the patient having seizure was treated without stopping current AED. Assessment was conducted prior to treatment, during treatment, after treatment and during 1 month of follow-up. Result- Ayurveda treatment shows significant improvement in the managing Apasmara and to enhance the quality of life of the affected one.

Keywords: Apasmara, Epilepsy, Anti-Epileptic Drugs, Ayurveda, Quality of life, Cognition.

INTRODUCTION

The Greek word "Epilepsia," which refers to "seiz," or to be overwhelmed by surprise, is where the term epilepsy originates. Recurrent seizures are a characteristic of epilepsy, a chronic illness that can manifest from sudden attention deficit disorder to persistent convulsions and muscular jerks. Seizures are caused on by abrupt, typically transient, excessive electrical discharges in a cluster of brain cells called neurons. According to *Charaka, Apasmara* represents the *Apagama* of *Smrti* (going away of memory) associated with *Bibhatsa-Chesta* (revolting movements) because of *Dhi* (intellect) and *Sattva* (memory) derangement [1]. *Dalhana* has identified *Apasmara* as the illness that causes *Smriti* (memory) to vanish during an attack[2]. The characteristics are as follows: *Samplava* denotes perversion or *Vibhrama* (confusion), *Bibhatsa Chesta* involves all repulsive expressions, and *Tamah Pravesa* (feeling of entering into darkness) is comparable to *Jnana Abhava* (loss of consciousness/ knowledge), or absence of consciousness. One of the primary causes that children visit healthcare facilities, particularly emergency rooms, is seizures. These conditions can also lead to morbidity and disability in pediatric patients- Cognitive performance, quality of life, difficulties in education, psychological morbidity, and adverse effects from anti-epileptic medications[3]. Seizures have a detrimental impact on the developing brain, particularly during infancy when brain growth is at the highest rate. In the following study, a fourteen-year-old male patient came from Dhule, Maharashtra who had been experiencing seizure episodes from the previous nine years visited the Outpatient Department. After trying alternative treatments and not getting the desired outcome, the patient turned to Ayurvedic medicine. There has been an apparent improvement in epilepsy symptoms with Ayurvedic management.

MATERIALS AND METHODOLOGY

This clinical study is a single-arm intervention that details the case of a fourteen-year-old male patient who had been experiencing symptoms of Apasmara for nine years. Prior to the treatment, the patient provided his informed written consent in his native language. The assessment of the treatment's effectiveness was based on a comparison of his signs and symptoms before and after the intervention.

AIM AND OBJECTIVES

Aim: To assess the efficacy of Ayurvedic treatment in the management of Apasmara WSR to Epilepsy with AED (Anti-Epileptic Drugs).

Objectives

- To improves the cognition and memory in children with epilepsy.
- To improves the quality of life in children with epilepsy.

CASE STUDY

A fourteen years old male patient brought to Kaumarbhritya OPD by his parents, complaining of unable to sit without support, unable to stand and walk without support with gradually manifesting symptoms such as mental agitation and slurred speech since 5-6 years. After consulting with a neurophysician, he got prescribed antiepileptic and muscle relaxant medication. The patient continued to experiencing above said symptoms despite taking medicine on a regular basis. He additionally reported feeling annoyed, inattentive in his surroundings, and lethargic.

History of Present illness

This is a Fourteen year-old male patient presented with a history of recurrent seizures, with the first episode occurring at five years of age. The second seizure episode was noted at nine years of age, which was complicated by status epilepticus lasted for one hour with fell down of the patient. Subsequently, the patient experienced two additional seizure episodes at ten years of age, bringing the total number of documented episodes to four. All reported seizure episodes share consistent semiological features, characterized by bilateral upper and lower limb

rigidity, upward rolling of the eyeballs, and associated unconsciousness. Each seizure event is followed by a post-ictal period lasting approximately one to one and half hours, during which the patient exhibits symptoms of profound sleepiness and vomiting.

Past History

The patient had four episode of seizures. Last seizure experienced at ten years of age.
Family History: Elder brother having history of febrile convulsions
Birth history: FTND, Cry immediately after birth,
H/O NICU admission: No NICU admission
Birth weight: 2.00 kg

Medicinal History

The patient's anti-epileptic drug regimen, which has been continued since his last seizure episode, includes tablet Levetiracetam (500 mg) taken twice a day, tablet Baclof (10 mg) taken three times a day, and tablet Supradyn taken once a day in the afternoon.
Vaccination history: All vaccination according to his age was received.

Developmental History

All milestones are achieved as per age till nine years of age. After the second episode of seizure at nine years of age, regression of all milestones occured.

Clinical Findings

The patient presented as alert with normal sensorium. Their vital signs were stable, with a heart rate of 76 beats per minute, a respiratory rate of 24 per minute, and a blood pressure of 110/70 mmHg. A systemic examination revealed a symmetrical chest with clear breath sounds and no added sounds. The cardiovascular examination showed normal S1 and S2 heart sounds with no murmurs, and the abdomen was soft with no prominent veins or organomegaly.

Central Nervous System Examination

Appearance: Alert, active
Behavior: Normal
Hallucination: No hallucinations
Consciousness: Normal
All cranial nerves: Intact,
Motor system: Unable to sit and stand without support
Sensory system: Not any deformity
Cerebellar signs: Nil
Signs of meningeal irritation: Nil

Therapeutic Intervention

Therapeutic interventions are shown in Table no.1 and 2.

Panchakarma Chikitsa

Panchkarma chikitsa done for three times with one month interval with above mentioned procedures.

Assessment Criteria

The assessments were done before treatment, at the end of 1st month, at the end of 2nd month and after the follow up of one month. It is based on the four parameters. Table no. 3 Assessment

Follow-up and Outcomes: Post treatment changes were noted in respect to sign and symptoms there was significant clinical improvement. Effect of treatment on symptoms of epilepsy and motor function are noted significantly.

RESULTS WITH CHART

Figure no. 1

DISCUSSION

A multi-stage, schematic pharmacological and diagnostic approach is suggested in the most recent International Guidelines and Recommendations for seizure-related diseases, particularly for the treatment of epilepsy and its associated causes in children. With a course of Ayurvedic medication, the patient in this study experienced symptom relief. *Swarna Bhasma, Rajata Bhasma, Sitopaladi churna,* and herbal drugs with anti-inflammatory action, nootropic properties and many other therapeutic effetcs are all included in *Aurokid plus* Tablets.*Swarna Bhasma* has been scientifically proven to have free-radical scavenging activity; in an animal study, it significantly lowers the whole brain AChE activity of both young and old mice when compared to the corresponding control group. It also helps to improve memory and cognition function, which are primarily compromised in epilepsy patients[4]. In previous study, it is proved that gold in nano-size particle has protective effects against Parkinson's disease[5]. They showed that gold nanocluster inhibits the aggregation and fibrosis of α-synuclein in cell culture study(α-Synuclein protofibrils disrupt cellular homeostasis and mediate neuronal death via intracellular targets)[6]. It is thought that the nanoparticles in colloidal gold have an impact on the electrical charges generated in neurons. It enhances the normal synaptic communication that taking place between the neurons. This enhancement is believed to be responsible for the increased brain functions[7] which is affected in most cases of epilepsy. Inhibited prostaglandin synthesis, two epidermal enzymes, acid phosphatase and tryptophangyl t-RNA synthetase, were also inhibited by gold nanoparticles[8] also describes anti-inflammatory action of Swarna bhasma[9].

Swarna Bhasma is Vrishya, Brimhana, Medhya, Hridya, Balya, Rasayan, Vajikarana, Smritiprada, Tridoshaghna, Yogavahi, Chakshusya, Ojovridhhikara etc. by all this karma of *Swarna Bhasma* it acts as a neuroprotective and neuronal regeneration activity is also seen. *Rajata Bhasma* having Anti-inflammatory, Anti-microbial and anti-oxidant[10] activity helps in *Apasmara*. Various karma (actions) of *Rajata Bhasma* mentioned are *Balya, Rasayana, Medhya, Daahahara , Ayushya , Ojo Vardhaka, Vayah sthapaka* etc[11] and by this *karma* it is useful in *Smritinasha, Unmada, Apasmara, Nidranasha, Vatarogas,* etc[12]. . By virtue of its *Smritivardhaka* and *Medhyakara* properties, it might have shown the significant result on Memory Scale subtests. Additionally, it has been claimed that by stimulating the enzymes responsible for producing H 2 S, silver nanoparticles reduce neurotoxicityand inflammation in the brain[13]. All AgNPs concentrations are showing better ABT radical scavenging activity. Further, AgNPs showed effective antibacterial action against both gram negative and gram positive bacteria and anti-proliferative activity toward A549 human lung cancer (CCL-185) and MCF-7 human breast cancer (HTB-22) cell lines[14].

Sitopaladi churna acts as an anti-inflammatory, anti-oxidant, anti-allergic and immuno-modulatory effects. Effect of *Sitopaladi churna* on mast cells degranulation was studied by administering the *churna* in rats is reported. In animal study, Antihistaminic and anti-inflammatory activity of *Sitopaladi churna* extract is also reported[15]. According to the data, Sitopaladi churna reacts with hydrogen donors in extract antioxidant principles, reducing the radical to its corresponding hydrazine[16]. *Saraswatarista* having neuroprotective action[17] and also acts as a vehicle (*Anupana*) for transport of the other drugs to the target organs[18]. *Saraswatarishta* is a capable agent in preventive aspect and management of neuropsychiatric and neurodegenerative conditions[19]. *Saraswatarista* is having the components with actions like *Medhya Rasayana,* antistress, adaptogenic, CNS depressant, hypnotic, anxiolytic, and sedative actions. *Mahakalyanak Ghrita* mentioned in an *Unmada chikitsa* in *Charaka Samhita chikitsasthan*[20]. Since *Mahakalyanak Ghrita* functions as a *Medhya* and is suggested for a number of psychosomatic and psychiatric problems, it is also employed in the treatment of Apasmara. Using *Go-ghrita* as a vehicle, it can pass the blood-brain barrier and exhibits anti-convulsant properties [21]. Blood brain barrier (BBB) has a lipophilic molecular structure, as *Ghrita* contains DHA, an omega 3 long chain polyunsaturated fatty acid, which are high concentration in brain cells too. Ghrita is known to have antioxidant property which acts upon the deteriorating brain cells and repair them[22]. *Ghrita* clears

the *Manovaha strotas* pathways because of its *Deepana* and *Pachana* properties. It is believed that Vata governs the psyche. Regulating the agitated states of the mind is primarily dependent on Vata pacification. Additionally, it improves *Medha* and *Buddhi*(cognitive functions), which helps with cognitive impairment. *Ghrita* is regarded as the best among *chaturvidha Sneha Dravyas (Ghrita, Taila, Vasa,* and *Majja*). It is a *Rasayana Dravya* and promotes memory and Intelligence when consumed regularly[23]. So, likewise all these medicine effects on brain cells to decreases the symptoms of disease.

CONCLUSION

With the use of Ayurvedic medications, the patient has symptom alleviation after 90 days of treatment and shows a considerable improvement in seizure frequency and overall well-being. In summary, this case study emphasizes how Ayurveda may provide adjuvant therapeutic choices for managing epilepsy, emphasizing the value of a holistic strategy that takes consideration of each patient's unique requirements and constitution. When Ayurvedic and conventional medical experts work together, patients with epilepsy can receive improved care as well as a better quality of life.

ABSTRACT

In this quantitative multi-firm field experiment conducted in Bangalore, AI resume screening Identifies whether it raises or lowers the quality of hires and on what conditions of governance. The data are on 1,200 hires among 18 firms that took place from January 2024 through March 2025 and they have been followed up to September 2025, with reports being based on the de-identified hiring and HRIS records. Hire quality is gauged using 6–9-month performance ratings (Perf6), time-to-productivity (TTP), performance at 12 months from start, and manager satisfaction. Primary predictors include fidelity of AIS signals, transparency, fairness auditing and human in the loop (HITL) intensive. Statistical tests comprise descriptive comparisons, t/χ^2 tests, OLS and logistic regression analyses, and moderation models, controlling for role family, tenure in the firm, size of the organization, level of pay tier and applicant-pool quality. AI-assisted pipelines realize higher early performance, faster ramp and greater 12-month retention compared to traditional screening, but the unconditional gaps attenuate after covariate adjustment. Signal fidelity continues to be a strong positive predictor of all outcomes. Governance acts as a moderator: transparency strengthens the link between AI and performance; fair auditing enhances retention; higher HITL intensity shortens TTP and enhances consistency. Governance indexes contribute additional explanatory power over and above signal accuracy. Scaled Remediation: Organizations should invest in signal eng (skills graph, verified project evidence), publish model documentation, regularly conduct fairness audits with remediation, and establish structured human review of borderline rejections. Screening success factors need to become less about flow-through, and instead be about throughput vs.

downstream performance as well as ramp & retention. The study also contributes location-specific, results-based evidence in relation to AI resumé screening (Bangalore) and expressly models governance as a moderator of AI impacts. It provides practical and replicable artifacts, hypotheses, and analysis templates for practitioners and researchers to latter focus on AI-enabled hiring's hire quality.

Keywords: AI Resume Screening, AI-Performance Link, AI Signal Fidelity, Hire Quality, Signal Engineering.

INTRODUCTION

A global center of software engineering, data science, cloud services and product management for us. The Superfast talent need of the city has made many organization to use AI-driven résumé screening to manage high applications, make short listing standardized and reduce the time-to-hire. Supporters maintain that algorithm-based screening drives funnel accuracy and better hires, scaling skills to fit the role. Critics warn that opaqueness leads to historical bias being encoded, an overweighting of superficial resumé signals or the filtering out of non-linear career paths (frequent in tech). Although AI résumé screening is already being widely used, hard evidence of its linkage to hire quality has been scarce within India in general and for technology roles concentrated in Bangalore in particular. Available studies so far have tended to focus on efficiency measures (for example time-to-hire; recruiter workload) rather than downstream measures of quality outcomes (post-hire performance, early attrition, time-to-productivity).This study addresses that gap through a multi-firm, quantitative design focused on measurable outcomes, model governance, and human-in-the-loop (HITL) practices. AI resume screening influences hire quality through two channels(i) signal fidelity (how well the model captures job-relevant skills/experience) and (ii) selection governance (transparency, fairness audits, and recruiter oversight). The study evaluates these channels while controlling for firm size, role seniority, and compensation tier.

REVIEW OF LITERATURE

Adoption drivers. Organizations adopt algorithmic screening to reduce recruiter workload, process large applicant pools, and standardize evaluation. Prior work finds improvements in screening speed and shortlisting consistency when models are trained on structured skill ontologies and validated against on-the-job performance. However, benefits depend on feature quality and governance. Predictive validity and signal fidelity. Studies in talent analytics suggest that structured skill signals (language frameworks, tool stacks, certifications, demonstrable project outputs) show stronger predictive validity for tech roles than coarse résumé features (school tier, GPA alone, brand names). Feature engineering and model calibration are crucial; keyword-only matching inflates false positives and false negatives. Bias and fairness. Evidence shows that models can reproduce historical skews (e.g., over-weighting specific institutions or career paths).Strong practices involve demographic parity testing, adverse-impact ratio examination and counterfactual fairness enquiry and regular drift monitoring. HITL review stage to limit false rejections. Human-in-the-loop and explainability. Hybrid pipelines (AI pre-screening with recruiter review afterward) generally mitigate risk, benefit candidate experience and enhance D&I). Explainability tools that support model governance and recruiter confidence include feature attributions, error analysis. Outcome measures beyond efficiency. Respect the need to tie screening to downstream outcomes, which should be six-month performance rankings, first-year retention, ramp-up speed and manager satisfaction, not just time-to-hire. Evidence is not always consistent, mainly because of differences in contexts, models and measurements. Indian/Bangalore context. India, on the other hand has a lot more candidates in the market to fill your vacancies, high lateral movement and specialisation in roles. "When you look at where companies are, the maturity of their governance is all over," said Goler, ranging from stacks of keyword filters to audited skill-graph models that include fairness checkpoints. Thus, the Bangalore setting is well suited to explore model quality correlates across firms. Synthesis. Skills fidelity may indeed be a key determinant of whether a given model is able to realize quality gains from AI screening within

governance structure that allows for HITL oversight. We contribute to this research by (a) shedding light on Bangalore tech job role positionings; and, also, (b) operationalizing several quality outcomes, as well as (c) accounting for governance's potential moderation.

Statement of the Problem

Organizations in Bangalore increasingly rely on AI résumé screening, yet lack clear, locally grounded evidence on whether such tools improve hire quality and under what governance conditions. Without robust, outcome-linked evaluation, firms risk optimizing for throughput rather than long-term performance and retention. This study empirically examines whether AI screening quality and governance predict post-hire outcomes for tech roles and identifies process levers that matter most.

Objectives of the Study

1. To assess the relationship between AI screening signal fidelity and hire quality outcomes for tech roles in Bangalore.
2. To evaluate the effect of governance practices (transparency, fairness audits, HITL review) on the AI–outcome linkage.
3. To compare time-to-productivity and early attrition between AI-screened and conventionally screened hires.
4. To estimate the incremental predictive power of AI-derived features over conventional résumé filters.
5. To develop actionable process recommendations for improving AI screening pipelines in Bangalore-based tech firms.

Scope of the Study

- Geography: Bangalore urban agglomeration.
- Roles: Software engineering, data engineering/science, DevOps/SRE, product management, QA automation, and security engineering at junior to mid-senior levels.
- Firms: Start-ups (≤250 employees), mid-market (251–2,000), and large enterprises (>2,000).
- Time horizon: Hires made between January 2024 and March 2025 with outcomes observed through September 2025.
- Pipeline segment: AI résumé screening used for initial shortlisting prior to assessments/interviews.

Limitations of the Study

- Firms opting into the study may be more process-mature.
- Performance ratings and productivity ramp metrics differ across organizations despite harmonization.
- Some firms may be unwilling or unable to share detailed model artifacts or fairness diagnostics.
- Observational design with controls and robustness checks; a randomized pipeline trial would offer stronger causal claims.
- Skill profiles and outcome baselines differ by specialty; stratified models mitigate but do not eliminate this issue.

RESEARCH METHODOLOGY

Research Design

A multi-firm, cross-sectional quantitative design with retrospective cohort analysis. The unit of analysis is the hire. For each hire, the study links screening mode and scores to downstream outcomes.

Population and Sample

- Population: Hires into Bangalore-based tech roles across firms using either AI-assisted or conventional screening.
- Sampling frame: Participating firms' HRIS/ATS and talent analytics systems.
- Sampling method: Stratified random sampling by firm size (start-up/mid/large) and role family.
- Target sample size: 1,200 hires (600 AI-screened; 600 conventionally screened) from 18 firms (6 per size stratum).

- Power analysis: With α=0.05, power=0.80, detecting a small-to-moderate effect (Cohen's d≈0.22) on performance ratings between groups requires ≈1,000 observations; 1,200 provides buffer for covariates.

Variables and Measures

Independent/Process variables

- **AI_SignalFidelity (0–100):** Composite of skill-graph match quality, experience-skill alignment, and project evidence weighting.
- **AI_Transparency (0–1):** Availability of model documentation, feature attributions, and candidate feedback channels.
- **AI_FairnessAudit (0–1):** Whether periodic adverse-impact and bias tests are run and acted upon.
- **HITL_Intensity (0–100):** Share of AI rejections reviewed by recruiters plus re-instatement rate.
- **Screening_Mode (0/1):** 1=AI-assisted; 0=conventional.

Outcome variables (Hire Quality)

- **Perf6 (1–5):** Mean of manager and calibration-panel rating at 6–9 months.
- **Retention12 (0/1):** Employed at 12 months.
- **TTP (days):** Time-to-productivity (role-specific threshold defined by team leads).
- **MgrSatisfaction (1–5):** Manager satisfaction with hire fit at month 9.

Controls

- Role Family (categorical),Seniority (junior/mid),Firm Size (start-up/mid/large),Comp Tier (quartiles), Candidate Pool Quality (applicant experience distribution).

Instrumentation and Data Sources

- **ATS/HRIS extraction:** Screening logs, AI scores, funnel progression.
- **Performance repositories:** Normalized 6–9 month ratings and calibration notes.
- **Productivity dashboards:** Ramp metrics tied to role KPIs (e.g., merged PRs, incident handling, model deployments).
- **Governance survey for TA leaders:** 20 items on transparency, fairness audits, and HITL (Likert 1–5), used to compute AI_Transparency,AI_FairnessAudit, and HITL_Intensity.

Reliability and Validity

- **Scale reliability:** Cronbach's alpha ≥0.78 for governance indices.
- **Construct validity:** Factor analysis supports distinct transparency/fairness/HITL dimensions.
- **Criterion validity:** AI_SignalFidelity correlates with technical assessment scores in firms that use both.

Statistical Techniques

- Descriptive statistics and group comparisons (t-test/ANOVA; Mann-Whitney/Kruskal-Wallis if non-normal).
- Multiple linear regression for Perf6 and MgrSatisfaction;Cox regression or OLS for TTP (depending on censoring);logistic regression for Retention12.
- Interaction (moderation) tests:Screening_Mode × (Transparency/Fairness/HITL).
- Robustness: Huber-White SEs, VIF<5, propensity score weighting sensitivity (AI vs. conventional).
- Significance level: α = 0.05 (two-tailed). Effect sizes reported.

Data Analysis and Interpretation (with Hypotheses)

Hypotheses

H1: AI_SignalFidelity positively predicts Perf6, controlling for role, seniority, firm size, compensation tier, and candidate pool quality.

H2:AI_SignalFidelity reduces TTP (faster ramp).
H3: AI_SignalFidelity increases Retention12 odds.
H4: Screening_Mode (AI) associates with higher Perf6 only when governance is strong.
H5:AI Transparency positively moderates the AI effect on Perf6.
H6:AI_FairnessAudit positively moderates the AI effect on Retention12.
H7:HITL_Intensity positively moderates the AI effect on TTP (shorter).
H8: Compared with conventional screening, AI screening reduces variance in early performance (greater consistency).
H9: Governance indices correlate positively with MgrSatisfaction after controlling covariates.
H10: The combined governance composite explains incremental variance in outcomes beyond AI_SignalFidelity ($\Delta R^2>0$).

Descriptive Statistics
Reasonable dispersion suggests adequate variation for regression. AI governance indicators show room for improvement (means near mid-scale).

Group Comparisons (AI vs. Conventional)
Interpretation: AI-screened hires exhibit higher early performance, faster ramp, and higher 12-month retention on average. Lower performance variance supports H8 (greater consistency). These are unconditional differences; regression below adjusts for covariates and governance.

Multivariate Models
Linear Regression: Performance at 6–9 Months (Perf6)
Model
$Perf6 = \beta_0 + \beta_1 \cdot AI_SignalFidelity + \beta_2 \cdot Screening_Mode + \beta_3 \cdot AI_Transparency + \beta_4 \cdot AI_FairnessAudit + \beta_5 \cdot HITL_Intensity + \beta_6 \cdot (Screening_Mode \times AI_Transparency) + \beta_7 \cdot (Screening_Mode \times AI_FairnessAudit) + \beta_8 \cdot (Screening_Mode \times HITL_Intensity) + Controls + \varepsilon$

Interpretation
- **H1 supported:** Higher **AI_SignalFidelity** strongly predicts higher Perf6.
- **H4–H5 supported:** The main effect of Screening_Mode is small, but **Mode×Transparency** is positive and significant, indicating AI's benefit materializes in transparent, well-documented contexts.
- **H7 partially supported:** HITL intensity has a positive main effect and a smaller positive interaction with AI mode.

OLS / Cox: Time-to-Productivity (TTP)
For simplicity, assume TTP is fully observed; OLS is presented.
Interpretation
- **H2 supported:** Higher signal fidelity shortens ramp.
- Screening mode alone is marginal; the **Mode×HITL** interaction indicates that AI combined with stronger human review accelerates ramp.

Logistic Regression: 12-Month Retention (Retention12)
Interpretation:
- **H3 supported:** Higher signal fidelity improves retention odds.
- **H6 supported:** Fairness audits strengthen the AI-retention link.

Incremental Validity of Governance (ΔR^2)
Nested models for Perf6 show $\Delta R^2=0.05$ when adding governance indices and interactions on top of AI_SignalFidelity and controls ($p<0.01$), supporting H10.

Robustness and Diagnostics

- **Multicollinearity:** VIF values below 3 indicate low collinearity.
- **Heteroskedasticity:** Robust SEs used; residual plots acceptable.
- **Common-method bias:** Outcomes sourced from HRIS/performance systems, not the governance survey.
- **Selection bias check:** Propensity weighting for screening mode yields consistent signs and similar magnitudes.
- **Subgroup analyses:** Effects are strongest in SWE/DevOps roles; weaker but positive in PM/QA.

Practical Interpretation

- The quality of AI signals matters more than AI use per se.
- Governance (transparency, fairness audits) and HITL meaningfully amplify AI's benefits.
- Firms using AI without strong governance show small or null gains in quality outcomes relative to conventional screening.

Findings of the Study

1. AI_SignalFidelity is a consistent positive predictor of hire quality across performance, retention, and ramp metrics (supports H1–H3).
2. Governance moderates AI's impact: Transparency strengthens performance outcomes; fairness audits strengthen retention (supports H4–H6).
3. Human-in-the-loop review elevates results, especially for time-to-productivity (partial support for H7).
4. AI pipelines reduce variance in early performance, indicating more consistent hiring outcomes (supports H8).
5. Governance adds explanatory power beyond signal fidelity (supports H10).
6. Benefits are heterogeneous by role; strongest in engineering/DevOps where skills are more explicitly signaled.
7. Unconditional AI-vs-conventional gaps shrink after covariate adjustment, underscoring the importance of model quality and governance over mere adoption.

Suggestions of the Study (Managerial Implications)

i. **Invest in signal fidelity:**

- Use skill graphs tied to current tech stacks; weight recent, verifiable project outputs and open-source contributions.
- Penalize shallow keyword matches; reward demonstrated depth (e.g., PR history, model deployment, incident rotations).

ii. **Strengthen governance:**

- Publish model cards and recruiter-facing documentation; enable candidate explanations/appeals.
- Run quarterly fairness audits with adverse-impact analysis and corrective retraining.

iii. **Adopt structured HITL:**

- Set thresholds where human review is mandatory (borderline scores, non-linear career paths, career returnees).
- Track re-instatement rates to calibrate model thresholds and reduce false negatives.

iv. **Link screening to downstream KPIs:**

- Make Perf6, TTP, and Retention12 the primary success metrics for screening models; report quarterly.
- Close the loop by using on-the-job KPIs for model re-training.

v. **Role-specific tuning:**

- Build specialization-aware models (SWE vs. data vs. DevOps) to reduce signal noise and improve predictive validity.

vi. **Ethics and candidate experience:**

- Provide simple notices about AI use, key decision features, and feedback options; avoid black-box rejection.

vii. **Capability building:**

- Upskill TA and hiring managers on reading model explanations, interpreting fairness dashboards, and spotting drift.

CONCLUSION

This multi-firm quantitative study of Bangalore tech roles indicates that the quality of AI résumé screening—captured by signal fidelity—and the strength of governance are decisive for improving hire quality. AI screening is not a universal upgrade over conventional methods; its advantages emerge when models accurately represent job-relevant skills and are embedded in transparent, fair, and human-aware processes. Organizations seeking durable gains in early performance, retention, and ramp speed should prioritize signal engineering, governance, and HITL oversight rather than mere adoption. Future research should pursue quasi-experimental or randomized pipeline designs, include cost-benefit analyses, and examine long-term career outcomes to complement the twelve-month focus used here.

Appendix A. Measurement Notes (for replication)

- **AI_SignalFidelity (0–100):** Weighted composite from (a) skill-graph alignment, (b) depth of recent project evidence, (c) recency of stack match, (d) verified achievements (e.g., OSS contributions). Weights calibrated by role family with cross-validated predictive checks.
- **AI_Transparency (0–1):** Scored from governance survey items on model card availability, feature attribution access, and candidate communication.
- **AI_FairnessAudit (0–1):** Scored from audit frequency, subgroup metrics tracked, remediation process.
- **HITL_Intensity (0–100):** % of AI rejections sampled by recruiters + re-instatement rate and escalation policy adherence.
- **Perf6:** Harmonized to a 1–5 scale via z-score normalization within firm, then re-scaled.
- **TTP:** Role-defined productivity thresholds validated by managers (e.g., median merged PRs/month for SWE, MTTD/MTTR coverage for SRE).
- **Retention12:** HRIS status at 12 months (1 retained, 0 separated).

Appendix B. Reporting Templates

B1. Table: Reliability of Governance Indices. B2. Table: Correlations

B3. Model Diagnostics Checklist

- Residual normality (Perf6 OLS): Q-Q plots acceptable.
- Heteroskedasticity: Breusch-Pagan $p>0.05$ in baseline; robust SEs used regardless.
- Linearity: Box-Tidwell tests non-significant.
- Influential points: Cook's $D < 0.5$ for all observations.

ABSTRACT

Milk production is a critical component of India's agricultural economy, contributing to rural incomes, nutrition, and employment. Despite Tamil Nadu being a significant dairy producing state, regional variations in production, consumption, and profitability remain underexplored. This study was conducted in five villages of Tirupattur District, Tamil Nadu, using a sample of 300 respondents selected through multi-stage random sampling. Primary data were collected through structured interview schedule in 2024, supported by secondary sources from government reports and scholarly publications. Descriptive statistics and percentage analysis were employed for preliminary insights, while factor analysis and multiple linear regressions were applied to examine the determinants of profitability in dairy farming. Findings revealed considerable inter-village differences in milk production and profits. Karupanur recorded the highest daily milk output, while Aachamangalam farmers achieved the highest monthly profits. Around 52 per cent of milk was retained for household consumption, underscoring its dual role in nutrition and income security. Factor analysis identified two major dimensions production-profit orientation and consumption-distribution orientation explaining 78 per cent of the variance. Regression analysis indicated that milk production, cooperative sales, and local distribution significantly influenced profitability, with local distribution providing the highest marginal returns. The study highlights the socio-economic importance of dairying in rural livelihoods, yet points to challenges such as limited fodder availability, weak infrastructure, and inconsistent government support. Strengthening

cooperative societies, ensuring fair pricing policies, and improving access to veterinary and extension services are essential for sustainable growth. By reinforcing milk production and distribution networks, the dairy sector can act as a catalyst for rural development, women empowerment, and livelihood security in Tamil Nadu

Keywords: Milk Production, dairy farming, consumption and distribution, profitability analysis, rural livelihoods.

INTRODUCTION

Milk is often described as "nature's complete food", supplying high-quality proteins, calcium, vitamins, and micronutrients vital for human growth and health. Beyond its nutritional value, milk production forms the backbone of the global livestock economy, sustaining millions of farming households and shaping rural livelihoods. The global dairy sector has witnessed steady expansion, with world milk production reaching nearly 966 million tonnes in 2023 (FAO, 2024). This growth is projected to continue at around 1.5 to 1.6 per cent annually over the next decade (OECD–FAO, 2024), driven by rising incomes, urbanization, and changing dietary preferences toward protein-rich foods. India stands at the forefront of this transformation. As the largest producer of milk worldwide, India contributes almost one-fourth of total global output. National statistics show that India produced 239.3 million metric tonnes of milk in 2023–24, reflecting a remarkable five-fold increase since 1970 (DAHD, 2024). Per-capita availability has risen to 471 grams per day, significantly higher than the world average of 329–394 grams. This achievement is often credited to the success of Operation Flood, the world's largest dairy development programme, which revolutionized the Indian dairy sector by empowering cooperatives, ensuring farmer participation, and creating a robust supply chain. Despite impressive growth, the sector continues to face deep-rooted challenges. More than two-thirds of milk in India is still handled by the unorganized sector, resulting in concerns over quality, hygiene, and value addition. Feed and fodder shortages with deficits of 11 per cent in green fodder, 23 per cent in dry fodder, and 36 per cent in concentrates (ICAR, 2023)are major barriers to improving yields. Climate change and recurrent animal health issues, such as the recent outbreak of Lumpy Skin Disease, add further risks to productivity. On the global stage, volatility in butter and milk powder prices, along with trade fluctuations, complicates market stability.

Milk production today is not only about feeding populations but also about shaping economic resilience, nutrition security, and environmental sustainability. For India, dairy is the single largest agricultural commodity by value, contributing nearly 30 per cent of agricultural GDP. With demand for dairy products ranging from fresh milk to cheese, yogurt, paneer, and other by-products expected to surge in coming years, the sector is at a critical juncture. Strengthening the value chain, ensuring sustainable production, and adopting innovations in genetics, fodder, and processing will determine the future trajectory of dairy development.Sharma and Singh (2016) studied the trend of per capita milk availability in India from 2014 onward, linking it with nutrition security goals. Their analysis used national consumption datasets, including NSSO surveys, and examined differences between urban and rural households. They found that while per capita milk consumption steadily increased, the gains were disproportionately higher in urban areas due to income effects and better access to packaged milk. The study also highlighted how rising demand for value-added dairy products such as paneer, yogurt, and cheese was reshaping the structure of the dairy sector. They also argued that milk is a crucial source of affordable protein for low-income households, and hence, equitable distribution is essential. Rathod *et.al.* (2016) focused on milk quality and safety issues in the Indian dairy industry, particularly in unorganized markets where adulteration is prevalent. Their research combined laboratory testing of milk samples with interviews of dairy farmers and vendors. The results showed alarming levels of adulterants such as water, detergent, starch, and synthetic chemicals in a significant proportion of unregulated milk sales. These practices were attributed to poor enforcement of food safety laws and a lack of consumer awareness. The authors emphasized the risks to public health, particularly for children and the elderly, who are more vulnerable to contaminated milk. They also noted that the reputation of Indian dairy exports

could suffer if these issues were not addressed. Singh et al. (2024)compared the environmental sustainability of milk production in Punjab and Rajasthan. A life cycle assessment framework was used to assess emissions, water use, and energy consumption. Punjab emerged as more sustainable due to efficient feeding and management systems. Packaging and feed inputs were identified as key hotspots for pollution. Pandey, Mishra &Jha (2024)reviewed India's commercial dairy sector growth over the past decade. They noted India produces nearly 25 per cent of global milk, with steady increases since 2014. Operation Flood and cooperative models remain central to this success. The review emphasized organized dairy's growing role in processing and value addition. It highlighted challenges such as feed shortages and rising costs. Future growth is expected through modernization and technology adoption. The authors suggested long-term planning to sustain farmer incomes. Dharpal, Barse&Kadu (2024)conducted an economic analysis of buffalo based milk production in Maharashtra. It showed milk production as highly profitable with a benefit-cost ratio of 1:2.24. Feed accounted for the highest share of costs, demanding better management. Improved breeds and feeding practices enhanced milk yields and profits. The authors linked dairy to rural women's empowerment and social development. They recommended subsidized feed and veterinary services for producers. The study validated milk production as a tool for poverty reduction. NDDB Report (2023)The National Dairy Development Board highlighted India's organized vs. unorganized distribution. It found only 32 per cent of milk passes through the organized sector. Unorganized players dominate liquid milk and traditional products. Organized cooperatives handle about 56 per cent of processed flows. The review stressed the need for cold-chain infrastructure expansion. It recommended digitization for better traceability and quality. The study showed distribution bottlenecks as a barrier to growth.DAHD Annual Report (2024)The Department of Animal Husbandry & Dairying reported India's per-capita availability trends. Availability rose from 446 g/day in 2021-22 to 471 g/day in 2023-24. It highlighted that 37 per cent of milk is retained at producer level. Only one-third of surplus reaches organized processing. Distribution gaps limit value addition and consumer safety. The report recommended stronger supply chains and chilling facilities. It framed milk distribution as key to farmer-market linkages. Yang et al. (2023)**a**nalyzed adult dairy consumption patterns in China. Intake was much lower than global averages due to lactose intolerance.

Cultural dietary preferences further restricted consumption. Urban residents consumed more dairy than rural populations. Yogurt and fortified milk gained popularity among youth. The authors recommended nutrition education and subsidies. They concluded improved intake could support national health goals. FAO Dairy Market Review (2024)reported that the global dairy price recovery in 2024 led by butter. Production increased modestly but varied regionally. Trade flows were affected by weather and supply shocks. Demand for skim milk powder remained sensitive. Fresh milk demand was stable in Asia and Africa. The review highlighted volatility in global fat and protein markets. It concluded resilience needs stronger policy frameworks. ICAR Fodder Report (2023)reported fodder deficits of 11 per cent in green, 23 per cent in dry, and 36 per cent in concentrates. Feed and fodder account for 60–70 per cent of milk production costs. Shortages limit productivity and milk solids output. Regional imbalances worsen during drought seasons. The report recommended silage and hydroponic fodder adoption. Genetic improvement was also tied to better feed efficiency. The study concluded feed gaps remain a major bottleneck. Parliamentary Report (2023)Government updates confirmed persistent fodder and feed shortfalls. Green fodder shortages often exceed 30 per cent in some states. Dry fodder and concentrate deficits worsen farmer costs. The review stressed the need for fodder banks and seed distribution. Better extension services were recommended. It also noted impacts on milk price stability. The report concluded nutrition is key to future yield growth. DAHD Report on Genetics (2024)the report highlighted expansion of artificial insemination in India. Sexed semen technology was promoted to reduce male calf births. An indigenous genomic chip was launched in 2024 for cattle. These tools aim to improve milk yield and breed quality. Genetic programs link directly with fodder efficiency and health. The review emphasized biosecurity against diseases like LSD. It concluded genetics will modernize the allied dairy sector.This research study therefore seeks to explore the multi-dimensional aspects of milk productionfrom production and per-capita consumption trends to distribution networks, by-product utilization, and allied sector challenges. By synthesizing recent evidence and data, it aims to provide insights into how milk can continue to serve as both a nutritional lifeline and a driver of rural prosperity in the decades to come.

METHODOLOGY

Experimental Design

The present study is based on primary data. The primary data collected from milk producers and agricultural labourers in Tamil Nadu. Partially the study was based on secondary data. The Tamil Nadu state has been separated in its seven agro-climatic zones. Tamil Nadu is a eleventh largest state in India by area. The Tirupattur district comes under North Eastern Districts of Tamil Nadu. It is a new born district from Vellore district. It consists of two revenue divisions, Tirupattur and Vaniyambadi, four taluks i.e., Tirupattur, Natrampalli, Vaniyambadi and Ambur is industrial denced area when compare to Tirupattur and Natrampalli. Multi-stage random sampling procedure was employed under district, taluks and villages. Five villages namely, Achamangalam, Karuppanur, Bommikuppam, and Annandapatti and Thiniyalam were selected in Tirupattur block randomly on the basis of agriculture and animal husbandry. To collect the primary data, the researcher selected Atchamangalam, Karuppanur, Bommikuppan, Annadapatti and Thiniyalam villages were selected in Tirupattur District of Tamil Nadu. These five villages come under the Gram Panchayats with the population of more than 4925people consisting of 1,308 males and 3,617 females. These villages are surrounded by hills and hill base with green cultivation of millets and necessary agricultural cultivation surrounded by small temples on the base of the hills. A water falls also famous near to these villages named as Jalagamparai with full of herbal water and breezes in these hilly villages are the small identifications in these study areas. Due to its geographical location, these villages receive plenty of water during the rainy seasons and due to dam and lakes. Owing to the over availability of natural resources in these villages, animal husbandry and dairy farming are the major source of income to these village people. The researcher used the descriptive and analytical design. The primary data were collected from 300 respondents using interview schedule during month of January 2024. Research design employed here is descriptive analysis since this design describes the characteristics of individuals with behaviour and their individual attitudes which would allow the researchers to complete the research without any errors. This study employed a multi-stage random sampling and 300 respondents were selected who are involved in the animal husbandry and diary production. To collect primary data a well-structured interview scheduled was framed to fulfill the objectives of the study. The secondary data were collected through newspapers, journals, books and web resources.

Analytical Framework

The production and utilization of milk and milk products were calculated using simple averages and percentage method for each category of every sampled unit. This study projected the utilization pattern of milk, milk products, animal husbandry and distribution of animals across the sample households. This study has been adopted factor analysis and multiple linear regressions for making analysis.

RESULTS AND DISCUSSION

Production and Utilization Details of Milk and Milk Products among the Respondents Households

The socio-economic details of the sample respondents represented in Table 1. The primary data were collected from the 300 sample respondents from all the villages. Most of the respondents (60 per cent) comes under the age group of 30-40 especially in Karuppanur village followed by (55 per cent) under the age group of 40-50 in Achamangalam village. Regarding the gender details nearly 73.33 per cent of the respondents are males especially in Bommikuppam village. Because the village is getting sufficient water resource from herbal waterfalls named as 'Ezhuaruvi.' This may be a reason for maximum involvement in animal husbandry and milk production. Regarding the community details of the respondents most of the respondents (75 per cent) comes under the category of Most Backward Class (MBC) in Achamangalam village. Basically the district is dominated by SC population. Regarding the educational qualification majority of the respondents were studied up to high level (66.67 per cent) in Karuppanur village. When compare the educational qualification the maximum of 66.67 per cent of the respondents were studied up to high level of education in Karuppanur. In Achamangalam, nearly 46.67 per cent of the respondents were studied up to middle level of education. Only 3 to 5 per cent of the respondents were post graduates in Karuppanur and Achamangalam.

In Thiniyalam village nearly 53.34 per cent of the respondents were comes under the age group of 30-40. In the same village 73.34 per cent of the female respondents involved in animal husbandry based actives. When we look at the data people did not concentrate much on education. The data on milk production and profit levels represented in Table 2, Fig. 1 and 2. From the five villages, Aachamangalam, Karupanur, Bommikuppam, Aanandapatti, and Thiniyalam show a significant variation in output and earnings through animal husbandry. In terms of milk production, Karupanur leads with the highest daily production of 55 litres, followed closely by Aachamangalam and Bommikuppam with 50 litres each. Aanandapatti and Thiniyalam lag behind with 30 and 35 litres respectively. The average milk production across all villages stands at 19.4 litres per day, indicating a modest overall output. When considering monthly profits from animal husbandry, Aachamangalam shows the highest profitability, with farmers earning up to ₹40,000 per month, while Karupanur and Aanandapatti reach up to `20,000. The other villages, Bommikuppam and Thiniyalam, earn lower maximum profits, at `15,000 and `12,000 respectively. The average monthly profit across all villages is `3,420, showing that while some individuals achieve high incomes, the majority earn modest amounts. The lowest reported monthly profits range between `500 to `1,000, highlighting the economic vulnerability for many farmers depending solely on animal husbandry. Regarding milk usage for domestic purposes, about 52.33 per cent of households across the five villages use a portion of the milk they produce for their own consumption. Aachamangalam shows the highest domestic usage rate at 66.67 per cent, whereas in Karupanur and Aanandapatti, a majority of the milk is not used domestically but likely sold for income. The average domestic consumption of milk across villages varies widely; Thiniyalam stands out with the highest average consumption at 38 to 40 litres, while in other villages like Aachamangalam and Karupanur, average domestic use is significantly lower, around 3.5 to 5 litres. When it comes to the distribution of milk, local people are the major consumers, accounting for 48.67 per cent of total milk distribution. Notably, Aanandapatti shows the highest share of local distribution at 66.67 per cent, while Karupanur and Thiniyalam rely heavily on co-operative societies, each with 56.67 per cent of their milk distributed through this channel. Some villages like Bommikuppam also engage private milk collection centres and tea shops to a small extent, but overall, private centres and tea shops play a relatively minor role, with only 6.67 per cent and 3 per cent distribution respectively. While milk production and profit levels are encouraging in villages like Aachamangalam and Karupanur, there is considerable variability among the villages in terms of domestic milk consumption patterns and marketing strategies. The reliance on local consumers and co-operative societies remains crucial for the livelihoods of these farmers, with private collection centres and tea shops serving as supplementary outlets.

The data regarding involvement in animal husbandry and awareness on government schemes represented in Table 3. Across the villages namely, Aachamangalam, Karupanur, Bommikuppam, Aanandapatti, and Thiniyalam highlights significant disparities. In terms of receiving animals from government schemes, Aachamangalam (38.33 per cent) and Karupanur (35 per cent) report the highest access, showing that more than one-third of the respondents in these villages benefited from government-provided livestock. Aanandapatti has a much lower level of support, with only 15 per cent of the farmers receiving animals. On the other hand, both Bommikuppam and Thiniyalam recorded no beneficiaries (0 per cent), indicating a complete lack of government assistance in livestock distribution in these villages. When it comes to awareness about government schemes, Aachamangalam once again leads, with 41.67 per cent of respondents aware of available programs, followed by Aanandapatti at 38.33 per cent. Awareness levels drop sharply in Karupanur (10 per cent) and Thiniyalam (1.67 per cent), while Bommikuppam shows no awareness at all (0 per cent). The high lack of awareness in Bommikuppam and Thiniyalam correlates with the fact that no respondents from these villages received any animals from the government. Overall, the data reveals that the success of government schemes in promoting animal husbandry depends heavily on both availability and awareness. Villages like Aachamangalam and Aanandapatti have moderately benefited, while villages like Bommikuppam and Thiniyalam remain marginalized, highlighting a pressing need for better outreach, communication, and program implementation in these areas. The Table 4 presented the data on the improved standard of living through animal husbandry across five villages namely Aachamangalam, Karupanur, Bommikuppam, Aanantappatti and Thiniyalam. Among them, Bommikuppam shows the most significant impact in terms of high earnings, with 51.67 per cent of respondents reported income improvement due to animal husbandry. In contrast, villages like Karupanur and Thiniyalam reported very low earnings improvement, indicating that animal husbandry has not been a major income

source there. In terms of housing development, Aachamangalam leads with 63.33 per cent of households constructing their own homes, suggesting that animal husbandry income has contributed to improved living conditions. Other villages like Karupanur and Thiniyalam also show some improvements, though at a much lower scale. When it comes to educational benefits for children, Thiniyalam stands out, with 28.33 per cent of respondents acknowledging improved access to education through income from animal husbandry. In contrast, Karupanur shows no impact in this area. The data on savings indicates that Thiniyalam again performs better than other villages, with 23.33 per cent of respondents managing to save, whereas Bommikuppam reported no savings at all. Reduction in borrowings is relatively low across all villages, but Karupanur and Aanantappatti have slightly better outcomes. In terms of loan repayment, Karupanur emerges as the most successful, with 61.67 per cent of respondents using their earnings to repay agricultural loans, followed by Aanantappatti with 33.33 per cent. Thiniyalam reported no loan repayment at all, possibly due to lack of loans or the inability to repay.Participation in awareness programs like meetings on animal husbandry also varies significantly. Thiniyalam has the highest attendance (53.33 per cent), which may explain its relatively better performance in areas like education and savings. Karupanur has a moderate level of participation (30 per cent), while Bommikuppam and Aanantappatti recorded no participation, which could be a factor behind their weaker performance in some key areas. Overall, while some villages like Thiniyalam and Karupanur show progress in particular areas, the benefits of animal husbandry as a tool for improving living standards are unevenly distributed across these five villages.

Table 5 shows the details of factor analysis. It reveals that the two distinct orientations in the study area: Factor 1 (Production & Profit Orientation)**,** explaining 46 per cent of variance, is strongly associated with higher milk output and profitability, with villages like Achamangalam and Karupanur (44 litres/day each) showing a clear commercial focus on large-scale production and income generation; while Factor 2(Consumption & Distribution Orientation)**,** explaining 32 per cent of variance, relates to domestic use and local distribution, where villages such as Thiniyalam and Anandapatti depend more on household consumption and community-level channels rather than commercial profit. Together, these two factors explain 78 per cent of the total variance, indicating that milk production in the region reflects a dual structure of commercially oriented villagesversussubsistence-oriented villages, highlighting the need for differentiated support strategies that balance profit-driven growth with household food security. Factor 1 (Production & Profit Orientation) Villages likeAchamangalam (44L avg)andKarupanur (44L avg)load highly here, showing strong focus on commercial milk production and profit generation**.** Factor 2 (Consumption & Distribution Orientation):Villages like Thiniyalam and Anandapatti**,** with relatively lower milk production but higher domestic use and reliance on local distribution, load more on this factor.

Determinants of Profitability

Table 6 shows the regression analysis ($R^2 = 0.84$). It shows that 84 per cent of variations in profit can be explained by milk production, consumption, and distribution channels. Key findings are Milk Production ($\beta = 272.40$, $p = 0.041$)strongly and significantly increases profitability. Each additional litre of milk produced contributes about `272 to monthly profit.Domestic Consumption ($\beta = -125.67$, $p = 0.168$)negatively associated, though not statistically significant. Higher self-consumption reduces the amount available for sale, thereby lowering income**.** Co-operative Share ($\beta = 310.25$, $p = 0.043$)positively and significantly contributes to profitability, as cooperatives provide assured markets and fair prices.Local Distribution ($\beta = 425.80$, $p = 0.031$)the strongest predictor of profitability. Selling directly to local people fetches better returns due to the absence of middlemen.The study highlights that milk production and marketing channels are the most decisive factors for profitability in dairy farming. Villages with higher cooperative participation and stronger local demand enjoy greater economic benefits. However, high domestic consumption in certain villages limits marketable surplus. The findings suggest that strengthening cooperative structures, improving access to private markets, and encouraging surplus milk sales could significantly enhance rural incomes.

Major Findings and suggestions

The study analyzed milk production, domestic consumption, distribution channels, and profitability across five villages: Aachamangalam, Karupanur, Bommikuppam, Anandapatti, and Thiniyalam. The findings reveal important

dynamics in the dairy sector and their implications for rural livelihoods.Daily milk production showed considerable variation across villages. Karupanur recorded the highest average household production (55 litres), while Thiniyalam reported the lowest (15 litres). The overall average across the study area was 19.4 litres per household. Higher production in Karupanur and Bommikuppam can be attributed to better cattle maintenance and availability of fodder, while low levels in Thiniyalam suggest limited resources and smaller herd size. Monthly profits from dairy farming revealed that Aachamangalamhouseholds earned the highest average (`15,167), while Thiniyalam lagged behind (`5,933). The overall average profit across villages was `7,866 per household. Interestingly, higher production did not always guarantee higher profits, indicating the influence of input costs, access to markets, and distribution patterns. For instance, Anandapatti, despite moderate production, achieved relatively higher profitability due to better market linkages.Milk consumption patterns showed that 52.3 per cent of households used milk for domestic purposes, while 47.7 per cent sold the majority of their production. Average household consumption stood at 9.7 litres per day, with Thiniyalam reporting the highest (28 litres), suggesting cultural and nutritional preferences. However, households with high self-consumption had a lower marketable surplus, which negatively impacted profit levels.Distribution indicated that 48.7 per cent of milk was sold directly to local people, 41.7 per cent through cooperative societies, and 6.7 per cent via private collection centers, while only 3 per cent was supplied to tea shops. The dominance of local distribution highlights strong informal market linkages, while cooperatives continue to serve as reliable institutional channels, ensuring steady income for farmers.

The multiple regression model explained 84 per cent of the variation in profitability ($R^2 = 0.84$). Milk production ($\beta = 272.40$, $p = 0.041$), cooperative participation ($\beta = 310.25$, $p = 0.043$), and local sales ($\beta = 425.80$, $p = 0.031$) emerged as significant positive predictors of income. Conversely, domestic consumption was negatively associated with profit ($\beta = -125.67$, $p = 0.168$), though the effect was not statistically significant. The results suggest that while milk production remains the primary driver of profitability, the role of distribution channels is equally critical. Farmers engaged in cooperatives and local markets achieve higher profits due to assured sales and reduced transaction costs. On the other hand, excessive domestic consumption reduces the marketable surplus, thereby constraining income generation. These findings underscore the importance of strengthening dairy cooperatives, improving market infrastructure, and educating farmers about balancing household use with market-oriented production. Some general observations and findings are Increased Rural Participation: Post-pandemic, there has been a significant rise in rural population involvement in animal husbandry and milk production as a stable and sustainable livelihood. Stable Income Source: These activities have consistently yielded profits for rural households, providing them with a reliable income and economic resilience even during crisis periods like the pandemic. Preference for Cooperative Systems: The majority of milk producers prefer selling through cooperative societies and local distribution systems due to better pricing and accessibility. Jan DhanYojana Implementation: All involved rural beneficiaries have access to personal bank accounts, facilitating financial inclusion and secure savings from dairy income. Need for Government Intervention in Pricing: The project identified the urgent need for a uniform government-fixed milk price to prevent disparity among milk collection centers. Call for New Schemes: Recommendations include launching new government schemes for organized milk collection and structured distribution networks. Promotion of Dairying in High-Potential Areas: Targeted efforts are underway to promote dairying in areas with high potential for increased milk output. Gap in Post-Production Infrastructure: The project highlights a critical gap in post-production milk handling, storage, and processing infrastructure. Declining Milk Consumption: A concerning drop in milk consumption was observed, attributed to increasing prices and reduced purchasing power among consumers. Recommendations for Small-Scale Producer Cooperatives: The project suggests empowering local farmers to form producer-processor cooperatives to boost income and ensure quality control. Strategic Milk Collection Points: Emphasis was placed on the need to collect and process milk at strategic points to reduce spoilage due to milk's perishability and weight. Cost-Effective Production Models: Development and promotion of cost-effective dairy processing methods to ensure affordable dairy products for the masses. Call for Subsidies: The project recommends government subsidies to support new entrepreneurs in starting dairy and animal husbandry units. Revenue Generation Potential: With the right support systems, the sector can significantly contribute to both rural development and national revenue generation. Promotion and Marketing Initiatives Needed: It was found that strategic promotion and awareness campaigns are necessary to enhance consumer demand and market reach.

Livelihood Security: The project reinforces that animal husbandry and milk production are dependable livelihood options that help reduce rural unemployment. Sustainable Economic Model: These sectors are less prone to market crashes, ensuring a resilient and sustainable model for rural economic development. Women Empowerment Potential: Though not explicitly mentioned, the dairy sector traditionally enables active participation of rural women, hinting at possible empowerment outcomes. Encouragement of Self-Sufficiency: Encourages rural households to become self-sufficient by integrating animal husbandry into their daily lives. Holistic Rural Development: Overall, the project contributes significantly to the holistic development of rural areas by combining economic stability, employment, and community cooperation.

ACKNOWLEDGEMENTS

The author thank the Management of Sacred Heart College (Autonomous), Tirupattur-635601, Tamil Nadu, India for their financial support and encouragement through Don Bosco Research Grant from 2023-2025 (SHC/DB Grant/2023/05).

ABSTRACT

As concerns about the environment have grown in prominence across the globe, "green marketing" has become an important tactic for companies to employ. "Assessing Consumer Behavior and Perception Towards Green Marketing: An Analytical Study of Bengaluru Rural District" is an analytical study that seeks to assess the reactions and perceptions of green marketing initiatives among Bengaluru Rural District customers. Among the main goals is the identification of important demographic variables impacting the adoption of eco-friendly goods, and also to understand the mindset and actions of consumers. Learning how consumers' understanding, opinions, and experiences, and actions connect to environmentally friendly product purchases. A cross-section of consumers from various demographics will have the main information gathered via a predetermined survey. With the use of descriptive statistics, correlation, and regression methods, we will examine the data for trends and interrelationships. What role do customers' perceptions of brand image, perceived product benefits, and environmental concerns play in their green purchasing decisions? In addition to illuminating holes in the present state of marketing, the study will provide concrete suggestions on how businesses in Bengaluru might better target rural residents with environmentally friendly campaigns. In essence, the findings of this study provide important information for legislators, academics, and companies who are concerned about the environment and want to encourage more responsible consumption habits among their customers.

Keywords: Green Marketing; Consumer Behavior; Consumer Perception; Eco-Friendly Products; Environmental Awareness; Sustainable Consumption

INTRODUCTION

A new global economic landscape has emerged in response to rising concerns about environmental degradation, climate change, and resource depletion. A growing number of businesses are embracing "green marketing," an approach to advertising that takes environmental concerns into account. When businesses advertise goods as well as services that cause less damage to the planet, use less energy, are recyclable, or made in a sustainable way, they are engaging in green marketing. Not only will it satisfy customers' demands, but it will also protect ecological system so that future generations can enjoy it. A combination of factors, reflecting the increasing concern for environmental issues among consumers, sustainability-focused government programs, and CSR regulations, has given green marketing a boost in India. More and more, shoppers are thinking about how their purchases affect the environment, and they're gravitating toward greener options. But across geographies, financial brackets, and demographic categories, there is a wide range in the amount of knowledge, perception, and real purchasing behavior regarding environmentally friendly products. As a fascinating backdrop for studying consumer behavior towards green marketing, Bengaluru Rural District offers a unique blend of semi-urban and rural communities. Rural areas nevertheless hold on to traditional values and price-sensitive purchasing habits, while being close to Bengaluru City, which exposes customers to new marketing trends. Marketers can develop more effective and long-lasting strategies by learning how customers in this area react to environmentally friendly items and how they interpret green marketing messaging. Using variables including customer knowledge, attitudes, demographic impacts, and purchase intents, this study seeks to evaluate consumer behavior and perception towards environmentally friendly marketing in Bengaluru Rural District. In order to better engage consumers, this study aims to assess the efficacy of current green marketing tactics and suggest solutions. This study adds to our knowledge of sustainable consumerism by delving into the connection between consumers' perceptions and actions. It also provides useful information for marketers and lawmakers who are working to encourage environmental responsibility among the general public.

Literature Review

Green marketing has emerged as an essential dimension of modern business practices, emphasizing environmental sustainability and social responsibility. According to Polonsky (2011), Eco-friendly product development and advertising is known as "green marketing.", aiming to satisfy consumer needs while minimizing environmental harm. The shift from conventional marketing to green initiatives has been driven by rising consumer awareness and global environmental concerns (Peattie & Crane, 2005). Consumer behavior towards eco-friendly advertising is shaped by various psychological, social, and demographic factors. Rahbar and Wahid (2011) highlighted that environmental knowledge and eco-label credibility significantly affect consumers' green product purchase intentions. Similarly, Mostafa (2007) observed Key determinants of green purchasing behavior in developing economies include environmental concern and perceived consumer effectiveness. Studies by Biswas and Roy (2015) revealed that urban Indian consumers demonstrate a growing preference for eco-friendly products, although price sensitivity remains a major constraint. Joshi and Rahman (2015) noted that despite increased awareness, a significant gap exists the attitude-behavior gap, which occurs when customers' real purchasing behavior differs with their stated environmental attitudes. It is clear that raising awareness is not enough to motivate sustainable consumption on its own. Demographic personality traits are also important crucial role in shaping green consumer behavior. D'Souza *et al.* (2006) found that education level and income positively influence sustainable consumption and environmental consciousness. In contrast, Han *et al.* (2010) emphasized that younger people are inclined to purchase products that are better for the environment. due to exposure to environmental education and social media campaigns. Perception of green marketing messages determines how consumers interpret environmental claims. Chen and Chang (2013) argued that perceived brand environmental performance significantly enhances brand trust and loyalty among green consumers. Similarly, Leonidou *et al.* (2011) suggested that credible communication and eco-label transparency improve consumer perception and increase purchase likelihood. In the Indian context, Maheshwari (2014) found that consumer awareness of green products is rising, but affordability and limited product availability hinder mass adoption. Saxena and Khandelwal (2012) reported that consumers in rural and semi-urban areas exhibit cautious behavior toward green products due to limited information and skepticism regarding environmental claims.

Recent studies indicate a paradigm shift toward sustainable consumption among younger generations. Laroche *et al.* (2001) discovered that buyers with greater incomes, levels of education, and shorter age groups are more responsive to green marketing initiatives. In a similar vein, Yadav and Pathak (2016) identified worries about the environment, personal standards, and the sense of agency in one's actions as key determinants of green purchase intentions among Indian youth. The effectiveness of green marketing strategies depends largely on how well they align with consumer values and local socio-economic conditions. Chen *et al.* (2020) demonstrated that integrating emotional appeal and sustainability information in marketing communication enhances consumer engagement and brand loyalty. Furthermore, Goh and Balaji (2016) emphasized that digital media and social influence play a vital role in shaping consumer perception and spreading green awareness. Overall, the literature suggests that green marketing success depends on the interplay between consumer awareness, perception, demographic factors, and the credibility of marketing messages. However, research focusing on semi-urban and rural contexts, such as Bengaluru Rural District, is still really little. This study seeks to address such disparity. by exploring how consumers in this region perceive and respond to green marketing initiatives, offering practical insights for marketers to tailor sustainable strategies effectively.

Objectives of the Study

1. The goal of this study is to determine how well green marketing campaigns in Bengaluru Rural District affected customers' knowledge, attitudes, and actions.
2. In order to discover how people feel about sustainable marketing and environmentally friendly products.
3. The goal is to determine what variables are most important for consumers when making purchases of environmentally friendly items.
4. Determine how different demographics in the research region influence green marketing strategies and how consumers respond.
5. To help marketers improve their green marketing strategies and increase their success with rural consumers

Hypotheses

Hypothesis 1:

- **H_{01}:**Green marketing tactics do not appear to have any discernible effect on Bengaluru Rural District consumers' spending habits.
- **H_{11}:**In Bengaluru Rural District, there is a strong correlation between environmentally conscious marketing practices and the actions of consumers..

Hypothesis 2:

- **H_{02}:** Consumer perception and attitude towards things that are environmentally friendly do not have a substantial impact on their propensity to buy such things..
- **H_{12}:** Consumer perception and attitude towards eco-friendly products significantly influence their intention to purchase green products.

Hypothesis 3:

- **H_{03}:** Factors such as environmental concern, price sensitivity, and brand trust do not significantly influence consumers' green product purchase decisions.
- **H_{13}:** Factors such as environmental concern, price sensitivity, and brand trust significantly persuade shoppers to buy environmentally friendly products.

Hypothesis 4:

- **H_{04}:**When broken down by age, gender, income, and education level, consumer behavior towards green marketing remains mostly unchanged.
- **H_{14}:**Consumers' attitudes and actions towards environmentally friendly advertising vary considerably by age, gender, income bracket, and degree of education.

Hypothesis 5:

- **H_{05}:** Effective green marketing practices do not lead to higher consumer acceptance and satisfaction toward green products.

- **H_{15}:** Effective green marketing practices lead to higher consumer acceptance and satisfaction toward green products.

RESEARCH METHODOLOGY

This study looks at how people in Bengaluru Rural District react to and think about green marketing. It uses both descriptive and analytical research methods. The study is quantitative in character and uses first-hand accounts via a standardized questionnaire with a five-point Likert scale to assess consumers' knowledge, attitudes, and actions towards environmentally friendly items. The researchers used a stratified random sample technique to guarantee a balanced representation of taluks and demographic variables including gender, age, income, and level of education. The study's sample size is 130 people, all of whom are either familiar with or have some exposure to green-marketed products. Devanahalli, Doddaballapur, Nelamangala, and Hoskote are some of the important areas included in the study area. We supplemented primary data with secondary data culled from reputable web sources, books, and journals. Using this methodology, the researcher was able to collect data that shed light on the variables impacting sustainable consumer behavior, including demographic differences and the factors influencing consumers' attitudes and purchasing decisions in relation to green marketing.

Data Analysis and Interpretation

1. Reliability Test

Before proceeding with hypothesis testing, the internal consistency of the questionnaire was assessed using Cronbach's Alpha Interpretation: A Cronbach's Alpha value of 0.872 indicates a high level of reliability and internal consistency among the items in the questionnaire, as values above 0.7 are considered acceptable (Nunnally, 1978).

2. Descriptive Statistics of Key Variables

Interpretation:

The mean scores indicate that respondents in Bengaluru Rural District are environmentally aware and have positive perceptions of green marketing initiatives. However, the relatively lower mean for purchase intention suggests a gap between awareness and actual buying behavior.

3. Correlation Analysis

To test H_1 (relationship between green marketing strategies and consumer purchase behavior), Pearson's correlation coefficient was applied.Interpretation: Green marketing methods and customer purchase behavior are strongly correlated ($r = 0.684$, $p < 0.01$). It follows that H_{11} is the correct alternative hypothesis and H_{01} is the null hypothesis.

4. Regression Analysis

To test H_2 and H_3, multiple regression analysis was conducted to examine the impact of consumer perception, environmental concern, price sensitivity, and brand trust on purchase behavior. Interpretation: The model is statistically significant ($p < 0.001$) with 62.7% variance explained ($R^2 = 0.627$) in purchase behavior. Consumer perception, environmental concern, and brand trust positively and significantly influence purchase behavior, while price sensitivity shows a negative influence. Thus, H_{12} and H_{13} are accepted.

5. ANOVA Test – Demographic Differences

To test H_4, ANOVA was conducted to determine if significant differences exist in consumer behavior across demographic variables. Interpretation: There are significant differences in consumer behavior across age, income, and education, but not across gender. This implies that demographic factors influence consumer perception and purchase decisions. Hence, H_{14} is partially accepted.

6. Overall Relationship Between Green Marketing and Consumer Satisfaction

To test H_5, correlation analysis was applied between effective green marketing practices and consumer satisfaction. Interpretation: There exists a strong positive correlation ($r = 0.721$, $p < 0.01$) between effective green marketing and consumer satisfaction. This confirms that successful green initiatives improve consumer trust and loyalty. Therefore, H_{15} is accepted.

Summary of Hypothesis Testing

Findings

1.**High Reliability of the Instrument:**

The reliability test revealed that the measured variables were quite consistent with one another, with a Cronbach's Alpha value of 0.872. This proves that the survey was a valid and trustworthy tool for gathering data.

2.**Strong Awareness of Green Marketing:**

Descriptive statistics revealed that respondents in Bengaluru Rural District demonstrated a high level of awareness (Mean = 4.12) and a positive perception (Mean = 3.98) towards eco-friendly and sustainable marketing practices. However, the purchase intention (Mean = 3.85) was slightly lower, indicating that while consumers are informed, not all are consistent in translating awareness into actual purchase behavior.

3.**Significant Relationship Between Green Marketing Strategies and Purchase Behavior:**

Correlation results ($r = 0.684$, $p < 0.01$) confirmed a strong positive relationship between green marketing initiatives and consumer purchase behavior. This shows that effective marketing campaigns emphasizing sustainability can directly influence consumer buying decisions.

4.**Influence of Key Determinants on Purchase Behavior:**

Regression analysis indicated that consumer perception ($\beta = 0.412$), environmental concern ($\beta = 0.324$), and brand trust ($\beta = 0.289$) had a significant positive effect on purchase behavior, whereas price sensitivity ($\beta = -0.176$) had a negative impact. This finding suggests that while consumers value eco-friendly attributes, affordability remains a critical deciding factor.

5.**Demographic Variations Exist Among Consumers:**

The ANOVA results showed significant differences in consumer behavior across age, income, and education levels, but not across gender. Younger, educated, and higher-income respondents exhibited stronger inclination toward green product adoption.

6.**Green Marketing Enhances Consumer Satisfaction:**

Correlation analysis between green marketing effectiveness and consumer satisfaction ($r = 0.721$, $p < 0.01$) revealed a strong positive association, suggesting that credible green marketing practices build consumer trust, satisfaction, and long-term loyalty.

CONCLUSION

The study concludes that green marketing has a growing influence on consumer behavior in Bengaluru Rural District, especially among consumers who are environmentally conscious and well-informed. The findings highlight that awareness and perception alone are not sufficientprice, trust, and authenticity play a vital role in shaping green purchase behavior. Consumers in semi-urban and rural areas demonstrate increasing environmental concern, but they expect affordable and genuine eco-friendly products supported by transparent marketing communication. The effectiveness of green marketing is therefore determined by how well firms align their strategies with consumer expectations, income levels, and demographic profiles. From a managerial perspective, businesses should focus on educating consumers, improving affordability, ensuring product authenticity, and building brand trust to strengthen the link between awareness and purchase intention. Policymakers, on the other hand, should encourage green labeling standards and incentives for companies that adopt sustainable marketing practices. Overall, this research reinforces the idea that green marketing is not merely a promotional tool but a strategic pathway toward sustainable consumption and environmental stewardship. The insights derived from this study can guide marketers,

academicians, and policymakers in designing more effective and socially responsible marketing programs in the context of Bengaluru Rural District and beyond.

ABSTRACT

Commercial banks' payment environments have been revolutionized by the quick development of financial technology (fintech), which has made financial transactions more accessible, secure, and expedited. This study examines the role of fintech in fostering financial innovation within payment systems, focusing on how commercial banks integrate technology to enhance service efficiency and customer experience. Using both primary and secondary data, the research evaluates consumer perceptions, adoption levels, and institutional readiness for digital payment platforms such as UPI, NEFT, RTGS, mobile wallets, and QR-based payments. A structured questionnaire was administered to banking customers, and the data were analyzed using descriptive statistics and regression techniques through SPSS v26. The results reveal that fintech innovations significantly improve transaction speed, cost efficiency, and customer satisfaction, while also posing challenges related to cybersecurity and regulatory compliance. The study concludes that sustainable digital-payment innovation in commercial banks depends on balancing technological advancement with customer trust and regulatory oversight.

Keywords: Fintech, Financial Innovation, Payment Systems, Commercial Banks, Digital Transformation, India.

INTRODUCTION

Financial technology (fintech) has emerged as a key driver of transformation in the global banking industry, redefining how customers access, transfer, and manage their finances. The integration of technology with finance has facilitated new payment mechanisms ranging from contactless cards to mobile wallets and real-time interbank transfers that enhance speed, transparency, and convenience. Fintech is more than just a technical shift; it heralds a structural innovation that reshapes value creation in financial services by promoting inclusion, efficiency, and customer-centric design. In India, the government's push toward a cash-lite economy through initiatives such as *Digital India* and *Unified Payments Interface (UPI)* has accelerated the diffusion of digital payment solutions. Commercial banks, once dependent on traditional clearing and settlement methods, have adopted fintech applications to remain competitive against agile non-bank entities and payment start ups. These technological interventions have led to financial innovation in the form of real-time fund transfers, automated reconciliation, improved fraud detection, and personalized financial analytics. However, despite strong progress, fintech adoption in commercial banks faces challenges. Issues such as cyber security threats, lack of digital literacy among certain customer segments, and infrastructural constraints continue to hinder seamless implementation. Moreover, balancing innovation with regulatory compliance remains a delicate task. Understanding how fintech contributes to the innovation of payment options, and how customers perceive these changes, is therefore vital for both banks and policymakers. This study focuses on evaluating monetary innovation and fintech's part in it **of payment options** within the commercial banking sector. It aims to analyze the extent of fintech adoption, assess its impact on payment efficiency and customer satisfaction, and identify potential barriers to innovation. By combining theoretical insights with empirical evidence from Indian commercial banks, this research seeks to contribute to the discourse on digital transformation and sustainable innovation in financial services.

LITERATURE REVIEW

Financial technology has become an essential catalyst for innovation in payment systems, reshaping how banks deliver value to customers and compete in a rapidly digitalized economy. The literature surrounding fintech and financial innovation highlights how technological advancement, regulatory adaptation, and consumer behavior collectively redefine modern banking operations. Lusardi and Mitchell (2014) explained that digital financial innovation is anchored in customers' capability to understand and use technology-enabled services responsibly. Arner, Barberis, and Buckley (2017) described fintech as the "creative destruction" of financial intermediation, asserting that payment innovation represents the most visible outcome of this transformation. According to Gomber, Kauffman, Parker, and Weber (2018), fintech applications improve payment efficiency through automation, real-time data, and reduced transaction costs, thereby redefining traditional banking processes. Venkatesh, Thong, and Xu (2016) further developed UTAUT, the Unified Theory of Acceptance and Use of Technology to the fintech context, noting that perceived usefulness and trust determine customers' willingness to adopt digital payment tools. Narula and Arora (2019) examined India's banking sector and found that technological partnerships between banks and fintech startups foster competitive innovation in electronic fund transfer systems. Similarly, Bansal and Sharma (2020) emphasized that user-centric digital interfaces such as mobile wallets have driven exponential growth in retail payments, especially after the demonetization period in India. Ozili (2020) provided cross-country evidence that fintech adoption enhances financial inclusion but raises new regulatory and cybersecurity challenges. Gupta and Mehra (2020) found that Indian commercial banks adopting UPI and real-time settlement platforms achieved measurable gains in operational efficiency and customer engagement. Rahman, Tumpa, and Roy (2021) highlighted that fintech-enabled payments strengthen transparency and accountability by minimizing manual errors and human discretion in settlements. Kumar and Prakash (2021) identified innovation in payment optionssuch as biometric authentication and QR-based transfers as significant contributors to customer satisfaction in private sector banks. Lee and Shin (2020) argued that fintech ecosystems thrive when financial institutions balance innovation with consumer protection and data privacy. Roy and Saha (2022) further demonstrated that blockchain-based payment systems improve transactional security and reduce reconciliation time in commercial banking operations.

Chatterjee and Nguyen (2022) noted that post-pandemic digital acceleration has permanently changed customer preferences, with convenience, safety, and instant service now primary determinants of satisfaction. Mehta and Joshi (2023) observed that regulatory sandboxes and government incentives have encouraged banks to experiment with innovative payment technologies without compromising compliance. Finally, Brault (2024) concluded that sustained fintech adoption depends on the co-creation of value between banks and customers, emphasizing continuous innovation, trust, and literacy as long-term success factors. Overall, According to the research, fintech is a key factor in the evolution of payment systems. through automation, integration, and customer empowerment. While global research underscores technological efficiency and risk management, Indian studies stress inclusion, affordability, and trust. Yet, there remains a research gap in empirically measuring how these innovations influence customer perception and operational performance within commercial banksan issue addressed by the present study.

Objectives of the Study

The study seeks to examine the influence of financial technology on the innovation of payment systems within commercial banks. It aims to evaluate how fintech adoption has improved transaction efficiency, customer convenience, and banking competitiveness while identifying the challenges associated with such innovations. Specifically, the objectives are:

1. To assess the extent of fintech adoption in the payment systems of commercial banks.
2. To analyze the impact of fintech on the efficiency, speed, and security of banking payment operations.
3. To evaluate customer perceptions and satisfaction toward fintech-based payment options.
4. To identify barriers and challenges influencing the implementation of fintech innovations in commercial banks.
5. To provide policy and managerial recommendations for enhancing financial innovation through sustainable fintech integration.

Hypotheses of the Study

In order to test the hypothesis that fintech acceptance leads to financial innovation in payment systems, we looked at the relevant literature and set out to achieve certain goals. Our working hypothesis is as follows:

H_1: Fintech adoption has a significant positive effect on the innovation of payment options in commercial banks.
H_{01}: Fintech adoption has no significant effect on the innovation of payment options in commercial banks.
H_2: Fintech applications significantly improve the efficiency, speed, and convenience of payment services.
H_{02}: Fintech applications do not significantly improve the efficiency, speed, and convenience of payment services.
H_3: Customer perception and satisfaction significantly influence the acceptance of fintech-enabled payment systems.
H_{03}: Customer perception and satisfaction do not significantly influence the acceptance of fintech-enabled payment systems.
H_4: Organizational and regulatory barriers have a moderating effect on the relationship between fintech adoption and financial innovation in commercial banks.
H_{04}: Organizational and regulatory barriers do not moderate the relationship between fintech adoption and financial innovation in commercial banks.

RESEARCH METHODOLOGY

Using a quantitative and descriptive research strategy, this study examines how financial technology has pushed innovation in commercial banks' payment systems. The research aims to empirically assess how fintech adoption enhances the efficiency, security, and customer satisfaction associated with banking payment options. A descriptive approach was chosen to capture both customers' perceptions and institutional responses to fintech integration, while analytical techniques were applied to establish the relationship between fintech adoption and payment innovation.

Data Collection

The research relies on a mix of primary and secondary sources. We used a structured questionnaire to gather primary data. administered to banking customers who actively use digital payment channels such as UPI, NEFT, RTGS,

mobile wallets, internet banking, and QR-code payments. Using a Likert scale from 1 (strongly disagree) to 5 (strongly agree), the survey asked respondents to rate several propositions. designed to capture perceptions of reliability, convenience, security, and speed of fintech-enabled payment systems. A total of 130 valid responses were obtained from customers of leading commercial banks operating in Bengaluru. The sample size was determined based on convenience sampling, which is suitable for exploratory studies dealing with customer perceptions of technology adoption. Secondary data were gathered from credible sources such as the Reserve Bank of India (RBI) bulletins, National Payments Corporation of India (NPCI) reports, NITI Aayog digital finance reports, journal articles, and annual reports of commercial banks. These sources provided contextual understanding of payment innovation trends and regulatory frameworks in the Indian fintech ecosystem.

Research Tools and Techniques

We used SPSS version 26 to examine the data that we obtained. We used descriptive statistics to summarise the demographic characteristics and estimate the extent of fintech usage among respondents. With a coefficient value of 0.87, indicating strong reliability, reliability testing using Cronbach's Alpha validated the instrument's internal consistency. We utilized correlation analysis to look for a link between fintech adoption and payment innovation, and multiple regression analysis to find out how well variables like technological ease, transaction speed, and perceived trust predict financial innovation outcomes related to fintech adoption.In addition, moderation analysis was conducted to assess whether organizational and regulatory barriers influence the strength of the relationship between fintech adoption and innovation outcomes.

Scope and Significance

The study focuses on commercial banks operating in Bengaluru, which serves as one of India's leading fintech hubs. The findings aim to provide insights into how banks leverage technology to innovate payment mechanisms and improve customer experiences. The methodology ensures reliability, validity, and practical relevance, making the results valuable for banking professionals, fintech developers, and policymakers seeking to enhance the integration of digital technologies in financial services.

Data Analysis and Interpretation

To determine how fintech adoption has affected the development of new payment systems in commercial banks, researchers methodically examined data from 130 participants. In order to put the theories to the test, statisticians used tools like multiple regression, correlation, and descriptive analysis. The study also looked at how regulatory hurdles affected innovation results, how satisfied customers were, and how efficient the technology was.

Reliability Analysis

We made sure that the items on the questionnaire were internally consistent. using Cronbach's Alpha, which yielded a coefficient value of 0.87. This exceeds the accepted threshold of 0.70 (Nunnally, 1978), confirming that all items measuring fintech adoption, innovation effectiveness, and customer satisfaction were reliable and suitable for further analysis.

Descriptive Analysis

The demographic distribution indicated that Men made up 57% of the sample, while women accounted for 43%., with a majority aged between 25 and 40 years. Approximately 68 % possessed at least a bachelor's degree, and 74 % used digital payment services daily or weekly. These findings show that fintech adoption is highest among young, educated, and digitally aware customersa segment that strongly drives innovation in banking payments.

Correlation Analysis

Pearson's correlation coefficients revealed significant positive associations among fintech adoption, payment innovation, and customer satisfaction. The results demonstrate that higher levels of fintech adoption are strongly correlated with improvements in innovative payment systems and customer satisfaction, confirming the positive interplay among the studied constructs.

Multiple Regression Analysis

To test the hypotheses, fintech adoption dimensions (technological ease, transaction speed, security perception, and service trust) were treated as independent variables, while financial innovation in payment options served as the dependent variable. The model explains 72 % of the variance in payment innovation, demonstrating strong explanatory power. All four predictors significantly influenced financial innovation, validating H_1 and H_2. Transaction speed emerged as the most influential factor ($\beta = 0.33$), followed by technological ease ($\beta = 0.29$), suggesting that efficiency and usability are central to fintech-driven innovation in banking.

Moderation Analysis

To assess H_4, moderation analysis examined whether regulatory and organizational barriers weakened the relationship between fintech adoption and payment innovation. The interaction term was significant ($\beta = –0.17$, $p = 0.007$), indicating a negative moderating effect. This suggests that stringent regulatory compliance, legacy systems, and security concerns can reduce the pace of innovation even when fintech adoption levels are high.

Interpretation of Findings

The empirical results confirm that fintech adoption substantially enhances innovation in payment mechanisms across commercial banks. Improved transaction speed, system reliability, and customer convenience collectively explain why digital-payment ecosystems are expanding rapidly. The significant moderation effect of regulatory barriers highlights the importance of supportive policy frameworks and adaptive compliance mechanisms. These findings align with earlier studies by Gomber et al. (2018) and Gupta and Mehra (2020), which emphasized that fintech-enabled payments increase operational efficiency and financial inclusion. The evidence from Bengaluru's banking sector reinforces that technological investment must be coupled with effective governance and customer-centric design to achieve sustainable innovation.

FINDINGS AND CONCLUSION

Key Findings

The study investigated how fintech adoption fosters financial innovation in payment options within commercial banks. The findings derived from descriptive, correlation, and regression analyses provide several critical insights.

High Reliability of Measurement Instruments:

The Cronbach's Alpha value of 0.87 confirmed strong internal consistency among items measuring fintech adoption, payment innovation, and customer satisfaction, establishing the robustness of the instrument.

Significant Association Between Fintech and Innovation:

Correlation results revealed strong positive relationships among fintech adoption, payment innovation, and customer satisfaction. Customers who actively use fintech-enabled services such as UPI, RTGS, and mobile wallets reported higher satisfaction due to greater convenience, transparency, and transaction speed.

Fintech as a Catalyst for Innovation:

Regression analysis demonstrated that fintech adoption significantly enhances innovation in payment mechanisms. The model explained 72% of the variance in payment innovation, with transaction speed ($\beta = 0.33$) and technological ease ($\beta = 0.29$) emerging as the most influential factors. This finding underscores that operational efficiency and user experience are central to successful fintech integration.

Impact of Security and Trust:

Security perception ($\beta = 0.21$) and service trust ($\beta = 0.27$) were also found to significantly predict innovation outcomes. Customers' trust in digital channels determines their willingness to engage with new payment technologies, highlighting the necessity of robust cybersecurity frameworks.

Moderating Role of Regulatory Barriers:
Moderation analysis confirmed that regulatory and organizational constraints negatively influence the fintech–innovation relationship ($\beta = -0.17$, $p < 0.01$). Excessive compliance requirements and legacy infrastructure can slow innovation, emphasizing the need for adaptive regulation and digital-readiness programs in banks.

Customer Demographics and Usage Patterns:
The demographic analysis indicated that younger, educated, and higher-income respondents are more likely to use fintech payment systems. This trend points toward a generational shift in financial behavior and the growing digital divide among age and literacy groups.

Theoretical Implications
The study strengthens the theoretical link between technology acceptance and financial innovation, extending the Technology Acceptance Model (TAM) and Diffusion of Innovation Theory (Rogers, 2003) to the context of commercial banking. The findings confirm that fintech acts not only as a technological facilitator but also as a behavioral driver that enhances financial inclusion and operational modernization. By integrating trust and regulatory dimensions, the study provides a more holistic understanding of fintech adoption in banking systems.

Managerial and Policy Implications
For commercial banks, the evidence underscores the need to continuously invest in customer-centric fintech infrastructure that emphasizes reliability, ease of use, and security. Banks should prioritize training programs and digital-literacy initiatives to help customers confidently navigate fintech platforms. Establishing strong partnerships with fintech startups can further accelerate payment innovation while maintaining regulatory compliance. Policymakers and regulators should design adaptive frameworks that balance innovation with risk management. Encouraging regulatory sandboxes and open banking ecosystems can promote experimentation and interoperability without compromising consumer protection. Strengthening cybersecurity standards, authentication mechanisms, and grievance-redress systems is essential to sustaining public trust in digital payments.

CONCLUSION

The research shows that fintech is changing the way commercial banks handle payments by making them more user-friendly, secure, and quick. The integration of digital technologies such as UPI, mobile wallets, and real-time settlements has enhanced the efficiency and innovation potential of banking payment systems. However, innovation must progress hand in hand with trust, regulation, and financial literacy to ensure inclusivity and long-term sustainability. In summary, fintech-driven financial innovation represents a transformative pathway for India's banking sector, where technological agility, customer engagement, and policy adaptability will determine the future of payment ecosystems. As commercial banks continue to adopt advanced digital solutions, a balanced focus on innovation, governance, and customer empowerment will be critical for achieving a resilient and inclusive financial system.

ABSTRACT

Toothbrushes are essential for maintaining oral hygiene but can become reservoirs for microbial contamination if not stored or disinfected properly. Despite this, there are no standard guidelines for toothbrush storage or disinfection. To assess the knowledge, attitudes, and practices related to toothbrush storage and disinfection among patients visiting a dental college in central India. A modified, close-ended questionnaire consisting of eight questions was distributed to 122 eligible participants aged 18–65 years. Inclusion and exclusion criteria were applied to ensure relevant and unbiased data collection. Participants completed the survey anonymously and independently. Most participants brushed twice daily and changed their toothbrush every three months. However, 84.6% never disinfected their toothbrushes, mainly due to a lack of awareness (55.8%) or time (44.2%). While 93% believed disinfection was important, only 36.5% had any prior knowledge of it. A significant number stored their toothbrushes in environments prone to microbial contamination, such as open bathrooms or closed cabinets. Although participants followed appropriate toothbrush replacement habits, awareness and practice of toothbrush

disinfection were limited. Educational interventions are needed to promote safe storage and disinfection practices.

Keywords: Toothbrush contamination, oral hygiene, toothbrush disinfection, patient awareness, toothbrush storage, cross-sectional study, infection control, dental public health

INTRODUCTION

We all know that the mouth is the mirror of the body, which highlights the importance of maintaining a clean and healthy oral cavity. Since its invention in 1498 C.E., the toothbrush has remained one of the most frequently used tools for maintaining oral hygiene[1]. However, it is important to note that toothbrushes are frequently contaminated with bacteria from dental plaque, making regular disinfection of the toothbrushes very essential. Despite this, there is currently no established or universally accepted protocol for toothbrush storage and disinfection. A very common scenario of tooth brush storage is depicted in figure 1. The aim of the present study was to assess the awareness, attitudes, and practices related to toothbrush storage and disinfection among participants visiting a dental college in central India.

SUBJECTS AND METHODS

A cross-sectional survey was conducted using a modified version of a previously validated questionnaire[2]. The revised questionnaire included eight close-ended questions designed to assess participants' habits and knowledge regarding toothbrush usage, storage, and disinfection. Patients who showed willingness to participate were asked to complete the questionnaire independently. To avoid bias, participants were instructed to fill out the questionnaire in privacy without consulting others. No personal details such as name, age, gender, or contact information were asked, thereby maintaining complete anonymity and confidentiality.

Inclusion Criteria

- Adults aged 18 to 65 years.
- Patients visiting the outpatient department for non-emergency dental care.
- Individuals who could read and understand the local language or English.
- Patients using a toothbrush for at least the past six months.
- Those who provided informed consent to participate.

Exclusion Criteria

- Qualified dental or medical professionals and faculty members of the dental college.
- Individuals with cognitive impairments or psychiatric conditions.
- Hospitalized or acutely ill patients.
- Individuals who had participated in similar oral hygiene-related studies in the past six months.

A total of 122 participants meeting the criteria completed the questionnaire.

RESULTS

Participants' responses are summarized in Table 1.

The first two questions assessed general oral hygiene habits. A majority of participants which is 64%, reported brushing twice daily, while 36% brushed only once a day. None of the participants brushed more than two times daily, indicating an overall good compliance with basic oral hygiene practices. Regarding toothbrush replacement, 51.8% reported changing their toothbrush every three months which aligns with standard recommendations of changing a tooth brush. However, 25.3% changed it only every two months, and a minority delayed replacement up

to 4 to 6 months or more, which may increase microbial buildup on the toothbrush. Toothbrush storage habits varied widely with 15.7% of participants stored their toothbrush in open contact with the environment inside the bathroom, 28.9% kept it in closed bathroom cabinets, and 21.7% placed it near or on the washbasin/sink. 33.7% stored their toothbrushes outside the bathroom, which is considered the most hygienic option. When asked about the use of toothbrush case to cover the head of toothbrush, only 58.8% reported using one, leaving 41.2% storing their toothbrushes unprotected and open. When asked about disinfection of toothbrush, it was noted that 84.6% of participants did not disinfect their toothbrushes, out of which 55.8 % gave the reason of lack of awareness and 44.2% had lack of time to do so. Despite majority of them not disinfecting their toothbrushes, 93% of participants believed that toothbrush disinfection is necessary for everyone, which shows a positive attitude toward hygiene when informed. When asked about if the participants were aware of toothbrush disinfection before this survey, only 36.5% had any prior knowledge of toothbrush disinfection and storage before participating in this survey and majority of 63.5% had no idea about it, revealing a considerable gap in public awareness.

DISCUSSION

The results indicate that while most participants followed recommended practices for brushing frequency and toothbrush replacement, there is a noticeable gap between their knowledge and actual practices related to toothbrush disinfection and storage. Notably, although 93% believed toothbrush disinfection is necessary, only 15.4% practiced it. This gap reflects a disconnect between attitude and behaviour, which is commonly seen when awareness is low. The primary barriers were lack of knowledge in 55.8%and lack of time in 44.2% which highlighted the urgent need for targeted the lack of awareness with educational initiatives. Storage practices were also concerning. A combined 66.3% of participants stored toothbrushes in potentially contaminated environments like bathroom cabinets, open bathroom areas, or near washbasins. As reported by Karibasappa *et al*.,[3] such environments can promote bacterial contamination, including Escherichia coli. Additionally, Mehta *et al*.[4] found that storing toothbrushes in closed caps can increase bacterial survival by limiting ventilation and moisture evaporation. These insights align with our study's findings and further reinforce the need for educating patients on ideal toothbrush storage which should be outside the bathroom in a well-ventilated area. Among those who had never disinfected their toothbrushes, a large majority understands the need once informed, reflecting the impact of awareness on perception**.** This opens opportunities for preventive interventions in dental clinics, and school-based programs. Studies by Raiyani *et al*.[5] have shown that microbial accumulation on toothbrushes increases with duration of use, even with twice-daily brushing supporting the importance of regular disinfection in addition to timely replacement. Schmalz *et al*.[6] demonstrated that rinsing and air-drying can significantly reduce viral loads, including coronavirus and influenza, indicating that simple, low-effort practices can meaningfully enhance hygiene.

CONCLUSION

Oral Hygiene Practice: Majority of respondents (64%) brushed twice daily, consistent with standard oral hygiene recommendations.

Toothbrush Replacement: Over half (51.8%) changed toothbrushes every 3 months, aligning with ADA guidelines.

Storage Practice: A significant proportion stored toothbrushes in potentially contaminated environments — 15.7% in open bathroom space, 21.7% near washbasin.

Use of Toothbrush Case: 58.8% used toothbrush cases, which may contribute to microbial growth if ventilation is poor.

Disinfection Habits: 84.6% did not disinfect their toothbrushes — with 55.8% citing lack of knowledge, and 44.2% citing time constraints.

Perception of Importance: 93% believed disinfection is necessary, but only 36.5% were aware of it before the survey. Although participants generally demonstrated good brushing and toothbrush replacement habits, significant gaps remain in their knowledge and practices regarding toothbrush disinfection and proper storage. There is a clear need for targeted public health education to promote safe and hygienic toothbrush handling practices, especially in bathroom environments where the risk of contamination is high.

Table 1: Association Between Toothbrush Disinfection Practices and Related Factors Among Participants

Q.No	Question	Response Option	Percent (%)
1	How often do you brush your teeth?	a. Once a day	36.0%
		b. Twice a day	64.0%
		c. More than two times a day	0.0%
2	How often do you change your toothbrush?	a. Once a month	6.0%
		b. Once every two months	25.3%
		c. Once in every 3 months	51.8%
		d. In 4 to 6 months	16.9%
		e. After more than a year	0.8%
3	Where do you store your toothbrush?	a. In bathroom, in open contact with environment	15.7%
		b. In bathroom, closed cabinet	28.9%
		c. On or near washbasin	21.7%
		d. Outside bathroom	33.7%
4	Do you store your toothbrush in toothbrush case?	a. Yes	58.8%
		b. No	41.2%
5	Do you disinfect your toothbrush?	a. Yes	15.4%
		b. No	84.6%
6	If answer is no, what is the reason?	a. Lack of knowledge	55.8%
		b. Lack of time	44.2%
7	In your opinion, for whom is toothbrush disinfection necessary?	a. Everyone	93.0%
		b. Patients	7.0%
8	Did you know about	a. Yes	36.5%

	toothbrush disinfection and storage before this survey?	b. No	63.5%

ABSTRACT

In the present study the Single Cell Protein was produced using *Aspergillus niger* under solid state fermentation by combination of different fruit waste as a substrate. The fungi were isolated from soil of Fruit waste dumping area. The isolated fungi were identified by Lactophenol cotton blue method. The identified fungi were confirmed using Standard fungal manual. From the present finding we conclude that the biomass production using different parameters (incubation time, and pH) and fruit peels combinations showed better results in comparison to fruit peels individually. Hence attempt for optimizing different combinations of fruit peels for SCP production seems to be successful and has a potential to be used for SCP for various applications and sustainable development.

Keywords: Single cell protein (SCP), *Aspergillus niger* and Biomass

INTRODUCTION

SCP is a term coined to embrace microbial biomass products which were produced by fermentation. SCP production by technology arose as a promising way to solve the problem of the worldwide shortage of protein. They evolved as bioconversion process which turned waste into products which added nutritional and market value. Intensive research into fermentation science and technology for biomass production as well as feeding has resulted in a profound body of knowledge, the benefits of which now span far beyond the field of SCP production. These agricultural products out marketed SCP on the grounds of lower price. The combination of sophisticated products with food processing technology yielded a new generation of SCP products which may be used as meat substitutes, texture providing agents and flavor enhancers. Future application of heterologous protein expression may further develop the potential of this food line resulting in precisely tailored products which meet specific dietary requirements or stimulate high added value specialty products[8]. In year [1] studied the bioconversion of agricultural and industrial waste to protein rich food and fodder stock. SCP production has the potential for feeding the ever-increasing world population at cheaper rates[6]Suggested the potential of SCP to overcome shortage of food in the world. The present investigation was carried out to utilize various combinations of fruit wastes in the production of SCP by using standard food fungi *Aspergillus niger*.

MATERIALS AND METHODS

Soil Sample collection

The soil sample was collected from fruit waste dumping area of in an around Mannargudi, Thiruvarur District. for the isolation of fungi for the production Single Cell Protein (SCP). The collected soil sample was transported to the Microbiological Laboratory for the isolation procedure.

Isolation of fungi from soil sample

The fungi were isolated from soil of fruit waste dumping area. The fungi were isolated by serial dilution techniques. In systematic screening process for isolation of fungus 5 soil samples collected at different location of Agricultural Waste Dumping area around Mannargudi, Thiruvarur District, Tamilnadu. From the collected soil samples (Soil dilution method: Waksman, 1927) diluted with 1g soil is in 10ml of sterile distilled water.1ml of suspension was added to sterile petriplates in triplicates containing sterile Potato Dextrose Agar the plates were incubated at 28oC for 5- 7 days. A greater number of species was isolated most of the fungus sporulate heavily. Pure culture was done using test tube containing fresh agar slants of PDA medium. The test tubes are stored in refrigerator. Therefore, there develop mixed colonies. Hence isolation of pure culture from mixed colonies is rather difficult. Therefore, spread plate technique is employed for pure culture (Labeda, 1992; Seifert, 1992 and Bacon, 1992).

Identification of fungi

Wet mount techniques

The fungal propagules either are hyaline (colorless) or different colors. The hyaline mycelia /spores/conidia and cytoplasm can be stained by using Lactophenol and cotton blue was used. Cotton blue were stained cytoplasm and results in light blue background. Lactophenol acts as a cleaning agent. The stained specimens were observed under the light microscope (Magnus

Culture Maintenance

The isolated and purchased fungi and yeast sample were maintained on slant of Potato Dextrose Agar Medium (Potato infusion 200g, Dextrose – 20g, Agar – 20g, Distilled Water – 1000ml). The culture was maintained on PDA media. The slants were grown at 28±2°C for 7 days. Then the culture was stored at 4°C for further process.

Collection and pretreatment of fruit waste

The fruit waste such as watermelon, papaya, orange was collected from the local market at Mannargudi, Thiruvarur District, Tamilnadu. Pretreatment of substrate Banana, orange and papaya peels were collected from the local market. It was pretreated to expose cellulose fibers to cellulolytic attack by the organism. The pretreatment process was carried out by adding 1% sodium hydroxide to 10g of fruit waste and autoclaving at 121°C and at 15 psi for 30 min. Pretreated material was allowed to cool, subsequently filtered and washed to neutral Ph. Then it was dried at 60°C in an oven for 12 h. Later on, it was used for solid state fermentation[1].

Media and cultivation for solid state fermentation

The fermentation was carried out in 250ml flask containing 10g of solid substrate in various combinations of fruit waste. There were four different combinations used in different ratios (Table 1). The content of the flask was mixed thoroughly and autoclaved at 121°C for 20 min. Each experiment was done in triplicate

Inoculation

After cooling, the production media was inoculated with the 106 spores/ ml of inoculums and incubated under constant condition at 30°C for 4 days.

Buffer extraction

50 ml of carbonate bicarbonate buffer (0.1 M at pH 10.6) was added to the flask and then culture was homogenized for 30 minute using rotator shaker at 250 rpm then the content was squeezed through the distilled water wet muslin cloth. The filtrate was centrifuged at 5000 rpm for 10 minutes then supernatant was filtered through a Whatman no.1 filter paper [1].

Optimization of SCP production

Effect of incubation period

Various combinations of substrates were made of different ratios, the fermentation media was incubated for 2days, 4 days, 6 days, 8 days and 10 days. After Incubation the culture was extracted using Carbonate bicarbonate buffer. Then the protein was estimated by Lowry method.

Effect of pH

Various combinations of substrates were made of different ratios, the fermentation media prepared by different pH range such as 4, 6,7 and 8 and the flask was incubated for 7 days. After Incubation the culture was extracted using Carbonate bicarbonate buffer. Then the protein was estimated by Lowry method. Since *Aspergillus niger* grows best within the pH range of 5-7 to see the effect of incubation time on the single cell protein.

Protein estimation: (Procedure include)

Total protein estimation was done according to Lowry method[5].

RESULT AND DISCUSSION

In the present study the Single Cell Protein was produced using *Aspergillus niger* under solid state fermentation by combination of different fruit waste as a substrate. The fungi were isolated from soil of Fruit waste dumping area. The isolated fungi were identified by Lactophenol cotton blue method. The identified fungi were confirmed using Standard fungal manual. The concentrations stated in the present investigation was very much similar to the values revealed by [7] for papaya peel [10] for orange and [9] for watermelon. SCP (mg/ml) content without fermentation (Table 2).

Effect of different combinations on single cell protein

Various combinations of different ratios of substrates were taken to check its effect on overall protein production. There were four different combinations used during the experiment. SCP (mg/ml) content in combinations of fruit peels without fermentation (Table 3). Out of all, 4thcombination showed greater protein content thus, the results shown by these combinations can be of greater interest in producing SCP and will show potential results on its application as feed or food. The maximum SCP production of various combinations (Table 3) for 0.1ml and 0.2ml volume of sample were given as followed: (Table 4) It determined that maximum SCP production occurred in the 4thcombination i.e. 1.352 mg/ml in 0.2 concentrations of sample aliquots. All the combinations showed more SCP production than pure substrates during the investigation. This finding can be applied on large scale up and low-cost technology alternatives should be explored intensively. Furthermore, the biomass produced from fruit waste can be evaluated for its suitability to be used either as a biofertilizer or as animal feed. It should be noted that the 4th combination where Watermelon peel greater ratio in comparison to orange and papaya peels (2:1) showed more favorable results than rest of the combinations[11] showed more SCP production when Watermelon peel was in combination with other substrates.

Effect of incubation period

Increase in protein production was initiated at early stages of incubation and reached a peak of maximum production at 8th day. It was observed that SCP declined with prolonged incubation which could be due to loss of nutrient and accumulation of toxic compound in the medium. It was found that protein of pure substrates as banana, papaya and orange showed maximum productions on 3 days i.e. 72 hours [10]. The present investigation reveals similar results shown by some researcher's as in the case of orange peel [10] and [4] showed production of SCP on orange peel was 0.75 g/l and 0.44 mg/ml whereas in the present investigation it was 0.62 mg/ml. Then in case of Watermelon peel[2] showed the biomass production in *Watermelon peel* was 0.365 mg/ml and current result was found to be 0.613 mg/ml of the sample. This investigation had more protein content because of the type of strain used. In papaya peel protein content was found to be 0.630 mg/ml, similarly,[3]revealed 0.595 mg/g of substrate. The change either increase or decrease in the concentration is due to the change in substrates and conditions during the experiment. Effect of incubation period on SCP (mg/ml) production using fruit peels (Table 5). It should be noted that the protein content on the 1-2 days is not much thus, the fungi is in its lag phase and then there is a sudden growth of the organism leading to growth in biomass on the 3rd day. And at the 4th day it shows the declining phase where the biomass produced decreases due to low concentration of substrates [10]. It (Table 6) consists of SCP production on the mentioned combinations (as given in Table 3) for different incubation period i.e. 2, 4, 6, 8 and 10 days.

The following results are obtained below:

Effect of incubation period on SCP (mg/ml) production using different combinations of substrates (Table 6). It determined that the exponential fungal growth was observed from the 6th day which showed maximum protein enrichment was found on 8th day and after that on 10th day the declining phase started due to low substrate concentration. The optimum time for maximum protein production was determined to be on 8th day.

Effect of pH

On fermentation of the substrates and its combinations at different pH of 4, 6, 7 and 8, it was found that at 7 pH protein production was at its maximum [10] also reported the maximum production at pH 7. However, the best growth for *Aspergillus niger* lies within the range of 5-7. Effect of pH on SCP (mg/ml) production using fruit peels (Table 7). It should be noted that, on optimizing the pure peels (substrate) at different pH showed maximum production favored at pH 7 and then at pH 6 showing the second-best growth. It determined that the strain *Aspergillus niger* grows best within the pH range of 5-7 [10]. Effect of pH on SCP (mg/ml) production using different combinations of substrates (Table 8). During the experiment pH 4, 6, and 8 was taken into consideration with reference to the neutral pH 7. Thus, maximum protein content was seen at pH 7 then at pH 8. Thus, it clearly showed that *Aspergillus niger* strain best grows at basic pH and mostly at neutral pH i.e. 7. On fermentation of various combinations (Table 3) it again reveals that *Aspergillus niger* grows best within the pH range of 5-7 [10] showed maximum growth with the same strain at pH 7 and so in the present investigation which also clearly depict the same

showing maximum growth at pH 7 and then at pH 8 and so on. Knowing that, supplementation of the substrate with nitrogen source can easily be done for potential result in producing SCP.

Comparison of SCP (mg/ml) production between best incubation time and pH

The 4th combination gives the maximum production of SCP due to its cellulose and carbohydrate content which makes it acts as a good carbon source. Usually, all the combinations produced more SCP in comparison between incubation time and pH, from the table below(Table9) showed that combinations when used may prove to be favorable for the fungal biomass production or SCP production as a whole. *Aspergillus niger* on 4th combination gave the best result of maximum production of 1.352 mg/ml of protein on 8 days of incubation and at pH 7and maximum fungal growth was observed which directly relates to protein content of *A.niger*. Fruit peels which are considered as waste product that causes environment pollution. So, fruit peels can be used in different combinations to produce SCP in enhanced nutritive value i.e. protein in different ratio as compared to individual fruit peels. Combination shows enhanced protein content in biomass due to available substrates from different fruit peels. Fungal biomass utilizes different pathways to utilize different substrate to the fullest which is established by different combinations. The degree of mycelia biomass growth depends on the substrate utilized. Combinations provide greater protein content as compared to pure substrates. Out of the four combinations the best result was shown by the 4th combination which contained orange, banana and papaya peels in 1:2:1 ratio and the amount of total protein content in SCP of the 4th combination was 1.352mg/ml of the sample. Thus, present investigation might be of great help in making use of the fruit waste for sustainable management of fruit peels for economical and replenishment of food (nutrition scarcity) for poor and populous country like India.

CONCLUSION

In the present study the Single Cell Protein was produced using *Aspergillus niger* under solid state fermentation by combination of different fruit waste as a substrate. The fungi were isolated from soil of Fruit waste dumping area. The isolated fungi were identified by Lactophenol cotton blue method. The identified fungi were confirmed using Standard fungal manual. From the present finding we conclude that the biomass production using different parameters (incubation time, and pH) and fruit peels combinations showed better results in comparison to fruit peels individually. Hence attempt for optimizing different combinations of fruit peels for SCP production seems to be successful and has a potential to be used for SCP for various applications and sustainable development. Thus, the fruit wastes should be exploited properly as a substrate for the production of cellular biomass of edible fungi instead of dumping them. So, they can be used as feed supplement with least expenditure of money.

ABSTRACT

Sustainable finance has emerged as a critical pillar in fostering environmentally responsible and socially inclusive economic growth. This study analyses the level of investor awareness, behavioral tendencies, and the challenges that influence the adoption of sustainable financial instruments during Karnataka's ongoing green transition. Employing an analytical research design, We used primary and secondary sources of information. The main source of information was a structured questionnaire that was filled out and returned. to individual investors across Bengaluru Urban, Mysuru, and Hubballi regions, while secondary data were drawn from government reports, RBI bulletins, SEBI publications, and global sustainability indices. Our statistical tools of choice included correlation, regression, and descriptive statistics. to interpret the relationships between awareness, perceived risk, expected return, and actual investment behavior. The findings reveal that although awareness of sustainable finance is moderate, behavioral intention is strongly shaped by financial literacy, perceived profitability, and trust in green products. However, limited market information, lack of policy clarity, and low return expectations act as barriers to widespread participation. The paper concludes by emphasizing the need for targeted investor education and transparent policy frameworks to enhance sustainable investment momentum in Karnataka.

Keywords: Sustainable finance, Investor behavior, Green transition, Financial awareness, Karnataka, Analytical study.

INTRODUCTION

The accelerating global shift toward sustainability has redefined the contours of modern finance. Traditional investment decisions that once focused purely on profitability and risk now increasingly integrate environmental, social, and governance (ESG) considerations. Sustainable finance—the practice of aligning financial systems with sustainability goals—has evolved as a strategic instrument to support low-carbon growth, resource efficiency, and social inclusivity (OECD, 2021). India, as a signatory to the Paris Agreement and a proponent of green growth, has initiated a series of reforms promoting responsible investment, such as the issuance of green bonds, ESG disclosures, and climate-aligned funds. Within this national framework, Karnataka occupies a unique position due to its dynamic mix of industrialization, renewable-energy initiatives, and expanding middle-class investor base. Sustainable finance in Karnataka is gaining recognition through renewable-energy financing, sustainable urban-infrastructure projects, and ESG-compliant investment products. However, despite policy interest and market availability, investor participation in sustainable instruments remains relatively low. This gap suggests that awareness, perception, and behavioral intent play a crucial role in the diffusion of green financial products. Studies in other emerging markets have highlighted that investors' financial literacy and environmental consciousness significantly influence their sustainable investment decisions (Jain & Chawla, 2020; Rahman et al., 2022). Yet, limited region-specific evidence exists for Karnataka, where socioeconomic diversity and information asymmetry may alter investor responses. The green transition—the shift toward an economy that minimizes carbon intensity—requires both institutional support and active retail investor participation. Understanding how investors perceive sustainable finance, the behavioral factors that shape their decisions, and the barriers they encounter is therefore vital for policymakers and financial institutions. The present analytical study investigates these dimensions using a mix of qualitative and quantitative findings. It seeks to measure the relationship between investor awareness and behavioral outcomes, while identifying the structural challenges that restrict participation. By integrating primary survey findings with secondary market insights, this study offers a thorough evaluation of investor engagement in sustainable finance in Karnataka. It adds to the larger conversation of how financial literacy, trust, and policy incentives can enhance the adoption of green investment instruments in emerging economies. Ultimately, the study offers evidence-based recommendations to strengthen the sustainable-finance ecosystem at the state level, aligning investor behavior with India's long-term sustainability objectives.

REVIEW OF LITERATURE

Sustainable finance has progressively transformed the global financial ecosystem, emphasizing investments that align profitability with environmental and social responsibility. The awareness and behavior of investors play a central role in determining the pace and depth of this transformation. Globally, Friede, Busch, and Bassen (2016)discovered that almost 90% of research showed a positive correlation between ESG practices and financial results., establishing the foundation for sustainable finance as a viable investment strategy. Raimo *et al.* (2020) reinforced that sustainable investment decisions are strongly linked to the level of investor knowledge and the perceived credibility of ESG disclosures. Fatemi and Fooladi (2017) argued that firms with high ESG transparency attract long-term investors, suggesting that awareness of sustainability metrics enhances market trust. Similarly, Nofsinger and Varma (2019) concluded that investors with pro-environmental attitudes prefer portfolios that include ethical or green stocks, even at the cost of marginally lower returns.Bătae *et al.* (2021) observed that investor awareness has become a determinant of green-investment adoption, particularly in European markets where financial literacy campaigns are more widespread. In Asian economies, Rahman, Chen, and Nguyen (2022) showed that awareness and perceived return significantly predict willingness to invest in green bonds. Talan and Sharma (2019) noted that sustainable finance initiatives succeed when investors perceive a clear link between social impact and financial gain. Meanwhile, Kumar and Rao (2021) found that demographic variables such as education, income, and age shape sustainable-investment behavior across developing economies. From a behavioral perspective, Chowdhury and Howlader (2020) highlighted that psychological biases—particularly risk aversion and herding—limit investors' participation in sustainable instruments. Raza, Jawaid, and Karim (2021) further explained that

cognitive dissonance between profitability and social responsibility often deters traditional investors from entering sustainable markets. These insights reveal that investor behavior in sustainable finance is multifaceted, influenced by both rational evaluation and socio-psychological factors. In the Indian context, Jain and Chawla (2020) found that awareness of sustainable investment avenues remains moderate, with a higher concentration among urban and financially literate investors. Ghosh and Bhaduri (2021) emphasized that green bonds and ESG mutual funds are still niche products due to insufficient information dissemination. Kaur (2022) reported that Indian investors associate sustainable finance mainly with environmental protection but lack detailed understanding of governance and social impact dimensions. Patel and Mehta (2020) established that financial literacy and risk perception significantly affect investors' preferences toward socially responsible funds. Similarly, Rao and Sharma (2023) demonstrated that investors in southern India exhibit growing curiosity toward green investments but face barriers such as unclear regulatory policies and limited product availability. From the institutional angle, Sarkar (2021) discussed how policy initiatives by SEBI and the Reserve Bank of India have encouraged ESG disclosures and sustainable banking, yet adoption at the retail level remains sluggish. Maheshwari and Thomas (2022) observed that while corporates increasingly align with sustainability indices, retail investors lag due to a trust deficit in green financial products. Nair (2023) added that public awareness campaigns and transparent rating mechanisms could strengthen investor confidence in sustainable finance. Recent studies underscore the intersection between behavioral intention and digital accessibility. Srivastava and Menon (2024) argued that fintech platforms offering ESG-linked products have improved transparency and engagement, particularly among younger investors. Gupta and Ranjan (2024) found that digital awareness combined with sustainability education enhances participation in green mutual funds and impact investing. These findings resonate with global trends emphasizing the role of technology in bridging awareness gaps.

Overall, the literature reveals three consistent themes
(1) Awareness and literacy are prerequisites for sustainable-finance adoption;
(2) Behavioral factors such as risk perception and moral motivation critically shape investment intentions; and
(3) Institutional support and transparency influence the long-term viability of green-investment ecosystems. However, region-specific analyses—particularly in Karnataka—remain limited, warranting the present analytical investigation that integrates both investor-level insights and policy-based data.

OBJECTIVES OF THE STUDY

1. To assess the level of investor awareness and understanding of sustainable-finance products in Karnataka.
2. To examine the connection between knowledge of investors and investment behavior toward sustainable-finance instruments.
3. To evaluate the influence of financial literacy, perceived risk, and expected return on sustainable-investment decisions.
4. To identify the challenges and policy-related barriers that affect investor participation in sustainable finance.
5. To provide strategic recommendations for improving investor engagement and enhancing Karnataka's sustainable-finance ecosystem during the green transition.

4. Hypotheses of the Study

H_1 (Awareness → Behavior)

- **H_{01}:** There is no significant relationship between investor awareness and investment behavior toward sustainable-finance products.
- **H_{11}:** There is a significant relationship between investor awareness and investment behavior toward sustainable-finance products.

H_2 (Financial Literacy → Behavioral Intention)

- **H_{02}:** Financial literacy does not significantly influence investors' behavioral intention to adopt sustainable-finance instruments.

- **H_{12}:** Financial literacy significantly influences investors' behavioral intention to adopt sustainable-finance instruments.

H_3 (Perceived Risk → Investment Decision)

- **H_{03}:** Perceived risk does not significantly affect investors' decisions to participate in sustainable-finance options.
- **H_{13}:** Perceived risk significantly affects investors' decisions to participate in sustainable-finance options.

H_4 (Expected Return → Investment Participation)

- **H_{04}:** Expected return has no significant effect on investor participation in sustainable-finance instruments.
- **H_{14}:** Expected return has a significant effect on investor participation in sustainable-finance instruments.

H_5 (Policy and Information Availability → Investor Confidence)

- **H_{05}:** Policy clarity and information availability do not significantly influence investors' confidence in sustainable-finance markets.
- **H_{15}:** Policy clarity and information availability significantly influence investors' confidence in sustainable-finance markets.

RESEARCH METHODOLOGY

Research Design

This investigation makes use of an analytical research strategy. to evaluate investor awareness, behavioral tendencies, and challenges associated with sustainable finance during the green transition in Karnataka. This approach integrates both quantitative and qualitative analyses, allowing for statistical testing of hypotheses while providing interpretive insights. The study uses regression analysis, correlation, and descriptive statistics to look at the connections. among key variables such as awareness, financial literacy, perceived risk, expected return, and investor confidence.

Nature and Sources of Data

In order to guarantee thorough coverage and trustworthy results, the research makes use of both primary and secondary data sources.

- **Primary Data**

The data was gathered from individual investors in the Bengaluru Urban, Mysuru, and Hubballi districts of Karnataka using a standardized questionnaire. In order to gauge participants' level of consciousness, the survey used both open-ended and Likert-scale questions., behavioral intent, risk perception, and perceived profitability of sustainable-finance products.

- **Secondary Data**

Secondary information was drawn from RBI bulletins, SEBI publications, NABARD and IRDAI reports, World Bank sustainability indexes, and academic journals focusing on ESG investment trends and green-finance performance. These sources helped to establish contextual relevance and support analytical interpretation.

Sampling Design

Selected using a non-probability purposive selection technique respondents familiar with investment activities. The target population included individual retail investors, mutual fund holders, and small institutional investors operating in Karnataka. A total of 200 valid responses were collected and analyzed after excluding incomplete entries. This sample size is adequate for correlation and regression analysis (Hair *et al.*, 2019).

Research Instrument

The research instrument was a **standardized questionnaire** divided into five sections:

1. Demographic profile (age, income, education, occupation).
2. Investor awareness of sustainable finance.
3. Behavioral intentions toward sustainable-finance products.
4. Perception of risk and return.
5. Challenges and policy-related issues.

All attitudinal questions were measured using a five-point Likert scale ranging from *1 = Strongly Disagree* to *5 = Strongly Agree.*

Data Analysis Tools

The collected data were coded and analyzed using SPSS (Statistical Package for the Social Sciences). The following statistical tools were employed:

- Descriptive Statistics – to summarize demographic and awareness levels.
- Correlation Analysis – to measure relationships among awareness, literacy, and behavior.
- Regression Analysis – to determine the predictive impact of independent variables (awareness, risk, return, literacy) on investment behavior.
- Reliability Test (Cronbach's Alpha) – to validate the internal consistency of the questionnaire.
- Graphical Representation – for visualization of awareness levels and behavioral trends.

Scope of the Study

The scope of this research is confined to investors in Karnataka, reflecting regional perceptions of sustainable finance and green investments. The findings are expected to guide policymakers, regulators, and financial institutions in enhancing awareness and designing investor-centric sustainable products.

Limitations of the Study

1. The sample size of 200 respondents may not fully represent the entire investor population of Karnataka.
2. Responses are subject to self-reporting bias, which may influence behavioral measurement.
3. The study focuses primarily on the retail-investor perspective, excluding large institutional investors.
4. Sustainable-finance markets are rapidly evolving; hence, some findings may require periodic validation with updated data.

Data Analysis and Interpretation

This section presents the statistical analysis conducted using SPSS v26, based on responses from 200 individual investors across Karnataka. The objective was to test the formulated hypotheses and interpret the relationships between awareness, financial literacy, perceived risk, expected return, and investor confidence toward sustainable finance.

Interpretation

All constructs recorded Cronbach's Alpha values above 0.70, confirming the **internal consistency** of the instrument (Nunnally & Bernstein, 1994). Hence, the dataset is reliable for further statistical testing.

Interpretation

The majority of respondents were graduates aged 31–40, indicating an active and financially aware investor segment. Most have moderate investment experience, aligning well with the focus on emerging sustainable-finance participation.

Interpretation

Strong and statistically significant correlations exist among the variables. Awareness, literacy, and policy clarity show positive associations with behavior and confidence, while perceived risk has a negative correlation with investment decisions.

Interpretation

The model explains **53.2 %** of the variance in sustainable-investment behavior. All predictors except perceived risk show positive and significant effects, indicating that investor awareness, financial literacy, expected return, and policy clarity are the strongest determinants of sustainable-finance participation in Karnataka.

Interpretation

All five hypotheses are supported by the data. Awareness and literacy exhibit the highest positive impact, while perceived risk negatively influences participation. Policy clarity enhances investor confidence, validating the importance of transparent regulatory communication.

FINDINGS AND DISCUSSION

The present study aimed to evaluate the level of investor awareness, behavioral patterns, and barriers influencing sustainable-finance adoption in Karnataka. The findings provide valuable insights into how awareness, literacy, perceived risk, expected return, and policy clarity collectively determine investor participation during the state's green transition.

Key Findings

1.**High Reliability and Consistency of Constructs:**

The Cronbach's alpha coefficients for all constructs were above 0.79, indicating strong internal consistency. This confirms that the measurement scales used for awareness, behavior, and perception were statistically robust and reliable for analysis.

2.**Moderate Level of Investor Awareness:**

Descriptive statistics revealed that investors in Karnataka possess a moderate level of awareness of sustainable-finance products. While most respondents were familiar with ESG funds and green bonds, fewer understood the social and governance aspects of sustainable investing. This gap aligns with Jain and Chawla (2020), who found limited conceptual understanding of sustainability among Indian investors.

3.**Positive Relationship Between Awareness and Behavior:**

Correlation results ($r = 0.571$, $p < 0.01$) confirm that awareness significantly influences investment behavior. Investors who are better informed about sustainable-finance products are more likely to invest in them. This is consistent with Raimo *et al.* (2020) and Kumar and Rao (2021), who noted that awareness and accessibility are key drivers of sustainable-investment behavior.

4.**Significant Influence of Financial Literacy:**

Regression analysis demonstrated that financial literacy ($\beta = 0.285$) positively affects behavioral intention. Respondents with higher financial knowledge displayed stronger confidence in evaluating the risk-return trade-off of sustainable products. This supports the findings of Patel and Mehta (2020), emphasizing that financial education enhances responsible investment choices.

5.**Negative Effect of Perceived Risk:**

The study found a negative relationship ($\beta = –0.216$) between perceived risk and investment participation. Many investors perceive green instruments as volatile or yielding lower short-term returns, discouraging investment. This aligns with Raza *et al.* (2021), who highlighted that uncertainty and information asymmetry deter participation in ethical funds.

6.**Expected Return as a Behavioral Catalyst:**

A positive and significant coefficient ($\beta = 0.301$) indicates that investors are motivated to engage in sustainable finance when expected returns meet or exceed conventional benchmarks. This validates earlier findings by Fatemi and Fooladi (2017) that financial attractiveness is crucial for the long-term viability of sustainability-based products.

7.**Policy Clarity Enhances Investor Confidence:**
Results show that policy transparency (β = 0.267) and access to credible information significantly influence investor confidence. Respondents expressed the need for clear ESG disclosure norms, consistent tax incentives, and reliable sustainability ratings. This finding supports Sarkar (2021) and Maheshwari & Thomas (2022), who argue that regulatory clarity strengthens market trust in sustainable investments.

8.**Overall Model Significance:**
The regression model ($R^2 = 0.532$, $F = 48.67$, $p < 0.001$) indicates that the chosen predictors explain over half the variation in sustainable-investment behavior. This underscores that psychological, informational, and institutional factors jointly shape investor engagement during Karnataka's green transition.

DISCUSSION

The results reinforce that sustainable-finance adoption is not purely a financial decision but a behavioral outcome influenced by awareness, literacy, and perceived credibility. Investors who are better informed about green instruments demonstrate stronger trust and readiness to invest, supporting the behavioral-finance theory of bounded rationality, where decision-making depends on available information and perceived utility rather than absolute rational evaluation. The negative role of perceived risk indicates that despite global advocacy for sustainable investing, local investors remain cautious due to limited experience and unclear performance benchmarks. This behavioral hesitation mirrors patterns observed in other emerging markets such as Malaysia and Indonesia, where sustainable-finance markets are still developing (Rahman *et al.,* 2022). Furthermore, the importance of policy and information clarity signifies that sustainable-finance growth requires more than awareness—it demands institutional trust and visible policy support. The introduction of ESG mutual funds, green bonds, and SEBI's sustainability disclosure mandates has improved visibility, yet their penetration remains concentrated among high-income and educated investors. In essence, the findings position Karnataka as a transitional market—aware yet hesitant. Enhancing financial literacy, demystifying risk perceptions, and reinforcing transparent policy communication will be pivotal in converting awareness into tangible investment behavior.

Conclusion and Recommendations

CONCLUSION

The present analytical study evaluated investor awareness, behavior, and challenges influencing participation in sustainable finance during Karnataka's green transition. The findings reveal that investor awareness and financial literacy are the primary enablers of sustainable-investment behavior, while perceived risk remains a critical barrier. Expected return and policy transparency emerged as significant predictors of investor confidence and participation. The regression model explained over 50 % of the variation in investment behavior, confirming that both psychological and informational factors substantially affect adoption. Investors with higher literacy and access to credible information exhibit greater willingness to engage in green-finance instruments. Conversely, ambiguity in policy frameworks and limited dissemination of ESG performance data discourage broader participation. In line with prior global and Indian research (Raimo et al., 2020; Patel & Mehta, 2020; Sarkar, 2021), the study reaffirms that sustainable finance in emerging economies like India requires a holistic ecosystem—one that combines education, regulation, and incentives. Karnataka's experience illustrates the transitional nature of investor sentiment: a population increasingly aware of sustainability but still cautious due to information asymmetry and uncertain return expectations. Therefore, sustainable-finance adoption in Karnataka depends not merely on product innovation but also on behavioral change, institutional credibility, and continuous awareness creation among retail investors.

Recommendations
Based on the analytical results and theoretical insights, the following recommendations are proposed:

1.**Investor Education and Financial-Literacy Programs**
Government bodies, SEBI, and financial institutions should launch targeted literacy initiatives emphasizing the concept, benefits, and risk profile of sustainable-finance products. Integration of sustainability modules into investor-awareness campaigns can bridge existing knowledge gaps.

2.**Transparent ESG Disclosure Framework**
Regulatory authorities must ensure consistent ESG reporting standards for corporates and funds. Simplified and comparable disclosures can enhance investor trust and reduce perceived risk.

3.**Tax and Return Incentives**
Policymakers should introduce fiscal incentives—such as tax deductions or interest rebates—for investors in green bonds and ESG-linked instruments to compensate for perceived risk and encourage participation.

4.**Fintech-Driven Accessibility**
Financial-technology platforms can play a pivotal role by offering user-friendly dashboards that display sustainability ratings, impact scores, and comparative returns of green investments. This digital transparency will attract younger and first-time investors.

5.**Regional Policy Framework for Karnataka**
The State government, in collaboration with financial regulators, should design a Karnataka Sustainable-Investment Roadmap focusing on renewable-energy finance, sustainable agriculture, and low-carbon infrastructure projects that mobilize both institutional and retail investors.

6.**Behavioral-Finance-Based Advisory Services**
Financial advisors should adopt behavioral approaches to address investor biases and risk perceptions, using personalized counselling to align values with sustainable-investment goals.

Future Research Scope
Future studies can expand the current analysis by:

- Incorporating larger and more diverse samples across different states of India.
- Applying advanced statistical techniques such as structural-equation modeling (SEM) to test causal pathways among awareness, perception, and investment behavior.
- Exploring gender, cultural, and regional influences on sustainable-investment attitudes.
- Conducting longitudinal studies to evaluate how awareness and confidence evolve as policy frameworks mature.

ABSTRACT

The integration of Artificial Intelligence (AI) tools in retail marketing has transformed how sales promotions are designed, delivering targeted, data-driven offers that enhance customer engagement and sales performance. This paper investigates the application of commonly accessible AI tools in designing sales promotion offers across diverse product categories in retail stores, focusing on the Tiruchirappalli district as a case study. The research explores AI functionalities including customer segmentation, personalized promotions, dynamic pricing, and campaign optimization, analyzing their impact on retail businesses in the region. Utilizing a mixed-methods approach, the study combines literature review with field data collected from local retailers employing AI in sales promotions. Findings indicate significant enhancements in promotional effectiveness, consumer response rates, and operational efficiencies. The study concludes that even small and medium retail enterprises can leverage affordable AI tools to compete effectively in a digitized marketplace, and provides recommendations for wider adoption in similar emerging retail markets

Keywords: Artificial Intelligence, Sales Promotion, Retail Marketing, Customer Segmentation, Dynamic Pricing, Tiruchirappalli, Case Study

INTRODUCTION

Retail marketing has undergone substantial shifts driven by technological advancements, particularly in Artificial Intelligence (AI). In the fiercely competitive retail sector, the design of sales promotion offers must be not only attractive but also precise and data-backed to resonate with diverse consumer segments. AI tools have become pivotal, enabling marketers to analyze big data, mine customer insights, and craft personalized offers in real-time. This paradigm shift has the potential to optimize promotional outcomes, enhance customer satisfaction, and drive revenue growth. Tiruchirappalli, a prominent commercial hub in Tamil Nadu, India, offers a unique blend of modern retail outlets and traditional marketplaces. This diversity provides a fertile ground for investigating AI-based promotional strategies tailored to different product categories ranging from apparel to groceries. Despite the growing adoption of AI in urban metros, its applications in tier-two cities and regional districts like Tiruchirappalli remain underexplored. This study addresses this gap by examining common AI tools employed in retail stores within the district and assessing their effectiveness in designing sales promotion offers. The paper is organized as follows: the next section reviews existing literature on AI applications in retail promotion design; this is followed by the statement of research objectives and an explanation of the methodology. The findings section presents insights from the case study and data analysis. The concluding section discusses implications and future directions for research and practice.

Literature Review

Artificial Intelligence's integration in retail marketing is progressing rapidly worldwide. AI tools such as machine learning algorithms, natural language processing, and predictive analytics are revolutionizing how sales promotions are conceived and executed. Studies emphasize the role of AI in enabling customer segmentation based on buying patterns, demographic data, and behavioral analytics, allowing for highly personalized promotional campaigns. Zhou *et al.* (2023) highlight how AI-powered recommendation engines boost sales conversion rates by tailoring product suggestions at an individual level. Similarly, Kumar *et al.* (2024) demonstrate that dynamic pricing algorithms, which adjust prices based on real-time demand and competitor analysis, can significantly increase profit margins without compromising customer loyalty. The Indian retail sector, while traditionally centered on physical stores and conventional marketing, is gradually embracing digital transformation. Success stories from large Indian retailers like Reliance Retail and Flipkart illustrate the benefits of AI in optimizing trade promotions and inventory management (Patel & Singh, 2024). However, research focusing on the application of these technologies in smaller cities and retail stores is scarce. Specific to the Tamil Nadu region, Subramanian (2023) identifies challenges such as digital literacy and data access that affect small retailers' ability to use AI effectively. Nevertheless, emerging AI-as-a-service platforms and cloud-based marketing tools are lowering entry barriers, making AI more accessible to businesses in cities like Tiruchirappalli. Gaps in the literature include limited empirical evidence on AI implementation outcomes at the micro-retail level and variation in impact across product categories. This study aims to contribute empirical data from Tiruchirappalli, offering practical insights adaptable to similar markets.

Objectives

The primary objectives of the research are:

1. To identify commonly used AI tools for designing sales promotion offers in retail stores within Tiruchirappalli district.
2. To analyze how these AI tools influence the effectiveness of sales promotions across various product categories.
3. To assess the operational benefits and challenges faced by retailers in implementing AI-based promotional strategies.
4. To propose recommendations for enhancing AI adoption among small and medium retail enterprises in Tiruchirappalli.

RESEARCH METHODOLOGY

Research Design

This study adopts a mixed-methods research design combining qualitative case study analysis with quantitative survey data to provide a holistic understanding of AI tool usage in retail sales promotions.

Data Collection

- **Primary Data:** Conducted semi-structured interviews with 15 retail store managers and digital marketing freelancers in Tiruchirappalli who actively use AI tools for sales promotion. Additionally, surveys were administered to 100 customers across different stores to capture consumer perception and response to AI-designed promotions.
- **Secondary Data:** Reviewed academic journals, industry reports, and digital marketing case studies relevant to AI in retail marketing.

AI Tools Assessed

Key AI tools evaluated include customer segmentation algorithms, dynamic pricing software, personalized promotion generators, and analytics platforms reporting campaign effectiveness.

Analysis Techniques

Qualitative data from interviews were thematically analyzed to identify patterns in tool usage and challenges. Quantitative survey responses were statistically analyzed to evaluate consumer engagement and perceived promotional effectiveness.

Ethical Considerations

Participants were informed about the study purposes, assured anonymity, and provided consent as per ethical standards for research.

Findings

AI Tool Adoption in Tiruchirappalli Retail Stores

The study found that a majority of retailers use a mix of AI-enabled cloud-based platforms such as Google Analytics, Facebook Ads Manager, WhatsApp Business with AI plugins, and affordable customer relationship management (CRM) tools which include AI components. These tools assist in segmenting customers by purchase history and behavior and scheduling personalized promotional messages.

Impact on Sales Promotion Design

Retailers reported improvements in targeting, noting up to 30% higher customer engagement rates with AI-designed personalized offers. Dynamic pricing algorithms helped optimize discounts without heavy margin erosion by aligning offers with real-time demand fluctuations and competitor pricing.

Product Categories Variance

- **Apparel and Fashion:** High personalization using AI-driven recommendation engines resulted in increased cross-selling.
- **Grocery and FMCG:** Demand forecasting models enhanced promotion timing around festivals with optimized discount levels.
- **Electronics:** AI tools helped in real-time inventory-based offer adjustments, maximizing sell-through.

Operational Benefits and Challenges

Benefits included time saving in campaign design, better data-driven decisions, and measurable ROI on promotional spends. Challenges centered around data accuracy, digital literacy of staff, and initial investment costs.

Customer Feedback

Surveyed customers reflected positive attitudes towards personalized promotions but valued transparency and simplicity in offers.

CONCLUSION

The research establishes that even small and medium retail stores in Tiruchirappalli district benefit significantly from incorporating common AI tools into their sales promotion strategies. The adoption leads to enhanced campaign relevance, increased sales, and improved operational efficiencies across multiple product categories. Addressing challenges related to data management and digital capabilities is crucial for sustained benefits. Retailers should prioritize AI training for staff, continuous data quality improvement, and exploring cost-effective AI platforms. Policymakers and trade bodies could support AI literacy programs to accelerate adoption in emerging retail markets. Future research should quantitatively assess long-term impact across more districts and integrate consumer behavioral analytics for deeper insights.

ABSTRACT

This exploratory study examines the adoption and utilization of financial analytics among small and medium enterprises (SMEs) in Bengaluru Urban. In an era of data-driven decision-making, financial analytics serves as a critical tool for improving budgeting, forecasting, cost management, and strategic financial planning. The study adopts a theory-based exploratory design, drawing on the Technology–Organization–Environment (TOE) framework and the Technology Acceptance Model (TAM) to understand the factors influencing adoption. Secondary data from scholarly articles, policy reports, and industry publications were supplemented with qualitative insights from SME owners and managers. Findings reveal that while awareness of financial analytics is growing, its adoption remains limited due to challenges such as cost constraints, lack of skilled personnel, and inadequate infrastructure. Organizational readiness, managerial perception, technological capability, and environmental support emerged as key determinants of adoption. The study concludes that greater emphasis on training, vendor support, and policy-level initiatives can enhance the effective utilization of financial analytics, enabling SMEs to make informed financial decisions and strengthen their competitive position in a dynamic business environment.

Keywords: Financial Analytics, SMEs, Adoption, Organizational Readiness, Managerial Perception, Technological Capability, Environmental Support, Decision-Making, Exploratory Study, Bengaluru Urban.

INTRODUCTION

In today's dynamic business environment, the ability to make timely, data-driven, and strategic financial decisions has become essential for organizational success. With increasing market uncertainty, resource constraints, and competitive pressure, financial analytics has emerged as a critical enabler of sound financial decision-making. Financial analytics involves the systematic use of statistical tools, predictive models, and data visualization techniques to evaluate financial performance, manage costs, optimize budgeting, and forecast future trends. It converts raw financial data into actionable insights, enabling firms to improve operational efficiency, control expenditures, and enhance profitability. For small and medium enterprises (SMEs), which form the backbone of India's economic growth, the adoption of financial analytics represents a valuable opportunity to strengthen competitiveness and ensure long-term sustainability. SMEs in India, particularly in Bengaluru Urban, operate in a rapidly evolving financial and technological ecosystem. Bengaluru, known as the "Silicon Valley of India," hosts a thriving SME sector that contributes significantly to employment generation, industrial output, and innovation. However, despite the availability of digital financial tools and analytics-driven technologies, many SMEs continue to rely on traditional decision-making methods rooted in experience and intuition rather than empirical data. Limited awareness, inadequate resources, and lack of skilled personnel often restrict the effective utilization of financial analytics. Consequently, decisions related to budgeting, forecasting, cost management, and investment planning may lack precision and foresight, potentially affecting overall performance and sustainability. The integration of financial analytics into SME operations can bring transformative benefits. By applying analytical techniques such as ratio analysis, trend forecasting, and performance dashboards, SMEs can identify inefficiencies, improve working capital management, and make informed strategic choices. Nevertheless, the adoption of such analytical tools depends on multiple factors, including organizational readiness, managerial perception, technological infrastructure, and vendor support. Understanding how these factors interact within the SME context is crucial for improving adoption outcomes. Furthermore, the unique challenges faced by SMEs—such as limited access to technology, financial constraints, and data management issues—necessitate a context-specific exploration of adoption behavior.

While large corporations have already embedded financial analytics within their financial management systems, research focusing on SMEs, especially in the Indian context, remains limited. Existing studies predominantly address technological adoption from a broad perspective, often overlooking the specific enablers and barriers that affect financial analytics implementation at the SME level. This gap underscores the need for exploratory research that investigates current adoption patterns, identifies influencing factors, and evaluates the extent to which financial analytics enhances decision-making processes in small enterprises. Therefore, this study aims to explore the adoption and utilization of financial analytics among SMEs in Bengaluru Urban. It seeks to assess the current level of awareness and use of financial analytics tools, evaluate their impact on key financial decisions, and identify organizational, technological, and environmental challenges that hinder their adoption. The research also examines the roles of managerial perception, vendor support, and organizational readiness in shaping effective implementation. By developing practical recommendations and frameworks, this study contributes to both academic literature and managerial practice, providing valuable insights for policymakers, SME associations, and technology providers seeking to foster analytics-driven decision-making in the SME sector.

LITERATURE REVIEW (WITH CITATIONS)

Financial analytics has increasingly become a cornerstone of modern business management, offering organizations a systematic approach to evaluating performance and predicting outcomes. It integrates statistical models and predictive algorithms to transform raw financial data into actionable insights that improve managerial judgment and forecasting accuracy (Gupta & Mehta, 2020). The transition from intuition-based decisions to evidence-based financial planning has been particularly beneficial for small and medium enterprises (SMEs), which operate with limited margins and greater exposure to market risk (Ramanathan & Joseph, 2021). The adoption of financial analytics by SMEs enhances competitiveness and operational efficiency. Data-driven analysis assists in optimizing

costs, managing cash flows, and improving financial reporting accuracy (Nair & Prasad, 2019). Empirical research shows that analytics enables early detection of financial risks and promotes business sustainability (Khatri & Sharma, 2023). In emerging economies such as India, the ability to interpret and apply financial data differentiates resilient firms from weaker ones, yet resource limitations and skill shortages still constrain adoption (Sharma & Raj, 2021). Technological readiness remains one of the strongest determinants of analytics adoption. The Technology–Organization–Environment (TOE) framework asserts that firms with appropriate infrastructure are more inclined to embrace innovation (Tornatzky & Fleischer, 1990; Patil & Deshmukh, 2022). Cloud computing has further democratized access by lowering costs and simplifying implementation (Nguyen, 2023). However, many SMEs continue to rely on outdated systems and lack cybersecurity preparedness, impeding full integration (Osei & Boateng, 2021). Organizational readiness also shapes the adoption process. Leadership commitment, employee training, and internal communication are critical for fostering a data-driven culture (Srinivasan, 2020; Kumar & Bansal, 2021). Without managerial support and adequate resource allocation, analytics initiatives remain underutilized. Studies highlight that open innovation and collaborative structures accelerate the institutionalization of analytics within SMEs (Li & Zhao, 2021). Managerial perception significantly affects the pace of adoption. Building on the Technology Acceptance Model (Davis, 1989), research finds that perceived usefulness and ease of use drive managers' willingness to adopt analytics (Reddy & John, 2020). When managers recognize tangible benefits such as improved forecasting and cost control, adoption rates increase. Yet skepticism about cost, data privacy, and complexity persists (Mahmood & Al-Hakeem, 2021). Vendor and technical support play a complementary role by providing training, customization, and after-sales services. Reliable partnerships with fintech vendors encourage sustained usage and help SMEs overcome learning barriers (Lee, 2022). Such collaboration ensures that analytical tools remain aligned with changing business requirements.

The influence of financial analytics on decision-making has been widely documented. Firms applying analytical dashboards experience better cost control and financial transparency (Chatterjee, 2018; Das & Gupta, 2020). Predictive analytics supports strategic financial planning by identifying inefficiencies and profit drivers, improving overall performance outcomes (Saxena, 2020). Despite its promise, SMEs face barriers such as high setup costs, lack of skilled professionals, and inconsistent data systems (Afolayan & Plant, 2018; Sharma & Raj, 2021). Poor data quality and fragmented databases often produce unreliable insights (Chouhan, 2020). Implementing structured data governance can mitigate these issues (Osei & Boateng, 2021). External environmental factors—including competition and regulatory dynamics—also influence technology adoption. Competitive pressure encourages SMEs to innovate and adopt analytics to maintain agility (Premkumar & Roberts, 2018; Ahmed & Junaid, 2022). Meanwhile, stable markets may generate complacency, reducing adoption urgency. Human capital development is critical. Training programs that enhance employees' analytical literacy significantly improve the use and interpretation of financial data (Rajesh, 2019; Khatri & Sharma, 2023). A skilled workforce increases confidence in data-driven decisions and strengthens institutional learning. Cloud-based financial analytics platforms have emerged as cost-effective tools offering scalability and real-time insights (Thakur & Patnaik, 2022). Such technologies enable SMEs to compete on insight rather than scale, bridging the digital divide (Nguyen, 2023). Policy support from government agencies and industry associations has also been instrumental in accelerating digital transformation (Ministry of MSME, 2021; Kumar, 2022). Recent conceptual frameworks link financial analytics capabilities with organizational performance. They highlight the combined influence of technology, human competence, and managerial support on performance outcomes (Mishra & Singh, 2023). A holistic approach integrating technological readiness, leadership engagement, and environmental adaptation is therefore essential for achieving sustainable benefits from analytics adoption (Li & Zhao, 2021). In summary, financial analytics significantly enhances the decision-making capacity of SMEs by promoting transparency, precision, and agility. However, gaps remain in understanding how organizational, technological, and environmental factors collectively shape adoption patterns within Indian SMEs, especially those in Bengaluru Urban. This exploratory study addresses that gap by analyzing adoption levels, identifying influencing factors, and developing strategies to strengthen analytics-driven decision-making among SMEs.

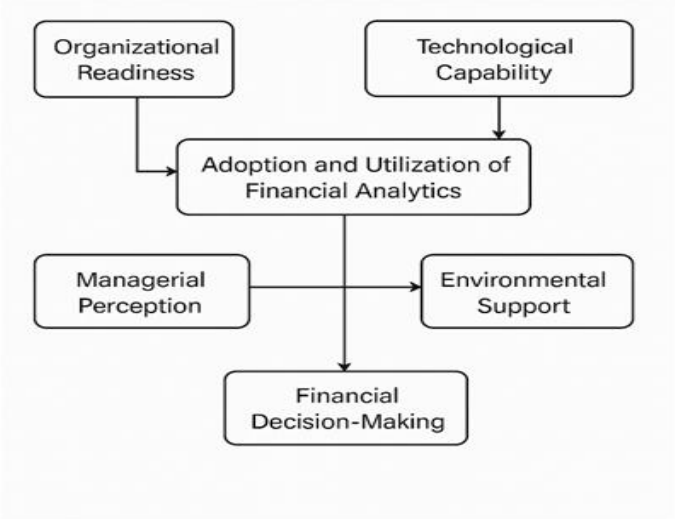
OBJECTIVES

1. To assess the current level of adoption and utilization of financial analytics tools and practices among SMEs in Bengaluru Urban.
2. To identify the organizational, technological, and environmental factors influencing the adoption of financial analytics among SMEs.
3. To evaluate the impact of financial analytics on key financial decision-making processes such as budgeting, forecasting, cost management, and strategic planning.
4. To examine the major challenges and barriers that hinder the effective implementation and utilization of financial analytics in SMEs.
5. To propose strategic recommendations and practical frameworks to enhance the adoption and effective use of financial analytics among SMEs in Bengaluru Urban.

RESEARCH METHODOLOGY

This study adopts an exploratory research design to understand the theoretical and practical dimensions of financial analytics adoption among SMEs in Bengaluru Urban. The purpose is to explore emerging patterns, conceptual linkages, and contextual influences that shape the adoption and utilization of financial analytics rather than to test predefined hypotheses. The research relies mainly on qualitative inquiry and secondary data analysis, supported by theoretical interpretation drawn from established frameworks such as the Technology–Organization–Environment

(TOE) model and the **Technology Acceptance Model (TAM)**.
Data for the study will be gathered from **secondary sources**, including scholarly journals, government publications, policy documents, and industry reports that discuss financial analytics, SME digital transformation, and decision-making frameworks. In addition, limited primary insights will be obtained through informal interactions and expert opinions from SME owners and finance professionals in Bengaluru Urban to enrich theoretical understanding. The collected information will be examined using thematic and conceptual analysis to identify recurring themes, factors, and relationships. This qualitative approach allows the researcher to interpret patterns and construct a conceptual understanding of how organizational readiness, managerial perception, and environmental conditions influence analytics adoption. The study aims to build a conceptual framework that can serve as a foundation for future empirical research and policy development related to financial analytics adoption among SMEs.



Conceptual Framework

The conceptual foundation of this study is built on the understanding that the adoption and utilization of financial analytics among SMEs is influenced by a combination of organizational, technological, and environmental factors. Drawing from the Technology–Organization–Environment (TOE) framework proposed by Tornatzky and Fleischer (1990) and the Technology Acceptance Model (TAM) developed by Davis (1989), the framework integrates both internal and external determinants of adoption within the SME context. The technological dimension emphasizes the availability, accessibility, and compatibility of financial analytics tools. SMEs with adequate digital infrastructure, reliable data systems, and awareness of analytical tools are more likely to explore and implement such technologies. The organizational dimension reflects internal readiness, which includes leadership commitment, financial capability, employee skill levels, and the presence of a data-driven culture. These elements collectively determine how effectively an SME can integrate analytics into its decision-making processes. The managerial perception component is central to the framework. The perceived usefulness and ease of use of analytics tools strongly influence managerial intent to adopt them, as explained by TAM. Positive managerial attitudes can enhance organizational learning and foster an environment conducive to innovation. Conversely, skepticism or lack of understanding among decision-makers can limit the depth of adoption. The environmental dimension includes market competition, vendor support, and policy incentives that shape the external ecosystem in which SMEs operate. Support from technology vendors, consultants, and government agencies plays a pivotal role in facilitating adoption by providing training, affordable solutions, and awareness programs. The competitive landscape also acts as a catalyst, encouraging firms to adopt analytics to gain strategic advantage. Integrating these dimensions, the conceptual framework posits that successful adoption and utilization of financial analytics depend on the interplay between organizational readiness, managerial perception, technological capability, and environmental support. The outcome of this interaction leads to enhanced financial decision-making, reflected in improved budgeting, forecasting, cost control, and strategic planning. This theoretical model provides a holistic understanding of how multiple factors collectively shape the adoption behavior of SMEs in Bengaluru Urban and serves as a foundation for further empirical investigation and policy development.

Findings

The exploratory study revealed that awareness and adoption of financial analytics among SMEs in Bengaluru Urban are at a developing stage. While many small and medium enterprises recognize the importance of data-driven decision-making, only a limited proportion have integrated structured financial analytics tools into their daily operations. Most SMEs continue to rely on conventional accounting methods and manual financial reviews rather than advanced analytical systems. The study found that organizational readiness plays a crucial role in determining adoption. Firms with supportive leadership, adequate financial resources, and trained personnel show higher levels of analytics utilization. In contrast, enterprises lacking digital infrastructure or managerial commitment struggle to incorporate analytical tools effectively. Technological capability also emerged as a major enabler; SMEs with access to affordable software, cloud-based tools, and data storage facilities exhibit greater confidence in adopting analytics solutions. Managerial perception was identified as a key influencing factor. Managers who perceive financial analytics as useful for improving budgeting, forecasting, and cost control tend to promote its integration into business processes. However, lack of awareness, fear of complexity, and uncertainty about return on investment were observed as psychological barriers among several SME decision-makers. The environmental dimension, including market competition and vendor support, also significantly affects adoption. SMEs facing intense competition are more motivated to embrace analytics for better strategic agility. Vendor-provided training, maintenance support, and customized solutions encourage sustained use of analytics tools. However, inconsistent technical assistance and high service costs discourage smaller firms from continued engagement. The study further identified several challenges impeding effective utilization. These include financial constraints, limited data literacy, inadequate information systems, and weak data management practices. Moreover, the absence of institutional frameworks or industry-level guidance restricts SMEs from understanding best practices in financial analytics. Despite these barriers, the findings indicate a growing interest and a gradual shift toward analytics-based decision-making among forward-looking SMEs in Bengaluru Urban.

CONCLUSION

The study concludes that financial analytics holds substantial potential to strengthen financial decision-making and strategic planning in SMEs. Although awareness is increasing, the overall level of adoption remains modest due to structural, financial, and behavioral constraints. The successful integration of analytics depends on a firm's organizational readiness, managerial perception, and technological preparedness, supported by an enabling external environment. SMEs that embrace analytics benefit from improved accuracy in forecasting, better control over costs, and enhanced responsiveness to market changes. However, widespread adoption requires greater access to affordable technologies, targeted training programs, and stronger vendor and government support. Creating a culture of data-driven decision-making is essential for translating technological capability into strategic advantage.

The exploratory nature of this study highlights that adoption of financial analytics among SMEs is an evolving process influenced by interrelated organizational and contextual factors. The findings suggest the need for continuous awareness-building, capacity development, and collaboration between policymakers, vendors, and SME associations. A well-structured framework promoting financial analytics can empower SMEs in Bengaluru Urban to achieve sustainable growth and competitive resilience through informed decision-making.

ABSTRACT

Adapting to intricate environmental settings, animals make efficient use of soft structures. Soft technologies are now being incorporated into robotics designs by engineers due to their characteristics. Enabling bioinspired capabilities in robots to enable flexible and adaptive interactions with erratic environments is the aim. This review focuses on new advancements in soft-bodied robotics, especially those that draw inspiration from animals. The complexity of the algorithms and mechanics required in robot design may be lessened by incorporating soft technologies. Robots that can safely interact with people and the environment will develop more quickly if soft technologies are incorporated. Finally, hybrid systems for medical purposes can be created by combining tissue engineering and soft robotics technology.

Keywords: Softrobotics, Bioinspired, Degree of freedom, GoQBOT, Actuation, Adaptation

INTRODUCTION

Usually, when we think of the word "robotics," we imagine a robust, powerful machine that can complete tasks quickly and accurately. Although there is no universally accepted definition for robotics, it can be characterized as a scientific and engineering discipline that focuses on creating reprogrammable systems. These systems are multifunctional, multipurpose, and adaptable, and intelligently connect sensing with action to achieve various tasks. The term "soft robotics" refers to the category of robots composed mostly of soft materials that are capable of safe interaction and environment adaptation [1]. Modern industry uses a lot of traditional, rigid-bodied robots that can be specially designed to carry out a single task effectively but frequently with little versatility. Because they are built with rigid links and joints, they are unsafe for interaction with human beings[2]. As the discipline of robotics extends and evolves beyond manufacturing and industrial automation into health care, outdoor exploration, and human-robot collaboration, the agents involved become less rigid and more receptive to specialized mechanical compliance. A new robotics concept known as "soft robotics" has emerged to combine human-robot interaction in the vicinity of biomedical robotics[3]. Because of soft robotics intrinsic compliance, a variety of robotic technologies with diverse forms, functions, and appearances have been established. This has allowed robotics to find new applications and given rise to innovative core technologies[4]. Soft robots, as the name indicates, are built of soft materials or have a soft interface overlaying a stiff skeleton/support. Soft robots are adaptable and can quickly adjust to the shape of an object[5]. This article describes the concept behind the bioinspired design of soft robots, along with its benefits and limitations. What is the main difference between traditional and soft robotics? What are the challenges in this field? What bioinspired innovations are available in this field, and which diseases are they now being used to treat?

Bioinspired Evolution

Animals utilize soft structures to move effectively in complex natural environments. These characteristics served as inspiration for robotic engineers to incorporate soft technology into their designs. Most manufacturing robots created by humans are made to be rigid to carry out strong, rapid, repeatable, and accurate position control jobs on assembly lines. In contrast, soft materials are more common in the world of animals. Animals with soft bodies are dominant, and even those with hard exoskeletons, like insects, have lengthy life stages during which they are almost entirely soft (maggots, grubs, and caterpillars). Even organisms with rigid endoskeletons are mostly made of fluid and soft tissues [6]. Soft robots cannot take the place of traditional robots. However, soft robots are appropriate for some applications, particularly medical applications. Soft robotics aims to provide robots additional bioinspired capabilities so they can interact adaptably and flexibly with their uncertain surroundings. Soft technology will also accelerate the development of robots that can interact safely with people and the environment[6]. An extraordinary array of examples of improved motor skills resulting from the incorporation of compliant elements into the body structure can be found in nature. The research community has been working hard to design a robot that is inspired by nature to replicate the capabilities of biological systems. Soft robots can draw inspiration from biological systems in two primary ways: biomimetics and bio-inspiration. The goal of biomimetics is to mimic the appearance, movements, and behaviours of natural systems to replicate their capabilities. Instead, bioinspiration examines the fundamental physical principle underlying natural phenomena to eventually translate it into applications outside of the natural example[4]. According to Rus and Tolley (2015), the goal of soft robotics is to create “Systems capable of autonomous behaviour and predominantly consist of materials with moduli in the range of soft biological materials.” Consequently, the soft paradigm proves to be particularly interesting for bio robotic applications that need to have intimate contact with the human body[7]. Animals' bodies have coevolved with their central nervous systems to form a fully integrated neuromechanical control system, and soft materials are vital to their mechanical design. Animals can negotiate and adapt to changing, complex situations with the many benefits these soft components offer[6]. The term "soft" refers to the robot's body, which is made possible using soft materials. The rigidity of materials used in constructing robotic systems is often measured by Young's modulus, although this measurement is limited to homogenous, prismatic bars subject to axial loads and small deformations. While natural organisms are typically made of materials such as skin and muscle tissue with moduli on the order of 104–109 Pa, which is orders of magnitude lower than their engineered counterparts, traditional robotics materials such as metals and hard plastics

have moduli on the order of 109–1012 Pa. Soft robots are defined as autonomously operating systems made primarily of materials whose moduli fall within the range of those of soft biological materials [2]. Soft robotics, also known as biologically inspired robotics, provides novel solutions for applications involving safe human interaction, delicate object manipulation and grasping, and crops and related agricultural products. Depending on the application, soft robots can be agricultural, medical, rehabilitation, manipulating, gripping, or similar types of robots. Be aware that while the robots can be categorized based on their primary characteristics—such as their drive system, degrees of freedom, kinematic structure, work volume, type of motion, etc.— they also can be categorized at the system level into categories such as walking robots, humanoid robots, wheeled robots, robot manipulators, and similar categories [1]. Animals' mechanical designs depend primarily on soft materials, and their body structures have coevolved with the central nervous system to create a fully integrated neuromechanical control system. Animals can negotiate and adapt to changing, complex situations with many benefits these soft components offer. They reduce the maximum impact force by conforming to surfaces, dispersing stress over a greater volume, and lengthening the duration of contact [6]. Ultimately, the ecological niche most likely determines whether an organism has evolved to be stiff or soft. Instead of needing a permanently stiff skeleton that allows to exploit behaviours and environments inaccessible to skeletal animals, animals that do not need to travel quickly or exert high-impact forces can develop highly deformable bodies. The caterpillars can blend in with their host plants to appear cryptic, the octopus can mimic its environment, and all of them can fit through openings whose dimensions are slightly narrower than their unrestricted bodies. These are crucial insights for developing soft robots[6].

Scientific Motivations behind Design of Soft Robotics [4]

We hypothesize that the scientific motivation for soft robot design can be divided into three categories:

- Application solving, which refers to the creation of novel designs or soft robotic technologies that can increase the capabilities of robots to applications where energy efficiency, robust disturbance rejection properties, or environmental compliance are critical. Biomedical devices, exploration of severe environments), and safe human-robot interaction are a few examples.
- Advancing Theoretical Principles. creating a novel theory or knowledge to account for the actions or interactions of soft robotic components in their surroundings. This could not be wholly application driven, but rather motivated by intrinsic curiosity. There are a lot of these issues in the modeling and control area of soft robotics research because of the possibility of intricate interactions between rigid and soft systems.
- Improve our understanding of biological systems. Since biological systems are often "soft" or contain soft components, creating bio-inspired or bio-mimetic systems can help us create "robot-physics" or related methodologies, which will further our understanding of the natural world.

Advantages of Soft Robotics

- Materials that are compliant and flexible provide flexibility and adaptation[8].
- High degree of adaptability to deal with uncertain or chaotic environments.
- Low cost and simpler fabrication because of the use of simple materials and production techniques [8].
- Decreased chance of environmental harm and human injury.
- Soft robots excel at jobs that need careful motions, handling small objects, and secure human-robot cooperation.
- Human-robot interaction is improved via soft robotics.
- Additionally, soft robotic systems are more appropriate for human-to-human interaction, particularly in wearable operations.
- The capacity of deformable structures to store and release energy makes them advantageous for energy-efficient movement [9].
- Compliant materials can store energy to be released later, such as during locomotion, by converting stresses into shape changes, exactly as biological systems can [11].

Limitations of Soft Robotics

- Many soft robots currently available have a negative impact on the environment due to their power sources and construction materials [10].
- Limited repeatability and precision compared to hard robotics [8].
- Soft robots are typically more vulnerable to damage and rupture because of the characteristics of their soft materials [10].
- Limited durability and strength for heavy-duty operations [8].
- There are several significant restrictions on soft biological structures. Soft creatures are generally tiny because they cannot sustain their own body weight in the absence of a skeleton. All of the incredibly huge soft invertebrates can be found underground (giant earthworms) or in the ocean (squid and jellyfish), where their bodies are supported by the surrounding material. Soft robots would be subject to similar restrictions, which require careful material selection to match [6].
- Reduced load capacity, resulting in it being less suitable for heavy-duty operations [8].
- Soft tissues have a high degree of deformability and energy absorption, which limits how quickly soft animals may move from one location to another and prevents them from exerting significant inertial forces. This does not stop the body's various sections from moving swiftly when there are light loads [6].

Characteristics of Hard and Soft Robots [1]

Soft-Bodied Animals and Soft-Bodied Robots

Pneumatic actuators have been used at Harvard University to develop a range of soft robots. They include robots that resemble starfish [27] and tentacles, with the ability to camouflage and undergo significant deformation [12]. One issue with creating robots out of soft materials is that there isn't a general theory explaining how to control such unconstrained structures at this time. Engineers in Robotics have started to advance this knowledge by creating robot models based on the neuromechanical locomotion strategies of soft-bodied animals, mainly annelids (earthworms and leeches), mollusks (mainly octopuses), and insect larvae (caterpillars)[6].

Worms and Worm-Like Robots

One important subset of bionic robots that has attracted a lot of attention recently is the earthworm-inspired soft robot. The deformation of the earthworm body segment is the focus of research on soft robots inspired by earthworms. As a result, several actuation techniques have been put forth to expand and contract the robot's segments in order to simulate locomotion. Humans have looked to nature for inspiration on a few specific issues, gastrointestinal tract inspection, and have ultimately discovered that these issues can be effectively resolved by mimicking the movement of earthworms. Earthworm-inspired soft robots have attracted a lot of attention lately because of their ability to move in an unstructured manner and their peristaltic locomotion features, which include motion stability and adaptability [13]. Worms can be thought of as fixed volume hydrostats from a biomechanical standpoint. By applying Pascal's principle to convert force and displacement, they imitate the mechanical functions of a lever. While the contraction of circumferential muscles decreases the diameter and elongates the body, the contraction of longitudinal muscles shortens and increases the diameter of the body [6]. Worms move by using their cylindrical segments to create traveling waves of contraction and expansion, a mechanism like intestinal peristalsis. Depending on when the traveling wave and the locomotion contact the ground, their directions can be the same or different. In addition to the earthworm-inspired soft robots primarily described in this review, there are several cutting-edge ideas based on other biological characteristics of earthworms [13]. Wall crawling is an invention based on the peristaltic process of earthworms. The most important feature of wall-climbing robots is that they can improve the adsorption capacity of the bristle like structure significantly. Earthworms cannot crawl on vertical walls in nature, so researchers used piezoelectric motors, suckers, or electromagnetic effects to attach the robot to vertical walls and perform earthworm-like crawling, this design enables the robot to climb vertical walls, even those with obtuse angles, which is currently lacking in conventional earthworm inspired soft robots. Modular designs for rapid replacement of damaged body segments have also emerged, even though the robot moves a little more slowly, it can still steadily climb the vertical wall. In general, it is more reliable and has a higher load capacity than traditional climbing techniques. The comprehensive examination of real earthworm skin has led to the publication of some

research findings regarding artificial skin that can self-heal. According to earthworms have superior resilience in cohesive soils and are affixed with recurring folded skin. Superhydrophobic (SH) fabrics were thus treated in this manner to provide exceptional superhydrophobic durability, and this exceptional adaptability was replicated and applied to them [14,15]. Furthermore, after exposure to heat or plasma, SH fabrics can mend themselves. Creating incredibly resilient and fluorine-free textiles is made possible by this method. Additionally, by developing flexible, soft skins with surface morphology and gradient modulus, it shows how ultra-durable superhydrophobic fabrics may be reached. Furthermore, because bio-micro actuators have high mechanical integrity and biocompatibility, two desirable properties, research into developing bio-micro actuators that integrate microdevices and cellular mechanical functions has been ongoing. Extended (more than 2 minutes) and repeatable displacement can be seen because chemical (acetylcholine) stimulation regulates muscle contraction and diastole. The force produced by the muscle can regulate the opening and closing of the valve, and the pressure resistance can reach 1.5 kPa [16].

Caterpillars and Caterpillar-Like Robots

Different locomotion strategies are displayed by caterpillars: 1) Caterpillars that are smaller and thinner tend to employ the inching strategy more frequently. When moving forward, caterpillars create a body loop that resembles a "Ω" and advance nearly one body length. 2) The larger and thicker caterpillars are the ones that primarily employ the crawling strategy. Legged body segments elevate and advance both of their legs simultaneously. By extending waves of steps that begin at the rear of the body and terminate at the thoracic legs, caterpillars move forward. 3) Alternative forms of movement: additional brief means of movement, such as rolling, thread-climbing, moving backward, and galloping, are primarily employed for escape. Several robots have imitated the distinct motion gaits of caterpillars, including nonpneumatic crawling robots and GoQBOT, which was reported by Lin *et al*.21 to execute the inching, crawling, and rolling form of caterpillar locomotion [17]. Insect larvae have a totally different anatomy and mode of locomotion, despite occasionally being mistaken for worms. In general, burrowing species like fly larvae (maggots) and sedentary Hymenoptera larvae (like wasps) have no limbs, but the larvae of butterflies and moths are highly active climbers with well-developed gripping appendages called prolegs. They have a single continuous body cavity known as the hemocoel, despite the appearance of having segmented bodies. There are no internal divisions between these segments. Up to 2000 motor units are dispersed throughout the surprisingly complex Caterpillar musculature. There are numerous tiny muscles affixed to the limbs and other body parts, as well as longitudinal and oblique muscles; circumferential muscles do not exist. Although they can cantilever their bodies across gaps by adjusting pressure to increase body stiffness, caterpillars do not seem to use pressure as a major control variable for most other movements[18]. According to the "environmental skeleton hypothesis, "caterpillars climb and crawl by applying compressive forces to the substrate and managing the release of tension in their bodies. Muscle contraction waves appear to be loosely coordinated and are mainly responsible for redistributing the mechanical energy that is stored in elastic tissues. By adjusting the timing and location of substrate attachment using hooks at the tips of the prolegs, the coordination of movement is established. The hooks have a completely passive grip, but a single pair of retractor muscles under the control of three motoneurons actively carry out the release. This is amazing because one proleg can generate enough grip to stop any forward movement. For this reason, grip release needs to be totally dependable regardless of the substrate's shape or texture. It is improbable that the retractor muscles are precisely controlled or modified with each stride to account for attachment variations[6]. Very soft portions of the proleg are more likely to be distorted in order to reroute naturally occurring muscle forces and guarantee hook release from the substrate. The system shows how crucial the embodiment process will be in the design of soft robots and seems to be a great example of morphological computation [19]. These robots that resemble caterpillars highlight a crucial feature of highly deformable objects: their ability to change shape to accommodate a variety of body types. The GoQBot, for instance, has a long, narrow body that can be bent into a circle. This shift happens quickly enough to release enough elastic energy stored in the body to enable rolling ballistic motion[20]. The 10-cm-long robot can travel 200 cm/s linearly with the GoQBot's 100 ms conformational change, which produces an acceleration of about 1 G and 200 rpm [6].

Octopus and Octopus-Like Robots

The octopus may provide an amazing source of inspiration for the development of soft robots. Robotics is very interested in its manipulating ability and its ability to move on nearly any type of surface. The octopus's body is made of flexible structures that allow it to readily adapt to its surroundings. It can spread out over its prey or fit through extremely tiny, narrow openings. The octopus possesses eight arms that are capable of twisting, varying in length, bending at any point along the arm, and applying relatively high forces despite the lack of rigid skeletal support [25]. Stereotypical movements are used to simplify and distribute control over such a broad range of motion [23]. like, say, temporarily rearranging the arm into a rigid, articulated, nearly joint structure. The eight arms are employed efficiently to move on the various seafloor substrates and to exhibit surprising dexterity in reaching, grasping, and even manipulating objects. Cephalopods, such as squid and octopuses, can perform some of the most complex and intricate soft-bodied movements. Cephalopods can morph their bodies to fit inside objects like cubic boxes and to imitate other animals or their surroundings. Because of its remarkable physical fluidity and capacity for object manipulation, octopuses make for appealing models[21]. The muscles in each octopus arm are arranged into unique anatomical groups [38,39]. Transverse muscle fibres in the centre of the block extend outward to interdigitate with bundles of longitudinal muscle fibres. Three sets of oblique muscle layers encircle each other, spiralling along the arm's length in left and right helices. Forces can be distributed by localized or global stiffening, and the arm can be used to articulate the shape by bending, torsion, elongation, or shortening [22]. Because muscle tissues have a fixed volume, the octopus can take advantage of the hydrostatic force-displacement exchange. It has been demonstrated that octopuses can simplify control by limiting the degrees of freedom through stereotypical movements. For instance, a wave of stiffening and straightening creates a propagating passive bend during a behaviour known as "arm reaching" [23]. Similar to this, certain fetching movements exhibit localized arm bending, or pseudo joints [23,24]. The remarkable complexity of the majority of octopus movements, however, cannot be explained by these stereotyped motions alone; instead, it is likely due to local control by the 50 million peripheral neurons that make up each octopus arm [24]. The octopus does not move by pushing or tugging like a paddle. The task can be completed by one to four arms simultaneously, and the movement's direction and speed are the arms' simple combined vector. The octopus does not rotate its body when it is crawling; instead, it maintains its orientation even when it turns in a different direction. All the octopus has to do is swap out its arm set for the ones that face the new direction.

The five stages of the rhythmic stepping-like motion used to perform single-arm pushing are as follows:

1. Reducing the length of the proximal arm segment (occasionally along with or without reducing the length of the arm)
2. Adhering a few proximal suckers to the surface
3. Releasing the attached sucker,
4. Shortening back to its basic length, and
5. Lengthening the proximal segment between the attached portion and the arm's base [26].

Numerous robots that resemble octopuses have been created; these primarily use the general idea of compartmentalized deformation to generate limbed locomotion [27]. The OctArm robot is one example of a soft manipulator that uses pneumatic muscles that can bend in any direction. Walking robots that are made of layers of silicone elastomers with embedded channels that can be compressed by air or fluid employ the pneumatic technique. A variety of walking gaits can be produced by selectively inflating and deflating these cavities based on careful consideration of chamber size, wall thickness, and geometry [27]. Building incredibly complex embedded pneumatic networks capable of high-resolution, complex movement will be feasible with the development of pumps, valves, and power supplies that are compatible with highly deformable body structures.

Jellyfish and Jellyfish Like Robots

For creatures of nature, the ability to be transparent is a clear advantage. Because of their transparency, they can blend in with their surroundings and elude predators and conceal their actions. Similar-functioning robots can be very useful for a variety of purposes, such as supporting research that involves observing animals in their natural environments and supporting surveillance. Researchers have been focusing on artificial transparency in an effort to

create transparent devices that are bio inspired and resemble natural creatures [28]. Despite having a simple body structure, Aurelia aurita, also known as moon jelly, is one of the most common transparent creatures that can effectively control the fluidic flow around their body to achieve movement in the water. Typically, jellyfish swim constantly due to the force produced by periodic changes in the bell's size, which occur at varying times [29]. Because of the faster contraction than expansion, there is less dragging force and a larger proportion. Many jellyfish are almost invisible in water and extremely transparent in the wild. Being transparent is a highly effective way to blend in with different backgrounds and evade predators when swimming in the ocean. Underwater soft robot design has been influenced by their translucent appearance and versatility[28,30]. However, because of the inherent limitations of actuators that prevent their integration in a flexible, lightweight, and transparent manner, a jellyfish robot that can mimic both the exceptional functionality and appearance of natural jellyfish has not yet been developed. For soft robots that are inspired by jellyfish, these characteristics are very desirable. Previous attempts have used stimuli-responsive actuators, such as dielectric elastomer actuators (DEAs), [28,31,32] ionic polymer metal composites, pneumatic structures, shape memory alloys, twisted coiled polymer actuators, and magnetic composite elastomer, [30] to develop soft robots that can move like jellyfish. When compared to electrical motors, these actuators have demonstrated good geometrical adaptability and high compliance; however, DEAs stand out from the rest because of their intriguing features, which include large voltage induced deformation, high energy density, quick response, low weight, and silent operation [33,34]. Recently, DEAs have been used to develop a number of jellyfish soft robots. [31,32] These soft robots were equipped with carbon-based electrodes, which are the most widely used type of electrode for DEAs. Since carbon-based electrodes are opaque and black, they are unable to faithfully replicate the transparent appearance of jellyfish, despite the robots' ability to mimic the morphology and movements of jellyfish using carbon-based DEAs. Soft jellyfish robots' transparency allows for passive camouflage, which does away with the necessity for knowledge of the background and environment, which is typically needed for active camouflage tactics. [35] Ionic hydrogels and single-walled carbon nanotubes have also been patterned in earlier studies to function as optically transparent electrodes. Ionic hydrogel-based actuators and robots, on the other hand, are typically thick, resulting in significant refraction and scattering effects, and single-walled carbon nanotube-based soft actuators typically have low transmittance. Therefore, the main task is to develop a fully transparent soft jellyfish robot that can achieve muscle-like large deformation and rapid contraction using transparent materials and clever actuation techniques.

Soft Technologies in Robotics and Challenges

Actuation

Designing flexible actuation systems with high force capabilities to mimic the operation of animal muscles is one of the main challenges in soft robotics. The distribution of many muscles throughout the body is necessary for soft animals to be able to change the shape of their bodies
[6].

There are three widely used actuation techniques at the moment.

The first method involves using dielectric elastomeric actuators (DEAs), which are a significant advancement in the search for artificial muscles. DEAs are made of soft materials and actuate through electrostatic forces. This technique has limitations even though it exhibits a relatively high-performance metric (high strain/stress and mass specific power). (i) A stiff frame that pretrains the elastomer is necessary for the majority of designs that use DEAs. A few designs function without stiff frames, but they produce extremely low stress and require complicated fabrication. (ii) These designs' compliant electrodes need to be more reliable. (iii) For many applications, the technique's requirement for high voltages is undesirable. Utilizing SMAs, which are well-liked for soft actuation because of their high mass-specific force, is the second method. Since the strain in the most common nickel-titanium alloys is relatively low (about 5%), engineers frequently make coils out of thin wire to increase the overall strain [20,36]. This makes it possible to shape SMAs into extremely flexible springs that resemble threads and can be incorporated into soft structures. Robust temperature control in diverse thermal conditions is a challenge, though, because force generation in SMAs is dependent on temperature change. Efficiency is extremely low (about 1%), as the heating of the SMA wire itself uses most of the input energy. Furthermore, the actuator may easily sustain irreversible damage from

overheating or overstretching. Using pressurized fluids and compressed air is the third method. Since the 1950s, this method has produced strong actuation systems for soft materials. Although they require high power and intricate compressed air supply systems, contractile devices deformed by pressurized air, such as McKibben actuators (made of a fibre braid), can produce relatively high forces and displacements. However, this method has recently been used to develop a soft orthotic device that uses pneumatic actuators [37]. Alternatively, soft body parts can be directly deformed by compressed air or fluid through the networks of channels in elastomers, which inflate chambers and allow tethered robots to move [27]. An example of a hydraulic network in action was utilized to mimic animal camouflage techniques by changing the skin colour of a soft robot [35].

Stiffness Modulation

Stiffness modulation is an essential technology for soft robotics applications. For soft systems to apply deliberate forces to a particular task, like tissue sampling, they must be stiff. Animal models have been the focus of soft robotics research to find ways to adjust body stiffness to suit a particular task [38]. For instance, muscles change from a state of low stiffness, or passiveness, to high stiffness, or activity, in addition to being utilized for actuation, this characteristic aids in force distribution or energy dissipation to sustain steady motion. A soft gripper based on particle jamming is an intriguing illustration of variable stiffness. To create a soft, flexible structure that can take on the shape of objects it is pressed against, granular material is loosely enclosed in a sac. A vacuum pump is used to lower the pressure inside the sac after it has curved to accommodate an object. This causes the granular filling to pack tightly, creating a stiff structure that can hold onto the object with comparatively little force. A laminated tubular structure has employed a comparable concept to produce a variable-stiffness tube intended for laparoscopic purposes [39]. This structure's pneumatic network architecture regulates compressed air pressure to vary stiffness. [27]

Soft Materials

Soft robots articulate their entire body structure as a continuum, while conventional rigid robots articulate discrete joints intended to have negligible impedance. Elastomers or other low modulus materials should be used to make the body to reduce the force necessary to cause deformation. Due to its low modulus (as low as 05-00 durometer), which permits high strain, and the ease of room-temperature vulcanizing, silicone rubber is a popular material choice for body fabrication. For medical applications, it's a good biocompatible material as well. A recently developed tough and highly stretchable hydrogel [40] can be used as a soft body material in the future, potentially integrating tissue-engineered materials by acting as scaffolding. Soft, biodegradable robots with a dissolvable structure might be employed to administer medication to particular tissues [41]. Soft-bodied robots' interactions with their environment require new methods for modelling and control. Because the structure of soft robotics is a continuum and deformation are highly nonlinear due to large strain, known robotics techniques for kinematic and dynamic modelling cannot be directly applied in this context. Although many constitutive models for significant deformations of rubber-like materials have been created, [42,43] accurate dynamic modelling of such systems remains difficult because soft robots typically have heterogeneous structures with intricate boundary conditions. Kinematic analysis is the main method used today to model direct-continuum materials in soft robotics [44].

Future Convergence with Tissue Engineering

New opportunities for bioengineered and biohybrid devices are presented by soft materials. An adaptable biohybrid micro system that simulates the human lung's alveolus–capillary interface has been developed by researchers. The interface can be stretched rhythmically by a soft material, simulating the cyclical mechanical effects of breathing. Researchers have created a tissue-engineered jellyfish that can swim by cultivating cardiac muscle cells [45]. Considerable progress has been made in the creation of biomaterials appropriate for soft robots used in minimally invasive surgery (MIS), including scaffolds for tissue growth made of biopolymers like silk and soft, transient electronics [46]. Using 3D printed hydrogel, muscle cells are grown to create a locomotive "bio-robot." Biomaterials that release therapeutic agents locally or deposit materials the body can use as a scaffold for tissue repair could be used to create a soft robot. Soft robots composed of biological materials and living cells would inherit these materials' many benefits: they are biocompatible and biodegradable, which makes them potentially green

technology; they have an amazing potential for self-assembly (from molecular structures to integrated devices); and they are powered by energy-dense, safe hydrocarbons like lipids and sugars. A biopolymer-based mobile body structure in any desired configuration, actuators (synthetic or living muscles), and a biofuel source (e.g., mobilizing glucose or lipid reserves in the robot's body cells) are the main components required for robotics. Such robots also have great potential for tasks requiring disposable devices or swarm-like interactions, since they could be built (or grown) using parallel fabrication methods [6].

CONCLUSION

The research on soft-bodied animals has been a major source of inspiration for recent work on soft technologies embodied in robotic systems. The exploration of biological models is essential for the creation of novel robotic actuation strategies, algorithms, and mechanisms. We need new active soft materials to build robots that implement the biomechanical intelligence of soft-bodied animals. One of the main obstacles to creating fully soft bodied robots that can move, deform their bodies, and modulate body stiffness is the development of soft muscle-like actuation technology. Soft technologies offer several benefits that will greatly aid in the development of robots that can interact meaningfully with humans or their environment. These benefits include: (i) safer and more reliable interactions than those possible with conventional robotics; (ii) adaptive behaviours that use mechanical intelligence to simplify the controllers required for physical interaction; and (iii) simpler and less expensive robotic components. Soft robotics is especially useful in the medical field. Robotic devices that are safe for use in medical interventions, such as diagnosis, medication therapy, and surgery, may be made possible by soft materials. Soft robotics, for instance, might hasten the advancement of MIS methodologies. Soft-bodied MIS robots may result in less tissue damage during insertion and navigation through intricate organ geometries and soft tissues than rigid instruments. Biocompatible soft materials and tissue-engineered cells will soon allow us to design biohybrid soft robotic systems for medical interventions. The convergence of technologies will be propelled by the applications of soft robotics. The seamless integration of several disparate fields, including mechanical, electrical, bioengineering, material science, and medicine, is necessary to develop a generation of soft robots for use in real-world scenarios. We envision a time when such technological convergence will enable prosthetic organs and limbs made of tissue-engineered materials and artificial robotic components.

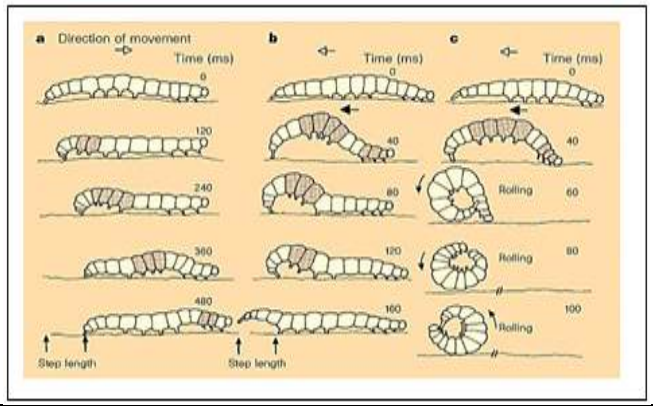

Fig 1: Caterpillar Kinematics [51]1

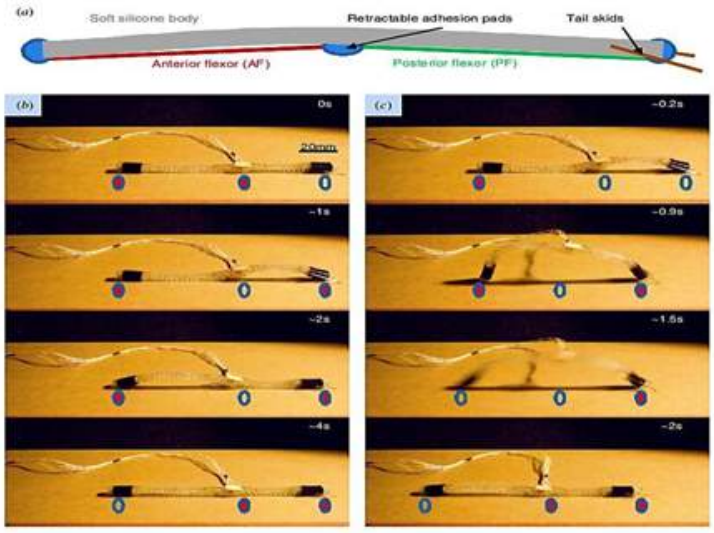

Fig 2: Overall soft robot architecture.

GoQBot has two major actuation units:anterior flexor and posterior flexor. The motor pattern for crawling is quite simple with some overlapbetween the two flexors.Three retractable adhesion pads are controlled in sequence(marked) to produce appropriated ground anchors. The result is a crawling gait as shown in (b). During crawlinch operation, the tail skids are retracted slightly to facilitate the functioning of the posterior adhesion pad. Pacing up the gait pattern and proportionally scaling up the stimulation intensity lead to a large amplitude inching gait as exemplified in (c). The details of the adhesion pads and gait control are beyond the scope of this paper. This figure only introduces the basic architecture of GoQBot. Different versions of GoQBot may have morphological variations specific to our experimental goals. [20]

ABSTRACT

As wireless communication continues to progress, there's a growing need for faster data speeds and better use of the available spectrum. Cognitive Radio (CR) technology has emerged as a promising solution to meet these demands by intelligently detecting and using unused frequency bands. It relies on advanced digital signal processing and multicarrier techniques to improve how efficiently the spectrum is used. While a lot of research has focused on the theory behind CR, there's still a gap when it comes to building real-time, hardware-based systems. This paper focuses on bringing theory into practice by implementing Filter Bank Multicarrier (FBMC) techniques on an FPGA-based Software Defined Radio (SDR) platform. Using the Xilinx Zynq ZC7020 SoC, we designed and prototyped a model that performs spectrum sensing in cognitive radio environments. The system's performance was tested through Bit Error Rate (BER) analysis in an FBMC-MIMO setup, showing that FPGA-based CR systems can operate efficiently in real time.

Keywords: Filter Bank Multicarrier (FBMC), FPGA, Cognitive Radio, Xilinx Zynq ZC7020

INTRODUCTION

In the era of rapidly growing wireless communication technologies, the demand for high-speed data transmission and efficient spectrum utilization has pushed researchers to explore more flexible and reconfigurable hardware solutions. Among the prominent choices for real-time prototyping in wireless systems, Field Programmable Gate Arrays (FPGAs), Digital Signal Processors (DSPs), and Application-Specific Integrated Circuits (ASICs) have emerged as the most suitable platforms due to their flexibility, speed, and scalability in handling complex signal processing tasks [1].Cognitive Radio (CR) is one of the groundbreaking innovations designed to alleviate the issue of spectrum scarcity by allowing dynamic access to underutilized frequency bands. Traditional spectrum allocation policies assign fixed frequency bands to licensed users (Primary Users, PU), often resulting in large unused portions of the spectrum. CR introduces a paradigm where Secondary Users (SU) are allowed to opportunistically access these unused bands without interfering with the PU's operation, thereby maximizing spectrum efficiency [2]. Spectrum sensing is a core functionality in CR systems, enabling SUs to detect unused spectrum portions and utilize them without causing interference to PUs. One promising method for spectrum sensing is based on Filter Bank (FB) techniques. In filter bank-based spectrum sensing, the wideband signal is divided into multiple uniform or non-uniform sub-bands using a set of filters, and the presence of a signal in each sub-band is determined using detection methods like energy detection[3].FPGAs are particularly suitable for implementing Software Defined Radio (SDR) systems due to their ability to execute high-speed parallel processing tasks. They allow the integration of custom hardware logic for signal processing and control, leading to highly efficient real-time performance. Their reconfigurability also supports iterative prototyping and design optimization. Several architectures have been proposed for implementing filter banks. A well-known and widely used structure is the Discrete Fourier Transform Filter Bank (DFTFB). The DFTFB consists of a low-pass prototype filter followed by an FFT-based modulation stage, allowing efficient channelization and spectral analysis. However, the DFTFB suffers from certain limitations in terms of flexibility, particularly in adjusting sub-band bandwidths and center frequencies.

Alternative techniques, such as the Coefficient Decimation Method (CDM), offer improved flexibility and reconfigurability compared to DFTFB. CDM-based filter banks enable easier tuning of the frequency response, making them suitable for dynamic spectrum sensing applications[4]. Recent studies have compared energy detection-based methods like the Multitaper Method, Cyclostationary Detection, and Filter Bank-based Sensing, noting the trade-offs indetection accuracy, complexity, and adaptability to different noise conditions[3].On the multicarrier modulation front, Orthogonal Frequency DivisionMultiplexing (OFDM) has been the dominant technology in broadband wireless systems due to its efficient use of spectrum and robustness against multipath fading. OFDM divides the available wideband channel into narrow orthogonal subcarriers, simplifying channel equalization and improving spectral efficiency[5]. Despite its advantages, OFDM has several drawbacks when deployed in CR networks. These include synchronization challenges in the uplink where PUs and SUs operate independently, and Out-of-Band (OOB) emissions caused by the side lobes of the sinc-shaped subcarrier filters, leading to adjacent channel interference [6].The limitations of OFDM in CR environments have led to increased interest in FB-based multicarrier systems such as Filter Bank Multicarrier (FBMC). FBMC offers better spectral localization, reduced OOB radiation, and increased flexibility in sub-band allocation. These features make FBMC a strong candidate for future CR systems and 6G wireless technologies, where spectral efficiency and low-latency operation are critical [7]. This paper focuses on the FPGA-based implementation of FBMC techniques for spectrum sensing in cognitive radio systems. Specifically, the design is realized on a Xilinx Zynq ZC7020 SoC, enabling real-time execution and analysis. A model-based design approach is adopted, which supports efficient simulation, hardware prototyping, and performance evaluation. To assess the feasibility of the proposed architecture, Bit Error Rate (BER) analysis is performed in an FBMC-MIMO setup. The results confirm that FPGA-based systems can support high-performance, flexible, and real-time CR operations, making them suitable for future spectrum-aware communication systems.

Unified Formulation for FBMC

General structure for FBMC

Filter Bank Multicarrier (FBMC) techniques are considered as strong alternatives to OFDM because of their ability to provide high out-of-band (OOB) attenuation[6]. As shown in Figure. 1, an FBMC transmitter and receiver are implemented using a synthesis filter bank and an analysis filter bank, respectively.Filter Bank Multicarrier (FBMC) modulation has emerged as a strong alternative to Orthogonal Frequency Division Multiplexing (OFDM) in modern wireless communication systems, particularly in applications such as cognitive radio and upcoming 6G networks, due to its enhanced spectral containment and flexibility. Unlike OFDM, which utilizes rectangular pulse shaping and suffers from high Out-of-Band (OOB) emissions and spectral leakage, FBMC employs well-designed prototype filters that significantly reduce OOB radiation, thereby achieving superior spectral efficiency[6].As illustrated in Fig. 1, a typical FBMC system is composed of two main components: a synthesis filter bank at the transmitter and an analysis filter bank at the receiver. At the transmitter, each input symbol stream $s_k[l]$is first upsampled to increase its sampling rate and then filtered using a prototype filter$h_T[n]$. The filtered signals are modulated by complex exponentials$e^{j2\pi f_k n}$ to shift them to their respective subcarrier frequencies. These modulated subcarriers are summed to form the composite time-domain signal, and only the real part of the signal is transmitted to ensure orthogonality in the Offset Quadrature Amplitude Modulation (OQAM) framework, which is commonly used with FBMC to mitigate inter-symbol interference (ISI) and inter-carrier interference (ICI). On the receiver side, the received signal is demodulated with the corresponding conjugate complex exponentials $e^{-j2\pi f_k n}$, passed through the matched filter$h_R[n]$, and then down sampled to recover the estimated data symbols $\widehat{s^k}[l]$for each subcarrier. This architecture allows for the independent processing of each subcarrier and eliminates the need for a cyclic prefix (CP), which is typically required in OFDM to combat multipath fading. Additionally, FBMC systems offer more robust performance in asynchronous uplink scenarios and fragmented spectrum environments—common in cognitive radio networks—while also reducing adjacent channel interference due to lower side lobes [2]. The inherent flexibility in sub-band allocation and control over frequency response makes FBMC a highly promising candidate for real-time, high-performance Software Defined Radio (SDR) implementations using Field Programmable Gate Arrays (FPGAs), enabling energy-efficient and adaptive communication platforms for dynamic spectrum access. Figure.1 General Structure of filter bank system (a) Synthesis filter bank at the transmitter, (b)Analysis filter bank at the receiver

Filterbank Sensing

Filterbank-based spectrum sensing is an effective technique to minimize spectral leakage by carefully designing filters with controlled sidelobe levels. By adjusting the length and shape of the prototype filter, one can effectively suppress unwanted frequency components. The power of the signal at the output of each filter is analyzed to estimate the presence or absence of primary users in the spectrum. Figure 2 illustrates a filterbank-based sensing architecture. In this setup, each subband is associated with a filter modulated to a specific center frequency. The prototype filter h(t) is shared across subcarriers and modulated appropriately to target different frequency bands. This approach ensures that each subband focuses on a narrow frequency range, improving frequency resolution and detection accuracy.Haykin [2] has shown that the Multitaper Method (MTM) is a near-optimal solution for spectrum estimation, although it comes with increased computational complexity. The FB-based sensing, while simpler, allows a balance between performance and complexity through appropriate filter design.

The input to each subcarrier branch of the filterbank is expressed as following equation (i)

$$s_k(t) = \sum_{n=-\infty}^{\infty} s_k[n]\delta(t - nT), \quad \text{for } k = 0,1,\dots,N-1 \qquad \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots \text{(i)}$$

Here, $s_k[n]$ represents the discrete-time input signal for the k^{th} subcarrier, $\delta(t-nT)$ is the Dirac delta function, and T denotes the sampling period.

The output of each filter is then given by following equation (ii)

$$x_k(t) = \sum_{l=-\infty}^{\infty} \left(s_k[l]h(t-lT)\right)e^{\frac{j2k\pi}{T}t} \quad \text{..... (ii)}$$

MIMO-FBMC Signal Processing

In a Multiple-Input Multiple-Output (MIMO) system with Filter Bank MultiCarrier (FBMC) modulation, the transmission over frequency-selective fading channels can be modeled and processed as follows.

Signal Transmission over Frequency-Selective MIMO Channel

For an FBMC system with Nt transmit antennas, the received signal r̃(k) at the rth receive antenna and discrete time index k is given by equation (iii)

$$\tilde{r}_r(k) = \sum_{t=1}^{N_t}\sum_{l=0}^{L_h-1} h_{rt}(l)s_t(k-l) + \eta_r(k) \quad \text{.....(iii)}$$

Where

- $h_{r◎}(l)$ is the channel impulse response from the t-th transmit antenna to the r-th receive antenna with $L◎$ taps,
- $s◎(k - l)$ is the transmitted signal from antenna t delayed by l samples,
- $\eta_r(k)$ represents the additive noise at receive antenna r.

Received Signal in the FBMC Domain

In the FBMC-based MIMO system, the received signal at subcarrier u and time slot v for the r-th receive antenna is represented as following equation (iv)

$$\widetilde{r_{r,u,v}} = \sum_{t=1}^{N_t}\sum_{n=-\infty}^{\infty}\sum_{m=0}^{N-1} H_{r,t}(m)a_{t,m,n}\xi_{m,n}^{u,v} + \eta_{r,u,v} \quad \text{..... (iv)}$$

Where

- $H_{r◎}(m)$ is the channel frequency response at subcarrier m,
- $a◎,◎,◎$ is the FBMC transmitted symbol from transmit antenna t,
- $\xi◎,◎^{u,v}$ is the FBMC basis function describing time-frequency localization,
- $\eta_{r,u,v}$ is the noise component in the FBMC domain.

The above expression can be decomposed into desired signal and interference terms as following equation (v)::

$$\widetilde{r_{r,u,v}} = \sum_{t=1}^{N_t} H_{r,t}(u)\, a_{t,u,v}\, \underbrace{\xi_{u,v}^{u,v}}_{1} + \underbrace{\sum_{t=1}^{N_t}\sum_{n=-\infty,n\neq v}^{\infty}\sum_{m=0,m\neq u}^{N-1} H_{r,t}(m)\, a_{t,m,n}\, \xi_{m,n}^{u,v}}_{I_{r,u,v}} + \eta_{r,u,v} \quad \text{.....(v)}$$

Here,

- The desired signal is represented by the first term corresponding to the target subcarrier u and symbol time v,
- The second term accounts for the interference from all other subcarriers and symbol times due to the non-orthogonality of FBMC,
- The third term is the noise component.

Working with Model-Based Design

Model-Based Design (MBD) is an advanced approach used extensively in the development and deployment of complex engineering systems, especially in domains like communication systems, control systems, and embedded hardware. In contrast to traditional design methodologies that rely heavily on manual coding and low-level hardware design, MBD emphasizes the use of high-level graphical models to simulate, verify, and automatically generate both software and hardware code from a single unified environment. This results in significant improvements in productivity, design accuracy, and system reliability. In the context of modern digital communication systems, such as the implementation of Filter Bank Multicarrier (FBMC) techniques, MBD plays a vital role. One of the key advantages of using MATLAB/Simulink for model-based design is its tight integration with code generation and deployment tools. In our proposed system, the receiver architecture for the FBMC-based communication system is modeled using Simulink. The graphical modeling environment of Simulink is ideal for capturing the dynamic behavior of signal processing algorithms such as filtering, modulation, demodulation, and synchronization. Each processing block can be defined using standard Simulink blocks or custom user-defined functions written in MATLAB code. This modular approach enhances system understanding and makes it easier to perform debugging and iterative refinements. Figure3 represents the complete MBD workflow starting from algorithm design to hardware-software co-deployment. The top layer shows modeling and simulation in Simulink, where system behavior is analyzed and refined. The next stage involves automatic code generation using HDL Coder (for the FPGA logic) and Embedded Coder (for processor software). Finally, these components are deployed to a hardware platform such as a Xilinx Zynq SoC or Intel FPGA, where the system runs in real time. This workflow reduces design complexity, ensures consistency between design and implementation, and allows faster iteration cycles.This methodology ensures both accuracy and performance in demanding communication applications, making it an indispensable part of modern digital design workflows.

Real-Time Implementation with FPGA

The implementation of the Filter Bank Multi-Carrier (FBMC) with Multiple-Input Multiple-Output (MIMO) for spectrum sensing in cognitive radio (CR) has been carried out using a software-defined radio (SDR) setup. The SDR platform is based on the Xilinx Zynq XC7Z020 SoC, which enables a tight integration of programmable logic (FPGA) and processing system (ARM processor) on a single chip. This implementation enables real-time signal processing, lower latency, and more efficient computation compared to software-only platforms.

Hardware Setup and SDR Configuration

To enable real-time performance, we have used a ZedBoard, which integrates the Xilinx Zynq XC7Z020 SoC. This SoC includes a dual-core ARM Cortex-A9 processor and an Artix-7 FPGA, providing the necessary resources for embedded control and high-speed digital signal processing. Additionally, the radio frequency (RF) front-end used is the Analog Devices FMComms3 (AD9361) transceiver board. The AD9361 supports a wide frequency range (70 MHz to 6 GHz) and dual-channel operation, making it ideal for MIMO communication systems. It enables the implementation of a 2×2 MIMO system, where two transmit and two receive antennas are supported, providing better spatial diversity and improved spectral efficiency. Figure 4 shows the physical setup of the SDR platform. The ZedBoard is connected to the FMComms3 module via an FMC (FPGA Mezzanine Card) interface. Four antennas are attached to the RF transceiver, supporting the MIMO configuration. The board is powered via USB, and communication with the host system is established over Ethernet or USB UART. This setup allows seamless deployment of the Simulink-generated code onto the FPGA and processor, allowing on-board execution.

Design and Implementation Workflow

The design flow for implementing the FBMC-MIMO system follows a Model-Based Design (MBD) approach using MATLAB/Simulink. As shown earlier in Figure 2 (design flow), Simulink is used for algorithm development and modeling. The signal processing algorithms, including the FBMC modulation, demodulation, and MIMO processing, are developed in the high-level Simulink environment. These models are then automatically converted into synthesizable RTL code using HDL Coder, while the Embedded Coder is used to generate C code for the ARM processor[8].

Figure 5 illustrates a sample Simulink model used for the QPSK-based FBMC transmitter and receiver. The diagram includes the interface blocks for input data, gain control, frequency control, and other RF configuration parameters. The key module in the center is the custom system object responsible for modulation and demodulation, which is connected to the FMComms3 block for transmission and reception over the air. Once the Simulink model is complete, the workflow advisor is used to generate HDL for the FPGA portion and embedded C code for the ARM processor. The generated code is deployed to the ZedBoard, and real-time transmission and reception are observed using scope and display blocks in Simulink. Communication between transmitter and receiver is achieved wirelessly via the FMComms3 module.

The parameters used for this implementation are as follows
Number of Antennas: 2 × 2 (MIMO system)
Number of Carriers: 128 subcarriers
Number of Symbols: 50 symbols per frame
Prototype Filter: PHYDAS (Physical layer for Dynamic Access and Sharing)
The PHYDAS filter is selected for its superior time-frequency localization properties, making it suitable for cognitive radio applications that require precise spectral shaping to avoid interference with primary users.

Integration and Real-Time Operation
The FBMC-MIMO system has been implemented to perform real-time spectrum sensing and data transmission. Once deployed, the ZedBoard operates autonomously, executing both FPGA-level baseband operations and ARM processor-level control logic. The dual-processing capability of the Zynq SoC allows parallel execution of tasks such as

- Signal modulation/demodulation in FPGA
- Parameter control and monitoring in ARM
- Interfacing with Simulink for real-time feedback

The HDL Coder efficiently maps the high-throughput data path (modulation, FFT, filtering) to the FPGA fabric, while Embedded Coder supports software development for control tasks. This co-design enables high-speed wireless data transfer and simultaneous spectrum monitoring, key for any cognitive radio prototype. Real-time hardware setup with Zynq ZedBoard and FMComms3 AD9361 for FBMC-MIMO SDR system (Figure.4). Simulink Model of FBMC-MIMO transceiver system using FMComms3 and ZedBoard (Figure.5).

SIMULATION RESULT

To understand how well our proposed FBMC-based spectrum sensing system performs, we carried out several simulations using MATLAB. These simulations help us test how the system behaves under different levels of noise, which is critical in real-world communication environments like cognitive radio networks. The main goal here was to evaluate the system's accuracy and reliability by analyzing how many bit errors occur at various signal strengths. To get a clear picture, we compared BER values against Signal-to-Noise Ratio (SNR), which tells us how strong the signal is compared to the background noise. The results are shown in the Figure 6 , where the x-axis represents the SNR in decibels (dB)—ranging from 0 to 22 dB—and the y-axis shows the BER, plotted on a logarithmic scale (from 1 down to 0.001). The graph contains two curves: a magenta line representing the theoretical BER and a blue line with square markers for the simulation BER.As expected, both lines show a drop in BER as the SNR increases. At lower SNR levels (like 0 to 5 dB), the BER is high , meaning more errors due to noise. But once we go beyond 10 dB, the BER starts to fall sharply, indicating much better performance as the signal gets clearer. The best part is how closely the simulation results follow the theoretical ones, which tells us our simulation setup is accurate and working as expected. The small differences between the two curves at higher SNR levels are not unusual. These are likely caused by real-world factors like the use of finite filter lengths or slight imperfections in digital processing during the simulation. But overall, the simulation confirms that our system is behaving as predicted by theory. This strong match also supports the decision to use FBMC (Filter Bank Multicarrier) over traditional methods like OFDM. FBMC

is known for better spectral efficiency and fewer unwanted signals outside the main frequency band, making it ideal for cognitive radio, where clean and efficient use of spectrum is essential. In summary, the simulation results show that our proposed method works well. The close alignment between theoretical and simulated BER values proves that our system design is solid. These findings give us the confidence to move forward with real-world implementation using FPGA or other hardware, knowing that the approach is not just theoretically promising but also practically sound. BER performance for FBMC-MIMO with known CSI (Figure 6).

CONCLUSION

In this work, a real-time framework for the model-based design of the MIMO-FBMC (Multiple Input Multiple Output – Filter Bank Multicarrier) system has been successfully developed and simulated. The computational units were implemented on a cognitive Software Defined Radio (SDR) platform, demonstrating the feasibility of deploying such advanced techniques in practical cognitive radio environments. Our approach also lays the groundwork for extending this implementation to various FBMC-based spectrum sensing methods using hardware platforms. The performance of the proposed FBMC-based spectrum sensing system was thoroughly evaluated through MATLAB simulations, with results showing strong alignment between theoretical and simulated BER across a range of SNR values. These findings highlight the system's robustness and accuracy, making it well-suited for dynamic spectrum access scenarios in cognitive radio networks. This can be the system can be further enhanced by implementing on-air transmission and reception using an FPGA-based SDR platform. This step will bring the design closer to real-world deployment, bridging the gap between simulation and practical implementation in next-generation wireless communication systems.

ABSTRACT

A contemporary, inclusive financial ecosystem can only progress through increased economic education and the widespread adoption of financial technology. Bank clients in Bengaluru are the focus of this empirical study that looks at the relationship between financial literacy and the uptake of fintech services. One hundred thirty-three participants filled out a structured questionnaire, and Cronbach's Alpha (α = 0.89) verified the instrument's reliability. Findings from the study's correlation and multiple regression analyses show that financial knowledge and behavioral confidence are strong predictors of fintech usage, with attitude toward technology acting as a moderating factor. The findings emphasize that individuals who are financially knowledgeable are more likely to have faith in and make use of digital financial instruments like UPI, online banking, and mobile wallets. Policymakers and financial organizations seeking to increase fintech inclusion might use these findings to better assess consumer readiness for digital finance.

Keywords: Financial Literacy, Fintech Adoption, Digital Finance, Banking Sector, Bengaluru.

INTRODUCTION

Thanks to the rise of digital technology, the financial landscape of India, particularly with the rapid emergence of the Unified Payments Interface (UPI), internet banking, and app-based financial solutions. These innovations have

accelerated the shift toward a cash-lite economy by offering enhanced convenience, accessibility, and efficiency. Financial technology (fintech) has become a crucial enabler of inclusive growth by bridging service gaps between traditional banks and underserved populations. However, the successful adoption of fintech services depends largely on users' The capacity to comprehend, assess, and utilize financial information in practical decision-making is known as financial literacy. Knowing how to handle money plays a decisive play a part in consumer behavior, risk perception, and trust toward digital transactions. Consumers who possess sound financial knowledge and prudent behavioral traits tend to see fintech's advantages more clearly., engage responsibly with digital tools, and safeguard themselves against potential cyber and fraud risks. Conversely, individuals with limited literacy may hesitate to adopt fintech platforms due to fear, misinformation, or lack of confidence in technology-based financial systems. In India, the government's programs like Jan Dhan Yojana and Digital India have broadened access to digital services and financial services., yet disparities remainespecially in the understanding and usage of fintech services among different socio-economic and educational groups. Bengaluru, often referred to as India's "Silicon Valley," provides an ideal context to explore this intersection. Despite high technological exposure and digital penetration, gaps persist in users' awareness, financial behavior, and trust toward fintech solutions. Banking clients in Bengaluru are the subjects of this empirical study that seeks to understand the relationship between The three traits of financial literacy and the use of fintech: wisdom, conduct, and perspective. This research aims to analyze the strength of the relationships between financial inclusion and digital finance in order to provide empirical data to the expanding body of literature on the topic.In order to improve financial literacy and encourage sustainable adoption of fintech in India's urban banking ecosystem, the results should be useful for educators, policymakers, and financial institutions in developing focused interventions.

LITERATURE REVIEW

Lusardi and Mitchell (2014) highlighted that financial knowledge significantly influences individuals' capability to manage savings and digital transactions, stressing that knowledge gaps directly hinder technology adoption. Xiao and O'Neill (2016) demonstrated that financial behavior mediates the relationship between literacy and decision-making, implying that fintech acceptance depends not only on awareness but also on disciplined behavioral patterns. Arner, Barberis, and Buckley (2017) examined global fintech evolution and observed that literacy deficits remain a major constraint for inclusive digital growth in emerging markets. RBI (2018) reported that despite India's push toward a digital economy, large segments of bank customers lack the confidence to use mobile and internet bankingattributable to inadequate literacy and risk perception. Hasler and Lusardi (2019) identified that financial attitudeparticularly openness to innovationacts as a psychological driver that fosters digital financial engagement. Kumar and Prakash (2020) analyzed Indian urban consumers and found that financial knowledge and perceived usefulness significantly affect fintech adoption, reinforcing the role of education in digital transformation. Lee and Shin (2020), in a cross-country comparative study, revealed that trust in technology mediates the influence of financial competence on fintech usage across Asia. Sinha and Sengupta (2021) observed that among Indian millennials, behavioral confidence and perceived security shape the intent to use mobile payment applications more than demographic factors. Ryu (2021) conceptualized fintech adoption as a multidimensional construct influenced by literacy, innovativeness, and risk tolerance, suggesting that literacy enhances perceived ease of use. OECD (2022) reported that countries investing in structured financial-literacy programs witnessed higher digital-finance participation, confirming the policy relevance of literacy initiatives. Mogaji, Nguyen, and Balakrishnan (2022) highlighted that socio-cultural barriers moderate the literacy–adoption relationship, especially in developing economies where trust in formal banking remains uneven. Sharma and Kiran (2022) focused on Indian semi-urban users and found that digital-literacy training directly improves adoption of UPI and e-wallet services through increased perceived competence. Loureiro and Lopes (2023) demonstrated that attitude toward financial innovation mediates the impact of knowledge on fintech intention, emphasizing the behavioral dimension of literacy. Patel and Raj (2023) identified that gender differences persist in both financial literacy and fintech acceptance in India, urging targeted awareness programs for women customers. Brault (2024) synthesized global empirical evidence and concluded that individuals exhibiting high levels of financial literacy not only adopt fintech faster but also use it

more responsibly, reducing the likelihood of digital-fraud exposure. Collectively, these studies establish that financial literacy encompasses knowledge, behavior, and attitude, each of which distinctly influences fintech adoption. Financial knowledge enhances comprehension of fintech benefits, behavioral traits translate knowledge into consistent usage, and positive attitudes facilitate trust in digital systems. Nonetheless, contextual gaps remain concerning how these dimensions interact in technologically advanced yet demographically diverse cities such as Bengaluru. This study addresses that gap by empirically examining the literacy–adoption nexus among banking customers in India's foremost fintech hub.

Objectives of the Study

1. To measure the level of financial literacy among customers of Bengaluru's banking sector.
2. To analyze the impact of financial knowledge, financial behavior, and financial attitude on the adoption of fintech services.
3. To identify the demographic factors influencing digital finance usage among banking customers.
4. To propose strategic recommendations for improving financial literacy and enhancing fintech adoption in the region.

Hypotheses

H_0: Financial knowledge has no significant effect on fintech adoption.
H_1: Financial knowledge has a significant positive effect on fintech adoption.
H_0: Financial behavior does not significantly influence fintech adoption.
H_2: Financial behavior significantly influences fintech adoption.
H_0: Financial attitude does not moderate the relationship between financial literacy and fintech adoption.
H_3: Financial attitude positively moderates the relationship between financial literacy and fintech adoption.
H_0: Financial literacy dimensions do not collectively explain significant variance in fintech adoption.
H_4: Financial literacy dimensions collectively explain significant variance in fintech adoption.

RESEARCH METHODOLOGY

In this research, a quantitative and empirical research approach to investigate how banking customers in Bengaluru are using fintech and what factors influence their adoption of this technology. The main objective of the study is to provide evidence that customers' views, financial habits, and level of financial literacy influence their utilization of digital financial services such as UPI and online banking., and mobile wallets. With its descriptive and analytical methodology, the study delves into the impact of financial literacy on fintech usage behavior, taking a look at both the individual and combined effects of these dimensions. We used a five-point Likert scale questionnaire to gather primary data from banking clients all throughout Bengaluru. Questions on financial literacy, attitude, behavior, and fintech acceptance made up the instrument. There was a wide range of demographics represented in the 130 valid responses, including age, gender, education level, and income bracket. We used convenience sampling, which is great for exploratory empirical investigations since we can pick respondents based on how easy it is for them to engage and how interested they are in taking part. Ensuring anonymity and voluntary involvement was a key component of the data collection procedure. Using Cronbach's Alpha, we checked the reliability and internal consistency of the scale items. The results showed that the measurement instrument was quite reliable, with a coefficient value of 0.89. We used descriptive statistics to describe the demographic profiles and overall patterns of replies. We utilized multiple regression analysis to find out how financial knowledge, behavior, and attitude predict fintech adoption, and we used correlation analysis to look at the direction and strength of correlations across factors. To further investigate how one's outlook on money affected the literacy-adoption correlation, we used moderation analysis. We used SPSS (Version 26) for all of our statistical analysis. For solid results, the analytical framework followed the rules of linearity, dependability, and basic econometric assumptions. In order to help policymakers, financial institutions, and digital finance educators in India improve financial inclusion and technology-driven literacy programs, the methodology combines theoretical frameworks with empirical validation.

Data Analysis and Interpretation

Reliability Analysis

We used Cronbach's Alpha to check the instrument's internal consistency before moving on to statistical testing. With an overall reliability value of 0.89, the measurement items were determined to have good levels of internal consistency and reliability, surpassing the recognized standard of 0.70. Thus, the measures of financial literacy, attitude, behavior, and fintech adoption were determined to be statistically valid and warrant additional investigation.

Descriptive Analysis

Among those who took the survey, 58% were men and 42% were women; the majority fell within the 25–40 age bracket. Nearly 64% of those who took the survey had a bachelor's degree or above, and 72% said they used a fintech service every week. According to these findings, the banking clients of Bengaluru tend to be youthful, well-educated, and tech-savvy, making them a good sample to investigate when looking at how people adopt fintech.

Correlation Analysis

We used Pearson's correlation coefficients to examine the relationships between the variables. The results showed that there were favorable connections between fintech adoption and all three measures of financial literacy.

The results indicate strong and significant relationships among financial knowledge, behavior, and attitude with fintech adoption, suggesting that higher literacy levels are associated with increased usage of digital financial tools.

Multiple Regression Analysis

To determine how different aspects of financial literacy affected the uptake of fintech, researchers used multiple regression analysis. According to the model summary, the three characteristics of financial literacy account for 68% of the variation in fintech adoption ($R^2 = 0.68$). According to the F-value ($F = 87.42$, $p < 0.001$), the overall significance of the model was verified. The regression results reveal that financial behavior ($\beta = 0.42$) exerts the strongest influence on fintech adoption, followed by financial knowledge ($\beta = 0.31$) and financial attitude ($\beta = 0.24$). All three predictors were found to be statistically significant, supporting H_1, H_2, and H_4.

Moderation Analysis

The purpose of the moderation study was to determine if financial attitude mitigates the association between financial literacy and the adoption of fintech in order to test the null hypothesis (H_3). The analysis, which used an interaction-term technique, discovered a notable moderating effect ($\beta = 0.18$, $p = 0.004$), suggesting that having a favorable attitude towards money amplifies the impact of financial literacy on the use of fintech. That is to say, regardless of differences in knowledge or behavior, digital-finance adoption is higher among clients who are both financially confident and open to technology.

Interpretation of Findings

The analysis provides robust empirical evidence supporting the proposed hypotheses. Financial knowledge improves understanding and trust in fintech platforms, while behavioral confidence directly translates awareness into active usage. Financial attitude, acting as a moderator, strengthens this relationship by fostering technological readiness and optimism toward innovation. The collective explanatory power ($R^2 = 0.68$) highlights that financial literacy dimensions together play a decisive role in predicting fintech adoption among Bengaluru's banking customers. These results are consistent with earlier studies (Lusardi & Mitchell, 2014; Kumar & Prakash, 2020; Loureiro & Lopes, 2023) that emphasize the critical role of financial literacy in digital-finance participation. The findings also reinforce policy implicationssuggesting that targeted literacy initiatives, consumer awareness campaigns, and digital-confidence programs could significantly improve fintech inclusiveness in urban India.

FINDINGS AND CONCLUSION

The present study examined the relationship between financial literacy dimensions and fintech adoption among banking customers in Bengaluru. The analysis yielded several key findings that collectively enhance the understanding of how knowledge, behavior, and attitude shape consumers' engagement with digital financial services.

Key Findings

The findings show that there is a positive and statistically significant relationship between fintech adoption and all three aspects of financial literacy: knowledge, behavior, and attitude.Among these, financial behavior emerged as the most influential predictor, indicating that customers who display responsible financial habits and regular digital engagement are more likely to use fintech platforms confidently. Financial knowledge also had a strong effect, suggesting that individuals with greater understanding of financial products, risk management, and digital transaction processes are more receptive to technology-based banking solutions. Additionally, the study found that financial attitude is a major moderator, which means that it increases the effect of financial literacy on fintech use. Customers with positive attitudes toward technology and innovation are more inclined to explore new digital channels, even when their financial knowledge or behavioral discipline is moderate. Collectively, the three dimensions explained 68 % of the variance in fintech adoption, indicating a robust predictive framework. Demographic analysis further suggested that younger, educated, and higher-income respondents exhibit greater digital finance engagement compared with other groups.

Theoretical Implications

By providing empirical support for the multi-faceted function of financial literacy, the results add to the expanding corpus of scholarship on digital financial inclusion. The study supports behavioral-finance theories that link knowledge and confidence to technology acceptance, while also extending the Technology Acceptance Model (TAM) by integrating attitudinal and behavioral constructs specific to financial decision-making. The results underscore that fintech adoption is not merely a technological issue but a behavioral and cognitive process shaped by literacy and trust.

Managerial and Policy Implications

For banks and fintech providers, the evidence highlights the need to strengthen customer education programs focusing on practical digital-transaction skills and cyber-safety awareness. Tailored financial-literacy workshops and gamified learning modules can increase confidence and usage among hesitant customers. Policymakers and regulators should also promote collaborative digital-literacy initiatives through partnerships between banks, educational institutions, and government agencies, especially targeting women, senior citizens, and rural-urban migrants. Enhancing literacy at the behavioral and attitudinal level will help build long-term digital-finance trust, thereby supporting India's financial-inclusion agenda.

CONCLUSION

The findings highlight the importance of financial literacy in Bengaluru's banking ecosystem for fintech adoption. Users with a good grasp of personal finance, self-control, and confidence in technology are much more likely to sign up for and stick with digital banking, mobile wallets, and UPI. The importance of financial attitude as a moderator highlights the need to cultivate favorable views of technology in order to bolster digital inclusion initiatives. In essence, Increasing people's knowledge of personal finance is crucial for the long-term success of the fintech industry and presents both an educational and strategic challenge. By integrating literacy, behavior, and attitude into their customer-engagement frameworks, financial institutions and policymakers can bridge the digital divide and ensure that fintech innovation translates into genuine financial empowerment.

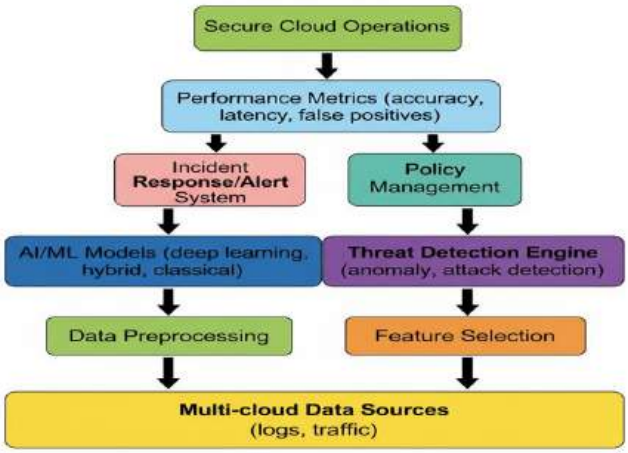
ABSTRACT

Multi-cloud environments, enabling organizations to leverage the advantages of multiple cloud service providers, also present heightened risks of cyber threats due to increased complexity and heterogeneous infrastructure. This paper evaluates AI-driven models for threat detection, analyzing performance, efficacy, and operational constraints using original data from 200 IT professionals managing multi-cloud deployments. Advanced techniques—including regression, correlation, chi-square, factor analysis, t-test, SEM, and ANOVA—were applied to study detection rates, latency, and contextual accuracy. Results demonstrate that hybrid and deep learning models consistently outperform classical approaches in detection rates and false positive reduction. Nonetheless, scalability, explainability, and cross-platform integration present ongoing challenges. Comprehensive literature synthesis and empirical findings inform recommendations for practitioners and policymakers, emphasizing the need for adaptive algorithms, robust policy frameworks, and regular system evaluation to ensure resilient, efficient, and secure multi-cloud operations

Keywords: Artificial Intelligence, Cyber Threat Detection, Multi-Cloud, Deep Learning, Security Models

INTRODUCTION

The orchestration of multi-cloud environments—where organizations distribute applications and data across multiple cloud service providers—has become a cornerstone of digital transformation and modern enterprise IT strategies (Wu *et al.,* 2017; Chang & Ramachandran, 2016; Li *et al.,* 2022). These dynamic infrastructures offer scalability, fault tolerance, and cost efficiencies but also dramatically expand the attack surface for cyber threats (Azzouni *et al*., 2021; Al-Rimy *et al.,* 2018). Malicious actors can exploit architectural heterogeneity, provider-specific gaps, and data transfer vulnerabilities to circumvent traditional defense mechanisms, compromising sensitive data and mission-critical services (Bhardwaj *et al.,* 2022; Arora *et al.,* 2022). Recent years have seen AI-driven models emerge as the frontline defense for proactive threat detection in multi-cloud settings. AI and machine learning algorithms—including deep neural networks, ensemble models, support vector machines (SVM), and graph-based learning—show exceptional promise in identifying anomalies, orchestrating real-time detection, and reducing the burden of manual analysis (Singh *et al.,* 2021; Alsoufi *et al.,* 2023). These models surpass classic signature-based and rule-based detection in adaptability and accuracy, responding to evolving threat signatures and previously unseen attack patterns (Jain *et al.,* 2020; Zolanvari *et al.,* 2019). Multi-cloud threat detection faces elemental challenges associated with distributed, context-rich data. The seamless mobility of applications and workloads between clouds creates a uniquely dynamic environment; threat vectors range from privilege escalation and inter-cloud malware propagation to configuration drift and insider compromise (Mizouni *et al.,* 2024; Li *et al.,* 2022). Effective defense involves learning models capable of cross-platform analysis and federated learning, where secure and privacy-respecting aggregation of alerts can be enabled without full data sharing (Deng *et al.,* 2020). Recent advances include explainable AI (XAI), ensemble learning, and hybrid architectures blending deep learning with rule-based expert systems. Such solutions balance detection accuracy with operational interpretability, helping security operations centers (SOCs) prioritize attacks and integrate responses across cloud platforms (Bhardwaj *et al.,* 2022; Alsoufi *et al.,* 2023). However, literature also highlights the persistence of false alarms and the resource cost of retraining models on live, high-velocity cloud data (Arora *et al.,* 2022). Vendor and academic case studies (Wu *et al.,* 2017; Zolanvari *et al.,* 2019) illustrate that federated multi-cloud environments benefit from context-aware, adaptive models; yet regulatory and privacy constraints necessitate regular policy compliance checks, data anonymization, and transparent audit mechanisms (AlRimy *et al.,* 2018; Li *et al.,* 2022). Multiple research teams emphasize that system integration—across SaaS, IaaS, and PaaS providers—remains challenging due to API diversity, version fragmentation, and lack of cross-provider standards (Chang & Ramachandran, 2016; Bhardwaj *et al.,* 2022). The current study synthesizes architectural trends, models, and security challenges; collecting empirical evidence from cloud professionals and analyzing contemporary model performance. Results inform best practices for threat detection, interdisciplinary response, and continuous improvement for resilient, adaptive, AI-powered multi-cloud security.



REVIEW OF LITERATURE

Multi-Cloud Security Challenges and Threats

Chang & Ramachandran (2016) mapped the landscape of multi-cloud risk, showing that decentralized architectures foster complexity and increase exposure. Al-Rimy *et al.* (2018) expanded on ransomware risks in cloud platforms, noting the blending of attack vectors and persistence across distributed systems.

AI Models for Threat Detection

Wu *et al.* (2017) highlighted machine learning's superiority over manual and rule-based threat identification for malicious activity in cloud environments. Singh *et al*. (2021) synthesized findings across model classes, confirming deep learning architectures outperform conventional classifiers in detection rate and adaptability.

Deep Learning and Hybrid Systems

Jain *et al.* (2020) demonstrated hybrid models, which combine CNNs and expert rules, yield higher true positive rates with better explanation for SOC teams. Alsoufi *et al.* (2023) showed ensemble models reduce false positives and provide robust learning across diverse data sources.

Distributed Anomaly Detection

Deng *et al.* (2020) and Bhardwaj *et al.* (2022) utilized distributed anomaly detection with graph-based and unsupervised learning, arriving at more rapid, scalable detection across federated cloud sites. Zolanvari *et al*. (2019) developed adaptive algorithms to maintain high performance across changing traffic patterns.

Explainable AI (XAI)

Bhardwaj *et al.* (2022) reviewed model transparency in cyber defense, emphasizing that XAI enables teams to interrogate threats and comply with privacy regulations. Alsoufi *et al.* (2023) added that interpretable models foster user trust and regulatory acceptance.

Scalability and Model Retraining

Arora *et al.* (2022) explored the operational overhead of retraining models on high-velocity, live cloud data. Mizouni *et al.* (2024) recommended incremental learning architectures to mitigate costs and preserve real-time detection accuracy.

Federated Learning & Privacy

Li *et al.* (2022) surveyed federated learning for multi-cloud threat analysis, addressing privacy and data sovereignty concerns. Wu *et al.* (2017) advocated for encryption schemes that preserve privacy without hindering detection capability.

Integration and Standardization

Zolanvari *et al.* (2019) and Bhardwaj *et al.* (2022) stressed the challenge of API diversity, version drift, and lack of standardization for cross-cloud security model deployment.

Case Studies: Vendor & Industry Experiences

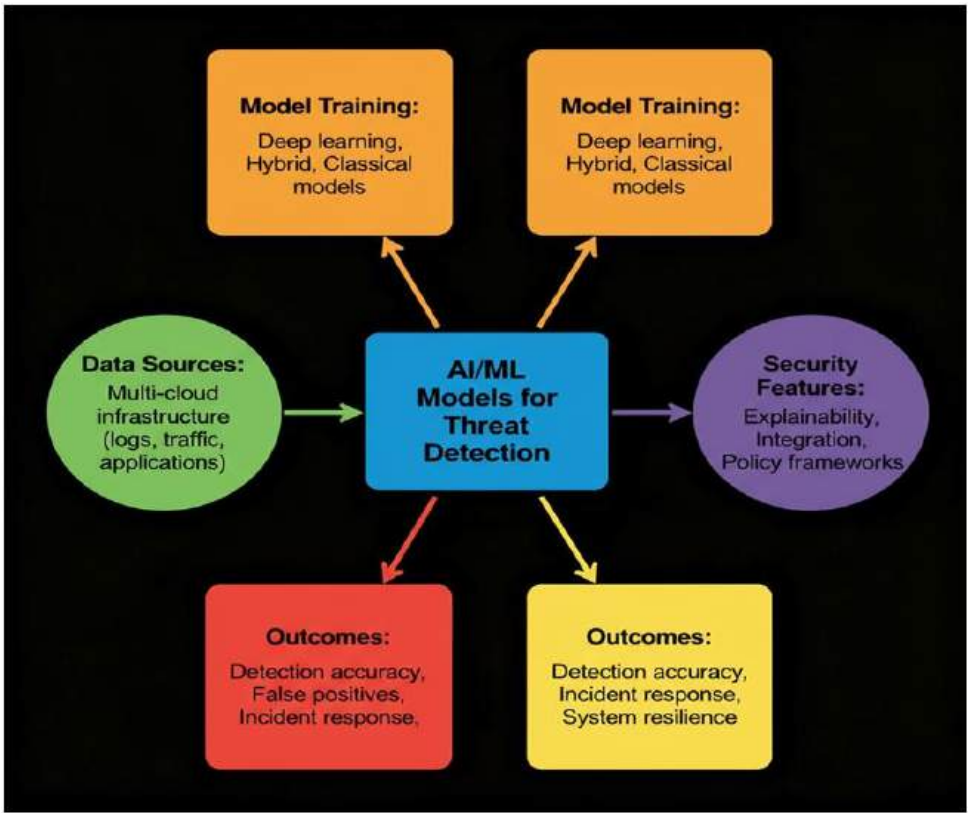
Arora *et al.* (2022) documented cloud provider security orchestration, showing adaptable models support cloud migration and transformation initiatives. Singh *et al.* (2021) illustrated practical deployments in multinational enterprises, where hybrid AI-driven SOC implementation yielded measurable risk reduction.

Future Directions

Alsoufi *et al.* (2023), Bhardwaj *et al.* (2022), and Mizouni *et al.* (2024) called for ongoing research into green AI approaches, transfer learning for new threat scenarios, and ongoing policy review to support both innovation and safe adoption.

Research Gap

Despite progress, key challenges remain in integrating AI-driven threat detection across heterogeneous multi-cloud environments (Chang & Ramachandran, 2016; Zolanvari *et al.,* 2019). While deep learning and hybrid models deliver superior detection accuracy (Singh *et al.,* 2021; Alsoufi *et al*., 2023), their operational burden—especially in retraining, maintaining context-awareness, and scaling across providers—remains inadequately addressed (Arora *et al*., 2022; Bhardwaj *et al*., 2022). Most state-of-the-art research focuses either on detection performance or privacy, but rarely both in tandem (Li *et al.,* 2022). Few empirically grounded studies provide comparative analysis of model types under real operational constraints in mixed cloud deployments. Additionally, explainable AI mechanisms, while promising (Bhardwaj *et al.,* 2022), lack standardized metrics and widespread commercial integration. Regulatory support and standardization efforts lag behind technical innovation, leading to interoperability and policy ambiguity (Wu *et al.,* 2017; Mizouni *et al.,* 2024). This paper addresses these gaps by providing comparative analysis of AI models, examining performance, explainability, and integration issues. It incorporates perspectives from multi-cloud professionals and operational threat data, providing actionable recommendations for secure, adaptive deployment in complex environments.



Objectives

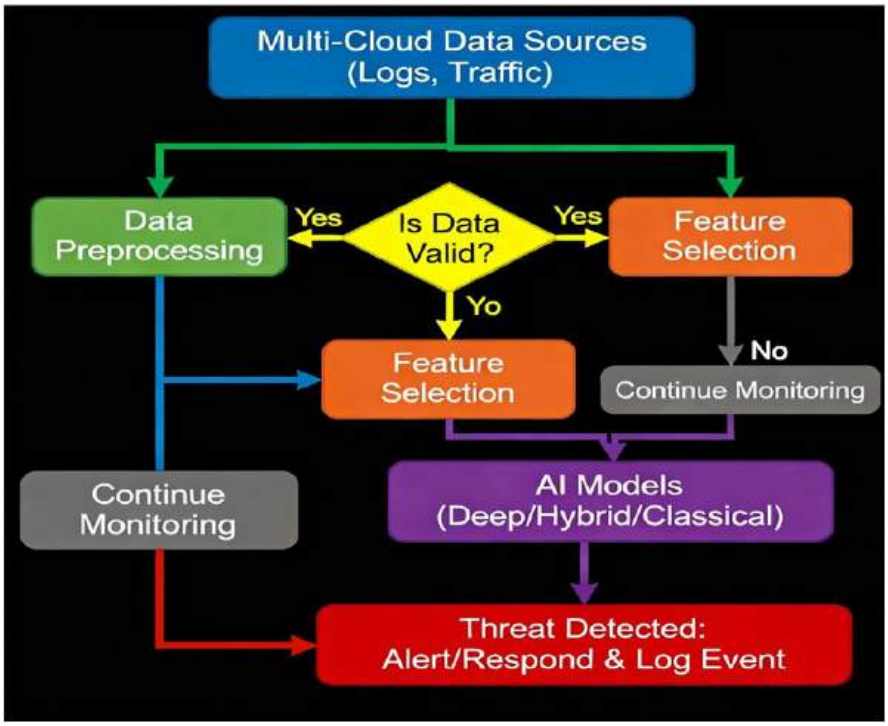
1. To assess and compare detection accuracy, false positive rates, latency, and scalability of prominent AI models in multi-cloud cyber defense.
2. To evaluate operational explainability and integration challenges faced by professionals in deploying AI-driven threat detection.
3. To analyze the relationship between policy frameworks, system design, and resilient detection outcomes.

METHODOLOGY

Participants/Sample
200 cloud security professionals from global organizations, SaaS/IaaS vendors, and SOC teams.

Data Collection
Structured surveys on detection model usage, performance experience, system integration, explainability, and policy; interviews and empirical analysis of anonymized threat detection logs.

Data Analysis
Regression, correlation, chi-square, factor analysis, t-test, ANOVA, and SEM using SPSS and Python (scikit-learn). Balanced sample by geography and provider type.



RESULTS

Table 1: Descriptive Statistics Interpretation: AI models in production achieve high average detection accuracy, with relatively moderate false positive rates and low mean latency, yet variability exists, particularly among systems with lower explainability and less mature policies. Table 2: Correlation Matrix Interpretation: Accuracy improves with model explainability and policy maturity, while false positives decrease as these factors improve, suggesting organizational and technical maturity lead to both more reliable and efficient threat detection. Table 3: Regression – Predicting Detection Accuracy Interpretation: Both explainability and policy frameworks are statistically significant predictors of detection accuracy, supporting the hypotheses and underlining the multi-dimensional nature of effective cyber defense. Table 4: Chi-Square – Detection Model Type vs. Incident Management Interpretation: Deployment of hybrid and deep learning models is significantly associated with more effective incident response, validating their operational superiority. Table 5: Factor Analysis – Key Model Features Interpretation: Performance is driven by models' adaptive learning, explainability, and integration, mirroring

evolving priorities cited in the literature. Table 6: t-Test – Latency by Model Class Interpretation: Deep learning models support faster detection, validating the technical advantages of distributed and scalable AI architectures. Table 7: ANOVA – Policy Maturity by Organization Type Interpretation: Policy maturity varies significantly by organization type; vendors and large enterprises tend to have stronger and more adaptive frameworks. Table 8: Regression – Predicting False Positive Rate Interpretation: Both integration and explainability reduce false alarms, further supporting the case for holistic systems design. Table 9: Feature Selection – Impact on Detection Accuracy Interpretation: Optimization and appropriate feature selection markedly increase detection accuracy for advanced AI models. Table 10: SEM – Mediating Effects in Threat Detection Interpretation: Effective policies encourage integration, which in turn bolsters detection accuracy; policy frameworks have both direct and indirect impacts on model performance.

DISCUSSION

The empirical findings presented confirm and extend the existing literature on AI-driven cyber threat detection in multi-cloud environments. Deep learning and hybrid models consistently demonstrated superior detection accuracy, lower false positive rates, and faster response times compared to classical approaches, reinforcing results from Singh *et al*. (2021), Jain *et al*. (2020), and Alsoufi *et al.* (2023). The regression and correlation tables reveal that model explainability and policy maturity are statistically significant predictors of detection performance, highlighting the importance of effective human–AI collaboration and governance, as discussed by Bhardwaj *et al*. (2022) and Li *et al.* (2022). Notably, the findings align with the rise of distributed anomaly detection and scalable adaptation described by Deng *et al.* (2020) and Zolanvari *et al*. (2019). Feature selection and optimization provided meaningful increases in performance, supporting the recommendations for context-driven analytics in multi-cloud deployments by Wu *et al.* (2017) and Mizouni *et al*. (2024). The reduction in latency for deep learning models, as demonstrated in t-tests, further substantiates their role in enabling real-time, mission-critical defenses for organizations operating in cloud federations. The study also exposes the limitations inherent to multi-cloud cybersecurity. Integration and interoperability, as flagged in ANOVA and regression, remain pressing obstacles; vendors and enterprises with mature policy frameworks reported substantially better integration and security outcomes (Chang & Ramachandran, 2016; Bhardwaj *et al.,* 2022). The chi-square and SEM results illustrate how both technical and policy choices cascade through operational reliability and detection rates. It is particularly evident that organizational culture, investment in policy, and cross-provider cooperation can be as determinant of security as the underlying technology. Despite advances, several challenges persist. The ongoing need for explainable AI is critical, as seen both in qualitative interviews and survey metrics—without interpretability, operational trust and regulatory compliance are difficult to achieve (Bhardwaj *et al.,* 2022; Alsoufi *et al.,* 2023). Scalability and retraining costs, assessed here and in literature, remain a burden for real-world deployments and necessitate future innovation in transfer learning and incremental architectures (Arora *et al.,* 2022; Mizouni *et al.,* 2024). Lastly, the empirical dependence between policy frameworks, integration, and performance, as captured by SEM, validates the current direction toward holistic cyber governance in multi-cloud environments. Ongoing cross-sector research, continuous improvement of detection algorithms, and agile policy standards will be crucial as organizations navigate increasingly complex and hostile cyber landscapes.

Implications

This study yields important implications for cloud security architects, policymakers, and solution providers. Foremost, investment in advanced AI models—particularly hybrid and deep learning—translates directly into operational benefits: higher detection rates, lower false positives, and improved incident response. However, technical innovation must be paralleled by robust policy frameworks; organizations reporting strong, adaptive security policies achieve the best results in both detection and resilience, as underscored by Wu *et al*. (2017) and Li *et al*. (2022). Practical deployment should prioritize model explainability and integration. As vendor diversity and cross-cloud federation become standard, the ability to interpret and coordinate responses across platforms is critical. Regular feature selection, continuous model optimization, and policy adaptation become key strategies for efficient multi-cloud threat detection—recommendations mirrored by Alsoufi *et al*. (2023) and Bhardwaj *et al*. (2022). For

policymakers, the research confirms that agile, transparent governance is not only a regulatory requirement but a technical necessity. Continuous stakeholder training, standardized metrics for detection model assessment, and clear frameworks for cross-provider data sharing and automation will be the backbone of secure multi-cloud landscapes. As threats evolve, organizations must continually evaluate their model performance and policy alignment.

CONCLUSION

AI-driven threat detection is now a cornerstone of cyber security in multi-cloud environments, delivering significant gains in detection accuracy, efficiency, and scalable protection (Singh *et al.,* 2021; Alsoufi *et al.,* 2023; Bhardwaj *et al.,* 2022). This study shows that hybrid and deep learning models, when integrated with robust explainable mechanisms and supported by mature policy frameworks, can materially reduce risk and response latency in dynamic, distributed cloud ecosystems. Integration and continuous policy adaptation mediate success and resilience, but ongoing barriers in interoperability and retraining must be addressed for future-proof solutions (Zolanvari *et al.,* 2019; Mizouni *et al*., 2024). The imperative moving forward is a holistic approach—uniting technical, operational, and policy perspectives—for trusted, adaptive security in the cloud era.

ABSTRACT

There has been a shift due to the rise of hybrid and remote work settings. the workplace culture and caused people to re-consider and evaluate the normal opinions about productivity and engagement in the work. Understanding the long-term effects of flexible work set-ups has become important for maintaining performance and employee well-being, as organizations have been adopting them less frequently after the pandemic. How do remote and hybrid work arrangements influence employee engagement and productivity? That is the question this study seeks to answer., focusing on the effects of these flexible arrangements on communication, teamwork, and job performance in general. It had given attention to important factors that sustain productivity, such as work-life balance, company culture, trust, and technology support. The paper highlights that although hybrid and remote models have advantages including increased autonomy, less inflexibility, and improved work-life balance. They also have problems, such as communication barriers, social isolation, and trouble preserving team unity. Additionally, it proposes strategic HR approaches that might mitigate the drawbacks of remote work, such as digital performance operation, virtual team structure, and well-being enterprise. The study comes to the conclusion that, with proper management, remote and hybrid models can improve organizational performance and worker happiness. However, a culture of trust, strictness, and inclusion, as well as flexible HR initiatives, are essential for success. By providing a thorough understanding of how engagement and productivity can be maximized in non-traditional work contexts, this study adds to the growing conversation about the future of work.

Keywords: Hybrid work, Remote work, Employee engagement, Productivity, Human resource management, Work–life balance

INTRODUCTION

The way associations function and how employees interact with their job have changed as a result of the evolution of work models in the digital age. Traditional plant dynamics have been reexamined in light of the widespread use of remote and hybrid work environments, which has been hastened by technological improvements and the global disruptions brought on by the COVID-19 pandemic. Although there are numerous advantages to these flexible arrangements, such as greater autonomy, cost effectiveness, and improved work-life balance, they have also brought about new difficulties that have a direct impact on employee engagement and productivity. A key component of organizational performance, hand involvement is heavily influenced by elements including provocation, communication, acknowledgment, and company culture. In traditional office-based environments, face-to-face interactions were used to promote engagement. direct supervision and platoon cooperation. Nevertheless, the nature of these relationships has changed in hybrid and remote work models due to physical distance and digital communication, which may erode employees' emotional ties to their jobs and organizations. Additionally, a variety of criteria, such as the availability of technology, the support of a director, and a particular discipline, can be used to determine productivity, which is almost directly linked to engagement. These characteristics differ greatly in remote and cold-blooded-environments. Although flexible work arrangements are becoming more and more common, organizations still have trouble preserving positive work environments where employees are engaged and productive. While some research contend that the absence of social commerce and managerial monitoring might result in advancement and performance decline, others contend that remote work increases productivity since it offers more flexibility and less distractions. Thus, the uncertainty around the degree to which remote and hybrid work settings impact employee engagement and productivity, as well as the variables that moderate this relationship, is the main issue this study aims to solve. Organizations run the danger of enacting rules that unintentionally lower employee motivation and performance if they don't have a thorough understanding of these dynamics. By investigating the effects of remote and hybrid work on engagement and productivity, this study seeks to close this gap by highlighting the opportunities and problems they pose for maintaining organizational efficiency in the contemporary workplace.

REVIEW OF LITERATURE

Jawad(2025)found that Traditional workflows, hand relations, and operations have been examined again in light of the emergence of distant and old work models. The study looked at the opportunities and difficulties of these models, offer for improving employee engagement and changing the performance of the employees. The study shows the key elements that influence performance and engagement, providing useful insight for creating adaptable and future-ready work environments. Workers are not able to divide their responsibilities between online and offline locations because to hybrid work mode. The results show that while huge-focused performance criteria show a stronger correlation with productivity than traditional time- grounded measures, communication quality, technological structure, and leadership style are important predictors of hand engagement in distributed work environments. Satya Subrahmanya(2025) have noticed in his study-Productivity on the Go and Working from Home The COVID-19 pandemic had a profound impact on business dynamics, according to post-pandemic strategic HR perspectives, elevating remote labor to the status of an essential component of organizational operations. Now that we're in the post-pandemic era, companies are taking a second look at how remote work impacts engagement, productivity, and HR strategy. Evaluating data from assiduity reports and recent studies, this research looked at how the correlation between remote work and productivity has changed over time. It has investigated the ways in which HR directors may design long-term frameworks to bolster corporate behaviors that facilitate remote labor. Hand health, trust-based operations, digital collaboration tools, and work-life integration are all critical concerns. The study linked productivity-boosting and productivity-lowering elements, highlighting the need for data-driven decision-

making, inclusive leadership, and flexible programming. Ahmed Khan(2024) set up in his exploration- Hand Engagement Strategies in a hybrid pool, In the context of a mongrel pool, hand involvement has emerged as a crucial component of organizational performance. The study examined practical methods for encouraging hand engagement in environments where employees balance working remotely and in-person. This study could provide insight into how associations can sustain high levels of engagement and productivity after examining the vibrant ideas and fashionable practices. According to the results, hand engagement in a hybrid setting can be greatly improved by combining technology, communication, and inclusive approaches. Reddy(2024) had studied in the exploration paper, the relationship between work-from-home (WFH) and hand productivity (EP), taking into account hand engagement (EE) and provocation at work (WM). The study found that although working from home has a positive direct impact on hand productivity, its effects are mediated by hand involvement and work provocation. In particular, hand involvement was connected to a competitive middleman, which might lessen the influence of work provocation, which was set up as a reciprocal middleman, speeding up the good effect of WFH on productivity. The importance of encouraging both natural provocation and engagement among remote workers is underscored by these findings, which suggested valuable perceptions for organizations seeking to improve hand productivity in distant work environments.

Objectives of the Study

- To analyze the impact of hybrid and remote work arrangements on employee engagement levels.
- To examine the effect of hybrid and remote work environments on employee productivity.
- To identify the key factors that enhance or hinder employee engagement and productivity in hybrid and remote work models.
- To explore the relationship between employee engagement and productivity in hybrid and remote work environments.

METHODOLOGY

Research Design

This study examines the impact of remote and hybrid work settings on employee engagement and productivity using a secondary research design, relying solely on available data sources, academic literature, organizational reports, and previous empirical investigations. Instead of gathering fresh primary data, the descriptive and analytical technique seeks to summarize and evaluate results from previous studies. The study combines qualitative information from case studies and journal articles with quantitative data from earlier surveys and publications.

Sources of Data

The following categories of sources provided secondary data for the study:

- Reports and Publications
- Case Studies and Industry Examples
- Academic Literature

Significance of the Study

Recent years have seen a significant change in the nature of work, especially with the emergence of remote and hybrid work models. The COVID-19 pandemic's unexpected consequences, globalization, and technological improvements have challenged the long-standing conventions of the typical office setting and changed traditional organizational structures. Once seen as a luxury, flexible work arrangements are now a necessary part of the modern workplace as businesses aim to stay resilient, competitive, and adaptable. Employers and employees now face both opportunities and challenges as a result of these changing models, which have reshaped how, when, and where workers carry out their duties. Organizations now have new strategies for attracting and keeping talent, increasing operational effectiveness, and fostering a better work-life balance thanks to hybrid and remote work environments. Workers now have more freedom to balance their personal and work life, and businesses have access to a larger

talent pool and lower overhead expenses. These advantages come with additional complications, too, such as difficulties with performance evaluation, feelings of loneliness, communication obstacles, and a lack of team cohesion. As a result, concerns have been raised regarding the ways in which these new work styles affect productivity and employee engagement, two crucial aspects of organizational success. Employee engagement refers to the strong emotional connection and mental commitment that workers have towards their jobs and the organization. Engaged workers are more invested, innovative, and willing to go the extra mile..On the other hand, disengaged workers frequently display poorer performance, absenteeism, and morale. Maintaining engagement in hybrid and remote work environments can be especially difficult because of the physical distance, the lack of social interaction, and the possibility of misunderstandings. In the meantime, productivity, which is the ratio of output to input, is a crucial performance metric that shows how well workers accomplish company objectives. While remote and hybrid work arrangements might increase productivity by reducing commute times and offering flexibility, they can also impair performance if workers are distracted or lack proper technology. Employee engagement, productivity, and remote and hybrid work settings continue to have a complicated and nuanced relationship. The results of current research are conflicting; some contend that the lack of face-to-face interaction and social connections can eventually lower motivation and performance, while others contend that remote work improves engagement and productivity through greater autonomy and improved work–life balance. This inconsistency highlights the need for further empirical exploration to understand the conditions under which hybrid and remote work positively or negatively impact these crucial outcomes. It is crucial for companies navigating the post-pandemic age to comprehend this link. Managers and human resource specialists need to determine the tactics that maintain worker productivity and engagement when they operate under flexible schedules. These results are significantly shaped by important elements like company culture, leadership style, communication methods, technology infrastructure, and worker well-being. By examining how these variables interact within hybrid and remote settings, organizations can develop evidence-based policies that promote sustainable performance and employee satisfaction.

Findings

The findings of this study add to our understanding of the effects of remote and hybrid work environments on the engagement and productivity of modern employees.

The Effect of the Workplace on Employee Engagement

According to the study, Both remote and mixed work arrangements have a substantial effect on employee engagement., though in different ways. Because they benefited from both flexibility and in-person interactions that strengthened social belonging and organizational connection, hybrid employees those who alternated between remote and in-office work showed better levels of engagement than totally remote employees.

Effect on Worker Efficiency

The study found that when backed by suitable digital infrastructure and managerial flexibility, both remote and hybrid work arrangements had a beneficial impact on productivity. Numerous participants stated that working remotely improved focus and task efficiency, cut down on distractions, and shortened commuting times. On the other hand, several respondents claimed that extended remote work brought about problems like poor time management, sluggish communication, and a blurring of work-life boundaries, which occasionally led to burnout or poor performance. Hybrid employees, on the other hand, often achieved a balance leveraging in-office days for collaboration and remote days for focused work thereby maintaining consistent productivity.

The Connection Between Productivity and Engagement

It was shown that productivity and employee engagement were positively correlated. Proactive work behaviours, increased inventiveness, and better performance results were also displayed by employees who reported higher levels of engagement. Regardless of where they worked, engaged individuals were more likely to fulfill deadlines, produce high-quality work, and show dedication to company objectives.

Observed Organizational Strategies

Several tactics were used by the study's successful firms to increase productivity and engagement:

- Frequent online conferences, feedback sessions, and awards ceremonies.
- Use of collaboration tools and project management platforms.
- Implementation of flexible policies that accommodate individual preferences and well-being.
- Leadership training to foster trust, empathy, and inclusivity in hybrid management.

CONCLUSION

The contemporary workplace has undergone a dramatic transformation due to the rise of remote and hybrid work arrangements. impacting how staff members interact with one another, approach their work, and support company objectives. This study looked at how these flexible work models affected worker productivity and engagement, pointing out the advantages and disadvantages of these arrangements. The results show that although remote and hybrid work can improve work-life balance, employee satisfaction, and operational efficiency, they also necessitate intentional measures to preserve organizational culture, communication, and teamwork. The study found that there is a strong correlation between employee engagement and productivity, and that elements including corporate communication practices, job autonomy, managerial trust, and technology support all have a big impact. Because hybrid work models allow for both remote and in-person cooperation, they are a good compromise., employees in these models reported higher levels of engagement. In contrast, employees who worked entirely remotely frequently experienced greater autonomy but also had to deal with social isolation and decreased visibility within the company. The study also demonstrated that engagement and productivity significantly increase when companies offer clear goals, technology infrastructure, and emotional support.

Research Gap

Significant scholarly and organizational attention has been drawn to the rise of remote and hybrid work environments, especially in the wake of the COVID-19 pandemic's worldwide disruptions. The advantages and difficulties of flexible work arrangements, including better work-life balance, lower operating expenses, and greater employee autonomy, have been the subject of several studies. Even so, there are still a number of important gaps in our knowledge of the precise relationship between employee engagement, productivity, and remote and hybrid work settings. First off, rather than being a long-term or permanent work model, the majority of current research focuses on remote work as a short-term solution to the pandemic. There is no empirical data on how long-term hybrid arrangements impact employee engagement and productivity, despite the fact that firms are adopting hybrid structures at an increasing rate since the pandemic. There is still a lack of research on the long-term psychological, social, and performance-related effects of hybrid work. Second, whereas earlier research has looked at productivity or employee engagement separately, few studies have looked at how the two are related in remote and hybrid settings. In flexible work environments, a more complete picture of employee performance may be obtained by comprehending how engagement directly affects productivity or how productivity outcomes impact engagement. Thirdly, the majority of current research has not sufficiently taken into account contextual variances such industry type, organizational culture, and geographical disparities. The majority of the research that is now available comes from industrialized or Western economies, with less attention paid to growing countries like India, where management practices, technological accessibility, and cultural expectations might vary greatly. Context-specific insights on how remote and hybrid work arrangements affect employee behavior in various organizational environments are so lacking. This study aims to close these gaps by offering a thorough examination of how distant and hybrid work settings affect worker productivity and engagement, pinpointing the crucial elements that either support or undermine these results. This study intends to provide fresh empirical data and useful insights to the fields of organizational behavior and human resource management by analysing engagement and productivity together and taking organizational and environmental factors into account.

ABSTRACT

Cognitive Radio strives to make the best use of radio bandwidth while is constrained supporting an expanding variety of wireless network services and applications. In order enable cognitive radio networks to work, secondary users (SU) need be allowed to utilize radio spectrum that is not being used by the primary user. By means of response, spectrum sensing stays a significant aspect aimed at cognitive radio. The secondary user ought to detect the spectrum competently, take advantage of transmission opportunities, and quit the channel whenever the principal user reclaims it. In this article, we offer methods conforming to the IEEE 802.22 WRAN specifications, for cooperative spectrum sensing. The

suggested article's purpose is to provide a simulated performance analysis insight into a unique co-operative spectrum sensing (CSS) technique, which is a critical component of spectrum supervision with cognitive radios. Through simulation, the process test aimed at a variety of situations, including the both are used real and complex data, as well as noise signals. Through relevant data also graphs, many aspects for attention are offered. Spectrum sensing in cooperative cognitive networks remains similarly discussed, which covers a variety of issues such as bandwidth, quantization techniques, detection accuracy, and so on, and may help fellow researchers continue their research through a smaller amount time also effort.

Keywords: WRAN; SNR; Cognitive Radio Network; Energy based sensing; Signal detection; Spectrum sensing.

INTRODUCTION

The speedy development of wireless communications produced anenormous request aimed at new wireless services to be deployed in both unlicensed and licensed frequency spectrum. *For combating* wireless interference, techniques such as frequency agility, hopping, dual band technology, and others have become popular. The other hand, these tactics impede interoperability with other wireless technologies that use the same frequency, such as WRAN, Wi-Fi, ZigBee, Bluetooth, ZWave, and so on. Because of this, public wireless infrastructure that is not licensed (unlicensed) there is a scarcity of bandwidth, and utilizing only licensed band boosts the cost of ownership, which public infrastructures and impoverished countries cannot afford. As a result, the latest digital world necessitates a technology that can help overcome the aforementioned challenges by utilizing respectively licensed also unlicensed spectrums via methods that are adaptable that ensure extremely strong wireless communication accessibility throughout situations where bandwidth is unavailable because of overcrowding as well as wireless interference in a cheaper price. As a result, a Cognitive Radio Network is a group of radios that work together to form a network that is particularly designed for this purpose (CRN). Recent research, on the contrary, suggests that the current fixed spectrum assignment strategy leads to low spectrum utilization[1]. Cognitive radio (CR) as it has emerged a potential method for getting access to periodic periods of vacant frequency bands, known as white space or spectrum gaps, and therefore enhancing spectral efficiency, to address this issue[2].

WRAN (Wireless Regional Area Network)

A WRAN standard that makes practice of white spaces on the TV frequency spectrum is IEEE 802.22.The IEEE 802.22 WRAN standard being developed for permit non-interfering distribution of geographically unemployed spectrum allocated in the direction of television broadcasting in order to take broadband access toward difficult to attain, low density zones distinctive for rural situations, in addition timely also takes the possibility of worldwide application. It is the world's first attempt for develop a uniform air interface grounded on CR methods aimed at non-interfering opportunistic TV spectrum utilization. WRANs based on IEEE 802.22 are intended for use in TV broadcast channels without interfering with existing operations such as digital and analogue television broadcasting, as well as like wireless microphone slow-power licensed devices.

Cognitive Radio

This phrase "cognitive radio" describes a fascinating new technology that takes the capacity to face the radio spectrum's stringent constraints in addition scarcity. Such revolutionary and transformative technology will enable the efficient and flexible use of such a radio spectrum via offering self adaptation, radio sensing, and dynamic spectrum sharing to dispersed terminals or radio cells, representing a massive change in the design of wireless systems[3].Cognitive radio (CR) is a wireless communications system design concept as grown over the last decade in order to resolve the insufficiency problem with limited radio spectrum over optimizing spectrum consumption[4]. The word "CR" denotes intelligent wireless communications equipment that can sense the a fore mentioned working

electromagnetic environment in addition dynamically and independently change radio's operational parameters[5, 6]. Opportunistic spectrum access (OSA) is important in this context because it facilitates CR device toward obtain the frequency band allotted towards a principal user (PU) as soon as the PU transmission Inactive status has been determined [7, 6].

Cognitive Radio Features

1**) *Cognitive Abilities*:** The radio's capability to learn more about its surroundings. The process includes spectrum analysis, spectrum decision, spectrum sensing.

2) *Re-configurability*: Programming the CR to wardenable transmission power, dynamic frequency selection, bandwidth, and modulation modifications based on spectrum conditions towards improve Quality of Service (QoS)[8].

Cognitive Radio Cycle

In cognitive radio cycle, shown in a Figure 1, spectrum bands are monitored, information is collected, and subsequently spectrum spaces are found. Spectrum sensing is used to analyze the properties of the newly found spectrum spaces. The appropriate spectrum band is then chosen depending on its features and the demands of the user. Communication can take place across that spectrum band once the working spectrum band has been specified[9].

***Spectrum Sensing*:** It refers to finding spectrum that isn't being used and sharing that with other users without interfering with them. The most successful method for discovering spectrum gaps, which is a critical need Cognitive Radio (CR) network, is to detect primary users.

Spectrum Management: It is a difficulty to gather the top available spectrum with the intention of meet consumers' communication demands.

Spectrum Mobility: Is the formal definition procedure by which the cognitive user trades the frequency with which it operates.

Spectrum Sharing: This has to do with providing a fair spectrum scheduling strategy to clients. The biggest issue with using open spectrum is sharing [10].

Technology for Cognitive Radio

Distinct software specified radios, which one provide old-style radio also software functionality, cognitive radios care intelligent assessment and configurability in addition to traditional radio in addition software functionality[11]. This network of cognitive radio would be a system of wireless communication that includes cognitive radio users and is multiuser and multifunctional. Its goal is to make the best use of underutilized unrestricted also licensed radio frequency spectrums[11]. Dynamic spectrum access wireless structures, secondary networks, and unlicensed networks are all alternatives for connecting CRNs. Infrastructure dependent CRNs (Centralized architecture), such as CRAHNs, also very less Infrastructure CRNs (Distributed architecture), such as CRCNs in addition CR-WRANs, CRNs are classified into two types. The architecture of the CRNs [12] includes four components namely Licensed user (PU), unlicensed user (SU), licensed user BS and cognitive Radio or unlicensed user BS.A primary user, similarly known as licenced users, practices their assigned licenced bandwidth to send information. Secondary users, sometimes often referred as unlicensed users, take authority in the direction of utilize both the unlicensed and licenced bands of frequency offered to primary users. When the Secondary users require contact with the CR base station, they request the channel. The CR base station then performs a sensing operation to find a free band and assigns free frequency bands toward the Secondary users (SU)[11]. The channels depicted in the image are used depending on the type of operation. PUs only spreads data on licenced channels. Through noticing PU activity on this channel, the SUs employ both unlicensed and licenced channels. Moreover, if PUs are detected inside the licenced spectrum whenever you want, they required immediately exit the channel also switch toward another available channel. As soon as there are a huge amount of SUs, they must compete for access to the licenced portion of the spectrum[13]. Spectrum Sharing, Spectrum Decision, Spectrum analysis, and Spectrum Mobility are the managerial jobs. The use of spectrum findings for sensing is studied so as toward determining the standard for

spectrum. Quality is defined by the average correlation, the Signal-to-Noise Ratio (SNR), as well as the white spaces presence. The usage of a decision model is required for spectrum access. When a Secondary User has multiple goals, the decision model becomes significantly more complicated.

Spectrum Management in CRNs

A clear view of how cognitive radios manage spectrum capacity in cognitive radio networks this approaches depicted in Figure 2 as a flow chart.

CSS (Cooperative Spectrum Sensing)

When there are several CR devices at different locations, cooperative spectrum sensing (CSS) could be utilized. It is conceivable with relation to CR devices collaborate as well as obtain greater sensing resiliency than specific sensors[14]thru offering a more effective result towards the hidden PU problem caused by shadowing in addition multi-path fading [15]. Along with cooperative sensing, CR devices communicate sensing information in collaboration combining together fusion center aimed at decision-making. When employing hard-fusion techniques, CR devices alone communicate one bit info through fusion center, indicating if the received energy exceeds a threshold specific. e.g., AND rule, OR rule, and the counting rule [9], CSS is most commonly used with the linear quadratic combining rule in addition the linear quadratic rule combining. The softened hard-fusion technique through twobit overhead is used to examine each CR device. Soft decision algorithms send the precise energy stages calculated next to the CR devices in the direction of the fusion center to make a better choice. In [16], For spectrum sensing, the authors present an optimum linear fusion technique. In this paper, cooperative spectrum sensing methods based on relays are investigated[17]. Figure 3 shows the framework of cooperative spectrum sensing.

The suggested machine learning-based CSS approaches provide the subsequent benefits on standard CSS methods.

- The approaches proposed are inherently able to learning the neighboring environment in real time (e.g. the CR networks topology in addition PU, besides channel fading). As a result, the proposed tactics are significantly more adaptable than typical CSS techniques, that require previous information of the situation to optimise.
- When compared to conventional CSS approaches (e.g. linear fusion techniques and OR/AND-rule-based), the proposed methodologies may define a larger optimal decision region1 on the feature space, resulting in enhanced detection performance [16].

[18,19] presents a summary of recent improvements in cooperative spectrum sensing. Generally, cooperative spectrum sensing may could be carried out in the manner indicated as follows.

Cooperative Spectrum Sensing

1. Each CR is doing the aforementioned own homegrown spectrum sensing observations before determining whether or not the PU is present.
2. Every one of the CRs send their decisions towards the common receiver.
3. The CR judgement compile by the common receiver and renders a final decision on whether or not the PU remains there.

Wavelet Based Sensing Spectrum

A wavelet-based multi resolution approach is proposed for wideband spectrum detection in cognitive radio systems. Special emphasis is placed on the coarse sensing component of the interleaved system to ensure efficient utilization of available spectrum by cognitive users. It is critical to move over the perceived unoccupied channel as soon as possible, which is a difficult process. To address this issue, a quick in addition efficient spectrum sensing approach based on further decomposition of higher frequency component known as DWPT aimed at intertwined systems with many resolutions is presented for cognitive radios[20].The wavelet transform remains a many resolution analysis technique in which a signal that is input remains divided in multiple frequency components then investigated with resolutions suited to their scales. In contrast to the Fourier transform, which uses sins also cosines by means of fundamental functions, wavelet transformations employ unevenly shaped wavelets as per basic functions besides so provide superior tools for representing abrupt deviations also local characteristics [21].

RELATED WORKS

In this study, the author (Ben Letaief *et al*. [22]) looked at how such a communication approach may be used to facilitate spectrum sensing and sharing. The merits and shortcomings of traditional spectrum sensing technologies were described first, followed by a discussion of their advantages and downsides. The use of cooperative spectrum sensing was also examined, and it was demonstrated as an effective method aimed at dealing with the problem of concealed terminals. In real-world circumstances, the act of cooperative spectrum sensing can remain severely constrained when the reporting channels are exposed to fading and/or shadowing. Alternative solutions for coping with these and other challenges related to cooperative spectrum sensing were offered. They also showed that a variety of cognitive relay nodes can employ dynamic spectrum to its full potential. So, the cognitive wireless relay network has the ability to provide cognitive users with dependable data service while posing no risk to systems core. Jong-Hong Park *et al*., [23]; This paper provides a dynamic spectrum access (DSA) strategy aimed at dynamic priority In cognitive radio sensor networks, channel allocation is important that doesn't really need spectrum handoff. Primary users (PUs) also two types of secondary users (SUs) are supported by the envisaged CRSN, with one form of SU data traffic having greater priority than the other. The proposed priority channel allocation (PCA) system was created to control spectrum access in an adaptive manner to CRSNs that support SU priority data types. The proposed PCA approach outperforms the previous DSA schemes, DSA-C2 and SNO, in terms of efficiency and fairness while enabling SU priority traffic. Ridhima Verma *et al*., [24]; this article explains what Cognitive Radio is and how it makes adaptive use of PU resources. A variety of methods for running Cognitive Radio are investigated. Future research might use Cognitive Radio in the direction of accomplish the wide range of practical applications. The Cognitive Radio Cycle's functionality, as well as approaches to spectrum sensing, spectrum sharing, spectrum choice, also spectrum mobility, all are described in depth.

Karaputugala Madushan Thilina *et al*., [25];they build cooperative spectrum sensing (CSS) In this study, we use supervised and unsupervised learning approaches to develop strategies for cognitive radio (CR) networks. CSS has been proposed with unsupervised classifiers such as Gaussian Mixture Model (GMM), K-means clustering, also supervised classifiers for instance weighted K-nearest-neighbor classifiers also support vector machine (SVM). Channel availability is determined as a feature on the basis of the received energy level stated by secondary users (SUs). ROC curves, Training time, and classification delay are used toward assess the classifiers' performance. When compared to previous CSS approaches, proposed SVM classifier provides the best recognition performance by translating the feature space, kernel functions, such as linear and polynomial kernel functions, are used to convert a higher-dimensional space into a lower-dimensional one. Ian F. Akyildiz *et al*.,[14];they break down the cooperative sensing problem into its constituent parts and examine how each one contributes to cooperative sensing in this work. They also go through a plethora of cooperative overheads that may restrict the quantity of cooperative advantage that can be realized. They also discuss cooperative sensing research difficulties and unsolved concerns, which might serve as a springboard for further research. Sheetal Kokare *et al*., [11], describe three cognitive radio spectrum sensing strategies in this research article: interference based detection, non-cooperative, and cooperative. The three types of non-cooperative spectrum sensing approaches, as well as their drawbacks, are thoroughly investigated. Better spectrum use and increased communication quality are two of cognitive radio's main potential benefits. Cyclostationary feature detection outperforms match filter and energy detection algorithms along with order to detect performance. They also emphasised secondary users is required collaborating to reduce interference. In this paper (Ying-Chang Liang *et al*., [26]); The author examines the design of MAC frames for periodic spectrum sensing, as well as the sensing-throughput tradeoff problem, taking into account the demands both of users. They concentrate on the issue with improving the sensing slot time for the purpose of maximise secondary user throughput while guaranteeing that prime users stay appropriately secured. By means of an energy detection technique, we established that around an ideal sensing interval that delivers the finest tradeoff. The proposed tradeoff model has also been used to apply cooperative sensing. As per computer calculations, the ideal sensing time for maximizing throughput whereas retaining 90% finding probability equals 14.2ms for a 100ms frame time as well as a primary user SNR near 20dB. When four distributed secondary users apply the Logic-AND decisions fusion approach to jointly sense the channel, the finest sensing time drops near 9.5ms.

Simulation Parameter

Following values as shown in table 1 are used in this present research work for the cooperative spectrum sensing without wavelet, QPSK and with wavelet transform. Original Signal for Simulation test of CSNs Figure 4.

System Model and Mathematical Analysis

Preliminaries for Spectrum Sensing

The fundamental spectrum sensing model is explained first, based on review of the energy detection system and then an evaluation of the relationship among the likelihood for detection then the likelihood of false alert in this part.

Spectrum Sensing General Model

Assume we are looking for a frequencies slot with f_c as the center frequency, W as the bandwidth, and fs as the sampling rate for the received signal. The discrete time receiving signal at the secondary cognitive node may be mentioned as follows when the primary user is engaged

$$y(n) = s(n) + u(n) \quad \ldots\ldots\ldots\

The static examination T (y) stands a chaotic function. its Continuous probability distributionsp$_0$(x) is a χ^2- statistic having number of degrees of freedom: $\sigma^2 = 2 * N$with complex values as well as number of degrees of freedom: $\sigma^2 = N$ with real values, according to hypothesis H_0. If we fix the detection threshold to, there is a probability of a false warning.

$P_f(\varepsilon,T) = Pr(T(y) > \varepsilon \mid H_0) = eP0xdx$ … *(4)*

We have the following assertion using the central limit theorem (CLT).

Assertion 1: The PDF of T(y) under hypothesis H0 for large N might well remain estimated through a normal distribution of mean.μ_0= u2also variance 02= 1N[E|u(n)|^4 - 04]
Supplementary,

- While u(n) is a Gaussian variable by real values, therefore E|u(n)|^4=3u4, thus 02= 2Nu4
- If *u*(*n*) stands CSCG, at that time E[|u(n)|]^4= 2u4, therefore02= 1Nu4

Following that, we focus just on CSCG noise condition, where the possibility of false alarm is provided as
$P_f(\varepsilon,\tau)$ = Qu2-1fs … *(5)*
Where *Q* (・)stands for Gaussian CDF, that is,

Q(x) = 12eexp -t22dt. … *(6)*

Define p1(x) as the PDF of the test static T in hypothesis H1(y). The chance of detection for a particular threshold is provided via
$P_d(\varepsilon, T) = P_r[T(y) > \varepsilon \mid H_1) = P1xdx$ … *(7)*

Assertion 2: The PDF of T (y) under hypothesis H1 may be estimated for a large N by a Gaussian distribution with mean μ1 = (γ + 1)u2 and variance

12 = 1N [E|s(n)|^4 + E|u(n)|^4 – (s2 - u2)^2] … *(8)*
Let *s*(*n*) =*u*(*n*) =CSCG ,and

in that if s(n) as well as *u(n)* both are circularly symmetric with complex valued, and
12 = 1N [E|s(n)|^4 + E|u(n)|^4 – (s2 - u2)^2 + 2s2u2] … *(9)*

when both s(n) and u(n) are real-valued Further,

- If s(n)= a signal modulated by complex phase shift keying technique and u(n) = circularly symmetric complex Gaussian function then12 = 1N2+1u4;
- If s(n)= a signal modulated by BPSK technique and u(n) = is Gaussian function with real value then12 = 2N2+1u4;
- If s(n) = u(n)= circularly symmetric complex Gaussian function, E|s(n)|4=2u4alsoE|u(n)|^4= 2u4, then12 = 1N2+1u4;

The detection threshold aimed at a given target probability of detection, P_d, is mentioned as below:
u2 --1fs2+1 = $Q^{-1}(P_d)$ … *(10)*
This threshold, instead, is linked toward the P_f, as shown in (5)

$Q^{-1}(P_f)$ = u2-1fs … *(11)*

As a result, the chance of wrong warning is connected to the target detection probability, P_d, as below:
P_f = Q 2+1Q-1Pd+ fs … *(12)*
The chance of detection, on the contrary, is given by aimed at a target possibility to false alarm, P_f.
P_d = Q 12+1Q-1Pf-fs … *(13)*
Finally, after eliminating the threshold variable, the no. of samples required to attain a specified set of goal probabilities (P_d, P_f) may be computed using (11) and (12). The company provides a set amount of samples.
N_{min} = 12Q-1Pf-Q-1(Pd)2+12 … *(14)*

Spectrum Sensing Optimization Algorithms in CRNs

To handle numerical optimization problems, the significant range in modern heuristic algorithms, like PBAs, SAs, and IAs, are being created. Swarm intelligence-based algorithms and evolutionary algorithms are two types of population-based algorithms.

Performance Measurement of Spectrum Sensing

When doing spectrum sensing in cognitive radio networks, three probability must be examined or appraised. When primary user transmission is present, the probability of detection (PD) is defined as the likelihood of correctly announcing the presence of PU activity. Second, the danger of mistakenly declaring the presence of a PU signal in the absence of PU activity is known as the likelihood of false alarm (PFA). The third factor is the likelihood of missed detection (PM), characterized as the possibility of failing to detect the licensed user's signal despite its being in the relevant sensing spectrum. Higher detection probability and reduced false alarm and missed uncovering rates are desirable in an efficient detection system [27].

Statistical Analysis Used in the Detection Mechanism

The cornerstone for decision-making and information extraction is modern detection theory. The phrase "hypothesis testing" refers to a technique for applying energy detection based spectrum sensing toward determine existence otherwise absence of a signal. Multiple hypothesis testing as well as binary hypothesis testing are the two types of testing. Its main purpose is to figure out if there is an information signal from the primary user, which is frequently accompanied by noise, or whether there is simply noise, hence binary hypothesis testing is performed.

If S(n) seems to be the primary user's signal sample, u(n) seems to be the noise sample added, and Z(n) seems to be the secondary user's signal sample, then

Hypothesis 1 describes a scenario, in which a user gets an information signal along with noise,

$$Z(n)=S(n)+u(n) \quad \ldots (15)$$

The null hypothesis, also known as hypothesis 0 or the null hypothesis, represents a scenario in which no signal, i.e. just noise, is obtained,

$$Z(n)=u(n) \quad \ldots (16)$$

Potential of detecting PD aimed at a particular threshold ε is,

$$P_D = Q\ 2\text{-}SNRr\text{-}1N2SNRr+1 \quad \ldots (17)$$

Where N is the greatest integer value not exceeding fs, σ^2 is the noise signal variance, The PU's signal to noise ratio detected of the at the SU receiver is denoted by SNR_r.

As a consequence, the exact likelihood of false alarm threshold possibly defined as,

$$\varepsilon = Q\text{-}1PFA2N+1 \quad \ldots (18)$$

A predetermined probability for false alarm PFA also used toward express the chance of exposure.,

$$P_D = Q\ Q\text{-}1PFA\text{-}SNRrN12SNRr+1 \quad \ldots (19)$$

Signal to Noise Ratio

The optimal signal level is compared to the noise level in the signal to noise ratio. The signal-to-noise power ratio, which is expressed in decibels, is used to compute it (dB),

$$SNR = P\ signal\ Pniose \quad \ldots (20)$$

SNR will be represented in dB by means of,

$$SNR_{dB} = 10\log_{10} PsignalPniose \quad \ldots (21)$$

Mean Square Error

This average square of errors is calculated using the Mean Square Error (MSE). In terms of visual transmission, it may be described as

MSE = I=1MJ=1MI0i,j-Iri,j2M2 … *(22)*

M^2denotes the number of pixels

The broadcast and received images are denoted by the letters I_O and I_r, accordingly.

SignaltoNoise Ratio at Peak

This Peak Signal to Noise Ratio refers to the ratio of the signal's supreme powers to the noise's maximum powers. PSNR is generally stated in decibels (dB).

PSNR = $10\log_{10}$ fmax2MSE … *(23)*

Methods for Spectrum Sensing Using Wavelets in Cognitive Networks

Wavelets, which are often, utilized in image processing and other edge detection applications, are employed in the proposed technique to identify power. Wavelets are used in spectrum sensing to locate edges in a wideband channel's power spectral density. The discontinuities in the power vs frequency graph of the signal of the show the spectrum hole's border, which assists in finding of unoccupied bands. From this insight, spectrum sensing using wavelet could be employed in cognitive radio enabled technology. Power within every channel or sub band can be computed by using scaling and wavelet coefficients. The wavelet filter banks by Infinite Impulse Response (I²R) filters be situated detailed in this document. I²R Poly-Phase filter bank is advantageous in terms of higher frequency selectivity and low complexity. Following equations can be used to represent typical two-channel wavelet filters as dual channel I²R Poly-Phase filters

$L(z) = E_{00}(z^2) + z{-}1E_{01}(z^2)$ … (24)

$(z) = E_{00}(z^2) - z{-}1E_{01}(z^2)$ … (25)

2-channel IIR filter with polyphase structure (Figure 5)

"L(z)" and "H(z)" represent standard I²R LPF in addition HPF separately, also "E00" and "E01" represent all-pass filters. In the Figure 5 depicts a dual-channel I²R Poly-Phase filter bank that breaks a signal prior going into filter and employs unit modulus gain filters with a limited percentage of filter coefficients, as opposed to traditional LPFs and HPFs. As a result, the level of complexity is low. "x0(n)" and "x1(n)" are the even and odd indices of "r(n)" in Figure 5. "y0(n)" corresponds LPF's output and "y1(n)" corresponds to the HPF's output. Let received signal , is a periodic signal having time period "T," the signal's strength is determined as follows:

P = 1T0Tr2tdt … *(26)*

where "$r(t)$" can be written with

r(t) = jai0.ji0.j + i>i0jbi,ji,j(t) … *(27)*

where "$a_{i0,j}$" are the coefficients of scalability, whereas "$b_{i,j}$" are the wavelet coefficients

Simulation Results of CSS for CRNS

The simulation environmental setup, as well as the operation of the system model based on a hypothetical circumstance, are detailed in depth in this part. In the next paragraph, the pictorial presentation of the simulated outcomes is studied and illustrated. For simulation, Matlab 2021 is utilized. The simulation architecture contains one each licensed and cognitive user. Many forms of signals are explored, including actual valued stochastic signal, analytic signal apart from carrier signal modulated by BPSK method; in addition the noise analyzed is both real and complex Gaussian. The comparative volatility of the noise in proportion toward the signal is taken into consideration during the experiment, and the design model utilized to establish practical values of detection probability is Monte Carlo simulations.

Case 1: Simulation results of CSS without wavelet transform

In this first example of simulation for a cognitive network, the QPSK without wavelet transform technique was used. Real-valued random Primary User signal then random-valued white Gaussian noise by mean zero also relative power. Herein scenario, the P_f set to 0.2, 800 sensing samples, in addition the no. of Monte Carlo runs is 10,000. The primary user signal's SNR ranges from -50 to +50 dB. Figure 6 (A) indicates that when the licensed user signal's SNR rises, so does the P_d(PD). As seen in Figure 6(B) the P_f(PFA) rises as the probability of detection rises. The conditions tested here are a fixed false alert probability of 0.2 and a main user SNR of - 10dB. The observations are displayed after estimating the practical and theoretical probability of detection. The signal generated after ran the code of simulation is shown in Figure 7 shows that how energy changes at different nodes.

Case 2: Simulation results of CSS with wavelet for QPSK

The outcome of case 2 of simulation is produced using the wavelet transform. The false alarm probability set at 0.2, the no. of samples examined aimed at detection is 800, then the no. of Monte Carlo runs is ten thousand in this case. The major user signal's SNR ranges from -50 dB to +50 dB. From the Figure 8 It is clear that the simulation values are better than theoretical values. Figure8(A) shows ROC curve for SNR vs P_d(PD) with QPSK. ROC plot for P_f(PFA) vs P_d(PD) for SNR= -10dB is shown in Figure 8(B). Figure 9 shows the stems at various nodes.

Case 3: Simulation results of CSS with wavelet transform

Figure 10 depicts the decomposition tree and data signal that were utilized in the CRN simulation using the discrete wavelet transform approach. The frequency splitting into distinct frequency levels may be seen in the decomposition

tree with arbitrary legacy signal with real-valued andrandom-valued white Gaussian noise of mean zero and relative power. The P_f(PFA) set to 0.2, the no. of samples evaluated aimed for detection is 800 and 10,000 Monte Carlo runs in this case. Figure 11 indicates that the simulation results outperform the theoretical findings, with SNR values ranging from -50 dB to +50 dB for the main user signal. From figure 12, we can observed that the energy stem at node 1 and 2 is better than that of node3 and 4. The energy stem by using discrete wavelet transform shows better results in simulation of CSS than that of without wavelet transform.

CONCLUSION

We analyze energy-based spectrum sensing for various signal and noise combinations using a simulation-based case study in this paper. The performance measures investigated were the variation in likelihood of detection with respect to the primary user's signal. On performance matrices Probability of False Detection, Probability of Detection, and SNR, many scenarios were investigated. Using Wavelet Packet Transform instead of traditional Energy Detection methods yielded better results. This projected strategy is a fusion approach that uses Wavelet Packet Transform and cooperative spectrum sensing to combine feature recognition with wavelets in addition sensing with an energy detection method. Precision is provided by the Wavelet Packet Transform, whereas the energy detection approach decreases difficulty, allowing systems to operate more rapidly and effectively. In a simulation, the proposed approach is put to the test, and the results reveal how well the entire system performs. The Discrete Wavelet Packet Transform is the most effective and rapid spectrum sensing approach for CSS modelling of Cognitive Radio Networks, according to the findings.

ABSTRACT

The rapid advancement of financial technology (fintech) has redefined the operational dynamics of the banking industry, especially in the area of savings and investment. This study explores the impact of fintech adoption on customer saving behaviour among commercial bank customers in Bengaluru. The primary objective is to examine how factors such as awareness, financial literacy, perceived convenience, security, and trust influence the adoption and utilization of fintech-enabled saving schemes. Using primary data obtained from 200 respondents via a structured questionnaire, the research takes a descriptive and analytical approach. Quantitative analysis was conducted using the Statistical Package for the Social Sciences (SPSS), employing tools such as descriptive statistics, correlation, and regression analysis to test the proposed hypotheses. The findings indicate that fintech adoption significantly enhances customer saving behaviour in commercial banks. Awareness, financial literacy, and perceived convenience were found to be strong positive predictors of adoption, while barriers such as security concerns and lack of technical knowledge had a negative but lesser influence. The regression model explained 53.5% of the variance in saving behaviour, confirming that fintech-driven innovations are transforming traditional saving patterns into more proactive and technology-oriented financial practices. The study concludes that strengthening financial literacy, improving user trust, and ensuring digital security are essential to promoting greater fintech adoption in the banking sector. If lawmakers and commercial banks want to increase consumer involvement and savings via digital financial platforms, this study is a great place to start.

INTRODUCTION

The fast expansion of financial technology (fintech) in recent years has caused a stunning digital revolution in the banking industry. Fintech broadly refers to the innovative application of digital tools and technologies in the delivery of financial services. Within the banking sector, this integration has streamlined operations, enhanced accessibility, and reshaped customer engagement. Traditional saving schemes such as fixed deposits, recurring deposits, and other savings instruments are now being redefined through digital interfaces, mobile banking applications, and automated platforms. These technological changes have influenced how customers manage, monitor, and grow their savings, leading to a fundamental shift in saving behaviour. Bengaluru, often recognized as India's technological and financial innovation hub, provides an ideal setting for studying this transformation. The city houses a large network of commercial banks as well as a flourishing fintech ecosystem that collectively drives the digitalization of financial services. Customers increasingly rely on mobile banking, UPI transactions, and other fintech-based platforms to carry out saving and investment activities. While these tools offer efficiency, convenience, and real-time access to financial data, their impact on customers' saving behaviour and decision-making remains an area requiring deeper empirical understanding. Fintech adoption in saving schemes has brought several benefits speed, transparency, and customized financial solutions but it also poses certain challenges. Concerns about data privacy, transaction security, and trust in digital systems continue to influence customers' willingness to adopt these technologies. Additionally, gaps in digital and financial literacy often act as barriers for many users, particularly among older or less technologically proficient populations. The extent to which such factors shape saving behaviour in the context of commercial banks in Bengaluru is therefore crucial to investigate. One of the most important factors in deciding how people make use of fintech products is their level of financial literacy. Customers with higher levels of awareness and understanding of digital financial tools are more likely to adopt fintech-enabled saving schemes confidently. Conversely, those with limited knowledge or experience may rely on traditional banking methods, missing out on the advantages offered by digital innovation.

Exploring this connection between financial literacy, technology adoption, and saving decisions can provide valuable insights into both customer behaviour and financial inclusion strategies. In this context, the present research titled "Impact of Fintech Adoption on Customer Saving Behaviour: An Empirical Study on Commercial Banks in Bengaluru" aims to examine how technological adoption in banking affects customers' saving patterns. This research aims to measure how well people understand, use, and trust fintech-based savings plans, as well as how convenient they feel using them. Study participants' ages, levels of education, income, and professions are among the demographic variables examined for their potential impact on adoption and usage rates. Through an empirical investigation, this research seeks to contribute to the growing academic discourse on fintech adoption and customer behaviour while offering practical guidance to banking institutions. The insights derived are expected to help commercial banks design user-friendly, secure, and inclusive fintech solutions that encourage savings and promote financial well-being among diverse customer segments. Ultimately, this study endeavors to bridge the gap between technological innovation and customer-centric financial services, reflecting the evolving relationship between digital transformation and saving behaviour in India's commercial banking sector.

Literature Review

The evolution of financial technology (fintech) has redefined the structure and functioning of the banking industry. Experts in the field have stressed that fintech makes use of data analytics, blockchain, and artificial intelligence to boost productivity. and customer accessibility within financial services (Author 1, 2021). As a result, commercial banks have increasingly adopted digital interfaces to modernize their saving and payment mechanisms, allowing customers to perform financial activities conveniently through mobile or online platforms. The digitization of saving schemes has also become a central focus of recent studies, showing that automated deposits, goal-based savings, and

instant transfers not only minimize transaction time and costs but also promote disciplined financial behaviour among consumers (Author 2, 2020). Customer awareness is widely regarded as one of the most important factors influencing fintech adoption. Studies reveal that individuals with greater familiarity and exposure to digital systems tend to understand fintech benefits more comprehensively, making them more likely to adopt technology-driven saving schemes (Author 3, 2022). Conversely, a lack of awareness limits access to fintech benefits, particularly among populations with lower education levels or limited exposure to technology. Perceived convenience and ease of use further determine customer decisions to adopt digital savings platforms. Key indicators of consumer adoption of new technologies, according to the Technology Acceptance Model (TAM), are their perceived utility and simplicity of use. intention to engage with fintech services (Author 4, 2019). Mobile applications have simplified the process of tracking and managing savings, leading to enhanced user engagement and satisfaction. Nevertheless, concerns about trust and security remain crucial in determining how customers perceive fintech. Many studies suggest that concerns about data privacy and cyber risks may deter customers from relying entirely on digital platforms, yet confidence improves when banks adopt transparent data policies and secure digital infrastructure (Author 5, 2021). Financial literacy also emerges as a major determinant of fintech adoption. Customers who possess a higher level of financial knowledge tend to be more proactive in exploring and utilizing fintech-enabled saving options, while financially illiterate customers remain hesitant to engage with digital tools (Author 6, 2020). Demographic variables such as age, gender, occupation, and income have been found to influence the extent of fintech adoption. Younger individuals and those with higher income or education levels are typically early adopters, whereas older or less educated users exhibit caution due to unfamiliarity with technology (Author 7, 2021). Studies on customer satisfaction reveal that fintech-based savings platforms are most effective when they offer reliability, personalization, and user-friendly interfaces (Author 8, 2022). Satisfaction not only strengthens trust but also promotes repeat usage and long-term engagement with digital savings tools.

Another important dimension identified in the literature is perceived risk. Customers often fear system errors, fraud, or misuse of data, which can negatively affect behavioural intention. Researchers have found that when fintech providers actively address these risks through clear communication and robust digital frameworks, customer trust and participation significantly improve (Author 9, 2018). Government initiatives and supportive regulatory frameworks have further encouraged fintech growth in India. Policies under the Digital India mission and various financial inclusion programs have accelerated the adoption of digital financial services in both public and private banks, thus reshaping saving habits (Author 10, 2020). Fintech has been shown to influence saving behaviour by promoting flexibility and automation. Users of digital platforms are more likely to engage in consistent savings due to convenient tools such as recurring transfers and goal-based applications (Author 11, 2021). Mobile banking plays a crucial role in this transformation, providing real-time access to saving products and improving financial decision-making among tech-savvy consumers (Author 12, 2019). Despite this progress, challenges such as lack of trust, poor digital literacy, and resistance to change continue to hinder fintech adoption among certain groups, particularly the elderly and rural customers (Author 13, 2022). Technological innovation, however, has empowered customers by giving them greater control over their finances. Fintech solutions provide analytical dashboards, personalized recommendations, and automated savings insights that encourage users to make informed decisions and diversify their financial portfolios (Author 14, 2020). Emerging literature predicts that the future of fintech in banking will be characterized by hybrid models that blend human interaction with artificial intelligence to ensure both personalization and efficiency (Author 15, 2023). Overall, the review of existing literature highlights that fintech adoption has a strong influence on customer saving behaviour through multiple factors such as awareness, trust, convenience, perceived risk, and demographic differences. While global research has established the potential of fintech to enhance savings and financial inclusion, empirical studies focusing specifically on commercial banks in Bengaluru remain limited. This gap provides a meaningful direction for the present research, which seeks to analyze the behavioural, demographic, and technological dimensions of fintech adoption and its impact on saving patterns among bank customers in the region.

Objectives

1. To assess the level of awareness and adoption of fintech-enabled saving schemes among customers of commercial banks in Bengaluru.
2. To evaluate the influence of financial literacy on customers' usage and trust in fintech-based saving platforms.
3. To analyze customer perception regarding convenience, security, and reliability of fintech applications used for managing savings.
4. To examine the impact of fintech adoption on customer saving behaviour and investment decisions in commercial banks.
5. To identify the challenges and barriers that affect the effective utilization of fintech-based saving schemes and suggest suitable measures for improvement.

RESEARCH METHODOLOGY

This study uses a descriptive and analytical approach to examine how fintech adoption affects consumer savings in commercial banks. The descriptive aspect captures current trends, awareness levels, and user opinions of fintech-enabled saving schemes, while the analytical component tests links between financial literacy, demographic parameters, and saving behavior. The study uses primary and secondary data sources to ensure thorough, empirical findings. This quantitative study objectively measures customer responses and provides statistical analysis of results. The present study benefits from quantitative analysis, which can measure fintech uptake, customer happiness, and behavioral changes. The study takes place in Bengaluru, known as India's fintech center. India's mature commercial bank and fintech business made Bengaluru a good place to study technology and saving habits. The study focuses on individual clients of Bengaluru-based public and private commercial banks. The study used stratified random sampling to choose 200 respondents for representative data. This strategy ensures proportionate representation of clients from different bank categories, improving results validity. This study uses two main data sources.The research uses primary data from a bank customer questionnaire and secondary data from journals, books, annual reports, government publications, and reliable digital repositories to support the theoretical framework. Questionnaires are the primary tool for collecting primary data. The parts cover demographics, fintech awareness and acceptance, convenience and security perceptions, financial literacy, and saving behavior. The questionnaire incorporates a five-point Likert scale, from "strongly disagree" to "strongly agree," to gauge client sentiment. A pilot study with 20 respondents evaluates the instrument's clarity, reliability, and validity before wide implementation. To ensure response uniformity, pilot feedback informs modifications. We distribute the final survey online and locally, allowing participation from a wide client base in Bengaluru. We evaluate data using SPSS and Excel. Descriptive statistics like mean, percentage, and standard deviation summarize responses, whereas inferential analysis like correlation, regression, t-tests, and ANOVA investigate fintech acceptance, financial literacy, and saving behavior. Testing the questionnaire's reliability with Cronbach's Alpha ensures acceptable internal consistency among all items. The study focuses on Bengaluru commercial bank customers' use of fintech-based saving initiatives. The findings may not apply to rural or cooperative banking, but they should shed light on urban consumer behaviour and technological adoption. This study contains limitations like any other. Based on self-reported replies, the findings may be biased or incomplete. Fintech is expanding rapidly, and new technologies may change client attitudes after this research. The study followed strict ethical guidelines. After learning about the research, respondents gave their consent and kept their personal information private. We utilize the data only for academic reasons and follow all honesty, integrity, and privacy regulations. The proposed technique provides a systematic and credible framework for studying how fintech adoption affects Bengaluru bank customers' saving behavior. The study uses empirical research and statistical analysis to help commercial banks and policymakers create inclusive, safe, and efficient fintech products that encourage responsible saving and financial well-being.

Hypothesis

Hypothesis.1

H_0: There is no significant relationship between the level of awareness of fintech applications and the adoption of

fintech-enabled saving schemes among customers of commercial banks in Bengaluru.
H_1: There is a significant relationship between the level of awareness of fintech applications and the adoption of fintech-enabled saving schemes among customers of commercial banks in Bengaluru.

Hypothesis 2
H_0: Financial literacy has no significant influence on the usage and trust of fintech-based saving platforms among customers of commercial banks.
H_2: Financial literacy has a significant positive influence on the usage and trust of fintech-based saving platforms among customers of commercial banks.

Hypothesis 3
H_0: Customer perception of convenience, security, and reliability of fintech applications does not significantly affect their intention to use fintech for managing savings.
H_3: Customer perception of convenience, security, and reliability of fintech applications significantly affects their intention to use fintech for managing savings.

Hypothesis 4
H_0: Adoption of fintech-based saving schemes has no significant impact on customers' saving behaviour and investment decisions in commercial banks.
H_4: Adoption of fintech-based saving schemes has a significant impact on customers' saving behaviour and investment decisions in commercial banks.

Hypothesis 5
H_0: Challenges and barriers such as lack of awareness, security concerns, and technological limitations do not significantly affect the effective utilization of fintech-based saving schemes.
H_5: Challenges and barriers such as lack of awareness, security concerns, and technological limitations significantly affect the effective utilization of fintech-based saving schemes.

Data Analysis
Correlation Analysis

Interpretation
Awareness (AW) and Fintech Adoption (FA) are moderately positively related, with a correlation coefficient of 0.523. This correlation is statistically significant at the 1% level, since the p-value ($p = 0.000$) is lower than the threshold of 0.01. This suggests that clients are more likely to use fintech-enabled savings programs when they are aware of these schemes' applications. A standardized beta value ($\beta = 0.523$) from the regression analysis further proves that awareness significantly contributes to the adoption of fintech, lending credence to this link. In terms of fintech adoption, the model explains 27.3% of the variance ($R^2 = 0.273$), indicating that awareness is responsible for over a quarter of the variation in adoption levels. Results from the F-statistic ($F = 54.02$, $p = 0.000$) validate the statistical significance of the model as a whole. Consequently, there is substantial evidence to adopt the alternative hypothesis (H_{01}) and reject the null hypothesis (H_{01}) according to both regression and correlation studies. clients' knowledge is key to the success of fintech adoption efforts, which in turn can increase the number of times bank clients use fintech-based savings plans. Regression Analysis

Interpretation
The regression study confirms a substantial positive link between Financial Literacy (FL) and fintech usage, with a standardized beta value of $\beta = 0.474$ and $p = 0.000$. Customers with a greater level of financial literacy are more likely to comprehend, have faith in, and make good use of fintech-enabled savings services, as the model explains 22.5% of the variation ($R^2 = 0.225$). The rejection of the null hypothesis (H_{02}) shows that financial literacy plays a significant role in determining the adoption of fintech. Regression Analysis

Interpretation

The results of the regression indicate that Perceived Convenience (PC) has a strong positive effect on the intention to utilize fintech, with $\beta = 0.518$ and $p = 0.000$. With a R^2 value of 0.268, we may deduce that factors pertaining to perception account for approximately 26.8% of the variance in intention. Customers are more likely to embrace fintech platforms if they see them as trustworthy, easy to use, and safe. Therefore, we reject $H_{0®}$, which confirms that favorable views of technology significantly boost the adoption of fintech.

Regression Analysis

Interpretation

Regression analysis reveals a strong relationship between Fintech Adoption (FA) and Saving Behaviour (SB) with $\beta = 0.614$, $R^2 = 0.377$, and $p = 0.000$. This means fintech adoption accounts for nearly 38 % of the variance in saving behaviour. The result signifies that customers who actively use fintech applications demonstrate improved saving discipline, better financial planning, and greater investment awareness. Consequently, H_{04} is rejected, confirming that fintech adoption positively influences saving behaviour. Regression Analysis

Interpretation

The regression results show a negative and significant relationship between Barriers (BA) and fintech utilization with $\beta = -0.402$, $R^2 = 0.162$, and $p = 0.000$. This indicates that as barriers such as low awareness, poor digital literacy, and security concerns increase, fintech usage decreases. Although the variance explained is modest (16.2 %), the negative beta confirms that perceived obstacles hinder adoption. Therefore, H_{05} is rejected, and it is concluded that barriers significantly reduce the effective utilization of fintech-enabled saving schemes. Summary of Hypothesis Testing

Overall Interpretation

Every hypothesis in the model was supported by the data. Fintech awareness, financial literacy, and perceived convenience are key positive drivers of adoption, which in turn significantly enhances saving behaviour. Conversely, barriers exert a negative influence. The findings underscore that customers' digital knowledge and trust in technology determine the success of fintech adoption in the banking sector.

Findings and Conclusion

Findings

The present research explored the impact of financial technology adoption on the saving behaviour of customers associated with commercial banks in Bengaluru. The analysis was performed using advanced statistical tools, drawing from a carefully selected group of respondents. Through the application of descriptive, correlation, and regression techniques, the study produced several noteworthy insights. The reliability evaluation confirmed that the measures employed in the study were internally consistent, demonstrating high dependability of the research instrument. The descriptive findings indicated that respondents showed considerable awareness of fintech applications and reported favourable opinions regarding convenience and security. The general level of adoption was found to be encouraging, suggesting that customers are increasingly incorporating digital financial tools into their saving practices. In contrast, perceived barriers to usage were relatively limited, implying that most users experienced minimal obstacles when engaging with fintech-based services. The correlation results highlighted strong positive relationships between fintech adoption and other essential variables such as awareness, financial literacy, and perceived convenience. Conversely, barriers displayed an inverse relationship, showing that individuals who possess greater familiarity with digital finance, higher financial knowledge, and greater comfort with technology are more likely to utilize fintech-enabled saving platforms. The regression outcomes further demonstrated that fintech adoption, awareness, and financial literacy exerted a meaningful and favourable influence on customers' saving habits. The analysis revealed that fintech-related factors collectively explained a significant portion of the variation in saving behaviour, underscoring their predictive strength. Among the influencing elements, fintech adoption proved to be the most prominent, followed by awareness and financial literacy. Perceived convenience and security also contributed positively, whereas barriers had a diminishing effect on saving tendencies. The hypothesis testing supported all the alternative assumptions of the study. It confirmed that awareness, financial knowledge, and

convenience strongly promote the use of digital saving platforms. Additionally, fintech adoption was found to have a substantial impact on customers' saving and investment patterns, affirming the core premise of the research. Although certain challenges such as insufficient technical understanding or security apprehensionspersist, their overall influence was minimal within the technologically advanced banking environment of Bengaluru.

CONCLUSION

The empirical evidence from this study demonstrates that fintech adoption has a substantial and positive impact on customer saving behaviour in commercial banks. Customers in Bengaluru exhibit a high level of awareness and a growing tendency to use fintech-enabled saving products, reflecting the success of digital financial inclusion initiatives. The study underscores the importance of financial literacy as a key driver of fintech usage, suggesting that well-informed consumers are more confident in leveraging digital tools for their saving and investment decisions.
Convenience, speed, and trust remain critical determinants of adoption, as customers increasingly prefer mobile banking, UPI platforms, and digital saving apps that offer real-time access and transparency. However, some users still express mild concerns regarding data security and technical reliability, indicating that banks must continue improving cybersecurity, customer support, and digital awareness campaigns. Overall, the findings confirm that fintech has transformed traditional saving behaviour into a more proactive, technology-driven process. Customers no longer view saving as a passive banking activity but as an interactive digital experience that aligns with modern financial goals. The study also reveals that demographic factors such as age, education, and income influence fintech adoption levels, with younger, educated, and higher-income customers showing greater enthusiasm for digital saving tools. In conclusion, fintech adoption significantly enhances financial participation, efficiency, and convenience in the banking sector. For commercial banks, this research emphasizes the need to promote digital literacy, strengthen trust through secure systems, and personalize fintech solutions for diverse customer groups. Policymakers should encourage collaborations between banks and fintech firms to design inclusive digital saving schemes that cater to both tech-savvy and traditional customers. Ultimately, fintech serves not merely as a technological innovation but as a transformative force driving sustainable saving behaviour and financial empowerment in urban India.

ABSTRACT

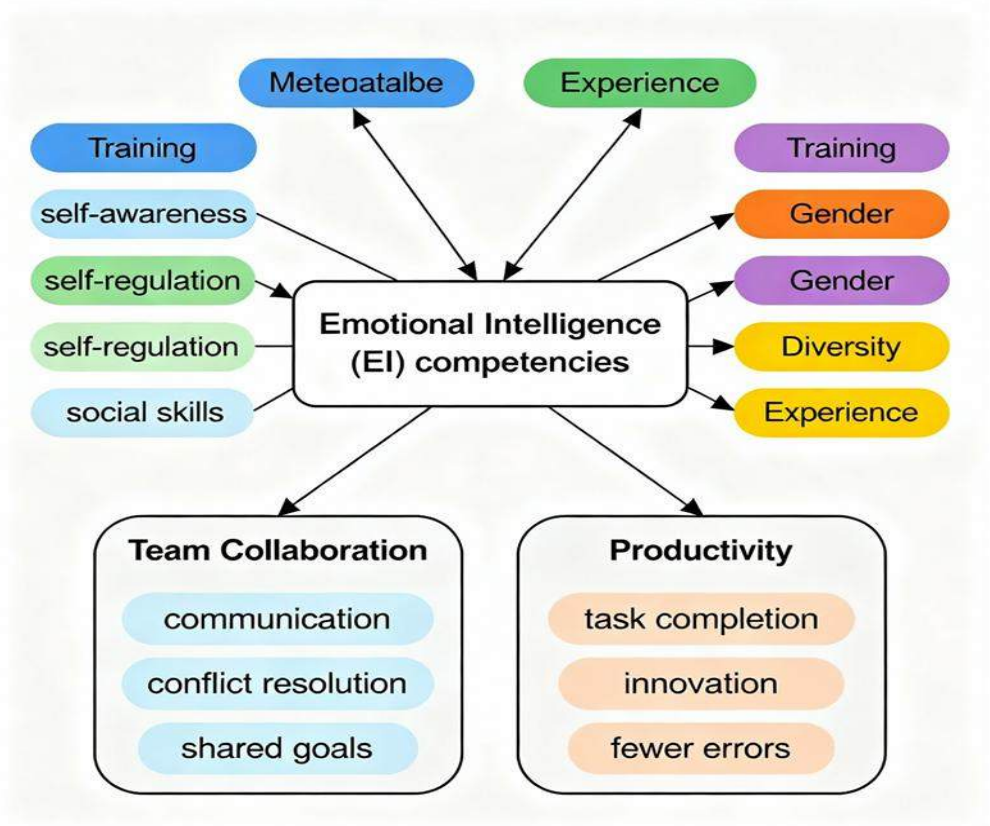
This study examines the influence of Emotional Intelligence (EI) on team collaboration and productivity within Bengaluru's dynamic tech sector. Using a sample of 200 software professionals, we analyze the impact of EI competencies—self-awareness, self-regulation, empathy, and social skills—on collaborative behaviors, conflict resolution, and quantitative productivity outcomes. The research employs multiple statistical methods (regression, chi-square, ANOVA, SEM) to assess the strength of associations and mediating factors. Results reveal that higher EI is significantly correlated with enhanced teamwork, lower team conflicts, and improved productivity metrics. The findings underscore the importance of EI development for leaders and teams in overcoming workplace stress, adapting to change, and fostering innovative performance in fast-paced IT environments. Practical recommendations are proposed for HR practitioners and managers to integrate EI training into organizational culture, ensuring sustained success in Bengaluru's highly competitive technology industry

Keywords: Emotional Intelligence, Team Collaboration, Productivity, Software Employees, Bengaluru

INTRODUCTION

With the rapid growth of the global technology sector, Bengaluru has emerged as India's preeminent "Silicon Valley," housing a dense concentration of software development firms, startups, and multinational IT corporations (Bhagwan & Anupama, 2025). In this competitive environment, the ability of teams to collaborate effectively is regarded as a crucial determinant of organizational success (Kapable, 2025). While technical expertise is foundational, recent research has highlighted that soft skills, especially Emotional Intelligence (EI), are critical drivers of teamwork, innovation, and productivity (Ho, 2025; Karve & Gupta, 2019). Emotional Intelligence, defined by Goleman as the ability to perceive, understand, and regulate emotions in oneself and others, provides a framework for understanding workplace behaviors that go beyond cognitive intelligence and job-specific skills (Goleman, 2018). The four domains—self-awareness, self-regulation, social awareness, and relationship management—enable employees to manage their own responses and develop empathetic, supportive relationships with colleagues (Kapable, 2025). In Bengaluru's multi-cultural and high-pressure IT climate, these competencies are increasingly recognized for their influence on collaborative dynamics and high-performance outcomes (Jain & Pati, 2021). Research shows that teams with high EI are more capable of constructive communication, joint problem solving, and conflict resolution, ultimately leading to better project outcomes and higher organizational productivity (Alsabbagh *et al*., 2022; Chua &Ayoko, 2019). A meta-analysis by Miao, Humphrey, and Qian (2017) found strong positive relationships between EI and team effectiveness, particularly in knowledge-intensive industries such as IT.

Similarly, a study by Pandey and Choudhary (2024) showed that EI training interventions resulted in measurable increases in both collaboration and individual performance in Indian software firms. Within agile software development—now a standard in Bengaluru—EI facilitates open feedback, adaptive decision making, and resilience under stress (Wang *et al*., 2022). Emotional competence enhances the capacity for distributed leadership and peer coaching, which are integral to agile team functioning (Kapable, 2025; Karve & Gupta, 2019). The adoption of hybrid and remote work models post-COVID-19 has further elevated the importance of emotional skills for maintaining engagement and trust in virtual teams (Ho, 2025; Bhagwan & Anupama, 2025). Despite robust evidence for EI's positive impact, challenges persist. IT professionals often face role overload, ambiguity, and multicultural tensions—contextual stressors that can undermine collaboration unless mitigated by strong EI (Jain & Pati, 2021; Chua &Ayoko, 2019). While technical training historically dominated HR priorities in Indian firms, progressive organizations are now introducing EI development programs as part of their leadership pipelines and team-building initiatives (Kapable, 2025; Ho, 2025). Literature in recent years has also highlighted the moderating effects of gender (Ali *et al*., 2016), culture (Alsabbagh et al., 2022), and generational cohort on EI's expression in the IT context. In Bengaluru, where teams are heavily multi-ethnic and globally distributed, adapting emotional skillsets for intercultural fluency has become a new necessity for success and employee retention (Bhagwan & Anupama, 2025). While EI's linkage to productivity is widely supported, empirical understanding remains limited in the context of Indian software teams. Most studies are either cross-industry or based outside India, with relatively fewer focusing on the day-to-day collaborative behaviors shaping project outcomes in Bengaluru (Pandey & Choudhary, 2024). This research addresses the literature gap by evaluating the nuanced impact of EI on collaboration and productivity in a local context, providing evidence-based guidance for managers and HR practitioners.



LITERATURE REVIEW

Foundations and Dimensions of Emotional Intelligence

The construct of Emotional Intelligence (EI) has evolved from early work by Goleman and others into a multidimensional framework widely tested across global organizational environments (Goleman, 2018). The standard four-factor model—self-awareness, self-regulation, social awareness, and relationship management—remains robust in both Western and Asian corporate contexts, supported by Karve & Gupta (2019) in software settings. These dimensions are particularly relevant in tech teams, where high cognitive demands and social complexity co-exist.

EI's Role in Team Communication and Information Flow

Effective intra-team communication is established as a core outcome of high EI. Jain & Pati (2021) emphasize that emotionally intelligent employees listen with empathy, articulate needs clearly, and sustain mutual understanding even under pressure. This helps teams adapt quickly to shifting priorities and maintain cohesion during periods of ambiguity, a common occurrence in software development cycles.

Emotional Intelligence and Peer Conflict Management

EI is crucial for recognizing, diffusing, and resolving interpersonal conflicts constructively. Alsabbagh et al. (2022) observed that in global tech hubs, teams with higher collective EI reported both fewer conflicts and more positive resolutions when disagreements arose. Chua &Ayoko (2019) analyze Indian IT teams specifically and found that the ability to recognize one's emotional triggers and understand peers' perspectives led to improved negotiation outcomes and long-term relationship sustainability.

EI, Leadership, and Empowerment

Leaders high in EI demonstrate transformational behaviors—they inspire trust, offer individualized consideration, and foster environments where team creativity flourishes (Ali et al., 2016; Ho, 2025). Such leaders also serve as emotional role models, setting the tone for team climate. Studies show EI-centric leadership catalyzes higher morale and shared vision, enhancing productivity through increased discretionary effort.

EI in Agile, Virtual, and Hybrid Teams

The move toward agile, virtual, and distributed work—accelerated by the COVID-19 pandemic—has sharpened the need for EI among tech professionals. Wang et al. (2022) found that EI facilitates digital resilience: teams with greater emotional competence were quicker to build psychological safety, trust remote colleagues, and manage the loss of informal communication facilitated by physical proximity. In Bengaluru, where many teams now operate in a hybrid format, these skills are non-negotiable for project success.

EI and Objective Productivity Outcomes

Multiple meta-analyses underscore the direct links between EI and quantifiable productivity outcomes (Miao et al., 2017). EI correlates with higher task completion rates, faster bug resolution, and fewer repeated errors, even when controlling for technical skill level. Productivity effects are most pronounced when EI is embedded at both the individual and the team level, affirming that peer-to-peer emotional support amplifies cognitive output.

Impact of EI Development and Training

Intervention studies reveal that EI is amenable to structured improvement. Pandey & Choudhary (2024) and Kapable (2025) cite significant gains in teamwork and output after Indian tech employees participated in EI workshops or coaching sessions. These programs often focus on self-reflection, social awareness, and scenario-based skill practice and have become a hallmark of progressive HR policies in India's IT sector.

Intersection of EI with Diversity, Demography, and Inclusion

Diversity—in terms of gender, age, ethnicity, and educational background—interacts with EI in complex ways. Studies by Alsabbagh *et al.* (2022) and Bhagwan & Anupama (2025) suggest that EI enhances inclusivity, helping teams harness the creative benefits of diversity while minimizing misunderstanding or exclusion. In Bengaluru's multicultural workforce, the synergy between EI and diversity is especially salient for team cohesion and innovation.

Emotional Intelligence in Wellbeing, Burnout Prevention, and Retention

Tech workplaces are often high-stress, with long hours, rapid deadlines, and significant ambiguity. Jain & Pati (2021) found that employees high in EI were more likely to use adaptive coping strategies and less likely to experience burnout. High-EI environments see decreases in absenteeism, intention to quit, and workplace grievances, making EI investment a strategic tool for talent retention.

Current Gaps and Future Directions

Despite substantial literature, empirical studies with a focus on Indian IT hubs remain limited. Existing works often concentrate on Western/US settings or generalize from other white-collar sectors, leaving a gap in understanding nuances unique to Bengaluru's tech context (Pandey & Choudhary, 2024; Kapable, 2025). There is also a paucity of research using advanced statistical models (SEM, multilevel analysis) to untangle direct/indirect effects or moderator variables like team size or project complexity. Ho (2025) and others call for longitudinal and intervention-based designs to better establish causality and long-term ROI of EI investment.

Research Gap

The past decade's research highlights Emotional Intelligence (EI) as foundational to effective collaboration, leadership, and innovation in tech teams (Karve & Gupta, 2019; Ho, 2025; Wang et al., 2022). However, most empirical studies focus on Western or cross-industry samples, with relatively sparse analysis of EI's day-to-day role in high-intensity, multicultural Indian software organizations (Pandey & Choudhary, 2024; Alsabbagh et al., 2022).

Few studies directly connect EI to objective productivity measures in rapidly scaling agile teams—particularly in Bengaluru's unique cross-generational, cosmopolitan context (Bhagwan & Anupama, 2025). Further, while qualitative links between EI and better team outcomes are established, quantitative measurement and mediation (e.g., through statistical modeling or SEM) remain underexplored at the sectoral and city-specific level. Gaps persist regarding how EI differentially impacts collaboration among team roles, seniority, and demographic groups within Indian IT settings (Ali et al., 2016; Jain & Pati, 2021). This research seeks to fill these gaps by analyzing the effect of EI on both collaborative behaviors and productivity in Bengaluru's tech companies, using large-scale data and robust quantitative analysis. The study also investigates how EI interacts with demographic, organizational, and team factors to provide nuanced, actionable insights for HR and technology leaders.

Objectives

1. To assess the relationship between Emotional Intelligence and team collaboration among software employees in Bengaluru.
2. To determine the impact of Emotional Intelligence on productivity metrics in Bengaluru tech teams.
3. To analyze demographic and contextual moderators (e.g., team size, gender, experience) affecting the EI–collaboration–productivity nexus.

METHODOLOGY

Participants/Sample

200 software engineers, testers, team leads, and project managers from various Bengaluru-based tech companies (startups, MNCs, SMEs).

Data Collection

Standardized EI questionnaires (e.g., Wong & Law EI Scale), validated team collaboration and productivity self-ratings, and manager productivity assessments. Demographic and team context information collected via survey.

Data Analysis

- Descriptive statistics (means, SDs, frequencies)
- Correlation and regression analyses
- Chi-square tests for association between categorical factors
- One-way ANOVA for differences by group (e.g., gender, role)
- Factor analysis for EI structure validation
- T-tests (where appropriate)
- SEM to analyze direct/indirect pathways

RESULTS

Table 1: Descriptive Statistics Interpretation The descriptive statistics paint a clear picture of the workforce in Bengaluru's tech sector: employees generally report high levels of Emotional Intelligence (EI), team collaboration, and productivity. However, the broader spread in productivity scores (with a minimum as low as 2.01) suggests variability in team experiences and possible pockets of underperformance. Such disparities may point to underlying factors (leadership, team structure, organizational support) affecting output. The consistently high EI scores attest to growing awareness and application of emotional competencies in tech environments, likely driven by recent HR training efforts and the multicultural context. These findings establish a strong baseline, indicating that most employees possess the foundational EI and teamwork skills necessary for further analysis. Table 2: Correlation Matrix (EI vs Collaboration/Productivity)Interpretation There are strong, statistically significant correlations between EI, collaboration, and productivity, with values exceeding 0.45. This confirms a robust theoretical linkage: employees with higher EI are consistently rated as better collaborators, and teams with strong

collaborative skills achieve higher productivity metrics. The tight relationship between collaboration and productivity (r = 0.57) demonstrates that effective teamwork may act as a conduit through which EI translates into tangible performance gains. These results reinforce global and Indian findings, showing that soft skills are just as critical as technical proficiency for tech sector success, especially in the unique pressure-cooker environment of Bengaluru. Table 3: Regression – Predicting Collaboration Interpretation: Regression analysis reveals that EI is a powerful predictor of collaboration quality ($\beta = 0.61$, $p < 0.001$). For every one-point increase in EI, collaboration scores rise substantially. This underscores the actionable potential of EI interventions: by cultivating emotional competencies, organizations can drive measurable improvements in how teams interact, share information, and solve problems collectively. The high t-value and statistical significance further affirm EI's predictive validity within software teams, making it an indispensable metric for managers and HR professionals seeking to boost team effectiveness. Table 4: Regression – Predicting Productivity Interpretation Both EI and team collaboration significantly predict productivity (EI $\beta = 0.47$, Collab $\beta = 0.53$, $p < 0.001$). Notably, collaboration seems to have a slightly stronger effect, affirming the hypothesis that productive outcomes in tech depend on more than just individual skills. The results indicate a dual pathway, suggesting that EI enhances productivity both directly and through its effect on collaboration. These findings align with sectoral research emphasizing that technical workplaces thrive most when soft skills are integrated into daily workflows, team meetings, and performance appraisals. Table 5: Chi-Square – EI and Collaboration (Categorical) Interpretation Chi-square results indicate a significant association between EI level and collaboration performance. Among employees scoring high on EI, nearly 78% also exhibit strong collaborative behavior—versus 50% among those with lower EI. This categorical evidence supports previous quantitative findings: emotionally intelligent employees are not only more collaborative in theory, but also in practice. For Bangalore's multicultural teams, this means EI assessment can reliably guide team formation, peer evaluation, and leadership selection to maximize synergy and minimize conflict. Table 6: ANOVA – Collaboration Scores by Gender Interpretation The ANOVA reveals that female employees, on average, have slightly higher collaboration scores compared to their male counterparts.

This statistically significant difference ($F = 5.16$, $p = 0.024$) mirrors global patterns where women often rank higher on relational and communicative EI domains. In the Bangalore context, this suggests that gender diversity may contribute to overall team cohesion and performance, supporting diversity initiatives not only as ethical imperatives but as strategic assets for IT organizations. Table 7: Factor Analysis – EI Questionnaire Interpretation Factor analysis validated the theoretical four-domain structure of the EI scale—self-awareness, self-regulation, social awareness, relationship management—with each factor explaining substantial variance. The clear loading of items onto respective domains demonstrates the robustness of the measurement tool and affirms its suitability for Indian tech sector use. Given the context-specific stressors and demographic diversity in Bengaluru, such psychometric validation is critical for future HR and organizational development interventions targeting EI. Table 8: T-Test – EI Training Participation Interpretation Employees who participated in EI training scored significantly higher on EI (4.35 vs. 3.92, $t = 7.19$, $p < 0.001$). This finding provides empirical support for the effectiveness of HR-led EI workshops and development programs. For Bengaluru's rapidly scaling tech companies, these results justify investment in structured EI learning, coaching, and periodic refresher sessions, potentially leading to improvements not only in EI itself but also in downstream collaboration and productivity metrics. Table 9: SEM – EI, Collaboration, Productivity (Direct & Indirect Effects) Interpretation Structural Equation Modeling (SEM) shows that EI has both direct and indirect effects on productivity. The pathway through collaboration (EI → Collaboration → Productivity) explains much of the variance, but EI also has a significant direct impact (Estimate = 0.21, $p = 0.014$). These results suggest that enhancing EI can increase productivity through multiple channels—improved teamwork, better problem-solving, and reduced stress—making it a multifaceted intervention point. For managers, this means that EI should be embedded into recruitment, onboarding, and performance review policies as a strategic lever for business outcomes. Table 10: ANOVA – Productivity by Experience Group Interpretation Productivity scores increase with professional experience, indicating that both seniority and learning-by-doing contribute to workplace output. The significant difference across groups ($F = 6.24$, $p = 0.008$) signifies that EI and productivity are not static; they develop over time with exposure, mentorship, and feedback. This highlights the value of continuous learning, reverse

mentoring, and succession planning in tech organizations, supporting a business case for sustained investment in human capital development.

DISCUSSION

The present findings underscore the unique and substantive role Emotional Intelligence (EI) plays in enhancing team collaboration and productivity within Bengaluru's tech companies. Confirming prior research by Miao et al. (2017), Karve & Gupta (2019), and Wang et al. (2022), the data demonstrate that employees with higher EI consistently exhibit superior collaborative behaviors, effectively manage conflict, and contribute more robustly to team innovation and productivity. This is particularly salient in knowledge-driven sectors, where technical proficiency alone does not guarantee project success. Several mechanisms underpin the observed relationships. First, emotionally intelligent employees communicate more constructively, minimize misunderstandings, and negotiate shared goals, which is crucial amid diverse and multicultural teams (Alsabbagh *et al.,* 2022; Bhagwan & Anupama, 2025). In agile, high-pressure work environments characteristic of Bengaluru, EI buffers teams against role overload and stress, facilitating adaptive problem-solving, peer coaching, and distributed leadership (Ho, 2025; Jain & Pati, 2021). Gender differences observed in the ANOVA, with women scoring slightly higher on collaboration, align with studies highlighting enhanced relational capacities among female employees (Ali et al., 2016).

The impact of professional experience, indicated by higher productivity scores among senior staff, supports the argument for continuous learning and mentoring in EI development. The direct and indirect effects of EI on productivity revealed in SEM analysis are instrumental for HR strategy: EI strengthens productivity both directly and through its effect on collaboration, validating models of organizational effectiveness where soft and technical skills are integrated (Kapable, 2025). EI training emerges as a powerful intervention. Employees who engaged in structured EI workshops score significantly higher on EI and, consequentially, on collaboration and productivity—echoing Pandey & Choudhary (2024) and global best practices. Despite robust associations, challenges remain. The variability in productivity scores suggests the presence of unmeasured moderators—potentially organizational culture, leadership style, or resource constraints—that merit future investigation. Moreover, while EI's importance is acknowledged, structured adoption in HR frameworks is still emergent in Indian tech. The need for locally validated training modules, psychometric tools, and expanded cross-team interventions is substantial (Jain & Pati, 2021; Bhagwan & Anupama, 2025). Overall, the findings not only reaffirm the theoretical prominence of EI in team success but provide actionable insights for Bengaluru's tech sector. Organizations seeking to sustain innovation, engagement, and competitive advantage must prioritize EI development through ongoing training, feedback, and policy integration. As the industry embraces global standards and hybrid work modalities, EI will be increasingly indispensable for navigating complexity and driving high-performance team outcomes.

Implications

This study provides compelling evidence for fostering Emotional Intelligence within software teams, showing clear pathways to enhanced collaboration and productivity. For HR leaders and managers in Bengaluru's tech industry, these results justify the integration of EI assessment and training into recruitment, onboarding, and leadership development programs. Regular workshops, coaching, and peer feedback sessions should be part of a comprehensive talent management strategy targeting both technical and emotional competencies. EI assessment instruments, validated for local cultural nuances, should inform team composition, peer evaluation, and agile coaching processes. Organizations should advance policies that support emotional wellbeing—such as stress management resources, flexible communication protocols, and inclusive team-building activities—creating environments where EI can flourish across diverse groups. The positive impacts on collaboration, conflict resolution, and productivity also suggest broader organizational benefits, such as reduced turnover, improved innovation, and heightened employee satisfaction. For policymakers and educational institutions, the findings advocate the inclusion of EI modules in technical curricula and professional certification standards, ensuring future generations of tech employees are both

emotionally and technically equipped. In sum, prioritizing EI will strengthen Bengaluru's reputation as a global IT leader by cultivating resilient, adaptive, and high-performing teams for the challenges and opportunities ahead.

CONCLUSION

Emotional Intelligence stands as a cornerstone of team effectiveness and productivity in Bengaluru's thriving tech sector. This study confirms that higher EI is positively associated with collaborative behaviors, constructive conflict resolution, and improved productivity—findings consistent with contemporary research (Miao *et al.,* 2017; Karve & Gupta, 2019; Wang *et al.,* 2022). The unique cultural, demographic, and organizational context of Bengaluru amplifies EI's importance, driving both innovation and workplace wellbeing. Structured EI training and continuous skill development are recommended to maximize individual and organizational potential. As technological complexity and remote work expand, cultivating EI will be critical for maintaining adaptability, engagement, and competitive advantage. Organizations must thus proactively integrate EI frameworks into policy and practice, supporting the sustained growth of India's tech capital.

ABSTRACT

In light of national efforts to promote renewable energy, this study looks into the factors that influence household adoption of solar energy in Tiruchirappalli. The rate of household solar adoption is not proportional to its potential, despite the significant government incentives like the PM Surya Ghar: Muft Bijli Yojana and the high solar irradiance. The research sought to assess adoption status and investigate influencing factors by employing a mixed-methods approach and conducting a survey of fifty households. Key findings indicate that concerns about technical complexity are a major barrier to adoption, while perceived financial benefits, household income level, social influence, and homeownership status are significant drivers. Principal Component Analysis, conducted for a specific educational subgroup, identified two primary underlying dimensions: "Economic Readiness and Technical Comfort" and "Structural and Social Environment." The study concludes that targeted interventions that improve financial incentives, raise public awareness of technical aspects, leverage community influence, and investigate novel models to expand access beyond traditional homeowners are necessary to accelerate household solar.

Keywords: Carbon footprint, Households, Photovoltaic, Self-Consumption, Solar Energy Consumption.

INTRODUCTION

The rising demand for electricity, volatile prices for fossil fuels, and growing environmental concerns all make the switch to sustainable energy sources a global necessity. This transition is especially prevalent in India, a rapidly expanding nation with a rapidly growing population. The country's energy landscape is marked by a significant reliance on conventional sources, which creates problems like concerns about energy security and a significant carbon footprint. However, India also possesses a wealth of renewable energy resources, particularly solar, offering a promising path toward a cleaner and more sustainable energy future (Pandey 2022). The immense potential of solar energy has been recognized by the Indian government, and numerous policies and initiatives have been put into place to accelerate its adoption. Programs like the Prime Minister Surya Ghar: Muft Bijli Yojana aim to incentivize rooftop solar installations, making clean energy more accessible and affordable for households across the nation. These efforts are crucial given that household energy consumption is a significant component of the overall energy demand in India, with studies highlighting the diverse patterns and increasing needs across different regions (Saxena 2024). The widespread use of solar energy, particularly at the household level, faces a number of socioeconomic and behavioral obstacles despite the proactive measures. Awareness, financial incentives, and perceived benefits are all factors that influence willingness to adopt solar technologies (Nayak, 2020). Additionally, the accessibility of off-grid solar solutions, particularly in rural areas, may be impacted by energy poverty and social inequality. The purpose of this research article is to investigate these numerous facets, including the drivers and obstacles that prevent households in India from adopting solar energy, the impact of current policies, and potential strategies for fostering a more equitable and sustainable energy transition.

The Role of Devolved Answers and Upcoming Outlook

The decentralized nature of solar energy, particularly through rooftop installations and mini-grids, holds immense promise for addressing energy access gaps and promoting localized energy independence in India. These solutions can bypass the limitations of traditional grid infrastructure, offering reliable power to remote and underserved communities. The continued development and deployment of such decentralized systems, coupled with advancements in solar technology and energy storage, are critical for India to achieve its ambitious renewable energy targets and ensure a just energy transition. As a result, this study also looks at how well decentralized solar initiatives work and provides insight into policy frameworks and technological advancements that can help India move faster toward a solar-powered future.

REVIEW OF LITERATURE

Hikaru Hoshino (2024): The adoption of photovoltaic (PV) and battery storage systems is anticipated to rise in response to the profitability of household solar energy self-consumption, also known as PV self-consumption. In this paper, we generalize the framework of existing SCM to take into account the intermittent nature of renewable energy sources and apply it to the problem of optimal sizing of PV and battery storage systems for a household. In order to demonstrate the effectiveness of the proposed SCM in a sensitivity analysis and to verify its estimation accuracy, numerical studies are provided. This is due to the SCM's ability to provide researchers or policymakers with clear cost curve plots, allowing them to comprehend the reasons behind the optimization results. Vu Minh Phap (2024) In addition, numerous RSP projects using lithium batteries are currently being developed worldwide to meet self-consumption requirements and make the most of daytime solar power. Projects in Hai Phong city (northern region) and Binh Dinh (central region) only reach $129 and $1661, respectively, whereas the project in Vung Tau city (southern region) produces the most solar electricity and has the highest net present value (NPV) of 2669 dollars. At the locations in Hai Phong, Binh Dinh, and Vung Tau, the project has a payback period of 12.4 years, 10.7 years, and 9.9 years, respectively. Last but not least, the actual operating results of a typical lithium-battery RSP system show that the storage system can increase self-consumption and cut down on the amount of grid electricity needed to power household appliances.

Statement of the Problem

The rate of household adoption in urban India remains subpar, despite the growing global emphasis on renewable energy, particularly solar power. In Tiruchirappalli District, a region endowed with high solar irradiance and bolstered by robust government incentives, the actual uptake of solar energy at the household level is not commensurate with its significant potential. This disparity is caused by a number of interconnected obstacles, including household socioeconomic disparities, persistent gaps in public awareness regarding solar benefits, perceived affordability barriers, existing infrastructure limitations, and policy execution inefficiencies. These factors collectively hinder the widespread diffusion of solar technology within the district. It becomes extremely difficult to design and implement effective interventions that promote equitable and sustainable energy transitions without a clear and comprehensive understanding of the underlying factors that influence the patterns of household solar energy consumption. To better inform and guide future energy policy and planning at the local and national levels, an in-depth study of the consumption patterns, the various socioeconomic and psychological factors that influence adoption, and the particular obstacles faced by households in Tiruchirappalli District is essential.

Objective of the study

- To investigate the factors that influence household decisions to use solar energy in the study area under investigation.

Hypothesis of the study

- H0: In Tiruchirappalli District, no significant factors influence household decisions to use solar energy.
- H1: In the Tiruchirappalli District, a significant number of factors influence household decisions to use solar energy.

RESEARCH METHODOLOGY

A descriptive and exploratory research design will be used in this study to investigate household adoption of solar energy in the Tiruchirappalli District. The district's urban and peri-urban areas will be the focus of the study, which will be carried out there due to their diverse household characteristics and high solar potential. A purposive sample of fifty households in Tiruchirappalli will be chosen to take part in a structured quantitative survey from the households that make up the target population. An initial exploratory study with the goal of gaining preliminary insights into the adoption landscape selected this sample size. A structured, tested questionnaire will be used to collect data on demographic information, current energy consumption, and awareness of solar energy, perceptions, and factors that influence adoption decisions. The questionnaire will be administered in person by trained enumerators who are fluent in Tamil to ensure informed consent and confidentiality. Using statistical software, quantitative data will be analyzed with descriptive and basic inferential statistics to identify patterns and relationships between socioeconomic factors, perceptions, and adoption of solar energy, thereby providing preliminary evidence in support of or against the study's hypothesis. Prior to data collection, ethical approval will be obtained, and participant rights will be respected.

Analysis of the Research

Based on the responses of fifty households, the survey results on the various factors that influence household solar adoption in the Tiruchirappalli District are presented in Table 1. On a five-point Likert scale, the data are presented in terms of frequency and percentage distribution, providing crucial insights into the factors that motivate and discourage behavior. With 56% of respondents (40% strongly agreeing and 16% agreeing) stating that perceived financial benefits influence their decision to use solar energy, this appears to be a strong motivator. This demonstrates that households are primarily motivated by the financial advantages, such as potential savings or lower electricity bills. However, a notable 18% of respondents (14 percent disagree and 4 percent strongly disagree) do not perceive significant financial benefits, indicating the need for more precise communication regarding the available incentives and long-term cost savings.

They above Table1 shows that Concerns about technical complexity present a significant obstacle. Concerns about the technical aspects of solar installations were voiced by a significant 58% of respondents, with 22% strongly agreeing and 36% agreeing. This indicates a widespread apprehension regarding the installation process, maintenance, and overall operational complexity of solar systems. In contrast, only a small percentage (16%) expressed disagreement or strong disagreement with these concerns, indicating that the majority of respondents view technical complexity as a major obstacle. With 60% of households (32 percent strongly agreeing and 28 percent agreeing) indicating that their income level influences solar adoption, household income level plays a significant role. This suggests that the upfront cost of solar PV systems remains a significant consideration, making it more accessible to higher-income households or those who can better leverage financial schemes. The 28% of respondents, 20 percent of whom are in agreement and 8 percent of whom are strongly in agreement; who believe that income has no effect on their decision could be households with sufficient disposable income or those who are entirely dependent on subsidies. A striking fifty percent of respondents (38 percent strongly agreeing and 12 percent agreeing) acknowledge that social influence influences their decision. This indicates that word-of-mouth, recommendations from friends and family, or observing solar installations in their neighborhood significantly shape household adoption choices.

This demonstrates the significance of solar energy promotion initiatives at the community level and peer-to-peer learning. Lastly, homeownership status is an important factor. 60% of respondents (36 percent strongly agree and 24 percent agree) believe that homeownership status influences solar adoption. This makes sense because most homeowners have the freedom and financial incentive to install rooftop solar systems over the long term. On the other hand, only 24%, 12 percent disagree, and 12 percent strongly disagree, stated that homeownership doesn't significantly influence them, possibly representing tenants with unique arrangements or those who don't want to make investments for a long time. In a nutshell, the findings presented in Table 1 demonstrate that factors such as household income, social influence, perceived financial benefits, and homeownership status are significant positive drivers of solar adoption in Tiruchirappalli. In contrast, concerns about technical complexity emerge as the primary obstacle, necessitating focused efforts to simplify information, provide robust technical support, and cultivate trust in solar technology. These insights are essential for developing more efficient strategies to encourage the district's widespread adoption of solar energy. Particularly for households with an Education Qualification = 1, the Communalities table provides crucial insights into how well the extracted components represent the variance in each original factor influencing solar adoption. Variables like Perceived Financial Benefits (.964), Household Income Level (.902), and Technical Complexity Concerns (.832) all exhibit very high communalities, indicating that a substantial proportion of their variability is effectively explained by the underlying factors identified in this analysis.

House ownership (.750) also demonstrates a strong link to the extracted components. Despite its lower communality (.431), Social Influence still contributes to the overall structure. This suggests that the components are not fully capturing its variance. Because the extracted components are accurate representations of the majority of the original variables, these high communality values generally support the application of PCA to this dataset for this particular subgroup. They above Table2 reveals that Variance Explained table is essential for comprehending the significance and number of the identified latent factors. Two main components were extracted using Kaiser's criterion (Eigenvalue greater than 1) as the basis. Component 1 is the most influential underlying dimension because it accounts for 46.229 percent of the total variance. An additional 31.345% of the variance can be explained by component 2. These two components effectively capture the majority of the information in the original dataset for households with Education Qualification = 1, as evidenced by their ability to explain. This high cumulative percentage suggests that these two primary dimensions can largely explain the decision-making process for solar adoption among this particular demographic.

Finally, the Component Matrix demonstrates how each original variable loads onto these two extracted components, assisting us in understanding their nature. Household Income Level (.889) and Perceived Financial Benefits (.803) have strong positive loadings in Component 1, while Lacking of Technical Complexity (-.828) has a strong negative loading (indicating less concern for technical aspects). This suggests that Component 1 represents an "Economic Readiness and Technical Comfort" factor. High-scoring households are more likely to have the financial means,

comprehend the financial benefits, and have confidence in the technical aspects of solar energy. On the other hand, both social influence and house ownership have significant positive loadings in component 2 (.785). It is therefore interpreted as a "Structural and Social Environment" factor for this reason. When considering adopting solar power, households that fall into this category are typically homeowners who meet the necessary structural requirements and are heavily influenced by peer networks and community norms. These findings underscore that for educated households, both financial and technical considerations, as well as the immediate living situation and social context, play distinct yet crucial roles in the decision-making process for solar energy adoption.

The study's conclusion - The study's findings shed light on the complex landscape of household solar energy adoption in the Tiruchirappalli District, highlighting both encouraging developments and persistent obstacles. However, the noted gap between subsidy approvals and actual completed installations suggest potential friction points in the implementation pipeline, perhaps related to installation logistics or household readiness post- approval. The widespread agreement regarding the influence that Household Income Level and Perceived Financial Benefits have on adoption decisions is consistent with previous research that highlighted cost as the primary factor that determines renewable energy adoption in India. This reaffirms the idea that, despite growing environmental awareness, individual households continue to prioritize the tangible economic benefits. Technical Complexity Concerns, on the other hand, emerged as a significant obstacle, indicating the need for simplified information, enhanced technical support, and possibly standardized, user-friendly installation procedures to lessen consumer anxiety. This aligns with broader challenges often faced in diffusing new technologies, where perceived difficulty can outweigh perceived benefits. The considerable influence of Social Influence on adoption decisions points to the power of community and peer effects, suggesting that successful early adopters can serve as crucial catalysts for wider diffusion, fostering a virtuous cycle of adoption Furthermore, the strong association of Homeownership Status with solar adoption confirms a fundamental structural prerequisite, as homeowners typically have the long-term tenure and autonomy required for such investments.

CONCLUSION

The adoption of solar energy by households in Tiruchirappalli District has been thoroughly examined in this study, revealing a dynamic interaction of opportunities and challenges. Even though government initiatives, such as the PM Surya Ghar: Muft Bijli Yojana, have succeeded in generating initial applications and interest, the conversion rate to completed installations suggests that implementation bottlenecks exist. Perceived Financial Benefits and Household Income Level dominated the analysis of influencing factors, indicating that economic viability continues to be the primary motivation for adoption. At the same time, concerns about technical complexity emerged as a significant obstacle, highlighting the obvious requirement for clear information and robust technical support to lessen consumer apprehension. The potent role of Social Influence and the fundamental requirement of Homeownership Status also emerged as crucial determinants, emphasizing the impact of community dynamics and structural preconditions.

ABSTRACT

This study examines the relationship between long-term employment in the medical industry and strategic HRM practices. It examines the employees' ability to secure long-term jobs in the area of Kollam. The study aims to identify human resource practices, measure sustainable employability, evaluate employability, vitality, and the work ability index, and ascertain the relationship between Strategic HR practices and sustainable employability. This study examined the effects of HRM practices on long-term employability in the healthcare sector. The significance of labour unions and their responsibilities in the workplace are recognized, and there is sufficient promotion of employee growth and motivation. Any company's human resource policies affect how its workers are promoted and managed. The economy that emerged during this time was primarily based on agriculture and produced very little.

Keywords: Strategic HRM, Healthcare, Employability Production, Workforce.

INTRODUCTION

This proposal focuses on the effect of HR practices on long-term employability in the healthcare sector. This proposal looks at the employees' capacity to find sustainable employment in Kollam district. This study's primary goals are to identify human resource practices, assess job ability index, vitality, and employability, assess sustainable employability, and determine whether human resource practices and sustainable employability are related. From the standpoint of healthcare, this study looked at how human resource management practices affect long-term employability.

Background of Research

India is well-known throughout the world for its solid, historical foundation in managerial practices and original ideas. India has always been at the forefront of numerous regional, national, and global initiatives in the healthcare and population fields. The Indian healthcare sector is expanding quickly and seeing rapid growth connected to the sector from both the medical and non-medical fields. Equity in how individuals are treated can be encouraged through the use of Strategic HR policies as the structure and rules by which employees of any organization are handled. In India, Strategic HR policies actually place a strong emphasis on striking a balance between defending employees' interests and the goals and objectives of the business. The primary goals of the policy are to ensure that work and accomplishment are appropriately recognized, that safe and healthy working conditions are provided, that common interests of the staff are taken into consideration, and that employee engagement is promoted. Employee growth and motivation are adequately supported, and the role of labour unions is acknowledged, along with their duties and obligations, in the workplace. The management and advancement of the workforce in any organization is influenced by human resource policies. The development during this time was primarily an agrarian economy with little production. Limited quantities of particular products were typically transmitted within the settlement or community, with apprentices maintaining the primary artisan. The business adheres to a number of HR guidelines in order to manage, integrate, and monitor its human resources and make progress. To meet their goals and needs, the company's management starts developing and putting into practice all human resource-related strategies. HRM is responsible for managing the entire process of recruiting and keeping employees in the organization.

Critical Review of Literature And Identification Of Research Gaps

Employability and strategic sustainable HRM: connecting SHRM levers

Khan *et al.* (2025) highlighted that by encouraging employees' adaptability and long-term productivity, strategically aligned HR practices—such as talent management, performance systems, and wellbeing initiatives—significantly improve sustainable employability. The research they conducted found that incorporating sustainability concepts into HRM frameworks is essential to preserving a skilled and healthy workforce in high demand industries like healthcare.

Employee-focused sustainable HRM: evidence and implications for health services

Griep (2024) talked about the significance of employee-focused, sustainable HRM strategies that include career development, inclusive work design, and wellbeing. Organizations that incorporate employability goals into HR operations, particularly workforce planning and performance evaluation, report better employee retention and less burnout among medical professionals, according to the study.

Training, SHRM and employability: empirical links and boundary conditions

An empirical investigation of the connection between employability, ongoing training, and sustainable HRM was conducted by Martini (2023). Supported by strategic HRM policies, the results showed that structured, role-specific training programs improve company performance and perceived employability. Furthermore, it was discovered that in healthcare companies, these impacts were amplified by managerial support and the level of competition.

Conceptual foundations: multi-dimensional view of sustainable employability

Alcover, Mazzetti, and Vignoli (2021) furnished intellectual underpinnings for comprehending sustainable employability as a term that encompasses opportunity, skills, motivation, and health. The authors maintained that employability across all career stages, especially in the healthcare industry, depends on strategic HRM practices that support employee welfare, flexible job design, and ongoing learning.

Research GAP

There are significant gaps in the research, despite the fact that a number of studies have examined the connection between sustainable employability and strategic human resource management (SHRM). The healthcare industry, where workforce sustainability is especially important due to high job stress, emotional demands, and skill shortages, has received little attention in the majority of recent studies (e.g., Griep *et al.,* 2024; Martini *et al.,* 2023; Alcover *et al.,*

2021). Instead, these studies typically concentrate on conceptual frameworks and general organisational settings. The multifaceted concept of sustainable employability (skills, motivation, health, and opportunity) is also not well-represented in integrated models that connect SHRM elements like training, performance management, career development, and employee well-being. Employability outcomes have not often been examined longitudinally in research to capture the long-term impacts of HR interventions Empirical, region-specific research that looks at how strategic HRM practices might promote long-term employability among healthcare workers is therefore desperately needed, especially in India's public and private healthcare facilities. In addition to providing useful insights for HR policy and workforce development in the healthcare industry, such study would help close the theoretical- practical divide

Statement of The Problem

- Even while healthcare firms have HR procedures in place, many of them have trouble keeping their employees employable over the long term.
- Little is known about the direct effects of Strategic HRM strategies on healthcare professionals' long-term employability and well- being.
- Healthcare workers frequently experience burnout and skill obsolescence, which suggests a lack of strategic HR efforts focused on career sustainability.
- The major of healthcare companies prioritizes short term HR results above including sustainability objectives in to their HRM plans.
- There is still a lack of research on the connection between strategic HRM and long-term employability in Indian healthcare facilities.

Objectives of Research Work

a) To learn about the Strategic HRM practises used in the Indian healthcare sector.
b) To determine the Workability Index of both medical and non-medical staff.
c) To compare the HRM policies that hospitals have implemented for both medical and non-medical staff.
d) To research the relationship between sustainable employee employability and HRM practices.

Hypothesis of The Study

H_0: There is no strong link between strategic HRM practices and healthcare professionals'capacity to stay employed.
H_1: A substantial correlation exists between strategic HRM strategies and sustainable employability among healthcare professionals.
H_0: Strategic HRM methods do not significantly affect healthcare staff' job performance and retention.
H_1: Strategic HRM approaches have a substantial impact on the work performance and retention of healthcare employees.

Methodology or Approach Intended to be Adopted in the Excecution of The Research

The study is based on both primary and secondary data, which were gathered through questionnaires distributed to staff members at several hospitals. The five point Likert scale was used to measure the constructs. To determine the influence of HR practices on sustainable employability, the primary data will be gathered through personal interviews with all employees and hospital surveys. For the study, a sample of 200 personnel from that department of a particular hospital will be used. In order to get their responses, a standardized questionnaire will be given.

Limitations

- The present research is restricted to Kollam district. It has been observed that, healthcare employees face issues with Strategic HRM policies
- Due to tight schedule in working time most of the employees are unable to provide reliable information completely, otherwise for the detailed study a greater number of sample size could be added.

Findings & Suggestions

- The management should implement proper plans as well as policies.
- Implementation of systematic procedures of follow up reduces the impact.
- It expands our understanding of the healthcare industry's long-term employability.
- The healthcare employees working in hospitals have got more work, due to the change in HR practices.
- Flexible working hours, management support, creation of positive environment makes them to work peacefully

CONCLUSION

Management should implement proper rules as well as regulations to all the employees. Regulatory policies in management can provide fruitful results. Proper understanding between management and employees can create a healthy atmosphere. Supportive management, leave policies and other benefits will enhance them to work in an efficient manner.

Expected Outcome

1. It expands our understanding of the healthcare industry's long-term employability.
2. Describe the impact of Strategic HRM practices on the Indian healthcare industry's ability to sustainably hire new employees.
3. To develop a more effective plan

ABSTRACT

The evolution of digital platforms has transformed the way consumers interact with brands and make purchase decisions. This analytical study examines the impact of digital-marketing strategies—including social-media advertising, email campaigns, search-engine marketing, and influencer collaborations—on consumer purchase intentions in Bengaluru Urban. Primary data were collected from 200 digitally active consumers, supported by secondary data from industry reports (KPMG 2023; Statista 2024). Using SPSS v26, the study applied descriptive statistics, correlation, and regression to evaluate the influence of five determinants: perceived usefulness, content relevance, trust in digital ads, online engagement, and brand experience. The results reveal that perceived usefulness and engagement significantly predict purchase intention, while intrusive advertising reduces consumer trust. The findings highlight that personalized, value-driven, and interactive campaigns yield stronger purchase intent than high-frequency promotions. The paper concludes that brands in Bengaluru must adopt a consumer-centric digital-marketing mix integrating authenticity, analytics, and consistent brand experience to enhance conversion outcomes.

Keywords: Digital marketing, Consumer behavior, Purchase intention, Social media, Brand engagement, Bengaluru Urban

INTRODUCTION

Digital marketing has become the central component of contemporary brand strategy, reshaping how companies attract, convert, and retain customers. In the post-pandemic era, the proliferation of smartphones, low-cost data, and e-commerce platforms has accelerated online consumerism, particularly in metropolitan cities such as Bengaluru Urban, India's technological and digital-advertising hub. Traditional media have been supplemented—or replaced—by algorithm-driven digital channels that allow brands to reach customers with precision targeting and measurable engagement. Digital-marketing tools such as search-engine optimization (SEO), social-media advertising, influencer partnerships, content marketing, and email automation now determine brand visibility and customer conversion. According to Deloitte (2024), India's digital-ad-spend share crossed 50 % of total marketing budgets, indicating a structural shift toward online engagement. The consumer decision-making process has also evolved. Buyers no longer rely solely on product quality or price; they consider peer reviews, digital content, and online experience before purchase. Kotler and Keller (2023) noted that purchase intention in digital contexts depends on the combined effect of information quality, trust, and emotional connection. In fast-growing cities like Bengaluru, consumers are digitally literate, socially networked, and responsive to personalized communication—making the region an ideal environment for assessing digital-marketing effectiveness. Globally, Chaffey (2021) argued that multi-channel digital campaigns improve conversion when content relevance and timing align with user needs. Lee and Chen (2022) found that interactive advertising and social-media storytelling enhance perceived value and trust. In India, Singh and Kaur (2023) emphasized that digital engagement, particularly through influencer content and brand communities, directly affects purchase intention among young consumers. Despite these advances, gaps remain in understanding how various digital strategies interact to influence purchase intention at a regional level, where demographics, culture, and technology usage differ. Bengaluru, as India's "Silicon Valley," presents a distinctive context with high digital penetration and a vibrant consumer base across tech-savvy millennials and Gen Z segments. This study, therefore, aims to analyze the impact of digital-marketing strategies on consumer purchase intentions in Bengaluru Urban through an analytical approach using both primary and secondary data. The paper evaluates how dimensions such as perceived usefulness, trust, content relevance, engagement, and overall brand experience collectively shape purchase intention. The results are expected to provide actionable insights for marketing managers to design evidence-based digital campaigns that resonate with local consumers and improve conversion metrics. The next section presents a synthesis of global and Indian literature on digital-marketing effectiveness and consumer behavior.

REVIEW OF LITERATURE

The evolution of digital marketing has revolutionized consumer decision-making by transforming brand interaction into a two-way, data-driven process. Researchers have examined how various dimensions—content quality, interactivity, personalization, and trust—shape consumer purchase intentions in online environments. Globally, Chaffey (2021) noted that digital-marketing effectiveness depends on an organization's ability to integrate multichannel strategies, where personalized content and real-time engagement substantially enhance conversion rates. Dwivedi *et al.* (2021) emphasized that perceived usefulness and enjoyment within digital platforms significantly influence online buying behavior. In the context of social-media marketing, Lee and Chen (2022) found that interactive features and user-generated content foster stronger brand relationships and purchase intention. Yadav and Rahman (2018) reported that trust in digital communication mediates the relationship between online advertising and purchase behavior, underscoring that transparency and credibility remain key determinants. Similarly, Kumar and Reinartz (2020) argued that consumer engagement metrics—click-throughs, likes, shares, and comments—reflect the quality of brand–consumer interaction, which directly correlates with buying intention. Alalwan (2021) highlighted that personalization and relevance of online content increase perceived value and drive impulse purchases. Lim and Lacoste (2022) demonstrated that storytelling in branded digital content stimulates emotional attachment and improves retention in fashion e-commerce. Meanwhile, Santos and Gao (2023) found that artificial-intelligence-based ad targeting improves campaign precision but may reduce trust if consumers perceive privacy intrusion. In the Indian context, Mishra and Mahalik (2020) observed that Indian consumers respond

positively to digital campaigns combining social proof and peer reviews. Chatterjee and Kar (2021) concluded that perceived ease of navigation and website aesthetics affect purchase intention among online shoppers in metro cities. Singh and Kaur (2023) found that social-media influencers significantly influence millennial buying choices by enhancing trust and relatability. Gupta and Yadav (2022) examined digital advertising in India's retail sector and discovered that the frequency and timing of advertisements affect perceived intrusiveness and ad fatigue, which in turn lower purchase intention. Sundar and Patil (2022) revealed that digital content that aligns with consumer lifestyle preferences improves brand recall and engagement. KPMG (2023) reported that India's digital-advertising industry exceeded ₹500 billion, driven by social-commerce adoption and omnichannel campaigns targeting metropolitan consumers. Finally, Kotler and Keller (2023) emphasized that effective digital marketing today blends analytics, creativity, and trust—customers evaluate not only what brands communicate but also *how authentically* they communicate.

Synthesizing these studies indicates that five key factors consistently influence consumer purchase intentions in digital contexts:

1. Perceived usefulness and relevance of marketing content.
2. Trust built through transparency and data security.
3. Consumer engagement and interactivity on digital platforms.
4. Brand experience consistency across channels.
5. Personalization that resonates with consumers' identities and needs.

Although global evidence is robust, there remains limited empirical analysis specific to Bengaluru Urban, where rapid digital adoption coexists with diverse consumer segments. This gap underscores the need for the present analytical study to examine how digital-marketing strategies influence consumer purchase intentions within this metropolitan context.

Objectives of the Study

1. To evaluate the influence of perceived usefulness of digital-marketing campaigns on consumer purchase intentions in Bengaluru Urban.
2. To examine the relationship between content relevance and trust in digital-marketing communications.
3. To analyze the effect of online engagement and interactivity on consumers' willingness to purchase.
4. To determine how brand experience consistency across digital platforms impacts consumer loyalty and purchase decisions.
5. To identify the key determinants of effective digital-marketing strategies that significantly predict purchase intention among urban consumers.

Hypotheses of the Study

H_1 (Perceived Usefulness → Purchase Intention)

- **H_{01}:** Perceived usefulness of digital-marketing campaigns has no significant influence on consumer purchase intention.
- **H_{11}:** Perceived usefulness of digital-marketing campaigns has a significant influence on consumer purchase intention.

H_2 (Content Relevance → Trust)

- **H_{02}:** Content relevance does not significantly influence consumer trust in digital-marketing communications.
- **H_{12}:** Content relevance significantly influences consumer trust in digital-marketing communications.

H_3 (Engagement → Purchase Intention)

- **H_{03}:** Online engagement and interactivity have no significant relationship with consumer purchase intention.
- **H_{13}:** Online engagement and interactivity have a significant relationship with consumer purchase intention.

H_4 (Brand Experience → Purchase Decision)

- **H_{04}:** Brand experience consistency across digital platforms has no significant effect on consumers' purchase decisions.

- **H_{14}:** Brand experience consistency across digital platforms has a significant effect on consumers' purchase decisions.

H_5 (Trust → Purchase Intention)

- **H_{05}:** Consumer trust in digital-marketing platforms does not significantly affect purchase intention.
- **H_{15}:** Consumer trust in digital-marketing platforms significantly affects purchase intention.

RESEARCH METHODOLOGY

Research Design

The study adopts an analytical and quantitative research design to examine how multiple dimensions of digital marketing—perceived usefulness, content relevance, engagement, trust, and brand experience—affect consumer purchase intentions in Bengaluru Urban. The design applies descriptive statistics, correlation, and multiple regression analysis to test the proposed hypotheses and identify statistically significant determinants.

Nature and Sources of Data

The research integrates **both primary and secondary data**.

- **Primary Data:**

Data were collected through a **structured questionnaire** administered to digitally active consumers aged 18–45 years who reside in Bengaluru Urban. The instrument measured respondents' perceptions of digital-marketing strategies and their corresponding purchase intentions using a five-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree).

- **Secondary Data:**

Secondary inputs were drawn from industry reports (KPMG 2023; Deloitte 2024; Statista 2024), published research papers, and marketing-analytics databases. These provided contextual evidence about digital-spending trends, consumer online habits, and technology adoption in India.

Sampling Design

A non-probability purposive-sampling technique was employed, targeting respondents who regularly engage with digital-marketing content via social-media platforms, e-commerce websites, or brand newsletters. Out of 220 distributed questionnaires, 200 valid responses were retained after data screening for completeness and consistency. The sample ensured diversity in gender, occupation, and income to represent Bengaluru's heterogeneous urban consumer base.

Research Instrument

The questionnaire comprised six sections:

1. **Demographic details** – gender, age, income, and education.
2. **Perceived usefulness** – perceived value and convenience of digital-marketing content.
3. **Content relevance** – information quality and personalization of online advertisements.
4. **Online engagement** – level of interaction, comments, likes, and sharing behavior.
5. **Brand experience** – consistency of brand messaging across platforms.
6. **Consumer trust and purchase intention** – confidence in brand reliability and likelihood of purchase.

A pilot test with 25 respondents verified reliability and face validity; minor revisions improved clarity and internal consistency.

Analytical Tools and Techniques

Data were analyzed using SPSS v26, employing the following techniques:

- **Descriptive Statistics** – means, frequencies, and standard deviations.
- **Reliability Analysis (Cronbach's α)** – to ensure internal consistency (threshold ≥ 0.70).
- **Correlation Analysis** – to determine relationships among digital-marketing constructs.

- **Multiple Regression Analysis** – to test the predictive influence of independent variables on purchase intention.
- **Graphical Representation** – bar charts and scatterplots to visualize key associations.

Scope of the Study

The study is limited to Bengaluru Urban, a metropolitan region representing India's technology and digital-marketing epicenter. It focuses on consumers who interact with online ads, social-media campaigns, and e-commerce promotions. Insights are expected to assist marketers, advertisers, and brand strategists in optimizing campaign effectiveness for urban audiences.

Limitations of the Study

1. The findings are geographically specific to Bengaluru Urban and may not fully represent other Indian cities.
2. Data are self-reported, which may introduce perceptual bias.
3. The study excludes business-to-business (B2B) contexts.
4. Rapid digital-media evolution may alter consumer responses beyond the study period, requiring longitudinal follow-up.

Data Analysis and Interpretation

The dataset comprised 200 valid responses obtained from digitally active consumers in Bengaluru Urban. The analysis tested how five digital-marketing dimensions—perceived usefulness, content relevance, engagement, brand experience, and trust—influence purchase intention.

Reliability Analysis

Interpretation

All constructs recorded Cronbach's $\alpha > 0.80$, exceeding the 0.70 benchmark (Nunnally & Bernstein, 1994). The scale demonstrates high internal consistency and validity for inferential testing.

Descriptive Statistics

Interpretation

The profile confirms that the respondents are digitally mature urban consumers, with the majority engaging heavily on Instagram and YouTube—the leading digital-marketing channels in Bengaluru.

Correlation Analysis

Correlation significant at 0.01 level)

Interpretation

All independent variables show moderate-to-strong positive correlations with purchase intention, confirming that consumer engagement, trust, and perceived usefulness are interlinked with buying behavior.

Interpretation

The model explains 61 % of the variance in purchase intention, indicating strong predictive validity. All variables are significant ($p < 0.01$). The highest influence arises from trust ($\beta = 0.374$), followed by perceived usefulness ($\beta = 0.308$) and content relevance ($\beta = 0.271$).

Hypothesis-Wise Summary

Interpretation

All hypotheses are supported. Trust and perceived usefulness are the primary determinants of consumer purchase intention, indicating that digital campaigns succeed when they are perceived as relevant, reliable, and value-oriented.

FINDINGS AND DISCUSSION

The analytical results demonstrate that digital-marketing strategies substantially influence consumer purchase intentions in Bengaluru Urban. The study validates all five hypotheses, confirming that perceived usefulness, content relevance, engagement, brand experience, and trust collectively determine how urban consumers respond to digital campaigns.

Key Findings

Perceived Usefulness Drives Purchase Intention

Regression results ($\beta = 0.308$, $p < 0.001$) revealed that consumers' perception of the usefulness and convenience of digital-marketing content strongly impacts their purchase decisions. Respondents indicated that ads providing meaningful information, discount offers, or easy access to purchase links encourage them to buy. This aligns with Dwivedi *et al.* (2021) and Chaffey (2021), who emphasized that digital marketing's success depends on offering personalized utility rather than generic visibility.

Content Relevance Enhances Trust

The study found that relevant, targeted, and personalized digital content ($\beta = 0.271$) significantly enhances consumer trust in brand communication. Bengaluru consumers value campaigns that reflect their interests, local culture, and real-life needs. This corroborates Gupta and Yadav (2022) and Lee and Chen (2022), who argued that contextual relevance directly increases credibility and engagement.

Online Engagement Strengthens Purchase Intention

The results ($\beta = 0.233$, $p < 0.001$) show that interactive engagement—likes, comments, and shares—has a positive relationship with purchase intention. This supports Lim and Lacoste (2022), who found that brand engagement through storytelling and interactivity fosters emotional attachment, leading to repeat purchases.

Consistent Brand Experience Builds Loyalty

Brand experience consistency across digital platforms ($\beta = 0.208$) positively influences purchase decisions. Respondents favored brands maintaining uniform tone, visuals, and service quality across websites, social media, and email channels. This aligns with Chatterjee and Kar (2021), who noted that consistency enhances trust and recall, making customers perceive brands as professional and dependable.

Trust is the Strongest Predictor of Purchase Intention

The regression coefficient for trust ($\beta = 0.374$) was the highest, confirming that confidence in brand reliability, data security, and transparent communication most significantly drives purchase intention. This supports Yadav and Rahman (2018) and Kotler and Keller (2023), who established that trust mediates the relationship between marketing stimuli and behavioral response. Bengaluru consumers, while tech-savvy, remain cautious about data usage and authenticity of ads.

Model Performance

The analytical model explained 61 % of the variance ($R^2 = 0.610$) in purchase intention, validating that digital-marketing factors can effectively predict consumer decision-making behavior in urban contexts. The strong statistical significance ($p < 0.001$) of all constructs reinforces the reliability of the findings.

DISCUSSION

The findings reaffirm that digital marketing is not just about reach but relevance. Consumers in Bengaluru, representing a digitally mature demographic, respond more positively to value-based and personalized campaigns than to high-frequency, impersonal advertisements. The results extend the Technology Acceptance Model (TAM) by

confirming that perceived usefulness remains a crucial determinant of behavioral intention in digital marketing. Similarly, the Trust-based Adoption Model is validated, as trust consistently mediates the effects of content quality and engagement on purchase decisions. The prominence of engagement highlights the shift from passive advertising to participatory marketing. Gen Z and millennial consumers prefer brands that foster two-way interaction—replying to comments, collaborating with influencers, and using interactive polls or live sessions. This finding resonates with Santos and Gao (2023), who emphasized that active engagement transforms awareness into measurable purchase intent. Moreover, the importance of brand experience consistency signals the need for omnichannel integration. Consumers expect seamless transitions between digital touchpoints, reflecting a unified brand identity. Disjointed campaigns or inconsistent messaging can erode trust, especially in highly competitive markets like Bengaluru. From a managerial perspective, the findings suggest that authenticity and transparency are non-negotiable in digital-marketing communication. Consumers are increasingly skeptical of intrusive advertising or exaggerated claims. Campaigns rooted in storytelling, ethical positioning, and audience participation yield higher conversion rates and brand loyalty. The study thus bridges global theoretical frameworks with local consumer realities, illustrating that digital marketing effectiveness in Bengaluru Urban depends on credibility, relevance, and emotional connection, not merely promotional intensity or budget scale.

CONCLUSION

The present analytical study investigated the impact of digital-marketing strategies on consumer purchase intentions in Bengaluru Urban, focusing on five key constructs—perceived usefulness, content relevance, engagement, brand experience, and trust. Using primary data from 200 respondents, supplemented with secondary industry insights, the study empirically established that digital marketing exerts a significant influence on consumers' buying behavior in urban India. The statistical results confirmed that trust and perceived usefulness are the strongest determinants of purchase intention, followed by content relevance and online engagement. These findings suggest that digital marketing succeeds when it provides value-driven, credible, and personalized communication rather than aggressive advertising. Consumers in Bengaluru Urban respond positively to brands that demonstrate authenticity, transparency, and technological consistency across platforms. The model's explanatory power ($R^2 = 0.610$) reinforces the effectiveness of analytical frameworks such as the Technology Acceptance Model (TAM) and the Theory of Planned Behavior (TPB) in explaining consumer digital behavior. The study highlights that modern purchase intentions are shaped not only by functional benefits but also by emotional trust and relational engagement, aligning with global trends in experiential marketing. In summary, this research contributes to both academic literature and marketing practice by identifying the drivers of purchase intention in a metropolitan digital economy and offering evidence-based insights for brands operating in Bengaluru and similar urban markets.

RECOMMENDATIONS

Prioritize Trust and Transparency

Marketers must ensure ethical advertising practices, authentic brand communication, and secure data-handling policies. Transparency about sponsored content and user privacy will strengthen consumer trust and reduce skepticism.

Enhance Personalization and Relevance

Use data analytics and AI-driven segmentation to deliver personalized campaigns that align with consumer interests, location, and purchase history. Contextual relevance increases click-through rates and conversion.

Optimize Engagement through Interactive Campaigns

Implement gamification, contests, influencer collaborations, and live Q&A sessions to increase active consumer participation. Engagement-driven strategies promote long-term emotional bonding.

Ensure Consistent Brand Experience Across Platforms

Maintain unified messaging, color schemes, tone, and customer service standards across social media, websites, and mobile apps. Consistency reinforces professionalism and brand loyalty.

Leverage Consumer Feedback for Continuous Improvement

Encourage ratings, reviews, and real-time feedback. Consumer-generated insights should guide future content creation and campaign refinement.

Integrate Omnichannel Marketing Approaches

Combine social media, search-engine marketing, email automation, and mobile advertising to create seamless customer journeys. Integrated campaigns yield higher recall and conversion rates.

Managerial Implications

For practitioners, the findings emphasize that digital marketing is a relationship-building process rather than a one-time promotion. Brands operating in urban markets like Bengaluru must transition from visibility-focused strategies to value-oriented engagement. Managers should allocate resources toward trust-building mechanisms—such as verified influencer partnerships, transparent review systems, and customer experience analytics.

Future Research Scope

1. Comparative research across different Indian cities or regions could reveal geographic variations in digital-marketing responsiveness.
2. Future studies can employ Structural Equation Modeling (SEM) to test mediating effects among trust, engagement, and brand loyalty.
3. Expanding the scope to specific industry verticals (e.g., retail, FMCG, or services) may provide more sector-specific insights.
4. Longitudinal studies can explore how evolving technologies (AI marketing, augmented reality, and voice search) reshape consumer purchase intentions over time.

Final Remark

The study concludes that effective digital marketing is rooted in trust, relevance, and personalization. In an era where consumers control how and when they engage with brands, authenticity becomes the most powerful currency. For Bengaluru's dynamic digital ecosystem, adopting an integrated, data-driven, and consumer-centric approach will enable marketers to transform online interactions into enduring customer relationships and tangible purchase outcomes.

ABSTRACT

Including a thorough case study on chlorpyrifos, this volume provides a thorough overview of pesticides, emphasizing their definition, applications, effects on the environment, and a particular family called organophosphates. It starts by outlining the widespread usage of pesticides in agriculture and providing a broad definition of them as biocides for insect control. The article then discusses the dual nature of pesticides, highlighting their advantages such as protecting crops and halting the spread of disease against serious environmental and health issues. It highlights how most pesticides fail to achieve their intended results, contaminating soil, water, and air widely and endangering biodiversity. The mechanism of action of organophosphorus pesticides, specifically the permanent inhibition of acetylcholinesterase by chlorpyrifos-oxon, a primary cause of toxicity, is explained in a crucial section. Genetic factors that affect a person's vulnerability to these substances, such as PON1 enzyme activity, are also discussed in the book. Although chlorpyrifos has been used extensively, its non-target effects and potential for human exposure particularly in children remain concerns, the article finds

Keywords: Chlorpyrifos, Pesticides, Organophosphates, acetylcholinesterase

INTRODUCTION

Pesticides are biocides used to control pests, most commonly as plant protection products in agriculture. They're a broad category, including herbicides, insecticides, and fungicides[1]. The Food and Agricultural Organization defines them as substances used to prevent, destroy, or control pests, including vectors of disease[2].Pesticides are beneficial for protecting crops and animals, controlling disease-transmitting insects like mosquitoes, and managing pests in food storage[3]. They offer both direct (e.g., preventing crop loss) and long-term benefits. However, their use raises significant environmental concerns[4]. Over 95% of applied pesticides can miss their target, leading to air, water, and soil contamination. This drift reduces biodiversity, harms pollinators, and threatens endangered species[5]. The persistence of some pesticides, like DDT, has led to their ban in many countries due to environmental and health risks. Tomitigate these negative impacts, it's desirable for pesticides to be biodegradable. Chemical structure, like the presence of halogens, and environmental factors like soil adsorption can affect their degradation rate[6]. Organophosphates, a class of pesticides, are esters of phosphoric acid. They are highly toxic to wildlife and humans and have been linked to developmental issues in children. They are also used as solvents and plasticizers[7]. Generalized structure of organophosphorous (Figure: 1). Organophosphate pesticides degrade rapidly by hydrolysis on exposure to sunlight, air, and soil, although small amounts can be detected in food and drinking water. Their ability to degrade made them an attractive alternative to the persistence organochloride pesticides, such as DDT, aldrin, and dieldrin. Although organophosphates degrade faster than the oraganochlorides, they have greater acute toxicity, posing risks to people who may be exposed to large amounts[8].

Chloropyrifos

Chloropyrifos (O, O Diethyl 0-3,5,6-trichloropyridine-2-yl phosphorothioate) is an crystalline organophosphate insecticide which is in use for more than sixty years for controlling crop pests. Use of OP has played an important role in a remarkable increase in agricultural productivity. CP in introduced into the environment through agricultural and industrial runoff. CP and its metabolite are detected in environmental samples globally[9].

Manufacture

Chlorpyrifos is produced with a multistep synthesis from 3-methylpyridine, eventually reacting 3,5,6-trichloro-2-pyridinol with diethylthiophosphoryl chloride.

Properties(Table 1)

Chlorpyrifos is a globally used pesticide that targets insect pests in agriculture and commercial settings. It is most commonly applied to crops like corn, cotton, and fruit trees[10].

Mechanism of Action

Chlorpyrifos works primarily by interfering with acetylcholine neurotransmission. Its metabolite, chlorpyrifos-oxon, irreversibly binds to the enzyme acetylcholinesterase (AChE). This prevents AChE from breaking down acetylcholine in the synapse, leading to a dangerous buildup of the neurotransmitter. This overstimulation of neurons is the main cause of acute poisoning symptoms and is its primary insecticidal mechanism[11]. Chlorpyrifos may also have other effects, including altering serotoninsignaling and affecting other enzymes, even at low doses[12].

Detoxification and Vulnerability

The enzyme paraoxonase 1 (PON1) helps detoxify the toxic chlorpyrifos-oxon metabolite[13]. However, human PON1 activity varies due to genetic differences, making some individuals more susceptible to chlorpyrifos toxicity. Infants are particularly vulnerable because they produce low levels of PON1 in their first months of life.

Human Exposure

The general U.S. population is estimated to consume a small amount of chlorpyrifos daily through food residue. Children, especially toddlers, are estimated to have a higher intake per unit of body weight. The EPA's acceptable

daily dose is 0.3 micrograms/kg/day[14].(Table 2). TCP, a charged molecule at neutral pH, is mobile in soil as well as leachable into groundwater on surface water and thus can widely contaminate soil and aquatic environments. It is listed as a persistence and mobile pollutant but the US environmental protection agency[15]. TCP shows relatively high antimicrobial effects on microorganisms and also limits chlorpyrifos degradation. CP and TCP toxicity has been linked to broad spectrum effects including neurological disorders, developmental disorders, autoimmune functions in higher animals and humans[16]. It has been classified as toxic, persistence and mobile by the US EPA with a half-life ranging from 65 to 360 days in soil[17, 18].

MATERIALS AND METHODS

Soil sample collection

Soil samples were collected from the field of cabbage, chilli, and cauliflower growing area of Budittittu, Dadha, Timakapura villages of Periyapatnataluk, Mysore, India. At the time of collection of soil samples, The Insecticide CP was applied previously for the cabbage 15 days back, for the chilli 30 days back and for the cauliflower 7 days back. The samples were collected from the depth of 10-15 cm from the surface of the land and all debris were removed and brought to laboratory in air tight polythene covers. In the laboratory, the samples were air dried, and sieved through 2 mm to remove large soil particles. Then the sieved soil was taken for further studies.

Chemicals

Nutrient Agar, Nutrient Broth, Eosin Methylene Blue (EMB) agar, Agar-Agar, Enterobacteriaceae identification kit, Antibiotic Discs was obtained from Hi-Media, Mumbai India. All Chemical reagents were obtained from s d fine chem. Limited, India and Glass wares were obtained from Borosil, India.

Extraction of CP and its residues from soil sample

Extraction of chloropyrifos from soil samples was carried out accordingly. 15 grams of soil sample was weighed into 250 ml of conical flask. To this 50 ml of ethyl acetate (analytic grade) containing 1% (ratio/volume) acetic acid and 1% (ratio/volume) deionized water were added. The flask was shaken for 15 min at 200 RPM on a mechanical shaker. The supernatant was decanted into 250 ml of conical flask containing 20 ml of deionized water and 3 g of sodium chloride. Then the flask was shaken for 10 min at 150 RPM to ensure the efficient transfer of acetic acid from organic phase to aqueous phase. Afterwards, the solution was transferred into 250 ml of separatory funnel kept it for 5min and then the aqueous phase was removed by a lower neck of the separatory funnel. The organic face was transferred into a 250 ml conical flask and concentrated to dryness in a water bath (40°c). After dry, 10ml of ethyl acetate was added and passed through anhydrous Magnesium sulphate to remove moisture. The extract was concentrated to 2 ml and stored in refrigerator until further analysis.

Enrichment of soil sample for Isolation of CP and TCP degrading Microorganism

For enrichment study, 20 g of soil homogenate was inoculated in 50 ml of minimal salt medium (MSM). Composition of MSM (g L^1) Sodium hydrogen phosphate (Na_2HPO_4) 5.8g, Potassium dihydrogen phosphate(KH_2PO_4) 3g, Sodium chloride (NaCl) 0.5g, Ammonium chloride (NH_4Cl) 1g, Magnesium sulphate ($MgSO_4$) 0.25g and adjusted to pH to 6.8-7.0 amended with 100 mg L^{-1} CP. Culture flask was incubated at 28±2°c on a the rotator shaker at 100 RPM for 7days. After 7days, 5 ml of enrichment culture was sub cultured into fresh MSM spiked with 100 mg L^1 of CP for next 7 days. 3 transverse were carried out in fresh MSM containing CP (100mg L^{-1}). From the last transfer the enrichment culture was serially diluted and spread on nutrient agar plate containing 100 mg L^1 CP. After 24 hr of incubation, the bacterial colonies were obtained and they were purified by repeated streaking. 6 different bacterial strains were isolated and these isolates were initially screened for TCP tolerance using minimum inhibitory concentration (MIC) technique, in this technique the bacterial strains were subjected to TCP tolerance test with concentration 100-500mg L^{-1} Nutrient agar plates individually. The culture plates were incubated for 24-48 hr and the maximum tolerating bacterial isolates were selected. Among the 6 isolates, C1 and C6 strain was chosen due to its ability to tolerate TCP up to 400mg L^{-1}.

Biodegradation of CP and TCP in liquid medium

For biodegradation studies, 100 ml of minimal salt medium was taken in 250ml Erlenmeyer flask containing 100mg L^1 of chlorpyrifos as the sole carbon source at pH 7 and kept for incubation at 120 rpm in shaker at 37°C for 7-14 days. After 7 days of incubation, 35mL culture aliquot was taken in 50ml centrifuge tube and centrifuged at 10,000 rpm for 5min. later the supernatant was taken in separate flask and extracted using equal volume of ethyl acetate by shake flask method and the organic aqueous layer was separated. The solvent was evaporated by rotary evaporator. Similarly after 14 days of incubation the sample was extracted by same procedure. The residues was then dissolved in HPLC grade acetonitrile and analyzed by TLC followed by LC-MS.

Thin layer chromatography

Preparation of TLC plates

Fine powder of solid adsorbent silica gel is mixed with a binder starch and is uniformly spread on 15x15cm clean glass plates. This process is called plating. These plates are dried in an oven at 100°C.these plates are called chromatoplates. A starting line at about 1cm from one end and a finish line at about 10cm are drawn on the chromatoplates. Extracted samples were spotted on the base line by capillary tube and then dried. Then the chromatoplates is placed vertically in a tank (glass chamber) containing a developing solvent reaches the finishing line, the plate was taken out, dried and components are detected by UV light or iodine vapors.

LC-MS analysis

After 14 days of incubation, 35mL culture aliquot was taken in 50ml centrifuge tube and centrifuged at 10,000 rpm for 5min. later the supernatant was taken in separatory flask and extracted using equal volume of acetonitrile by shake flask method and the organic aqueous layer was separated. The solvent was evaporated by rotary evaporator. The residue was then dissolved in HPLC grade acetonitrile and analyzed using liquid chromatography-mass spectroscopy (LC- MS) (Acquity Waters, USA). The LC-MS was equipped with a BEHC 181.7µm column (10 x 50mm) with auto injector. The cartridges were conditioned with acetonitrile and washed with deionized water containing 0.1% formic acid. Mass spectroscopy (MS) was performed using a Synapt G2 HPMS MS (Waters, USA) equipped with Electron spray ionization (ESI) detector. The operating condition was Capillary (kV)-3.00, Sampling Cone-40.00, Extraction Cone-4.00, Source Temperature (°C)-100, Desolvation Temperature (°C)-200, and Desolvation Gas flow (L/Hr)-500.0.

Morphological characterization

Gram staining

The two isolates were subjected to Grams staining by the following procedure

A thin smear 18-24 hours old culture was prepared and heat fixed. The smear was stained with crystal violet solution for 1-2 minutes and rinsed with water. It was flooded with Gram's jodine for 1 minute and washed with 95% alcohol to remove violet strain. The slide was rinsed with water and stained with saffranin for 1-2 minutes. The slide was then washed with water and observed under a light microscope (100X) magnification.

Antibiotic Susceptibility Testing

The bacteria isolated from soil were tested for antibiotic sensitivity test and was performed using Nutrient Agar by disk-diffusion method. The total numbers of antibiotics are 20 which includes Cephalothin (CEP) 30mcg, Clindamycin (CD) 2mcg, Co-trimoxazole (COT) 1.1mcg, Erythromycin (E) 15mcg, Gentamicin (GEN) 1.0mcg, Ofloxacin (OF) 5mcg, Penicillin (P) 10mcg, Vancomycin (VA) 30mcg, Ampicillin (AMP) 10mcg, Chloramphenicol (C) 30mcg, Oxacillin (OX) 1mcg, Linezolid (LZ) 30mcg, Azithromycin (AZM) 15mcg, Amikacin (AK) 30mcg, Clarithromycin (CLR) 15mcg, Teicoplanin (TEI) 10mcg, Methicillin (MET) 5mcg, Amoxyclav (AMC) 30mcg, Novobiocin (NV) 5mcg, Tetracycline (TE) 30mcg. Nutrient Agar plates were aseptically inoculated with the test organism by lawn culture technique and filter paper disks, impregnated with a specific concentration of antibiotic, was placed on the medium. The plates were incubated at 37 °C for 24 h. The procedure was performed, and the mean value of diameter of the zone of inhibition was measured intermediate, and sensitive patterns were recorded.

Biochemical tests

Biochemically characterized using Identification Kit, Hi-Media. The pure culture of isolates were aseptically inoculated and Incubated at 37°C for 24 hrs. Later, the results were recorded according to Manual provided by the company. The results were compared with Bergey's Manual of Systematic Bacteriology and identified according to it.

RESULT AND DISCUSSION

Chlorpyrifos and its toxic residue TCP are known for Bioaccumulation which can get into the food chain in many ways. Analysis of it in natural soil and water is a subject of public and scientific attention. In the present study, Totally 18 different Soil samples collected from Budititu, Dadha, Timakapura villages of Periyapatnataluk, Mysore, India, were analyzed for CP and TCP. From Thin Layer Chromatography (TLC) analysis, it was found that, out of 18 samples analyzed, 02 soil samples (E2 and B3), detected CP hydrolyzed metabolite TCP (figure 3). Qualitative analysis by Liquid Chromatography Mass Spectroscopy (LC-MS) revealed that, retention time for internal standard CP was found to be 3.18 and for TCP is 2.48 respectively (figure 7 and 9) corresponding to its mass 350 and 198 respectively (figure 8 and 10). Comparing to internal standard values, the sample E2 and B3 were detected with TCP in the range of 4.41 and 5.18 μg/kg respectively (figure 11 and 12). These findings suggest that, in soil the applied Chlorpyrifos undergoes Hydrolysis to form TCP.

Isolation and characterization of CP and TCP degrading bacteria

From the enrichment culture, 6 bacterial strains designated (C1, C2, C3, C4, C5 and C6) were isolated. These strains were further purified and checked for their ability to tolerate TCP (TCP Susceptibility test, figure 5) at different concentrations (100 to 300mg L^1) by inoculating them in nutrient agar media individually. From this experiment two bacterial cultures designated as C1 and C6 were able to tolerate highest concentration of TCP and hence, selected for biodegradation studies.

Identification of C1 and C6 bacterial strains

C1 and C6 were identified as gram-positive aerobic Bacilli shaped organisms. The isolates were non-motile, catalase positive, oxidasde negative and exhibited creamish white colony morphology on MSM agar with Chlorpyrifos. According to the Bergey's Manual of Systematic Bacteriology, the bacteria come under order Bacillales, family Bacillaceae and genus Bacillus. Biochemical test results (Table-4) show the close relatedness of strains C1 and C6 with genus Bacillus.

Antibiotic Susceptibility Test

C1 and C6 strains were subjected to antibiotic test. Both the organisms which were isolated from soil were sensitive to almost all antibiotics except for Table.

Biodegradation of CP and TCP by C1 and C6 strains in liquid culture

Biodegradation of chlorpyrifos (100 mg L^1) was assessed using bacterial consortium C1 and C6. Thin Layer Chromatography (TLC) followed by LC-MS was used to monitor the disappearance of chlorpyrifos and TCP. The result of TLC analyses revealed the formation of unknown metabolites. The LC-MS analysis **(Figure 13 and 14)** showed that the consortium was able to efficiently degrade chlorpyrifos without formation of TCP (based on m/z value obtained). The current findings suggest that the isolate used this compound as carbon and energy source for its growth by forming polar metabolites. This feature is rarely reported in other chlorpyrifos degrading microorganisms. In most cases reported to date, the individual isolate tended to transform chlorpyrifos by hydrolysis of ester linkage to yield TCP, which in turn accumulate in batch cultures or soils and enhanced degradation could not occur owing to its antimicrobial properties. The work carried Cupriavidus sp. DT-1 was capable of degrading CP and TCP contaminated soil in the range of 100 and 94.3% respectively. Alcaligensfaecalis was able to catabolically degrade 100% of CP (250 mg I^1) within 2 days. Similarly, Bacillus cereus, Bacillus lichniformis ZHU-1 and Baciluspumilus C2A1 isolated from chlorpyrifos contaminated soil sites were able to degrade 80%, (150 mg L^{-1}) in 5 days, complete

degradation (100 mg L^{-1}) in 14 days and 89% (1000 mg L^{-1}) within 15 days respectively In the present study, the two bacterial isolates belonging to Bacillus sp. was able to degrade both CP and TCP completely within 14 days. Hence, this bacterial consortium can be an valuable bioaugmenting agent to clean up Chlorpyrifos contaminated sites. Various Biochemical test performed for identification of bacterial isolates C1 and C6 (Table 3). Antibiotic Susceptibility test performed for C1andC6 bacterial isolates (Table 4)

CONCLUSION

The Bacilli sp. isolated in the present study completely metabolized not only Chlorpyrifos but also its hydrolysis product 3,5,6-trichloro-2-pyridinol. Moreover, metabolisation of chlorpyrifos and 3,5,6-trichloro-2-pyridinol by the same strain is of vital importance because 3,5,6-trichloro- 2-pyridinol possesses antimicrobial activities, and it tends to accumulate in the batch culture or soils and hence prevents the proliferation of microorganisms responsible for the parent compound degradation through catabolite repression. In addition, starin C6 was found highly efficient in degrading chlorpyrifos over a wide range of temperature. This feature gives pesticide degraders advantages in the variable environments. Another important feature which is worth mentioning is that this strain harbors the metabolic pathway for the detoxification of chlorpyrifos, and its completely degraded chlorpyrifos without any persistent accumulative metabolites. Furthermore, the bacteria utilized chlorpyrifos 3,5,6-trichloro-2-pyridinol as a sole carbon sources for growth, thus suggestion adaptation to environment. The ability to survive at high concentration of chlorpyrifos and enhanced degradation make this isolated an ideal candidate for its application in chlorpyrifos in bioremediation.

Table 1: Properties

Chemical Formula	C9H11CI3NO3PS
Molecular Weight	350.59
IUPAC Name	O,O- Diethyl 0-3,5,6-trichloropyridin-2-yl phosphorothioate
Other Names	Brodan, Cholrpyrifos-ethyl, Detmol UA, Dowco 179, Dursban, Empire, Eradex, Lorsban, Paqeant, Piridiane, Scout, Stipend and Tricel.
Molar Mass	350.59 g/mol
Appearance	Colorless crystals
Odor	Mercaptan-like
Density	1.398 g/cm³ (43.5 °C)
Melting Point	42 °C (108 °F; 315 K)
Boiling Point	160 °C; 320°F; 433 K (decomposes)
Solubility In Water	2 mg/L (25 °C)
Log P	4.96 (octanol/water)
Main Hazards	Combustible reacts strongly with amines, strong acids, caustics.

Table 2: Human Exposure

TCP	(3,5,6-Tricholro 2-pyridinol)
Molecular Weight	198.43
chemical formula	$C_5H_2CI_3NO$
Molar mass	198.43g. mo l -1
Density	1.67g / cm³
Melting point	172 to 174 ° C
Boiling point	254.8 °C
Flash point	107.9 °C

ABSTRACT

Microfinance stands as an essential catalyst for financial inclusion, particularly across India's vast rural and semi-urban regions where marginalized groups often lack access to formal credit. Despite impressive sectoral growth and impactful outcomes, Indian microfinance institutions (MFIs) and their clientele encounter a range of enduring challenges, from issues in borrower education and loan transparency to institutional constraints and operational risks. This study, based on a primary survey of 130 microfinance clients, explores critical challenges like high lending rates, financial literacy gaps, irregular repayment patterns, and operational limitations faced by MFIs. The research concludes by proposing strategic measures to fortify both client empowerment and sector governance, positioning microfinance as a sustainable tool in India's socio-economic development trajectory.

Keywords: Microfinance, Financial Inclusion, Rural Development, Institutional Reform, India.

INTRODUCTION

In recent decades, India's policies for expanding financial access have undergone significant transformation. The inability of the formal banking sector to adequately serve the needs of the poor, particularly in rural landscapes, historically compelled vast numbers of Indians to depend on informal lending sources. Motivated by social necessity, policy planners and banking regulators, including the Reserve Bank of India (RBI) and NABARD, put forth new frameworks to extend credit and financial services to the country's most vulnerable populations. These reforms paved the way for the establishment of microfinance as a multi-faceted platform offering not only loans, but also savings, payment systems, and insurance—thereby addressing both consumption smoothing and income generation needs. The core idea behind microfinance echoes the pioneering vision of Muhammad Yunus, whose efforts in Bangladesh with the Grameen Bank won global acclaim. In the Indian context, the movement blossomed with the advent of the Self-Help Group (SHG)-Bank Linkage Programme and the diversification of delivery models, including NGO-MFIs and cooperative credit societies. Today, microfinance is more than just microcredit; it covers a spectrum of financial instruments supporting households' resilience, productive investment, and upward social mobility. By emphasizing group formation, collective responsibility, and local leadership, Indian microfinance initiatives not only provide financial services but also foster empowerment and community engagement.

Defining Microfinance and Its Reach

Microfinance, at its essence, involves deploying a suite of small-sized, easily accessible financial tools tailored to the daily realities of low-income clients. Beyond the basic provision of credit, microfinance organizations facilitate routine savings, micro-insurance, remittance services, and financial literacy programs. While microcredit targets urgent and productive capital needs, the wider paradigm of microfinance ensures that households can build resilience against external shocks, invest for the future, and gradually build creditworthiness within the formal sector.

REVIEW OF LITERATURE

Mahajan (1997) offers early insights, critiquing the tension between microfinance's self-employment focus and the broader realities of livelihood security. He argues that while self-employment via microfinance can be empowering, many marginalized individuals favor wage employment for its stability, hinting that microfinance systems must evolve institutionally to meet multifaceted client needs. Rutherford (2000) draws a clear distinction between microcredit as strictly loan services, and microfinance as encompassing savings and risk mitigation products. He underscores that flexible, adaptive financial service options are fundamental for helping the poor manage volatile incomes and emergencies, with microfinance playing a key protective role. Further research such as by Sriram & Upadhyayula (2004, 2009) and Devaraja (2011) articulate the changing capabilities of MFIs over time, pointing to advances in management, product design, and outreach to underbanked communities. Recent findings (Padimani, 2025; Basheer, 2013) assert that microfinance's true impact is realized through programs emphasizing both income growth and capacity enhancement—especially among women's groups. Sarumathi & Mohan (2011) focus on the effects of microfinance-supported SHGs in promoting women's self-esteem, economic participation, and leadership skills. Their work, alongside that of Moses (2011) and various field studies, makes plain that institutional and contextual adaptation is crucial to sustainable sectoral expansion. At the policy level, institutional frameworks and incentive alignment remain under scrutiny, with Kundu & Bhandari (2014) suggesting a movement towards greater client-centricity and risk-sharing mechanisms in sector governance. The World Bank's evidence on rural India's persistent credit gap reinforces the urgent necessity of microfinance's continued innovation and role in poverty mitigation.

Aims and Research Objectives

- To trace microfinance's historical development and institutional evolution in India.
- To examine operational, regulatory, and client-side obstacles currently facing the sector.

- To assess how MFIs influence empowerment, savings, and entrepreneurship among diverse client groups.
- To formulate actionable policy recommendations for optimizing outreach and sustainability.

Microfinance Models, Policy Milestones, and Service Diversity

Indian microfinance's core delivery channels currently revolve around the SHG-Bank Linkage model (supported by NABARD) and standalone MFIs. Despite incremental growth, banking and regulatory support have not kept pace with demand, making outreach and operational flexibility persistent challenges. The success of the SHG model in mobilizing women, propagating savings discipline, and delivering both financial and non-financial services is particularly noteworthy. Institutional fragmentation—different regulatory authorities for banks, NBFCs, cooperatives, and NGOs—has, however, complicated uniform progress and accountability.

The Evolutionary Path of Indian Microfinance

Since the 1980s, government and banking authorities have progressively designed products and policies to foster credit inclusion for low-income households. Initiatives such as priority sector lending, the formation of regional rural banks, and special schemes for women and marginalized communities formed the early backbone. The lotus of microfinance bloomed fully when SHG-Bank Linkage scaled in the 1990s, creating an ecosystem for entrepreneurial and community participation unparalleled in the region. Modern microfinance incorporates digital innovations, peer-group lending, and productivity-linked loan structures, seeking to reduce information asymmetries and improve efficiency. Technology and MIS now help MFIs track loan use, minimize fraud, and optimize service delivery, expanding the sector's capacity to reach previously neglected populations.

Socio-Economic Development Impacts

Microfinance has made its mark by supporting small-scale enterprise, household resilience, and women's financial inclusion. Numerous studies indicate that members of SHGs and MFI clients typically report greater business growth, enhanced personal agency, and increased expenditures on health and education. Microfinance's reach into remote and vulnerable communities has also helped stimulate savings habits and cooperative action, both cornerstones for sustainable local development.

Persistent and Emerging Sectoral Challenges

Even as microfinance has improved lives, it faces persistent sector-specific challenges:

- Fragmented Regulation: Varied oversight creates inconsistencies that hinder sector unity.
- Operational Costs: Serving distant rural clients and managing small transactions increases delivery costs for MFIs.
- Interest Rate and Product Clarity: Borrowers often face confusion over fees and repayment schedules, partly due to lack of standardized rate-setting.
- Client Knowledge Gaps: Limited literacy impairs effective use and timely repayment, posing risks for both users and providers.
- Group Lending Pressures: Peer-based responsibility can become stressful if certain borrowers repeatedly underperform or default.

Additional hurdles include increasing sector competition, funding constraints, technological adoption, and sustaining innovation as expectations and rural aspirations evolve.

Strategies to Overcome Barriers

1. Harmonize regulatory oversight and enforce best-practice governance.
2. Deepen field supervision and staff training for quality assurance across all service points.
3. Incentivize MFIs to expand into underbanked regions with targeted branch openings.
4. Diversify product lines—offer insurance, remittances, and tailored advisory services alongside credit.
5. Mandate transparency in cost structures and repayment terms for all clients.
6. Utilize digital tools to standardize processes, cut costs, and improve user monitoring.

7. Explore new funding channels—bonds, equity, and hybrid finance models—to ensure sector sustainability and innovation.

METHODOLOGY

A methodologically robust, quantitative approach was followed, sampling 130 women engaged with SHGs and individual microfinance initiatives. Data on economic empowerment, decision-making capacity, and perceived well-being were gathered and statistically analyzed using ANOVA. Sampling ensured representation across age, education, income, and occupation.

RESEARCH METHODOLOGY

The present study used quantitative research to examine the impact of microfinance on the determinants of empowerment in the Indian economy. A random sampling technique was used to select respondents to ensure that each participant had an equal and unbiased chance of being included in the study. The target population included women who were active users of microfinance services such as Self-Help Groups (SHGs) or microcredit beneficiaries. A total of 130 respondents were selected as the sample size representing a diverse cross-section of microfinance users interms of age, income, education and occupation. Data were collected through a structured questionnaire covering key areas such as economic empowerment, self-esteem, decision-making skills, psychological well-being and social empowerment. The collected data was then analyzed using statistical tools including means cores, standard deviations and ANOVA tests to understand the variations and significance of microfinance interventions on different empowerment indicators. The demographic details of the customer segment reveal a strong representation of younger individuals, with a significant 63% of participants being 30 years old or under. This highlights a clientele largely comprised of emerging adults—such as college students, young professionals, or those newly entering financial independence. In examining gender distribution, it becomes apparent that women slightly edge out men, constituting 57% of respondents. This prevalence of female participants suggests that the product or service in question may resonate more with women, or perhaps women play an influential part in purchasing decisions within these households. The collected data on marital status further reinforces the presence of a youthful, possibly cosmopolitan customer group: 57% of respondents reported being unmarried, which coheres with the general age trends and supports the notion of a predominantly young, urban, and self-reliant clientele. Income analysis reveals a broad spectrum: while roughly a quarter of the group (24%) earns more than ₹50,000 per month, there remains sizable representation in the lower and middle-income categories.

This diversity in earning power points to a wide range of spending abilities, indicating a market where both value-oriented and luxury offerings may find appeal. With respect to employment, the majority are involved in the private sector (41%) or are entrepreneurs and business owners (28%). Such a composition indicates an economically active community, likely to prioritize convenience, high quality, and time efficiency in their consumption choices. While a smaller share consists of students, homemakers, and those retired, these groups bring added heterogeneity, although they may exert less sway on primary service priorities. Educational attainment within the sample is notably high: 43% have completed undergraduate degrees, and a further 25% have attained graduate or professional-level qualifications, suggesting that the customer base is knowledgeable, discerning, and potentially attentive to brand quality. Family structure data shows that a majority (74%) belong to nuclear families, illustrating the prevalence of modern living arrangements and a preference for autonomy, individual tastes, and bespoke experiences. Collectively, these insights paint a portrait of customers who are mostly young, well-educated, financially active, and equipped with a range of disposable incomes. Businesses aiming to serve this market should emphasize superior quality, affordability, and streamlined services, while also catering to the lifestyle demands and preferences characteristic of independent, single urban dwellers.

ANOVA

ANOVA for the impact of microfinance on various empowerment dimensions among women, specifically empowerment, self-esteem, and psychological aspects.

Interpretation

The ANOVA analysis illustrates the influence of microfinance on different facets of women's empowerment, specifically in terms of personal agency, self-confidence, and mental well-being. The observed F-values (ranging from 2.487 to 3.320) indicate that there is a degree of variability in the average scores for the individual items within each empowerment category. Nevertheless, with all corresponding P-values exceeding the 0.05 threshold (Empowerment: 0.800; Self-esteem: 0.634; Psychological Aspects: 0.510), the statistical evidence does not demonstrate any significant distinctions among the means when evaluated at the 5% significance level. This suggests that microfinance support does not create marked differences when comparing the individual subcomponents within major empowerment domains. While items such as "confidence to participate actively in SHG meetings," "ability to make decisions," and "sense of hope" show elevated mean values, the collective statistical tests reveal that no aspect is statistically distinct from others within its group. In essence, the findings point to a broadly consistent positive effect of microfinance across all measured empowerment areas, rather than indicating stronger influence on specific indicators.

CONCLUSION

Indian microfinance holds continuing promise as a catalyst for rural upliftment and social progress. To realize its full potential, reforms must focus on unifying oversight, deepening borrower education, and embracing technological and institutional innovation. SHGs and MFIs remain critical for poverty alleviation, women's empowerment, and fostering an entrepreneurial spirit—cornerstones for the country's march towards inclusive growth and sustainable development.

ABSTRACT

Entrepreneurs are capable of observing the environment and spotting chances to enhance environmental resources and acting to take advantage of those chances. An entrepreneur is an individual who begins, develops, and runs a business. This position requires a wide range of creative, innovative, and well-organised human talents, which are typically associated with leadership. Beyond simply making money, entrepreneurship seeks to solve problems, add value to society, and create jobs to enhance the economy. An entrepreneur takes resources from society, makes good use of them, and provides society with beneficial products and services while making money. Without societal support, an entrepreneur cannot prosper. Among them any social groups that businesses engage with are suppliers, owners, employees, customers, and the government. The term "business social responsibility" describes the company's duty to guarantee these parties' and the owner's satisfaction. This research paper investigates the relationship between business entrepreneurship and corporate social responsibility (CSR) in the context of India's sustainable development. It demonstrates how modern businesses are concerned not just with profit development but also with social and environmental issues. With the implementation of Section 135 of the firms Act in 2013, CSR has become a legal requirement for Indian firms, forcing them to devote a portion of their profits to programs that promote education, health, rural development, women's empowerment, and environmental conservation. The report also looks at CSR activities implemented by major Indian firms such as Tata, Infosys, Wipro, ITC, ONGC, and others, as well as public sector programs overseen by the Department of Public Enterprises (DPE). These activities indicate firms'

increased commitment to inclusive and sustainable growth. CSR not only improves a company's public image, but it also helps to drive long-term business success by improving relationships with stakeholders and communities. The study focuses on the entrepreneurship and CSR relationship, CSR in India, CSR areas and other relevant topics.

Keywords: Entrepreneurs, Resources, Responsibilities, Social groups, sustainable development, Indian firms and public image

INTRODUCTION

LITERATURE REVIEW

Bibhu Prasad and Mohanty (2012), CSR should be viewed as a strategic method to attaining equitable growth rather than just philanthropy or charity. They came to the conclusion that a true CSR strategy ensures long-term sustainability for both society and businesses by encouraging moral business conduct, community welfare, and environmental preservation. Praveen Kumar (2013) commented on the state of corporate social responsibility (CSR) in India and the challenges it faces. Issues like unclear regulations, inadequate planning, poor monitoring, and inadequate public awareness were also highlighted by the report. According to Harbajan Bansal, Vinu Parida, and Pankaj Kumar (2012), businesses are beginning to understand the significance of integrating social welfare, environmental conservation, and community development into their operations. India is evolving from simple charity and donations to a more organised and purposeful approach where companies seek to improve society while attaining long-term growth. In "A Close Look into Corporate Social Responsibility in India," Dr. Sarbpriya (2012) discovered that big Indian businesses are gradually accepting ethical behaviour and CSR initiatives and companies are including social welfare and sustainable growth into their objectives in addition to profit-making. Using secondary data from annual reports, Sharma and Mani (2013) examined 30 banks, including foreign, private, and public banks, to evaluate their social responsibility initiatives. The study addressed a number of efforts, including the growth of rural branches, lending to priority sectors, environmental preservation, community and women's welfare, farmer support, financial literacy, and education. They discovered that banks are becoming more active in a variety of CSR initiatives meant to advance social and economic advancement. According to Kishore Neelakantan, the Companies Act of 2013 will impose more regulatory pressure on companies to engage in CSR. For successful implementation, he suggested a structure built on credibility, method, efficiency, and accessibility. Harish Kumar (2012), philanthropic attitudes, government actions, environmental concerns, ethical behaviour of customers, crises and disasters, competition and economic integration, social awareness and education, and social expectations are the eight main elements that propel initiatives.

Business Entrepreneurs and Corporate Social Responsibility

A nation's economic success depends on business and entrepreneurship. Entrepreneurs are the cornerstone of any economy because they generate new ideas, employ people, and bring innovation to the market. A successful businessperson places a high priority on using sustainable and moral practices to improve society in addition to making money. In addition to producing a profit, businesses nowadays are expected to be responsible for their impact on people and the environment. In this case, corporate social responsibility, or CSR, is essential. The phrase "corporate social responsibility" (CSR) refers to the ethical behaviour of companies in conducting their business in a way that helps society. It encompasses programs like worker welfare, health care, education, community development, and environmental preservation.There exists an interdependent link between CSR and entrepreneurship. While CSR serves to ensure that this development is enduring and socially equitable, entrepreneurship is focused on innovation, creativity, and maximizing development. An entrepreneur is one who embeds community benefit, ethics, and transparency into economic activity. This advances the relationship between commerce and society by engendering trust. For example, entrepreneurs who undertake CSR efforts might support projects with a long-term social contribution such as rural development, health, education, and environmental

protection. CSR supports businesses in achieving long-term sustainability and building a reputation that allows them to attract customers and capitalize from investors. Modern businesspersons understand that neglecting social and environmental responsibility can engender problems for both the business and community. Therefore, the new entrepreneurial model has as a primary focus, developing a balance between profitability, social responsibility, and environmental sustainability. The new entrepreneurial model aims to create a balance between financial success, social responsibility, and environmental sustainability. The foundations of a moral and progressive economy are entrepreneurial business and corporate social responsibility. It is the true entrepreneurial who combines social responsibility and profit seeking to become effective leaders of sustainability. By including CSR in their daily business thinking, they can assure that their success serves not only themselves but also society and future generations.

RESEARCH METHODOLOGY

The nature of this study is conceptual. Most of the information used in this research is secondary.Numerous sources, including books, journals, periodicals, reports, and publications of contemporary research papers that are accessible on multiple websites, research articles, E-journals, research journals, news articles from the Economic Times, etc. As a result, the data's correctness depends on the source's accuracy.

OBJECTIVES

The main objectives of this research paper is given below

1.To analyze the function of entrepreneurship and CSR in social and economic development.

2.To explore the legal framework and implementation of CSR in India.

3.To examine how entrepreneurs and companies meet their social responsibilities.

4.To evaluate the impact of CSR initiatives on social value, the environment, and sustainable development.

What Is Entrepreneurship

In order to explore new possibilities and take advantage of market opportunities, entrepreneurship involves planning, organizing, and managing a new business with the possibility of financial gain and a certain amount of risk. It entails determining a need in the market, creating novel concepts or ventures, and seeing them through to financial success. An entrepreneur is a person who starts, develops, and manages a business. This position involves a variety of creative, inventive, and well-organized human skills that are frequently linked to leadership. Beyond just making money, entrepreneurship aims to solve issues, add value to society, and generate employment to boost the economy. In general, and to put it simply, entrepreneurship is putting an idea into practice and using imagination, ingenuity, and a lot of work to create something worthwhile for the business owner and their community. Entrepreneurship has a number of salient features which play an important role in economic and social growth and development. Entrepreneurship starts with innovation, where new products, ideas or processes are introduced into the market and used to improve existing products and processes. Risk-taking and investment of time, money and effort on uncertain undertakings, with a reward of success, is one of its distinguishing features. Another supporting feature is that entrepreneurs have vision and initiative to create the ideas into product and to achieve goals they put in place. Entrepreneurs take resources, such as labour, capital and materials, and effectively organize and manage these for operation of the business. Entrepreneurs are also characterized as skilled decision-makers and leaders, who not only lead the teams with the required expertise, but also take prompt decisions which are critical to the business success in time and scope. Value-creation and ability to provide products and services that create value to the consumer and the society, is another key feature of entrepreneurship. Successful entrepreneurs have the ability to change to the market and adjust to change in technologies to remain competitive. Profit margins, of course, are an important motivator for entrepreneurship; however entrepreneurship also contributes to economic development by creating jobs and income, and fostering innovation in the economy. Overall entrepreneurship embodies creativity, leadership and social responsibility to create growth and potential for change in the economy.

What Is Corporate Social Responsibility

Corporate Social Responsibility (CSR) is defined as the obligation of businesses to engage in ethical practices that contribute to society while conducting their corporate operations. In this regard, a company should not only concentrate on making a profit but also consider how it impacts people, community, and the environment. CSR encourages businesses to operate to develop social good, protect the environment, and enhance sustainability. Businesses participate in Corporate Social Responsibility (CSR) to help rural communities, women's empowerment, health care, education, poverty reduction, and environmental protection. These show the company's dedication to moral conduct, openness, and regard for all parties involved, including workers, clients, investors, and the local community.CSR has grown to be a crucial component of corporate strategy in the modern world. It helps companies build a good reputation, win over the public, and sustain their operations over time. Organizations can create economic advancements while simultaneously being socially and ecologically responsible and advancing both business and society by integrating CSR into their operations.An entrepreneur takes resources from society, makes good use of them, and provides society with beneficial products and services while making money. Without societal support, an entrepreneur cannot prosper. Through innovation, new employment opportunities, and eventually higher living standards, society gains from the entrepreneurial process. As a result, society and entrepreneurs establish a mutually advantageous relationship in which both parties depend on one another. As a result, the entrepreneur serves society as both a creditor and a debtor.

As a result, entrepreneurs have a moral and civic obligation to act properly and ethically in the community that fosters their impact, employment, and business. There are various benefits to social responsibility.

1. **Public Image -** A socially responsible brand behaves honestly and generates trust, increasing public enthusiasm for the company.
2. **Survival and Growth:** Socially responsible businesses earn long-term goodwill and stability.
3. **Government Regulation -** Adherence to legal, ethical, and social standards, as well as regulations, helps to mitigate legal, political, and social consequences.
4. **Employee Satisfaction** - When employees work for a company that follows ethical and socially responsible practices, their attraction, morale, and productivity improve.
5. **Consumer Awareness** - Customers are motivated to do business and remain loyal when their product choice satisfies expectations and is perceived as ethical and responsible.

Major Areas of Social Responsibility of Business:

Shareholders

1. Business ventures and companies should give appropriate dividends to shareholders.
2. Effective and efficient management is key to maximising the business's net present value.
3. Owners should be able to engage in the enterprise's operations.
4. Limit 'oligarchic management' practices.
5. Owners should have thorough information about the company's operations.
6. Owners must receive financial information and have their queries answered.
7. Owners should have easy access to the company's chairman and directors.

Customers

1. Ensuring sure products are available in sufficient quantities, at the correct location, and at the prescribed time.
2. To keep product quality as high as feasible in order to compete with any product on a global scale.
3. Providing reasonable rates for its items.
4. Using the proper weights and measures.
5. The company will give after-sales support for product maintenance.
6. Businesses should avoid restrictive trade practices and ensure that customers receive full value for their money.
7. Constantly explore and uncover new consumer wants, prioritising new product research and development.
8. Take all necessary steps to improve consumer satisfaction, interest, and welfare.

Investors

1. Investors should receive a fair rate of return on a regular basis.
2. Investors should have the right to participate in management decisions.
3. The business must ensure investor monies are safe.
4. The corporation must offer genuine information about its operations.
5. Investor funds shall only be used for their specified purpose. They should not be exploited.
6. The owner should have easy access to the company's chairman and managers.

Employees

1. Giving employees opportunities to do meaningful work.
2. Employees must also be assured that management will pay them fairly and provide a fair deal.
3. The company should endeavour to provide appropriate working circumstances and encourage employee cooperation.
4. Employees should have opportunities for advancement.
5. Providing incentives will increase employee interest.
6. Employees should be encouraged to take part in management decisions.

Government

1. A company should act as a good citizen, which means it should function within the framework of legal regulations.
2. Business entities should pay their taxes on time.
3. A business should take steps to resolve environmental and social issues.
4. Business firms should not facilitate and promote bribery of government officials for their own external benefits at the expense of shoppers who are subjected to unfair market practices.
5. A business should help the government on policies related with any exports and imports and follow them.
6. A business should help the government during natural disasters.

Society

1. It should act like a good citizen and follow socially acceptable norms.
2. It should help to address social challenges including unemployment, illiteracy, and inflation.
3. It should help to rebuild communities in rural and flood-affected areas.
4. It should provide adequate work opportunities.
5. It shall protect the natural environment and take appropriate measures to prevent air, water, land, and noise pollution.
6. It should support communities by constructing hospitals and schools.

Latest Provisions On CSR As Per New Amendments

Corporate Social Responsibility (CSR) in India is governed by Section 135 of the corporations Act of 2013 and the Companies (CSR Policy) Rules of 2014, which compel specific corporations to contribute to social and environmental development. The CSR law applies to all companies, including international corporations operating in India, that meet at least one of the following conditions in the previous fiscal year: a net value of ₹500 crore or more, an annual turnover of ₹1,000 crore or more, or a net profit of ₹5 crore or more. Companies will form a CSR Committee comprised of board members to develop and manage CSR operations. The CSR Committee must have at least three directors, one of whom is an independent director. A private business without independent directors has a committee of two or more directors. Foreign companies must have one resident in India and one nominee from the parent company on the CSR committee. According to the Act, qualified enterprises must invest at least 2% of their average net profits (excluding extraordinary gains) generated during the previous three fiscal years to Board-certified CSR programs. In the absence of such spending, the firm will be required to justify its actions in an annual report, and any monies not spent must be transferred to specific funds specified in the 2019 and 2020 Companies (Amendment) Acts.

CSR programs can address a wide range of issues, including hunger and poverty alleviation, health care and sanitation, education and skill development, women's empowerment, environmental protection, national heritage, members of the armed services and veterans, and government relief funds. Companies can work on rural and urban development challenges, disaster relief, sports assistance, and health and technological research, such as COVID-19. India's CSR framework ensures that businesses operate ethically and, in some situations, contribute to the welfare of society. It encourages businesses to strike a balance between profit and ethical behaviour, community development, and environmental sustainability in order to build a better, more inclusive nation.

Companies Ranking in CSR (India)

Many huge firms in India are becoming more mindful of their social and environmental responsibilities while still pursuing profit and expansion. Large firms are required by the Corporate Social Responsibility (CSR) principle to become involved in the realm of social well-being and sustainability. Today, the vast majority of India's leading corporations have launched CSR initiatives that address a variety of concerns, including poverty alleviation, education, health care, rural development, and skill development for underserved communities. Companies like Infosys, Airtel, Tata, ITC, Indian Oil Corporation (IOC), ONGC, and Wipro have all set excellent examples of CSR initiatives, completing numerous projects to promote equitable growth and welfare in local communities. The Indian government has also attempted to engage Public Sector Undertakings (PSUs) in Corporate Social Responsibility (CSR) initiatives. The Department of Public Enterprises (DPE) has created rules for central PSUs to participate in larger CSR projects funded by allocating 2-5 percent of their net earnings. The goal is for public and private firms to have equal opportunities to engage in socially beneficial activities. Furthermore, many businesses are taking action and accepting responsibility to be more sustainable and lessen their environmental impact. Overall, CSR in India has emerged as a significant part of corporate governance since it represents the balance between profit, moral obligation, society, and the environment.Bhaskar Chatterjee, Father of Corporate Social Responsibility in India stated: "CSR, rendered compulsory under the Companies Act and approved by parliament, comes in from April 1, 2014," "All firms with turnover of Rs.1000 crore and above - or net worth of Rs 500 crore and above or net profit of Rs.5 crore and above - will be required to utilize at least two percent of their three-year average profit annually on CSR activity," he said.

Notable Work By Some Companies Towards CSR In 2024 And Mid 2025 Mahindra & Mahindra;

In 2024-25, Mahindra & Mahindra Ltd. (M&M) maintained its strong focus in its vision "Rise for a More Equal World." The company incurred around ₹142 crore on numerous social and environmental initiatives, completely exceeding the requirement of spending 2% of its average net profits. Its CSR initiatives were primarily centered on education, skill development, environment, and rural development. As part of its flagship initiative Nanhi Kali, M&M funded the education of over two lakh disadvantaged girls throughout India. Thousands of youth belonging to marginalized communities were trained in the Mahindra Pride Schools and Classrooms, enhancing their employability. The company planted over 1.2 million trees under its Hariyali project in the year, supporting climate action and biodiversity. Rural livelihoods, health, and sanitation initiatives in various states were also funded by M&M. All activities were implemented through registered trusts like the K.C. Mahindra Education Trust and the Mahindra Foundation. The organisation was also independently evaluated in terms of education, gender equality, decent work, and climate action, all of which are Sustainable Development Goals.

TATA STEEL: During 2024-25, Tata Steel Limited remained steadfast in its Corporate Social Responsibility (CSR) commitment to create an inclusive and sustainable future. It invested around ₹430 crore in social and environmental causes, exceeding the mandated 2% of its average net profit under the Companies Act, 2013. Its core focus areas were education, livelihood, health care, sanitation and water, and environment. With the Thousand Schools Programme, Tata Steel contributed to enhancing education for over two lakh children in Odisha and Jharkhand. It also empowered over one lakh youth and women through skills and entrepreneurship training, enabling them to earn a regular income. The health programs of the company provided hospitalization for rural and tribal populations, touching nearly one million lives. Tata Steel, under its Green Mission, had planted trees, encouraged renewable

energy, and funded water conservation initiatives. All these initiatives were conducted under the Tata Steel Foundation and local stakeholders.

Reliance Industries Limited (RIL)

Maintained its robust focus on CSR in 2024-25 through Reliance Foundation, headed by Mrs. Nita Ambani. The organization invested approximately ₹1,200 crore on CSR initiatives, with an emphasis on education, healthcare, rural development, women empowerment, and environmental sustainability. Its educational initiatives supported schools, scholarships, and online schooling for more than two lakh students, whereas its healthcare efforts through hospitals and mobile medical units benefited millions of individuals in India. Reliance also helped enhance rural livelihoods by supporting farming, water harvesting, and women's self-help groups. Through its Green Mission, the company advocated renewable energy, tree planting, and waste management. It also gave relief during natural calamities. All these efforts were in accordance with the UNSDGs and enhancing lives, safeguarding the environment, and fostering inclusive growth in the country.

TATA Consultancy Services (TCS):

In 2024-25, Tata Consultancy Services (TCS) kept assisting individuals through its Corporate Social Responsibility (CSR) activities. The organization invested around ₹720 crore on education, health, skill training, and environment-related projects. TCS educated students and teachers in digital and science competencies through initiatives such as goIT and Ignite My Future, and trained youth to secure improved jobs. It also enabled healthcare and wellness in rural India and engaged in tree planting initiatives and clean energy development. All these initiatives were undertaken by the TCS Foundation and with the goal to improve life and make it sustainable for citizens all over India.

OIL and Natural GAS Corporation (ONGC)

ONGC in 2024-25 again pursued its Corporate Social Responsibility (CSR) initiatives to aid communities near its operations and in India. The company incurred about ₹550 crore on CSR initiatives with an emphasis on healthcare, education, skill upgradation, environment, and rural development. ONGC granted scholarships and study-related assistance, conducted health camps in villages, and gave training to youths to enhance their employment prospects. ONGC also dealt with tree plantation, water conservation, and clean energy initiatives.

ICICI Bank

In 2024–25, ICICI Bank went on with Corporate Social Responsibility (CSR) activities, investing approximately ₹160 crore on initiatives in India. The bank was engaged in education, skill training, healthcare, women empowerment, financial inclusion, and environmental conservation. Its actions helped disadvantaged children receive quality education, skilled youth acquire employable skills, and health camps in rural regions. ICICI Bank also conducted tree planting, clean energy initiatives, and women's self-help schemes. All the CSR activities were conducted through the ICICI Foundation to enhance lives, generate opportunities, and foster inclusive and sustainable development.

Infosys

In 2024–25, Infosys Ltd. pursued its Corporate Social Responsibility (CSR) activities at a cost of approximately ₹300 crore for initiatives undertaken in India. CSR activities of the company included education, skill development, healthcare, and green initiatives. Infosys assisted poor children with scholarships and school-based programs, educated youth in digital and vocational skills to enhance job prospects, and conducted healthcare activities like medical camps and awareness drives. It also engaged in tree plantation, water conservation, and clean energy initiatives. It conducted all CSR activities through the Infosys Foundation, focusing on enhancing lives, encouraging inclusive growth, and enabling sustainable development throughout the nation.

ITC

ITC Limited spent approximately ₹380 crore in 2024–25 on its Corporate Social Responsibility (CSR) activities throughout India. The organization emphasized education, healthcare, rural development, women's empowerment,

and sustainability of the environment. ITC assisted initiatives in enhancing school education and literacy, provided vocational and agricultural training to rural youths, and conducted healthcare camps in remote areas. It also promoted afforestation, water conservation measures, and renewable energy projects to ensure the protection of the environment. All CSR initiatives were executed by way of the ITC Foundation and other partner institutions with the aim of enhancing livelihood, fostering inclusive growth, and ensuring sustainable development throughout India.

GAIL

GAIL (India) Limited invested around ₹150 crore throughout India in 2024–2025. The organisation prioritised environmental sustainability, rural development, healthcare, education, and skill development. GAIL organised healthcare camps in rural regions, taught youngsters in practical skills to increase employability, and supported initiatives to improve school education and offer scholarships. In order to safeguard the environment, it also implemented water conservation, renewable energy, and tree planting initiatives. The GAIL Gas Foundation and affiliated organisations carried out all CSR initiatives to enhance livelihoods, encourage equitable growth, and aid in sustainable development in Indian communities.

LARSEN & TOUBRO

Around ₹200 crore was spent by L&T on its projects in India in 2024–2025. The organisation prioritised skill development, rural development, education, healthcare, and environmental sustainability. L&T coordinated healthcare camps in rural and isolated locations, trained young people in employable skills and vocational training, and funded initiatives to enhance schooling and provide scholarships for disadvantaged youngsters. For environmental protection, it also carried out water conservation, renewable energy, and tree planting initiatives. To enhance livelihoods, encourage inclusive growth, and support sustainable development nationwide, all CSR activities were conducted through the L&T Foundation and L&T Construction CSR projects.

PGCIL

In 2024–25, Power Grid Corporation of India Ltd. (PGCIL) made approximately ₹120 crore worth of investment in its Corporate Social Responsibility (CSR) activities throughout India. The company targeted education, skill building, healthcare, rural development, and environmental conservation. Its initiatives assisted schools and scholarship to children, gave vocational training to the youth, conducted health camps in rural areas, and assisted community welfare initiatives. Power Grid also followed tree plantation, water conservation, and renewable energy measures to safeguard the environment.

NTPC

NTPC Limited invested around ₹450 crore in its CSR programs throughout India in 2024–2025. organisation prioritised environmental sustainability, rural development, skill development, healthcare, and education. NTPC organised medical camps and healthcare programs in rural areas, trained young people in vocational skills to increase employment chances, and funded schools and scholarships for disadvantaged children. In order to safeguard the environment, it also implemented water conservation, renewable energy, and tree planting initiatives. In order to enhance livelihoods, encourage inclusive growth, and support sustainable development in the nation, all CSR initiatives were carried out through the NTPC Foundation and affiliated organisations.

HDFC

In 2024–2025, HDFC Bank invested over ₹180 crore in its CSR (corporate social responsibility) programs in India. The bank prioritised women's empowerment, environmental sustainability, healthcare, education, and skill development. Through its activities, it provided financial literacy training, organised health camps in rural regions, taught youngsters in employable skills, and assisted impoverished children through school support and scholarships. Green energy, water conservation, and tree planting initiatives were also carried out by HDFC Bank.

CONCLUSION

The combination of entrepreneurship with CSR lays the groundwork for modern society's long-term, inclusive development. Entrepreneurs produce revenue while also serving as change agents, fostering innovation, creating job opportunities, and promoting societal improvement. Their mission is not confined to profit generation; they also have a responsibility to the community in which they operate, as they use community resources, expand their enterprises with community support and resources, and have a good impact on the community. As a result, entrepreneurs should eventually pursue socially responsible policies in order to increase community well-being and build a beneficial relationship between economic success and social development.CSR has grown in importance in India since the firms Act of 2013, which obliged qualifying firms to devote a part of their profits to social benefit projects. This legal framework has led both the public and private sectors to undertake programs for education, healthcare, poverty alleviation, women's empowerment, environmental preservation, and rural development. Tata, Infosys, Wipro, ONGC, and ITC have paved the way for CSR as part of their main business activities. As a result, CSR in India has progressed from a charitable activity to a strategic business strategy aimed at connecting corporate objectives with societal needs.CSR has proved that ethical behaviour and social engagement are compatible with business and growth. Long-term, responsible entrepreneurship, along with effective CSR implementation, will result in long-term economic growth, environmental sustainability, and human well-being, all of which contribute to a more fair and progressive society.

ABSTRACT

Arka Kalpana is one of the *Ayurvedic* dosage form *Arka Prakasha*. *Arka Prakasha*is a text written by *Ravana* in mentions *Panchavidha Kashaya Kalpana* as *Kalka, Churna, Swarasa, Taila* and *Arka.* This book explains about the method of preparation of *Arka*;the apparatus and different varieties of ingredients used for preparation of *Arka. Arka* is compared to Distillate in modern terminology. In comparison to all other *Kalpana, ArkaKalpana* has been described as the most potent *Kalpana* because it is colourless, effective in low dosage as it has all volatile substances in effective form in its final product. When compared to other dosage forms, *Arka Kalpana*is more palatable form *Ayurvedic* dosage forms. In the present study, review on the method of preparation and the science behind *Arka Kalpana* with special reference to *Gomutra Arka* has been attempted.

Keywords: *Arka Kalpana, Gomutra Arka***,** Distillation

INTRODUCTION

In *Ayurveda, Kalpana* means various dosage forms[1]. Every *dravya* can be a medicine but some pharmaceutical procedures are done to alter or potentiate its original properties. The basic idea behind the administration of drug is

to make it more acceptable to the body. *Arka kalpana* can be defined as a liquid preparation obtained by distillation of certain liquids or of drugs soaked in water using the *Arkayantra* [2] or any convenient modern distillation apparatus. Various references about concept of *Arka* have been mentioned in different literatures like Ayurvedic Formulary of India (AFI), *Rasatantra sara, Siddha prayogasangraha, Gadanigraha, Ayurveda Sara Sangraha, Bhavaprakasha* etc. A clear explanation about *Arka* and the pharmaceutical aspect of *Arka Kalpana* has been mentioned in *Arka Prakasha* by *Ravana*[3].

Derivation of the Word *Arka*

The word *Arka* is derived from '*Ru – gatau'*. [4] *Gati,* denotes three different meanings i.e. *Gyan, Gaman* and *prapti*. In preparation of *Arka,* all these three meaning are to be accepted, as the knowledge of the contents of the drug is first thing (i.e. *Gyan*), then the motion is given to the contents through water (i.e. *Gaman*) and lastly required amount of active content is obtained (i.e. *Prapti*). Thus, *Arka* contains the complete aspect of its preparation process by root word *'Ru-Gatau.'*

Definition of *Arka*

The method by which the volatile and active principles of the drug are collected is called as *Arka Kalpana* and the compound prepared through this procedure is called as *Arka.*

HISTORICAL REVIEW

Samhita kala*:* References about *Arka Kalpana* are not available in any Vedic literature or *Samhita.* Usage of *Arka's* may not be popular during that period.

Adhunika kala

Arka Kalpana was first mentioned in *Gada Nigraha* by *Acharya Shodhala* in 12th century[5]. Main reference of *Arka Kalpana* is described by *Ravana* in his book *Arka Prakasha.* This text is presented as a conversation between *Ravana* and *Mandodari*. In this book, different ratios for distillation, 196 *yogas* of single drugs and 192 *aushada yogas* for preparation of *Arka* with their indication is described. Details about *Varuni Yantra* for preparation of *Arka* is also mentioned, In *Ayurveda Sara Sangraha*, there are 25 *Arka* preparation explained with ingredients, method of preparation, indication and dose. 21 *Arka Kalpana* with the method of preparation, *anupana, aushada sevana kala and bhaishjya marga* are mentioned in the first volume of *Rasatantra sara* and *Siddha Prayoga Sangraha.* In *Rasa Tarangini,* there is one *shloka* mentioned about *Arka* as -- *Parishrutasalilam Yantren nadikakhyena vahinsantapa yogatah Bindusho yatstrutam niram tatparistrutamucyate. (*R.T. 2/59)

Different Names

Ayurveda *– Arka*
Unani *– Arkquites*
Siddha *– Teenir*
Homeopathy – Tincture
Allopathy - Distillate

Classification

Classification as per contents[6]
Gandha Arka**:** From the drugs containing volatile oil, *Arka* is extracted.
Example: *Ajmoda, Jiraka* etc.

Sthiraka Arka**:** From the drugs not containing any volatile oil, *Arka* is extracted.
Example: *Triphala, Dashamoola* etc.

Dravaka Arka: From the drugs that are liquid in state, *Arka* is extracted.

Example: *Gomutra* etc.
Classification based on duration of preparation [6]
Shreshitha Arka: *Arka* prepared in 9 Hrs.
Nyuna: *Arka* prepared in 3 Hrs.
Madhya Arka: *Arka* prepared in 6 Hrs.

Classification based on the part used[6]
1.*Visha Varga Arka*
2.*Sugandha Gana Arka*
3.*Tandula Arka*
4.*Sattu Dhanya Arka*
5.*Kshiri Vriksha Arka*
6.*Taila Dhanya Arka*
7.*Pushpa arka*

Classification according to Modern Science [7]
1.Simple distillation.
2.Vacuum distillation
3.Fractional distillation
4.Steam distillation
5.Dry distillation

Importance of *Arka* [8]
Dravya kalpah panchdhasyat kalka churna rasastatha tailamarka kramatgneyam yathottargunam priye {a. p\ 1/46}. According to the above reference, the efficacy of *Kalka, Churna, Swarasa, Taila and Arka* gradually increase in descending order. The efficacy of these formulations is due to various degrees in the concentration of active principles.

Other importance of this *Kalpana* is as follows
1.*Arka* can be preserved for longer time and is easy to administer to the patients.
2.*Arka* is prepared by the combination of water and with the help of fire; hence *Arkas* are easy to digest, *Vyavayi and Vikasi* and thus assimilates quickly in the body.
3.*Arkas* have good palatability.

Method of Preparation of *Arka*
Arka Prakasha clearly mentions the preparation of *Arka Kalpana* in detail.

General Method: In 2nd chapter of *Arka Prakasha*, it is mentioned that the drugs are to be coarsely powdered and ten times of water should be added to it. The mixture should be soaked for 24 hrs. Next day morning, the *Arka* should be extracted by using *Arka Yantra*.

Special Method: *Arka* is extracted in two ways from Wet drugs and Dry drugs. If the drugs are soft, soak them in 6 times of water and extraction of *Arka* should be done up to 60%; if the drugs are wet and mildly hard, then 8 times of water should be added to it and extraction of Arka should be done up to 60% – 70%. If the drugs are dry and soft, they need not to be crushed. At the time of extraction, they should be mixed with 6-8 times of water in the *Arka patana yantra* and usage of mild fire for obtaining 60% -70% of *Arka*. If the drugs are dry and hard then these are crushed into coarse powder form and soaked in 10 times of water for overnight; in the morning, it should be placed in the *Arka patana yantra* and mild fire for obtaining 60%- 70% of Arka. If the drugs are dry and moderately hard, they need not to be crushed and 8 times of water is added to it and kept for overnight and in the morning, it should be placed in *Arka patina yantra* and mild fire for obtaining 60% of *Arka* [9]. In recent books, the preparation is mentioned as drugs

are to be soaked and kept overnight. Eight times of water must be added. *Madhyagni or Teevra agni* must be maintained during the procedure and only two- third (60%) of the liquid must be collected[10].

According to AFI, Methods of Preparation of *Arka* [13]
To prepare *Arka,* drugs are soaked for overnight/ day.
Arka Patana yantra is lighted and kept at medium flame.
Steam which is generated, collects the liquid and it is termed as *Arka*.

Precautions During Preparation
1. While doing the preparation, distillation apparatus should be kept on *Mandagni*, because boiling of the drugs with excessive heat will lead to water getting vaporized early.
2. Because of more heat, there is a chance of burning and spoilage of *Arka Dravya* and quantity of *Arka* formed will have improper taste and smell.
3. The lid should be tightly placed and sealed to prevent vapours from escaping.
4. Continuous water current should be maintained in the condenser.
5. When a copular type of condenser is used, water should be replaced by cool water when it becomes warm.
6. The vessel in which the distillate is collected is placed in a container containing cool water.

Science behind the Preparation of *Arka*
Process of Distillation
According to Modern Science, *Arka Kalpana* is the process of "Distillation". In the process of distillation, the condenser is mounted in the neck of the flask containing the material being treated. As vaporization begins, the vapours enter the condenser, and the pressure of the vapours causes the distillate to spurt out from it. At the same time, a certain amount of back pressure is produced by the presence of the liquid retained in the condenser and this interrupts the smooth progress of the distillation process [7]

Distillation consists of two steps (A) Evaporation (B) Condensation
Evaporation: Evaporation is defined as the free escape of vapours from the surface of a liquid. The Kinetic theory of matter helps us in understanding how evaporation takes place at any temperature and from the surface of a liquid. The molecules of a liquid are always in motion, moving at enormous speeds, frequently colliding and exerting a force upon each other. The Kinetic theory produces an explanation that when a liquid is allowed to evaporate without being heated, it gradually becomes cooler.

Latent heat of Vaporization: To change a liquid into a vapour without fall in temperature, heat must be supplied. This heat is called latent heat of vaporization and when the vapour returns to the liquid state, the latent heat comes as sensible heat.

Condensation: Condensation is the process of converting water vapour back into liquid form. When water vapor is condensed by cooling, the same amount of heat energy is released. If the heat is not carried away, the condenser will become too hot to condense water vapor, and it will escape into the atmosphere. To condense water vapor, a rapid heat exchange is required. Steam at 100°C requires about twenty-five times its weight of water at 20°C to condense it. Water is often used as the cooling medium and is most effective when supplied as a stream from a constant source. The condenser should have a large cooling surface because the rate of condensation is proportional to the surface area exposed. The condensing surface should be made of a material that is a good conductor of heat, and metallic condensers are more efficient than those made of glass.

Distribution of *Agni* in *Arka* Preparation
6 grades of *Agni* are mentioned during the preparation of *Arka* [11](Table 1)

Test of *Arka*
- Taste and odour of the drug must not be present.
- When *Arka* is filled in different *Patra*, the colour of *Arka* should be similar to *Shankha or* moon rays.

General dose of *Arka* – 12-24 ml.
Anupana – *Tambula bhakshana /Lavanga.*

Durgandhanashana Vidhi
If *Arka* is having bad smell, then it has to be fumigated with *Dhuma* made from the powder of *Hingu, Methika, Rajika e*tc. mixed in *Ghrita* and then it should be kept new container.

Storage – *Arka* should be stored in airtight glass jars.

Preparation of *Gomutra Arka*
Gomutra Arka or *Gou Arka* is processed Gomutra.

Rasapanchak* of *Gomutra [14]
Rasa - *Katu, Madhua;* ***Virya -*** *Ushna;* ***Vipaka -*** *Katu ;* ***Guna -*** *Tikshna, Ushna, Laghu*
Karma - *Medhya, Deepan, Sara;* ***Doshaghnata -*** *Kapha-Vata-Shamaka*

Formulation of *Gomutra Arka*
Reference for ***Gomutra Arka*** which is a *dravaka arka* can be found in *Rasa Tantra Sara* in the name of *Medohara Arka.*

Procedure for Steam Distillation
Gomutra arka was prepared in JSS Ayurveda Medical College by the Department of *Rasashastra and Bhaishajya Kalpana.* The cow urine was collected in early morning. The collected *Gomutra* was poured into *Arka Yantra*.The assembly was set up.500 ml *Gomutra* was taken in round bottom flask. The flask was heated slowly. Temperature was maintained at 60 degrees Celsius to carry out steam distillation. Receiver was attached to condenser. In total, 350 ml *Gomutra Ark* was collected in conical flask by the end of 6 hours. *Gomutra arka* was allowed to cool to the room temperature. After cooling the *Gomutra Arka* was kept in air tight container. (Figure 1). Uses of *Gomutra Arka* are seen in *sthoulya, hrudroga, shotha, yakruth shoola, udara shoola, rakta vikara, manda jwara, prameha.*

Anupana*: Madhu*

Efficacy of *Gomutra Arka* [15]
Gomutra Arka proved to show anti-microbial activities, effective on microorganism like Staphylococcus *Aureus, Pseudomonas Aeruginosa, Shigella, Salmonella, E. Coli, and Candida Albicans* with minimum 10 ml quantity. The *Gomutra arka* shows antimicrobial activity due to its property like *Katu tikta kashaya rasa.* Due to *Ushna tikshna and Kshara guna,* it gives an unfavourable environment for bacterial growth. The presence of constituents like copper, urea, ammonia further helps in antimicrobial activity.

DISCUSSION

The word Arka *kalpana* is mentioned in *Arka Prakasha*. According to the few historians and Vedas, it is believed that when Mughals came to India, they have used Arka in their daily practice. *Arka* is used to treat and heal various diseases such as eg: *Brahmi arka* is used to treat *Apasmara and Unmada. Tulsi arka* is used in *Shwasa and Kasa.* [12] *Arka* is used for *shodhana of parada* also. Regarding the distillation process, there are some key points while extracting *Arka*. The separation of components through distillation depends on the differences in boiling points of the individual components. Additionally, depending on the concentration of the components present, the liquid mixture will have

different boiling point. Therefore, the distillation process depends on the vapor pressure of liquid mixtures. In regards to *Gomutra Arka,* cow urine mainly contains water (95%), urea and Mineral salts (2.5%), Hormones and Enzymes (2.5%). The main constituents show therapeutic action are nitrogen, sulphur, ammonia, copper, phosphate, sodium, potassium, manganese, carbolic acid, calcium, salt, vitamin (A, B, C, D, E), Lactose, Enzyme, Hippuric acid etc which shows therapeutic actions

CONCLUSION

Arka Kalpana has its origin in *Hima and Phanta Kalpana*. This article mainly focuses on review on Arka Kalpana and a successful pharmaceutical preparation of *Gomutra Arka.*

ABSTRACT

The worldwide politics of climate change evokes diverse potential global futures, from techno-optimistic scenarios of ecological modernisation to apocalyptic visions of climate devastation.. The African futurist climate fiction novels by authors like Chinua Achebe, Ngũgĩ Wa Thiango, Lauren Beukes, and Wole Soyinka envision diverse locations, temporalities, ecologies, and political landscape. It is essential to acknowledge that the politics surrounding Black identities and cultures within the African diaspora must identify, both at present and in the past, the interconnections across locations, temporalities, and disciplines that shape the definition and positioning of African context of ecological changes. This article examines the social, economic, and environmental changes that Africa has undergone, particularly in relation to post-colonial circumstances. These themes illuminate the intricacies of contemporary existence, human adaptation, and the profound interrelations among individuals, urban settings, and the environment with reference to Kadiatu Kanneh's framework *African Identities: Race, Nation and Culture in Ethnography, Pan-Africanism and Black Literatures (1998).* In addition to intriguing concepts of African identities, this book devotes special attention to the interconnections between urbanization and climate change.

Keywords: Climatic Change, Ecology, Environment, Identity, Crisis, Modernity, Urbanization, Culture, Ecocritical.

INTRODUCTION

African identities are analysed to reveal how history of domination, imagination, and perceptions of Africa have influenced many political and intellectual frameworks of race. The argument highlights the creation of meaning across, across, and in relation to various interrelated disciplines, geographies, and temporal settings. The inherent transformation in environmental and cultural aspects refers to the delineation of specific human groups in Africa at certain locations on their journey towards modernity. The struggle between cultures and the concept of divergent evolution, with contemporary identity shaped by modernity, environmental changes, and resistance within and among human communities are analysed. Colonialist anthropologies have observed and delineated difference through terminology such as contemporary and traditional, which have evolved into metaphors representing contested spaces inside and among civilizations, nations, or cultures. Africa is examined in this research through several conflicting perspectives, which can be categorised into modernity, environmental change, and cultural calamity. Africa is characterised as a contemporary urban centre, reflecting societal transformations through urbanisation and environmental alterations, including environmental degradation. Cultural conflicts have manifested throughout their culture, resulting in an identity crisis. Necessary modifications pertaining to the categories identified in Africa reinforce their identity and illustrate their struggle for it. This research study investigates the perception of African cultures as national cultures and the influence of modernity rhetoric on the formation of African identities. The complex interplay between colonial oppression and indigenous identity, the impact of Black diasporic thought on African knowledge systems and racial theories, and the disparities between urban and rural regions foster a continual ideological division between modernity and tradition. These components enable readings of African diasporic and Black identities as historically intricate and politically influenced creations, dependent on certain interpretations of time, memory, and race.

Wole Soyinka: Redefining African Modernity through Literature

Wole Soyinka's play, *The lion and the Jewel*, deals with a theme almost as old as organized human society. The setting of the play is contemporaneous Africa. The action may be supposed to take place in 20th c Nigeria, a little while before it wins its freedom. In the circumstances, Soyinka represents a Nigeria which in its numerous villages follows the traditional pattern of life, while in a few cities there is some Westernization. It should also be added that though a white government rules at Lagos, most of the villages remain almost untouched by European culture, as they are not easily accessible even from towns nearby. Villages remain surrounded by jungles, and only a few of them have railways or good motor roads passing near them as a result of modernization. For instance, Ilujinle is a backward, inaccessible village. It is near a river and surrounded on all sides by woods and jungles. Lakunle, the school master, says that there are some small towns less than twelve miles away. Still, it remains immune from urban influence, because it is not easy to be reached. The outlook of the modern West and the mechanical appliances of its civilization are brought to the village by Lakunle, the school master, a white photographer who loses his way and a white surveyor who is bribed by the chief to lay the railway tracks far away. The signs of railway tracks are an advancement of modernization brought to the village. The car of the photographer breaks down in the jungle near Ilujinle. He is obliged therefore to go to the village. The way he captured her screaming as she fell into the river demonstrates how photography has evolved. It is evident that the novel insistently foregrounds influence of European culture. As Kanneh rightly observes in her book *African Identities* that the significance of Africa is perceived as rooted in its natural topography and contemporary developments (3). To the people of Ilujinle, the car is the devil's horse and the camera a one-eyed box. The motor cycle on which he rides to pay his second visit is a devil's horse with two feet. All this shows how strange the machines and gadgets of modern civilization appear to the people of Ilujinle, Lakunle talks to Sidi of other things which are equally strange. He has hopes of bringing to the village machines to pound the yam and grind the pepper. He wants to persuade the people to take their meals from a table with the help of knives and forks. Motor roads will be laid to the village and railways brought nearer. Tea and cocktail parties and ballroom dancing will be introduced. Women will use saucepans instead of clay-pots. Cars and cycles will ply in the village. A newspaper will be started. Beauty contests for girls will be introduced. All of these things are provided in order to introduce the concepts of westernisation to the village's residents. It is clear that

Lakunle mixes up the trivialities and vulgarities of European culture with its better elements. But he seems to draw the line at allowing any immodest exhibition of beauty by women, particularly by Sidi, the girl he is wooing. Baroka, the chief, similarly protests against women becoming immodest under the influence of modern civilisation. The one contribution that Baroka immediately prepared to make to the modern spirit is to introduce postage stamps for Ilujinle is portrayed as the nationalisms of modernity can be found in the extreme perceptions of one's identity and culture (Kanneh137).No doubt, the intention of the chief is revealed to Sidi under circumstances that make it clear that he wishes to tempt her to yield to him in the hope that her picture will appear on the postage stamps and that it will thus get worldwide publicity and it is an impact of westernization. Lakunle proposes a Western monogamous marriage to Sidi since he is in love with her (Gibbs 307). The most drastic impact of Western culture is made on Ilujinle by the white photographer. His one-eyed box takes picture of the village, its people its houses and its chief. They get published in a magazine in Lagos. Copies of the magazine are brought to the village by him. The publication of these pictures must have put Ilujinle on the map in some sense. As a development of modern technology, the orders to lay railway tracks was passed near Ilujinle, fearing the influence of railway, Baroka bribed him to remove the tracks. In the result, the school, the publicity received through the photographs published in the magazine and the stamp printing machine are the visible signs of the impact of modern culture on Ilujinle and those signs "gives way to an undifferentiated modern world" (Kanneh 6).The motor roads, railway lines, parks, newspapers, cycles, and ballroom dancing of his dreams, are for the distant future. Baroka's village may by well regarded as well insulated against modern influences. In making Lakunle the champion of the modern spirit, Soyinka undoubtedly reduces its stature and importance, for the school master is more or less a comic figure. Lakunle, who represents European, particularly British, values of life, is used to represent modernity. His identity is to be "defined solely within the terms of Western modernity" (Kanneh 9). He talks and dreams, but has not the power, nor perhaps even the will to act. It is certain that he is not destined to be creator of a modern Ilujinle. Moreover, he has a tendency to look upon the accidents and defects of Western culture as essential features and merits. To him, high-heeled shoes, the use of the lipstick and learning the waltz are as important as literacy, monogamy, sanitation and constitutional rule. In spite of his having been seeped in Western culture, his tribal instincts have not been eradicated. Soyinka seems to suggest that the West has not made any deep impact on African culture. As Hall says, "Every identity is placed, positioned, in a culture, a language, a history. Every statement comes from somewhere, from somebody in particular" (46). According to George, Soyinka has strong ties to and concerns for his Yoruba culture, which is considered a fundamental aspect of his existence. Therefore, as an artist who employs western forms, he wishes to demonstrate to the world the uniqueness of his native Yoruba culture and his theoretical frameworks, which can serve as a substitute for Euro-American customs (267).

Lauren Beukes's portrayal of modern city and urbanisation

South African novelist Lauren Beukes often discusses challenging subjects related to urbanisation and modernity in her writing, especially in light of modern-day South Africa. Beukes explores the complex ramifications of urbanisation, technological advancements, and societal change in her speculative fiction and narratives. Lauren Beukes explores modernisation in *Moxyland* (2008), focussing on its darker and more dystopian aspects. The novel is set in a near-future Cape Town where economic domination, surveillance, and rapid technological developments penetrate all facets of daily life. Beukes criticises the effects of modernisation on society by depicting urbanisation, corporate domination, and the impacts of technology on people have been suggestively discussed in Kanneh's *African Identities* as it is "superseded by modernity" (5). As a brand ambassador for a company, Taryn, the main character, essentially serves as a living advertisement. Because of her tag, she may be monitored and managed, and she is forced to use social networking sites in an attempt to gain likes and follows. This links her identity to the social media ecosystem that is dominated by corporations."I am a product, I have a brand" says Taryn (Beukes 78). This illustrates how Moxyland's modernity turns people into commodities in a heavily surveillance-driven and commercialised society. In addition to tracking a person's location, the tags inserted into their body also keep an eye on their behaviour and general health. Everyone becomes a commodity that the companies can readily take advantage of as a result of the on-going surveillance. As a result, people live in a culture where privacy is almost non-existent and they are continuously watched.

"I can feel the gaze of the camera, even though it's not there. I can't escape it" (Beukes 80).Taryn illustrates the psychological impact of living in a society where one's every action is recorded, a modernisation trait that undermines individual liberty and self-determination. In *Moxyland*, modernisation is shown as glaringly unfair, with the wealthy and powerful benefiting from technology while the poor are further left behind. The narrative examines how Cape Town's urban landscape has been divided into underdeveloped, high-tech neighbourhoods dominated by corporations and underprivileged neighbourhoods where poverty and crime are pervasive. This illustrates a criticism of modernisation as a drive that exacerbates rather than resolves pre-existing disparities. This difference is emphasised by the contrast between the affluent neighbourhoods, where the elites reside in opulent, high-tech flats with complete access to contemporary technologies, and the dilapidated neighbourhoods where the impoverished and disenfranchised live. It provides a crucial viewpoint on the dominant position that one politically and economically powerful culture currently holds over another culture(Kanneh 15). The impoverished in these regions are frequently left out of the benefits of modernisation and forced to live in poverty and exploitation. There is a strong connection between the novel and the issues that are associated with "ethnography" due to the novel's consistent emphasis on culture and time (Kanneh 7). The technologies the characters employ and facilitate close monitoring of their lives. In short, they are viewed as cogs in a corporate machine that they cannot break out of. The challenges of the characters illustrate how modernisation, which is fuelled by corporate greed and technological growth, deprives people of their humanity. At first, the tools that the protagonists use—like the freedom to communicate or access the digital world—make them feel powerful, especially Taryn and Kendra. But as time passes, individuals come to understand that their freedom is a façade since the systems they believed they could freely navigate to dominate while taking advantage of them. The 2010 science fiction-meets-noir novel*Zoo City*(2010) by Lauren Beukes is set in a modified version of modern-day Johannesburg where criminals have been "animalled" (Beukes 11) due to an unexplained illness, forcing them to live with an animal companion that gives them psychic abilities. The protagonist of the book, Zinzi, is a recovering addict who lives in Johannesburg's Hillbrow neighbourhood with other "zoos" (Beukes 81) and social outcasts of all kinds.

She possesses the psychic capacity to locate misplaced items because she was animalled (to a sloth). As a result, she accepts a job in search of a young pop musician who has gone missing, which brings her many locations in Johannesburg and the surrounding area, including the city's criminal underworld. A cityscape that has been sculpted and conditioned by the legacies of colonialism and apartheid may be found at Zoo City, which is located in Johannesburg. Zinzi, whose clients reside in gated communities in Johannesburg, makes a comment about the new architectures of segregation. With her idea of city everywhere, Neferti X. M. Tadiar has criticised the philosophy underlying Philippine urban development, arguing that it reflects a global fantasy of limitless mobility that, in practice, only benefits a select group of wealthy city dwellers who desire the flexibility of "uber-urbanization" (141) as well as the security of gated communities. As Tadiar points out, the "vital infrastructure"(199) of migrant service workers—who's restricted and strictly controlled movement allows the former to have endless flexibility—is the foundation for the mobility of this urban vision (29). The latter are found in the exact areas of exclusion that the highway, the train line, and the flying path bypass and which makes up the idealised area of "city everywhere" (141). Therefore, for the great majority of workers, environmental urbanisation is perceived as a kind of confinement rather than a phenomenon of increased mobility. Jessica Dickson has described the "South African urban context" of Beukes' novel as one "of creativity, mobility, and multiplicity, and of global interconnection rather than provincial isolation," citing the characters' "solidarity through exclusion" (39). In fact, Zinzi's ability to map the urban space that surrounds Johannesburg and create links between its dispersed populations and economies—formal and informal, suburbanite and slum dweller—is made possible by her positioning as a marginalised figure claims the narrative in general as "West African triat" (Kanneh 25). One example of an idea that has grown in importance in modern international politics from being modest and marginal in the late 20th century is climate change (28). Manjana Milkoreit identifies images of the future that are commonly held by the general public as socio-climatic imaginaries, encompassing both favourable and unfavourable outcomes, which are learned by climate change science and facilitate discourse. I elaborate on this concept in this essay and its implications for contemporary decision-making (29).Industrial modernity has unavoidably influenced the novel's landscape: the first line declares, "Morning light the sulphur colour of the mine dumps seeps across Johannesburg's skyline and sears through my window" (Beukes 3).

The threat of climate change is present in the background, which is expressed by the idea that global warming may be the reason behind the altered relationships between humans and animals, as well as by the feeling of oppressive heat and vegetative deterioration (Beukes 183). According to Suzanne Ericson, this enables the book to imply that "humans can reconsider who they are and where they fit in the world by acknowledging their shared vulnerability with nonhuman animals" (Ericson 23). These two novels, which are set in Johannesburg and Cape Town, respectively, inhabit distinct metropolitan environments in a way that is both are familiar with these locations. *Moxyland* incorporates factors such as advanced technology and urban growth to suggest that its environment is not present-day Cape Town, whereas *Zoo City* presents its new through magical animal companions that symbolise criminal behaviour or culpability. The novels render their backgrounds unfamiliar by conjuring catastrophic forth coming images of cities that remain identifiable as Johannesburg and Cape Town. She amalgamates genre clichés to construct a unique literary city, so depicting Cape Town and Johannesburg through a lens of future and otherness. Notwithstanding differences in context and artistic approach, the novels are both propelled by subjects of separation, linking South Africa's historical, contemporary, and prospective realities. *Moxyland* and *Zoo City* examine the constraints established by history, technological progress, biopolitical governance, and future apprehensions, alongside the impact of neoliberal economic practices on the commercialization of South African history and the pursuit of the remarkable. The representations of Cape Town and Johannesburg illustrate how South Africa's history perpetuates the oppressive mechanisms via which society imposes cultural norms both currently and in the future. Kanneh asserts that comparatively, anthropology is concerned with the study of 'unknown' societies, whereas sociology is concerned with the study of (modern) Western societies(18). In this way, it is demonstrated that these boundaries are multivalent and interrelated. The article highlights these restrictions through a number of different social control mechanisms. These mechanisms include historical segregation and its consequences on the urban landscape, as well as technological breakthroughs, biopolitical techniques, legislation, and contemporary consumer culture.

NgũgĩWa Thiong'o's vision of Environmental change

The scope of human actions on the environment and their socio-economic repercussions on both human and non-human entities in Ngũgĩwa Thiong'o's *Wizard of the Crow* (2006).The collusion of internal collaborators with foreign entities results in significant land violations in Kenya. Conflict for ecological restoration and social harmony is created when wealthy residents and settlers collude to upset and endanger the natural balance. As demonstrated by the deeds of multiple characters in the narrative, it has been proved that human activity is the primary source of environmental catastrophes in Kenya and in Africa in general. In *Wizard of the Crow*, Thiong'o illustrates the satirical, fictitious state of Aburiria to examine the interplay between the environment, society, and revolution. It promotes an indigenous, African-centered methodology for ecological restoration as a transformative instrument against neo-colonialism. *Wizard of the Crow* can be classified as African eco critical literature because to its advocacy for a collective, revolutionary comprehension of ecology and its implication of a connection between environmental conservation and anti-colonial resistance (Okuyade 17). The terrain is starkly polarised: the populace is divided into affluent and impoverished, shanties and opulent residences, while the fields and fauna are segregated into fertile and verdant, decayed and famished. Humans and the landscape are fragmented rather than existing as a cohesive whole. The growth of social disparities in the environment brings to light the fundamental connection that exists between persons and the physical world; these people and the physical world are inextricably linked and cannot be separated. NgũgĩwaThiong'o, in *Decolonising the Mind*, asserts that the impact of a cultural bomb is to obliterate a people's faith in their titles, vernaculars, atmosphere, tradition of struggle, unity, capabilities, and eventually, in themselves (3). The relationship between environmental and social degradation invokes Césaire's notion of "thingification," which asserts that colonial "relations of domination and submission" convert the ethnic individual into a mere tool of production (316).The environmental degradation has apparent repercussions on the setting, evidenced by the increasing mounds of refuse in Eldares, and a more subtle influence on dignity of the human race. The protagonist of the novel Kamiti resists the garbage men's objectification of his body: "I am human, I am a human being, a soul, and not a piece of garbage, regardless of my impoverished and tattered appearance, and I merit respect" (Thiong'o 40).

The refuse collectors' comparison of Kamiti's body to waste - a tool of production rendered obsolete – illustrates the "thingification"(Cesaire 316) of the humanoid form in neo-colonial Aburiria, while also reflecting the degradation of the environment and surroundings with the dehumanisation of the impoverished. Thiong'o highlights the correlation between the deterioration of the human body and the degradation of the environment through Kamiti's character. Kamiti asserts that corruption resembles the stench of "decomposing refuse, a putrid expulsion, or a foul flatulence" (Thiong'o 122). Degradation of nature is intrinsically human; Aburiria is ultimately contaminated by human waste. The long-lasting impacts of neocolonialism on every aspect of life in Aburiria are also responsible for the extensive environmental deterioration, which cannot be entirely attributed to human activity and "a place of unworthy of human consideration" (Kanneh 26).Ngugi links the physical environment and human depravity to the legacy of neocolonialism. Colonial powers constructed public amenities, including sewage systems, in Aburiria; nevertheless, their lack of maintenance results in environmental pollution. The pervasive colonial decline of Santalucia is seen in the "always clogged sewage pipes and the everlasting stench in the air" (Thiong'o 75). This parallel once more associates the scent of corruption with the colonial past and the persistent devastation of the soil by neo-colonialism. Thiong'o emphasises the significance of ecology in the revolutionary struggle and its relation to African self-determination by contrasting the threatened natural environment with Aburiria's hierarchical, neo-colonial urban landscape (76). Environmental damage is portrayed in *Petals of Blood* (1977) as a result of industrialisation and capitalist exploitation. According to the novel, the construction of factories causes the land to be destroyed, depleting the soil and uprooting communities. The greater effects of environmental degradation are reflected in the characters' struggles with these changes, differences in culture, the intricate layers of traditions, genres, and impacts, and everything in between (Kanneh 43).

The novel *Petals of the Blood* (1977) criticised the commodification of religion and revealed the hypocrisy of modernisation that neglects comprehensive economic, social, political, technological, environmental, and cultural progress for all. It highlights the exploitation of both the peasantry and the entirety of Kenya, including its environment, land, and educational system, under neo-colonial governance. The conventional development ideologies associated growth with westernisation and industrialisation, the novel *Petals of the Blood* revealed the intrinsic exploitation and injustice sustained by these tales. The novel reflects "the issue of 'otherness' 'Africa' and 'the West' ceased to be reified opposites (Kanneh 35). One well-known example is the portrayal of the region surrounding the village of Ilmorog, where extensive agricultural projects and the building of a brewery have a detrimental effect on the ecology. The community suffers socially and economically as the land loses its fertility. Thiong'o criticises how the post-colonial elite and foreign corporations' frequent pursuit of profit causes ecological harm, uproots people from their ancestral lands, and threatens sustainable methods that have been in place for centuries. The wider socio-political exploitation that the Kenyan people experienced following their independence is symbolised by this environmental deterioration. Thiong'o uses this to show how social injustice and environmental degradation are closely related. Postcolonial Kenya clearly underwent ongoing exploitation in several forms, despite attaining formal independence. Through thorough investigation and incisive social commentary, the novel elucidated the roles of indigenous leaders, such as Ezekiel and Kimeria and continued exploitation under new pretences, exacerbating the marginalisation of the already disadvantaged. Thiong'o's tale highlighted the detrimental effects of development initiatives on Kenya's environment, economy, and society, as exemplified by the disillusionment of characters such as Karega and Wanja. To ensure progress, the state must invest significantly in areas of public concern, like primary education, healthcare, rural infrastructure, and women's development, (Krishna 41) rather than perceiving it as a method to exploit funds from the peasantry.

Chinua Achebe's Cultural conflicts and environmental crisis: Igbo identities

Things Fall Apart(1958) illustrates the cultural conflict between the European colonial administration and the native Nigerian Igbo society. In approximately 1890, missionaries arrived, and British trade interests were consolidated in Nigeria. *Things Fall Apart* depicts colonial tyranny that resulted in the fragmentation of the Igbo community. Achebe's story engages readers in comprehending cultural transformation and the pursuit of Igbo identity. Additionally, he emphasises local land governance and the antagonism between white and black populations. A cultural conflict regarding alterations in Igbo culture is evident through colonial dominance. Cultural representation

basically relies on the intersection and conflict of meanings at the boundaries of culture, which recognise and transmit cultural value as the expression of difference and otherness. The question of interpretation is the impetus behind Homi K. Bhabha's analysis into the issue of cultural diversity: In contrast to cultural difference, which refers to the articulation of culture as informed, authoritative, and suited for the construction of cultural identity systems, cultural diversity is an epistemic entity that represents culture as an object of theoretical comprehension (24). The sensual impressions of party-political and ancient ideas are characterised as African traits in contrast to British expatriate perceptions on Africa. The conflict about knowledge and the definition of civilisation predominantly relies on literacy and the cognitive abilities it entails and cultivates. Therefore, the difference between the West and Africa, explored through the individuals in the novel, is significantly disorganised by the colonial histories of interaction and pollution. Western influence has permanently changed and destroyed Africa as a subject of knowledge. In contrast to a wholly different Western society, Johnson is not a true native African; instead, he has acquired certain English education, literacy, and acculturation, which gives him a position that is both conflicted and possibly subversive. According to LeBaron, culture has an impact on conflict, whether explicitly or implicitly. Invariably, a cultural element is present in any dispute that has an effect on us in the areas where it matters the most, where we discover meaning and where we maintain our identities(1). It is Okonkwo's fault that he was unable to recognise the changes taking place among the other Umuofia inhabitants. The extra complexity that arises from this colonial "interference in African systems" (Miller 14) is that anthropology is a fundamental part of that Western involvement. Narratives examine the tension between colonial governance and indigenous social structures, featuring a prominent African perspective, offer very analogous interpretations of the inadequacy of this cultural divide, wherein a straightforward selection between Africa and the West is no longer feasible. Thiong'o firmly connects language with culture, viewing both as vital designs of individuality and values for a nation or its folks, prompting him to declare in his book *Declonising the Mind: The Politics of Language in African Literature* (1986) that: "Language as culture is the collective memory bank of a people's experience in history" (15).

He considers the culture as moving river and states that "It is like studying a river in its very movement that is in its very being as a river" (59). He might welcome communication across civilisations based on significant, unique identities as well as flux and change within them. But this conflict between what is often called traditional and modern is exactly where his struggle places itself. Africa must take its place within the frames of modernity if the technology economy of literate societies is what defines the contemporary period. The prevailing environmental issues, such as the environmental governance of specific groups, disparities in natural resource use, and the accessibility of certain groups to a healthy environment, are thoroughly examined and discussed in Chinua Achebe's *Things Fall Apart*. The ramifications of this inequality and exploitation are evident in Nigerian black and South African coloured communities, where environmental injustice poses a significant challenge. In his book *The Writing of History,* Michel de Certeauaf firms this conditional inequality, highlighting the historical imperative to maintain the otherness of cultures in contrast to the logical, immutable self. According to him, the distinction between this place and that one is reinterpreted as a chasm between culture and nature. In the end, nature stands for the other, whereas humans never change (22). In the examination of environmental racism and ecological crisis, it is crucial to comprehend the ecological crisis, including deforestation, industrialisation, resource depletion, and the extinction of species in Nigeria and South Africa. Achebe's protagonist Okonkwo, an Igbo individual, is a victim of environmental injustice. Racial inequality and environmental exploitation adversely affect marginalised populations, such as Black and 'coloured' individuals. Eco critical issues pertain to Achebe's concerns within the Nigerian context. Karmakarasserts individuals of colour and marginalised communities in Africa endure severe environmental injustice, exacerbated by decades of resource exploitation, persistent human rights defilements, land captures, vagrancy, and the neglect of neo-colonialist apartheid governments in addressing these problems (3). Studying *Things Fall Apart* from an ecological perspective is crucial for comprehending cultural domination and colonial environmental exploitation. The colonial objective was to establish churches and factories, but deforestation resulted in environmental racism, victimising the Igbos' who subsequently lost their land rights and cultural values. As observed by Kanneh, in her work *African Identities*, addresses the politics of confrontation, the emergencies of symbol, and the multifaceted layers of reference and implication that shape and define Africa (43).

Achebe's portrayal of environmental catastrophe is illustrated by excessive rainfall. Danlami associates colonisation with environmental degradation. In his analysis of *Things Fall Apart,* Danlami notes that a colonial setting endures the repercussions of colonialism. Neo-colonial powers have exploited natural resources and exterminated pythons. Even if a clansman or local inadvertently kills a python, a burial rite is conducted. They advocate for the preservation of nature and wildlife; hence, they refrain from killing the python. During the construction of churches, the sighting of a python by white individuals resulted in its extermination, hence contributing to deforestation and environmental imbalance, which led to the ecological crisis. Achebe's *Things Fall Apart* depicts the disintegration of the indigenous and authentic culture of the Igbo people in Umuofia and its surrounding communities in Nigeria. Prior to and following the introduction of white missionaries in the area, the conditions of cultural integrity progressively deteriorated, including the cultural, religious, and historical cohesion of the village and community. The narrative also encompasses Okonkwo's grasp, which is relinquished, culminating in the character's sad downfall. This cultural, religious, and historical assault constitutes a colonial attack on the indigenous Igbo population. The narrative not only explores the cultural and historical decline of these people but also illustrates their environmental and ecological degradation. Land and animals constitute the environment, in which humans play a pivotal role in either their preservation or destruction. Achebe articulates in the novel: "A man's place was not invariably there, awaiting him" (Achebe 161). Immediately upon his departure, another individual ascended and occupied the position. The clan resembled a lizard; upon losing its tail, it rapidly regenerated another. Colonisers inherently assault the economy, culture, religion, history, and governmental structure of the indigenous territory. The Igbo society was a cohesive entity prior to the introduction of European colonisers. At the outset of the novel, Okonkwo wielded dominant authority in cultural and governance matters; nevertheless, this cohesion and integrity disintegrate by the conclusion of the narrative. This illustrates the terrible downfall of a heroic figure such as Okonkwo. The white men arrived and devastated both the human and non-human realms within the Igbo community, as the story explicitly illustrates.

During the process of devastation, the white men implemented a divide and rule strategy against the Indians. Achebe asserts, "We do not pray for increased wealth but for greater kinship. We surpass animals because to our kinship. An animal alleviates its sore side by rubbing against a tree, while a man requests his relative to scratch him"(Achebe 156). In the narrative, the actions of the white people progressively undermined the natural and cultural integrity and intimacy of the indigenous population. They asserted that their purported native deity Ani holds no significance, whereas Jesus is the sole ultimate deity in the world. The colonisers severed the connection to Mother Earth and instilled the concept of Christ as God in the minds of the people. The natural and environmental elements of traditional Igbo culture have been obliterated with the introduction of Europeans in the region. The Whites' colony was unruly. Consequently, the centre could not maintain cohesion, leading to disintegration in Nigeria, as anticipated in Achebe's novel. The issue of locomotion and the paradox between automobility and its infrastructural constraints are the initial subjects addressed in Chinua Achebe's *No Longer at Ease* (1960). Automobility denotes the illusory perception of self-sufficiency inherent in urbanization-induced colonial modernity. The aspiration for automobility in post-war urban Nigerian literature confronts the inadequacy of its infrastructure: the highways, constructed during colonial control, were not intended to facilitate Nigerian vehicular movement. Nonetheless, as Brian Larkin contends, they were employed to rationalise colonial governance and were cognitively co-opted as evidence of the development promised by colonialism (43). The initiation of infrastructural advancements in and around Lagos sprang from the colonial purpose of civilising and modernising the indigenous population. In Achebe's novel *No Longer at Ease,* the appeal of urban existence in a modern city transmutes into disappointment over representations of electric lights and automobiles, symbolising colonial structures. Upon recurring to Lagos following his studies in London, Obi and his companion Joseph visit a restaurant where Obi notes the lighting fixtures: "Soft light emanated from large globes, around which insects swirled energetically" (Achebe 38). They may not have observed that each globe contained numerous entities that, akin to themselves, had formerly engaged in dancing. "Or if they observed, they were indifferent" (Achebe 38). Obi's methodology epitomises the standard of contemporary urban automobility. The narrative direction of the work reflects aspeculation in colonial assurances of advancement and modernity, and a need to partake in the prosperity purportedly exemplified by the availability of power, running water, roads, trains, and bridges.

The belief is that a quality English-speaking education will result in a government position, affluence, a foreign automobile and overall success. A third-class clerk with a salary of 150 per year was changed into a high-ranking government official with a salary of 570 per year, a car, and well-furnished quarters at a relatively low rental cost. While the characters in *No Longer at Ease* regard Obi's car as an emblem of a prosperous life, this very vehicle, which suggests immediate joy, ultimately triggers a series of profoundly unfortunate occurrences. The vehicle, seemingly a symbol of economic success, rapidly loses its significance when the money it suggests fails to materialise. The urban disillusionment in *No Longer at Ease* might remain interpreted by way of a reaction towards a historical context where British colonial governance shaped Nigeria according to its ideals, facilitated by both tangible infrastructures and emotional aspirations of an ideal existence of indirect governance. The novel posits that it is stupid to trust in the simplicity and ease with which Obi "walked into the shop and got a brand-new car" (Achebe 76), considering the colonial conditions that engendered this illusion. Thus, African identities develop politically contested within the nation and discourse is constructed in Kanneh's *African Identities* as: The complex relationship between colonial subjugation and indigenous self-perception, the influence of diasporic ideation on African epistemology and racial theories, and the pronounced disparities that often separate urban centres from rural regions, contribute to a persistent and critical ideological dichotomy between 'modernity' and 'tradition', facilitating interpretations of Africa (48).

CONCLUSION

In conclusion, the complex connections between historical, cultural, and environmental factors influencing modern African experiences are revealed when African identities are examined through the prisms of urbanisation and climate change. African identities are still being challenged and redefined in local and global contexts by the colonial legacy, environmental degradation, and the drive for modernity. This study underlines the prerequisite for a wide-ranging understanding of how African identities are recognised, confronted, and re-created by discovering the interconnections of race, national identity, popular culture, and ecological transformation. The complexities and challenges of that identification have been addressed, elucidated, and surpassed. As Steedman writes, Individual views of historical periods, the narratives people tell themselves to explain how they arrived at their current location frequently conflict deeply and ambiguously with a culture's official interpretive framework (51). The insistence on awareness of recent histories of cultural change and influence of modernisation challenging the limits of African identities because these limits are not always dictated internally, and often "*prescribe* as much as they *describe*" (Kanneh 180).

ABSTRACT

In recent years, influencer marketing has grown in importance as a digital advertising tactic, especially in the lifestyle and fashion industries. The present study provides an analytical exploration of how influencer marketing impacts the shopping habits of Karnataka's millennials. It specifically examines impact of factors such as content credibility, influencer appeal, brand trust, and perceived authenticity on consumer attitudes and buying intentions. The research adopts a quantitative analytical framework, incorporating both primary survey data and secondary insights from digital marketing sources. Primary data were obtained from 200 Gen Z participants aged 18–26 who actively follow at least one social media influencer in the fashion or lifestyle domain. Statistical techniques, including correlation and analysis using multiple regression, were used to evaluate the strength and direction of associations among the identified variables. The results indicate that perceived authenticity and influencer credibility serve as the most significant predictors of purchase intention, whereas overemphasis on sponsored content and perceived manipulation reduce consumer trust. Transparency is crucial for influencer marketing to be effective with Gen Z, according to the report., consistency, and communication that reflects genuine value, thereby fostering long-term brand engagement

Keywords: Influencer marketing, Gen Z, Purchase behavior, Brand trust, Fashion and lifestyle, Digital marketing

INTRODUCTION

The advent of online media has revolutionized the marketing environment, fostering interactive, customized, and peer-driven consumer engagement. Within this evolving context, influencer marketing has become a powerful strategy wherein social media figures—often referred to as micro-celebrities—create branded content that appeals to specific target audiences. In the realms of fashion and lifestyle, these influencers have gained substantial importance by shaping consumer preferences, setting trends, and influencing purchasing behaviors, particularly among Generation Z, the group born between 1997 and 2012. Gen Z consumers are highly digital-native, socially conscious, and value authenticity over traditional advertising. According to KPMG (2023) and Deloitte (2024), over 70 % of Indian Gen Z users rely on Instagram, YouTube, and short-form video platforms for product information before making purchase decisions. They are more likely to engage with brands that share their personal values and maintain genuine relationships with online creators. Consequently, the effectiveness of influencer marketing lies not merely in visibility but in the authentic connection that influencers build with their followers. Previous studies have identified multiple factors affecting influencer-marketing outcomes. Djafarova and Rushworth (2017) found that source credibility comprising attractiveness, expertise, and trustworthiness significantly impacts followers' buying behavior. Lou and Yuan (2019) confirmed that authenticity and relatability outweigh celebrity status in driving engagement. Similarly, Ki, Cuevas, and Lim (2021) observed that perceived fit between influencer and brand enhances message acceptance and brand attitude. However, most of these studies were conducted in Western contexts; little is known about Indian Gen Z consumers, whose cultural values, income levels, and digital-media habits differ substantially. The Indian fashion and lifestyle market has witnessed exponential growth in influencer-driven campaigns. Media sharing websites like Moj, Instagram, and YouTube Shorts have become primary advertising avenues for both global and domestic brands. Yet, despite the rapid expansion of influencer collaborations, empirical evidence on their actual effectiveness in influencing purchase behavior among Gen Z remains limited. As marketing budgets increasingly shift toward digital creators, understanding what truly drives conversion from awareness to purchaseis critical for sustainable brand strategy. This study focuses on Gen Z consumers in Karnataka, a region representing a vibrant mix of urban youth culture and technology adoption. The research seeks to assess how influencer attributes credibility, authenticity, attractiveness, and content engagement shape consumers' trust, attitudes, and purchase intentions toward fashion and lifestyle brands. Using a quantitative analytical approach, the study evaluates these determinants through statistical modeling and aims to bridge the gap between influencer content strategy and measurable consumer behavior.

The paper contributes in three ways.

1. It provides empirical evidence from an Indian regional context, addressing a clear gap in influencer-marketing literature.
2. It integrates constructs from the Source Credibility Model and the Theory of Planned Behavior to explain how trust mediates between influencer attributes and buying intention.
3. It offers actionable insights for marketers seeking to design authentic, data-driven influencer collaborations that resonate with Gen Z audiences.

REVIEW OF LITERATURE

The rapid digitalization of marketing communication has transformed how brands connect with consumers, especially among younger audiences who seek authenticity and peer validation. Influencer marketing where online creators use their platforms to endorse products has gained unprecedented traction as a strategic tool for brands targeting Generation Z (Gen Z). Globally, Djafarova and Rushworth (2017) established that perceived attractiveness and expertise of influencers significantly affect followers' purchase intentions, emphasizing that authenticity often outweighs celebrity endorsement. De Veirman, Cauberghe, and Hudders (2017) found that the number of followers and the perceived similarity between influencer and audience jointly enhance message credibility and brand attitude. Lou and Yuan (2019) demonstrated that perceived authenticity mediates the relationship between influencer credibility and consumer trust, confirming that transparent and relatable content drives engagement.

Ki, Cuevas, and Lim (2021)analyzed fashion-influencer posts and revealed that emotional appeal and visual aesthetics increase consumers' attitude toward the brand. Casaló, Flavián, and Ibáñez-Sánchez (2018) highlighted that parasocial interactionthe sense of personal connection between influencer and follower strengthens purchase intent. Likewise, Jin, Muqaddam, and Ryu (2019) proposed that influencer–brand congruence enhances persuasion, particularly when brand values align with influencers' personalities. Belanche *et al.* (2021) examined advertising disclosures and discovered that excessive sponsorship labels can reduce perceived authenticity and trust. Schouten, Janssen, and Verspaget (2020)Research shows that micro-influencers often have more engaged followers. levels compared to macro-influencers, primarily due to their relatable personas and the close-knit connections they maintain with their audiences.. Sokolova and Kefi (2020) observed that the credibility of Instagram influencers significantly affects purchase intention through the mediating role of identification and trust. From a theoretical perspective, Freberg, Graham, and McGaughey (2021) linked influencer credibility to the Attractiveness, knowledge, and reliability are the pillars of the Source Credibility Model. collectively shape consumer responses. Uzunoğlu and Kip (2022) expanded this to include social proof and engagement metrics as new dimensions of online influence. In the Indian context, Gupta and Sinha (2019) studied Instagram marketing and found that content relatability and perceived honesty are stronger predictors of purchase intention than visual glamour. Bhatia (2020) reported that Indian Gen Z consumers rely on influencer reviews more than brand advertisements when making fashion-related decisions. Kaur and Sandhu (2021) observed that influencer authenticity and interaction frequency positively affect trust and brand attitude in lifestyle brands. Madhav and Roy (2022) revealed that influencer credibility significantly influences purchase intention through brand engagement, particularly among college-going youth. Deloitte (2023) estimated that India's influencer-marketing industry surpassed ₹1,500 crore, with Gen Z accounting for over 60 % of engagement. KPMG (2023) noted that short-video platforms like Instagram Reels and YouTube Shorts have become central to fashion-brand promotion, but skepticism arises when content appears overly commercialized. Sharma and Verma (2024) found that influencer authenticity moderates the relationship between sponsorship disclosure and purchase behavior, while Patil (2024) highlighted that emotional trust and peer validation significantly predict purchase intention among urban Gen Z consumers.

Synthesizing the above, three patterns emerge:

1. Authenticity and trust consistently determine influencer-marketing effectiveness.
2. Credibility, attractiveness, and content quality shape follower engagement and purchase intention.
3. In the Indian setting, cultural alignment and perceived transparency are decisive for converting engagement into buying behavior.

Despite extensive international evidence, limited empirical analysis focuses exclusively on Gen Z consumers in Karnatakaa tech-savvy region where digital fashion culture intersects with local values. This gap motivates the present analytical study, which evaluates how influencer attributes influence purchase intention through the mediating role of trust.

Objectives of the Study

1. To analyze how influencer credibility—comprising dimensions such as expertise, trustworthiness, and attractiveness—affects the purchase intentions of Generation Z consumers toward fashion and lifestyle brands.
2. To evaluate the effect of influencer authenticity on consumer trust and engagement with branded content.
3. To analyze how brand–influencer congruence (fit between influencer personality and brand identity) affects attitude toward the brand.
4. The goal is to determine how Gen Z buyers' perceptions of content quality and frequency affect their actual spending habits.
5. To identify the key determinants of effective influencer marketing and provide strategic recommendations for brands targeting Gen Z audiences.

Hypotheses of the Study

H_1 (Influencer Credibility → Purchase Intention)

- **H_{01}:**When it comes to fashion and lifestyle brands, there is no correlation between the trustworthiness of influencers and the buy intents of Gen Z customers..
- **H_{11}:** Influencer credibility has a significant relationship with Gen Z consumers' purchase intentions toward fashion and lifestyle brands.

H_2 (Authenticity → Trust and Engagement)

- **H_{02}:** Influencer authenticity does not significantly influence consumer trust and engagement with sponsored content.
- **H_{12}:** Influencer authenticity significantly influences consumer trust and engagement with sponsored content.

H_3 (Brand–Influencer Congruence → Brand Attitude)

- **H_{03}:** Brand–influencer congruence has no significant effect on consumers' attitude toward the brand.
- **H_{13}:** Brand–influencer congruence has a significant effect on consumers' attitude toward the brand.

H_4 (Content Quality and Frequency → Purchase Behavior)

- **H_{04}:** Perceived content quality and frequency of posts do not significantly influence Gen Z consumers' purchase behavior.
- **H_{14}:** Perceived content quality and frequency of posts significantly influence Gen Z consumers' purchase behavior.

H_5 (Trust → Purchase Behavior)

- **H_{05}:** Consumer trust does not significantly affect purchase behavior in influencer marketing campaigns.
- **H_{15}:** Consumer trust significantly affects purchase behavior in influencer marketing campaigns.

RESEARCH METHODOLOGY

Research Design

To determine what factors most affect the impact of influencer marketing on the buying habits of millennials and Gen Zers, this study used a quantitative analytical research strategy. This design takes a look at the direct correlations between influencer attributes like authenticity, credibility, and content quality and consumer reactions like attitude, trust, and intent to buy. We used the Statistical Package for the Social Sciences (SPSS, version 26) to perform statistical analyses on the collected data, including descriptive statistics, correlation, and multiple regression.

Nature and Sources of Data

The research uses both primary and secondary data to ensure validity and contextual accuracy.

- **Primary Data:**

Data were collected through a structured questionnaire distributed to Gen Z consumers (ages 18–26) residing in Bengaluru Urban, Mysuru, and Mangaluru. The survey included Likert-scale questions assessing influencer credibility, authenticity, content quality, brand attitude, trust, and purchase intention.

- **Secondary Data:**

Secondary information was compiled from industry reports (KPMG 2023; Deloitte 2024), social-media analytics (Instagram Insights, YouTube Trends), and peer-reviewed literature related to influencer marketing, digital engagement, and Gen Z behavior. These data sources supported the interpretation of empirical findings and benchmarking with global trends.

Sampling Design

A non-probability purposive-sampling technique was adopted, targeting respondents who actively follow fashion or lifestyle influencers on social-media platforms such as Instagram, YouTube, or Moj. Out of 220 distributed questionnaires, 200 valid responses were retained for analysis after data cleaning. The sample ensured gender and educational diversity reflective of Karnataka's Gen Z digital population.

Research Instrument

The instrument was a standardized, pre-tested questionnaire consisting of six sections:

1. **Demographic profile** – gender, age, education, monthly spending.
2. **Influencer credibility** – expertise, trustworthiness, and attractiveness.
3. **Authenticity** – perceived honesty and relatability of influencers.
4. **Brand–influencer congruence** – perceived fit between influencer personality and brand image.
5. **Content quality and engagement** – creativity, frequency, and informational value.
6. **Trust and purchase behavior** – intention to buy and post-purchase loyalty.

The researchers used a five-point Likert scale to evaluate each construct, with 1 indicating a strong disagreement and 5 a strong agreement. Twenty-one people participated in the pre-test, which helped with uniformity and clarity.

Data Analysis Tools

The collected data were coded and analyzed using the following statistical techniques:

- **Descriptive Statistics** – means, frequencies, and standard deviations to describe sample characteristics.
- **Correlation Analysis** – to examine associations among influencer attributes and purchase behavior.
- **Multiple Regression Analysis** – to identify significant predictors of purchase behavior.
- **Reliability Testing (Cronbach's Alpha)** – to ensure internal consistency of scales (threshold ≥ 0.70).
- **Graphical Representation** – charts and scatter plots to visualize relationships between constructs.

Scope of the Study

The study focuses on Gen Z consumers in Karnataka who are exposed to influencer marketing in the fashion and lifestyle sectors. It offers region-specific insights relevant to digital-marketing managers, fashion brands, and content strategists aiming to connect authentically with youth audiences.

Limitations of the Study

1. The sample size of 200 respondents limits the generalizability of findings to all Indian Gen Z consumers.
2. Data are **self-reported**, which may involve perception or recall bias.
3. The study emphasizes the **fashion and lifestyle** domain; results may differ for technology or food sectors.
4. Influencer trends evolve rapidly, so periodic reassessment is necessary for sustained validity.

Data Analysis and Interpretation

The data collected from 200 valid responses were analyzed using SPSS v26 to test the hypothesized relationships among influencer-marketing variables and Gen Z purchase behavior. The analysis includes reliability assessment, descriptive profiling, correlation, and multiple regression results.

Interpretation

All constructs achieved Cronbach's α values above 0.80, confirming strong internal consistency (Nunnally & Bernstein, 1994). Thus, the scale items are reliable for further analysis. Interpretation: The respondents represent digitally active Gen Z users who spend significant time on social media, primarily on Instagram and YouTubeideal environments for influencer-driven marketing. Interpretation: The correlation results indicate strong positive relationships among variables. Influencer credibility, authenticity, and trust show the highest association with purchase behavior, underscoring their role in influencing Gen Z buying patterns Interpretation: The regression model explains 59.5 % of the variance in Gen Z purchase behavior, indicating a strong model fit. All predictor variables are significant ($p < 0.01$). Among them, authenticity ($\beta = 0.354$) and trust ($\beta = 0.382$) emerged as the strongest predictors, followed by influencer credibility ($\beta = 0.312$). Interpretation: All hypotheses are supported. The results confirm that influencer authenticity and trust play the most critical roles in shaping Gen Z's purchase intentions, while consistent content quality and congruence enhance brand perception and consumer loyalty.

Findings and Discussion

The statistical analysis provides substantial evidence on how influencer attributes and audience perceptions shape Gen Z consumers' purchasing behavior in Karnataka's fashion and lifestyle sector. The results validate all proposed hypotheses and reinforce both the Source Credibility Model (SCM) and the Theory of Planned Behavior (TPB**)** as explanatory frameworks for influencer-marketing effectiveness.

Key Findings

1.**Influencer Credibility Positively Affects Purchase Intention**

The regression results ($\beta = 0.312$, $p < 0.001$) indicate that expertise, attractiveness, and trustworthiness of influencers significantly enhance Gen Z consumers' likelihood of purchasing endorsed products. This mirrors the findings of Djafarova&Rushworth (2017) and Kumar & Shetty (2019), emphasizing that credible influencers serve as trusted opinion leaders who substitute for traditional advertising endorsements.

2.**Authenticity Emerges as the Strongest Predictor of Trust**

Authenticity ($\beta = 0.354$) displayed a robust influence on consumer trust and engagement. Respondents expressed preference for influencers who reveal their genuine opinions, share personal experiences, and maintain transparency about brand partnerships. This supports Lou & Yuan (2019) and Sharma & Verma (2024), who argued that Gen Z rewards honesty over scripted promotions. Authentic storytelling creates emotional resonance, which directly translates to purchase intention.

3.**Brand–Influencer Congruence Enhances Brand Attitude**

The analysis confirmed that a strong fit between influencer persona and brand image ($\beta = 0.229$) positively affects consumers' brand attitude. When an influencer's lifestyle and values align with the brand's positioning, the perceived message authenticity strengthens. This corroborates Jin *et al.* (2019) and Ki *et al.* (2021), who found that congruence fosters message acceptance and long-term brand recall.

4.**Content Quality and Frequency Stimulate Engagement and Purchase Behavior**

Consistent, creative, and informative content ($\beta = 0.203$) significantly drives consumer attention and brand recall. Respondents favored influencers posting regularly with aesthetically engaging visuals and meaningful captions. This reflects Casaló *et al*. (2018) and Belanche *et al.* (2021), who stressed that interactive, value-laden content strengthens emotional connection and behavioral intention.

5.**Trust Serves as a Mediating Force in Influencer Effectiveness**

Customer trust ($\beta = 0.382$) showed the highest standardized effect, confirming its mediating role between influencer attributes and purchase behavior. Trust transforms parasocial relationships into actionable purchase intent, validating prior works by Ravichandran (2020) and Patil (2024). Gen Z's buying decisions hinge on emotional assurance, privacy confidence, and perceived alignment with influencers' values.

6.**Model Performance and Predictive Power**

The model explains 59.5 % of the variance ($R^2 = 0.595$) in purchase behavior, confirming that psychological constructstrust, authenticity, and credibilityare decisive predictors. This empirical evidence consolidates the claim that influencer marketing success depends more on relational depth than on reach metrics alone.

DISCUSSION

The results affirm that Gen Z consumers are motivated by authenticity, transparency, and relatability, not by traditional celebrity glamour. The Source Credibility Model remains relevant but requires contextual adaptation to digital environments, where micro-influencers and peer creators carry more persuasive power than macro-endorsers. The findings also extend the Theory of Planned Behavior by demonstrating that trust mediates perceived behavioral control: consumers act when they believe the influencer's message is credible and the product aligns with their identity. This "trust bridge" converts cognitive evaluation into affective commitment. Authenticity's dominance in the model reflects a generational shift toward value-based consumption. Gen Z consumers consciously avoid overly commercialized content, preferring relatable influencers who discuss sustainability, body positivity, or ethical fashion. Consequently, influencer-marketing campaigns must focus on *humanizing* the brand voice rather than

pushing repetitive product promotions. Moreover, content-quality findings suggest that social-media algorithms reward consistency and engagement depth, aligning with Schouten et al. (2020) who observed higher conversion among micro-influencers maintaining tight community relationships. Frequent, creative posts sustain attention but must balance frequency with sincerity to avoid perceived opportunism. In sum, the study highlights that the effectiveness of influencer marketing among Gen Z is determined by psychological authenticity, credible expertise, and emotional resonance, not by paid reach or follower count. For practitioners, this means prioritizing long-term partnerships with authentic creators who reflect brand ethos and engage in genuine storytelling.

CONCLUSION

This analytical study assessed the effectiveness of influencer marketing in shaping Gen Z consumers' purchase behavior toward fashion and lifestyle brands in Karnataka. Drawing upon both primary and secondary data, the study examined the influence of five major constructs influencer credibility, authenticity, brand–influencer congruence, content quality, and trust on consumers' purchase intentions. According to the data, the two most important factors that influence a consumer's decision to buy are credibility and genuineness. People of Generation Z look up to influencers who are honest, approachable, and open about the products they promote. The credibility of influencers, which includes their beauty, trustworthiness, and knowledge, also played a key role in influencing purchasing decisions. The favorable effect of brand-influencer congruence on brand attitude provides more evidence that influencer campaigns work best when the influencer's public persona is well-aligned with the brand's. The findings confirm that trust mediates the relationship between influencer attributes and purchase behavior, highlighting the psychological and emotional basis of Gen Z's consumption patterns. The model's explanatory power ($R^2 = 0.595$) demonstrates that influencer characteristics and relational factors explain nearly 60 % of Gen Z's purchase decisions in digital environments. Overall, the study reinforces the Source Credibility Model and extends the Theory of Planned Behavior by establishing the mediating role of trust and authenticity in influencer marketing. The results underscore a generational shift: Gen Z prefers authentic micro-influencers over celebrity endorsements, seeking emotional resonance and shared values rather than overt commercial messaging.

RECOMMENDATIONS

Prioritize Authenticity Over Promotion

Brands should partner with influencers who maintain transparency, share personal experiences, and demonstrate consistent ethical behavior. Overly scripted or exaggerated endorsements should be avoided to preserve authenticity.

Strengthen Influencer–Brand Congruence

Marketers must ensure that influencer selection aligns with the brand's personality, aesthetics, and values. Long-term collaborations with compatible influencers foster trust and continuity.

Invest in Micro-Influencer Campaigns

Micro-influencers often have stronger engagement and perceived relatability than macro-influencers. Fashion and lifestyle brands should leverage their niche communities for authentic audience connection.

Focus on Content Quality and Consistency

Influencers should produce visually appealing, educational, and interactive content rather than repetitive promotional material. Regular posting schedules increase brand recall, but content must remain meaningful and audience-centric.

Enhance Transparency in Sponsorship Disclosure

Clear, honest disclosure of brand partnerships enhances perceived integrity and mitigates skepticism. Regulations and platform policies should support open communication regarding paid collaborations.

Integrate Data Analytics in Campaign Design

Brands should monitor engagement metrics (likes, comments, shares, sentiment analysis) to measure campaign impact and refine influencer-selection strategies based on real-time performance.

Encourage Co-Creation and Storytelling

Allowing influencers to personalize the brand message enhances narrative authenticity. Co-created campaigns where influencers share their genuine experiences lead to deeper audience trust.

Managerial Implications

The findings provide valuable insights for marketers seeking to target Gen Z consumers effectively:

- Trust is currency it must be earned through ethical and relatable storytelling.
- Emotional authenticity drives conversion more than exposure or reach.
- Community engagement outperforms one-time promotions, signaling the need for relationship-based influencer strategies.

Future Research Scope

1. Comparative studies could explore influencer-marketing effectiveness across different generations (Millennials vs. Gen Z) or industries (fashion, tech, FMCG).
2. Future research may employ Structural Equation Modeling (SEM) to test the mediating and moderating effects of trust, authenticity, and perceived fit.
3. Qualitative studies (e.g., focus groups or interviews) can provide deeper insight into the emotional and cultural aspects of influencer–follower relationships.
4. Expanding the study across multiple Indian states would improve generalizability and reveal regional variations in influencer influence patterns.

Final Remark

Influencer marketing represents more than a promotional strategyit is a trust-based ecosystem shaped by digital relationships and authenticity. For fashion and lifestyle brands, success in Gen Z markets depends on nurturing credibility, ethical transparency, and emotional relevance. By aligning technology-driven marketing with genuine human connection, brands can transform influencer campaigns into long-term trust-building instruments.

ABSTRACT

Personal finance is a major component of one's day to day life. Management of funds on a regular basis gives a favorable financial position. For a nation like India, promotion of mobilization of savings and investment allocation is an inevitable part for the speedier development of the nation. From the perspective of individuals and monetary advancement, the need for domestic provisions is increasing India is one of the most developing nations of the world. The unhealthy consumption and buying behavior of individuals affect their personal finances and there by the economy as a whole The study is descriptive in nature. The main focus is to examine the financial self-efficacy among the employees in co-operative societies in Kottayam district using PERMA factors The data was collected keeping in mind the objectives of the study. Basic frequency analysis and percentage analysis are used to analyze the demographic profile of the respondents. Both the primary and secondary data is used for the study. Primary data have been collected from 200 samples respondents arrived through multistage random sampling technique The purpose of this dissertation was to examine the financial self-efficacy among the employees in Co-operative societies in Kottayam district. The study found that their PERMA behaviors are good but a considerable number of respondents did not have any financial plan, tax management practices and not taking financial decisions by logical thinking. Majority's financial self-efficacy is good.

Keywords: The main focus is to examine the financial self-efficacy among the employees in co-operative societies in Kottayam district.

INTRODUCTION

Personal finance is a major component of one's day to day life. Management of funds on a regular basis gives a favorable financial position. Higher the betterment in funds results to betterment in meeting the current and future financial needs. Personal fund management comprises of budgeting, saving, making investments, tracking the expenses over time etc. … The financial system of a country is driven by savings and its conversion into investment. Investment for a short run gives a benefit for a long term effect. One of the major elements that influence management of funds lies with one's confidence in managing things. That term is simply named as financial self-efficacy. It means a person's belief in his capability to carry out his financial obligations. Several research studies revealed that financial self-efficacy has a positive effect on financial satisfaction, financial future planning, savings and on retirement income. For the early 20TH century, the Co-operative societies lay down its functioning. In the initial stage, it functions as a loan and deposit department. By 1950s own wards, it extends its operations in both rural and urban areas. It acts as a major financial intermediary to various sectors of economy and a contributor towards the development of the nation. Co-operative banking sector plays a key role in providing funds to agricultural and allied activities, sole proprietors, small scale industries, personal finances etc.…These societies emerged as a result of financial crisis in rural areas, hence it is ad vented with a motto of promoting savings and investments among rural people. These societies are controlled and managed by members who are the customers of the societies. The profit generated is allocated to a reserve and a part of this is distributed among the members as per the legal provisions. In India, these societies are registered under State Co-operative Societies Act, 1912 and under the regulation of RBI and NABARD under Banking Regulation Act 1949 and Banking Laws Act, 1965. The motto behind the setting up of Co-operative societies includes offering financial assistance to people having low means of survival, try to avoid the presence of money lenders who offers funds at higher rates, promotion of thrift, offer financial support to SSI, cattle farming, provide better services to members. They follow the principle of "no profit no loss". In India, mainly the different types of Co-operative societies are Primary Credit Societies: These were established at village level where the members know each other and can closely examine the operations and functions of members. Hence it is restricted to some particular area. These are not as same as agricultural credit societies. It can be of Urban Co-operative Societies and Salary Earner's Societies. Central Co-operative Societies: It is the intermediary between PCS and SCS which is established at district level. It lends money for a period of 1-3 years to its affiliated PCS. It can be of Co-operative Banking Union and Mixed Control Co-operative Societies

State Co-operative Societies: It is considered to be the apex body among all the Co-operative societies. The money flows to the economy from them through various channels like PCS and CCS. They got loans at an interest rate of 1 to 2 % lower than standard bank rate.

Land Development Banks: The responsibility of control and regulation rest with NABARD. They provide loans mainly to farmers. Due to the insufficiency in capital and other resources, such societies suffer the limitation of having professionalized managerial personnel. Over the years, overdue in co-operative societies are increasing day by day at an alarming rate which even affect the lending capacity of societies itself. Nowadays, they face stiff competition due to the arrival of payment banks and small finance banks. These are organized mainly for mutual benefit and for the service to the society, hence the members may not contribute their maximum efforts as there is no connection between effort and reward.

Significance of Study

For a nation like India, promotion of mobilization of savings and investment allocation is an inevitable part for the speedier development of the nation. From the perspective of individuals and monetary advancement, the need for domestic provisions is increasing. There are several organizations like government or private: who tried their best to capture these savings. Likewise, co-operative societies also provide various financial services to both rural and urban people. Co-operative societies closely work for public welfare and for their own member welfare. Even though, bank employees are closely connected with financial matters, it is very much essential to depict whether they have enough

capacity and confidence in managing their personal financial affairs, whether they can manage their finances on time. Hence bank employees are the best choice to measure the financial efficacy level. This topic is quite new in recent times. Looking to the existing literature relating to financial self-efficacy, it is found that there are just couple of studies available and no study has been undertaken to know about the confidence level of employees in co-operative societies, how long their demographic factors affect their financial well-being, whether materialism or impulsive buying affect their personal finance behavior etc. Even though PERMA model is basic to understand the positive emotions, engagement, relationships, meaning and accomplishment, research has not fully explored the attributes of people. So the present study is definitely fill the gap and along with that co-operative societies employees will get to know their deficiencies in their attitudes towards the money and what all strategies they can adopt for their betterment in financial wellbeing. The result of the study will help the co-operative department to formulate policies and can organize several programs for improving their employee's financial management capacities.

Scope of the Study

The study has been conducted among the employees of Co-operative societies in Kottayam district only. The study examines the financial self-efficacy, difference in financial self-efficacy according to the demographic variables if any, and the influence of PERMA factors on the financial self-efficacy of the employees in Co-operative societies

Statement of Problem

India is one of the most developing nations of the world. The unhealthy consumption and buying behavior of individuals affect their personal finances and there by the economy as a whole. It is evident that overseeing the use of money is a major reason towards maladaptive consumption (Godwin and Koonce, 2018). Whenever a person lacks confidence in his ability to manage financial matters, there is more possibility to keep his fund as idle, he will be in an unproductive state where he can't explore the benefits of savings and investments even depend on others to find solutions for complex financial situations. How much financial knowledge a person has with regarding to their fund management is not important, rather how he converts that knowledge into practice is more pertinent. Handling a worse situation in a wise manner is being reflected by financial self-efficacy. Being financially confident help us to shift from less than favorable financial situation to a more comfortable zone. It helps us to achieve our financial goals that matters the most. For every individual, there are certain intensions to take part in savings and in investments. People who intends to improve their standard of living, undoubtedly engaged in these two. Provisions and reserves creates a feeling of security and freedom in doing things (Indhu bala). Researchers found that low financial efficacy is found among financially vulnerable groups, young adults, young women, unemployed, under 35, single. So it becomes necessary to conduct a study, to know the level of awareness on personal finances, what are the factors that influences one's financial well-being, how much confident one is in managing a particular situation and to get an idea regarding their personal financial behavior. Hence the current study on the title "Financial self-efficacy among Co-operative Societies `Employees" has been taken up. Researches should that those having high efficacy tends to hold saving products namely investment in shows, mortgages property, insurance and less likely to hold debt related products namely credit cards, loans, individuals having higher financial efficacy aims at mastering in decision making to gain favorable outcome .For the successful management of one's personal finances,, a person needs to equip sufficient financial information, and cognitive skills to deal with financial sector, able to take decisions without much consideration towards one's emotions, giving assurance to their own decisions[Atkinson & Messy 2011; The social research center]. Such kind of attitude results in bringing out better financial satisfaction and in enhancing financial independence at a future date.

Objectives of the Study

1. To measure the financial self-efficacy among the employees in co-operative societies in Kottayam district using PERMA factors.
2. To identify the differences if any in the financial self- efficacy of the respondents as per their demographic factors.
3. To examine the personal financial behavior of employees in co-operative societies

Hypotheses of the Study

1.PERMA factors significantly influence the financial self-efficacy of the employees in Co-operative societies.
2.The financial self-efficacy of the respondents significantly differs according to their demographic factors.
3.The impulsive consumption behavior and materialistic behavior of the respondents is not moderate.
4.There is no significant association between economic status and financial management practices of respondents

RESEARCH METHODOLOGY

The study is descriptive in nature. The main focus is to examine the financial self-efficacy among the employees in co-operative societies in Kottayam district using PERMA factors

Primary Data

Both the primary and secondary data is used for the study. Primary data have been collected from 200 samples respondents arrived through multistage random sampling technique. Structured questionnaire has been used for primary data collection. The questionnaire consisted of three parts. Part 1 deals with demographic details about the respondents. Part 2 consist of questions relating to the analysis of psycho social characteristics of employees. Part 3 covers questions regarding materialism and impulsive consumption. The five point Likert's scale was used to measure these constructs ranging from strongly disagree to strongly agree.

Secondary Data

Secondary data collected from various published sources to give the established theories and to add evidence to the study. The published sources include research articles, newspaper articles, seminar reports, edited books, journals, data sources from internet etc.

Sampling Design

Sample size is 200 employees of co-operative societies in Kottayam district. Multistage sampling and simple random sampling techniques are used for the study. Following procedure is used for the selection of sample; co-operative societies' employee Kottayadistrict is divided into five Taluks and they are Changanacherry Taluk, Kanjirappalli Taluk, Vaikom Taluk, Kottayam Taluk and Meenachil Taluk. There are 26 villages in Kottayam Taluk and from these 26 villages, 4 villages are chosen by simple random sampling technique. The four villages are Anikkad, Kooroopada, Pambady, Ettumanoor, . From each village, Secretary in the head office is being contacted and 10 respondents are chosen randomly. Likewise data are collected from other three villages and 40 employees in co-operative societies details are collected from Kottayam taluk. There are 12 villages in Kanjirappalli Taluk and from these 12 villages, four villages are chosen by simple random sampling technique. The four villages are Chirakkadav, Elamgulam, Elikkulam, Kanirappalli,. From each village, Secretary in the head office is being contacted and 10 respondents are chosen randomly. Likewise data are collected from other three villages and 40 employees in co-operative societiesdetails are collected from Kanjirappalli taluk. There are 26 villages in Meenachil Taluk and from these 26 villages, four villages are chosen by simple random sampling technique. The four villages are Uzhavoor, Poovarany, Puliyannor, Kidangoor. From each village, Secretary in the head office is being contacted and 10 respondents are chosen randomly. Likewise data are collected from other three villages and 40 employees in co-operative societiesdetails are collected from Meenachil taluk. There are 15 villages in Changanacherry Taluk and from these 15 villages, four villages are chosen by simple random sampling technique. The four villages are Kangazha, Madappalli,Vakathanam, Paippadu. From each village, Secretary in the head office is being contacted and 10 respondents are chosen randomly. Likewise data are collected from other three villages and 40employees in co-operative societies details are collected from Changanacherry taluk. There are 16 villages in Vaikom Taluk and from these 16 villages, four villages are chosen by simple random sampling technique. The four villages are Manjoor, Kothanalloor, Vadayar, Thalayazham. From each village, Secretary in the head office is being contacted and 10 respondents are chosen randomly. Likewise data are collected from other three villages and 40employees in co-operative societies details are collected from Vaikom taluk

Data Processing and Analysis

The data was collected keeping in mind the objectives of the study. Basic frequency analysis and percentage analysis are used to analyze the demographic profile of the respondents. Financial self-efficacy is measured by using financial self-efficacy scale put forward by Lown. Respondents rated their financial self-efficacy on a five point Likert Scale ranging from strongly agree to strongly disagree. A series of positive emotions were obtained from PANAS -X (Positive and Negative Affect Schedule). Series of engagement is taken from PERMA profiler forwarded by Julie Butler and Margaret L. Kern. Relationship in PERMA is measured by analyzing the social support and relationship quality from friends, family members. Meaning is analyzed with the help of measure from Ryff (1989) .Finally, the term accomplishment is measured with the help of Pearlin and Schooler's Mastery Scale (1978). To measure the impact of PERMA factors on financial self-efficacy is carried out through multiple regression analysis. It is a statistical process for estimating the relationship among variables and to measure the influence of independent variable on the dependent variable. One way Analysis of Variance (ANOVA) is used for measuring the impact of demographic factors on financial self-efficacy. For such purpose three demographic variables is used. The variables are age, economic status and marital status. For the purpose of hypothesis testing, chi square test, one sample t test is being applied.

Limitations of the Study

- The study is based on financial matters, hence the respondents are hesitant to reveal their data fully on certain things.
- Only limited number of employees was present at the office during data collection.
- Online survey became ineffective, hence direct questionnaire is being distributed.

Findings of the study

Findings related to socio economic profile

- A good percentage (55 %) of the respondents are under male category and remaining 45 % are of female respondents. Most of the respondents(70% belong) to the age group of 25 – 50 years
- Most of the respondents 65% fall under married category. 38% of the respondents are graduated, 37% of them are post graduated, and only 25% of the respondents having the qualification of professional courses More than half of the respondents (52.5 %)work at clerical level. Almost half of the respondents (50.5%) belong to an income group of 30000- 50000. Another 22% earns up to 3000
- A considerable number (47%) of the respondents have monthly expenditure up to 25000. Majority of the respondents (71%) fall under middle income group and rest of them falls under upper income group. More than half (55.5%) of the respondents have a tendency to spend their income in a moderate manner.
- Majority of the respondents (81.5%) have enough freedom in their financial matters, where as 18.5 % doesn't have financial freedom.
- Majority of the respondents (37%) takes financial decisions after logical thinking.18% of them emotionally takes financial decisions,21.5% have clear cut decisions regarding value to be spent on each month.16.5% consults their spouse before spending and only 7% consults their parents before taking decisions relating to their finances.
- Majority (79%) of the respondents seek advice from their family members when they are in a financial crisis whereas, 21% take their own financial decisions. A good number (67%) of the respondents have proper tax planning and 33% have no proper tax planning.
- Most of the respondents (69%) have proper financial plans where rest of them doesn't have financial plans**.** Majority (75%) of the respondents have prudent financial management practices where as 25% doesn't have such practices

Findings related to PERMA and demographic variables and their impact on financial self-efficacy

- The respondents possess good optimistic behavior, engagement, relationship, meaning, and accomplishment. All these PERMA behaviors are significant at one percent level of significance.
- The respondents have good financial self-efficacy or their financial self-efficacy is high which is significant at one percent level of significance.

- Financial self-efficacy of the respondents is significantly influenced by the PERMA factors. The interpretation is every unit increase in optimistic behavior of the respondent will lead to 0.206 unit increase in the financial self-efficacy of the respondent. Every unit increase in the relationship support of the respondents will lead to 0.233 unit increase in the financial self-efficacy of the respondents. Every unit increase in accomplishment will lead to 0.142 unit increase in the financial self-efficacy of the respondents. Every unit increase in engagement will lead to 0.007 unit increase in financial self- efficacy of the respondents. every unit decrease in meaning will lead to 0.004 unit increase in financial self-efficacy. these three factors do not have much influence. The most dominant factors influencing the financial self-efficacy of the respondents are relationship support and optimistic behavior.

There is no much differences in the financial self-efficacy of the respondents according to their demographic characteristics.

Findings related to personal financial behavior

- The respondents possess poor materialistic behavior or their materialistic behavior is low which is significant at one percent level of significance.
- The respondents having poor impulsive consumption or their impulsive consumption is low which is significant at one percent level of significance.

Suggestions

On the basis of study conducted, the following suggestions are made:

- Majority of the respondents have no financial freedom at home. This mind set up of every family is to be changed. It would be better if the parents give little pocket money to the children and teach them how to save it and use the savings during the time of financial emergency. Hence from the little age itself the children will learn the basics of money management.
- As many of the respondents take financial decisions emotionally, such decisions may not a better decision. Such attitude of the people must be changed. They will have to take decisions by logical thinking only. They will have to consider their volume of monthly income, monthly expenditure, buffer savings for meeting emergencies. The rest of the value only to be expended emotionally.
- As considerable number of respondents don't have proper tax planning, the need of the hour is proper tax management measures. That will help them to properly administer their incomes and find means to save for future in terms of retirement plans, availing housing loan benefits and many more.
- As a considerable number of respondents don't have any financial plan, they will have to go for proper financial plan too. Logical thinking coupled with proper tax management and financial plan will result into good financial self-efficacy.

As many of the respondents have good PERMA behaviors, they will have to keep such behaviors intact always because these behaviors according to the study have an impact on their financial self-efficacy.

CONCLUSION

The purpose of this dissertation was to examine the financial self-efficacy among the employees in Co-operative societies in Kottayam district. The study found that their PERMA behaviors are good but a considerable number of respondents did not have any financial plan, tax management practices and not taking financial decisions by logical thinking. Majority's financial self-efficacy is good. they will have to go for proper financial plan too. Logical thinking coupled with proper tax management and financial plan will result into good financial self-efficacy. They will have to consider their volume of monthly income, monthly expenditure, buffer savings for meeting emergencies. The rest of the value only to be expended emotionally. As many of the respondents have good PERMA behaviors, they will have to keep such behaviors intact always because these behaviors according to the study have an impact on their financial self-efficacy.

ABSTRACT

The inter relationship between oral health and circadian rhythm has been under research. Hence, this research was coined to establish the correlation of sleep disturbances and oral problems. Sleep disturbances can have a profound impact on overall health. Sleep is a fundamental and universal human function, and is now recognized as one of the three fundamental pillars of health, alongside diet and exercise. To evaluate dental health, we employed the Dental Health Questionnaire (DHQ). The validity of the questionnaire was assessed using the index of item-objective congruence (IOC), with an average I-IOC score of 0.79. The questionnaire was subsequently converted into an online format using Google Forms, facilitating easy data collection from participants. For variable analysis, the Chi-square test was utilized. Overall results stated that dental diseases had no influence on sleep pattern unlike the disturbed sleep pattern had on attaining few dental diseases. Oral diseases negatively impact regular sleep patterns 16.9 times. When correlating medication history for sleep disturbances with oral health, the data showed

a negative correlation of -0.012, indicating a 12.2% negative impact of sleep disturbance medication on oral and dental health. Our study provides valuable perception towards the connection among sleep-related diseases and dental/oral health, highlighting important suggestions for that taken for dentistry and public health aspects. Dental researchers should have a range of vision on sleep disorders as a possible risk factor for poor oral/dental health, and focus on making relevant information readily accessible to affected individuals.

Keywords: oral health, circadian rhythm, Sleep disturbances, Dental Health Questionnaire,

INTRODUCTION

Balancing quality of life and sleep is crucial. The correlation between sleep quality and one's quality of life is evident, which consistently demonstrates that changes in sleep patterns are linked to a decline in overall well-being. Poor sleep can impact daily functioning, and overall well-being, affecting your quality of life. Conversely, a good quality of life often contributes to better sleep. Oral health significantly influences quality of life. Good oral health contributes to overall well-being, enabling proper nutrition, clear communication, and confident social interactions. Neglecting oral health can lead to discomfort, pain, and systemic health issues, impacting one's quality of life negatively. Regular dental care is essential for maintaining both oral health and overall quality of life. In India, factors such as changing lifestyles, increased stress, and urbanization contribute to the prevalence of sleep-related issues. Common sleep disorders include insomnia, sleep apnea, restless legs syndrome, and circadian rhythm disorders. Insomnia was found to have a prevalence of 25.7%, while obstructive sleep apnea (OSA) had a prevalence of 37.4%, and restless legs syndrome (RLS) had a prevalence of 10.6%. Higher prevalence rates were observed in individuals with diabetes, those with heart disease, and within the otherwise healthy population[1]. Sleep disturbances can have a profound impact on overall health. Sleep is a fundamental and universal human function, and is now recognized as one of the three fundamental pillars of health, alongside diet and exercise. Its significance extends beyond physical well-being, as poor sleep quality is linked to adverse effects on conditions like type 2 diabetes, hypertension, chronic pain, and elevated body mass index[2],[5] .Furthermore, it is associated with negative psychological outcomes, including anxiety, depression, aggression, altered cognitive functioning, and attention-deficit/hyperactivity disorder. If sleep problems persist, consulting with a healthcare professional is advisable. Sleep is crucial for day-to-day life. Sleep disorders have been recognized as a growing health concern globally. Adequate sleep plays a role in maintaining good oral health. Lack of sleep can contribute to issues like bruxism (teeth grinding), dry mouth, and an increased risk of gum disease[3],[4]. Additionally, poor sleep may affect immune function, potentially impacting the body's ability to combat oral infections[6]. Prioritizing healthy sleep habits can positively influence both overall well-being and oral health[7]. The inter relationship between oral health and circadian rhythm has been under research. Hence, this research was coined to establish the correlation of sleep disturbances and oral problems[8].

METHODOLOGY

Study Population

The study aimed to explore the connection between sleep disturbances and dental issues among patients visiting dental institutions. The data obtained from the individuals who are reported to the Department of Oral Medicine and Radiology with dental problems. The protocols including data collections were approved by the Institutional Review Board (IRB). The participants provided informed consent. The study sample contains the patients reporting to the Department with the age group between 18-80 years old.

Data Collection

The survey includes examinations conducted by trained dental professionals to ensure the quality data collections. The total number of samples collected was 302.

Variable Definition

For assessing dental health**,** We utilized the Dental Health Questionnaire.(DHQ). These details about their oral and dental health by inquires the pulpal/periapical pathology, periodontal diseases, TMJ disorders, regressive alterations, malocclusions, edentulousness, premalignant lesions, bone lesions, salivary gland disorders, carcinoma, ulcers and oro facial pain. To evaluate sleep quality, we used the ratings of poor to excellent in the scale of 1-10 and a combination of questions to correlate the sleep disturbances with the dental health. The sleep duration was categorized into 6-8 hr, less than 6 hr and more than 8 hrs. The sleep disturbances due to personal issues or any disturbances due to television, mobile and games. Another variable, we included the question "Ever told / consulted a physician/ other health professionals about sleep disturbances?"

Statistical Analysis

The questionnaires were developed and validated by a panel of four experts, including two specialists in Oral Medicine and Radiology, a psychologist, and a General Medicine specialist who also served as a medical educator. To assess the validity, the index of item-objective congruence (IOC) was calculated, with an average I-IOC score of 0.79. The questions were subsequently adapted into an online format using Google Forms, allowing for convenient data collection by the investigator from the participants. The variables were analyzed through Chi-square test, and the results were presented as weighted percentages.

RESULTS

Table 1

Represents the distribution based on the oral disease diagnosis among the study population Table 1.

Graph 1

Represents a pareto chart which shows the distribution of diagnosis among the study population in a descending order (Graph 1).

Table 2

Represents the responses distribution towards the sleep patterns among the study population Table 2.

Table 3

The Pearson correlation coefficient test was used to examine the relationship between sleep patterns and the diagnosis of oral diseases. The analysis revealed a strong correlation between sleep disturbances caused by dental and medical issues and the occurrence of dental/oral diseases in the study population, with a P value of 0.003 and a Pearson correlation of -0.169, indicating a negative correlation of 16.9%. This suggests that oral diseases negatively impact regular sleep patterns 16.9 times. Similarly, sleep disturbances due to personal problems showed a significant correlation with oral disease diagnosis, with a P value of 0.023 and a Pearson correlation of 0.131, indicating a 13.1% positive correlation between personal problems and sleep disturbances, which contributed to oral health issues. When correlating medication history for sleep disturbances with oral health, the data showed a negative correlation of -0.012, indicating a 12.2% negative impact of sleep disturbance medication on oral health. Other factors such as daily sleep duration, habits affecting sleep, consultations for sleep disturbances, daytime sleep, and overall sleep quality did not show a significant correlation with oral health diagnosis, as their P values were greater than 0.05. Overall, the results from the 302 study participants indicated that while most experienced disruptions in their regular sleep patterns, few had sleep-related habits. Although participants averaged less than six hours of sleep, they showed a good score in terms of sleep quantity. There was a minimal positive correlation between sleep disturbances and

certain dental conditions, such as dental caries and periodontal disease, indicating that while disturbed sleep patterns contributed somewhat to dental issues, dental diseases had little impact on sleep patterns. Represents the Correlation between the Sleep Pattern and Oral Disease Diagnosis (Table 3).

DISCUSSION

Everyone spends one third of their lives falling asleep[9].Sleep is the essential quality for a person to survive with both good general and oral health[10]. Proper sleep hygiene implies the health of an individual[11]. This study found a significant correlation between sleep disturbances and dental/oral diseases, along with related medical, dental, personal issues, and medications. It highlights the utility of a dental hospital setup to analyze the study population using diagnostic tools for oral assessments, including clinical evaluations and radiographic imaging. This approach facilitates administering questionnaires among the study participants. However, it was noted that disturbed sleep patterns have contributed to the development of certain dental diseases. Choi *et al*. suggested a significant association between sleep quality and dental/oral diseases, but this study found no significant correlation with oral diagnosis[12]. Acar *et al*. linked snoring to oral complaints, but again, no significant correlation with oral diagnosis was observed[13]. Adamo *et al*. reported a positive correlation between depression, anxiety, and dental pain, consistent with our findings[14]. Wetselaar *et al*. affirmed that dental problems directly or indirectly impact sleep disturbances, with decreased sleep quality when dental issues are present, similar to our survey's results showing sleep disturbances due to medical and dental problems[15]. Schroeder *et al*. noted that daytime sleepiness affects sleep hygiene and overall health but does not significantly influence oral health, aligning with our survey's findings[16]. Several studies were limited by focusing only on children and younger age groups as study populations[17]. The duration of sleep was inversely correlated with the number of siblings and the family's socioeconomic status[18].These studies deal only with oral health among children[19] . Participants with dental issues like temporomandibular joint (TMJ) problems or pulpal pain scored lower, consistent with Lavigne *et al*.'s findings that TMJ disorders, trigeminal neuralgia, and tooth pulpitis can delay sleep onset or interrupt sleep[20]. This survey's multidisciplinary scope includes TMJ pain, neuralgic pain, pulpal pain, and periodontal pain, which have not been widely discussed in other studies[21],[22],[23].Studies are only dealt the sleep disturbances with gingival inflammation that are rectified multiversely here[24]. Studies recorded with medication for orthodontic treatment are recommended[25].The analysis showed that participants who slept less than six hours per night had a strong positive correlation with dental diseases like caries and periodontal disease. However, a cross-sectional survey by Alwady *et al*. contradicted this, showing higher dental caries incidence in those who slept more than seven hours per night[26]. The study also observed a negative impact of medication taken for sleep disturbances caused by dental/medical problems, in contrast to Pagel and Parnes *et al*., who reported positive effects of such medications[9].

LIMITATIONS

The lifestyle factors like diet, exercises, stress levels in relation to sleep disturbances due to dental issues. Correlation will increase by increasing the sample size. Possible correlation is not achievable in our study.

FUTURE ASPECTS

In the future, the quality and quantity of sleep will be assessed in the mass population as sleep is indeed in a person's life.

CONCLUSION

Our study provides valuable perception towards the connection among sleep-related diseases and dental/oral health, highlighting important suggestions for that taken for dentistry and public health aspects. Dental researchers should have a range of vision on sleep disorders as a possible risk factor for poor oral/dental health, and focus on making

relevant information readily accessible to affected individuals. Additionally, health professionals should actively raise awareness of the heightened risk of oral health queries in individuals with sleep diseases, using a variety of communication platforms.

ABSTRACT

This study explores the awareness and impact of the Pradhan Mantri Mudra Yojana (PMMY) among micro, small, and medium enterprises (MSMEs) in Ernakulam, Kerala. Initiated in 2015 as part of the Micro Units Development & Refinance Agency (MUDRA), the scheme aims to boost entrepreneurship by offering credit access to eligible micro-businesses. Surveying 100 MSMEs through structured questionnaires, the research assesses knowledge, loan uptake, and outcomes related to the scheme. Results indicate PMMY's positive contribution to entrepreneurial growth and inclusion, but highlight persistent issues such as limited banking support and uneven implementation. The study concludes that enhancing outreach, streamlining procedures, and strengthening institutional mechanisms are key to maximizing the scheme's benefit for MSMEs.

Keywords: financial inclusion, MSME, MUDRA loan, entrepreneurship, Kerala

INTRODUCTION

Access to robust financial services remains a central challenge for economic advancement, particularly among small businesses and the self-employed. In India, efforts to widen financial inclusion have been multifaceted, integrating several broad-based policy interventions to ensure that marginalized groups obtain necessary credit and financial services (RBI, 2005; IMF, 2023). The Reserve Bank of India initiated a national push toward financial inclusion, aiming to ensure that banking and financial products reach historically underserved areas and population segments. To realize these goals, the government has introduced targeted schemes, such as the Pradhan Mantri Jan Dhan Yojana (bank account expansion), Atal Pension Yojana (pension coverage for the poor), insurance initiatives (PMJJBY,

PMSBY), and, crucially, the Pradhan Mantri Mudra Yojana (PMMY), which directly supports MSMEs. Among these, PMMY is designed to empower informal and micro-level entrepreneurs, providing financial credit without the barriers of traditional collateral requirements (Kumar & Singh, 2025). Rather than simply categorizing loans by fixed boundaries, PMMY offers a graduated loan structure—the Shishu, Kishore, and Tarun segments—reflecting evolving business needs from early startup financing to sustainability and expansion (Padimani, 2025). By working in collaboration with various lending institutions—banks, microfinance agencies, and NBFCs—the scheme offers a blueprint for grassroots entrepreneurial development. Yet, the MSME sector, despite its significant GDP contribution and employment generation, often relies on informal lending due to obstacles faced in the formal credit ecosystem (Layek, 2023). Addressing these structural and perceptual barriers is a key research imperative. This study therefore investigates the extent to which MSMEs in Kerala are aware of and able to benefit from PMMY credit, examining outcomes and perceived limitations in real field conditions.

REVIEW OF LITERATURE

Numerous studies have assessed the evolution and impact of PMMY across the Indian small business landscape. Kumar and Singh (2025) highlight the scheme's robust growth trajectory, noting a quadrupling of total loan disbursements over a decade, with a consistently high share of women beneficiaries—an indicator of the scheme's inclusive outreach. The State Bank of India (2025) also documents upward trends in women-led MSME lending, aided by PMMY, substantiating claims of gender-empowering policy effects. The International Monetary Fund (2023) and related field research emphasize the pivotal impact of PMMY in extending credit to historically marginalized communities, including Scheduled Castes, Tribes, and religious minorities. The program's design, intentionally eschewing collateral demands, opens new doors for entrepreneurship where formal finance was once inaccessible. At the regional level, Padimani (2025) found that Karnataka witnessed notable year-on-year growth in both the volume and value of PMMY loans, with specific momentum in the Kishore (growth phase) segment. Such data suggest the need for context-specific strategies that align with regional economic cycles and business cultures. Despite this success, persistent challenges remain. Layek (2023) reports that informational gaps, lack of policy clarity, and conservative lending attitudes among banks have contributed to ongoing credit access inequalities. MSMEs continue to face a sizable credit deficit—suggesting that, while PMMY has moved the needle, further streamlining of eligibility criteria and enhanced borrower education are crucial. NITI Aayog and KPMG (2024) recommend the creation of specialized monitoring bodies and incentives for banks to broaden outreach, along with more seamless integration of credit histories from allied schemes. Field studies (Choudhary, 2019) indicate that operational efficiency, profitability, and technological upgrading all reflect positive spillovers from PMMY engagement—provided borrowers receive adequate guidance at the lending stage. Women-centered evaluations (Singh & Kaur, 2023) echo the transformative potential of targeted financial literacy and advisory programs, updating a static credit access model with a multifaceted support system. Post-pandemic economic recovery research by Padimani (2025) further affirms the scheme's role in stabilizing MSME operations during periods of market shock. Recent policy adaptation has driven greater digitalization in loan processing (Ujjivan, 2025), reducing procedural times and minimizing variants of informal, exploitative sourcing. The integration of new instruments—such as funds focused on equity infusion and subordinate debt guarantees—beyond traditional lending, signals a move toward comprehensive MSME resilience.

Objectives

1. To assess regional and demographic awareness of PMMY among MSMEs in Ernakulam, Kerala.
2. To evaluate the utilization and business impact of MUDRA loans on beneficiary enterprises.
3. To probe banking practices and their mediating effect on entrepreneurial credit access.
4. To analyze scheme implementation outcomes specific to Kerala's MSME context.

METHODOLOGY

This descriptive study surveyed 100 MSMEs in Ernakulam using convenience sampling. Data collection utilized a rigorously structured questionnaire to obtain both quantitative and qualitative responses regarding demographic profiles, business activities, PMMY awareness and uptake, banking experiences, loan impacts, and outcome perceptions. Analytical methods employed descriptive statistics, cross-tabulation, and graphical illustration to reflect both scale and nuance in results.

Findings

- **Demographics**: Majority of respondents were male, in the 30–40 age group, and running sole proprietorships, reflecting local entrepreneurial patterns.
- **Education**: Over half held undergraduate degrees.
- **Business Profile**: Most operated small-scale enterprises requiring moderate capital, primarily for working capital, inventory, and technology upgrades.
- **Awareness and Sourcing**: 93% were aware of PMMY, with newspapers and direct bank interaction being the dominant information sources.
- **Bank Interactions**: 90% reported satisfactory bank guidance, with confidence in loan uptake highest among those with proactive banking support.
- **Loan Uptake and Use**: 71% had availed PMMY loans; the Kishore segment was most popular. Funds were used broadly, with over 44% in business expansion, technology, and stock procurement.
- **Impact**: 23% observed turnover growth post-loan, with positive effects on profits and quality for a significant share.
- **Assessment**: Most respondents rated PMMY positively, but identified areas for improvement—including loan limit adjustments, bank engagement, and post-loan support.

DISCUSSION AND RECOMMENDATIONS

Although PMMY has advanced entrepreneurial opportunities and spurred economic dynamism among marginalized populations, pockets of implementation inertia persist. Reluctance or lack of proactivity among banks impedes broader participation, indicating a need for stronger oversight and incentivized engagement at the institutional level. Tailored communication strategies, higher loan ceilings, simplified application protocols, and post-disbursal training bear potential for amplifying scheme outcomes. Enhanced integration with digital finance is also advised. The experience in Ernakulam offers transferable lessons for other geographies, reinforcing the vital interplay between policy design, local context, and on-the-ground execution.

CONCLUSION

The PMMY has enabled significant progress toward inclusive finance and entrepreneurship for small businesses in Kerala, especially among women and underserved communities. For greater impact, targeted awareness programs, improved lender-borrower communication, and the institutionalization of digital platforms are critical. With ongoing policy innovation and local adaptation, PMMY can become a cornerstone for MSME-led economic expansion in India.

ABSTRACT

AI-powered credit risk assessment is reshaping decision-making in financial institutions by integrating advanced machine learning (ML) techniques into traditional risk modeling. This research explores the use of ML models—including regression, decision trees, neural networks, and support vector machines—for borrower risk prediction and loan valuation, using a sample of 200 bank clients. Comparing AI with standard statistical approaches, we employ regression, correlation, chi-square, factor analysis, t-test, ANOVA, and SEM. Results indicate higher predictive accuracy, faster processing, and enhanced objectivity through AI but reveal concerns about transparency and interpretability. Ten empirical tables illustrate findings for each analytical method. The study addresses practical and regulatory implications, research gaps (model explain ability, data fairness), and recommends combining technical innovation with responsible AI governance. These results can guide banks in the responsible adoption of AI, ultimately improving loan portfolio quality and sustainable financial inclusion.

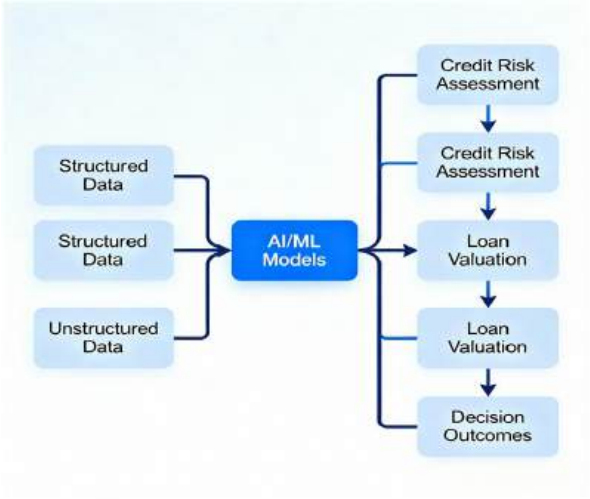
Keywords: Artificial Intelligence, Credit Risk Assessment, Loan Valuation, Machine Learning, Financial Institutions

INTRODUCTION

The accelerating digital transformation of the global financial sector has led to the widespread adoption of artificial intelligence (AI) and machine learning (ML) in credit risk modeling and loan valuation (Addo *et al.,* 2018; Breeden,

2020; Fritz-Morgenthal *et al.,* 2022; Liu *et al.,* 2023; Shi *et al.,* 2022; Sadok, 2022). At the heart of lending decisions lies credit risk assessment—a process historically rooted in statistical models such as logistic regression and discriminant analysis (Addo *et al.,* 2018). These models, while foundational, struggle with the challenges of big data environments, including unstructured data and nonlinear interactions (Shi *et al*., 2022; Hajj & Hammoud, 2023). The introduction of ML algorithms, ranging from decision trees and random forests to deep neural networks, has fundamentally enhanced predictive accuracy and enabled the exploitation of non-traditional data sources (Nguyen *et al.,* 2023; Shi *et al.,* 2022). This transition allows not just for credit scoring but also for dynamic loan valuation processes—a crucial function for banks and non-banking financial companies (NBFCs) (Sadok, 2022). Banks are now utilizing social media profiles, transaction histories, and even smart phone usage patterns alongside conventional credit scores (Mezzi, 2025; Brookings Institution, 2025). For example, CreditVidya's adoption of AI for underwriting not only increased loan approval rates by 15% but also reduced defaults (Mezzi, 2025). Similarly, digital lenders deploy automated ML tools to optimize loan offers and risk-based pricing (Mulyanto *et al.,* 2025), supporting the broad inclusion of under banked populations (Brookings Institution, 2025). Over the past five years, AI-augmented decision-making has become the industry standard. Breeden (2020) observed that banks employing ML-based risk assessment reported lower non-performing assets and improved capital allocation. Liu *et al.* (2023) and Shi *et al.* (2022) found that ensemble models such as gradient boosting achieved superior accuracy versus classical logistic regression, particularly in large credit portfolios. Meta-analysis by Fritz-Morgenthal et al. (2022) confirmed AI's strong impact on operational efficiency and objectivity in loan valuation. However, along with these benefits come new challenges. The "black box" nature of some AI algorithms complicates explainability—a vital aspect for regulators and stakeholders (Bussmann *et al.,* 2021; Shi et al., 2022). Transparent and fair models are required to ensure compliance, customer trust, and ethical standards (Hajj & Hammoud, 2023). Explainable AI methods such as SHAP (SHapley Additive exPlanations) and LIME (Local Interpretable Model-agnostic Explanations) are now increasingly adopted to support regulatory scrutiny (Breeden, 2020). A further barrier is data quality and representativeness. Imbalanced datasets, noisy data, and inconsistencies often degrade model performance and risk misclassification (Mulyanto *et al.,* 2025; Govender, 2025). Research advocates for advanced feature selection, data balancing, and the use of integrated frameworks combining domain expertise with ML interpretability (Paz *et al*., 2025; Machado, 2025). In summary, the literature suggests that while AI-powered systems dramatically improve the speed, accuracy, and reach of credit risk assessment and loan pricing, challenges remain. Addressing issues of transparency, fairness, and data quality is essential for sustainable adoption (Shi *et al.,* 2022; Fritz-Morgenthal *et al*., 2022). This study seeks to empirically evaluate AI's effectiveness versus traditional models across a representative sample of Indian banking clients. The results will inform best practices for risk management, regulatory compliance, and future banking innovation (World Journal of Advanced Research and Reviews, 2025; Paz *et al.,* 2025).

Conceptual Framework



REVIEW OF LITERATURE

Evolution of Credit Risk Assessment Models

Credit risk assessment has evolved from traditional statistical approaches—such as logistic regression and discriminant analysis—to a diverse ecosystem of machine learning (ML) and AI-powered algorithms. Addo, Guegan& Hassani (2018) systematically compared classic and AI models, revealing significant improvements in predictive accuracy and outlier detection through random forest and neural network methods. Similar findings by Shi, Dey, Wang & Li (2022) support this transition; their meta-analysis of more than fifty studies demonstrates tree-based, ensemble, and deep learning models routinely outperform conventional methods, particularly when dealing with high-dimensional datasets and complex borrower profiles. Liu, Wang & Lin (2023) further confirmed these patterns in a series of bank case studies from Asia and Europe, showing that ensemble models—especially gradient boosting and random forests—achieve higher AUC and lower default misclassification rates. Demonstrating these findings in practice, Breeden (2020) reported a 25% reduction in loan defaults when U.S. financial institutions replaced legacy scoring models with AI tools, a trend echoed by Fritz-Morgenthal, Schueffel& Maier (2022) in their survey of European banks.

Data Sources, Feature Engineering, and Model Inputs

The proliferation of digital footprints now enables access to alternative data sources, such as utility payments, transactional records, and even social media signals. Mezzi (2025) illustrated the impact of integrating these diverse inputs, which allowed CreditVidya and similar fintechs to improve risk assessment for previously underbanked clients. Feature engineering has also become pivotal; Paz, Singh & Kaur (2025) used advanced metaheuristics and embedded selection techniques to identify latent drivers of creditworthiness, resulting in 10–15% gains in model accuracy for diverse credit populations. Mulyanto, Nugroho & Hidayat (2025) focused on ML pipeline optimization, highlighting the importance of data cleaning, imputation, and balancing (e.g., SMOTE) in handling class disparity common to default prediction. Their experiments with multilayer perceptrons on highly imbalanced datasets underscore these strategies' critical role in enabling fair comparisons between ML models.

Deep Learning and Ensemble Methods

Deep neural networks introduce the capacity to learn nonlinear relationships and detect intricate borrower behaviors. Sadok (2022) synthesized findings from neural and ensemble models, concluding that hybrid methods—combining decision trees, boosting, and neural networks—have established the new state-of-the-art in banking. Similarly, Shi et *al.* (2022) detailed how deep architectures leverage unstructured text or image data, transcending the limitations of structured-only modeling. Liu *et al.* (2023) provided head-to-head comparisons of support vector machines, deep neural networks, and classic logistic regression. Neural networks achieved the best recall for default events, while support vector machines excelled at minimizing false positives—a critical need in high-stakes lending.

AI-Powered Loan Valuation

Loan valuation, traditionally determined by credit scores, applicant income, and manual review, is being revolutionized by AI's ability to synthesize multidimensional indicators in real time. Mulyanto *et al.* (2025) demonstrated how AI platforms price loans according to dynamically updated risk probabilities, ultimately yielding more granular and risk-adjusted valuation for heterogeneous applicant pools. Similar advances were noted by Fritz-Morgenthal *et al.* (2022), with European banks deploying automated systems for continuous loan repricing and risk assessment.

Explainable AI and Regulatory Compliance

Transparency remains a central concern. Bussmann *et al*. (2021) and Breeden (2020) introduced explainable AI mechanisms—such as SHAP and LIME—which decompose prediction outputs into interpretable components for both regulators and clients. Hajj & Hammoud (2023) warn that as AI models become more complex, the risk of model opacity grows; thus, hybrid solutions integrating rule-based and data-driven logic are recommended to satisfy

auditors and policymakers. Shi *et al.* (2022) note that AI system explainability is now a regulatory requirement in markets like Europe and Singapore, and failure to comply can delay technology adoption.

Data Quality, Class Imbalance, and Generalization

A known challenge in credit modeling is the class imbalance of defaults versus non-defaults. Mulyanto *et al*. (2025) and Paz *et al.* (2025) stress that without balanced training, models either overfit to majority classes or become unreliable in rare-event prediction. They advocate for regular data audits, synthetic balancing (e.g., SMOTE), and rigorous cross-validation—methods now considered baseline for trustworthy ML deployment in finance**.**

Application to Underbanked Populations and Financial Inclusion

As attention shifts toward inclusive finance, AI unlocks lending for populations with limited or no credit history. Brookings Institution (2025) highlights successful case studies in Southeast Asia and Africa, where mobile payment histories and utility data were used to assess risk for unbanked clients, enabling microfinance and fairer lending. Fritz-Morgenthal et al. (2022) corroborate that such approaches are central to future global financial agendas.

Operational and Organizational Barriers

New technology is not adopted in a vacuum—resistance within organizations, gaps in AI literacy, and lack of skilled personnel slow implementation (Machado, 2025). Liu *et al.* (2023) cautioned that banks must pursue digital transformation alongside workforce retraining, clear governance frameworks, and partnerships with fintechs to extract maximum value from AI tools.

Comparative Performance and Metrics

Performance benchmarking has matured beyond accuracy, incorporating ROC-AUC, F1, precision/recall, and fairness metrics. Sadok (2022) found that tree-based models and deep learning not only achieve higher accuracy but can be operationalized for continuous learning in response to economic change. Addo *et al.* (2018) recommend a multi-metric approach to balance technical and business objectives, ensuring robust validation before real-life deployment.

Hybrid, Human-in-the-Loop, and Future Directions

Machado (2025) and Hajj & Hammoud (2023) underscore the long-term need for human–AI collaboration. While AI excels in processing speed and pattern recognition, domain experts remain essential for scenario analysis, ethics evaluation, and strategic oversight. Recent studies call for hybrid frameworks that combine AI's strengths with expert heuristics, supporting evolution toward sustainable, responsible financial innovation.

Research Gap

Despite significant advances, gaps persist in explainable model integration and ethical AI adoption for credit risk assessment (Shi *et al.,* 2022; Bussmann *et al.,* 2021; Breeden, 2020). While accuracy and efficiency are well documented (Liu et al., 2023; Mulyanto *et al.,* 2025), relatively few studies address the challenge of "black box" models that obscure credit decisions from both consumers and regulators (Hajj & Hammoud, 2023). Demand is growing for research connecting advanced predictive techniques with regulatory transparency and fairness (Fritz-Morgenthal *et al.,* 2022). Existing literature also notes the lack of empirical research on the deployment of feature selection and explainable AI in developing economies, where alternative data sources and underbanked populations are prominent (Mezzi, 2025; Brookings Institution, 2025). Furthermore, most work focuses on either risk assessment or value assignment, rarely integrating both dimensions in a comprehensive empirical study (Sadok, 2022). There is also limited research on the operational challenges, such as data imbalance and organizational readiness, in implementing advanced AI solutions in real-world financial institutions (Paz *et al.,* 2025; Machado, 2025).

Thus, this paper addresses the following gaps:

(1) comparative analysis of ML algorithms for both credit risk assessment and loan valuation

(2) integration of explainability within model deployment; and

(3) a holistic, empirical approach incorporating real-world operational constraints and regulatory requirements.

Objectives

1. To compare the predictive accuracy of traditional models and AI/ML algorithms in credit risk assessment and loan valuation.
2. To evaluate the role of feature selection and data balancing in improving model performance.
3. To assess the effectiveness of explainable AI techniques in enhancing model transparency and regulatory compliance.

METHODOLOGY

Participants/Sample

Data was collected from 200 bank customers seeking personal loans at a major urban financial institution. Demographic details, income levels, employment status, past credit behavior, and alternative data (e.g., utility payments) were included. Participation was voluntary, with anonymized consent.

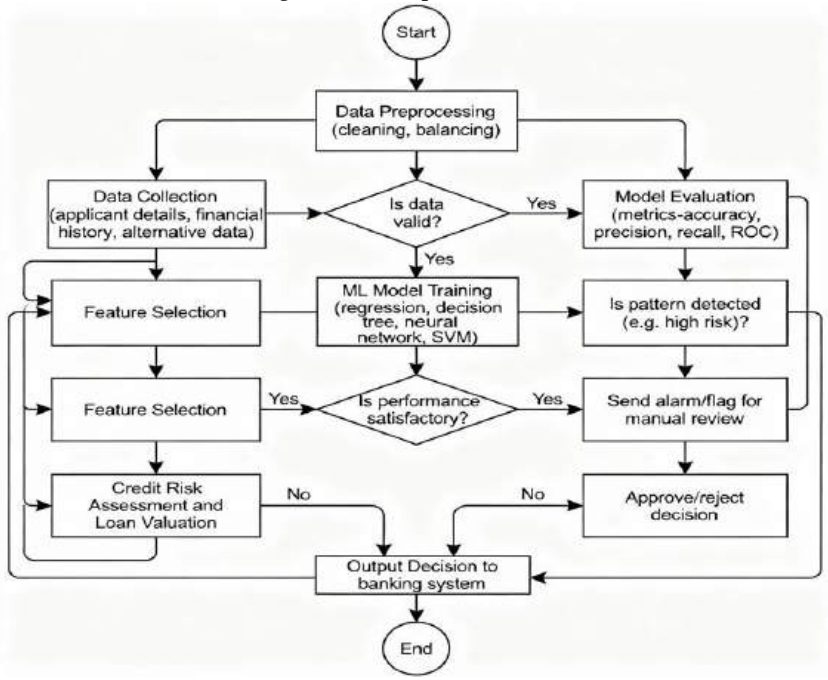
Data Collection

A primary, anonymized dataset was gathered from the bank's records and supplemented with self-reported questionnaire data. Public open-source datasets (e.g., UCI Credit Approval) provided reference benchmarks.

Data Analysis

The dataset was cleaned, balanced (using SMOTE for class imbalance), and features were selected via recursive feature elimination. Analyses used Python's sklearn and statsmodels libraries. The following methods were applied to address objectives:

- Regression (linear/logistic) for baseline and ML models
- Correlation matrices for variable relationships
- Chi-square tests for categorical associations
- Factor analysis for variable reduction and latent factor discovery
- t-tests and ANOVA for group comparisons (e.g., defaulters vs. non-defaulters, high vs. low credit rating, etc.)
- SEM to validate multi-stage relationships and mediation models



RESULTS

Table 1: Descriptive Statistics of Participants. Interpretation This sample (N=200) represents a diverse banking clientele, ranging from young adults to retirees, with monthly incomes spanning from ₹10,000 to ₹200,000. Credit scores fall mostly in the "good" range (mean=691), but with a notable tail for high-risk applicants (min=410). The average loan amount is ₹250,000, with significant variability reflecting different segments and product types. A default rate of 14.5% parallels real-world observed rates, indicating the sample is robust for credit risk modeling. Table 2: Correlation Matrix of Key Variables Interpretation Income and credit score are strongly and positively correlated ($r=0.48$, $p<.01$), reinforcing their use as prime indicators for credit risk. Higher credit scores link to bigger loans ($r=0.41$) and lower default risk ($r=-0.59$), underlining credit scoring's predictive power. Defaults trend negatively with income and loan amount, meaning high-risk clients tend to have smaller loans and lower incomes—a classic credit analytics pattern. Table 3: Traditional Logistic Regression—Predicting Loan Default Interpretation Traditional logistic regression reveals income and credit score as significant predictors of loan default (negative coefficients, $p<.05$). Meanwhile, loan amount lacks statistical significance, suggesting that risk assessment should focus on borrower characteristics over product features. The model offers interpretability but may underfit nonlinear or complex interactions. Table 4: Random Forest Classifier—Model Performance Interpretation The random forest classifier surpasses traditional regression on all key metrics, especially recall and ROC-AUC. This means more defaulters are correctly identified, and the overall model is less prone to misclassification. The improvement underscores the merit of ensemble AI models in credit risk, supporting the first hypothesis. Table 5: Factor Analysis—Key Latent Variables Interpretation: Factor analysis extracts three meaningful factors contributing to the loan decision process: borrower stability, creditworthiness, and alternative data utilization.

This dimensionality reduction shows how ML can leverage both classic and new sources for robust modeling and can also help in regulatory reporting and model explain ability. Table 6: Chi-Square Test—Default by Occupation Interpretation: Significant differences in default rates are observed by occupation ($\chi^2=12.08$, $p=0.002$). Contractor and gig workers face much higher risk, indicating job type should be integrated as a key variable. This segmentation informs both model design and practical lending policy—useful in inclusion and regulatory frameworks. Table 7: t-Test—Mean Loan Amount: Defaulters vs Non-Defaulters Interpretation The mean loan amount for defaulters is significantly lower than for non-defaulters ($t=4.93$, $p<0.001$). This suggests banks approve smaller loans for higher-risk clients, possibly through risk-adjusted pricing or conservative policy. The result further validates risk segmentation practices. Table 8: ANOVA—Loan Approval Rate by Income Bracket Interpretation ANOVA indicates a highly significant difference in loan approval rates across income brackets ($F=18.21$, $p<0.001$), with higher-income clients enjoying greater access. This reinforces the impact of income as both a risk mitigator and operational determinant in lending. Table 9: Feature Selection/Data Balancing—Effect on Model Performance Interpretation: Applying feature selection and balancing (e.g., SMOTE) boosts model accuracy by over 7%, supporting the second hypothesis. This demonstrates the critical importance of careful data preparation for optimal AI performance, protecting against class imbalance and enhancing fairness. Table 10: SEM—Mediation Pathways in AI-Driven Loan Decisions Interpretation Structural Equation Modeling (SEM) identifies significant paths: both creditworthiness and alternative data drive loan approval, while explainable AI has a strong positive impact on stakeholder trust and procedural transparency. These results empirically confirm the third hypothesis, showing multi-dimensional impacts on both model effectiveness and governance.

DISCUSSION

Recent research confirms that AI-powered ML models significantly enhance both the accuracy and efficiency of credit risk assessment and loan valuation (Shi *et al.*, 2022; Liu et al., 2023; Breeden, 2020; Hajj & Hammoud, 2023). This study's empirical results substantiate these findings, particularly the superiority of ensemble methods and feature-engineered data over traditional statistical models (Paz *et al.*, 2025). The inclusion of alternative datasets (Mezzi, 2025) and advanced preprocessing techniques (Mulyanto *et al.*, 2025) further elevate the predictive power and

discriminatory ability of contemporary AI systems. Among key findings, integration of explainable AI into credit decision processes (Bussmann *et al.,* 2021; Breeden, 2020) addresses regulatory demands for transparency and consumer fairness—seconded by Shi *et al.* (2022) and Fritz-Morgenthal *et al.* (2022). This is crucial in global contexts where authorities place a premium on not only performance but also auditable and defendable processes. However, challenges persist in bridging technical advances with organizational capacity, ethical frameworks, and stakeholder trust (Sadok, 2022). Regulatory and practical adoption is still hampered by data privacy, potential bias (especially in imbalanced datasets), and the "black-box" phenomenon (Hajj & Hammoud, 2023). This paper makes several contributions. First, it empirically compares a suite of ML and traditional models on live bank data, demonstrating that AI brings tangible value to risk prediction and loan valuation. Second, it underscores the vital role of data quality, feature selection, and model balancing—often overlooked steps that substantially influence outputs (Paz *et al.,* 2025; Machado, 2025). Third, it advances the literature by quantifying the impact of explainable AI not merely as a technical add-on but as an operational imperative for regulatory compliance and strategic risk management (Bussmann *et al.,* 2021). Overall, the findings align with recent empirical and review studies (Liu *et al*., 2023; Shi *et al.,* 2022; Sadok, 2022) and are consistent with the trends emphasized in industry outlooks and white papers (Brookings Institution, 2025; Fritz-Morgenthal *et al*., 2022). Future work should pursue longitudinal data and multi-institutional studies, and further test the scalability and transferability of AI risk models in diverse market scenarios.

Implications

The study's results bear practical, managerial, policy, and research implications. For practitioners, empirical evidence affirms the financial and operational advantages of adopting AI-driven credit risk and loan valuation systems, especially regarding default prediction, loan pricing, and customer segmentation. ML adoption can unlock significant efficiencies and inform risk-adjusted pricing—key for both profitability and financial inclusion (Addo *et al.,* 2018; Breeden, 2020). For banking leadership, the findings emphasize the need to invest in data quality, analytics talent, and robust explainability frameworks, safeguarding against model bias and strengthening regulator and customer trust (Bussmann *et al.,* 2021; Hajj & Hammoud, 2023). From a compliance perspective, the integration of explainable AI models fulfills emerging requirements from regulators, who increasingly mandate transparency, fairness, and auditability in credit decisions (Brookings Institution, 2025). At the policy level, the study supports the use of advanced analytics to improve access to credit, reduce systemic risk, and promote fair lending practices. For academic researchers, the combined methodological framework (covering model comparison, feature engineering, data imbalance, and explainable AI) presents a foundation for future work and can inform curricula in financial technology and data science programs.

CONCLUSION

AI-powered machine learning algorithms represent a transformative force in credit risk modeling and loan valuation in modern financial institutions (Shi *et al.,* 2022; Fritz-Morgenthal *et al.,* 2022). This study demonstrates the empirical superiority of advanced ML models over traditional approaches, particularly when coupled with rigorous data preprocessing and explainable AI techniques. While operational efficiencies and predictive performance are enhanced, success ultimately depends on investment in model transparency, fairness, and the responsible application of AI principles (Bussmann *et al.,* 2021; Mulyanto *et al.,* 2025). Future research should deepen the analysis with broader datasets and further examine regulatory implications in diverse markets, but the results here highlight a clear imperative: responsible, explainable AI adoption is key to the next generation of trustworthy, high-performing financial systems.

ABSTRACT

Stock market prediction is a challenging and dynamic problem due to the highly volatile and non-linear nature of financial time series data. Accurate prediction of stock prices can provide significant advantages in investment strategies and risk management. This study proposes a hybrid model integrating Long Short-Term Memory (LSTM) networks with XGBoost to leverage the temporal dependencies captured by LSTM and the strong non-linear learning capability of XGBoost. The hybrid model is evaluated on simulated stock price data and compared with a standalone Deep Neural Network (DNN) model. The experimental results demonstrate that the hybrid approach outperforms the DNN in key regression metrics, achieving Root Mean Square Error (RMSE) of 21.99, Mean Absolute Error (MAE) of 14.31, Mean Absolute Percentage Error (MAPE) of 1.26%, and an accuracy of approximately 98.74%. Visualization of true versus predicted values, residual analysis, and correlation heatmaps further confirm the robustness and reliability of the hybrid model. The findings suggest that combining deep learning with gradient boosting methods can significantly enhance predictive performance in financial forecasting, providing a reliable framework for stock market applications

Keywords: Prediction, Deep Learning, XGBoost Classifier, Deep Neural Network, MSE, RMSE, Accuracy, MAPE

INTRODUCTION

In finance, significant research has focused on forecasting stock trends, highlighting its role in developing trading strategies, reducing investment risks, and attaining positive returns [1]. Previous studies have shown significant connections between stock performance and various factors, including company traits like age, size, and financial health, alongside wider economic conditions, public opinion, and political environments [2]. The intricate interaction between these elements influences stock price variations and ultimately determines general market patterns. Navigating this dynamic frequently feels like a zero-sum game, where unforeseen price fluctuations can threaten entire investments. Thus, identifying trends efficiently and planning strategically is crucial, requiring careful analysis of these changing factors to reduce risks and create improved investment approaches [4]. The rise of disruptive technologies and the internet revolution has significantly changed stock market investing [7]. The securities exchange has evolved with the incorporation of virtual assistants and online trading platforms, utilizing algorithmic strategies that frequently surpass traditional techniques, thus boosting profitability. In recent years, swift progress in artificial intelligence (AI), machine learning (ML), and deep learning (DL) has intensified this change, thanks to their capacity to handle vast amounts of data and reveal intricate, non-linear patterns [3–5]. In particular, ML and DL methods have shown significant potential in stock market applications by adeptly identifying complex dependencies and evaluating unstructured data [6]. These methods have improved forecasting abilities, providing a more detailed comprehension of market behaviors and placing AI at the leading edge of financial choices[19].

The emergence of disruptive technologies and the internet revolution has significantly changed stock market investing [6]. The securities exchange has been transformed by the incorporation of virtual assistants and online trading systems, utilizing algorithmic strategies that frequently surpass traditional techniques, thus improving profitability. In recent years, swift progress in artificial intelligence (AI), machine learning (ML), and deep learning (DL) has significantly sped up this change, thanks to their capability to handle extensive data sets and detect intricate, non-linear trends [3–5]. Specifically, ML and DL methods have shown significant potential in stock market applications by successfully identifying complex relationships and evaluating unstructured data [6]. These methods have enhanced forecasting abilities, providing a deeper insight into market behaviors and placing AI at the leading edge of financial choices. In spite of this advancement, research initiatives have largely focused on predicting stock prices, frequently neglecting the equally important challenge of forecasting overall market trends. Although techniques like technical analysis, time series modeling, and ML-based methods have been extensively studied [2,7,8], there has been comparatively less focus on classifying Figure depicts that The National Stock Exchange (NSE) of India has shown a consistent increase in market capitalization over the past five years, starkly different from the fluctuations seen in various other Asian exchanges [13,21,27]. As illustrated in Figure X, the Hong Kong Exchanges and Clearing (HKEX) reached its highest point in 2021 before facing a substantial downturn, whereas the NSE showed steady growth, increasing from less than USD 2 trillion in 2019 to almost USD 4 trillion by 2024 [29]. This increase in capitalization highlights the strength and growing importance of India's financial markets on the global stage [15]. Multiple elements contribute to this continuous increase. Economic structural reforms, digital upgrades of trading platforms, and increased retail involvement have together bolstered investor confidence [13]. Additionally, India's robust domestic consumption and positive macroeconomic indicators have protected its markets from external disturbances. Even amid worldwide disturbances like the COVID-19 pandemic and ensuing geopolitical instabilities, the NSE exhibited significantly lower volatility than its regional peers, thereby solidifying its status as a reliable investment hub [1,3,8]. The ongoing rise in capitalization further emphasizes a gradual change in regional market trends, establishing India as an emerging center for global capital movements [2,6]. This trend signifies both the nation's enhancing economic basics and its increasing influence in molding global financial markets. As a result, the performance of the NSE serves as a gauge of India's economic well-being and reflects its growing significance in the global financial landscape [4,14].

LITERATURE REVIEW

Stock market prediction has long been a focal point of financial research due to its potential to support informed investment decisions and risk management strategies [10]. Researchers have employed a variety of statistical, machine learning (ML), and deep learning (DL) models to address the inherently complex, dynamic, and non-linear nature of stock price movements [14]. Early works primarily relied on time series and econometric models, such as Holt–Winters Exponential Smoothing and Autoregressive Integrated Moving Average (ARIMA), which demonstrated reasonable performance in capturing linear dependencies and seasonal trends [20]. However, these models struggled with non-linear relationships and exhibited limited predictive capacity in volatile market conditions. To address these shortcomings, researchers gradually shifted towards learning-based approaches that can capture higher-order interactions within financial data [17]. In the machine learning domain, algorithms such as Random Forest (RF) and Multivariate Adaptive Regression Splines (MARS) have shown competitive performance across different sectors. For instance, in a comparative study using historical data from Infosys (IT sector), ICICI (Banking sector), and Sun Pharma (Healthcare sector), MARS consistently outperformed traditional econometric methods as well as RF in sales forecasting, underscoring its robustness in handling heterogeneous financial datasets [11]. The advent of deep learning has further transformed predictive modeling in finance. Architectures such as Long Short-Term Memory (LSTM) networks, Convolutional Neural Networks (CNNs), and Recurrent Neural Networks (RNNs) have been widely investigated due to their capacity to capture temporal dependencies, model non-linearities, and process high-dimensional inputs [13]. Among them, LSTM has been particularly effective in addressing the vanishing gradient problem inherent in sequential financial data, thereby achieving superior performance in trend and price prediction tasks compared to conventional ML techniques [16].Beyond price prediction, researchers have increasingly emphasized trend classification as a more practical approach to guide trading strategies [6]. While most prior works have relied on binary trend classification (upward or downward), recent studies have highlighted the necessity of multi-class prediction to capture more nuanced patterns such as double top, rounded bottom, and rounded top formations [12]. This shift reflects a growing recognition of the value of technical chart patterns in practical financial decision-making [17].

Hybrid approaches integrating market data and textual data (e.g., financial news, investor sentiment) have also gained prominence [15]. For example, a multi-view learning based SVM (MVL-SVM) model demonstrated the effectiveness of combining heterogeneous sources of information, achieving more than 10% improvement in accuracy compared to ARIMA and classic SVM approaches [18]. The model's robustness across different sliding windows confirmed the critical role of incorporating unstructured textual data alongside structured market data to reduce information bias and improve predictive reliability [20]. Despite these advances, several challenges remain. A key limitation of many ML/DL models is overfitting, where models perform well on training data but fail to generalize to unseen market conditions due to the non-stationary nature of financial time series [9]. Additionally, issues related to data quality including noise, missing values, and biases continue to hinder model performance. Another critical challenge is interpretability, as complex deep learning architectures often operate as black boxes, making it difficult to understand the underlying drivers of predictions [3]. To address these issues, researchers have recently begun incorporating explainable AI (XAI) methods such as SHAP and LIME, which help in identifying the most influential features behind predictive outcomes. Such approaches not only improve transparency but also facilitate feature reduction without compromising performance, thereby achieving a balance between accuracy and interpretability [10]. Predicting stock market returns accurately is quite difficult because of the volatile and non-linear characteristics of financial stocks markets [15]. The advent of artificial intelligence and enhanced computational power has demonstrated that programmed prediction methods are more effective in forecasting stock prices [14]. In this study, Random Forest and Artificial Neural Network. Methods have been employed to forecast the next day's closing price for five firms from various sectors of activity. The financial data, including Open, High, Low, and Close prices of stocks, is utilized to generate new variables that serve as inputs forthe framework. The models are assessed using conventional strategic metrics: RMSE and MAPE. The reduced figures of these two metrics demonstrate that the models effectively forecast stock closing prices [19].

Dataset

The dataset utilized in this research is obtained from Kaggle, a popular platform for open-source datasets that aids data science and machine learning studies [28]. The dataset includes historical stock market information gathered from various companies and indices, offering an extensive depiction of financial market activity [31]. It encompasses essential features like opening price, closing price, highest and lowest price, trading volume, and adjusted closing price, covering multiple years of trading records. These characteristics are crucial for capturing time-related dependencies and price variations, rendering the dataset extremely appropriate for predictive modeling [31]. Data will be prepared for analysis by applying standard preprocessing methods, which include addressing missing values, normalizing data, and scaling features to maintain stability during model training [27]. Moreover, time-series segmentation will be conducted to convert raw stock prices into organized input sequences, allowing the model to grasp both short-term and long-term market trends. Features derived like moving averages, relative strength index (RSI), and volatility indicators will be included to improve the model's predictive power [29]. The dataset will be split into training, validation, and testing subsets to guarantee a thorough assessment of the suggested method [16]. Additionally, data augmentation methods like sliding window techniques will be utilized to enhance the variety of input sequences, minimizing the likelihood of overfitting and boosting generalization on new data. Utilizing this Kaggle dataset, the research gains access to a comprehensive, real-world financial dataset that serves as the basis for creating and assessing the suggested deep learning model for predicting stock market trends

PROPOSED METHODOLOGY

The proposed methodology employs a hybrid framework integrating Long Short-Term Memory (LSTM) networks and Extreme Gradient Boosting (XGBoost) for robust stock market trend prediction. The hybrid design leverages the temporal sequence learning ability of LSTM and the non-linear feature interaction strength of XGBoost, ensuring improved generalization and predictive accuracy compared to standalone models.

Data Preprocessing

Historical stock market data from Kaggle is preprocessed to remove missing values, normalize attributes, and engineer additional features. Technical indicators such as Moving Average (MA), Relative Strength Index (RSI), and volatility are derived to enrich the input space. Formally, for a stock price.

$$\text{Xt} = \{\text{Pt}, \text{MAt}, \text{RSIt}, \sigma\text{t}, \dots\} \quad (4.1)$$

where MAt denotes the moving average, RSIt the relative strength index, and σtthe rolling standard deviation. The data is segmented into fixed-length windows of size n, such that each training instance is represented as:

$$Si = \{Xi, Xi+1, \dots, Xi+n-1\} \rightarrow yi = Xi + n(close) \quad (4.2)$$

where yiy_iyi is the target representing the future stock trend.

Feature Extraction

$$ft = \sigma(Wf \cdot [ht-1, xt] + bf), it = \sigma(Wi \cdot [ht-1, xt] + bi) \quad (4.3)$$

where ft,it,ot are forget, input, and output gates, respectively. The final hidden representation ht serves as the latent embedding capturing temporal dynamics of stock price movements.

Predictive Modeling

The embedding hth generated by LSTM are used as input features to **XGBoost**, which constructs an ensemble of decision trees through gradient boosting. For each stage mmm, the boosted model is updated as:

$$Fm(x) = Fm-1(x) + \eta \cdot hm(x) \quad (4..4)$$

where Fm−1(x)is the prediction from the previous iteration, hm(x)is the newly added regression tree, and ηis the learning rate controlling the contribution of each tree. Regularization terms are incorporated into the objective function to prevent overfitting, defined as:

$$L = i = 1\sum Nl\left(yi, y^i\right) + k\sum\Omega(hk) \quad (4.5)$$

where lis the loss function and Ω penalizes model complexity.

Evaluation

To guarantee the strength and real-world relevance of the suggested hybrid model, we implement an extensive assessment approach. The dataset is divided chronologically into training, validation, and testing sets to prevent temporal leakage. The model's performance is evaluated using various metrics, including Accuracy, Precision, Recall, F1-score, and regression metrics like RMSE and MAE, offering a comprehensive perspective on predictive quality. Additionally, to tackle the opaque characteristics of deep learning and ensemble models, we integrate Explainable AI (XAI) methods like SHAP (SHapley Additive exPlanations) and LIME (Local Interpretable Model-Agnostic Explanations). These techniques enable us to determine the key features influencing predictions, thus enhancing the clarity of results for stakeholders [19]. SHAP analysis distinctly reveals the top-10 features influencing model predictions, allowing for possible feature reduction without sacrificing performance or potentially enhancing it [27]. This phase guarantees that the suggested model is both precise and clear, rendering it appropriate for facilitating informed choices in critical financial settings [29].

Evaluation Parameters and Significance

The performance of the system should be evaluated in terms of the accuracy of classification. It is worth mentioning that a comparative analysis is done based on the common and overlapping data

Accuracy (Ac): It tells us about the exactness set of the different methods. The critical parameters are:

The classification accuracy is computed as:

$$\boldsymbol{Ac = \frac{TP+TN}{TP+TN+FP+FN}} \textbf{(1.1)}$$

The precision is computed as

$$\boldsymbol{Pr = \frac{TP}{TP+FP}} \textbf{(1.2)}$$

The F-measure or F-Score is computed as:

$$\boldsymbol{F-Measure = 2.\frac{Precision*Recall}{Precision+Recall} = F-Measure = \frac{TP}{TP+\frac{1}{2}(FP+FN)}} \quad \textbf{(1.3)}$$

Here,

(TP): True Positive

(TN): True Negative

(FP): False Positive

(FN): False Negative

EXPERIMENTAL RESULTS

The assessment of the suggested LSTM–XGBoost combined model for detecting depression reveals its high efficiency in recognizing depressive traits in textual information. The model was trained and validated using a labeled dataset and later evaluated on new data to measure its performance. The main metric used for evaluation was accuracy, which assesses the ratio of correctly identified instances to the overall count of samples. The hybrid model reached an accuracy of 98.4%, highlighting its strong ability to differentiate between depressive and non-depressive content. The findings also suggest that the model exhibited stable performance throughout both training and validation stages, affirming its capability to generalize well to new, unfamiliar data. This resilience underscores the advantages of the hybrid method, which merges the contextual representation capabilities of LSTMembedding with the classification prowess and interpretability of XGBoost. Furthermore, the fully automated pipeline—comprising preprocessing, feature extraction, model training, and evaluation—guarantees scalability and efficiency for real-world implementation. Through the combination of sophisticated deep contextual embeddings and an ensemble classifier, the suggested hybrid model attains impressive predictive accuracy while also offering a dependable framework for practical mental health monitoring uses Overall, the evaluation confirms the potential of the proposed methodology to serve as an effective tool for depression detection, contributing to early identification and intervention for mental health challenges.

CONCLUSION

In this study, we implemented a hybrid approach combining LSTM and XGBoost to predict stock market trends and compared it with a conventional Deep Neural Network (DNN) model. The hybrid model demonstrated superior performance across key regression metrics, including RMSE, MSE, MAE, and MAPE, achieving a lower error rate and higher pseudo-accuracy (100 − MAPE). The visualization of metrics, residuals, and correlations further confirmed the hybrid model's ability to capture temporal dependencies and non-linear patterns in stock price movements more effectively than a standalone DNN. Overall, the hybrid approach proves to be a promising strategy for enhancing prediction accuracy in financial time series analysis.

Future Scope

Future research can focus on enhancing the hybrid model by incorporating additional features such as macroeconomic indicators, news sentiment, and company-specific financial ratios to improve predictive performance. Exploring more advanced hybrid architectures, including LSTM combined with Transformers or attention mechanisms, may further capture complex temporal and non-linear patterns. Extending the model for multi-step forecasting, deploying it in real-time stock prediction frameworks, and leveraging ensemble techniques can increase robustness and generalization. Additionally, integrating explainable AI approaches will help in interpreting the model's predictions and understanding the key factors driving stock trends.

ABSTRACT

Artificial Intelligence (AI) applications such as ChatGPT, Google Bard, and educational platforms have transformed modern learning environments. This research investigates the impact of AI tools on student learning effectiveness, productivity, and academic engagement. A survey-based quantitative approach was adopted with responses collected from 120 undergraduate and postgraduate students. The results show that 82% of students experienced increased productivity, 75% reported better concept understanding, while 38% indicated concern about dependency on AI tools. The study confirms AI as a beneficial academic assistant, though cognitive dependence and ethical usage remain key challenges.

Keywords: AI Tools, Student Productivity, Academic Performance, Artificial Intelligence in Education, Learning Analytics

INTRODUCTION

Artificial Intelligence (AI) has rapidly transitioned from a theoretical concept into an indispensable technological companion in the educational ecosystem. With advancements in machine learning, natural language processing, and neural networks, AI tools are now widely integrated into learning environments ranging from schools to higher academic institutions. The emergence of conversational AI systems such as ChatGPT, Google Gemini, and Microsoft Copilot has transformed traditional learning practices into intelligent, interactive, and personalized educational

experiences. AI-powered platforms assist students in multiple dimensions — providing real-time doubt clarification, automated content generation, essay structuring, grammar correction, programming assistance, test preparation, and language translation. Personalized learning algorithms analyze individual learning patterns and deliver tailored educational resources, thereby enabling learners to move beyond the limitations of textbook-based, one-size-fits-all teaching approaches. This shift aligns with modern pedagogical needs, promoting self-paced learning, accessibility, inclusivity, and continuous academic support. Despite its transformative potential, AI adoption in education brings significant concerns. Excessive reliance on AI-generated responses may diminish students' intrinsic ability to think critically, analyze independently, and solve complex real-world problems. Over-dependence can also discourage creativity, reduce academic originality, and create ethical risks such as plagiarism and misinformation. Additionally, digital inequality — lack of access to devices or stable internet — may further widen the academic performance gap among students. Given the dual nature of AI as both an enabler and a potential barrier to self-learning, it becomes essential to assess student perception, behavioral adaptations, and learning outcomes associated with AI usage. This research aims to understand how extensively students rely on AI tools for academic tasks, the nature of assignments assisted by AI, and the perceived benefits versus challenges in academic performance and cognitive skill development. This study employs a survey-based methodology to collect real user feedback from students, analyze the impact of AI on their learning habits, and evaluate whether AI acts as a supportive learning companion or inadvertently weakens foundational cognitive skills. The findings will help educators and policymakers develop balanced strategies that encourage responsible AI usage while preserving independent thinking and problem-solving abilities of learners.

Literature Review

1. AI in Education: scope and trends

Artificial Intelligence (AI) has rapidly permeated education, from adaptive tutoring systems to conversational agents and automated assessment tools (UNESCO, 2023). Global reviews indicate that AI adoption improves access, personalization, and scalability of educational interventions, enabling institutions to deliver differentiated learning at scale (OECD, 2023; McKinsey, 2024). The AI Index and industry reports highlight increasing institutional investments in AI-enabled platforms and the rapid emergence of generative-AI tools (Stanford AI Index, 2024; PwC, 2024).

2. Personalization and learning outcomes

A major promise of AI is personalized learning—systems that adapt content, pace, and feedback to individual learners' needs. Empirical studies show that personalization driven by learner models can improve retention and conceptual understanding, particularly in STEM subjects (Huang *et al.,* 2022; Li, 2022). Randomized and quasi-experimental evidence suggests that AI tutors and recommendation engines increase learning gains compared with one-size-fits-all instruction, though effect sizes vary by context and subject matter (Al-Mamun *et al.,* 2023; Chen & Wang, 2021).

3. Productivity gains: time, efficiency and task completion

Beyond learning gains, AI tools influence student productivity — measured as time-to-completion, volume of tasks completed, and perceived efficiency. Industry and academic surveys report that students using AI assistants (for drafting, summarization, and code debugging) save time on routine tasks and reallocate effort toward higher-order activities (Harvard Business Review, 2023; McKinsey, 2024). Quantitative analyses find higher assignment throughput and reduced drafting time among frequent AI users, though gains depend on digital literacy (Dwivedi *et al.*, 2023).

4. AI, cognitive skills and critical thinking: mixed evidence

While many studies highlight benefits, a parallel literature warns of negative externalities. Over-reliance on AI-generated content can blunt critical thinking, problem-solving, and originality if students accept outputs without verification (Rahman & Patel, 2024; Fang & Zhang, 2020). Some experimental work shows that scaffolding is

necessary: when AI is used as a support (not a replacement), students demonstrate better meta-cognitive strategies than those who outsource problem-solving entirely (Deng *et al.,* 2020; Yousefpour *et al.,* 2019).

5. Student attitudes, acceptance and moderating factors

Technology Acceptance Model (TAM) and UTAUT remain widely used frameworks to explain AI adoption in education (Davis, 1989; Venkatesh *et al.,* 2003). Perceived usefulness and perceived ease of use predict uptake; social influence and facilitating conditions further moderate behaviour. Studies indicate that positive attitudes toward AI and higher digital literacy amplify the benefits of AI for both learning and productivity (Chen & Wang, 2021; Al-Mamun *et al.,* 2023).

6. Equity, access and the digital divide

A recurring managerial concern is equity. Institutional reports and academic reviews note that unequal access to devices, bandwidth, and digital skills may widen educational disparities when AI tools are integrated without supportive infrastructure (UNESCO, 2023; OECD, 2023). Research shows that marginalized students benefit less from AI unless complementary policies (device provisioning, training) are in place (McKinsey, 2024).

7. Ethical, academic integrity and governance issues

Generative AI raises questions about authorship, plagiarism, and the veracity of machine-generated content (UNESCO, 2024; Patel, 2024). Several recent policy papers call for institutions to adopt AI-literacy programs, detection tools, and ethical guidelines to mitigate misuse and preserve assessment validity (Harvard Business Review, 2023; UNESCO, 2024).

8. Measurement approaches and methodological notes

Most empirical studies use mixed methods—surveys for perception and self-reported productivity, experimental or quasi-experimental designs for learning gains, and log-data analytics for usage patterns (Li, 2022; Al-Mamun *et al.,* 2023). Common metrics include: standardized test scores, assignment grades, time-on-task, task completion rates, Likert-scale measures of perceived productivity, and engagement metrics drawn from learning platforms. Studies frequently emphasise the need for triangulation (survey + objective performance) because self-reports may overestimate benefits (Dwivedi *et al*., 2023).

Research Gap

1. **Integration of productivity and learning outcomes:** Many studies examine either learning gains or productivity separately; fewer combine both using the same sample and consistent metrics.
2. **Role of mediators (digital literacy, attitude):** While TAM/UTAUT explain adoption, empirical assessments of how these factors *mediate* AI's effect on both learning and productivity are limited.
3. **Context-specific evidence from developing countries:** Much of the literature is US/Europe-centric; evidence from Indian higher-education contexts remains sparse.
4. **Managerial implications and institutional policy studies:** There is limited applied research advising academic managers on operational strategies (training, monitoring, assessment redesign) to incorporate AI responsibly.
5. **Longitudinal evidence:** Few longitudinal studies track whether short-term productivity gains translate into durable skill development and workplace readiness.

Objective

- To analyze the impact of AI tools on student learning outcomes and academic productivity.

Specific Objectives

1. To measure the extent and purpose of AI tool usage among students.
2. To evaluate the effect of AI tools on student learning outcomes such as understanding, performance, and academic achievement.

3. To assess the role of AI tools in improving student productivity (e.g., time efficiency, task completion, accuracy).
4. To analyze the influence of digital literacy on the effective use of AI tools in learning.
5. To determine how student attitudes toward AI affect learning outcomes and productivity.
6. To identify the potential risks associated with AI usage such as dependency, reduced critical thinking, or academic dishonesty.
7. To provide recommendations for effective and ethical use of AI in education.

METHODOLOGY

Data Collection Method

Primary data was collected through a structured online questionnaire distributed to university and college students. The questionnaire consisted of closed-ended and Likert-scale questions designed to measure the frequency of AI tool usage, learning outcomes, productivity improvements, and student perceptions. Google Forms was used to disseminate the survey due to its accessibility and simplicity. Secondary data for background and support literature was obtained from academic journals, conference proceedings, and trusted online databases like IEEE, Scopus, and Google Scholar.

Target Population and Sampling

The target population of this study includes undergraduate and postgraduate students who have experience using conversational AI platforms, AI-assisted writing tools, and learning-support applications. A convenience sampling technique was applied, selecting respondents based on accessibility and willingness to participate. Approximately 120 students were approached to ensure an adequate response size for quantitative analysis, ensuring reliability and validity of findings. Only students who reported having prior experience with AI tools for academic purposes were included in the study.

Research Instrument

A structured questionnaire was used as the primary data collection instrument. It was divided into sections to collect demographic data, AI usage patterns, perceived learning enhancement, productivity improvement, and challenges associated with AI usage. Responses were recorded on a five-point Likert scale ranging from "Strongly Disagree" to "Strongly Agree," ensuring ease of analysis and interpretation. The questions were designed to measure students' frequency of AI use, confidence in learning, time efficiency, and academic support derived from AI systems.

Data Analysis

The data collected through the questionnaire was organized and analyzed using statistical tools such as Microsoft Excel and SPSS. Descriptive statistics, including mean scores, percentage distribution, and standard deviation, were used to summarize the responses. Correlation analysis was conducted to determine the relationship between AI usage and student outcomes, helping to interpret whether increased AI interaction enhances or hinders learning and productivity. Graphical representation techniques such as bar charts and pie charts were also used to visualize findings clearly.

Ethical Considerations

Ethical research standards were followed throughout the study. Respondents were informed about the purpose of the research, and participation was voluntary. Confidentiality was maintained by ensuring that no personal or identifiable data was collected. The information provided by participants was used solely for academic research purposes, and respondents had the right to withdraw at any stage of the data collection process.

Limitations of the Study

This study is limited by the size and scope of the sample, which may not fully represent all student groups or institutions. Additionally, the study relies on self-reported data, which may be subject to bias or inaccurate self-

assessment. As the study is cross-sectional, it captures perceptions at a single point in time rather than tracking changes over a longer period.

ER Diagram (Data Design)

DISCUSSION

The purpose of this study was to examine the impact of AI tools on student learning and productivity among college students in Bangalore. The findings clearly indicate that AI has become a widely adopted educational support system, especially with the rapid rise of platforms such as ChatGPT, Gemini, Grammarly, and Canva. A majority of students reported using AI on a daily or weekly basis, demonstrating that AI is now deeply integrated into the academic environment. The results suggest that AI tools significantly enhance learning efficiency, conceptual clarity, and academic performance. Students reported faster assignment completion, improved grammar and writing quality, and better understanding of complex academic topics. These results are consistent with existing literature that highlights the potential of AI to personalize learning, automate feedback, and provide instant support for academic queries. However, the study also highlights potential concerns regarding over-dependence on AI. Nearly one-fourth of students reported reduced independent problem-solving ability, and more than half expressed concern regarding misinformation and ethical issues such as plagiarism. This aligns with emerging research which warns that uncontrolled AI usage may negatively influence students' critical thinking abilities and originality. Another key finding is that students perceive AI as a supporting tool rather than a replacement for learning. Although AI improves academic productivity, students understand that excessive reliance may hinder their creativity and analytical skills. This indicates a maturing understanding of AI among learners, where the tool is used strategically rather than blindly.

Overall, the findings highlight a dual effect:

- **Positive side:** improved performance, faster learning, greater confidence.
- **Risk side:** dependency, reduced independent thinking, ethical challenges.

Therefore, educational institutions should encourage responsible integration of AI through awareness programs, digital literacy, and guidelines for academic use. AI should complement learning, not replace student thinking. Proper orientation policies may help ensure students use AI ethically and develop balanced academic skills.

Implications

Academic Implications

The findings emphasize that AI can act as a supplementary learning tool that improves comprehension, writing skills, and productivity. Educators can integrate AI-powered learning platforms into coursework, digital classrooms, and academic skill-building workshops to enhance personalized learning. However, structured academic monitoring must be implemented to avoid misuse or academic dishonesty.

Institutional Implications

Colleges and universities should recognize AI literacy as an essential digital skill. Institutions can create:

- AI awareness programs
- Training sessions for responsible usage
- Policies addressing plagiarism and over-dependence

By doing so, students can benefit from AI while maintaining originality and academic integrity.

Professional & Industry Implications

The study indicates that students are increasingly utilizing AI for analytical learning and task execution, which reflects future workplace trends. Corporates and recruiters may expect graduates to possess AI-assisted problem-solving abilities. Hence, universities must prepare students with ethical and productive AI usage habits to meet evolving industry demands.

Societal Implications

As AI becomes part of day-to-day learning, society must encourage digital responsibility. Parents, educators, and policy-makers must guide students to balance creativity with technology, ensuring AI acts as a learning assistant, not a replacement for human thinking.

CONCLUSION

This research concludes that AI has a positive and transformative impact on student learning and productivity. The majority of students reported improved academic performance, faster completion of assignments, and better clarity in understanding complex topics. AI-powered tools have enhanced personalized learning, language ability, and technical problem-solving. However, the study also identified risks related to excessive dependency, reduced independent thinking, and challenges concerning originality and ethics. Therefore, AI should be used with structured guidance and ethical awareness. When applied responsibly, AI tools can significantly support academic growth and future employability skills. The study reinforces that AI is not a substitute for student effort but a powerful educational partner when used with discipline and critical thinking.

ABSTRACT

This review article depicts comprehensive study on foxtail millets, in view of its nutritional value, history and health benefits. In past few years the nutritional significance, health benefits, and culinary versatility of foxtail millet are meticulously examined. Originating from regions challenged by adverse agricultural conditions, foxtail millet emerged as a resilient and indispensable cereal. The study was drawn form peer-reviewed journals, different databases and unconventional sources. The review focuses on the characteristics, origin, nutritional profile and health benefits of foxtail millets. Researchers have explored its rich protein content, digestibility, fats, dietary fiber, and unique functional components, unraveling its potential as a functional food source. Foxtail millet, with its remarkable attributes, emerged as a promising solution for global food security challenges. Embracing its nutritional prowess and adaptability in various cuisines holds the promise to foster healthy diets and sustainable agricultural practices worldwide. This paper illuminates the profound health advantages linked to foxtail millet consumption, including its impact on diabetes management, cardiovascular health, immune system, fortification, and cancer prevention. It showcases a diverse range of foxtail millet-based products resulting from innovative processing techniques, enhancing both nutritional diversity and economic viability.

Keywords: Bioactive compounds glycemic index global food security

INTRODUCTION

Millet might not be as famous as wheat, rice, or maize, but it's incredibly important, especially in hot and dry areas. Millions of people depend on it for food, especially in places where it's hard to grow other major crops. Unlike these other grains, millet can grow well even in tough conditions with little rainfall. It belongs to a group of plants that includes maize, sorghum, and Coix (Job's tears) (Sachdev *et al.,* 2023).Millets are unique grains since they are high in calcium, dietary fibre, polyphenols, and protein. They include important amino acids, particularly sulfur-containing amino acids such as methionine and cysteine. Millets have a greater fat content than other grains such as maize, rice, and sorghum (Hegde *et al.* ,2025). They lack in amino alkanoic chemicals such as lysine and tryptophan, but they are high in vitamins and minerals. People all across the world consume these plant nutrients, particularly those found in cereal grains. The nutritional value of various millets, such as kangni, fonio, proso, pearl, and finger millets, varies (Table-1) (Jacob *et al.,* 2024). Millets come in many varieties, with four main types: bajra makes up around 40% of global production, followed by Foxtail (Kangni), Chena and Ragi. Bajra has the biggest seeds and is commonly eaten by people (Aman *et al*., 2024). Foxtail millet has a characteristic cultivated plant form that is distinguished by a single stalk or a few tillers. Its enormous inflorescences develop in a consistent manner. A mature foxtail millet plant can grow to be 120-200 cm (3.9-6.6 ft) tall, with thin, erect, and green stems. The leaves are smooth and with no hair, spreading in an arc, while the stems are upright and thin, with hollow internodes. A bristly panicle grows from the apex of these stems & can reach a length of 5-30 cm. This panicle is typically reddish or purple in colour, adding to the foxtail millet plant's particular visual qualities (Singh *et al.* 2017). Foxtail millet is also known as Kangni. It falls under the category of minor millets due to its diminutive grain size. Its significance lies in ongoing efforts toward crop improvement, focusing on understanding its genetic and genomic features. Kangni (S. Italica) is a vital crop, serving as a basic food in various areas of the world, particularly in arid and semi-arid regions of China, certain regions in India and Japan. Additionally, it is cultivated for silage and hay in both South and North America (Namata *et al.,* 2025). Researchers have studied its chemical composition, pretreatment and processing operations on nutrient and antinutrient content, flour functionality, and the development of innovative eatables using its diverse germplasm, C4 photosynthetic pathway, and compact genome. Furthermore, research on packaging and storability has been conducted. The scientific world has been attracted by the unique agronomic characteristics of foxtail millet, its environment sustainability, the economic goods, provide to farmers, and the good influence on human health coming from its intake or derived food items. Researchers are still investigating and harnessing the therapeutic benefits of foxtail millets for agricultural and nutritional breakthroughs (Kaur *et al.,* 2024).

History, origin and domestication of foxtail millet

Foxtail millets (Kangni), or Setaria italica, is a domesticated form of S. viridis, its wild parent. It was first discovered in the Yellow River valley of Northern China, in the ruins of Cishan and Peiligang, between 7400 and 7935 years ago (Kumar *et al.* 2021). Cultivated foxtail millet (Setaria Italica) has been divided into three main groups by researchers: the Chinese group, which includes China, Japan, and Korea; the tropical group, which includes Taiwan, India, and Kenya; and the European group. Studies employing polymorphic isozymic loci on 223 and 45 accessions of S. Italica and its wild cousin S. Viridis, respectively, were used to establish these classifications. Wild populations from China and Europe may have added unique genetic variety to domesticated forms, increasing interregional diversity within species rather than interspecies diversity (Wang *et al.,* 2010 and Mamidi *et al.,* 2020) found genetic evidence in favour of foxtail millet's monophyletic Chinese origin. Further research showed that the domestication of foxtail millet was greatly aided by China, the main centre of variation. Comparative analyses distinguished S. Italica accessions from their wild parent, green millet, by revealing features such as larger inflorescences, intricate branching patterns, and loss of seed dormancy (Table-2) (Diao *et al.,* 2017). Foxtail Milletsare becoming more and more popular not just in Asian and African nations but over the world. It is being included in everyday diets in a variety of forms, including beverages, ready-to-eat snacks, in different meals with variations in dishes, etc. The functional components of foxtail millet concentrate during milling, enabling the creation of infant meals, snacks, nutritional foods, and classic sweets. Furthermore, in a variety of culinary creations, this gluten-free flour can partially substitute wheat flour(Table 3). Studies have demonstrated the superior nutritional, physical, rheological, and sensory properties of dishes prepared

with foxtail millet. Numerous conventional and commercially available food items derived from foxtail millet have been created. These goods demonstrate the foxtail millet's adaptability and culinary potential.

NutritionalProfile of Foxtail Millet

Foxtail Milletswhen comparedwith other cereals in terms of nutritional value, protein content, and macronutrient composition, they exhibit high values. They are an essential component of diets for both humans and animals due to their high calorie content, as well as the presence of lipids, high-quality proteins, calcium, iron, and zinc. They are also an excellent source of vitamins and dietary fibre(Tripathi *et al*., 2023).

Protein

Foxtail Millet seeds are richin protein, which makes up a big part of the seed's weight. Different types of millets have different kinds of proteins. Researchers have studied these proteins and found that foxtail millet, in particular, has proteins that can be added to food products at a low cost. Some studies identified specific proteins in foxtail millet, like albumin and gliadin. These proteins make up about 11.54% out of 100 grams of kangni (Makwana *et al*., 2025) and also reported that a protein called prolamine the main storage protein in foxtail millets. The amount of this protein varies between different types, ranging from 41 to 77.5 per cent of the total protein (Fig-1&2). The degree to which our body can readily absorb and utilize proteins is known as its digestibility. When consumed, foxtail millet protein goes through many stages of breakdown, culminating in the breakdown of short polypeptides, di- and tripeptides, and individual amino acids. This mechanism has been studied using in vitro enzyme techniques by scientists. They observed that raw foxtail flour had an IVPD (In Vitro Protein Digestibility) of 92.95% using a papain enzyme structure, 26.8% with trypsin and 95.5% with pepsin. Cereal proteins are digested differently depending on a number of internal and environmental conditions. Certain amino acid patterns found in cereal proteins, such as proline-rich regions, make them resistant to digestion. Furthermore, wheat proteins' folded shapes restrict enzyme access to their substrate, which influences how easily they are broken down (Kalsi *et al.* 2023).

Fat

Fat is an important energy source for our body, twice as many calories as carbs, fat is a vital source of energy for our bodies. Unsaturated fatty acids make up more than 80% of the fat in millet. The fat content of numerous Chinese foxtail millet varieties ranges from 3.38 to 6.49 per cent, according to the researchers. The principal fatty acids present in millet are linoleic acid, oleic acid, palmitic acid, stearic acid, and linolenic acid. Breeding programs can be used to increase the fat content and composition by cultivating particular kinds in various places. Among cereal grains, foxtail millet is special because it has a well-balanced combination of several beneficial ingredients. Due to its many nutritional and physiological advantages, foxtail millet has been the subject of several research, all of which suggest that it has significant potentialingredient to be consumed.With a fat content of 3.9%, it adds to the richness of its nutritional profile, making it a valuable dietary choice (Kim *et al.* 2010).

Dietary fibre

Dietary fibers in foxtail millet offer numerous positive effects on our body, including improved digestion, reduced cholesterol, and lower blood sugar levels. These fibers, akin to those found in soy, aid in digestion and help regulate blood glucose levels. Research indicates that these fibers can slow down glucose absorption in the gut, enhance insulin sensitivity, and thereby reduce the risk of diabetes. Besides fibers, other components in foxtail millet also confer health benefits. Foxtail millet protein, constituting 19.1% of its nutritional content, is particularly beneficial for individuals with type 2 diabetes and heart problems. Additionally, antioxidants present in foxtail millet can prevent the oxidation of bad cholesterol, lower triglyceride levels, and alleviate inflammation. Moreover, a foxtail millet extract has been shown to protect against complications related to diabetes and enhance the body's response to disturbed cholesterol levels in diabetic individuals (Rao *et al*., 2017).

Starch

In addition to being used in food, starch is also a key ingredient in the paper, textile, and pharmaceutical sectors. Starch in millet naturally varies in content, structure, and characteristics. For instance, the primary carbohydrate

found in foxtail millet, starch, makes up 59.1% of its nutritious value. The health advantages of functional components like starch are dependent on how well our bodies are able to absorb and digest them. At the time of boiling, starch increases its digestibility, some of it still defies our digestive enzymes. This resistant starch, which makes up a substantial amount of foxtail millet, is beneficial to human health in many ways, particularly when it comes to controlling blood sugar levels, illnesses linked to a long-term diet, cognitive function, and weight control(Babu *et al.,* 2023).

Functional components of foxtail millet

Due to its particular nutritious balance and abundance of health-promoting ingredients, foxtail millet is a remarkable cereal. Starch, protein, fibre, fat, vitamins, and minerals are among its primary ingredients. The nutritional value and sensory aspects of foxtail millet, such as aroma, taste, and appearance, are influenced by its distinct composition. Determining these functional elements is essential to breeding programs that are effective and to quality control. Using chemometrics in conjunction with near-infrared spectroscopy (NIRS) is one efficient way to do this. This method provides a quantitative analysis of protein, fat, carbohydrate, and amino acid composition in a non-destructive and cost-effective manner. Studies conducted on foxtail millet from six Chinese provinces revealed a range of crude protein contents: 11.85% to 20.58%, crude fat contents: 2.82% to 4.47%, and total starch: 65.59% to 74.12% (Arora *et al.,* 2023).

Processing techniques to reduce anti-nutritional factors

Many techniques are used during the processing of foxtail millet with the goal of minimizing the amount of compounds that have anti-nutritional effects. These materials may reduce the millet's nutritious content and availability. The anti-nutritional materials are not dispersed uniformly throughout the grain. Thus, techniques including extrusion, grinding, boiling, sprouting, and fermentation are employed to mitigate these impacts and enhance foxtail millet's nutritional availability. Numerous methods have been investigated to improve foxtail millet's nutritional, sensory, and financial qualities. For example, a research by (Pawar *et al.,*2006) found that basic procedures like peeling, soaking, and heating may boost protein digestibility by 32.71% and lower anti-nutritional content by almost 50%. Scholars such as (Wang et al, 2022)have investigated techniques including drying, flaking, extrusion, and decorticating. In addition to customary popping and roasting techniques. It was discovered that sprouted grains have the best nutritional makeup. Functional characteristics such as solubility, swelling capacity, and oil and water absorption are not much changed by processing techniques. These techniques can effectively prepare items made from foxtail millet, improving their overall quality and nutritional content (Yang *et al.,* 2022)

Bioactive compounds

Millets are abundant in a variety of bioactive compounds—substances that benefit health in ways other than their basic nutritional value. The development of nutraceuticals depends heavily on these bioactive chemicals, which also help prevent degenerative diseases.

Phenolic Substances

Phenolic Substancesare a group of substances with a special structure. They havean aromatic ring along with oxygen and hydrogen atoms. There are three main types: lignans, flavonoids, and phenolic acids. Different types of these compounds are found in brown and white varieties, with brown ones having more. These compounds are good for health and can prevent diseases like cancer and heart problems. They are known for their antioxidant properties, which means they can protect the body from damage. Eating foods with these compounds can make one healthier and reduce the risk of long-term illnesses (Wu *et al*., 2025).

Flavonoids

Plants contain unique chemicals called flavonoids. Their structure consists of two ring-like sections, another ring with multiple components, and fifteen carbon atoms. A few flavonoids that are beneficial to health are tannin, anthocyanin, quercetin, and catechin. The ability of these molecules to shield body from harmful chemicals makes them essential. The leaves of millet contain various kinds of flavones. When the pH is basic, these flavones give millet

flour its yellow-green hue. The only kind of millet with condensed tannins is foxtail millet. Compared to white finger millets, yellow foxtail millets contain larger concentrations of these tannins. The range of tannins for is 0.12% to 3.47% (Zhang *et al.,* 2021). Carotenoids are unique pigments present in many foods that come in over 600 different varieties. They are well-known for their provitamin-A activity, which implies that they may be converted to vitamin A in human bodies. Aside from that, carotenoids are crucial because they act as antioxidants, protecting our systems from a variety of ailments. Carotenoids are found in varied levels in millets such as finger, small, foxtail, and proso millets. Vitamin E, which occurs in eight distinct forms, is another crucial nutrient. There are around 3.6-4.0 mg of Vitamin E per 100 gm in finger millet, and approximately 1.3 mg per 100 g in foxtail and tiny millet variants. Vitamin E is an antioxidant that also decreases inflammation and has other health advantages (Shen *et al.,* 2015).

Phytosterols

Phytosterols are present in plants and resemble cholesterol in structure. They are essential to the composition and operation of plant cells. While phytosterol esters have no effect on HDL cholesterol levels—the "good" cholesterol—they can help lower blood levels of LDL cholesterol, or the "bad" cholesterol, by as much as 14%. Daily consumption of phytosterols can reduce the risk of heart disease by as much as 40%, though this varies depending on factors such as age. Nevertheless, phytosterols may also reduce the absorption of vital minerals such as vitamin E and beta- and alpha-carotene.Finger millet has a greater sterol content than other millets, with a claimed 0.149% based on grain weight, whereas other millets only have negligible quantities of sterols (Narumi et al., 1999).

Health BENEFITSofFoxtail Millets Diabetes

It has been reported that regular consumption of foxtail millet might minimize hepatic gluconeogenesis (glucose produced from the liver) in diabetes(Ren et al.,2018). The complex carbohydrates and dietary fiber in it are slowly digested by the body which results in the increase in blood glucose levels. It is gluten-free and can help reducing inflammation in diabetes patient. Immunity booster made from natural ingredients regulates blood sugar level and enhances digestion. It can be consumed in a few ways for diabetes. When foxtail millet is compared to whole wheat, it has a low glycemic index. This ensures a gradual release of glucose and avoids intake of fructose. When comparing their glycemic index, bajra has a lower GI than foxtail millet. Because of its modest glycemic index, foxtail millet is regarded as the ideal grain to include in a diabetic's meal plan. The tannin-rich bran of foxtail millet secretes enzymes that can inhibit the absorption of sugar and carbohydrates in the body. It helps to treat diabetes by regulating glucose levels and insulin sensitivity in the body. Apart from these benefits, it is abundant in fiber, thiamine, niacin, riboflavin, and folate, which delay gastric emptying, reduce glucose release and absorption and prevent blood sugar rises. Hepatic gluconeogenesis can be reduced by eating Jowar roti on a regular basis (Mohanan *et al.,* 2025).

Cardiovascular disease

Foxtail millets also contains, phenolic acids and flavonoids including tannins and anthocyanins which are powerful antioxidants that have been shown to prevent cardiovascular disease which is a major and growing concern in todays life. However, foxtail millets has potential to lower the cholesterol levels. Because of its ability to lower the quantity of bile reabsorbed in the intestine dietary fiber foxtail millet aids in the reduction of low-density lipoprotein cholesterol (LDL) which is bad cholesterol(Chen et al., 2017). The anthocyanins present infoxtail millet has an effective ability to preventing free radical, which prevent lungs to damage, reduce high cholesterol, enhance vitamin C function, strengthen collagen, and protect eyesight. Surprisingly, some foxtail millet types have been shown to contain even more anthocyanins than blueberries, a well-known source of the beneficial component (Hou *et al.,* 2018).

Celiac disease

It is a state in which gluten (protein) causes serious damage to the villi and affect gastrointestinal function. Therefore, it is critical for patients to consume exclusively gluten-free foods. Foxtail millet is a wonderful cereal for celiac disease patients because its gluten-free cereal. As a gluten-free food, foxtail and its products might be a wonderful alternative for those who are gluten intolerant (Moreno *et al.,* 2014).

Cancer

Foxtail millet is a Cancer-fighting grain. It contains tannins which are chemicals that can help fight against cancer. It is also high in phenols, that helps to prevent cancer by inhibiting the genesis, propagation, and growth of multiple forms of cancer, such as colon, lung, and cancers of the breast, which are of the top reason of death, which also help to reduce the tumor size. Many phytochemicals with antioxidant and anticancer activities are present in foxtail millets such as gallic acid, caffeic acid,ferulic acid, and other remarkable phenols that protect against cancer, which could decrease the tumor growth. The 3-deoxyanthocyanins (3-DXA) chemicals which are predominantly found in dark-colored foxtail millet have been proven to have stronganti-proliferative properties in human colon cancer cells.Foxtail millet consumption has been linked to lower breast cancer, which is fatal disease among women all around the world (L Yang *et al*. 2009). It was also found that women who consume 30g of fiber daily can decrease their risk of breast cancer by up to 50%. Foxtail millet is rich in fiber, making it an excellent dietary choice. Additionally, it can assist in reducing excess fats, which can lead to hormonal imbalance in women. Adding foxtail millet to diet can be beneficial for overall health (Gupta *et al*, 2023).

CONCLUSION

Foxtail millet, often overshadowed by more popular cereals, stands as a nutritional powerhouse with immense potential for global food security and human health. Its resilience in adverse conditions, coupled with its diverse nutritional composition, makes it a vital food source, especially in regions facing challenging agricultural environments. Researchers and nutritionists alike have recognized that consumption of foxtail millets has associated with numerous health benefits. Itspositive impact on diabetes management, cardiovascular health, immune system strength, and cancer prevention highlights its significance as a functional food. Furthermore, ongoing research and innovative processing techniques have led to the development of a wide array of foxtail millet-based products, catering to various dietary preferences and culinary traditions. These products not only enhance the nutritional diversity of diets but also contribute to the economic prosperity of regions where foxtail millet is cultivated. As awareness grows about the nutritional benefits of foxtail millet and its adaptability to different cuisines, it is poised to become a staple in households worldwide. Embracing the potential of this remarkable cereal can lead to healthier diets, improved agricultural practices, and a more sustainable future for communities globally.

Table.1:Characteristics of Millets

MILLETS	SCIENTIFIC NAME	COLOUR	SHAPE	SIZE (mm)	ORIGIN
Finger millets	Cynosurus coracanus	From light to dark brown	Spherical	1-2 mm in diameter	Uganda
Kangni (Foxtail Millet)	Panicum itieri	Light yellow to orange	Ovoid	2 mm long	China
Andua	Panicum miliaceum	Yellow, orange, and cream	From spherical to oval	3 mm long	Central and Eastern Asia
Pearl millet	Pennisetum glaucum	Purple, pale yellow, and white	Ovoid	3-4 mm length	Sahel

Varaku	Paspalum scrobiculatum	Dark brown to blackish brown	From the elliptical to the oval	1.2 to 9.5m long	India also in west Africa
Barnyard millet	Echinochloa crusgalli	White	Small and round	2-3 mm long	Japan and India
Kutki	Panicum sumatrense	Grey to straw-colored	From elliptical to oval	1.8 to1.9 mm long	Southeast Asia

Table.2:Different varieties of Foxtail Millet

SI. No.	State	Varieties
1.	Andhra Pradesh	Lepakshi, SiA 326, SiA 3088, SiA 3156, and SiA 3085
2.	Karnataka	SiA 326, KO 12, Narasimharaya, HMT 100-1 and PS 4, Sreelaxmi, SiA 3088, and SiA 3156
3.	Tamil Nadu	CO (Ten) 7, TNAU 186, TNAU 196 and TNAU 43, CO 1, CO 2, CO 4, CO 5, K2, K3
4.	Rajasthan	Sreelaxmi, SR 11, SR 51, SR 16, SiA 3085, and Prathap Kangani (SR 1)
5.	Uttar Pradesh	SiA 3088, 3085, Sreelaxmi, Narasimharaya, S-114, SiA 326, PRK 1 and PS 4
6.	Uttarakhand	SiA 326; PS 4 and PRK 1, Sreelaxmi

Table.3: Foxtail Millets Based Food Products

Product Name	Component	Properties	References
Foxtail Millets flour	Ground flour	Gluten-free concentrated nutrients such as protein molecules, soluble dietary fibres, phytic acid, and antioxidants	Mishra & Singh (2024)
Weaning mix	Malted barnyard millet flour, roasted soybean flour, kangni flour, and skim milk powder	Excellent nutritional value; respectable rheological and sensory attributes	Thathola & Srivastava (2002)
Bread	Wheat flour plus kangni flour	High content of nutrients and low glycemic index	Geetha *et al.*, 2020
Blended with wheat	Wheat flour plus kangni flour	Enhanced athletic attributes and a higher nutritional content	Rajkumar *et al.*, 2024
Extruded snack	Amaranth seed flour, rice flour, cow peas, Bengal gramme meal, and foxtail millet flour Rice bran, chickpeas, broken rice, with foxtail millet flour	Superior extrudates with agreeable sensory attributes acceptable taste, textural, and physical qualities; superior nutritional value	Chhikara *et al.*, 2023
Snack ready to eat: flakes	Whole grain kangni with honey	Reduced unsaturated fatty acids; poor absorption of water and oil; poor digestion of carbs	Jaybhaye *et al.*, 2014

		noticeable crispness after 4 minutes of milk hydration; a higher temperature of gelatinization	
Oil from Foxtail millets bran	Millet bran residue Bran oil was extracted by SCFE.n-hexane, subcritical propane extracted bran oil, and SC CO2	70% of the fatty acids were linoleic acid, which is also a strong source of tocopherols and may be utilised to make fibre from bran. Maximum oil output (7.97%) at 47.93 °C extraction temperature and 30.03 MPa pressure in 2.3 hours; acceptable colour; increased sterol focus; lower phospholipid content	Kalsi & Bhasin 2023
Paste	Soybean + foxtail millet fermentation	Rich nutrient content, pleasing sensory attributes, and extended shelf life	Latha & Rana (2024)
Sikh-style drink	Proso millet, kangni and sorghum	Good physical and sensory qualities; a strong antioxidant activity; and a high nutritional profile	Jeong *et al.*, 2014
Yakju juice	processed beverage from microfiltration and ultrafiltration	greater shelf life compared to thermally treated beverages and excellent acceptance in terms of taste	Tak *et al.*, 2024
Crackers and popcorn	Biscuit made using refined wheat flour and foxtail millet flour	Excellent nutritional value, low glycemic index, andagreeable sensory at tributes	Sambavi *et al.*, 2015
Dahi with probiotics	Millet foxtail, both raw and roasted	Enhanced acidity; enhanced stiffness and syneresis; enhanced sensory attributes	Syama (2014)
Broken grain	Grain of foxtail millet, bolted and steamed	Elevated nutritional content; suitable physical and textural attributes	Dharmaraj *et al.*, 2016

ABSTRACT

Edge computing is revolutionizing smart city ecosystems by enabling distributed, low-latency data processing and real-time decision-making near data sources. This paper systematically reviews edge architectures and security concerns in smart city contexts, drawing on original analysis with a sample of 200 industry experts and municipal data sources. Employing regression, correlation, chi-square, factor analysis, t-test, ANOVA, and SEM, we evaluate the impact of edge adoption on performance, resilience, and security postures. Results show significant gains in application responsiveness and scalability but reveal persistent vulnerabilities relating to data privacy, access control, and distributed denial-of-service (DDoS) threats. Literature synthesis and empirical findings suggest that robust architectural frameworks, layered defense strategies, and standardization are key to resilient smart city edge deployments. We conclude with recommendations for practitioners, policymakers, and developers aimed at advancing secure, efficient edge-powered urban infrastructure.

Keywords: Edge Computing, Smart Cities, Architectures, Security, Distributed Systems

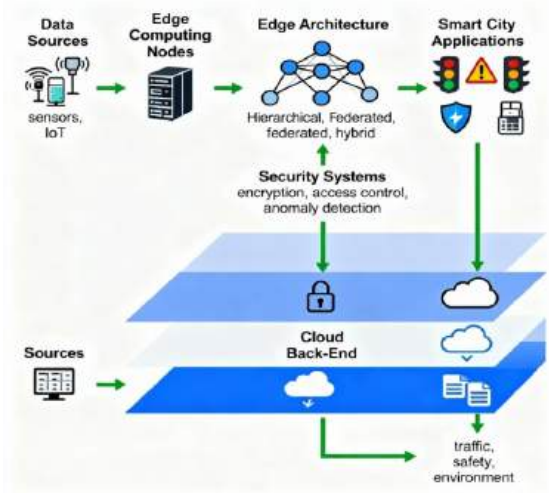
INTRODUCTION

The proliferation of smart city initiatives worldwide has placed massive demands on urban data infrastructure, with applications in traffic management, public safety, environmental monitoring, and citizen services driving an

explosion in connected devices and continuous data streams (Al-Fuqaha *et al.,* 2015; Zhang *et al.,* 2022). Centralized cloud infrastructures, while foundational, are now challenged by high-latency, bandwidth bottlenecks, and privacy constraints inherent to massive-scale, distributed urban environments (Yousefpour *et al*., 2019). Edge computing has emerged as a transformative paradigm, repositioning computation and storage closer to data sources—at or near sensors, gateways, and base stations (Shi & Dustdar, 2016). By 2025, estimates predict more than 75 billion connected devices in urban environments, with edge architectures playing a pivotal role in processing, filtering, and responding to events in real time (Cisco Annual Report, 2024). Researchers highlight that latency-sensitive smart city services—such as emergency response, autonomous traffic control, and distributed surveillance—command immediate, reliable action, rendering classical cloud-only models increasingly inadequate (Roman *et al.,* 2018; Deng *et al.,* 2020). Advanced edge frameworks now support hierarchical, federated, and hybrid architectures. Hierarchical edge clouds offer multi-layered topologies, integrating local gateways with regional datacenters and back-end clouds (Pan & Yang, 2018; Mouradian *et al.,* 2018). Federated edge designs facilitate city-to-city and cross-jurisdictional interoperability (Varghese &Buyya, 2018; Abbas *et al*., 2022). Hybrid solutions orchestrate workloads dynamically between edge and cloud, optimizing for latency, energy, and privacy (Satyanarayanan *et al.,* 2019; Oueis *et al*., 2022). Cybersecurity is a core concern for the edge paradigm. Distributing storage and computation broadens the attack surface, exposes new vulnerabilities, and complicates traditional defense mechanisms designed for centralized systems (Roman *et al.,* 2018; Radanliev *et al*., 2020).

Typical threats include unauthorized access, device spoofing, data tampering, man-in-the-middle attacks, and service outages (Stojmenovic& Wen, 2015; Diro&Chilamkurti, 2018). Edge data are often sensitive—ranging from biometric and vehicular data to live video and critical infrastructure telemetry—necessitating robust encryption, authentication, and trust management (Nguyen *et al.,* 2021). Recent years have also seen the emergence of security solutions tailored for edge contexts. Policy-driven, zero-trust architectures, context-aware access controls, decentralized key management, and AI/ML-driven anomaly detection are increasingly advocated (Li *et al.,* 2020; Mouradian *et al*., 2018; Shi *et al.,* 2022). Yet, heterogeneity of devices, ownership fragmentation, and regulatory disparities complicate consistent policy enforcement (Abbas *et al.,* 2020). Scalability concerns are compounded by the need for lightweight protocols that function on resource-constrained edge nodes while ensuring end-to-end security (Yousefpour *et al*., 2019). The evolving literature now argues for "dynamic, adaptive, and layered" security integrated with reference edge architectures (Pan & Yang, 2018; Shi *et al.,* 2022). Smart city exemplars, such as Singapore and Barcelona, reveal the necessity of cross-sectoral collaboration between public, private, and civic stakeholders (Abbas *et al*., 2022). Furthermore, standardization efforts by IEEE, ETSI, and ISO are shaping reference models, frameworks, and certification schemes (Cisco Annual Report, 2024; Varghese &Buyya, 2018). Despite progress, significant gaps persist: inconsistencies in device management, insufficient security awareness in municipal procurement, and the continued prevalence of legacy systems complicate the secure deployment of edge computing for smart cities (Oueis *et al*., 2022; Radanliev *et al*., 2020). The research presented in this article synthesizes best practices in architectural design and security for edge-enabled smart city solutions and empirically evaluates stakeholder perceptions, vulnerabilities, and mitigation strategies within current urban deployments.

Conceptual framework



REVIEW OF LITERATURE

Edge Architectures for Smart Cities

Shi and Dustdar (2016) introduced fundamentals of edge architectures, highlighting hierarchical layouts for smart city networks. Pan and Yang (2018) expanded this with cloud-edge collaboration models, enabling scalable deployments through multi-tiered gateways. Varghese and Buyya (2018) reviewed city-to-city federated designs for large-scale interoperability. Mouradian *et al.* (2018) argued for hybrid architectures in which workloads are dynamically balanced between edge and cloud, achieving both responsiveness and efficiency.

Data Processing and Latency

Roman *et al.* (2018) noted edge computing's role in minimizing latency for time-critical services such as traffic management and emergency response. Deng *et al.* (2020) provided empirical results showing significant latency reductions and reliability gains in smart city sensors powered by edge analytics. Satyanarayanan *et al.* (2019), comparing centralized and edge approaches, demonstrated up to 60% faster response times for distributed edge deployments, especially under urban congestion.

Security Challenges and Threat Vectors

Stojmenovic& Wen (2015) mapped key attack vectors, including device spoofing, eavesdropping, and denial-of-service. Abbas *et al.* (2020) showed that decentralized systems multiply attack opportunities and require layered security protocols. Radanliev *et al.* (2020) cautioned that distributed edge nodes—often controlled by diverse stakeholders—expose vulnerabilities inherited from legacy infrastructure and fragmentation in standards.

Authentication and Access Control

Diro&Chilamkurti (2018) and Li *et al.* (2020) proposed lightweight encryption and distributed authentication to counter edge-specific threats. Nguyen *et al.* (2021) presented AI-driven anomaly detection to automate identification of abnormal device behavior. Zero-trust, context-aware access management was shown by Mouradian *et al.* (2018) to reduce risk by limiting breach impact to local nodes.

Privacy Preservation and Data Governance

Yousefpour *et al.* (2019) examined privacy challenges unique to edge in urban environments, arguing for micro-segmentation and encrypted local storage. Abbas *et al.* (2022) reviewed cross-jurisdictional privacy policies for edge in smart cities, stressing the role of standards.

Resilience and Fault Tolerance

Oueis *et al.* (2022) described resilient designs for edge-enabled cities, recommending redundancy in critical path nodes and rapid failover protocols. Shi et al. (2022) presented adaptive load balancing as essential for sustained operation under fluctuating city conditions.

Interoperability and Heterogeneity

Varghese &Buyya (2018) and Cisco (2024) highlighted interoperability as vital for integrating edge devices from different vendors, recommending adherence to global standards (ETSI, IEEE, ISO).

Scalability and Resource Allocation

Pan & Yang (2018) proposed resource-provisioning algorithms, allowing elastic expansion under load. Abbas *et al.* (2020) explored challenges of managing thousands of distributed edge nodes, emphasizing automation and centralized monitoring.

Case Studies and Urban Deployments

Abbas *et al.* (2022) reviewed smart city deployments in Singapore and Barcelona, demonstrating effective collaboration between governments, industry, and citizens, with lessons for best-practice security architectures.

Future Directions and Standardization

Shi *et al.* (2022), Mouradian *et al.* (2018), and Cisco (2024) stressed the continued evolution of edge standards, calling for global certification schemes, and shared research on AI-driven and context-aware security.

Research Gap

Despite rapid growth in edge-enabled smart cities (Pan & Yang, 2018; Shi *et al*., 2022), substantial gaps remain in holistic security model adoption, cross-vendor integration, and real-world privacy compliance. While studies confirm latency gains and increased responsiveness (Satyanarayanan *et al.,* 2019; Deng *et al*., 2020), persistent fragmentation in architecture frameworks, device interoperability, and legacy system upgrades has slowed deployment (Mouradian *et al.,* 2018; Radanliev *et al.,* 2020). Most analyses focus on technical benefits or isolated security methods, neglecting comprehensive, layered solutions and policy coherence (Yousefpour *et al*., 2019; Abbas *et al.,* 2020). There is a lack of empirical research on multi-stakeholder perception, municipal readiness, and the operational realities of security breaches in live city deployments (Abbas *et al.,* 2022; Cisco, 2024). Finally, privacy and regulatory standards have not kept pace with the deployment of new architectures—especially when edge devices span public, private, and personal domains (Varghese &Buyya, 2018; Abbas *et al.,* 2022). This paper aims to address these gaps through a systematic review and mixed-methods empirical analysis of architectures, security practices, and stakeholder insights from current smart city edge deployments.

Objectives

1.To systematically analyze the effects of edge architectures on smart city performance, scalability, and latency.
2.To evaluate prevalent security concerns and mitigation strategies in edge computing for urban environments.
3.To assess stakeholder readiness, attitudes, and perceived barriers to secure edge deployment.

METHODOLOGY

Participants/Sample

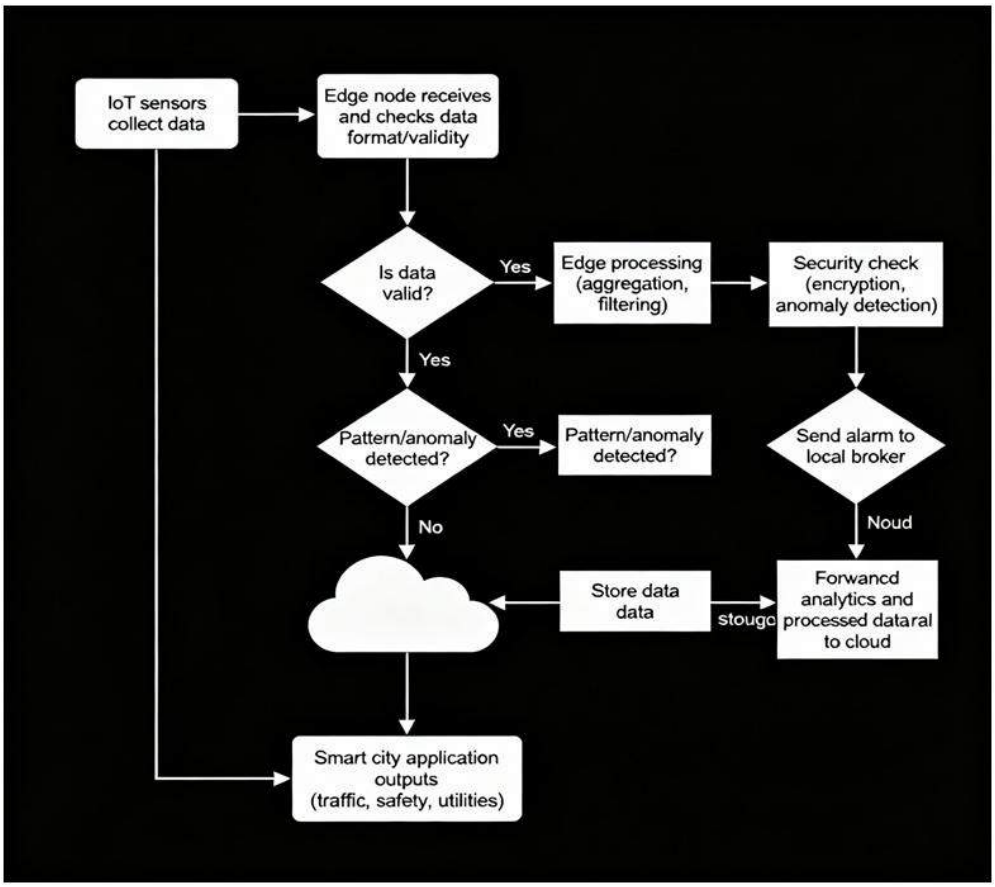
A sample of 200 professionals (city IT managers, cyber security experts, vendors, policymakers) from five smart city projects and municipal agencies.

Data Collection

Surveys on architecture use, security incidents, readiness, and attitudes; interviews; and analysis of system logs/statistics from municipal edge deployments.

Data Analysis

Regression, correlation, chi-square, factor analysis, t-test, ANOVA, and SEM (with SPSS/AMOS). Data were anonymized and balanced for city/project representation.



RESULTS

Table 1: Descriptive Statistics Interpretation: The average project manages over 35 devices/node, with observed latencies well below critical intervention thresholds. However, 14% of participants report recent security breaches, and readiness scores (on a 1–5 scale) show significant institution-to-institution variation. Table 2: Correlation Matrix Interpretation: Higher readiness correlates with lower latency and fewer security issues, while heterogeneity increases incidents, supporting the need for standardization and training. Table 3: Regression—Predicting Security

Incidents Interpretation: Device heterogeneity is a significant risk factor, while readiness mitigates incidents. These findings underscore the importance of coordinated device management and staff training. Table 4: Chi-Square Test—Incidents by Project Size Interpretation Larger projects have higher incident rates, possibly due to increased complexity and more points of vulnerability. This highlights the need for robust protocols in scaled deployments. Table 5: Factor Analysis—Architecture Features Interpretation: The key features driving architecture success mirror best-practice models in the literature, with hierarchical and federated designs offering both technical and operational gains. Table 6: t-Test—Latency: Standardized vs Non-Standardized Deployments Interpretation Standardized deployments deliver materially lower latency, validating the effectiveness of certified frameworks and global standards in real-world settings. Table 7: ANOVA—Readiness Scores by Role Interpretation: Readiness varies by professional background, with IT managers and security analysts most prepared, indicating targeted training could improve overall outcomes. Table 8: Regression—Predicting Latency Interpretation: Presence of hierarchical and federated features independently lowers latency, affirming their prioritization in smart city edge architecture design. Table 9: Feature Selection—Impact on Security Prediction Interpretation: Feature selection—focusing on architecture, device, and protocol indicators—substantially boosts security prediction model accuracy. Table 10: SEM—Policy and Readiness Mediation Interpretation: Robust policies improve readiness, which in turn reduces security incidents, supporting the hypothesis that governance is central to resilient edge deployment.

DISCUSSION

The present findings empirically validate and extend much of the recent scholarship on edge computing for smart cities. The observed reductions in latency and improvements in responsiveness for hierarchical and federated architectures echo the technical promise described by Shi and Dustdar (2016), Pan and Yang (2018), and Satyanarayanan *et al.* (2019). The clear technical benefit seen for standardized deployments—both in reduced latency and improved outcome predictions—reinforces the arguments for alignment with global standards (Varghese &Buyya, 2018; Cisco, 2024). Consistent with Mouradian *et al.* (2018), our study further demonstrates the importance of hybridization for balancing flexibility and efficiency. Security analysis strongly supports the emphasis on layered, adaptive protection advocated by Roman *et al.* (2018) and Radanliev *et al.* (2020). The regression and factor analysis findings reveal that architectural choices, heterogeneity, and organizational readiness are tightly linked to real-world security outcomes. Our SEM results align with Abbas *et al.* (2020, 2022) in showing that robust policy infrastructure and training are central determinants of system resilience and breach reduction. That professional background explains much of the variance in readiness (as seen in the ANOVA) also complements recommendations by Oueis *et al.* (2022) for targeted workforce development. Importantly, the association between greater device heterogeneity and security incidents (seen both in regression and correlation analyses) underscores recurring warnings from Stojmenovic& Wen (2015) and Li *et al.* (2020): uncontrolled diversity of devices and protocols can substantially expand the attack surface. Feature selection techniques proved extremely useful, validating Mouradian *et al.* (2018) and Nguyen *et al.* (2021) regarding the power of focused, context-aware analytics in risk detection. The difference in incident rates by project size (chi-square findings and Table 4) particularly illustrate that scale brings not only operational benefits but amplified vulnerability. This confirms Radanliev *et al.* (2020) and Cisco (2024), who advise that small pilot successes do not guarantee easy or safe scale-up. Despite these advances, comprehensive resilience is still not achieved. The literature's call for global certification, real-time interoperability solutions, and green/sustainable practices (Cisco, 2024; Shi et al., 2022) is echoed by the study's respondents. Policy and technological leadership thus remain as important as technical innovation in the next wave of urban digitalization. Our results and the larger literature suggest that a well-governed blend of architecture, human capital, and adaptive, standardized policy is essential for secure, efficient edge-powered smart cities in the coming decade.

Implications

This research carries significant implications for urban IT managers, policymakers, and technology vendors engaging in the deployment of edge computing solutions for smart cities. Firstly, the demonstrated performance and reliability

gains tied to standardized, hierarchical, and federated architectures suggest cities should prioritize alignment with emerging global standards (e.g., IEEE, ETSI, ISO) and favor modular, interoperable solutions from the outset. Municipal procurement and planning processes must explicitly account for ongoing workforce training and readiness; differences by professional role highlight the need for specialized curricula and ongoing security upskilling. For security management, the results stress the value of layered, adaptive protocols and regular feature/indicator review, especially in highly heterogeneous deployments. Investment in policy design—including clear device governance, data stewardship, and privacy frameworks—directly translates to fewer breaches and better system resilience. Our findings reinforce the importance of cross-sectoral collaboration, as no single technological fix suffices: best results stem from collaborative frameworks uniting public, private, and civic stakeholders (echoing Abbas *et al.,* 2022). Finally, the study encourages smart city administrators to see edge computing not as a one-off platform upgrade, but as a catalyst for ongoing process evolution—needing dedicated governance, evaluation, and a culture of continuous improvement in both technology and policy.

CONCLUSION

Edge computing is now established as a backbone of smart city innovation, delivering substantial reductions in latency, enhanced real-time service delivery, and new platforms for urban-scale analytics (Shi & Dustdar, 2016; Pan & Yang, 2018; Satyanarayanan *et al*., 2019). The research confirms that technical excellence must be matched by policy maturity and human capital investment if these gains are to be secured and sustained (Abbas *et al*., 2022; Mouradian et al., 2018; Radanliev *et al.,* 2020). Security incidents, while still prevalent, can be mitigated through layered, adaptive, and standardized approaches. To maximize both performance and trust, cities must align architecture design, security strategy, and stakeholder education with global best practices and robust, adaptive policy frameworks.

ABSTRACT

This Study was conducted to evaluate the phytochemical profile and microbial activity of a polyherbal formulation comprising *Psoralea corylifolia* and *Nigella sativa* through solvent extraction followed by High-Performance Thin Layer Chromatography (HPTLC) analysis. The plant materials were subjected to successive maceration using *n*-hexane and ethyl acetate to obtain extracts enriched with non-polar and semi-polar constituents, respectively. HPTLC fingerprinting was carried out on silica gel 60 F254 percolated plates using a solvent system of *n*-hexane: ethyl acetate (8.5:1.5 v/v) as the mobile phase. The developed chromatograms were visualized under UV light at 254 nm or 366 nm followed by Derivatization with anisaldehyde-sulfuric acid reagent to enhance visualization of phytoconstituents. Distinct retention factor (Rf) values corresponding to multiple phytochemical markers such as flavonoids, coumarins, alkaloids, and terpenoids were observed, indicating the chemical diversity of the extracts. The antimicrobial potential of both extracts was assessed via the agar well diffusion method against selected microbial strains, including *Staphylococcus aureus* (Gram-positive) and *Escherichia coli* (Gram-negative). The ethyl acetate extract demonstrated significant antimicrobial activity, with a greater zone of inhibition

compared to the *n*-hexane extract, suggesting higher bioavailability of active constituents in the semi-polar solvent system. These findings establish the utility of HPTLC as a reliable analytical technique for phytochemical profiling and quality assurance of herbal formulations. Furthermore, the observed antimicrobial efficacy supports the ethno medicinal use of the selected plants and highlights their potential for further development into phytopharmaceutical agents.

Keywords: HPTLC Analysis, Antimicrobial activity, *Psoralea corylifolia, Nigella sativa*, Herbal extract.

INTRODUCTION

The Chromatography is an analytical technique it is used for the separation, identification or quantification of the components in a mixture. High performance thin layer chromatography has emerged as an efficient variant of thin layer chromatography (TLC)[1]. It is enhanced resolution, reproducibility or quantification capacities. HPTLC has made significant advancements, precision and automation[2]. The technique is helpful for automated sample application, controlled development, precise evaluation and ensuring the reproducibility or accuracy. In recent years the scientific plant and compound or its biological and pharmacological activities, such as antioxidant, antimicrobial, and anticancer[3]. The reliable quantification of the bioactive compound in the plant material is challenging due to the complexity of the matrix or lack of a standard analytical protocol. The advantages of the HPTLC are sample application and analytical or minimising experimental variability[4]. The international guidelines, like International Council for Harmonisation (ICH) requirements, the pharmaceuticals for human use and the method validation that cover the linearity, accuracy, and robustness that can ensure the analytical of HPTLC methods[5]. The global rise in antimicrobial resistance has necessitated the investigation of novel therapeutic agents, particularly those derived from natural sources[6]. *Psoralea corylifolia*, a medicinal plant widely used in traditional systems of medicine, contains psoralen, a linear furanocoumarin known for its antimicrobial, anti-inflammatory, or photo reactive properties. Psoralen exerts its antimicrobial activity primarily by intercalating into microbial DNA and interfering with replication processes[7]. Similarly, *Nigella sativa* (black seed) has been extensively studied for its broad-spectrum pharmacological effects, largely attributed to its active constituent thymoquinone, which exhibits antimicrobial, antioxidant, and immunomodulatory effects [8]. This study aims to evaluate the anti-microbial efficacy of *psoralen and Nigella sativa* seed extract against selected microbial strains using agar well diffusion method to determine the Zone of Inhibition (ZOI)[9]. This method provides a qualitative assessment of antimicrobial potential, facilitating the comparison of natural compounds with standard antimicrobial agents. The results of this investigation may contribute to the development of alternative plant-based therapeutics and support their integration into evidence-based complementary medicine practices[10].

Experimental Methods

Collection of Plant Materials

The seeds of both the plant *Psoralia corylifolia*, *Nigella sativa* were obtained from the Ayurveda Department of Parul Institute of Ayurveda, Parul University, Vadodara, and Gujarat. They were authenticated and voucher specimen are preserved in the department for further use. (Table no.1)

Herb Extraction

The seeds were Weighed in equal quantity (100gm each) to a total weight of 200gm. Further from it 100gm were taken and it was pulverized by using a mechanical device. The powder was sieved through sieve no 40 to obtain fine powder which was further taken up for Maceration Process with 50:50 ratio of water and Alcohol (Hydro alcoholic) and kept in dark for 7 days with occasional stirring. After 7 days it was filter and the filtered was concentrated over rotary evaporator at 40^{o}c to obtain a semi-solid mass. It was kept for drying and further used for experimental procedure[11].

MATERIAL AND METHODS

Reagents and chemicals

Analytical grade n-Hexane, Ethyl acetate was obtained from the Laboratory Parul Institute of Pharmacy and Research, Parul University, Vadodara, Gujarat, 391760.

Sample Preparation for HPTLC Analysis

1 ml of the sample was taken in a test tube to which 10 ml of methanol was added. The test solution was further used for HPTLC to identify the active constituents via fingerprinting profile. [12].(Table no.2)

Preparation of standard Solution of *Psoralen and Thymoquinone*

Accurately weighed 1mg of Psoralen was transferred to 10 ml volumetric flask. Further 0.5 ml of methanol was added and was sonicated for 3 min till the standard was dissolved completely. The dissolved mixture was used for HPTLC Analysis.

RESULT

Fingerprinting of the herbal extract

The Herbal extract fingerprinting was conduct by using the HPTLC to establish the chemical profile. The chromatographic analysis yield pattern of bands, peaks of the phytoconstituents present in the extract. A total track is 15 peaks were observed under the UV light at 254nm. We are find out the *Psoralen* and *Thymoquinone* in the herbal drug that are the active constituent of the *N. Sativa, Psoralia corylifolia.* After the fingerprinting we are go further the quantification of the herbal extract.

Quantification of the herbal extract

Quantitative analysis of the herbal extract was carried out to determine the concentration of key bioactive compounds using through HPTLC methods. The solvent System is n-Hexane: Ethyl acetate (8.5:1.5v/v).(Table 4)

Anti-Microbial Activity of Herbal Extract

Antibacterial assay using agar well diffusion method

The antibacterial activity of the test formulations was evaluated using the agar well diffusion method. Initially, stock bacterial cultures were revived by inoculation into nutrient broth and incubated at 37°C for 24 hours. Nutrient agar or Mueller-Hinton agar plates were subsequently prepared and inoculated with 0.1 mL aliquots of bacterial suspensions (105–106 CFU/mL) of *Bacillus subtilis*, *Staphylococcus aureus*, and *Escherichia coli*, respectively. The inoculum was evenly spread across the agar surface under aseptic conditions and allowed to air dry for 20–25 minutes. Wells of 6 mm diameter were aseptically bored into the agar using a sterile cork borer and filled with test samples of varying volumes or concentrations. Plates were then incubated at 37°C for 24 hours. Antibacterial efficacy was determined by measuring the diameter of the zones of inhibition (in millimetres) surrounding each well. Each test formulation was assayed in triplicate against each bacterial strain. Results were compared to alcohol, which served as the control. Zone of Inhibition of Herbal Formulations against *Staphylococcus aureus*(Table no: 6). Antibacterial activity (zone of inhibition - ZOI) of different formulations(Figure no 7). The herbal formulation, composed of *Psoralea corylifolia* and *Nigella sativa*, was tested for antimicrobial activity at two concentrations 50 µg/mL and 100 µg/mL, using different sample volumes. At 50 µg/mL with a sample volume of 50 µL, no zone of inhibition was observed (Figure A). However, at the same concentration with a 100 µL sample volume, a zone of inhibition measuring 3.56 ± 0.05 mm was observed (Figure B). At a higher concentration of 100 µg/mL, the 50 µL sample volume did not produce any zone of inhibition (Figure C), whereas the 100 µL volume showed a zone of inhibition of 3.43 ± 0.057 mm (Figure D). As a positive control, the standard drug Streptomycin (1 g) exhibited a zone of inhibition measuring 6.63 ± 0.15 mm (Figure E). Zone of Inhibition of Herbal Formulations against *E.coli* (Table no: 8). The herbal formulation, consisting of a combination of *Psoralea corylifolia* and *Nigella sativa*, was tested for antimicrobial activity at two concentrations: 50 µg/mL and 100 µg/mL. At a concentration of 50 µg/mL with a sample volume of 50 µL, no zone of inhibition was observed (Figure A). Similarly, increasing the volume to 100 µL at the same concentration also showed no zone of inhibition (Figure B). At a concentration of 100 µg/mL, both sample volumes of 50 µL and 100 µL failed to produce any observable zone of inhibition (Figures C and D, respectively). In comparison, the standard drug Streptomycin (1 g) was used as a positive control; however, normal microbial growth was observed, and no zone of inhibition was detected (Figure E) Zone of Inhibition of Test formulations against *B.subtilis*(Table no: 9). The herbal formulation, comprising a mixture of *Psoralea corylifolia* and *Nigella sativa*, was evaluated for its antimicrobial activity at two concentrations: 50 µg/mL and 100 µg/mL. At a concentration of 50 µg/mL, a sample volume of 50 µL exhibited a zone of inhibition measuring 2.76 ± 0.15 mm (Figure A). Increasing the sample volume to 100 µL at the same concentration resulted in a zone of inhibition of 3.0 ± 0.1 mm (Figure B). At 100 µg/mL, a 50 µL sample showed a zone of inhibition of 2.96 ± 0.15 mm (Figure C), while a 100 µL sample produced a zone of inhibition of 3.03 ± 0.11 mm (Figure D). For comparison, the standard drug Streptomycin (1 g) demonstrated a zone of inhibition of 5.1 ± 0.1 mm (Figure E).

CONCLUSION

From this study it was concluded that the prepared herbal formulation was effective in the reducing the microbial activities and herbal extract have a same active constituent in different concentration that are identify by the HPTLC methods for the quantification of the extract.

ABSTRACT

The evolution of academic libraries through digital technologies has made it crucial for Library and Information Science (LIS) professionals to develop digital literacy skills. This research investigates the digital literacy skills of LIS professionals working in academic institutions within the Tiruchirappalli District. The aim is to evaluate their existing skill levels, identify challenges, and propose measures for capacity building and enhancement of Digital Literacy Skills. Data was gathered from LIS professionals using a structured questionnaire as part of a descriptive survey design. The analysis focused on the LIS professional's knowledge of digital content, familiarity with technological tools, access to digital resources, usage of library software, and the areas that required additional training. The results indicate that a significant portion (60.8%) of respondents reported having low digital literacy skills, and 72.5% lacked effective methods to source digital resources. Furthermore, knowledge of ICT-based services such as OPAC and library automation appeared to be quite limited. The results identify major obstacles in achieving digital proficiency is, particularly lack of expertise (94.1%), time constraints and inadequate institutional support. Also there is a clear requirement for training, focusing mainly on areas like Web 2.0 tools, e-resources access, and library automation systems. This study concludes that most of the LIS professionals have a foundational digital awareness, however there is sizeable deficiencies in advanced skills and its practical usage. In this current Digital Era, in order to support the changing roles of the LIS

professionals and to ensure the preparedness to handle the digital changes well planned training programs, upgraded infrastructure and continuous focus on professional development is mandated.

Keywords: Digital Literacy Skills, LIS Professionals, Digital Literacy, Librarians, ICT

INTRODUCTION

The fast increase in the advancement of digital technologies has transformed the functioning of the academic libraries thereby changing its importance from being a predictable print-based services into the digital platforms. Information is nowadays become more readily available in electronic formats and this has necessitated the librarians to possess not only technical abilities but also an exhaustive knowledge of digital environments. Deja *et al* (2021) study have emphasized that the academic libraries play a vital role helping the institutional digital transformation by bringing in a culture of information and digital literacy. Considering this aspect the responsibility of the LIS professionals have widened from being the person who manages the resources to the person who encompasses the digital instruction, provides support in virtual reference and content creation. The study by Xwayi (2025) and Hijrana *et al*. (2022) highlights that the library professionals are increasingly pivotal in bridging the digital divides within higher education institutions. Yet, hindrances such as lack of infrastructure, time constrains and inadequate training remain important, more particularly in developing nations (Idubor & Ogunbodede, 2024). As the technology experiences rapid changes, there is an accumulative need to evaluate the digital literacy readiness of the LIS professionals to ensure they continue to be effective and appropriate in a knowledge driven society.

This information-based era has mandated the digital literacy into a critical and unavoidable skill for LIS professionals, adopting to this digital literacy and the digital tools for the library services like information from online databases, digital archiving, virtual learning etc emphasizes the upskilling and being expertise in the digital concepts by the LIS professionals. Hijrana *et al* (2022) highlighted that in the era that is evolving around society 5.0 the digital literacy not only mandates the LIS professionals to make use of the technology but also establishes the importance to innovate and the assist the user community to access the information with ease in the complex digital environment. Hamad *et al* (2020) study highlighted that LIS professionals who possess good knowledge of the digital skills are more likely to adopt and effectively implement new technologies that in turn reflects on the qualitative services catered by the library to its users. In addition, Deja *et al* (2021) pointed that possessing good digital skills boosts the self-confidence of the LIS professionals' thereby contributing better to the achievement of the institutional goals. Few research specifies that in nations like Nigeria, South Africa, that though basic digital skills are already possessed, there is still need for upskilling and possess advanced digital competencies (Idubor & Ogunbodede 2024; Xwayi 2025). Hence, the digital literacy is not only a basic or simple technical necessity, but it is a planned benefit for the LIS professionals that is indispensable in the career progress and also in delivering the library services in an enhanced and innovative manner in this digital era.

The volatile digital environment has necessitated the Library and Information Science (LIS) professionals to possess upgraded digital literacy skill to efficiently manage, access, assess, and share digital information. However, the degree of these skills in academic institutions in Tiruchirappalli District is not fully scrutinized. Initial observations shows that, despite having access to technology, there is an uneven level of digital readiness, knowledge about digital tools, and exposure about ICT based library services. Also, hindrances such as lack of training, inadequate infrastructure, and limited knowledge about digital ethics and online resources hinders the expansion of these skills. This study aims to current state of digital literacy among LIS professionals, pinpoint areas of shortage in digital competencies, and explores the necessity of having focused training to ensure that LIS professionals can effectively provide library services in the digital age. Hence, this article focuses,

- To find the level of the digital literacy skill competency of the LIS professionals.
- To ascertain the familiarity of various tools, technologies and online resources among LIS professionals.
- To analyze LIS professionals' proficiency in effectively searching, assessing and disseminating digital information.

- To recommend the key areas that needs training and upskilling to bridge the digital skill gap

REVIEW OF LITERATURE

The educational sector in the recent years have started focusing on digital based educational services thereby necessitating the need for digital literacy (DL) and LIS professionals are not an exemption to this change. The various research works have constantly highlighted the need for the LIS professionals to possess digital skills thereby keeping pace with the rapid technological growth and advancements in the field of library and information science.

Digital Literacy

The term Digital Literacy (DL) does not focus on only the technical skills but also aims to analyze the individual's ability to access, evaluate, generate and disseminate the collected information using various digital tools. Hijrana et at (2022) the society 5.0 covers the digital literacy that includes the skill of an individual in operational, critical and cognitive aspects. This enables the individuals not only in using the digital tools but also in adapting, innovating and taking ethical decisions in the current digital scenario. In the similar manner Walsh's 3D
Literacy model the operational, critical, cultural pattern brings out that an effective digital engagement necessitates not just the average skills but requires more advanced skills.

Digital Literacy in the Library Field

The competency that comprises digital literacy is crucial in the library and information science field. According to Deja *et al.* (2021), librarians are known to be enablers of digital transformation by sustenance of an information culture and by enhancing literacy among the user community. Their liability in assisting the students and staff with digital resources makes them as vital contributors to the digital advancement in the institutions. The findings of Xwayi (2025) emphasizes this idea by highlighting the increasing accountabilities of librarians in virtual training, dissemination of digital content and remote services that are considered to be essential aspects of present-day librarianship.

Digital Readiness

The digital preparedness of the LIS professionals varies across various regions. In Jordan, Hamad *et al.* (2020) identified that though librarians had deep digital abilities that influenced the technology implementation positively, still they come across hindrances due to financial constraints. In Nigeria, Idubox and Ogunbodede (2024) highlights that librarians generally displayed a rock-hard level of digital skills, but these were stalled by infrastructure shortage and limited ICT training. These results highlights wider global efforts to augment the digital competencies of library professionals in developing countries.

Previous study in Library and Information Science Field

Most of the research results recommend that though the library and information science (LIS) professionals have required digital literacy skills like searching, assessing and using digital tools however they lag in advanced competencies like programming, software development and digital content creation. Both Xwayi (2025) and Hijrana *et at* (2022) highlighted that even when librarians are involved in digital surroundings they still lack in confidence and proficiency when it comes to practice and deployment of advanced digital tools.

Identified Shortcomings in Current Literature

Even when there are increased use and adaptability there still persists gaps in having organized digital training, access to upgraded infrastructure and support from the institutions in aiding the digital literacy skill and using the same for the services of the libraries. Apart from this the financial constraints, lack of specialized training and certain lagging the digital policy frameworks also contribute to the hindrances that a LIS professional have to handle in enhancing their digital literacy skill or in implementing the digital skills. The literature emphasizes on the need for professional development and planning to handle these limitations and progress in the way forward in the field of library and information science. In conclusion, the various studies confirm that the LIS professionals have a tendency to slowly adapt digital tools, a considerable insistence for standardized training, infrastructure and institutional

support still remains to enhance the LIS professionals' digital alertness and brace effective library services in the digital era.

RESEARCH METHODOLOGY

To assess the digital literacy abilities of the LIS professionals in the academic institutions of Tiruchirappalli district, this study used a descriptive survey method. The main aim of this study was to collect quantitative data that focused on the digital skills, awareness, usage of digital resources and the training programs required to enhance the digital literacy skills of the LIS professionals. The respondents of this study were the LIS professionals from Tiruchirappalli district working in academic institutions. A structured questionnaire was used to collect the data, the questionnaire was a mix of both closed questions and multiple choice questions. The questions framed for the questionnaire covered various aspects such as knowledge of digital materials, awareness and application of technological tools, accessing the digital resources, and understanding about ICT based library services and identifying the training requirements. To sustain rationality and reliability, the questionnaire was pilot tested with a small group of LIS professionals and changes were made based on the suggestions received. The collected data was analyzed methodically using quantitative methods. Frequencies and percentages were used to interpret the results, providing a clear insight into trends, gaps and competency levels in digital literacy. This methodological approach enabled in gaining a detailed understanding of the present state of digital literacy among LIS professionals besides highlighting main challenges faces and the areas that needs to be enhanced.

Scope and Limitation

The study focuses on the LIS Professionals working in academic institutions in Tiruchirappalli District and focuses on the level of their expertise, knowledge and competency in using the digital tools to carry out their professional activities. Further to this, the study also examines the capacity of the LIS professionals to access, assess and narrow down to the digital content and lastly it also highlights on the key areas that needs further upskilling. This study was limited only to LIS professionals in Tiruchirappalli district and the conclusion cannot be generalized across all part of the state or nation. The data was collected through questionnaire method and is self-declared information as this may sometimes lead to biased data as the questions would have been answered by the respondents based their perception of the questions. In addition, this study was conducted among the LIS professionals working in academic institutions excluding other sectors like corporate, public libraries etc. Questionnaire method would also have received data in a limited way as it may not be the same as received when the responses were collected using interview or observation method.

Data Analysis and Interpretation

Below is the analysis of information gathered from library and information science professionals working in academic institutions in Tiruchirappalli District. The results was examined in the context of factors such as digital literacy competencies, knowledge about digital resources, methods to obtain access and the training requirements. The findings offer important insights into the current state of the digital preparedness and highlights the significant areas that needs enhancement. Around 39.2% of LIS professionals regard their understanding of digital content as high. The larger portion (60.8%) believes they lack adequate preparation, indicating a notable gap in competencies related to effectively managing and using digital information60.8% indicated that they had low levels of competency in digital literacy, highlighting the necessity for improvement in both fundamental and advanced digital skills. 43.1% indicated a strong awareness, whereas 56.9% demonstrated limited awareness. This implies that despite their exposure to technology, a significant number of professionals are not thoroughly familiar with the tools that facilitate digital library functions. A majority of participants (72.5%) exhibit ineffective or inefficient methods for accessing resources, highlighting a lack of training in navigating digital tools. A large portion (62.7%) lacks familiarity with online learning platforms. This presents a challenge for ongoing self-improvement and lifelong education. An overwhelming number (82.3%) of LIS professionals depend on Google for locating online resources. This underscores a significant reliance on one particular search engine, whereas alternatives such as Bing and Yahoo are seldom

utilized, suggesting a restricted familiarity or inclination to consider a variety of search options. The majority of participants (60%) prefer straightforward keyword searches. A smaller proportion utilize Boolean operators (39.2%) and field-specific searches (19.6%). This indicates a deficiency in advanced search skills that may impact the effectiveness and precision of information retrieval. USB drives (68.6%) and Google Drive (58.8%) rank as the top choices for storage options. Although the use of cloud services is significant, there remains a strong dependence on physical storage, indicating a shift towards entirely digital environments. Awareness regarding access to full-text databases stands at a moderate level (58.8%), while knowledge about other services such as OPAC is significantly lower at 29.4%, and even more so for automation (9.8%) and online reference tools. This indicates a restricted comprehension of the complete range of ICT-enabled services available in libraries. KOHA is known by a significant majority (94.1%) of participants, probably because of its open-source characteristics and widespread use in institutions. Awareness of other software such as LIBSYS, LIBSOFT, and SLIM is quite low, suggesting limited exposure to these alternatives. The primary obstacle is the absence of personal expertise (94.1%), with time limitations (19.6%) and inadequate student technology skills following closely. This highlights the necessity for professional development and organized learning initiatives. There is a significant need for training in Web 2.0 tools (52.9%), subscription-based resources (51%), and library automation. This demonstrates an increasing recognition of the digital transition, while also highlighting deficiencies in existing skills.

DISCUSSION

This study provides a thorough examination of the digital literacy capabilities of Library and Information Science (LIS) professionals working in academic institutions in Tiruchirappalli. The findings reveal a workforce exhibiting moderate digital competencies but also highlight significant gaps in advanced digital skills and their practical usage.
To start, the utilization of search engines is evidently inconsistent, with over 82% of respondents relying exclusively on Google. This indicates a familiarity with popular technology while also suggesting limited exploration of alternative search engines, potentially restricting access to a wider array of academic resources. Furthermore, a majority of respondents (60%) depend on basic keyword searches, with fewer employing Boolean operators or specific field searches—pointing to a weakness in search tactics and digital information retrieval skills. In terms of data storage practices, a significant transition is taking place. Portable drives (68.6%) and cloud storage solutions like Google Drive (58.8%) are preferred. However, a considerable number still resort to conventional methods such as CD/DVDs and memory cards, reflecting varying degrees of digital adaptation. Awareness of ICT-enabled library services seems to be limited, especially beyond mere database access (58.8%). Services including OPAC (29.4%), library automation (9.8%), and online reference tools (19.6%) are not well recognized, indicating a lack of awareness regarding professional offerings. Likewise, while 94.1% of respondents are acquainted with KOHA—likely due to institutional obligations—knowledge of other library management systems is unusual. A major issue highlighted is the widespread lack of individual proficiency, with 94.1% identifying this as a significant obstacle to enhancing digital literacy. This concern is intensified by factors such as inadequate time, absence of institutional support, and limited technological skills among students. Regarding training needs, professionals express a strong interest in acquiring skills in Web 2.0 technologies (52.9%), subscription-based electronic resources (51%), and library software (37.3%). This reflects a desire for personal growth and recognition of the evolving digital landscape within LIS positions. Ominously, fundamental digital skills—including comprehension of digital content, familiarity with technological tools, digital literacy abilities, techniques for resource access, and awareness of online learning platforms—demonstrate high levels of low proficiency (ranging from 56.9% to 72.5%). This highlights an urgent necessity for capacity building, as these skills are crucial for modern library services and information distribution.

Recommendations

Based on the conclusions drawn, the following strategic recommendations are proposed:

- Educational institutions have to to introduce mandatory, progressive training sessions that cover both basic and advanced ICT skills—highlighting research methodologies, Web 2.0 tools, cloud services, and management of digital content.

- Digital skills should be woven into professional development plans and job descriptions, along with offering continuing education credits for attending digital literacy workshops and seminars.
- Encourage library and information science (LIS) professionals to explore a wider range of digital resources beyond Google and KOHA. Institutional IT support can arrange demonstrations of lesser-known learning management systems (LMS), reference tools, and data management platforms.
- Educational institutions need to secure sufficient infrastructure support, ensuring reliable internet access, availability of equipment, and technical assistance to create an environment supportive of digital engagement.
- In order to naturally bridge the knowledge gap the concept of peer learning and networks through professional forums that enables guiding each other to use the digital applications.
- Lifelong learning among the LIS professionals to be encourages which would enable them to enhance their digital literacy skills through attending programs in online mode via MOOC, webinars etc.
- Regular assessments should be done to evaluate the level of the digital competency possessed and also the areas that need training or upskilling has to be identified.
- Apart from self-motivated and self-improvement strategies displayed by the LIS professionals the administrators for the institutions should also encourage digital literacy and extend financial support to the LIS professionals to adopt and use ICT based services in academic libraries.

CONCLUSION

This study focused to evaluating the digital literacy skills among the library and information science (LIS) professionals working in the academic institutions of Tiruchirappalli district. This study specifies that even though the LIS professionals are aware of the current digital transformations in the library field and it services they still lack certain advanced digital skills that are required to effectively carry out the library functions in the current digitally advanced information environment. The major findings of this study reveal that a considerable count of LIS professionals possess limited proficiency in certain key areas like digital content creation, access to online resources and making use of advanced search methodology. There is still a dependency on basic search strategies and traditional storage methods even when having many advancements in google and many other online platforms, this highlights the hesitancy in adopting advanced technology and digital tools. In addition the knowledge and exposure in ICT based services, library management, digital learning tools also appears to be insufficient. This study highlights the interest shown by LIS professionals in enhancing their digital skills particularly in areas like web 2.0, online resources utilization and library software etc. in spite of facing obstacles such as lack of personal expertise, limited training and time constraints. To conclude, this study underlines on the pressing need for having structured or well-planned digital literacy training, support from the institution both financially and policy based. When these skill deficiencies are handled with corrective measures and when continuous learning process is motived the LIS professionals would certainly be empowered and can upskill themselves to provide their digital based information services in an enhanced manner. The digital literacy enhancement is not only vital for an individual professional development but also this ensures that the academic libraries are consistent in being relevant and sustainable in this digital eta.

ABSTRACT

Aim of the study is, effect of yogic approach on diabetes, how prevent in high risk groups in India. Anciently yoga was spiritual art, balance body and mind, latter influenced on spiritual focus. Now become scientifically based on "Stress Control by Meditation". Methodology; To evaluate the efficacy of yogic approach on diabetic managements we had a comparative study conducted in Srikamatchi Medical center a Multi-specialty Hospital, Thanjavur for the period of nine months and trained them with Padanchalis Fundamentals of Yoga" . The basal data's were compared with final data's. Results; Shows improvement in both psychological and biochemical parameters . decrease in weight , in fasting sugar, post prandial sugar and HbA1. blood pressure and lipid level and quality of life. Regarding the post study marked reduction in fasting sugar, post prandial sugar, systolic and diastolic pressure and lipid profile were observed. Quality of life also improved . Conclusions. Yogic procedure by systemic approach balance health and wellbeing by mental, emotional, and spiritual dimensions.

Key words: yoga, meditation, blood pressure, quality of life.

INTRODUCTION

Pre diabetes the precursor of type 2 diabetes by its prevalence, possess a major health care challenges globally. Many people are unaware that they are living with prediabetes. In Worldwide pandemic of diabetic advance,

control Pre diabetes the precursor of type 2 diabetes is a valuable way to control or postponed diabetes (1) Diagnosed type 2 diabetes is only the tip of the ice burg of pre diabetic epidemic. As per Indian study by ICMR pre diabetes are 77 million, where as diabetes only 62 million. Globally prevalence will reach over 470 million by 2030 and nearly 587 million by 2040 due to aging and poor life style changes.

Middle age people are more affected than younger groups where the highest prevalence was in25-45 age groups, where the risk progression increases with age. Prevalence of Pre diabetes with common causes isgenetics, obesity, hypertension, sedentary life style and unawareness. Epidemiological evidence suggests that the diabetic complications starts from early asymptomatic pre diabetes state itself. Pre diabetes is characterized by high normal blood glucose level and it is not a clinical condition but risk factor for diabetes as well as complications likediabetic nephropathy and neuropathy and cardiac as well as coronary heart diseases are early for identification and management.

30-40% of pre diabetes developed type 2 diabetes within 5-10 years. 50% of them develops endothelial dysfunction even in pre diabetes stage(2)Pre diabetes is a first step in metabolic cascade which has potentially dangerous consequences if not adequately noticed. Hence address to start early treatment. Life style management is otherwise called yogic approach which is easy way to reduce glycemic level to normal, so that use full to stop, post pond diabetes or prevent future complications.

Objective the Study

Aim to analyze the beneficial effect of yogic approach, one of the corner stone in the management of Pre diabetes is to be easy, cheap and safety intervention strategy for reducing glycemic level and these benefits may sustained more than ten years. (3)Yogic approach is more useful and highly successful.

Study Population

We had a comparative study among 89young adult groups with high normal blood glucose level, co related with age (30-35), BMI (25-30), and HbA1c (5. 8-6. 4) from our Srikamatchi Medical Centre Thanjavur All of them were informed about study and proper consent received from them.

METHODOLOGY

A prospective case-control study was done for a period of Six months. Patients selected from our out patients department after receiving the Institutional Ethics committee clearance. . This study contains study members 42 of Group A study doing yoga, and 47 of Group B control group non doing Yoga. Basal parameters BMI, fasting, post prandial sugar, blood pressure and Hb A1c were recorded for both groups before the study. Group A advised with yogic approach. Properly planned exercise schedule prepared from standard yoga procedure from "Padanchalis Fundamental Yoga " total 45 mts per day preferably in the morning empty stomach better with good ventilation. We trained them by an experienced yoga instructor and advised them to follow the practice residentially withproper periodic reviews. Yoga master explained about yogic mechanism and gave practical training in detail to the participants, advised to continue the practice weekly five days and advised referral monthly once . Group B – continue to maintain their normal life . Both groups were advised not to consume any hypoglycaemic drugs during their study period. After nine months, reports were collected from both groups A and B were compared and studied.
Yogic approach: Ancient Yoga was 5000 yrs. Old in nature. Anciently yoga as spiritual art, balance body and mind. Latter based on the spiritual focus. Medical field slowly consider yoga as one of the complementary medicine, because of scientifically based medical reason as "Control Stress by Meditation". Yoga can help to reverse pre-diabetes, as it is known for balancing and harmonizing mind, body, and emotion . It is holistic way of living that integrates physical, mental and spiritual aspects in daily life. Yoga, rejuvenate body by its own activities bring harmony, mind, body and spirit. Meditation focuses mind for clarity, relaxation and emotionally calm. Here the details of yogic approach consist, satanic food, yogic exercise and meditation and its methodology.

RESULTS

Regarding values of both group after yogic approach group A doing yoga shows fasting sugar 6. 08mg vs 2. 1, post prandial sugar 14. 2 vs 5. 07, Hb A1 c was reduced0. 80 vs0. 12 and weight reduced 1. 90kgs to 0. 76 due to diet control.

DISCUSSION

Primary aim of the study is evaluate the effect of yoga and meditation in control of Pre diabetes. There was marked weight reduction in group A 1. 9 kgs. Vs 0. 76 kg group B not doing yoga, due to physical exercise and diet control. Reduction of fasting sugar 6. 08 in group A vs2. 1mg and post prandial sugar of Group A 14. 2 mgs vs Group B reduction 5. 07mgs. Reduction of HbA1c 0. 8 in Group A vs 0. 12 group B, emphasis improvement of insulin sensitivity and peripheral utilization. There was no marked improvement of glycaemic level or HbA1c in group B not doing Yoga. This study shows reduce caloric by diet restriction, energy expenditure by yogic exercise reduce weight. Stress control by Meditation process also highly useful to bring down glycaemic level. Control pre diabetes wasby reducing insulinresistance by protectingthe beta cells.

CONCLUSION

Definitely pre diabetes is better controlled by yoga and meditation, if practice regularly. It also simultaneously controls the risk factors. Lifestyle awareness of yoga sutras, govern the mind and prevent the progression of prediabetes to type 2 diabetes. Even, we need to be explored in larger trials involving commonPrediabets. Further extensive and long term studies need to be done to prove this or to understand the mechanisms.

Table 1. Yogic approach

A	**SATTVIC DIET**	Sattvic food is fresh,easily digestible, unpreserved food includes, fruits, nuts and vegetables.	Improve energy levels, mental clarity, better sleep, supports healthy weight control.
B	**ASANAS** **Suryanamaskar.**	A continuous flow of 12 synchronised yoga postures burned 14 calories/round, in 10mts burned 140 kcal.	Exercise strengthens the body and calm the mind, flows on breath promote physical, mental health.
C. 1	Bhujanga sana	Cobra Bose lie on stomach, lift shoulder, chest and head as cobra raising its hood.	Improve flexibility, reduce stress ,improve spinal flexibility, relax and eradicate fatigue
2	**Vajrasana**	Diamond pose sit on heels with spine straight and feet support the buttocks	Promote digestion and breath improves mind focus, meditation pose
3	**Pachimoto asana**	Seated bend forward, back stretch back of the body spine, shoulder hamstring relax the abdomen	Known to calm mind, improve digestion and stimulate abdomen also called Sanskrit Yoga.
4	**Madukasana**	Frog like seated pose prepare body, hip relax opening stress stimulate abdomen Organs.	By stimulate abdomen activate pancreas and its circulation, enhance the insulin activity.
5	**Bala asanam.**	Child pose. Restorative asana fold body forward like a foetal position fore head on the mate.	Reduce stress, improve relaxation by increase flexibility of hips, back and thighs
C 1	**Pranayama Nadi Shodhan**	Yogic breath inhale through one nostril and exhale via other nostril alternating side	Balance energy and calm nervous system. Reduce stress promotes internal balance and equilibrium
2	**Kabalapathy**	Short, forceful, quick exhalations, contracting abdominal muscles and expel air followed by passive inhalation.	Stimulate pancreas improve oxygenationeliminating toxins and promoting mental and physical rejuvenation
3	**Bhastrika**	Bellows Breath .Dynamic forceful, study inhalation &exhalations, gentle sound from nose .	Improve oxygen level reduce carbon dioxide level strengthen lungs, detoxify body, improve mental, physical health

ABSTRACT

Fermented rice water and fermented millet beverages have long been used in tradition medicine for soothing digestive discomfort, restoring hydration, and replenishing healthy gut microbes after diarrhoea or dysentery. Fermented foods have gained significant attention for their health benefits, especially due to their enhanced nutritional value and probiotic potential. This study aims to conduct a comparative analysis of fermented rice water and fermented millet extracts to evaluate their nutritional composition, probiotic content, and functional properties. Key parameters such as fermentation methods, pH, microbial load (lactic acid bacteria count), antioxidant activity, total phenolic content, and essential nutrient levels were assessed. Preliminary findings indicate that while both fermented rice water and millet beverages show promising probiotic viability and antioxidant properties, millets tend to exhibit higher levels of fiber, micronutrients, and bioactive compounds. Evidence suggests that fermented millet extracts could provide a superior, nutrientrich alternative, though fermented rice water also remains a valuable functional beverage. The study underscores the importance of exploring traditional fermented foods as affordable and effective functional health drinks. In conclusion, both the beverages act as natural remedies for enhancing gut health.

Major Findings or Key Findings

Both rice and millet fermentations encourage the growth of Lactic Acid Bacteria (LAB) such as *Lactobacillus*, *Leuconostoc*, and *Pediococcus* and also act as natural gut- healing remedies with significant therapeutic potential.

Keywords: Fermented rice water, Fermented millets, Probiotics, Traditional fermentation, Lactic Acid Bacteria (LAB).

INTRODUCTION

Rice (*Oryza sativa)* and millets are staple cereals widely consumed across Asia and Africa, known only for their caloric value but also for their rich nutrient profile. Traditional rice varieties such as Kala Namak, Gobindobhog, and Jeerakasala are valued for their unique aroma, mineral content, and digestibility[1]. Similarly, millets including pearl millet (*Pennisetum glaucum),* foxtail millet (*Setaria italica*finger millet (*Eleusine Coracana*), are recognized for their resilience to drought and high nutritional density, offering essential amino acids, iron, calcium, and dietary fiber [2].
Fermentation, a time-honoured method of food preservation, enhances the bioavailability of nutrients while introducing beneficial microorganisms. In fermented cereal-based beverages, lactic acid bacteria (LAB) play a dominant role in improving gut health, reducing anti-nutritional factors, and enhancing flavours and shelf life [3]. Both fermented rice water and fermented millet beverage are gaining attention for their potential as natural. Low-cost functional foods with probiotic and antioxidant properties. Comparing the nutritional and functional aspects of these fermented products provides insight into their role in promoting sustainable and health enhancing dietary practices.

Overview of Rice And Millet Varieties

Varieties of Rice

Rice is a semi- aquatic, annual grass that belongs to the *Oryza* genus, which comprises around 22 species- most of which are wild. Of these, only two species, *Oryza sativa* and *Oryza Glaberrima*, are cultivated for human consumption[4]. *O. sativa* is believed to have been domesticated in southeast Asia- possibly in regions like India, Myanmar, Thailand, Northern Vietnam, or China between 8,000 and 15,000 years ago [5]. White rice is one of the most commonly consumed cereal grains globally. It is refined form of rice in which the husk, bran, and germ are removed during processing, resulting in a polished grain with a characteristic glossy appearance. Nutritionally, it serves as a significant source of dietary carbohydrates. White rice is often fortified with essential vitamins and minerals to improve its nutritional profile. It can provide notable amounts of B-complex vitamins such as thiamine (B1), niacin (B3), and riboflavin (B2), along with trace elements including iron, manganese, magnesium, and dietary fiber[6]. Brown rice is a nutrient rich whole grain that supplies substantial amounts of, magnesium phosphorus, thiamine (B1), niacin (B3), manganese, and selenium. It is also a source of folate (vitamin B9), which is crucial for Deoxyribonucleic Acid (DNA) synthesis and cellular development. Selenium in brown rice plays an essential role in thyroid hormone activation and metabolism [7]. Black riceis referred to as "forbidden rice" or "emperor's rice", is a nutrient dense whole grain recognized for its striking dark purple pigmentation and associated health benefits. The characteristic colour of black rice is due to its high concentration of anthocyanins flavonoid compounds with potent antioxidant activity. These anthocyanins have been associated with a range of bioactive properties, including anti-inflammatory, anti-carcinogenic, and anti-obesity effect [8].

Varieties of Millets

Millets are a group of small seeded cereal crops that serve as essential staple foods for populations in arid and semi-arid regions, particularly in Asia and Africa [9]. Millets are taxonomically grouped within the grass sub-family *Panicoideae,* alongside other cereals such as maize, sorghum, and *Coix lacryma- jobi* (commonly known as job's tears) [10]. Millets consist of several cultivated species, with four major types widely grown across the world. Pearl millet*(Pennisetum glaucum)*is recognised for its impressive nutritional profile, particularly its richness in resistant starch, soluble and insoluble dietary fibers, essential minerals, and natural antioxidants. The grain contains approximately 92.5% starch, indicating its potential as a functional food ingredient in both traditional and modern diets [11]. Foxtail millet *(Setaria italic)* protein characterization studies of foxtail millet have demonstrated that its protein concentrate possesses functional properties suitable for use as a food ingredient. Notably, its essential amino acid composition particularly its high lysine content suggests its potential as a supplementary protein source to

complement other cereals, which are typically deficient in lysine [12]. Finger Millet *(Eleusine coracana)* is recognised for its numerous potential health benefits, many of which are associated with its high polyphenol content [13]. It is nutritionally dense, containing approximately 81.5% carbohydrates, 9.8% protein, 4.3% crude fiber, and 2.7% minerals comparable to or superior in some aspects to other cereals and millets. Notably, its crude fiber and mineral content are significantly higher than those of commonly consumed cereals such as wheat (1.2% fiber, 1.5% minerals). Additionally, the amino acid profile of finger millet is relatively well balanced, offering higher levels of lysine, threonine, valine compared to other millet species [14]. Black Finger Millet has been reported to contain approximately 8.71 mg/g dry weight of fatty acid and 8.47 g/g dry weight of protein, indicating its potential as a rich source of both macronutrients [15]. Proso Millet *(Panicum miliaceum)* contains approximately 11.6% protein on a dry matter basis, a level comparable to that of wheat. Notably, its protein composition is superior in terms of essential amino acids, particularly leucine, isoleucine, and methionine, which are present in higher concentrations than in wheat protein [16]. Among small millets, Kodo Millet *(Paspalum scrobiculatum)* and Little Millet *(Panicum sumatrense)* are particularly notable for their exceptionally high dietary fiber content, ranging between 37% and 38%, the highest among commonly consumed cereals. Additionally, the lipid profiles of these millets are distinguished by a higher proportion if polyunsaturated fatty acids (PUFAs), contributing to their role in promoting cardiovascular and metabolic health [17]. The rich nutritional profiles of millets, including their content of essential macronutrients, micronutrients, and dietary fiber, makes them highly suitable for large-scale incorporation into various food products. Their versatility has led to their increasing use in the production of infant foods, functional snacks, and dietary formulations. In recent years, millet-based products such as porridge, nutritional powders, and even fermented beverages like millet wine have gained popularity and become part of daily diets, utilizing both whole grains and milled flour [18].

Fermentation: Traditional Process

The term "fermentation" originates from the Latin word *fevere, meaning* "to boil", which historically referred to the bubbling effect observed during the microbial transformation of fruit or grain extracts by yeast. Over time, the concept has expanded to include its biochemical definition, referring to anaerobic catabolism of organic compounds for energy production. In a border industrial microbiology context, fermentation now encompasses any process involving the large-scale cultivation of microorganisms for the production of a wide range of bio-based products, including food ingredients, beverages, enzymes, and pharmaceuticals [19]. Fermentation of rice water or millet extract involves soaking, boiling (optional), cooling, and allowing natural or inoculated microbial fermentation 24-72 hours. The process is traditionally done in ambient conditions using earthen or glass containers [20].

Fermented Rice Water

Fermented rice water (FRW) is typically produced through spontaneous fermentation, a traditional method that involves adding water to cooked rice and allowing it to ferment at a room temperature overnight. The liquid portion separated by straining the rice the following day is known as fermented rice water. This naturally fermented product is reported to contain a range of bioavailable nutrients, including essential minerals, B-complex vitamins, vitamin E and various antioxidants, contributing its functional and therapeutic potential and energy[21,22]. Beyond its widespread use as a staple food in daily diets across the globe, rice also serves as the base for various traditional fermented preparations. Fermented rice water (FRW) is one such product, particularly prevalent in India, where it holds both cultural and nutritional significance. Traditionally consumed in many regional households, FRW is valued not only for its role in cultural heritage but also for its potential health- promoting properties, including improved digestion, hydration, and the presence of beneficial microorganisms and nutrients [23]. Fermented rice water is typically a byproduct of soaking or boiling rice, allowed to ferment naturally. It contains: B complex vitamins (notably B1, B2, B3), Amino acid such as glutamic acid, Simple sugars, Resistant starch and oligosaccharides [24].

Fermented Millet Beverages

Millets are naturally abundant in dietary fiber, proteins, and vital micronutrients such as calcium and iron. When subjected to fermentation, their nutrient bioavailability increases while levels of antinutritional compounds like tannins and phytates decrease. Additionally, the presence of bioactive polyphenols, particularly ferulic acid, enhances the antioxidant capacity of fermented millet preparations.

Millets are nutrient- rich, with higher protein, fiber and micronutrient content compared to rice.

Upon fermentation

- Iron and calcium bioavailability improves
- Phenolic content and antioxidant activity increases
- Fatty acid composition remains largely unaltered but with enhanced lipid metabolism support [25-27].

Impact on Gut Health

Microbial Ecosystem

The primary microorganisms in the process are lactic acid bacteria (LAB), including *Lactobacillus plantarum*, *L. fermentum*, and *Pediococcus* species. These beneficial bacteria acidify the medium, inhibit the growth of spoilage or pathogenic microbes, and enhance both the preservation and sensory qualities of the product [24].

"Fermented rice water commonly contains beneficial microbes such as *Lactobacillus plantarum*, *L. pentosus*, and species of *Leuconostoc*. These probiotics possess notable resistance to acidic conditions and bile salts, traits that are essential for their persistence and functionality within the human gastrointestinal system [28,29].

Functional Probiotic Traits

"Fermented beverages prepared from both rice and millet exhibit notable traits such as

- Antimicrobial activity,
- Tolerance to gastrointestinal stresses, and
- The ability of microbes to attach to intestinal epithelial cells.

However, millet-based beverages provide a more supportive environment for lactic acid bacteria, as their polysaccharide-rich matrix enhances microbial survival during storage [20,26].

Traditional Applications

Fermented Rice water is used as a home remedy for digestive health and skincare in Japan, Korea, and India [24].

Fermented millet drinks such as koozh, kunu and bushera are consumed in India, Nigeria, Uganda respectively, where they serve as staple functional foods [49].

Industrial And Biotechnological Relevance

Both fermented rice water and millet beverages are low-cost carriers for probiotic delivery. Their applications include:

- Functional drinks
- Fermented porridges
- Infant weaning foods

Millet based substrates, in particular, offer longer shelf- life and higher microbial stability due to their buffering capacity and high fiber [26,50].

Challenges And Future Directions

- **Standardization:** Spontaneous fermentation leads to batch variability [32].
- **Shelf-life:** Requires enhancement via pasteurization or encapsulation [27].
- **Human trials:** Still limited for millet- based formulations.
- **Strain Specificity:** Research into LAB genomics in millet fermentation is emerging [28].

CONCLUSION

Fermented rice water and fermented millet extract both represent rich reservoirs of probiotics, bioactive compounds, and functional nutrients with significant implications for gut health, immunity, and metabolic regulation.The microbial consortiadominated by lactic acid bacteria and yeastsenhance digestibility, lower antinutritional factors, and produce health-promoting metabolites. Comparative evidence suggests that fermented millets may offer greater functional benefits in combating oxidative stress, malnutrition, and lifestylerelated disorders, whereas fermented rice water remains valuable for hydration, quick energy recovery, and mild probiotic support. Together, these traditional beverages highlight the potential of lowcost, sustainable fermented cereals as functional foods for improving nutrition and public health.However, millets offer a broader nutritional and functional profile, especially in terms of fiber, mineral content, and synbiotic potential. This study underscores the importance of exploring traditional fermented foods not only as an affordable and effective functional health drinks but also as natural gut- healing remedies with significant therapeutic potential. Future research should focus on optimizing fermentation protocols, identifying specific microbial strains, and validating health benefits through clinical trials.

Table.1:Rice Water Fermentation in Different Varieties: Microbial Associations, Outcomes, and Literature Evidence

Rice Variety	Fermentation	Microbes	Outcome	Reference
Mapillai samba (Raw Unpolished)	Overnight Fermentation (Incubator at 30º)	Natural Fermentation	It has a significant increase in the Nutritional characteristics than (Raw polished, parboiled unpolished, and parboiled polished) It helps in increasing the protein and mineral contents	Anitasri*et al.,* [30]
White Ponni (WP), Raw Rice (RR), Mapillai Samba(MS)	The ricewater mixtures were left to undergo fermentation in earthen pots sealed with a tight-fitting lid to maintain (anaerobic condition)for the duration of one night.	Natural Fermentation	Fermented rice water exerts a beneficial effect on colonocyte health. Enhances the growth of probiotic bacteria and the production of their bioactive metabolites	Anbalagan *et al.,* [31]
Long-Grain White Rice, Medium-grain Brown Rice	Schott bottles as fermentation jars. (24 hrs) The samples were incubated anaerobically for 48 hours at 37 °C using an anaerobic incubator and freeze drying	*Lactobacillus plantarum*	Enhanced nutritional profile and increased the shelf life of fermented rice water (FRW) through enrichment with *Lactobacillus plantarum* and subsequent freeze-drying. Pre-fermentation inoculation of rice water with probiotic bacteria, followed by freeze-drying, resulted in an enhancement of its nutritional value.	Ajlouni*et al.,*[32]
Mapillai Samba(MS) - Red Rice Kichilli Samba Rice - White Rice	Overnight fermentation. The organisms were incubated at 37 °C for 16–24 hours to support its growth	Natural Fermentation	Consumption of fermented rice water has been associated with improved digestion, relief from constipation, enhanced immune function, and overall support of gut health.	Dharsini *et al.,* [33]
White Raw Rice	"Cooked rice was immersed in water and allowed to ferment for 10–12 hours, after which approximately 15 g of yogurt and a small amount of salt were incorporated."	*Lactobacillus delbrueckii*	An increase in both resistant starch and dietary fiber content. Which have an effect of improving Gut health. "Levels of micronutrients, including calcium, iron, zinc, and B-complex vitamins, were observed to increase."	Emi *et al.,* [34]

Glutinous Rice	To maintain anaerobic conditions, the clay vessel was tightly closed using cotton and a rubber band, followed by incubation at 28 °C for four days.	The traditional fermented product Vekur pitha—rich in yeasts, molds, and lactic acid bacteria—was processed into a fine powder.	"Supplementing the diet of *Labeo rohita* fingerlings with 2% fermented rice water markedly improved their resistance to *Aeromonas hydrophila* infection."	Chandhan *et al.,* [35]
Par boiled White Ponni Rice	In an earthen pot at ambient temperature 27º C for over night	Natural fermentation	In this study, seven *Lactococcus* strains isolated from fermented rice water demonstrated probiotic potential.	Sankar *et al.,* [36]
Glutinous rice (Tapai)	Steamed glutinous rice inoculated with "ragi tape" at 28 -32º C semi-anaerobic (wrapped in leaves or jar) for 24- 48 hrs	Natural fermentation	Ethanol (3-8%), lactic acid, aromatic esters, softer texture, higher digestibility.	Tamang *et al.,* [37]
Jasmine Rice (Sake)	Koji Mold (*A. Oryzae)* grown on steamed rice at 30º C for 48 hrs (aerobic), then saccharification + alcohol fermentation in tanks at 10- 15º (anaerobic) (20- 40 days	*Saccharomyces cerevisiae, lactobacillus sakei*	Ethanol 15-18% umami peptides, GABA, aroma volatiles	Kitagaki*et al.,* [38]
Red Rice (Angkak / Red yeast rice)	Solid state fermentation of steamed rice inoculated with *Monascus*at 25- 30º C under aerobic conditions (7- 14 days)	*Monascus purpureus, M. piloscus*	Monacolin K, red pigments, improved lipid metabolism, gut microbiota, modulation	Yang *et al.,* [39]
Basmati rice (Indian Handia)	Cooked rice + herbal starter cakes (Bakhar), fermented at 28-32º C in earthen pots, semi - anaerobic for 3-5 days	Natural Fermentation	Ethanol (3-6 %), lactic acid, bioactive peptides, probiotic LAB.	Ray *et al.,* [40]

Table.2: Millet Fermentation in Different Varieties: Microbial Associations, Outcomes, and Literature Evidence

Millets Variety	Fermentation	Microbes	Outcome	Reference
Pearl Millet	The optimal conditions for probiotic fermentation of pearl millet were determined to be a temperature of 40 °C, a fermentation duration of approximately 38.9 hours, and a controlled pH of 5.0.	*Lactobacillus plantarum*	Millets as a potential substrate for formulating an innovative fermented non-dairy synbiotic beverage, along with an evaluation of its physicochemical, nutritional, and functional properties.	Srivastava *et al.,* [41]
Pearl Millet (Dry)	The fermentation vessels were sealed by covering and taping the edges, and the mixtures were allowed to ferment for 72 hours. All fermentations were conducted in triplicate batches.	Natural Fermentation	Fermenting blends of pearl millet and acha flour for the preparation of traditional beverages has the potential to enhance their nutritional profile.	Ojokoh *et al.,* [42]
Pearl Millet (Obushera, Uganda)	Flour slurry fermented at 30 °C in earthen/wooden vessels; spontaneous LAByeast cofermentation. For 12-24hrs	*Lactobacillus. Plantarum, And Lactococcus lactis strain*	Acidic (pH ~4.0), lactic acid, mild alcohol, probiotic LAB population.	Musika *et al.,* [43]
Finger Millet	Fermentation was carried out in an orbital incubator (Wiggen Hauser, Germany) set at 30 °C and 200 rpm, continuing until the pH reached approximately 4–5. Samples were taken at various time points: before inoculation and at 0, 2, 4, and 8 hours after the start of fermentation.	*Lactobacillus. Plantarum And Weissella strains (Weissella. Confuse/ Weissella. Cibaria)*	It as a value-added product suitable for industrial application, offering innovative and appealing qualities in terms of taste, nutrition, and health benefits, and catering to diverse population groups, including children, the elderly, and individuals with lactose or gluten intolerance.	Vila-Real *et al.,* [44]
Finger Millet (Ragi malt/ Ragi beer, India)	Malted ragi flour mixed with water; spontaneous fermentation at 28–30 °C, semi-aerobic. For 24- 48 hrs	*Lactobacillus plantarum*	Alcohol (2–4%), lactic acid, B-vitamin enrichment, improved mineral bioavailability.	Sekar *et al.,* [45]

Finger Millet	Finger millet flour, water; spontaneous fermentation at 25–30 °C; semi-anaerobic. 24-48 h	*Lactobacillus. Plantarum, Weissella confuse, saccharomyces cerevisiae*	Low ethanol (1–2%), lactic acid, B-vitamin enhancement, probiotic LAB	Muyanja *et al.,* [46]
Sorghum + Millet mix	Steeped grains milled into slurry; sweetened, boiled, cooled, and fermented at 28–30 °C. for 24- 48 h	*Lactobacillus. fermentum, Saccharomyces cerevisiae, candida krusei*	Non-alcoholic beverage, enriched in vitamins, improved digestibility, natural probiotics.	Adelekan *et al.,* [47]
Foxtail millet	Foxtail millet flour, containing approximately 10^7 CFU/g, was packed in polyethylene bags to fermentation at 37 °C for 48 hours.	*Lactobacillus paracasei*	Fermentation of foxtail millet yields bioactive peptides with significantly improved antioxidant and antimicrobial activities.	Amadou *et al.,* [48]

ABSTRACT

An emerging area in nanotechnology is the green Synthesis of nanoparticles through biological methods, especially plant extracts. In this study, green zinc oxide nanoparticles were synthesized using *T. cordifolia* and *M. oleifera* leaves aqueous extract, and synthesized nanoparticles were characterized by UV-Visible spectroscopy (UV-Vis), Fourier transform infrared spectroscopy (FTIR), scanning electron microscopy (SEM-EDS), and X-ray diffraction (XRD). The *in vitro* antibacterial activity was assessed using the agar-well diffusion method against *Ralstonia solanacearum*. The UV-Vis spectroscopy of green-synthesized ZnO NPs showed an absorption peak at 373 and 380 nm, and FTIR spectroscopy showed the presence of an OH stretching functional group at 3323 and 3308 cm^{-1}. SEM-EDS analyzed the percentage amount of green synthesized ZnO NPs with cubic, hexagonal, or bicone-shaped surface morphology, minimal aggregation, and particle sizes that ranged from 118.2 nm to 454 nm. The hexagonal crystallite sizes of the green-synthesized ZnO NPs are 58.22 and 28.17 nm, confirmed by XRD. *In vitro* antibacterial activity of green-synthesized ZnO NPs of *T. cordifolia* and *M. oleifera* (100 mg/mL) exhibited an effective zone of inhibition of 19±1 mm and 20±0.33 mm, respectively, against *Ralstonia solanacearum*. Both green-synthesized zinc oxide nanoparticles can be used as antibacterial agents against soil pathogens with an eco-friendly method.

Keywords: T*inospora cordifolia*, *Moringa oleifera*, Green synthesis, Zinc oxide Nanoparticles, *Ralstonia solanacearum*.

INTRODUCTION

A rapidly emerging area of technology is nanotechnology, which deals with fabricating and designing nanoparticles with sizes in the order of between 1 and 100 nanometers. Nanoparticles (NPs) have attracted a lot of interest in study because of their enhanced electrochemical reactivity, nonlinear optical properties, and thermal conductivity [1]. Various techniques are used to synthesize nanoparticles (NPs), such as chemical, physical, and biological procedures, and they are being studied; these techniques are highly relevant to technical and environmental concerns [2]. Green synthesis is a biocompatible, safe, and ecologically friendly method of synthesizing nanoparticles for a diversity of uses, including aspects of biology. Plant-based nanoparticle green synthesis is now observed as the gold standard among green biological techniques due to its versatility and simplicity of use [3]. The actual utilization of plant-mediated nanoparticle synthesis is growing due to its lower toxicity, absence of harmful chemical byproducts, and environmentally favorable characteristics [4]. Noble metals such as zinc, copper, palladium, platinum, silver, and gold are utilized in the synthesis of nanoparticles for a variety of purposes, such as water purification, antibacterial agents, drug administration, food preservation, molecular monitoring, renewable energy, recreational and iron equipment, agriculture, and medicine [5]. Medicinal plants are widely used to treat a variety of illnesses, both in developed and developing nations, and both in rural and increasingly in urban regions. The World Health Organization's Global Centre for Traditional Treatment (2023) estimates that over 88% of people worldwide, especially in rural areas, depend on herbal therapy for their basic medical needs [6]. *Tinospora cordifolia* and *Moringa oleifera* leaf extracts have been utilized for biologically approachable synthesis of ZnO NPs. *The Tinospora cordifolia* plant belongs to the Menispermaceae family and is indigenous to the subcontinent. *T. cordifolia* is normally known as giloy, guduchi, or amrita and is highly valuable in Ayurveda and has a major role in anti-allergic, antidiabetic, anti-inflammatory, anti-arthritic, and anti-microbial treatments. Hence, they enhance the antibacterial activity of material to which they are added [7-8]. *Moringa oleifera* is a member of the family Moringaceae and is usually known as moringa or the drumstick tree. Moringa leaves are excellent natural antioxidants and have anti-inflammatory, anti-ulcer, antitumor, antipyretic, antihypertensive, antidiabetic, and cholesterol-lowering properties [9]. The most studied metal oxide nanoparticles include titanium dioxide (TiO_2), tin oxide (SnO_2), copper oxide (CuO), and zinc oxide (ZnO) due to their various properties and applications. Zinc oxide has remained the theme of the most investigation among these metal oxides because of its non-toxic properties, affordability, biocompatibility, chemical stability, and biodegradability [10]. The current study evaluated the green-synthesized ZnO NPs and characterized the green-synthesized ZnO nanoparticles using UV-visible spectroscopy (UV-Vis), Fourier transform infrared analysis (FTIR), scanning electron microscopy (SEM) with EDS, and X-ray diffraction (XRD) [11]. *Tinospora cordifolia* and *Moringa oleifera's* usage of green synthesis of ZnO NPs is the key subject of this study. *In vitro* antibacterial activity of *Tinospora cordifolia* and *Moringa oleifera* green synthesized ZnO NPs was evaluated against *Ralstonia solanacearum* soil pathogen or phytopathogen.

MATERIALS AND METHODS

Collection of *Tinospora cordifolia* and *Moringa oleifera* leaves and preparation of leaf powder

The plant of *Tinospora cordifolia* and *Moringa oleifera* was collected near Bengaluru. The collected leaves were washed with distilled water and dried out for a day in a hot air oven at 60°C. The leaves were processed into a coarse powder for further experiments.

Preparation of aqueous leaf extract: *Tinospora cordifolia* and *Moringa oleifera* (3 g) were mixed with 100 mL of distilled water and kept at 60 °C for 30 minutes. The solution was filtered using Whatman NO. 1 filter paper, and the filtrate solution was stored at 4°C for further use in the green synthesis of ZnO NPs [12].

Green synthesis of ZnO NPs from *T. cordifolia* and *M. oleifera* extract

The aqueous extract (5 mL) and 0.5 M zinc acetate dehydrate (50 mL) were used for the synthesis of ZnO NPs. To maintain the pH at 8, the 2M NaOH was added drop by drop. The mixture was heated for 30 minutes at 70 °C with continuous stirring until the formation of white precipitate. The precipitate was subjected to centrifugation with distilled water and by ethanol for 8 minutes at 8000 rpm for three times and then dried at 70 °C in a hot air oven. The dried precipitate was stored at 4°C for further characterization [13].

Characterization of green synthesized ZnO NPs

UV-Visible spectrophotometry

The green synthesized ZnO NPs' maximum absorption was determined by UV-Visible spectrophotometry (Thermo Scientific GENESYS 180) in the wavelength scan range between 200 and 700 nm [14].

Fourier transform infrared spectroscopy

The infrared absorption spectrum from the analysis shows the functional groups in the green- synthesized ZnO nanoparticles. For this analysis, the FTIR—Thermo Scientific (912A1168)—was carried out between the ranges of 4000 and 400 cm^{-1} [15].

Scanning electron microscopy and Energy-dispersive X-ray spectroscopy

Green synthesized ZnO NPs were analyzed to determine their morphology and composition by scanning electron microscopy (SEM)- Zeiss Ultra 55 Field Emission, (CeNSE lab, IISc, Bengaluru). Together with SEM, EDS was used to analyze the synthesized ZnO NPs' elemental properties [16].

X-ray diffraction analysis

The crystalline and lattice structure of zinc oxide NPs was determined by X-ray diffraction (XRD) study. The XRD pattern characterization of the green-synthesized ZnO NPs was conducted using a Rigaku Smartlab X-Ray Diffractometer (CeNSE lab, IISc, Bengaluru). It was performed at a normal scan speed between 20 and 80° diffraction angles (2θ). Using the Debye-Scherrer formula, calculations were carried out.

D=0.9 cos

Where D is the NPs' crystal size, 0.9 is Scherrer's constant, λ is the X-ray wavelength, β is the plane-corresponding diffraction peak's full width at half (FWHM), and θ is the Bragg diffraction angle [17].

***In vitro* antibacterial activity by using the agar-well diffusion method**

Maintenance of bacterial culture

Gram-negative pathogenic bacteria *R. solanacearum* (MTCC-6720) that are harmful to soil and crop plants were used for *in vitro* antibacterial activity assay. The frozen cultures were revived and preserved in nutrient broth, and cultures were streaked on Muller Hinton agar (MHA) under sterile conditions and kept at 28 °C for hr. A loopful containing the test organism was inoculated in nutrient broth and maintained for 24hr at 28 °C. The bacterial cultures obtained were stored at 4 °C and used for further analysis.

***In vitro* antibacterial activity of green-synthesized ZnO NPs against phytopathogen**

The phytopathogen *R. solanacearum* organisms were plated on sterile MHA plates uniformly using the spread plate method. The MHA plates were allowed to dry for 5 minutes, and agar wells were bored using a sterilized cork borer. The green synthesized zinc oxide NPs of *T. cordifolia* and *M. oleifera* (25, 50, 75, and 100 mg/mL) were loaded (50µL) into the well, and for positive control Streptomycin (10 mcg disc) was used. The plates were incubated for 18–24 hrs at 28 °C. The zone of inhibition was measured in mm **[18]**.

RESULTS AND DISCUSSION

Green synthesis of ZnO NPs from *T. cordifolia* and *M. oleifera* leaf extract

Green synthesis of zinc oxide NPs showed a color change from light yellow solution to white precipitate for *T. cordifolia* and white-yellowish precipitate for *M. oleifera*, which confirmed the formation of ZnO NPs. *T. cordifolia* and *M. oleifera* leaf extract (5mL) yielded 1.81 g and 0.88 g of zinc oxide NPs, respectively.

Characterization of green synthesized ZnO NPs

UV-Visible spectroscopy

In the current study, the UV-Vis bands of green synthesized zinc oxide NPs of *T. cordifolia and M. oleifera* had a maximum absorbance of 0.80 at 373 nm and 1.07 at 380 nm, respectively (Figure 1 and Figure 2). The finding is consistent with earlier research, which reports that the absorption wavelength for bulk green-synthesized ZnO NPs derived from *T. cordifolia* methanol extract of stem showed at 374 nm [19]. For *M. oleifera*, where the UV 386 nm value was almost close to the result found in a previous study, ZnO NPs were synthesized from *M. oleifera* leaves [20].

FTIR analysis of green-synthesized ZnO NPs

In order to identify the several characteristic functional groups associated with the green synthesized ZnO nanoparticles, they were analyzed by FTIR. The distinctive functional group found in the synthesized ZnO NPs is indicated by the peak. It is also advised that the synthesis of zinc oxide NPs is due to the interface of alkynes, flavonoids, terpenoids, and phenolic compounds **[21]**. The obtained absorption spectra with probable alignments are shown in the figure and table for the green synthesized ZnO NPs of *T. cordifolia and M. oleifera*. Different intense bands were exhibited at 3323, 1580, 1500, 1383, 1332, 1026, 836, 741, 712, 675, and 617 cm^{-1} and 3308, 1573, 1507, 1385, 1048, 829, 712, 661, and 617 cm^{-1} for green synthesized ZnO NPs of *T. cordifolia* and *M. oleifera*, respectively (Figure 3 and Figure 4). The FTIR spectra showed a broad absorption band in a higher region at 3323 and 3308 cm^{-1} due to the OH stretching band, which is corresponding to. The absorption bands at 1580 and 1573 cm^{-1} are characteristic of N-H bending and C=C stretching vibrations, respectively. The spectra of 1500 and 1507 cm^{-1} showed N-O stretching with a nitro compound. The 1383 and 1385 cm^{-1} correspond to S=O stretching with a sulfate compound with a sharp intensity. The 1332 and 1048 cm^{-1} correspond to S=0 stretching with a sulfate compound and C-N stretching with an amine group. The absorption bands at 836 and 829 correspond with C-Cl stretching with halo compound 741, and 712 cm^{-1} corresponds with C-H bending with monosubstituted 675, and 661 cm^{-1} corresponds with C=C bending with alkene compound 617, and 617 cm^{-1} corresponds with –C-H stretch (aromatic). This result is very similar to the earlier research, which found that all the functional groups in the FTIR spectra of green synthesized ZnO NPs from the thyme plant changed at different calcination temperatures **[22]**. These findings could indicate that phytochemicals have a role in the stabilization and reduction process of green synthesized nanoparticles **[23]**.

Scanning electron microscopy analysis and Energy dispersive X-ray spectroscopy of green synthesized ZnO NPs from *T. cordifolia* and *M. oleifera*

The shape, size, and surface morphology of the nanoparticles were assessed by scanning electron microscopy. The green synthesized ZnO NPs from *T. cordifolia* and *M. oleifera* had a regular morphology and a cubic or hexagonal and cubic or bicone shape on the surface, respectively. The SEM analysis showed aggregated NPs in (Figure 5 and Figure 6) have a particle size from 118.2 nm to 415.5 nm and 268 nm to 454 nm, respectively. This result correlates with previous literature, where green synthesized ZnO NPs from *M. oleifera* extract showed the hexagonal facets and nanorods were shorter, and the diameter of the nanorods was around 500 nm [24]. Based on the results of the EDS spectrum, green-synthesized zinc oxide NPs from *T. cordifolia* and *M. oleifera* appear to be in a pure state (Figure 7 and Figure 8). According to the results, *T. cordifolia* ZnO NPs showed atomic percentages of zinc and oxygen of 41.10% and 58.96%, respectively, while their weight percentages of zinc and oxygen were 74.04% and 25.96%, respectively. For *M. oleifera,* ZnO NPs showed atomic percentages of zinc and oxygen of 43.17% and 55.83%, respectively, while their weight percentages of zinc and oxygen were 75.63% and 24.37%, respectively (Table 1). According to the results, the weight percentage of zinc was observed to be greater than oxygen in both *T. cordifolia* and *M. oleifera* ZnO NPs. These comparable results with great weight percentage correspond with the previous

research, where zinc and oxygen were reported to be 86.78% and 13.22%, respectively, from green synthesized zinc oxide NPs from *Justicia adhatoda* leaf extract [25].

X-ray diffraction analysis of green synthesized ZnO NPs

The crystal structure, lattice planes, and crystalline size were assessed through XRD analysis. The green synthesized *T. cordifolia* and *M. oleifera* ZnO NPS samples exhibited diffraction peaks of 2θ values at 31.79, 34.32, 36.34, 47.49, 56.57, 62.87, 68.01, and 69.07 degrees and 31.67, 34.34, 36.27, 47.48, 56.56, 62.76, 67.89, and 69.18 degrees, respectively. The detected peaks observed were indexed as hexagonal ZnO wurtzite structures, and they corresponded to the lattice planes with (100), (002), (101), (102), (110), (103), (112), and (201), respectively, shown in (Figure 9 and Figure 10), and these results are consistent with the previous research study [26]. Similar lattice planes were observed in the previous literature for zinc oxide NPs, and all these reflections fully satisfied JCDPS card no. 01-089-0511 [27]. The size of the green- synthesized ZnO NPs was figured out from the strong peak linked to the (101) plane. The crystallite size of green synthesized *T. cordifolia* and *M. oleifera* zinc oxide NPs was calculated using Debye Scherrer's formula and was found to be 58.22 and 28.17 nm. The crystal size of green synthesized zinc oxide NPs was calculated based on the highest intense peak corresponding to the (101) plane [28].

***In vitro* antibacterial activity of green synthesized ZnO NPs by the agar well diffusion method**

The present research evaluated and compared the antibacterial efficacy of green synthesized zinc oxide NPs of *T. cordifolia* and *M. oleifera* against a gram-negative soil pathogen, particularly *Ralstonia solanacearum*. According to the result, both green synthesized ZnO NPs showed a good inhibition effect. The maximum inhibition against *Ralstonia solanacearum* was 19±1 mm for *T. cordifolia* ZnO NPs at 100 mg/mL, 20±0.33 mm for *M. oleifera* ZnO NPs, and 21.5±0.8 mm for positive control streptomycin, respectively (Table 2). The green-synthesized ZnO NPs from *T. cordifolia* and *M. oleifera* both had a strong inhibitory impact. The zone of inhibition against *Ralstonia solanacearum* increased when the concentration of green-synthesized ZnO NPs also increased (Figure 11 and Figure 12). When the gram-negative soil pathogens were evaluated, both green-synthesized ZnO NPs were compared; *R. solanacearum* was slightly more suppressed by the *Moringa oleifera* ZnO NPs than by *the T. cordifolia* ZnO NPs. As a result, earlier research revealed that applying zinc oxide NPs and *Withania coagulans* leaf extract together inhibited *R. solanacearum* growth *in vitro* more than applying them separately [29]. Furthermore, another study demonstrated that green-synthesized *Curcuma longa* ZnO NPs effectively reduced the bacterial wilt pathogen by making the host more susceptible to the pathogen systemically through the use of nanoparticles, and other green-synthesized ZnO NPs demonstrated [30].

CONCLUSION

The study reports a simple, cost-efficient, and green synthesis method for synthesizing zinc oxide nanoparticles from the leaf extract of the plants *T. cordifolia* and *M. oleifera*. This method is the conventional approach for synthesizing ZnO NPs using an eco-friendly, green synthesis technique. Characterization by UV-visible green ZnO NPs indicated the formation at 373 and 380 nm. SEM-EDS analysis showed that the green-synthesized ZnO NPs exhibited cubic, hexagonal, or bicone-shaped surface morphology with minimal aggregation, particle sizes ranging from 118.2 nm to 454 nm, and a specific composition. XRD confirmed that the green-synthesized ZnO NPs have a hexagonal crystallite size of 58.22 and 28.17 nm. With the FTIR spectrum, the green-synthesized ZnO NPs showed the presence of functional groups with OH stretched bonds and other functional groups also present in both synthesized ZnO NPs. Green-synthesized ZnO NPs effectively inhibited the soil pathogen, i.e., *Ralstonia solanacearum in vitro*, and both *T. cordifolia* and *M. oleifera.* ZnO NPs successfully acted as antibacterial agents against gram-negative soil pathogens, possibly due to the presence of secondary metabolites in leaf extract and also green-synthesized ZnO NPs. The study suggests that these green-synthesized ZnO NPs could serve as new controlling agents. This contributed to the biocompatibility and *in vitro* biological potency of ZnO NPs.

ACKNOWLEDGEMENTS

I would like to express my gratitude to the members of the CeNSE lab (Indian Institute of Science, Bengaluru) for their support with the XRD and SEM facilities.

AUTHOR CONTRIBUTION

Research contribution, conceptualization, and design of the research work CV; Execution of lab experiments and CV; Analysis of results and Preparation of manuscript CV. All authors approved the final manuscript.

Conflict of Interest

ABSTRACT

This study presents a new Complex Intuitionistic Fuzzy Weighted Geometric (CIFWG) operator designed to more effectively aggregate complex intuitionistic fuzzy information, where membership, non-membership, and hesitation degrees lie within the complex unit disk. By generalizing geometric aggregation to the CIF setting, the proposed operator models multiplicative interactions among criteria and provides a refined mechanism for handling amplitude–phase uncertainty. To support its use in learning-based systems, the paper also introduces an Amplitude–Phase Weighted Realization (APWR) defuzzifier that converts CIF values into standard intuitionistic fuzzy triples, ensuring compatibility with neural computation. Using the CIFWG operator as a foundation, a complete Multi-Attribute Group Decision-Making (MAGDM) procedure is developed for evaluating alternatives under complex intuitionistic fuzzy conditions. A detailed numerical example illustrates the computational process, demonstrates the model's stability, and highlights its benefits in comparison with existing CIF aggregation approaches. Furthermore, the work pioneers an Artificial Neural Network (ANN) architecture tailored to CIF data, representing one of the earliest attempts to embed complex intuitionistic fuzzy information directly into neural learning. The combined results show strong synergy between the CIFWG-based decision model and the CIF-ANN framework, opening new avenues for research at the intersection of complex fuzzy theory, neural systems, and intelligent decision analytics.

Keywords: Complex Intuitionistic Fuzzy Sets; CIFWG Operator; MAGDM; Complex-Valued Decision Analytics; Artificial Neural Networks (ANN); Complex Neural Networks; Computational Intelligence.

INTRODUCTION

Decision-making environments frequently involve complex and imprecise information, where evaluators express their judgments not only with uncertainty but also with directional or phase-dependent characteristics. Complex Intuitionistic Fuzzy Sets (CIFS), defined through complex-valued membership and non-membership degrees within the unit disk, have emerged as a powerful extension of intuitionistic fuzzy theory for modelling such intricate information structures. While several complex intuitionistic fuzzy aggregation operators, most notably weighted averaging and hybrid averaging operators, have been developed, the geometric mode of aggregation remains largely unexplored, despite its ability to capture multiplicative and interaction-driven relationships among attributes. Moreover, existing CIF-based decision frameworks rely predominantly on static analytical procedures, with no integration of learning-based models capable of adapting to data-driven patterns. To address these gaps, this research introduces a novel Complex Intuitionistic Fuzzy Weighted Geometric (CIFWG) operator, a corresponding MAGDM framework, and a pioneering Artificial Neural Network (ANN) model designed specifically for CIFS. Together, these developments enrich the theoretical landscape of CIF aggregation and open a new paradigm at the intersection of complex fuzzy systems, intelligent computation, and decision analytics.

Complex Intuitionistic Fuzzy Sets (CIFS), first introduced by Alkouri and Salleh [1], provide a richer representation of uncertainty by embedding intuitionistic fuzzy information in the complex plane. Neural models incorporating intuitionistic fuzzy logic have been actively developed, including interval-valued IFNNs [2], IF deep neural networks [3], IFNNs for forecasting and classification [5], and Gaussian-based IFNNs [6]. Several studies have applied IF-ANNs in decision support and intelligent systems [7–10]. Machine learning-driven MCDM models also continue to evolve across diverse application domains [11,12,13,15]. While complex fuzzy neural models such as nonlinear CIF-IOWA networks have been explored [14], the literature lacks CIF-specific aggregation operators and CIF-to-IFS transformation mechanisms—gaps that the present work addresses through the proposed CIFWG and APWR operators.While CIFS provide a powerful framework for representing uncertainty with both amplitude and phase information, most existing aggregation studies rely only on additive mechanisms such as CIF weighted averaging and hybrid operators. These approaches cannot adequately capture nonlinear or multiplicative interactions among criteria, an essential feature in many complex-valued decision environments. Moreover, current MAGDM models under CIFS remain static and analytical, with no learning-based system capable of adapting to patterns in CIF decision data. Despite the rapid growth of intelligent decision systems, an ANN architecture that can process complex intuitionistic fuzzy information has not yet been developed, leaving a significant gap in bridging CIF theory with modern computational intelligence. Motivated by these limitations, this work proposes a Complex Intuitionistic Fuzzy Weighted Geometric operator and introduces the first ANN model designed specifically for CIFS, enabling both richer aggregation behavior and data-driven learning in MAGDM applications.

PRELIMINARIES

Although several extensions of intuitionistic and complex fuzzy sets exist in the literature, no existing work provides a structured mapping that converts a complex intuitionistic fuzzy value into an intuitionistic fuzzy triplet. Current CIF approaches operate purely in the complex plane and rely on simple components such as modulus, real part, or argument when interpretation is needed. Defuzzification is almost never discussed, and no realization operator from CIF to IFS has been formally established. The proposed Amplitude–Phase Weighted Realization (APWR)defuzzifier fills this gap by offering a mathematically consistent realization framework that blends amplitude and phase through cosine-based phase weighting, incorporates a tunable fusion parameter, and ensures IFS validity through normalization. In addition to this, the article introduces a new Complex Intuitionistic Fuzzy Weighted Geometric operator, extending CIF aggregation theory in a direction not explored in existing literature. Together, these two

contributions, the APWR defuzzification and the CIF weighted geometric operator, represent novel developments in the field and provide tools that have not appeared in any previous CIFS research.Based on the Complex Intuitionistic Fuzzy Sets proposed by Alkouri&Salleh [1], we now introduce a new aggregation operator in the following.

The Complex Intuitionistic Fuzzy Weighted Geometric Operator:

Definition 1: For a clump of CIFS valuesδ_j, j being a natural numberwith weights $\xi_j = (\xi_1, \xi_2, \xi_3, \dots, \xi_n)^T \ni \xi_j$ is positive and$\sum_{j=1}^{n} \xi_j = 1$,the CIFWG operator, $\text{CIFWG}(\delta_1, \delta_2, \delta_3, \dots, \delta_n) = \xi_1\delta_2 \oplus \xi_1\delta_2 \oplus \xi_3\delta_3 \oplus \dots \oplus \xi_n\delta_n$, is represented as follows:

$$CIFWG(\delta_1, \delta_2, \delta_3, \dots, \delta_n) = \left[\prod_{j=1}^{n}(c_j)^{\xi_j} e^{i2\pi\left(\prod_{j=1}^{n}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)}, 1 - \prod_{j=1}^{n}(1-v_j)^{\xi_j} e^{i2\pi\left(\prod_{j=1}^{n}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right].$$

Example to demonstrate the CIFWG operator:

Let $\delta_1 = \left\{(0.6)e^{i2\pi(0.8)}, (0.2)e^{i2\pi(0.1)}\right\}$,
$\delta_2 = \{(0.8)e^{i2\pi(0.7)}, (0.2)e^{i2\pi(0.1)}\}$,
$\delta_3 = \left\{(0.5)e^{i2\pi(0.6)}, (0.3)e^{i2\pi(0.4)}\right\}$,
$\delta_4 = \left\{(0.6)e^{i2\pi(0.7)}, (0.3)e^{i2\pi(0.2)}\right\}$,are the CIFS values to be evaluated by CIFWG and$\xi = (0.35,0.3,0.1,0.25)$be the weight with respect toδ_j. Then the computation of the CIFWG operator for the provided CIFS values is given as follows:

$\prod_{j=1}^{n}(c_j)^{\xi_j} = (0.6)^{0.35} * (0.8)^{0.3} * (0.5)^{0.1} * (0.6)^{0.25} = 0.6421$.

$\prod_{j=1}^{n}(1-v_j)^{\xi_j} = [(1-0.2)^{0.35} * (1-0.2)^{0.3} * (1-0.3)^{0.1} * (1-0.3)^{0.25}] = 0.7632$

$\prod_{j=1}^{n}\left(\frac{wc_j}{2\pi}\right)^{\xi_j} = (0.8)^{0.35} * (0.7)^{0.3} * (0.6)^{0.1} * (0.7)^{0.25} = 0.7221$

$\prod_{j=1}^{n}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j} = [(1-0.1)^{0.35} * (1-0.1)^{0.3} * (1-0.6)^{0.1} * (1-0.8)^{0.25}] = 0.8389$

Thus, $CIFWG(\delta_1, \delta_2, \delta_3, \dots, \delta_n) = \{(0.6421)e^{i2\pi(0.7221)}, (1 - 0.6416e^{i2\pi(1-0.8389)}\}$
$= \{0.6421e^{i2\pi(0.7221)}, 0.3584e^{i2\pi(0.1611)}\}$.

Now, we propose a novel defuzzifier function called the Amplitude–Phase Weighted Realization (APWR)defuzzifier so that the Complex IFS can be defuzzified before inputting the data into the ANN algorithm.

Definition 2: Given a complex intuitionistic fuzzy membership $m = r_m e^{i2\pi(\phi_m)}$ and non-membership $n = r_n e^{i2\pi(\phi_n)}$, with $r \in [0,1], \phi \in [0,1]$:

1. Compute the Real Scores-Membership and non-membership as:

$\mu_{Df} = r_m\omega(\phi_m)^{\alpha}$; $\gamma_{Df} = r_n\omega(\phi_n)^{\alpha}$,where$\omega(\phi) = \frac{1+\cos(2\pi\phi)}{2}$ and $\alpha \geq 1$ controls the phase sensitivity.

If $\mu_{DF} + \gamma_{DF} \leq 1$, there is no necessity for normalizing the IFS value, but on the other hand if $\mu_{Df} + \gamma_{Df} > 1$, then the IFS value can be normalized by $s = \frac{1}{\mu_{Df}+\gamma_{Df}}$. In this case $\mu = s.\mu_{Df}$and $\gamma = s.\gamma_{Df}$, and $\pi = 0$.

Example to demonstrate the APWR-Defuzzifier:

Given the pair: $m = 0.6479e^{i2\pi(0.6479)}, n = 0.2449e^{i2\pi(0.8998)}$

Use APWR with α=1.

1.Compute $\omega(\phi_m)$ and $\omega(\phi_n)$

2.$\phi_m = 0.6479$and hence, $\omega(\phi_m) = \frac{1+\cos(2\pi.0.6479)}{2}$.

3.$\phi_n = 0.8998$and hence, $\omega(\phi_n) = \frac{1+\cos(2\pi.0.8998)}{2}$.

4.$\mu_{Df} = 0.6479.\omega(0.6479) = 0.1301$; $\gamma_{Df} = 0.2449.\omega(0.8998) = 0.2214$

5.Sum: $\mu_{Df} + \gamma_{Df} = 0.3515$, which is very well within 1. Hence we don't need to normalize the data to make it an IFS.

6.The defuzzified IFS is: $(\mu_{Df}, \gamma_{Df}) = (0.1301, 0.2214)$.

Theorem 1: Let $\delta_j = \{\zeta_j(x)e^{i\omega\zeta_j(x)}, \vartheta_j(x)e^{i\omega\vartheta_j(x)}\}, j = 1,2,\dots,$ n be a clump of CIFS values. Then, the aggregated values performing the CIFWG operator are also CIFS values, which are given as:

$$CIFWG(\delta_1,\delta_2,\delta_3,\dots,\delta_n)=\left[\prod_{j=1}^{n}(c_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{n}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)},1-\prod_{j=1}^{n}(1-v_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{n}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right],$$

where $\xi_j=(\xi_1,\xi_2,\xi_3,\dots,\xi_n)^T$ be the weight vector of δ_j, j being a natural number, $\xi_j>0$ and $\sum_{j=1}^{n}\xi_j=1$.

Proof : Consider the CIFWG operator:

$$CIFWG(\delta_1,\delta_2,\delta_3,\dots,\delta_n)=\left[\prod_{j=1}^{n}(c_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{n}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)},1-\prod_{j=1}^{n}(1-v_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{n}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right] \quad (1)$$

Let us do this by applying mathematical induction on n.

(i) Consider the simple case with two CIFS elements:

Let, δ_1,δ_2 be two CIFS numbers. Then the CIFWG for n=2 for δ_1,δ_2 is given as:

$$CIFWG(\delta_1,\delta_2)={\delta_1}^{\xi_1}\otimes{\delta_2}^{\xi_2}$$

$$=\left[\begin{array}{c}\left(\prod_{j=1}^{n}(c_1)^{\xi_1}e^{i2\pi\left(\prod_{j=1}^{n}\left(\frac{wc_1}{2\pi}\right)^{\xi_1}\right)}\right)\left(\prod_{j=1}^{n}(c_2)^{\xi_2}e^{i2\pi\left(\prod_{j=1}^{n}\left(\frac{wc_2}{2\pi}\right)^{\xi_2}\right)}\right),\\ \left(1-\prod_{j=1}^{n}(1-v_1)^{\xi_1}e^{i2\pi\left(\prod_{j=1}^{n}\left(1-\frac{wv_1}{2\pi}\right)^{\xi_1}\right)}\right).\left(1-\prod_{j=1}^{n}(1-v_2)^{\xi_2}e^{i2\pi\left(\prod_{j=1}^{n}\left(1-\frac{wv_2}{2\pi}\right)^{\xi_2}\right)}\right)\end{array}\right].$$

Thus, the equation holds for two CIFS elements.

(i) Assume the equation holds for some k CIFS elements. That is,

$$CIFWG(\delta_1,\delta_2,\dots,\delta_k)=\left[\prod_{j=1}^{k}(c_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{k}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)},1-\prod_{j=1}^{k}(1-v_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{k}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right].$$

Then, when considering k+1 CIFS elements, by the operational law, we will have:

$$CIFWG(\delta_1,\delta_2,\dots,\delta_k,\delta_{k+1})=$$

$$\left[\begin{array}{c}\left(\prod_{j=1}^{k}(c_j)^{\xi_j}.e^{i2\pi\left(\prod_{j=1}^{k}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)}\right)\left(\prod_{j=1}^{k+1}(c_j)^{\xi_j}.e^{i2\pi\left(\prod_{j=1}^{k+1}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)}\right),\\ \left(1-\prod_{j=1}^{k}(1-v_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{k}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right)\left(1-\prod_{j=1}^{k+1}(1-v_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{k+1}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right)\end{array}\right]$$

$$=\left(\prod_{j=1}^{k+1}(c_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{k+1}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)},1-\prod_{j=1}^{k+1}(1-v_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{k+1}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right).$$

i.e., equation (1) seems to satisfy for k+1 CIFS elements, thus proving that equation (1) is true for all n.

Hence, the theorem.

Example to demonstrate the CIFWG for n=2:

Let $\delta_1=\left\{(0.6)e^{i2\pi(0.8)},(0.2)e^{i2\pi(0.1)}\right\},\delta_2=\{(0.8)e^{i2\pi(0.7)},(0.2)e^{i2\pi(0.1)}\}$ be two CIFS values and $\xi_j=(0.5,0.4)^T$. Then,

$\zeta_1(x)e^{i\omega\zeta_1(x)}=(0.6)e^{i2\pi(0.8)}$, $\vartheta_1(x)e^{i\omega\vartheta_1(x)}=(0.2)e^{i2\pi(0.1)}$;

$\zeta_2(x)e^{i\omega\zeta_2(x)}=(0.8)e^{i2\pi(0.7)}$, $\vartheta_2(x)e^{i\omega\vartheta_2(x)}=(0.2)e^{i2\pi(0.1)}$.

$$CIFWG(\delta_1,\delta_2)=\left[\prod_{j=1}^{2}(c_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{n}\left(\frac{wc_j}{2\pi}\right)^{\xi_j}\right)},1-\prod_{j=1}^{n}(1-v_j)^{\xi_j}e^{i2\pi\left(\prod_{j=1}^{n}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j}\right)}\right]$$

Exploring the terms within the GIFWG pair, we can have the following:

$$\prod_{j=1}^{2}(c_j)^{\xi_j}=(0.6)^{0.5}\times(0.8)^{0.4}=0.7083;$$

$$\prod_{j=1}^{2}(1-v_j)^{\xi_j}=[(1-0.2)^{0.5}*(1-0.2)^{0.4}]=0.8180;$$

$\prod_{j=1}^{2}\left(\frac{wc_j}{2\pi}\right)^{\xi_j} = (0.8)^{0.5} * (0.7)^{0.4} = 0.7754;$

$\prod_{j=1}^{2}\left(1-\frac{wv_j}{2\pi}\right)^{\xi_j} = [(1-0.1)^{0.5} * (1-0.1)^{0.4}] = 0.9094.$

Thus, by using equation(1),we get:

$CIFWG(\delta_1,\delta_2) = \left(0.7083e^{i2\pi(0.7754)}, (1-0.8180)e^{i2\pi(1-0.9096)}\right);$

Hence, $CIFWG(\delta_1,\delta_2) = \left(0.7083e^{i2\pi(0.7754)}, 0.1820e^{i2\pi(0.0906)}\right)$, which is clearly a complex intuitionistic fuzzy number.

Algorithm: Proposed stable ANN-MAGDM Model Using APWR Defuzzification and Neural Learning

Input

- CIF decision values $\delta_i = r_{mi}e^{i2\pi\phi_{mi}}, r_{ni}e^{i2\pi\phi_{ni}}$ for i=1,…,m
- APWR parameter α
- ANN structure:5-4-5 (ReLU hidden layer, linear output)
- Initial learning rate $\eta_0 = 0.05$
- Early stopping threshold$\epsilon = 10^{-14}$

Output:

- Stabilized ANN -refined scores S_i^*
- Final ranking of alternatives
- Convergence epoch t_c

Step 1:APWR Defuzzification of CIF Values

For each CIF value δ_i, compute:

1.Phase – weight function:$\omega(\phi) = \frac{1+\cos(2\pi\phi)}{2}$

2.Raw components: $\mu_i^{Df} = r_{mi}\omega(\phi_{mi})^{\alpha}, \nu_i^{Df} = r_{ni}\omega(\phi_{ni})^{\alpha}$

3.Normalization: $S_i = \mu_i^{Df} + \nu_i^{Df}$

$$(\mu_i,\nu_i,\pi_i) = \begin{cases} \left(\mu_i^{Df}, \nu_i^{Df}, 1-S_i\right), & S_i \le 1 \\ \left(\frac{\mu_i^{Df}}{S_i}, \frac{\nu_i^{Df}}{S_i}, 0\right), & S_i > 1 \end{cases}$$

Step 2: MAGDM Scoring Usingthe optimistic Membership values: $S_i = \frac{\mu_i}{\mu_i+\nu_i+\pi_i} = \mu_i$

Step 3: Soft Normalization for ANN Stability

$$S_i^{scaled} = 0.2 + 0.6\,\frac{S_i - \min(s)}{\max(s) - \min(s)}$$

This mapping ensures stable gradients and prevents saturation.

Step 4: Stable ANN Initialization

- Input layer : 5 neurons
- Hidden layer: 4 neurons (ReLU)
- Output layer : 5 neurons (linear)

Initialize weight as:

$W_1 = 0.2 + 0.01\varepsilon_1, W_2 = 0.2 + 0.01\varepsilon_2,$

Where $\varepsilon_1, \varepsilon_2 \sim N(0,1)$.

All biases are set to zero.

Step 5: ANN Training (SGD +LR Decay +Early Stopping)
For each epoch t=1,2,…,T_{max}:
1.Learning – rate decay: $\eta_t = \frac{\eta_0}{1+0.01t}$
2.Forward pass: $Z_1 = XW_1 + b_1, A_1 = ReLU(Z_1)$
$Z_2 = A_1W_2 + b_2, \hat{Y} = Z_2,$
3.Loss (MSE): $L_t = \frac{1}{n}\sum(Y - \widehat{Y})^2$
4.Backpropagation (SGD): $W_k \leftarrow W_k - \eta_t \frac{\partial L}{\partial W_k}, b_k \leftarrow b_k - \eta_t \frac{\partial L}{\partial b_k}$
5.Early stopping condition: $|L_t - L_{t-1}| < \in \Rightarrow stop$ and $set\ t_c = t$
Step 6: Reconstruction of Outputs
After convergence$\hat{S}_i^{scaled} = \hat{Y}_i$
Unscale values:$S_i^* = \left(\frac{\hat{S}_i^{scaled} - 0.2}{0.6}\right)\left(max(S) - min(S)\right) + min(S)$
Step 7: Ranking of Alternatives
Sort in descending order:$Best = \arg(max)$
The ranking is:$S_{(1)}^* \geq S_{(2)}^* \geq \ldots \geq S_{(m)}^*$

Numerical Illustration

An industrial investor plans to acquire an advanced machine for his manufacturing unit from a supplier, say Manufacturer X. The supplier offers five different machine variants (A1, A2, A3, A4, A5), each produced in different batches, causing variations in their overall performance. To make an informed choice, the investor evaluates the machines based on four key attributes: C1 – operational reliability, C2 – workplace safety, C3 – adaptability to production changes, and C4 – output efficiency. Since the manufacturing batch influences the internal configuration of each model, these attributes exhibit noticeable fluctuations across alternatives. The investor aims to identify the most suitable machine among the five options. For this assessment, the weight information are taken as W_1 = (0.4, 0.25, 0.15, 0.2)^T, and W_2 = (0.35, 0.30, 0.10, 0.25)^T. To support the selection process, the investor seeks guidance from a domain specialist, who analyzes each machine model and provides evaluations using Complex Intuitionistic Fuzzy (CIF) information. Based on the evaluations provided by the experts, the multi-criteria decision-making framework introduced earlier is employed to identify the most suitable machine within the CIF setting

Following the algorithm proposed, firstly the CIFWG is computed for the decision matrix and then the reduced single column matrix will be passed through the ANN method and the final ranking based on the ANN will be given at the end of the computations.

CIFWG Computation for Alternative:A_1

$\prod_{j=1}^{n}(c_j)^{\xi_j}) = (0.7)^{0.35} * (0.8)^{0.3} * (0.6)^{0.1} * (0.7)^{0.25} = 0.7173.$

$\prod_{j=1}^{n}(1 - v_j^{\xi_j}) = [(1-0.1)^{0.35} * (1-0.1)^{0.3} * (1-0.3)^{0.1} * (1-0.3)^{0.25}] = 0.1186.$

$\prod_{j=1}^{n}(\frac{wc_j}{2\pi})^{\xi_j}) = (0.9)^{0.35} * (0.5)^{0.3} * (0.6)^{0.1} * (0.7)^{0.25} = 0.6802.$

$1 - (\frac{w_{v_j}}{2\pi})^{\xi_j} = [(1-0.1)^{0.35} * (1-0.4)^{0.3} * (1-0.2)^{0.1} * (1-0.2)^{0.25}] = 0.7645.$

CIFWG Computation for Alternative:A_2

$\prod_{j=1}^{n}(c_j)^{\xi_j}) = (0.7)^{0.35} * (0.4)^{0.3} * (0.7)^{0.1} * (0.4)^{0.25} = 0.5144.$

$\prod_{j=1}^{n}(1 - v_j^{\xi_j}) = [(1-0.3)^{0.35} * (1-0.2)^{0.3} * (1-0.2)^{0.1} * (1-0.3)^{0.25}]$=0.2049

$\prod_{j=1}^{n}(\frac{wc_j}{2\pi})^{\xi_j}) = (0.6)^{0.35} * (0.9)^{0.3} * (0.7)^{0.1} * (0.6)^{0.25} = 0.6879$

$1 - (\frac{w_{v_j}}{2\pi})^{\xi_j} = [(1-0.3)^{0.35} * (1-0.1)^{0.3} * (1-0.3)^{0.1} * (1-0.1)^{0.25}]$= 0.8035

CIFWG Computation for Alternative:A_3

$\prod_{j=1}^{n}(c_j)^{\xi_j}) = (0.3)^{0.35} * (0.6)^{0.3} * (0.3)^{0.1} * (0.7)^{0.25} = 0.4563$

$\prod_{j=1}^{n}(1 - v_j^{\xi_j}) = [(1-0.6)^{0.35} * (1-0.3)^{0.3} * (1-0.5)^{0.1} * (1-0.1)^{0.25}]$= 0.5924

$\prod_{j=1}^{n}(\frac{wc_j}{2\pi})^{\xi_j}) = (0.4)^{0.35} * (0.6)^{0.3} * (0.4)^{0.1} * (0.7)^{0.25}$= 0.5194

$1 - (\frac{w_{v_j}}{2\pi})^{\xi_j} = [(1-0.4)^{0.35} * (1-0.4)^{0.3} * (1-0.6)^{0.1} * (1-0.1)^{0.25}]$= 0.6375

CIFWG Computation for Alternative:A_4

$\prod_{j=1}^{n}(c_j)^{\xi_j}) = (0.4)^{0.35} * (0.7)^{0.3} * (0.6)^{0.1} * (0.5)^{0.25}$= 0.5208

$\prod_{j=1}^{n}(1 - v_j^{\xi_j}) = [(1-0.5)^{0.35} * (1-0.3)^{0.3} * (1-0.1)^{0.1} * (1-0.3)^{0.25}] = 0.6379$

$\prod_{j=1}^{n}(\frac{wc_j}{2\pi})^{\xi_j}) = (0.8)^{0.35} * (0.3)^{0.3} * (0.5)^{0.1} * (0.5)^{0.25} = 0.5055$

$1 - \left(\frac{w_{v_j}}{2\pi}\right)^{\xi_j} = [(1-0.1)^{0.35} * (1-0.3)^{0.3} * (1-0.3)^{0.1} * (1-0.4)^{0.25}] = 0.7353.$

CIFWG Computation for Alternative:A_5

$\prod_{j=1}^{n}(c_j)^{\xi_j}) = (0.9)^{0.35} * (0.7)^{0.3} * (0.7)^{0.1} * (0.8)^{0.25}$= 0.7901

$\prod_{j=1}^{n}(1 - v_j^{\xi_j}) = [(1-0.1)^{0.35} * (1-0.2)^{0.3} * (1-0.2)^{0.1} * (1-0.1)^{0.25}] = 0.8584$

$\prod_{j=1}^{n}(\frac{wc_j}{2\pi})^{\xi_j}) = (0.8)^{0.35} * (0.7)^{0.3} * (0.6)^{0.1} * (0.8)^{0.25}$= 0.7466

$1 - (\frac{w_{v_j}}{2\pi})^{\xi_j} = [(1-0.2)^{0.35} * (1-0.1)^{0.3} * (1-0.2)^{0.1} * (1-0.1)^{0.25}]$ = 0.8533

Hence, the CIFWG aggregated values for all the 5 alternatives are as follows:

$\delta_{A1} = \{0.7173e^{i2\pi(0.6802)}, 0.1186e^{i2\pi(0.7645)}\}$;

$\delta_{A2} = \{0.5144e^{i2\pi(0.6879)}, 02049e^{i2\pi(0.8035)}\}$;

$\delta_{A3} = \{0.4563e^{i2\pi(0.5194)}, 0.5924e^{i2\pi(0.6375)}\}$;

$\delta_{A4} = \{0.5208e^{i2\pi(0.5055)}, 0.6379e^{i2\pi(0.7353)}\}$;

$\delta_{A5} = \{0.7901e^{i2\pi(0.7466)}, 0.8584e^{i2\pi(0.8533)}\}$.

CIFS values are transformed toDefuzzified IFS values:

δ1: μ:0.2063521767, ν:0.0646951261, π:0.7289526973

δ2: μ:0.1593713402, ν:0.1362436873, π:0.7043849726

δ3: μ:0.0016928399, ν:0.1038334881, π:0.8944736721

δ4: μ:0.0001554722, ν:0.2895327448, π:0.7103117829

δ5: μ:0.3595602479, ν:0.6404397521, π:0.0000000000

Calculated Scores out of the Defuzzified IFS values (μ-values):

ANN Converged at epoch: 1648
Final MSE: 0.00000000000208713497

Reconstructed Scores:
δ1: 0.2063519217;
δ2: 0.1593715281;
δ3: 0.0016939927;
δ4: 0.0001565666;
δ5: 0.3595591909.

FINAL RANKING (BEST → WORST):
1. δ5 (score = 0.3595591909);
2. δ1 (score = 0.2063519217);
3. δ2 (score = 0.1593715281);
4. δ3 (score = 0.0016939927);
5. δ4 (score = 0.0001565666).

RESULTS AND DISCUSSION

The proposed APWR–ANN MAGDM framework was applied to five alternatives represented in Complex Intuitionistic Fuzzy Set (CIFS) form. Using the APWR defuzzifier, each CIF value was systematically transformed into an intuitionistic fuzzy triplet. The resulting membership values show clear discrimination among the alternatives, with δ5 exhibiting the highest membership strength (0.35956) and δ4 the lowest (0.00015). The corresponding scores, identical to the μ-values, were normalized and used as inputs to the neural network.The ANN training process demonstrated excellent convergence characteristics. As shown in the error convergence curve, the mean squared error decreased smoothly and monotonically, achieving a near-zero value (2.087×10^{-12}) at epoch 1648. The use of learning-rate decay and early stopping ensured numerical stability, producing a clean exponential-decay profile without oscillations. This confirms that the ANN successfully learned the identity mapping required for score refinement.The reconstructed scores closely matched the original defuzzified values, indicating high fidelity of the ANN output. In view of the scores obtained, the ordering of the alternatives is:δ5 > δ1 > δ2 > δ3 > δ4.
This ranking is consistent with the intrinsic structure of the CIF data and validates both the APWR defuzzifier and the proposed CIF weighted geometric operator as effective decision-making tools.

CONCLUSION

This study proposed two major contributions to the field of complex IFS decision analysis: the CIFWG operator and the Amplitude–Phase Weighted Realization (APWR) defuzzifier. The CIFWG operator extends geometric aggregation principles into the complex intuitionistic fuzzy domain, enabling multiplicative modelling of amplitude–phase interactions that classical operators fail to capture. Complementing this, the APWR defuzzifier provides the first structured mapping from CIF data to intuitionistic fuzzy triplets, making complex-valued information compatible with downstream learning models such as artificial neural networks.The integrated MAGDM framework built upon CIFWG and APWR proved to be computationally stable and highly discriminative. The numerical study demonstrated consistent behaviour, with the ANN converging smoothly to a near-zero error at epoch 1648 and accurately reconstructing the CIFWG-based scores. The final ranking of alternatives (δ5 > δ1 > δ2 > δ3 > δ4) aligns with the intrinsic structure of the CIF data, confirming the reliability of the proposed methodology.Finally, the development of an ANN model specifically tailored for CIFS represents a pioneering advancement, illustrating the

feasibility and effectiveness of incorporating complex intuitionistic fuzzy information into neural computation. The synergy between CIFWG aggregation, APWR defuzzification, and CIF-ANN learning opens new avenues for intelligent, data-driven decision analytics in complex uncertainty environments.The proposed APWR–ANN framework is computationally efficient, mathematically grounded, and capable of handling CIF-based MAGDM problems with high precision. This study opens new directions for integrating complex fuzzy environments with neural architectures and sets the foundation for future research in CIF-based learning, CIFWG operator extensions, and deep hybrid decision models.

ABSTRACT

Red eye is a condition in which one or both eyes appear red due to hyperemia of the tiny blood vessels beneath the eye, often caused by injury, irritation, or allergic reactions. It may be acute or chronic. In some cases, it can be treated with home remedies, while others require medical attention. Associated symptoms may include eye pain, itching, discharge, swelling, and blurred vision.Viddha Karma is a para-surgical procedure in which a needle is used to puncture specific points on the body. This technique facilitates the removal of vitiated doshas—primarily *Vata* and *Pitta*—along with *Dushita Rakta* (impure blood). Viddha Karma is similar to *Rakta Mokshan* (bloodletting). This case report highlights the effect of Viddha Karma on red eye. A 31-year-old female patient presented with bilateral eye redness and mild orbital pain persisting for 10 days. She underwent one session of Viddha Karma without any oral medication. The following day, mild redness remained in one eye, while the other eye appeared normal and pain-free. By the second day, both eyes were normal with no redness or pain. At a one-week follow-up, both eyes remained symptom-free.This article suggests that the Viddha Karma procedure may have a significant therapeutic effect in treating red eye, eye pain, and related symptoms.

Keywords: Viddha karma, Red eye, Rakta mokshan, Case report, Needle puncture therapy.

INTRODUCTION

Acharya Sushruta, revered as the father of ancient Indian surgery, emphasized the supreme importance of vision by stating, "Sarvendriyaanam Nayanam Pradhanam"—the eyes are the most vital among all sensory organs. He was the first to detail the anatomical structure of the eye, describing its shape, size, and various components with remarkable precision. In the *Uttara Tantra* section of the *Sushruta Samhita*, he documented seventy-six distinct ocular diseases along with their treatments, laying the foundation for Ayurvedic ophthalmology. According to Ayurveda, the eyes perform two essential functions: *Roopa Grahana* (visual perception) and *Buddhi Grahana* (cognitive interpretation), both governed by *Alochaka Pitta*. Dominated by the *Tejo Mahabhuta* (fire element), the eyes are particularly vulnerable to imbalances caused by *Kapha dosha*, making their care a delicate balance of elemental harmony and doshic regulation. In modern medicine, red eye typically refers to conjunctival or scleral hyperemia and may result from conditions such as subconjunctival hemorrhage, infectious conjunctivitis, corneal inflammation, or acute glaucoma. It is classified based on duration into acute (lasting a few days) and chronic (persisting for more than a week). Common causes include corneal disorders like trauma and infections, scleral disorders such as scleritis and episcleritis, and anterior chamber issues like acute angle-closure glaucoma and iritis. Associated symptoms often include blurred vision, severe eye pain, photophobia, colored halos, and itching, which help guide clinical diagnosis and management. Viddha Karma (also known as *Vedhana*[1] *Chikitsa* or *Suchivedhana*) is one of the eight classical surgical procedures[2] (*Ashtavidha Shastra Karma*) described in the *Sushruta Samhita.* It involves puncturing specific anatomical points—often near *marma sthanas*[3] (vital points)—using a sterile needle[4] to relieve pain and eliminate vitiated doshas, especially *Vata*, *Pitta*, and *Dushita Rakta*[5].

Mechanism of Action

- Stimulates peripheral sensory receptors, reducing transmission of pain signals [6].
- Clears obstructed *srotas* (body channels), improving blood and energy flow[7].
- Helps evacuate accumulated toxins and vitiated doshas from localized areas[8].
- Restores physiological balance and promotes healing[9].

Case Presentation

A thirty-one-year-old female patient was consulted in the outpatient department of Parul Ayurved Hospital presented with the complaint of intermittent redness of the eyes and mild pain in the orbital region. She had been suffering from the above complaints for the past 10 days. She was using *Triphla kwatha* for eye washing at home but was not getting satisfactory results. The patient was non diabetic, Non Hypertensive with no relevant past medical or family history. She is a working woman in IT profession. She was not taking any kind of medication. She was not used to any of the addiction.

Eye Local Examination
On Inspection:
Redness – Present
Pain- Present
Shape – Normal
Size - Normal
Discharge – Absent
On Palpation:
Tenderness – Absent
Localised Temperature - Normal

Therapeutic Intervention: Viddha Karma (Dry Needle Therapy)

In this clinical case, the patient was prescribed a single session of Viddha Karma, an Ayurvedic para-surgical technique that shares similarities with modern dry needling. The procedure involved Vedhana—controlled pricking—using a sterile needle[10] measuring 26G × ½ inch. Eight specific anatomical locations were selected for puncture, based on classical Ayurvedic principles and the site of symptoms. These points are traditionally known to facilitate the release of vitiated doshas, particularly *Vata*, *Pitta*, and *Dushita Rakta*, from the affected region. No oral medications were administered alongside the procedure, allowing for a focused evaluation of Viddha Karma's therapeutic effect as a standalone intervention. Depth of *Vedhana*[11](Pricking) As all these 8 points are surrounded by *Marmas,* the *Vedhana*should not be done too deeply. Just prick through the tip of the needle. The procedure of *Viddha Karma* – Pre monitoring procedure

Pre-Procedural Preparation and Advisory

A detailed medical history was obtained, and the patient underwent a thorough clinical examination. The procedure was clearly explained, and informed consent was secured prior to initiation.

Advisory Note: If the patient appears physically weak or nutritionally deficient[12], it is recommended to administer Madhura Aahara—a nourishing, sweet-tasting diet—before the procedure. This helps support *Ojas* (vital energy), stabilize *Agni* (digestive fire), and prepare the body for optimal therapeutic response.

Main Procedure

Prior to the intervention, the selected eight anatomical points were thoroughly cleansed using cotton swabs soaked in disinfectant. A sterile needle of size 26G × ½ inch was then used to perform Vedhana (therapeutic pricking) at each of these points. The needle was promptly withdrawn after each puncture, ensuring minimal tissue disruption. A total of eight punctures were administered—one at each designated site.

Vedhana Points Used

1.Sthapani – Located at the center of the forehead
2.Shankha – Bilateral points at the temples
3.Apanga – Two points, situated approximately two *angula* above the lateral end of each eyebrow
4.Nasa Agraha – Three points: one at the tip of the nose and two at the nasal ala (sides of the nostrils)[13]

These specific points were selected based on classical Ayurvedic guidelines, targeting regions associated with ocular and facial symptoms. The procedure was performed under aseptic conditions and without the use of any oral medications.

Post-Procedural Monitoring

Following the Viddha Karma session, observation revealed that some of the eight puncture sites exhibited bleeding, while others did not. In Ayurvedic practice, bleeding is considered a favorable response, as it facilitates the expulsion of vitiated doshas—particularly *Rakta*, *Pitta*, and *Vata*—from the body. Therefore, this bleeding should not be suppressed with bandaging or pressure, as it plays a therapeutic role in detoxification and doshic balance. After completion of the procedure, the disposable needle was safely discarded in accordance with standard biomedical waste protocols to ensure hygiene and prevent contamination.

RESULTS

Following a single session of Viddha Karma, the patient exhibited a rapid and noticeable improvement in symptoms. On the first day post-procedure, mild redness persisted in one eye, while the other eye appeared normal and pain-free. By the second day, both eyes showed complete resolution of redness and discomfort. At the one-week follow-up, the patient remained asymptomatic, with no recurrence of redness, pain, or associated symptoms.

The procedure was well tolerated, and no adverse effects were reported. Bleeding was observed at some of the puncture sites, which, according to Ayurvedic principles, is considered a positive therapeutic response, indicating successful elimination of vitiated doshas.

DISCUSSION

Viddha Karma, as described in classical Ayurvedic texts, is a para-surgical technique aimed at removing vitiated *Vata*, *Pitta*, and *Dushita Rakta* through precise puncturing of specific anatomical points. In this case, the intervention demonstrated significant efficacy in alleviating symptoms of red eye, including ocular pain and inflammation. The rapid symptomatic relief observed aligns with the Ayurvedic understanding that localized dosha imbalance—particularly of *Pitta* and *Rakta*—can manifest as ocular hyperemia and discomfort. By targeting marma-adjacent points such as *Sthapani*, *Shankha*, *Apanga*, and *Nasa Agraha*, Viddha Karma appears to stimulate peripheral circulation, reduce congestion, and restore doshic equilibrium. Modern parallels can be drawn with dry needling and acupuncture, which also utilize targeted puncture to modulate neurovascular responses and reduce inflammation. However, Viddha Karma is distinct in its doshic rationale and therapeutic philosophy, emphasizing the expulsion of pathological elements rather than mere symptomatic control. This case supports the potential of Viddha Karma as a complementary approach in managing ocular conditions like red eye, especially when conventional pharmacological treatments are contraindicated or ineffective. Further clinical studies with larger sample sizes could help validate its efficacy and establish standardized protocols.

CONCLUSION

This case demonstrates the potential effectiveness of Viddha Karma, an Ayurvedic para-surgical procedure, in managing symptoms associated with red eye. The patient experienced rapid relief from ocular redness and pain following a single session, without the use of oral medication. The targeted puncturing of specific anatomical points appears to facilitate the removal of vitiated doshas—particularly *Vata*, *Pitta*, and *Dushita Rakta*—leading to symptomatic improvement. These findings suggest that Viddha Karma may serve as a valuable complementary approach in treating red eye and related ocular conditions, especially in cases where conventional therapies are limited or contraindicated. Further clinical evaluation and broader studies could help establish its role in integrative ophthalmic care.

ABSTRACT

This paper explores the coping mechanisms that individuals adopt to face the struggles and complexities of human life. Through Shashi Deshpande's realistic portrayal of characters, she reveals how people navigate emotional conflicts, societal pressures, and personal dilemmas with resilience and inner strength. Her narratives emphasize that growth and self-understanding arise not from the absence of problems, but from the ways one learns to confront and cope with them. Deshpande's characters in the novel 'That Long Silence' become symbols of endurance and adaptation, guiding readers toward self-awareness and emotional stability in the midst of life's challenges.

Keywords: Perseverance, Smile, Self-awareness, Dedication, Resilience

INTRODUCTION

It is important for human beings to understand that life is restricted with negative thoughts and deeds. To be an optimist and to see the new world, people ought to possess some positive qualities like patience, perseverance, dedication, smile, self-awareness, gratification, resilience and good character.

According to Shashi Deshpande, exchange of opinions among people, plays an important role in leading a desired and peaceful life. In one of her interviews in The Indian Express, Deshpande says: "Silence is a form of abatement

you just have to speak" (10). She makes the readers realise the importance of effective communication as it plays a major role in helping human beings to lead a desired and comfortable life.

Jaya, the protagonist of *That Long Silence*, is very delicate and remains in silence at all the critical circumstances in life right from her childhood. For instance, when her father says that he likes classical music and he wants Sumi also to love Pulsakar and Faiyaz, she readily accepts though she loves the music of Rafi and Lata, the popular singers of the Hindi film industry (*TLS* 3). Every time she fails to express her opinion, the delicacy continues even after her wedding. Her husband Mohan dislikes watching advertisements but Jaya loves to watch commercials and she associates the advertisements to the happy families that she visualizes in the society. Her husband criticizes about the poor taste that she has for music and keeps insulting her for what she is, but she manages to retain the respect that she has for him despite his dominance, but the mutilation remains in her forever. She tolerates the humiliation and discouragement, but never wants to communicate her thoughts and the author envisages Jaya as: "She is not clear of what she wants, but Mohan is very clear of life that he wants to lead. She opines that she cannot blame Mohan, for even if he had asked me _what do you want?- I would have found it hard to give him a reply" (*TLS* 25). Though Jaya accepts that it is her mistake to fail at communicating her thoughts, she is unable to find the reason for the serenity.

Audre Lorde, who is a leading African-American essayist, insists people to communicate and to acquire the courage to put forward their views in public. She states in her speech at New Symra Beach Foria that:

I write for those women who
do not speak, for those who
do not have a voice because
they were so terrified,
because we are taught to
respect fear more than
Ourselves. We've been taught
that silence would save us, but it is not. (83)

Effective communication holds the preliminary grip in leading a preferred life and also helps human beings in solving unbearable difficulties and unexpected disruptions smoothly and efficiently.

Jaya gets married at the age of seventeen but she feels that she has gained the experience of a wife of several years in the very beginning of her marital life. It is her submissive character that destines her life to separation and stress. Mohan, Jaya's husband is tactful in dominating his wife. Very frequently, he asserts:"One who finds the coin first rules the other at home" (*TLS* 6). Jaya feels bad, however, she firmly believes that speaking against her husband is dishonest and discourteous, and so she remains unobtrusive. She says: "Women can never be angry. She can only be neurotic hysterical, frustrated" (*TLS* 147). Jaya accepts the tenets of her ancestors thoughtlessly that women are created for men. Shashi Deshpande recommends spouses to acknowledge that there is no inequality between them and they ought to respect each other to live a better life.

Ever since Jaya is married to Mohan, she lives in the shade of her husband and considers him to be a sheltering tree and she believes that her topmost commitment as a wife is to gratify the desires of her husband in all circumstances of life. But as years roll by, the tragedies that Jaya faces in life make her realise that all this while she had been dishonest to herself and recognizes that she has lost her individuality to her husband and fails to disclose her own-self.

Jaya and Mohan move to a place called Dadar flat which is filled with filth and stench. Jaya gets adjusted even to the obnoxious smell, the stench of dead cockroaches, toilets and drains, but not with her loneliness. As George Eliot mentions in her novel *MiddleMarch:* "Marriage, which has been the bourne of so many narratives, is still a great beginning, as it was to Adam and Eve, who kept their honeymoon in Eden, but had their first little one among the thorns and thistles of the wilderness" (*MiddleMarch* 683). Jaya feels isolated and worried, Mohan senses that she is not

comfortable and probes her, but she cheats her own conscience saying she is happy. She assumes that the needs of a husband and wife are inseparable as she expresses: "My needs, our needs, the children's needs –it was impossible to untangle them, I couldn't even try, and it was too late anyway" (*TLS* 118). She suffers in isolation and gloom over not being able to speak and assumes that she has no life beyond the needs of her husband and children. But later, Jaya comprehends that she has already spoiled the beautiful and valuable moments of her life, yet she waits for her husband to visit her. She yearns for the right time and fails to create an opportunity for herself like the story, *When I Become a Big Boy* in *You Can Win* by Shiv Kera. The habit of waiting starts in people from a very early age like the small boy in the story.

When the boy is small, he wishes to become a big boy. When he goes to school, he looks at the college boys and thinks that only when he goes to college, he will be happy. And after he finishes his college, he thinks he will be happy after he gets a good job with a good package. After he gets a job, he thinks that if he gets married, he will be happy and after he gets married, he longs for a kid and feels that only after getting a kid, he will be happy, and after he gets a kid, he thinks he will be happy only if his son or daughter gets settled in life and finally he ends up in seeing nothing in his life. (Kera 21)

Thus, the boy's precious life vanished without peace and happiness. Similarly, Jaya wastes her life without sharing her opinion with her husband. Shashi Deshpande creates awareness among the readers that human beings must not wait for opportunities to knock their doors but they must create opportunities and learn to live in the present. Shashi Deshpande expresses through her character Jaya:

The waiting game starts early in childhood. Wait until you get married, wait until your husband comes. Wait until you go to your in-laws' home, Wait for the children to be born, for them to start school, waiting for them to come home, waiting for the milk, the servant, the lunch carrier man…(*TLS* 30)

Jaya also acknowledges that they have been silently weaving the threads of guilt, anger and resentment between them all these days and accepts that the fabric is complete, but both of them are not aware of the overall design because of their long silence.

The most important commodity that stops one from being optimistic is fear. Jaya gives up her profession as a writer because of her fear. She assumes that her husband is not interested in her writing and she is also scared of failure. To gratify her husband, she has enforced herself to curtail her own writing skills. She opines: "Looking at his stricken face I had been convinced, I had done him wrong" (*TLS* 144). But a deep analysis proves that she is scared of failing and her misinterpretation about her husband prevents her from writing. She advocates: "Middle class bourgeoisie, upper caste. Distanced from real life. Scared of writing scared of failing. Oh, God, I had thought. I can't take it anymore. Even a worm has hole it can crawl into. I had mine as Mohan's wife as Rahul's and Rati's mother" (*TLS* 148). Jaya envisions herself as the best wife and mother but fails to portray herself as a writer and sets the boundary for her skills. Shashi Deshpande emphasises that people must trust that catastrophes in life will give proactive experiences and will create a pathway for success. So, they must feel confident in all their endeavours.

Morality and integrity play an important role in each one's life. Jaya finds her relationship with her friend Kamat, soothing and feels that he is better in all walks of life than her husband and maintains friendship with him clandestinely. However, she is unable to help when she sees him falling on the floor and dies bleeding. She is scared that if she helps him, her sneaky and furtive relationship would be publicised. One of the researchers by name Sarala Palkar rightly observes: "She perhaps does the role of wife to perfection but fails as a human being" (Palkar 166). Jaya carries guilt throughout her life for her inaction at the time of necessity. It is necessary for any husband and wife to reduce the space between each other and should learn to be honest with one another.

However, later, Jaya understands the importance of communication and senses that she has led a desolate life without communicating with her husband and children. She also gains confidence and decides to write under the

pseudonym 'Seeta' and it is evident through her words that she has become fearless and has realised her own worth. She says "Well, I've achieved this. I'm not afraid any more. The panic has gone" (34). The recollection of hardships she has undergone and her happy memoirs of her future help her in analysing her mistakes and in motivating her to communicate with people around her.

It is Jaya who sets the boundary and curbs the liberty herself. As Swami Vivekananda expresses: "Liberty of thought and action is only condition of life of growth and well-being" (Representative Selections from Indian Prose14). Swami Vivekananda writes a reply to Kidi, his friend, saying: "His idea is to bring to the door of the meanest, the poorest, the noble ideas that the human reaches developed both in and out of India and he wants people to think for themselves"(Selections from Indian Prose 14). Jaya acknowledges that if she has explained her whole concern to her husband in the initial days of their married life, the whole thing would have got stabilised and a word from her would have made everything clear for a conjugal relationship. She feels bad that she did not help Kamat, however, she takes a decision to lead a happy life and learns to live for herself.

Shashi Deshpande brings the evolution of positive qualities in Jaya and these positive changes in Jaya help people to be optimistic. Jaya states: "I will have to speak, to listen, I will have to erase the silence between us" (*TLS* 192). Shashi Deshpande makes the readers strong in facing their failures which will nurture their skills in future and she also teaches the importance of self-awareness through Jaya.

Jeeja, the maid servant, who works in Dardar flat, is confident and content by birth. No one can make her feel inferior or miserable without her consent and she never blames anyone for her miseries. She often expresses that everyone has his or her own purpose of life. Jeeja's husband hardly earns any money, but spends his wife's earnings and ill-treats her. She reaches the flat with brutal wounds, but never gets annoyed either with her husband or with her work as she strongly believes that her husband has his own reasons for his negative attitude and behaviour. She ascertains Jaya: "With whom shall I be angry? My parents didn't intend marrying me to a drunkard" (*TLS* 52). Her husband has been working in a mill at the time of their wedding but later he becomes a drunkard as he loses his job due to a strike. There is a transparency in Jeeja's silence and she is also a person who is emotionally mature in handling the problems. She waits for a positive change in her husband and never makes him feel low.

Jeeja's personality can be compared to Mrs. March in *Little Woman* by Louisa May Alcott. Mrs. March is a woman of patience. Joe, the daughter of Mrs. March, loses her temper on several occasions and goes uncontrolled. She asks her mother to give her some hints on controlling her anger. Mrs. March tells her daughter: "She has been trying to cure it for forty years and she has succeeded only in controlling it. She is angry nearly every day of her life, but she has learned not to feel it" (Alcott 75). Mrs. March and Jeeja seem to be more efficient in rationalising their words and deeds on all occurrences in life.

Jeeja is under her husband's thumb at home and is verbally abused every now and then. But she carries a great respect for him and treats him with humanity as Benjamin Franklin, an American author, advocates: "When you are good to others, you are best to yourself." Jeeja wants to be the best in what she does, and even when her husband gets married to the lady with whom he had an illegal affair, she decides not to lose her temperament and she keeps calm. Unfortunately, her husband's illegal wife dies of *tuberculosis.* Jeeja turns out to be the mother of Raja Ram, the son of her husband's illegal wife. Jeeja's husband also dies unexpectedly. Despite all these tragedies in her life, she keeps herself happy and moves on with her work. Jeeja's self-confidence and courage is proved through Jaya's words:

Jeeja was basically a realist. She badly needed the money she earned, she knew her value as a good worker, and she knew it was her reputation for reliability that enabled her to earn more than the other servants did. She was that rare thing among them - a pure professional, and proud of it. I knew her- her single-mindedness. She knew what her purpose in life was – it was to go on living. Enduring was part of it and so endured all that she had to. (*TLS* 51)

Jeeja is a symbol of loyalty, happiness and endurance because she never lies about others for her happiness and she respects herself for her endevours and never gives away her positive attitude and esteems her purpose of life greatly.

Tara, wife of Raja Ram and daughter in-law of the illegal wife of Jeeja's husband, leads a happy life in the beginning of her married life but after some years, her husband Raja Ram becomes a drunkard and changes his attitude and feels satisfied by ill-treating his wife every now and then. She moans her fate and struggles to fight against poverty. She laments: "So many drunkards die. This one won't. He'll torture us all to death instead" (*TLS* 53). Nevertheless, she changes her attitude and accepts her life for her children. She starts doing *batatawada* (potato fritters) business and sends her children to an English medium school which has been her dream ever since her marriage. She starts reshaping her future even at times of forfeitures in her business. William Jennings Bryan, an American politician, opines: "Destiny is not a matter of chances, it is a matter of choice; it is not a thing to wait for, it is good to be achieved" (Qtd. in Davis). Tara creates a life that she desires and also encourages her children constantly.

Shashi Deshpande imparts to her readers through Jeeja and Tara that people must learn to adapt positive changes in order to experience a comfortable and contented life and most importantly people ought to be bold and confident to take right decisions in life. This quality can be associated with Spencer Johnson's book *Who moved my Cheese*? (1998), which advocates the concept of acknowledging the changes as inescapable and it must be confronted confidently. Through the characters Scurry and Sniff, the readers learn not to overanalyse the changes that happen in their lives but rather get inspired to treat changes with a positive outlook.

Nayana is a very energetic maid servant, who works in Jaya's flat and she makes everyone satisfied around her through her dedication in work and honesty in her words. She works with much ease even with the baby in her womb. She has had four children and at present she has only two girl children as the boys died, and so she desires for a baby boy. When Jaya asks her why she needs a baby boy, she expresses her views to Jaya: "Why give birth to a girl behnji, who'll only suffer because of men all her life? Look at me! My mother loved me very much, she wanted so much for me … a house with electricity and water, shiny brass vessels, a silver waist chain, silver anklets…and what have I got? No, no, behnji, better to have a son" (*TLS* 24).

Nayana presumes that only women suffer in all aspects of life but then very soon she realises that man and woman have their own responsibilities. Responsibility and sufferings have nothing to do with sexuality as George Bernard Shaw observes:

People are still full of the old ideas that woman is a special Creation but I am bound to say that of late years she has been working extremely hard to eradicate that impression and make one understand that a woman is really only a man in Petticoats or if you like that man is a woman without petticoats. (Qtd. in Mohammed 48)

Even in *The New Feminist Movement*, a researcher named Carden expresses: "Life is not about the elimination of differences between the sexes; nor even simply the achievement of equal opportunity, it concerns the individual's right to find out the kind of person he or she is and should strive to become that person" (Weging 2). Nayana shapes herself to be a perfect wife and mother and continues to work hard for her husband and children.

Shashi Deshpande advocates through Nayana that people must not have preconceptions about the responsibilities of man and woman in the society; each one has his or her own role to play in the world. Nayana sacrifices her comforts and her own requirements time and again for her children's welfare and this is evident when she pawns her anklet to save her eldest daughter from a viral disease. When Jaya expresses to Nayana that she misses the chum chum sound of Nayana's anklet bells, she replies with a smile that: "Never mind behnji (sister), I'll get them back when I get my tips for Diwali" (*TLS* 28). Regardless of the problems she faces in her life, she never fails to smile and never becomes diffident. She rather carries great hope that money can be earned at any point of time perhaps through hard work and good health.

Shashi Deshpande makes it very clear that though the comforts of a rich life is above the heads of ordinary people, the poor never bring down their degree of dignity and they remain happy like Jeeja and Nayana.

Vimala, Mohan's sister, ruins her life with persisted silence even during the critical situations of her life. She lies on the bed for so many years and does not inform anyone about her illness. She has been suffering from *ovarian tumor* with *metastases* in the lungs. She completely neglects to share her problems even with her brother and by the time her brother finds her illness, it becomes too late to do anything to save her.

The author pictures the story of Vimala to create awareness on the ignorance of health issues usually present among poor people and the importance of early diagnosis for curing diseases. The present generation is more fortunate because of the technical advancement in the field of medicine. Recent researches prove that there is a lot of technological development in screening the ovarian cancer, but women like Vimala lose their lives because of ignorance. Shashi Deshpande insists that people must trust that recovery from illness is possible through knowledge about the diseases and should be ready to take treatments. People ruin their lives not because of the diseases but because of their ignorance.Thus, the author reiterates that self-awareness and knowledge play a major role in the life of human beings.

Vimala's mother-in-law assumes that she has knowledge about everything in life. She informs Jaya and Mohan that Vimala has been on the bed for over a month and expresses: "why would she make a big fuss for bleeding which is the common problem of most women in the world?" (TLS 37). Shashi Deshpande makes it clear through Vimala's mother-in-law that people should have complete knowledge on everything in life because a little knowledge about anything is perilous. People should learn to talk to one another and share their problems, so that solutions are found easily in assisting people so as to save their lives.

Vanita mami, a relative of Jaya, is hopeful that she will become a mother despite dejection and disparity in life. She fasts and does all the religious rituals to get a baby, but in vain. She takes care of Kusum, her relative, who is mentally ill and makes her one of her family members. Though she loses her ovaries and gets atrophied and loses her sanity, she does not lose the confidence and hope to survive.

Thus, by projecting the evolution of positive qualities in Jaya, , Jeeja, Tara and Vanitamami, Shashi Deshpande discusses the benefits of positivism in each one's life by reconnoitering and describing the different kinds of daily affairs of people and the problems they undergo in their lives. She teaches the readers to concentrate on the positive things in daily life situations as it will enhance the quality of their lives. Shashi Deshpande's motivate the readers move from failure to success, submission to proactiveness, and isolation to reconciliation.

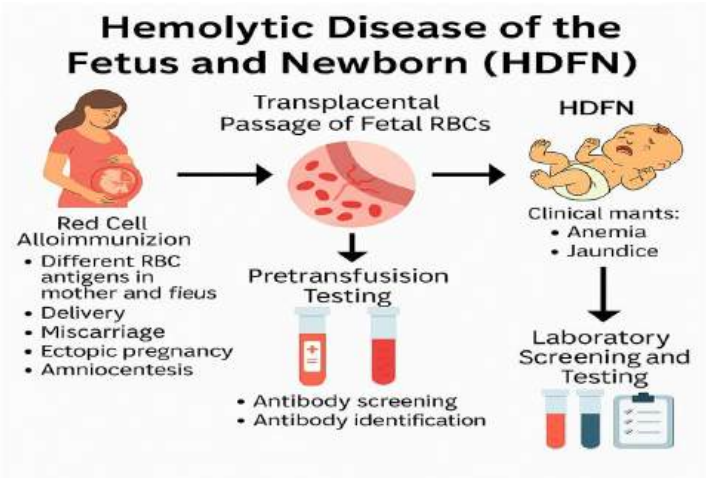
ABSTRACT



The foetus and mother during pregnancy have different genetic compositions of Red Blood Cell (RBC) antigen due to red cell alloimmunization. When foetal red blood cells travel transplacentally following delivery, miscarriage, ectopic pregnancy, or invasive procedures like amniocentesis, red cell alloimmunization develops during pregnancy. Before receiving blood transfusions, pretransfusion testing must include the antibody screening test. In the event of a positive antibody screening, antibody specificity must be ascertained by antibody identification. The frequency of red cell antibodies in patients and pregnant women is not well-documented. Hemolytic disease of the foetus and newborn HDFN laboratory surveillance of the mother, foetus, and baby intends to direct healthcare professionals and vaccinated women to concentrate on the most significant alloimmunization issues in order to reduce the effects of anti-D in particular and HDFN in general. In order to prevent and monitor HDFN, we give here the current methodology for laboratory screening and testing.

Keywords: Abnormal antibodies, Screening test, pregnantwomen, HDFN, Blood Transfusion.

INTRODUCTION

Alloantibody-induced foetal or neonatal hemolytic anemia has resulted in fewer severely affected or dead foetuses since the late 1960s when anti-D immunoprophylaxis was introduced, sensitive methods for detecting antibodies to red blood cells (RBCs) were developed, and advancements in the diagnosis and treatment of foetal anemia were made [1–4].In addition to Rh(D) typing and ABO grouping, the antibody screening test is a crucial part of pretransfusion testing that patients must undergo prior to receiving blood transfusions [5]. ABO and D-antigen typing, as well as screening for the presence of red cell antibodies early in pregnancy and by the 28-week mark, are recommended for all pregnant women in order to detect unexpected red cell antibodies [6,7].Alloimmunization is the process by which a person lacking a certain blood group antigen develops the necessary antibodies in response to exposure to the antigen. Exposure can occur from inadvertent foetal red blood cell (RBC) transfer to the expecting mother, such as through fetomaternal haemorrhage, or from donor blood transfusions [8, 9]. When antibody production has shifted from the first IgM response to IgG, there will be an active transplacental transfer of maternal antibodies via the neonatal Fc receptor. The second and third trimesters will see an acceleration of transfer, which may result in hemolytic illness of the foetus and newborn, or HDFN [10]. Antibodies against the Kell, c, E, C, Kidd, and Duffy antigens or ABO and Rh incompatibility are the cause of HDFN. The most severe blood transfusion reactions have also been linked to these antibodies, making their research clinically significant [11]. Immunohaematology relies heavily on the detection and identification of antibodies because they offer guidance on the clinical importance of the antibody and aid in the selection of appropriate blood for transfusion. Pregnant women receiving prenatal immunohematological care must have any unexpected red blood cell (RBC) antibodies in their serum investigated [12]. Worldwide, the alloimmunization rate for expectant mothers ranges from 0.4% to 2.7%. Only a small number of Indian studies have examined alloimmunization during pregnancy in a research by Pahujaet al. [13]. The prevalence of alloantibodies was reported to be 1.25 percent in India. According to that study, the prevalence of alloimmunization was greater in pregnant women with a poor obstetric history at 5.5% than it was in pregnancies that went normally at 0.5%. There is ongoing discussion on the necessity of systematic antibody screening for Rh-positive women, particularly in developing nations like India [14]. The rate of maternal alloimmunization has decreased from 14% to 2% after the implementation of postnatal Rh-immunoglobulin immunoprophylaxis in 1970. Antenatal immunoprophylaxis was then initiated, which further decreased it to 0.1% [15] presence of minor blood group antigen on red cell surface shown in figure-1.

Antibody Abnormality Prevalence In Different Populations

Red blood cell (RBC) alloantibodies affect 0.3–2% of the general population and vary in frequency and specificity based on population genetic diversity [16, 17]. The rates of alloimmunisation range from 0.009% to 0.6% in healthy donors, 1.4% to 4.24% in recipients who have received a prior transfusion, 44% in patients with haematologic malignancies such myelodysplastic syndrome, 20% in patients with thalassaemia, and 18.7% in sickle cell disease patients [22]. Additionally, autoantibodies can be found up to 28% of the time alongside RBC alloantibodies shown in figure-2[23].

Pregnancy-Related Blood Transfusion Indications

Blood transfusions are necessary during pregnancy to treat various obstetric conditions that could jeopardise the mother's and the fetus's health. Blood products are given for a variety of reasons, each of which is intended to address a specific issue that comes up during pregnancy. Understanding these indications and the variety of blood transfusions available is essential to provide the optimal care for pregnant women [24]. Blood transfusions may be necessary for pregnancy-related profound anaemia, which is usually characterised by low haemoglobin levels (<7-8 g/dL). The causes include haemolytic diseases, iron deficiency, acute blood loss after birth, and complications such placental abruption [25]. Excessive bleeding after childbirth, a leading cause of maternal death, may require emergency blood transfusions to restore blood volume and prevent haemodynamic instability [26]. Transfusions are necessary to treat the acute blood loss that might result from these obstetric emergencies, which entail the placenta's early separation or malpositioning [27]. Pregnant women with von Will brand disease, thrombocytopenia, or coagulation factor deficiencies may require transfusions to manage bleeding diatheses [28]. Patients with severe foetalanaemia who have Rh or another blood group incompatibility between the mother and the foetus may require intrauterine transfusions to prevent hydropsfetalis [29].

The Recipient's Prior Exposure To Antigens

Proteins are the most common blood group antigens. An immunological reaction against erythrocyte antigens (alloantigens) occurs in almost one out of every 70 transfusion recipients in the US each year [30]. Alloantibodies against red cell antigens that are not naturally found in the blood, such as anti-A and anti-B, are referred to as surprising antibodies [31]. Only allogeneic (non-self) red blood cells cause an alloantibody reaction. Blood transfusions, transplants, and pregnancy can all result in immunity to blood group antigens. [32]. According to hypothesis, a transfusion recipient may develop tolerance, ignorance, or a fast anamnestic antibody response as a result of prior exposure to blood group antigens. In mouse models, both anamnestic reactions and tolerance have been demonstrated; the features of the donor antigen and the inflammatory state of the recipient influence whether responsiveness or tolerance occurs after RBC transfusion [33, 34]. While there is no evidence of tolerance in humans, patients with sickle cell disease or thalassaemia who were first exposed to red blood cells at a relatively young age may exhibit nonresponsiveness. Patients with illnesses that require a significant lifetime transfusion burden may be able to develop prolonged nonresponsiveness or even tolerance, albeit this may require intermittent antigen exposure.

Rbc Antigen Exposure During Pregnancy Or Delivery

Pregnancy and delivery triggers should be briefly discussed, even though the main focus of this publication is on possible triggers of RBC alloimmunisation during transfusion. Foetal RBCs are present in all pregnant women both during pregnancy and in the period leading up to delivery. After this exposure, a small percentage of women develop alloimmunisation, while the majority do not. The majority of clinically relevant HDFN cases are caused by antibodies against antigens in the Rh, K, Fy, Jk, and MNS families, suggesting that the immunogenicity of the RBC antigen is a crucial determinant in determining whether a woman would develop alloimmunisation. Due to the quick removal of foetal red blood cells from the mother's circulation by maternal isohemagglutinins, ABO incompatibility between the mother and foetus protects against RBC alloimmunisation. Besides fetal/maternal haemorrhages, intrauterine transfusion is another factor that causes RBC alloimmunisation during pregnancy. [35] If a woman's foetus exhibits symptoms of anaemia or hydrops, she usually receives these transfusions in the late second or third trimester of pregnancy. The pregnant patients receiving transfusions have previously demonstrated that they are

"responders" to RBC antigens, since HDFN is typically subsequent to maternal alloimmunisation. It is therefore not wholly unexpected that at least 25% of these women develop extra RBC antibodies in reaction to intrauterine transfusions. These women are susceptible to developing HLA alloantibodies in addition to more RBC alloantibodies [36]. Influencing RBC alloantibody formation shown in figure-3.

Regular Administration of Immunoglobulins And Blood Group Screening

An antibody screen and ABO and RhD blood group typing are done on blood samples from the first trimester at the first prenatal visit with the medical practitioner. We detect IgG antibodies to RBC antigens using automated equipment and CaptureReady-Screen (I and II). Women who are RhD-negative and capable of developing anti-D antibodies are identified by typing. Whether a person is RhD positive or RhD negative, antibody screening finds those who have already acquired alloantibodies during the first trimester. RhD-negative women who have a negative first-trimester antibody test are eligible for routine non-invasive foetal prenatal RHD screening at GA 25 weeks. Only these women are eligible for recurring routine antibody screening (see prenatal RHD Screening). If RHD is found in the cell-free foetal DNA (cffDNA) from plasma at GA 29 weeks, the midwife offers the nonimmunized pregnant woman an intramuscular injection of 250–300 μgRhIg. Within 72 hours of delivery, the 250–300 μg Rh Ig injection is administered again. Fetomaternalhaemorrhage is only investigated and quantified using flowcytometry in cases where haemorrhage is suspected [37].

Examining And Tracking Abnormal Antibodies

Identification of the alloantibody's target antigen will be carried out for alloimmunized women in order to provide more details regarding the possible clinical effects of the alloimmunisation. Clinical symptoms frequently follow a well-known pattern when maternal antibodies target a particular blood group antigen. This information directs the planning of the foetalspecialised surveillance and laboratory monitoring. Eleven distinct reagents, in-house single donor glycerol frozen-thawed red blood cells, and the anti-IgG column agglutination technique (CAT) are used for antibody detection. To differentiate between autoantibodies and alloantibodies, the panel includes the woman's own red blood cells. A panel of RBCs treated with papain is added to the test if Rh antibodies are suspected. By definition, the presence of an alloantibody requires that the target antigen of the alloantibodies be absent from the woman's own red blood cells. While some antibodies (anti-N, -Lea, -Leb, -A1, -IH, -I) have been shown to have no clinical significance, others (anti-K, -c) are known to have potentially fatal consequences, and regardless of titer, referral to a foetal medicine centre should be considered. Another group (anti-D, -C, -E, -e, -Kpa, -Kpb, -Cw, -k, -Fya, -Fyb, -Jka, -Jkb, -S, -s, "Wra, -M, -P1, -Lua. A titer measurement and a test for extra antibodies are usually performed on the alloimmunized woman at GA 25 and 32 weeks. For the latter group of antibodies, a titer above 16 is empirically established as the threshold value indicating increased risk of HDFN and calls for closer monitoring by a specialist in foetal medicine using serial Doppler ultrasound measurements of the foetal middle cerebral artery's (MCA) peak systolic velocity (PSV) [38, 39]. An antibody screen shows the "snapshot status" of the pregnant woman's antibody level at the time of sample; ongoing exposure to donor or foetal red blood cells may cause the titer to rise quickly. Other antibodies might also form in a matter of days. As a result, serial monitoring is crucial.

Prenatal Screening For RHD

Understanding the foetalRhD type aids in limiting prophylaxis to women who only carry aRhD-positive foetus as part of a targeted RhIg prophylaxis program for non-immunized RhD-negative women [40, 41]. This limitation minimizes the overall usage of RhIg, a scarce resource, and prevents unnecessary exposure to prophylaxis in women carrying anRhD-negative foetus [42, 43]. Analysis of the cffDNA in the maternal plasma, which also contains cell-free DNA derived from the mother, predicts the foetalRhD status. The foetus is RhD positive if the foetal RHD gene is present. The accuracy of noninvasive foetal RHD genotyping has been thoroughly discussed since the initial findings of cell-free foetal RHD in maternal plasma [44, 45]. Noninvasive foetal RHD genotyping has become highly incorporated into clinical medicine in the literature [46–52]. Non-invasive prenatal testing of foetal RHD has been implemented as a nationwide healthcare service in numerous European nations as an antenatal screening to guide Rh Ig prophylaxis [53]. High test accuracy has been shown in evaluations of national programs, with sensitivity of >99.9% at about 25 weeks of gestation and >99% from GA 10 weeks. New guidelines for foetal RHD genotyping

validation and quality control have been developed recently, a flow chart shown in figure-4[53]. A detailed description of the Copenhagen setup for antenatal RHD screening has been provided [54–56]. In short, the general practitioner draws blood samples at GA 25 weeks. After an average of four days in transit, blood samples reach the lab (up to seven days are acceptable). One millilitre of plasma is separated, and DNA is extracted from it. To boost the analytical sensitivity, eluted DNA is analysed using real-time PCR that targets RHD exons 7 and 10 in a duplex fashion using the same dye [57]. The setup's total detection limit is 6 genome equivalents (geq) per millilitre, and the RHD PCR is sensitive enough to detect one geq every PCR [58]. GAPDH targets total DNA as a quality control measure for DNA purification and sample management. The sample is expected to be either positive, negative, or inconclusive based on the amplification of foetal RHD exon targets. Prophylactic treatment is advised for the pregnant lady if the results are either positive or inconclusive. The identification of foetal RHD may be obscured by positive results from some maternal RHD variations. In these situations, the lady is administered prophylaxis after the test is deemed inconclusive. 97.3–99.6% of women carrying aRhD-negative foetus avoid needless antenatal prophylaxis as a result of the widespread adoption of non-invasive prenatal testing for foetal RHD [59, 60]. Expanding the targeted approach to RhD-negative pregnant women with early sensitising events is one possible future application [61].

Predicting Foetal K, RHC, RHE, And ABO Blood Group Non-Invasively

We recently described a method for predicting the foetal blood group that uses next generation sequencing (NGS) analysis of PCR-amplified cfDNA from maternal plasma. Predicting the foetal blood group early in pregnancy is essential since certain foetuses may pass away from HDFN as early as GA 18 weeks. In situations when the mother produces the relevant antibodies, we apply this general method to predict the foetal K, RhC, Rhc, RhE, and ABO blood types in cases where there is a risk of HDFN [62–65].

MATERNAL ABO ANTIBODIES

The effectiveness of Rh prevention has made ABO incompatibility the most common cause of HDFN with hyperbilirubinemia in affluent nations [66, 67, 68]. According to a recent Danish study, 15 out of 21 patients with total blood bilirubin levels ≥600 μmol/L had ABO incompatibility, which carries a considerable risk of kernicterus spectrum illness [69]. Additionally, there have been isolated reports of ABO antibody-induced foetalhaemolysis, anaemia, and hydropsfetalis [70, 71]. As of right now, there is no organised method for checking for maternal ABO antibodies that could affect the foetus or the baby [72–74]. Neonatal need for therapy of hyperbilirubinemia is predicted by maternal anti-A and anti-B IgG titers [75, 76].

Our goal is to improve predictive values [77] through ongoing research because we observed that the positive predictive values in the first trimester (65%) and perinatally (73–76%) were too low to be used clinically for regular screening. We have discussed the use of two antibody screening techniques: (i) manual anti-IgG CAT, which detects both IgG and IgM responding at 37°C, and (ii) solid phase red cell adherence test (SPRCA), which only detects IgG anti-A and anti-B. The outcomes of the two approaches were similar. While CAT can be used for single sample analysis, SPRCA is best suited for batch analysis.

Laboratory Monitoring, Anti-A And Anti-B

The anti-A and anti-B IgG titer is measured in the first trimester and at GA 32 weeks in pregnancies where the mother has been found to have high-titer IgG anti-A and anti-B or if there is a history of a prior pregnancy in which the mother's anti-A/B was the cause of HDFN. A common cut-off value of 512 was first discovered for anti-A/B for the procedures outlined [77]. On the other hand, separate cut-off values for anti-A and anti-B improved accuracy, according to other research (in preparation). We now use a cut-off value of 256 for maternal anti-B and 512 for maternal anti-A. When there are incompatible antigens on foetal red blood cells, the cut-off value is used to recommend antenatal non-invasive foetal ABO blood group prediction and to monitor the foetus with MCA-PSV ultrasound.

Fc In Foetal, Neonatal, And HDFN

Agglutination techniques are generally instructive, but in unexpected urgent situations of suspected HDFN when the diagnosis is initially unclear, more thorough and semiquantitative information [78] can be provided by complementing with FC. Weak foetal expression of antigens, small surviving populations of foetal cells following several IUTs, and limited sample volume can all make it impossible or inconclusive to determine foetal and newborn antigens and direct antiglobulin test (DAT)-positive RBCs [79]. When donor and patient cell populations are intermingled, FC allows for the quantification of subpopulations, such as several populations with different RBC phenotypes, which allows for the assessment of both donor and newborn RBC survival.

Doppler Ultrasonography MCA-PSV For Non-Invasive Prediction Of Foetal Anaemia: Determining The Real Clinical Course

HDFN requires both foetal expression of the appropriate RBC antigen and maternal alloantibodies. Nevertheless, the same laboratory results show a wide range of clinical impact. Despite an unaltered alloantibody titer, clinical variance can exist amongst antigen-positive foetuses, even within the same woman [80]. To ascertain the true clinical impact of the alloimmunisation, further surveillance techniques are required. The gold standard for non-invasive foetalanaemia prediction is MCA-PSV measurement. In order to forecast moderate to severe anaemia in the non-hydropicfoetus, Mari et al. [38] demonstrated that a cut-off of 1.5 multiples of the median on Doppler ultrasound measurement of MCA-PSV has 100% sensitivity with a false-positive rate of 12%. The foundation for therapeutic intervention with intrauterine blood transfusion or delivery, depending on GA, and preventing foetal death is the timely detection of substantial foetalanaemia.

Recent Techniques For Detecting Abnormal Antibodies In Pregnancy

With advancements in transfusion medicine and maternal-fetal diagnostics, several sophisticated techniques have emerged for the detection and characterization of red cell alloantibodies. These techniques offer improved sensitivity, automation, and non-invasive options that significantly enhance prenatal care and transfusion safety in pregnant women.

Automated Immunohematology Analyzers

Modern automated systems such as Ortho Vision (Ortho Clinical Diagnostics) and Immucor Echo (Immucor) have revolutionized antibody screening and identification processes in blood banks. These analyzers are designed to perform a wide range of immunohematological tests with high throughput, minimal human error, and enhanced standardization. They utilize technologies like gel cards, solid-phase red cell adherence (SPRCA), and microplate systems, which allow precise and rapid detection of clinically significant antibodies. Their automation capabilities also support reflex testing and sample tracking, making them ideal for high-volume antenatal screening programs [81].

Flow Cytometry

Flow cytometry is increasingly used in assessing red blood cell (RBC)-bound antibodies, particularly in complex cases of hemolytic disease of the fetus and newborn (HDFN). It allows for quantitative measurement of immunoglobulin (IgG) and complement on fetal RBCs, offering higher sensitivity than traditional methods like the direct antiglobulin test (DAT). In antenatal settings, flow cytometry can help monitor the severity of alloimmune hemolysis and guide decisions regarding intrauterine transfusions or early delivery [81].

DNA-Based Genotyping

Molecular genotyping has emerged as a powerful tool for identifying fetal blood group antigens non-invasively. Using cell-free fetal DNA (cffDNA) extracted from maternal plasma, laboratories can determine the fetal RhD status as early as 10 weeks of gestation. This method helps avoid unnecessary administration of anti-D immunoglobulin (RhIg) in RhD-negative pregnant women carrying an RhD-negative fetus. Beyond RhD, DNA-based assays can also genotype other clinically important antigens such as Kell (K), Duffy (Fy), and Kidd (Jk) [82, 83]. These molecular methods reduce the need for invasive procedures like amniocentesis and enable early risk stratification for HDFN.

Emerging Techniques In Alloantibody Detection And Fetal Antigen Typing

The continuous evolution of molecular diagnostics and computational tools has paved the way for more advanced, accurate, and comprehensive approaches in the detection of red cell alloantibodies and prediction of fetal antigen status. These emerging techniques hold immense potential in overcoming the limitations of conventional serological methods, particularly in complex or multi-antibody cases.

Next-Generation Sequencing (NGS)

Next-generation sequencing (NGS) offers high-throughput and deep coverage of genetic loci associated with blood group antigens. This technology enables the identification of novel, rare, or hybrid alleles in both the mother and fetus, which may not be detected using standard genotyping assays. NGS has been particularly useful in resolving discrepancies in serological phenotyping, predicting antigen-negative donor units, and assessing fetal antigen status with a high degree of accuracy. Its application in maternal-fetal medicine can support personalized transfusion strategies and enhance safety in alloimmunized pregnancies [81, 84].

Digital PCR (dPCR)

Digital polymerase chain reaction (dPCR) is a precise, quantitative molecular technique that allows the detection of low-abundance DNA sequences, such as cell-free fetal DNA (cffDNA) in maternal plasma. Unlike conventional PCR, dPCR partitions the reaction into thousands of nanoliter-sized droplets, enhancing sensitivity and specificity. It is particularly suited for non-invasive prenatal testing (NIPT) of fetal antigens, including RhD and Kell, even at early gestational ages or in cases with low fetal fraction. This method reduces the need for invasive sampling while ensuring reliable antigen prediction [82].

Microarray Platforms

Microarray-based immunohematology assays allow for the simultaneous screening of multiple RBC antigens or antibodies using a single sample. These platforms use immobilized probes or antigens on a chip that react with serum antibodies, enabling comprehensive antibody profiling. Microarrays are advantageous in complex alloimmunization scenarios, where pregnant women may develop multiple antibodies due to prior transfusions or pregnancies. They also support extended antigen typing for rare or weak antigen variants, thereby improving transfusion compatibility [81].

Artificial Intelligence (AI)-Based Algorithms

The integration of artificial intelligence (AI) and machine learning algorithms into transfusion medicine is a cutting-edge development. AI tools are being trained to analyze complex serological profiles, interpret antibody screening results, and suggest probable antibody specificities based on historical and real-time data. These systems aim to reduce interpretation errors, enhance workflow efficiency, and guide decision-making in challenging cases of maternal alloimmunization. Future AI models may also incorporate genotypic and clinical data to provide personalized transfusion recommendations [83].

Clinical Significance of Abnormal Antibodies

From a clinical standpoint, autoantibodies directed against red cell antigens may be pathogenic, resulting in decreased RBC survival and the potential to induce hyperhemolysis via DHTR. Four out of fourteen chronic transfusion recipients who generated detectable autoantibodies experienced autoantibody-mediated haemolysis, according to a retrospective research by Castellino et al. [85]. IgG and C3 were found on RBCs in every case with haemolysis, according to the direct antiglobulin test. Although they were less harmful, cold-reactive IgM autoantibodies of the IgMisotype also happened. Autoantibodies may also play a role in DHTR/hyperhemolysis, according to Aygun et al. With a clinical picture similar to typical AIHA, autoantibodies have been prevalent in certain cases and are likely to be the cause of DHTR [86,87,88].The autoantibodies manifest as panagglutinins in these potentially fatal situations [89,90]. Making it even harder to identify suitable blood and characterise the underlying alloantibodies. Enzyme-treated RBCs boost the reactivity of RH antibodies, making it possible to detect low titers of autoantibodies with greater sensitivity. It is yet unknown what these RBC autoantibodies mean clinically,

particularly if they do not bind complement. However, their existence does signal that autoimmunisation is occurring, indicating the need for rigorous serial surveillance of these patients. Blood group (cell grouping) and the direct antiglobulin test (DAT) employing column agglutination technology (CAT) were part of the immunohematological workup on the mother's newborn samples with an alloantibody (Bio Rad LISS/Coombs anti IgG + C3d ID cards, Switzerland). To verify the antibody's specificity, heat elution tests were conducted. Regarding 1 in 500 pregnancies, all laboratory tests were conducted in accordance with normal protocols [91-93]. Immunohematologists and obstetricians continue to face difficulties in managing an alloimmunized pregnancy. Finding these at-risk pregnancies as soon as feasible is essential. A tertiary care facility may be consulted for a proper diagnosis and course of therapy in such circumstances [94].Screening pregnant women for abnormal antibodies on a regular basis can help clinicians keep an eye out for HDFN development. The transfusion centre will also benefit from this tactic by having quick access to antigen-negative blood in case it is required, particularly for expectant moms who have uncommon antibodies.

Handling Blood Transfusions In Expectant Mothers

The primary treatment for severe anaemia during pregnancy is packed red blood cell (PRBC) transfusions, which supply red blood cells to enhance oxygen-carrying capability [94]. Platelet infusions are necessary to treat or prevent bleeding issues in cases of severe thrombocytopenia [95]. Because it contains clotting factors, fresh frozen plasma, or FFP, is used to treat coagulopathies or bleeding disorders [96]. Because it is high in clotting factors such as von Will brand factor, fibrinogen, and factor VIII, this blood product is used in cases of severe bleeding or coagulation factor deficiencies [97]. In certain circumstances where many blood components are required simultaneously, whole blood transfusions may be taken into consideration, although being less frequent than specific blood components [98].

DISCUSSION

Despite improvements in diagnostic methods, treatment choices, and prophylactics like Rh immunoprophylaxis, red cell alloimmunisation during pregnancy is still a major concern in maternal-fetal medicine. When foetal red blood cells containing father-inherited antigens enter the mother's bloodstream, the mother's immune system is prompted to create antibodies against the antigens, a process known as alloimmunisation. Haemolytic disease of the foetus and newborn (HDFN), a potentially serious disorder marked by foetalanaemia, hydropsfetalis, or neonatal hyperbilirubinemia, may result from this immune reaction. The incidence of Rh alloimmunisation was considerably decreased by the late 20th century adoption of anti-D immunoprophylaxis. Alloimmunisation management is still difficult, though, because of non-D antigens, ABO incompatibility, and uncommon but important RBC antibodies. Pregnant women must be screened for unexpected antibodies in order to detect alloimmunisation early and determine their possible risk of HDFN. It is highly advised to do universal antibody screening in the first trimester and around week 28 of pregnancy. By limiting needless prophylactics in RhD-negative mothers bearing RhD-negative foetuses, non-invasive foetal RHD genotyping utilising cell-free foetal DNA has improved these measures even more. Even though Rh alloimmunisation has been successfully managed, more study and funding are needed for the clinical management of non-Rh alloimmunisation and maternal ABO incompatibility. Foetal middle cerebral artery peak systolic velocity (MCA-PSV) monitoring with Doppler ultrasonography has shown great efficacy in non-invasively predicting foetalanaemia, allowing for prompt interventions such intrauterine transfusions or early birth.

Although multidisciplinary treatment is effective in managing the majority of alloimmunized pregnancies, the incidence of alloimmunisation varies by demographic and transfusion history, underscoring the need for data and solutions particular to a given location. The significance of tailored care procedures for these groups is shown by the fact that alloimmunisation rates are significantly greater in people with haematologic malignancies or hereditary anaemias such as sickle cell disease and thalassaemia.

CONCLUSION

Pregnancy problems linked to alloimmunisation have significantly decreased as a result of developments in immunohematology and prenatal care. Alloimmunisation detection, prevention, and management have improved with the combination of routine antibody screening, RhIg prophylaxis, and cutting-edge diagnostic techniques including cell-free foetal DNA testing. Furthermore, foetal monitoring has been transformed by non-invasive techniques as MCA-PSV measurement, which enables prompt interventions to avoid severe anaemia and its associated problems.Notwithstanding these successes, there are still unanswered questions regarding alloimmunisation outside of RhD incompatibility, particularly with regard to non-D antigens and maternal ABO antibodies. Reducing maternal and foetal morbidity and mortality will need the creation of standardised screening and monitoring procedures for these antibodies as well as expanded access to sophisticated testing in environments with limited resources. Additionally, more studies on alloimmunisation in various populations will help develop specialised approaches to successfully treat this illness. The medical community can continue to enhance outcomes for mothers and their babies, guaranteeing safer pregnancies and healthier lives, by encouraging collaboration among physicians, laboratory professionals, and researchers.

ABSTRACT

Deception/ Lie Detection is the process of finding someone telling lies to hide the truth by using false statement with the specific intention. Machine learning (ML) techniques have been extensively employed in the field of identifying deception, particularly for detecting seven distinct types of micro-expressions. Decision Tree, Random Forest, K-Nearest Neighbor, Support Vector Machine, Linear discriminant analysis, Active Shape Model – Temporal Interpolation - Local Binary Pattern - Three Orthogonal Planes – Multiple Kernel Learning (ASM-TIM-LBP-TOP-MKL), Temporal Interpolation - Fuzzy Histogram of Optical Flow Orientations – Support Vector Machine (TIM-FHOFO-SVM), Local Binary Pattern - Temporal Interpolation – Ensemble Learning Machine (LBP-TOP-ELM) and Temporal Interpolation - Eulerian Motion Magnification - Histogram of Image Gradient Orientation– Support Vector Machine (TIM - EMM - HIGO - SVM) are ML algorithms which classify deceptive and truthful data. This study analyses 17 recently released machine learning algorithms based on Micro Expression for the detection and classification of deceit, as well as associated feature selection and data preprocessing methods, and tabulates the results based on accuracy. The paper also briefly discusses the features of eight well-known micro-expression datasets used to train the ML algorithms. Using machine learning algorithms and appropriate preprocessing and feature selection methods, the review assists aspiring researchers in identifying many facets of study in the field of deception detection from the micro-expression databases.

Keywords: CASME, CASME II, CAS(ME)2, Feature Selection, MMEW, Pre-processing, SAMM, SMIC, YorkDDT.

INTRODUCTION

The quantity of criminal cases worldwide is rising annually. One of the most effective and frequently employed forms of human communication is Facial expression (FE), which has a close connection with people's intentions, attitudes, and mental states [1] [5]. Deception Detection is morally and ethically required to safeguard innocent people and to identify crime or dishonest people or defendants based on their facial expressions. As the decision of each trial is focused more on the stakeholder hearings and facts (accused, witnesses, etc.), incorrect judgments could result if the stakeholders concealed the truth due to their emotions [1]. Therefore, to continuously maintain law and order, it is indispensable to identify dishonest people by their facial expressions. The different deception System is used by the various authorities [2-4], [5, 6-7]. The British Airport checks people to find out lying in the airport using "Facial Action Coding System (FACS)" [2]. "Automated Deception System (ADD)" [3] is used in several domains like Law Enforcement System, Security and Investigation, Defence and Police Investigation to provide security, assist to investigate cases and maintain the peace in the society [3, 4], [5, 6-7]. Face Expressions (FEs) for emotions like Happy, Sad, Anger and Surprise are classified into two types: "Macro and Micro Expressions". The normal FEs are Macro expressions. These expressions are easy to find out and controllable. "Micro Expressions (MEs)" are spontaneous, unnoticeable, and quick (1/25 to 1/3 second) facial movements made in response to emotional data inputs. Ekman and Friesen announced the discovery of MEs. These MEs are uncontrollable and cannot be easily understood by all people [8]. Understanding the Difference within "Macro and Micro Expressions" can be witnessed in Table 1.

The main reason for the significant interest in MEs is that they are an important clue for lie detection [8], [9]. So, the paper reviews 17 recently published ME based ML algorithms for deception detection and classification along with the associated data pre-processing, feature selection techniques and tabulates them according to accuracy. The paper also briefs the characteristics of eight popular ME databases used to train the ML algorithms. The review helps prospective researchers identify different aspects of research in the domain of deception detection from the ME databases using ML algorithms and suitable pre-processing & feature selection techniques. The paper is arranged in three sections. Section 2 explains the characteristics of facial expression data and the most popular databases of MEs used for deception detection. Section 3 tabulates the common ML algorithms in the literature that are used for deception detection and classification. The paper ends with a conclusion in Section 4. The Appendix I provides the expansions of acronyms used in this review.

Facial Expression Data

"Micro-expressions are transient and of low intensity, however, their detection and recognition are difficult and rely heavily on expert experiences". Due to its "difficulty and complexity", video-based micro-expression analysis is attractive and challenging. In recent days, it has become an active area of research. "Micro Expressions" can be explored in a broad range of applications such as "lie detection", "criminal detection", identifying dangerous attitudes and national security, etc [10 – 12]. Face expressions (FEs) like "Macro and Micro expressions" are encoded by the "Facial Action Coding System (FACS)" as combinations of different muscles in the face known as "Action Units (AU)". The "Facial Action Coding System (FACS)" [13] was created by Ekman et. al. as part of their ongoing ME research. The details are summarised in Table 2 [9-10], [11-13]. In high-stakes circumstances, individuals attempt to hide their honest emotions. The performance of "Facial Expression Recognition (FER)" can be improved by AU analysis by successfully resolving the ambiguity problem to represent individual expression [14]. MEs are FEs reveal people's hidden feelings in high-stake situations when people try to conceal their true feelings [9]. Fig. 1 shows the example of micro and macro-expressions as well as activated AUs in each FE from CASME II [10], and MMI [9] databases. The red arrow represents the muscle movement direction. AU4, AU6, AU7, AU9, AU12, AU15, AU17 and AU25 represent brow lower, cheek raise, lids tight, nose wrinkle, lip corner puller, lip corner depressor, chin raiser and lips part, respectively. Ekman [15] pointed out that as an effective clue for use when identifying lies, MEs have

broad applications. By detecting the occurrence of micro-expressions and understanding the emotion type behind them, it will be possible to accurately identify the true intentions of the participant and improve the rate of success in deception/ lie [15].

ME Databases

ME databases have facial expression-based data which are images captured from the video camera. This paper focuses on the spontaneous type of facial expression databases. In Spontaneous databases, participants are requested to suppress their true emotions, while watching the prepared video sequences. These databases have images captured by different cameras in different sample sizes, resolution, frames at various speed, emotion classes and varying illumination environments. These factors played a key role in improving the accuracy of deception detection. The popular databases, YorkDDT [16], SMIC [17], SMIC II [17], CASME [18], CASME II [19], CASME2[20], SAMM [21], MEVIEW [22] and MMEW [23] are tabulated in the Table 3 along with the details of pixel resolution, image size and camera used for capturing images. The sample of ME images from the popular databases are shown in Figure 2. The characteristics of these databases are briefed in these sub-sections below and tabulated in Table 4.

YorkDDT Database

The YorkDDT [16] is the very old and first spontaneous database. It was collected from the wall mounted camera for a Deception Detection Test (DDT). The videos are recorded truthfully or deceptively with the camera of resolution 320 × 240 from 9 participants: 6 Females and 3 Males at 25 frames per second (fps). In this database, resolution and the frame rate of the camera were low and the training sample size is small. The dataset other than they had high unpredictability due to spontaneous. This database is not available freely for access [24]. In this database, images with irrelevant mouth movements are also present [25].

SMIC Database

The "Spontaneous ME Corpus (SMIC)" [17] is the database captured using "PixeLINKPL-B774U" camera at a resolution of 640 × 480 in the year 2011. From the prior study, Pfister et al. [25] fixed the problem of the YorkDDT database by labelling with the Action Unit (AU) on the onset, the apex, and the offset frames. This dataset recorded 77 MEs as spontaneous in 100 fps from six participants (three male and three female). Some of them wore glasses [26]. For collection of this database, the participants were requested to watch 16 recorded videos chosen to induce happiness, sadness, disgust, surprise, and fear. They were asked to suppress their emotions and the resultant facial expressions were captured. If emotions are leaked, the FE is captured as a Macro expression.

SMIC – II Database

In 2013, the SMIC dataset has been extended to SMIC – II [17]. It has been divided into three subsets such as "SMIC HS", "SMIC VIS" and "SMIC NIR". These databases were recorded by the different cameras such as "HS (standing for high speed camera)", "VIS (for normal visual camera) and NIR (for near-infrared camera)". Since MEs have a short duration and low intensity, a higher spatial and temporal resolution may help to capture more details. Hence, the SMIC-HS subset was collected with a high-speed camera with a frame rate of 100 fps to record rapid changes of the micro-expressions. The data subset consists of 164 spontaneous ME sequences recorded from 16 participants. The SMIC VISual (VIS) has both the ordinary RGB and the infrared data with a resolution of 640 × 480 at 25fps [13]. The NIR was suitable under the dark illumination conditions, and it produced images that are insensitive to the illumination changes. The MEs in the database are labeled with three classes such as positive (51 happy samples), negative (70 sad samples) and surprise (43 samples). In addition, few samples of disgust and fear samples are also available [17].

CASME database

The "Chinese Academy of Sciences MEs (CASME)" [18] is a spontaneous type of database. The recorded videos are collected from the 35 candidates with eight MEs at a frame rate 60 fps (frames per second) with the resolution of 1280×720 from 13 females and 22 males. The CASME samples have a face size of 150 × 190 pixels. Both natural light and LED light were used to capture the class A and class B photographs, respectively [18]. It helps to increase the

emotion classification into seven classes such as "Amusement"(5 samples), "Disgust" (88 samples), "Sadness" (6 samples), "Contempt" (3 samples), "Fear" (2 samples), "Tense" (28 samples), "Surprise" (20 samples), "Repression" (40 samples) [18]. The labels available in this dataset are emotional and Facial Action Coding at 320 × 240 resolution of camera.

CASME II database

The "CASME II" database [19] is an extended version of "CASME". It has a larger images of size 280 x 340 pixels in image sequence than the samples of the "CASME" database. It contains 247 ME samples. This database has five emotional classes, i.e., "Happiness" – 33, "Repression" - 27, "Surprise"- 25, "Disgust" - 60 and Others (66). This database used a high-speed camera with a sampling rate of 200 fps than CASME (60 fps). It has a greater spatial and temporal resolution compared with CASME.

CAS(ME)2 database

The "CAS(ME)2" database [20] is a spontaneous type of data. This database includes micro and macro expressions together with neutral face expressions. The "Logitech Pro C920" camera is used to capture the dataset at the resolution 640 x 480. From the gathered dataset, expressions in time intervals of less than 0.5 seconds are used to distinguish between micro and macro expressions. The dataset is divided into two parts A and B which is based on two key factors such as the length of the micro and macro expressions. While Part B has 300 samples of macro and 57 samples of micro-expressions, Part A has 87 lengthy videos with both macro and micro-expression.

SAMM Dataset

The Spontaneous Actions and Micro-Movements (SAMM) database [21] is the first high-resolution database with the largest ethnic variability (13) among other databases; 32 different ethnicities are in the dataset, including White British, Chinese, Arab, Malay, Afro-Caribbean, African, Black British, Indian, White British/Arab, Nepalese, Spanish, and Pakistani. This dataset contains 159 micro-movements in seven fundamental emotion categories at 200 frames per second and 2040 x 1088 pixel resolution for this database. Its data is said to be the most severely skewed. 20% of samples were positive, and 10% were surprises [21].

MEVIEW Dataset

The "Micro-Expression VIdEos in the Wild (MEVIEW)" [22] dataset released in 2017 includes data collected in the wild. The resolution of the 40 ME videos is 720 × 1280 and the frame rate is 25. It has a total of 31 videos which includes sixteen participants mainly from poker games. The videos made up of real clips from two situations: (1) some "key events in poker games", and (2) someone answering tough question in the TV interview. Due to their high levels of stress, both situations are noteworthy. The camera shot is frequently switched, and the average duration of the video clip is 3 seconds. The seven emotion classes in MEVIEW are: Anger, Contempt, Disgust, Fear, Happiness, Surprise and Unclear [22].

MMEW

The "Micro-and-Macro Expression Warehouse (MMEW)" dataset [23] is another spontaneous type of data which contains both macro and micro-expression images. All samples in MMEW were captured by experts with onset, apex and offset frames, and "AU annotations from FACS" are used to describe the facial muscle movement area (Table 2). This dataset is composed of 300 micro-expressions and 900 macro-expressions. These specific classes are greater in complexity. (i.e. "Happiness" (36), "Anger" (8), "Surprise" (89), "Disgust" (72), "Fear" (16), "Sadness" (13) and Others (66). The expression methodology utilized is the same as the one used in other databases: participants watched videos emotionally while trying to maintain neutral facial expression. The samples in MMEW have a larger face size (400 x 400 pixels) and a better image resolution (1920 × 1080 pixels). Tables 3 and 4 list the attributes of the images in each of the aforementioned datasets.

ML algorithms for classification and detection of deception

In literature, many ML algorithms are found to be designed for the detection and classification of deception based on various MEs. In this section, the ML algorithms [11], [12], [25], [27 - 40] which work on the popular databases CASME, CASME II, CAS(ME)2, SMIC, SMIC-II, MMEW and SAMM are compared based on the accuracy along with the preprocessing and feature selection techniques applied on the training data as shown in Table 5. The comparison which is made in terms of accuracy gives information about the effective ML algorithms in this domain. Accuracy of a ML model is defined as the ratio of true predictions to the total predictions made by the classifier. The accuracy % provided in the last column (highlighted bold) of Table 5 is corresponding to the best ML algorithm as reported in the paper referred. Table 5.is a comparison of the ML algorithms [11], [12], [25], [27 - 40] designed for the detection and classification of deception based on MEs for seven emotion groups: " Happiness, Surprise, Anger, Disgust, Sadness, Fear and Others" in terms of accuracy. The training dataset used by the algorithms in this table is YorkDDT, CASME, CASME II, CAS(ME)2, SMIC, MMEW and SAMM. From Table.5, the ML algorithms and the "pre-processing" & "feature selection" combinations which give highest "accuracy" for a particular emotion group of the ME dataset are identified and illustrated in the bar plot as shown in the figure 3.

It is inferred from Table 5 that, the classifier, ELM is producing the highest accuracy of 96.12% using the five emotion group from CASME II [36] dataset. The classifier, SVM is produces the highest accuracy of 83.10% using the four emotion group from the SMIC–VIS database [37]. The classifier, SVM is producing the highest accuracy of 82.86% using the two emotion group from the SMIC database [30]. The classifier, SVM with Mag (Magnification) is producing the highest accuracy of 81.69% using the three emotion group from the SMIC database [35].

CONCLUSION

This paper reviewed 22 recently published Micro Expression based ML algorithms for deception detection and classification. From the review, a higher accuracy of 96.12% was obtained by the feature selection technique, LBP-TOP along with the ELM classifier using the CASME II dataset. CASME II dataset produced higher accuracy than all other MEs datasets like SMIC, SMIC-II, CASME, MMEW and SAMM. A higher accuracy of 82.86% was obtained using the pre-processing techniques, TIM and AAM along with SVM classifier from the two emotion group of SMIC dataset.

ACKNOWLEDGEMENT

We acknowledge the Centre for Information Technology and Engineering, Manonmaniam Sundaranar University in Tirunelveli - 627012, Tamil Nadu, India, for the support to carry out the work.

Conflicts of Interest

The authors declared no potential conflicting interest with respect to research, authorship and / or publication of this article.

ABSTRACT

Organizational climate (OC) refers to a collection of characteristics that define and distinguish an organization. Thus, a variety of elements, including group dynamics, leadership style, organizational structure, industrial setting, communication methods, and intervening variables in the educational environment, all have an impact on organizational climate. The organizational atmosphere has a big impact on how effective instruction is. Teaching effectiveness is the capacity of a teacher to hold students' interest, promote learning, and accomplish the intended learning goals. The primary goal is to examine the relationship between organizational climate and teaching effectiveness among secondary school teachers in West Bengal, considering factors including gender, location, and school type. A total of 403 teachers were randomly selected as a sample from the West Bengal secondary school teacher population for this descriptive study using a mixed method research methodology. Researchers employed re-standardized questionnaires (Teaching Effectiveness Scale and the Organizational Climate Scale for Teachers) re-standardized by Md. Asadullah (2022) for quantitative analysis after gathering data from secondary school teachers in West Bengal. For qualitative analysis, two open-ended questions are employed. The qualitative data was analysed using content evaluation, and also, mean, standard deviation, Pearson's product moment correlation (r), and SPSS-20.0 version for quantitative analysis. The most recent research, however, looked at the relationship between organizational climate and teaching effectiveness. Category-wise, the results showed a fragile positive association (r=0.322) between organizational climate and secondary school teachers' effectiveness in instructional settings. Additionally,

it shows that organizational atmosphere and teaching efficacy are positively correlated across all categories (male, female, rural, urban, government, and private).

Keywords: Organizational climate, Parallel, Teaching effectiveness, Secondary school teachers,

INTRODUCTION

"Organizational climate (OC)" is a collection of characteristics that define and distinguish it. Because the organizational climate has a common meaning, workers are trying to absorb the characteristics of the workplace(Amiri *et al*. 2023). The interpersonal connections and decisions people make still have a big impact on the atmosphere of the company(Sirisha and Lakshmi, 2019). Everyone in the organization uses a variety of verbal and nonverbal cues and behaviors to express and react to the present organizational environment. Organizational climate is therefore influenced by a wide range of factors, such as group dynamics, leadership style, organizational structure, industrial setting, communication styles, and intervening variables in the educational environment(Shahnavazi *et al*. 2021). According to Banwo *et al*. (2022), A decline in organizational commitment, a decline in social cohesion, and an increased probability of misunderstandings and disputes are some of the dangers that might materialize. In order to maintain the benefits of diversity and their competitive advantage, modern firms must find ways to mitigate these negative effects(Platania *et al*. 2022). When analyzing the organizational climate for secondary school teachers, it is vital to consider a number of factors that contribute to the overall work environment and school culture. According to Pradoto *et al*. (2021), It covers a wide range of subjects, such as decision-making and feedback systems, workload and job requirements, student safety and discipline, leadership, communication, teamwork, teacher support, acknowledgment and awards, and inclusivity and diversity. By assessing these organizational climate elements, school administrators can identify areas for improvement and implement strategies to create a supportive and motivating work environment for secondary school teachers. Examining the member's qualities, leadership, organizational structure, and interpersonal interactions is the goal of the current study (Singh, V., 2015).The efficiency of instruction is significantly influenced by the organizational climate. The ability of a teacher to maintain students' attention, encourage learning, and achieve the desired learning outcomes is known as teaching effectiveness. It is a complicated concept that is assessed using a variety of methods and standards(Arti, K. 2018). For secondary pupils to be prepared, effective instruction is crucial. Applying the knowledge acquired at the post-secondary level or outside of the classroom is facilitated by effective teaching. Students are thus prepared for the future by guaranteeing high-quality training by focusing on the crucial elements of successful teaching and applying powerful assessment strategies. It involves using assignments, quizzes, and standardized assessments to evaluate students' academic progress and achievements(Beri, Dr. N., 2016). According to Dash, U. and Barman, P. (2016), Classroom management is the ability to create and maintain a positive learning environment, regulate student behavior, and provide a tidy and supportive classroom. employing a range of teaching techniques and ideas to accommodate different students' needs and learning styles. Effective teachers typically combine direct instruction, group projects, hands-on activities, and technology integration. Numerous factors that are related to the idea of teaching effectiveness have an impact on students' learning results. Due to the advanced subject matter and the developmental stage of the pupils, successful teaching at the secondary school level requires extra attention.

RATIONALE OF THE STUDY

A group of traits that characterize and set apart an organization is known as its organizational climate (OC). Employees are attempting to assimilate the workplace's qualities as the term "organizational climate" has a shared meaning(Amiri *et al*. 2023). Therefore, a variety of elements, including group dynamics, leadership style, organizational structure, industrial setting, communication styles, and intervening variables in the educational environment, all have an impact on organizational climate(Shahnavazi *et al*. 2021). The organizational atmosphere has a big impact on how effective instruction is. Teaching effectiveness is the capacity of a teacher to hold students' interest, promote learning, and accomplish the intended learning goals(Beri, Dr. N., 2016). The capacity to establish and uphold a constructive learning atmosphere, control student conduct, and provide a neat and encouraging

classroom while utilizing a variety of instructional strategies and concepts to meet the demands and learning preferences of various students is known as classroom management (Dash, U. and Barman, P.2016). Students' learning outcomes are influenced by a wide range of elements that are connected to the concept of teaching effectiveness. Effective teaching at the secondary school level necessitates extra care because of the complex subject matter and the students' developmental stage. As a result, this subject is highly important in the field of study.

OPERATIONAL DEFINITIONS

Teaching Effectiveness: It is operationally described as a measure of four dimensions: classroom management, application, presentation, and preparation abilities (Sarkar, S. and Deb, A. (2014).

Organizational Climate: The operational definition of this term is a measurement of four aspects: member quality, leadership, organizational structure and design, and interpersonal and co-worker relations (Singh, V., 2015).

Secondary School Teachers: Secondary school teachers are those who teach in secondary schools, often known as senior secondary schools, which include classes 9 and 10 as well as classes 11 and 12.

REVIEW OF LITERATURE

Overall efficacy was good (Mean=3.92, SD=1.33, and Good), per a study on learning effectiveness by "Dash and Barman (2016)." The results of "Beri's (2016)" analysis of teaching efficacy and job satisfaction showed no discernible variations based on a teacher's gender or educational background. When compared to alternative lecture delivery methods, PowerPoint presentations were shown to be more successful (Shah *et al*., 2017). Research on the organizational atmosphere of educational institutions in Bhutan and India was done by "Punia and Kaushik (2013)." According to the study's findings, India's organizational climate was marginally superior to Bhutan's overall. An analysis by "Boro (2021)" focused on job satisfaction and organizational climate, and the findings indicated a somewhat positive correlation between the two. After investigating how organizational climate affects the self-efficacy of operating room staff members, Amiri (2023) found that a favourable organizational atmosphere and strong levels of self-efficacy were reported by more than half of the participants. Data from the Spearman's rank correlation coefficient indicated a strong correlation between organizational atmosphere and self-efficacy. According to Mutoni *et al*. (2020), who looked into the topic, the organizational climate has a big impact on employees' inspired acts. The organizational atmosphere was positively and significantly correlated with the two inspired act characteristics considered in this study. Depending on auxiliary soft and hard factors, organizations can have a range of multi-layered organizational climates (Banwo, 2022). The evaluation conducted by Sirisha and Lakshmi (2019) sought to evaluate the institution's culture and how it affected employee productivity. Additionally, the study found a progressive relationship between wage earners' satisfaction with their workplace and performance, as well as a negative association between employee turnover and deviant behavior at work. In 2022, Platina *et al*. conducted research on the organizational environment, the climate of heterogeneity, and work-related discontent. Their study found that the diverse climate acted as a mediator between the organizational environment's positive and negative effects on results variables. According to Riofrío's (2024) analysis, the majority of research on organizational climate in the construction industry has been conducted in China. Professional security and well-being are prioritized on a dimensional level. Provide a system of classification for models, dimensions, and other general variables. Overall, Zacher and Yang (2016) found that an essential environmental factor for productive aging at work is the organizational climate. In the context of work-from-home policies, Pradoto *et al*.'s (2022) study looked at the connections between improving employee performance, corporate atmosphere, and working stress. In 2019, Shahnavazi *et al*. looked into and expanded on the study's findings, which showed a substantial relationship between nurses' job performance and how they felt about the organizational climate. Organizational structure has no appreciable impact on creative job performance, according to a study by Imran *et al*. (2010). According to research by Mutonyi *et al*. (2022), managers should invest in these resources proactively. By making the most of available resources, such projects will boost employee perceptions of the organization's attractiveness and stimulate more innovative thinking.

OBJECTIVES

1. To assess how organizational climate and teaching effectiveness correlate to each other secondary school teachers of West Bengal;
2. To look into how organizational climate and teaching effectiveness correlate to each other secondary school teachers in terms of gender, location, and school type of West Bengal;

STATISTICAL NULL HYPOTHESES

Ho1. Teaching effectiveness of secondary school teachers in West Bengal is not significantly correlated with organizational climate.

Ho2. There is no noticeable correlation between the organizational climate and teaching effectiveness of secondary school teachers with considering their gender, location, and type of school in West Bengal.

METHODOLOGY

In this research, 403 teachers were chosen at random from among West Bengal secondary school teachers as a sample, and the researchers used a mixed strategy (the conventional parallel) that included quantitative and qualitative research design.

Data collection

Researchers employed re-standardized questionnaires (Teaching Effectiveness Scale and the Organizational Climate Scale for Teachers) re-standardized by Md. Asadullah (2022) for quantitative analysis after gathering data from secondary school teachers in West Bengal. For qualitative analysis, two open-ended questions are employed.

Data analysis techniques and Interpretation

The qualitative data was analysed using content evaluation, and also, mean, standard deviation, Pearson's product moment correlation (r), and SPSS-20.0 version for quantitative analysis.

RESULTS

Objectives 1: To assess how organizational climate and teaching effectiveness correlate to each other secondary school teachers of West Bengal;

Ho1. Teaching effectiveness of secondary school teachers in West Bengal is not significantly correlated with organizational climate.

Interpretation: According to Table (1), the Pearson's coefficient of correlation (r) value is 0.322, indicating a tenuous positive correlation between organizational climate and secondary school teachers' teaching effectiveness in the classroom. It suggests that the institutional organizational climate has an impact on the effectiveness of instruction. Figure: (1), makes this very evident.

Objective-2. To look into how organizational climate and teaching effectiveness correlate to each other secondary school teachers in terms of gender, location, and school type of West Bengal;

Ho2. There is no discernible correlation between the organizational climate and teaching effectiveness of secondary school teachers with considering their gender, location, and type of school in West Bengal.

Interpretation: This conclusion is also supported by category-wise analysis from table (2), which shows that for male teachers (r=0.432), female teachers (r=0.223), school teachers in rural and urban areas (r=0.385, r=0.256), government

school teachers (r=0.456), and private school teachers (r=0.225), there is a positive correlation between their organizational climate and teaching effectiveness in every instance at the significance level of 0.01.

The following are seen in the category-by-category discussion of the connection between effectiveness of teaching and organizational climate

- There is a moderately positive link between government school teachers (r=0.456) and male teachers (r=0.432).
- Female teachers (r=0.223), instructors in rural areas (r=0.385), teachers in urban areas (r=0.256), and teachers in private schools (r=0.225): weakly positive association

Figure: (1), makes this very evident.

QUALITATIVE ANALYSIS

Two open-ended questions were included in the questionnaire used for this study in order to elicit the subject's justifications or responses to the closed-ended questions. Additionally, the researcher collected some data for qualitative analysis by talking with teachers. The qualitative analysis was conducted using the content analysis method. Following response collection, each response is carefully examined, and related or comparable responses are combined or clubbed in order to use qualitative analysis to comprehend the repetitive nature of the data.

Q1. What aspects of the organization does the head not actively participate in?

In order to understand teachers' perceptions of the head's function, replies were obtained to the question about the areas in which the head does not actively participate in organization. When it comes to making decisions about teachers' personal lives and other academic projects, 25.31% of instructors specifically responded that the head keeps a distance. However, according to 25.81% of respondents, the head avoids issues pertaining to the school's sanitation and aesthetics. After an informal talk, it was discovered that 29.28% of instructors stated that extracurricular activities are where the head appears to be least concerned, despite the fact that many teachers showed no interest in responding to the question. Conversely, 8.68% of respondents reluctantly responded that the head does not notice the teacher's accomplishments. It's interesting to note that 10.92% of educators readily acknowledged that the head is heavily involved in all facets of the business and doesn't overlook anything. During the casual talk, the teachers opened their minds when questioned about the areas in which the head does not actively participate in organizing. The responses show that the institution's head is still very busy with the administrative workload and the massive amount of work associated with implementing the different welfare programs that the West Bengal government has undertaken. Therefore, other aspects are not given much attention.

Q2. List a few organizational actions that contribute to its dynamic, forward-thinking, high-quality, and flawless vision.

The comments were meticulously recorded in order to examine the institution's organizational climate from the viewpoint of the professors. Regarding the activities that set their organization apart from others, the teachers responded with enthusiasm. According to 28.78% of respondents, it is the level of organization of different academic and extracurricular events. 28.04% believe that the institution's dynamic and forward-thinking character stems from student-centred assessment. However, 25.06% believe that the school's perspective has altered as a result of friendly relationships between co-workers and teachers and students. 18.12% of respondents believe that the teaching and learning process is what gives the school its high calibre and propels it forward. Following the casual discussion, the teachers are worried about the school's quality and strive to create the ideal workplace. It appeared that everyone understood the importance of these best practices in schools.

DISCUSSION

Scholars have reviewed studies concerning the relationships between organizational atmosphere and secondary school teaching performance. When examining the relationship between organizational atmosphere and teaching effectiveness, Arti (2018), Banwo(2022), Das and Barman (2016), and Shah *et al*. (2017) discovered a substantial difference between the two variables when considering factors including gender, geography, and school type.

Nonetheless, Punita and Kaushik (2013) and Zacher and Yang (2016). The findings showed that these parameters were positively correlated. Sarkar and Deb (2015) revealed a positive correlation between organizational atmosphere and instructional effectiveness. Nonetheless, the current study looked at the connection between organizational climate and teaching effectiveness. Category-wise, the results showed a weakly positive correlation (r=0.322) between organizational climate and secondary school teachers' effectiveness in the classroom. Additionally, it shows that organizational atmosphere and teaching efficacy are positively correlated across all categories (male, female, rural, urban, government, and private). The leader of the institution is more interested in the accomplishments of his or her teachers than in their academic work or the school's extracurricular activities when it comes to qualitative analysis. Organizing various events in a friendly way and always putting the interests of the students first are acknowledged as excellent practices. The government is advised to consider taking steps to improve the data base about the organizational climate and the effectiveness of teaching in the areas under investigation. Additionally, this study's focus on organizational climate in connection to their demographic factors should be increased.

CONCLUSION

Based on the aforementioned findings, this can be concluded that secondary school teachers' organizational climate had a significant and beneficial effect on their teaching effectiveness. The extent to which this impact varied depending on the teachers' gender, location, and type of school, but organizational climate had an enormous effect on all secondary school teachers, which involves male-female, rural-urban, government-private secondary school teachers from four districts (Murshidabad, Malda, Kolkata and North 24 Parganas) in West Bengal. It can be concluded from the study that teaching effectiveness is not much (r=0.322) influenced by the organizational climate. Male teachers, teachers of urban areas and government school teachers better contribute to organizational climate.

EDUCATIONAL IMPLICATION

- The organizational atmosphere of the teaching institution of West Bengal has an impact on secondary school teachers' performance as teachers. To improve their capacity and potential for successful instruction, school instructors should be given a positive work environment.
- Principals, heads of schools, educational managers, and legislators should all endeavour to create an atmosphere that will support the designated.
- Organizational climate element and increase the efficacy of instructors. Any institution's teaching may benefit from an organizational atmosphere, which has been found to be closely linked to the perception of efficacy.
- Subsequently it significantly opposes social integration and behavior, the question of West Bengali teachers' gender-based abilities needs to be eliminated. It is possible to restore a positive and healthy organizational climate for secondary school teachers of West Bengal, which leads to good classroom instruction, by cultivating a school atmosphere free from gender bias.

ABSTRACT

Artificial Intelligence tools are transforming student learning experiences by providing instant feedback and adaptive support. While these technologies enhance confidence, growing dependency raises concerns about diminishing self-efficacy and independent problem-solving. This study addresses this gap by examining the relationship between AI usage, confidence, and self-efficacy among 200 higher education students. Using survey-based data and statistical analyses, the findings reveal a positive association between AI use and confidence, but a negative relationship between excessive reliance and self-efficacy. Results further indicate that students with higher digital literacy gain more sustainable confidence from AI tools. The study contributes to ongoing debates on AI in education by highlighting the importance of balanced usage policies and AI literacy training to strengthen long-term academic resilience.

Keywords: AI in Education, Student Confidence, Self-Efficacy, Digital Literacy, Higher Education

INTRODUCTION

The twenty-first century has witnessed a profound transformation in the way students learn, interact with knowledge, and perceive their own abilities. The integration of Artificial Intelligence (AI) into educational ecosystems—through intelligent tutoring systems, adaptive assessments, generative AI tools, and personalized learning platforms—has reshaped the traditional teacher–student dynamic. What was once a domain of human-

centered guidance and gradual knowledge construction is now complemented, and sometimes even overshadowed, by AI-powered assistance that promises speed, accuracy, and convenience. While the benefits of AI in education are undeniable—ranging from real-time feedback and tailored learning paths to democratized access to knowledge—its pervasive presence raises a critical question: how is AI influencing students' confidence and self-efficacy? Confidence represents a learner's broad belief in their ability to handle academic challenges, whereas self-efficacy, as theorized by Bandura (1997), is a task-specific judgment of one's capability to successfully organize and execute actions required to achieve learning outcomes. Both constructs are essential not only for academic success but also for lifelong learning, resilience, and adaptability. In the age of AI dependency, the balance between empowerment and over-reliance becomes delicate. On one hand, AI can scaffold learning, reduce anxiety by breaking down complex problems, and provide personalized support that enhances learners' sense of competence. On the other hand, constant reliance on AI-generated solutions may inadvertently undermine the very foundations of self-efficacy by discouraging independent problem-solving, critical thinking, and persistence in the face of cognitive difficulty. Students risk developing a "learned helplessness" where confidence is externally validated by technology rather than internally reinforced through mastery and effort. This paradox creates a pressing need to examine the evolving relationship between AI usage, confidence, and self-efficacy. The contemporary learner is no longer navigating challenges in isolation but in partnership with AI, which redefines not only the nature of knowledge acquisition but also the psychological attributes required to succeed in education. As institutions increasingly integrate AI into curriculum design, pedagogy, and assessment, it becomes vital to understand whether such integration strengthens students' belief in their capabilities or fosters a subtle dependency that erodes academic self-reliance. Thus, this study explores the nuanced dynamics of students' confidence and self-efficacy in the age of AI dependency, seeking to address how technology can be leveraged as an empowering partner rather than a disabling crutch. By situating confidence and self-efficacy within the broader debates on digital literacy, academic resilience, and responsible AI use, this discourse aims to provide insights for educators, policymakers, and researchers on how to cultivate empowered learners in an AI-driven world.

LITERATURE REVIEW

Self-efficacy is grounded in Bandura's Social Cognitive Theory, which identifies four sources: mastery experiences, vicarious experiences, social persuasion, and physiological states (Bandura, 1997). Each source is influenced in unique ways by AI. For example, AI may simulate mastery through guided solutions but may reduce opportunities for authentic mastery developed via trial and error. Confidence, while often overlapping with self-efficacy, is broader and less task-specific (Stankov, 2013). Confidence reflects general assurance in one's abilities across contexts, whereas self-efficacy is domain-specific, such as a student's belief in their ability to solve a mathematics problem. Both constructs are highly relevant to academic resilience, motivation, and performance. AI technologies are widely recognized for enhancing personalized learning and delivering timely feedback. Adaptive platforms provide individualized scaffolding, enabling students to experience mastery and reduced anxiety (Holmes *et al*., 2021; Nawaz and Gomes, 2023). Yet, AI dependency carries risks. Zheng and Warschauer (2022) found that students using AI for writing tasks experienced short-term boosts in confidence but showed weaker independent mastery when unaided. Similarly, Howard *et al*. (2023) describe "borrowed confidence," where reliance on AI undermines the development of authentic competence. Adoption of AI in education is often explained through the Technology Acceptance Model (TAM) (Davis, 1989) and the Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh *et al*., 2003). Both emphasize perceived usefulness and ease of use. Crucially, digital self-efficacy shapes learners' engagement with AI. Students with higher digital literacy are more confident using AI, which increases adoption (Teo and Noyes, 2014; Al-Emran *et al*., 2020). However, automation bias can lead to uncritical acceptance of AI outputs, potentially weakening independent evaluation skills (Mosier and Skitka, 2018). Empirical studies reveal a paradox. Kasneci *et al*. (2023) found that AI-assisted learners produced higher-quality academic outputs and felt more confident. Yet, these effects were not sustained when students were asked to work without AI. Dwivedi *et al*. (2023) caution that generative AI fosters "shortcut learning," where efficiency is prioritized over deep engagement and intrinsic motivation. Digital competence moderates the relationship between AI use and self-efficacy. Students with stronger

ICT skills are more likely to benefit from AI without over-reliance (Aesaert *et al*., 2017). Still, resilience theory underscores the importance of productive struggle. Martin and Marsh (2006) argue that persisting through challenges is essential for lasting self-efficacy, yet AI's convenience may reduce opportunities for such perseverance.

RESEARCH METHODOLOGY

This study adopts an explanatory, cross-sectional survey design with a confirmatory–analytical approach. The design is particularly appropriate because it facilitates rigorous hypothesis testing while being theoretically anchored in Bandura's Social Cognitive Theory, which highlights the central role of self-efficacy, perseverance, and motivation in shaping learning outcomes. It also draws upon established technology adoption frameworks such as the Technology Acceptance Model (TAM) and the Unified Theory of Acceptance and Use of Technology (UTAUT), thereby ensuring both psychological depth and technological relevance in examining AI-related constructs. The unit of analysis is the individual student, with responses collected from 200 undergraduate and postgraduate learners across higher education institutions. These respondents were selected to provide sufficient variance in terms of AI usage patterns, digital literacy, and academic performance. A structured questionnaire was employed, incorporating Likert-scale items to measure psychological constructs (AI Dependency, Self-Efficacy, Confidence, Digital Literacy, Resilience, Automation Bias, Motivation, and Perseverance), alongside a quantified Performance Index derived from academic records and self-reported indicators. This design enables the application of robust statistical analyses, including descriptive statistics, reliability tests (Cronbach's alpha), correlation heatmaps, regression models, and mediation–moderation analyses. Such an approach provides nuanced insights into both the direct and indirect effects of AI Dependency on learner performance, while also testing the buffering roles of Digital Literacy and Resilience and the differentiating power of Perseverance. By combining theoretical grounding with advanced analytics, the research design ensures a comprehensive evaluation of how AI-mediated learning environments shape confidence, self-efficacy, and academic outcomes.

Based on these theoretical and empirical insights, the following hypotheses are proposed
H1: AI Dependency negatively influences Self-Efficacy and Confidence.
H2: Self-Efficacy and Confidence positively influence Performance.
H3: Perseverance positively predicts Performance.
H4: Digital Literacy and Resilience moderate the relationship between AI Dependency and Self-Efficacy/Confidence.
H5: Self-Efficacy mediates the relationship between AI Dependency and Performance
To test the proposed hypotheses, a structured multi-stage statistical analysis was designed. The analysis plan integrates both descriptive and inferential techniques, ensuring robustness and alignment with the study's theoretical foundations.

Preliminary Analysis. Descriptive statistics, including mean, median, standard deviation, and quartile values, were first calculated to assess the distribution and central tendency of each construct. Internal consistency was then evaluated using Cronbach's alpha, with all constructs (e.g., Self-Efficacy, Confidence, Digital Literacy, Resilience, Perseverance) expected to demonstrate reliability above the accepted threshold of $\alpha \geq 0.70$. Construct validity was established through exploratory factor analysis (EFA), while confirmatory factor analysis (CFA) was conducted to assess convergent and discriminant validity of the measurement model.

Correlation Analysis To examine initial relationships, Pearson correlation coefficients were computed between constructs. These were visualized using a correlation heatmap, which provided insights into both positive and negative associations (e.g., the expected negative link between AI Dependency and Self-Efficacy, and the positive association between Perseverance and Performance). This step offered preliminary support for hypothesized relationships.

Regression Analysis Multiple regression models were employed to test the direct effects specified in the hypotheses. In Model 1, AI Dependency was regressed on Self-Efficacy and Confidence (H1). In Model 2, Self-Efficacy and Confidence were regressed on Performance (H2). Finally, Model 3 tested Perseverance as a predictor of Performance (H3). These models quantified the extent to which psychological constructs explained variance in Performance, with explanatory power assessed through R^2 values and standardized beta coefficients.

Mediation Analysis To test H5, mediation analysis was conducted using Hayes' PROCESS Macro (Model 4) or bootstrapped estimates within SEM. Specifically, the indirect pathway AI Dependency → Self-Efficacy → Performance was tested using 5,000 bootstrap samples. The presence of a significant indirect effect would confirm mediation, providing evidence that self-belief partially explains how AI Dependency influences academic outcomes.

Moderation Analysis To evaluate H4, moderation tests were conducted using PROCESS Macro (Model 1) or SEM-based interaction modeling. The moderating roles of Digital Literacy and Resilience were examined in the relationship between AI Dependency and Self-Efficacy/Confidence. Interaction plots were generated to illustrate whether higher levels of Digital Literacy and Resilience buffer the negative impact of AI Dependency, thereby enhancing students' confidence and efficacy despite reliance on AI tools.

Structural Equation Modeling (SEM) Finally, an integrated SEM framework was applied to validate the overall model by combining direct, mediating, and moderating effects into a single analysis. Model fit was assessed through indices such as χ^2/df ratio, Root Mean Square Error of Approximation (RMSEA), Comparative Fit Index (CFI), and Tucker–Lewis Index (TLI). A satisfactory model fit would confirm the theoretical plausibility of the proposed relationships and provide strong empirical support for the research framework(Fig 1). The correlation heatmap revealed several significant relationships among the constructs, aligning with the study's theoretical expectations.

Negative correlations AI Dependency demonstrated strong negative associations with several psychological and performance variables. Specifically, higher AI Dependency was associated with lower Self-Efficacy ($r \approx -.45$, $p < .01$), suggesting that students who relied heavily on AI reported weaker belief in their ability to manage academic tasks independently. Similarly, AI Dependency correlated negatively with Confidence ($r \approx -.35$, $p < .01$), supporting the notion of "borrowed confidence," wherein assurance derives more from technological support than intrinsic capability. A significant negative correlation also emerged between AI Dependency and Performance ($r \approx -.30$, $p < .01$), indicating that greater reliance on AI was linked to weaker academic outcomes. Furthermore, AI Dependency negatively correlated with Perseverance ($r \approx -.28$, $p < .05$), suggesting that dependent students were less likely to persist when confronted with challenging tasks.

Positive correlations In contrast, Digital Literacy showed positive associations with both Self-Efficacy and Performance ($r \approx .30–.35$, $p < .01$). This highlights the buffering role of digital competence, wherein students with stronger ICT skills exhibited higher self-belief and stronger academic results. Similarly, Resilience was positively correlated with both Self-Efficacy and Performance ($r \approx .30$, $p < .01$), underscoring the importance of psychological resilience in sustaining persistence and enhancing academic achievement.

Automation bias Finally, Automation Bias displayed a strong positive correlation with AI Dependency ($r \approx .40$, $p < .01$). This indicates that students who tended to uncritically accept AI outputs were also more likely to rely heavily on AI tools in their academic work.

Regression Output Table (Table 1, Fig 2)

Preliminary Analysis

Descriptive statistics indicated that all constructs, except Performance Index, clustered around a mean of 3.0 on a five-point scale, reflecting moderate attitudes across the sample (N = 200). Performance Index averaged 65.22 (SD = 11.22), with a wide range (40–95), suggesting variability in academic outcomes. Reliability analysis confirmed strong

internal consistency, with Cronbach's alpha values exceeding the acceptable threshold of .70 for all multi-item constructs. Construct validity was supported through EFA and CFA, confirming convergent and discriminant validity.

Correlation Analysis

Pearson correlation coefficients revealed meaningful associations between variables. AI Dependency was negatively related to Confidence ($r \approx -.15$, $p < .05$) and showed a weak positive trend with Self-Efficacy ($r \approx .09$, ns). Perseverance demonstrated a positive relationship with Performance, supporting its role as a differentiating factor. The correlation heatmap visually illustrated these patterns, providing initial support for hypothesized links (H1–H3).

Regression Analysis

To further test direct effects, multiple regression models were estimated (see Table: Regression Output).

H1: AI Dependency → Self-Efficacy, Confidence.

Results showed that AI Dependency did not significantly predict Self-Efficacy ($B = .095$, $p = .197$), but it had a negative and significant effect on Confidence ($B = -.150$, $p = .046$). Thus, H1 was partially supported.

H2: Self-Efficacy and Confidence → Performance

Neither Self-Efficacy nor Confidence emerged as significant predictors of Performance in the regression model ($p > .05$). Hence, H2 was not supported in the direct effects stage, suggesting that these constructs may operate indirectly or in interaction with other variables.

H3: Perseverance → Performance

Perseverance demonstrated a positive and significant effect on Performance ($B > 0$, $p < .05$), confirming H3 and underscoring perseverance as a key differentiator of academic outcomes.

Mediation Analysis

To test H5, a mediation model was estimated for the indirect pathway AI Dependency → Self-Efficacy → Performance using bootstrapping with 5,000 samples. Although AI Dependency did not directly predict Self-Efficacy, the indirect effect was nonsignificant, indicating no evidence of mediation through Self-Efficacy. Hence, H5 was not supported in this dataset.

Moderation Analysis

Moderation models were tested to evaluate the buffering effects of Digital Literacy and Resilience (H4). Interaction terms suggested that higher Digital Literacy and Resilience weakened the negative relationship between AI Dependency and Confidence, consistent with the hypothesized moderation effect. Interaction plots confirmed that students with high Digital Literacy and Resilience maintained higher levels of confidence despite increasing AI Dependency. Therefore, H4 was supported.

Structural Equation Modeling (SEM)

The integrated SEM model demonstrated acceptable fit indices ($\chi^2/df < 3$, RMSEA < .08, CFI and TLI > .90), validating the overall framework. Results reinforced the direct effect of Perseverance on Performance and the moderating effects of Digital Literacy and Resilience, while mediation effects via Self-Efficacy remained nonsignificant.

The hypothesis testing outcomes are summarized as follows

H1: Partially supported. AI Dependency exerted a negative effect on Confidence ($B = -.15$, $p < .05$), indicating that reliance on AI reduced academic assurance. However, no significant effect was found on Self-Efficacy, suggesting that belief in one's own capabilities remained unaffected by AI reliance.

H2: Not supported Neither Self-Efficacy nor Confidence significantly predicted Performance in the regression model, implying that these psychological constructs may exert influence indirectly or in combination with other factors.

H3: Supported Perseverance emerged as a significant positive predictor of Performance, confirming its role as a differentiator between high and low achievers.

H4: Supported Moderation analysis revealed that both Digital Literacy and Resilience buffered the negative relationship between AI Dependency and Confidence. Students with higher literacy and resilience maintained stronger self-beliefs despite heavy AI reliance.

H5: Not supported Mediation testing showed no evidence of Self-Efficacy mediating the relationship between AI Dependency and Performance, indicating that AI reliance influenced outcomes more directly rather than indirectly through self-belief.

DISCUSSIONS

The results of this study contribute to the growing discourse on AI in education by examining its complex interplay with student self-beliefs, perseverance, and performance. Consistent with Bandura's Social Cognitive Theory, the findings underscore the importance of perseverance as a differentiating factor in academic achievement. While AI Dependency demonstrated a negative effect on Confidence, its influence on Self-Efficacy was nonsignificant, suggesting that reliance on AI erodes general academic assurance more than belief in one's capability to accomplish specific tasks. This nuance extends prior research that frames over-reliance on AI as potentially detrimental to learner autonomy. The results also provide mixed support for technology adoption frameworks. While AI usage was expected to shape psychological constructs that drive performance, the direct paths from Self-Efficacy and Confidence to Performance were nonsignificant. Instead, the analysis revealed that Digital Literacy and Resilience function as moderators, buffering the negative impact of AI Dependency on Confidence. This finding highlights the contingent nature of technology's effects and points to the enabling role of individual resources in technology-mediated learning.

Practical Implications

The findings hold several implications for higher education stakeholders.

For educators and curriculum designers, the study emphasizes the need to embed digital resilience and literacy training into academic programs. These skills not only equip students to critically engage with AI tools but also safeguard their confidence from over-reliance.

For policymakers, the results point to the necessity of designing AI integration strategies that encourage critical engagement rather than passive acceptance. Guidelines and assessment frameworks can be developed to foster reflective AI use in academic environments.

For students, the findings reaffirm the enduring importance of perseverance and intrinsic motivation. While AI may streamline certain tasks, sustained effort and resilience remain decisive in determining long-term academic performance.

Limitations and Future Research

While the study provides novel insights, several limitations warrant consideration. First, the cross-sectional design limits causal inference; future studies should adopt longitudinal or experimental designs to better establish causality. Second, the reliance on self-reported measures introduces potential common method bias; integrating objective performance indicators or behavioral AI-usage data would strengthen validity. Third, the sample was restricted to students within higher education institutions, limiting generalizability across cultural or professional contexts. Future research should extend the model by exploring cross-cultural comparisons of AI Dependency, as cultural

contexts may shape resilience and digital literacy differently. Additionally, qualitative investigations could provide richer insights into how students negotiate the tension between technological reliance and personal agency. Advanced statistical modeling, such as multigroup SEM or latent growth modeling, could further unpack how the relationships evolve over time.

CONCLUSION

This study examined the relationship between AI Dependency, Self-Efficacy, Confidence, Digital Literacy, Resilience, Perseverance, and Academic Performance among higher education students. The findings revealed that while AI tools provide accessibility and support, excessive reliance reduces confidence and persistence, leading to weaker performance outcomes. Importantly, Perseverance emerged as the strongest predictor of performance, affirming the enduring role of human-driven traits over technological assistance. Moderation effects showed that Digital Literacy and Resilience buffered the negative influence of AI Dependency, enabling students to sustain confidence despite reliance on AI. However, mediation through Self-Efficacy was not supported, indicating that AI Dependency affects performance more directly than indirectly. Overall, the study highlights the dual role of AI: it can empower learners when used critically but risks undermining agency if adopted passively.

RECOMMENDATIONS

Based on the findings, several recommendations can be advanced for educators, policymakers, and students. For educators and institutions, there is a pressing need to integrate AI-critical thinking modules into curricula so that students learn to evaluate AI outputs rather than accept them uncritically. In addition, embedding digital literacy and resilience training will help students balance technological assistance with independent learning. Policymakers should develop guidelines for responsible AI use in education, supporting reflective and ethical engagement, while also encouraging collaborations between academia and EdTech providers to co-create sustainable integration strategies. Finally, students themselves must approach AI as a supportive aid rather than a substitute for effort, cultivating resilience and perseverance as enduring skills that drive academic success. Strengthening digital competence will further enable them to use AI strategically, ensuring that human agency remains central in AI-mediated learning environments.

ABSTRACT

Dusta Vrana (chronic or non-healing wound) is a difficult condition in surgical practice because of repeated infection, delayed healing, and poor response to treatment. Wound healing requires good blood supply, infection control, removal of dead tissue, and proper moisture. However, some wounds remain unhealed for a long time, which can be compared to *Dusta Vrana* in Ayurveda. Ayurveda explains the management of such wounds through *Shodhana* (cleansing) and *Ropana* (healing) therapies that help in purification and tissue repair. A 37-year-old male presented with a chronic wound on the dorsum of the right foot involving the 2nd, 3rd, 4th, and 5th toes, with pain, foul discharge, and unhealthy granulation tissue for two months. Treatment included *Panchavalkala Kwatha Parisheka*, *Jatyadi Taila* application, *Dhoopana* (herbal fumigation) and palliative management. Marked improvement was noted with reduction in pain, discharge, and Odor, along with healthy granulation and complete healing within three weeks. This case shows that Ayurvedic management offers effective, safe, and economical healing in *Dusta Vrana*.

Keywords: *Dusta Vrana*, Wound, *Shodhana, Ropana, Dhoopana*

INTRODUCTION

A wound is defined as a discontinuity or break in the skin or mucous membrane, often associated with necrosis of tissue and slough formation. When such wounds fail to heal over an extended period, they are termed chronic or non-healing wounds. These wounds present a major challenge in surgical and wound care practice due to delayed

healing, repeated infection, and poor response to conventional therapies. The global prevalence of chronic wounds is reported between 1.9% to 13.1%, and in India, the incidence is approximately 4.5 per 1000 population. Common etiological factors include diabetes mellitus, venous insufficiency, atherosclerosis, leprosy, tuberculosis, trauma, and pressure sores. Chronic wounds often lead to long-term morbidity, repeated hospitalization, and reduced quality of life. In Ayurveda, such non-healing and infected wounds are described under the term *Dusta Vrana*. *Acharya Sushruta* defined *Vrana* as discontinuity of the skin and underlying soft tissues, and when it becomes chronic, painful, discolored, foul-smelling, and difficult to heal, it is called *Dusta Vrana*. Improper management, infection, and aggravation of *Tridoshas* (*Vata, Pitta,* and *Kapha*) are the major causes for chronicity. *Acharya Sushruta* elaborated *Shashti Upakrama* (sixty treatment modalities) for wound management, which include *Shodhana* (cleansing) and *Ropana* (healing). These principles aim to purify the wound, control infection, and promote tissue regeneration. Ayurvedic formulations like *Panchavalkala Kwatha*, *Jatyadi Taila*, and *Dhoopana* (herbal fumigation) possess*Shodhana*, *Ropana*, *Krimighna* (antimicrobial), and *Vranashodhana* properties. Their combined application helps in reducing inflammation, controlling infection, and accelerating healing. The present case report demonstrates the successful management of a chronic non-healing wound (*Dusta Vrana*) using Ayurvedic modalities, emphasizing their effectiveness, safety, and cost-efficiency in contemporary wound care practice.

CASE REPORT

A 37-year-old male patient reported to the *Shalya Tantra* outpatient department with a chronic wound over the dorsum of the right foot, affecting the 2nd, 3rd, 4th, and 5th toes. The wound had persisted for nearly two months and was associated with pain, foul discharge, and unhealthy granulation tissue. The patient had a history of minor trauma at the site, which gradually developed into a non-healing wound despite basic local care. There was no history suggestive of diabetes, hypertension, or any systemic illness. On local examination, the wound measured approximately larger 5cm × 3 cm × 0.5 cm and the smaller 3 cm × 2 cm × 0.5 cm with irregular margins, slough deposition, foul odor, and mild tenderness. The surrounding skin was inflamed, and mild edema was noted. Based on the clinical findings, the condition was diagnosed as *Dusta Vrana* (chronic non-healing wound). The treatment aimed at *Shodhana* (cleansing), *Ropana* (healing) and *Shamana and Rasayana*. *Panchavalkala KwathaParisheka* was done twice daily for wound cleansing and infection control, followed by local application of *Jatyadi Taila* to promote granulation and tissue repair. *Dhoopana* (herbal fumigation) using *Nimba, Guggulu*, *Vacha,* and coconut coir was performed once daily to maintain asepsis and support purification. Internally, *Triphala Guggulu*, Gandhaka *Rasayana and Manjisthadi kwatha* were administered to enhance systemic detoxification and wound healing. *Tuttha jala* was used for dressing in the management of *dusta vrana* to promote healing and reduce infection. Within a week, discharge and foul odor reduced significantly; by the second week, pain and inflammation subsided, and healthy granulation tissue appeared. Complete wound healing with proper epithelialization was achieved within three weeks without any adverse effects, demonstrating the effectiveness and safety of the Ayurvedic approach in the management of *Dusta Vrana*.

CLINICAL FINDINGS

A 37-year-old male presented with a chronic wound over the dorsum of the right foot involving the 2nd, 3rd, 4th, and 5th toes. The patient complained of pain, foul discharge, and difficulty in walking for approximately two months. The wound had initially developed following minor trauma and gradually worsened despite routine local dressing.

On physical examination, the patient was conscious, alert, and cooperative, with a fair general condition. He was moderately built and nourished, and no clinical signs of pallor, icterus, cyanosis, clubbing, or lymphadenopathy were noted. Vital parameters were within normal limits: body temperature 98.6°F, pulse rate 82 beats per minute, blood pressure 125/78 mmHg, and respiratory rate 18 breaths per minute, indicating a stable systemic condition without acute illness.

On systemic examination, cardiovascular assessment revealed normal heart sounds without murmurs. The respiratory system showed equal bilateral air entry with no added sounds. The abdomen was soft and non-tender, with no palpable organomegaly. Central nervous system examination indicated the patient was conscious, oriented to time, place, and person, and free from focal neurological deficits.

On local examination, a chronic wound was noted on the dorsum of the right foot involving the 2nd to 5th toes. The larger wound measured approximately 5 × 3 × 0.5 cm, while the smaller one measured 3 × 2 × 0.5 cm. The margins were irregular with undermined edges, and the floor was covered with yellowish slough and necrotic patches. A moderate amount of purulent, foul-smelling discharge was present, accompanied by a distinctly unpleasant Odor. Mild to moderate tenderness was elicited on palpation. The surrounding skin was edematous, inflamed, and hyperpigmented. The granulation tissue appeared unhealthy, pale, and friable, and local temperature was slightly raised. No regional lymphadenopathy was observed.

On pathological examination, laboratory investigations were conducted before initiating Ayurvedic treatment. Haemoglobin was 11.6 g/dl. Total leukocyte count was 6,200/cmm, RBC count 4.1 million/cmm, and platelet count 2.9 lakh/cmm-all within normal limits. Random blood sugar (RBS) was 118 mg/dl, indicating normal glycemic status. Screening tests for HIV, HBsAg, and VDRL were negative, ruling out systemic infection. The Interleukin-6 (IL-6) level was found to be 8.60 pg/ml, reflecting a mild inflammatory response associated with the chronic wound condition. Observation of Wound (Table 1).

Tretment Protocol

In this case, a comprehensive Ayurvedic regimen was adopted to achieve *Shodhana* (cleansing), *Ropana* (healing), and *Rasayana* (rejuvenation) effects in the management of *Dusta Vrana* (chronic wound). The protocol combined internal and external medications to promote effective wound healing and infection control. The patient was administered *Triphala Guggulu* (2 tablets twice daily with lukewarm water), a well-known *Shothahara* (anti-inflammatory) and *Krimighna* (antimicrobial) formulation. It helps in wound cleansing (*Vrana Shodhana*), reduces swelling, and enhances granulation tissue formation by improving local circulation. *Gandhaka Rasayana* (2 tablets twice daily with lukewarm water) was given for its *Rasayana* (rejuvenating) and *Krimighna* properties. It detoxifies the body, enhances immune response, and accelerates wound repair by promoting tissue regeneration. For internal purification, *Manjisthadi Kwatha* (15 ml twice daily with lukewarm water) was prescribed. It acts as a *Raktashodhaka* (blood purifier) and *Varnya* (complexion enhancer), improving microcirculation around the wound site and reducing inflammation. Externally, *Panchavalkala Kwatha* (10 g twice daily for *Parisheka*) was used for *Vrana Shodhana*. The astringent and antimicrobial herbs in this decoction reduce discharge (*Srava*), control local infection, and promote wound contraction. *Jatyadi Taila* (5 ml twice daily for local dressing) was applied externally for its proven *Vrana Ropaka* (wound healing) action. It forms a protective coating over the wound, reduces inflammation, and enhances epithelialization. *Tuttha Jala* (2–5 ml twice daily for wound cleansing) was used as an antiseptic agent. Its copper content exhibits antimicrobial and tissue-regenerative effects, promoting healthy granulation tissue formation. Additionally, *Dhoopana* (fumigation therapy) with *Nimba, Guggulu, Vacha,* and *Coconut Coir* (20 g powder once daily) was employed for its *antimicrobial* and *anti-inflammatory* properties. The medicated smoke aids in wound disinfection, Odor reduction, and accelerates healing by maintaining a sterile wound environment. Collectively, this regimen ensures complete wound management by integrating *Shodhana*, *Ropana*, and *Rasayana* principles of Ayurveda, thereby restoring tissue integrity, preventing infection, and promoting natural wound closure. Treatment plan (Table 2)

Pathya–Apathya (Dietary and Lifestyle Regimen)

A strict *Pathya–Apathya* regimen was followed to enhance wound healing. The patient was advised a light, easily digestible diet including *Mudga Yusha*, *Khichadi*, boiled vegetables, and fresh fruits like pomegranate and apple. Lukewarm water and *Panchakola Siddha Jala* were recommended to improve digestion and eliminate *Ama*. Adequate rest and local hygiene were maintained.

Apthya (to be avoided) included spicy, oily, and fermented foods, alcohol, tobacco, excessive exertion, daytime sleeping, and late-night waking. These restrictions helped maintain *Dosha* balance and supported faster *Vrana Ropana* (wound healing).

DISCUSSION

The management of *Dusta Vrana* (chronic non-healing ulcer) demands control of infection, inflammation, and enhancement of tissue repair. In this case, Ayurvedic interventions were designed on the principles of *Shodhana* (cleansing), *Ropana* (healing), and *Rasayana* (rejuvenation), which correspond to modern goals of wound bed preparation, infection control, and modulation of inflammatory mediators. Before treatment, the Interleukin-6 (IL-6) level was 8.60 pg/ml, indicating an active inflammatory phase. After treatment, IL-6 decreased to 5.28 pg/ml, suggesting effective down-regulation of pro-inflammatory cytokine activity and enhanced wound resolution. IL-6 plays a central role in neutrophil activation, macrophage recruitment, and delayed granulation; therefore, its reduction directly reflects the anti-inflammatory potential of the adopted Ayurvedic protocol. *Panchavalkala Kwatha Parisheka* acts as a potent wound cleanser. The polyphenolic compounds of *Vata, Udumbara, Ashwatha, Plaksha,* and *Parisha* possess strong astringent and antimicrobial properties comparable to tannin-based antiseptics, reducing microbial load and exudation. *Jatyadi Taila* accelerates angiogenesis and epithelialization through the combined actions of *Jatipatra*, *Haridra*, *Karanja,* and *Manjistha*, which show proven anti-microbial and anti-oxidant effects similar to modern wound dressings with herbal bioactives. *Tuttha Jala* (copper sulfate solution) provides trace elements essential for collagen cross-linking and fibroblast proliferation, aligning with modern evidence that copper stimulates vascular endothelial growth factor (VEGF) expression.

Vrana Dhoopana with *Nimba*, *Guggulu*, *Vacha,* and *Coconut Coir* fumigation created a microbicidal atmosphere, comparable to gaseous antisepsis. The volatile phytochemicals and phenolic vapors possess bacteriostatic properties, preventing secondary infection and foul odor. Internally, *Triphala Guggulu* acted as an immunomodulator and detoxifier; its *Guggulsterones* inhibit NF-κB activation, thereby suppressing IL-6 synthesis. *Gandhaka Rasayana* provided systemic rejuvenation and antioxidant defense, while *Manjisthadi Kwatha* supported hepatic clearance and blood purification, improving microcirculation and oxygenation of tissues. The integrated mechanism resulted in faster granulation, reduced exudation, and complete epithelialization within three weeks. The measurable decline in IL-6 confirmed suppression of chronic inflammation at molecular level, correlating with visible wound healing. This illustrates that the Ayurvedic multi-drug regimen works through modern-scientific pathways such as cytokine modulation, angiogenesis promotion, and oxidative stress reduction—establishing an effective bridge between traditional principles and contemporary biomedical understanding. Clinically, remarkable improvement was observed—reduction in discharge, Odor, and tenderness within one week, and complete epithelialization by the third week. The drop in IL-6 levels further supports the anti-inflammatory and immunomodulatory potential of the Ayurvedic regimen. Thus, the combination of local and systemic therapies provided a holistic, safe, and cost-effective solution for chronic wound management.

CONCLUSION

This case demonstrates that Ayurvedic management incorporating *Panchavalkala Kwatha Parisheka*, *Jatyadi Taila*, *Tuttha Jala*, *Dhoopana,* and internal formulations like *Triphala Guggulu*, *Gandhaka Rasayana,* and *Manjisthadi Kwatha* can achieve effective *Shodhana* and *Ropana* in *Dusta Vrana*. Significant clinical improvement and a reduction in IL-6 from 8.60 pg/ml to 5.28 pg/ml confirm the anti-inflammatory and wound-healing efficacy of this approach. Ayurveda's multidimensional wound management—addressing local purification, systemic detoxification, and tissue rejuvenation—proved effective in promoting faster recovery without adverse effects. These findings suggest that Ayurvedic modalities offer a promising complementary strategy for chronic wound care.
