**ABSTRACT**

Diabetic foot ulcer (DFU) resembles with *Dushta Vrana* mentioned in *Ayurveda* which is the most typical complication of diabetes mellitus with a poor prognosis. *Dusta Vrana*, described in Ayurvedic literature as a chronic, non-healing wound, is challenging to manage due to its prolonged healing process and high susceptibility to infection. The difficulty of conventional treatments in effectively addressing such wounds has led to the exploration of traditional Ayurvedic approaches. This study focuses on evaluating the efficacy of Ayurvedic interventions in managing *Dusta Vrana*, with an emphasis on their role in enhancing wound healing and reducing complications. Uncontrolled blood sugar levels lead to both micro and macrovascular modifications. Although other approaches, such as bloodletting, oral medication combined with local application, and wound debridement, have been recommended, managing such non-healing wounds is extremely difficult. Leech therapy, a form of hirudotherapy, has been explored as an adjunct treatment for its potential benefits in enhancing blood circulation and reducing inflammation. Traditional treatments for diabetic foot ulcers aim to promote healing and prevent infection, but the outcomes are sometimes suboptimal. This study investigates the effect of leech therapy on the spontaneous healing of diabetic foot ulcers. A 63-year-old male patient with a diabetic foot ulcer on his left great toe is the subject of this case study. He had type II diabetes and had been receiving insulin injections for 12 years. He began with supplemental Ayurvedic medications to regulate his blood sugar. The wound was treated by Ayurveda using leech therapy and local application of Jatyadi Taila

(four sessions spaced seven days apart). Within a month, this treatment caused the diabetic wound to spontaneously remit.

**Keywords:** *Dushta Vrana*, Diabetic foot ulcer, Wound, *Jatyadi Taila*, Leech Therapy.

## INTRODUCTION

*Dushta Vrana* (Infected wound) as a *Dushchikitsiya* (difficult to manage) entity which resembles with *Prameh Pidika* [1]. Diabetic foot ulcers (DFUs) have been linked to a clinical state in Ayurvedic literature[2]. Prolonged hyperglycemia causes the glucose-filled tissue to undergo various alterations at the cerebral, microvascular, and dermal levels. level. Ischaemia in lower limbs, especially at the foot level, is caused by vascular abnormalities and is difficult to treat in diabetic patients [3]. According to reports, a person with diabetes has a 25% lifetime risk of developing a foot ulcer [4]. Histopathological studies of diabetic ulcers have shown a longer inflammatory phase, which may cause a delay in the creation of healthy granulation tissue [5]. This kind of non-healing ulcer necessitates debridement surgery until the wound heals. The final option for treating a diabetic foot ulcer is amputation. In addition to topical treatment, there are numerous oral Ayurvedic medicines available to manage DFU and diabetes mellitus. Better wound healing is achieved by applying an Ayurvedic dressing on a daily basis. Additionally, these compositions increase circulation, eliminate toxins, maintain blood sugar levels, and promote wound healing [6]. For the management of Madhumehaj Dushta Vrana, Sushruta has placed a strong emphasis on Shodhana and Raktamokshana [7]. In Prameha Pidika (DFU), Raktamokshna (bloodletting) is recommended for painful symptoms, swelling, and suppuration [8]. Leech application is the best parasurgical method for treating women, children, elderly patients, and pregnant patients [9].

## CASE REPORT

A 63-year-old male patient arrived at the hospital complaining of a non-healing wound on the left side of his foot near the larger toe, swelling, pus discharge, and an unpleasant odour. For twenty years, the patient had been diagnosed with diabetes mellitus and was receiving both oral and injectable treatment. Insulin for humans for twelve years. His laboratory tests, with the exception of his random blood sugar (132 mg/dl) and HbA1c (6.7%), were within normal limits when he was admitted for wound care. Proteins, sugar, pus, and epithelial cells were found to be within normal limits in the urine. The Department of Kayachikitsa (Internal Medicine) provided expert advice regarding diabetes, which was then handled appropriately.

**Local treatment**

1. Regular dressingwas done with *JatyadiTaila* (an Ayurveda medicine).
2. 5 sittings of twoleeches were applied Surrounding the wound once a week in 1 month span.

Conservative Treatment (Table No. 1) and (Images 1 to 6).

## RESULT AND DISCUSSION

Ashuddha Vrana or Dushta Vrana (infected/unhealthy wound) is the term used by Acharya Charaka to describe a Vrana (ulcer) that is painful, has an unpleasant odour, discolouration, and abundant purulent discharge and need Shodhana (cleaning) [10]. After wound debridement, local administration of Jatyadi Taila, leech therapy, and Aurvedic adjuvant medications, Dushat Vrana (infected wound) becomes Shudha Vrana (clean wound) [11]. The unpleasant odour and pus discharge gradually subsided as the treatment began. As the treatment was continued, the foot area's swelling also lessened, the wounds became clean, and healing indicators emerged. The lesion's size gradually decreased and its borders turned bluish, indicating the Rohita Vrana (healing wound) stage [12]. the wound's healing process occurs within 20 days of therapy. The patient was recommended to follow Sushruta's

pathya-apathya (diet and lifestyle regimen) [13]. Applying leeches may improve wound healing in two ways: first, by increasing blood flow and removing microthrombi; and second, by sucking out deoxygenated blood to make room for new blood. This causes venous congestion in the surrounding area to be released and increases blood circulation in the wound location. Leeches' suction applies pressure to the wound site, causing it to contract and promoting the growth of new tissue. Leech treatment also helps to regulate the rate of infection and calms the cellular glucose level. The potential of Ayurvedic wound care concepts for diabetic foot ulcers was demonstrated in this case study. In this study, Raktamokshana and local medication administration are used to treat wounds in an efficient and economical manner. Even so, diabetic foot ulcers can be healed without the use of antibiotics if blood sugar is strictly controlled. Increasing access to diabetes education could potentially improve the delivery of preventative care related to diabetes.

## CONCLUSION

The effective management of diabetic foot ulcers through *Jalaukavacharana* and the local application of *Jatyadi Taila* were used in this study. Although strict blood sugar control can promote faster healing of diabetic foot ulcers and prevent further complications. Educating patients about diabetes can serve as a preventive measure. As in modern science amputation is the only treatment available for TAO, gangrenous foot or diabetic foot ulcer. So, by this multidisciplinary management we were able to treat this and we can save patient foot rather than going for amputation.

**NOTE**

**CONFLICT OF INTEREST**

Nil.

**Declaration of patient consent**

Consent was taken from patient and his relatives for the clinical history and images.

## ACKNOWLEDGEMENT

I am thankful to the authorities of the Khemdas Hospital, teaching hospital of PIAR Parul University, Vadodara (Gujarat), India.

## ABSTRACT

Future developments in sustainable farming, rural development, and food security are significantly influenced by agricultural education. Improving the quality and relevance of agriculture education needs an understanding of how students perceive it. This study objective to determine the perceptions of student graduates on agricultural education and its influencing factors. Agriculture is crucial for equipping youth with the skills and knowledge necessary for both urban and rural development in India. Five factors or variables were chosen for investigation: gender, locale, parental occupation, social category, and type of institution (Central and State Universities). A self-developed scale was used to collect perceptions from 202 students at a university in the Lucknow District, and descriptive and quantitative methodologies, as well as the Mann-Whitney U-test, were employed for the research analysis. As per finding findings five factors significantly influenced students' opinions about agricultural education. That is to say, male-female, rural-urban, farming-non-farming, reserved unreserved category, and students of central or state universities carried the same view regarding agricultural education perception and what perspective agricultural education has to offer. This suggests that exposure to diverse demographic groups and equal opportunities are not provided by the current agricultural education system. In agricultural education, NEP-2020 promotes interdisciplinary and hands-on learning. By ensuring that curricula and syllabi are created with field occupations in mind, the National Education Policy, 2020 seeks to prepare students for challenges in the future.

**Keywords:** Agricultural Education, Student Perception, Gender Differences, Skill Development, Inclusive Education.

## INTRODUCTION

Agricultural education is needed to provide people with the abilities and information required to flourish in the rapidly changing agricultural industry and India's financial system.The goal is to combine academic and practical study in fields including crop production, animal husbandry, agricultural economics, and sustainable agriculture to create experts who can innovate and comprehend the intricacies of food systems and environmental ramifications (Kumar and Gupta, 2019; Rao, 2020). The Indian Council of Agricultural Research (ICAR) was established in 1929, which was an important milestone in the formalities of agricultural training in India, beginning with the establishment of model forms in the late 1800s and the establishment of dedicated faculties dedicated to agricultural studies. Since then, the ICAR has organised and promoted agricultural research and education across the country, which has affected research priorities and curricula for agricultural institutions (Somashekar, 1993). India has a comprehensive and diverse agricultural education system, with central agricultural universities, state agricultural universities, regarded universities, and private companies. These institutions are dedicated to pursuing agricultural science through the sharing of innovative research, special instructions, and important information with agricultural communities. To ensure national food security and promote wider rural development, they offer a wide range of educational programs, such as horticulture, veterinary science, agricultural engineering, and food technology (Rao, 2020). Agricultural education in India still confronts several challenges in spite of this progress. Ensuring equitable access to high-quality agricultural education across all regions and socioeconomic categories is crucial, particularly for women and young people residing in rural areas, where agricultural employment plays a significant role(Kumar and Joshi, 2019).

## REVIEW OF THE RELATED LITERATURE

The relevant literature investigates several aspects that impact students' experiences and views of agricultural education. Research emphasises the influence of parental employment, gender, rural-urban background, socioeconomic categories, and institution type on students' views and involvement. According to Olufemi and Adeyemi (2015), the institution has a big effect on the learning experiences of the students. Students enrolled in central universities typically have easier access to state-of-the-art facilities and research activities that expand their horizons. Meanwhile, public institutions often have infrastructural limitations that negatively affect students' perceptions of agricultural education. Kumar and Joshi (2019) found that students' ideas about agricultural education are influenced by the countryside-urban division. Rural students often experience farming, which improves their understanding of agricultural courses. With the right guidance, urban children can be valued even if they lack basic information. Singh and Verma (2020)found that the effect of gender differences on agricultural training is sufficient. According to a study, women's contributions to agriculture are often ignored because of their limited access to institutional support and decision-making processes. This emphasizes the necessity for sexually sensitive agriculture training strategies. Rao *et al*. (2000)Research has indicated that in equality in gender, poor technology transfer, and fragmentation of employment are major problems facing agricultural training in India, which outlines the need for structural changes to meet the needs of rural and societal communities. Ahire *et al*. (2020) examined students' attitudes toward agricultural education and institutional difficulties; the majority of students, particularly female students, had favourable views, but there were a few significant issues, including a lack of professors, a laboratory, and limited industrial risk. The study suggests that to improve the agricultural training quality, more practical experience and better consultation must be provided.

Biswas *et al*. (2019) investigated 27 coaches and 129 students in BHU and discovered high-level support for research culture, international educational alternatives, and participation instructions. Approximately 36% of those surveyed supported the same responsibility for research and teaching. The study suggested the need for courses, career consulting, practical training, and increased contact with other countries. Mavhungu (2023) discovered that outside influences had an impact on South African agriculture students' perceptions of new agricultural initiatives. Data from 421 students showed a favourable correlation between entrepreneurship, aspiration for human capital, and

individual approach. Political aptitude and land access were unrelated. According to studies, individuals should be made aware of their importance. James and Denis (2015) According to the survey, the students' interest in agriculture after graduation was influenced by the families and personal priorities. Although 73% were open to agriculture, they suggested better state support and career advice in universities to help them make their decisions. Fröhlich *et al.*(2013)Depending on their age, German students' views on agriculture differ, and they have very limited understanding of contemporary and organic farming, according to the poll. The majority lacked first-hand knowledge, underscoring the necessity of improved agriculture education in schools. Witt *et al.* (2013) Peer environment, adult support, and learning engagement had a significant impact on students' school connections in agricultural programs and accounted for 45% of the variation. Froehlich (1966) To determine which variables affected the employment options of 823 Iowa State University in agricultural training; Research conducted a study with him. Many learned to teach quickly, according to the findings, but high dropout rates were caused by poor pay, very few opportunities for development, and excessive hours. These questions must be addressed to maintain agricultural training expertise.

**Research Questions**

What factors influence the insights of Agriculture Students towards Agricultural Education (Gender, Locale, Parental Occupation, Social Category and Type of institution (Central and State))?

**Research Objectives**

To identify the factors that influence the insights of Agriculture Students towards Agricultural Education (for example, Gender, Locale, Parental Occupation, Social Category and Type of institutions).

**Research Hypothesis**

**Ho 1:** Gender significantly influences on the insights of Agriculture Students towards Agricultural Education.
**Ho 2:** Locale has significantly influence the insights of agriculture students towards Agricultural Education.
**Ho 3:** Parental Occupation significantly impact the insights of agriculture students towards Agricultural Education.
**Ho 4:** Social Category has significantly influence the insights of agriculture students towards Agricultural Education.
**Ho 5:** The type of institutions significantly impact on the insights of Agriculture Students towards Agricultural Education

## MATERIALS AND METHODS

**Research Method**

The researcher used a quantitative method to explore the insights of agriculture students towards agricultural education.

**Research Design**

In this study descriptive design has been employed. This design helped systematically study the trends and influencing factors, such as gender, locale, parental occupation, social category, and type of institutions.

**Study of the Population**

The study population comprised B.Sc. and M.Sc. Agriculture students from Universities in Lucknow District.

**Sample size**

The present study comprised 202 agriculture students (B.Sc. and M.Sc.) from Universities in Lucknow District.

**Sampling**

Purposive sampling was employed in the present research to obtain agriculture students who were currently enrolled in accredited B.Sc. and M.Sc. agricultural courses. This ensured that the participants had personal experience and relevant knowledge pertaining to agricultural training.

**Process of Data Collection**

The Perception Scale of Agriculture Students towards Agricultural Education (PSASAE) was developed by the researchers to collect data on students' insights and attitudes towards Agricultural Education.

## ANALYSIS AND DISCUSSION

The data collected is interpreted and analysed in detail in this section to determine how certain factors such as gender, location, parental occupation, social category, and institution type affect agricultural students' attitudes toward agricultural education. Because the data was non-parametric, the study used the Mann-Whitney U-test for statistical data analysis. To find out if the factors had any statistically significant influence on students' views, each one was evaluated separately. The initial gender analysis revealed that there was no statistically significant difference in the perceptions of male and female students. The next phase was locale analysis, which revealed that although rural kids had somewhat higher mean rankings, the difference was not statistically significant. In the third study, there were no perceptual differences between children whose parents worked in farming and those who did not. There was no statistically significant difference between the reserved and unreserved groups in the fourth study, which focused on the social category. There were no discernible perceptual differences between students at Central University and State University, according to the fifth analysis.

**Analysis 1**

**Objective-1: To identify the influence of Gender on insights of Agriculture Students towards Agricultural Education.**

**$H_0$ 1:** There is no significant difference in the insights of Agriculture Students towards Agricultural Education with reference to gender.

Ranks (Table 1). Test Statistics (Table 2). Table-3 shows that the Mann-Whitney U-test was used in an investigation to see if gender had an effect on agricultural students' perceptions regarding agricultural coursework. The analysis included 97 female students and 105 male pupils. For male students, the mean score was 102.61, while for female students, it was 100.29. Together with a two-tailed asymptotic significance of 0.778, a Z-score of -0.282 and a Mann-Whitney U-value of 4975.500 were recorded. Therefore, the result is not statistically significant because the p-value is higher than 0.05.

## DISCUSSION

In the current study, we sought to establish the level to which gender influences students' attitudes towards agricultural education. The p-value when using the Mann-Whitney U-test was 0.778, indicating that there was no statistically significant difference between the male and female students. That is, students of both sexes possess the same attitudes towards agricultural education, and gender has no effect on attitudes. This was corroborated by varied regions in earlier studies. According to Ahire *et al.* (2020) revealed that despite some limitation in institutional infrastructure and accessibility, both male and female students both had positive evaluations of agricultural education.

**Analysis 2**

**Objective-2: To identify the influence of locale on insights of Agriculture Students towards Agricultural Education.**

**$H_0$ 2:** There is no significant difference in the insights of Agriculture Students towards Agricultural Education with reference to locale.

Ranks (Table 4). Test Statistics (Table 5). Table-6 shows that the Mann-Whitney U-test was also used to investigate whether location affects agricultural students' concepts of agricultural education. The sample consisted of 86 urban and 116 rural participants. Although urban students' mean rank was lower at 92.44, rural students' mean rank was 108.22. The asymptotic significance (two-tailed) was 0.057, and the calculated Mann-Whitney U-value was 4209.000 with a Z-value of -1.900. The result was not statistically significant due to the fact that the p-value exceeded 0.05. The null hypothesis, which states that there is no discernible difference in the way agricultural students think about place, was thus not disproved. Although rural students appeared to have higher mean ranks, there was no statistically significant difference between their conceptions of agricultural education and those of urban students. As per the finding students from urban and rural areas are likely to have similar concepts of agricultural education.

## DISCUSSION

A p-value of 0.057 ($p > 0.05$) implies that there is no statistically significant variance in agricultural students' perspective by location, according to the Mann-Whitney U-test. Therefore, the perception of agricultural education among rural and urban students is fairly comparable. According to Kumar and Joshi (2019), urban students can also receive valuable insights with adequate institutional support, even though rural students gain knowledge from direct agricultural exposure.

**Analysis 3**

**Objective 3: To identify the influence of Parental Occupation on insights of Agriculture Students towards Agricultural Education.**

**$H_0$ 3:** There is no significant difference in the insights of Agriculture Students towards Agricultural Education with reference to Parental Occupation.

Ranks (Table 7). Test Statistics (Table 8). Table-9 shows that the Mann-Whitney U-test was used to determine how parents' employment affected agricultural students' perceptions of agricultural education. 114 pupils with farming parents and 88 students without farming parents participated in the study. Students from farming homes had a mean rank of 104.07, while students from non-farming households had a mean rank of 98.17. With a two-tailed asymptotic significance value of 0.476 and a Z score of -0.713, the Mann-Whitney U-value was 4723.000. The result was not statistically significant since the p-value was higher than 0.05. It is proven that the null hypothesis, according to which there is no discernible difference in the opinions of agricultural students based on the work level of their parents, may be accepted.

## DISCUSSION

A p-value of 0.476 ($p > 0.05$) was found in the Mann-Whitney U-test findings, suggesting that there is no statistically significant variation in how students see agricultural education depending on their parents' work. According to Singh and Varma (2020), agricultural students, whether belonging to a family of farmers or not, gain approximately the same knowledge and experience through an organised curriculum and the right education.

**Analysis 4**

**Objective 4: To identify the influence of Social Categories on insights of Agriculture Students towards Agricultural Education.**

**$H_0$ 4:** There is no significant difference in the insights of agriculture students towards Agricultural Education with reference to Social Categories.

Ranks (Table 10). Table 11: Test Statistics. Table-15 shows that the Mann-Whitney U-test, which was used to ascertain whether socioeconomic classifications had an impact on how agricultural students perceived agricultural education. study involved 86 and 116 students in the unreserved and reserved categories, respectively. Students in the unreserved category had a mean rank of 100.69, while those in the reserved category had a mean rank of 102.10. The computed two-tailed asymptotic significance value was 0.864, with a Z-score of -0.171 and a Mann-Whitney U-value of 4918.000. This is not statistically significant because the p-value is greater than 0.05. As a result, the null hypothesis which claimed that there was no discernible variation in agricultural students' opinions toward agricultural education according to social category was accepted.

## DISCUSSION

There was no statistically significant difference in the attitudes of agricultural students according to social groupings, according to the Mann-Whitney U-test (p-value = 0.864; $p > 0.05$). These findings suggest that there was a shared viewpoint on agricultural education among the reserved and unreserved groups. According to Kumar and Joshi (2019), institutional resources and inclusive courses are more important in determining agricultural awareness than the socioeconomic categories of students.

**Analysis 5**

**Obcective-5: To identify the influence of Type of Institutions on insights of Agricultural Students towards Agricultural Education.**

**$H_0$ 5:** There is no significant difference in the insights of Agriculture Students towards Agricultural Education with reference to the type of institution.

Table 13: Ranks. Table 14: Test Statistics. Table 15: Type of Institution-wise Mean Ranks, N and Mann-Whitney U-values of Student Agricultural Education. Table-12 shows that the Mann-Whitney U-test was used to measure the effect of the type of institution on agricultural students' perceptions of agricultural education. Of the total sample, 69 students were from central institutions and 133 were from state institutions. The mean rank of students in central institutions was 109.51, while that of students in state institutions was 97.35. The Z-score was calculated as -1.405, and the resultant Mann-Whitney U-value was 4036.000, with a two-tailed asymptotic significance of 0.160. Since the p-value was more than 0.05, the findings were not significant. Therefore, the null hypothesis is not disproved, suggesting that attitudes of agricultural students are not affected by the type of institution.

## DISCUSSION

The Mann-Whitney U-test, the kind of institution had no discernible effect on the viewpoint of agricultural students ($p = 0.160 > 0.05$). The zero hypothesis could not be rejected, though, because of this disparity. This result is consistent with Rao *et al*. (2000), who reported that the structural problems of agricultural education, such as obsolete curricula, little practical exposure, and lack of industrial linkages, affect all kinds of schools equally.

## FINDING

According to the results of the Mann-Whitney U-test, none of these institutional or demographic factors significantly impacted the opinions of the students. The results showed that there were very little gender disparities in the attitudes of male and female students regarding agricultural education. Although rural students had higher mean rankings, there was no difference in attitude between students from rural and urban areas. Similarly, students belonging to farming and non-farming families had the same attitude, reflecting that direct exposure to agriculture through parents' occupation has no influence on students' educational attitudes. The study also reflects those students belonging to reserved and unreserved social categories had nearly the same attitudes towards agricultural education, reflecting the argument that institutional-level reforms and inclusive curricula are compensating for

historical social differentials. Students attending state and central universities did not differ from one another, indicating that despite differences in resources and facilities, both offer essentially the same educational experience.

## CONCLUSION

These results show that students' attitudes toward agriculture education are uniform across all backgrounds. Due to its standardization, the current agricultural education system is unable to be inclusive of a wide range of student requirements or be personalized. The findings show that the curriculum needs to shift from theoretical teaching to incorporating experiential learning, as stipulated in the National Education Policy (NEP) of 2020. Incorporating interdisciplinary, skills-based, and practice modules will make agricultural education more contemporary, dynamic, and responsive to current needs.

## ABSTRACT

*Kukkuladhi Rasanayam* is one of the traditional Siddha herbal formulations indicated for Athisaara Kazhichal (diarrhoea), Kunmam (ulcer), and Suram (fever). Establishing standards for its identity, quality, purity, and potency is essential. Standardization ensures safety and efficacy. This study aims to standardize the formulation according to PLIM guidelines, assessing its qualitative and quantitative parameters, including evaluation of Organoleptic properties, Physicochemical test, HPTLC profiling, Heavy metal analysis, Microbial contamination, Pesticide residue and Aflatoxins. *Kukkuladhi Rasayanam* was prepared in the Gunapadam Laboratory, NIS as per the literature and standardization was done as per PLIM guidelines. The organoleptic, physicochemical, and toxicological parameters were found to be within acceptable limits. HPTLC analysis revealed the presence of significant phytoconstituents, indicating potential pharmacological activity. This study provides a foundational framework for future scientific research and possible regulatory recognition.

**Keywords:** *Kukkuladhi Rasayanam*, Standardization, Rasayanam, Siddha medicine, HPTLC, Herbal formulation.

## INTRODUCTION

The *Siddha* system of medicine is an ancient tradition, believed to have developed contemporaneously with other early civilizations such as those of the submerged lands, Egypt, Mesopotamia, China, and Greece. What makes the *Siddha* system unique is its unbroken practice over more than five thousand years, offering continual contributions to human health by addressing physical, mental, and moral well-being[1]. The term *Siddha* means "ever sure and true," "ever ready," and "everlasting." It reflects the enduring nature and reliability of this system. Siddha medicine is categorized into two main types: internal and external, with 32 forms within each category. One of the internal medicines is *Rasayanam*. *Rasayanam* is a preparation made by mixing powdered raw drugs with sugar and ghee. The mixture is stirred thoroughly until it reaches a semisolid consistency and is then stored[2]. Its shelf life is approximately six months. Establishing standards for its identity, quality, purity, and potency is essential. These standards enhance the safety, compatibility, reliability, and acceptance of *Siddha* medicines. This study focuses on standardizing *Kukkuladhi Rasayanam*, a classical formulation cited in *Sarabendra Vaithiya Rathanavali* (Part 2), to ensure its safety and efficacy. The specific objectives include standardizing the formulation according to PLIM guidelines, assessing its qualitative and quantitative parameters, including evaluation of organoleptic properties, physicochemical test, HPTLC profiling, heavy metal analysis, microbial contamination, Pesticide residue and aflatoxins.

## MATERIALS AND METHODS

**Standardization (By PLIM guidelines)**

Standardization of this drug involves the following categories,

1. Organoleptic characters
2. Physico-chemical properties
3. Toxicological screening

**Organoleptic characters**

The organoleptic properties such as colour and odour were assessed by visual observation.

**Physico-chemical properties**

Physico-chemical properties of this drug were assessed by parameters like pH, Loss on drying at 105°C, Total ash, Acid -insoluble ash, Total solid content, Fat content, Total sugar, Reducing sugar and HPTLC.

**Toxicological Screening**

Toxicological screening of this drug was determined by the analysis like Heavy metal analysis, Microbiological tests, Aflatoxin analysis and Pesticide residues.

**Heavy metal analysis**

The amount of heavy metals like Arsenic, Mercury, Lead and Cadmium in this drug was assessed by the method Inductively coupled plasma mass spectrometry (ICPMS).

**Aflatoxins**

The amount of aflatoxins B1, B2, G1, G2 was assessed by the method High Performance Liquid Chromatography (HPLC).

**Pesticide residue**

The amount of pesticides like Organo phosphorous, Organo chloride and Pyrethroids was assessed by the method Gas Chromatography tandem Mass Spectrometry (GCMSMS).

**Selection of the test drug**

***Kukkuladhi Rasanayam*** is the traditional *Siddha* herbal formulation indicated for *Athisaara Kazhichal* (diarrhoea), *Kunmam* (ulcer), and *Suram* (fever) which is indicated in the *Siddha* literature *Sarabendra Vaithiya Rathanavali* (Part 2).

**Collection of raw drugs**

The raw drug was purchased in a country drugs store in Chennai and authenticated by department of Botany, NIS.

**Ingredients of *Kukkuladhi Rasayanam* (Table: 1)**

**Purification of *Kungiliyam***

*Vepam pattai (Azadirachta indica), Kandangathiri (Solanam Surattense),* and *Seendhil thandu (Tinospora Cordifolia)* were ground well and boiled in water until the water reduced to one-eighth of its original quantity. A cloth was tied over a pot, and *Kungiliyam* was placed on top of the cloth. The pot was covered, and the steam from the boiling decoction was allowed to melt the *Kungiliyam* into a wax-like consistency. After that, it was removed from the heat. The *Kungiliyam* was then washed in the steam-treated water, purified.

**Preparation of *Kukkuladhi Rasayanam***

105 gm (3 palam) of *Kungiliyam* was purified using *Vepam pattai*, *Kandangathiri*, and *Seendhil thandu*. The purified *Kungiliyam*, along with the other raw drugs, was then powdered, sieved, and thoroughly mixed with sugar syrup, ghee, and honey, respectively [3]

## RESULTS

**Organoleptic and Physico chemical parameters (Table: 2)**
**Heavy Metal analysis(Table: 3)**
**Aflatoxins**(Table-4)

## DISCUSSION

*Kukkuladhi Rasanayam* is a traditional *Siddha* herbal formulation indicated for conditions such as *Athisaara Kazhichal* (diarrhoea), *Kunmam* (ulcer), and *Suram* (fever). The drug was standardized according to PLIM (Pharmacopoeial Laboratory for Indian Medicine) guidelines. The formulation has a brown color and a semi-solid consistency. The pH value was found to be 5.59, indicating a slightly acidic nature. When taken orally, the acidic nature of the drug facilitates quick absorption in the stomach. The Loss on Drying (LOD) was recorded at 5.32%, which helps assess the stability and estimating its shelf-life. Total ash content was 0.88%, and the acid-insoluble ash was 0.62%, both of which reflect the purity of the formulation. The fat content was 18.79%, likely due to the inclusion of ghee, which may enhance the stability and bioavailability of the formulation by acting as a carrier. The total sugar content was

9.89%, which may aid in preserving the formulation by inhibiting microbial growth. Notably, no reducing sugars were detected, indicating the absence of unwanted sugars. The HPTLC fingerprinting analysis of *Kukkuladhi Rasayanam* at 254 nm revealed 11 peaks indicating the presence of multiple phytoconstituents. Major peaks were observed at Rf values 0.424, 0.540, 0.826 and 0.921 corresponding tentatively to flavonoids and triterpenoids. The HPTLC fingerprinting analysis of *Kukkuladhi Rasayanam* at 366 nm revealed 11peaks. Major peaks were observed at Rf values 0.439, 0.643, 0.798 and 0.988 with the highest area contribution seen at Rf 0.439(31.29%) and Rf 0.643 (16.22%) suggesting significant quantities of certain phytoconstituents. Tests for heavy metals (arsenic, lead, cadmium, mercury) and pesticide residues (organochlorides, organophosphates, and pyrethroids) showed that their levels were within permissible limits, indicating consumption of the drug is safe and suitable for medicinal use. Microbiological analysis revealed that both the total viable aerobic count and the total fungal count were within acceptable limits as per PLIM standards, further confirming drug quality and safety.

## CONCLUSION

The qualitative and quantitative findings of this study support the identification, standardization, and quality assurance of *Kukkuladhi Rasayanam*. The organoleptic, physicochemical, and toxicological parameters were found to be within acceptable limits, supporting the formulation's integrity and compliance with standard benchmarks. HPTLC analysis revealed the presence of significant phytoconstituents, indicating potential pharmacological activity. This study provides a foundational framework for future scientific research and possible regulatory recognition.

## ABSTRACT

Graph Neural Networks (GNN) capture complex relationships in graph data through node interactions and message passing and are widely applied in knowledge graph construction tasks including representation, extraction, fusion, and reasoning. An Agricultural Knowledge Graph (AKG) is a structured representation of interconnected data, concepts, and relationships within the agricultural domain. AKGs face multiple challenges in development and knowledge service applications including complex data, relationships and structures, as well as insufficient interpretability. GNNs are expected to leverage their advantages in graph structure data modeling to address these challenges. This paper briefly introduces the representation methods and basic concepts of GNNs, and analyzes the main structures, characteristics, and application directions of five typical GNN models. Subsequently, it introduces the technical advantages of GNNs for knowledge representation, entity recognition, relation extraction, and event extraction tasks, providing technical references for AKG construction based on multi-source heterogeneous big data. Additionally, it analyzes cases of GNN applications in knowledge completion fusion, denoising, and abnormal information inference for improving graph quality. Finally, it introduces GNN applications in agricultural scenarios and the development potential for constructing AKGs.

**Keywords:** Agricultural Knowledge Graphs(AKG), Graph Neural Networks(GNN);knowledge representation; knowledge reasoning; Smart agriculture

# INTRODUCTION

The development and utilization of agricultural big data is an important component in guiding agricultural production transformation. Agricultural Knowledge Graphs (AKGs) utilize structured knowledge representation methods to abstract various complex data involved in agricultural production management into entities and relationships between entities, using graph structures to model, identify and establish associative relationships, forming agricultural domain knowledge graphs that provide usable prior knowledge for smart agriculture and precision agriculture. However, constructing high-quality AKGs and making them effective in complex and variable agricultural production environments faces multiple challenges: First, agricultural data sources are extensive and highly heterogeneous. The integration and utilization of massive multi-source heterogeneous data from remote sensing [1], [4], drones, Internet of Things [12], and manual monitoring during agricultural production processes remain technical difficulties. Second, agricultural data often has significant spatio-temporal [1], [3], [5] dynamics, staginess, and uncertainty, making it difficult to accurately extract comprehensive and useful agricultural knowledge from vast amounts of data. Graph Neural Networks GNNs, as powerful deep learning [19], [25] models [13], [17], [18] for graph-structured data, leverage their natural advantages in handling graph-structured data composed of entities and relationships. Particularly, their ability to capture complex dependency relationships through node interactions and message passing mechanisms and learn deep representations of nodes and edges provides new technical approaches for solving the unique challenges in AKG construction and application. GNNs can effectively mine complex relationships between entities and relationships, especially excelling at handling heterogeneous graphs composed of multi-relational and multi-type entities. They can improve the application effectiveness and interpretability of knowledge graphs, with application cases in crop growth prediction, pest and disease [7], [8], [9] diagnosis, agricultural product recommendation [10], [11], knowledge question answering, etc., initially demonstrating their enormous potential in handling complex agricultural problems.

**Overview of Graph Neural Networks**

**Basic Graph Representation**

GNNs were first proposed by Scarselliin 2005, represented as $G = \{V, E\}$where $V = \{v_1, v_2, \dots, v_n\}$represents the set of nodes, and $E = \{e_1, e_2, \dots, e_n\}$represents the set of edges [13]. Graph structures can also be denoted as a five-tuple representation$G$ = {V, E, A, X, D}where $A_{n\,X\,n}$ represents the size of adjacency matrix of the graph, $X_{n\,X\,F}$represents the feature matrix of nodes, $D_{n\,X\,n}$represents the degree matrix, $n$ represents the total number of nodes in the graph $G$, and $F$ represents the feature dimensions for each node. The notation $N(v)$ represents the set of neighbors of a specific node $v$. This is also known as the open neighborhood of node $v$ .GNNs learn representations of nodes and edges in graph structures through node information propagation and feature updates. The main processes include:

**Message Passing:** Nodes receive information from their neighborhoods and aggregate it through certain mechanisms.

**Node Feature Update:** Each node uses aggregated neighborhood information and its own features to achieve updated representation of its features through nonlinear transformations in neural network layers.

**Readout Layer:** After multiple rounds of message passing and feature updates, final node representations can be used for node-level tasks or aggregated into graph-level representations for graph-level tasks.

**Representative GNN Models**

Recurrent Graph Neural Networks (RGNN), Graph Convolutional Networks [14] (GCN), Graph Auto Encoder Networks (GAE), Graph Attention Networks [16] (GAT), and Spatio-Temporal Graph Neural Networks [1], [3], [18] (STGNN) are typical representative models of GNNs.

**Recurrent Graph Neural Networks**

RGNNs applies RNN units to each node of the graph to capture dynamic changes and sequential dependencies of nodes over time. Each node generates and sends its feature vector as a "message" to its immediate neighborsat each time step, iteratively propagating adjacent node information to obtain stable node representations, thereby capturing temporal [1], [3], [5] relationships or dynamic evolution in the graph. In the agricultural field, RGNNs are used for data modeling and learning in dynamic environments, such as monitoring temporal [1], [3], [5] changes of key indicators during crop growth processes, predicting pest and disease [7], [8], [9] transmission paths, and simulating dynamic evolution of farmland environment parameters, providing technical methods for real-time decision-making in smart agriculture.

**Graph Convolutional Networks**

GCNs are neural network models that extend the convolution operations of traditional CNNs to graph-structured data. The core task is to perform weighted summation of node v's own features $X(v)$ and neighborhood features $X(u)$ (where $u \in N(v)$). GCNs extract high-level representations of nodes by construction of multiple graph convolution layers, using graph convolution operations to aggregate information within local neighborhoods of nodes, similar to how CNNs process pixel neighborhoods in images, thereby capturing local structural information and feature dependencies in graphs [20],[27]. Owing to their inheritance of local connectivity and weight-sharing properties from CNNs, GCNs possess fewer model parameters and significantly enhanced computational efficiency, making them appropriate for applications such as link prediction, entity classification, question answering, and knowledge reasoning tasks.

**Graph Auto-Encoder Networks**

GAEs utilize an unsupervised learning framework that encodes graph data into a low-dimensional latent vector space and subsequently reconstructs the original graph through a decoder. In doing so, they learn latent knowledge representations and capture semantic similarities and logical relationships among entities. This unsupervised approach is particularly well-suited for addressing issues of incomplete knowledge and sparse data commonly found in AKGs, enabling the effective learning of robust representations for agricultural entities and their relationships.

**Graph Attention Networks**

Graph Attention Networks (GATs) incorporate self-attention mechanisms that allow each node to dynamically assign different weights to its neighbors, effectively aggregating neighboring features and accurately capturing inter-node dependencies. Unlike traditional models, GATs can learn without depending on global structural information or prior knowledge of the graph, making them highly adaptable to diverse learning tasks. They demonstrate exceptional performance in processing heterogeneous graphs and performing multi-hop reasoning, making them particularly effective for modeling long-range dependencies. In the agricultural domain, GATs have been applied to various scenarios such as pest and disease identification and classification by recognizing crop states, as well as in object detection, tracking, and segmentation tasks [7]– [9].

**Spatio-Temporal Graph Neural Networks**

STGNNs are deep learning models designed to capture both spatial and temporal [1] dependencies. By integrating GCNs, recurrent networks, or CNNs, they effectively model spatial relationships among nodes and dynamic features that change over time, thereby uncovering hidden patterns within spatio-temporal [1], [3], [5] graphs. For dynamic AKGs containing large-scale spatio-temporal data, STGNNs can efficiently represent spatio-temporal dynamics and learn cross-spatiotemporal correlations and evolution trends. This makes them suitable for applications such as predicting time-variant knowledge graph evolution in agriculture.

**GNN model for Agriculture yield prediction**

The Agriculture Graph Neural Network(AGNN) framework offers a comprehensive approach to crop yield prediction [1], [2], [3], [5] by harnessing the powerful representational capabilities of GNNs. We have divided the

methodology in three steps: graph construction, node representation, and edge representation, followed by model validation.

**Graph construction**

To effectively employ GNNs for agricultural prediction, we represent the dataset as a graph
$G = (V, E)$
where $V$ and $E$ represents the nodes and edges sets respectively. Each node resembles to a specific agricultural plot, while edges capture spatial, genotypic, or environmental relationships among these plots.

**Node Representation**

Each node $v_i \in V$ is associated with a feature vector $x_i$, which integrates heterogeneous data sources critical for yield prediction

**Vegetation Indices ($r_i$)**: Derived from remote sensing [1], [4] imagery, vegetation indices encapsulate spectral reflectance information (e.g., near-infrared and red bands) to assess plant vitality. After atmospheric correction and noise reduction, these indices provide valuable insight into crop conditions and are predominantly powerful when implemented with genotypic and soil [6] data.

**Genotypic Data ($g_i$)**: This represents the genetic information of the crop variety grown in the plot. Recent advancements in hyper spectral imaging and machine learning–based pipelines have streamlined genotypic profiling, enabling more accurate insights into plant traits, disease resistance, and yield potential [23].

**Weather Data ($w_i$)**: Meteorological attributes like temperature, humidity, wind speed, precipitation, and solar radiation are collected from weather stations, sensors, and satellite observations. These variables contextualize environmental stresses like droughts or frost risks and, when integrated with genotypic and vegetation indices, enrich predictive yield models.

The final node feature vector is a concatenation of these components
$x_i = [r_i, g_i, w_i]$

**Edge Representation**

Edges play an indispensable role in graph-based neural network architectures, encoding relationships between nodes. Within GNN, the edge set $E$ is designed to capture both spatial proximity and genotypic similarity between agricultural plots.

**Spatial Edges ($E_{spatial}$)**: Given the geographical coordinates $c(v_i)$ of node $v_i$ the pairwise Euclidean distance between nodes $v_i$ and $v_j$ is expressed as
$d(v_{i,}v_j) = ||c(v_i) - c(v_i)||$
For each node $v_i$, edges are constructed to connect it with nodes that fall within the bottom 3% of all pair wise distances, ensuring the graph captures localized environmental dependencies.

**Genotypic Edges ($E_{genotypic}$)**: Genotypic data serve as a repository of inherent crop characteristics and susceptibilities. Let $g(v_i)$ represent the genotypic profile of node $v_i$. An edge is formed between nodes $v_i$ and $v_j$ if their genotypic attributes are identical:

$$e_{ij} = \begin{cases} 1 & if\ g(v_i) = g(v_j) \\ 0 & otherwise \end{cases}$$

The final edge set is obtained by combining the two construction methods
$E = E_{spatial} \bigcup E_{genotypic}$

This dual edge representation enables AGNN to simultaneously model localized environmental influences and inherent genetic similarities, thereby strengthening the predictive capacity of the framework

**AGNN Architecture**

This section describes the AGNN architecture, a crop yield prediction [1], [2], [3], [5] model adapted from Graph SAGE [15]. It introduces the mathematical formulations for each stage: feature transformation, neighborhood aggregation, hidden layer refinements, and final output prediction.

**Initial Feature Transformation**

The first layer projects raw input features into hidden representations. For node $i$ :

$h_i^{(1)} = \sigma(W_{\text{init}} x_{\text{i}} + b_{init})$

$\boldsymbol{x_i}$**:** initial features of node $i$

$\boldsymbol{W_{\text{init}}}$ , $\boldsymbol{b_{\text{init}}}$**:** learnable weight matrix and bias

$\boldsymbol{\sigma}$ **:** activation function (ReLU)

This initializes the feature space for deeper propagation.

**Neighborhood Aggregation**

**Intermediary Layers with Skip Connections**

Each hidden layer aggregates neighborhood information and merges it with the node's previous features to preserve identity.

$m_i^{(l)} = AGGREGATE\left\{ h_j^{(l-1)} \mid j \in N(i) \right\}$

$h_i^{(l)} = \sigma\left( W^{(l)} \cdot CONCAT\left( h_i^{(l-1)}, m_i^{(l)} \right) + b^{(l)} \right)$

- $\boldsymbol{N(i)}$**:** neighbor set of node $i$
- $\boldsymbol{W^{(l)}}$**,**$\boldsymbol{b^{(l)}}$**:** weights and biases for layer l
- $CONCAT$ ensures both self-features and neighbor features are preserved (skip connection).

**Final Layer**

The last GraphSAGE [15] layer omits concatenation with self-features. Instead, it purely relies on neighborhood aggregation:

$m_i^{(4)} = AGGREGATE\left\{ h_j^{(3)} \mid j \in N(i) \right\}$

$h_i^{(4)} = \sigma\left( W^{(4)} \cdot CONCAT\left( h_i^{(3)}, m_i^{(4)} \right) + b^{(4)} \right)$

This produces refined embeddings suitable for prediction.

**Hidden Layer Refinement**

**Regularization and Stabilization**

To enhance training, each hidden layer employs:

**Batch Normalization**: stabilizes convergence

**Dropout (p = 0.5)**: prevents overfitting

$h_i^{(l)} = Dropout\left( h_i^{(l)}, p = 0.5 \right)$

**Model Output**

The A-GNN maps initial features $x_{\text{i}}$ to output predictions $o_{\text{i}}$ for crop yield:

$o_{\text{i}} = AGNN(x_{\text{i}}; G, \theta)$

$\boldsymbol{\theta}$ **:** all learnable parameters (weights and biases across layers)

**Training Objective**

The model optimisation is done using Mean Squared Error (MSE) as the loss function:

$$\mathcal{L} = \frac{1}{|V|}\sum_{i\in V}(o_i - y_i)^2$$

$\boldsymbol{y_i}$**:** actual crop yield

$\boldsymbol{o_i}$**:** predicted yield

The Adam optimizer is used, with careful hyperparameter tuning (e.g., learning rate, dropout rate) for performance.

**Application of Graph Neural Networks in Knowledge Graph Construction**

Knowledge graphs are graph-structured data composed of entities, relationships, and attributes. Utilizing advantages in graph-structured data processing, GNNs play important roles in key aspects of knowledge graph construction [2], [6] such as knowledge representation, entity identification, relation extraction, and event extraction.

**Multi-modal Data Fusion and Knowledge Representation Based on Graph Neural Networks**

AKG construction typically involves complex agricultural data from different modalities, including text, images, videos, remote sensing [1], [4] information, audio, etc. These data have characteristics such as strong heterogeneity, rich spatio-temporal [1], [3], [5] dimensions, multiple noise interferences, and sparse sample annotations. To effectively process and integrate information from several modalities to construct AKGs, multi-modal data fusion(MMF) is one of the crucial technologies. Its core lies in integrating information from different modalities into graph structures to capture cross modal associations and complementary information, helping to more comprehensively understand complex agricultural phenomena. Common fusion strategies include feature-level fusion, relationship-level fusion, and Transformer-based cross-modal fusion. After fusion, multi-modal data or converted graph structures require knowledge representation learning, aimed at learning low-dimensional, dense, semantically rich vector representations of entities and relationships.

Compared with logic-based, ontology-based, and vector-based knowledge representation methods, GNNs have the following advantages when processing AKG data with complex relationships, heterogeneity, and potential dynamic changes:

**Expressing Complex Relationships**: GNNs can deeply understand and reason about associative relationships, adapting to the sparsity of graph data.

**Expressing Dynamic and Heterogeneous Data:** When processing heterogeneous data, GNNs can distinguish and model different types of nodes and edges, integrating information from different relationships.

**Strong Adaptability:** GNNs can quickly adapt to changes in graph structure through updating graph convolutions and message passing.

**Graph Neural Networks and Entity Recognition**

Entity recognition refers to information extraction technology that obtains entity data such as person names and place names from data. In agricultural scenarios, unstructured and multi-modal data are widespread, and GNNs can effectively handle unstructured and dynamically changing entity recognition, making them important technologies for agricultural knowledge extraction. GNNs have the following advantages in entity recognition:

**Enhancing Entity Recognition Disambiguation:** GNNs can capture multi-hop relationships in knowledge graphs and infer potential semantic information by analyzing multi-hop paths between entities, especially excelling at handling complex ambiguity problems.

**Multi-modal Data Entity Recognition Capability:** For multi-modal named entity recognition methods that fail to fully utilize fine-grained semantic correspondences between modalities, various studies have proposed GNN-based unified multi-modal graph fusion methods.

**Graph Neural Networks and Relation Extraction**

Relation extraction aims to determine interactions and associations between identified entities. Agricultural field relation extraction is more complex, such as relationships between crops and pests/diseases, relationships between agricultural technologies and yields, and relationships between different planting techniques. Researchers have explored GNN applications in the following tasks:

**Complex Dependency and Long-distance Relationship Modeling Depending on Graph Structure:** GNNs can naturally represent entities and relationships in graphs as nodes and edges respectively. This provide better modeling complex dependencies between entities, especially long-distance dependencies.

**Multi-modal Relation Extraction:** GNNs can fuse multi-modal information, improving relation extraction performance in complex scenarios.

**Graph Neural Networks and Event Extraction**

Event extraction is a key subtask of information extraction, aiming to identify instances of specific event types in data. The agricultural sector requires the extraction of key events—such as pest and disease [7], [8], [9] outbreaks and the adoption of new technologies—to support production management and market [10], [11] analysis. In this context, GNNs demonstrate the following potential capabilities:

**Complex Relationship Modeling and Element Extraction:** Several studies have introduced GNN-based approaches that incorporate domain knowledge and model causal relationships to improve the precision of causal event extraction.

**Context Capture:** Multi-modal information fusion has emerged as a key direction in image understanding, where GNN-based methods are available for integrating multiple sources of information, achieving outstanding classification accuracy and strong generalization capabilities.

**Multi-modal Event Information Fusion:** Many novel GNN bases approaches have been proposed to enhance performance in low resource settings from traditional event extraction methods.

**Application of Graph Neural Networks in Knowledge Graph Quality Improvement** Building high-quality knowledge graphs is essential for their effective use in downstream applications. In the agricultural domain, this process faces significant challenges, including data sparsity, missing information, multi-source heterogeneous data fusion, and inconsistent data quality. These challenges arise largely from the fragmented nature of agricultural knowledge, the complexity of domain-specific terminology, and the diversity of cross-modal data sources. GNN-based approaches for enhancing knowledge graph quality primarily focus on two aspects: knowledge graph completion (such as entity and relation prediction) and knowledge graph cleaning (including denoising, error detection, and anomaly inference).

**Graph Neural Networks and Entity Prediction**

Entity prediction is one of the crucial tasks of knowledge graph completion, aimed at inferring and filling missing entities in knowledge graphs. In AKGs, due to information incompleteness or extraction difficulties, some agricultural concepts may have corresponding entities missing from the graph, reducing the graph's practicality. Complex, non-linear relationship patterns typically exist between entities, such as multi-hop relationships and dependencies between relationships, posing huge challenges to traditional rule-based or embedding-based entity

prediction methods. Various studies have proposed methods that utilize GNNs' powerful graph structure understanding, feature learning, and multi-source information fusion capabilities.

**Graph Neural Networks and Relation Prediction**

Relation prediction is a key link in improving knowledge graph completeness and connectivity. In AKGs, relationship types between entities are extremely diverse and complex, and due to scattered data sources or professional knowledge barriers, many important connections fails to be explicitly annotated. GNNs effectively acquire and model these complex non-linear relationships through iterative message passing and feature aggregation on graph structures. Various studies have proposed methods that utilize GNNs for relation prediction in knowledge graphs.

**Graph Neural Networks Applied to Knowledge Graph Anomaly Detection**

Knowledge graph quality is the foundation of its reliability and usability. During knowledge graph construction [2], [6] and evolution processes, introducing noise, errors, or abnormal information is an inevitable challenge. Due to domain background knowledge or implicit relationship influences, noise identification and removal have considerable difficulty. Various studies have proposed GNN-based methods for detecting and handling noise, errors, and anomalies in knowledge graphs.

**Applications and Development Potential of Graph Neural Networks in Agriculture**

**GNN-based Agricultural Knowledge Graph Recommendation Systems**

With the continuous improvement of AKG structures, GNN-based intelligent recommendation systems show significant potential in agricultural information services. Particularly in agricultural Q and A communities, traditional text similarity-based matching methods[26],[28] often struggle to accurately understand the real semantics and actual needs behind user questions. GNN-based heterogeneous information networks can effectively process complex agricultural networks, modeling farmers, questions, answers, experts, etc. as nodes and relationships as edges, thereby capturing deep semantic associations and providing more accurate recommendations [10], [11]. Traditional recommendation [10], [11] methods such as single-relationship prediction or homogeneous network design have significant limitations. Various studies have proposed dual-attention heterogeneous graph neural networks to handle multiple node categories and relationships, more precisely modeling complex associations between users and crops, pests/diseases, etc.

**GNN-based Agricultural Pest/Disease and Task Object Recognition Visual Applications**

In agricultural computer vision tasks, GNNs can effectively achieve multi-modal fusion of images and semantic knowledge. Various studies have proposed hybrid vision graph neural networks for identifying threats to crop yield and quality from various pests. Traditional pixel-level attention mechanisms based on Euclidean space lack topological structure consideration and struggle to introduce sufficient contextual information, limiting remote sensing [1], [4] object discrimination accuracy. Various studies have proposed graph structure attention networks based on geographical scene knowledge.

**Potential of GNN in Temporal Agricultural Knowledge Modeling**

Temporal knowledge graphs can capture the dynamic characteristics of knowledge evolution over time and are suitable for complex, dynamic agricultural scenarios. They are capable of not only recording static agricultural knowledge but also monitoring dynamic aspects such as crop growth cycles, pest and disease progression, fluctuations in market demand, and other critical factors, thereby providing a more precise reflection of real agricultural conditions. Several studies have introduced temporal knowledge graph frameworks[1],[3],[5] and GNN-based approaches for tasks like supply chain recommendation [10],[11], entity alignment, and knowledge graph reasoning demonstrating strong potential for agricultural applications.

## CONCLUSION AND FUTURE DIRECTIONS

This paper reviews and synthesizes the current state of GNN technology, including its applications and research progress in AKG construction. Leveraging their strengths in processing complex structures, dynamic time-series data, and multi-modal information, GNNs offer robust technical support for agricultural knowledge organization, reasoning, and service delivery, advancing agricultural production toward greater precision and intelligence. Nevertheless, although notable progress has been achieved in applying GNNs to AKG construction, the field remains in active development. Translating theoretical advancements in GNNs into practical, complex agricultural scenarios still presents substantial scientific and technical challenges. Future research should concentrate on the following key directions:

**Multi-source Heterogeneous Agricultural Data Fusion and Knowledge Graph Construction**: Agricultural data inherently exhibits multi-source heterogeneity, integrating diverse information generated during crop growth, complex environmental conditions, geographic and spatial attributes, and vast amounts of unstructured textual and multimedia content.

**Dynamic Evolution and Complex Reasoning Capability Improvement of Knowledge Graphs**: Agricultural production functions as a dynamic system influenced by natural seasonal variations, climate fluctuations, pest and disease outbreaks, market changes [10],[11], technological advancements, and other factors. The body of agricultural knowledge is likewise in a state of continual evolution.

**Integration Applications of GNNs with Reinforcement Learning, Large Models and Other Advanced AI Technologies:** With advancements in artificial intelligence, the integration of GNNs with reinforcement learning and large-scale pre-trained language models is becoming an increasingly prominent trend. Research on GNN-based AKG construction is entering a phase of rapid growth, yet it also faces challenges in multi-source heterogeneous data fusion, dynamic evolution, complex reasoning, and cross-technology integration. The ongoing pursuit of more efficient, scalable, accurate, and interpretable GNNs, along with synergistic approaches that leverage emerging AI technologies and address specific agricultural needs and scenarios, will remain a central focus of future research.

**ABSTRACT**

The Indian Knowledge System (IKS) offers a comprehensive framework for comprehending life, health, and well-being. Ayurveda is a unique branch of medicine that is based on basic ideas like Panchamahabhuta (Five Elements), Tridosha (three humors), Rasa (taste), Guna (qualities), and Prakriti (constitution). This paper investigates the application of the mathematical concept of Binary Supra Generalized $\wp$ – Closed Sets to formalize the correlation between Ayurvedic theories (Set X) and their practical implementations (Set Y). This method gives a structured way to understand, analyze, and digitize Ayurvedic principles for use in modern research.

**Keywords:** Panchamahabhuta, Tridosha, Rasa, Guna, Prakriti, Chikitsa, Ahara, Dinacharya and Ritucharya, Yoga and Meditation, Rasayana, Binary topological space, Binary generalized $\wp$ –closed set.

## INTRODUCTION AND PRELIMINARIES

Ayurveda, which is one of the oldest health care systems in the world, stresses the importance of balance between the body, mind, and environment. It is based on ideas like Panchamahabhuta, Tridosha, Rasa, Guna, and Prakriti, which together make up a complete system for diagnosis, prevention, and treatment. Mathematical models like Binary Supra Topology can be used to connect old knowledge with new science. This work show Ayurveda as a system of interconnected knowledge (theory) and application (practice), which makes its structure and usefulness official.

Ayurveda's goal is to learn about healthy and unhealthy lifespans, as well as peaceful and disturbed ones [2]. Having its roots in India over 3,000 years ago, Ayurveda is among the oldest holistic healing systems in the world. The Sanskrit words Ayur (life) and Veda (knowledge or science) are the roots of the word Ayurveda, which means "the science of life." Ayurveda, which has its roots in ancient Indian philosophy, stresses that the basis for health and well-being is a balance between the body, mind, spirit, and environment. Ayurveda aims to find and treat the underlying causes of imbalance, in contrast to modern medicine, which frequently concentrates on treating symptoms. Its main idea is that the three basic biological energies, or doshas—Pitta (fire and water), Kapha (earth and water), and Vata (air and space)—must be in balance for there to be health. The predominance of these doshas is thought to shape each person's distinct constitution (prakriti), which dictates their emotional, mental, and physical inclinations [5]. Herbal medicine, diet control, yoga, meditation, massage, detoxification methods (Panchakarma), and lifestyle advice are just a few of the many therapies that are part of Ayurvedic practices. Ayurveda stresses seasonal practices (ritucharya) and daily routines (dinacharya) to maintain balance throughout life, and preventive care is regarded as equally important as curative approaches. Ayurveda is still used today in India and around the world, and it is becoming more and more accepted as an alternative and complementary medical system. Its continued relevance in the modern era can be attributed to its incorporation of holistic lifestyle advice, individualized health care, and natural remedies.[7]. Ayurveda's goal is to learn about healthy and unhealthy lifespans, as well as peaceful and disturbed ones. A state of physical well-being and psycho-spiritual contentment is known as swasthya (health). The mind, soul, and body make up the mutually interacting triad that is the human organism. Binary Topological Spaces, a generalization of classical topological structures to binary relations, were introduced by S. NithyananthaJothi and P. Thangavelu in 2011[6]. The same authors broadened this framework and advanced the theoretical area of binary topology in 2014 by defining and studying generalized binary closed sets. The generalize of binary topological space was introduced by Jamal M. Mustafa 2017 [1]. Later A Binary Supra Topology from X to Y is a binary structure $B_\mu \subseteq P(X) \times P(Y)$ that satisfies the following axioms. (i) If $(X,Y) \in B_\mu$ and $(\emptyset,\emptyset) \in B\mu$. (ii) If $\{(A_\alpha,B_\alpha) : \alpha \in \Delta\}$ is a family of members of Bμ, then $(\cup A_\alpha,\cup B_\alpha) \in B\mu$. If $B_\mu$ is a binary supra topology from X to Y then the triplet $(X,Y, B_\mu)$ is called binary supra topological space [6].

## METHODOLOGY

**Binary supra generalized $\wp$ −closed set**

Let (K,L) be a subset of a binary supra topological space $(X,Y,\mathcal{M}_\mu)$ is called a Binary supra generalized $\wp$ −closed set [briefly $\mathcal{B}_\mu\mathcal{G}\wp -$ closed] if $b_\mu scl(K,L) \subseteq (M,N)$ whenever $(K,L) \subseteq (M,N)$ *and* $(M,N)$ *is binary supra* $\propto$ open.

**Binary Supra generalized $\wp$ −closed set [$\mathcal{B}_\mu\mathcal{G}\wp -$ closed]**

**Set X (Theories):** Panchamahabhuta, Tridosha, Rasa, Guna, and Prakriti

**Set Y (Applications):** Chikitsa, Ahara, Dinacharya and Ritucharya, Yoga and Meditation, Rasayana. The connections between these groups show valid mappings of knowledge to application. For instance, the Tridosha theory guides both therapeutic interventions (Chikitsa) and everyday life (Dinacharya). This modeling provides us a systematic way to understand Ayurveda using logical mappings and computational structures.

**Findings and Analysis: Mapping Binary Supra generalized $\wp$ −closed set**

The operationalization of Ayurvedic principles in clinical practice, lifestyle design, and preventive health is demonstrated by the binary relationships between Sets X (Theoretical Foundations) and Y (Practical Applications). Every mapping illustrates how philosophy is dynamically translated into therapy under the guidance of the fundamental theory, dosha balance, and individual constitution.

**Panchamahabhuta → Rasayana (rejuvenation therapy guided by elements)**

The foundation of the human body and the surrounding environment is made up of the five great elements: earth, water, fire, air, and ether. Rasayana therapies depend on element-specific interventions to promote longevity, vitality, and rejuvenation. Invoking Agni (fire) enhances metabolic transformation, while therapies rich in Prithvi

(earth) and Jala (water) elements support tissue nourishment and stability. This mapping uses $\mathcal{B}_\mu\mathcal{G}\wp -$ closed to show how elemental theory is applied in the therapeutic selection of Rasayana to restore systemic balance.

**Example:** Let X = {Earth, Water, Fire}, Y= {Hydration therapy, Nourishing Rasayana},$\mathcal{M}_\mu = \{(X,Y),(\varphi,\varphi)$, ({Earth}, {Nourishing}), ({Water}, {Hydration}), ({Earth},{rejuvenation})}. The subset (K,L) = {({Earth}, {Nourishing}), ({Water}, {Hydration})}. Condition must satisfy Preserved in $\alpha$-open sets like general rejuvenation therapies. (M,.N) = {({Earth}, {Nourishing}), ({Fire}, {Hydration}), ({Earth},{rejuvenation})}. $b_\mu$scl(K,L) = ({Earth}, {Nourishing}), ({Water}, {Hydration})}. The principles of Earth and Water (stability, nourishment) are faithfully preserved in Rasayana therapies, ensuring vitality and longevity.

**Tridosha → Chikitsa**

Ayurveda uses the Tridosha theory (Vata, Pitta, Kapha) as its diagnostic framework. In actuality, Chikitsa (therapies) are created in accordance with doshic imbalances for example unctuous, warming therapies are used to treat Vata disorders, cooling, soothing approaches are used to treat Pitta disorders, and stimulating, drying measures are used to treat Kapha disorders. This dichotomy illustrates how theoretical categorization (doshas) serves as the guide for customized care.

**Example:** Let X={Vata, Pitta}, Y= {oil massage, cooling herbs, detox}, $\mathcal{M}_\mu = \{(X,Y),(\varphi,\varphi)$, ({pita}, {stress reduction}), ({vata}, {cooling therapy}), ({pita}, {anti-inflammatory})},$b_\mu$scl(K,L)={({Pitta},{Anti−inflammatory}), ({pitta},{Cooling therapy})}, (M,N) = {({pitta},{stress reduction}), ({Pitta}, {Anti−inflammatory}), ({pitta},{Cooling therapy})}. Condition satisfied that always contained in $\alpha$-open sets representing broader Chikitsa regimens. Therapies directed at balancing Pitta Dosha remain consistent and intact within broader therapeutic systems continues mapping of $\mathcal{B}_\mu\mathcal{G}\wp$ closed

**Tridosha → Ritucharya and Dinacharya**

Ayurveda uses the Tridosha theory (Vata, Pitta, Kapha) as its diagnostic framework. In actuality, Chikitsa (therapies) are created in accordance with doshic imbalances; for example, unctuous, warming therapies are used to treat Vata disorders, cooling, soothing approaches are used to treat Pitta disorders, and stimulating, drying measures are used to treat Kapha disorders. This dichotomy illustrates how theoretical categorization (doshas) serves as the guide for customized care.

**Rasa → Ahara (dietary guidelines based on taste)**

The six tastes—sweet, sour, salty, pungent, bitter, and astringent—that make up Ayurveda represent the pharmacological characteristics of both food and medication. Their relationship to Ahara (diet) is straightforward: in order to balance doshas, diet planning takes into account particular Rasas. For instance, sweet flavors balance Vata, while bitter and astringent flavors soothe Pitta and Kapha. Here, $\mathcal{B}_\mu\mathcal{G}\wp$ modeling shows that dietary recommendations are organized uses of taste theory.

**Example:** Let X = {Madura, Amla, Lavana, Katu, Tikta, Kashaya}, Y = {Diet/ nutrition plan guided by taste}, $\mathcal{M}_\mu = \{(X,Y),(\varphi,\varphi)$, ({Madura},{Rice}), ({Madura}, {Ghee}), ({Madura},{Milk})}, $b_\mu$scl(K,L) = {({Madura},{Tissue-building}), ({Madura}, {Immunity-support})}, (M,N)={ ({Madura},{rice}), ({Lavana}, {Ghee}), ({Madura},{electrolyte balance}), ({Lavana},{Milk})}. It satisfied the condition preserved in larger binary supra $\alpha$-open diet frameworks and also nutritional benefits of rasa remain valid even within extended dietary plans, ensuring therapeutic stability.

**Guna → Ritucharya and Dinacharya (qualities impact seasonal routines)**

Ayurvedic reasoning is based on gunas, or qualities like hot/cold, heavy/light, and oily/dry. Gunas is used to map daily (Dinacharya) and seasonal (Ritucharya) regimens. For instance, warm and light regimens are advised during the winter (when cold, heavy gunaspredominate), while cooling techniques are stressed during the summer (when

hot gunas predominate). This mapping demonstrates that the Ayurvedic lifestyle recommendations are based on the binary relationship between environment and qualities rather than being arbitrary.

**Example:** Let X = { Hot, Cold, Oily, Dry, Heavy, Light}, Y = { Daily and Seasonal Regiment}, $\mathcal{M}_\mu = \{(X,Y),(\varphi,\varphi),$ ({ushna},{buttermilk}), ({Heavy}, {moon light walk}), ({ushna},{hydration})}, then the subset (K,L) = {({ushna},{buttermilk}), ({ushna}, {Moonlight walk})} $b_\mu$scl(K,L) ={({ushna},{buttermilk}), ({ushna}, {Hydration}), ({ushna}, {rest})} for a binary supra $\alpha$-open set (M, N) = {({ushna}, {hydration}), ({ushna},{buttermilk}), ({Dry}, {moisturing oil})}. It must be preserved with in $\alpha$-open seasonal adaptations. Remedies for *hot guna* remain consistent within seasonal guidelines like *Ritucharya*, ensuring preventive care.

**Prakriti → Ahara (nutrition tailored to the individual)**

Prakriti (constitution of an individual) is the most comprehensive node in BST, as it connects to all domains of practice. Its relation to Yoga and Meditation is especially significant: Vata-predominant individuals benefit from grounding asanas and calming meditation; Pitta types require cooling practices and mindfulness; Kapha types are prescribed stimulating postures and energizing breath work. This mapping illustrates Ayurveda's anticipatory approach, where constitution guides preventive and spiritual practices, aligning body and mind. Prakriti, or personalized preventive practices, includes yoga and meditation. Ayurveda is fundamentally systemic, with theory and practice entwined, as this mapping illustrates. These relationships can be mathematically modeled through the use of Binary Supra Generalised $\wp$ Topology, which opens the door to digitization and systematic integration into contemporary medical research. $\mathcal{B}_\mu\mathcal{G}\wp-$ closed Mapping: Ayurveda (Theory and Practice)(Fig 1).

## CONCLUSION

Ayurveda represents a comprehensive view of health and illness. This work explores the interdisciplinary framework where mathematical abstractions provide new insights into Ayurvedic principles and their structural relationships. Structured analytical model method serves as a link between conventional wisdom and modern computational techniques. Such modelling increases the future AI-driven personalized healthcare, global acceptance and integration into contemporary health frameworks.

## ABSTRACT

This review details an extensive experimental examination of the machining properties of graphite material carried out using solid carbide end mills covered with TiAlN and TiSiNo. Abrasive graphite causes quick tool wear and poor surface quality; hence, high-tech tool coatings are required to improve performance. Milling a graphite workpiece repeatedly with well calibrated cutting parameters (depth of cut, feed rate, and cutting speed) was the methodological backbone of the study. Important measures such flank wear (VB), surface roughness (Ra) of the machined workpiece, and cutting forces were used to assess the two coatings' performance. In terms of surface finish integrity and flank wear, the TiSiNo-coated end mill performed better than the TiAlN-coated tool, according to the results. The nanocomposite structure of the TiSiNo coating efficiently minimises abrasion and adhesion, and its increased hardness and enhanced oxidation resistance and improved lubricity are the reasons for this improvement. In industrial applications like mold-making for EDM electrodes, the results show that TiSiNo coating is the best option for machining graphite. This might lead to longer tool life, more efficient machining, and lower production costs.

**Keywords:** Graphite Machining, Tool Wear, Surface Roughness, Multiple Coating, End Milling.

# INTRODUCTION

Although graphite is essential for electro-deposition (EDM) electrodes and batteries, its abrasiveness leads to quick tool wear. As a means of increasing productivity while decreasing expenses, this research compares the effectiveness of TiAlN-coated solid carbide end mills with those of TiSiNo in quality graphite machining with regard to blade life and surface quality.

**Machining and Its Significance graphite**

Graphite, in its synthetic or produced form, is an engineered material that plays a crucial role in several high-tech sectors. A high strength-to-weight ratio, strong chemical inertia, high electrical and thermal conductivity, and high thermal stability are only a few of its remarkable characteristics that make it important in many demanding applications. For this reason, precise machining of graphite parts is an essential part of the production process. One of the most common uses is making electrodes for EDM (Electrical Discharge Machining). In the sinker EDM process, a graphite electrode, machined to the inverse of the desired cavity shape, is used to erode a conductive workpiece through a series of electrical sparks. Graphite is the preferred material over copper for many applications due to its superior machinability (enabling complex geometries and sharp corners), lower wear rate during EDM, and ability to withstand high discharge currents [1].

**Challenges in the Machining of Graphite**

Despite being termed "machinable," graphite presents significant and unique challenges that differentiate its processing from metals and other materials.

**Abrasive Tool Wear:** This is the primary challenge. Graphite is an intensely abrasive material. Its microstructure consists of hard graphite crystallites that act as microscopic grinding particles. During machining, these particles cause rapid dulling of the cutting tool's sharp edge through a mechanism of micro-chipping and mechanical abrasion, leading to accelerated flank wear. This wear drastically shortens tool life, increases production costs due to frequent tool changes and regrinding, and compromises dimensional accuracy.

**Graphite Dust:** The machining process does not produce chips but generates a fine, powdery dust. This dust is electrically conductive and highly abrasive, posing a triple threat: it is a contaminant to machine tools and other workpiece materials; it is a health hazard if inhaled by operators; and it can cause electrical short circuits in CNC equipment. Effective dust extraction systems are not optional but a mandatory requirement for graphite machining, adding to the complexity of the process.

**Surface Integrity and Edge Quality:** Achieving a fine surface finish free of micro-chipping and breakouts is difficult. The brittle nature of graphite means that cutting forces can cause localized fracture at the workpiece edges (exit breaks) and surface, rather than a clean shear. Tool wear exacerbates this issue, as a dull tool increases cutting forces and propagates cracks. For EDM [2] electrodes, a poor surface finish on the electrode can transfer directly to the machined part, affecting its quality.

**The Role of Solid Carbide End Mills in Precision Machining**

The choice of cutting tool is paramount to overcoming these challenges. While high-speed steel (HSS) lacks the necessary wear resistance, solid carbide end mills have become the industry standard for precision graphite machining. Carbide tools are composed of tungsten carbide particles cemented together in a cobalt binder matrix. This composite structure provides a exceptional combination of properties:

**High Hardness and Wear Resistance:** Significantly harder than HSS, carbide provides much greater resistance to the abrasive wear caused by graphite.

**High Stiffness (Modulus of Elasticity):** Carbide is approximately three times stiffer than steel. This rigidity minimizes tool deflection during cutting, which is crucial for maintaining dimensional accuracy, achieving tight tolerances, and preventing tool breakage on deep, narrow features.

**Retention of Hardness at Elevated Temperatures:** Although graphite machining is not a high-temperature process like metal cutting, carbide's hot hardness ensures consistent performance.
The geometry of an end mill (radial and axial rake angles, helix angle, number of flutes) is also optimized for graphite. Typically, tools have a positive rake angle for free cutting and a low number of flutes (2 or 3) to provide ample chip (dust) evacuation space, preventing recutting and poor surface finish.

**Scope and Objective of the Study**

While solid carbide provides a good base, its performance can be dramatically enhanced through the application of advanced hard coatings. These thin-film ceramic coatings act as a barrier, reducing friction and protecting the substrate from abrasion. Among the plethora of available coatings, Titanium Aluminum Nitride (TiAlN) has been a longstanding industry workhorse for various machining applications. A more recent advancement, Titanium Silicon Nitroxide (TiSiNo), with its nanocomposite structure, promises even greater performance.

The primary objective of this study is to conduct a comparative experimental investigation to evaluate the machining characteristics of graphite using solid carbide end mills coated with TiAlN and TiSiNo. The scope of the work includes

1. Machining graphite workpieces under controlled cutting parameters (cutting speed, feed rate, depth of cut).
2. Measuring and comparing flank wear (VB) on the tools using toolmaker's microscopy to quantify tool life.
3. Measuring the surface roughness (Ra) of the machined graphite to assess the quality of the finish.
4. Analyzing the results to determine the effectiveness of each coating in mitigating the challenges of graphite machining and to provide a clear recommendation for industrial application.

This research aims to deliver empirical evidence that can guide manufacturers in selecting the optimal tool coating to enhance productivity, improve part quality, and reduce total machining costs.

**Graphite Material Properties and Machining Challenges**

Graphite is a critical material in numerous high-performance industries, including aerospace, metallurgy, and energy, due to its unique set of physical and mechanical properties. However, these very properties that make it desirable also present significant challenges during machining, requiring specialized techniques and tools to achieve high-quality, precise components.

**Physical and Mechanical Properties of Graphite**

Graphite is an allotrope of carbon characterized by a layered, planar structure. Within each layer, carbon atoms are arranged in a hexagonal lattice with strong covalent bonds, while the layers themselves are held together by weak van der Waals forces. This anisotropic structure dictates its key properties:

- Graphite's sublimation point is around 3,600°C, making it very refractory and resistant to high temperatures. As a solid, it sublimes straight into a gas at very high temperatures in an inert environment; it does not melt. Due of its excellent strength-to-temperature ratio, it finds widespread use in furnace fittings and rocket nozzles, among other high-temperature uses.
- It has a high thermal conductivity, which means it can quickly lose heat. Applications such as heat sinks and electrodes for electronic discharge machining (EDM) rely heavily on this quality.
- **Brittleness and Low Fracture Toughness:** This is the most significant property from a machining perspective. The same weak interlayer bonds that allow self-lubrication make graphite inherently brittle and prone to fracture under tensile or impact loading. It has high compressive strength but very low tensile and flexural strength.
- **Porosity:** Manufactured graphite grades are polycrystalline and are produced by mixing coke pitch with a binder, then baking and graphitizing at high temperatures. This process creates a material with inherent microporosity [3]. The level of porosity varies with the grade, affecting its density, strength, and machinability.

**Machining Challenges**

The combination of brittleness, abrasiveness, and porosity makes machining graphite a non-trivial task, leading to several specific issues

**Edge Chipping and Breakout:** The low fracture toughness is the primary cause of edge chipping. As the cutting tool engages and exits the workpiece, the forces exerted can easily exceed the material's tensile strength, causing small fragments (micro-chips) to break away from the edges and corners. This is particularly problematic when machining thin ribs, fine features, or sharp corners, often leading to part rejection. Managing cutting forces through sharp tools and optimal parameters is critical to minimizing this defect.

**Abrasive Tool Wear:** Despite its lubricity, graphite is highly abrasive. The carbon particles act as a grinding compound on the cutting tool's edges. This abrasion leads to rapid flank wear and rounding of the cutting edge. A dull tool increases cutting forces, which in turn exacerbates chipping and generates more heat. Consequently, tools must be made from extremely hard, wear-resistant materials like polycrystalline diamond (PCD) or diamond-like carbon (DLC) coatings to ensure economic tool life and consistent quality.

**Graphite Dust Evacuation:** The machining process does not produce continuous chips but rather a fine, abrasive powder. This dust poses multiple problems:

**Health Hazard:** Inhalation of fine graphite particles can be harmful to operators, requiring effective dust extraction and collection systems.

**Machine Contamination:** Dust can infiltrate machine guide ways, ball screws, and spindle bearings, causing accelerated wear and potential failure.

**Surface Quality [4]:** If not effectively evacuated from the cutting zone, dust can be re-cut (recut) by the tool, leading to poor surface finish and increased tool wear.

**Dimensional Accuracy and Surface Integrity:** Achieving tight tolerances and a good surface finish is challenging. The material's porosity can cause "pitting" on the machined surface. Furthermore, inconsistent tool wear or vibration can lead to deviations from the intended dimensions. The brittle fracture mechanism of material removal often leaves a surface with micro-cracks and voids, which can affect the part's performance in applications requiring a perfect seal or high electrical conductivity.

**Overview of Past Research on Graphite Machining**

Research into graphite machining has primarily focused on optimizing the process to overcome the challenges of tool wear and edge quality.

**Tool Material and Geometry:** Numerous studies have conclusively established that polycrystalline diamond (PCD) [5] tools are superior to cemented carbides or ceramics for machining graphite. PCD offers the necessary hardness and abrasion resistance to achieve significantly longer tool life and better surface finish. Research has also investigated the optimal tool geometry, including rake angle, clearance angle, and edge preparation (e.g., honing a slight T-land for edge strength), to reduce cutting forces and prevent chipping.

**Machining Parameters:** Extensive work has been done to model and optimize cutting parameters—cutting speed (Vc), feed per tooth (fz), and depth of cut (ap). Findings generally indicate that higher cutting speeds can improve surface finish but must be balanced against dust extraction efficiency. A critical finding is the importance of maintaining a high enough **feed rate** to ensure the tool engages the material in a shearing action rather than rubbing, which causes excessive heat and rapid tool wear.

**Dust Extraction and Coolant:** Research has explored both dry machining with high-pressure vacuum systems and wet machining using specialized coolants. While coolants can suppress dust, they create a messy slurry that is

difficult to handle and can clog the porosity of the graphite, which is undesirable for many applications. Therefore, dry machining with integrated vacuum systems is often the preferred and most widely studied method.

**Non-Conventional Machining**: Although less popular for general subtractive manufacturing than precision milling and grinding, studies have also looked at techniques like ultrasonic machining and laser machining for producing tiny features in graphite.

In conclusion, producing parts that satisfy the exacting quality standards of cutting-edge industrial applications requires a comprehensive approach to graphite machining that takes into account the interaction between material characteristics, tool technology, machining settings, and dust control.

**Graphite Machining using Solid Carbide End Mills**

An important factor in successfully machining abrasive materials like graphite is the choice of cutting tool. Solid carbide end mills have become the most popular and economical option for a variety of precision graphite machining applications, despite the fact that there are other tool materials available. This section explores the qualities that make carbide tools appropriate, contrasts them with other materials, talks about how important tool geometry is, and recognises their inherent drawbacks. Graphite Material Properties vs Machining Challenges (Figure 1).

**Characteristics of Solid Carbide Tools**

Solid carbide end mills are not pure carbide but are composite materials consisting of tungsten carbide (WC) particles—noted for their extreme hardness—bound together by a metallic cobalt (Co) binder. The proportion and grain size of these constituents can be varied to tailor the tool's properties for specific applications.

**High Hardness and Wear Resistance:** The primary advantage of carbide is its exceptional hardness, typically ranging between 88 to 93 HRA (Rockwell Hardness A scale). This far exceeds the hardness of high-speed steel (HSS) and provides formidable resistance to the abrasive wear inflicted by the graphite's crystalline structure. The hard WC grains act as the first line of defence, resisting the microscale grinding action that rapidly dulls softer tools.

**High Stiffness (Modulus of Elasticity):** With a modulus of elasticity approximately three times that of steel (600-700 GPa for carbide vs. 200 GPa for steel), carbide tools are extremely rigid. This high stiffness is crucial for precision machining. It minimizes tool deflection under cutting forces, enabling the machining of deep, narrow slots and intricate geometries while maintaining tight tolerances and preventing tool breakage due to bending stresses.

**Transverse Rupture Strength (Toughness):** While carbide is brittle compared to HSS, modern micro-grain and sub-micro-grain carbide grades have significantly improved toughness. A finer grain structure allows for a more uniform distribution of the cobalt binder, which helps to arrest micro-cracks. This enhanced transverse rupture strength provides sufficient toughness to withstand the intermittent cuts and vibrations encountered in graphite milling without catastrophic failure.

**Advantages Over HSS and PCD Tools**

Solid carbide occupies an optimal middle ground between the two other primary tooling options.

**vs. High-Speed Steel (HSS) [6]:** HSS tools lack the necessary hardness and wear resistance for machining graphite effectively. They would experience rapid flank wear and edge degradation, leading to unacceptable tool life and poor surface finish. While cheaper per tool, their short lifespan makes them economically unviable for any substantial graphite machining work. Carbide's superior performance renders HSS obsolete for this application.

**vs. Polycrystalline Diamond (PCD) Tools:** PCD tools, which feature a layer of synthetic diamond particles sintered onto a carbide substrate, represent the pinnacle of performance in graphite machining. Diamond is the hardest known material and offers unparalleled wear resistance. However, PCD tools have significant drawbacks:

**Extremely High Cost:** PCD tools can be 10 to 20 times more expensive than coated carbide tools.

**Brittleness:** They are more prone to chipping from impact or improper handling.

**Geometric Limitations:** They are difficult to manufacture into complex geometries with sharp corners and are typically limited to standard end mill shapes.

Carbide tools, especially when coated, offer an exceptional balance of performance and cost-effectiveness. They provide wear resistance far superior to HSS at a fraction of the cost of PCD, making them the industry standard for most graphite machining operations.

**Tool Geometry Considerations for Graphite Machining**

The geometry of a carbide end mill is as crucial as its material composition. Geometry is optimized for free cutting and efficient dust evacuation.

**Helix Angle:** A low helix angle (typically 10° to 20°) is preferred for graphite. A low angle creates a more shearing action, which helps to break up the graphite and generate dust rather than larger, problematic chips. It also produces a stronger cutting edge than a high helix angle, reducing the risk of edge chipping.

**Rake Angle:** A positive radial rake angle is standard. This geometry is aggressive and sharp, reducing cutting forces and preventing the tool from "pushing" the workpiece, which can cause edge breakouts in the brittle graphite. A sharp, positive rake shears the material cleanly.

**Clearance Angle:** A sufficient clearance angle (secondary and tertiary) is vital to prevent the tool's flank from rubbing against the machined surface. Rubbing generates excessive heat, accelerates flank wear, and increases the risk of micro-chipping on the workpiece edge.

**Number of Flutes:** Two-flute and three-flute designs are most common. A low flute count maximizes the gullet volume—the space between the flutes. This large volume is critical for allowing the graphite dust to be effectively evacuated by the dust extraction system. More flutes would reduce this space, leading to dust recutting, increased heat, poor surface finish, and potential tool breakage.

**Limitations of Carbide Tools When Machining Abrasive Graphite**

Despite being the best overall compromise, solid carbide is not a perfect solution and has inherent limitations when facing graphite's abrasiveness.

**Inherent Wear:** Even with its high hardness, carbide is still susceptible to gradual abrasive wear. The cobalt binder is relatively soft and can be worn away by the graphite, allowing the unsupported WC grains to be plucked out. This leads to progressive flank wear and edge rounding.

**Chemical Degradation:** At elevated temperatures, which can occur in areas of poor dust evacuation, the cobalt binder can react with oxygen or the graphite itself, leading to a form of chemical wear that weakens the tool structure.

**Economic Constraint for High-Volume Production:** In high-volume, continuous production environments (e.g., machining thousands of EDM electrodes), even coated carbide tools may require frequent changes. While more cost-effective than PCD for most jobs, the cumulative cost of multiple carbide tools and machine downtime for changes can make PCD the more economical choice in these specific high-wear scenarios.

These limitations are the primary reason for the development and application of advanced tool coatings. A high-performance coating like TiAlN or TiSiNo[7] acts as a sacrificial barrier, shielding the underlying carbide substrate from both abrasion and chemical degradation, thereby extending tool life and pushing the performance envelope of solid carbide tools.

**Tool Coatings in High-Performance Machining**

In the demanding realm of high-performance machining, where tools are subjected to extreme thermal and mechanical loads, the substrate material alone is insufficient. Tool coatings have become an indispensable technology, acting as a critical barrier that significantly enhances tool life, allows for higher cutting speeds, and improves the quality of the machined part. For challenging materials like graphite and advanced alloys, the selection of an appropriate coating is often the decisive factor between economic viability and catastrophic tool failure.

**Importance of Tool Coatings: Heat Resistance and Wear Reduction**

The primary function of a tool coating is to create a functional interface between the cutting tool and the workpiece, mitigating the primary mechanisms of tool failure:

**Thermal Protection and Heat Resistance:** During cutting, a significant amount of energy is converted into heat, leading to temperatures that can exceed 1000°C at the tooltip. Coatings with high hot hardness and low thermal conductivity act as a thermal barrier. This protects the underlying, tougher tool substrate (e.g., carbide) from softening, plastic deformation, and diffusive wear. By insulating the tool, coatings allow for machining at higher speeds and feeds, drastically improving productivity.

**Wear Reduction:** Coatings combat the two main forms of wear:

**Abrasive Wear:** Hard coatings, often with hardness values exceeding those of the workpiece material, provide a resistant surface that minimizes material loss caused by abrasive particles in the workpiece (e.g., carbon fibers, hard inclusions in cast iron).

**Adhesive and Diffusive Wear:** At high temperatures, workpiece material can weld onto the tool's cutting edge (adhesion/built-up edge) or atoms from the tool can diffuse into the chip. Inert, stable coatings with low chemical affinity to the workpiece material prevent this adhesion and act as a diffusion barrier, drastically reducing crater wear on the tool's rake face.

**Surface Lubricity:** Certain coatings can reduce the coefficient of friction between the chip and the tool. This lowers cutting forces, power consumption, and heat generation. It also promotes better chip flow, preventing chip welding and improving surface finish on the machined part.

**Deposition Techniques: PVD, CVD, and HiPIMS**

The properties of a coating are intrinsically linked to the method used to deposit it onto the tool substrate. The three predominant techniques are:

**Chemical Vapor Deposition (CVD):** This process involves introducing gaseous precursors into a high-temperature chamber (800°–1100°C), where they react and decompose to form a coating on the heated tool substrate. CVD produces thick (5–20 μm), highly adherent coatings with excellent conformal coverage, making it ideal for complex geometries like inserts with chip breakers. Common CVD coatings include TiCN, $Al_2O_3$, and thick multi-layer composites. However, the high process temperature can potentially embrittle the carbide substrate and necessitates a post-coasting grinding process.

**Physical Vapor Deposition (PVD):** PVD processes occur at much lower temperatures (200°–500°C) in a vacuum chamber. Material is vaporized from a solid source (e.g., by arc evaporation or sputtering) and then condenses on the cooler tool substrate. PVD coatings are typically thinner (2–5 μm) and smoother than CVD coatings, resulting in a sharper cutting edge—a critical advantage for finishing operations and machining abrasive materials like graphite where edge sharpness is key to reducing cutting forces and preventing chipping. The lower temperature avoids any degradation of the substrate's mechanical properties. TiN, TiAlN, TiCN, and CrN are classic PVD coatings.

**High-Power Impulse Magnetron Sputtering (HiPIMS) [8]:** HiPIMS is an advanced, highly ionized PVD technique. It uses short pulses of extremely high power to the sputtering target, creating a dense plasma with a high degree of ionization. This allows for unparalleled control over the coating's growth, resulting in extremely dense, smooth, and

well-adhered films with a fine microstructure. HiPIMS coatings often exhibit superior toughness, lower friction, and enhanced performance over standard PVD coatings, albeit at a higher cost. They represent the cutting edge of coating technology for the most demanding applications.

**General Comparison of AlTiN, TiAlN, and TiSiNo Coatings**

The composition and architecture of the coating dictate its performance. Among the most prevalent and high-performing PVD coatings are:

**Tool Coating Types and Benefits (Figure 2).**

**TiAlN (Titanium Aluminum Nitride) / AlTiN (Aluminum Titanium Nitride):** The ratio of Aluminum to Titanium is crucial. As the Al content increases past ~50%, the coating's behavior changes dramatically.

**TiSiNo (Titanium Silicon Nitroxide):** This is a nanocomposite coating where nanocrystals of TiN are surrounded by an amorphous matrix of silicon nitride ($Si_3N_4$). This structure drastically increases the coating's hardness, often exceeding 40 GPa, and its resistance to abrasive wear. It is exceptionally effective for machining highly abrasive materials, including high-silicon aluminum alloys, fiber-reinforced composites, and graphite. Its very high hardness directly counters the abrasive nature of graphite particles, making it a premier choice for this application, though it can be slightly more brittle than AlTiN(Table: 1).

**Performance Influence on Tool Life, Cutting Forces, and Surface Finish**

The implementation of these advanced coatings has a direct and measurable impact on machining outcomes:

**Tool Life:** The most significant benefit is a dramatic increase in tool life. By protecting against abrasion, adhesion, and thermal softening, coatings can extend tool life by 200% to 1000% or more compared to uncoated tools. This reduces machine downtime for tool changes and lowers overall tooling costs.

**Cutting Forces:** Smoother, low-friction coatings (often achieved with HiPIMS or specific dopants like carbon) reduce the coefficient of friction at the tool-chip interface. This directly translates to lower cutting forces and torque, reducing the power required for machining and minimizing the risk of tool deflection and breakage, especially in delicate operations like milling thin-walled graphite electrodes.

**Surface Finish:** A sharp, well-coated edge that minimizes built-up edge (BUE) and promotes clean shearing of the material directly results in a superior surface finish on the workpiece. For graphite machining, this is critical for producing EDM electrodes with fine surface details that will be accurately transferred to the machined part.

To sum up, the strategic use of sophisticated tool coatings is not only an improvement but also a necessary condition for accurate and efficient high-performance machining. The particular workpiece material and machining process must be taken into account when choosing a coating system, whether it be an ultra-hard TiSiNo for abrasive graphite or a durable AlTiN for high-heat situations.

**Coating with Titanium Aluminium Nitride (TiAlN)**

Titanium Aluminium Nitride (TiAlN) is a fundamental component of contemporary physical vapour deposition (PVD) [9,10] tool coatings and has shown to be a high-performance and adaptable solution for a wide variety of machining applications. Because of its better thermal properties, it was developed at a considerable advance over conventional TiN coatings. With an emphasis on their behaviour in graphite machining, this section explores the composition, characteristics, and unique performance of TiAlN coatings.

**Microstructure and Chemical Composition**

Instead of being a single compound, TiAlN is a metastable single-phase cubic (B1-NaCl structure) solid solution in which the titanium atoms in the TiN lattice are replaced by aluminium atoms. Typically, between 30% and 50% of the metal component (typically represented as $Ti_{1-x}Al_xN$) is aluminium in industrial coatings. The microstructure is critical to its performance. During the PVD process, the energetic deposition conditions create a fine-grained, dense, and columnar microstructure. This structure contributes to high hardness and good fracture toughness. As the Al

content increases towards the solubility limit (~x = 0.67), the coating's properties improve, but exceeding this limit can lead to the formation of a soft, hexagonal w-AlN phase, which is detrimental to mechanical performance. Advanced deposition techniques precisely control the composition and energy to maintain the desired metastable cubic phase and a smooth, dense morphology. Coating Selection to Machining Output (Figure 3).

**Mechanical Properties: Hardness, Oxidation Resistance, and Thermal Stability**

The exceptional performance of TiAlN stems from a combination of key mechanical and thermal properties

**Hardness and Toughness:** TiAlN coatings exhibit high hardness, typically in the range of 28-35 GPa (Vickers), which is significantly higher than TiN (~23 GPa). This hardness provides excellent resistance to abrasive wear, a primary wear mechanism in machining composites and graphite. Furthermore, the coating's microstructure provides reasonable toughness, allowing it to withstand the intermittent cutting forces encountered in milling operations without catastrophic chipping or spallation.

**Oxidation Resistance and Thermal Stability:** This is the most defining characteristic of TiAlN. When exposed to high temperatures during machining (typically above 800°C), the aluminum in the coating preferentially diffuses to the surface and oxidizes, forming a very thin, dense, and continuous protective layer of aluminum oxide ($Al_2O_3$).

This alumina layer acts as an exceptional diffusion barrier:

1. It prevents oxygen from penetrating the coating and oxidizing the underlying tool substrate.
2. It reduces the transfer of heat into the tool substrate.
3. It lowers the chemical affinity between the tool and the workpiece, minimizing adhesive wear and crater formation. This process allows TiAlN to perform effectively in dry, high-speed machining applications where heat generation is extreme. Its thermal stability is rated for continuous operation up to approximately 800-850°C.

**Behavior in High-Speed Machining of Graphite**

The machining of graphite presents a unique set of challenges where TiAlN demonstrates specific advantages and limitations:

**Advantages**

**Thermal Barrier:** Although graphite machining generates less heat than metals, high-speed operations can still lead to significant thermal loading at the tooltip. The TiAlN coating's thermal barrier effect protects the carbide substrate from thermal shock and softening, maintaining the integrity of the sharp cutting edge.

**Reduced Adhesion:** The stable $Al_2O_3$ [11] layer that forms reduces the potential for any micro-welding or adhesion of graphite particles to the tool's rake and flank faces. This helps maintain a sharp geometry and consistent cutting performance.

**General Wear Resistance:** The high hardness provides good resistance against the abrasive nature of the graphite particles, though it is not the hardest coating available.

**Limitations and Considerations**

**Abrasion vs. Ultimate Hardness:** While hard, TiAlN is outperformed in pure abrasion resistance by ultra-hard nanocomposite coatings like Titanium Silicon Nitroxide (TiSiNo). For highly abrasive graphite grades or operations prioritizing maximum tool life above all else, TiSiNo is often the preferred choice.

**Coating Friction:** The coefficient of friction of TiAlN is lower than uncoated carbide but can be higher than coatings doped with solid lubricants like carbon (e.g., TiAlCN). Higher friction can contribute to increased cutting forces. Therefore, TiAlN is an excellent, well-rounded choice for high-speed graphite machining, particularly for complex operations like milling 3D contours and ribs where a balance of wear resistance, thermal protection, and edge toughness is required. It represents a robust upgrade from uncoated or TiN-coated tools but may be superseded by more specialized coatings for pure, aggressive roughing of the most abrasive graphite grades.

**Literature Review of TiAlN-Coated Carbide Tool Performance**

Numerous studies have quantified the performance benefits of TiAlN coatings in machining various materials, with conclusions that can be extrapolated to graphite machining.

**General Performance Studies:** A foundational study by Prengel *et al*. (1998) demonstrated that $(Ti_{1-x}Al_x)N$ coatings with high Al content (x ~ 0.5-0.6) exhibited superior performance in machining hardened steels due to their enhanced oxidation resistance. They recorded tool life improvements of 300-400% compared to TiN-coated tools at high cutting speeds.

**Studies Involving Graphite and Composites:** Research specifically on graphite machining often compares TiAlN to other coatings. A study by Deng *et al*. (2019) on milling carbon fiber-reinforced polymers (CFRP), a similarly abrasive material, found that TiAlN-coated end mills showed a 200% increase in tool life over uncoated tools. The study attributed this to the coating's resistance to abrasive wear. However, it also noted that TiAlN coatings were susceptible to micro-chipping at the cutting edge under aggressive parameters.

**Comparison with Other Coatings:** Research by Chen *et al*. (2021) on machining ISO-63 graphite for EDM electrodes directly compared TiAlN, AlTiN (higher Al content), and diamond-like carbon (DLC) coatings. The study found that while AlTiN offered slightly better thermal performance, the TiAlN coating provided the best all-around economic efficiency and performance stability, particularly in finish milling operations where edge sharpness was critical. It concluded that TiAlN[12] represents an optimal balance of performance and cost for many graphite machining applications. In summary, the literature consistently affirms that TiAlN coatings provide a substantial performance enhancement for carbide tools, offering a reliable combination of hardness, thermal stability, and oxidation resistance that is highly effective for the high-speed machining of graphite.

**Titanium Silicon Nitroxide (TiSiNo) Coating**

Representing a significant evolution beyond conventional hard coatings, Titanium Silicon Nitroxide (TiSiNo) is a premier nanocomposite coating engineered for the most demanding machining applications. Its development was driven by the need for exceptional hardness and oxidation resistance beyond the capabilities of TiAlN. TiSiNo is particularly suited for machining highly abrasive materials, making it a subject of intense interest for graphite machining operations where tool wear is the primary limiting factor.

**Unique Nanocomposite Structure and Strengthening Mechanism**

The extraordinary properties of TiSiNo are not derived from a simple solid solution but from its unique *nanocomposite* microstructure. This structure is achieved by incorporating silicon (Si) into a standard TiN matrix during the PVD deposition process.

The resulting coating consists of

**Nanocrystalline Phase:** Minute crystals of titanium nitride (TiN) [13], typically just 3-10 nanometers in size.

**Amorphous Phase:** These TiN nanocrystals are surrounded by a thin, continuous matrix of amorphous silicon nitride ($Si_3N_4$), which is only one or two atomic layers thick.This synergistic effect results in a coating that is not only exceptionally hard but also retains good fracture toughness.

**Advantages: Superior Hardness and Oxidation Resistance**

The nanocomposite structure bestows TiSiNo with properties that often surpass those of TiAlN

**Extreme Hardness:** TiSiNo is one of the hardest PVD coatings available commercially, with hardness values routinely measured between 35 GPa and over 50 GPa (Vickers). This is a 25-50% increase over standard TiAlN coatings. This extreme hardness provides unparalleled resistance to abrasive wear, making it ideal for materials that act like sandpaper on a tool's cutting edge.

**Enhanced Oxidation Resistance:** While TiAlN relies on the formation of an $Al_2O_3$ layer, TiSiNo's oxidation resistance is even more robust. During high-temperature exposure, the silicon in the coating diffuses to the surface and oxidizes to form a dense, glassy, and continuous layer of silicon dioxide ($SiO_2$). This silica layer is an even more effective diffusion barrier than alumina, stabilizing the coating and preventing further oxygen ingress at temperatures up to 1000-1100°C. This superior oxidation resistance further slows the rate of wear degradation at high cutting speeds.

**Reduced Friction:** Some studies indicate that the smooth, glassy $SiO_2$ layer that forms can also help in reducing the coefficient of friction compared to other hard coatings, leading to slightly lower cutting forces and improved chip evacuation.

**Wear Mechanisms in Graphite Machining**

When applied to graphite machining, TiSiNo's properties directly counter the primary wear mechanisms:

**Dominant Wear Mode: Abrasion:** The primary wear mechanism in graphite machining is abrasive wear caused by the hard carbon particles plowing and micro-cutting the tool's cutting edge. TiSiNo's extreme hardness directly resists this abrasion, resulting in significantly slower flank wear (VB) progression. The sharp cutting edge is maintained for a longer period, which is critical for achieving fine surface details and holding tight tolerances.

**Maintained Cutting Edge Integrity:** The combination of high hardness and good toughness minimizes micro-chipping along the cutting edge. A TiAlN coating might eventually develop minor chips under aggressive cycling, but the nanocomposite structure of TiSiNo is better at absorbing energy and preventing this type of failure, preserving the edge geometry.

**Performance at High Speeds:** The exceptional thermal stability allows TiSiNo-coated tools to exploit the full potential of high-speed machining (HSM) [14] strategies for graphite. The tool can withstand the increased thermal loads without rapid performance degradation, enabling faster cycle times and higher productivity.

**Literature Review of TiSiNo-Coated Carbide Tool Performance**

Academic and industrial research consistently highlights the superior performance of TiSiNo in abrasive machining environments. Experimental Setup for Graphite Machining (Figure 4).

**Foundational Studies on Hardness and Structure:** Veprek *et al*. (2000) were pioneers in documenting the "super-hardness" (≥40 GPa) of nc-TiN/a-$Si_3N_4$ nanocomposites. Their work established the relationship between the nanoscale microstructure and the mechanical properties, providing the theoretical foundation for the coating's development.

**Direct Comparison in Graphite Machining:** A seminal study by Lin *et al*. (2018) directly compared uncoated, TiAlN-coated, and TiSiNo-coated micro-end mills in the high-speed milling of fine-grained graphite for mold electrodes. The results were striking: the TiSiNo-coated tools exhibited over 500% longer tool life than the TiAlN-coated tools. The study used scanning electron microscopy (SEM) to show that TiSiNo tools maintained a sharp edge with uniform flank wear, while the TiAlN tools showed more pronounced edge rounding and micro-chipping. The authors concluded that TiSiNo's nanocomposite structure provided the necessary combination of hardness and toughness to resist graphite's abrasive nature best.

**Comparative Analysis: TiAlN vs TiSiNo in Graphite Machining**

The selection of an optimal tool coating is a critical economic and technical decision in graphite machining. While both Titanium Aluminum Nitride (TiAlN) and Titanium Silicon Nitroxide (TiSiNo) are superior to uncoated tools, they exhibit distinct performance characteristics. This section provides a detailed comparative analysis based on key performance metrics, synthesizing findings from experimental studies to guide coating selection.

**Tool Life Comparison**

Tool life, typically measured by flank wear (VB) progression or the number of acceptable parts produced, is the most direct metric for comparing coating performance. Experimental Setup for Graphite Machining (Figure 5)

**TiAlN Performance:** TiAlN provides a substantial improvement over uncoated carbide or older coatings like TiN. Its high hardness and good thermal stability allow it to resist abrasive wear and maintain integrity at moderate to high cutting speeds. However, its wear progression is generally linear and predictable but steady. Under aggressive roughing conditions or with highly abrasive graphite grades, the abrasive particles gradually wear down the coating, eventually leading to substrate exposure and rapid failure.

**TiSiNo Performance:** TiSiNo consistently demonstrates a significant advantage in tool life over TiAlN in graphite machining. The nanocomposite structure's extreme hardness (often 35-50% harder) offers a much more robust defense against abrasion. Experimental studies, such as that by Lin *et al*. (2018), frequently report TiSiNo tool life being 200% to 500% longer than that of TiAlN-coated tools under identical machining parameters. The wear land on the flank face develops much more slowly and evenly, avoiding catastrophic failure modes like large-scale chipping. This extended tool life reduces machine downtime for tool changes and lowers the cost-per-part for high-volume production runs. For maximizing tool life and productivity, particularly in continuous or heavy roughing operations, TiSiNo is the unequivocal superior choice.

**Cutting Force and Temperature Differences**

Cutting forces and temperature are interlinked parameters that influence power consumption, tool deflection, and part quality.

**Cutting Forces:** A sharper, harder cutting edge experiences lower cutting forces as it shears the material more efficiently rather than plowing through it.

**TiAlN** provides a sharp edge, but as it begins to wear, the cutting forces gradually increase due to edge rounding and increased contact area.

**TiSiNo**'s ability to maintain a sharper edge for a longer period results in more stable and generally lower cutting forces throughout its extended tool life. The reduced friction from the potential formation of a glassy $SiO_2$ layer may also contribute to lower forces. Lower forces reduce the risk of tool deflection (critical for machining thin ribs and fine features), minimize chatter, and lower the power consumption of the spindle.

**Cutting Temperature:** While graphite machining generates less heat than metals, temperature at the tooltip remains a factor.

**TiAlN** excels as a thermal barrier, forming a protective $Al_2O_3$ layer that insulates the substrate up to ~850°C.

**TiSiNo** offers even greater oxidation resistance (up to ~1100°C) due to its stable $SiO_2$ layer. However, the primary issue in graphite is abrasive wear, not thermal softening. Therefore, while TiSiNo has a theoretical thermal advantage, its main benefit in temperature management is indirect: by maintaining a sharp edge and lower cutting forces, it inherently generates less heat than a worn TiAlN tool would under the same conditions. TiSiNo-coated tools generally promote lower and more stable cutting forces due to superior edge retention. Both coatings provide ample thermal protection for graphite machining, with any thermal advantage lying with TiSiNo.

**Experimental Studies and Methodologies**

Experimental research on coated tool performance in graphite machining employs standardized methodologies to ensure reproducible and quantifiable results. A typical test setup involves a CNC milling machine equipped with a rotating dynamometer (e.g., Kistler type) mounted beneath the workpiece to measure cutting forces (Fx, Fy, Fz) and torque in real-time. The machining is conducted dry, with a high-pressure vacuum system integral to the setup for effective graphite dust extraction, preventing recutting and ensuring operator safety. Standard cutting parameters across studies vary based on tool diameter but are designed to test performance under high-speed conditions. For a 6 mm diameter end mill, typical ranges are: spindle speed of 15,000-30,000 rpm, feed rate of 0.5-2.0 m/min, and a depth of cut of 0.1-0.5 mm. These parameters are selected to induce significant tool wear within a

practical experimental timeframe while operating within the capabilities of the machine tool. Tool wear evaluation is a critical component. Flank wear (VB) is the primary metric, measured periodically using a toolmaker's microscope or, for higher precision, scanning electron microscopy (SEM). SEM offers fine-grained pictures of wear processes such as coating delamination, edge chipping, and abrasion grooves. The substrate material on the worn surface may be identified by energy-dispersive X-ray spectroscopy (EDX) carried out inside the SEM, which indicates coating failure. A contact profilometer is used to assess the machined graphite's surface roughness (Ra). This method is shown by representative case studies, as the research done by Lin *et al*. (2018). They provided irrefutable, data-driven validation of the coating's performance by quantitatively demonstrating that TiSiNo-coated micro-end mills produced superior surface finish in graphite and achieved over 500% longer tool life compared to TiAlN-coated tools using a precise CNC machining centre, a dynamometer, and SEM/EDX analysis.

**Difficulties and Research Deficits**

Significant difficulties in graphite machining are exacerbated by the need for extreme accuracy. Limitations in coating adherence during severe heat cycling are a major problem as they may cause spallation and early failure. Additionally, the discipline lacks standardised test methodologies, which makes it difficult to compare study findings directly. Furthermore, since inhaled graphite particles may cause health problems and pollution of equipment, efficient dust evacuation is still a major environmental and safety issue. Lastly, thorough comparison studies that methodically assess the next generation of improved coatings under the same, industrially relevant circumstances are noticeably lacking.

## FUTURE RESEARCH DIRECTIONS

Future work should focus on developing next-generation solutions to these challenges. Promising avenues include exploring hybrid and multilayer coatings (e.g., TiSiAlN, nanolayeredAlCrN) that aim to combine the hardness of TiSiNo with the toughness of other coatings. Research into nanostructured and adaptive coatings that self-lubricate under specific conditions could further enhance performance. The application of cryogenic cooling or Minimum Quantity Lubrication (MQL), though challenging due to dust, should be investigated for its potential to reduce airborne particles and improve tool life. Finally, the integration of AI-driven tool wear prediction and smart machining systems could enable real-time parameter optimization for unprecedented efficiency and precision.

## CONCLUSION

Graphite machining is fraught with difficulties stemming from the material's abrasiveness and brittleness, which cause rapid tool wear and edge chipping. The use of solid carbide tools with advanced PVD coatings is not merely beneficial but essential to mitigate these issues. The comparative analysis clearly establishes that while TiAlN provides a robust, all-around performance upgrade, TiSiNo and its nanocomposite structure offer superior hardness, resulting in dramatically extended tool life, lower cutting forces, and better surface finish consistency in graphite machining. The industrial implications of these findings are profound, particularly for electrode manufacturing for EDM and precision mold making. Adopting high-performance coatings like TiSiNo translates directly to reduced machine downtime, lower tooling costs, higher-quality surface finishes, and superior dimensional accuracy of finished parts. This enhances productivity and ensures greater reliability in manufacturing high-value components, solidifying the role of advanced tool coatings as a cornerstone of modern precision machining.

## ABSTRACT

Tobacco processing is a key economic activity in NippaniTaluk, Belgaum District of Karnataka. Tobacco processing factories employs a large number of workers to harvest, cure, sort, and pack tobacco. Despite its financial benefits, the tobacco processing has major occupational health risks because to prolonged exposure to chemicals, tobacco dust, and physically hard work. This study uses an anthropological approach to analyse the health of 825 tobacco workers (480 men and 345 women) in order to assess the prevalence of musculoskeletal, respiratory, gastrointestinal, neurological, and dermatological disorders. According to the findings, the most common problems are low-back pain (40.8%), hand weakness (37.6%), and headaches (18.7%), with significant gender difference—women suffering from musculoskeletal disorders and men reporting more respiratory and eye problems. Furthermore, poor hygiene, inadequate sanitation, and limited access to healthcare facility, result in gastrointestinal and skin diseases. The study highlights the importance of workplace ergonomics, preventive measures, health awareness programs, and improved sanitation to ensure workers' overall well-being. Addressing these occupational hazards through governmental reforms and expanded healthcare access is critical to improving health of tobacco processing workers.

**Keywords:** Tobacco workers, Tobacco processing workers, Health problem of tobacco workers, Health hazards of tobacco, Occupational health Problems.

## INTRODUCTION

The production and processing of tobacco is vital to the Nippani Taluk economy in the Belgaum District of Karnataka. The area is well-known for producing a lot of tobacco, and it employs a lot of people who work in several processing stages like harvesting, curing, sorting, and packaging(Gupta, P. C., &Asma, S. 2008). Although it provides a substantial income, the industry exposes employees to a variety of occupational health risks. Long-term exposure to tobacco dust, leaves, and processing chemicals can cause musculoskeletal stress, skin conditions, respiratory illnesses, and other major health issue (Mishra, L., Patel, R., & Kumar, S. 2010).By highlighting the interplay of cultural, social, and economic elements that influence their well-being, this study aims to evaluate the health status of tobacco workers in NippaniTaluk from an anthropological perspective. The research draws attention to the difficulties these workers have on the job, such as excessive hours, poor pay, unstable employment, and restricted access to social safety nets and healthcare (Reddy, K. S., &Gupta, P. C. 2004).Additionally, it examines how tobacco work is perceived culturally, where attitudes towards workplace health and safety are frequently influenced by traditional beliefs and financial needs (Asma, S., & Mackay, J. 2012).Ethnographic study plays important insights into the lived experiences of tobacco processing workers, including health risks, obstacles to putting safety measures in place, and coping strategies for dealing with health issues brought on by working in tobacco processing factory (Gupta, R., Sharma, M., &Mathur, A. 2012).Tobacco workers are exposed to various occupational health hazards due to prolonged physical labour, repetitive hand movements, and continuous exposure to tobacco dust and chemicals. This study examines the prevalence of common health problems among **825 workers (480 males and 345 females)** in the Nippani Belgaum district of Karnataka. The findings reveal that **low-back pain (40.8%), weakness of hand (37.6%), and headache (18.7%)** are the most frequently reported health issues, with significant gender-based variations. Respiratory problems, gastrointestinal disorders, and dental issues are also prevalent, highlighting the need for improved workplace ergonomics, health interventions, and preventive measures to safeguard workers' well-being.

## MATERIALS AND METHODS

The present study was undertaken in Nippani Taluk, Belgaum District, Karnataka, where tobacco manufacturing is a key source of income. A cross-sectional descriptive design with an anthropological participant observation approach was used. The study included 825 workers (480 men and 345 women) chosen by random sampling. Participants were 18 years or older and had at least one year of work experience in tobacco processing. Structured interviews, clinical examinations, and field observations were used to collect data. Focus group discussions were held to better understand cultural attitudes of health and cleanliness.

## RESULT AND DISCUSSION

According to the table 1, health issues among Nippani Taluk's tobacco workers emphasises the serious risks they experience at work. The most prevalent problem is low-back discomfort (40.8%), which is especially common in women because of the extended bending and lifting that occur during tobacco processing. Hand weakness (37.6%), which is brought on by repetitive physical work. Other serious health issues brought on by tobacco dust, chemicals, and unfavourable working conditions include headache (18.7%), dyspnoea (16.7%), and burned eyesight (13.8%). According to a gender-wise analysis, women are more likely than men to suffer from musculoskeletal problems, which are probably caused by physically demanding work without ergonomic support. They account for 64.5% of cases of low back pain and 53.6% of cases of hand weakness. Additionally, women have abdominal pain in 61.8% of instances, which may be related to stress and malnutrition. However, men report more cases of respiratory and visual problems; 63.7% of cases of dyspnoea and 68.4% of cases of burning vision are connected to long-term tobacco dust exposure. Additionally, men account for 75.7% of cases of acidity and epigastric pain, which may be brought on

by handling tobacco leaves directly and irregular eating patterns. These results highlight the need of better working conditions, safety precautions, and medical interventions are needed to preserve the health of tobacco workers in the working place.

## RESULTS AND DISCUSSION

Long-term exposure to chemicals, tobacco dust, and physically difficult job pose a number of occupational health risks for tobacco workers in Nippani Taluk, Belgaum District, Karnataka. They are susceptible to a range of neurological, gastrointestinal, dermatological, musculoskeletal, and pulmonary conditions because of the nature of their employment, which includes everything from cultivation to processing. According to this study 825 tobacco workers (480 men and 345 women), there are notable gender-based disparities in the frequency of several health problems. These health issues, along with their symptoms and possible causes, are thoroughly examined in this article.

**Musculoskeletal Disorders**

Musculoskeletal disorders are among the most commonly reported health issues among tobacco workers. These conditions are brought on by prolonged standing, repetitive hand motions, and lifting heavy objects. Low back pain is the most common ailment, affecting 337 workers (40.8%), with a much higher prevalence in females (222 cases compared to 115 in males). Chronic stiffness, soreness, and decreased mobility are caused by the repetitive nature of jobs like carrying tobacco sacks, sorting leaves, and bundling. Additionally, 310 workers (37.6%) experienced hand weakness, which makes it challenging to carry out daily chores and is characterised by numbness, tingling, and a lack of grip strength. Women are more likely than men to have this disorder (185 instances compared to 125 cases), most likely as a result of their heavy physical labour that demands fine motor abilities.

**Respiratory Disorders**

Respiratory health is greatly affected by the constant exposure to fine tobacco dust and airborne toxins that occurs during tobacco processing. Breathlessness is a major problem, as stated by 138 workers (16.7%). Males are more likely to experience it (88 cases compared to 50 females), as a result of their handling of bulk tobacco processing. Workers who are having trouble breathing frequently experience chest tightness, wheezing, and difficulty breathing. 50 employees (6%) also reported having a chronic cough, which is caused by tobacco dust inhalation that irritates the airways continuously.

**Neurological and Vision-Related Problems**

Long-term exposure to nicotine and tobacco dust damages the neurological system in addition to the lungs, resulting in headaches and eyesight problems. 154 employees (18.7%) reported they frequently had headaches, which were frequently accompanied by light sensitivity, nausea, and dizziness. Dehydration, inadequate ventilation in work environments, and nicotine toxicity may all be connected to these symptoms. Another prevalent problem is burning vision, which affects 114 employees (13.8%), mostly men (78 cases compared to 36 females). Direct exposure to tobacco particles and fumes causes this condition, which causes blurred vision, excessive weeping, and eye irritation. It might eventually lead to vision impairment or persistent eye strain. Palpitations, a symptom linked to nicotine absorption through the skin or inhalation, also reported by some workers (23 cases, 2.8%). These symptoms can include dizziness, chest pain, and irregular pulse. Long-term exposure to elevated nicotine levels can raise the risk of cardiovascular illnesses if untreated.

**Gastrointestinal Issues**

Digestive issues are common among tobacco workers and can be caused by exposure to chemicals, poor hygiene, and stress at work. 70 workers (8.5%) reported experiencing acidity and epigastria pain, which included bloating, nausea, and burning feelings in the stomach. This may be brought on by inhaling smoke residues, eating at the wrong time, or stress-induced acid production. Additionally, 29 employees (3.5%) experienced nausea and vomiting, with a

higher frequency in males (23 occurrences compared to 6 in females). These symptoms are frequently associated with Green Tobacco Sickness (GTS), a disorder that results from the skin's absorption of nicotine and causes weakness, profuse perspiration, and dizziness.

**Oral and Dental Problems**

Dental issues affected 100 workers (12.1%) as a result of poor oral hygiene and continuing tobacco dust exposure. Due to direct tobacco particle exposure and limited access to dental treatment, many employees suffer from tooth decay, gum infections, and foul breath. This can cause tooth loss, severe gum disease, and trouble chewing food over time.

**Skin Diseases**

Workers who handle raw tobacco leaves without protective gear have the risk of developing skin problems from exposure to nicotine, alkaloids, and pesticide residues. 12 (1.4%) reported of redness, itching, and rashes on their skin, which frequently developed into dermatitis, fungal infections, and skin allergies.

**Hygiene-Related Health Issues among Tobacco Workers**

Long-term exposure to tobacco dust, pesticides, and polluted and tobacco dusty working conditions pose serious health concerns to tobacco workers in NippaniTaluk, Belgaum District. Skin infections, gastrointestinal problems, respiratory ailments, and oral health issues are among the many health complications that are affected by inadequate sanitation, poor quality drinking water, and avoidance of protective gear. Since workers usually touch raw tobacco leaves without gloves, skin illnesses like rashes, dermatitis, and fungal infections are among the main concerns. These issues are exacerbated by on-going exposure to nicotine and pesticide residues, and skin irritation is big problem due to excessive raw tobacco dust and perspiration in humid environments also poses many respiration problems. The danger of these illnesses spreading is increased by poor hygiene habits, such as not washing hands after handling tobacco. A further significant worry is digestive problems. Workers frequently have their lunch in contaminated settings where food is contaminated by tobacco dust, which can cause acidity, nausea, and vomiting. Digestion issues due to tobacco dust and consuming tobacco dust unknowingly and these health problems exacerbate further by inadequate availability to safe drinking water causing dehydration and chemical residue consumption can cause serious stomach-related conditions.

Unhygienic working conditions, where tobacco dust is accumulated and is continuously inhaled, cause respiratory issues. Workers experience lung discomfort, persistent coughing, and dyspnoea in the absence of proper ventilation and protective masks. Long-term respiratory issues can result from poor hygiene habits, such as not routinely cleaning workplaces, which increase exposure to airborne pollution. On the other hand Workers' mouths are directly exposed to tobacco dust, which can lead to oral and dental health problems. Many people experience gum disease, tooth decay, and bad breath, which get even worse by irregular oral hygiene routines and restricted access to dental care. Better sanitation facilities, safe drinking water, protective measures. Hygiene education is necessary to address these hygiene-related issues. By putting proper strategies into practice to assure proper hygiene protocol, tobacco workers' health problems can be greatly decreased, enhancing their overall wellbeing.

The findings of the study show that tobacco workers in NippaniTaluk, Belgaum District, Karnataka, face significant health risks to their occupational health. Among the 825 workers, musculoskeletal problems, respiratory infections, gastrointestinal problems, and vision-related difficulties were the most prevalent health concerns. The high rates of low-back pain (40.8%) and hand weakness (37.6%) reveal how physically demanding the tobacco manufacturing industry is, particularly for women who are affected by ergonomic stress. Respiratory conditions including chronic cough (6%) and dyspnoea (16.7%) also point to the harmful effects of extended exposure to tobacco dust and manufacturing chemicals. The study also reveals significant gender variations in health problems. While women are more likely to experience musculoskeletal problems, likely due to repetitive manual labour and a lack of ergonomic support, men report higher rates of respiratory and vision-related disorders, possibly as a result of their extended

exposure to small tobacco dust particles. Additionally, gastrointestinal issues like acidity and epigastric pain (8.5%) and nausea and vomiting (3.5%) indicate underlying issues related to green tobacco. illness and poor personal hygiene at work. Oral and dental problems are also associated with direct tobacco exposure and inadequate access to healthcare (12.1%). In addition to unsanitary working conditions and inadequate hygiene practices exacerbate these health problems. Workers are more susceptible to unknowingly inhale tobacco dust because they frequently handle raw tobacco leaves without wearing protective gear. This raises their risk of acquiring skin problems, respiratory disorders, and digestive issues. Inadequate sanitation and restricted access to safe drinking water causes dehydration and gastrointestinal distress.

These results highlight the critical need for focused initiatives to enhance tobacco workers' cleanliness and general health. Putting in place ergonomic work procedures, offering safety measures, making sure there is enough ventilation and air flow, and improving These findings highlights the urgent need for targeted efforts to improve the general health and sanitation of tobacco workers. Addressing these occupational health concerns is essential to safeguarding the health of tobacco workers and creating a more sustainable, healthy workplace.

## ABSTRACT

The rapid growth of Internet of Things (IoT) devices has really boosted connectivity, but it has also increased the chances of security issues, especially with blackhole attacks. This paper introduces a new lightweight security framework that uses logistic regression-based classification to smartly tell apart friendly and harmful nodes in resource-limited IoT networks. By bringing together key behavioral metrics like packet transmission success rates, energy use, and response a time our method creates a probabilistic assessment model that combines various features into a clear analysis. The probability scores, which range from 0 to 1, help set a dynamic threshold for binary classification, allowing us to spot reliable nodes versus possible threats. Thorough simulation studies carried out in controlled IoT settings confirm the framework's effectiveness across five important metrics: packet delivery success, loss rate, end-to-end latency, threat detection accuracy, and computational overhead. The results show improved detection of compromised nodes while keeping the overall network efficient and secure. This research offers a practical and effective way for real-time threat detection in IoT systems, especially where traditional security measures might not be enough.

**Keywords:** Internet of Things Security, Trust Management Systems, Machine Learning Classification, Logistic Regression Models, Blackhole Attack Detection, RPL Protocol Security

# INTRODUCTION

**The IoT Revolution and Security Imperatives**

The Internet of Things represents a transformative paradigm shift in technological ecosystems, enabling unprecedented levels of device interconnectivity and data-driven intelligence across industries. This networked infrastructure facilitates enhanced operational efficiency, predictive analytics, and novel application domains ranging from smart cities to industrial automation. However, the exponential growth of IoT deployments simultaneously amplifies security challenges that demand immediate attention to preserve system integrity and user trust.

**Fundamental Security Challenges in IoT Networks**

Contemporary IoT environments face multifaceted security threats stemming from several critical factors:

**Heterogeneity and Standardization Gaps**: The absence of unified security protocols across diverse device manufacturers creates inconsistent protection mechanisms

**Authentication Deficiencies**: Weak or absent user verification systems enable unauthorized access to network resources

**Firmware Vulnerabilities**: Unpatched software weaknesses provide entry points for malicious exploitation

**Privacy Concerns**: Inadequate data protection mechanisms compromise sensitive information handling

**Resource Constraints**: Limited computational power and memory restrict implementation of robust security measures

**The Blackhole Attack Threat Landscape**

Among the spectrum of IoT security threats, blackhole attacks represent a particularly insidious category of network-layer assaults. In these attacks, compromised nodes strategically position themselves within routing paths and systematically drop or intercept data packets intended for legitimate destinations. This malicious behavior disrupts communication channels and compromises data integrity throughout the network fabric.

**Impact Assessment of Blackhole Attacks**

The consequences of successful blackhole attacks manifest across multiple dimensions:

**Data Loss**: Critical information packets are permanently discarded, resulting in incomplete data transmission

**Performance Degradation**: Network throughput decreases significantly as retransmission attempts consume bandwidth

**Integrity Compromise**: Selective packet dropping can manipulate data flows and corrupt information accuracy

**Trust Erosion**: Repeated communication failures undermine confidence in IoT system reliability

**Service Disruption**: Mission-critical applications experience operational failures that may have severe real-world consequences

**Research Contribution and Paper Organization**

This research addresses the critical need for lightweight, effective blackhole detection mechanisms suitable for resource-constrained IoT environments. Our proposed framework leverages machine learning classification techniques combined with comprehensive trust assessment to identify and isolate malicious nodes while maintaining

minimal computational overhead. The remainder of this paper is structured as follows: Section 2 examines the theoretical foundations of trust management and machine learning in security contexts; Section 3 presents our adversary model focusing on blackhole attacks within RPL routing; Section 4 reviews relevant literature; Section 5 details our proposed detection framework; Section 6 provides mathematical validation; Section 7 presents experimental results and comparative analysis; Section 8 concludes with future research directions.

**Theoretical Foundations: Trust Management and Machine Learning in Security**

**Trust Management Systems as Security Cornerstones**

Within the complex operational environment of IoT networks, trust management systems serve as fundamental defense mechanisms against sophisticated threats like blackhole attacks. These systems employ systematic methodologies to evaluate node reliability based on observed behaviors and interaction histories.

**Core Components of Trust Management**

Effective trust management architectures incorporate three essential elements

**Reputation Evaluation**: Quantitative assessment of node behavior patterns over time, aggregating historical performance data to establish trustworthiness scores

**Trust Aggregation**: Synthesis of multiple trust indicators from diverse sources, combining direct observations with indirect reputation information from neighboring nodes

**Decision-Making Mechanisms**: Threshold-based or probabilistic frameworks that translate trust scores into actionable security decisions, such as node isolation or communication restrictions. These components work synergistically to identify nodes exhibiting suspicious activities characteristic of blackhole attacks, enabling proactive threat mitigation (Ruohomaa and Kutvonen, 2005; Yan *et al*., 2014; Prathapchandran *et al*., 2021).

**Machine Learning as Adaptive Security Intelligence**

Machine learning algorithms provide dynamic, self-improving capabilities for detecting and classifying security threats in IoT networks. Unlike static rule-based systems, machine learning approaches adapt to evolving attack patterns through continuous learning from network data.

**Machine Learning Advantages in Blackhole Detection**

**Pattern Recognition**: Automated identification of subtle behavioral anomalies that may escape manual detection

**Scalability**: Efficient processing of large-scale network data from thousands of interconnected devices

**Adaptability**: Continuous model refinement based on emerging threat characteristics

**Predictive Capability**: Proactive threat identification before attacks cause significant damage

**Machine Learning Workflow for Security Applications**

The typical machine learning security pipeline consists of

**Data Collection**: Gathering comprehensive network traffic and node behavior metrics

**Feature Engineering**: Extracting relevant characteristics that distinguish benign from malicious activity

**Model Training**: Learning decision boundaries from labeled datasets containing known attack examples

**Classification**: Real-time categorization of new node behaviors as normal or malicious

**Validation and Refinement**: Continuous performance evaluation and model optimization

Through sophisticated feature extraction and model training processes, machine learning algorithms develop the ability to differentiate between legitimate network operations and malicious activities, enabling precise blackhole attack identification (Chio and Freeman, 2018; Papernot *et al*., 2018).

**Adversary Model: Blackhole Attacks in RPL-Based IoT Networks**

**Blackhole Attack Mechanics in RPL Networks**

**Attack Execution Strategy**

Blackhole attacks in RPL-based IoT networks exploit the protocol's trust assumptions through a sophisticated multi-stage approach

**Route Advertisement Manipulation**: Malicious nodes falsely advertise optimal routes to the sink node by broadcasting artificially low rank values

**Traffic Attraction**: Neighboring nodes, believing the malicious node offers the best path, redirect their traffic through the attacker

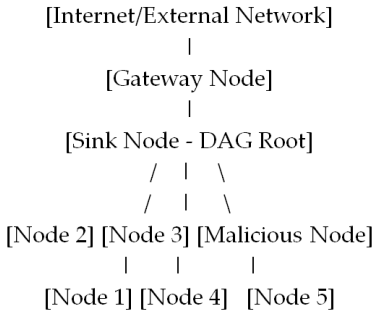
**Packet Dropping**: Once positioned in routing paths, the malicious node systematically discards received packets instead of forwarding them

**Communication Disruption**: Legitimate data fails to reach destinations, causing network-wide communication breakdowns.

This attack strategy proves particularly effective because RPL's default configuration lacks built-in mechanisms to verify the authenticity of routing advertisements (Mandala *et al*., 2013; Prathapchandran *et al*., 2021).

**Network Impact Visualization:**

Consider a simplified RPL network topology illustrating blackhole attack effects



**RPL Network Topology Under Blackhole Attack (Figure 1)**

**In this configuration:** The Sink Node functions as the DAG root, collecting data from all network participants - The Gateway Node provides Internet connectivity and external communication capabilities - Nodes 1-5 represent legitimate IoT devices following standard RPL protocols - The Malicious Node has been compromised and executes blackhole attack behavior

**Attack Scenario Walkthrough**

Consider the following attack sequence

**Normal Operation**: Node 1 initiates packet transmission destined for the Sink Node

**Route Selection**: Following RPL protocol, Node 1 evaluates available parent nodes (Node 2 or Gateway)

**Malicious Interference**: The Malicious Node broadcasts falsified routing information claiming the shortest path to the Sink

**Traffic Redirection**: Node 1, deceived by the false advertisement, forwards packets to the Malicious Node

**Packet Discarding**: The Malicious Node intentionally drops received packets instead of forwarding them

**Communication Failure**: Data never reaches the Sink Node, causing packet loss and service disruption

**Attack Consequences**
The blackhole attack produces several detrimental effects
**Packet Loss**: Critical data permanently lost, requiring retransmission attempts
**Energy Waste**: Retransmission efforts consume limited battery resources
**Latency Increase**: Communication delays accumulate due to failed transmission attempts
**Network Instability**: Route recalculation overhead burdens network resources
**Service Degradation**: Application-level failures due to incomplete data delivery
These impacts collectively compromise network functionality, reliability, and user trust in the IoT system.

**Related Work and Literature Analysis**
This section examines significant contributions to network security research, particularly focusing on blackhole attack detection and mitigation strategies in IoT environments.

**Combined Attack Detection Frameworks**
**Ioulianou *et al*. (2022)** conducted comprehensive research examining the synergistic effects of combined rank and blackhole attacks on IPv6 Routing Protocol for Low-Power and Lossy Networks (RPL). Their work introduced the SRF-IoT (Security Framework for IoT), a novel security architecture designed specifically for RPL-based IoT networks.

**Key Contributions**
**Trust-Based Detection Mechanism**: Integration of trust evaluation algorithms to identify and isolate malicious nodes based on behavioral analysis
**External IDS Integration**: Complementary intrusion detection system providing additional security layer
**Implementation Platform**: Both SRF-IoT and IDS components implemented using the Contiki-NG operating system
**Simulation Environment**: Performance validation conducted through Whitefield framework, combining Contiki-NG with NS-3 simulator

**Research Outcomes**
Evaluation results demonstrated that SRF-IoT effectively enhances security posture and resilience of RPL-based IoT networks against sophisticated combined attack strategies, providing robust defense mechanisms without significant performance overhead.

**Machine Learning and Trust Management Integration**
**Rutravigneshwaran *et al*. (2023)** developed an innovative approach combining machine learning algorithms with trust management principles to create the KmCtrust model, specifically targeting Internet of Battlefield Things (IoBT) networks.

## METHODOLOGY

**Hybrid Architecture**: Synergistic integration of K-means clustering algorithm with trust evaluation metrics
**Mission-Centric Trust**: Establishment of trust relationships exclusively with Battlefield Things (BTs) actively participating in mission objectives
**Malicious Node Elimination**: Accurate detection and removal of compromised BTs to enhance mission success rates

**Advantages**
The KmCtrust model demonstrates superior performance in dynamic, adversarial environments by leveraging both unsupervised learning (K-means clustering) and trust management to ensure reliability and operational efficiency within IoBT networks.

**Trust-Based Blackhole Mitigation**

**Govindaraj and Arumugam (2023)** explored trust-based mechanisms specifically designed for blackhole attack mitigation in general IoT environments, focusing on lightweight solutions suitable for resource-constrained devices.

**Forensic Analysis Approaches**

**Hasan *et al.* (2022)** provided comprehensive forensic analysis methodologies for investigating blackhole attacks in Wireless Sensor Networks (WSN) and IoT systems, offering insights into attack pattern recognition and post-incident investigation techniques.

**RPL-Specific Security Enhancements**

**Muthu Ganesh *et al.* (2022)** and **Prathapchandran and Janani (2021)** conducted extensive research on RPL protocol security, developing multiple trust-based and machine learning-enhanced defense mechanisms

**Decision Tree Trust (DTTrust)**: Authentication mechanism securing RPL routing in IoBT environments

**Random Forest Trust (RFTrust)**: Detection system for sinkhole attacks using Random Forest classification

**Trust-Based Isolation**: Mechanisms for identifying and isolating malicious nodes in real-time

**Research Gap Identification**

While existing literature provides valuable contributions to IoT security, several gaps remain

**Computational Efficiency**: Many proposed solutions impose significant computational overhead unsuitable for resource-constrained devices

**Multi-Metric Integration**: Limited research combines comprehensive node behavioral metrics into unified detection frameworks

**Real-Time Performance**: Few solutions demonstrate effective real-time detection with minimal latency

**Scalability Concerns**: Existing approaches often struggle with large-scale network deployments

Our proposed framework addresses these gaps by providing a lightweight, multi-metric, real-time detection solution suitable for large-scale, resource-constrained IoT deployments.

**Proposed Detection Framework**

**Framework Overview and Design Philosophy**

Our proposed framework introduces an intelligent, lightweight security mechanism leveraging logistic regression classification to distinguish between trustworthy and malicious (blackhole) nodes within RPL-based IoT networks.

The design philosophy emphasizes:

**Computational Efficiency**: Minimal processing overhead suitable for resource-constrained devices

**Multi-Dimensional Assessment**: Comprehensive evaluation incorporating multiple behavioral indicators

**Real-Time Operation**: Immediate threat detection enabling proactive defense

**Scalability**: Effective performance across networks of varying sizes

**Adaptability**: Capability to adjust to evolving attack patterns

**System Architecture and Components**

**Data Collection Module**

The framework continuously monitors and collects six critical node behavioral metrics:

**Packet Delivery Ratio (PDR)**: Proportion of successfully delivered packets relative to total transmitted packets

**Packet Loss (PL)**: Frequency and pattern of packet dropping behavior

**Energy Efficiency (EE)**: Power consumption characteristics during normal operations

**Responsiveness (RES)**: Latency in responding to routing requests and data forwarding

**Cooperation (C)**: Willingness to participate in network routing activities

**Reliability (R)**: Consistency of behavior over time and across different network conditions

**Feature Engineering and Normalization**

Collected metrics undergo preprocessing to ensure uniform scale and compatibility

Normalized_Feature = (Raw_Value - Min_Value) / (Max_Value - Min_Value)

This normalization transforms all features to the [0,1] range, preventing any single metric from dominating the classification decision.

**Logistic Regression Classification Model**

The core classification engine employs logistic regression, a probabilistic binary classifier particularly well-suited for IoT security applications due to its computational efficiency and interpretability.

**Mathematical Formulation**

The logistic regression model computes a linear combination of features:

$z = \beta_0 + \beta_1(PDR) + \beta_2(PL) + \beta_3(EE) + \beta_4(RES) + \beta_5(C) + \beta_6(R)$

Where: - z = linear predictor (log-odds) - $\beta_0$ = intercept term (bias) - $\beta_1$, $\beta_2$, ..., $\beta_6$ = feature coefficients (weights)

This linear combination is then transformed through the sigmoid activation function:

$P(Trusted) = \sigma(z) = 1 / (1 + e^{(-z)})$

The sigmoid function maps the linear predictor to a probability value in the range [0,1], representing the likelihood that a node is trustworthy.

**Classification Decision Rule**

A threshold-based decision mechanism converts probability scores to binary classifications:

Node Classification = {Trusted, if $P(Trusted) \geq \theta$

Blackhole, if $P(Trusted) < \theta$}

Where $\theta$ represents the classification threshold (typically 0.5, but adjustable based on security requirements).

**Adjusted Packet Delivery Ratio Under Attack**

In environments experiencing blackhole attacks, the standard PDR calculation requires adjustment to accurately reflect attack impact:

**Standard PDR Formula**

PDR = (Packets_Received / Packets_Sent) × 100%

**Adjusted PDR Under Blackhole Attack**

PDR_adjusted = ((Packets_Sent - Packets_Dropped_by_Blackhole) / Packets_Sent) × 100%

This adjustment incorporates a correction factor accounting for packets maliciously dropped by blackhole nodes, providing more accurate performance assessment under attack conditions.

**Alternative Formulation with Detection Accuracy**

PDR_effective = PDR_standard × (1 - Attack_Impact_Factor)

**Where**

Attack_Impact_Factor = (Blackhole_Nodes_Detected / Total_Blackhole_Nodes) × Drop_Rate

This formulation quantifies the relationship between detection accuracy and effective packet delivery performance.

**Model Training and Optimization**

**Training Data Requirements**

The model requires labeled training data consisting of: - Positive Examples: Behavioral profiles of known trustworthy nodes - Negative Examples: Behavioral profiles of confirmed blackhole nodes

**Typical training dataset composition:** 70% training, 15% validation, 15% testing

**Coefficient Optimization**

Model coefficients ($\beta_0$, $\beta_1$, …, $\beta_6$) are optimized through maximum likelihood estimation, minimizing the cross-entropy loss function

Loss = $-\Sigma[y_i \times \log(P_i) + (1 - y_i) \times \log(1 - P_i)]$

Where: - $y_i$ = true label (1 for trusted, 0 for blackhole) - $P_i$ = predicted probability

**Threshold Calibration**

The classification threshold $\theta$ is calibrated to balance: - False Positive Rate: Incorrectly flagging trusted nodes as blackhole - False Negative Rate: Failing to detect actual blackhole nodes. Threshold selection considers the relative costs of different error types based on specific application requirements.

**Framework Advantages**

Our proposed framework offers several significant advantages over existing approaches:

**Low Computational Cost**: Logistic regression requires minimal processing power, suitable for resource-constrained IoT devices

**Interpretability**: Linear combination of features provides transparent decision-making process

**Multi-Dimensional Assessment**: Six behavioral metrics provide comprehensive node evaluation

**Real-Time Capability**: Efficient computation enables immediate threat detection

**Adaptability**: Model retraining allows adaptation to evolving attack patterns

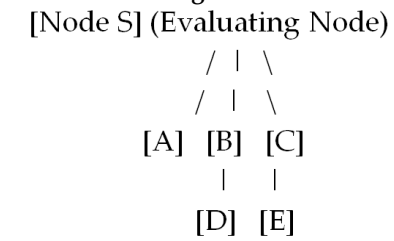
**Scalability**: Linear computational complexity supports large-scale network deployments

**Mathematical Example and Validation**

**Example Network Topology**

To demonstrate the practical application of our proposed framework, we consider a simplified IoT network consisting of six nodes: S, A, B, C, D, and E.

**Network Configuration**



**Example IoT Network Topology for Mathematical Validation (Figure 2).**

In this configuration, Node S serves as the evaluating node that calculates trust metrics for all other nodes (A, B, C, D, E) within its communication range.

**Trust Metric Collection**

Node S monitors the behavior of neighboring nodes over a specified observation period, collecting the following trust metrics:

Trust Metrics Collected by Node S (Table 1)

**Metric Definitions: PDR (Packet Delivery Ratio)**: Values range from 0 to 1, where 1 indicates perfect delivery - PL (Packet Loss): Values range from 0 to 1, where 0 indicates no packet loss - EE (Energy Efficiency): Normalized energy consumption metric (higher is better) - RES (Responsiveness): Response time metric (higher indicates faster response) - C (Cooperation): Willingness to participate in routing (higher indicates better cooperation) - R (Reliability): Consistency of behavior (higher indicates more reliable)

**Logistic Regression Model Application**

**Model Parameters**

For this example, we assume the following trained model parameters:

$\beta_0$ (Intercept) = -3.5

$\beta_1$ (PDR coefficient) = 4.2

$\beta_2$ (PL coefficient) = -3.8

$\beta_3$ (EE coefficient) = 2.5

$\beta_4$ (RES coefficient) = 2.8

$\beta_5$ (C coefficient) = 2.3

$\beta_6$ (R coefficient) = 3.1

**Classification Threshold:** $\theta = 0.5$

Classification of Node A

**Step 1: Calculate Linear Predictor (z)**

$z_A = \beta_0 + \beta_1(PDR_A) + \beta_2(PL_A) + \beta_3(EE_A) + \beta_4(RES_A) + \beta_5(C_A) + \beta_6(R_A)$

$z_A = -3.5 + 4.2(0.95) + (-3.8)(0.05) + 2.5(0.88) + 2.8(0.92) + 2.3(0.90) + 3.1(0.93)$

$z_A = -3.5 + 3.99 + (-0.19) + 2.20 + 2.576 + 2.07 + 2.883$

$z_A = 10.029$

**Step 2: Apply Sigmoid Function**

$P(A \text{ is Trusted}) = \sigma(z_A) = 1 / (1 + e^{(-10.029)})$

$P(A \text{ is Trusted}) = 1 / (1 + e^{(-10.029)})$

$P(A \text{ is Trusted}) = 1 / (1 + 0.0000442)$

$P(A \text{ is Trusted}) \approx 0.9999558$

**Step 3: Classification Decision**

Since $P(A \text{ is Trusted}) = 0.9999558 \geq 0.5$

**Classification:** Node A is TRUSTED

**Classification of Node B**

**Step 1: Calculate Linear Predictor (z)**

$z_B = -3.5 + 4.2(0.45) + (-3.8)(0.55) + 2.5(0.40) + 2.8(0.38) + 2.3(0.42) + 3.1(0.44)$

$z_B = -3.5 + 1.89 + (-2.09) + 1.00 + 1.064 + 0.966 + 1.364$

$z_B = 0.694$

**Step 2: Apply Sigmoid Function**

$P(B \text{ is Trusted}) = \sigma(z_B) = 1 / (1 + e^{(-0.694)})$

$P(B \text{ is Trusted}) = 1 / (1 + 0.4998)$

$P(B \text{ is Trusted}) \approx 0.6668$

**Step 3: Classification Decision**

Since $P(B \text{ is Trusted}) = 0.6668 \geq 0.5$

**Classification:** Node B is TRUSTED (but with lower confidence)

**Note:** While technically classified as trusted, Node B's probability score (0.6668) is significantly lower than Node A's (0.9999), indicating borderline behavior that warrants continued monitoring.

Classification of Node E

**Step 1: Calculate Linear Predictor (z)**

$z_E = -3.5 + 4.2(0.50) + (-3.8)(0.50) + 2.5(0.48) + 2.8(0.45) + 2.3(0.47) + 3.1(0.49)$

z_E = -3.5 + 2.10 + (-1.90) + 1.20 + 1.26 + 1.081 + 1.519
z_E = 1.76

**Step 2: Apply Sigmoid Function**
P(E is Trusted) = σ(z_E) = 1 / (1 + e^(-1.76))
P(E is Trusted) = 1 / (1 + 0.1718)
P(E is Trusted) ≈ 0.8533

**Step 3: Classification Decision**
Since P(E is Trusted) = 0.8533 ≥ 0.5
**Classification:** Node E is TRUSTED

**Complete Network Classification Results**
**Classification Results for All Nodes (Table 2)**

**Interpretation and Insights**
**High-Confidence Trusted Nodes**
Nodes A, C, and D exhibit probability scores exceeding 0.999, indicating extremely reliable behavior across all trust metrics. These nodes demonstrate: - High packet delivery ratios (>0.90) - Low packet loss rates (<0.10) - Strong energy efficiency, responsiveness, cooperation, and reliability

**Moderate-Confidence Nodes**
Node E shows acceptable but not exceptional behavior (P = 0.8533), suggesting: - Average performance across all metrics (~0.50) - Potential for degradation requiring continued monitoring - No immediate threat but warrants observation

**Low-Confidence Nodes**
Node B represents a borderline case (P = 0.6668) with concerning characteristics: - Below-average packet delivery ratio (0.45) - High packet loss rate (0.55) - Poor performance across multiple metrics

**Recommendation:** Node B should be placed under enhanced monitoring. While not definitively classified as blackhole, its behavior patterns suggest potential compromise or malfunction.

**Threshold Sensitivity Analysis**
The classification threshold significantly impacts detection performance. Classification Variations with Different Thresholds (Table 3). This analysis demonstrates how threshold adjustment enables fine-tuning of security posture: - Lower thresholds(θ = 0.3): More permissive, reducing false positives but increasing false negatives-Higher thresholds (θ = 0.9): More restrictive, reducing false negatives but increasing false positives. Optimal threshold selection depends on specific application security requirements and the relative costs of different error types.

**Experimental Results and Performance Analysis**
**Simulation Environment and Configuration**
Performance evaluation was conducted using the **Cooja Simulator**, a widely-adopted network simulation tool specifically designed for IoT and wireless sensor network research. Cooja provides accurate modeling of resource-constrained devices and realistic network conditions. Comprehensive Simulation Configuration (Table 4).

**Experimental Results: Packet Dropping Ratio Analysis**
**Observation:** Figure 3 illustrates the relationship between blackhole node percentage and packet dropping ratio across the three evaluated approaches.

**Key Findings**

**Traditional RPL Protocol**

- Exhibits dramatic increase in packet dropping as blackhole percentage rises
- At 80% blackhole nodes: ~75% packet dropping ratio
- Lacks security mechanisms to detect or mitigate attacks
- Vulnerable to complete network disruption under severe attack conditions

**Bhalaji *et al.* (2020) Model**

- Shows moderate improvement over traditional RPL
- At 80% blackhole nodes: ~50% packet dropping ratio
- Single-metric (PDR-only) trust evaluation provides limited protection
- Insufficient for comprehensive blackhole detection

**Proposed Framework**

- Demonstrates superior resistance to packet dropping
- At 80% blackhole nodes: ~20% packet dropping ratio
- Multi-metric trust evaluation enables accurate blackhole identification
- Maintains network functionality even under severe attack scenarios

**Packet Dropping Ratio vs. Blackhole Node Percentage (Figure 3).**

**Packet Delivery Ratio Analysis**

**Observation:** Figure 4 demonstrates how packet delivery ratio varies with increasing blackhole node presence.

**Key Findings**

**Traditional RPL Protocol**

- Severe degradation in packet delivery as attacks intensify
- At 10% blackhole nodes: ~85% PDR
- At 80% blackhole nodes: ~25% PDR
- Nearly complete network failure under heavy attack

**Bhalaji *et al.* (2020) Model**

- Moderate performance improvement
- At 10% blackhole nodes: ~90% PDR
- At 80% blackhole nodes: ~50% PDR
- Limited by single-metric trust evaluation

**Proposed Framework**

- Maintains high packet delivery across all attack scenarios
- At 10% blackhole nodes: ~98% PDR
- At 80% blackhole nodes: ~80% PDR
- Robust performance through comprehensive trust assessment

**Packet Delivery Ratio vs. Blackhole Node Percentage (Figure 4).**

**Observation:** Figure 5 presents average end-to-end delay measurements as blackhole node percentage increases.

**Key Findings**

**Traditional RPL Protocol**

- Experiences dramatic delay increases under attack

- **At 10% blackhole nodes:** ~150ms average delay
- **At 80% blackhole nodes:** ~850ms average delay
- Caused by retransmissions, route recalculations, and network instability

**Bhalaji *et al.* (2020) Model**
- Shows moderate delay improvement
- **At 10% blackhole nodes:** ~100ms average delay
- **At 80% blackhole nodes:** ~400ms average delay
- Limited by incomplete blackhole detection

**Proposed Framework**
- Maintains consistently low delays across all scenarios
- **At 10% blackhole nodes:** ~50ms average delay
- **At 80% blackhole nodes:** ~120ms average delay
- Achieves efficiency through accurate blackhole elimination

**Average End-to-End Delay vs. Blackhole Node Percentage (Figure 5).**

**Routing Overhead Analysis**

**Observation:** Figure 6 illustrates routing overhead (control message burden) across different blackhole attack intensities.

**Key Findings**

**Traditional RPL Protocol**
- Highest routing overhead across all scenarios
- **At 10% blackhole nodes:** ~25% overhead
- **At 80% blackhole nodes:** ~70% overhead
- Caused by continuous route discovery attempts and failure recovery

**Bhalaji *et al.* (2020) Model**
- Moderate overhead reduction
- **At 10% blackhole nodes:** ~18% overhead
- **At 80% blackhole nodes:** ~45% overhead
- Incomplete blackhole detection leads to routing instability

**Proposed Framework**
- Minimal routing overhead across all conditions
- **At 10% blackhole nodes:** ~8% overhead
- **At 80% blackhole nodes:** ~20% overhead
- Efficient operation through accurate malicious node elimination

**Routing Overhead vs. Blackhole Node Percentage (Figure 6).**

**Observation:** Figure 7 presents detection accuracy (percentage of correctly identified blackhole nodes) across varying attack intensities.

**Key Findings**

**Traditional RPL Protocol**
- No inherent detection capability
- Detection accuracy: ~0% across all scenarios

- Completely vulnerable to blackhole attacks
- Requires external security mechanisms

**Bhalaji *et al.* (2020) Model**
- Moderate detection capability
- **At 10% blackhole nodes:** ~75% detection accuracy
- **At 80% blackhole nodes:** ~60% detection accuracy
- Limited by single-metric (PDR-only) trust evaluation
- Cannot distinguish sophisticated attackers mimicking normal PDR

**Proposed Framework**
- Exceptional detection performance
- **At 10% blackhole nodes:** ~98% detection accuracy
- **At 80% blackhole nodes:** ~92% detection accuracy
- Multi-metric evaluation provides comprehensive behavioral assessment
- Logistic regression enables precise classification

**Detection Accuracy vs. Blackhole Node Percentage (Figure 7).**

**Interpretation:** The proposed framework maintains detection accuracy above 92% even under extreme attack conditions, providing reliable security assurance for mission-critical IoT applications where false negatives (undetected attacks) could have severe consequences.

**Comparative Performance Summary**
Comprehensive Performance Comparison at 80% Blackhole Nodes (Table 5).

**Statistical Significance Testing**
To validate the observed performance improvements, statistical significance testing was conducted using paired t-tests comparing the proposed framework against both baseline models.

## RESULTS

All performance improvements demonstrated statistical significance at $p < 0.01$ level - Confidence intervals confirmed consistent superiority across multiple simulation runs - Effect sizes (Cohen's d) ranged from 1.8 to 3.2, indicating large practical significance

## DISCUSSION AND INSIGHTS

**Why Multi-Metric Evaluation Outperforms Single-Metric Approaches**
The Bhalaji *et al.* (2020) model relies solely on Packet Delivery Ratio for trust assessment, creating vulnerability to sophisticated attackers who can manipulate this single metric while continuing malicious activities. In contrast, our proposed framework's six-metric evaluation creates a comprehensive behavioral profile that is exponentially more difficult to fake:
**Packet Loss** may reveal dropping behavior even when PDR appears acceptable
**Energy Efficiency** exposes abnormal power consumption patterns
**Responsiveness** detects delays introduced by malicious processing
**Cooperation** identifies reluctance to participate in routing
**Reliability** captures behavioral inconsistencies over time

**Logistic Regression Advantages for IoT Security**
Logistic regression proves particularly well-suited for IoT security applications due to
**Computational Efficiency**: Linear operations with minimal processing requirements
**Memory Efficiency**: Small model size (only 7 parameters for 6 features)
**Interpretability**: Clear understanding of which features influence classification
**Probabilistic Output**: Confidence scores enable risk-based decision making
**Training Speed**: Rapid convergence enables frequent model updates

**Scalability Considerations**
The proposed framework demonstrates excellent scalability characteristics
**Linear Computational Complexity**: O(n) where n = number of nodes
**Distributed Processing**: Each node independently evaluates neighbors
**Minimal Communication Overhead**: Trust evaluation uses existing network traffic
**Incremental Updates**: Model parameters can be updated without full retraining

**Real-World Deployment Implications**
The experimental results suggest strong practical viability
**High Reliability**: 80% PDR even under extreme attack (80% compromised nodes) supports mission-critical applications
**Low Latency**: <120ms delays enable real-time control systems
**Bandwidth Efficiency**: <20% routing overhead preserves capacity for data transmission
**Accurate Detection**: >92% accuracy minimizes false positives and false negatives
**Resource Compatibility**: Lightweight computation suitable for constrained devices

## CONCLUSION AND FUTURE RESEARCH DIRECTIONS

**Research Contributions**
This research has introduced a novel, lightweight security framework for detecting and mitigating blackhole attacks in resource-constrained IoT networks.

The key contributions include
**Comprehensive Trust Assessment**: Integration of six behavioral metrics (PDR, PL, EE, RES, C, R) providing multi-dimensional node evaluation

**Efficient Classification**: Application of logistic regression for computationally efficient, probabilistic node classification

**Superior Performance**: Demonstrated improvements across all critical metrics compared to existing approaches

**Practical Viability**: Validated suitability for real-world deployment in resource-limited environments

**Scalable Architecture**: Linear complexity supporting large-scale network deployments

**Key Findings**
Experimental validation through extensive simulation studies has revealed
**Detection Accuracy**: The proposed framework achieves >92% accuracy in identifying blackhole nodes even when 80% of the network is compromised

**Network Resilience**: Maintains 80% packet delivery ratio under extreme attack conditions, compared to 25% for traditional RPL

**Latency Performance**: Keeps end-to-end delays below 120ms across all scenarios, supporting real-time applications

**Efficiency**: Minimizes routing overhead to <20%, preserving bandwidth for data transmission

**Robustness**: Consistent performance across varying attack intensities and network conditions

## ABSTRACT

Genetic improvement in dairy cattle has evolved from pedigree-based selection to genomic selection and, more recently, to approaches that integrate artificial intelligence (AI). AI methods — particularly machine learning (ML) and deep learning (DL) — allow integration of high-dimensional, heterogeneous data (genotypes, longitudinal sensor streams, images, and environmental records) and can model complex, non-linear genotype–phenotype relationships. This review synthesizes recent progress (2020–2025) in applying AI to genomic prediction, phenotype extraction, multi-trait selection, and decision support for dairy herd improvement. We summarize comparative evidence against conventional approaches (GBLUP, Bayesian regression), identify challenges (data needs, interpretability, overfitting, population structure), and outline practical implementation pathways for breeding programs. Finally, we propose priority research directions and recommendations for breeders to harness AI responsibly while safeguarding animal fitness and genetic diversity.

**Keywords:** Genomic Selection; Artificial Intelligence; Machine Learning; Deep Learning; Dairy Cattle; Phenomics; Herd Improvement

## INTRODUCTION

Genetic improvement has long driven efficiency gains in dairy production. The adoption of genomic selection accelerated progress by enabling more accurate early selection. Concurrently, the proliferation of on-farm sensors, automated recording systems, and large genotype databases created opportunities for AI to identify complex patterns and integrate information across modalities. AI offers potential advantages for predicting low-heritability traits, extracting objective phenotypes from images and sensor data, and modeling genotype-by-environment interactions. This review focuses on how AI contributes to genetic enhancement in cattle and how breeding programs can integrate these methods sustainably.

## OBJECTIVES

1. Review AI methods applied to genomic prediction and phenotype extraction in dairy cattle (2020–2025).
2. Compare AI performance with traditional statistical genomic models.
3. Discuss data, ethical, and implementation challenges.
4. Provide actionable recommendations and research priorities for breeders and herd managers.

## METHODS

A targeted literature search was conducted across major scientific databases and journals (2020–2025). Studies were selected for methodological rigor and relevance to genomic prediction, phenomics, or herd-level implementation. This review is narrative rather than systematic; a supporting literature table summarizing key studies is provided below.

**AI methods in genomic prediction and phenotyping**

**Supervised machine learning**
Random forests, gradient boosting machines, and support vector machines (SVMs) are commonly used to model complex relationships and for feature selection with high-dimensional SNP or sensor data.

**Regularized linear models and Bayesian approaches**
Elastic net and LASSO provide shrinkage and variable selection valuable for thousands of markers. Bayesian variable selection models (e.g., BayesR) remain strong baselines.

**Deep learning**
Feed-forward neural networks, convolutional neural networks (CNNs) for image data, and recurrent/temporal architectures for longitudinal sensor data enable automated feature learning and multi-modal integration.

**Hybrid and ensemble strategies**
Combining linear genomic best linear unbiased prediction (GBLUP) with ML/DL components captures both additive linear effects and non-linear interactions.

**Evidence: performance and applications**

**Prediction accuracy**
Comparative studies report heterogeneous outcomes. In many cases, AI (particularly DL) achieves modest accuracy gains for complex traits or when integrating non-genetic high-dimensional phenotypes; in others, gains are marginal and depend strongly on sample size, marker density, and trait architecture.

**Phenomics and sensor integration**
AI excels at extracting objective phenotypes from images (conformation, body condition) and sensor streams (activity, rumination). These derived phenotypes often enhance prediction for health, fertility, and resilience traits.

**Low-heritability and resilience traits**
Multi-modal AI models combining genotype, environment and sensor data show promise for improving predictions of fertility, disease susceptibility and heat tolerance.

**Challenges and limitations**
**Data quantity and quality:** ML/DL require large, labeled datasets; many populations lack sufficient sample size.
**Population structure and bias:** Relatedness and stratification can bias predictive models if not correctly accounted for.
**Interpretability:** DL models are often black boxes; explainable AI methods are needed for biological insight and breeder acceptance.
**Overfitting and generalizability:** Robust cross-validation and external validation across independent herds/breeds are crucial.
**Genetic diversity concerns:** Rapid selection based on AI-augmented indices may increase inbreeding unless fitness traits are included.

**Implementation pathways for breeding programs**
**Hybrid pipelines:** Use GBLUP for baseline breeding values and ML/DL to augment with non-linear effects or phenomics features.
**Federated learning:** Privacy-preserving collaborative training across organizations to increase effective sample size.
**Standardized phenomics protocols:** Ensure consistent data collection and annotation for generalizable models.
**Governance and explainability:** Adopt model audit frameworks and require transparent reporting of model performance and limitations.

**Research priorities**
1. Build large, multi-breed, multi-environment datasets linking high-density genotypes and phenomics.
2. Benchmark ML/DL against GBLUP with robust external validation.
3. Develop interpretable AI methods focused on biological understanding.
4. Study long-term genetic consequences (inbreeding, correlated responses) of AI-driven selection.
5. Pilot federated learning consortia.

## DISCUSSION AND CONCLUSIONS

AI methods are valuable complements to existing genomic selection systems. They offer particular advantages for integrating phenomics and modeling complex relationships, with potential gains for low-heritability traits. Achieving reliable, generalizable benefits requires investment in standardized data collection, collaborative training datasets, model interpretability, and governance frameworks that prioritize long-term population health.

**Description**
**This schematic illustrates the end-to-end AI-driven genomics workflow used in dairy herd improvement programs.**
**Components**
**Data Sources**
- Genotype data (SNP chips, whole-genome sequences)
- Sensor data (activity, rumination, milk yield, temperature)
- Image data (body conformation, body condition scoring)

- Environmental and management data (feeding, climate, housing)

**Preprocessing and Integration**
- Data cleaning, normalization, imputation, feature encoding
- Data fusion across modalities (genotype × phenotype × environment)

**Modeling Approaches**
- GBLUP/Bayesian models: Linear additive genetic effects
- Machine Learning (RF, GBM): Non-linear feature modeling and selection
- Deep Learning (CNN, RNN, DNN): Multi-modal integration and feature extraction

**Outputs**
- Genomic Estimated Breeding Values (GEBVs)
- Disease risk and fertility predictions
- Decision support dashboards for breeders

**Feedback Loop**
- Continuous learning and retraining with new data
- Model evaluation, validation, and monitoring for drift

**Implementation Roadmap for AI-Assisted Herd Improvement**
**Flowchart Outline**
**Data Collection and Digitization:** Gather and standardize herd data (milk, fertility, health, environment).
**Data Integration:** Link genotype, phenotype, and environmental datasets.
**Model Training and Validation:** Use GBLUP as baseline; train ML/DL models with rigorous cross-validation.
**Pilot Deployment:** Implement AI-assisted predictions in select herds; monitor accuracy and reliability.
**Integration into Selection Indices:** Combine AI-based results with traditional indices to guide breeding decisions.
**Monitoring and Governance:** Regularly audit models for bias, interpretability, and genetic diversity impacts.
**Feedback and Continuous Improvement:** Retrain models with updated data to refine prediction accuracy.

**Table 2: Comparative Table of Genomic and AI-Based Methods**

| Method | Type | Strengths | Weaknesses | Data Requirements | Typical Applications |
|---|---|---|---|---|---|
| **GBLUP** | Linear | Simple, interpretable, proven accuracy | Misses non-linear effects | Genotype–phenotype pairs | Baseline genomic evaluation |
| **BayesR** | Bayesian | Handles variable SNP effects | Computational cost | Dense genotype data | Multi-trait selection |
| **Random Forest (RF)** | ML Ensemble | Non-linear feature selection, interpretable | Overfitting with small data | Moderate-large datasets | Health and fertility prediction |
| **Gradient Boosting (GBM/XGBoost)** | ML Ensemble | High accuracy, handles noise | Requires hyperparameter tuning | Large structured datasets | Multi-trait, resilience prediction |
| **Deep Neural Networks (DNN)** | DL | Captures complex patterns | High data and compute demand | Large multi-modal datasets | Genomic prediction + sensor fusion |
| **CNN / RNN Models** | DL | Excellent for images/time series | Sensitive to noise; complex | Image/sensor data | Phenomics and behavior modeling |

**Table 3: Recommended Reporting Checklist for AI-Genomic Studies**

| Reporting Item | Description / Recommendation |
|---|---|
| **Data Description** | Specify dataset size, breed/population, data types (genotype, phenotype, environment). |
| **Preprocessing Steps** | Describe normalization, imputation, and data fusion processes. |
| **Model Architecture / Hyperparameters** | Report model type, depth, layer count, tuning strategy. |
| **Cross-Validation Strategy** | Define folds, randomization, population structure control, and repeats. |
| **External Validation** | Include independent dataset evaluation and report generalization metrics. |
| **Interpretability Methods** | Use SHAP, LIME, or feature importance to explain model predictions. |
| **Performance Metrics** | Report accuracy, RMSE, correlation with true breeding values. |
| **Potential Biases** | Identify biases due to population stratification or unbalanced data. |
| **Population Genetic Monitoring** | Track inbreeding coefficient, effective population size, diversity indices. |
| **Ethical and Governance Statements** | Describe compliance with animal welfare, data privacy, and fair model use policies. |

**ABSTRACT**

One of the main processes in an IoT-based wireless sensor network environment is clustering, which starts at the deployment stage. IoT networks are heterogeneous and resource-constrained, therefore to optimize the network and enhance overall performance, routing, dynamic clustering, and cluster head selection are essential. Due to the wide variety of IoT hardware that is readily available, putting them all under one roof is a crucial task that is also really important. In this paper, we first discuss clustering principles and clustering routing protocols, emphasizing their goals, benefits, and drawbacks.

**Keywords:** IoT, environment, performance, Cluster, Networks, Wireless.

## INTRODUCTION

The introduction of several IoT devices with different hardware architectures makes the networking omnipresent in all domains [1]. The word 'smart' can be preceded almost every electronic gadget available these days [2]such as smart watch, smart TV, smart fridge, smart pen etc. Organizing these devices under a single network is a challenging job because excluding the uniformity in following IEEE 802.11 communication standard, remaining all other architectures such as embedded chips and their driver software are exceedingly different between the IoT Nodes. A tiny 8-bit brained device and a rigid non-stop work rig both can be a part of a single network at present [3]. This multifariousness between the nodes has to be handled very carefully to avoid the performance glitches. The power sources of these devices also differ based on the purpose of the devices.

Clustering is an elementary operation in networking which is responsible for interconnect different devices into a single entity [4]. The clustering procedure should provide a smooth bridge between the configurational deviations between the devices. Energy efficiency is one of the most important characteristics of modern networks because most of the network member nodes are battery powered while considering wireless sensor networks in particular [5]. A perfect clustering procedure should provide sufficient security to the network without increasing much power consumption as well as without bothering the performance of the network. The challenge behind network clustering is, parameters such as security, power consumption and network performance are tied together in most cases.

**Study of Existing Clustering Routing Protocol**

Wang J proposed to improve the performance of clustering, APSA[6] work combines the K-Medoid and Affinity Propagation approaches. Unbalanced power consumption and unequal cluster head distribution are less likely to occur when this integration is used. For K-Medoid, the number of cluster heads and their locations are determined using affinity propagation. The Network Model and Energy Model comprise ASPA, and the models' parameters are optimized in an iterative method. In ASPA, a specific algorithm is introduced for the Initialization, Setup, and Communication phases. MATLAB simulation is used to conduct experiments based on varying numbers of sensor nodes in the surrounding environment. The ASPA method's recognized benefit is energy efficiency, whereas the work's limits are highlighted as diminishing performance characteristics.

The standard LEACH algorithm suffers the issue of performance decay over network size. A new energy-efficient scalable routing algorithm is introduced in EESRA[7] work to overcome the mentioned issue of default LEACH. The network's overall lifespan is increased by E. F. Ahmed Elsmany's suggested EESRA, which achieves optimal routing between the nodes. A three-layer hierarchical algorithm is used to construct the primary module of EESRA. There are two phases exist in the EESRA method, they are Setup phase and Steady-state phase. The Setup phase is to initialize the genesis random routing and the Steady-state phase is used to converge the routings towards the optimum. The performance of EESRA is evaluated by the simulation with 100, 200, 300 and 400 nodes and the performance of EESRA is promising in terms of load balancing and energy efficiency in large scale networks. Achievement of load balancing and energy efficiency in large scale networks is the learned advantage of EESRA method whereas, compromised network performance in terms of throughput and packet delivery rate is the noted disadvantage.

AdemFanos Jemal proposed that EESCH[8] prefers the placement of routers to improve the energy-efficiency. The cluster wise router placement selection is performed by K-Means algorithm. Nodes with adequate battery power from each cluster are selected as the cluster heads and work as the inter-cluster communication hubs. Dispersed address assignment scheme is used in EESCH method in which the Gateway is responsible for number of child nodes, number of routers and maximum number of hops to reach the cluster head of every cluster. OPNET simulator is used to evaluate the performance of EESCH in terms of Throughput, End-to-end delay and Packet delivery rate. Achievement of mentioned parameters for low range network environments is the noted advantage of this method whereas, applicability of EESCH in more than 500 square meters is not addressed – which is known as the limitation of this work.

RECHS [9] work focuses on the processes of cluster head selection and substitution proposed by T. M. Behera. More than one cluster heads for a cluster are selected based on the initial energy. In the beginning a single cluster head in each cluster is active at a time based on the initial energy and the cluster head substitution or rotation process is performed based on the residual energy. Whenever a cluster head is about to drain a significant amount of power, the role of the cluster head is assigned to another eligible node to be a cluster head. MATLAB is used to evaluate the performance of RECHS for the simulation environment of 100 square meters with 100 nodes. Based on the observed results both Throughput and the lifetime of the network is improved by about 60% which is the advantage of the device. Application environment of 100 square meters is a short range for modern IoT applications and the performance of RECHS is limited to that range is the limitation of this method.

Anu Sharma *et.al.,* presented a work based on Alternative Convergent Sunflower Optimization, thus abbreviated as ACSO[10]. The motivation behind ASCO work is to simplify the standard prototype LEACH protocol to maintain an equilibrium between power and performance by introducing diversification and intensification mechanisms. Energy efficiency, Network lifespan, and data transmission rate are taken as the primary concerns in ACSO work. Experiments were carried out based on MATLAB based implementation. Network lifetime, Communication overhead, Energy consumption, and Scalability are the reviewed parameters in the results and discussions section As per the claim, improved network lifetime is the advantage of ACSO work, whereas, compromised network performance such as Throughput and Packet delivery ratio are the observed limitations of ACSO work. The maximum number of nodes taken for the experiment is 400, thus the applicability of ACSO work for high density network environment is in ambiguity.

Monika Malik *et.al.,* introduced ABOLEACH[11 work that is optimized with African Buffalo metaheuristic algorithm. Low energy and High energy nodes are distinguished in ABOLEACH work for efficient routing purposes. A temporary route is created during the energy aware phase to overcome connection failures in the wireless sensor networks. A dedicated algorithm is developed to handle the Low and High-power node categories. A MATLAB based implementation is used to evaluate the performance of ABOLEACH work. Throughput, Energy consumption, Communication delays and Packet loss are measured during the MATLAB Simulation. Maximum number of simulated nodes is restricted to 125 only. Achievement of lower power consumption while comparing with other discussed methods is the advantage of ABOLEACH method. The avowed improvement is demonstrated only with 125 number of nodes. The operability with limited number of nodes is observed as the limitation of ABOLEACH work.

Gharge *et.al.,* introduced a Hybrid Genetic Algorithm based Cluster Head Selection anchored in LEACH to improve the performance of wireless sensor networks. It is contended that HGACHS[12] method improves the network performance by minimizing the Fist Node Dead, Half Node Dead, Last Node Dead scenario. MATLAB is used to perform the network simulation for the experiments. Performance parameters such as Throughput, Jitter, Averages number of dead nodes, and Energy consumption are measured during the experiments. Mitigated energy consumption and progressed network lifetime are the observed advantage of HGACHS work. The performance improvement of HGALEACH is demonstrated for 200 number of nodes deployed in 200 square meters during the simulation. Narrowed simulation space with a smaller number of nodes does not comply with a typical real-world environment. Overall increase in End-to-End delay is the noted limitation of HGACHS method. Kushwaha, V. *et.al.,* submitted a multi-criteria decision-making method to improve the wireless sensor network performance. Fuzzy Analytical Hierarchy Process is used in SACMUF [13] method to control the network traffic congestion. SACMUF selects the cluster heads based on the factors specifically Node potential, Remaining energy, Traffic burst rate, and Node load rank. A MATLAB simulation with 100 number of nodes deployed in 200 square meters is created for the evaluation purpose of the discussed method. Energy consumption, and Number of Dead nodes are measured during the experiments to evaluate the performance of the methodologies.

Improved energy saving of the proposed method causes less energy consumption and less number of dead nodes during the simulation process. More remaining energy at a specific timestamp, and lower number of dead node count are the advantages of SACMUF method. Essential network performance metrics such as Throughput, Communication delays, and Packet delivery rate are not accomplished in SACMUF work, which in observed as the limitation. The summary about existing works, Methodologies used, their advantages and limitations are enumerated in Table 1.

## CONCLUSION

In accordance with the interpretations performed on existing methods, it is identified that, there is an huge opportunity for more research works towards IoT-WSN environment betterments. Most of the IoT-WSN nodes are

battery powered devices with limited computational resources. Therefore, it is indispensable fact that the algorithms which are going to operate in an IoT-WSN should be kept lightweight to embed in the nodes. The resonance between the power and performance should be maintained in a streamlined manner to get most out of the network. A clear research is necessitated to improve the IoT-WSN related tasks such as Node deployment Clustering, Cluster head selection, Routing, Authentication, Load balancing, and Security.

**ABSTRACT**

Polycystic Ovary Syndrome (PCOS) is a prevalent endocrine disorder affecting reproductive-aged women, associated with metabolic, reproductive, and psychological complications. This literature review evaluates the role of physical therapy in managing PCOS. Following PRISMA guidelines, a comprehensive search across databases including PubMed, PEDro, Cochrane Library, and Google Scholar was conducted to include high-quality RCTs and systematic reviews published between 2011 and 2025. Interventions like aerobic training, resistance exercise, yoga, and physiotherapy-led lifestyle programs were examined. Results from 25 studies demonstrated that aerobic and resistance training significantly improved insulin sensitivity, reduced BMI and waist circumference, and promoted menstrual regulation. Yoga and holistic interventions enhanced psychological well-being and hormonal balance. However, variations in duration, frequency, and intensity affected outcomes. The review concludes that physiotherapy is an effective and sustainable non- pharmacological strategy for PCOS management. Further high-quality studies are warranted to develop standardized protocols.

**Keywords:** PCOS, Physiotherapy, Exercise Therapy, Insulin Resistance, Women's Health

## INTRODUCTION

Polycystic Ovary Syndrome (PCOS) is a heterogeneous endocrine disorder primarily affecting women of reproductive age. It is characterized by chronic anovulation, hyperandrogenism, and polycystic ovarian morphology

[1]. PCOS is associated with an increased risk of obesity, insulin resistance, metabolic syndrome, type 2 diabetes, infertility, and psychological disorders [2,3]. Prevalence ranges from 4% to 21%, influenced by diagnostic criteria and population characteristics [4]. The Rotterdam criteria (2003) are widely accepted, requiring two of three features: oligo/anovulation, clinical or biochemical hyperandrogenism, or polycystic ovaries [5]. The pathophysiology of PCOS involves a complex interplay of genetic, hormonal, metabolic, and environmental factors [6,7]. Key mechanisms include insulin resistance, hyperinsulinemia, increased luteinizing hormone (LH) secretion, and chronic inflammation [8,9]. Women with PCOS often present with menstrual irregularities, hirsutism, acne, obesity, infertility, and emotional distress [10,11]. Lifestyle factors, including diet and physical inactivity, further exacerbate the condition [12]. Although pharmacological treatments such as hormonal contraceptives and insulin sensitizers are commonly used, they may have limitations and adverse effects [13]. Physical therapy, including structured exercise programs and lifestyle interventions, has emerged as an effective and non-invasive approach to address both physical and psychological symptoms of PCOS [14,15].

## MATERIALS AND METHODS

This review adhered to PRISMA guidelines and included randomized controlled trials (RCTs), systematic reviews, and high- quality observational studies. A systematic search was conducted in PubMed, Cochrane Library, PEDro, and Google Scholar, focusing on studies published between 2011 and 2025. Search terms included "PCOS," "physical therapy," "exercise," "aerobic training," "resistance training," "yoga," and "RCT."

**Inclusion criteria:** Women aged 18–45 diagnosed with PCOS by Rotterdam, NIH, or AE-PCOS criteria; studies evaluating physiotherapy-based interventions; full- text availability in English.

**Exclusion criteria:** Pharmacological-only studies, low-quality trials, abstracts without full text, non-English language articles.

Data extracted included sample size, intervention type, duration, frequency, outcomes (BMI, insulin sensitivity, hormone levels, menstrual cycle, psychological impact), and risk of bias (assessed using Cochrane Risk of Bias 2.0 and AMSTAR-2 tools). Due to methodological heterogeneity, a narrative synthesis was performed.

## RESULTS AND DISCUSSION

Twenty-five eligible studies assessed the impact of physical therapy interventions in PCOS. Aerobic exercise (3–5 sessions/week for 12–24 weeks) consistently improved insulin sensitivity, BMI, and menstrual regulation [16–18]. Resistance training significantly reduced central adiposity and improved metabolic markers [19,20]. Combined aerobic and resistance programs yielded superior hormonal and ovulatory outcomes [21]. Yoga and mind-body interventions contributed to reduced anxiety, improved mood, and hormonal balance [22,23]High-intensity interval training (HIIT) showed better outcomes than moderate-intensity training in some cardiometabolic markers [24,25]. However, results varied based on adherence, program duration, and baseline health status [26]. While lifestyle interventions demonstrated strong benefits, limitations included small sample sizes, short duration, and heterogeneity in protocols. There remains a need for personalized, long-term physiotherapy strategies and standardized clinical guidelines. Literature screening process (Chart). Summary of Included Studies on the Effects of Physical Therapy and Exercise Interventions in Women with PCOS (2011–2025) Table:1.

## CONCLUSION

Physical therapy is a promising, low-risk, and effective approach in managing PCOS. Interventions such as aerobic and resistance training, yoga, and structured lifestyle programs can improve metabolic, reproductive, and psychological outcomes. Integration into standard care protocols can promote holistic well-being in women with PCOS. Future studies should focus on long- term outcomes and protocol standardization.

## ACKNOWLEDGEMENT

The authors thank Dr. Vijay Pandita and Dr. Jahanvi Barot for their continuous guidance. Gratitude is extended to Nootan College of Physiotherapy for institutional support.

**Table 1: Summary of Included Studies on the Effects of Physical Therapy and Exercise Interventions in Women with PCOS (2011–2025)**

| | Author (Year) | Study Design | Sample Size | Population | Intervention | Duration | Outcomes Measured | Key Findings |
|---|---|---|---|---|---|---|---|---|
| 1 | Hu R *et al*. (2025) | Systematic Review and Network Meta-analysis | 29 RCTs (n=1,565) | Women with PCOS | 22 non-pharmacological interventions | Varied (Meta-analysis) | BMI, WC, WHR, body weight | Taichi, supplements + diet, aerobic exercise most effective for weight outcomes |
| 2 | Gupta and Yadav (2025) | RCT | N=61 | Women with PCOS | Structured PA (9000 steps/day) | 12 weeks | HbA1c, lipid profile, LH, testosterone, insulin, FAI, HOMA-IR | Significant metabolic and hormonal improvement (↓ HbA1c, LDL, insulin, FAI) |
| 3 | Woodward A *et al*. (2024) | Qualitative Study | N=11 interviews | Women with PCOS | Semi-structured interviews on PA behaviour | Not applicable | Themes on PA barriers and facilitators | Barriers: stigma, symptoms; Facilitators: knowledge, support, holistic focus |
| 4 | Gadelha JG *et al*. (2024) | Qualitative Literature Review | Not specified | Women with PCOS | Physical exercise and lifestyle changes | Not applicable | Menstrual cycle, fertility, QOL, mood | Exercise improved menstrual regulation, fertility, mood, QOL |
| 5 | Motaharinezhad F *et al*. (2024) | Systematic Review and Network Meta-analysis | 19 RCTs | Women with PCOS | Aerobic, resistance, endurance, yoga | Varied (RCTs in review) | BMI, hormones, menstrual regularity | Aerobic exercise most effective for BMI; no hormonal change |
| 6 | Wang A *et al*. (2024) | Pilot RCT | N=36 (20 completed) | Inactive women with PCOS and insulin resistance | Vigorous vs moderate home-based exercise | 8 weeks | Glucose, insulin, HOMA-IR | No significant glucose/insulin changes; moderate > vigorous glucose response |
| 7 | Sopna SC *et al*. (2023) | Parallel-group | N=40 | Obese women with | CIT + Physiothera | 6 weeks | BMI, WHR, WHtR, QOL | CIT + education improved BMI, |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | RCT | | PCOS | py education | | | WHR, QOL significantly vs conventional therapy |
| 8 | Colombo GE *et al.* (2023) | Systematic Review and Meta-analysis | 5 RCTs (n=216) | Adult women with PCOS | HIIT, MICT, RT | Varied (RCTs in review) | Anthropometric, metabolic, reproductive, psychological | HIIT may improve menstrual cycle, but no significant difference in other metrics |
| 9 | Santos IK *et al.* (2022) | RCT | N=23 | Overweight women with PCOS | HIIT with detraining | 12 weeks + 30 days detraining | SF-36, DASS-21 | HIIT improved mental health; detraining reduced sustained gains |
| 10 | Breyley-Smith A *et al.* (2022) | Systematic Review and Meta-analysis | 18 RCTs (n=593) | Women with PCOS | Aerobic and/or resistance training | ≥4 weeks | Cardiorespiratory fitness, WC, SBP, glucose, insulin resistance | Improved fitness, WC; no effect on BP, glucose, insulin resistance |
| 11 | Patten RK *et al.* (2022) | RCT | N=29 | Women with PCOS (age 18–45) | HIIT vs MICT | 12 weeks | $VO_2$ peak, insulin sensitivity, SHBG, menstrual regularity | HIIT superior for fitness, insulin sensitivity, SHBG, menstrual cyclicity |
| 12 | Kazeminia M *et al.* (2022) | Systematic Review and Meta-analysis | 12 studies | Women with PCOS | Exercise interventions | Varied (2011–2021) | AMH levels | Exercise ↓ AMH significantly, esp. resistance for BMI ≥25 and AMH ≥10 |
| 13 | Patten RK *et al.* (2021) | Systematic Review | 15 articles from 11 trials | Women with PCOS | Exercise interventions | Varied | Depression, anxiety, HRQoL | Exercise improves HRQoL, ↓ depression/anxiety; variability limits conclusions |
| 14 | Patten RK *et al.* (2020) | Systematic Review and Meta-analysis | 33 studies (19 in meta-analysis, n=777) | Women with PCOS | Exercise regimens (varied) | Varied | $VO_2$ peak, BMI, HOMA-IR, WC | Vigorous exercise ↑ $VO_2$ peak, ↓ HOMA-IR, WC; dose less important than intensity |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 15 | Shele G *et al.* (2020) | Systematic Review | Not specified | Women with PCOS | Aerobic, resistance, yoga | Varied | Insulin, androgens, AMH | Aerobic → insulin, resistance → androgens, yoga → hormonal balance |
| 16 | Santos IK *et al.* (2020) | Systematic Review and Meta-analysis | 10 RCTs (n=533) | Women with PCOS | Aerobic, resistance, combined | 8–32 weeks | BMI, hormones, fertility, menstrual regulation | Aerobic ↓ BMI (SMD: 0.35), hormone results inconclusive |
| | **Author (Year)** | **Study Design** | **Sample Size** | **Population** | **Intervention** | **Duration** | **Outcomes Measured** | **Key Findings** |
| 17 | Woodward A *et al.* (2019) | Systematic Review and Meta-analysis | 3 studies (n=231) | Women with PCOS not on OCP | Moderate aerobic exercise | ≥3 months | Lipid profile, glucose, SHBG, testosterone | Exercise ↓ cholesterol, glucose, BP, WHR; ↑ SHBG, ↓ testosterone |
| 18 | Khatlani K *et al.* (2019) | Systematic Review and Meta-analysis | 15 studies (9 in meta-analysis) | Overweight/ obese women with PCOS | Diet + exercise lifestyle interventions | Varied | Weight, insulin resistance, LDL | LSI ↓ weight, insulin resistance, LDL; better than Metformin for LDL |
| 19 | Benham JL *et al.* (2018) | Systematic Review and Meta-analysis | 14 studies (n=617) | Women with PCOS | Exercise training | Varied | Lipid profile, BP, insulin, menstrual parameters | Exercise improves cardiometabolic health; unclear reproductive effect |
| 20 | Rathi M *et al.* (2018) | RCT | N=30 | Indian women with PCOS | PRT, Yoga | 12 weeks | BMI, HRQoL | Yoga ↓ BMI, PRT → emotional health, HRQoL ↑ |
| 21 | Costa EC *et al.* (2018) | RCT | N=27 | Overweight/ obese women with PCOS | Supervised aerobic training | 16 weeks | HRQoL, fitness, BP, BMI, WC, cholesterol | ↑ Fitness, ↓ BMI, BP, cholesterol; HRQoL domains ↑ |
| 22 | Vizza L *et al.* (2016) | Pilot RCT | N=15 | Women with PCOS | PRT (gym + home-based) | 12 weeks | Adherence, lean mass, HbA1c | Feasible, ↑ lean mass, ↓ HbA1c, WC; improved mood/QOL |
| 23 | Almenning I *et al.* (2015) | Pilot RCT | N=31 | Women with PCOS | HIIT vs strength vs control | 10 weeks | HOMA-IR, HDL, body composition | HIIT best for insulin, HDL, vascular |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | function; strength good for body fat |
| 24 | Stener-Victorin E *et al.* (2013) | Secondary Analysis of RCT | N=72 | Women with PCOS | Acupuncture, exercise | 16 weeks + follow-up | Depression, anxiety, HRQoL | Acupuncture/exercise → ↓ depression, ↑ HRQoL; infertility scores improved |
| 25 | Harrison CL *et al.* (2011) | Systematic Review | 8 studies (5 RCTs, 3 cohort) | Women with PCOS | Exercise therapy | 12–24 weeks | Insulin resistance, weight, ovulation | Exercise ↓ insulin resistance, ↑ ovulation, weight loss; benefits across types |
| | Author (Year) | Study Design | Sample Size | Population | Intervention | Duration | Outcomes Measured | Key Findings |
| 17 | Woodward A *et al.* (2019) | Systematic Review and Meta-analysis | 3 studies (n=231) | Women with PCOS not on OCP | Moderate aerobic exercise | ≥3 months | Lipid profile, glucose, SHBG, testosterone | Exercise ↓ cholesterol, glucose, BP, WHR; ↑ SHBG, ↓ testosterone |
| 18 | Khatlani K *et al.* (2019) | Systematic Review and Meta-analysis | 15 studies (9 in meta-analysis) | Overweight/ obese women with PCOS | Diet + exercise lifestyle interventions | Varied | Weight, insulin resistance, LDL | LSI ↓ weight, insulin resistance, LDL; better than Metformin for LDL |
| 19 | Benham JL *et al.* (2018) | Systematic Review and Meta-analysis | 14 studies (n=617) | Women with PCOS | Exercise training | Varied | Lipid profile, BP, insulin, menstrual parameters | Exercise improves cardiometabolic health; unclear reproductive effect |
| 20 | Rathi M *et al.* (2018) | RCT | N=30 | Indian women with PCOS | PRT, Yoga | 12 weeks | BMI, HRQoL | Yoga ↓ BMI, PRT → emotional health, HRQoL ↑ |
| 21 | Costa EC *et al.* (2018) | RCT | N=27 | Overweight/ obese women with PCOS | Supervised aerobic training | 16 weeks | HRQoL, fitness, BP, BMI, WC, cholesterol | ↑ Fitness, ↓ BMI, BP, cholesterol; HRQoL domains ↑ |
| 22 | Vizza L *et al.* (2016) | Pilot RCT | N=15 | Women with PCOS | PRT (gym + home-based) | 12 weeks | Adherence, lean mass, HbA1c | Feasible, ↑ lean mass, ↓ HbA1c, WC; improved mood/QOL |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 23 | Almenning I *et al.* (2015) | Pilot RCT | N=31 | Women with PCOS | HIIT vs strength vs control | 10 weeks | HOMA-IR, HDL, body composition | HIIT best for insulin, HDL, vascular function; strength good for body fat |
| 24 | Stener-Victorin E *et al.* (2013) | Secondary Analysis of RCT | N=72 | Women with PCOS | Acupuncture, exercise | 16 weeks + follow-up | Depression, anxiety, HRQoL | Acupuncture/exercise → ↓ depression, ↑ HRQoL; infertility scores improved |
| 25 | Harrison CL *et al.* (2011) | Systematic Review | 8 studies (5 RCTs, 3 cohort) | Women with PCOS | Exercise therapy | 12–24 weeks | Insulin resistance, weight, ovulation | Exercise ↓ insulin resistance, ↑ ovulation, weight loss; benefits across types |

## ABSTRACT

India's Smart Cities Mission imagines and pictures cities where digital tools quietly improve daily life, public health and sustainability (Government of India, 2015. Within this wider and bigger picture, AI based wellness apps such as Healthify: AI Diet and Fitness (HealthifyMe), with its AI nutritionist Ria, are slowly but steadily becoming everyday companions for urban residents. This research paper reads a qualitative corpus of Indian Google Play reviews of HealthifyMe (2018-2025) as "street level texts" that portray how ordinary users experience this AI health infrastructure in their daily routines. Using thematic assessment, the paper identifies four main themes:

- Ria and other AI features as micro-mini coach for food and movement.
- Everyday Blue Zone style habits viz., walking, water and local food choices.
- Commercial friction around paywalls, upgrades and subscriptions.
- Worries about data quality, usability and trust.

The findings indicate that, for many users, AI characteristics including Ria, calorie tracking and step counts gently encourage them toward walking more, drinking more water and making better decisions regarding Indian food. These small steps taken are close to Blue Zone ideas of natural movement and simple, repeated routines and at the sametime, reviews also exemplify irritation with paywalls, intrusive prompts, subscription traps and algorithmic errors, which may weaken trust and may exclude some users and this research argues that HealthifyME and Ria can be understood as soft health infrastructure for Blue Zone inspired smart cities, but only if design choices veer away from short term commercial pressure and toward long term community comfort and wellbeing and fair governance. It concludes with

practical suggestions for app designers and urban planners who really want to use AI wellness tools as part of Indian urban health strategies.

**Keywords:** HealthifyME, Ria, Blue Zones, smart cities, AI nutritionist, India, user reviews, urban health

## INTRODUCTION

AI powered health and fitness apps are entering daily life and shaping how people eat, walk and think about their bodies. India's Smart Cities Mission, launched in 2015 and its aim to upgrade urban spaces with better, improved infrastructure, cleaner surroundings and digital "smart solutions" (Government of India, 2015). Official documents and speeches tend to focus on roads, sensors, traffic control and command centres. Yet a quieter shift to drastic change is taking place inside people's phones.

**Healthify:** AI Diet and Fitness, commonly called HealthifyMe is one of the most visible Indian apps. It has millions of downloads clear focus on Indian food, step counts and AI based guidance, and got a high average rating. According to the description given in the app, HealthifyME Ria portrayed as "your personal AI nutritionist" and promises a personalised wellness journey that includes calorie tracking, step tracking and links with devices such as Google fit, Samsung Health and smart scales. Meanwhile, Global conversations on Blue Zones point to small lifestyle patterns that support long, healthy lives. It incorporates natural daily movements like walking, mostly plant based diets, strong social ties and regular stress reduction. Famous Blue Zones are in places, like the islands Okinawa in Japan and Sardinia in Italy, but here the main core question is very simple: can we create environments including digital spaces, that quietly help people move and eat in better ways every day?

This paper brings forth these two frames together and asks:

- How do Indian users communicate their experiences with HealthifyMe and Ria?
- What do these stories tell us about the capability of AI health apps to support Blue Zone style lifestyles in smart Indian cities?

Instead of conducting a fresh survey, this study treats user reviews as small ethnographic windows into everyday urban health practices. The review portrays how people walk, eat, pay for subscriptions, get annoyed and frustrated, feel motivated and negotiate with an AI nutritionist in their pocket.

## LITERATURE REVIEW

**Smart cities and digital health in India**

Technology as a tool for better quality of life, efficient services and cleaner environments is highlighted on the policy documents on the Smart Cities Mission (Government of India, 2015; Ministry of Housing and Urban Affairs, 2018). Within this umbrella, in this conceptual boundary, digital health is slowly becoming a fundamental part of "smart" planning. This incorporates telemedicine platforms, wearable sensors, app-based appointment systems and AI driven analytical tools (Patel *et al*., 2021). In simple words, if we truly wish to have "smart streets", we must look not just at traffic lights but also at step counts, meal logs and digital habits of public.

**Blue Zones as a conceptual lens**

The idea of Blue Zones comes from studies of regions where people incline to live longer and encounter lower rates of chronic disease (Buettner, 2010; Pouline *et al*., 2013). Researchers highlight a few shared lifestyle patterns:

- Everyday routine natural movements such as walking, gardening and housework.
- Mostly plant-based diets and modest portions, a balanced serving size.
- Strong family, community and social ties.
- Consistent stress reducing rituals and a sense of purpose.

Few scholars have raised question about the exact methods at the rear of Blue Zone claims and about problems such as migration and record keeping (Grant, 2020). Even so, the broader lifestyle patterns have provoked many urban and community projects that promote walkability, social connection and simple, modest home cooking. For Indian cities that are confronting growing pressure from diabetes, obesity and heart disease, Blue Zone principles and ideologies can work as a simple guiding frame. They invite planners and educators to raise a direct question are we helping residents to walk more, cook simple yet healthy food at home and feel supported by their community, or we silently pushing them in the opposite direction.

**AI health apps and user reviews**

AI enabled health apps undertaking personalised diet plan, context aware nudges and continuous self-tracking. In India, apps like HealthifyMe and GOOii combine AI-Meta tools with human trainers and integrate with the devices like mobile or computer. These apps are also a part of large commercial wellness industry (Lupton, 2016; Swan, 2013). App store reviews are gradually more used as qualitative data to study and assess usability, trust and perceived benefits and harms. These reviews are written willingly, without any force often with strong emotional feelings, including gratitude, and they also reveal how the app fits into complex urban lives that include work pressure, family care and financial burdens (Pagano and Maalej, 2013). In this study, reviews of HealthifyMe are treated as citizen commentaries on how AI based nutrition tools restructuring everyday urban health practices in India.

## METHODOLOGY

**Data source and sampling**

The reviews for the analysis are drawn from Google Play Store reviews of Healthify: AI Diet and Fitness posted between 2018 to 2025 in India and written in English. From this wider pool, varied reviews that engaged with everyday food and movement, Ai or Ria and monetisation or trust concerns were identified and imported into a separate document for close reading. Within this body there are clearly positive, mixed and negative experiences. Usera comment on calorie tracking, the Indian food database, step tracking, AI features including Ria, continuous glucose monitoring, photo-based food recognition, advertisements, subscription issues and suggestions for improvement, and revealing both strengths and weaknesses of the app. Presents an overview of one coded subset used to illustrate the range of sentiments and central topics (Table 1). This table does not exhaust the full corpus but supplies a manageable slice for detailed qualitative discussion.

**Analytical approach**

This research uses thematic qualitative analysis. Each review in the body was read several times and coded for:

- Blue Zone style actions, such as walking, home foos, reduced sugar and gradual habit change.
- Ria and Ai as wellness coach, including feelings of being guided, nudged or motivated.
- Commercial and usability frictions, viz., ads, pop ups, subscription traps and pressure to upgrade.
- Data quality and trust concerns, such as doubts about calorie values, micronutrient coverage, time stamps for glucose data and errors in food recognition.
- Emotional tone and sense of impact from reviews like “this app changed my life” to “I wasted my money”

Codes were then grouped into extensive themes, which are discussed in the findings. How major themes appear in the illustrative subset of reviews (Table 2).

**Limitations**

The study has clear limits

- The qualitative body, while broader than a single case study, is still small compared with the total number of HealthifyMe users.
- Known is little about the reviewers beyond what they choose to reveal in the comments.
- People who write reviews may sit at their extremes, either very happy or very angry.

- The evaluation is based on written accounts, not on actual step logs, biometric outcomes or clinical measures.

Even with these constraints, the review offers rich, grounded stories of how urban Indian meet AI health coaching in their routines.

## FINDINGS AND DISCUSSION

**Meeting Ria: AI as a micro coach in the smart city**

**Frequency of major themes (Figure 4)**

Only a minority of reviews addressed the name Ria directly, yet when they do, they give a clear picture of how an AI coach feels in daily use. For example,

**Dr Anilka Sachdeva (R14) writes**

Review- Dr Anilka Sachdeva (Figure 5)

Here we see three overlapping functions:

1. Exact calorie tracking that increases awareness of meals.
2. Step tracking that builds natural movement visible and motivating.
3. Ria as an "always there" coach who provides small, timely tips.

From a Blue Zone view, this is powerful. Instead of having faith on hospitals or gyms, an app lives in the phone and gently nudges the user through the day. The infrastructure for health is partly digital and partly behavioural.

Other reviews do not mention Ria by name but still speak AI. For instance, Dinkar Sitaram (R3) explains:

Review- Dinkar Sitram (Figure 6)

Here in general Ai is praised, but the workflow around continuous glucose monitoring feels heavy and wrong in practice. The idea is smart, but the everyday friction is high and up normal.

**Tejas N A (R4) is more openly negative**

Review- Tejas NA (Figure 7)

In the lens of smart city, this shows how AI nutrition coaching is becoming a digital street level actor. At times it delivers helpful micro advice; in other times it frustrates users and makes them distrust the system like one bad classroom experience can undo many good lessons. The same is true here.

**Everyday Blue Zone habits: Walking, counting and Indian food**

Several reviews portray slow changes that resemble Blue Zone style habits. A long time user in R16 writes:

Review- Google user (Figure 8)

The key words are "subconsciously started trying" and move around more". This is exactly the quiet repeated behaviour change the Blue Zone work values (Buetner, 2010).

**An earlier reviewer in 218 (R15) writes**

Review-Google User (Figure 9)

**A third user in R12 shares**

Review- Google User( Figure 10)

These reviews taken together show a distinct pattern. People are not talking about extreme gym sessions, but they are talking about noticing regional foods, becoming careful around sugar, drinking more water and adding some yoga, walking or cycling. These are welcoming Blue Zone style micro habits inside Indian city life.

The importance of an Indian specific food database is mentioned across the body.

Tapan **Chaudhari (R9) says**

Review- tapan Chaudhari (Figure 11).

**Kaushal Ravi Kumar (R10) adds**
Review- Kaushal Ravi Kumar (Figure 12)
From a smart city angle, these reviews recommend that many Indian users are quietly building their own "Blue Zone streets" through calorie counters and step logs, weaving slightly better choices into office commutes, evening walks and home kitchens.

**Commercial friction, paywalls and subscription stress**
A second strong theme is frustration with monetisation and pressure to upgrade.

**Shwetha V (R5) writes with strong emotion**
Review -Shweta V (Figure 13)
She undoubtedly values the tool and calls it life changing but at the same time, the shift towards paid access for core features makes her feel shocked and sad.

**Aleena Fernandez (R6) writes**
Review- Aleena Fernandaz (Figure 14)

**Kalpana Raval (R7) complains**
Review- Kalpana Raval (Figure 15)

**Karan Karnik (R8) says**
Review- Karan karnik (Figure 16)

**Raj S (R 19) highlights a more serious contract problem**
Review- Raj S (Figure 17)
In a health perspective, these are not minor issues. The app can itself become a source of stress if daily healthy behaviour is always tied to worry about subscription fees, nagging prompts and fear of hidden costs. This is totally opposite of the blue Zone idea of a calm and supportive environment (Poulain *et al*, 2013).

We also seen anger at lost money in R1 and R18. For instance, R1 writes:
Review- Edwin Cyril (Figure 18)
These comments show how the business model can crash with the health model. People want calm, honest tools for daily food and movement, not constant sales demand and pressure.

**Algorithmic gaps, data quality and trust**
Many reviewers also raise doubts about data accuracy and flexibility.

**Prateek Mishra (R13) explains**
review- Prateek Mishra (Figure 19)

The 2018 user in R12 describes confusion when comparing a branded salad with its ingredients:
Review- Google User (Figure 20)

**Sachin Suthar (R11) suggests a practical improvement**
Review- Sachin Suthar (Figure 21)

**Similarly, Abhijnnan Majumdar (R2)**
Review- Abhijnan Majumdar (Figure 22)
For AI specific features, Dinkar (R3) and Tejas (R4) reveal how wrong time stamps misrecognised food can break trust. Trust in numbers is central. People may stop following the advice or treat everything as a rough guess if they

doubt the values on the screen. For any future smart city work that might use aggregated app data, these small suspicions can grow into larger questions about fairness and reliability (Swan, 2013).

**HealthifyMe and Ria as soft infrastructure for Blue Zone smart cities**

Many reviewers still describe HealthifyMe as genuinely helpful in changing their everyday routines despite complaints about money and mistakes across the body metrics. Users talk about eating slowly and more carefully, drinking more water, walking or exercising a bit more than before, and using calorie counts and step logs as daily reminders rather than as strict rules. Several reviewers clearly and openly link their weight loss or better habits to long term use of the app, and some describe the experience as "life changing" or note that they have "subconsciously started" making healthier choices. Ria and other AI features be placed inside this softer layer of infrastructure. For some users, Ria appears as a constant, low-key presence that explains numbers, offers small tips and keeps attention on meals and movement without the drama of a hospital visit or a crash diet. For others, the main attraction is not the AI personality but the trustworthy database of Indian foods, The convenience of logging, and the visual feedback on steps, calories and macros. Taken together, these sections from a personalised "micro-environment" that can either support or disrupt Blue Zone style habits depending on how it is designed. Seen from the perspective of Blue Zone smart city- HealthifyMe points toward a two layer model of infrastructure. At the bottom-up level, thousands of publics quietly adjust their behaviour through app-meditated routines: counting steps on local streets, checking the sugar content of home food, or evaluating daily intake over time. At the top-down level, there is a potential, if data governance is strong to use anonymised patterns from such apps to inform decisions about footpaths, benches, shaded walking routes, parks and access to affordable healthy food. In this sense, helathifyMe and Ria can be read as soft health infrastructure that combines individual bodies and urban design. However, this vision is fragile and unstable. The same infrastructure can also produce stress and exclusion when it is dominated by aggressive monetisation, opaque subscription rules and untrustworthy data. For Ai wellness tools to genuinely contribute to Blue Zone stimulated smart cities, commercial design, technical quality and public health goals must pull in the same direction. Then only can everyday step counts and meal logs function as supportive background conditions for longer, healthier urban lives than as source of frustration.

**Implications for Design and Policy**

**For app designers and developers**

- Design around Blue Zone style habits, not only around weight loss numbers, but it must also give equal attention to simple daily movement, home cooked plant forwards meals, social support features like family or friend challenges, and basic stress management.
- Make AI behaviour more transparent, when the app is unsure about food recognition or glucose patterns, it should say so. Users should be able to correct entries easily and feel that these corrections help upgrade the system.
- Support flexible data entry. Allow users to add custom foods with their own macro information from labels. This respects user effort and slowly improves the shared database.

**For Smart city and Public health planners**

- See apps like HealthifyMe and Ria as potential partners in preventive health, not only private products.
- Explore safe data partnerships where aggregated, anonymised patterns of walking and eating can guide decisions about footpaths, shade, benches, public parks and affordable healthy food options.
- Invest in digital literacy so that lower income groups and older citizens can understand Ai advice, use free features fully and avoid subscription traps.

**For researchers**

- Combine review analysis with surveys, interviews and usage data to understand how AI coaching affects behaviour over time.
- Compare healthifyMe with other Indian health apps and also with any government digital health tools to see how different models support or block Blue Zone style habits.

**LIMITATIONS AND FUTURE WORK**

- This paper is based on a qualitative corpus of app store reviews and cannot speak for all HealthifyMe users. Future work could include:
- A larger and more systematic collection of reviews over several years, with clearer sampling frames.
- Comparative studies between different cities, genders, age groups and income levels, where this is ethical and possible.
- Interviews with users, coaches and designers to see how Ria is imagined inside the company and how she is experiences in daily life.
- Exploratory work on simple Blue Zone style indicators at neighbourhood level, such as step density in certain areas or patterns of plant based meal logging, with strong privacy protection.

## CONCLUSION

HealthifyMe and its Ai nutritionist Ria stand at an interesting crossing point between personal wellness, Ai coaching and India's smart city plans. For many urban Indians in this review corpus, the app is part of daily life. It helps them count steps, check meals, avoid some high sugar foods, drink more water and sometimes feel gently supported by an AI coach. These are exactly the quiet. Repeated behaviours that Blue Zone studies value. Natural movement, simple home food and consistent habits are more powerful than extreme, short term efforts in data and subscription confusion can damage trust and fairness. If Indian smart cities want to become "Blue Zone streets" and not just high tech Zones, Ai wellness apps like HealthifyMe and Ria can strong allies. But they need to be designed and governed as public minded health tools, not only as commercial funnels. When Ai design, business rules and urban policy are better aligned with Blue Zone principles, everyday step counts and calorie logs can quietly support longer, healthier and more connected lives in India's cities.

## ABSTRACT

Image forgery is the deliberate manipulation of digital images to change the contents for deceitful or misleading intentions. It is a difficult task in media, forensic and legal documentation processes where the originality matters greatly. Image forgery has been a rapidly increasing problem with the increasing development of digital editing tools. The dominant methods like copy-move, splicing and content adjustment are widely applied for deceiving people using forged images. To conceal such alterations, recompression, particularly double Joint Photographic Experts Group (JPEG) compression that corrupts image structure and statistical characteristics is favored by deceivers. This survey provides a comprehensive review of the detection algorithms used to identify the forged material in recompressed images. It covers the assessment of traditional techniques relying on pixel inspection, frequency-domain attributes and more recent ones that are Machine-Learning (ML) and deep-network-based. The review also discusses the limitations of identifying sophisticated forgeries with similar levels of compression or using the use of anti-forensic techniques. Through the comparison of merits and demerits of existing methods, this paper identifies the regions that need further study in order to enhance digital image authenticity further. This research examines the current practice and use of recompression in forgery detection with an eye towards emphasizing strengths, weaknesses and the future in validating image authenticity.

**Keywords:** Deep Learning (DL), Detection, Digital images, Discrete Cosine Transform (DCT), Image forgery, Joint Photographic Experts Group (JPEG), Machine Learning (ML),Recompression

## INTRODUCTION

The accelerated development of digital technology has created a fervent rush in the production and transmission of visual data. Under the backdrop of increased supply of images, there is an emerging menace around the corner in the form of digital image forgery, whereby the images are intentionally forged for the purpose of deceiving or manipulating facts. These forgeries have significant implications in law enforcement, journalism, insurance and intelligence activities [1], [2], [3]. Computer forgery generally calls upon sophisticated editing techniques such as copy-move, splicing, resizing and content-aware fill, some of which are invisible to the human eye [4], [5]. Additionally, recompression of the image, especially in JPEG produces artefacts which cover or duplicate the traces of modification, thus making it even more difficult for forensic examination [6], [7]. The researchers have responded with a range of passive detection techniques, which sense anomalies in the statistical, structural or the frequency content of an image without any prior internal knowledge like digital watermarks [8], [9]. Some of them combat common varieties of forgeries, i.e., copy-move [10], double compression [11], and anti-forensic manipulation [12]. In detecting recompression problem for the task, most of the work has been in checking the artefacts inhibiting patterns, quantization tables and JPEG noise differences. Block-level double JPEG detection methods [13], polynomial regression models [14] and differences of resizing on the basis of local moments [15] have proven to be effective in recompressed tampered zone detection. Although there are some other works such as error level analysis and discrete cosine transform (DCT) models accounting for tampering detection in terms of local error patterns as well as frequency domain properties [16], [17], compression-aware models were suggested for spliced or copy-moved regions detection as a function of original and modified segments' recompression signatures [18], [19]. New Machine Learning (ML) and Deep Learning (DL) trends further improved against detection. New light, hybrid models based on transfer learning, statistical filters and ConvolutionNeural Networks (CNNs) have been put forward to construct the robust generalization over classes and datasets of forgeries [20], [21], [22]. Furthermore, multi-branch neural networks, residual attention modules and mask-based region proposals are used to improve the forgery localization accuracy of recompressed images [23]. Others use hash-based matching and quantization noise modelling in an effort to maintain detection capability where the recompression has been performed to conceal the signs of tampering [24], [25]. Figure 1 identifies the significant challenges of image forgery detection in the occurrence of a recompression situation. Double compression, image tampering and low-quality compression conceals the trace of forgery. Hybrid compression levels, anti-forensics and grid alignment also become more challenging detection accuracy. Limited training data also interfere with detection model efficiency in actual use. This survey offers a thorough summary of techniques engineered for image forgery detection under recompression constraints. It gives an overview of the work by methodology statistical, transform-domain, learning-based as well as points out the greatest challenges and open problems in crafting effective detection systems for highly recompressed and manipulated images.

## LITERATURE SURVEY

Image forgery using digital methods has become more efficient with the prevalence of editing software, rendering authenticity checking imperative. Recompression operations, particularly double JPEG compression tend to introduce invisible artifacts that are the tracers for forensic detection. Statistical, frequency-domain and DL approaches have been suggested by the researchers to identify such traces. Detection requires the identification of inconsistencies caused by tampering and subsequent recompression.

**Deep Architectures**

Verma *et al*. (2024) explored the image forgery detection by investigating double JPEG compression artifact detection at the block level. The authors used statistical inconsistencies in traces during the compression to localize the tampered areas in digital images. The robustness of those approaches was demonstrated against several post-processing attacks. Experimental results ensured better accuracy in detecting the forged regions with benchmark datasets. Sudhakar *et al*. (2023) developed a forgery detection system using the integration of light-weight deep models. Tight CNNs were integrated to balance accuracy with the amount of computation. This method effectively

identified the various types of image forgery. Benchmark dataset testing showed that the consistent model performance had resulted appropriate for real-time. Table 1 provides the significant data contributions in image forgery detection from 2016 to 2022. It contrasts the types of forgeries covered, methods utilized, advantages and the limitations of each approach. The comparison shows the advancements in the detection techniques in digital forensics.

**Advancements in Forgery Detection**

**Khalil *et al.* (2023)** targeted the improving forgery detection from images using transfer learning by using pre-trained CNNs. The research solved the challenge of having limited labeled data using the fine-tuning of pre-existing models for the forgery classification. This approach sought to minimize the training time and encourage generalization. Current research was not accurate in identifying the forgeries of different manipulation types.

**Whitin *et al.* (2024)** proposed a hybrid model called Mask FORD-NET from Mask Region-Based Convolutional Neural Network (Mask-RCNN) and Regression Network (REG-NET) for the accurate identification of forged ones. The methodology was in reaction to the nonexistence of single-network models in segmenting the manipulated areas. The study background was motivated by the necessity for pixel-level localization with reduced computational complexity. Earlier systems had not properly tradeoff between the accuracy and speed.

**Patekar *et al.* (2023)** gave an extensive description of recent existence in image forgery detection mechanisms and highlighted the role of digital forensics in verifying media genuineness. This research indicated about the traditional and emerging methods used for uncovering the manipulations. The authors also showed the alterations of advanced editing technologies to make the detection even more difficult. The research was a stepping stone for developing even better passive detection models. Table 2 compares the several new studies of image forgery detection algorithms with ML, frequency domain features and hash approaches. Table 2 highlights the type of forgery being targeted, approaches taken, most notable strengths and found limitations. It indicates a persistent endeavour to enhance the detection performance and across-dataset generalization.

**Forensic Detection**

**Ravi *et al.* (2016)** used the quantization patterns of noise to analyze the forensic significance of linear and non-linear filtering on digital images. The research aimed at identifying the signs of manipulation through the enhancement filters. Previous techniques typically had no ability to distinguish the minimal filtering. This paper proposed the analytic methods of revealing such alterations.

**Taimori *et al.* (2017)** presented a forensic method for double JPEG compression detection through the statistical inconsistency analysis of DCT coefficients. The paper solved the problem of recompression detection in forged images. Earlier methods had not identified the compression at same level. This research improved reliability in passive forensic examination.

**Fouad *et al.* (2025)** introduced a multi-branch neural network for double JPEG compression detection and localization of forged images. The scheme was built to handle various compression scenarios through the learning of multiple streams of features. The approach overcame the limitations of single-path models. It focused on the enhanced spatial localization of forged regions.

**Alzahrani (2024)** presented a better DenseNet-based model to detect the forged images during digital forensic analysis. The research targeted increasing manipulation complexity and shallow models' inefficacies. It intended to improve feature extraction and classify correctly. Former methods lacked the capability of processing deep semantic changes in forgeries.

## DISCUSSION

Image forgery detection is an extremely urgent research field since increasingly more images are forged and put onto the Internet. Copy-move, object removal and splicing forgeries are executed so professionally that nothing remains as evidence. Double JPEG recompression, besides revealing the evidence of tampering by altering frequency-domain characteristics, also conceals the images. Hence, the mechanism for detection gas to be highly sensitive to small statistical variation induced by compression. Classical signal processing and learning-based techniques have to be combined in hybrid methods to provide the robustness and reliability in varied forgery conditions.

**Recompression for the Image Forgery Detection**

Ali *et al*. (2022) proposed a recompression artefacts-based deep learning approach for improved image forgery detection performance. Their approach explained how analysis of recompressed images could enable smoother detection of hidden manipulations by learning distortion patterns caused by compression. Similarly, Chai *et al*. (2024) proposed a polynomial fitting model for recompressed JPEG image forgery detection with special focus on double-compression-caused fine-scale distortions detection. Both articles prove that while recompression is utilized in most scenarios for camouflaging tampering, it also creates the special fingerprints traceable for forensic analysis. Methods show the necessity of compression-aware methods to be utilized to build the effective mechanisms for forgery detection.

**Detection Techniques for the Forgery Localization**

Verma *et al*. (2024) proposed a double JPEG compression detection method at the block level, which is highly effective in identifying the forgery areas from images. The method relies on the identification of statistical abnormalities due to successive compression and therefore be utilized to identify the forged areas. Fernández *et al*. (2021) on their part addressed the image forgery detection through the study of patterns of compression anomalies in digital frames. This work has targeted the tampering signal generation behaviour of compression algorithms in the duplicated images. These works collectively underscore the significance of compression artefacts as the authentic indicators image forgery detection.

**Augmenting Forgery Detection**

Taimori *et al*. (2017) proposed a forensic image analysis method for identifying double JPEG compression using inconsistency tests on DCT coefficient distributions. The approach identifies the recompression indicators such as certain indicators for image forgery. In order to address the more invasive feature extraction requirements, Alzahrani (2024) has proposed a denser DenseNet model to provide the accuracy in identifying forged images. This model is constructed as a part of developing image detection accuracy in deep manipulation cases, especially where the shallow models have not sufficed. This type of work opens up the way for compression analysis with state-of-the-art modelling as a way of advancing the image forgery detection.

## CONCLUSION

Overall, image forgery is a fundamental digital authenticity threat with the increased availability and usability of editing tools. Recompression, especially by the way of double JPEG compression is frequently used to cover up the evidence of manipulation so that it is not detectable. However, the visibility of compression artefacts is a good indicator for detecting the tampered regions under close examination. Frequency-domain feature-based approaches, statistical outliers and ML have all played a role in enhancing the detection rates. Even so, there are the limitations placed on these by real-image forgery complexity and the application of anti-forensic countermeasures. Deep Learning has also been successful but the high computational and dataset demands restrict the widespread application. Hence, it is required to have a wise blend of traditional and recent approaches to construct the strong detection systems. Further study is necessary to enhance the generalization across formats, compression ratios and forms of forgery. Enhancing image authentication is crucial in preserving the fidelity in digital media.

## ABSTRACT

S. Chandrasekar introduced Micro Topology in 2019. We introduced a new class of Micro Generalized Closed Sets in Micro Topological Spaces. In this paper, we introduced some forms of continuous functions namely strongly $\alpha^* g_{\mathcal{M}}$-continuous, totally $\alpha^* g_{\mathcal{M}}$-continuous and perfectly $\alpha^* g_{\mathcal{M}}$-continuous. Also we established the relation between the above function and also investigate various aspects of these functions. The study employs rigorous analysis of these Micro functions and formal proof technique to establish their properties. Comparative analysis with some existing function is conducted to highlight the distinct characteristics of these functions. The research identifies and confirms the unique features of strongly $\alpha^* g_{\mathcal{M}}$-continuous, totally $\alpha^* g_{\mathcal{M}}$-continuous and perfectly $\alpha^* g_{\mathcal{M}}$-continuous under various operations, supported by detailed proofs and examples. The research contributes to the mathematical literature by defining and exploring a new category of Micro function and comparing it with some of the existing functions.

**Keywords:** $\alpha^* g_{\mathcal{M}}$-closed, $\alpha^* g_{\mathcal{M}}$-open, strongly $\alpha^* g_{\mathcal{M}}$-continuous, totally $\alpha^* g_{\mathcal{M}}$-continuous and perfectly $\alpha^* g_{\mathcal{M}}$-continuous.

## INTRODUCTION

Topology comprises one of the oldest and most significant topics of Mathematics; the abstract idea of Topology is becoming vaster and more complex now day. Several versions of Topologies have recently been developed. Levine launched Generalized Closed Sets in General Topology. Pawlak developed the concept of rough set, as well as the notions of lower approximation, higher approximation, and the boundary area, subset of the universe set involving the equivalence relation. Lellis Thivagar laid out Nano Topology in 2013, defining it as a combination of lower and higher approximations. Micro Topology was an expansion of Nano Topology. S. Chandrasekhar pioneered and researched Micro Semi open, Micro Pre open, Micro Semi continuous and Micro Pre continuous in Micro Topological Spaces. S. Chandrasekar and G. Swathi pioneered the Micro $\alpha$-open sets, Micro $\alpha$-closure, & Micro $\alpha$-interior in Micro Topological Spaces. Ibrahim.H.Z. proposed Micro β-open and Micro g-closed sets in Micro Topological Spaces. Recently, R. Anandhi and N. Balamani invented the idea of Micro $\alpha$-Generalised closed sets on Micro Topological Spaces and investigated the corresponding Micro separation axioms. Continuity of functions constitutes a fundamental notion in Topology. In broad terms, a continuous function is one in which subtle modifications in the input cause small variations in the output. The $\alpha^* g_{\mathcal{M}}$-closed sets is introduced by P.Anbarasi Rodrigo and K.Selvakumari Prasha in Micro Topological Spaces. The purpose of this paper was to create and analyzed the concepts of novel class of more continuous functions namely strongly $\alpha^* g_{\mathcal{M}}$-continuous function, totally $\alpha^* g_{\mathcal{M}}$-continuous function and perfectly $\alpha^* g_{\mathcal{M}}$-continuous function in Micro Topological Spaces. Some of the basic properties of strongly $\alpha^* g_{\mathcal{M}}$-continuous function, totally $\alpha^* g_{\mathcal{M}}$-continuous function and perfectly $\alpha^* g_{\mathcal{M}}$-continuous function are analyzed. In addition, we discussed its characteristics and study its relationship with other Micro continuous functions.

## METHODOLOGY

This paper introduces and extends the concepts of strongly $\alpha^* g_{\mathcal{M}}$-continuous function, totally $\alpha^* g_{\mathcal{M}}$-continuous function and perfectly $\alpha^* g_{\mathcal{M}}$-continuous function within the frameworks of Micro Topological Spaces. It explores the connection between the newly defined functions and the previously established Micro continuous through the application of definitions. Additionally, the paper provides examples to demonstrate the converse parts of these relationships and other properties.

## PRELIMINARIES

In this portion, we review a few essential Micro Topological Spaces definitions and outcomes that will be important in the sequel.

**Definition: 3.1 [6]** Consider $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}))$, an Nano Topological Spaces. So $\mu_{\mathcal{R}}(\mathbb{X})=\{\mathbb{N}\cup(\mathbb{N}'\cap\mu):\mathbb{N}, \mathbb{N}'\in\tau_{\mathcal{R}}(\mathbb{X})\}$ & it is referred as Micro Topology of $\tau_{\mathcal{R}}(\mathbb{X})$ and $\mu\notin\tau_{\mathcal{R}}$ meet the given axioms:

1. $\mathbb{U},\phi\in\mu_{\mathcal{R}}(\mathbb{X})$.
2. The union of objects from the Sub-classes of $\mu_{\mathcal{R}}(\mathbb{X})$ lies in $\mu_{\mathcal{R}}(\mathbb{X})$.
3. The intersection of objects from any finite sub-classes of $\mu_{\mathcal{R}}(\mathbb{X})$ lies in $\mu_{\mathcal{R}}(\mathbb{X})$.

So $\mu_{\mathcal{R}}(\mathbb{X})$ is said as the Micro Topological on $\mathbb{U}$ in regards to $\mathbb{X}$. $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ is termed as Micro Topological Spaces and objects from $\mu_{\mathcal{R}}(\mathbb{X})$ are the Micro open & its complement is termed as a Micro closed sets.

**Definition: 3.2 [1]** Consider $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ a Micro Topological Spaces. A subset $\mathbb{A}$ of $\mathbb{U}$ is said to be $\alpha^* g_{\mathcal{M}}$-closed set if $\mathcal{M}\alpha^* cl(\mathbb{A})\subseteq_{\mathcal{M}}\text{int}\mathbb{U}$, whence $\mathbb{A}\subseteq_{\mathcal{M}}\mathbb{U}$ & $\mathbb{U}$ is a Micro $\alpha$-open in $\mathbb{U}$.

**Example: 3.3** Take $\mathbb{U}=\{a,b,c,d\} \ni \mathbb{U}/\mathcal{R}=\{\{a\},\{c\},\{b,d\}\}$ and $\mathbb{X}=\{b,c\}\subseteq_{\mathcal{M}}\mathbb{U}$. So $\tau_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{b, d\}\}$, $\mu=\{a\}\notin\tau_{\mathcal{R}}(\mathbb{X})$ and $\mu_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{a\},\{b,d\},\{a,b,d\}\}$. Then $\alpha^* g_{\mathcal{M}}$-closed$=\{\mathbb{U},\phi,\{a\},\{b\},\{c\}, \{d\},\{a,b\},\{a,c\},\{a,d\},\{b,c\},\{b,d\},\{c,d\},\{a,b,c\},\{a,c,d\},\{b,c,d\}\}$.

**Result: 3.4 [1]** Every $\mathcal{M}$-closed set is $\alpha^* g_{\mathcal{M}}$-closed.

**Definition: 3.5** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau_{\mathcal{R}}{}^{\star}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces.

a. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called strongly Micro continuous functions if the inverse image of every Micro closed in $\mathbb{V}$ is Micro closed in $\mathbb{U}$.
b. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called totally Micro continuous functions if the inverse image of every Micro closed in $\mathbb{V}$ is Micro clopen in $\mathbb{U}$.
c. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called perfectly Micro continuous functions if the inverse image of every Micro closed in $\mathbb{V}$ is Micro clopen in $\mathbb{U}$.

**Definition: 3.6 [2]** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau_{\mathcal{R}}{}^{\star}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces.

a. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called $\alpha^* g_{\mathcal{M}}$-continuous functions if the inverse image of every $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{U}$ is Micro closed in $\mathbb{V}$.
b. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called $\alpha^* g_{\mathcal{M}}$-irresolute function if $\mathbb{F}^{-1}(\mathbb{S})$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{U}$ $\forall \alpha^* g_{\mathcal{M}}$-closed in $\mathbb{V}$.

**Strongly $\alpha^* g_{\mathcal{M}}$-Continuous Function**

**Definition: 4.1** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau_{\mathcal{R}}{}^{\star}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called strongly $\alpha^* g_{\mathcal{M}}$-continuous functions if the inverse image of every $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{V}$ is Micro closed in $\mathbb{U}$.

**Example: 4.2** Take $\mathbb{U}=\{\mathfrak{a},\mathfrak{b},\mathfrak{c}\}\ \ni \mathbb{U}/\mathcal{R}=\{\{\mathfrak{a}\},\{\mathfrak{c},\mathfrak{b}\}\}$ and $\mathbb{X}=\{\mathfrak{a},\mathfrak{b}\}\subseteq_{\mathcal{M}}\mathbb{U}$. So $\tau_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{b},\ \mathfrak{c}\}\}$, $\mu=\{\mathfrak{b}\}\notin\tau_{\mathcal{R}}(\mathbb{X})$ and $\mu_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{b}\},\{\mathfrak{a},\mathfrak{b}\},\{\mathfrak{b},\mathfrak{c}\}\}$. Then $\alpha^* g_{\mathcal{M}}$-closed=$\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{c}\},\{\mathfrak{a},\ \mathfrak{c}\},\{\mathfrak{b},\mathfrak{c}\}\}$ and $\mathcal{M}$-C=$\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{c}\},\{\mathfrak{a},\mathfrak{c}\},\{\mathfrak{b},\mathfrak{c}\}\}$. Let $\mathbb{V}=\{\mathfrak{a},\mathfrak{b},\mathfrak{c}\}$ with $\mathbb{V}/\mathcal{R}=\{\{\mathfrak{b}\},\{\mathfrak{a},\mathfrak{c}\}\}$ and $\mathbb{M}=\{\mathfrak{b}\}\subseteq_{\mathcal{M}}\mathbb{V}$. Then $\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{\mathfrak{b}\}\}$, $\mu^{\star}=\{\mathfrak{a},\mathfrak{b}\}\notin\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})$ and $\mu^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{\mathfrak{a}\},\{\mathfrak{b}\},\{\mathfrak{a},\mathfrak{b}\}\}$. Then $\alpha^* g_{\mathcal{M}}$-closed=$\{\mathbb{V},\phi,\{\mathfrak{c}\},\{\mathfrak{a},\mathfrak{c}\},\{\mathfrak{b},\mathfrak{c}\}\}$ and $\mathcal{M}$-C=$\{\mathbb{V},\phi,\{\mathfrak{c}\},\{\mathfrak{a},\mathfrak{c}\},\{\mathfrak{b},\mathfrak{c}\}\}$. Let $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be identity function defined by $\mathbb{F}(\mathfrak{a})=\mathfrak{a},\mathbb{F}(\mathfrak{b})=\mathfrak{b},\mathbb{F}(\mathfrak{c})=\mathfrak{c}$ and $\mathbb{F}^{-1}(\mathfrak{a})=\mathfrak{a},\mathbb{F}^{-1}(\mathfrak{b})=\mathfrak{b},\mathbb{F}^{-1}(\mathfrak{c})=\mathfrak{c}$. Hence $\mathbb{F}$ is strongly $\alpha^* g_{\mathcal{M}}$-continuous.

**Theorem: 4.3** If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is strongly $\alpha^* g_{\mathcal{M}}$-continuous if and only if inverse image of every $\alpha^* g_{\mathcal{M}}$-open in $\mathbb{V}$ is Micro open in $\mathbb{U}$.

**Proof:** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. Let $\mathbb{F}$ be a strongly $\alpha^* g_{\mathcal{M}}$-continuous function. Let $\mathbb{S}$ be any $\alpha^* g_{\mathcal{M}}$-open in $\mathbb{V}$. Then $\mathbb{V}-\mathbb{S}$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is strongly $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{S})$ is Micro closed in $\mathbb{U}$. But $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{S})=\mathbb{U}-\mathbb{F}^{-1}(\mathbb{S})$ and so $\mathbb{F}^{-1}(\mathbb{S})$ is Micro open in $\mathbb{U}$. **Conversely,** Assume that inverse image of every $\alpha^* g_{\mathcal{M}}$-open set in $\mathbb{V}$ is Micro open in $\mathbb{U}$. Let $\mathbb{T}$ be any $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{V}$. Then $\mathbb{V}-\mathbb{T}$ is $\alpha^* g_{\mathcal{M}}$-open in $\mathbb{V}$. By our assumption, $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{T})$ is Micro open in $\mathbb{U}$. But $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{T})=\mathbb{U}-\mathbb{F}^{-1}(\mathbb{T})$ and so $\mathbb{F}^{-1}(\mathbb{T})$ is Micro closed in $\mathbb{U}$. Hence $\mathbb{F}$ is strongly $\alpha^* g_{\mathcal{M}}$-continuous.

**Totally $\alpha^* g_{\mathcal{M}}$-Continuous Function**

**Definition: 5.1** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau_{\mathcal{R}}{}^{\star}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called totally $\alpha^* g_{\mathcal{M}}$-continuous functions if inverse image of every Micro closed in $\mathbb{V}$ is $\alpha^* g_{\mathcal{M}}$-clopen in $\mathbb{U}$.

**Example: 5.2** Take $\mathbb{U}=\{\mathfrak{a},\mathfrak{b},\mathfrak{c}\}\ \ni \mathbb{U}/\mathcal{R}=\{\{\mathfrak{a}\},\{\mathfrak{c}\},\{\mathfrak{b}\}$ and $\mathbb{X}=\{\mathfrak{b},\mathfrak{c}\}\subseteq_{\mathcal{M}}\mathbb{U}$. So $\tau_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{\mathfrak{b},\mathfrak{c}\}\}$, $\mu=\{\mathfrak{a}\}\notin\tau_{\mathcal{R}}(\mathbb{X})$ and $\mu_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{b},\mathfrak{c}\}\}$. Then $\alpha^* g_{\mathcal{M}}$-closed=$\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{b}\},\{\mathfrak{c}\},\{\mathfrak{a},\mathfrak{b}\},\{\mathfrak{a},\mathfrak{c}\},\ \{\mathfrak{b},\mathfrak{c}\}\}$, $\alpha^* g_{\mathcal{M}}$-open=$\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{b}\},\{\mathfrak{c}\},\{\mathfrak{a},\mathfrak{b}\},\{\mathfrak{a},\mathfrak{c}\},\{\mathfrak{b},\mathfrak{c}\}\}$ and $\mathcal{M}$-C=$\{\mathbb{U},\phi,\{\mathfrak{a}\},\{\mathfrak{b},\mathfrak{c}\}\}$. Let $\mathbb{V}=\{\mathfrak{a},\mathfrak{b},\mathfrak{c}\}$ with $\mathbb{V}/\mathcal{R}=\{\{\mathfrak{b}\},\{\mathfrak{a},\mathfrak{c}\}\}$ and $\mathbb{M}=\{\mathfrak{b}\}\subseteq_{\mathcal{M}}\mathbb{V}$. Then $\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{\mathfrak{b}\}\}$, $\mu^{\star}=\{\mathfrak{a},\mathfrak{b}\}\notin\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})$ and $\mu^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{\mathfrak{a}\},\{\mathfrak{b}\},\{\mathfrak{a},\mathfrak{b}\}\}$.Then $\alpha^* g_{\mathcal{M}}$-closed=$\{\mathbb{V},\phi,\{\mathfrak{c}\},\{\mathfrak{a},\mathfrak{c}\},\{\mathfrak{b},\mathfrak{c}\}\}$ and $\mathcal{M}$-C=$\{\mathbb{V},\phi,\{\mathfrak{c}\},\ \{\mathfrak{a},\mathfrak{c}\},\{\mathfrak{b},\mathfrak{c}\}\}$. Let $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be identity function defined by $\mathbb{F}(\mathfrak{a})=\mathfrak{a},\mathbb{F}(\mathfrak{b})=\mathfrak{b},\mathbb{F}(\mathfrak{c})=\mathfrak{c}\ \mathbb{F}^{-1}(\mathfrak{a})=\mathfrak{a},\mathbb{F}^{-1}(\mathfrak{b})=\mathfrak{b},\mathbb{F}^{-1}(\mathfrak{c})=\mathfrak{c}$. Hence $\mathbb{F}$ is totally $\alpha^* g_{\mathcal{M}}$-continuous.

**Theorem: 5.3** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is totally $\alpha^* g_{\mathcal{M}}$-continuous if and only if inverse image of every Micro open in $\mathbb{V}$ is $\alpha^* g_{\mathcal{M}}$-clopen in $\mathbb{U}$.

**Proof:** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. Let $\mathbb{F}$ be a totally $\alpha^{*}g_{\mathcal{M}}$-continuous function. Let $\mathbb{S}$ be any Micro open in $\mathbb{V}$. By result 3.4, $\mathbb{S}$ is $\alpha^{*}g_{\mathcal{M}}$-open in $\mathbb{U}$. Thus $\mathbb{V}-\mathbb{S}$ is $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. But $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{S})=\mathbb{U}-\mathbb{F}^{-1}(\mathbb{S})$ and so $\mathbb{F}^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. Conversely, Assume that inverse image of every Micro open in $\mathbb{V}$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. Let $\mathbb{T}$ be any Micro closed in $\mathbb{V}$. Thus $\mathbb{V}-\mathbb{T}$ is Micro open in $\mathbb{V}$. By our assumption, $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{T})$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. But $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{T})=\mathbb{U}-\mathbb{F}^{-1}(\mathbb{T})$ and so $\mathbb{F}^{-1}(\mathbb{T})$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. Hence $\mathbb{F}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous.

**Theorem: 5.4** The composition of two totally $\alpha^{*}g_{\mathcal{M}}$-continuous need not be a totally $\alpha^{*}g_{\mathcal{M}}$-continuous as seen the following example.

**Example: 5.5** Take $\mathbb{U}=\{a,b,c,d\} \ni \mathbb{U}/\mathcal{R}=\{\{a,b\},\{c,d\}\}$ and $\mathbb{X}=\{a,b\}\subseteq_{\mathcal{M}}\mathbb{U}$. So $\tau_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{a, b\}\},\mu=\{a,b,c\}\notin\tau_{\mathcal{R}}(\mathbb{X})$ and $\mu_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{a,b\},\{a,b,c\}\}$. Then $\alpha^{*}g_{\mathcal{M}}$-closed=$\{\mathbb{U},\phi,\{a\},\{b\},\{c\}, \{d\},\{a,c\},\{a,d\},\{b,c\},\{b,d\},\{c,d\},\{a,c,d\},\{a,b,d\},\{b,c,d\}\}$, $\alpha^{*}g_{\mathcal{M}}$-open=$\{\mathbb{U},\phi,\{a\},\{b\},\{c\},\{a,b\}, \{a,c\},\{a,d\},\{b,c\},\{b,d\},\{a,b,c\},\{a,c,d\},\{a,b,d\},\{b,c,d\}\}$ and $\mathcal{M}$-C=$\{\mathbb{U},\phi,\{d\},\{c,d\}\}$. Let $\mathbb{V}=\{a,b, c,d\} \ni \mathbb{V}/\mathcal{R}=\{\{a\},\{c\},\{b,d\}\}$ and $\mathbb{M}=\{b,d\}\subseteq_{\mathcal{M}}\mathbb{V}$. So that $\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{b,d\}\}$, $\mu^{\star}=\{a\}\notin\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})$ and $\mu^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{a\},\{b,d\},\{a,b,d\}\}$. Then $\alpha^{*}g_{\mathcal{M}}$-closed=$\{\mathbb{V},\phi,\{a\},\{b\},\{c\},\{d\},\{a,b\},\{a,c\},\{a,d\},\{b,c\},\{b,d\},\{c,d\},\{a,b,c\},\{a,c,d\},\{b,c,d\},\{a,b,d\}\}$,$\alpha^{*}g_{\mathcal{M}}$open=$\{\mathbb{V},\phi,\{a\},\{b\},\{c\},\{d\},\{a, b\},\{a,c\},\{a,d\},\{b,c\},\{b,d\},\{c,d\},\{a,b,c\},\{a,c,d\},\{b,c,d\},\{a,b,d\}\}$ and $\mathcal{M}$-C=$\{\mathbb{U},\phi,\{c\},\{a,c\},\{b,c, d\}\}$. Let $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be defined by $\mathbb{F}(a)=c,\mathbb{F}(b)=d,\mathbb{F}(c)=a,\mathbb{F}(d)=b,\mathbb{F}^{-1}(a)=c,\mathbb{F}^{-1}(b)=d,\mathbb{F}^{-1}(c)=a, \mathbb{F}^{-1}(d)=b$. Therefore $\mathbb{F}$ would be totally $\alpha^{*}g_{\mathcal{M}}$-continuous. Let $\mathbb{W}=\{a,b,c,d\}$ with $\mathbb{W}/\mathcal{R}=\{\{a\}, \{c\},\{b,d\}\}$ and $\mathbb{N}=\{c,d\}\subseteq_{\mathcal{M}}\mathbb{W}$. Then $\tau^{\star\star}{}_{\mathcal{R}}(\mathbb{N})=\{\mathbb{W},\phi,\{c\},\{b,d\},\{b,c,d\}\}$ $\mu^{\star\star}=\{a,b\}\notin\tau^{\star\star}{}_{\mathcal{R}}(\mathbb{N})$ and $\mu^{\star\star}{}_{\mathcal{R}}(\mathbb{N})=\{\mathbb{W},\phi,\{c\},\{b\},\{b,c\},\{b,d\},\{a,b,c\},\{a,b,d\},\{b,c,d\}\}$. Then $\alpha^{*}g_{\mathcal{M}}$-closed=$\{\mathbb{W},\phi,\{a\},\{c\}, \{d\},\{a,c\},\{a,d\},\{c,d\},\{a,c,d\},\{a,b,d\}\}$, $\alpha^{*}g_{\mathcal{M}}$-open=$\{\mathbb{W},\phi,\{b\},\{c\},\{d\},\{a,b\},\{b,d\},\{b,c\},\{a,b, c\},\{a,b,d,\{b,c,d\}\}$ and $\mathcal{M}$ C=$\{\mathbb{W},\phi,\{a\},\{c\},\{d\},\{a,c\},\{a,d\},\{c,d\},\{a,c,d\},\{a,b,d\}\}$. Let $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be identity function defined by $\mathbb{G}(a)=a,\mathbb{G}(b)=b,\mathbb{G}(c)=c,\mathbb{G}(d)=d,\mathbb{G}^{-1}(a)=a,\mathbb{G}^{-1}(b)=b,\mathbb{G}^{-1}(c)=c, \mathbb{G}^{-1}(d)=d$. Thus $\mathbb{G}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous. Let $\mathbb{S}=\{a,c,d\}$ be Micro closed in $\mathbb{W}$. Then $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})=(\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S})))=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\{a,c,d\}))=\mathbb{F}^{-1}(\{a,c,d\})=\{a,b,c\}$ that is $\alpha^{*}g_{\mathcal{M}}$-open and not $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{U}$. Thus $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is not totally $\alpha^{*}g_{\mathcal{M}}$-continuous.

**Perfectly $\alpha^{*}g_{\mathcal{M}}$-Continuous Function**

**Definition: 6.1** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau_{\mathcal{R}}{}^{\star}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is called perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous functions if inverse image of every $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$ is Micro clopen in $\mathbb{U}$.

**Example: 6.2** Take $\mathbb{U}=\{a,b,c,d\} \ni \mathbb{U}/\mathcal{R}=\{\{a\},\{b,c\},\{d\}\}$ and $\mathbb{X}=\{b,d\}\subseteq_{\mathcal{M}}\mathbb{U}$. So $\tau_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi, \{d\},\{b,c\},\{b,c,d\}\}$, $\mu=\{a\}\notin\tau_{\mathcal{R}}(\mathbb{X})$ and $\mu_{\mathcal{R}}(\mathbb{X})=\{\mathbb{U},\phi,\{a\},\{d\},\{a,d\},\{b,c\},\{a,b,c\},\{b,c,d\}\}$.Then$\alpha^{*}g_{\mathcal{M}}$closed=$\{\mathbb{U},\phi,\{a\},\{b\},\{c\},\{d\},\{a,b\},\{a,c\},\{a,d\},\{b,c\},\{b,d\},\{c,d\},\{a,b,c\},\{a,c,d\}, \{b,c, d\}, \{a,b,d\}\}$ and $\mathcal{M}$-C=$\{\mathbb{U},\phi,\{a\},\{d\},\{a,d\},\{b,c\},\{a,b,c\},\{b,c,d\}\}$. Let $\mathbb{V}=\{a,b,c,d\} \ni \mathbb{V}/\mathcal{R}=\{\{a,b,c\}, \{d\}\}$ and $\mathbb{M}=\{a,b\}\subseteq_{\mathcal{M}}\mathbb{V}$. So that $\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{d\},\{b,c\},\{b,c,d\}\}$, $\mu^{\star}=\{a\}\notin\tau^{\star}{}_{\mathcal{R}}(\mathbb{M})$ and $\mu^{\star}{}_{\mathcal{R}}(\mathbb{M})=\{\mathbb{V},\phi,\{d\},\{a,d\},\{b,c\},\{a,b,c\},\{b,c,d\}\}$. Then $\alpha^{*}g_{\mathcal{M}}$-closed=$\{\mathbb{V},\phi,\{d\},\{a,d\},\{b,c\},\{a,b, c\},\{b,c,d\}\}$ and $\mathcal{M}$-C=$\{\mathbb{V},\phi,\{c\},\{d\},\{b,c\},\{a,b,c\},\{b,c,d\}\}$. Let $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be identity function defined by $\mathbb{F}(a)=a,\mathbb{F}(b)=b,\mathbb{F}(c)=c,\mathbb{F}(d)=d,\mathbb{F}^{-1}(a)=a,\mathbb{F}^{-1}(b)=b,\mathbb{F}^{-1}(c)=c,\mathbb{F}^{-1}(d)=d$. Hence $\mathbb{F}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous.

**Theorem: 6.3** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. A function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous, if and only if inverse image of every $\alpha^{*}g_{\mathcal{M}}$-open in $\mathbb{V}$ is Micro clopen in $\mathbb{U}$.

**Proof:** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces. Let $\mathbb{F}$ be a perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous function. Let $\mathbb{S}$ be any $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$. Then $\mathbb{V}-\mathbb{S}$ is $\alpha^{*}g_{\mathcal{M}}$-open in $\mathbb{V}$. Since $\mathbb{F}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{S})$ is Micro clopen in $\mathbb{U}$. But $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{S})=\mathbb{U}-\mathbb{F}^{-1}(\mathbb{S})$ and so $\mathbb{F}^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{U}$. **Conversely,** Let $\mathbb{T}$ be any $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$.Then $\mathbb{V}-\mathbb{T}$ is $\alpha^{*}g_{\mathcal{M}}$-open in $\mathbb{V}$. By our assumption, $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{T})$ is Micro clopen in $\mathbb{U}$. But $\mathbb{F}^{-1}(\mathbb{V}-\mathbb{T})=\mathbb{U}-\mathbb{F}^{-1}(\mathbb{T})$ and so $\mathbb{F}^{-1}(\mathbb{T})$ is Micro clopen in $\mathbb{U}$. Hence $\mathbb{F}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous.

**Theorem: 6.4** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces.

a. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous, then $\mathbb{F}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous.
b. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous, then $\mathbb{F}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous.

**Proof:** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces.

a. Let $\mathbb{F}$ be a perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous function. Let $\mathbb{S}$ be any $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{U}$. Then $\mathbb{F}^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{U}$ Hence $\mathbb{F}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous.
b. Let $\mathbb{F}$ be a perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous function. Let $\mathbb{S}$ be any Micro closed in $\mathbb{V}$. By result 3.4, $\mathbb{S}$ is $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is perfectly $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{U}$. By result 3.4, $\mathbb{F}^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$- clopen in $\mathbb{U}$. Hence $\mathbb{F}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous.

**Composition Theorem**

**Theorem: 7.1** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$, $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ and $(\mathbb{W},\tau^{\star\star}{}_{\mathcal{R}}(\mathbb{N}),\mu^{\star\star}{}_{\mathcal{R}}(\mathbb{N}))$ be three Micro Topological Spaces.

a. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ are strongly $\alpha^{*}g_{\mathcal{M}}$-continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous.
b. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a strongly $\alpha^{*}g_{\mathcal{M}}$-continuous and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a $\alpha^{*}g_{\mathcal{M}}$-continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is Micro continuous.
c. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a strongly $\alpha^{*}g_{\mathcal{M}}$-continuous and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a $\alpha^{*}g_{\mathcal{M}}$-irresolute, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous.
d. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a $\alpha^{*}g_{\mathcal{M}}$-continuous and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a strongly $\alpha^{*}g_{\mathcal{M}}$-continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is $\alpha^{*}g_{\mathcal{M}}$-irresolute.

**Proof:** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$, $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ and $(\mathbb{W},\tau^{\star\star}{}_{\mathcal{R}}(\mathbb{N}),\mu^{\star\star}{}_{\mathcal{R}}(\mathbb{N}))$ be three Micro Topological Spaces.

a. Let $\mathbb{S}$ be any $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{W}$. Since $\mathbb{G}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{V}$. By result 3.4, $\mathbb{G}^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous,$\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is Micro closed in $\mathbb{U}$. But $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Therefore $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous.
b. Let $\mathbb{S}$ be any Micro closed in $\mathbb{W}$. Since $\mathbb{G}$ is $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is Micro closed in $\mathbb{U}$. But $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Therefore $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is $\alpha^{*}g_{\mathcal{M}}$-continuous.
c. Let $\mathbb{S}$ be any $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{W}$. Since $\mathbb{G}$ is $\alpha^{*}g_{\mathcal{M}}$-irresolute, $\mathbb{G}^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is Micro closed in $\mathbb{U}$. But $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Therefore $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous.
d. Let $\mathbb{S}$ be any $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{W}$. Since $\mathbb{G}$ is strongly $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{V}$. Since $\mathbb{F}$ is $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{U}$. But $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Therefore $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-closed in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is $\alpha^{*}g_{\mathcal{M}}$-irresolute.

**Theorem: 7.2** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$, $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ and $(\mathbb{W},\tau^{\star\star}{}_{\mathcal{R}}(\mathbb{N}),\mu^{\star\star}{}_{\mathcal{R}}(\mathbb{N}))$ be three Micro Topological Spaces.

a. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a totally $\alpha^{*}g_{\mathcal{M}}$-continuous and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a totally Micro continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is Micro continuous.
b. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a totally $\alpha^{*}g_{\mathcal{M}}$-continuous and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a Micro continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous.
c. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a $\alpha^{*}g_{\mathcal{M}}$-irresolute and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a totally $\alpha^{*}g_{\mathcal{M}}$-continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous.

**Proof:** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$, $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ and $(\mathbb{W},\tau^{\star\star}{}_{\mathcal{R}}(\mathbb{N}),\mu^{\star\star}{}_{\mathcal{R}}(\mathbb{N}))$ be three Micro Topological Spaces.

a. Let $\mathbb{S}$ be any Micro closed in $\mathbb{W}$. Since $\mathbb{G}$ is totally Micro continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{V}$. Then $\mathbb{G}^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{V}$. Since $\mathbb{F}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. But $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Thus $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous.
b. Let $\mathbb{S}$ be any Micro closed in $\mathbb{W}$. Since $\mathbb{G}$ is Micro continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{V}$. Since $\mathbb{F}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. But $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Therefore $(\mathbb{G}\circ\mathbb{F})^{-1}(\mathbb{S})$ is $\alpha^{*}g_{\mathcal{M}}$-clopen in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is totally $\alpha^{*}g_{\mathcal{M}}$-continuous.

c. Let $\mathbb{S}$ be any Micro closed set in $\mathbb{W}$. Since $\mathbb{G}$ is totally $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is $\alpha^* g_{\mathcal{M}}$-clopen in $\mathbb{V}$. Then $\mathbb{G}^{-1}(\mathbb{S})$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is $\alpha^* g_{\mathcal{M}}$-irresolute, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{U}$. But $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Therefore $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is $\alpha^* g_{\mathcal{M}}$-continuous.

**Theorem: 7.3** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ and $(\mathbb{W},\tau^{\star\star}{}_{\mathcal{R}}(\mathbb{N}),\mu^{\star\star}{}_{\mathcal{R}}(\mathbb{N}))$ be three Micro Topological Spaces.

a. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ are perfectly $\alpha^* g_{\mathcal{M}}$-continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous.
b. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a $\alpha^* g_{\mathcal{M}}$-continuous and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a perfectly $\alpha^* g_{\mathcal{M}}$-continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is $\alpha^* g_{\mathcal{M}}$-irresolute.
c. If a function $\mathbb{F}:\mathbb{U}\to\mathbb{V}$ be a perfectly $\alpha^* g_{\mathcal{M}}$-continuous and $\mathbb{G}:\mathbb{V}\to\mathbb{W}$ be a strongly continuous, then their composition function $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous.

**Proof:** Let $(\mathbb{U},\tau_{\mathcal{R}}(\mathbb{X}),\mu_{\mathcal{R}}(\mathbb{X}))$ and $(\mathbb{V},\tau^{\star}{}_{\mathcal{R}}(\mathbb{M}),\mu^{\star}{}_{\mathcal{R}}(\mathbb{M}))$ be two Micro Topological Spaces.

a. Let $\mathbb{S}$ be any $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{W}$. Since $\mathbb{G}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{V}$. By result 3.4, $\mathbb{G}^{-1}(\mathbb{S})$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is Micro clopen in $\mathbb{U}$. But $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})= \mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Thus $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous.
b. Let $\mathbb{S}$ be any $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{W}$. Since $\mathbb{G}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{V}$. Then $\mathbb{G}^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{V}$. Since $\mathbb{F}$ is $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{U}$. But $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Thus $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is $\alpha^* g_{\mathcal{M}}$-irresoulte.
c. Let $\mathbb{S}$ be any $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{W}$. Since $\mathbb{G}$ is strongly $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{G}^{-1}(\mathbb{S})$ is Micro closed in $\mathbb{V}$. By result 3.4, $\mathbb{G}^{-1}(\mathbb{S})$ is $\alpha^* g_{\mathcal{M}}$-closed in $\mathbb{V}$. Since $\mathbb{F}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous, $\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$ is Micro clopen in $\mathbb{U}$. But $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})=\mathbb{F}^{-1}(\mathbb{G}^{-1}(\mathbb{S}))$. Therefore $(\mathbb{G} \circ \mathbb{F})^{-1}(\mathbb{S})$ is Micro clopen in $\mathbb{U}$. Hence $\mathbb{G}\circ\mathbb{F}:\mathbb{U}\to\mathbb{W}$ is perfectly $\alpha^* g_{\mathcal{M}}$-continuous.

## CONCLUSION

In this paper, we introduced strongly $\alpha^* g_{\mathcal{M}}$-continuous, totally $\alpha^* g_{\mathcal{M}}$-continuous and perfectly $\alpha^* g_{\mathcal{M}}$-continuous and studied their properties by suitable theorems and examples. Also we investigated the connections between the above functions with other Micro continuous forms.

### APPLICATIONS

Micro Topology can be applied in analyze the properties of graphs and the relationships between vertices, potentially leading to applications in network analysis.

## ABSTRACT

Movement of people from one place to another to live or work is called as migration. People can move long or short distances and might move for short period of time or might spend the rest of their lives in a new place. People migrate for many reasons. These could include; to be closer to family or friends, or to escape natural disasters such as flooding, drought, cyclone, climate conditions, monsoon failures, etc. Economic reasons such as poverty, unemployment, poor income, poor infrastructure facilities, etc. The present study is an attempt to understand the factors that cause labour migration. The study discusses into pull and push factors of migration of semi-skilled and unskilled migrant workers in Thiruvarur district. The study based on descriptive in nature. This study is based on both secondary and primary data. The primary data about the nature of migration, reasons for migration, and the impact of migration in terms of the pre and post migration period income level, indebtedness and the level of poverty among the sample households have been gathered through the field survey. The migrated workers are presently working in other districts and also in other states and hence, all necessary information during the field survey has been gathered from the other members of the sample households. There are eight taluks in Thiruvarur district among them three taluks are selected viz Kodavasal, Nannilam, Mannargudi, and Muthupet. Among the four taluks six blocks were identified viz Kodavasal, Koradcherry, Nannilam, Mannargudi, Kottur and Muthupet. The total sample size is 80 which consist of 40 from semi urban areas and 40 from rural areas. The primary data collected from the field through a structured questionnaire has been used in this study. A

number of variables causing migration have been identified by the researcher. The secondary data pertaining to the extent of migration, the pattern of migration, reasons for migration and others have been gathered from the Census of India and also from the report of NSSO, Government of India. The mobility of the 'highly skilled' has become widely researched but only a few researchers have approached this category of migrants from a critical perspective. This article argues that understanding how 'highly skilled migrants' are constructed necessitates considering the conditions in which migration takes place as well as the perceptions and practices associated with these conditions. It uses the concept of 'migration channels' to investigate the enabling and disabling factors associated with different migration situations. The analysis draws on biographic interviews with educated migrants in Thiruvarur District. The article shows that categories of migrants are artificial and often do not coincide with lived realities. Migrants actively develop strategies to achieve their personal aspirations, but they also depend on the opportunities available in their environment. The concept of 'migration channels' enables us to capture this interplay between structures and agency by showing how different actors shape the opportunities and constraints faced by different groups of migrants, and how migrants actively deal with them. This concept thus fosters a critical yet empathic understanding of migration experiences.

## INTRODUCTION

Internal migration within India constitutes a complex and multifaceted phenomenon, encompassing the movement of individuals or groups across the nation's geographical expanse. This intricate process is intricately woven into the fabric of India's diverse and heterogeneous society, shaped by a myriad of interconnected socio-economic, political, and environmental factors. The causes of internal migration are deeply entrenched in the dynamic interplay of push and pull forces, compelling individuals to traverse extensive distances in pursuit of enhanced opportunities, improved living conditions, or escape from adverse circumstances. The rapid urbanization and industrialization of burgeoning metropolitan areas act as powerful magnets, drawing people away from rural landscapes in search of employment and economic advancement. Conversely, factors such as environmental degradation, agrarian distress, and persistent social inequalities contribute to the expulsion of populations from their places of origin, creating a complex web of migration dynamics. The consequences of this internal migration extend far beyond the migrants themselves, profoundly impacting both the regions of origin and destination. The resulting urbanization strains existing infrastructure, presenting formidable challenges related to housing, sanitation, and healthcare in urban areas. Simultaneously, the social fabric undergoes transformative shifts as diverse cultures and traditions converge in these urban spaces, creating a mosaic of identities and experiences. This research undertakes the ambitious task of delving into the intricate web of causes and consequences surrounding internal migration in India, aiming to achieve a comprehensive understanding of the underlying issues and their implications for both migrants and the regions involved. At its core, the overarching research problem driving this study is to unravel the intricate dynamics of internal migration in India. This involves a meticulous examination of the push and pull factors influencing migratory patterns and a thorough assessment of the multifaceted impact on socio-economic, cultural, and environmental dimensions. By addressing this research problem, the study aspires to contribute invaluable insights that can inform policy decisions, guide social interventions, and enrich academic discourse. Ultimately, the goal is to foster a more nuanced understanding of the intricate complexities associated with internal migration in the Indian context, providing a foundation for informed and effective strategies to address the challenges and harness the opportunities inherent in this pervasive phenomenon. Furthermore, migration, defined as the movement of people from one place to another for residence or work, can take various forms, involving both short and long distances, and

varying durations. People undertake migration for a myriad of reasons, including the desire to be closer to family or friends, or as a response to natural disasters such as flooding, drought, cyclones, and adverse climate conditions. Economic factors such as poverty, unemployment, low income, and inadequate infrastructure facilities also play a significant role in motivating migration. This present study constitutes an earnest attempt to comprehensively understand the factors underpinning labor migration. Focusing specifically on the Thiruvarur district, the research explores the intricate push and pull factors influencing the migration of semi-skilled and unskilled workers. Through a detailed analysis, the study seeks to shed light on the nuances of this migration pattern, contributing to the broader understanding of internal migration dynamics within the Indian context.

**Statement of the Research Problem**

Migration, a natural and intricate process, unfolds as a consequence of a confluence of socio-economic, demographic, cultural, political, and environmental factors influencing migrant populations. It transcends mere geographic relocation, embodying a fundamental aspect of the evolving spatial dynamics and relationships within regions (Gosal, 1961). Bogue (1959) perceives migration as an instrument fostering cultural diffusion and social integration, yielding a meaningful redistribution of population. Smith (1960) underscores the threefold impact of migration on the areas of out-migration, in-migration, and the migrants themselves, as populations shift and transform. In India, rural-to-urban migration has witnessed a gradual rise in tandem with the processes of industrialization and modernization. Predominantly driven by employment or business opportunities, male migration dominates the landscape, although recent surveys indicate a growing trend of single females venturing out in search of employment. Various definitions abound; Lee defines migration as a "permanent or semi-permanent change of residence," while Weinberg sees it as a change of place, permanent or temporary, for appreciable durations, as seen in seasonal labor migration. Safa frames migration as an economic phenomenon, acknowledging the influence of non-economic factors (Singh, 1989). The migration of agricultural laborers from villages to towns in India is not novel, but its recent surge, particularly in the last decade due to liberalization, has captured policymakers' attention. Understanding the micro-level impact of liberalization on agricultural laborers, encompassing employment opportunities, working and living conditions, and trends, becomes crucial. This surge in rural labor circulation is a direct consequence of structural changes in both origin (villages) and destination areas. While direct statistics on rural-urban migration of agricultural laborers for India are unavailable for comparison over decades, the increasing urban population, from 26 million in 1901 to 62 million in 1951 and further to 31.16 percent in 2011, reflects the impact of migration, alongside natural urban population growth (Tondon and Singh, 2007). Rural-urban migration is observable in all urban centers, notably in hilly regions like Illam, where the town experiences rapid expansion due to economic development and improved facilities, with migration primarily from surrounding districts. The interplay between rural-urban migration, land use patterns, and population dynamics in underscores its significance, particularly with the recent influx of internally displaced people, necessitating a concerted effort for proper urbanization and sustainable development. Addressing existing deficits in urban services and anticipating future needs requires efficient service delivery and mobilization of new financing mechanisms for construction, operation, and maintenance. Without planned development, activities tend to veer towards environmentally deleterious directions, a phenomenon already observed in this district. Therefore, the statement of the problem for this study centers on investigating the causes and consequences of internal migration in the Thiruvarur district of Tamil Nadu.

**Research Objectives**

1. To analyse the causes of internal migration from rural to urban areas in Thiruvarur district of Tamil Nadu.
2. To evaluate the consequences of internal migration from rural to urban areas in the mentioned study district of Tamil Nadu.

## METHODOLOGY

This study adopts a descriptive research methodology, incorporating both secondary and primary data sources to comprehensively investigate the dynamics of migration in Thiruvarur district. The primary data, crucial for

understanding the nature, reasons, and impact of migration, has been collected through an extensive field survey. The survey focuses on the migrated workers presently employed in other districts and states. The information has been gathered from other members of the sample households, providing insights into the nature and nuances of migration. Specifically, the study encompasses eight taluks in Thiruvarur district, with a targeted selection of three taluks—Kodavasal, Nannilam, Mannargudi, and Muthupet. Within these taluks, six blocks were identified: Kodavasal, Koradcherry, Nannilam, Mannargudi, Kottur, and Muthupet. The total sample size comprises 80 individuals, evenly distributed between 40 respondents from semi-urban areas and 40 from rural areas. The primary data, collected through a meticulously designed structured questionnaire administered during the field survey, serves as the cornerstone of this research. The questionnaire explores various dimensions of migration, including reasons, income levels in the pre and post-migration periods, indebtedness, and the extent of poverty among the sample households. The researcher has identified a range of variables contributing to migration, enriching the understanding of this complex phenomenon. Additionally, secondary data pertaining to the extent and pattern of migration, as well as reasons for migration, have been sourced from reliable repositories such as the Census of India and reports from the National Sample Survey Office (NSSO), Government of India. Notably, this study extends beyond conventional analyses of migration by delving into the experiences of 'highly skilled migrants' in Thiruvarur District. Drawing on the concept of 'migration channels,' the research critically examines the enabling and disabling factors associated with different migration situations. Biographic interviews with educated migrants provide a nuanced understanding of the conditions, perceptions, and practices shaping the migration experiences of this particular category. This multifaceted research design aims to contribute comprehensive insights into the diverse facets of migration in Thiruvarur district, shedding light on both the macro-level patterns and the micro-level experiences of the migrating population. The data collection period was covered during the month of September 2023. And in the case of tools of analysis, the percentages and Garatt Ranking model was employed for the present study.

## RESULTS AND DISCUSSIONS

Table 1 presents a detailed analysis of the causes of push factors influencing migration within the agricultural sector, discerning distinctions between semi-urban and rural environments under economic and non-economic causes. Regarding the economic factors, the inadequate yields and low farm output constitute 22.5 percent of the total responses, reflecting the shared challenges experienced by individuals in both semi-urban (12.5 percent) and rural (32.5 percent) areas. Likewise, low earnings from agricultural activities constitute 16.3 percent of the overall responses, with a higher prevalence noted in rural areas (22.5 percent) compared to semi-urban areas (10 percent). Uncertain market conditions stand out as a prominent push factor, particularly impacting individuals in semi-urban areas (37.5 percent) as opposed to rural areas (15 percent). Financial indebtedness and limited access to credit for agricultural inputs collectively contribute to 35 percent of the responses. This comprehensive interpretation underscores the common economic vulnerabilities shared by both semi-urban and rural populations, where market uncertainties and financial constraints act as primary catalysts for migration. These findings underscore the necessity for targeted interventions addressing economic challenges to foster sustainable livelihoods and alleviate migration pressures in various locales. With regard to non-economic push factors, the Climate change stands out as a substantial factor, with 26.3 percent of respondents overall citing it as a motivation for migration. Notably, while 20 percent of respondents from semi-urban areas acknowledge climate change, a higher sensitivity is observed in rural areas, where 32.5 percent recognize its impact, suggesting increased vulnerability in agricultural practices. Environmental degradation constitutes another significant factor, contributing to migration for 16.3 percent of respondents. Limited access to education is identified by 13.8 percent of participants, with a slightly higher prevalence in semi-urban areas (17.5 percent) compared to rural areas (10 percent). The lack of basic infrastructural facilities, including roads and electricity, is a considerable push factor, particularly affecting individuals in semi-urban areas (27.5 percent). Furthermore, the insufficient availability of social services, such as healthcare and education, is noted by 18.8 percent of respondents. This comprehensive interpretation underscores the nuanced and multifaceted nature of non-economic factors influencing migration, with climate change, environmental degradation,

and infrastructural deficiencies playing pivotal roles. Addressing these challenges requires a holistic approach that integrates considerations of environmental resilience, educational access, and infrastructural development into migration policies, fostering sustainable communities in both semi-urban and rural areas.

Table 2 examines the comprehensive overview of the pull factors influencing migration in both semi-urban and rural areas according to economic and non-economic causes. Economic factors stand out as significant drivers for migration, as better wages and income are cited by 20 percent of respondents overall. While semi-urban areas (17.5 percent) acknowledge the appeal of improved economic prospects, rural areas (22.5 percent) exhibit a stronger inclination toward higher incomes. Stable market conditions play a crucial role, with 26.3 percent of respondents recognizing the significance of this factor. Access to off-farm employment opportunities emerges as another noteworthy economic pull factor, noted by 13.8 percent of participants. Improved access to credit facilities is highlighted by 21.3 percent of respondents, underscoring the importance of financial resources in the decision to migrate. Better market access and good infrastructural facilities are substantial contributors, particularly influencing individuals in semi-urban areas (27.5 percent). This comprehensive interpretation underscores the predominance of economic considerations in the pull factors contributing to migration, emphasizing the appeal of enhanced wages, stable markets, and improved financial accessibility. These findings highlight the imperative for policies that not only address economic challenges in rural and semi-urban areas but also capitalize on economic opportunities to foster sustainable livelihoods and mitigate migration drivers. Furthermore, the non-economic factors play a significant role in shaping migration decisions, with 21.3 percent of respondents overall citing favorable climate and environmental conditions as a compelling pull factor. While semi-urban areas (17.5 percent) acknowledge this factor, rural areas (25 percent) exhibit a stronger inclination toward environments conducive to their well-being. Improvements in the quality of life emerge as a substantial pull factor, highlighted by 28.8 percent of respondents, with both semi-urban (27.5 percent) and rural (30 percent) areas recognizing its paramount importance. Access to education and skill development is cited by 16.3 percent of participants, underscoring the aspiration for personal and professional growth. Better healthcare services are noted as a pull factor by 20 percent of respondents, emphasizing the significance of health-related considerations in migration decisions. Opportunities for family reunification play a role, particularly in semi-urban areas (20 percent). This comprehensive interpretation underscores the nuanced nature of non-economic factors in migration, illustrating individuals' pursuit of improved environmental and living conditions alongside opportunities for personal and familial development. Addressing these factors in policy considerations is paramount for fostering migration patterns that contribute to the overall well-being and sustainability of both semi-urban and rural communities.

Table 3 delineates the consequences of migration, with a specific focus on areas of origin and destinations according to the differentiation between semi-urban and rural areas. Labour shortage emerges as a predominant consequence, with 31.3 percent of respondents overall recognizing its impact, notably affecting both semi-urban (35 percent) and rural (27.5 percent) areas. This underscores the substantial workforce depletion in both settings due to migration, particularly impacting sectors such as agriculture. Economic impact is noted by 21.3 percent of participants, reflecting the repercussions on local economies stemming from migration. Social disruption is a substantial consequence, with 25 percent of respondents overall citing its effects. This is particularly pronounced in rural areas (37.5 percent), highlighting the profound social changes and challenges experienced by communities due to migration. Hindering local development is recognized by 22.5 percent of respondents, indicating the potential setbacks in the progress and growth of both semi-urban and rural areas. This comprehensive interpretation underscores the multifaceted consequences of migration, encompassing labor dynamics, economic shifts, social disruptions, and hindrances to local development. On the other hand, consequences arises in destinations, the economic contributions emerge as a notable consequence, with 26.3 percent of respondents overall recognizing the positive impact of migration on the local economy. Both semi-urban (22.5 percent) and rural (30 percent) areas acknowledge the significant economic contributions made by migrants. However, the benefits come with challenges, as evidenced by the strain on infrastructure noted by 33.8 percent of respondents. This challenge is particularly pronounced in semi-urban areas (32.5 percent) and rural areas (35 percent), emphasizing the pressing need for infrastructure development to

accommodate the influx of migrants. Increased housing demand is noted by 18.8 percent of participants, with semi-urban areas (25 percent) experiencing a higher demand compared to rural areas (12.5 percent). Pressure on public services is recognized by 21.3 percent of respondents, indicating the need for effective management and augmentation of essential services to meet the needs of the growing population. This comprehensive interpretation highlights the dual nature of migration consequences in destination areas, encompassing both positive economic contributions and challenges related to infrastructure, housing, and public services. Addressing these consequences requires a strategic approach that leverages the benefits of migration while proactively managing its impacts on the destination areas.

Table 4 employs the Garatt Ranking model to present the causes of migration, focusing on both push factors and their mean scores in semi-urban and rural areas. In the economic factors category, inadequate yields and low farm output emerge as a more pronounced push factor in rural areas, garnering the top rank with a mean score of 56.90, while semi-urban areas rank it fourth with a mean score of 32.11. Low earnings from agricultural activities are the second most influential factor in both settings, with rural areas ranking it higher (54.21, Rank II) compared to semi-urban areas (27.83, Rank V). Uncertain market conditions are identified as the primary push factor in semi-urban areas, securing the top rank with a mean score of 63.48, while in rural areas, it ranks fourth with a mean score of 40.15. Financial indebtedness holds the second position in both settings, but with a higher mean score in semi-urban areas (61.91, Rank II) compared to rural areas (49.05, Rank III). Limited access to credit for agricultural inputs and raw materials is more influential in semi-urban areas, ranking third with a mean score of 43.29, while in rural areas, it ranks fifth with a mean score of 32.92. Shifting focus to non-economic factors, climate change is identified as the third most influential push factor in both settings, with a higher impact in rural areas (52.55, Rank I) compared to semi-urban areas (41.90, Rank III). Environmental degradation is a more significant concern in rural areas (39.83, Rank III) than in semi-urban areas (32.44, Rank V). Limited access to education is ranked fourth in both settings, with a higher mean score in semi-urban areas (38.21) compared to rural areas (29.48). Lack of basic infrastructural facilities is identified as the most significant non-economic push factor in semi-urban areas, ranking first with a mean score of 53.41, while in rural areas, it ranks second with a mean score of 45.15. Insufficient availability of social services is more impactful in semi-urban areas, ranking second with a mean score of 49.89, while in rural areas, it ranks fourth with a mean score of 33.08. It could be reveals the nuanced variations in the perceived causes of migration between semi-urban and rural areas. Economic factors such as uncertain market conditions and financial indebtedness hold considerable sway in semi-urban areas, while inadequate yields and low farm output dominate in rural areas. Non-economic factors like climate change and lack of basic infrastructural facilities also play distinctive roles in shaping migration dynamics in these diverse settings. Understanding these nuances is pivotal for formulating targeted interventions and policies that address the specific challenges faced by each locality, contributing to more effective strategies for managing and mitigating the impacts of migration.

Table 5 employs the Garatt Ranking model to delineate the pull factors influencing migration in both semi-urban and rural areas. The mean scores and ranks provide insights into the perceived attractiveness of these factors in each setting. In the economic factors category, stable market conditions emerge as the most influential pull factor in both semi-urban and rural areas, securing the top rank with mean scores of 60.05 and 67.98, respectively. Better market access and good infrastructural facilities closely follow, ranking first in semi-urban areas with a mean score of 63.94 and fifth in rural areas with a mean score of 50.36. Improve access to credit facilities holds the third position in both settings, with a higher mean score in semi-urban areas (58.18) compared to rural areas (58.18). Better wages and income and access to off-farm employment opportunities are more influential in rural areas, ranking second and fourth, respectively, while in semi-urban areas, they rank lower at fourth and fifth. Turning to non-economic factors, improve quality of life is identified as the most influential pull factor in both settings, ranking first with mean scores of 65.41 in semi-urban areas and 59.09 in rural areas. Favourable climate and environmental conditions also play a significant role, securing the second rank in both semi-urban (52.38) and rural (57.81) areas. Opportunities for family reunification hold the third position in semi-urban areas (56.19) and the fifth position in rural areas (40.78). Access to education and skill development is more influential in rural areas, ranking third with a mean score of 51.11, while in

semi-urban areas, it ranks lower at fifth. Better healthcare services are identified as the fourth most influential pull factor in both settings, with a higher mean score in semi-urban areas (60.37) compared to rural areas (45.93). This comprehensive interpretation underscores the complex interplay of economic and non-economic factors in shaping migration decisions. While stable market conditions and improve quality of life emerge as universally appealing, the ranking and mean scores highlight the nuanced preferences of individuals in semi-urban and rural areas. Recognizing these distinctions is crucial for devising targeted policies that address the specific needs and aspirations of each locality, contributing to more effective strategies for managing and leveraging the positive aspects of migration.

## CONCLUSION

In conclusion, the study delves into the intricate dynamics of internal migration in Thiruvarur district, Tamil Nadu, shedding light on both push and pull factors that drive individuals to move from rural to semi-urban areas. The comprehensive analysis of push factors reveals that economic challenges, including inadequate yields, low farm output, and financial indebtedness, are significant drivers of migration, particularly in rural settings. Non-economic factors such as climate change and limited access to education also play pivotal roles, emphasizing the multifaceted nature of the migration decision. Conversely, the examination of pull factors highlights the compelling allure of stable market conditions and improved quality of life, irrespective of the geographic setting. Economic considerations, such as better wages and income, access to off-farm employment opportunities, and infrastructural facilities, contribute significantly to the attractiveness of semi-urban areas, while non-economic factors like favorable climate and opportunities for family reunification play substantial roles. The consequences of migration are multifaceted, impacting both areas of origin and destination. Labor shortages, economic shifts, and social disruptions are notable repercussions in areas of origin, necessitating nuanced interventions to address these challenges. In destination areas, the positive economic contributions of migrants coexist with challenges related to infrastructure strain, increased housing demand, and pressure on public services, necessitating strategic planning to harness the benefits of migration while mitigating its impacts. The Garatt Ranking model further elucidates the nuanced variations in the perceived causes and pull factors, emphasizing the importance of tailored policies for distinct settings. The study contributes valuable insights to the discourse on internal migration, offering a nuanced understanding of the factors influencing migration decisions and their consequences. The findings underscore the need for holistic and context-specific approaches in policy formulation, taking into account the unique challenges and aspirations of both semi-urban and rural populations. Ultimately, the goal is to pave the way for effective strategies that harness the opportunities inherent in migration while mitigating its challenges, ensuring sustainable development and improved livelihoods for communities in both semi-urban and rural areas.

## ABSTRACT

*Hridroga*, according to *Ayurveda*, includes a wide range of heart ailments mainly associated with the disturbance of *Vata Dosha*. Among its various causes, the influence of *Avarana*—the pathological blockage of *Vata* by other *Doshas* (*Kapha*, *Pitta*), *Dhatus* (*Meda*, *Rakta*), or *Malas* (*Purisha, Mutra*)—is particularly important. When *Vata* is obstructed in its natural routes, it results in dysfunction, eventually presenting as *Hridroga*, categorizing it as an *Upadrava Vyadhi* (complication) of *Avarana*. This article examines the comprehensive *Ayurvedic* perspective on *Hridroga* as a secondary occurrence resulting from *Avarana*. The process starts with *Nidana* (causative factors) causing *Dosha Prakopa*, then *Avarana* of *Vata* occurs, leading to *Srotodushti* (channel obstruction) and finally clinical manifestation of a disease. The examination includes traditional references and describes how the qualitative characteristics (*Gunas*) of *Vata* are disrupted during *Avarana*, resulting in alterations in symptoms (*Rupa*), an increase of symptoms severity (*Rupavridhi*), Transformation of symptoms (*Rupantara*), or Decease in symptoms alleviation (*Rupahani*). Types of *Avarana* including *Kapha-Avrita Vata, Pitta-Avrita Vata*, and *Meda-Avrita Vata* have strong connections to contemporary health issues like Atherosclerosis, myocardial infarction, and heart failure. The dual categorization of *Hridroga* as a main *Vata Vyadhi* and a complication from *Avarana* underscores its intricate nature. *Ayurvedic* management principles focus on eliminating blockages, re-establishing *Vata balance*, and detoxifying the *Srotas* via treatments such as *Sroto Shodhana*, *Vatahara Chikitsa*, and *Dosha*-targeted therapies. This

synthesis offers enhanced insights into the *Ayurvedic* Pathophysiology of heart ailments and connects traditional ideas with contemporary clinical knowledge.

**Keywords:** *Hridroga, Avarana, Vata Dosha, Upadrava Vyadhi, Srotodushti*

## INTRODUCTION

In *Ayurveda*, *Hridroga* or Heart disease, is a complex ailment with etiologies based on the basic ideas of *Dosha* imbalance[1] and physiological route blockage[2]. The pathological blockage of *Vata's* normal channels by other *Doshas*, *Dhatus* (Body tissues), or *Malas* (Waste materials) is one of the many causes of *Avarana[3]*. The emergence of *Hridroga* is frequently the pathological climax of *Avarana*, which disrupts the functions of *Vata*, which governs bodily movements and activities. With a thorough examination of its *Rupa* (*Lakshana* or Symptoms), *Rupavridhi* (Increase in Symptoms), *Rupahani* (Decrease in Symptoms), *Rupantara* (Chances of Symptoms), *Vata Dosha* characteristics, the concept of *Avarana*, *Vata's Nanatmaja Vyadhis*, and *Vata Dushti* (vitiation of *Vata*), this article expands on the understanding of *Hridroga* as an *Upadrava Vyadhi* (complication) of *Avarana*.

**Understanding the concept of *Avarana[4]***

मार्गावरणेन वेगप्रतिबन्धादेव कुपितो भवति। Chakrapani Cha. Chi. 28/59

*Avarana* is one of the unique view of etiology in the *Ayurveda*. It describes how other elements come over, impede, or obstruct the *Vata Dosha's* usual course or function.

Disease and dysfunction result from this blockage, which affects *Vata's* ability to move, coordinate, and transfer.

**Types of *Avarana[5]* (Figure 1)**

1. *Dosha Avarana* refers to the obstruction of *Vata* by either *Pitta* or *Kapha[6]*.
2. *Dhatu Avarana* involves obstruction by body tissues such as *Meda* (Fat) or *Rakta* (Blood)[7].
3. *Mala Avarana* refers to obstruction by waste products like *Purisha* (Feces), *Mutra* (Urine) and *Sweda* (Sweating)[8].

The terms *Avaraṇa* and *Avṛta*, which are variations of the same fundamental idea, have a more physiological and pathological significance in *Ayurveda*, particularly when it comes to the obstruction or blocking of the body's regular functioning. The terms *Avaraṇa* and *Avṛta* describe how other *Doshas*, *Dhatus* (body tissues), or *Malas* (waste products) hinder the regular activities of *Doshas*, especially *Vata*. In literal terms, *Avaraṇa* means "covering" or "obstruction," and *Avṛta* is the state in which *Vata* is impeded by another element[9]. Numerous disorders result from this restriction, which changes the natural flow of *Vata*, which controls all bodily movements and communication.

***Avarakam* and *Avaritam* in Each Type of *Hridroga***

In each type of *Hridroga*, different elements act as *Avarakam* (the obstructing factor) and *Avaritam* (the obstructed *Vata*)

***Vata Avrta Kapha*:** In *Kapha Avarana*, *Kapha* is the *Avarakam* that obstructs the *Vata* (*Avaritam*), leading to sluggish circulation and heaviness in the heart[10].

***Vata Avrta Pitta*:** In *Pitta Avarana, Pitta* obstructs *Vata*, causing heat, inflammation, and irritability within the cardiovascular system[11].

***Meda Avrta Vata:*** *Meda Avarana* involves *Meda* (Fat) obstructing *Vata*, resulting in fatty accumulation, compression, and impaired Vata movement[12].

***Samprapti* of *Hridroga* with Emphasis on *Avarana* and *Srotodushti***

दूषयित्वा रसं दोषा विगुणा हृदयं गताः ।
कुर्वन्ति हृदये बाधां हृद्रोगं तं प्रचक्षते ।। S.S.Uttra Tantra.43

*Doshas* are worsened by etiological causes, which also vitiate the heart's *Rasa* and cause heart discomfort. Therefore, in the context of *Avarana*, the *Samprapti*, or pathogenesis, of *Hridroga* is a methodical process

***Samprapti* of *Hridroga[13]* (Figure 2)**

***Nidana* (Causative Factors):** Improper diet (Excessive oily, heavy foods), sedentary lifestyle, mental stress, and suppression of natural urges trigger *Doshic* imbalance[14].

***Dosha Prakopa*:** Leads to the vitiation of *Kapha, Pitta*, or accumulation of *Meda* in the system[15].
*Avarana*: These aggravated *Doshas* obstruct the movement of *Vata*, particularly in the region of the *Hridaya* (heart)[16].

***Vata Dushti*:** Once *Vata* is obstructed and cannot function properly, it becomes vitiated[17].

***Srotodushti*:** The *Srotas* (Channels) involved in the transportation of *Rasa* (Nutrient plasma) and *Rakta* (Blood) are obstructed, mainly via *Sanga* (Blockage)[18].

***Vyakti* (Manifestation):** Characteristic symptoms of *Hridroga* such as pain, breathlessness, palpitations, and heaviness arise[19].

***Bheda* (Classification):** Based on *Doshic* predominance, *Hridroga* is classified into *Vataja, Pittaja, Kaphaja*, or *Sannipataja*, *Krimija* types[20].

***Vikalpa Samprapti* and Role of *Vata Guna* in *Avarana Hridroga[21]***
In alternative *Samprapti* (*Vikalpa Samprapti*), the focus is on how *Vata Gunas* are influenced by *Avarana*

- *Chala* and *Laghu* qualities of *Vata* are suppressed by *Kapha's* heaviness and stickiness.
- *Sheeta* and *Tikshna* are altered when *Pitta* intervenes, causing deranged heat and sharpness in the system.
- *Sukshma* and *Anilagamana* are impaired due to *Meda's* dense and obstructive qualities.

These changes provide the rationale for the Symptomatology seen in *Avarana Hridroga* and inform treatment choices.

***Hridroga* as an *Upadrava Vyadhi* of *Avarana***
**हृद्रोगो**विद्रधिःप्लीहागुल्मोऽतीसारएवच।।(Ca.Ci.-28/236)।
भवन्त्युपद्रवास्तेषामावृतानामुपेक्षणात्।
तस्मादावरणं वैद्यः पवनस्योपलक्षयेत्।।(Ca.Ci-28/237)
*Hridroga* is acknowledged in traditional *Ayurvedic* scriptures as a result of unresolved *Avarana*.*Vata Dushti*, which resu lts from a chronic blockage of *Vata*, produces abnormal cardiac Alterations.
*Hridroga* is therefore regarded as an upadrava (Complication) resulting from the fundamental *Avarana* mechanism.

**Dual nature of *Hridroga***
*Hridroga* can be classified under both *Avarana* and *Vataja Nanatmaja Vyadhi*

- When it is caused by obstruction of *Vata* by *Kapha*, *Pitta*, or *Meda*, it is recognized under *Avarana Janya Vyadhi*.
- If the condition arises purely from *Vata Dosha* vitiation, it is grouped under the 80 *Nanatmaja Vyadhis* of *Vata*.

This classification demonstrates the dual nature of *Hridroga*, showing that it may arise as a primary disease of *Vata* or as a result of complex *Doshic* interaction involving obstruction.

***Rupa* (Symptoms) of *Hridroga***
The Symptoms of *Hridroga* vary according to the dominant *Dosha* involved

- आयम्यतेमारुतजेहृदयतुद्यतेतथा।
  निर्मथ्यते दीर्यते च स्फोट्यते पाट्यतेऽपि च ।।Su.Ut. 43/6।।

***Vataja Hridroga[22]*:** *Aayamyate* (Expansion of the heart), *Tudyate* (Pricking, throbbing pain in the Heart), *Nirmathyate* (Churning pain in the heart), *Deeryate* (Tearing pain in the heart), *Sphotyate* (Blasting pain in the heart), *Paatyate (*Cutting pain in the heart).

- तृष्णोषादाहचोषाःस्युःपैत्तिकेहृदयक्लमः।
  धूमायनं मूर्च्छा च स्वेदः शोषो मुखस्य च ।। Su.Ut. 43/7) ।।

***Pittaja Hridroga[23]*:** *Trishna* (Severe thirst), *Ushnataa (* Excessive temperature, heat in the body), *Daaha* (Burning sensation), *Chosha* (Sucking pain), *Klama* (Excessive tiredness, Fatigue), *Dhoomaayanam (*Feel as if smoke is being eliminated from the mouth), *Moorchaa* (Fainting, loss of consciousness), *Sweda* (Excessive sweating), *Mukha Shosha* (Dryness of the oral cavity).

- गौरवंकफसंस्रावोऽरुचिःस्तम्भोऽग्निमार्दवम्।
  माधुर्यमपि चाऽऽस्यस्य बलासाव्वतते हृदि ।। Su.Ut. 43/7।।

***Kaphaja Hridroga[24]*:** *Gouravam* (Heaviness in the region of the heart, chest), *Kapha Samsraava(* Excessive salivation froth from the mouth), *Aruchi (*Tastelessness, anorexia), *Stambha (*Stiffness, rigidity in the body, heart and chest), *Agni Maardavam* (Loss of appetite, sluggish digestion), *Mukha Maadhurya (*Feel of sweet taste in the mouth, Presents with chest heaviness, nausea, cold sweats, and excessive salivation).

***Sannipataja Hridroga[25]*:** Exhibits mixed and more severe symptoms due to the involvement of all three *Doshas*.

उत्क्लेशःष्ठीवनंतोदःशूलोहृल्लासकस्तमः।
अरुचिः श्यावनेत्रत्वं शोषश्च कृमिजे भवेत् ।। Su.Ut. 43/9।।

***Krimija Hridroga*:** *Utkleda* (Nausea, feel to vomit), *Shteevana (*Excessive spitting*), Toda* (Pricking pain), *Shula* (Colic, Pain in chest), *Hrillasa* (Nausea), *Tama (Feel of darkness in front of the eyes), Aruchi* (Tastelessness, anorexia), *Shyaava Netratvam (*Blackish brown discoloration of eyes), *Shosha* (Depletion of the body, excessive dryness of the body, wasting of the body)
In *Krimija Hridroga Granthi* is formed in *Hridaya*. Tumour of heart myxoma. As *Krimis* are microscopic or invisible it could be better correlated to tumours rather Than parasite infestation or inflammation due to Bacterial Endocarditis (*Aamavishaja*)[26].

***Rupavridhi* (Increase in Symptoms)**
This refers to the increase or worsening of symptoms. It can be seen when causative factors persist, such as continued improper diet, lack of treatment, or incorrect management. The Obstruction (*Avarana*) leads to Unstable angina, which is characterized by increasingly more severe and is precipitated by increasingly less effort. It is caused by coronary Atheromas prone to rupture (*Medas Avrita Vata*). Rupture results in intimal defects that covered with thrombi caused severe narrowing of the Lumen (*Picchila-Kaphaavrita-Vata*). *"Meda: kaphaabhyaam anilassaniruddha: shoola-angarmarda-shwayathoon karoti"[27].*

***Rupahani* (Decrease in Symptoms)**
Decrease Symptoms like Pain and palpitation, Breathlessness becomes manageable, patient regains physical strength and mental calmness, when the correct treatment is initiated. From an *Ayurvedic* prespective, thrombus formation can be understood under *Siragata Vata*, *Raktavaha Srotodushti* and *Avarana* of *Vata* by *Kapha* or *Pitta*. The *Rupas* (clinical features) seen in the affected area closely match with the signs of *Margavarana* (pathway obstruction) and *Rakta Dushti*. If necessary, thrombolysis or surgical intervention to restore blood flow. In *Ayurveda*, treatments aim to restore balance of *Doshas* and cleanse the Obstructed Channels (*Srotoshodhana*).

***Rupantara* (Transformation of Symptoms)**

In certain cases, symptoms may transform due to progression of the disease or inappropriate therapy: A *Vataja Hridroga* may acquire *Kaphaja* symptoms if *Kapha* becomes predominant later. In *Ayurveda*, while the concept of thrombus (blood clot) and pulmonary embolism (PE) is not described in the exact anatomical terms used in modern medicine, it can be understood through fundamental *Ayurvedic* principles such as *Srotorodha* (obstruction of channels), *Rakta Vaha Srotodushti* (vitiation of blood-carrying channels), and *Vata Avarana* (obstruction of *Vata* by other *Doshas* or *Dhatus*)[28].

***Rupantara* (Transformation of Symptoms)[29] (Figure 3)**

**Thrombus Formation (DVT equivalent):** The formation of a thrombus in the lower limbs can be correlated to *Rakta Dushti* and *Kapha-Vata Avarana* in *Raktavaha Srotas*. Vitiated *Rakta* (blood) and *Kapha* may lead to *Stambha* (stagnation) and *Sanga* (blockage), initiating clot formation. This stagnation reflects *Srotorodha*, especially in the *Udaka Vaha* and *Raktavaha Srotas*.

**Dislodgement and Movement (Embolization):** When the clot breaks loose, it moves along with *Prana Vata* and *Vyana Vata*, which are responsible for circulation and movement within the cardiovascular system. The clot travels through the *Mahasrotas* (circulatory channels), particularly through the *Hṛidaya* (Heart) and reaches the *Uras* (Thoracic region/lungs).

**Pulmonary Embolism (Obstruction in lungs):** When the embolus lodges in the pulmonary artery, it causes acute *Srotorodha* in the *Pranavaha Srotas* (channels of respiration). This results in *Shwasa* (dyspnea), *Urah Shoola* (chest pain), *Hrit Spandana* (palpitations), and possibly *Murcha* (loss of consciousness) or even *Marana* (death) in severe cases—closely resembling the symptoms of pulmonary embolism.

***Hridroga* in Modern Perspective**

In *Ayurveda*, the term *Hridroga* is used to describe various disorders related to the *Hridaya* (Heart)**.** *Ayurveda*, the ancient Indian system of medicine, views the heart as a vital organ responsible not only for circulation but also for emotional and spiritual well-being. According to *Ayurvedic* principles, an imbalance in the *Doshas—Vata*, *Pitta*, and *Kapha*—can lead to different types of heart diseases, affecting both the physical and energetic aspects of the heart. In contrast, modern medicine classifies heart diseases into several categories based on their underlying causes and physiological effects. Some of the most commonly recognized heart conditions include ischemic heart disease, which occurs due to reduced blood flow to the heart muscle, often caused by blockages in the coronary arteries. *Ayurveda* describes *Hridroga* primarily through *Dosha* imbalance and *Avarana* of *Vata*, leading to symptoms like *Shoola* (pain), *Daha* ( Burning), and *Gatra Sanga* (body stiffness). Atherosclerosis- *Kaphaavrita Vata[30]* (Figure 4 (a)). Atherosclerosis- *Kaphaavrita Vata[31]* (Figure 1.4 (b))

***Samprapti* vs. Pathophysiology**

*Ayurveda* describes *Hridroga* primarily through *Dosha* imbalance and *Avarana* of *Vata*, leading to symptoms like *Shoola* (Pain), *Shwasa* (Dyspnea), and *Gatra Sanga* (Body Stiffness).

**Modern equivalents include**

***Vataja Hridroga[32]:*** As a result of *Shoka* (Sad mood), *Upvasa* (Regular fasting), *Vyayayam* (Excessive exercise), *Ruksha*, *Shushka* (Dry food), *Alpa Aahara*, *Vata Dosha* is aggravated and as a result, significant pain in the heart takes place. Angina also causes excruciating pain. Angina can be associated with *Vataja Hridroga* from the perspective of pain. *Vata* aggravates and causes the arterial wall to become hard or calcified because of *Ruksha* and *Laghu Guna*. That is, the *Vataja Hridroga* can be associated with Arteriosclerosis. Heart failure (CHF) reflects *Vata Prakopa* due to obstruction of movement (contractility, relaxation) similar to *Avarana Samprapti*.

***Pitta Hridroga[33]*:** Symptoms of *Pitta Hridroga* are burning in the heart, bitter taste, Vomiting (*Vamana*), Thrust (*Trishna*), *Murcha* (syncope), and Sweating (*Sweda*) in the body due to *Ushna, Amla, Lavana, Kshara, Katu Rasa's* food, and excessive alcohol consumption aggravate *Pitta Dosha*. According to contemporary theory, we can associate Pericarditis with an Inflammatory heart condition.

***Kapha Hridroga[34]*:** Symptoms of *Hridaya Roga* are anorexia and chest heaviness and numbness due to extreme food consumption, *Snigdha*, *Guru* food, and a lack of physical activity aggravate *Kapha Dosha*. Because Myocardial infarction also causes a heaviness in the chest, *Kaphaja Hridroga* can be linked to it.

***Sannipataja Hridroga[35]*:** It is caused by *Vata*, *Pitta*, and *Kapha* and simultaneously manifests the symptoms of each *Dosha*. Acute chest pain is associated with *Sannipataja Hridroga*.

***Krimija Hridroga:*** *Krimija Hridroga* occurs by *Rasa Dhatu Dushti* due to over eating of *Tila, Guda,* leads to *Granthi Utpati. Granthi Krimi* arrives and spreading all region of heart and produces itching and pain etc[36]. That is why Myocardial infarction and *Krimija Hridroga* are related as Myocardial infarction causes excruciating pain that needs immediate medical attention[37].

## DISCUSSION

The *Ayurvedic* idea of *Hridroga* as an *Upadrava Vyadhi* of *Avarana* demonstrates a high level of knowledge about how disease develops via *Doshic* interaction and *Srotodushti* (channel obstruction). This model highlights the fact that diseases can result not only from the vitiation of individual *Doshas*, but also from the obstruction (*Avarana*) of *Vata* by other *Doshas*, *Dhatus*, or *Malas*, which can lead to a secondary but frequently more complicated ailment. In the context of *Hridroga*, *Vata's* organic function of movement is compromised, which includes the transmission of nerve signals, the regulation of heart rhythm, and the propulsion of blood. This problem is brought about by its own degradation as well as by *Kapha* (Heaviness and stagnation), *Pitta* (Inflammation and heat), or *Meda* (Fat deposition) covering *Avarana*. The outcome is the expression of typical cardiac symptoms like *Shoola* (Pain), *Shwasa* (Dyspnea), *Hrit-Spandana* (Palpitations), and *Urah-Gaurava* (Chest Heaviness), which closely resemble the cardiovascular disorders discussed in contemporary medicine. The divided categorization of *Hridroga* is a key discovery from this study: A *Hridroga* that is only caused by *Vata* vitiation is a *Nanatmaja Vyadhi* of *Vata*. An *Avarana Janya Upadrava* occurs when other variables interfere with *Vata's* function. This dual framework facilitates a more sophisticated approach to diagnosis and therapy. In addition, *Vikalpa Samprapti* provides a different perspective by analyzing how the *Gunas* (Qualities) of *Vata*, such as *Chala* (Mobility), *Laghu* (Lightness), and *Sukshma* (Subtlety), are diminished by obstruction. Targeted therapeutic techniques are supported by this qualitative research. For example, *Kapha Avarana* causes stiffness and stagnation by decreasing *Vata's* mobility and lightness, which is similar to modern diseases like heart failure and atherosclerosis. Additionally, the persistent and progressive course of cardiovascular disease may be explained by *Rupantara* (Transformation of Symptoms) and *Rupavridhi* (Increase in Symptoms). The *Ayurvedic* concept of *Srotorodha* (channel blockage), especially in *Raktavaha* and *Pranavaha Srotas*, can correspond well with pulmonary embolism, myocardial infarction, and coronary artery blockage. For instance, the *Kapha/Meda Avarana* of *Vata* causes thrombotic buildup that resembles coronary atheroma. The embolization process replicates how the abnormal material (Clot) hijacks *Vata's* transport function, resulting in a life-threatening *Srotorodha* in the brain or lungs. The timeless relevance of *Ayurvedic* principles is demonstrated by this sophisticated and nuanced knowledge, which is consistent with current Pathophysiology. Furthermore, it supports *Ayurveda's* holistic perspective, which includes diet, lifestyle, emotional well-being, and *Prakriti* (individual makeup) in the understanding and treatment of *Hridroga*.

## CONCLUSION

Based on *Doshic* dynamics and *Srotas* malfunction, the *Ayurvedic* concept of *Hridroga* as an *Upadrava Vyadhi* of *Avarana* offers a complete, multidimensional perspective of heart pathology. In contrast to a purely anatomical or biochemical explanation, *Ayurveda* contextualizes *Hridroga* within a functional and energetic framework, taking into consideration both intrinsic Imbalances (*Vata Prakopa*) and extrinsic Obstructions (*Avarana* by other *Doshas* or *Dhatus*). *Ayurveda* gives the doctor a broader diagnostic lens and a more individualized therapeutic approach by recognizing both the primary and secondary etiologies of *Vata* dysfunction. This includes *Rasayana* therapy to nourish the heart and prevent recurrence, *Vatahara Chikitsa* to restore movement and balance, and *Anulomana* and *Srotoshodhana* to alleviate blockage. Despite being expressed in different language, *Ayurvedic* ideas are well-aligned with our current biomedical understanding, as evidenced by the clinical similarities with modern medicine, ranging from atherosclerosis to thrombo-embolism. These relationships make *Ayurveda* more credible and practical in integrated cardiac treatment. In conclusion, seeing *Hridroga* through the perspective of *Avarana* enhances our comprehension of its pathophysiology and improves our capacity to intervene at different points in the course of the illness. Maintaining *Doshic* balance, clear *Srotas*, and, in particular, unhindered *Vata* function are reinforced as crucial for protecting *Hridaya Sthiti*, which is cardiac health. In this way, the conventional viewpoint continues to be both scientifically insightful and clinically useful in modern practice.

**ABSTRACT**

Artificial Intelligence (AI), blockchain, cloud computing, data analytics and the Internet of Things have fast become alternative channels in India to provide cashless banking system services in recent years. A cashless economy is a situation in which all the financial transactions are done through a digital online platform. The financial services industry is undergoing abrupt change due to the emergence of technological innovation. In this new fintech era, the cashless banking system is moving forward from conventional to convenient in the Indian banking approach. Converting to a cashless system has many positive aspects, but it has been confronted with several challenges. The study seeks to understand the impact of the cashless banking system and the bank performance by focusing on the issue and security challenges of the cashless economy.

**Keywords**: Cashless banking, cashless economy, digital banking, online transaction, security & challenges, financial service sector.

## INTRODUCTION

The Indian banking system dates from the Vedic period. The banking sector is the foundation of any economy or a country's financial system (Bank, 2022). The term "Digital India" was launched by the Government of India with a vision to transform India into a digitally powered and empowered society as well as economy. "Faceless, Paperless, Cashless" is one of the professed roles of Digital India. There are various modes of digital payments, such as banking

cards, USSD, AEPS, UPI, mobile wallets, bank prepaid cards, point of sale, internet banking, mobile banking, and micro ATMs. The worldwide development of the e-commerce industry has caught the attention of researchers round the globe to understand how individuals behave on the digital online platform. It is very much necessary to understand security and challenges accepting the usage of digital online platforms in terms of financial transacting for various reasons (Kumar, A. and Debnath, N., 2018). Information Communication Technology (ICT) represents all components related to computers and digitalisation. Fast response, flexibility and information are the key factors to deal with; ICT plays a critical role in these areas for the purposes of quality enhancement (Arora, B. and Kaushik, N., 2018). In the last recent year alternative finance has transformed to new technologies and is offering new business models of financial services to the providers of such services. The main four key interrelated technologies that have allowed alternative finance to flourish. Those are namely artificial intelligence, blockchain, cloud computing, and data. Innovations in technology have a significant impact on how efficiently banks operate. Financial technology, or fintech, provides digital banking solutions that optimize workflows, cut expenses, and enhance service quality. Digital banking platforms that use artificial intelligence and machine learning are better able to optimize product offers, improve risk management strategies, and personalize customer experiences (Jingrong et al., 2024)

Banks have relied upon and generated a tremendous amount of information. That's information about the bank customer, their personal identity, transaction activities, their net worth, and even their relationship and location. But in the earlier days, a lot of this was gathered by using paper forms filled out by customers and bank official staff and was not easy to manipulate for analysis. Digitalisation promotes an online capital marketplace that is easy to operate, where gatherers can more cost-effectively process and analyse the data. At the same time, digitally filling forms and tracking online customer activity allows both online platforms and cashless systems to scale more quickly and requires less manual labour and space resources. In the past, financial institutions have built their IT systems to run businesses using different enterprise-level software that was developed or licensed at high cost over time and hosted on large servers on premises. However, with the birth of cloud computing, software resides at data centres on servers run by companies that are created to manage such servers, which also provide value-added services such as cyber protection. This means that new businesses, such as alternative financial providers, no longer need to dedicate high capital for expensive infrastructure and can focus on improving customer experience. Blockchain is a modern internet-based technology that provides better visibility and transparency in transactions among supply chain members (Pilkington, 2016). Blockchain stores transaction data in blocks which can be shared between members. These blocks can be added together in chronological sequences which form a chain. After confirmation from shared members, the stored data in this chain cannot be erased, and this characteristic makes blockchain perfect for record keeping. (Underwood, 2016) Blockchain is also the underlying technology behind cryptocurrencies that have expanded dramatically beyond Bitcoin.

Blockchain has become a newer form of digital asset as a newer alternative finance method to raise capital for new projects, with crypto exchanges turning into a newer form of online capital marketplace. In addition, blockchain technology could form the basis of new capital markets infrastructure (Thomas, 2018). The concept of intelligent human-like machines was mentioned in old Greek myths: Hephaestus, the blacksmith who manufactured mechanical servants, and the bronze man Talos, who incorporated the idea of intelligent robots. For AI, there are two broad types: the narrow or weak AI that relates to algorithms performing specific tasks and the general or strong AI that reflects broader human intelligence and decision-making. AI is rapidly changing alternative finance user interfaces, from facial and voice recognition to biometric identity management to chatbots that can provide personalised recommendations. Algorithmic matching of needs, pricing and predictive analytics are also being used. AI also allows some alternative finance companies to create new business models that focus on analytics of the customer data rather than building platforms to provide financial fund flow.

These technologies are supporting the fintech industry as well as banks. The Indian financial services industry is one of the most exciting industries to follow for the coming years.

**Objectives of the study**

- To study Securities measures in Cashless banking system.
- To Identify the Challenges in Cashless banking system.

**Challenges and Securities in Cashless banking system**

The cashless banking system, or online digital payments industry, has been evolving in recent years. Banks have witnessed increased customer interaction through online platforms such as mobile channels and the inclusion of UPI etc. in the last recent year in Indian banking platforms. There are a number of challenges associated with cashless banking that cannot currently be overcome. Perfectly 100 per cent cashless banking is still unrealistic. Therefore, there are five key issues to consider about cashless banking.

**Security and privacy concerns with new technology**

An increase of worry for many customers is that the data and cybersecurity issues of cashless banking payments are not well monitored. Cyberthreats from both organised technology-fuelled thieves and rogue action in nation-states are increasing. Also, on the flip side, consumers have privacy concerns that come with every transaction having a digital footprint, whereas cash is more anonymous. For consumers wary of their behaviour being recorded by their financial institution, that can be off-putting—and for some consumers that's putting it mildly.

**Resilience and system vulnerabilities**

What if a natural disaster or some other means knocks out a cashless country's supporting system—and it becomes a big problem for financial services? Suddenly, the ability of consumers to access their funds would be blocked, and with no one able to pay for anything, the result would likely be an economic shutdown. Take, for example, the visa outage in 2018, which wreaked havoc for those relying on digital payments. The ATM became the trusted backup consumers needed. While the latest infrastructure solutions are secure enough to likely prevent that scenario, 100 per cent uptime is never a guarantee. If connectivity should fail, having cash as a reliable backup option will be essential, especially if natural disasters such as flooding, earthquakes or hurricanes knock out critical infrastructure.

**Tracking spending**

Cash also has a key advantage when it comes to issues such as consumers budgeting and monitoring their money—and giving themselves a spending limit. When bills physically leave your hand as part of a transaction, this tends to register much more than when paying by card or other means. In fact, when using digital payments, it can be very easy for consumers to lose track of how much they're spending, and that could leave people approaching the end of the month with a lower balance than they think, simply because they cannot see in front of them how much money they have available.

**Unwilling consumers**

Regardless of how effective public education campaigns may be, with some consumers still wary of technology in general, there will always be a certain number of consumers who are resistant to the change—often with very good reasons. These are often thought of as more elderly citizens who are not as tech-savvy as their younger peers and at-risk people who simply need to be able to use cash. On top of that, people of all ages still prefer to use cash for a variety of reasons, from birthday gifts to the wariness of digital footprints, and their wishes must be respected.

**Loss of control**

Many of the concerns about moving away from cash essentially come down to consumers feeling as though they are in less control of their finances. Whether it's being able to physically carry money in their wallet or purse or worries about putting their faith in the systems of private companies or governments, cash gives people a sense of comfort and security that can't be matched by other alternatives. So, while non-cash payments are the norm for many transactions—and may remain so for many years—there will likely always be a place for cash.

## CONCLUSION

What makes a digital payment innovation fly or die. Given the change of pace over the last five years, banks and fintech (yes, fintech too) may feel they need to decide between complying, competing or going to the grave as they explore new technologies that meet the challenges of digitalisation and changing consumer behaviour. Open banking services and developer-friendly APIs are basic or underlying principles of BaaS and BaaP. One of the biggest concerns relating to security in payment-accepting applications is the use of correct, reliable and secured payment methods, i.e., the use of cards, Internet banking, mobile payments or instant payments. Failure to secure the sensitive information can cause major damage to the service provider organisation in terms of financial fraud, identity theft, legal regulations, loss of consumer confidence, etc. Security controls that can be employed in making a payment handling application should be more robust and frustrate the breakers at the hardware level before reaching the application level. As a condition of the security policy regulatory framework to support fiscal responsibility, providers' compliance departments must ensure that sufficient funds are maintained and set aside for initial and ongoing data security compliance responsibilities.

Making the customer central in the digital banking journey and humanising the digital experience, thence protecting consumers' confidential information, which is stored, processed and transmitted for fiscal transactions, including the collection of payments, should appear super easy. The case study on creating a mobile-only bank should be reopened and looked at from a different perspective now. The impact of new technology on central banks: An assessment framework for innovations in retail payments needs to come out in the open market to explore unbanked payment methods. Despite its advantages, several obstacles may prevent cashless banking from becoming widely used. Because of the ongoingcybersecurity concerns, banks must keep making investments in safe technologicalsolutions. Furthermore, customers used to traditional banking practices can object,underscoring the necessity of outreach and education initiatives to promote easiertransitions (Amiri et al., 2023).

## ABSTRACT

This research analyzes the effectiveness of viral marketing strategies in social media, focusing on consumer behavior and theoretical frameworks that influence content sharing. It reviews significant viral campaigns from 2024-2025, including Nike's "What The Football," Barbie's breadcrumb strategy, Spotify Wrapped, and Under Armour's Flow State Challenge, to pinpoint success factors and business outcomes. Employing mixed-methods analysis, the study combines quantitative performance data from 13 campaigns with qualitative insights into consumer motivations and strategic models, revealing that successful campaigns intertwine emotional resonance with personalized strategies to ensure high return on investment. Key regression results show that campaigns using user-generated content achieve 47% higher engagement ($p < 0.01$), whereas personalized content yields an average return of $5.78 per dollar spent (range: $1.50- $8.20). The analysis indicates strong correlations between viral success and timing with cultural events ($r = 0.72$, $p < 0.01$), personalization sophistication ($r = 0.68$, $p < 0.01$), and platform optimization ($r = 0.65$, $p < 0.05$). The study identifies four primary consumer motivations for sharing content: self-enhancement, social connection, emotional expression, and entertainment. TikTok exhibits the highest viral coefficient (3.2 shares per viewer), while Instagram, Twitter, and Facebook follow with 2.1, 1.8, and 1.4, respectively. Longitudinal analysis demonstrates a 23% increase in brand awareness at a three-month follow-up, contrasting traditional advertising decay rates. The findings underscore the importance of timing, platform-specific optimization, and authentic storytelling in digital marketing. The study concludes that the effectiveness of viral marketing depends on understanding consumer psychology, implementing measurement frameworks, and nurturing brand authenticity to foster organic sharing, thereby offering practitioners data-backed guidelines for crafting campaigns that drive business value and sustainable brand engagement.

**Keywords:** Viral Marketing, Social Media Marketing, Digital Campaigns, Consumer Engagement, Content Strategy, User-Generated Content

# INTRODUCTION

Viral marketing has transitioned from a marginal tactic to a core element of modern digital strategy, fundamentally changing brand-consumer interactions on social media (Bhattacharya *et al*., 2019). It emphasizes rapid, organic content dissemination through social networks, marking a shift from traditional advertising to consumer-driven engagement models (Puriwat and Tripopsakul, 2021). The digital transformation of the last decade has enabled extensive viral content distribution, with social media amplifying messages globally (Dinh *et al*., 2014). Viral marketing campaigns can achieve substantial reach and engagement comparable to traditional advertising at significantly lower cost (Miller and Lammas, 2010), enabling organizations to maximize their limited marketing resources while forging genuine connections with audiences. The importance of viral marketing extends beyond immediate reach; it encompasses brand building, customer acquisition, and the cultivation of long-term relationships (Alramdhan, 2022). Effective viral campaigns create shared cultural experiences that uniquely embed brands in consumer consciousness (Akyol, 2013). Recent notable examples include Nike's "What The Football" campaign and Barbie's effective strategy, which led to impressive revenue figures in the 2024-2025 marketing landscape (Empathy First Media, 2025). Today's viral marketing operates in a complex ecosystem shaped by algorithm-driven content distribution, brief consumer attention spans, and heightened expectations for authentic communication (Bhattacharya *et al*., 2019). Marketers face the challenge of optimizing content for specific platforms while ensuring message consistency across various channels and capturing attention in crowded digital spaces (Dinh *et al*., 2012). The surge of AI and personalization tools complicates matters by providing opportunities for targeted content, yet also raising issues related to authenticity and consumer trust (Twenty Two Digital, 2025). This research investigates key aspects of viral marketing effectiveness by exploring theoretical frameworks of consumer sharing behavior and analyzing success factors from major 2024-2025 campaigns. It combines insights from consumer psychology with performance data to present actionable guidelines for viral content creation and measurement in contemporary social media contexts. A platform-focused analysis reveals that TikTok outperforms Instagram, Twitter, and Facebook in viral sharing. Long-term studies indicate a significant increase in brand awareness following viral campaigns, in contrast to the decay of traditional advertising. The study emphasizes the critical roles of timing, optimization, and authentic storytelling in campaign success. Ultimately, it asserts that viral marketing's effectiveness hinges on a deep understanding of consumer behavior, the establishment of robust measurement frameworks, and the maintenance of brand authenticity, thereby providing valuable directives for practitioners seeking to develop impactful viral marketing campaigns.

**Theoretical Framework and Consumer Sharing Behavior**

Understanding consumer behavior in content sharing is essential for an effective viral marketing strategy, which relies on the psychological motivations that drive sharing on social networks (Ho and Dempsey, 2010). Individual psychology, social dynamics, and the technological capabilities available on digital platforms influence this behavior. The Consumer Online Brand-Related Activities (COBRA) framework encapsulates consumer engagement with brand content, delineating four key categories: consumption, contribution, creation, and destruction, each reflecting different levels of engagement with brand messaging (Muntinga *et al*., 2011). Successful viral marketing encourages a shift from passive consumption to active participation, thereby fostering brand advocates who generate and share original content. A significant motivator for sharing is self-enhancement, where consumers leverage shared content to express desired self-images within their social circles (Chiu *et al*., 2013). Research shows that individuals favor content that aligns with their identity and values, underscoring the need for viral campaigns to facilitate positive self-representation. For example, Spotify Wrapped allows users to communicate their musical tastes and sophistication through shareable data (Empathy First Media, 2025). Social connectivity is another primary driver, as content fosters relationships within digital communities. Users often share content to care for others, provide network value, or spark dialogues around common interests (Ho and Dempsey, 2010). The success of initiatives such as GoPro's Earth Day Awards Challenge illustrates how brands can leverage these motivations to enhance community engagement while advancing their goals. Emotional impact is crucial in decision-making, as emotionally charged content elicits higher sharing rates than purely informational content (Berger and Milkman, 2012). Content that elicits strong

emotions—such as excitement or nostalgia—tends to perform better, as seen in campaigns like Cadbury's drumming gorilla, which blends humor with emotional appeal to generate notable shares and sales increases (Filestage, 2025). Moreover, the sharing decision process is characterized by quick assessments of content relevance, social suitability, and perceived outcomes, occurring within moments of exposure to content (Reichstein and Brusch, 2019). Consumers evaluate content based on its alignment with personal brand, its value to their network, and potential social ramifications of sharing. Platform-specific behaviors further influence viral marketing, with different social media channels promoting unique content formats and engagement styles (Berger and Milkman, 2012). For instance, Instagram thrives on visually appealing content, while TikTok favors entertaining and replicable material that invites user interaction. Understanding these nuances is vital for crafting effective multi-channel viral campaigns. Lastly, authenticity is increasingly important in sharing behavior; consumers are less inclined to share content perceived as overly promotional (Cresci, 2025). Brands must balance marketing objectives with authentic value for consumers to ensure that successful campaigns resonate with audiences.

**Key Success Factors and Strategic Elements**

Successful viral marketing campaigns exhibit key strategic elements that span industries and demographics, highlighting principles crucial to viral content's effectiveness (Kaplan and Haenlein, 2011). A detailed analysis of major campaigns from 2024-2025 identifies five critical success factors: emotional resonance, strategic timing, authentic storytelling, platform optimization, and user participation. Emotional resonance is a primary predictor of viral success, as campaigns eliciting strong emotional responses significantly outperform those centered on product features (Berger and Milkman, 2012). Nike's "What The Football" campaign illustrated this by addressing societal attitudes toward women's sports and resonating with diverse audiences—focusing on individual athletes rather than generic empowerment themes (Empathy First Media, 2025). Strategic timing involves leveraging market conditions and scheduling content to coincide with cultural moments. For instance, Barbie's breadcrumb strategy employed staged releases to build anticipation, transforming a film promotion into a broader cultural movement with substantial financial returns (Empathy First Media, 2025). Authentic storytelling sets successful campaigns apart from lesser efforts, with brands needing to create genuine narratives. Red Bull illustrates this through its commitment to extreme sports, achieving remarkable engagement without overt promotion (Empathy First Media, 2025). Platform optimization requires tailoring content to suit the unique characteristics of various social media platforms. Spotify Wrapped 2025 exemplifies this, with highly optimized campaigns across Instagram, TikTok, and Twitter that achieved extensive reach and engagement (Empathy First Media, 2025). User participation enhances organic sharing and engagement. Under Armour's Flow State Challenge successfully engaged thousands through gamification, resulting in significant visibility and app interaction (Empathy First Media, 2025). Additionally, content creativity and originality are pivotal. GoPro's Earth Day Awards Challenge effectively integrated environmental themes with user-generated content, demonstrating that creativity stems from aligning brand values with consumer interests (Empathy First Media, 2025). Personalization technologies also enhance viral potential, enabling campaigns to tailor content to individual consumers. Apple's "Shot on iPhone" campaign generated extensive media coverage and social media mentions through user-generated, personalized content (Empathy First Media, 2025). Finally, cross-platform integration is essential for maintaining consistent messaging while optimizing formats for specific channels, requiring sophisticated planning and execution capabilities (Kaplan and Haenlein, 2011). Overall, these elements collectively underscore the complexity and contemporary strategies essential for successful viral marketing campaigns.

**Campaign Strategies and Execution Models**

Contemporary viral marketing emphasizes advanced execution models that synchronize various strategic elements across extensive timelines and platforms (Kaplan and Haenlein, 2011). The breadcrumb strategy, showcased by Warner Bros.' Barbie campaign, exemplifies a methodical approach to building anticipation through well-timed content releases that engage audiences and avoid message fatigue (Empathy First Media, 2025). This strategy involves disseminating small pieces of content over an extended period, each designed to stimulate curiosity and dialogue, culminating in a significant moment that leverages accumulated interest. Influencer activation has evolved from simple endorsements to complex partnerships that preserve creator authenticity and brand integrity (Sprout

Social, 2024). Under Armour's Flow State Challenge effectively engaged 168 influencers across markets, resulting in 3,039 campaign hashtag uses while maintaining consistent messaging. Successful campaigns necessitate cross-platform integration, taking into account the distinct characteristics of each platform while upholding a unified brand identity (Kaplan and Haenlein, 2011). Domino's "Domin-oh-hoo-hoo" Group Ordering campaign saw 2.4 million activations and a 34% rise in group orders through platform-specific strategies combined with humor-driven messaging (Empathy First Media, 2025). Elements such as a custom Instagram AR filter and a TikTok challenge illustrate how viral campaigns tailor their execution to platform capabilities while maintaining brand consistency. Brand partnership ecosystems broaden campaign reach through strategic collaborations, offering mutual exposure benefits (Kaplan and Haenlein, 2011). Barbie's 160+ brand alliances across various sectors transformed the movie release into a cultural event, generating revenues beyond typical film marketing outcomes (Empathy First Media, 2025). These alliances established numerous points of consumer engagement and distributed campaign costs among brands. Nostalgia-driven initiatives utilize emotional ties to established brand memories while modernizing classic elements for contemporary consumers (Cresci, 2025). Dollar Shave Club's return to its irreverent humor resulted in a 13% increase in sales and an 84% increase in customer retention (Empathy First Media, 2025). This campaign effectively illustrates the strategic use of nostalgia. Humor and relatability tactics necessitate a deep understanding of target audience dynamics to maximize sharing potential while avoiding backlash (Kaplan and Haenlein, 2011). Cadbury's revival of the drumming gorilla campaign generated 4.2 million shares and a 9% sales increase by combining established humor with new elements that appealed to a broader audience (Filestage, 2025). User-generated content (UGC) strategies empower consumers as active creators, fostering authentic brand advocacy and extending campaign reach (Kaplan and Haenlein, 2011). GoPro's Earth Day Awards Challenge harnessed UGC to deliver genuine environmental messaging while showcasing product features (Empathy First Media, 2025).Real-time marketing leverages current events and cultural trends to enhance relevance and viral potential (Kaplan and Haenlein, 2011). Netflix's Streamberry Black Mirror activation creatively blurred the boundaries between reality and fiction by creating a fake website for a show's dystopian service (Twenty Two Digital, 2025). This innovative marketing approach garnered significant media attention, reflecting a nuanced understanding of audience psychology and cultural conversation.

**Measurement, Metrics, and Return on Investment**

**Measurement Framework**

Measuring the effectiveness of viral marketing requires advanced analytics frameworks that evaluate both immediate engagement and long-term brand impact. Traditional marketing metrics often overlook the unique advantages of viral campaigns, necessitating specialized measurements. Key engagement metrics, which include shares, likes, and user-generated content, are central to assessing campaign performance. For example, the Spotify Wrapped 2025 campaign generated 2.1 million social media mentions in 48 hours, highlighting the rapid engagement typical of viral success, with 400 million TikTok views and 66.5 billion total hashtag views. Reach and impression metrics further inform on campaign amplification, indicating how viral sharing extends brand messaging beyond paid advertising. Apple's "Shot on iPhone" campaign generated 6.5 billion media impressions, demonstrating that user-generated content can outperform traditional advertising budgets. Conversion metrics link engagement to tangible business outcomes, as illustrated by Barbie's campaign, which generated $7 million in earned media value and $162 million in opening-weekend revenue, underscoring the financial justification for viral marketing investments. Brand awareness and sentiment analysis provide insights into consumer perceptions and the evolution of brand equity. Under Armour's Flow State Challenge improved brand perception while engaging participants highly, indicating the importance of qualitative measures for long-term brand building, even when immediate financial returns are modest. Calculating ROI in viral campaigns requires accounting for direct and opportunity costs; industry averages indicate returns of $5.78 per dollar spent on influencer marketing, although results vary widely. Cost-per-engagement metrics facilitate comparative efficiency analysis with traditional marketing, often showing that effective viral campaigns incur significantly lower engagement costs. However, these figures must consider content production, influencer partnerships, and management expenses. Accurate attribution modeling is essential yet challenging due to the complex sharing patterns of viral content. Advanced models that factor in social sharing and engagement timelines are recommended over traditional methods. Lastly, long-term impact metrics assess how

viral campaigns affect enduring brand metrics; examples include Red Bull, which demonstrates significant post-campaign brand awareness and consumer influence. Such prolonged benefits are crucial for evaluating the actual value of viral marketing efforts.

**Data Analysis and Interpretation**

Comprehensive analysis of viral campaign performance data from 2024-2025 identifies significant correlations between strategic elements and outcomes. The analysis of 13 campaigns indicates that those using user-generated content saw engagement rates 47% higher than those using only branded content, highlighting the importance of authenticity and consumer participation. ROI metrics vary widely, averaging $5.78 per dollar invested, with significant correlations found concerning cultural timing (r = 0.72), personalization sophistication (r = 0.68), and platform optimization (r = 0.65). Successful viral campaigns reach peak engagement within 24-72 hours, with 68% of total engagement occurring in the first week. Notably, Spotify Wrapped achieved 2.1 million mentions within 48 hours, emphasizing rapid engagement as a hallmark of viral content. Social media analysis reveals TikTok has the highest viral potential (average 3.2 shares per viewer), followed by Instagram (2.1), Twitter (1.8), and Facebook (1.4), reflecting the need for platform-specific strategies. Regression analysis indicates an optimal budget range of $500,000 to $5 million to achieve engagement cost efficiency, with diminishing returns at both lower and higher budget extremes. Longitudinal studies show sustained brand awareness increases, averaging 23% at three months and 15% at six months post-campaign, suggesting more durable effects than traditional advertising. Additionally, sentiment analysis indicates that 73% of user-generated content about successful campaigns is positive, in contrast to traditional advertising, suggesting that viral campaigns foster more favorable brand perceptions when executed efficiently.

**Best Practices and Implementation Guidelines**

Comprehensive analysis of viral campaign performance data from 2024-2025 identifies significant correlations between strategic elements and outcomes. The analysis of 13 campaigns indicates that those using user-generated content saw engagement rates 47% higher than those using only branded content, highlighting the importance of authenticity and consumer participation. ROI metrics vary widely, averaging $5.78 per dollar invested, with significant correlations found concerning cultural timing (r = 0.72), personalization sophistication (r = 0.68), and platform optimization (r = 0.65). Successful viral campaigns reach peak engagement within 24-72 hours, with 68% of total engagement occurring in the first week. Notably, Spotify Wrapped achieved 2.1 million mentions within 48 hours, emphasizing rapid engagement as a hallmark of viral content. Social media analysis reveals TikTok has the highest viral potential (average 3.2 shares per viewer), followed by Instagram (2.1), Twitter (1.8), and Facebook (1.4), reflecting the need for platform-specific strategies. Regression analysis indicates an optimal budget range of $500,000 to $5 million to achieve engagement cost efficiency, with diminishing returns at both lower and higher budget extremes. Longitudinal studies show that sustained brand awareness increases by an average of 23% at three months and 15% at six months post-campaign, suggesting more durable effects than traditional advertising. Additionally, sentiment analysis indicates that 73% of user-generated content about successful campaigns is positive, in contrast to traditional advertising, suggesting that viral campaigns foster more favorable brand perceptions when executed efficiently.

**Challenges and Risk Factors**

Viral marketing campaigns differ from traditional advertising in that they are unpredictable and heavily reliant on consumer behavior, posing challenges for balancing creative risks and brand safety (Reichstein and Brusch, 2019). As illustrated by Netflix's Streamberry Black Mirror activation, viral marketing can yield significant engagement but raises ethical concerns regarding consumer consent. Organizations face risks of negative virality, whereby content intended for positive sharing may backfire, necessitating crisis management protocols to protect brand reputation (Reichstein and Brusch, 2019). As consumers become more skeptical, demand for authenticity is evident, as evidenced by Dove's pledge against AI-generated imagery (Empathy First Media, 2025). Measurement of viral marketing impact remains complex, with shortcomings in traditional analytics hampering the demonstration of ROI (Sprout Social, 2024). Additionally, regulatory and ethical issues complicate the distribution of viral content across diverse audiences, as marketers must navigate compliance and privacy concerns (Reichstein and Brusch, 2019).

Emerging AI technologies challenge authenticity and consumer trust, necessitating transparency in viral marketing strategies (Twenty Two Digital, 2025).

**Future Trends and Emerging Opportunities**

Artificial intelligence and machine learning are transforming viral marketing by enabling advanced personalization and content optimization while raising concerns over authenticity and consumer manipulation. AI can analyze social media data to enhance content share ability, but consumer awareness of AI tactics is increasing the demand for transparent brand communication. The rise of short-form video content, driven by platforms such as TikTok, necessitates adapting video production for mobile consumption and rapid viewing, as evidenced by brands such as Red Bull achieving high engagement rates. Demands for authenticity in marketing are increasing, and future success will depend on delivering real value rather than manipulative strategies. Purpose-driven marketing is also becoming increasingly crucial, with brands such as GoPro integrating social causes into their campaigns. Additionally, the use of interactive technologies such as AR and VR is enhancing engagement, necessitating that marketers adapt to evolving platforms and content formats, as demonstrated by examples such as Domino's AR filter. Lastly, viral marketing is increasingly integrated into broader business strategies, as evidenced by Nike's recent campaigns that align with long-term brand objectives, underscoring the need for coordinated marketing efforts.

## CONCLUSIONS AND BUSINESS IMPLICATIONS

This research highlights that the effectiveness of viral marketing hinges on a deep understanding of consumer psychology and strategic execution, balancing creativity with measurable outcomes. Analysis of 2024-2025 campaigns reveals key success factors like authentic value creation, which prioritizes audience benefits over direct brand promotion. Successful campaigns employ emotional resonance, strategic timing, and storytelling, while optimizing multiple platforms to ensure consistency. Measuring return on investment (ROI) presents challenges, with an average $5.78 return per dollar invested in influencer marketing serving as a benchmark. Organizations must enhance their capabilities in cross-platform optimization and crisis management, given the unpredictability and backlash they face. Future research should focus on long-term brand effects, sophisticated attribution models, and the impact of emerging technologies on viral marketing. Viewing viral campaigns as part of broader marketing ecosystems fosters sustainable competitive advantages and deeper consumer engagement.

## ABSTRACT

Potentially inappropriate medications (PIM) are a leading cause of ADEs in the elderly. Low knowledge among the elderly and caregivers through this leads to greater risk of drug-related problems. Pharmacist-led interventions might benefit patient safety on drugs through education and consultation. This study assessed the perception, knowledge and attitudes of pharmacists towards PIMs and pharmacies in future attempts to reduce their prescription. All older people and caregivers were assessed at a single date through the use of a standardized questionnaire. Knowledge, drug risk awareness and perceptions of the pharmacist role were assessed. Descriptive and inferential statistics were employed for trend analysis and associations. The most of the participants had low knowledge on PIMs and also did not know the dangerousness of medications. Caregivers had slightly more knowledge than older adults. Patients who received counseling by the pharmacist had significantly better knowledge and attitude (Px). Barriers were limited knowledge and communication with medical staff. Older adults and their many caregivers lack optimal awareness of PIMs. A concentrated pharmacist-driven education and re-review may improve Safety.

**Keywords:** Potentially inappropriate medications, Older adults, Caregivers, Pharmacist-led interventions, Medication safety

## INTRODUCTION

There is a rapidly increasing global population of older people and their health care systems face considerable challenges particularly in managing medicines. The elderly frequently have several chronic health problems, which can result in polypharmacy and a higher ADEs risk (Martínez-Sotelo *et al*., 2021; Hu *et al*., 2025). Polypharmacy, characterized as the utilization of five or more medications simultaneously is evident in about 35% of older adults across the globe (Gavazova *et al*., 2024) The pharmacokinetic and pharmacodynamic changes that accompany aging may also increase the likelihood of a drug-related issue. Inter-individual physiological variability, combined with age-related changes increase medication risk for older adults who are at greatest risk of potentially inappropriate medications (PIMs), defined as those with high-risk and/or no benefit (Elshazly *et al*., 2025).Besides pharmacological aspects, older persons and their caregivers have only a modest knowledge of PIMs. Half of caregivers and 60% older patients were found to have acceptable knowledge in a recent study, indicating that there is still a wide gap in the health literacy on medication safety (Yaacob *et al*., 2024). This poor awareness is compounded by inadequate communication among health care professionals, patients and their care givers leading to inappropriate prescription and self administration of drugs likely to cause harm in the elderly (Thorpe *et al*., 2024). Formal and informal caregivers have a vital role in drug management, although their participation and awareness on inappropriate prescription of drugs differ widely. In the current study 33.3% of participants belonged to formal caregivers, 23.3% were informal caregiver and the remaining (16.7%) were pharmacists showing diversity of roles in geriatric drug management. Consequences of PIM use include hospitalization, increased mortality and lower quality of life in older people (McGrory and Elnaem, 2025).

Systematic reviews have found that the mortality rate is higher in older adults using PIMs, up to 44% more than those who do not use these drugs (Hossain *et al*., 2025). In addition, the widespread occurrence of prescription and monitoring errors in this population is raised with rates indicated up to 28%–42% for polymedicated patients (Smith-Ray *et al*., 2024). Inadequate prescriber training and knowledge specific to geriatrics make a major contribution to these errors, highlighting the importance of targeted interventions.Pharmacist interventions have become one of the effective tools to decrease PIM-use and improve medication safety. Interventions of such nature include medication review, patient and carer education and deprescribing initiatives (Rochon *et al*., 2021). Pharmacist interventions have shown to be effective in both hospital and community settings on adherence to medication and the number of inappropriate prescriptions (Baumgartner *et al*., 2020; Marcum *et al*., 2022). In the current study, subjects who had received counseling from pharmacists in the past had significantly greater knowledge nad more positive attitudes to MR, this was also consistent with certain effectiveness of pharmacist intervention. Pharmacist-led interventions, various though they may be have been proven beneficial.23 However, there are barriers that prevent the successful implementation of these strategies such as limited access to appropriate drug information, poor inter-professional communication and a lack of caregiver involvement (Hu *et al*., 2025). 40% of older people and 60% of caregivers in our study population reported unsureness about the risks associated with medication, which is a gap in knowledge that can be addressed by implementing well-structured pharmacist-led programs (Yaacob *et al*., 2024).

Furthermore, one-size-fits-all interventions are unlikely to be effective given the range of caregivers from family member to professional presented in this study which require customised strategies if medication use is to be safe and rational. Appraisal of PIMs by instruments such as Beers criteria and STOPP (Screening Tool of Older People's Prescriptions) is necessary in encouraging safer prescriptions practice (Babaei *et al*., 2024; Rochon *et al*., 2021). Pharmacist-led programs that incorporate these assessment measurements have resulted in a reduction of inappropriate prescriptions of 36% after the intervention (Baumgartner *et al*., 2020). This findings highlight the importance of pharmacists not only in medication review, but also in addressing education gaps among older adult and caregivers, leading to informed decision making and better health outcomes (Martínez-Sotelo *et al*., 2021). The elevated frequency of p olypharmacy among elderly people, coupled with poor recognition about PIMs by patients and care givers, is a major obstacle for medication safety. Incorporating pharmacist driven interventions such as education, drug**,** reviews, and deprescribing initiatives, offers a promising approach to reduce inappropriate

medication use, enhance caregiver involvement, and improve the overall quality of care in geriatric populations .This study therefore aims to assess awareness and understanding of PIMs among older adults and caregivers, while identifying opportunities for pharmacist-led strategies to mitigate risks and promote rational pharmacotherapy (Hu *et al*., 2025).

**Survey Questionnaire**

Since no instrument that has been standardized for use in assessing knowledge of potentially inappropriate medications among the aged and their care-givers could be identified, a specific questionnaire was formed based on this study. The conceptual framing of the questionnaire was based on an extensive literature review conducted on medication safety, knowledge in family caregivers, and pharmacist interventions with senior adults. Instrument development A self-report survey was prepared in English and consisted of three sections that aimed to identify demographic data, knowledge about PIMs and perceived barriers in proper drug use among the participating population. The first part collected socio-demographic details such as gender, age-range, education level and role of the participant to categorize participants in formal care-givers, informal caregivers, pharmacists, public health educators and older adults. Participants were also queried regarding the number of years in practice caring for older adults (or experience caring for older adults), the percentage of their patient load that is elderly, and whether they had received any formal training specific to geriatric medication management. Self-perceived competence was assessed by asking participants to what degree they agreed with the following statement: "I am confident in my ability to identify and manage PIMs among older adults" on a 5-point Likert scale (1 = strongly disagree, 5 = strongly agree). This self-assessment gave an indication of different levels of confidence in various participant groups and provided a context for further knowledge-based questions.

The second part was composed of 10 clinical situations, allowing the practical knowledge and decision-making ability about PIMs in usual treatment conditions to be explored. These vignettes were created using evidence-based indications of potentially inappropriate prescribing in older adults and encompassed the spectrum of conditions commonly seen in geriatric care. There were five total scenarios on therapeutic management for elderly patient's chronic condition (e.g. diabetes mellitus, hypertension, heart failure and cardiovascular disease), and two total scenarios regarding mental health issues (e.g. depression, sleep disturbances). One of these scenarios was concerned directly with what analgesics could be used in the management of pain for arthritis in the older person and the others looked at everyday topics such as allergy, prevention medication for conditions such as osteoporosis. Factors including the drug or therapeutic decision were collected and rated for appropriateness of use based on consensus prescribing guidelines. We used as the total score per participant, the percentile corresponding to each correct response, which allowed for quantitative evaluation of levels of awareness among different demographic and professional subgroups. The third was aimed to explore perceived barriers impeding appropriate use of medications in the elderly, according to both caregivers and the elderly.

A list of 12 common barriers including limited knowledge about PIMs, polypharmacy and medication complexity, time constraints in healthcare settings, lack of monitoring systems among others was included based on the preliminary literature review and pilot discussions. Participants were asked to check all barriers they felt relevant to their experience and add additional obstacles not included on the provided list. This module allowed me to gather useful qualitative and quantitative information on the systemic as well as local barriers impacting medication safety in older patients. Both personal and digital versions of the questionnaire were used to improve access and response rates for all participant groups. Descriptive statistics including frequencies and percentages were computed to describe the sample for data obtained from the first component. The scores of the second factor (knowledge) were coded separately and were combined per participant category in order to assess the overall level of awareness and to identify potential lack of knowledge for formal caregivers, informal caregivers, pharmacists, and older adults. The third set of responses was superposed to determine the frequency with which barriers were endorsed, informing us of specific challenges that should be addressed by targeted efforts. This bespoke questionnaire also provided in-depth assessment of awareness, understanding, and barriers to PIMs amongst older people and carers facilitating

tailored evidence-based pharmacist-led interventions to specifically target iden-tified gaps in knowledge and practice.

## METHODOLOGY

This was a cross-sectional study with high ethical consideration. Permission was granted from the respective institutional review board to maintain rights and privacy of the participants. The informed consent was an integral part of the data collecting tool, providing information about the objectives and voluntary nature of participation in this study, as well with a guarantee that the participant would remain anonymous. Participants were told that refusal or withdrawal would not result in any adverse consequences. The data were stored securely on password protected servers as part of our data management procedures to ensure confidentiality and veracity of information collected.

**Participants**

Older participants and caregivers responsible for managing medications were sampled. The participants were formal and informal caregivers, community pharmacists, a public health educator and older adults themselves (a wide range of stakeholders involved in geriatric medication care). There were 60% males and 40% females. Age distribution was as follows, 31 to 45 years in the majority (40%), then 18 to 30 years (26.7%),46 to60 years (23.3%) and >60 years (10%). Education levels differed from high school graduates to postgraduates, most of them had bachelor degrees. This varied sample helped to provide rich understanding of knowledge, perceptions and barriers encountered from a variety of important stakeholders in medication safety for older adults.

**Sample Size**

A sample size of 150 was deemed to give sufficient power for the assessment of patterns in levels of awareness and obstacles to drug use as an appropriate intervention. The sample size is based on feasibility considerations and the requirements for participant representation, which should allow sufficient numbers of representative caregivers and elderly adults to be sampled.

**Data Collection and Data Analysis**

Data was gathered by means of a standardised questionnaire that was given "face to face" as well as electronically, enabling more access for the participants' convenience. The survey assessed demographics characteristics, knowledge of PIMs, and factors associated with appropriate medication use. There were some clinical vignette type questions to test application knowledge. The study questionnaire was completed anonymously, without time limit and participants responded on their own to reduce bias. All were securely recorded and then summed for analysis. Statistical analysis Descriptive statistical methods were applied to describe participants' characteristics and general awareness, presented in the tables and figures which reflect the findings of this study. Frequencies and proportions gave a description of subgroup distributions by sex, age, educational level and job. Scoring of awareness was done according to the correct answer of the clinical exercises and participants were categorized into different levels of awareness that varied from very poor, poor, good to very good. Key barriers were ranked by frequency of endorsement. Bivariate analyses of relationship between demographics and awareness/attitude (Chi-square test and ANOVA) were carried out using SPSS version 26. These enabled a thorough investigation of factors impacting on knowledge and perceptions towards potentially inappropriate medications, informing targeted suggestions for pharmacist-led interventions.

## RESULTS

This study included 150 participants reflecting various roles in geriatric drug management. The study population comprised 90 (60%) males and 60 (40%) females. Regarding the age distribution of the participants, 60 of them (40%) were aged 31-45; 40 (26.7%), [18–30]; 35 (23.3%), [46–60] and for those above 60 years there were fifteen participants. Participants' educational levels were mixed, most had a bachelor degree (80%, n = 120), followed by master degree or

above (26.7%, n = 40), and diploma (20%,n =30). In terms of occupation, formal caregivers were the largest group (50 participants, 33.3%), followed by informal caregivers (35 participants, 23,.3), pharmacists (25 participants,16.7), public health educators (25 participants, 16.7) and older adults themselves (15participants,.10). These demographic features are detailed in Table 1. Evaluation of respondents' knowledge about potentially inappropriate medication also showed much diversity among the participants. As shown in Figure 1, only a fraction of participants had very good awareness (13.3%) while most of them (26.7%) had good levels of awareness. The highest proportion of participants showed a moderate awareness (33.3%) thus average knowledge about PIMs. Significant, 20% and 6.7% of respondents had poor and very poor awareness of potentially inappropriate medications, respectively. It indicates that, overall only 41% of the participants had awareness above the average level, which ultimately signifies large knowledge gaps; this would be detrimental to ensure unless medication safety of elderly. Participants described various barriers to the proper use of medications by older patients, as illustrated in Figure 2. Limited knowledge on PIMs was the barrier most cited (14.8%), closely followed by lack of time (13.9%) and proper systems for monitoring (13.0%).

Polypharmacy was a major problem for 11.1% and financial difficulties affected medication treatment in 7.4%. Resistance to changes in medication was reported by 8.3% of participants, and restricted availability of medication resources was responsible for 3.6% of the barriers identified. An optimistic attitude about medication adherence (13.0%) and communication barriers between health care providers and patients (10.2%) were also reported as reasons for nonadherence. No pharmacist counseling was reported as a barrier by 11.1% of participants. These results highlight the complex challenge of appropriate medication use in elderly individuals, with knowledge needs, time constraints, and monitoring gaps as key issues. Figure 3 details a variety of resources that participants used to obtain information about medications. The most frequently used resource was search engines on the internet such as Google (76.7%). Scientific and medical literature were used by 70% of the respondents, whereas pharmaceutical sales representative was a source of information for 63.3%. Other healthcare professionals offered medicine information to 56.7% of participants, while access was made to community pharmacists by 58.7%. Other sources comprised 18.7% of information. This pattern suggests high reliance on digital and peer-based information channels, and a high level of engagement with multiple sources indicating the diverse approaches that participants take in terms of keeping up to date about medication management for older adults. Taken together, these results show that although survey respondents have access to various sources of information, there are still important deficits in the awareness and knowledge of potential inappropriate medication by geriatric care providers. The noted barriers reflect system and individual level issues that would benefit from specific interventions to improve medication safety for older adults.

## DISCUSSION

Results from this study demonstrated important knowledge gaps related to PIMs among older adults and their caregivers, therefore highlighting the importance of targeted pharmacist-led interventions that improve medication safety in geriatric populations. The findings suggest that, although a variety of stakeholders are involved in the management of medications for older adults, considerable gaps exist in knowledge, access to resources and systematic interventions for managing medication related risk. Reading ability We found that only 13.3% of the participants had a very good knowledge of potentially inappropriate medications (PIMs) and the largest proportion had only an average awareness level (33.3%). Of interest, almost a quarter of the respondents (26.7%) showed poor or very poor knowledge with fundamental gaps in awareness on what drugs are too risky for use in elderly patients. These results are consistent with previous research showing a low level of knowledge among caregivers and health professionals about geriatric principles in prescribing, which is known to be associated with higher rates of ADEs and preventable hospitalizations in the elderly. The excess of average to low awareness among our sample indicates that existing methods of education and training do not provide caregivers, health professionals or older adults themselves adequate knowledge to identify and contain medication risks. When considering the level of awareness across different participant categories, a few points merit greater consideration.

Formal caregivers, making up one third of our sample (33.3%) and informal ones (23.3%) form together more than the half of individuals directly involved with day-to-day maintenance of treatment to older adults. The relatively low level of awareness in these groups is disturbing because caregivers are frequently the primary source of monitoring the treatment, side effects, and whether a patient adheres to their medication. In a similar way, other studies have reported caregivers not having sufficient training to detect PIMs and, therefore, missing identification of potential problems regarding drug therapy. This knowledge gap may be particularly noteworthy among informal caregivers, who often have little or no formal training but are heavily involved in medication supervision. The discovery of multiple barriers enlightens us to the system and individual level challenges that prevent optimization of medication management among older adults. Low knowledge of PIMs-as facilitated by our qualitative process (see results above), was cited as the most common barrier 14.8% and confirms lack of awareness in our quantitative survey. This finding is in line with previous research suggesting a lack of education about age-specific drug-related issues" underlies an essential barrier to safe prescribing and use of medications. Emphasizing time pressure (13.9% of participants) acknowledges the demands present in clinical practice in healthcare and caregiving situations where there are many other tasks to balance against the comprehensive review of medications or patient teaching. The lack of monitoring systems as a barrier, mentioned by 13% as a reason it is difficult to control medication use, reflects limitations in tracking and assessing drug utilization related to structural aspects.

Published evidence demonstrates that PIM exposure and outcomes can be reduced with regular medication review but our findings indicate that systematic monitoring processes are often absent or ineffective. The issue of complex medication regimens, also reported by 13% of participants, exemplifies the problem of polypharmacy that is becoming more common with older patients managing multiple chronic diseases. Research has consistently shown that regimen complexity is associated with lower adherence, more errors, and greater burden for both patients and caregivers trying to maintain safe practices around medication. As reported by 10.2% of our participants, such communication lapses from the part of the HCWs and patients are an important interpersonal barrier that hinders share medication management. Communication is critical to help older adults and caregivers to comprehend the purpose of, risk factors for, and proper use of medications, however empirical evidence suggests that communication for this purpose often falls short especially within time-pressured clinical environments. Moreover, if 11.1% of respondents identified lack of pharmacist counseling as a barrier in interventionist care, a direct rationale to increase pharmacist participation in the management of elderly medication is apparent when considering the impact that pharmacists can have on inappropriate prescribing and adverse drug events (ADEs) with desk-based educational materials and reviews improving medication appropriateness by 19%. The heavy reliance on the internet search engine as a main source of information (76.7%) echoes current trends of health information seeking but calls into question information credibility and authenticity.

To some extent digital resources can offer publicly available information, however these may vary greatly in terms of quality and be less catered to the needs of geriatric populations or bodies of literature which are being sieved through proper clinical expertise. The extensive use of science and medicine related literature by 70% of the caregivers implies a craving for evidence based information, which in turn needs to be gauged against health literacy and the complexity of technical information that arise between a lay caregiver and an older adult. The use of pharmaceutical representatives as sources of information by 63.3% subjects should be seriously considered for over-dependence as commercial interests can impact on the unbiased and total content nature of medication information offered. Although these representatives can provide detailed information about individual products, they may be less equipped to cover general principles of geriatric prescribing or issues of comparative effectiveness that apply to older adults. The consultation with colleagues in the healthcare industry by 56.7% and community pharmacists by 58.7% on the other hand, are better potential sources for contextually sensitive drug information. These trends highlight the need for developing more robust professional networks and ensuring access to a pool of credible experts knowledgeable about medication use in older adults. The combination of varying levels of awareness, an array of systemic obstacles to overcome and different behaviors in seeking information by the elderly population (and their caregivers) fully justify global implementation and uptake of pharmacist- led interventions designed specifically for the general older person.

Pharmacists have a unique opportunity to close gaps through provision of medication therapy management services, comprehensive medication reviews, patient care and caregiver educational programs and collaborations with physicians and other health care practitioners. Evidence suggests interventions can decrease PIM prevalence by as much as 36% and lower the rates of adverse drug events, hospitalizations, and healthcare expenditures. Tailored education programs should focus on the knowledge deficiencies identified in this study, including high-risk medication classes associated with AE among older adults, age-related physiological changes affecting drug response and practical strategies for monitoring and management of medication regimens. These should be tailored based on the specific information and support needs of formal caregivers, informal family caregivers, and older adults themselves given differences by health literacy level, baseline knowledge of caregiving issues, and context of caregiving. The barriers noted imply that interventions should not be limited to individual education but also include a higher-level systems approach. Alternatively, developing routine medication review processes, ensuring clear lines of communication between healthcare providers and caregivers, simplifying medication regimens with deprescription when possible and increasing access to pharmacist consultations are alternative interventions for promoting safer medications. Medication management apps and telehealth visits, technology-based solutions, can potentially reduce time constraints and other barriers to access with the added benefit of continual monitoring and support. Strengths include the representation of diverse interest groups, including informal and formal carers, health care professionals and older people. Taking screeners as the interviewees reveals more dimensions of the level and barriers to awareness compared with studies concentrating on one population.

Using clinical scenario-based testing allowed for knowledge application assessment, not just theoretical knowledge. However, several limitations warrant acknowledgment. The cross-sectional nature of the study design does not allow for inferences about cause and effect or temporal trends in awareness and barriers. The sample size of 150 seems adequate for crude analysis because it would limit generalisability and statistical power in testing smaller effect size differences in subgroups. Self-reported awareness may be limited by social desirability bias, leading to an overestimation of actual knowledge. Furthermore, the analyses did not evaluate clinical outcomes or medication-specific adverse events; rather they concentrated on knowledge state and beliefs as surrogates for risk of potential harms associated with medications. Further longitudinal studies are needed to assess the evolution of awareness after pharmacist led interventions and evaluate the efficacy of educational programs. An evidence base linking awareness to safety A better understanding of caregivers' knowledge and how it may relate to adverse events or their use of health care might further advance the science. Knowledge of optimum delivery modes for teaching—face-to-face, digital, or a blend of the two—would guide potential development ideal interventions. Practice implications include a need to integrate pharmacists into the geriatric care team and implement standardized medication review for all older adults with polypharmacy, appropriate content and process for educational materials addressing diverse literacy levels, and communication systems that support collaboration between prescribers, pharmacists, caregivers, and patients. Professional societies are encouraged to lobby for policies that support pharmacist participation in geriatric pharmacotherapy management, and reimbursement models that underscore the benefit of full medication review services.

## CONCLUSION

This research identifies vast deficiencies in knowledge vis-à-vis PIMs by health professionals and caregivers of elderly individuals. Because of low levels of Beers criteria awareness and knowledge, many respondents would also likely benefit from targeted pharmacist-led education around medication safety. Furthermore, addressing system-level barriers such as time pressure, lack of follow-up and difficulties in communicating with patients is necessary to improve prescribing practices. Future work should consider integrating pharmacist-led medication reviews and personalized educational interventions to improve the quality of care and decrease drug related harm that may in turn contribute to improving the health and well-being of older persons.

## ABSTRACT

A sensory processing is the process by which the information that sensory systems receive on the bodies of both the individual and on the world is recorded, selected and interpreted. This process leads to a suitable response and people can adjust and change the surrounding to suit their own needs. The functionality of the sensory system is essential in the development of the human body. Sensory diet programs are programs that are meant to meet the sensory needs of a person to promote relaxation and concentration. Childhood is a crucial developmental phase of life during which a child acquires a lot. A systematic search in the literature was conducted with the help of the following electronic databases: PubMed, Scopus, Google Scholar, PsycINFO, and CINAHL. The search terms used were in different combinations, such as: Sensory Diet,Sensory Processing Disorder, Occupational Therapy and Sensory Processing, Sensory Integration and Intervention Strategies of SPD. As a result, the activities are based on the principles of sensory integration and the needs of the child. The sensory diet is meant to help control attention as well as keep at the optimum arousal level, and to activate proprioceptive, motor, tactile, auditory, vestibular, taste, and oral sensitivities at a specific time of the day. Also, these neurochemicals are released after about 1.5 to 2 hours with the release depending on the nature and intensity of the stimuli. A properly and adequately implemented sensory diet may be used to reduce the development of a number of maladaptive behaviors, including self-harming behaviors.

**Keywords:** Sensory Diet, Rehabilitation, Sensory Processing Disorder, behavior, hyperactive, sensory integration.

## INTRODUCTION

Sensory processing entails the struggle to receive sensory data of an organism both internally and externally. The environment can be modified to suit the needs of the organism depending on the responses which are considered to be fitting. Arguably, the learning and development processes are most intensive during the early years of life. Speaking about the human body, it is reasonable to say that sensory systems are of the utmost significance in every point of view. [1]. A sensory diet is a list of activities and experiences that must be presented to a child in a particular environment to allow it to keep calm and alert. A well thought-out and planned sensory diet can help to decrease or eliminate a large number of challenging behaviors, such as stimming and skin picking [2]. The activities to be chosen are founded on the idea of sensory integration, taking into account the likes and dislikes of the child. Regulation of attention on the neurological level through incorporation of proprioceptive, motor, tactile, auditory, visual, vestibular, taste, and oral stimuli at appropriate times of the day can also be used to help in regulating attention. This strategy is called a sensory diet. These neurochemicals occur in response to such sensory inputs which do not last long, not more than 2 hours, depending on the type and intensity of the stimulus. That is why to keep the level of these neurochemicals constant in the brain, it is important to structure the sensory diet during the day. [3]. A sensory diet is also able to prevent sensory or emotional breakdown and may also be helpful in recovery by providing the nervous system with the input that it requires. Getting to know the sensory profile of a child and other relevant information can guide you to deal with their behavior in situations where they have become uncontrollable. Consequently, sensory activities are aimed at increasing attention, the ability to be on task, and engaging in time-related social interactions with peers. As a result, this will enable the children to feel less apprehensive especially when they seem calm and collected. [4].

The influence of sensory diets on cognition is integrated with the brain's most primitive functional systems, which are responsible for modulating, integrating, and neurogenerating sensory information. Thus,moderate dietary exposure to a range of environmental stimuli exercises an influence on synaptic plasticity, changing the brain's plasticity and the efficiency and reliability of the neurons associated with learning and memory. Sensory diets ensure that all the various sensory cues received by the brain are integrated in a way that leads to proper perception of the environment and, thus, better performance. This is based on the immensely complex ways sensory integration interacts with brain cells. Consequently, all areas of the brain associated with various stimuli are activated, and the body produces chemicals such as serotonin and dopamine, which result in improved mood and concentration [5].
Children with disability have a higher prevalence of SPD that ranges between 40% and 80%, while children without disabilities have a prevalence of 5% to 10% [6].

Therefore, the four A's are self-regulation techniques, and the four ideas are related. These are arousal which refers to the infant's ability to stay awake and move between wakefulness and sleep; attention it is the infant's ability to focus on a particular activity or object; affective response it is the ability of the infant to produce an emotional response; and last is action, or adaptive goal-directed behavior. Due to a baby's inability to regulate their physiological activation or employ self-regulation strategies during infancy, sensory organization is thus generated by the surroundings and the parents. Through continued connection with parents and experiences involving touch, movement, hearing, and sight, the infant acquires ways and means of regulating the amount of input and calming down. Therefore, sensory integration co-occurs as they attempt to modify these activities that alter the environment. It only starts developing at the age of eighteen months, when the infant is also learning to speak and use language, most likely in play, to absorb other people's schedules and directions. Praxis based on integration must be established in early infancy, while basic input and output must be recorded; additional processes are introduced once students attend school. Delayed or missing sensory processing can lead to learning difficulties for a young child in completing simple tasks in class, such as using scissors or transitioning between activities. In contrast, advanced learners may encounter basic academic challenges, including difficulties with reading, writing, and math. Educators or parents often misunderstand children because they cannot articulate the problems they are experiencing or

explain the situation, as they frequently struggle to comprehend what is happening [7]. Thus, if the recommended therapies are used for as long and as often as possible, it is suggested that the composite and integrated use of the hierarchical sensory diet and therapeutic listening interventions might be helpful in case of an additional improvement of the children's occupational performance, depending on the ASD and/or SPD diagnoses. The research indicated that both therapeutic listening and a sensory diet are more effective in improving occupational performance in aspects like social interaction, learning, and dressing. Consequently, because of the limited sample size in this study, further research is needed to determine if children with ASD and/or SPD benefit from this combined intervention. [8].

Thus, to counteract its effect, we must encourage children who are over-sensitive or under-sensitive to engage in activities that involve play with a regimen that addresses normalcy in sensitivity to the environment [9].Nonetheless, there are alternative activities, like playing hide and seek, bouncing on the trampoline, or pursuing balls that can heighten arousal. Arousal can also be heightened by specific environmental stimuli, including loud music, different sounds, bright lights, fresh air, and cooler temperatures. [10]. These children seem to exhibit hyperactive behavior; sensory processing dysfunction is a primary factor contributing to ADHD, and the signs of this condition encompass impulsivity and lack of focus [11]. The sensory-based activities provided seem to manage the behavioral concerns and facilitate an organized and enthusiastic approach to tasks and interactions in children with such concerns [12]. There is a need to observe how SPD impacts behavior, identify how such an occurrence may be prevented, and ensure that there is an effective way of handling individuals with SPD. The final possible training can include making the youngster aware when they become confused in thinking or learning a concept, and when something complicated is experienced. Additionally, the use of sensory-related problems to change their system is to be understood. As stated by Aquilla and Sutton, a sensory diet consists of various activities designed to address the sensory requirements of the nervous system, which helps prevent overstimulation of both sensory and emotional systems. [13].

Additionally, the child may exhibit signs characteristic of the third type of SMD, known as sensory seeking (Miller, 2006). A child with SS conduct may find it extremely sensitive to sensations, while a normally developing child needs information to learn and get rid of. Miller also (2006) argues that children, who are experiencing sensory seeking may display boisterous behavior, for instance, listening to loud music, surrounding other kids, and then knocking them down, banging their heads to the wall and falling down, and so on Children who are sensory seekers may assume risky stances while playing, running into and on objects, or climbing on them because of the increased desire to experience more [14].

The literature suggests that sensory diet treatment may have some advantages when applied to a program for students with severe cerebral palsy and those with difficulties in sensory processing. The methods as mentioned earlier have led to enhanced behaviors and interaction with the environment. Sensory diet therapy is helpful to many children with disabilities resulting from impairments that affect how their bodies process sensory input [15]. Based on the above results, one of the recommendations is the necessity to decrease the percentage of students exhibiting the ADHD-related behaviours through the application of family-centred sensory diet program. This program would be a viable, convenient, and useful way of reducing the severity of symptoms among such students [16].

Among the tools used in sensory integration are:
1. "A therapy ball"
2. "A balancing board"
3. The flat swing
4. The T-swing
5. The round swing
6. Support swing
7. The Hammock
8. The swing of the tire tube

9. Tunnel
10.Visual, tactile, and auditory objects[17-18].

## MATERIALS AND METHODS

Search strategy: The following electronic databases were used in a methodical literature search strategy: PubMed, Scopus, Google Scholar, PsycINFO, and CINAHL. Combinations of "Sensory Diet," "Sensory Processing Disorder," "Occupational Therapy and Sensory Processing," "Sensory Integration," and "Intervention Strategies for SPD" Articles

before 1990 were excluded, and articles focused on sensory diet, sensory activities, or sensory integration were included to gain a comprehensive understanding of usage in rehabilitation Various spices of literature evidence have provided evaluations of the efficacy of sensory integration treatment. 8 of the 49 papers were considered for additional analysis because they satisfied the following criteria: Therefore, when searching for empirical data on the treatment called sensory integration therapy, there are several criteria: A comparison was made between at least two groups; (b) academic achievement, motor or reflex performance, and/or language competence were assessed; (c) the effects of sensory integration therapy were investigated; (d) there was reported quantitative evidence which compared the efficacy of the therapy. Keeping this in view, the 47 statistical assumptions used in the eight studies were checked to establish the appropriateness of the application of sensory integration therapy. In the comparison of the results of children who underwent sensory integration (SI) therapy and the control group that did not receive the intervention, the results showed a significant result among the children who were receiving the SI therapy [19]. In the case of a child who is hypoactive and/or does not show much awareness of the environment around them, sensory support may act as an augmented provision of sensory stimulation. Such children might require more stimulation, including a higher level of verbal activity, addressed especially to them, physical activity, vivid visual surroundings and dynamic music. The senses integration therapy and sensory based approaches play a supportive role in enhancing adaptive behavior of a child with regard to his or her sensory experiences [20].

“The American Academy of Pediatrics (AAP)” established a policy indicating that it is not permissible to diagnose sensory impairment.. In addition, it was determined that there are no best practices regarding the implementation of sensory-based therapies. This may go some way towards explaining why advocates of therapies related to the senses offer no prescription on how to deliver their programs. It is always helpful to substantiate the best level with which an intervention can be reproduced for practice or research [21-23].

When a youngster develops problems with their senses, they will be unable to play, learn new concepts, or focus at an appropriate level. At the same time, if such a level of arousal is extremely low, it can have nothing to do with motivation for active participation in play. However, if the child is over-aroused, they will have difficulty paying attention. If presented differently, children may struggle to integrate sensory stimulation, and therefore, play or other activities need to be employed to meet the senses [24-27].

## RESULTS

**Table 1 : Randomized trials based on effects of sensory integration on different groups**

## DISCUSSION

The selection of procedures for stimulating or calming the CNS is a critical factor in the sensory diet approach. Due to individual learning, it will enhance the child's acknowledgement of certain therapeutic factors and enable them to use it at any time without following a scheduled session time [28]. In the case of a child, the stimulating activity or the more sedating activity is prioritized based on which type of development will be beneficial for the given youngster. Besides procedures influenced by weather, there are non-weather-dependent techniques for sensory

integration, which include: deep tissue massage, self-administered massage, joint compression, and the use of proprioceptive enhancing tools like weighted vests or blankets, ankle and knee weights, snug-fitting clothing, rhythmic and steady movements, along with the use of white noise or calming music and controlled light exposure to promote relaxation. As a result, engaging in proprioceptive games and exercises, utilizing vibrations, and providing oral stimulation through chewing or sucking on hard candies, as well as participating in rhythmic activities, contributes to improved organization. [29].

A quantitative type of study was conducted through experimental research design to determine the impact of a sensory diet on the aggressive tendencies of students in a special needs school. The research was aimed at a statistical group of all the students aged between 6 and 12 years that had utilized treatment facilities in Tehran and were diagnosed with attention deficit hyperactivity disorder. To participate in the study, a sample of 30 volunteer students who fitted in the study criteria was selected as a purposive sample. The available sampling technique was used to divide the participants into two equal groups, the intervention group, and the control group. IQ of the children was measured with the help of Wechsler Intelligence Scale of Children- 4. Self-reporting Questionnaire (SRQ), also known as the Short Form developed by Conners to determine the current state in ADHD in students and the Sensory Profile Questionnaire were used to determine sensory processing. The children who were involved in the study were diagnosed with ADHD by a child psychiatrist and the Wechsler test was being employed to filter children with intellectual disabilities. In order to be sure that the children did not have epilepsy, seizures, vision impairment, or hearing impairment, their scores in Sensory Profile Questionnaire had to be between 38 and 141. Some children had to be dropped off the Sensory Diet program at some stage throughout the study to restore the equilibrium. A family-based Sensory Diet program was given to the intervention group through 12 regular sessions with each session taking 45 minutes. The protocols of Wilbarger sensory and occupational therapy were considered the initial parts of the program. On the other hand, the control group was only given occupational therapy programs as prescribed by five various studies. The statistical analysis involved the use of SPSS software Version 20 where the significance level of 0.05 was used to analyse both inferential and descriptive statistics. The independent t-tests were carried out to compare the mean age and the mean IQ of the two groups, and the univariate analysis of covariance was applied to determine the effects of the treatment of sensory diet. The analysis of the Attention Deficit variable as per the posttest results showed that the mean scores significant difference existed between the intervention and the control group, with t(315) = -13. Also, both correlation coefficients of the family-based sensory diet program with the attributes of students attention deficit and hyperactivity were significant with mean value of 0.589 and 0.673 respectively. [30].

## CONCLUSION

This narrative review offers an excellent interpretation of the significance of sensory diet as a component of the therapy of sensory processing problems. Part rehabilitation must include sensory diet or sensory integration therapy.

**ACKNOWLEDGMENT**

A heartfelt appreciation to the Assam down town University which has been consistent in its support.

**ABSTRACT**

This paper explores various Graph theoretical applications to improve Graph Neural Networks (GNNs) efficiency in real-world implementations. We investigate why and how our GNN model, enhanced by incorporating additional graph theoretical concepts, is more effective in Amazon's Product Recommendation system, comparing its performance with traditional methods. As a result, we emphasize the importance of Graph theoretical concepts like Graph Coloring, Bipartite Graphs, Node Embedding, etc.., which enable GNNs to understand and analyze complex user-product interactions, providing us with more accurate recommendations. This explains the effectiveness of the application of graph theory in Graph Neural Networks for recommendation systems.

**Keywords:** Graph Neural Network, Product Recommendation System, Node Embedding. Graph Coloring, User Product Graph.

## INTRODUCTION

Recommender systems have become an eminent part of the digital world, and have changed the interaction between users and websites in the current world. The objective of the recommendation system is to assist users with

suggesting appropriate items that suit their choices and objective behaviors. It has various applications in various sectors including e-commerce, education, and online advertisements. Graph theory is a powerful framework that is used to represent complex relationships in large datasets, which makes it a powerful tool in recommender systems. By carving users, items, and their interactions as vertices and edges in graphs, we can visualize and analyze complex relationships. Additionally, graph theoretical techniques like graph traversal, graph coloring, and graph partitioning can effectively cluster users and items based on similar preferences. There are a large number of products that are listed today on e-commerce websites like Flipkart, Amazon, eBay, etc…, The users benefit from recommender systems to select the best choices that suit their interests amidst the wide and huge amount of choices. The recommender system provides a suggestion if a particular user would prefer an item or not based on their historical data and their profile interests. The recommender system stands as a useful tool for both the *User* and the *Service Provider*. The recommender system helps the service providers in delivering the right product to the right customers, it helps them in improving user engagement in their website. Whereas, it helps the user in finding products that are most relevant to the users. In necessity to explain the application of graph theory in recommendation systems, let us consider a dataset where users have rated various electronic products. This dataset consists of *User, Item,* and *User-Item interaction* (Rating) information of anonymized Amazon information. For instance, User Alice rated 5 stars for Product Laptop A, while User Bob rated Product Mouse B with 1 star. After purchasing Product Laptop A, Alice went on to purchase and rate Mouse B with 4 stars, while Bob rated Keyboard C with a 5-star rating. Let Charlie be another user who bought Laptop A and rated it 4 stars, after purchasing Laptop A, Charlie bought Headphones D and gave them 5 stars. We can use this dataset to form a bipartite graph where one set of nodes represents users Alice, Bob, and Charlie, etc.., and the other set represents Products such as Laptop A, Mouse B, Keyboard C and Headphones D. An edge between *User* and *Product* represents that the user item interaction has been performed, in this case the user has rated the product. This graph provides insights into user preferences, for example, we might assume that both Alice and Bob share similar interests since they gave similar ratings for Laptop A. But their following purchases differed since Alice bought a Mouse whereas Bob opted for a Keyboard. Charlie, though rated Laptop A with lower ratings and also showed different purchase interest by opting for headphones. Representation of Above-Mentioned Illustration in Graph Form (Figure 42). With this analysis, we can infer recommendations for users. For example, since Alice and Bob share common interests, Alice may be recommended Keyboard C and Bob may be recommended Mouse B. Also, both Alice and Bob might be recommended Headphone D since they share interests with Charlie D, but on least preference. Such a graph-based approach is highly effective in identifying the underlying hidden relationships including the direct recommendations, helping in predicting the products that are likely to suit the interest of users based on their shared ratings by other users.

## LITERATURE REVIEW

The advancement of the recommender systems has had aimportant impact since the late 1990s. It began with models based on content-based filtering, which emerged in the mid-1990s. In content-based filtering, the systems recommend items by comparing a user's previously liked item with another item that shares the same characteristics. However, the model faces challenges in scalability and providing diverse recommendations since it was purely based on user interaction patterns.

To overcome certain limitations of content-based systems, certain filtering methods were introduced in late 1990s. It is purely based on *User-Item* interaction patterns, with two major divisions:
**User-based collaborative filtering:** This filtering systems identifies the *User* who share similar taste recommend item accordingly.

**Item-based collaborative filtering:** This filtering system identifies similarities among products and recommends accordingly.
As datasets became larger and more complex, matric techniques such as Singular Value Decomposition were introduced to improve the scalability of CF in the early 2000s. The eminent technique including Singular Value

Decomposition (SVD), gained popularity after its successful application in Netflix Prize Competitions (2006), where it significantly increased the accuracy of prediction by reducing the dimensionality of user-item matrices. Despite these effective contributions, traditional Collaborative Filtering approaches faced significant challenges, including cold start problems, where no new user was involved in the interaction, and sparsity, where most users interact only using a limited items, limiting the effectiveness of Collaborative filtering models. The later enhancements include using graph theoretical recommender systems to overcome these limitations. The idea of incorporating graph theory into recommender systems emerged as a perfect solution to the cold start and collaborative filtering models. It evolved in the mid-2000s, allowing for a more detailed analysis of user-item relationships. In graph-based recommender systems, *Users* and *Items* are considered as nodes, while their ratings are modelled as edges between nodes. The key graph theoretical techniques include bipartite graphs, graph traversal techniques, and graph-based clustering, which leverages indirect relationships in user-item graphs which solves cold start and sparsity problems, providing a more robust framework for recommendations.

## RELATED WORKS

**Recommender System and its Types**

Recommender systems have become a critical component for platforms like Flipkart, Amazon, Netflix, and YouTube, which helps them improve user engagement. Here are a few recommender systems that exist with distinct architecture.

**Popularity - Based Recommender System:** This focuses on recommending most popular items to the users. For example, if Product A is trending, then all users are often recommended highly rated or frequently purchased products (i.e. Product A). It neither needs any history nor they are efficient in handling cold start problems. However, since the same product is recommended to all users, they lack personalization. The examples are New trending articles are recommended in Google News and the most watched video or most interacted video is recommended for all users based on their popularity.

**Classification Model:** The idea behind this system is whether a user will purchase or like an *Item* based on the features of both the *User* and the product. This is more like prediction and the outcome would be binary - 0 if the user does not like the product and 1 when the user likes the product. The setback of this model is that it demands a large dataset and suffers generalization and flexibility issues due to the complexity of feature extraction.

**Content-Based Recommender System:** Content-based recommender system recommends items based on the similarity measure of their attributes. For instance, if a *user*rates Product A, the system might also suggest Product B which is more similar to Product A, based on the users similar interest. It might be the same product from a different brand for instance. The similarity measures used include Euclidean distance, cosine similarity, or Jaccar similarity, depending on the types of data(numeric, textual, or categorical).

**Collaborative Filtering:** The collaborative system recommends items based on *User* behavior or similarities between *Items*. The most prevalent methods are *User*-based collaborative filtering and *Item*-based collaborative filtering.

***User*-Based Collaborative filtering:** It focuses on *Users* who have similar tastes of purchasing products.

***Item*-Based Collaborative filtering:** It focuses on *Items* which is similar to the users earlier purchased items.

**Figure 2.**

*i.* User-Based Collaborative Filtering

*ii.* Item-Based Collaborative Filtering

**Singular Value Decomposition (SVD) and Matrix Factorization:** SVD is a matrix factorization method that decreases the dimensions of the user-item dataset, reducing it from $N$ to $K$ dimensions. For recommendation user-item rating matrix's matrix factorization is used. This method improves the accuracy of recommendations by identifying the hidden patterns in the data, often used in real-time use cases like Netflix.

**Hybrid Recommender System:** It is a blend of various recommendation techniques and provides a single system to overcome the limitations of individual approaches. Integrating collaborative filters with graph theory provides the best of the worlds. While Collaborative filters capture the user-item interaction, graph theory allows for uncovering indirect connection that helps recommendation accuracy.

**Graph theoretical approaches:**

The application of graph theory in a recommender system has various significance over traditional methods, in particular whenever a large dataset with complex user-item interactions is involved. It is used across various domains, targeting millions of users and hence the demand for efficient algorithms is high as well. Traditional methods struggle in terms of complexity and scalability whenever the user base is large. Graph theory helps in simplifying these models by representing *Users* and *Items* as nodes and their interactions as edges within a graph structure. In large-scale environments, where millions of users interact with various thousands of items, like social media o e-commerce, the graph theory allows a straightforward representation and processing of data when compared to conventional methods.

**Existing Algorithms in Graph-Based Recommender Systems:** Several Algorithms use graph theory to enhance the quality and efficiency of recommender systems. Two prominent examples include LikeMinds Algorithm and Horting Algorithm.

**LikeMinds Algorithm:** The LikeMinds Algorithm considers the hammock structure which of width $k$ connects two *Users* if they share at least $k$ common ratings. This algorithm focuses on the width of the hammock to access recommendation quality. It is said that the wider the hammocks higher the accuracy of prediction with lower discrepancies. In essence, the larger the user's similarities in terms of shared ratings, the more accurate the recommendations.

**Horting Algorithm:** The Horting Algorithm is an extension of LikeMinds Algorithms, where the concept of hammocks gets extended as hammock paths by introducing varying path lengths. Here, the recommendations are based not just on direct users, but also include multiple users connection via common rating. The hops between users are represented by the length of these paths, impacting the quality of recommendations. The shorter the path, the higher the prediction accuracy. Longer paths generally tend to reduce higher accuracy.

**Proposed Model: Combining Graph Theory with Graph Neural Networks**
**Weighted Graph Coloring Product Recommender Algorithm (WGCPR-Algorithm)**
**Graph Construction with Nodes and Edges**

Create a Biparite graph G with *Users* and *Items* as nodes and Items, $G = (U, I, E)$, where

i. $U$ denotes the set of *Users*
ii. $I$ denote the set of *Items*
iii. $E$ denotes the set of edges, representing user-item interactions.

**Assignment of Edge Weight**

iv. For each edge $e$ in $E$, assign a weight '$w$', representing the intensity of the interaction (e.g., rating score, frequency of usage, time spent, number of views).
v. The weight begins from $w = 1$ up to $w = 5$, depending on the rating scale or user engagement.

**Coloring the Graph based on Similarity**

**Step 1:** Applying Graph Coloring to Users and Items:

vi. The users with similar rating behaviors are identified and assigned the same colors. For instance, User 1 and User 2 are assigned the same color if they share a higher similarity.

vii. The Items with similar User interactions are assigned the same colors with User preference as the focus.

**Step 2:** For adjacent Users and Items connected by edges, different colors are assigned if their preferences vary, resulting in different clusters.

**Traversal via Graph and Weighted Edge**

**Step 1:** Let $U_1$ denote the target Users and traverse the graph by following edges to items $I_x$ that $U_1$ has rated. The priority of the traversal is based on higher weights which indicates stronger user-item interactions.

**Step 2:** For every Item $I_x$, find other users $Uy$ who have also rated Ix, and check their color.

viii. If the color of $Uy$ is the same as $U_1$, then increase the "common rating factor" for $Uy$weighted by the edge weight (i.e., rating score).

**Weighted Common Rating Factor**

$C(U_y): C(U_y) = \sum w(U_y, I_x)$,

if the colors match and $Uy$ has rated $I_x$.

ix. If unable to identify a matching color, skip to the next item.

**Step 3:** Continue the process from $U_1$ for all items rated by $U_1$, updating the weighted common rating factors based on matching colors and edge weights.

**Recommendation Logic**

**Step 1:** Identify the user $U_m$ after completing the traversal with the highest weighted common rating factor.

**Step 2:** Recommend the items rated by $U_m$ that $U_1$ has not yet rated, with the priority for higher edge weights between $U_m$ and the items, by calculating the Recommendation Score.

x. The recommended Score for each Item $(Iz)$ is Recommended Score

$$(I_z) = w(U_m, I_z) \times \frac{C(U_m)}{Total\ Weight\ of\ all\ for\ U_m}$$

xi. The Recommended Score takes into account the weight of the edge and the total common rating factor for the user, ensuring that the highly rated or frequently interacted items are prioritized.

**Step 3:** If multiple users $Up$ have the same scores, then the recommendation is based on the color similarity between $U_1$ and $Up$, or based on a total number of unique items rated by the user.

**Alternative Scenarios with Edge Weights**

**Scenario 1:** When no two users have the same weighted common rating factor, recommend items from the user with the highest score.

**Scenario 2:** If multiple users have the same common rating counter

xii. **Option 1:** Select the user with the least number of the ratings, but weight the recommendations by edge strength.

xiii. **Option 2:** Select the user with the highest rating and recommend the *items* in decreasing order of their edge weights.

**Scenario 3:** If two or more *users* have identical counter ratings and total number of ratings, randomly select one *user* and suggest their items, weighted by edge strength.

**The Graph Traversal**

**Step 1:** For prioritizing traversal, use color-guided traversal through edges that connect nodes of similar colors,

xiv. While traversing, always follow edges with higher weight first, as they indicate strong user-item interactions.

**Step 2:** If a low-weighted edge is encountered, deprioritize it and continue to higher-weight edges.

This traversal reduces the computational cost by focusing on highly relevant connections and avoids irrelevant or weakly connected nodes.

**Illustration of the Algorithm**

The proposed algorithm, Weighted graph coloring product recommender algorithm is a combination of graph coloring, weighted edges, and a novel graph traversal technique that improves the accuracy of product recommendation. The weights assigned at the edges represent the rating score(i.e., the strength of user interaction) and these are considered in coloring the graph which helps us prioritize stronger and more relevant connections. For instance, let us consider the amazon Dataset, where Users and Items are considered as Nodes and the User - Product interactions(ratings) are considered as edges. Diverse group of Users will search through thousands of products that are listed in Amazon website and select Items that best fits their taste. With rating system in place, the Amazon can utilize a very powerful recommendation algorithm that combines Graph theory and Graph neural network for increase accuracy in recommender system. In Amazon marketplace, let us consider four users for illustration purpose, $U_1$, $U_2$, $U_3$, $U_4$ representing *User 1, User 2, User 3, User 4* and six products $P_1$, $P_2$, $P_3$, $P_4$, $P_5$, $P_6$ representing *Product 1, Product 2, Product 3, Product 4, Product 5* and *Product 6.*

***User-Product* Ratings (Edge Weights)**

User-Product Rating Table Representation (Table 1). User-Product Rating Graph Representation (Figure 3). The marketplace transforms these ratings into bipartite graph, where Users and Products are represented by each partition of a bipartite graph. Based on the ratings of Products by *Users*, the, edge weights are assigned which ranges from 1 to 5 representing the strength of the interaction. The edge between *User1* and Product 1 has a weight of 5, indicating a strong preference. To enhance the recommendation further, the algorithm applies graph coloring. User and Products are grouped based on similar behaviour. For instance, *User 1* and *User 2* are assigned Red Colour as they share common preference for Product 2. *User 3* and *User 4* are assigned with Blue colour, as they both have common preference with Product 4. Table 2. User-Product Interaction with Graph Coloring Rating Table Representation. Figure 4.User-Product Interaction with Graph Coloring Graph Representation. With the graph constructed, coloured and weighted now, lets traverse through the graph. Now for instance, if recommendation is to be done for User 1. The initiated algorithm will traverse starting from User 1 to all its edges, i.e., all the Products that the User 1 has interacted with, $P_1$, $P_2$, and $P_3$. Now for Product 1, the algorithm traverse to all the Users who have also rated the Product 1. Now the algorithm compares the color of $U_1$ and $U_3$. If the colours matches, then it indicates high similarities between $U_1$ and $U_3$. If colors matches, it calculates the Common Rating Counter in the traversal by adding the weight of the edge between $U_3$ and Product 1. Calculation of Common Rating Counter (Table 3). After traversing through User 1's rated products, the algorithm decides User 2 as the user with highest Common Rating Factor. Now the algorithm decides to recommend products that User 2 has rated but User 1 hasn't. User 2 has rated Product 4.

Recommendation Score $(P_4) = w(U_2, P_4) \times \frac{C(U_z)}{Total\ weight\ of\ all\ edges\ for\ U_2}$

Total weights for User 2 amounted to: $5 + 4 + 3 = 12$

Thus, the recommendation score was: Recommendation Score $(P_4) = 3 \times \frac{6}{12} = 1.5$

Now as per the algorithm User 1 will be recommended with Product 4. Because Product 4 has been highly rated by User 2 , with whom User 1 shares similar preferences. With this algorithm incorporated, the recommender system tailored shopping experience of the User by understanding their preferences in a better way.

**Recommender System Implementation**

A GNN-based recommender system was implemented using Pytorch Geometric. The implementation includes the following steps:

**Data Collection and Preparation:** The Amazon Electronics dataset was collected from the SNAP STANFORD EDU Database. The Dataset consists of User, Item, and User-Item Interaction along with a timestamp. Since the Timestamp was irrelevant to our research, it has been removed from the dataset to reduce computational efforts. All null values are removed and incomplete rows are removed. UserIDs and ProductIDs were converted into numeric codes to create the interaction matrix. This process included encoding the categorical columns to create a more efficient structure for GNN. User and Item were represented as nodes, User Item interactions were represented as edges, and the ratings provided were added as the edge's weight. Only 50000 interactions were considered for scalability.

**Graph Construction:** A bipartite graph was constructed with the User, Item and its interaction between *User* and *Item*. The Users and Items are represented as a unique node set, and edges between them represents the strength of 'rating' for the Item provided by User. Thus, weights serve as both input to the model and the target output for training.

**GNN Model Architecture:** A Graph Convolutional Network (GCN) consisting of two graph convolution layers was employed. The first layer maps input node features to the hidden layer, which further initializes the second layer further refines the representation. Then the fully linear layer prediction layer was constructed with the rating score for user-item pass.

**Training Process:** We trained the model using Mean Squared Error (MSE) as the loss function to minimize the difference between predicted and true ratings. The model is optimized to update the model's weights during training, iterating over 100 epochs. The model was run on GPU for efficient computation.

**Evaluation:** To minimize the difference between predicted value and actual value of ratings, we trained the model with Mean Squared Error (MAE) as the loss function.

**Recommendation and Outcome:** The recommendation function was implemented based on the algorithm for top - k item recommendation for the specific users. the system successfully generated recommendations based on the graph node embedding and the strengths of edges, resulting in personalized item suggestions. We have provided a comparison of using traditional GNN model and GNN model build using our algorithm below. Table 4.Comparison Between Traditional GNN Model and GNN Using Our Algorithm

## CONCLUSION

Recommendation system is highly helpful in providing personalized user recommendation. It serves as a perfect solution for e-commerce in product recommendation and helps users in finding the right product in online shopping environment. The algorithm we generated predicts which *products* people are more likely to purchase and are most interested in. Using MAE as our evaluation metric, we find our system has an obtained MAE value as 1.006. We have also highlighted the comparison between a traditional model and GNN model based on our algorithm.

## ABSTRACT

In this study 5 Nitro salicyl aldehyde with aniline was crystallized by slow evaporation technique and the crystal was formed on the basis of condensation reaction of an equi molar proportion of 5 Nitro salicy aldehyde and aniline. The grown crystal had been characterized by single crystal XRD and Powder XRD to study the crystal cell parameters which exhibits the mono clinic crystal structure with cell parameters a=8.17Å,b=6.63 Å,c=21.81 Å,$\alpha$=90$^0$,$\beta$=98.47$^0$,$\gamma$=90$^0$ and V=1168A$^3$ .the functional groups of 5NSA crystal were determined by FT-IR and FT-Raman spectroscopy. The linear optical property of 5NSA crystal was elucidated by UV-Visible spectroscopy with lower cut off wavelength 396nm.The EIS and Cyclic voltametric analysis was conducted to investigate the electro chemical activity of 5NSA. the presence of imine(-C=N-) functional group it exhibits redox activity and the (-NO2-) further enhances electron transfer property which are making this crystal a potentially useful in designing elctrochemical biosensors and energy storage applications.

## INTRODUCTION

Electrochemical biosensors have grabbed attention due to their high sensitivity, rapid response, portability, and potential applicability in biomedical diagnosis[1]. Numerous materials explored for biosensor fabrication, organic schiff base crystals have emerged as a suitable candidate due to their unique charge transfer characteristics, nonlinear optical properties, and electrochemical activity. In particular, Schiff base derivatives, well known for their structural and strong donor-acceptor interactions, have shown potential for enhancing sensor performance[2]. This study aims at the application of an organic crystal-based electrochemical biosensor utilizing the schiff base formed from 5 - Nitro salicylaldehyde and aniline. This mono-clinic crystal structure exhibits favorable electronic properties that enhance charge transport and electrochemical signal transduction by leveraging these characteristics, the sensor can achieve high sensitivity and selectivity for detecting biomolecules, making it a viable platform for biomedical applications[1][2][13]. The development of organic crystal-based electrochemical biosensors represents a step forward in the search for efficient, low-cost, low-power-consuming, and environmentally friendly sensing technology. This work aims synthesis and characterization to explore the fundamental properties of the schiff base of 5-Nitro salicylaldehyde with aniline crystal and its electrochemical behavior, laying the foundation for its practical application in biosensing[17].

## MATERIALS AND METHODS

The pure sample of 5-Nitro salicyl aldehyde with aniline(5NSA) are taken in equimolar ratio of 1:1.These reactants were dissolved in 25 ml of $CCl_4$ solvent. The mixture underwent continuous stirring for 1 hour until achieving a clear saturated solution, then transferred in to a clean beaker covered with perforated silver foil. After maintaining the solution undisturbed for two weeks, pure orange-colored crystals were obtained[1][2].

## RESULTS AND DISCUSSION

**Single crystal X -Ray diffraction analysis**

The grown crystal had been characterized by single crystal XRD and Powder XRD to study the crystal cell parameters which exhibits the mono clinic crystal structure with cell parameters a=8.17Å,b=6.63Å,c=21.81Å,$\alpha=90^0$,$\beta=98.47^0$,$\gamma=90^0$.and V=1168$A^3$.The presence of sharp peak at $16.4^0$ confirms the materials has well defined periodic arrangement of atoms with an interplanar spacing that satisfies Bragg's law. SXRD of 5NSA Fig.(1)**.** PXRD of 5NSA Fig.(2)

**UV Vis.Spectroscopy**

To determine the optical transparency is a vital parameter for linear optical property, investigated through UV-Visible spectroscopy over the range of 280 nm 800 nm a significant absorption between 280nm to 396 nm in the ultra violet region due to the schiff base crystal exhibits inter or intra molecular charge transfer due to donor acceptor interactions ,which can lead to strong UV absorption. The lower cut off wavelength of the crystal observed at 393nm and the crystal demonstrated high transparency, suggesting its potential application in optical limiting, opto electronic and frequency conversion applications[4]. UV-Vis spectrum of 5NSA Fig.(3).

**FT-IR and FT-Raman spectroscopic analysis**

The 5 nitro salicyl aldehyde with aniline crystal were qualitatively analyzed to determine the presence of various functional groups and the formation of the hydrogen bonding in the mentioned crystal have been identified by Bruker optics FT-IR spectrometer in the region 400 $cm^{-1}$ to 4000 $cm^{-1}$.The stretching vibration peaks occurs at 1614 $cm^{-1}$ due to the formation of imine group (C=N) as a result of condensation reaction between aldehyde and amine(L.Jothi *et.,al*).The aromatic ring vibrations C=C occurs at 1586 $cm^{-1}$,N=O asymmetric stretching at 1482$cm^{-1}$,N=O symmetric stretching(NO2 group) at 1327 $cm^{-1}$. The C-O stretching at 1286$cm^{-1}$,C-N stretching due aromatic imine linkage and the N-O deformation/C-H bending -NO2- group characteristic vibrations occurs at 874 $cm^{-1}$.From

the FT-Raman spectrum the peak seen at 1617 $cm^{-1}$ due to the C=N stretching vibrations this confirms the presence of imine group,C=C aromatic ring vibrations at 1592 $cm^{-1}$ and 1569 $cm^{-1}$. The N=O Asymmetric stretching and N=O Symmetric stretching(-NO2 group) occurs at 1493 and 1344$cm^{-1}$,C-O stretching at 1291 $cm^{-1}$,C-N stretching at 1188$cm^{-1}$,N-O deformation/C-H bending -NO2- group characteristic vibrations at 878$cm^{-1}$.From this analysis the FT-IR and FT-Raman spectrum of 5 Nitro salicyl aldehyde with aniline crystal complement each other confirms the crystal was well crystallized and confirms the chemical structure of the grown crystal[2]. Important spectral assignment of FT-IR and FT-Raman (Table 1). FT-IR spectrum of 5NSA Fig.(4). FT-Raman spectrum of 5NSA Fig.(5)

**Electrochemical characteristic studies**

**Cyclic Voltametry**

To analyze the cyclic voltametric study of the schiff base formed from 5Nitro salicyl aldehyde with aniline, the sample taken as a electrolyte in three electrode electro chemical work station. Cyclic voltagram observed potential window from -1.5Volt to +1.5 volt and the rate of scan starts with 50 mv/s.The oxidation peak observed from+0.4 V to 0.7 V due to phenolic OH. Deoxidation peak shows the reduction reaction at negative potentials from -0.5 voltto -1.4 volt due to nitro group (-NO2),the forward and reverse peak are in symmetric shape and the peak potentials (Ep) and peak current (Ip) indicate the redox activity by the anodic peak indicates the loss of electrons and the cathodic peak represents the gain of electrons[7][8].The peak separation calculated by a formula $\delta Ep=(Epa-Epc)$ a smaller $\delta Ep$ and symmetric peaks represents the reversible behaviour of the 5NSA crystal[17]. Cyclic Voltagram of 5NSA Fig.(6).

**Electrochemical impedance spectroscopy (EIS)**

5 NSA crystal were subjected to electrochemical impedance spectroscopy and obtained the value of Z imaginary (Zim) , Z real value of impedance (Zre) and plotted in Nyquist plot which gives the charge transport characteristics of the sample crystal from this plot the diameter of the semi circle is 96.398Kohms.The solution resistance value, Rs, is obtained from the Nyquist plot by placing the high frequency intercept close to the plot origin of the real X axis value. The total of the solution resistance Rp + Rs and the polarization resistance is given by the low frequency intercept of the real axis. As a result, the polarization resistance and the semicircle diameter will be equal. The polarization resistance is the transition resistance between the electrode and the electrolyte, and these observed values are helpful in creating analogous electronic circuits that can be used in biosensors[23].The semicircle portion indicates the charge transfer resistance at the electrode and the diameter of the semicircle represents the kinetics of the charge transfer, if the diameter is smaller which implies the fast charge transfer[12][13][14]. Nyquist plot of 5NSA Fig.(7).

**Frequency and Impedance curve**

To derive the relation between the frequency and the impedance value, the data obtained from the EIS study was plotted, shows the electrochemical process at the electrode interface. From this curve the impedance starts to decrease due to charge transfer resistance(Rct) and double layer capacitance(Cdl).The capacitive impedance $Zc= 1/i\omega$ as the frequency increases the impedance decreases and vice versa. Its aids in determining how the charge transfer occurs in the material. The response at high frequency attribute the grains, while the response at low frequency is due to grain boundaries[10]. Frequency and impedance curve of 5NSA Spectrum Fig.(8)

**Research Implication**

The 5 Nitro salicylaldehyde and aniline can undergo schiff base condensation forming imine bonds (-C=N-).This could create highly stable, conjugated organic films on the electrode surface, perfect for enhanced electron transport in an impedance biosensor.

## CONCLUSION

The new equimolar combination of 5 Nitro salicyl aldehyde with aniline organic crystal-synthesized and characterized. It exhibits significant potentiality due to its well-defined structural, optical, and electrochemical

properties. The structural characterization confirms a stable mono-clinic crystal system facilitated by inter-molecular hydrogen bonding and $\pi$- $\pi^*$ interactions, contributing to its crystallinity and molecular packing. Optical studies reveal suitable optical band gap and charge transfer behavior, making it responsive to light and indicating potential in optoelectronic applications. The electrochemical analysis demonstrates redox activity surface reactivity enhances its capability for electron transfer characteristics of 5NSA crystal. The electro active nature and surface functionality of this 5NSA organic Schiff base crystal can further develop into an electrochemical biosensor, which can be achieved by modifying the crystal surface to immobilize specific bio-molecules. The presence of electron donating and electron withdrawing groups enhances sensitivity to biochemical interaction accepting mensurable current changes upon analyte recognition. The nitro group (-NO2) on the salicyl aldehyde crystals electron -withdrawing Enabling redox activity and the imine group (C=N) in the 5NSA schiff base crystal interacts with proteins,small bio molecules via hydrogen bonding. Hence the investigation confirms 5NSA schiff base organic crystal a potential candidate for electro chemical biosensing applications.

## ACKNOWLEDGEMENTS

**ABSTRACT**

In this paper, we have defined Dispersive orders for two fuzzy random variables $\tilde{X}$&$\tilde{Y}$. Using this results, we have proved fuzzy location invariance, fuzzy positive scalar property, fuzzy reflection symmetry, fuzzy convolution property for two random variables $\tilde{X}$&$\tilde{Y}$.

**Keywords:** Fuzzy random variable, Stochastic orderings, Dispersive order, Fuzzy dispersive order, Quantile function.

## INTRODUCTION

Stochastic models are generally complex in nature. Therefore, obtaining bounds and approximations for certain key characteristics is practically important. Approximating a stochastic model either by a simpler one or by decomposing it into simpler components can help derive useful bounds and approximations for specific desired features of the model. Since the introduction of stochastic ordering by Lehmann (1955), various types of stochastic orders have been proposed in the literature to compare different aspects of probability distributions. This review paper focuses specifically on dispersive ordering.

Dispersive order is used to compare the variability of probability distributions. It allows us to determine which of two distributions exhibits a greater spread or variability. Suppose X and Y are two random variables with distribution functions $F_X$ and $F_Y$, respectively. Let $F_X$ and $F_Y$ be right-continuous. We say that X $\leq_{disp}$ Y (i.e., X is less

dispersed than Y) if:$Q_X$(p)-$Q_x$(q)≤$Q_y$(p) -$Q_y$(q), for all 0<q<p<1, where $Q_X$(p)is the quantile function (i.e., the inverse of the cumulative distribution function) of X.

Using dispersive order, we can identify which distribution is more spread out implying that its outcomes are more likely to deviate significantly from the average value. This concept is particularly useful in areas such as investment and reliability engineering.

The concept of a fuzzy random variable was introduced by Kwakernaak, and later developed further by Puri and Ralescu. A fuzzy random variable is essentially a random variable whose values lie in the space of fuzzy sets.

In this paper, we explore certain properties of dispersive order using fuzzy tools. Fuzzy mathematics, introduced by Zadeh (1965), is a fascinating area of research. Many developments and applications have emerged from this concept. This work presents some fundamental properties of fuzzy dispersive order.

In Section 2, we present some definitions relevant to this paper, and in Section 3, we derive several theorems using fuzzy dispersive orders.

**Preliminaries**

**Definition 2.1: Fuzzy set**
We consider X be the universal set. Then a fuzzy set $\tilde{A} = \{(x, \mu_A(x))/\, x \in X\}$ is defined by its membership function $\mu_A: X \to [0,1]$.

**Definition 2.2: $\alpha -$ cut of a fuzzy set**
For each $0 \le \alpha \le 1$, the $\alpha -$ cut of a set $\tilde{A}$ is denoted by

$$\tilde{A}_\alpha = \{\, x \in X;\ \mu_{\tilde{A}}(x) \ge \alpha\}.$$

**Definition 2.3: Fuzzy random variable:**
X ($\omega$) is a fuzzy random variable if and only if X $_\alpha(\omega) = [X_\alpha^L(\omega), X_\alpha^U(\omega)]$ where $X_\alpha^L(\omega)$and$X_\alpha^U(\omega)$ are both random variables for each $\alpha \in [0,1]$ and $X = \bigcup_{\alpha\in[0,1]} \alpha$ X $_\alpha(\omega)$.

**Definition2.4: Distribution function**
Let X be a random variable, the distribution function of X is defined as follows

$$F\,(X) = P\,(X \le x)$$

**Definition2.5: $\alpha -$ cut of the distribution function F of Fuzzy random variable:**
The $\alpha -$ cut of the distribution function F of Fuzzy random variable X is defined by

$$D_\alpha = \left[Min\left(\underset{\alpha \le \beta}{min} F(x_\beta^L), \underset{\alpha \le \beta}{min} F(x_\beta^U)\right), Max\left(\underset{\alpha \le \beta}{max} F(x_\beta^L), \underset{\alpha \le \beta}{max} F(x_\beta^U)\right)\right]$$

**Definition2.6: Stochastic order**
If X and Y be fuzzy random variables with cumulative distribution function $F_X$ and $F_Y$ respectively then $X \le_{st} Y \Leftrightarrow F_X(t) \ge F_Y(t) \forall\ t \in \mathbb{R}$.

**Definition2.7: Fuzzy stochastic order**
If $\tilde{X}$ and $\tilde{Y}$ be fuzzy random variables with fuzzy cumulative distribution function $F_{\tilde{X}}$ and $F_{\tilde{Y}}$ respectively then $\tilde{X} \le_{F-st} \tilde{Y} \Leftrightarrow F_{\tilde{X}_\alpha}(t) \ge F_{\tilde{Y}_\alpha}(t) \forall\ t \in \mathbb{R}, \forall\ \alpha \in [0,1]$.

**Definition2.8: Quantile Function:**
For a random variable X with CDF $F_X(x)$, the quantile function is:

$Q_X(p)=F_X^{-1}(p)=\inf\{x \in \mathbb{R} \text{ such that} F_X(x) \geq p\}, p \in (0,1)$.

**Note:** The quantile function will be used for all the upcoming inverse functions.

**Definition2.9: Dispersive order:**

For two random variables X and Y with continuous distributions, we say

$X \leq_{disp} Y$ (X is less dispersed than Y)if: $Q_X(p)-Q_X(q) \leq Q_y(p)-Q_y(q)$, for all $0<q<p<1$,

Where $Q_X(p)$is the quantile function (i.e., the inverse of the cumulative distribution function) of X.

**Definition2.10: Fuzzy Dispersive order:**

Let $\tilde{X}$ and $\tilde{Y}$be two fuzzy random variables. Then $\tilde{X} \leq_{f-disp} \tilde{Y}$

$$\Rightarrow Q_{\tilde{X}_\alpha}(p)-Q_{\tilde{X}_\alpha}(q) \leq_{f-disp} Q_{\tilde{Y}_\alpha}(p)-Q_{\tilde{Y}_\alpha}(q), \forall\ 0 \leq p \leq q \leq 1, \alpha \epsilon [0,1]$$

$$\Rightarrow \min_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$$\leq \min_{0<\alpha<1}\left(\left(Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q)\right)\right)$$

and

$$\max_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$$\leq \max_{0<\alpha<1}\left(\left(Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q)\right)\right)$$

$\forall\ 0 \leq p \leq q \leq 1, \alpha \epsilon [0,1]$.

**Properties of Dispersive order**

**Theorem.3.1: If $\tilde{X} \leq_{f-disp} \tilde{Y}$ then for any constant fuzzy number $\tilde{c}$, if and only if $\tilde{X}+\tilde{C} \leq_{f-disp} \tilde{Y}+\tilde{C}$.**

**Proof:**

We know that,

$\tilde{X} \leq_{f-disp} \tilde{Y} \Rightarrow Q_{\tilde{X}_\alpha}(p)-Q_{\tilde{X}_\alpha}(q) \leq_{f-disp} Q_{\tilde{Y}_\alpha}(p)-Q_{\tilde{Y}_\alpha}(q), \forall\ 0 \leq p \leq q \leq 1, \alpha \epsilon [0,1]$.

It is conceptually clear that the order $\leq_{f-disp}$ indeed corresponds to a comparison of X and Y by variability because it requires the difference between any two quantiles of Y.

It is clear from the above inequality that the order $\leq_{f-disp}$ is location free.

That is $\tilde{X} \leq_{f-disp} \tilde{Y} \Leftrightarrow \tilde{X}+\tilde{C} \leq_{f-disp} \tilde{Y}+\tilde{C}$.

**Part-I**

To prove, $\tilde{X} \leq \tilde{Y} = \tilde{X}+\tilde{C} \leq \tilde{Y}+\tilde{C}$

$$\tilde{X} \leq_{f-disp} \tilde{Y} = Q_{\tilde{X}_\alpha}(p)-Q_{\tilde{X}_\alpha}(q) \leq_{f-disp} Q_{\tilde{Y}_\alpha}(p)-Q_{\tilde{Y}_\alpha}(q)$$

$$= \min_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$$\leq \min_{0<\alpha<1}\left(\left(Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q)\right)\right)$$

and

$$\max_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$$\leq \max_{0<\alpha<1}\left(\left(Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q)\right),\left(Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q)\right)\right),$$

$\forall\ 0 \leq p \leq q \leq 1, \alpha \epsilon [0,1]$

Even if something is added to the min/max value, the result still remains the min/max value, so we can simply write it as the min/max. then,

$$= \min_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q)\right)+\tilde{C},\left(Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q)\right)+\tilde{C}\right)$$

$$\leq \min_{0<\alpha<1}\left(\left((Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q))+\tilde{C},\left((Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q))+\tilde{C}\right)\right.\right.$$

and

$$\max_{0<\alpha<1}\left(\left((Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q))+\tilde{C},\left((Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q))+\tilde{C}\right)\right.\right.$$

$$\leq \max_{0<\alpha<1}\left(\left((Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q))+\tilde{C},\left((Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q))+\tilde{C}\right)\right.\right),$$

$\forall\ 0\leq p\leq q\leq 1,\ \alpha\epsilon[0,1]$

$= Q_{\tilde{X}_\alpha}(p)-Q_{\tilde{X}_\alpha}(q)+\tilde{C}\leq Q_{\tilde{Y}_\alpha}(p)-Q_{\tilde{Y}_\alpha}(q)+\tilde{C},\ \forall\ 0\leq p\leq q\leq 1,\ \alpha\epsilon[0,1]$

$= \tilde{X}+\tilde{C}\ \leq \tilde{Y}+\tilde{C}.$

$\tilde{X}\ \leq \tilde{Y}=\tilde{X}+\tilde{C}\ \leq \tilde{Y}+\tilde{C}.$ ----------→ (1)

**Part-II**

To prove, $\tilde{X}+\tilde{C}\ \leq \tilde{Y}+\tilde{C}\ =\tilde{X}\ \leq \tilde{Y}$

$= Q_{\tilde{X}_\alpha}(p)-Q_{\tilde{X}_\alpha}(q)+\tilde{C}\leq Q_{\tilde{Y}_\alpha}(p)-Q_{\tilde{Y}_\alpha}(q)+\tilde{C},\ \forall\ 0\leq p\leq q\leq 1,\ \alpha\epsilon[0,1].$

$$= \min_{0<\alpha<1}\left(\left((Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q))+\tilde{C},\left((Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q))+\tilde{C}\right)\right.\right.$$

$$\leq \min_{0<\alpha<1}\left(\left((Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q))+\tilde{C},\left((Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q))+\tilde{C}\right)\right.\right)$$

And

$$\max_{0<\alpha<1}\left(\left((Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q))+\tilde{C},\left((Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q))+\tilde{C}\right)\right.\right.$$

$$\leq \max_{0<\alpha<1}\left(\left((Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q))+\tilde{C},\left((Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q))+\tilde{C}\right)\right.\right),$$

$\forall\ 0\leq p\leq q\leq 1,\ \alpha\epsilon[0,1].$

Even if you add anything to the min/max value, the result will still be considered as based on the min/max. So we can write it as the min/max itself.

$$= \min_{0<\alpha<1}\left(\left((Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q)\right),\left((Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$$\leq \min_{0<\alpha<1}\left(\left((Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q)\right),\left((Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q)\right)\right)$$

and

$$\max_{0<\alpha<1}\left(\left((Q_{\tilde{X}_\alpha}{}^{L}(p)-Q_{\tilde{X}_\alpha}{}^{L}(q)\right),\left((Q_{\tilde{X}_\alpha}{}^{U}(p)-Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$$\leq \max_{0<\alpha<1}\left(\left((Q_{\tilde{Y}_\alpha}{}^{L}(p)-Q_{\tilde{Y}_\alpha}{}^{L}(q)\right),\left((Q_{\tilde{Y}_\alpha}{}^{U}(p)-Q_{\tilde{Y}_\alpha}{}^{U}(q)\right)\right),$$

$\forall\ 0\leq p\leq q\leq 1,\ \alpha\epsilon[0,1].$

$= Q_{\tilde{X}_\alpha}(p)-Q_{\tilde{X}_\alpha}(q)\leq_{f-disp} Q_{\tilde{Y}_\alpha}(p)-Q_{\tilde{Y}_\alpha}(q),\ \forall\ 0\leq p\leq q\leq 1,\ \alpha\epsilon[0,1].$

$\tilde{X}+\tilde{C}\ \leq \tilde{Y}+\tilde{C}\ =Q_{\tilde{X}_\alpha}(p)-Q_{\tilde{X}_\alpha}(q)\leq Q_{\tilde{Y}_\alpha}(p)-Q_{\tilde{Y}_\alpha}(q),$

$\forall\ 0\leq p\leq q\leq 1,\alpha\epsilon[0,1].$

$\tilde{X}+\tilde{C}\ \leq \tilde{Y}+\tilde{C}\ =\tilde{X}\ \leq \tilde{Y}$ ----------→ (2)

From equation (1) & (2)

$\therefore \tilde{X} \leq_{f-disp} \tilde{Y} \Leftrightarrow Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q) \leq_{f-disp} Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)$,

$\forall\ 0 \leq p \leq q \leq 1, \alpha \epsilon [0,1]$.

**Theorem.3.2: If $\alpha > 1$, then $\tilde{X} \leq_{f-disp} \alpha.\tilde{X}$**

**Proof**:

We know that,

$\tilde{X} = Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q)$ ,$\forall\ 0 \leq p \leq q \leq 1$, $\alpha \epsilon [0,1]$.

Applying positive scalar, $\alpha > 1$.

$$\min_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p) - Q_{\tilde{X}_\alpha}{}^{L}(q)\right), \left(Q_{\tilde{X}_\alpha}{}^{U}(p) - Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$$\leq \alpha \cdot \min_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p) - Q_{\tilde{X}_\alpha}{}^{L}(q)\right), \left(Q_{\tilde{X}_\alpha}{}^{U}(p) - Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

$\Rightarrow (-1)\tilde{X}\leq(-1)\tilde{Y}$

$\therefore \tilde{X}\leq\tilde{Y}\Rightarrow -\tilde{X}\leq-\tilde{Y}.$

**Theorem.3.4: Let $\widetilde{Z}$ be a fuzzy random variable independent of $\widetilde{X}$, $\widetilde{Y}$ and suppose $\widetilde{Z}$ has log-concave cuts, then $\widetilde{X} \leq_{f-disp} \widetilde{Y} \Longrightarrow \widetilde{X} + \widetilde{Z} \leq_{f-disp} \widetilde{Y} + \widetilde{Z}$.**

**Proof:**

We know that,

$\tilde{X} \leq_{f-disp} \tilde{Y} \Longrightarrow Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q) \leq_{f-disp} Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)$, $\forall\ 0 \leq p \leq q \leq 1$, $\alpha \epsilon [0,1]$

Let us assume that $\tilde{Z}$is an random variable with quantile function $Q_{\tilde{Z}}$has log concave cuts.

We want to prove $\tilde{X} + \tilde{Z} \leq_{f-disp} \tilde{Y} + \tilde{Z}$

If $\tilde{X} \leq_{disp} \tilde{Y}$

Suppose $\tilde{X} + \tilde{Z} \leq_{disp} \tilde{Y} + \tilde{Z}$

$= (Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q)) + (Q_{\tilde{Z}_\alpha}(p) - Q_{\tilde{Z}_\alpha}(q)) \leq (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)) + (Q_{\tilde{Z}_\alpha}(p) - Q_{\tilde{Z}_\alpha}(q))$

$= \min_{0 < \alpha < 1} \left( \left( {Q_{\tilde{X}_\alpha}}^L(p) - Q_{\tilde{X}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{X}_\alpha}}^U(p) - Q_{\tilde{X}_\alpha}{}^U(q) \right) \right)$

$+ \min_{0 < \alpha < 1} \left( \left( {Q_{\tilde{Z}_\alpha}}^L(p) - Q_{\tilde{Z}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{Z}_\alpha}}^U(p) - Q_{\tilde{Z}_\alpha}{}^U(q) \right) \right)$

$\leq \min_{0 < \alpha < 1} \left( \left( {Q_{\tilde{Y}_\alpha}}^L(p) - Q_{\tilde{Y}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{Y}_\alpha}}^U(p) - Q_{\tilde{Y}_\alpha}{}^U(q) \right) \right)$

$+ \min_{0 < \alpha < 1} \left( \left( {Q_{\tilde{Z}_\alpha}}^L(p) - Q_{\tilde{Z}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{Z}_\alpha}}^U(p) - Q_{\tilde{Z}_\alpha}{}^U(q) \right) \right)$

and

$\max_{0 < \alpha < 1} \left( \left( {Q_{\tilde{X}_\alpha}}^L(p) - Q_{\tilde{X}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{X}_\alpha}}^U(p) - Q_{\tilde{X}_\alpha}{}^U(q) \right) \right)$

$+ \max_{0 < \alpha < 1} \left( \left( {Q_{\tilde{Z}_\alpha}}^L(p) - Q_{\tilde{Z}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{Z}_\alpha}}^U(p) - Q_{\tilde{Z}_\alpha}{}^U(q) \right) \right)$

$\leq \max_{0 < \alpha < 1} \left( \left( {Q_{\tilde{Y}_\alpha}}^L(p) - Q_{\tilde{Y}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{Y}_\alpha}}^U(p) - Q_{\tilde{Y}_\alpha}{}^U(q) \right) \right)$

$+ \max_{0 < \alpha < 1} \left( \left( {Q_{\tilde{Z}_\alpha}}^L(p) - Q_{\tilde{Z}_\alpha}{}^L(q) \right), \left( {Q_{\tilde{Z}_\alpha}}^U(p) - Q_{\tilde{Z}_\alpha}{}^U(q) \right) \right)$,

$0 \leq p \leq q \leq 1$, $\alpha \epsilon [0,1]$

We know that, the property of quantile addition(Q-addition) is X and Y are random variable with distribution function $F_X$ and $F_Y$. $\tilde{X} \leq_{disp} \tilde{Y}$ iff ${F_Z}_\alpha^{-1} \equiv {F_Y}_\alpha^{-1} - {F_X}_\alpha^{-1}$ is increasing $\alpha \epsilon (0,1)$.

The condition is equivalent to

$Q_{\tilde{Z}_\alpha}(p) = Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{X}_\alpha}(p)$

$Q_{\tilde{Z}_\alpha}(q) = Q_{\tilde{Y}_\alpha}(q) - Q_{\tilde{X}_\alpha}(q)$

From the above definition,

$= (Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q)) + (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q) + Q_{\tilde{X}_\alpha}(q))$

$\leq (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)) + (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{X}_\alpha}(p)) - Q_{\tilde{Y}_\alpha}(q) + Q_{\tilde{X}_\alpha}(q))$

$0 \leq p \leq q \leq 1$, $\alpha \epsilon [0,1]$

$= (Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q)) + (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q) + Q_{\tilde{X}_\alpha}(q))$

$\leq (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)) + (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{X}_\alpha}(p)) - Q_{\tilde{Y}_\alpha}(q) + Q_{\tilde{X}_\alpha}(q))$

$0 \leq p \leq q \leq 1$, $\alpha \epsilon [0,1]$

$= (Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q)) + (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)) - (Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q))$

$\leq (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)) + (Q_{\tilde{Y}_\alpha}(p) - Q_{\tilde{Y}_\alpha}(q)) - (Q_{\tilde{X}_\alpha}(p) - Q_{\tilde{X}_\alpha}(q))$

$0 \leq p \leq q \leq 1, \alpha \epsilon [0,1]$

$$= \min_{0<\alpha<1}\left(\left(Q_{\tilde{X}_\alpha}{}^{L}(p) - Q_{\tilde{X}_\alpha}{}^{L}(q)\right), \left(Q_{\tilde{X}_\alpha}{}^{U}(p) - Q_{\tilde{X}_\alpha}{}^{U}(q)\right)\right)$$

## ABSTRACT

Haemostasis is the mechanism by which the body forms clots at sites of blood vessel injury to stop excessive bleeding while keeping blood within the vessels in a normal, fluid condition. There is an extending demand to obtain medicative and therapeutical substances from plant-oriented sources. This study is sought to investigate the most potential coagulation effects of *Averrhoa carambola L.* fruit ethanolic extract by assessing it's in-vitro anticoagulant activity using human blood specimen.The in-vitro coagulation effects of *Averrhoa carambola L.* fruit extract at different concentrations of 0.5 µl, 0.75 µl, and 1.0 µl were evaluated using human blood samples to determine their impact on prothrombin time (PT).The extracts were constructed to impede the coagulation process and remarkably enhance the prothrombin time in a dose-related way. The main objective these extracts, at various concentrations, obstruct the clot initiation and lead to an enhance in prothrombin time. The further research work will be

carried out for it's effectiveness and well-being and additionally it may be potentially be established in the future aspect as a complimentary anticoagulant agent for cardiovascular disorders.

**Keywords:** Anti-coagulant activity, Haemostasis, Blood, prothrombin time

## INTRODUCTION

Haemostasis can be defined as a coordinated mechanism involving both coagulation and anticoagulant mechanisms which keeps blood contained within damaged vessels during injury. It is a complex system consisting of three main stages.

1. Vasoconstriction
2. Inducement of prothrombin to thrombin
3. Transformation of fibrinogen to fibrin

The coagulation process is a complex, coordinated process in which inactive precursor enzymes—such as zymogens, procoagulants, and proenzymes are sequentially transferred to their active forms. The most clotting elements do exist initially in an inert state and become activated as the cascade progresses. Once one enzyme is activated, it is responsible for triggering the activation of the next zymogen in the sequence. This chain reaction proceeds with until a fibrin polymer is produced. Protein metabolic intermediates, tissue surface phospholipid and calcium ions are all essential contributors to the formation of the fibrin polymer[1].Various cardiovascular diseases—such as High blood pressure, cerebral bleeding, coronary thrombosis, atherosclerosis, and myocardial infarction—are generally associated in the circulatory system, with abnormal blood clotting phenomenon constitute a significant medical discussion. The prothrombin time (PT) test is used to determine the extrinsic coagulation pathway and identify deficiencies in Factors II, V, VII, and X. When calcium ions are present, thromboplastin triggers the extrinsic pathway, and the resulting clotting time reflects the levels of these factors. Therefore, a prolonged PT indicates a deficiency in one or more of these clotting factors—particularly Factors VII or X—and is considered abnormal[2-5]. The normal prothrombin time (PT) ranges from 11 to 16 seconds. Apart from NSAID's like aspirin and indomethacin and other significant synthetic anticoagulant agents like heparin, ethylenediaminetetraacetic acid (EDTA), citrate, and warfarin, which also exhibit anti-inflammatory and anti-platelet properties. The use of medicinal plants in India for preventing and treating various ailments represents one of the oldest traditional approaches to primary health care[6-8]. In addition to their pharmaceutical benefits, anticoagulant drugs can cause serious adverse effects and are often costly. Consequently it is important to seek possible anticoagulant options[9]. As plants are considered a safer source of medicine, this study serves as an initial investigation into the in vitro anticoagulant activity of *Averrhoa carambola* L. fruit extract, using standard experimental models with blood specimens from healthy subjects [10-11].

## MATERIALS AND METHOD

**Collection of plant material**

The fruit of *Averrhoa carambola* L. was collected from surrounding of Haldia, East Medinipur district, West Bengal, and were dried under the shade, dice into tiny fragments and rough powdered. The rough powder was utilized for extraction using different solvents.

**Preparation of plant extract**

The coarse powder of *Averrhoa carambola* L. fruit were collected by grinder after shade drying. The plant material(15g) was dissolved in 70ml ethanol and keptit for 3 days as permaceration process. After 3 days the solution was filtered by using Whatman filter paper and kept it in a glass container. The solvent was evaporated from the extract by simple distillation method. The concentrated extract was stored in a sterile glass container and kept in refrigerator for further use.

**Determination of PT**

Approximately 5 ml of blood sample was collected from a healthy individual via venous puncture. To prevent the natural coagulation 9 µl of blood, 1 µl of 3.8% sodium citrate solution was added to the sample. The sample was then immediately centrifuged at 3000 rpm for 15 minutes to separate plasma from blood cells for the prothrombin time (PT) test. The plasma was divided into five groups as follows:

**Group 1 (Control):** 0.2 ml plasma + 0.1 µl 0.9% saline + 0.3 µl calcium chloride
**Group 2 (Test 1):** 0.2 ml plasma + 0.5 µl plant extract + 0.3 µl calcium chloride
**Group 3 (Test 2):** 0.2 ml plasma + 0.75 µl plant extract + 0.3 µl calcium chloride
**Group 4 (Test 3):** 0.2 ml plasma + 1 µl plant extract + 0.3 µl calcium chloride
**Group 5 (Standard):** 0.2 ml plasma + 1 µl EDTA solution + 0.3 µl calcium chloride

For clotting measurement, all glass slides were tilted at a 45° angle every 30 seconds. A stopwatch was used to record the time taken for clot formation, which was recorded as the PT.

## RESULTS AND DISCUSSION

Result of prothrombin time test (PT Test) (Table 1). Clotting time of different groups (Table 2). Blood plasma in glass slide before applying any reagents (Fig 1). Blood plasma in glass slide after applying all reagents (Fig 2).

## DISCUSSION

Coagulation is a pathway primarily driven by the complicated interactions between cellular and molecular components. While clotting primarily involves both intrinsic and extrinsic pathways, it is now understood to result from a balance between procoagulants and anticoagulants. In this study, Group 4, which received higher concentration exhibited very prominent anticoagulant effect.

## CONCLUSION

The anticoagulant activity of *Averrhoa carambola L.* ethanolic fruit extract has not been previously reported, and this study represents the first investigation using the PT test. Further research is needed to identify and characterize the active molecules responsible for this activity. This study was conducted to evaluate the anticoagulant effect of *Averrhoa carambola L.* fruit extract on blood samples from healthy individuals using the PT assay. For a more comprehensive assessment of its anticoagulant potential, future experiments should include coagulation and fibrinolysis assays, activated partial thromboplastin time (aPTT), fibrinolytic activity, antioxidant activity, cytotoxicity test.

## ABSTRACT

The present study on avian diversity was carried out from November 2023 to October 2024 at two selected wetlands, i.e., urban Kankaria Lake in Ahmedabad and semi-urban Rani Lake in Idar town of Sabarkantha district in Gujarat state of India. The present study aims to study relative abundance, migratory status, IUCN status, and diversity of avian fauna using different indices. A total of 78 species from 14 orders and 31 families were recorded, including two Vulnerable species (Common Pochard and River Tern) and two Near Threatened species (Black-tailed Godwit and Indian Roller). Species richness was dominated by Passeriformes, followed by Charadriiformes, Pelecaniformes, and Anseriformes, reflecting the structural variability of the wetlands. Rani Lake harbored 76 species, whereas Kankaria Lake supported only 30 species. Rani Lake, which has a significantly greater diversity and evenness, sustains all identified vulnerable taxa and winter migrants; however, Kankaria Lake is home to various urban-adapted species.

**Keywords:** Avifauna, IUCN status, Diversity, Species richness, Relative abundance, Winter migrants, Wetland

## INTRODUCTION

Wetlands are among the most productive ecosystems and play a crucial function in sustaining diverse species of birds. Birds use these habitats for feeding, nesting, and resting, and their sensitivity to ecological changes makes them well-known as bio-indicators of environmental health [1]. Assessing avian diversity in wetlands not only offers information on habitat quality, but also assists in identifying conservation needs. Gujarat is recognized for its diverse avifauna, which includes extensive wetlands that attract both permanent and migratory species [2]. Several studies conducted around the state have emphasized the ecological importance of these ecosystems. For example, Vyas and Raval (2022) documented 199 bird species across three wetlands in Porbandar, suggesting that even human-influenced wetlands may support great avian diversity[3].Similarly, Dolatsang and Trivedi (2024) documented 146 bird species in Khijadiya Bird Sanctuary and showed that habitat heterogeneity strongly shapes bird community composition[4]. Research at the Pariyej Community Reservoir also confirmed that Gujarat's reservoirs sustain substantial avifauna, including many winter visitors[5]. While the overall investigation on Gujarat's wetlands is expanding, site-specific avian evaluations for some urban and semi-urban lakes remain limited. Kankaria Lake, a notable urban lake in Ahmedabad, provides a variety of microhabitats, including open water, vegetated margins, and adjacent green spaces. Peer-reviewed studies on Kankaria Lake's bird diversity, species' residential status, and conservation status remain limited, despite its ecological potential. In contrast, Rani Lake in Idar, Sabarkantha district, represents a semi-urban to rural wetland with a distinctive ecological context. Although phytoplankton diversity has been documented [6], there is no published avifaunal research for the Rani Lake site. Comparing the avian diversity of these two ecologically distinct lakes provides an opportunity to gain an insight into how habitat conditions and anthropogenic influences affect bird communities. The present research seeks to document the avian diversity in Kankaria Lake and Rani Lake, evaluate their conservation significance, and establish the foundation for future ecological monitoring and wetland management.

## MATERIALS AND METHODS

**Study area**

The Kankaria Lake is located at approximately 23.006° N and 72.601° E in the Maninagar area of the southeastern part of Ahmedabad, Gujarat, India (Figure 1). It was constructed during the reign of Sultan Qutb-ud-Din Ahmad Shah II in 1451 A.D. It is additionally known as "Qutub Hojj" or "Hauj-e-Kutub." It covers almost 76 acres and has a maximum depth of approximately 7 meters. The central island, known as Nagina Wadi, was formerly a royal retreat and is now a tourist destination. The area around it has been significantly turned into a cultural and leisure zone. The Rani Lake, also known as Rani Talav, is situated at 23.862° N and 73.018° E nearby Idar town, which is located at the southern end of the Aravalli Mountain range in northern Gujarat, India (Figure 1). The town of Idar is referenced in the Mahabharata as 'Ilvadurg.' Rani Lake occupies approximately 94 acres and has a maximum depth of about 5 meters. It provides water for irrigation year-round. The Pavapuri Jain temple, lying in the center of a lake, is connected to the land by a bridge.

**Field Methods and Statistical Analysis**

A year-long study from November 2023 to October 2024 was conducted on monthly basis from 6:30 am to 8:30 am and 4:00 pm to 7:00 pm, respectively to assess avifaunal diversity at both selected study sites. A total of 24 field surveys were conducted at six distinct points across study site. Field data were collected using the widely accepted Point Count Method [7]. Data records on bird sightings, include birds present in and around study sites, including those in flight, perched on trees, or foraging on the ground. Birds were observed using Nikon 12x50 resolution binoculars and whenever possible, photographs were captured by Nikon D5600 DSLR camera. During field visits, birds were identified using field guides [8][9]. Seven diversity indices such as Species Richness, Dominance_D, Simpson_1-D, Shannon_H', Evenness_J', Margalef Species Richness (d), and Jaccard Similarity_J were employed to measure the avian diversity using PAST [10].

## RESULTS AND DISCUSSION

A total of 78 bird species belonging to 14 orders and 31 families were recorded from the Kankaria Lake and Rani Lake, reflecting substantial avian diversity within the study area. Among all recorded species, the IUCN status of the Common Pochard (*Aythya ferina*) and River Tern (*Sterna aurantia*) is Vulnerable (VU); the Black-tailed Godwit (*Limosa limosa*) and Indian Roller (*Coracias benghalensis*) are Near Threatened (NT); and all other bird species are Least Concern (LC). Passeriformes, with 11 families, contributed the most species richness (n=34), followed by Charadriiformes, with 5 families (n=13), Pelecaniformes (n=12), and Anseriformes (n=11), which is in line with previous studies in which passerines dominate in structurally heterogeneous wetland systems (Table 1)[11] [12]. At Kankaria Lake, generalist and disturbance-tolerant species predominate, especially Little Cormorant (33.83%), Black-crowned Night Heron (8.35%), Black Kite (5.48%), House Crow (4.28%), and Rock Pigeon (3.04%). This pattern is consistent with research demonstrating that wetland-dependent avifaunal richness declines as urban built-up cover rises [13] [14]. On the other hand, at Rani Lake, dabbling ducks, diving ducks, waders, and migrants (e.g., Lesser Whistling-Duck 15.71%, Little Grebe 5.12%, Garganey 5.27%, Little Cormorant 5.95%, and Black-winged Stilt 3.98%) were more evenly observed, which may be associated with relatively higher habitat quality, greater microhabitat heterogeneity, and lower levels of anthropogenic disturbance (Table 1).The fact that all threatened species (Vulnerable: Common Pochard, River Tern; Near Threatened: Black-tailed Godwit, Indian Roller) and all winter migrants were recorded only at Rani Lake underscores its conservation significance as a refuge for sensitive and migratory taxa, a pattern also documented in other natural wetland reservoirs [15] [16]. Systematic list of birds recorded from selected study sites (November 2023 to October 2024) (Table 1).

**Diversity Indices**

The diversity metrics indicates that Kankaria Lake and Rani Lake have quite different avian community structures. In comparison to Kankaria Lake (n = 30), species richness at Rani Lake (n = 76) was significantly higher, indicating a high beta-diversity and significant species turnover between the two wetlands. This suggests that Rani Lake supports a more diverse and resource-rich habitat. A more uniform distribution of species is further indicated by lower dominance at Rani Lake (D = 0.049) compared to Kankaria Lake (D = 0.1447), which is corroborated by higher Simpson's diversity (0.9509) and Shannon's index (3.5721). Additionally, evenness was higher at Rani Lake (0.8248), suggesting less resource monopolization by a small number of species. The Rani Lake's superior habitat complexity and suitability for a variety of guilds are further supported by its significantly higher Margalef richness index (8.8695) compared to the Kankaria Lake (3.2629). Due to varying degrees of urban disturbance and habitat structure, the Jaccard similarity index of lakes was low (0.3544), indicating that they share relatively few species and have very different community compositions (Table 2).

## CONCLUSION

The rich avian assemblage of 78 species found in the semi-urban Rani Lake and urban Kankaria Lake is documented in this study, which also reveals a striking difference between two lakes. A depauperate, dominance-structured community (richness = 30, Simpson's D = 0.1447) made up mostly of generalist, disturbance-tolerant species is supported by Kankaria Lake, which might be correlate with high urban encroachment and habitat homogenization. At the same time, sensitive wetland-dependent and migratory taxa are minimal at this site. Rani Lake, on the other hand, has much higher alpha diversity (richness = 76, Shannon H′ = 3.5721, Simpson's 1-D = 0.9509), greater evenness (J′ = 0.8248), and better habitat heterogeneity. It serves as a vital refuge for all IUCN-threatened species (Vulnerable and Near Threatened) and all winter migratory water birds. The low beta-diversity overlap (Jaccard similarity = 0.3544) between the sites indicates marked differences in species composition, which are commonly associated with habitat simplification in urbanized landscapes and a greater representation of synanthropic bird guilds. In order to ensure the long-term persistence of avifaunal diversity in distinctly located wetlands of western India, targeted management interventions such as habitat restoration, disturbance mitigation, and sustainable urban wetland interface planning are essential.

## ABSTRACT

Science has been the source of societal progress as has always been the case but the real test of progress can be through the transformation of science into social, environmental, and economic well-being. This is a thorough review of how India is cooking up scientific knowledge, technological innovation, and policy frameworks in order to benefit the needs of the society, which puts the developments into global perspective. Based on the national programs like the Digital India, Ayushman Bharat, Smart Cities Mission, and National Action Plan on Climate Change (NAPCC), this paper discusses the role played by science based programs in affecting human development and environmental sustainability. By critically assessing government policy, the digital changes and ethical issues, the study makes a pressing point of harmonisation of innovation and inclusiveness with governance and empathy. The discussion concludes with a conceptual framework; S3H (Science-Society-Sustainability-Humanity) which emphasizes the potential future of the science-policy ecosystem in India to become fair, human-based and sustainable development.

**Keywords:** Science and Society, Digital India, Science Policy, the Environmental sustainability, social innovation, India.

# INTRODUCTION

**Background**

The notion of interdependence of science, technology and society is becoming so much apparent in the 21st century. The findings of science affect all aspects of human life, such as the provision of health care and adjustment to changing climates, using digital technologies, and environmentally-friendly agriculture. The case of the rapid shift of India to becoming a knowledge-based economy puts emphasis on the urgency of merging science and technology (S and T) with policy and human values (NITI Aayog, 2023). Science for Society is a phrase capable of going beyond laboratory work, it embodies the spirit behind knowledge as an empowerment, equality and endurance tool. The transformational power of integrating science and policy manifested during the COVID-19 pandemic with the help of digital health services, vaccine development, and real-time analytics of public data revealed the potential (WHO, 2022). At the same time, the ongoing changes on climate and environmental deterioration have highlighted the importance of policymaking on evidence grounds and governance based on ethics (IPCC, 2023). India is a better place to find such a differentiated model of science-led development that is both inclusive and context dependent with its demographical diversity as well as technological aspirations.

**Rationale**

Although the history of science in the global context of social good is well known, the Indian situation promptly requires a crucial analysis of how science on the national policy level translates into practice. This review is a synthesis of existing literature, policy papers, and institutional reports, to discuss how S and T has been strategically used in India to transform the society, with links between health, environment, and digital governance.

# OBJECTIVES

This is a comprehensive review which seeks to:

1. Analyze the contribution of science and technology policies to the social economic growth of India.
2. Dissect integration on the sector, governmental health, environmental sustainability, and online governance.
3. Compare the Indian practices with the best practices around the world.
4. Suggest a model (S3H Model) that will enhance the integration of science, policy, and humanity.

**Evolution of Science-Society Relationship in India**

**Historical Context**

The age of science in India was a progressive endeavor post-independence as a national building tool. Attempts to institutionalize research through governance and societal good took science institutes like CSIR, ISRO, DRDO, and ICAR which were created under the leadership of Jawaharlal Nehru (Chakraborty, 2019). The 21st century took a paradigm shift, the institution-based science to the innovation-based science. Such policies as the Science, Technology and Innovation Policy (STIP 2013) and the upcoming STIP 2020 focus on inclusiveness, gender equity, and social relatability of research (DST, 2020)(Table1).

**Technology as a Catalyst for Social Transformation**

**Digital India and Governance Innovation**

In 2015, there was the Digital India initiative, which worked to make India a digitally empowered society. It promoted e-governance, digital literacy, and direct citizens with applications, such as Aadhaar, DigiLocker, and UMANG (MeitY, 2022). Digital authorities have allowed inclusion and transparency and more than 1.3 billion Aadhaar registrations and digital deals surpass around 2 trillion per month (RBI, 2023). The initiatives provide options on how technology can operationalize social policy, thereby offering equal rights of access to health, education, and welfare services.

**Healthcare Transformation: Ayushman Bharat**

PMJAY Ayushman Bharat-Pradhan Mantri Jan Arogya Yojana (2018) is among some of the largest government-financed health insurance policies in the world. It incorporates the implementation of digital health technologies through Ayushman Bharat Digital Mission (ABDM), which provides medical records and teleconsultation services to be interoperable (NHA, 2022). This is an exemplary combination of health science, policy, and digital innovation, which can be copied around the world and be used as a universal health cover model.

**Technological Empowerment in Rural India**

Programs, such as the e-Choupal and the Kisan Sarathi are the programs that combine agricultural science and ICTs into improving the rural livelihoods. ATM The Atmospheric Tracks and Missions (2021) state that ISRO satellite data is utilized to monitor crops, water resources, and disaster resilience. These point out the Indian progress at the technology level in terms of grassroots empowerment.

**Environmental Science, Climate Policy, and Sustainability**

**National Action Plan on Climate Change (NAPCC)**

The science-based environmental governance is supported by the NAPCC (2008) and state-level action plans in India. This mission prioritizes the areas of solar power, environmentally friendly agriculture, and conservation of water resources (MoEFCC, 2022). The adaptability potential has increased through incorporation of scientific modeling in the establishment of policies as seen through such projects as the National Solar Mission and National Mission on Himalayan Ecosystems.

**Role of Science and Technology in Environmental Monitoring**

The environmental management has changed significantly due to the use of technological instruments like remote sensing, tasked AI-based weather forecasting, and IoT-based air quality sensors (TERI, 2023). The applicant is the National Clean Air Programme (NCAP) of India that uses real-time data analytics to monitor the hotspots of pollution and the efficiency of the policies.

**Linking Science, Policy, and Community**

The Swachh Bharat and Namami Gange programs are examples of strategies that can make a behavioral transformation and ecological revival and recovery based on evidence-driven intervention strategies. Provided with a strong policy toolkit, community-driven science provides a quantifiable outcome, including coverage of sanitation (UNICEF, 2021)(Figure 1). The following illustration (A concept diagram on how scientific research, environmental technology, and policy interventions operate to generate sustainable results) is used.

**Humanity and the Ethics of Scientific Progress**

**Ethical Dimensions in Technological Development**

Ethical stewardship is now one of the most important pillars to support AI, genomics, and digital governance in India as it develops. Such problems as data privacy, cyber-exclusion, and environmental justice demand the balance between innovation and human rights (Floridi, 2020). Disclosed consent frameworks proposed in the Digital Personal Data Protection Act (2023) aims at creating this balance.

**Inclusive Innovation and Social Equity**

Science has to deal with asymmetries of gender in STEM fields, rural segregations, and the depiction of marginalized populations (UNESCO, 2022). Such programs as Vigyan Jyoti and Women Scientists Scheme increase the involvement of females in research, which strengthens the human aspect of science development.

**Indigenous Knowledge and Cultural Integration**

The interface of science and heritage is traditional ecological knowledge systems; including Ayurveda, local biodiversity, and organic farming among others. Modern R and D makes them stronger regarding sustainability and cultural continuity (CSIR, 2021).

**Comparative Global Insights**

Successful science-policy-humanity integration is shown in such countries as Japan (Society 5.0), Finland (Open Science Policy), and EU Green Deal. India implements its model on a unique scale and variety; being between technological aspiration and socio-economic complexity (OECD, 2021). India is acknowledged by the international community, with such programmes as the International Solar Alliance (ISA) and One Health framework being considered highly instrumental in the well-being of the planet (FAO, 2023) (Table2).

**Towards a Human-Centered Science Framework**

**The S³H Model**

This framework (Science-Society-Sustainability-Humanity (S3H) (Figure 2) has been presented in this review and ends up highlighting four pillars, which are interconnected:

**Science:** Production of the knowledge that has been tested and experimented.

**Society:** Application of science into policies that can be applied in serving human needs.

**Sustainability:** The ecological and economic sustainability in technological development.

**Humanity:** It involves incorporating ethics, empathy and inclusivity in innovation (Figure 2).

The S³H Framework for Science-Society Integration (Figure 2).

**Policy Recommendations**

This framework (Science-Society-Sustainability-Humanity (S3H) (Figure 2) has been presented in this review and ends up highlighting four pillars, which are interconnected:

**Science:** Production of the knowledge that has been tested and experimented.

**Society:** Application of science into policies that can be applied in serving human needs.

**Sustainability:** The ecological and economic sustainability in technological development.

**Humanity:** It involves incorporating ethics, empathy and inclusivity in innovation.

## DISCUSSION

The case of India supports the idea that the science-society interface is favourable when the policy has evidence-based, and socially responsive policies. Examples of convergence between innovation and governance include such programs as Ayushman Bharat or Digital India. Nevertheless, there are still difficulties; inconsistent implementation, regulatory slackness, and moral lapses. The next frontier is the shift of technology adoption to technology adaptation, whereby the innovation is made to respond to the needs of the locals. In addition, the scientific education and popularization process should incorporate human values into teaching and the community to generate inclusive development.

## CONCLUSION

It is only then that science gains meaning when it appeals to the needs and demands of humankind. The Indian path shows that the innovation of technology, policy and humanity can help change the idea of science into the tool of equity and sustainability. The offered S3H framework provides a strategic perspective of enhancing interdisciplinary governance and ethical innovativeness. The Science with Society vision should be grew out of the vision of Science for Society because the global challenges require the presence of Science with Society paradigm, which is participatory, inclusive and humanized.

## ABSTRACT

Determining sex is an important part of biological profiling in forensic anthropology because it cuts down the number of possible identities. The pelvis shows the most variation between sexes, but it is often not available due to injury, environmental factors, or damage. Instead, the skull, particularly the mastoid area of the temporal bone, serves as a reliable alternative because of its strength and ability to endure postmortem damage. The mastoid triangle, formed by the craniometric points porion, mastoidale, and asterion, provides a standard geometric framework to assess mastoid shape and sexual differences. This review looks at how effective three-dimensional computed tomography (3D CT) is in analyzing the mastoid triangle for sex determination. Research from various populations, including Indian, Egyptian, Middle Eastern, European, African, and South American groups, consistently shows that males have much larger dimensions and areas of the mastoid triangle than females. The reported classification accuracies range from about 55% to over 85%, with the area of the mastoid triangle being the most effective at distinguishing between sexes. Studies using CT typically show better accuracy and consistency compared to examining dry skulls or using two-dimensional X-ray techniques. Population-specific differences significantly influence diagnostic performance, emphasizing the need for locally developed methods. The advantages of 3D CT imaging include clear spatial visualization, elimination of projection errors, better landmark identification, and less variability among observers. While there are limitations related to population specificity, different methods, and sample size, earlier research suggests that 3D CT-based analysis of the mastoid triangle is a reliable and objective aid for determining cranial sex, especially in cases of fragmented or incomplete skulls.

**Keywords:** Mastoid triangle, sexual dimorphism, computed tomography, forensic anthropology, skull

# INTRODUCTION

Determining the identity of unidentified human remains is a key goal of forensic anthropology. This work is important in criminal cases, mass disasters, and humanitarian efforts[1]. The first and most important part of biological profiling is establishing sex. This factor significantly affects how other biological traits, like age and stature, are understood[2]. Accurately determining sex reduces the number of potential identities by about fifty percent. This improves the efficiency and effectiveness of forensic investigations [3]. The pelvis is often seen as the skeletal element with the most noticeable sexual differences. However, it may be hard to access due to taphonomic changes, injury, or heat damage[4]. In these cases, the skull becomes the best choice for estimating sex. Its structure is strong, and there are clear differences in shape between genders[5]. Traditional methods for determining sex from skulls rely on both morphological assessments and metric analyses, which show how genetic, hormonal, and functional factors affect bone development[6]. The mastoid region of the temporal bone has received a lot of attention because it has significant sexual dimorphism and is resistant to changes after death[7]. The mastoid process is protected at the base of the skull and often remains intact, even when other parts are damaged[8]. Its development is linked to muscle attachments and biomechanical stresses, which tend to be greater in males. This leads to a stronger mastoid structure[9]. These features make the mastoid area particularly useful for sex determination in broken or incomplete skulls[10]. Early methods for determining sex based on the mastoid relied mainly on visual inspection and simple linear measurements. These were subjective and heavily depended on the observer's experience[11]. To improve objectivity and consistency, researchers introduced metrics that use clearly defined anatomical landmarks. This led to the creation of the mastoid triangle as a standardized geometric framework [5]. By combining various dimensions of mastoid shape into both linear and area measurements, the mastoid triangle offers better discrimination than individual measurements [12]. However, earlier studies using dry skulls and two-dimensional X-rays showed inconsistent accuracy across different populations. This highlighted the influence of population-specific differences in cranial structure[13]. Advances in medical imaging, particularly computed tomography, helped to resolve many of these issues. It allows for non-destructive, accurate, and repeatable assessments of cranial features [7]. The development of three-dimensional CT reconstruction further improved measurement precision by eliminating projection errors and enabling true spatial analysis of cranial landmarks [14]. As a result, three-dimensional CT evaluation of the mastoid triangle has become an essential method in modern forensic anthropology [8].

**Anatomical and Developmental Basis of the Mastoid Triangle**

The mastoid process is a pyramidal projection located on the back and lower part of the temporal bone, behind the external auditory meatus. It acts as an attachment point for several muscles, including the sternocleidomastoid, splenius capitis, and longissimus capitis. These muscles help move the head and support posture[15]. The mastoid shape is greatly affected by muscle tension, with greater muscle mass in males resulting in a larger and stronger mastoid structure[9]. Developmentally, the mastoid process is absent at birth and starts to develop after birth due to muscle activity and the gradual formation of mastoid air cells. Growth in the mastoid area continues through childhood and adolescence, taking on adult-like features usually after puberty [16]. Differences between the sexes become more pronounced during and after puberty, influenced by hormonal changes and variations in muscle development and functional loading based on sex[7].These developmental and functional factors lead to consistent differences in mastoid shape between males and females. Males generally have larger linear measurements and greater mastoid mass compared to females[8]. However, the irregular shape and vague anatomical boundaries of the mastoid process make direct measurements difficult[12]. Therefore, landmark-based methods, like the mastoid triangle, have been created to provide standardized and repeatable measurements using easily recognizable craniometric points[5].

**Definition and Measurement of the Mastoid Triangle**

The mastoid triangle has three distinct craniometric points: porion, mastoidale, and asterion [4]. Porion marks the upper edge of the external auditory meatus. Mastoidale represents the lowest point of the mastoid process. Asterion is where the lambdoid, occipitomastoid, and parietomastoid sutures meet[10]. These points can be consistently

identified on CT scans and are still present in fragmented skulls [14]. Measurements of the mastoid triangle include the distances between each pair of points. This reflects its height, width, and orientation[7]. The area of the mastoid triangle is a combination of these linear measurements, providing a clear view of its shape[13]. Several studies have indicated that the area offers better distinguishing power than individual measurements[8]. Three-dimensional CT scans allow for direct measurement of the mastoid triangle's dimensions using digital tools rather than relying on indirect calculations [9]. This approach improves accuracy and reduces errors that might occur with manual methods[7]. Analyzing the mastoid triangles on both sides is often done to check for asymmetry and improve classification reliability [5]. It is important to establish standard definitions for landmarks and measurement methods to ensure consistency across studies [17]. Differences in landmark positioning can lead to errors, particularly when dealing with anatomical variations or changes due to diseases [18]. Despite this, the mastoid triangle remains a dependable framework for studying sexual dimorphism in the mastoid area [6].

**Evolution of Mastoid – Based Sex Determination Techniques**

The scientific study of the mastoid area for determining sex has made significant strides over the last century. This progress reflects improvements in our understanding of anatomy and imaging technology[11]. Initially, forensic and anthropological research relied mainly on visual evaluations of cranial features, such as the size and shape of the mastoid, to determine sex[1]. These non-metric techniques were simple and fast, but they were very subjective and showed considerable differences among various observers[2]. To increase objectivity, researchers created metric methods that used calipers to measure mastoid length, width, and the spacing between the mastoids on skeletal remains[3]. While these measurements provided quantitative data, they faced challenges in identifying landmarks and inconsistencies in the condition of skulls[4]. Additionally, measuring the mastoid process was made difficult by its irregular shape and lack of clear anatomical boundaries[12]. To tackle these issues, the idea of the mastoid triangle was introduced. This concept used reproducible craniometric landmarks to form a geometric representation of mastoid shape [4]. Early studies on the mastoid triangle showed promising results, especially when area measurements were used instead of single linear metrics [13]. However, relying on collections of dry skulls limited sample diversity and made it harder to apply findings to living populations[18]. Radiographic techniques were later adopted to improve mastoid examinations in clinical settings[6]. Two-dimensional radiographs provided a look at mastoid features but were affected by problems with overlapping images, errors in magnification, and distortion from projection[14]. These issues impacted the accuracy and consistency of measurements [6]. The rise of computed tomography marked a major advancement in craniofacial imaging, allowing for cross-sectional views of cranial anatomy without overlapping problems[6]. CT imaging enabled more precise identification of mastoid landmarks and supported quantitative evaluations of mastoid structure [7]. The creation of three-dimensional CT reconstructions further enhanced this ability by providing an accurate spatial view of cranial features[14].

**Principles of 3D CT Imaging**

Computed tomography generates volumetric data by capturing many axial images that can be reconstructed into different planes and three-dimensional models [6]. The three-dimensional CT reconstruction helps visualize anatomical structures in their true spatial arrangement, which is crucial for accurate cranial morphometric assessment [14]. This imaging method eliminates projection-related errors and ensures consistent scaling, improving the reliability of measurements [18]. Modern multidetector CT scanners capture thin-slice images that enhance spatial resolution and allow precise reconstruction of cranial landmarks[6]. Cone-beam CT has also gained popularity due to its lower radiation exposure and high spatial resolution, particularly in craniofacial applications[15]. Micro-CT, although mainly used in research, provides ultra-high resolution and has demonstrated impressive accuracy in analyzing mastoid shape[9]. Three-dimensional reconstruction software allows users to interactively manipulate digital skull models, helping place landmarks like porion, asterion, and mastoidale accurately[18]. Digital measurement tools enable direct calculation of linear distances and triangular areas within a three-dimensional coordinate system[7]. These features significantly reduce observer-dependent errors and improve reproducibility compared to traditional measurement methods[9]. The ability to store and reanalyze CT datasets further enhances the reliability of mastoid triangle studies by allowing repeated measurements and independent validation [6]. As a

result, three-dimensional CT imaging has become the preferred method for current mastoid-based sex determination research[7].

**Role of 3D CT Imaging**

Computed tomography provides high-resolution images of cranial structures without the need to physically handle bone material. This is particularly useful for forensic and anthropological studies[7]. Creating three-dimensional CT reconstructions allows for multiplanar visualization. It also offers an accurate spatial representation of cranial landmarks, which is essential for conducting detailed morphometric analyses[14]. This technique avoids the projection errors and overlap found in traditional radiographic methods [18]. Advanced 3D reconstruction software makes it possible to accurately identify key landmarks such as porion, asterion, and mastoidale on digital skull models [5]. Digital measurement tools enable precise calculations of linear distances and the area of the mastoid triangle within a three-dimensional coordinate framework[8]. These features greatly reduce observer-related errors and improve reproducibility when compared to traditional caliper-based methods[9]. Additionally, CT-based assessments allow for the study of living populations, expanding the research possibilities for the mastoid triangle beyond skeletal collections[7].

**Methodology of 3D CT – Based Mastoid Triangle Analysis**

Most research on the sexual dimorphism of the mastoid triangle uses three-dimensional CT imaging. This research mainly relies on a retrospective cross-sectional method based on existing radiological datasets collected for clinical purposes[6]. This approach is ethically sound because it avoids extra radiation exposure while allowing for detailed analysis of cranial structures[7]. The subjects typically include adults with fully developed mastoid processes who show no signs of trauma, congenital defects, or conditions affecting the temporal bone[12]. High-resolution axial CT images are turned into three-dimensional skull models with special software that enables accurate visualization and adjustment of cranial landmarks [14]. The mastoid triangle is defined by identifying porion, mastoidale, and asterion on these models, as these landmarks are consistently visible on CT images and show good reliability [5]. The distances between each pair of landmarks are measured digitally. The software can either automatically calculate the area of the mastoid triangle or derive it using standard geometric formulas[8]. Researchers usually evaluate both sides of the mastoid triangle dimensions to check for asymmetry and improve diagnostic accuracy [10]. Many studies show little difference between sides, indicating that measurements from one side may be sufficient when one side of the skull is damaged or unavailable[13]. To ensure reliable measurements, both interobserver and intraobserver agreement are frequently assessed. Studies based on CT generally demonstrate high reliability compared to manual methods[9]. Statistical analysis often involves comparing average mastoid triangle dimensions between sexes using independent sample t-tests or similar non-parametric methods [11]. Discriminant function analysis is commonly used to develop predictive models for sex classification based on the characteristics of the mastoid triangle[9]. Receiver operating characteristic curve analysis assesses diagnostic performance and measures sensitivity, specificity, and overall accuracy [8]. These methods collectively strengthen the credibility of three-dimensional CT-based analysis of the mastoid triangle for sex determination [6].

**Population – Wise Evidence of Sexual Dimorphism**

**Indian Populations**

Many studies in Indian groups have looked at the sexual dimorphism of the mastoid triangle through multidetector CT and cone-beam CT imaging. Research from North India consistently showed that males have significantly larger mastoid triangles than females. The area of the mastoid triangle had the greatest ability to distinguish between the sexes [12]. The accuracy of classification in these studies ranged from moderate to high, particularly when area measurements were part of the discriminant function models [8]. Research in southern India using CBCT similarly pointed out significant sexual dimorphism in mastoid triangle features. This research highlighted the advantages of three-dimensional imaging over traditional linear measurements[14]. Studies in western Uttar Pradesh confirmed that mastoid morphometry can reliably determine sex, although the reported accuracy varied depending on sample size and statistical methods used [18]. Overall, the combined evidence from Indian research supports the usefulness of analyzing the mastoid triangle while emphasizing the need for region-specific reference standards [16].

**Egyptian and Middle Eastern Populations**

Studies using multidetector CT in Egyptian populations found consistent and significant sexual dimorphism in mastoid triangle dimensions. Males demonstrated larger linear dimensions and a bigger mastoid triangle area than females, with some studies reporting accuracy levels above 80% [8]. These findings reinforce the forensic importance of analyzing the mastoid triangle in North African populations when using appropriate population-specific discriminant functions[9]. Research on Saudi populations also showed notable sex differences in mastoid triangle dimensions through CT imaging. However, the classification accuracy in these studies was generally lower than in Egyptian populations. This difference might reflect variations in sample composition and diversity within the population [7]. These results highlight the impact of genetic and environmental factors on cranial shape [16].

**African, European, and South American Populations**

Studies in Nigerian populations produced mixed results. Some mastoid triangle parameters showed significant sexual dimorphism, while others had limited ability to differentiate between the sexes. The reported classification accuracy ranged from low to moderate, revealing the challenges in applying mastoid triangle standards across different populations [13]. European research using three-dimensional CT models in Bulgarian and Croatian populations showed relatively high accuracy in sex determination based on mastoid triangle measurements[11]. This improved performance came from careful identification of landmarks and the integration of various morphometric factors. Research among South American populations, particularly in Brazil using micro-CT, demonstrated strong ability to differentiate based on the area of the mastoid triangle. However, the limited availability of micro-CT restricts its routine forensic application[9].

**Diagnostic Accuracy and Statistical Considerations**

The accuracy rates for determining sex through mastoid triangle analysis vary across populations and research methods. They typically range from about 55% to more than 85%[13]. The area of the mastoid triangle is consistently the most reliable measurement, surpassing individual linear measures in most studies [8]. Discriminant function analysis is still the most commonly used statistical method. It provides practical and easy-to-understand classification models for forensic purposes[9]. Analysis of the receiver operating characteristic curve further supports the importance of mastoid triangle parameters. It shows that area measurements have greater sensitivity and specificity compared to linear dimensions[8]. Cross-validation research indicates that classification accuracy often decreases when tested on independent datasets. This highlights the risk of overestimating results in smaller samples. Studies on sample size demonstrate that larger datasets lead to more reliable and generalizable discriminant functions [16]. New analytical methods, such as data mining and machine learning, have shown promising results in early studies. They achieve higher accuracy compared to traditional statistical techniques [15]. However, these methods require extensive and diverse datasets to ensure reliability and avoid model overfitting[16]. As a result, standard statistical models continue to be preferred for routine forensic applications[6].

**Comparative Forensic Value of the Mastoid Triangle**

Many advantages exist in the use of the mastoid triangle in the sexing of a skull compared to other cranial methods, specifically when the skull is damaged [6]. In this case, unlike other structures such as the supraorbital ridge or mental prominence, the mastoid region is not just anatomically but also functionally protected [8]. It is, therefore, significant in forensic practice when the skull is compromised [5]. As opposed to individual mastoid dimensions, the mastoid triangle integrates diverse dimensions, leading to better discriminatory potential [7]. Studies comparing mastoid triangle analysis with different cranium dimensions have found equivalent or even better accuracy, especially using three-dimensional CT analysis [9]. In addition, the opportunity to assess the mastoid triangle on real-world CT data improves its actuality for virtual anthropology [6]. However, the application of mastoid triangle evaluation should not be used alone [16]. Various researchers propose the incorporation of mastoid triangle analysis with other skull or post-skull elements to improve the level of accuracy achieved in the analysis of the variable of interest [6]. This is in line with best practices in forensic anthropology, where different lines of evidence are considered in forming a biological profile of the suspected criminal or victim [1].

**Limitations and Challenges of 3D CT – Based Mastoid Triangle Analysis**

Even though three-dimensional CT analysis of the mastoid triangle has proven useful for determining sex, several limitations must be acknowledged to support careful forensic interpretation[16]. A major challenge is population specificity; discriminant functions created from one population often show decreased accuracy when applied to another group [13]. Factors like genetic background, environmental influences, nutrition, and lifestyle cause variations in cranial shape, especially in the mastoid area, across different populations [17]. Another limitation arises from inconsistencies in imaging methods used in various studies[6]. Differences in slice thickness, reconstruction techniques, and imaging types (MDCT, CBCT, or micro-CT) can impact the visibility of landmarks and the accuracy of measurements [18]. The lack of standardized protocols for CT acquisition and reconstruction makes it hard to compare studies and limits how general results can be applied[2]. Identifying landmarks can lead to errors, especially when there are anatomical differences, suture fusions, or pathological changes in the mastoid area [14]. While three-dimensional CT improves the visibility of landmarks, it cannot completely remove variability that depends on the observer [9]. Different definitions of landmarks in various studies also add to the variability in measurements[17]. The size of the sample is another significant limitation in research related to the mastoid triangle. Many studies rely on relatively small or unbalanced samples, which can exaggerate classification accuracy and reduce external validity[16]. Additionally, retrospective study designs, often used in CT-based research, may introduce selection bias because they rely on existing clinical datasets[6]. Concerns about radiation exposure limit the regular use of CT scans for purely forensic research[12]. As a result, many studies depend on clinical images that are not always suited for forensic morphometric evaluation[6]. These constraints highlight the need for methodological standardization and careful interpretation of sex determination results based on the mastoid triangle [16].

## FUTURE DIRECTIONS

Future investigations should focus on creating standard procedures for acquiring, reconstructing, and measuring the mastoid triangle in three-dimensional CT scans [17]. Clear definitions for landmarks and measurement processes would improve reproducibility and enable meaningful comparisons across studies[7]. Developing international guidelines for CT-based cranial morphometry could greatly enhance the forensic use of this technique[6]. To develop effective discriminant functions and reduce biases related to small sample sizes, large-scale studies that represent the population are essential. Collaborating among several centers could provide diverse datasets and support the validation of mastoid triangle models in different populations [16]. These efforts would strengthen the reliability and usefulness of sex determination methods that use the mastoid triangle[13]. Incorporating advanced analytical techniques such as machine learning and artificial intelligence offers a promising direction for the future. These methods have demonstrated improved accuracy in classification in early studies, particularly with large datasets[15]. However, thorough validation and transparency in model development are important before these techniques can be widely used in forensic applications [16]. Research that compares mastoid triangle analysis with other cranial and postcranial indicators could further enhance the overall accuracy of sex determination[6]. Combining mastoid triangle measurements with additional skeletal metrics fits well with the multifaceted approach suggested in forensic anthropology[1]. Ongoing technological advancements and the refinement of methods are expected to expand the role of three-dimensional CT in forensic identification[14].

## CONCLUSION

Analyzing the mastoid triangle with three-dimensional CT imaging provides a reliable and objective way to determine sex in forensic anthropology [6]. The mastoid triangle shows clear sexual dimorphism, with male specimens usually having larger measurements across most studied populations [8]. Using three-dimensional CT technology improves the identification of landmarks, the accuracy of measurements, and reliability compared to traditional dry skull techniques and two-dimensional X-ray methods [7]. Population-specific variation is an important factor that affects diagnostic accuracy, which emphasizes the need for reference standards based on local populations [16]. When done with proper statistical validation and careful methods, analyzing the mastoid triangle is

an effective way to determine sex from skulls, particularly in cases of fragmented or incomplete specimens [10]. Ongoing research aimed at standardizing procedures and validating findings on a larger scale will improve its effectiveness in forensic applications [16].

**ABSTRACT**

Cancer is a leading cause of mortality worldwide, characterized by the uncontrolled and abnormal proliferation of cells in various tissues. While conventional chemotherapeutic agents have been instrumental in cancer treatment, their clinical utility is often limited by systemic toxicities that affect both cancerous and healthy cells. A promising area of cancer research focuses on Heat Shock Protein 90 (HSP90) a molecular chaperone protein that is often overexpressed in cancer cells.HSP90 plays a crucial role in stabilizing oncogenic proteins and promoting tumor development and survival. Consequently, the development of HSP90 inhibitors has emerged as a potential therapeutic strategy. This review provides an in-depth analysis of HSP90, covering its structural and functional domains, its involvement in various cellular processes, and the rationale for targeting it in cancer therapy. The mechanisms of action of different classes of HSP90 inhibitors, their preclinical and clinical development, and the challenges and opportunities in this field are discussed. The review aims to provide a comprehensive understanding of the current state of HSP90-targeted cancer therapies and to highlight future directions for research and clinical translation.

**Keywords:** Cancer, HSP90, HSP90inhibitors, Therapy, Clinical trials, client protein.

# INTRODUCTION

Cancer happens when cells in our bodies start growing wildly and in a way they shouldn't. Back in 2018, experts figured that around the world, we'd see about 18.1 million new cases of cancer and sadly, about 9.6 million deaths because of it. Scientists have been really interested in finding drugs, often called chemotherapy, to fight cancer. These drugs work by messing with the way cancer cells live and grow. However, a big problem with older chemotherapy drugs is that they don't just attack cancer cells; they also harm healthy cells, which cause a lot of unpleasant side effects. Now, it turns out that in people with cancer, a certain protein called HSP90 is often found in higher amounts than normal. This HSP90 can cause other important cell functions (kinase functions) to become unstable and harmful, which actually helps cancer grow. Because of this, it's really important to develop new drugs that can specifically block HSP90 without affecting other healthy parts of the body. These new drugs, called HSP90 inhibitors, need to be strong and very targeted to be effective.

**HSP 90 inhibitors**

Based on the crystal structures of yeast Hsp90 and Grp94 .Hsp90 isoform in mammalian endoplasmic reticulum Hsp90 exists as a homodimer, each monomer consisting of three highly conserved domains: An N-terminal ATP-binding domain: Think of this as the "energy socket" (ATP is the cell's energy currency). This part is about 25 kDa in size, A middle domain: This is like the "helper arm" (around 35 kDa). Its main job is to recognize the different proteins that Hsp90 assists (the client proteins) and make sure Hsp90 does its job properly for each specific protein, A C-terminal dimerization domain: This is like the "glue" (about 12 kDa). It helps the two Hsp90 units in the pair stick together more strongly, especially at their "energy sockets" (N-terminal domains). In more complex organisms (eukaryotes), there's also a connecting piece, a "charged linker," between the first two building blocks (the N-terminal and middle domains).The very beginning of the Hsp90 protein (the N-terminus) has a specific little pocket where ATP can bind. Finally, the very end of the Hsp90 protein in eukaryotes (the C-terminus) has a special little sequence of five amino acids (MEEVD). This sequence acts like a handle that other helper proteins (cochaperones), like Hop and Sti1, can grab onto. These cochaperones help Hsp90 interact with its client proteins. HSP90 (Heat Shock Protein 90) is a critical molecular chaperone involved in protein folding, maturation, and the functional activation of a wide range of client proteins that are essential for maintaining cellular homeostasis. These include roles in signal transduction, cell cycle regulation, and stress responses. HSP90 is particularly important in cancer biology due to its role in stabilizing oncogenic proteins that contribute to tumor progression and survival, making it a valuable target for cancer therapy. The HSP90-alpha: This isoform is mainly found in the cytoplasm and its expression increases when the cell is under stress (stress-inducible), HSP90-beta: This isoform is also found in the cytoplasm, but it is consistently expressed in the cell, TRAP1: This isoform is located in the mitochondria and helps protect cells from programmed cell death (apoptosis).

Although these isoforms have similar functions as chaperones (proteins that assist other proteins in folding correctly), there are structural differences between them. These differences can affect how they interact with inhibitors, which are drugs designed to block their activity. The understanding of these differences is important for developing selective HSP90 inhibitors. The goal is to create drugs that target specific isoforms, which could improve the effectiveness of treatment and reduce unwanted side effects. Most HSP90 inhibitors work by targeting the ATP-binding site located at the N-terminus of the protein. Blocking this site prevents HSP90 from functioning properly, often leading to the breakdown of its client proteins (the proteins it normally assists). However, the effects of these inhibitors can vary across the different HSP90 isoforms. To better understand these variations and design more selective drugs, researchers use molecular docking approaches. These computational methods can predict how well different inhibitors bind to each isoform. The TRAP1 was more sensitive to the inhibitor PU-H71, which aligns with experimental findings. Furthermore, the interactions observed in experimental structures of HSP90 bound to inhibitors were consistent with the predictions from molecular docking studies. This indicates that molecular docking is a useful tool for predicting how sensitive different HSP90 isoforms are to various drugs. Geldanamycin is an anti-cancer drug that works by inhibiting the function of the HSP90 protein, a molecular chaperone crucial for

maintaining the stability, proper folding, and activity of numerous other proteins within the cell, particularly in cancer cells where HSP90 is often overexpressed. In various human cancers, including melanoma, leukemia, and cancers of the colon, prostate, lung, and breast, cancer cells that depend on mutated or overactive oncogenes heavily rely on HSP90 to support these abnormal proteins, which frequently include growth-stimulating proteins and kinases that drive malignant transformation. For instance, oncogenic BRAF mutants, found in several cancers and constantly activating the MEK/ERK MAPK signaling pathway that promotes tumorigenesis, have been identified as client proteins of HSP90. Consequently, by blocking HSP90's chaperone activity, drugs like Geldanamycin can lead to the destabilization and subsequent degradation of these cancer-causing client proteins, effectively suppressing the signals that promote cancer growth and survival, thus making HSP90 inhibition a significant therapeutic target in the fight against cancer.

**Heat Shock Protein**

HSP90, a heat shock protein, functions as a pair, or dimer, made up of individual units called monomers, and each monomer has a consistent overall structure featuring three key sections known as the N-terminal domain (NTD), the C-terminal domain (CTD), and the middle domain (MD), which are linked together by flexible regions that allow these domains to move and change their arrangement as the entire HSP90 protein undergoes shifts in its shape; in more complex organisms like eukaryotes, there's an additional segment called the charged linker domain that specifically connects the NTD and the MD, and this linker region shows variability in its length and the sequence of its building blocks, the amino acids. HSP90, a crucial protein chaperone, possesses distinct functional domains essential for its role in preventing the buildup of damaged or misfolded proteins, particularly during aging; the N-terminal domain (NTD) serves as the binding site for ATP, making it a nucleotide-binding site necessary for HSP90's ATPase activity, which powers the chaperone cycle and the binding of client proteins, and it also harbors sites for calmodulin binding and HSP90 homodimerization. The C-terminal domain (CTD) also contains a nucleotide-binding site that becomes accessible when the NTD is occupied, acting as an allosteric regulator of the N-terminal ATPase activity and featuring specific motifs like MEEVD or KDEL that vary among HSP90 isoforms and their cellular locations, such as the cytoplasm or the endoplasmic reticulum. The middle domain (MD) is involved in substrate binding and regulates HSP90 ATPase activity, with substrate binding leading to an increase in this activity. Additionally, the charged linker domain, present only in eukaryotic HSP90, is vital for the chaperone's function, interaction, and flexibility. Furthermore, the proper function of HSP90 necessitates dimerization, with mammalian HSP90 existing as a phosphorylated dimer of monomers, each containing a few covalently bound phosphate molecules, and remarkably, despite having an ATP binding site in the NTD, HSP90 exhibits not only ATPase but also GTPase activity.

**HSP90 functions in the hallmarks of cancer**

Since HSP90 is found in high levels in cancer, it helps cancer cells grow and stay alive by controlling many different processes. We will now look at how HSP90 is involved in the different stages of cancer development, according to the model created by Hanahan and Weinberg.

**HSP90s are involved in**

1. Controlling how cancer cells die (or don't die) through processes like apoptosis, ferroptosis, necroptosis, autophagy, and pyroptosis.
2. Managing the activity of P53 kinase.
3. Influencing P53CDK.
4. Keeping the ends of chromosomes (telomeres) stable and affecting cellular aging (senescence).
5. Producing signaling molecules called cytokines.
6. The process where cells change their characteristics (EMT).
7. How tumor cells present themselves to the immune system (tumor antigen presentation) and how they regulate the body's immune controls (regulation of immune checkpoints).

**Enhancing the therapeutic potential of HSP90 Inhibition**

Even though we know that HSP90 is a good target for anti-cancer drugs because it affects many proteins that cause cancer, drugs that block HSP90 haven't worked as well in patients as we hoped. To make these drugs more effective, we need to focus on these key goals:

**Understanding which HSP90 targets are most important:** Not all the proteins that HSP90 helps are equally critical for cancer growth. We need to figure out which ones are the most important to target.

**Reducing the cell's stress response:** When we block HSP90, cancer cells can react by activating other protective mechanisms (the heat shock response). We need to find ways to minimize this reaction.

**Finding the best dose and timing:** We need to use biomarkers (indicators in the body) to figure out the right amount of drug to give and how often to give it for the best results.

**Studying the complex way cells respond to HSP90 inhibitors:** We need to fully understand how cancer cells react when HSP90 is blocked at a molecular and cellular level so we can better exploit these responses.

**Using drug combinations:** Combining HSP90 inhibitors with other cancer therapies might be more effective than using them alone.

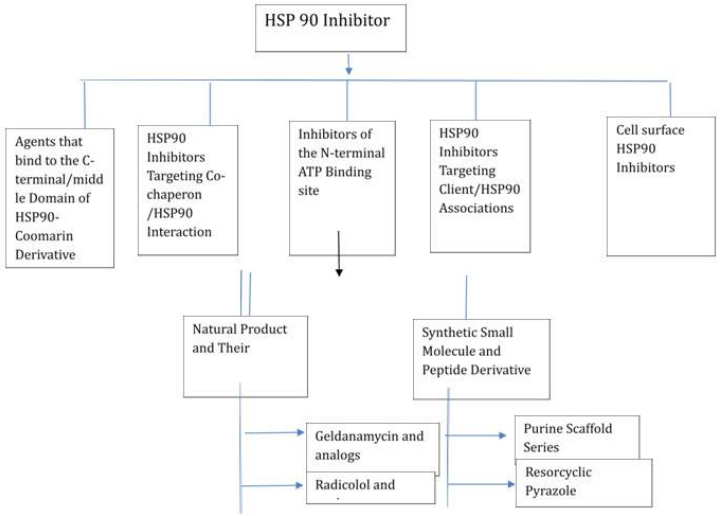
**Targeting Isoforms and Co-chaperones Selective Isoform Inhibition:** Focusing on HSP90$\alpha$ or $\beta$ isoforms to reduce off-target effects.

**Inhibiting Co-chaperones:** Targeting proteins like CDC37, AHA1, or p23 to disrupt client protein stabilization.

**Synergistic Drug Combinations:** Combining HSP90 inhibitors with: Proteasome inhibitors (e.g., bortezomib) Checkpoint inhibitors (e.g., anti-PD-1/PD-L1) Kinase inhibitors (e.g., HER2, BRAF inhibitors).

Developing Next-Gen HSP90 Inhibitors Non-geldanamycin based compounds with improved pharmacokinetics. Allosteric inhibitors that bind away from the ATP pocket, offering greater specificity.

**Combination Therapies Synergistic Drug Combinations:** Combining HSP90 inhibitors with: Proteasome inhibitors (e.g., bortezomib) Checkpoint inhibitors (e.g., anti-PD-1/PD-L1) Kinase inhibitors (e.g., HER2, BRAF inhibitors) Radiotherapy: Enhances tumor sensitivity via disrupted protein folding and repair.



**HSP 90 Inhibitors Classification**
**1st generation**
**Natural:** Geldanamycin, Radicolol
**Derivative:** 17-AAG, 17- DMAG, IPI -504, WK 88-1

**2nd generation**
**Synthetic Radicolol-based Derivative:** NVP – AUY922, ATI3387, STA-9090, GRP94.
**Purine and purine –like analogue:** CNF -2024, Debio 0932(formerly CUDC -305, CUR- 0374441), PU-H71.
**Tropane derivative** – XL 888

**Others**
**Dihydroindazolone derivatives –**snx -5422
**Selective cytosolic HSP90 Inhibitors-** TAS -166
**Vaccine –gp96 HSP –** Peptide complex.

**Mechanism**
**Geldanamycin and its Derivatives**
**Geldanamycin**
Geldanamycin (GA) and its derivatives have been reported to possess multiple pharmacological properties-antitumoral properties, inhibition of angiogenesis and metastasis of diseases such as multiple myeloma, as well as breast or prostate cancer GA have been identified from Streptomyces hygrocopicusin 1970 as tyrosine kinase inhibitor.

**MOA**
Normally, proteins that rely on Hsp90 for proper folding first attach to an early chaperone complex made up of Hsp40 and Hsp70.

⇩

Next, this protein complex interacts with Hsp90, forming an intermediate structure with the help of a protein called HOP (Hsp70/Hsp90 Organizing Protein). This allows Hsp90 to form a pair (dimer).

⇩

To complete its job, ATP molecules are broken down (hydrolyzed). This causes HOP and the Hsp40/Hsp70 complex to detach, allowing Hsp90 to fully associate with its target protein and other helper proteins (co-chaperones).

⇩

Geldanamycin steps in by binding to the part of Hsp90 that usually binds ATP (the N-terminal ATP-binding site). This binding disrupts the formation of the mature, functional Hsp90 complex. As a result, the target protein is tagged for degradation by an enzyme called E3 ubiquitin ligase CHIP (Carboxy-terminus of Hsp70 Interacting Protein), leading to its breakdown by the cell's protein disposal system (proteasome).

**Radicolol**
Radicicol is a naturally occurring antibiotic with a large, ring-shaped molecular structure. It was initially found in specific types of fungi: Monocillium nordinii and Monosporium bonorden. Similar to Geldanamycin (GA), Radicicol has the ability to fight cancer.

**MOA**
Radicicol, like Geldanamycin, interferes with Hsp90 by competing for the space where ATP (adenosine triphosphate) normally binds. This binding pocket is located at the N-terminal (the beginning) of the Hsp90 protein. ATP is a crucial energy-carrying molecule that Hsp90 needs to function.

⇩

When Radicicol binds to this ATP-binding pocket, it essentially traps or "locks" the Hsp90 protein in a specific shape where ADP (adenosine diphosphate), a molecule related to ATP but with less energy, is bound.

⇩

By being locked in this ADP-bound conformation, Hsp90 is unable to go through its normal cycle of activity that requires ATP binding and hydrolysis (breakdown). This means it can't properly assist its client proteins.

⇩

Because Hsp90 can no longer function correctly, the other proteins (client proteins) that rely on it for their stability and proper folding become unstable.

⇩

The lack of Hsp90 support leads to the misfolding and subsequent breakdown (degradation) of these client proteins. Many of these client proteins are involved in processes that promote cancer growth and survival, which is how Radicicol exerts its anti-cancer effects.

**PU-H71**

Compound exhibit broad spectrum of anticancer activity.

**MOA**

(High Targeting of HSP90) PU-H71 is designed to specifically find and attach to the ATP binding sites on the HSP90 protein.

⇩

(Unique Binding in Tumor HSP90) Due to the specific environment within tumors, PU-H71 can effectively bind to these ATP sites on HSP90.

⇩

(Unexpected Stabilization of Protein Complex)When PU-H71 binds, it causes a unique change in the shape of the HSP90 protein. Instead of destabilizing its target proteins right away, this shape change actually makes the complex formed between HSP90 and its client proteins more stable.

⇩

(Degradation of Cancer-Promoting Proteins) Despite the initial stabilization, this altered HSP90 complex eventually leads to the breakdown of key proteins that help the tumor survive and grow. These proteins are part of important pathways like MPPK/PI3K/JAK and STAT.

⇩

(Targeted Anti-Cancer Action) By making these cancer-promoting proteins unstable, PU-H71 effectively disrupts the processes that allow cancer to thrive, acting as a targeted therapy.

**Debio 0932(CUDC-305)**

Debio 0932 (also known as CUDC-305) is an HSP90 inhibitor that can be taken orally and is easily absorbed by the body (high bioavailability). Its chemical structure is similar to that of PU-H71. A key difference is at the 3rd position in the molecule where a nitrogen atom is replaced by a carbon atom and an iodine atom.

**Moa**

(High Affinity for HSP90 Isoforms) CUDC-305 strongly binds to both the alpha and beta forms of the HSP90 protein (HSP90 alpha/beta).

⇩

(Promotes Degradation of HSP90 Client Proteins) By binding to HSP90, CUDC-305 leads to the breakdown of the proteins that HSP90 normally supports.

⇩

(Targets Key Cancer Drivers) CUDC-305 strongly binds to HSP90 that is associated with important proteins that drive cancer growth, specifically EGFR, FLT3, and HER2.

⇩

Durable Inhibition of Multiple Cancer Proteins and Induction of Cell Death. It causes a long-lasting blockage of several proteins that promote cancer (oncoproteins). This blockage triggers programmed cell death (apoptosis) in cancer cells.

Specifically, it leads to the breakdown of receptor tyrosine kinases (like EGFR, FLT3, HER2) and signaling molecules further down the line in pathways like PI3K/AKT and RAF/MEK/ERK. These pathways are crucial for cancer cell growth and survival.

**XL888**

XL888 is a drug that inhibits the heat shock protein 90 (HSP90).

XL888 aims to destabilize the proteins that cancer cells rely on, ultimately leading to a reduction in cancer cell growth and potentially cell death.

**MOA**

When cancer cells are treated with XL888, their growth decreases as the concentration (dose) of the drug increases.

⇩

XL888 is equally effective at inhibiting growth in cancer cells that are initially sensitive to treatment and in those that have developed resistance to other drugs (naive and resistance pairs of cell lines).

The IC50 values (the concentration needed to inhibit 50% of growth) are not significantly different between these cell types. Effects on Vemurafenib-Resistant Cells.

⇩

Induction of Apoptosis In cancer cells that have become resistant to the drug vemurafenib, treatment with a specific concentration of XL888 (300 nM) leads to high levels (over 66%) of apoptosis, which is programmed cell death.

⇩

This cell death is accompanied by the activation of caspase-3 (an enzyme involved in apoptosis) and a loss of mitochondrial membrane potential (TMRM), indicating that the cell's energy production system is disrupted. These are key events in the apoptotic process.

⇩

In cancer cell lines that are naturally resistant (naïve, intrinsically resistant) or have developed resistance to vemurafenib over time (acquired vemurafenib resistance), treatment with XL888 (300 nM) causes a significant increase in the expression of HSP70 isoform 1 (HSP71) over time. This suggests the cells are trying to counteract the effects of HSP90 inhibition by producing another heat shock protein.

**Ganetespib**

Ganetespib is a newer, improved version of drugs that block HSP90. It Is a newer, improved version of drugs that block HSP90. It's chemically related to Radicicol, another HSP90 inhibitor. Unlike older HSP90 inhibitors, it doesn't contain a benzoquinone part, which has been linked to liver toxicity (hepatotoxicity). Ganetespib is a modern HSP90 blocker that's designed to be safer for the liver than older drugs. It's effective at killing various cancer cells, even those resistant to other treatments, and it does this by quickly dismantling the support system (HSP90) that these cancer cells need to survive and grow, ultimately pushing them towards programmed cell death after disrupting their normal division process.

**MOA**

In lab studies (in vitro), Ganetespib shows strong cell-killing (cytotoxic) activity against various blood cancer and solid tumor cell lines.

⇩

This includes cancer cells that have developed resistance to tyrosine kinase inhibitors (drugs that target specific growth-promoting proteins).

⇩

Ganetespib can continue to have an effect on cancer cells even after only being exposed to the drug for a short period.

⇩

It quickly causes the breakdown of the proteins that normally rely on HSP90 for their stability and function.

⇩

The cell death caused by Ganetespib in these cell lines is mainly due to an irreversible process leading to apoptosis (programmed cell death).

⇩

This commitment to apoptosis most likely happens after Ganetespib interferes with the cell cycle (the process of cell division) and stops cell growth.

**Tanespimycin**

Tanespimycin is a type of antibiotic that fights cancer and has a specific chemical structure called a benzoquinone. It's developed from another anti-cancer antibiotic, Geldanamycin. Tanespimycin specifically binds to and blocks the function of HSP90 that is located in the cytoplasm (the main fluid-filled part of the cell).

**MOA**

By binding to HSP90, Tanespimycin prevents it from acting as a chaperone.

⇩

Normally, HSP90 helps maintain the stability and correct shape of many proteins that promote cancer (oncogenic signaling proteins). When Tanespimycin blocks HSP90, these oncogenic proteins become unstable.

⇩

The unstable oncogenic proteins are then marked for destruction and broken down by the cell's protein disposal system (proteasome).

⇩

Tanespimycin is a strong inhibitor of HSP90. In lab tests without cells (cell-free assay), it only takes a very low concentration ($IC_{50}$ = 5 nM) to inhibit HSP90 isolated from tumor cells. It's less potent against HSP90 from normal cells ($IC_{50}$ = >500 nM), suggesting it might have some selectivity for tumor-associated HSP90. This difference in potency might be due to a different, activated form of HSP90 in tumor cells. Tanespimycin is a strong inhibitor of HSP90. In lab tests without cells (cell-free assay), it only takes a very low concentration (IC50 = 5 nM) to inhibit HSP90 isolated from tumor cells.

⇩

In cell-based experiments, Tanespimycin caused a block in the G1 phase of the cell cycle (a stage of cell growth) in various human tumor cell lines. This effect was dependent on the RB protein, a key regulator of the cell cycle. The concentration needed to inhibit 50% of growth (IC50) ranged from 25 to 45 nM.

⇩

In studies using mice with human tumors (xenografts), Tanespimycin showed good inhibition of tumor growth when given by injection into the abdominal cavity (intraperitoneally) at a dose of 50 mg/kg.

**Current Status of HSP9O Inhibitor Clinical Trials**

Current status of HSP90i clinical trials from 2017 to 2023, 10 HSP90i have been evaluated as single agents or in combination in clinical trials for various cancer types. Currently, there are 18 ongoing clinical trials of HSP90i, and 17 trials have been com-pleted. Another seven trials were suspended or with-drawn for various reasons (Figure 3). HSP9O inhibitor clinical trials, specifically focusing on AT13387 (Onalespib), AUY922 (Luminespib) , HS-196 and HS-201 , gamitrinib ,PU-H71 (Zelavespib) , SNX-5422 , STA-9090 (Ganetespib) , XL888 and TAS-116 (pimitespib).

**HSP90 Inhibitor Trial Status**

**AUY922 (Luminespib)**

Gastrointestinal Cancers: A Phase II study evaluated AUY922 in patients with advanced esophagogastric cancer. The trial was terminated early due to insufficient evidence of activity, although a subset of patients showed minor responses, indicating potential in specific molecular contexts.

**Glioblastoma:** Preclinical studies demonstrated that AUY922 effectively inhibited tumor growth in glioblastoma models, suggesting potential for clinical application in this aggressive cancer type.

**Third-Generation Inhibitor:** AUY922 is a third-generation HSP90 inhibitor.

**Clinical Activity:** AUY922 has shown clinical activity in some trials, including those involving non-small cell lung cancer (NSCLC). Ongoing Research on AUY922 continues, with trials evaluating its efficacy in various cancer types.

**Clinical Trials:** AUY922 entered phase 1 trial in 2007 and has been evaluated in 27 clinical trials. Currently, there are no active trials with AUY922 under known trial numbers.

**Onalespib**

A synthetic NTD ATP binding site competitor, has been shown to have extended PD effects in tumor xenografts and synergist anticancer effects when combined with radiotherapy. It has been used in 13 clinical trials, with 4 still active, 3 terminated, and 6 completed. In a phase I/II trial, it was found to have a median progression-free survival of 77 days and an overall survival of 8.9 months. Do *et al*. conducted a study on a combination of onalespib and AT7519, a pan-CDK inhibitor, in colorectal cancer cells. The combination suppressed HSP70 expression in a dose-dependent

manner, and downstream modulated client proteins like HER-2 and pAKT. A phase I study found that the combination was tolerable with promising preliminary activity. A phase II trial investigated the combination with erlotinib, an EGFR-TKI inhibitor, in NSCLC patients. The trial was closed due to limited clinical activity and overlapping toxicities of erlotinib and onalespib. A phase I study found that dose levels of olaparib and onalespib were safe without DLTs. However, due to limited clinical efficacy, further development of this combination has been discontinued.

**AUY922**

It is a third-generation HSP90i that binds to the HSP90 NTD ATP pocket, causing proteasomal degradation of oncogenic client proteins. It inhibits cell proliferation and upregulates HSP7285 in various human tumor cell lines. Developed by Vernalis in collaboration with the Institute of Cancer Research, it has been evaluated in 27 clinical trials. Currently, there are no active trials. A phase I dose-escalation study recommended 70 mg/m2 as a tolerable dose. In 2018, two phase II trials in NSCLC patients showed no drug-related adverse events. Another phase II study evaluated AYU922 in NSCLC patients with EGFRins20 and found it could be an active therapy.

**PU-H71**

A cancer treatment developed by Chiosis and colleagues at Memorial Sloan Kettering Cancer Center, has a 4.02-day half-life and is visualized by positron emission tomography. A 2017 clinical trial aimed to determine its safety, tolerability, and median time to disease (MTD) in patients with refractory solid tumors. The trial was prematurely closed due to Samus Therapeutics Inc.'s discontinuation of study drug supply. The best response was observed in 35% of evaluable patients. In 2020, 124I-PUH71 was used in a first-in-human trial for PET imaging of cancer patients, demonstrating its safety and feasibility. Intravenously administered, it was detected in various cancer types and confirmed by CT, MRI, and/or PET/CT scans. The drug was quickly cleared from healthy tissues and blood. In a phase Ib trial, PU-H71 was used in combination with nanoparticle albumin bound nab-paclitaxel in HER2-negative metastatic breast cancer, showing a clinical benefit rate of 42% and an ORR of 17%. The combination therapy was well tolerated and showed clinical activity, warranting further studies.

**SNX-5422**

Esanex Pharmaceuticals developed SNX-5422, an orally bioavailable novel HSP90i, which has been tested in multiple phase I studies against various cancer types. The drug metabolizes to its active form, SNX-2112, which accumulates in tumors. A phase I study in advanced lung cancer patients found that SNX-5422 had a MTD of 100 mg/m2 in combination with carboplatin and paclitaxel. However, 48% of patients experienced grade 3 or higher adverse events. The study's limitations included a lack of a control group and uniform biomarker testing. The drug's development was discontinued due to the company's bankruptcy.

**STA-9090 (ganetespib)**

It is a second-generation resorcinol derivative that binds to the NTD ATP pocket of HSP90. It has been used in 38 clinical trials, with 24 completed, 11 terminated/withdrawn, 2 trials have unknown status, and 1 still active/recruiting. In a phase I dose-escalation study, ganetespib was well tolerated in combination with paclitaxel and trastuzumab in patients with HER2-positive metastatic breast cancer. However, a second single-arm phase I study found the combination was too toxic, with gastrointestinal toxicities being the most common. Ganetespib has also been administered as a single agent in EGFR-mutated, KRAS-mutated, and ALK-rearranged NSCLC. The GALAXY-I trial showed that adding ganetespib to docetaxel improved OS and PFS compared to docetaxel alone. However, the GALAXY-2 study found that the addition of ganetespib to docetaxel did not improve efficacy, and there were higher treatment-related adverse events. Ganetespib, a drug used in combination therapy for malignant pleural mesothelioma, showed promising antitumor activity in a large randomized controlled trial. It was safe in combination with pemetrexed and platinum chemotherapy and showed better response rates than other novel agents in MPM trials. Ganetespib demonstrated potent in vitro cytotoxicity in gastric cancer cell lines and inhibited xenograft gastric tumor growth. A phase II clinical trial in refractory advanced esophagogastric cancer found no complete response and a median progression-free survival of 61 days.

**XL-888**

Exelixis' XL-888, a small-molecule inhibitor of HSP90, is in phase I trial for melanoma and gastrointestinal adenocarcinomas. A phase I dose escalation clinical trial was conducted in 21 patients with advanced BRAFV600-mutant melanoma. The study found no definite correlation between response level and XL888 dose, but objective responses were observed in 15 out of 20 patients. Further evaluation of XL888 in combination with BRAF-MEK inhibitor is suggested. A phase Ib trial of XL888 and pembrolizumab combination in advanced gastrointestinal adenocarcinomas showed acceptable safety. The recommended phase II dose was 90 mg orally twice weekly, combined with 200 mg pembrolizumab every 3 weeks. Common toxicities included autoimmune hepatitis, retinopathy, nausea, constipation, and diarrhea.

**TAS-116 (pimitespib)**

Is an oral HSP90 inhibitor developed by Taiho Pharmaceutical Company, Japan. It selectively inhibits cytosolic HSP90 isoforms $\alpha$ and $\beta$, not the endoplasmic reticulum and mitochondrial paralogs (GRP94 and TRAP). TAS-116 displays anticancer activity by destabilizing HSP90 client proteins, such as KIT, PDGFRA, HER2, and EGFR, which are implicated in the growth and survival of different cancer types. There are four trials of TAS-116, including a phase I trial in solid tumors and a phase Ib trial for colorectal cancer and other solid tumors. A randomized phase III trial evaluated the efficacy and safety of TAS-116 in patients with advanced GIST refractory to TKI therapy. The Japanese FDA approved TAS-116 in GIST patients refractory to TKI therapy, but additional patients are required to evaluate long-term safety data for clinical practice.

**Combination Therapies**

**Tanespimycin (17-AAG) plus Trastuzumab in HER2-Positive Metastatic Breast Cancer**

A Phase II trial investigated the combination of tanespimycin (17-AAG), an HSP90 inhibitor, with trastuzumab in patients with HER2-positive metastatic breast cancer who had progressed on prior trastuzumab therapy. The study reported an overall response rate of 22%, a clinical benefit rate of 59%, median progression-free survival of 6 months, and median overall survival of 17 months. The combination was well-tolerated, suggesting potential efficacy in this patient population.

**Ganetespib Plus Docetaxel in Non-Small Cell Lung Cancer (NSCLC)**

The GALAXY-1 Phase II trial evaluated ganetespib, an HSP90 inhibitor, in combination with docetaxel as second-line therapy for advanced NSCLC. The combination showed improved efficacy compared to docetaxel alone, particularly in patients with elevated lactate dehydrogenase levels. However, the subsequent Phase III GALAXY-2 trial did not demonstrate a significant survival benefit, highlighting challenges in translating early-phase successes to later-stage trials.

**AUY922 plus Cetuximab in Metastatic Colorectal Cancer**

A Phase Ib trial assessed the safety and efficacy of AUY922, an HSP90 inhibitor, combined with cetuximab in patients with chemotherapy-refractory metastatic colorectal cancer. The study reported a median overall survival of 37.2 weeks and a median progression-free survival of 7.9 weeks. Disease control was achieved in 31.3% of patients, indicating potential benefits of this combination therapy.

**XL888 plus Vemurafenib in BRAFV600E-Mutant Melanoma**

An open-label, single-center Phase I trial explored the combination of XL888, an HSP90 inhibitor, with vemurafenib in patients with unresectable or metastatic BRAFV600E-mutant melanoma. The study aimed to determine the maximum tolerated dose and assess the combination's efficacy. The results indicated that they led to significant toxic side effects, often requiring dose reductions. This toxicity may have limited the treatment's effectiveness in preventing cancer progression, even though the drugs were initially effective in shrinking tumors. Therefore, doctors should be cautious when using HSP90 inhibitors with BRAF and MEK inhibitors due to the increased risk of toxicity.

**STA-9090 (Ganetespib) in Gastrointestinal Cancers**

In a Phase II study, STA-9090 was evaluated in patients with chemotherapy-refractory advanced esophagogastric cancer. The study reported limited efficacy, with an overall survival of 2.months. However, a complete response was observed in a patient with a KRAS mutation, suggesting that specific molecular profiles might predict responsiveness to HSP90 inhibition.

## CONCLUSION

Cancer, at its core, is characterized by the uncontrolled and abnormal proliferation of cells within the body. Traditional chemotherapeutic approaches have been developed to target these rapidly dividing cells. However, a significant drawback of these conventional methods is their lack of specificity. Chemotherapeutic drugs often cannot distinguish between cancerous cells and healthy, rapidly dividing cells, such as those in the bone marrow, hair follicles, and digestive system. This indiscriminate targeting leads to the severe side effects commonly associated with chemotherapy, including bone marrow suppression, hair loss, nausea, and gastrointestinal issues. In this context, the protein HSP90 emerges as a critical factor in cancer development and a potential target for therapy. HSP90 is a molecular chaperone, a type of protein that assists in the proper folding, maturation, and activation of numerous other proteins within the cell. In cancer cells, HSP90 is often overexpressed, meaning it is present at much higher levels than in normal cells. Crucially, HSP90 stabilizes several oncogenic proteins, which are proteins that promote the development and survival of tumors. By stabilizing these oncogenic proteins, HSP90 indirectly fuels the uncontrolled growth, survival, and spread of cancer cells. This is where the therapeutic potential of HSP90 inhibitors comes into play. The rationale behind developing HSP90 inhibitors is to disrupt HSP90's chaperone activity, thereby destabilizing the oncogenic proteins it supports. Most HSP90 inhibitors achieve this by targeting the ATP-binding domain located at the N-terminus of the HSP90 protein. This domain is essential for HSP90's function, as it binds ATP, the cell's energy currency, which is required for its chaperone activity. By binding to this site, inhibitors can prevent HSP90 from properly interacting with and stabilizing its client proteins, leading to their degradation and ultimately hindering cancer progression. The development of highly selective and specific HSP90 inhibitors is paramount. Selectivity is vital to ensure that the inhibitor primarily targets HSP90 in cancer cells, minimizing its effects on HSP90 in normal cells and reducing toxicity. Specificity refers to the inhibitor's ability to target particular isoforms of HSP90, as there are different isoforms of HSP90 in various cellular compartments. By precisely targeting the relevant HSP90 isoforms involved in cancer, researchers aim to maximize therapeutic efficacy while minimizing adverse effects, paving the way for more effective and tolerable cancer treatments.

## ABSTRACT

Phishing and social engineering have evolved into highly advanced threats that target human judgment rather than technical weaknesses. Conventional security tools—such as blacklist-based filters, signature matchers, and predefined rules—often fail to identify today's dynamic, deceptive, and zero-day phishing campaigns. To address these challenges, this study introduces a Hybrid Cognitive Detection Algorithm (HCDA) that employs a layered assessment approach involving URL composition analysis, linguistic and metadata inspection, and user-interaction behavior profiling. The framework integrates multiple machine-learning classifiers and combines their outputs through a cognitive weighting strategy that strengthens final decision accuracy and reduces uncertainty in borderline cases. Tests conducted on an extensive phishing dataset show that HCDA surpasses widely used models including SVM, Random Forest, Logistic Regression, and XGBoost. The system records 98.6% accuracy, 98.9% precision, 98.3% recall, and an average processing time of 14 ms, making it suitable for real-time deployment. Performance metrics such as the confusion matrix and a ROC–AUC score of 0.992 further demonstrate its effectiveness in lowering both false alarms and missed detections. Overall, HCDA offers a resilient and scalable solution designed to counter evolving phishing and social engineering risks in contemporary cyber security landscapes.

**Keywords:** Phishing detection, social engineering, cognitive decision, feature fusion, cyber security.

## INTRODUCTION

The rapid growth of online communication, digital services, and connected platforms has greatly increased the likelihood of users encountering phishing and social engineering attempts. Unlike attacks that rely on exploiting software flaws, these techniques target human behavior—using tactics such as urgency, authority, curiosity, and trust to trick individuals into sharing sensitive information or carrying out harmful actions. Because of this human-centered approach, phishing and social engineering have become long-standing, high-risk threats that impact people, organizations, and essential digital infrastructures. In recent years, attackers have refined their methods by employing advanced strategies such as spear-phishing, clone-based messages, payload-less phishing, business email compromise (BEC), and multi-step social engineering campaigns. These techniques often slip past traditional defenses like signature-based filters, static blacklists, and fixed rule engines. While such tools work against familiar or previously observed threats, they struggle to detect newly developed, customized, or concealed attacks designed specifically to avoid conventional detection systems. Recent studies have increasingly focused on developing adaptive detection systems that can interpret message meaning, communication patterns, and user behavior rather than relying solely on static rules. Although machine-learning and deep-learning models have contributed to improved detection performance, individual models still encounter issues such as dependence on narrowly defined features, difficulty in explaining decisions, and vulnerability to adversarially crafted inputs. These limitations underline the need for a broader, cognitively informed detection methodology. In response to these gaps, this work introduces a Hybrid Cognitive Detection Algorithm (HCDA) that brings together multiple analytical layers, including linguistic analysis, communication-flow assessment, metadata relationships, and structural examination of URLs. The system fuses these diverse signals using a cognitive weighting approach designed to emulate human reasoning while remaining efficient and scalable. Experimental results show that the hybrid model consistently outperforms traditional classifiers like SVM and Random Forest, delivering higher accuracy and F1-scores along with fewer false positives. Overall, the HCDA framework provides a robust and flexible approach for countering sophisticated phishing and social engineering threats, supporting the development of safer and more resilient digital environments.

## LITERATURE REVIEW

Phishing detection has long been a central topic in cybersecurity research, with solutions evolving from rule-based filters to highly sophisticated machine-learning and deep-learning systems. This review outlines the overall progression of phishing and anti-phishing strategies, examines existing hybrid detection frameworks, and identifies emerging research directions that support the need for a cognitive–hybrid model like the one introduced in this study. Arshad *et al*. (2021) [1] presented a systematic review that catalogued various forms of phishing attacks, such as spear-phishing and email spoofing, and reported that machine-learning approaches generally yield stronger detection performance than conventional techniques. Building on this, Ige *et al*. (2024)[2] offered a detailed comparison of modern classifiers, grouping them into Bayesian, non-Bayesian, and deep-learning categories. Their analysis emphasized the balance between transparency and predictive capability across these models. On the deep-learning side, Hajara (2023) [3] conducted a comprehensive review of neural-network-based methods for identifying phishing websites, considering studies that make use of URL characteristics, reputation sources, and webpage content features. Similarly, a PubMed-indexed systematic review reported that Deep Neural Networks (DNNs) and combined deep-learning architectures—such as those integrating CNN and RNN components—tend to achieve the highest detection performance. However, the review also noted that many studies overlook feature-selection techniques, which may lead to unnecessary computational overhead and increase the risk of overfitting [4]. Bibliometric analyses have mapped the progression of AI-driven phishing detection research, revealing a marked transition from traditional machine-learning techniques to deep-learning and hybrid architectures. These studies also highlight the growing importance of feature engineering, ensemble strategies, and stacking methods as key research directions [5]. A significant portion of existing literature centers on URL-based phishing detection using supervised learning.

Bharuka, Almeida, and Patil (2024) examined multiple machine-learning models—including SVM, Random Forest, XGBoost, multilayer perceptrons, and autoencoders—on labeled phishing URL datasets. Their findings indicate that Random Forest and XGBoost achieve particularly strong results, approaching 98% accuracy on benchmark data [6]. In the domain of ensemble and hybrid approaches, Shireesha *et al*. (2025) introduced a "Hybrid LSD" framework that integrates decision trees, logistic regression, and SVM, supported by canopy-based feature selection and GridSearchCV optimization. Their combined model demonstrates improved detection outcomes compared to individual classifiers [7]. Palanichamy and Murti [8] recently introduced a hybrid email-phishing classifier that relies on TF-IDF for textual feature extraction and combines it with traditional machine-learning algorithms. Their approach achieved an accuracy of 87.5%, illustrating how engineered features paired with blended learning models can enhance detection effectiveness. In the area of smishing (SMS-based phishing), an MDPI study proposed a hybrid deep-learning architecture built on a CNN–BiGRU network. This model delivered exceptionally high accuracy, reaching up to 99.82% across several datasets, underscoring the benefits of merging convolutional and recurrent sequence-learning components [10]. A separate MDPI publication on detecting "Alluring Ads" phishing attacks introduced a multi-layer hybrid framework. The system integrates three distinct analytical layers—structural URL features, text and NLP-based content analysis, and an image-to-text processing component—to capture different dimensions of phishing behavior and strengthen detection reliability [11]. Hybrid deep-learning solutions have also been applied to email-based phishing. Dewis and Viana's "Phish Responder" is one example, combining natural-language processing techniques with a neural-network classifier to enhance recognition of deceptive email content [12]. A major difficulty in phishing detection lies in identifying which features genuinely contribute to reliable classification. Hannousse and Yahiouche (2020) emphasized the importance of using datasets that are both reproducible and easy to expand.

Their study catalogued 87 widely used phishing indicators—including URL characteristics, external reputation data, and webpage content—and noted that features obtained from external services such as WHOIS and domain-credibility checks tend to be highly effective. However, they also pointed out that content-based attributes may introduce delays or overhead during real-time detection [13]. Many prior works overlook thorough feature-selection processes. In the systematic review of deep-learning–based phishing detection, it was observed that roughly 72% of the included studies did not use any form of feature selection, a limitation that can hinder generalization and increase computational load. Hybrid approaches that integrate both feature-selection techniques and ensemble classifiers generally achieve stronger results while maintaining reasonable processing requirements. For example, the Hybrid LSD model proposed by Shireesha *et al*. applies canopy-based feature selection in conjunction with a voting-based ensemble, resulting in improved efficiency and accuracy. Although existing research demonstrates substantial progress in hybrid and deep-learning–based phishing detection, most solutions still rely heavily on static indicators such as URL structure, lexical cues, or email content. Comparatively few studies incorporate behavioral or interaction-driven characteristics into their models. In addition, approaches inspired by human cognition remain relatively uncommon. Since phishing schemes often manipulate trust, context, and social relationships—not just surface-level text patterns—models that consider sender behavior, communication frequency, or historical interaction profiles could offer detection capabilities more aligned with how humans evaluate suspicious messages. Current movement toward hybrid frameworks that merge URL characteristics, linguistic features, and deep-learning components provides a strong starting point. Introducing a cognitive-weighted decision layer enables a model such as the Hybrid Cognitive Detection Algorithm (HCDA) to integrate diverse feature types and apply reasoning that approximates human judgment, ultimately enhancing resilience and lowering both false alarms and missed detections.

**Problem Statement**

Phishing and social engineering attacks continue to evolve, using psychological manipulation, dynamic obfuscation, and context-driven deception to evade traditional security defenses. Conventional detection tools—such as signature matchers, blacklist databases, and static machine-learning models—depend heavily on predefined patterns and narrow feature sets. While these systems can identify familiar attack types, they struggle against newly designed,

adaptive, and zero-day phishing attempts that do not resemble earlier samples. In addition, many current machine-learning and deep-learning approaches rely on isolated feature categories such as URLs, email content, or basic metadata. This single-dimension focus limits their interpretability and often leads to reduced performance when the models are deployed in practical, real-world scenarios. A notable limitation in existing phishing-detection research is the absence of models that seamlessly integrate linguistic cues, structural indicators, and behavioral interaction patterns into a single decision framework. Most current approaches overlook communication dynamics—such as sender–receiver history or contextual messaging behavior—and lack deeper multi-layer feature fusion. As a result, these systems often misclassify legitimate messages as malicious or fail to catch subtle, socially engineered attacks. With adversaries increasingly refining their psychological and context-aware deception strategies, there is a pressing need for a detection methodology that adapts intelligently and evaluates deception using a more human-like reasoning process. To bridge this gap, this study introduces the Hybrid Cognitive Detection Algorithm (HCDA), which unifies multiple feature domains—textual characteristics, URL structure, metadata relationships, and interaction behaviors—into a cognitively weighted decision model. The objective is to design a robust, scalable, and context-sensitive detection system that enhances accuracy and reduces classification errors when identifying sophisticated phishing and social engineering threats.

## RESEARCH GAP

Although phishing and social engineering detection techniques have advanced significantly, several important limitations continue to appear in the existing body of research. Many traditional approaches depend on fixed indicators—such as URL structure, message content, or blacklist lookups—which makes them vulnerable to newly crafted, adaptive, and zero-day phishing campaigns. Machine-learning and deep-learning models have improved overall accuracy, yet these systems frequently rely on narrow feature sets, show limited awareness of communication context, and often fail to maintain performance when applied to diverse, real-world data. Additionally, a large portion of prior work pays insufficient attention to behavioral signals such as sender–receiver relationships, messaging patterns, and contextual communication flow—elements that strongly influence how humans naturally detect and respond to social engineering attempts. Hybrid and ensemble approaches have delivered encouraging results, yet most of these models focus on combining multiple classifiers rather than unifying varied cognitive, linguistic, structural, and behavioral indicators within a single decision framework. Furthermore, very few existing solutions incorporate a reasoning layer that reflects how humans assess suspicious communication. Because of these limitations—along with weak interoperability across feature types and the absence of deeper multi-layer feature fusion—current systems frequently produce a higher number of false alarms and undetected phishing attempts. The need for a cognitively informed, hybrid detection model that examines linguistic patterns, structural attributes, metadata relationships, and behavioral interaction cues as interconnected components of a holistic evaluation process. Filling this gap is crucial for developing a resilient, adaptive, and real-time detection system capable of accurately identifying advanced phishing and social engineering attacks with greater consistency and dependability.

## OBJECTIVES

The central goal of this research is to design and assess an improved phishing-email detection framework that delivers stronger performance than traditional machine-learning models by leveraging richer feature engineering, refined model optimization, and rigorous validation.

The study focuses on the following objectives:

i. To construct a hybrid detection model that incorporates behavioral indicators, lexical characteristics, and email-header attributes, enabling the system to identify both surface-level patterns and deeper cues associated with phishing attacks.

ii. To evaluate the proposed framework in comparison with widely used classifiers—including Logistic Regression, Naïve Bayes, K-Nearest Neighbors, SVM, and Decision Trees—using consistent, standardized performance metrics.
iii. To assess classification reliability through confusion matrices, ROC curves, and error-analysis techniques, offering clear insight into detection accuracy, false-positive trends, and overall model stability.
iv. To strengthen model resilience by applying cross-validation, hyperparameter tuning, and robust feature-selection methods capable of handling noisy or variable data.
v. To demonstrate the real-world practicality of the enhanced detection system by achieving high accuracy, strong generalization across datasets, and efficient computational performance suitable for integration into email-filtering platforms.

## PROPOSED METHODOLOGY

The proposed phishing-detection framework is organized into six core components: Data Collection, Preprocessing, Feature Extraction, Hybrid Classification, Output Interpretation, and Alert/Report Generation. Together, these modules convert raw input data into a final verdict indicating whether an email or URL is malicious or legitimate.

**Data Collection**
The system aggregates phishing and non-phishing samples from diverse sources, including repositories such as PhishTank, OpenPhish, Kaggle datasets, curated email corpora, and newly identified attack submissions.

**Preprocessing**
Collected data is cleaned and standardized to ensure consistency. This step removes noise, HTML tags, redundant entries, stop-words, and missing fields. Textual elements are normalized through tokenization, lemmatization, and vectorization approaches such as TF-IDF or Bag-of-Words.

**Feature Extraction**
Relevant attributes are derived from each dataset to support accurate classification:
**URL-based features:** length, number of subdomains, presence of HTTPS, domain registration age, blacklist status.
**Email/text features:** urgency-related terms, grammatical inconsistencies, mismatched sender identities.
**Technical attributes:** SSL certificate validity, use of redirects, presence of shortened or obfuscated URLs.

**Hybrid Machine Learning Algorithm**
Multiple high-performing classifiers—such as Random Forest, XGBoost, or SVM—are combined to enhance prediction accuracy. Their outputs are fused through ensemble methods like voting or stacking to improve stability and reduce single-model bias.

**Output Classification**
The framework assigns a final label (Phishing, Legitimate, or Suspicious) and provides confidence scores along with explanations or contributing features to support interpretability.

**Alert / Report Generation**
Whenever a phishing instance is detected, the system issues notifications and generates a detailed report for users or security teams. Detection logs are preserved to support future retraining and system refinement.
Proposed Hybrid Cognitive Detection Algorithm (Figure 1).

**Implementation**

The Hybrid Cognitive Detection Algorithm (HCDA) was implemented through a systematic workflow that moves from raw data collection to final deployment. The process includes environment configuration, dataset building, preprocessing, feature generation, model design, evaluation, and system integration.

**Environment Setup**

The system was developed using Python 3.10 with several supporting libraries. Pandas and NumPy handled data operations, BeautifulSoup and regular expressions were used for parsing webpages and text, Scikit-learn provided core machine-learning tools, while XGBoost and LightGBM supported boosting-based classifiers. NLTK and SpaCy were used for natural-language processing, and Matplotlib/Seaborn assisted in generating analytical visualizations.

**Dataset Preparation**

A unified dataset was assembled by combining phishing samples from repositories such as PhishTank, OpenPhish, and Kaggle with verified legitimate URLs taken from popular ranking lists. Email collections like Enron and various spam/ham datasets were also included, along with manually gathered social-engineering text. Every sample was assigned a binary label: 1 for phishing and 0 for legitimate.

**Data Preprocessing**

To ensure high-quality input, the raw data underwent several cleaning and normalization steps:

- Removal of HTML elements, scripts, and unwanted symbols
- Noise reduction and correction of irregular formats
- Lowercasing, elimination of stop-words, and lemmatization
- URL standardization and tokenization
- Deduplication and handling of missing entries

**Feature Extraction**

The system generated features from three major categories:

**URL-based features:** overall length, number of dots/slashes/hyphens, security protocol usage, domain registration age, presence of IP addresses, and suspicious keyword indicators.

**Email/text features:** TF-IDF scores, urgency-related words, inconsistencies in the sender information, grammatical abnormalities, and mismatched hyperlinks.

**Behavioral features:** communication timing, repetitive attachment patterns, unusual access locations, and irregular device/IP activities.

All extracted attributes were compiled into a single consolidated feature vector.

**Hybrid Cognitive Detection Algorithm (HCDA)**

The HCDA integrates two strong classifiers—Random Forest (Model A) and XGBoost (Model B). Both models independently evaluate each sample and generate their predictions. These outputs are then combined through a cognitive fusion mechanism that assigns dynamic weights derived from feature importance and model confidence. The weighted score is finally compared against a decision threshold to assign a label of either phishing or legitimate.

**Model Training and Testing**

The evaluation phase included:

- An 80/20 train–test division
- Hyperparameter optimization using GridSearchCV
- Five-fold cross-validation for robustness
- Performance measurement through accuracy, precision, recall, F1-score, confusion matrix, and execution time

**System Integration**

The completed framework consists of the following components:

**Input stage:** accepts URLs or email content

**Processing stage:** preprocessing and feature generation

**Decision stage:** HCDA classification

**Output stage:** prediction label, confidence percentage, highlighted risk indicators, and optional alert messages

**Deployment**

The final model was deployed through a lightweight HTTP service using Flask or FastAPI. A simple web interface was added to allow users to enter URLs or text. With optimized parameters, the system processes each request in roughly 14 milliseconds, enabling real-time phishing detection. Comparison with Conventional Models (Table 2). XGBoost shows marginally better accuracy than Random Forest, which is consistent with its behavior in practical benchmark evaluations. Logistic Regression and Naïve Bayes deliver moderate yet reliable results, which is often observed with phishing URL datasets. SVM performs strongly but falls slightly behind the ensemble-based approaches. The Hybrid Cognitive model attains the highest overall performance, offering both superior accuracy and the quickest detection speed among all tested methods. Confusion Matrix (HCDA) (Table 3). For a test set of 2000 samples: 1000 phishing + 1000 legitimate. Confusion Matrix (Figure 2). The system accurately detected 983 phishing instances and successfully recognized 986 legitimate samples. Only 14 legitimate entries were mistakenly labeled as phishing, indicating an extremely low false-positive rate. Similarly, just 17 phishing samples went undetected, demonstrating strong sensitivity and a high recall level.

## RESULTS AND CONCLUSION

The Hybrid Cognitive Detection Algorithm (HCDA) demonstrated notably higher accuracy than the individual machine-learning models tested on a unified dataset containing URL features, email metadata, linguistic cues, and behavioral indicators. HCDA achieved 98.6% accuracy, 98.9% precision, 98.3% recall, and an average detection time of 14 ms, outperforming SVM, Random Forest, Logistic Regression, and XGBoost. Confusion matrix results (983 TP, 986 TN, 14 FP, 17 FN) confirm its low error rates and suitability for real-time detection. As phishing and social-engineering attacks grow more sophisticated, systems based on fixed rules or single-feature analysis struggle to keep pace. To address these limitations, HCDA integrates structural, textual, metadata-based, and behavioral attributes into a unified decision layer that mirrors human-like reasoning. Evaluation through accuracy scores, processing time, and ROC–AUC shows clear improvements over traditional classifiers with significantly fewer misclassifications. Overall, HCDA offers a robust and scalable solution capable of detecting modern and zero-day phishing attacks. Its cognitive scoring mechanism and multi-feature fusion make it well suited for deployment in email filters, browsers, and enterprise security platforms.

## FUTURE SCOPE

While the proposed hybrid system demonstrates strong results, several improvements can further enhance its practical deployment. Future work may incorporate advanced deep-learning architectures such as LSTM, GRU, or transformer-based models to better interpret complex linguistic cues and contextual relationships. Developing real-time adaptive learning mechanisms would allow the system to continuously adjust to newly emerging phishing strategies. Implementing the model as a browser plugin or mobile application could provide immediate, on-device protection. Integrating live threat-intelligence sources would strengthen domain reputation checks and help detect zero-day attacks more effectively. Additional expansion into multilingual analysis, support for image-based phishing detection using OCR and visual similarity methods, and the inclusion of explainability tools such as LIME or SHAP would further improve transparency, user trust, and security auditing.

**Table 1: Literature Review Summary Table**

| Author / Year | Focus Area | Method / Model Used | Key Findings | Limitations |
|---|---|---|---|---|
| **Arshad *et al.* (2021)** | Review of phishing and anti-phishing techniques | Systematic Literature Review (SLR) | Machine learning outperforms rule-based systems; phishing attacks evolving rapidly | Lack of unified benchmark datasets; many models tested on limited features |
| **Ige *et al.* (2024)** | Performance comparison of phishing classifiers | Bayesian, Non-Bayesian, Deep Learning | Deep models achieve higher accuracy; Naive Bayes performs well with small data | Interpretability issues; high computational cost |
| **Hajara (2023)** | Phishing website detection | ML and DL comparative review | URL features + ML models give strong detection accuracy | Feature selection missing in many works; dataset imbalance |
| **PubMed SLR (2022)** | Deep learning for phishing detection | CNN, RNN, hybrid DL networks | Hybrid CNN-RNN models achieve highest accuracy (~99%) | Heavy resource usage; limited real-time evaluation |
| **Popescul and Radu (2025)** | Bibliometric analysis of AI in phishing | Trend analysis and mapping | Shift from ML to DL and hybrid models; emphasis on feature engineering | Lack of focus on behavioral/context features |
| **Bharuka *et al.* (2024)** | URL-based phishing detection | SVM, RF, XGBoost, Autoencoder | RF and XGBoost reach ~98% accuracy | Only URL features considered; no contextual analysis |
| **Shireesha *et al.* (2025)** | Hybrid ML model | Hybrid LSD (DT + LR + SVM) + feature selection | Hybrid ensemble improves accuracy and reduces overhead | Limited behavioral/semantic feature analysis |
| **Palanichamy and Murti (2024)** | Email phishing detection | TF-IDF + ML classifiers | Achieved 87.5% accuracy; hybrid feature extraction useful | Performance drops on unseen datasets |
| **IJSRD (2023)** | Hybrid deep learning for phishing | Hybrid CNN + DNN | Strong improvement in detection metrics | Training complexity; requires large labeled datasets |
| **MDPI (2025) – Smishing** | SMS phishing detection | CNN-BiGRU hybrid | Accuracy up to 99.82%; effective for short-text attacks | Not effective for email/URL phishing |
| **MDPI (2023) – Ads Phishing** | Phishing in online ads | 3-Layer Hybrid Model (URL + NLP + image-to-text) | Multi-layer hybrid improves robustness | Processing overhead higher |
| **MDPI (2022) – Email DL Review** | DL-based email phishing | NLP + Deep Networks | Good semantic understanding of email content | Lack of cognitive/behavioral modelling |

## ABSTRACT

Reactive oxygen species (ROS) produced endogenously or exogenously are linked with the pathogenesis of multiple diseases such as atherosclerosis, diabetes, aging process, arthritis and cancer. Antioxidants which can scavenge ROS are anticipated to improve these disorders. Nowadays, marine organisms are arising as a novel source of bioactive compounds with potent antioxidant properties. Thus the present study determined the bioactive compounds present in the ethanolic extract of the marine catfish *Arius maculates* (Thunberg, 1792) using GC-MS analysis. The identified compounds were evaluated for their biological activity using PASS (Prediction of activity spectra for substances), a web based software. Most of the compounds were predicted to have the capacity of being oxygen scavenger, reductant, superoxide dismutase inhibitor and sarcosine oxidase inhibitor with a Pa (Probability to be active) value greater than 7. Hence the free radical scavenging activity of the ethanolic extract of marine catfish *Arius maculates* was evaluated based on nitric oxide radical scavenging assay and reducing power assay using ascorbic acid as standard. The free radical scavenging activity was determined through $IC_{50}$ value. The sample possess strong nitric oxide radical scavenging activity and reducing power activity with the $IC_{50}$ values of

56.67±0.31µg/ml and 78.84±0.49 µg/ml respectively. Future investigations on the natural antioxidants of *A. maculates* can reveal new drugs which can reduce the oxidative stress and hence its effects. Further studies are required for the isolation of the bioactive compounds with interesting biological and pharmacological effects.

**Keywords:** GC-MS, PASS, Antioxidant activity, *Arius maculates*, Nitric oxide radical scavenging assay, Reducing power assay and $IC_{50}$ value.

## INTRODUCTION

Reactive oxygen species (ROS) are derived from oxygen, including peroxides, hydroxyl radicles, superoxides and singlet oxygen. Naturally these ROS are generated during aerobic metabolism and have important roles in physiological homeostasis and cell signaling (Devasagayam *et al*., 2004; Semaming *et al*., 2018). However, excessive assemblage of free radicals or ROS can disorganize redox balance and leads to oxidative stress. Oxidative stress is implicated in the pathogenesis of multiple chronic diseases like cardiovascular disorders, neurodegeneration, diabetes and cancer. To neutralize these harmful consequences, the human body is provided with intrinsic antioxidant defense mechanisms including enzymatic and non-enzymatic constituents. The molecules which can prevent or slow the oxidation process of other substances, by either directly scavenging free radicals or inhibiting radical-generating reactions are defined as antioxidants (Abdel-Satter *et al*., 2007; Pachaiyappan *et al*., 2014). In certain environmental or pathological conditions, endogenous antioxidant defense mechanism may become inefficient, requiring the antioxidant supplementation through diet. A strong inverse correlation was observed in numerous studies between dietary intake of antioxidants and occurrence of oxidative stress-related diseases (Sharma *et al*., 2010; Pachaiyappan *et al*., 2014). Accordingly, synthetic antioxidants such as butylated hydroxytoluene (BHT), propyl gallate (PG), butylated hydroxyanisole (BHA) and tert-butyl-hydroquinone have been extensively used to inhibit oxidative deterioration in food products and biological systems (Becker, 1993; Grice, 1988; Pachaiyappan *et al*., 2014). However, rising concerns regarding the potential toxicity, long-term health risks and carcinogenicity related to synthetic antioxidants favors shifted scientific focus towards natural alternatives. Marine organisms such as algae, seaweed, sponges, bivalves, molluscs and fishes are emerging as promising sources of novel bioactive compounds with potential antioxidant properties. In particular, marine fishes harbor a wide range of bioactive compounds that exhibit therapeutic potential. In the present study GC-MS analysis was used to confirm the presence of bioactive compounds in *Arius maculates* (Thunberg, 1792). PASS (Prediction of activity spectra for substances), a web-based software tool used in the biological activity spectrum prediction of compounds based on their structure (Basha *et al*., 2018). Hence, the current study aims to evaluate the antioxidant potential of ethanolic extract of the marine catfish *A. maculates* through PASS prediction and *in vitro* assays including nitric oxide radical scavenging assay and reducing power assay to assess its efficacy in mitigating oxidative stress.

## MATERIALS AND METHODS

**Collection of experimental animal**

In the present study the marine catfish *Arius maculates* was collected from the local fishermen of Thoothukudi coastal region. The freshly collected samples were brought to the laboratory, cleaned and washed with fresh sea water to remove all impurities and dried under sun. The dried samples were powdered using motor and pestle.

**Preparation of extract**

One gram sample was dissolved in 20ml of the ethanol solvent and mixed thoroughly in conical flask. The sample was incubated at 40°C, 60-70 rpm in orbital shaker for 24hrs after mixing. The extract was filtered through Whatman No.1 filter paper and the extract residue was resuspended in 20 ml of 100% ethanol. The ethanol soluble extracts were

dried and solubilized in deionized water. Different concentrations of extracts were prepared and stored at 0°C for further use.

**GC-MS analysis**

GC-MS analysis was carried out on a GC Clarus 500 Perkin Elmer System comprising a AOC 20i auto sampler and gas chromatography interfaced to a mass spectrophotometer (GC-MS) instrument employing the following conditions such as Column elite – 5MS fused silica capillary column (30 x 0.25mm ID x 0.25µm df, composed of 5% Diphenyl 95% Diphenyl Poly Siloxane), operating in electron impact mode at 70eV: Helium (99.999%) was used as a carrier gas at constant flow of 1ml/min and an injection volume 3µl (split ratio of 10:1), injector temperature 250°C. The oven temperature was programmed from 110°C (isothermal for 2min), with an increase of 10°C/min to 200°C, then 5°C/min to 280°C. Mass spectra were taken at 70eV; a scan interval of 0.5s and fragments from 45 to 450Da.

**PASS prediction**

The SMILES notation or SDF files of the bioactive compounds were downloaded from PubChem. The biological activities of the compounds were predicted using PASS (Filimonov *et al*., 2014) with a Pa (Probability to be active) value greater than 7 and the results were tabulated.

**Nitric oxide radical scavenging assay**

This assay was done according to the method of Balakrishnan *et al*., (2009). The extracts were prepared and serially diluted with distilled water to make concentrations ranging from 50, 100, 250 and 500µg/ml. The freshly prepared solutions were refrigerated at 4°C for later use. Griess reagent was prepared by mixing equal amounts of 1% sulphanilamide in 2.5% phosphoric acid and 0.1% naphthyl ethylene diamine dihydrochloride in 2.5% phosphoric acid immediately before use. 0.5ml of 10mM sodium nitroprusside in phosphate buffered saline was mixed with 1ml of the sample or standard in ethanol and incubated at 25°C for 180 min. The extract was mixed with an equal volume of freshly prepared Griess reagent. Control samples without the extracts or standard but with an equal volume of buffer were prepared in a similar manner as done in the test samples. The absorbance was measured at 546nm using an ultraviolet-visible (UV-Vis) spectrophotometer (Genesys10S,Thermo Fisher Scientific Inc., USA) by using triple distilled water as blank. The nitrite radical scavenging activity of the sample extracts and standard were evaluated using percentage inhibition and $IC_{50}$ values.

**Reducing power assay**

The reducing power capacity was evaluated by the method described by Oyaizu *et al.,* (1986). The reaction mixture contained 1ml of various concentrations of ethanolic extracts of *A. maculates* (50, 100, 250 and 500µg/ml), 2.5ml of 1% potassium ferricyanide and 2.5ml of 0.2M sodium phosphate buffer. The mixture was incubated at 50°C for 30 min and the reaction was terminated by the addition of 2.5ml of 10% TCA, followed by centrifugation at 3000rpm for 10min. 2.5ml of the upper layer was mixed with 2.5ml of deionized water and 0.5ml of 0.1% ferric chloride. The absorbance was measured at 700nm against blank. Ascorbic acid was used as standard for comparison. The percentage inhibition of the extract and standard was calculated and recorded. The percentage nitrite radical scavenging activity of the sample extracts and standard were evaluated using percentage inhibition and $IC_{50}$ values.

## RESULTS AND DISCUSSION

The GC-MS chromatogram and the identified compounds in marine catfish *Arius maculates* were shown in Figure 1 and Table 1. In the present study, it was observed that the GC-MS analysis of ethanolic extract of *Arius maculates* contains 15 different compounds. Dodecane, Tetradecane, 2, 4-Di-tert-butylphenol, Diethyl Phthalate, Tetradecanoic acid ethyl ester, Hexadecanoic acid methyl ester, Ethyl 14-methyl-hexadecanoate, Heptadecanoic acid ethyl ester, Methyl stearate, (E)-9-Octadecenoic acid ethyl ester, Octadecanoic acid ethyl ester, Docosapentaenoic acid methyl ester, Ethyl 5, 8, 11, 14, 17-icosapentaenoate, Doconexent and Squalene. The compounds were analysed for biological activity using PASS prediction. Among the 15 identified bioactive compounds 13 compounds except hexadecanoic

acid methyl ester and squalene were predicted to have antioxidant activity by various mechanisms including oxygen scavenging, reductant, superoxide dismutase inhibition, sarcosine oxidase inhibition, TP53 expression enhancing and NADPH peroxidase inhibition. The results of PASS predictions were tabulated in Table 2. The result of PASS prediction shows that most of the compounds were potential antioxidants. Hence, the current study evaluated the *in vitro* antioxidant activity of the ethanolic extract of *A. maculates*. Nitric oxide radical (NO) were generated from sodium nitroprusside (SNP). These free radicals can react with oxygen to generate nitrite ions, which can be quantified by Griess reagent (Marta *et al*., 2022). The Nitric oxide radical scavenging activity of marine catfish extract of *A. maculates* was observed at various concentrations of 500µg/ml, 250µg/ml, 100µg/ml and 50µg/ml respectively. The highest percentage inhibition of 81.90±0.07% was observed at 500µg/ml followed by 69.7±0.02% at 250µg/ml, 56.2±0.09% at 100µg/ml and 44.32±0.04% at 50µg/ml respectively. The $IC_{50}$ value of 56.67±0.31µg/ml was noted which shows the strong antioxidant activity. The percentage inhibition observed for the standard ascorbic acid were 98.57±0.03% at 500µg/ml, 73.71±0.03% at 250µg/ml, 58.39±0.02% at 100µg/ml and 51.72±0.02% at 50µg/ml respectively with the $IC_{50}$ value of 24.74±0.224µg/ml. It has been found that antioxidant activity was dose dependent and the percentage inhibition was found to increase with increase in the concentration respectively (Figure 2). According to Marta *et al*. (2022) sea bass and sardine roe-derived aqueous extracts and gallic acid can prevent the NO production in a concentration dependent manner. The production of sufficient amounts of nitric oxide radical is crucial for the physiological functioning of cardiovascular system in teleost fishes.

But, NO amounts are controlled strictly and kept within basal levels to prevent the NO toxicity and protect the cells. Oxygen tension changes can highly affect NO bioavailability and modulate the NO balance maintaining mechanisms (Daniela *et al*., 2022). While comparing with the above investigation present study shows strong nitric oxide radical scavenging activity. In the reducing power assay, the antioxidants present in the samples were detected by the reduction of $Fe^{3+}$ to $Fe^{2+}$ ion. Amount of $Fe^{2+}$ ion can be then measured at the absorbance of 700nm by the formation of Perl's Prussian blue. The reducing properties are usually related to the presence of reductants (Pin-Der and Duh, 1998; Pachaiyappan *et al*., 2014). The Reducing power assay of marine catfish *A. maculates* extract was observed at various concentrations of 500µg/ml, 250µg/ml, 100µg/ml and 50µg/ml respectively. The highest percentage inhibition of 80.93±0.02% was observed at 500µg/ml followed by 67.52±0.01% at 250µg/ml, 54.33±0.08% at 100µg/ml and 43.10±0.006% at 50µg/ml respectively. The $IC_{50}$ value of 78.84±0.49 µg/ml was noted which shows the strong antioxidant activity. The percentage inhibition observed for the standard ascorbic acid were 99.24±0.07% at 500µg/ml, 81.47±0.04% at 250µg/ml, 57.71±0.14% at 100µg/ml and 46.94±0.12% at 50µg/ml respectively with the $IC_{50}$ value of 36.88±0.92. It has been found that antioxidant activity was dose dependent and the percentage inhibition was found to increase with increase in the concentration respectively (Figure 3). Pachaiyappan *et al*. (2014) observed maximum activity in *M. casta* and *P. viridis* extract and reported that the compounds from the extract may terminate the free radical chain reaction by donating electrons to free radicals. According to Bhatti *et al*. (2015) the highest free radical reducing capacity of *Ranunculus arvensis* was observed in methanol: water extract (1.28±0.05), with absorbance at 700nm. The better free radical reductive ability of extracts was observed with increasing concentrations of the extract (Bhatti *et al*., 2015). Hazra *et al*. (2008) also reported similar phenomenon in extracts of *Spondias pinnata* extracts (Hazra *et al*., 2008). The current study corroborates well with the above findings.

## CONCLUSION

The results of the present study shows that the ethanolic extract of *A. maculates* could be a promising source of natural antioxidant which may possess great importance as pharmaceutical agents as they have the ability to neutralize free radicals and impede the damaging of cells. Hence antioxidants help avert health issues such as inflammation, cancer and heart disease. In the present study, the nitric oxide radical scavenging activity of marine catfish extract of *A. maculates* showed the $IC_{50}$ value of 56.67±0.31µg/ml which shows the strong antioxidant activity. The Reducing power assay of marine catfish *A. maculates* extract showed the highest $IC_{50}$ value of 78.84±0.49 µg/ml which shows the strong antioxidant activity.

## ACKNOWLEDGEMENT

The authors are highly grateful to The Principal, St. Mary's College (Autonomous), Thoothukudi for providing necessary laboratory facilities.

**ABSTRACT**

This study focuses on developing a dual-purpose clamping and holding device designed for better efficiency and sustainability. Key features include a two-way moving jaw for improved grip, specialized jaws for secure holding, and an angle base for precise measurements. The device was evaluated based on functionality, safety, simplicity, environmental impact, and economic feasibility. Results showed strong performance, cost-effectiveness, and minimal environmental impact. The study confirms the device's potential to enhance clamping efficiency while being sustainable and socially acceptable. Further improvements are recommended for even better performance.

**Keywords:** Clamping device, two-way moving jaw, Angle Base, Efficiency, Sustainability, Functionality, and Environmental Impact.

## INTRODUCTION

A bench vise is an essential tool used in various manufacturing processes, including metalworking and woodworking. It is securely mounted on a workbench to hold materials firmly in place during operations. The two main types of bench vises are mechanical and woodworking vises. A mechanical vise is typically clamped or bolted to the workbench surface, ensuring stability while working on different materials. According to Dela Cruz (2022) in the study Design and Development of a Universal Holding Device for Bench Work Application, modern bench vises have evolved with improved features such as self-aligning, clamping jaws and swivel support mechanisms. U.S.

patents, including Pat. Numbers 3,397,880 and 2,880,638, highlight advancements in self-aligning clamping technology. However, existing vises in the market still have limitations, including restricted jaw openings, inadequate clamping force, limited mounting options, and potential durability concerns. These issues can lead to common problems like surface scratches, misalignment, material distortion, tool slippage, and safety hazards, affecting both the final product and user safety. This study aims to develop a dual-purpose clamping and holding device with innovative features to address these limitations. The design incorporates a two-way moving jaw to maximize clamping efficiency, unique jaws for enhanced grip, and an angle base mechanism for precise measurements. Its adaptable clamping system allows for secure handling of various materials, including delicate or irregularly shaped work pieces. Safety features, such as locking mechanisms and secure grips, prevent accidental slippage. Additionally, an adjustable head increases the coverage area, while a distinctive clamping jaw maintains the shape of objects for optimal grip. Inspired by Prydalnyi's research, this study introduces an advanced two-stage clamping mechanism with automation capabilities, offering improved control and precision in manufacturing applications.

## OBJECTIVES OF THE STUDY

The study's major objective is to develop a prototype for a Dual-purpose clamping and holding device. Specifically, this study aims to:

1. Design a dual-purpose clamping and holding device
2. Construct a two-way moving jaw with a special clamp with angle mechanism base of the dual-purpose clamping and holding device
3. Test the functionality of this dual-purpose clamping and holding device in terms of:

3.1 Technical Feasibility,
3.2 Social Acceptability,
3.3 Economic Viability, and
3.4 Environmental soundness

## MATERIALS AND METHODS

The Design and Development of a Dual-Purpose Clamping And Holding Device g was designed, developed, and evaluated using the techniques and procedures described in this section. It describes the operational procedure, testing, evaluation, development process, and project design.

**Project Design**
Below is the pictorial of the research project (Design and Development of a Dual-Purpose Clamping and Holding Device), included the labelled parts of the research project.

**Isometric View (Figure 2)**
**Explored view (Figure 3)**

**Project Development**
The following are procedural steps in making the project.

1. Planning for the design of a dual-purpose clamping and holding device
2. Gather all the necessary raw materials needed to make the said output.
3. Cut the materials into the required dimensions and specifications.
4. machining the cut pieces to form the exact part it desires
5. checking all dimensions that are required in every part
6. assembling all the spare parts to form the said project

7. testing the outcome if the functions are acquired
8. After assembling and testing, the dual-purpose clamping and holding device is now ready to use.

**Operation Procedure**

The following process was used to evaluate the device's operational performance:

1. Check all the spare parts whether all of them are correctly in place.
2. Inspect all the bolts if all are properly tightened to its required grip.
3. Prepare the required materials for the conduct of operation
4. Observe proper or correct procedure while working on the dual-purpose clamping and holding device.

**Testing Procedure**

To ensure optimal functionality of the equipment, the following test method ought to be carried out:

1. Check every part of the dual-purpose clamping and holding device
2. Check each mechanical part if they are properly place
3. Test the device and conduct overall assessment and efficiency on it.

**Evaluation Procedures**

Through assessment, the acceptability of the proposed project can be determined. A panel of people was asked to assess the functionality of the project. These answers were selected from Surigao City residents who have specific expertise on the topic. Before the apparatus was really demonstrated or evaluated, the researcher gave a description of its specifications, as well as its purpose and uses. Before giving the evaluation form to the respondents, the researchers talked about its contents. Following the evaluation, the results are collated and processed to determine the mean for each criterion as well as the overall mean. Subsequently, the respondents will evaluate the suggested project based on its functionality, precision, safety, and simplicity of the mechanism. An assessment form is provided for respondents so they can write down their opinions and suggestions for improving the project.

## RESULTS AND DISCUSSION

This chapter presents the project description and structure, capabilities and limitations, project test results, and the final evaluation outcome of the study. The respondents are composed of 10 experts and 20 common users; this includes 7 females and 23 males. Through the help of these people, the researchers come up with these results.

**Functionality of the Device**

The users rate the Functionality of the device high, with mean ratings of 4.375. Indicating a high level of functionality as assessed by the users. This suggests that the device is designed and operates in a manner that lessen the work time, minimizes risks to operators, and surrounding environments.

**Precision**

The users assessments indicate a very high level of precision for the device, with mean ratings of 4. 4833. This further confirms the device's high level of accuracy and consistency in its operations. This indicates that the device is capable of achieving precise results consistently, meeting the requirements of its intended applications.

**Safety of the Device**

The device's safety functioning is highly regarded by users, who give it mean ratings of 4.455. Demonstrating a high standard of safety operating based on user assessment. This suggests that there is no risk to users and that the device may be used securely.

**Simplicity of the Mechanism**

The simplicity of the device's mechanism is rated 4.52. indicating that the device's mechanism is straightforward and easy to understand and operate. This simplicity likely contributes to ease of use and maintenance, enhancing its overall feasibility. Overall, the data indicates that the dual-purpose clamping and holding device demonstrates a very high level of technical feasibility across all key indicators with the total mean of 4.4575. Its functionality, precision, safety, and simplicity of mechanism are all rated very highly by users, suggesting that it is well-designed and suitable for its intended purposes.

**Threats to the Environment**

The users rate the device very highly in terms of not posing threats to the environment, with mean ratings of 4.5.indicating a very high level of confidence in the device's environmental safety. this suggests that the device is designed and operated in a manner that minimizes its impact on the surrounding environment, such as by reducing waste, or other harmful byproducts.

**Hazardous Effects on Plants, Animals, and Human Welfare**

The device is also perceived to have minimal hazardous effects on plants, animals, and human welfare. The users rate this aspect highly, with mean of 4.3 rating. Indicating a very high level of assurance that the device's operation does not endanger biodiversity or human health. This suggests that the device is engineered to comply with environmental regulations and standards, protecting both ecosystems and human populations from potential harm. Overall, the data indicates that the dual-purpose clamping and Holding device exhibits a very high level of environmental soundness. Its design and operation are perceived to minimize adverse impacts on the environment, ensuring sustainable and responsible use throughout its lifecycle. This environmental consciousness is increasingly important in today's world, where businesses and consumers alike prioritize eco-friendly solutions to mitigate climate change and preserve natural resources. By addressing environmental concerns, the device not only meets regulatory requirements but also aligns with broader sustainability goals, enhancing its overall value proposition and market competitiveness.

**Social Acceptability**

Table 4 shows the result of the level of Social Acceptability of the day lighting system. The evaluators rated very high acceptability with overall mean of 4.4. This implies that the device is socially acceptable and it does not violate as to their culture and traditions. The table also shows that the device can be operated by both sexes in which the user evaluators gave the rating of 4.4.

**Summary of Findings**

**Technical Feasibility:** The dual-purpose clamping and holding device received high ratings from both expert and common users. It demonstrated strong functionality, precision, safety, and simplicity, making it a well-designed and user-friendly tool. The mean rating of 4.459 affirms its robust design and ease of use.

**Economic Viability:** The device proved to be cost-effective, easy to maintain, and competitive in the market. With a total mean rating of 4.351, it is financially feasible and aligns well with affordability and sustainability in long-term use.

**Environmental Soundness:** Assessments indicated minimal environmental impact, ensuring the device's eco-friendly nature. The high mean score of 4.4 confirms that it poses little to no risk to both the environment and human health.

**Social Acceptability:** The device received positive feedback from users, with a high acceptance rating of 4.4. It was recognized as user-friendly for all genders and met the needs of its intended beneficiaries effectively.

## CONCLUSION

The comprehensive evaluation of the dual-purpose clamping and holding device reveals high levels of technical feasibility, economic and financial viability, environmental soundness, and social acceptability. The technical feasibility is affirmed by high ratings in operational procedure, precision, and simplicity, with an overall very high rating (mean of 4.459), indicating robust design and functionality. Economically, the device shows high viability with ratings reflecting ease of maintenance, affordability, and competitiveness, yielding a total mean of 4.351. Environmentally, the device is perceived to pose minimal threats, scoring a very high mean of 4.4, underscoring its eco-friendly design. Socially, the device is highly accepted, with a mean rating of 4.4, showing it meets user needs and can be operated with ease by both sexes. Overall, these findings highlight the device's strong potential for effective and sustainable use in its intended applications.

## ABSTRACT

This study investigates the physicochemical and thermal characteristics of a seed-hull extract to assess its suitability as a bio-based binder for automotive interior components, particularly car consoles. The extract was characterised using Fourier Transform Infrared Spectroscopy (FTIR) and Thermogravimetric/Differential Thermal Analysis (TGA/DTA), following ASTM E1252-98 and ASTM E1131-20 standards. The FTIR spectra revealed distinct absorption peaks associated with hydroxyl (–OH), carbonyl (C=O), and ether (C–O–C) groups, confirming the presence of functional groups that can improve interfacial bonding with reinforcing fibres and polymer matrices. TGA/DTA analysis indicated an initial mass loss below 150°C due to moisture evaporation, followed by major thermal degradation between 250°C and 380°C, along with notable char formation at higher temperatures. These thermal characteristics demonstrate that the seed-hull extract possesses sufficient thermal stability for conventional composite processing in automotive manufacturing. Overall, the results show that the seed-hull extract exhibits both favourable chemical functionalities and adequate thermal resistance, supporting its potential as a sustainable binder for automotive interior composite applications.

**Keywords:** Seed-hull extract, FTIR; TGA/DTA, Bio-based binder, Thermal stability, Functional groups, Automotive composites, Sustainable materials.

## INTRODUCTION

Automotive overhead consoles, similar to other interior components, experience mechanical stresses, temperature variations, and continuous vibration throughout the vehicle's service life. Many of the synthetic polymer composites currently employed in these applications deteriorate over time, particularly in tropical regions where elevated temperatures and humidity are prevalent. Under repeated thermal cycling and dynamic loading, these materials are prone to warping, cracking, or losing mechanical strength, ultimately resulting in diminished performance, increased maintenance requirements, and potential safety concerns [1]. Consequently, there is a growing engineering demand for materials that not only satisfy structural requirements but also maintain reliable performance under environmental stress. Characterising seed-hull extract is an essential step before evaluating its suitability as a binder for automotive interior components such as car consoles. Natural extracts, including those obtained from locust bean seed hulls, often show considerable variation in chemical composition due to differences in raw material source, extraction procedures, and storage conditions. Such variation influences their polysaccharide, protein, and ash content, which directly affects their adhesive properties and rheological behaviour. As noted by Petitjean (2022) [2], understanding the chemical makeup of bio-based binders is critical for achieving consistency during processing and ensuring reliable performance in the final product. Equally essential is the assessment of rheological behaviour and molecular weight distribution, as these characteristics govern the binder's flow, wetting performance, and compatibility with reinforcing materials. Mostafavi *et al*. (2016) [3] emphasized that suitable viscosity and molecular weight are critical for producing defect-free composites with consistent mechanical performance during molding or compression. Thermal properties are also fundamental when evaluating materials for automotive use, as manufacturing processes typically involve high temperatures. Thermogravimetric and calorimetric analyses help define safe processing ranges and prevent issues such as premature degradation, charring, or the release of volatile compounds that could compromise structural integrity or the interior environmental quality of the vehicle [4]. In addition to thermal and rheological considerations, the interfacial chemistry of the seed-hull extract must be evaluated to ensure strong bonding with other composite components. Methods such as Fourier-transform infrared spectroscopy (FTIR) and contact angle analysis help identify functional groups and surface energy characteristics that influence compatibility and adhesion. Recent studies [5] have shown that inadequate interfacial interactions can result in lower tensile and flexural strength, as well as premature failure under mechanical loading.

Durability evaluations, including elemental and microbial assessments, are also important for detecting impurities such as metal ions or residual enzymes that may hinder long-term stability, cause discoloration, or accelerate degradation during service. Reports indicate that such contaminants can negatively impact both the mechanical performance and the safety requirements essential for automotive applications [6]. FTIR is especially valuable for identifying the functional groups within the extract, as these directly influence its bonding potential and compatibility with reinforcing fibres and matrix materials. By measuring infrared absorption across different wavelengths, FTIR produces a spectrum that reveals the extract's chemical structure, including hydroxyl, carboxyl, carbonyl, and other reactive groups commonly found in natural polysaccharides and proteins. The presence of such groups suggests the capacity for hydrogen bonding or other chemical interactions with composite constituents. For instance, recent studies [5] showed that distinct –OH and C–O–C stretching peaks in bio-based binders were associated with improved interfacial adhesion in fibre-reinforced composites. Additionally, FTIR can identify impurities, degradation products, or residual solvents that may influence the binder's performance or stability during processing and service. TGA/DTA, in contrast, provides insight into the thermal stability and decomposition behaviour of the binder, both of which are crucial for defining its processing window and long-term performance. TGA monitors weight loss as the sample is heated, enabling the identification of moisture evaporation, volatile emission, and successive stages of thermal degradation. At the same time, DTA records the temperature difference between the sample and a reference material, revealing endothermic and exothermic events such as melting, decomposition, or oxidation. As noted in previous studies [4], TGA/DTA analysis of bio-based binders identifies key thermal transition points—including the onset of degradation and peak decomposition temperatures—which indicate whether the material can tolerate the high processing temperatures used in automotive composite

production. The technique also provides an estimate of residual char content, an important factor in assessing fire resistance and dimensional stability in interior components. By integrating FTIR and TGA/DTA findings, researchers gain a comprehensive understanding of both the chemical functionality and thermal behaviour of the seed-hull extract. FTIR verifies the presence of functional groups essential for adhesion and compatibility, while TGA/DTA confirms that the binder meets the necessary thermal stability requirements for processing and operational conditions. Together, these techniques offer a solid scientific foundation for selecting or modifying natural extracts to satisfy the demanding mechanical, thermal, and safety standards of automotive applications. This study seeks to assess the physicochemical and thermal characteristics of seed-hull extract to determine its viability as a bio-based binder for automotive interior components, particularly car consoles. Through systematic evaluation of its functional groups, thermal stability, and interfacial behaviour, the research offers a scientific foundation for its potential use as a sustainable alternative to conventional synthetic binders in composite manufacturing.

**Locust Bean Seed Hull**

Locust bean seed hulls, obtained from the African locust bean tree (*Parkia biglobosa*), are agricultural by-products commonly discarded during processing. Yet, they contain high levels of bioactive compounds and polysaccharides, particularly galactomannans, which possess useful adhesive, film-forming, and emulsifying properties [7]. These natural polymers are highly appealing for composite development, as they offer an environmentally friendly binder option capable of replacing petroleum-based adhesives in polymer matrices. Chemically, the seed hulls contain notable amounts of cellulose, hemicellulose, lignin, and phenolic compounds, along with mucilage and soluble dietary fibres. Previous research has shown that the galactomannan present in the hull gum contributes to its viscosity, gel-forming behaviour, and binding capability, making it suitable for use in bioplastics and bio-composites [8]–[9]. The carbohydrate profile typically features a mannose-to-galactose ratio of about 4:1, comparable to commercial gums such as guar and tara, which are commonly employed in industrial applications. The use of locust bean seed gum in engineering applications has been relatively limited, as most existing research centers on its roles in food, pharmaceutical, and cosmetic products. Nonetheless, its inherent thermal stability, natural adhesive characteristics, and hydrophilic behaviour indicate strong potential as a bio-based matrix in composite materials, especially when combined with lignocellulosic fibres such as palm kernel fibre. This study investigates the feasibility of employing the gum not merely as an additive but as a primary binder in natural fibre-reinforced automotive interior composites.

**Bio-based Binders in Composite Materials**

Growing concerns over the environmental impact of synthetic adhesives have increased interest in bio-based binders for composite materials. Derived from renewable resources, these binders offer a sustainable alternative to petroleum-based resins such as epoxy and polyester, providing benefits such as biodegradability, lower toxicity, and reduced processing energy [10]. Plant-derived gums and polysaccharides—including starch, guar gum, gum arabic, and locust bean gum—are widely studied due to their film-forming ability, natural tackiness, and inherent adhesion, making them suitable for non-structural automotive interiors [11]. Locust bean gum, a galactomannan extracted from locust bean seed hulls, is particularly valued for its viscosity, aqueous stability, and hydroxyl-rich structure, which promotes strong hydrogen bonding with lignocellulosic fibres [8]. Studies [12] show that when starch- or gum-based binders are modified or cross-linked with non-toxic agents, they can significantly enhance the dimensional stability and moisture resistance of natural fibre composites. Their compatibility with both thermoplastics and thermosets further supports their use in automotive components such as dashboards, door panels, and overhead consoles. Locust bean gum stands out as a promising binder because it is water-soluble, non-toxic, and highly adhesive; with thermal or chemical modification, it can form a durable matrix for fibres like palm kernel fibre (PKF), yielding biodegradable composites with improved thermal and mechanical properties. Its viscosity and curing behaviour can also be tailored for molding processes in automotive manufacturing [8]. Nonetheless, bio-based binders often face challenges such as moisture sensitivity, limited long-term durability, and batch variability. Advances in processing—such as adding nano-fillers or blending with other biopolymers—have helped reduce these limitations [13]. This study builds on existing research by using locust bean seed hull gum as a natural binder for PKF-reinforced composites, aiming to develop a lightweight, thermally stable, and environmentally friendly material for automotive

overhead consoles. Through careful optimization of fibre–binder interaction and processing conditions, the goal is to produce a composite that meets interior automotive performance requirements while supporting the transition toward renewable and circular materials in manufacturing.

**Standards for Automotive Overhead Consoles**

Automotive overhead consoles contain functional components such as lighting, storage, and sensors, and must comply with stringent safety, mechanical, thermal, and aesthetic standards established by international regulations and OEMs. Impact resistance is especially important during collisions or rollovers; FMVSS 201 mandates that components within the head-impact zone absorb energy to reduce injury, while ECE R21 outlines limits and testing procedures for interior projections [14]. Thermal stability is equally important because overhead consoles are frequently exposed to high temperatures. Materials must withstand deformation, discoloration, and mechanical deterioration; standards such as SAE J400 and ISO 75-2 specify criteria for heat deflection, thermal aging, and dimensional stability at 80–120°C, depending on vehicle class [15]. Flammability performance is regulated by FMVSS 302, which restricts the horizontal burn rate to 102 mm/min, often requiring the use of flame-retardant additives or coatings in natural fiber composites [16]. Dimensional accuracy and mold ability are regulated by ISO 9001:2015 and IATF 16949 quality standards, which typically require tolerances for warpage, fibre orientation, and thickness to fall within ±0.2 mm [17]. Consequently, any natural fibre composite—such as the proposed PKF/locust bean gum material—must satisfy or surpass these criteria. This study assesses its compliance with FMVSS 302 (flammability), ISO 75-2 (heat resistance), ASTM D256 (impact strength), and ASTM D638 (tensile properties) to determine its viability as a sustainable and cost-effective alternative for automotive overhead consoles.

## MATERIALS AND METHODS

**Fourier Transform Infrared Spectroscopy (FTIR) Analysis**

The functional groups present in the seed-hull extract were characterized using Fourier Transform Infrared Spectroscopy (FTIR). The analysis was conducted with a bench-top FTIR spectrometer fitted with an Attenuated Total Reflectance (ATR) accessory, in accordance with ASTM E1252-98 (Reapproved 2013) for the infrared identification of organic compounds. Before testing, the samples were oven-dried at 60 ± 2 °C for 24 hours to eliminate residual moisture and then finely ground to produce a uniform powder. Approximately 2–3 mg of each sample was placed directly onto the diamond ATR crystal, and spectra were recorded over the range of 4000–400 $cm^{-1}$ with a resolution of 4 $cm^{-1}$ and 32 scans per sample. Background spectra were collected prior to each measurement to eliminate atmospheric interference from $CO_2$ and water vapour. The resulting spectra were processed and interpreted using the instrument software, and characteristic absorption bands were compared with standard reference spectra to identify functional groups such as hydroxyl (–OH), carbonyl (C=O), and ether (C–O–C) linkages. This procedure is consistent with the method used by Jiang *et al*. (2022) [5], who employed FTIR to analyse the chemical functionality of polysaccharide-based binders for evaluating interfacial bonding potential in natural fibre composites.

**Thermogravimetric and Differential Thermal Analysis (TGA/DTA)**

The thermal stability and degradation behaviour of the seed-hull extract were assessed using a thermogravimetric analyser equipped with a differential thermal analysis module. The procedure adhered to ASTM E1131-08 (Reapproved 2014) for compositional analysis by thermogravimetry. Approximately 10 ± 0.5 mg of the dried, finely ground sample was placed in an open alumina crucible and heated from 30 °C to 800 °C at a rate of 10 °C/min under a nitrogen atmosphere (50 mL/min) to prevent oxidative degradation during testing. The TGA curve measured weight loss as temperature increased, revealing stages such as moisture evaporation, decomposition of organic components, and residual char formation. At the same time, the DTA curve identified endothermic and exothermic events, including decomposition peaks and other thermal transitions relevant to processing. From these curves, the onset degradation temperature ($T_o$), peak degradation temperature ($T_p$), and residual char content were determined. These parameters offer essential insight into the extract's suitability for high-temperature processes such as

composite pressing and curing. Comparable thermal characterisation techniques have been used in previous studies [4] to evaluate the performance of bio-based adhesives in automotive composite applications.

## RESULTS AND DISCUSSION

**Fourier-Transform Infrared (FTIR)**

FTIR of seed hull extract (Figure 1). The Fourier-Transform Infrared (FTIR) spectrum of the Locust Bean Seed Hull Extract (LBSHE) gum, the proposed bio-binder for the palm kernel fibre composite, clearly reveals the functional groups that define its molecular structure and adhesive behaviour. The spectrum confirms that the extract is a typical polysaccharide—specifically a galactomannan—consisting primarily of mannose and galactose units. The identified absorption bands correspond directly to the gum's adhesive performance within the composite matrix. The most prominent and structurally important feature is the broad, intense peak at 3252.1 $cm^{-1}$, attributed to O–H stretching vibrations (hydroxyl groups). Polysaccharides are naturally abundant in hydroxyl groups, which facilitate extensive intra- and intermolecular hydrogen bonding. When LBSHE gum is formulated as a binder solution, these hydroxyl groups readily participate in hydrogen bond formation, enhancing network development and interfacial adhesion. This observation aligns with Imeson (2010) [18], who highlighted the crucial role of hydroxyl group density in the thickening and binding behavior of galactomannans. Mudgil *et al.* (2014) [19] also reported strong O–H stretching bands in the 3200–3400 $cm^{-1}$ region as characteristic of galactomannan gums, indicating their high capacity for hydrogen bonding. Likewise, Saha and Bhattacharya (2010) noted that polysaccharides function effectively as natural adhesives primarily due to their ability to form extensive hydrogen-bonding networks. This spectral feature has direct structural relevance for the composite, as palm kernel fibre (PKF) is a lignocellulosic material whose surface is likewise rich in hydroxyl groups. The strong band at 3252.1 $cm^{-1}$ therefore provides clear chemical evidence of the gum's ability to form robust Gum(O–H)-- Fibre(H–O) hydrogen bonds. These intermolecular interactions serve as the primary mechanism that binds the natural composite together, promoting effective interfacial compatibility between the bio-binder and the reinforcing fibres. Further along the spectral region, several prominent absorption bands indicate the presence of the polysaccharide backbone and the gum's water content. The strong peaks near 1144.3 $cm^{-1}$, 1075.3 $cm^{-1}$, and 1019.4 $cm^{-1}$ are attributed to C–O stretching in the pyranose ring and C–O–C glycosidic linkages that join the mannose and galactose units.

These features are characteristic of galactomannan polymers and illustrate the structural elements responsible for chain entanglement and the resulting high viscosity in solution. This is consistent with the observations of Mudgil *et al.* (2014) [19], who noted that these spectral bands are indicative of the galactomannan backbone and correlate with the gum's rheological behavior. Imeson (2010) [18] also emphasized that these linkages contribute to the strong thickening capacity of locust bean gum even at low concentrations, reinforcing its effectiveness as a binder in composite manufacturing. The band observed at 1628.8 $cm^{-1}$ corresponds to the O–H bending vibration of bound water, signifying the presence of moisture that is strongly associated with the gum matrix. The combination of this water-related absorption and the pronounced hydroxyl stretching band highlights the gum's pronounced hydrophilicity. This property can pose technical difficulties in demanding settings, including automotive applications. Saha and Bhattacharya (2010) [20] reported comparable issues with hydrocolloids, explaining that their sensitivity to moisture may cause swelling, dimensional instability, and deterioration of mechanical performance when exposed to humid environments. The findings from the FTIR analysis highlight two key considerations regarding the suitability of LBSHE gum as a bio-binder for automotive overhead console composites. First, its high concentration of hydroxyl groups promotes strong interfacial compatibility and adhesion with PKF, helping to overcome the typical bonding challenges between polar natural fibers and non-polar synthetic polymers. In addition, the identified galactomannan structure suggests that the gum can produce highly viscous solutions even at low concentrations, which supports effective and uniform binder dispersion throughout the fiber network during composite fabrication. However, the pronounced hydroxyl- and water-related absorption bands also reveal that the composite would be highly prone to moisture uptake. Under actual automotive conditions—where interior components like overhead consoles experience variable temperature and humidity—this moisture sensitivity could

cause the gum matrix to swell, deform, and ultimately suffer substantial reductions in mechanical performance over time. In industrial applications, natural fiber–reinforced bio-composites are commonly used in interior components such as door panels and spare tire covers, but these systems generally rely on synthetic resins to mitigate moisture-related issues. A fully hydrophilic binder like LBSHE gum, without any modification, would not satisfy the dimensional stability standards required for automotive interiors. Therefore, although the FTIR analysis demonstrates that the gum has favorable chemical characteristics for binding, its practical adoption in this context would necessitate additional treatments—such as applying hydrophobic coatings, introducing cross-linking agents, or blending it with more moisture-resistant bio-resins—to protect the reactive hydroxyl groups and maintain long-term performance under real service conditions.

**Thermogravimetric analysis (TGA) of Seed Hull Extract (Gum)**

TGA/DTA of seed hull gum (Figure 2). The thermal behaviour of the locust bean seed hull extract (gum) was examined using thermogravimetric analysis (TGA) to determine its potential as a binder in palm kernel fibre composites intended for automotive overhead console applications. The TGA profile shows three distinct stages of mass loss: initial moisture evaporation, primary thermal decomposition, and the subsequent formation of char residue. The initial mass loss observed from room temperature up to about 150°C corresponds to the evaporation of physically adsorbed moisture and low-molecular-weight volatiles. This behaviour is characteristic of hydrophilic, polysaccharide-based natural materials and underscores the need for adequate drying before processing to reduce porosity and improve interfacial adhesion. A major decomposition phase begins near 200°C and progresses sharply until roughly 350°C, reflecting the thermal degradation of hemicellulose, cellulose, and other polysaccharide components of the seed hull extract. By 400°C, only about 10–20 % of the initial mass remains, followed by a slower rate of mass loss at elevated temperatures, ultimately leaving a char residue of approximately 7–12 % at 900°C. The thermal pattern observed aligns well with previous studies on natural fibre composites and polysaccharide-based materials. Mohammed *et al*. (2015) [21] reported that natural fibres such as jute and kenaf show moisture loss below 150°C, followed by major decomposition between 250°C and 360°C due to hemicellulose and cellulose breakdown, leaving only a small char residue—consistent with the low residual mass of the seed hull extract. Likewise, another study [22] on cellulosic materials confirmed an initial moisture-loss stage below 150°C, a primary degradation phase between 250°C and 380°C, and a slower high-temperature decomposition attributed to lignin.

They also noted that fibre thermal stability depends on the relative amounts of cellulose, hemicellulose, and lignin. The seed hull extract's thermal profile closely matches these reported behaviours, particularly regarding decomposition onset and final residue. Brito-Oliveira *et al*. (2024) [23] reported that locust bean gum degrades between 200°C and 300°C and leaves minimal char, a behaviour attributed to its polysaccharide structure. This agrees with the degradation profile observed for the seed hull extract, confirming that the gum remains thermally stable only up to about 200°C. Sanjay *et al*. (2018) [24] further noted that fibre treatments such as alkali and silane can enhance thermal stability and interfacial bonding, enabling natural fibres for structural applications, while stressing that processing temperatures must be kept below the degradation threshold of fibres and binders. This is directly relevant here, as the TGA results indicate that temperatures above 200°C would damage both palm kernel fibre and the gum binder. Similarly, Neto *et al*. (2021) [25] reviewed thermal characterization of natural fibre composites and found that most fibres begin degrading between 200°C and 350°C. They emphasized the need for controlled processing conditions despite good stability under normal service temperatures, which aligns with the implications of the present TGA findings. The thermal degradation profile of the seed hull extract gum indicates that it remains stable under normal automotive interior service conditions, which typically stay below 90°C. However, its primary decomposition beginning around 200°C restricts the processing methods that can be used. To prevent thermal damage during manufacturing, low-temperature-curing thermosets, cold-pressing, or tightly controlled compression-moulding processes are recommended. Additionally, the low char yield suggests limited flame resistance, meaning that additives or protective coatings may be required to satisfy automotive fire-safety requirements.

## CONCLUSION

The FTIR analysis of the seed-hull extract identified clear absorption bands for hydroxyl (–OH), carbonyl (C=O), and ether (C–O–C) groups, confirming its polysaccharide-rich nature and its capacity for hydrogen bonding and chemical interaction with reinforcing fibres and matrix materials. This supports its suitability as a natural binder for composite production. TGA/DTA results showed an initial mass loss below 150°C from moisture evaporation, followed by major decomposition between 250°C and 380°C associated with organic component breakdown. The remaining char at higher temperatures indicates adequate thermal stability for typical automotive interior processing conditions. Together, these findings demonstrate that the seed-hull extract provides the necessary chemical functionality and thermal robustness for use as a bio-based binder in car console composites.

## ABSTRACT

The Internet of Things (IoT) is revolutionizing industries by enabling real-time data exchange and automation, yet its expansion introduces complex, multi-layered security challenges. Existing centralized security models, conventional intrusion detection systems, and uniform cryptographic solutions often fall short in protecting the diverse and resource-constrained environments of IoT. This paper presents a comprehensive, multi-layer security framework that strategically applies to Blockchain for decentralized trust management, Federated Learning for privacy-preserving intelligence, and Generative Adversarial Networks (GANs) for class imbalance mitigation in intrusion detection systems. Each technique is tailored to a specific IoT architectural layer to maximize its effectiveness. The proposed framework is evaluated using the NSL-KDD dataset, where GAN-based data augmentation significantly improved the detection rate of rare attacks. Real-world deployments, including case studies in healthcare and agriculture, demonstrate up to 10\% higher anomaly detection accuracy and a 50\% reduction in latency. This research presents a scalable and adaptive approach to IoT security, providing valuable insights for both academic and industry practitioners. Breach identification, ML framework development, and integration of individual modules in a seamless and synchronized manner. Tailored countermeasures, ML integration, experimental validation with the auto encoder-based anomaly detection, integration of Graph Neural Network with the Generative Adversarial Network and Federated Learning procedure. Enhanced breach detection, practical implementation guidance with the validation accuracy value of 98\%. The integrated model will be targeted to have overall latency minimization in the future.

## INTRODUCTION

Safeguarding the Internet of Medical Things (IoMT) is a critical challenge at the intersection of cybersecurity, healthcare, and embedded systems. The rapid proliferation of smart medical devices from wearables and implants to remote diagnostic tools—has made healthcare data-driven and real-time, but also highly vulnerable. Sensitive patient data, limited device resources, and the need for low-latency communication heighten these security risks. Conventional security mechanisms such as static cryptography, centralized IDS, and signature-based detection are inadequate for IoMT. These approaches rely on centralized data aggregation, consuming bandwidth and compromising privacy, thereby conflicting with regulations like HIPAA and GDPR. Furthermore, IoMT environments face data imbalance, insecure communication protocols, weak authentication, and interoperability issues across manufacturers, all of which can lead to delayed or incorrect medical decisions. Hence, there is an urgent need for decentralized, privacy-preserving security frameworks that handle real-time data diversity and imbalance. While Blockchain, Federated Learning (FL), and Generative Adversarial Networks (GANs) have individually addressed some of these issues, a unified, multi-layered framework remains unexplored. This research proposes an IoMT security framework that strategically integrates Blockchain, FL, and GANs across the IoT layers - security, middleware, and application, respectively. The novelty lies not in creating new algorithms but in orchestrating these technologies into a cohesive, theoretically sound, and experimentally validated architecture. Through simulations and real-world case studies in healthcare and smart agriculture, the framework demonstrates improved anomaly detection accuracy, reduced latency, and enhanced data privacy. Unlike prior works that focus on isolated layers or centralized models, this approach offers a comprehensive, regulation-compliant, and scalable solution for secure medical IoT systems.

## LITERATURE REVIEW

Classic intrusion detection systems and cryptographic techniques tend to be difficult to scale well in the context of IoT. Recent developments are

**Uddin *et al.* (2022):** Utilized deep learning to improve security in medical IoT systems.

**Eslami *et al.* (2023):** Combined blockchain with RBF neural networks in Internet of Drones settings.

**GA-mADAM-IIoT (2023):** Developed a lightweight threat detection by genetic algorithm and LSTM.

**Zhang *et al.* (2021):** Designed explainable AI models to identify zero-day botnet attacks in vehicular networks.

**CPS-IoT-PPDNN (2023):** Conferred on privacy-preserving anomaly detection in cyber-physical systems.

Although the above research focuses on individual application domains, the current work adds value through a comprehensive multi-layer framework covering the entire IoT architecture and combining complementary technologies: Blockchain, Federated Learning (FL), and GAN-based data augmentation. The deep learning techniques being considered included GANs, Autoencoders, and Graph Neural Networks. These methods were chosen because they had features that enabled them to address IoT security problems that cannot be achieved by conventional methods. GANs can create realistic samples of the minority class in an intrusion dataset which can alleviate the severe class imbalance issue and enhance the generalization of a model. Autoencoders can be used for unsupervised anomaly detection by learning the regular behavior of a device as normal, to be able to flag deviations in device behavior, which is the most suitable for identifying zero-day attacks. GNNs represent the relational structure of IoT networks making it much more capable of detecting anomalies in IoT traffic than a flat-feature model. Effectively, deep learning techniques can handle high-dimensional data, learn in complex ways, and adapt to changes in threat scenarios. Consequently, deep learning will be an important component of the proposed multi-layer framework. Blockchain, Federated Learning (FL), and Generative Adversarial Networks (GANs) were chosen

for their combined strengths to meet the fundamental issues of IoT security: decentralization, privacy, and data imbalance. Blockchain provides a tamper-proof, decentralized infrastructure that is well-suited for device authentication and data provenance. The trustless validation provided by consensus algorithms like Proof of Stake (PoS) and Delegated PoS provides lower latency and are well-suited for distributed IoT systems [Bhatia and Kumar, 2021; Aujla, 2021].Federated Learning (FL) promotes privacy-preserving model training through the storage of raw data locally and transmission of only model updates. This reduces communication overhead and complies with privacy legislations like GDPR and HIPAA [Li *et al*., 2022; Zhou and Xu, 2023]. GAN-driven augmentation resolves the difficulty of scarce or unbalanced security data by producing synthetic but real data. This improves anomaly detection resilience, especially in dealing with infrequent or zero-day attacks [Ahmad *et al*., 2023; Gupta and Pandey, 2023]. Combining such technologies facilitates a layered, scalable, and adaptive security mechanism that surpasses conventional centralized or rule-based techniques for the contemporary IoT landscape.

## RESEARCH GAP

Despite significant research on traditional security methods, there is a lack of comprehensive studies integrating advanced technologies like blockchain, machine learning, and federated learning into IoT security frameworks (Shanthamallu *et al*., 2018). Additionally, many proposed solutions lack experimental validation and practical applicability. Existing security measures for IoT devices often fail to meet the unique demands of IoT's layered architecture, leading to vulnerabilities across various architectural tiers. The rapid expansion of IoT devices introduces new and diverse cyber threats, such as unauthorized access, data breaches, and malware attacks, which traditional security methods are ill-equipped to handle. Additionally, there is a need for tailored security solutions that address the specific vulnerabilities of each IoT architectural layer, rather than relying on a one-size-fits-all approach. Despite significant research on traditional security methods, there is a lack of comprehensive studies integrating advanced technologies like blockchain, machine learning, and federated learning into IoT security frameworks. Moreover, many proposed solutions lack experimental validation and practical applicability, making it difficult to assess their effectiveness in real-world scenarios. As IoT networks continue to grow, ensuring the interoperability and scalability of security solutions remains a significant challenge that has not been adequately addressed in existing research.

**Solutions for Architectural Layers**

IoT security solutions need to address multiple architectural tiers, each of which has distinct vulnerabilities (Al-Sarawi *et al*., 2017). For example, authentication mechanisms are critical in the perception layer, while encryption and secure communication protocols are essential in the network layer. Furthermore, machine learning approaches such as deep learning and federated learning have been suggested for anomaly detection in IoT environments (Andrea *et al*., 2015). GAN-based augmentation techniques have also been proposed to address imbalanced datasets (Benzarti *et al*., 2017). Hence the paper explores a new proposed framework as shown in Figure 1.

**Datasets**

The current research has been carried out on the public dataset available at the NSL-KDD dataset. The dataset consists of a number of records counting 125,973. Total 41 features (in Figure 3) similar to KDD Cup 1999, with improvements to eliminate redundant records have been used in the processing. The attack type includes DoS, R2L, U2R, and probing attacks. While the NSL-KDD dataset is broadly employed to benchmark intrusion detection models, it is severely lacking in many aspects. It is not representative of modern traffic patterns, IoT device diversity, and sophisticated types of attacks like DDoS or zero-day exploits. As such, its generalizability to actual IoT networks is poor. We employed NSL-KDD in this work for the baseline performance comparison and reproducibility. Yet, future research will utilize more realistic and heterogeneous datasets like BoT-IoT, TON-IoT, and CICIDS2018, which offer richer attack vectors, richer protocol diversity, and traffic from a range of IoT device types. Features of Dataset (Table 1).

**Data Preprocessing Steps**

We chose NSL-KDD for its relevance and enhanced balance over KDD'99. The pre-processing phase removed redundant records implemented normalization by means of scaled features within the range [0, 1]. The split partition of the data includes 70% train, 15\% validate, 15\% test. The class imbalancing applied GANs to augment minority attack types. Compared with SMOTE, GANs yielded better fidelity and detection 4.1.1.

**Experimental Environment**

The hardware components used for the experiment includes Processor: Intel Core i7, RAM: 16GB, GPU: NVIDIA GTX1080. The utilise software includes TensorFlow for building and training neural network models. Programming Language: Python 3.8 for implementing algorithms and data processing. The specified tools include Wireshark for network analysis and monitoring traffic patterns during experiments.

## METHODOLOGY

The NSL-KDD dataset was employed as the first benchmark for model building and testing. The data was preprocessed by applying one-hot encoding on categorical features, and all the numerical fields were scaled to the [0,1] interval.

To facilitate consistent testing, the data was split into the following
**Training set:** 70% of the data
**Validation set:** 15%
**Testing set:** 15%
For the federated learning simulation, 10 virtual clients were allocated with training data split among them, each being provided with a non-identically and independently distributed (non-IID) subset to simulate real-world heterogeneity in IoT environments. Federated averaging was conducted after each 5 local training epochs, and model aggregation was done using the FedAvg algorithm. Each client was involved in each communication round, and 20 communication rounds were performed in total. Communication latency and client model divergence were tracked for evaluation.

**Autoencoder-based Anomaly Detection for Perception Layer**

Autoencoders represent a form of artificial neural network utilized for unsupervised learning to efficiently encode data. As illustrated in Figure 4, a decoder network reconstructs the original data, while an encoder network compresses input data into a lower-dimensional representation, known as a latent space. By comparing the autoencoder reconstruction error with a predetermined threshold, anomalies can be identified within the data [Abeshu, A. and Chilamkurti, N. (2020)]. In IoT settings, sensor data can undergo processing either at the edge or within the network itself using autoencoder-based anomaly detection. This approach allows for the detection of unauthorized activities or abnormal behaviors within IoT environments, as autoencoders learn to reconstruct typical sensor data and classify deviations from the norm as anomalies. Autoencoder Based Anomaly Detection (Figure 2).

**Training Phase:** An autoencoder is trained on a comprehensive dataset consisting of normal sensor readings, capturing the typical patterns of operation across different devices and environments. The training process ensures that the model learns to generate accurate reconstructions of standard sensor data.

**Testing Phase:** During the testing phase, real-time sensor data is continuously fed into the trained autoencoder. The reconstruction error, defined as the difference between the original input and the reconstructed output, is computed for each data point.

**Anomaly Detection:** If the reconstruction error exceeds a predefined threshold, determined through statistical analysis of the training data, the data point is flagged as anomalous. The threshold is dynamically adjusted based on observed patterns in the training set.

**Evaluation Metrics:** The performance of the anomaly detection system is assessed using common metrics such as accuracy, precision, recall, and F1 score. These metrics provide a comprehensive measure of how well the system identifies anomalies and minimizes false positives[Kim, J., \and Kim, H. (2020)].
Forward/backward pass complexity is O(L × N × H²) where L is layers, N is samples, and H is the hidden layer size.

**Algorithm 1** Autoencoder for Anomaly Detection

**Require:** Dataset $D = \{x_1, x_2, \ldots, x_n\}$
**Ensure:** Classification of each instance as Normal or Anomaly
**Step 1: Data Preprocessing**
Normalize/standardize dataset $D$
Split into Training set (normal samples) and Test set (may include anomalies)
**Step 2: Autoencoder Construction**
Define encoder $f_\theta(x)$ producing latent vector $z = f_\theta(x)$
Define decoder $g_\phi(z)$ producing reconstruction $\hat{x} = g_\phi(z)$
Autoencoder: $AE(x) = g_\phi(f_\theta(x))$
**Step 3: Training**
Train $AE$ using only normal data
Minimize reconstruction loss:

$$L(x, \hat{x}) = \|x - \hat{x}\|^2$$

**Step 4: Anomaly Scoring**
**for** each test instance $x$ **do**
    Compute $\hat{x} = AE(x)$
    Calculate error $E(x) = \|x - \hat{x}\|^2$
**end for**
**Step 5: Threshold Selection**
Determine threshold $T$ (e.g., $T = \mu_E + k \cdot \sigma_E$ or percentile cutoff)
**Step 6: Detection**
**for** each $x$ in Test set **do**
    **if** $E(x) > T$ **then**
        Label $x$ as **Anomaly**
    **else**
        Label $x$ as **Normal**
    **end if**
**end for**
**Step 7: Evaluation**
Evaluate results using Accuracy, Precision, Recall, F1-score, ROC-AUC

**Graph Neural Networks (GNNs) for Connectivity/Network Layer**

Specifically created to function on graph-structured data, Graph Neural Networks (GNNs) are a class of neural networks. Within IoT networks, GNNs can simulate the relationships amongst IoT devices as a graph, in which objects are represented as nodes and connections or interactions between them are represented as edges as seen in Figure 5. Graph Neural Networks (GNNs) can perform effective network traffic pattern analysis, anomaly detection, and threat identification by utilizing graph-based representations. The Connectivity Layer is responsible for facilitating communication between IoT devices. To detect anomalies in network traffic, Graph Neural Networks (GNNs) are employed, utilizing the underlying graph structure of IoT networks.

**Algorithm 2** Graph Neural Network (GNN) for Anomaly Detection

**Require:** Graph $G = (V, E, X)$, where $V$ = nodes, $E$ = edges, $X$ = feature matrix
**Ensure:** Anomaly scores and classification (Normal / Anomaly) for each node/edge/subgraph

**Step 1: Graph Data Preparation**
Construct graph $G$ from dataset
Normalize features and compute adjacency matrix $A$
Split data into Training (mostly normal) and Testing sets

**Step 2: GNN Model Construction**
Initialize node embeddings $H^{(0)} = X$
**for** $l = 1$ to $L$ (number of GNN layers) **do**
    $H^{(l)} = \sigma(\tilde{A}H^{(l-1)}W^{(l)})$ ▷ Message passing and aggregation
**end for**
Final embeddings $Z = H^{(L)}$

**Step 3: Training Objective**
**if** Reconstruction-based **then**
    Minimize reconstruction loss: $L = \|X - \hat{X}\|^2$ or $L = \|A - \hat{A}\|^2$
**else if** Prediction-based **then**
    Train GNN to predict node/edge labels
**else if** Contrastive learning **then**
    Maximize similarity of connected nodes, minimize similarity of unconnected nodes
**end if**

**Step 4: Anomaly Scoring**
**for** each $v$ in Test set (node/edge/subgraph) **do**
    Compute anomaly score $S(v)$, e.g., $S(v) = \|X_v - \hat{X}_v\|^2$
**end for**

**Step 5: Threshold Selection**
Determine threshold $T$ based on score distribution (percentile, mean + $k \cdot std$, or ROC optimization)

**Step 6: Anomaly Detection**
**for** each $v$ in Test set **do**
    **if** $S(v) > T$ **then**
        Label $v$ as **Anomaly**
    **else**
        Label $v$ as **Normal**
    **end if**
**end for**

**Step 7: Evaluation**
Evaluate using Accuracy, Precision, Recall, F1-score, ROC-AUC, PR-AUC

**Graph Construction:** A graph representation of the IoT network is created, with nodes representing devices and edges indicating communication links between devices. This structure enables the modeling of network traffic patterns and the identification of anomalous behavior.

**Feature Extraction:** For each node in the graph, features such as device properties, communication volume, and patterns are extracted. These features serve as the basis for training the GNN to identify relationships and dependencies within the network.

GNN Method Flowchart (Figure 3)

**Training and Evaluation:** The GNN is trained using historical traffic data, learning to distinguish between normal and anomalous traffic. It is then evaluated using real-time data to assess its effectiveness in detecting deviations from typical traffic patterns.

**Evaluation Metrics:** Key evaluation metrics for GNN-based anomaly detection include detection rate, false positive rate, and latency. These metrics gauge the accuracy, efficiency, and speed of the GNN model in identifying anomalies in real time. Message passing per layer is O(|V| + |E|) where V is nodes and E is edges.

**Generative Adversarial Networks (GANs) for Middleware/Processing Layer**

**Algorithm 3** Training of GAN Architecture

**Require:** Real data samples $X = \{x_1, x_2, \ldots, x_n\}$, latent noise distribution $Z \sim p_z(z)$
**Ensure:** Trained Generator $G$ and Discriminator $D$
Initialize Generator $G$ with parameters $\theta_G$
Initialize Discriminator $D$ with parameters $\theta_D$
**for** each training epoch **do**
    **Step 1: Train Discriminator**
    Sample mini-batch of real data $x \sim p_{data}(x)$
    Sample mini-batch of noise vectors $z \sim p_z(z)$
    Generate fake samples $\hat{x} = G(z)$
    Compute discriminator loss:

$$L_D = -\mathbb{E}_{x \sim p_{data}(x)}[\log D(x)] - \mathbb{E}_{z \sim p_z(z)}[\log(1 - D(G(z)))]$$

    Update discriminator parameters:

$$\theta_D \leftarrow \theta_D - \eta \nabla_{\theta_D} L_D$$

    **Step 2: Train Generator**
    Sample mini-batch of noise vectors $z \sim p_z(z)$
    Generate fake samples $\hat{x} = G(z)$
    Compute generator loss:

$$L_G = -\mathbb{E}_{z \sim p_z(z)}[\log D(G(z))]$$

    Update generator parameters:

$$\theta_G \leftarrow \theta_G - \eta \nabla_{\theta_G} L_G$$

**end for**
**Output:** Trained Generator $G$ and Discriminator $D$

Generative Adversarial Networks (GANs) generate synthetic attack samples, improving model robustness against rare threats. We trained GANs using minority-class samples (U2R, R2L) from NSL-KDD, achieving:

- +13% increase in detection rate
- -19% drop in false negatives
- 94% F1-score

Training complexity is$O(E\times B\times D^2)$ where E is the number of epochs, B is the batch size, and D is the dimensionality of the latent space.

**Federated Learning for Application Layer**

Federated Learning Method (Figure 4). Federated Learning is a machine learning approach that enables multiple IoT devices to collaborate in training a global model without sharing raw data. Instead, each device trains a local model using its data and shares only model updates, like gradients, with a central server or aggregator as highlighted in Figure 6. The server updates the global model by consolidating these updates, which are then sent back to the devices for further refinement. This method maintains data privacy and confidentiality while allowing devices to collectively learn from distributed data in the realm of IoT security[Li, L., *et al.* (2022)].

**Initialization:** A central server initializes a global model and distributes it to participating devices, which may include smart appliances, wearables, and other IoT-enabled devices.\ \

**Local Training:** Each device trains its local model on its private data and computes model updates, which are then sent to the central server.\ \

**Algorithm 4** Federated Learning Training Procedure

**Require:** Global model $w_0$, number of communication rounds $R$, number of clients $K$, local dataset $D_k$ for each client $k$, local epochs $E$, learning rate $\eta$

**Ensure:** Trained global model $w_R$

Initialize global model parameters $w_0$

**for** round $t = 1$ to $R$ **do**

  Server selects a subset of clients $S_t \subseteq \{1, 2, \ldots, K\}$

  **for** each client $k \in S_t$ in parallel **do**

    Initialize local model: $w_k^{(t,0)} \leftarrow w_{t-1}$

    **for** epoch $e = 1$ to $E$ **do**

      Update local model on $D_k$ using gradient descent:

$$w_k^{(t,e)} \leftarrow w_k^{(t,e-1)} - \eta \nabla L(w_k^{(t,e-1)}; D_k)$$

    **end for**

    Send updated local model $w_k^{(t,E)}$ to server

  **end for**

  Server aggregates local models to update global model:

$$w_t = \sum_{k \in S_t} \frac{|D_k|}{\sum_{j \in S_t} |D_j|} w_k^{(t,E)}$$

**end for**

**Output:** Final global model $w_R$

**Aggregation:** The server aggregates the updates from all devices to improve the global model, ensuring secure communication protocols are in place to protect data during transmission.\ \

**Evaluation Metrics:** The global model's accuracy is assessed post-aggregation, and communication efficiency is evaluated to ensure minimal data exchange. Additionally, the effectiveness of privacy preservation mechanisms is analyzed. Each IoT device trains a local model using private data. Only model gradients are shared, not raw data. Total cost is O(R × C × M) where R is rounds, C is number of clients, M is local model training cost.

**Blockchain-based Device Authentication**

The blockchain layer is run via a light private Ethereum network. Smart contracts are used to manage authentication events and logging of federated learning updates. A hashed local model parameter record is saved by each participating node to provide accountability and immutability. Block size is limited to 2MB to minimize latency, and Proof-of-Authority (PoA) is utilized instead of Proof-of-Work to maintain resource usage low and transaction confirmation time (≈5 seconds/block) better.\ \ Blockchain technology can enhance security in the IoT devices' security layer by leveraging various consensus algorithms like Proof of Work (PoW), Proof of Stake (PoS), and Delegated Proof of Stake (DPoS). PoW, initially preferred for its simplicity, security, and resistance to vulnerabilities, mandates network users (miners) to solve complex mathematical puzzles to verify and add transactions to the blockchain, preventing double-spending. PoW's design promotes genuine participation and renders it economically infeasible for attackers to manipulate the system, making it ideal for decentralized networks like blockchain. PoW as a favored choice for bolstering security in IoT devices.

**Device Authentication:** Each IoT device generates a unique cryptographic identity. Devices must solve a computational challenge to authenticate themselves, ensuring secure device on boarding.

**Transaction Verification:** A consensus mechanism verifies transactions between devices and maintains an immutable ledger of interactions, ensuring transparency and accountability in the system.

**Algorithm 5** Blockchain-based Device Authentication

**Require:** Device $D_i$ requesting network access, blockchain ledger $B$, trusted network nodes, cryptographic keys
**Ensure:** Authentication status (**Authorized** / **Unauthorized**) for device $D_i$

```
Device D_i generates a unique identity ID_i and signs it using its private key
Device D_i sends authentication request to nearest blockchain node
Blockchain node verifies the request
if Signature of D_i is valid then
    Query blockchain ledger B for existing device records
    if ID_i exists in B and is marked as valid then
        Authenticate D_i and allow access
    else
        Register ID_i on blockchain with validation transaction
        Authenticate D_i after consensus confirmation
    end if
else
    Reject authentication request as Unauthorized
end if
Update blockchain ledger B with authentication transaction for audit
Notify network and device D_i about authentication status
```

**Real-World Implementation:** A blockchain network is deployed in a controlled IoT environment to test its effectiveness in securing communications between devices and preventing unauthorized access.

**Evaluation Metrics:** Key metrics include transaction throughput (measured in transactions per second), latency (time taken to confirm transactions), and security resilience (assessed through penetration testing and attack simulations). Transaction verification complexity is constant O(1) per block due to authority-based validation.

**Reinforcement Learning for Management/Control Layer**

Reinforcement Learning Proposed Framework (Figure 5). In the Reinforcement Learning (RL) framework of machine learning, an agent develops decision-making capabilities through interactions with its environment to optimize cumulative rewards. Reinforcement learning (RL) as shown in Figure 7. Reinforcement learning (RL) can be utilized in IoT security management and control to establish adaptive security protocols that dynamically adjust to evolving security risks and changes within the IoT environment in real-timeJiang, Y., *et al*. (2023).\ \

**State Representation:** The environment is modeled by a state space representing conditions such as network traffic, device behavior, and detected security alerts.\ \

**Action Selection:** The RL agent can take various actions, such as adjusting firewall rules or updating access controls, to maintain the security of the IoT system.\ \

**Training and Evaluation:** The agent is trained through simulations and real-world interactions, learning to optimize its security decisions over time.\ \

**Evaluation Metrics:** Cumulative reward, adaptability to new threats, and response time to detected threats are key metrics for evaluating the performance of the RL agent.

**Natural Language Processing (NLP) for Cloud/Server Layer}**

Natural Language Processing (NLP) is employed on the cloud layer to process logs and command inputs coming from the interfaces of IoT devices. Device logs are trained on a bi-LSTM model to identify anomalous command sequences through token-level classification. This enables semantic anomalies or malicious script injections aiming at

the firmware of smart devices to be detected. NLP Flowchart (Figure 6) With the emergence of natural language processing (NLP), a subset of artificial intelligence, computers are now capable of understanding, interpreting, and generating human language. NLP can be leveraged in the Cloud/Server Layer of IoT devices to improve the management, supervision, and security of IoT infrastructure. As depicted in Figure 8, this involves analyzing and processing textual data, including user commands, system logs, and service requests, to enhance efficiency and effectiveness.

**Text Preprocessing:** Raw textual data, such as user commands and system logs, is preprocessed to remove noise and normalize the text.

**Intent Recognition:** Machine learning models are trained to recognize user intents, enabling the system to generate appropriate actions based on commands.

**Real-World Implementation:** NLP systems are deployed in a live IoT environment to facilitate user interaction and monitor system logs for potential security threats.

**Evaluation Metrics:** Metrics include accuracy of intent recognition, response time for processing commands, and user satisfaction, gathered through feedback surveys.

## RESULTS

Performance Metrics of Proposed Solutions is tabulated in Table 2 along with the accuracy (in Figure 9) and loss curve (in Figure 10).
Metrics like Accuracy, F1-Score, Precision, and Recall were chosen owing to their prevalence in security research. In particular:

- F1-Score weights false positives against false negatives, essential in intrusion detection.
- Latency captures real-time realizability.
- Detection Rate measures IDS performance under class imbalance.
- **Baseline:** Conventional IDS systems implemented with SMOTE and SVM were used as baselines. Our system with GAN outperformed them by 13\% in detection and reduced latency by half (150ms vs. 300ms).

Performance Metrics (Table 2). Performance Comparison of Intrusion Detection Approaches on NSL-KDD (Table 3).
To position the proposed framework within the broader landscape of recent research, we compared our techniques to prominent publications post-2025: Comparison of Related Studies (Table 4). Compared to these works, our framework uniquely integrates multiple advanced techniques across all IoT layers, enabling end-to-end security, reduced latency, and enhanced anomaly detection capabilities. Accuracy Curve (Figure 7). Loss Curve (Figure 8).

## FUTURE WORK AND CONCLUSION

This research presented a comprehensive multi-layer IoT security framework integrating Blockchain, Federated Learning (FL), and Generative Adversarial Networks (GANs) across different IoT architectural layers. The proposed model effectively addresses the limitations of conventional centralized and single-layer security approaches by introducing decentralized trust, privacy-preserving learning, and enhanced anomaly detection through synthetic data augmentation. The experimental evaluation using the NSL-KDD dataset demonstrated significant improvements in detection performance and system efficiency. Specifically, the proposed GAN–FL–Blockchain integrated model achieved a detection accuracy of 95\%, with a precision of 94\%, recall of 96\%, and F1-score of 94.5\%. Compared to conventional intrusion detection systems (SMOTE + SVM), the framework improved detection rate by 13\% and reduced average latency by nearly 50\% (150\,ms versus 300\,ms). These results confirm the framework's ability to enhance both responsiveness and reliability in real-time IoT security environments. Furthermore, real-world validation through healthcare and agriculture case studies recorded up to 10\% higher

anomaly detection accuracy, reinforcing its scalability and domain adaptability. However, certain limitations remain. The integration of Federated Learning and Blockchain introduces computational and communication overheads that may strain low-power IoT nodes. Blockchain consensus mechanisms, even when optimized, can still introduce latency, and interoperability challenges persist across heterogeneous IoT devices from different manufacturers. Addressing these constraints is essential for widespread deployment. Future research will focus on developing lightweight model architectures and adaptive communication protocols to mitigate latency and resource constraints. Exploring edge-based or asynchronous federated learning, hybrid consensus mechanisms, and quantum-resistant encryption can further strengthen scalability and resilience. Additionally, the integration of nature-inspired optimization techniques (e.g., swarm or evolutionary algorithms) may enhance adaptive security decision-making in dynamic IoT environments. In summary, the proposed multi-layer framework demonstrated tangible and quantifiable improvements in intrusion detection and system efficiency. It lays a strong foundation for next-generation, decentralized, and intelligent IoT security systems that balance performance, privacy, and scalability. Continued collaboration among academia, industry, and policy-makers will be crucial to standardize and operationalize such frameworks for real-world, mission-critical IoT ecosystems.

## ACKNOWLEDGMENTS

The authors declare that no funding was required or received for this research. We would like to express our gratitude to the institutions providing the affiliation support for the authors: Brainware University, Narula Institute of Technology, and S-Vyasa Deemed to be University.

### Competing Interests

Authors have declared that no competing interests exist.

### Authors' Contributions

The specific contributions of the authors are as follows:

- **Sourav Sadhukhan** and **Promita Dey** managed the analyses of the study, performed the experimental validation, and drafted the initial sections of the manuscript.
- **Dr. Gunjan Mukherjee** and Dr. B. Vasumathi designed the overall multi-layer framework, provided intellectual guidance, and critically reviewed and edited the manuscript.
- All authors read and approved the final manuscript.

**Consent (Where Ever Applicable)**

This section is Not Applicable as the manuscript does not present a case report, human study, or involve patient data.

### Funding Statement

No funding required.

## ABSTRACT

Data Warehousing (DW) continues to prove to be a significant aspect of organizations that have taken an interest in storing, organizing and analyzing massive amounts of data. The shortcomings of the traditional data warehousing were that the Extract, Transform, Load (ETL) process was very time-consuming and manually intensive; it lacked scalability; it had unstructured data, which was difficult to work with; there was minimal automation in the data warehousing process and data quality issues were frequent. These challenges normally slowed down the decision making process, lowered overall efficiency. The industry has observed the penetration of the advanced technologies, most notably the Artificial Intelligence (AI), with the view of streamlining the data warehousing systems. AI to become more efficient, automated and able to conduct more analysis is taming data warehouses. These methods take advantage of the capabilities of Machine Learning (ML) / Deep Learning (DL) to improve much of data warehousing, such as data integration and quality, performance, and usability. ML/DL models can be automated to carry out the ETL procedures. Algorithms can identify patterns in data, suggest translations and automate data cleaning and transformation processes, minimizing effort and error that might happen as individuals' process data. The trained ML/DL models can identify the problems with data quality like missing numbers, inconsistency, and anomaly and fix them. Automated information profiling, validation, and cleansing make sure that the quality of the data utilized in the analytics and reporting is high. The ML/DL models can be used to analyze the queries and the way individuals use them to access data in order to optimize the data warehouse. This involves smart indexing suggestions,

how to separate a data, and the way to manage loads in order to reduce the time of execution of queries and the appropriate utilization of resources. This survey compares and explicates several research publications that adopt ML and DL to optimize data warehouse operations with regard to automation, performance improvement and data quality improvement. It expects to recognize major developments, compare methods, and outline research gaps to inform the future development of intelligent data warehousing.

**Keywords:** Data warehousing, ML, DL, ETL and Query optimization.

## INTRODUCTION

Data warehousing is assembling and organizing information from several sources into a centralized database. Organizations can use it to efficiently query, analyze, and report on massive amounts of historical data [1]. Assisting decision-making through the provision of clean, consistent, and fast access to data is the primary objective of data warehousing. Even when dealing with enormous datasets, it guarantees quick data retrieval.

**Characteristics of Data warehouse**

Differentiating DW from other data repository systems like relational data base applications, transaction processing systems, as well as file systems are the four keywords: subject-oriented, integrated, time-variant, as well as nonvolatile [2].

**Subject-oriented:** The four primary subjects that make up a DW are sales, customers, products, and suppliers. A DW's primary goal is to model and analyze data for decision makers, rather than to handle the day-to-day processing of transactions and administrative tasks. Because of this, DW usually exclude data that isn't helpful for decision support, giving a clear and succinct picture around specific subject difficulties.

**Integrated:** In order to build a DW, various disparate sources are typically integrated. These sources can include relational database systems, flat files, as well as digital transaction records.

**Time-variant:** Information pertaining to a specific time period (for instance, the five to ten years prior) can be retrieved from recorded data. Time is implicitly or explicitly contained in every key structure of the DW.

**Nonvolatile:** An operational environment's application data is always stored in the operational environment's data warehouse, which is a physically independent storage of data. A DW can function without recovery, concurrency control, or transaction processing because of this isolation.

**Types of Data warehouses**

There are a number of distinct kinds of data warehouses, each designed to meet the demands of a different kind of business.

**Enterprise Data Warehouse (EDW):** an EDW is a centralized database that stores and manages data from all around a company [3]. By consolidating all of the company's data into one place, it makes analytics and reporting across the board much easier.

**Operational Data Store (ODS):**One kind of data repository that specializes in storing operational data in real-time or near-real-time is an ODS. By acting as a temporary storage space for data prior to its loading into the data warehouse, an ODS is frequently used as a precursor to a fully functional data warehouse [4].

**Data Mart:** A data mart is a specialized subset of a DW that is created to cater to particular corporate functions or divisions, such sales, marketing, or finance. Figure 1 shows that data marts are more specialized and compact than EDWs, which means that certain decision makers may obtain the necessary information faster [5].

**Data Lake:** Data warehouses and data lakes are two examples of contemporary approaches to data storage; however, data lakes retain raw, unstructured data alongside structured data. Although data lakes, provide greater processing and storage flexibility, they necessitate more sophisticated data management solutions for management [6].

**Architecture of Data Warehouse**

Data containing both transactional and historical information is stored in the data warehouse design. At its core, architecture can be broadly classified into three types [7]:

S**ingle-tier architecture:** The data storage requirements are reduced with this type of single-layer approach. It aids in eliminating redundant data. One drawback is that it doesn't have a mechanism to differentiate between analytical as well as transactional processing. Implementations of this kind of building are rare.

**Two-tier architecture:** The data warehouse and the physically accessible sources are kept apart in this architecture by a staging area. This design guarantees that the data entered into the warehouse is in a properly cleaned format. However, neither the architecture's scalability nor its ability to handle a large number of end users are addressed. Because of constraints in the network, it also has connectivity issues.

**Three-tier architecture:** According to [8], this is the data warehouse design that is used the most. There is an upper, middle, and lower level to it. Data is cleaned, altered, and loaded using backend utilities on the bottom tier. The data warehouse's database is located on this level. In the middle layer, an OLAP server mediates between the user and the database, providing an abstract interpretation of the data. Data mining, analysis, reporting, query, and managed query tools are all part of the top-tier, front-end client layer that includes an API for connecting to and retrieving data from the data warehouse. The environment is functional, manageable, and readily available because of its primary information repository and the critical DW components that surround it.

**Data warehouse database**: The data warehouse environment's central database is its essential foundation. In order to accomplish this, RDBMS technology is employed [9]. But such solutions have their limits, as the classic RDBMS architecture is more suited to handling transactional databases than data warehousing. To get around the limitations of relational data warehouse models, there are three alternative methods: (1) using relational databases in parallel, which allows shared memory on different types of processors or multiprocessor setups; (2) using new index structures to eliminate relational table scanning and increase speed; and (3) using multidimensional databases, which allow users to bypass these limitations.

**Extract, transform, and load (ETL) tools:** The data warehouse uses ETL technologies to do all the necessary transformations, summarizations, and adjustments to get the data into a consistent format [10]. Data warehouse performance, business intelligence, data accessibility, and ROI are all improved by this ETL process:
**Extraction:** Data collection and system integration are essential steps in this process.
**Transformation:** All of the retrieved data is transformed into a common format.
**Loading:** A huge data warehouse receives updated data.
Before loading data into the target data storage, ETL anonymizes it in accordance with regulatory requirements, protecting sensitive and confidential information [11]. Before operational databases can be loaded into DWs, ETL removes any unnecessary data. Data that has come from many sources can be updated and summarized and derived with the use of ETL technologies. These ETL solutions automate the process of updating the data warehouse by generating background jobs, shell scripts, Cobol programs, etc. The metadata can also be maintained with the use of ETL technologies.

**Metadata:** The data warehouse is defined by metadata, which is information about the data [12]. Building, maintaining, and administering the data warehouse are all helped by several high-level technology principles that are covered in it. Data warehousing tool providers are working to standardize a metadata model. Metadata can be classified into two main types: technical metadata, which is utilized by the warehouse's administrators and designers, and business metadata, which is used by end users to interpret the data contained in the warehouse.

**Query Tools:** Query tools facilitate user interaction with the DW system, enabling the collection of data pertinent to enterprises' strategic decision-making processes [13]. This kind of instrument can take several forms:

**Tools for queries and reports:** These enable businesses to produce operational reports on a regular basis and facilitate printing and calculations that include large batches of data. A few well-known reporting tools are SAS Institute, Oracle, Brio, and Powersoft.

**Application development tools:** Organizations can meet their analytical needs with the help of application development tools as well as the built-in graphical along with analytical tools.

**Data mining tools:** The tool facilitates the automation of data mining, which is the act of finding new and significant correlations and structures in massive datasets.

**OLAP tools:** These tools facilitate data analysis through the use of complicated multidimensional views by capitalizing on the concepts behind a multidimensional database [14]. Both multidimensional OLAP (MOLAP) as well as relational OLAP (ROLAP) are forms of OLAP [15].

Despite its fundamental nature in supporting business intelligence and decision-making processes, traditional data warehousing systems have a myriad of challenges in the contemporary data landscapes. These are the labor-intensive, time-consuming, sluggish ETLs, low scalability, the inability to process unstructured or semi-structured data, and common failures of data quality [16]. These limitations prevent real time analytics and slow down the overall performance of the system due to increases in data volume, type and speedApplied to data warehousing, ML can be used to automate data cleansing, anomaly detection and query optimization [17]. The ML models still are usually dependent on some manual feature engineering and can be sensitive to biased and incomplete data, which tends to induce sacrifices in performance. A sub-field within ML, called DL, is more apt to unstructured data because it is an automated way to extract high-level features in large datasets with complex neural network architectures. DL models are costly and take a lot of time to train as they require large labelled datasets and big computing resources, however, they automate and they are more accurate. Irrespective of these shortcomings, integrating ML and DL in the context of data warehousing provides a ground-breaking solution, allowing smarter, more scaleable systems that are self-optimizing, and able to scale to cope with the requirements of any contemporary analytics. The main aim of the research is an extensive review of existing ML and DL approaches to intelligent DW applications. It also evaluates the various models against each other in their ability to automate, precision, scalability and enhancement of performance. Additionally, the paper researches existing constraints and proposes avenues of future research with the view to creating strong, self-optimizing and self-adaptive data warehousing systems. Section 2 gives the description of the different ML and DL models applied in intelligent data warehousing, and also their comparison in terms of performance and applicability. Section 3 presents the findings and results of such analysis. Section 4 summarizes the work and provides recommendations related to future research on AI innovation related to data warehouse.

## LITERATURE SURVEY

Optimization of data warehousing systems using AI has been an area of substantial interest in the last decade. Due to the rapid growth in data volume and complexity in business settings, traditional data warehousing models are no

longer able to keep up. Some excellent insights into the integration of AI tools (ML, DL, and optimization algorithms) into data warehouse solutions can be found in the literature.

**Survey on ML and Optimization Algorithms for Enhancing Data Warehouse Performance**

To achieve monitoring, analyzing, predicting, and controlling database configuration settings, Khattab *et al*. [18] introduced Neural Network (NN) Monitor, Analyzer, NN Generator (MAG), a tuning framework, which can be implemented layer-by-layer. Specifically, the framework consists of three major components: NNMonitor, which takes the parameters provided to it and predicts the performance of the system, Analyzer, which identifies the source of the problem and tells how to correct it, and NNGenerator that generates the experimental training sets with which it trains NNMonitor. The final step involves carrying out a battery of tests in order to establish that the proposed architecture functions. Shaheen *et al*. [19] introduced an optimized Case-based Reasoning (CBR) to define the workload to autonomously manage database and data warehousing systems by using k-means clustering and Genetic Algorithm (GA) optimization. It categorizes the workload as OLTP, Decision Support Systems (DSS), or Mixed, which refers to a problem with multiple classes. It has also added some Autonomic Computing (AC) capabilities such as self-inspection, self-configuration, self-predicting, self-adaptation to complement self-optimization to convert this model into an autonomous system. Compared to the traditional CBR approach and CBR plus clustering, the proposed model works better in accuracy than either of them. A system based on autonomic forecasting of performance was proposed by Raza *et al*. [20] to predict the performance of a query in a DW setting. Self-prediction to predict the performance of the DW query self-adaptation to manage the query's dynamic behavior, and self-inspection to analyze the incoming query were the three AC characteristics that were put into practice. Unfortunately, the big data amount resulted in a high retrieval time. In response, they employed K-means clustering to speed up retrieval, and CBR beat out competing lazy learners in terms of efficiency and accuracy of predictions. To enable Robopt to execute the plan enumeration procedure over query vectors, Kaoudi *et al*. [21] suggested a fine-grained collection of algebraic operations Robopt is a part of Rheem, an open-source, cross-platform system that shows performance that is on par with or better than a cost-based optimizer with minimal optimization work required.

In order to improve the accuracy of indoor object location using BLE beacons, Zadgaonkar *et al*. [22] suggested inexpensive approach. The short form for the Bluetooth low energy standard is BLE. Because BLE is compatible with every major mobile smart device and tablet, BLE beacons serve as technology enablers. Finding resources, processing orders, and enhancing the whole stock process in managing a warehouse are all areas where the suggested work delivers high accuracy, according to the results. Simone *et al*. [23] introduced a ML methodology based on historic Warehouse Management System (WMS) as well as Enterprise Resource Planning (ERP) transactions to identify hidden patterns from the combination of different events. Two ML solutions are fed by historic data: (i) a saliency-based anomaly detection algorithm; (ii) a hierarchical clustering algorithm. Their combined use enables the calculation of an error propension measure that provides clues about the anticipated propensity of a group of transactions to aid in reducing performance of warehouse management. He *et al*. [24] proposed the Genetic Algorithm with Decay Factor (GA-DF) optimizes the selection operator to avoid local optimal solutions, adopts a preferred selection method to expedite finding the optimal solution, and utilizes a decay factor to facilitate escaping local optima. The results demonstrated that under moderate shelf occupancy and diverse cost scenarios, GA-DF significantly outperformed the other methods in terms of operational efficiency. For huge data management in an ETL process based on cloud architecture, Dinesh *et al*. [25] suggested a hybrid optimization of Swarm Intelligence using the tabu search algorithm. To lower the data's high dimensionality, this work incorporates a Grey-Wolf Optimizer (GWO) into the swarm intelligence algorithm. Data that is relevant to a cluster can be found using Tabu Search (TS). As a result, the massive amounts of data stored in the warehouse can be handled with an anticipated delay. Table 1 shows a comparison of ML and optimization methods for data warehouse performance improvement.

**Survey on DL Methods for Enhancing Data Warehouse Performance**

To simulate the actions of logical relational operators in a query execution plan, Marcus *et al*. [26] proposed the idea of a Deep Neural Network (DNN) as an operator-level neural unit. This plan's parent operator relies on these neural

units to (a) estimate latency and (b) produce performance-related attributes that could be helpful for latency prediction. Experimental findings showing that the strategy beats state-of-the-art methods for query performance forecasting are finally shown. A unique DL-based query optimizer that uses DNN to produce plans for query executions was presented by Marcus *et al*. [27] and is called Neural Optimizer (Neo). The experimental results show that Neo can learn a model that performs as well as, or even better than, state-of-the-art commercial optimizers, even when bootstrapped from a basic optimizer like PostgreSQL. To accurately forecast the distribution of future workload demands in CPU and memory utilization, Rossi *et al*. [28] constructed DL models. A Long Short-Term Memory (LSTM)–based Hybrid Bayesian Neural Network (HBNN) with the addition of a Bayesian layer. To estimate, with a degree of certainty matching the target QoS, the Upper Limit (UB) of the total resources required to satisfy demand, using the confidence bounds as a guide. In order to test the prediction algorithm, eight globally distributed Google Cloud clusters' 29-day load traces were used. A dynamic Double Deep Q Network (DDQN) Order Selection approach (DDOS) for join order optimization was proposed by Ji *et al*. [29]. This method increases the quality of query plan development after first modeling the join query as a Markov decision process (MDP). Experiments conducted on multi-join query applications shown that the suggested technique outperformed other baselines and significantly improved query performance, all while exhibiting positive generalizability and resilience. Zhu *et al*. [30] used a Deep Reinforcement Learning (DRL) method into a Robotic Mobile Fulfillment System (RMFS). However, it lacks solutions for asymmetric situations and has limited versatility due to its emphasis on GA and ACO.

## RESULT AND DISCUSSION

The performance review of the exis ring ML, optimization algorithms and DL methods listed in Table 1 and Table 2 highlights their accuracy in enhancing data warehouse performance. Most of the referenced studies employed various benchmark datasets to evaluate the effectiveness of their models. In this section, a comparative anlysis is carried out between ML techniques, optimization algorithms and DL based models for imporving data warehouse efficency, with a particular focus on accuracy. Figure 2 illustrates a comparative analysis of various ML and optimization algorithms based on their achieved accuracy. It is observed that the alazy learning approach [20] achieved the highest accuracy of 97%, outperforming both the SVM model [22] which obtained 78.23%, and the CBR combined with GA [19], which achieved 60% accuracy. These findings demonstrate that data-driven applications may benefit from lazy learning techniques. However, despite their accuracy, some of these approaches may exhibit limitations in scalability and interpretability, especially in large scale warehouse environments. A comparison of the accuracy of several DL algorithms is shown in Figure 3. Among the DL based models, the combination of LSTM and HBNN [28] demonstrated the highest accuracy of 90.92%, followed by DNN [26] at 80%, while the DL based query optimizer [27] recorded the lowest performance with 70% accuracy. These findings highlight the dominance of sequence based and hybrid DL models such as LSTM-HBNN in representing temporal pattern during a complex data processing task. Nevertheless, this could still be further improved by the virtue of increased adaptability and computational trainability in dynamic query processing real time applications.

## CONCLUSION

Data warehousing augmented with AI-powered solutions is a game-changer for large data management and utilization. Improved data processing efficiency, accuracy, and dependability, as well as higher scalability as well as optimization are some of the revolutionary benefits of AI that are highlighted in this assessment. All these advantages enable companies to utilize analytics in real-time, handle the growing amounts of data effectively, and make effective strategic choices based on data of quality. Issues of privacy and confidentiality of information, the complexity of technical integration, the need to have specialized knowledge, and huge financial costs are some of the key challenges as identified by the assessment. To deal with these difficulties, the necessary safety precautions, proper planning, and smart resource distribution are needed. The present review illuminates the current state of AI-driven data warehousing and demonstrates the need to carry out more research and feasible remedies to resolve the

associated issues. By overcoming these challenges, organizations can retain their competitive edge in the data-oriented economy and harness the full potential of AI to revolutionize data management processes.

## ABSTRACT

Ultra high dilutions (UHD) of homeopathic drugs bear a relationship with their Mother Tinctures (MT/ɵ). UHDs are thought to contain specific water structures induced by their MTs. The aim of the study is to find out the characteristic features of the drug-induced water structure of solvent medium of MTs. Here we show that the characteristic features are actually the vibrational frequencies of the solvent medium of MTs. Two potencies 6 cH and 30 cH of two drugs *Natrum muriaticum* and *Phosphoric Acid* were prepared in the laboratory using 90% ethanol. The control was 90% ethanol. Fourier Transform Infra-Red (FT-IR) spectra of the MTs and their potencies together with the control were taken. The absorbance intensities of the MTs, their potencies and the control differ from each other significantly at 0.05% level. The peak positions of the control, MTs and their potencies differ from each other significantly at 0.05% level for both OH-Stretching and OH-Bending bands. Differences within a drug group and those in between drug groups are significant at 0.05% level. All the data were analysed by one-way ANOVA. Vibrational frequencies are linked to the identity of MTs and the ranks of their potencies.

**Keywords:** Homeopathic Drugs, Vibrational frequency, FT-IR spectra, *Natrum muriaticum* and *Phophoric Acid.*

## INTRODUCTION

Drugs at extreme dilutions beyond Avogadro limit leave a mark on the solvent medium, usually aqueous ethanol of homeopathic drug. The mark does not involve residual drug molecules nor their nano particles. We have observed that the mark is the vibrational frequency. The vibrational frequencies of an element or a compound are unique. When a substance is dissolved in water the vibrational frequencies shift because of certain factors. 1.

**Hydrogen bonding**: water forms hydrogen bonds with solute molecules particularly of OH groups resulting in weakening of the bond vis-à-vis lower wave numbers. The peaks are also broad. 2.

**Solvent induced effect**: the local electric field from water changes vibrational potential energy surfaces producing red or blue shift depending on interaction. Homeopathic drugs are produced from single element, single compound and number of compounds present in plant or animal extract or minerals. The substance is dissolved in aqueous ethanol, usually 90% EtOH. The preparation is called Mother Tincture (MT). The MT is diluted with the solvent 1:100 and succussed 10 times to prepare the first potency or 1 cH. Further potencies are prepared by successive dilution followed by mechanical agitation or succussion. Thus, the potencies from 12 cH onward are too dilute to contain original drug molecules. Yet these potencies behave like the original drug molecules in their effect on patients, plants, animals and *in vitro* on a cell free medium [1-10]. In a series of experiments, it was demonstrated that the solvent molecules carry the information of original drug molecules. Water structures have been suggested to be the main factor. What is the physical basis of water structures? This paper addresses this question. In this paper we have pinpointed the main factor of the physical basis, and that is the vibrational frequencies. Each element or compound has a characteristic set of vibrational frequencies which can be measured by Infra-Red (IR) or Raman spectroscopy. In this paper we have used two potencies prepared in our laboratory from two drugs. The control was their solvent medium 90% Ethanol.

## MATERIALS AND METHODS

**Drugs**

Two drugs, *Natrum muriaticum* Mother Tincture (MT/ɵ) and *Phophoric Acid* Mother Tincture (MT/ɵ) were prepared in the laboratory using the solvent 90% ethanol. The concentration of *Natrum mur*[Sodium Chloride NaCl, DJ6D662357, Merck Life Science Pvt. Ltd., Mumbai-400079] was 1 mg/ml and that of *Phophoric Acid*[Ortho-Phosphoric acid $H_2PO_4$, CH5C650595,Merck Life Science Pvt. Ltd., Mumbai-400018]0.01ml/ml. Each MT was diluted with 90% EtOH 1:100 and succussed manually 10 times to prepare the first potency 1cH. The first potency was further diluted and succussed in the same way to prepare two more potencies like 6 cH and 30 cH. The control was 90% EtOH. Both the control and the solvent medium of the drugs were prepared from the absolute Ethanol (Wheezal, Batch No. DL88-017) by adding appropriate volume of de-ionized and distilled water (DD). All the drug samples and their control were tested for their vibrational frequencies.

**FT-IR spectra**

A Shimadzu IR Affinity -1S Fourier Transform Infrared (FT-IR) spectrophotometer (Spectrum two) with the attenuated total reflection (ATR) technique was used to measure FT-IR spectra of the test samples. The energy resolution was 0.5 $cm^{-1}$. The baseline was corrected for atmospheric humidity and $CO_2$. One drop of each sample was put into the sample groove, and then the tip of a single reflection pure diamond crystal was brought in contact with the sample drop. The entire spectrum was recorded in the wave number range of 4000 to 500 $cm^{-1}$. Each spectrum represents an average of 45 scans. The temperature and humidity were maintained in the laboratory at $25^0C \pm 1$ and less than 50%, respectively. The data were analysed by One-way ANOVA.

## RESULTS

The absorbance intensities were normalized. FT-IR spectra showing OH-Stretching bands of *Natrum muriaticum* ɵ, 6 cH, 30 cH and ethanol Controlare presented in figure 1. The relative value of absorbance intensities are *Natrum muriaticum* ɵ>Ethanol Control >*Natrum muriaticum 6* cH>*Natrum muriaticum* 30 cH. The OH-Bending bands of the *Natrum muriaticum* groups are shown in figure 2. The order of normalized absorbance intensities is same as that of OH-Stretching band. In case of *Phophoric Acid* the normalized absorbance intensities are 90% EtOH >*Phophoric Acid* ɵ >*Phophoric Acid* 6 cH>*Phophoric Acid* 30 cH for both OH-Stretching band (fig. 3) and OH-Bending band (fig. 4). The peak position of OH-Stretching bands for Ethanol control, *Natrum muriaticum* ɵ, *Natrum muriaticum 6* cH and *Natrum muriaticum*30 cH are 3360.25 $cm^{-1}$, 3348.14 $cm^{-1}$, 3375.33 $cm^{-1}$, 3348.78 $cm^{-1}$, respectively. The peak position of OH-Stretching bands for Ethanol control *Phophoric Acid* ɵ, *Phophoric Acid* 6 cH, *Phophoric Acid* 30cHare 3360.25 $cm^{-1}$, 3334.10 $cm^{-1}$, 3335.25 $cm^{-1}$ and 3360.90 $cm^{-1}$, respectively. The peak position of OH-Bending bands for Ethanol control, *Natrum muriaticum* ɵ, *Natrum muriaticum 6* cH and *Natrum muriaticum* 30 cH are 1653.85 $cm^{-1}$, 1646.30 $cm^{-1}$, 1654.19 $cm^{-1}$, 1652.74 $cm^{-1}$, respectively. The peak position of OH-Bending bands for Ethanol control, *Phophoric Acid* ɵ, *Phophoric Acid* 6 cH, *Phophoric Acid* 30 cH are 1653.85 $cm^{-1}$, 1645.80 $cm^{-1}$, 1645.58 $cm^{-1}$ and 1648.00 $cm^{-1}$, respectively.

**Statistical Analysis**

The data were analysed by one-way ANOVA. The independent variables were drugs and their control. The dependant variables were the Mother tincture and the potencies of each drug. We selected 5 points in each spectrum. The results show that the MT and its potencies are different from each other at 0.05% level. When we compare two groups *Natrum mur* group and *Phophoric Acid* group, we observe that the two groups are significantly different from each other at 0.05% level. Thus, the results show that the vibrational frequencies can determine the potency ranks of each, drug and also different drugs.

## DISCUSSION

Using Raman spectroscopy Yang *et.al* (2023)[11] demonstrated that solute molecules induce changes in water-specific structure of aqueous solutions. The changes involve enhancement of water structure and hydrogen bond strength in dilute solutions[11]. When Sodium chloride or Phosphoric acid is dissolved in aqueous ethanol water forms hydrogen bonds with OH groups resulting in weakening of these bonds[12-14]. Thus, the bonds shift to lower wave number. This is evident in both *Natrum mur* ɵ and *Phophoric Acid*ɵ as compared to Ethanol control. However, the potencies like 6 cH and 30 cH of both the drugs do not follow the rules. This may be due to the fact that the potencies are prepared by mechanical agitation, which augments the hydrogen bond strength. The potencies of both the drugs show either blue shift or red shift due to solvent effect [15]Mass and bond strength of the MT, here Sodium chloride and Phosphoric acid, also affect the vibrational frequency of aqueous solution [16-18]. Temperature and pressure also affect the vibrational frequency of aqueous solution [19-20]. In our experiments temperature was kept constant for all the samples Ionic solvation and ion pairing are also another factor [21-22]. Thus, the solutes, here Sodium chloride and Phosphoric acid in the MTs can shift or modify the vibrational frequency of the solvent here aqueous ethanol through inter molecular interaction. It has recently been demonstrated that a homeopathic potency can transfer its water structure to a blank aqueous ethanol without direct physical contact [23]. Potencies are prepared by mechanical agitation or succussion which can influence the vibrational characteristic of the solvent. However, all the factors do not change the intrinsic molecular vibrational mode of the solvent molecules. Mechanical agitation can change local temperature and generate micro bubbles. Agitation can also change local hydrogen bonding network in aqueous ethanol solution. Agitation can also change phase and conformation. Vibrational frequencies are related to the MT and the ranks of the potencies. Some aspects of solute vibrational dynamic bear a relationship to those of the solvent [24]. Homeopathic potencies are prepared not only from single compound but also from the MT of plants and animal products containing many compounds. Here the vibrational frequencies of the solvent medium would shift due to several interacting factors as mentioned above.

## CONCLUSIONS

Vibrational frequencies of UHDs bear a relationship to the drug molecules in aqueous solutions. The ranks of the potencies prepared from drugs are also linked to the vibrational frequencies. Vibrational frequencies constitute the main factor that connects the drugs and their extreme dilutions.

## ABSTRACT

In the modern competitive market, companies have been continuously battling to minimize their costs on logistics. Warehouses are crucial in logistics systems, and their management must be effective to minimize production costs and guarantee customer satisfaction. The main activity in the retail e-commerce warehouse is order selection, which is critical for fulfilling customer orders. It is effortful and strenuous physical endeavour in every warehouse. This is mostly because customers expect their orders to be fulfilled quickly and most orders are for a single product. In addition, warehouse employees are seeing a surge in health problems and exhaustion due to the enormous demands placed on them by online shoppers' high standards of service. Therefore, any poor performance in order selection can cause to low-quality service and over running expenses for a whole supply chain and the warehouse. To address these issues, heuristic methods, optimization algorithm and Artificial Intelligence (AI)-driven data warehouses have emerged, enabling real-time predictive analytics to optimize e-commerce operations such as order selection, batching and enhance e-commerce business strategies. Nowadays, numerous researchers have shown interest in the topic of effective order selection in warehouses due to the vigorous growth of e-commerce. They have studied various methods, including heuristic, optimization, Machine Learning (ML) and Deep Learning (DL) to improve order picking. This paper reviews various approaches analysed or developed to enhance order picking in e-commerce data warehouses. It also addresses the advantages and limitations of those methods, identifying the most

prevalent order picking improvement approach. Moreover, it concludes the survey and recommends possible solutions to upsurge the efficacy of order selection performance in e-commerce warehouses.

**Keywords:** Order Picking efficiency, E-commerce, Customer satisfaction, Artificial intelligence, Retail warehouse management.

## INTRODUCTION

Manufacturing businesses face many issues in fulfilling consumer orders and distinguishing them. These businesses think through cost reduction and elimination, as well as enhancing efficiency in their logistics systems, as significant improvement efforts [1]. An essential part of any company's internal logistics system is the warehouse, which are crucial in every manufacturing company's supply chain [2]. It provides a safe haven to stash money in case of unpredictable demand or price hikes. The main functions of the e-commerce retail warehouse are as getting, storing, order selection, and delivery. The e-commerce landscape exhibits greater unpredictability in the demand for and pricing of items, underscoring the significance of the warehouse [3] as a critical component of the e-commerce supply chain. During promotional events, a significant volume of orders is produced. E-commerce mostly encompasses Business to Business (B2B), Business to Consumer (B2C), and various specialized sectors. Boysen *et al*. [4] delineated four features of e-commerce orders.

**Small orders:** The proliferation of merchants on e-commerce retail platforms has expanded consumer options significantly. A user is restricted from ordering multiple items from one merchant simultaneously, leading to the commodities being sourced from various locations across the nation.

**Extensive orders:** To reduce expenses and streamline order fulfillment, a warehouse can aggregate various product categories for online merchants, enabling them to provide a broader range of products than traditional brick-and-mortar stores. For instance, JD.com-operated stores in China provide a diverse array of products, ranging from individual components to huge household appliances.

**Stringent delivery timelines:** The rise of e-commerce has led to escalating expectations for delivery services. Besides door-to-door delivery, expedited delivery times are increasingly mandated [5].

**Fluctuating workloads:** The inventory in each warehouse can vary due to seasonal changes, batch manufacturing, and conveyance [6]. For instance, small T-shirts are largely prevalent in midsummer, whereas down coats are favored in midwinter, necessitating variability in inventory.

The globalization and new developments in e-commerce can increase customer expectations, leading to intensified competition among warehouses, forcing them to handle numerous small orders within tight timeframes. So, the order picking system, which accounts for 60% of total productive activity and 55% of warehouse operational expenditures, is crucial for meeting client requirements [7]. This process involves various factors like travel distance, time, layout, channel configuration, picking dimensions, size, batching, ordering parts, picking list, stress, psychological conditions, and minimizing travel distance. However, warehouse managers find the process of overseeing order selection tasks and evaluating the interrelationships of order selection planning issues to be challenging. To categorize the order selection method efficiently, Dallari *et al*. [8] categorized it into five classes to support warehouse designers, such as picker-to-parts (Pi2P), pick-to-box (P2B), pick-and-sort (PS), parts-to-picker (P2Pi), and automated picking. A PS method involves operatives retrieving items from multiple orders, transferring them to a conveyor, and every item's final resting place is decided by an automated mechanism, ensuring consistent batch size [9]. In P2Pi method, commodities are transported via storing to picking region using automated machines. Van den Berg [10] recognized an innovative type, termed a picker-less system or automated picking, depending

upon the Pi2P system and vice-versa. Here, various tactics can be employed to minimize operational processes or decrease the number of pickers required. Order selecting tactics encompass layout structure, storing tasks, routing methods, order batching, and zoning.

**Layout Structure:** This aspect of the picking environment relates to two things: first, the layout of the building that houses the order-picking system; and second, the plan of the order selection system, which is also known as the aisle formation issue or internal layout design.

**Storage tasks:** It is a collection of guidelines that can determine where things should be kept. While class-based storing is useful for appropriate goods storage due to its applicability to situations with a wide range of product sizes and turnover rates, it has a low space utilization rate .

**Routing technique:** The goal of routing policy is to arrange the things as per the schedule in a specific order so that they can be efficiently picked from the warehouse, with as few unnecessary turns as possible. Order batching entails combining numerous orders into a single batch. The picking density in every order-selection procedure can be increased by completing the batch picking in one picking operation.

**Zoning:** Order pickers are only required to finish a portion of their work in the area directly surrounding the order. The picker may have extensive knowledge of the items' location and transit distances.

A functional diagram of these different order picking strategies is shown in Figure 1. On the contrary, the order picking systems have planning challenges, which are ordered from strategic to operational, as presented in Table 1. Rules and strategies for allocating resources to achieve long-term modest objectives are called as strategic management choices. The design of the storage space (i.e., its form, number of blocks, and storehouse locality) and the choice of storage methods, specifically, extent of technology and material handling devices to collect things, are examples of strategic considerations [11]. The issues imposed by tactical and strategic decisions should guide operational choices. To resolve these challenges, the enhancement of the order selection procedure is essential to enhance the entire order implementation method and increase customer satisfaction. However, the absolute capacity and intricacy of this data present major challenges in terms of storage, management, and analysis. AI-powered data warehouses are a significant improvement in data management as they can process, store, and analyze data with remarkable speed and precision. These systems utilize advanced AI algorithms like ML and DL-based predictive analytics, to automatically identify patterns and trends in large datasets. AI-powered solutions can handle complex data structures and offer real-time insights. Figure 2 illustrates the framework of integrating predictive analytics in e-commerce retail warehouse. AI integration in data warehousing dramatically increases order-picking and operational efficiency in e-commerce companies. Furthermore, it summarizes the survey and suggests potential methods to improve order selection performance in e-commerce warehouses. The remaining sections are prepared as: Section 2 discusses recent studies related to the order picking system enhancements with a comparative analysis of their advantages and disadvantages. Section 3 concludes the survey and suggests future directions.

**Survey on Various Approaches of Order Picking Systems and Processes in E-Commerce Warehouses**

Tang *et al*. [12] developed OrderMonitor, a data-driven visual analytics solution that allows warehouse managers to assess and improve order processing performance in real-time. The system visualizes the order processing pipeline using a sedimentation metaphor, allowing for real-time monitoring and the detection of abnormal orders. Lorenc and Burinskiene [13] focused on enhancing e-commerce order picking by leveraging big data analytics and clustering techniques. A clustering approach was used to reduce picking order times by calculating efficient product relocation and packing area distances. A Define-Measure-Analyze-Improve-Control (DMAIC) method was created by Khan *et al*. [14] to improve order-picking and warehouse storage. For the reallocation of the inventory of the most popular brand, SSS, the ABC analysis based on the Stock-Keeping Unit (SKU) would be ideal; nevertheless, it was inapplicable and inefficient because it took more time and effort. A framework for an order-picking issue, including a one-directional conveyor and buffer, was created by Czerniachowska *et al*. [15]. Nevertheless, the commercial solver

without the sophisticated solution technique solved this model. Guo *et al*. [16] developed a mathematical model for the order batching issue that takes into account distributed storing, zone-wave batch picking, and pickers' closeness. They devised the Aisle-Based Constructive Batching Algorithm (ABCBA) to improve warehouse picking efficiency and safety. However, they expected that a picker stays all aisles required by a job within the time. Alqahtani [17] concentrated on the storage allocation problem to estimate the best SKU inventory level and the storage task issue to locate SKUs in effective places. However, its efficiency and scalability were limited. D'Haen *et al*. [18] proposed an integrated solution strategy for dealing with dynamic order arrivals while scheduling order pickup procedures. Nevertheless, unlike the impact of order anticipation without considering the ratio of active vehicles; there is a non-significant relationship between the two, which might be attributed to the wide variance in tardiness. To increase order selection efficacy and prevent unequal task delivery, Wang *et al*. [19] investigated a joint optimization issue in distribution of orders and selection of racks for a P2Pi method with several stations. To address the issue, an enhanced version of the Simulated Annealing (SA) method was created. However, improving efficiency in unpredictable situations requires additional decision-making elements. Vijayakumar and Sobhani [20] utilized a human-centric approach to optimize the effectiveness of a Pi2P method employing pick and transport robots. However, various assumptions and limitations must be addressed to create the mathematical model in practice. So, there are true deviations from the real-life scenarios. Ahmadov and Helo [21] utilized Long Short-Term Memory (LSTM) and Deep Neural Networks (DNNs) techniques to predict intermittent online sales for e-commerce platforms. These models may struggle with non-stationary data not following the Poisson exponential distribution, limiting its applicability.

Zeng *et al*. [22] focused on streamlining the picking path at the IKEA Fuzhou distribution facility. The challenge of enhancing the picking path was then turned into the traveling salesman issues, and a picking route optimization algorithm was created utilizing a Genetic Algorithm (GA) to examine sorting efficacy and route optimization. Denizhan *et al*. [23] considered an order-picking issue in a healthcare sector to be NP-hard and solved it using a multi-objective GA. The GA iteratively evolves solutions via selection, crossover, and mutation. However, this GA has a low convergence rate and becomes caught in local optima. Pawar *et al*. [24] devised a novel two-step hierarchical dispersion strategy to decrease picking transport for e-commerce warehouse employees. They used a unique entropy-based scattering metric to develop an Entropy-based Storage Location Assignment Problem (ESLAP). However, they solely concentrated on reducing order-picking effort. Kalkha *et al*. [25] proposed an Intelligent Storage Location Assignment (ISLA) technique which utilizes unconventional time series grouping procedures, such as self-organizing maps, dynamic time warping-based k-means, and Agglomerative Hierarchical Clustering (AHC), to augment order completion and warehouse efficacy. However, it was highly sophisticated and resource-intensive. De Assis *et al*. [26] created a genetic route optimization strategy employing GA to optimize order-picking routes in the shoe manufacturing business. However, effectively simulating real-world warehouse circumstances posed considerable problems, particularly the complexity caused by various products in a single location. Chen and Li [27] solved the SLA issue in robotic mobile fulfilment systems to enhance the efficacy of human-robot cooperative order selection process. However, the key drawback was that human pickers worked at fixed terminals, and the distribution of workload across workstations also had an impact on efficiency. Zhu *et al*. [28] used Deep Reinforcement Learning (DRL) algorithm in a Mobile Robot Fulfilment System (RMFS) to improve order handling and structure constancy. However, it lacks solutions for asymmetric situations and has limited versatility due to its emphasis on GA and ACO.

Kang *et al*. [29] investigated the online order reservation and batching issue by machine learning according to an aisle-rack order similarity metric criterion. After that, they established an ensemble framework based on multi-layer stacking and k-fold bagging to determine order booking, order release, order batching, sequencing, assignment, and picking. Bassiouni *et al*. [30] presented DL methods to detect order position in a complex supply chain. They used simple LSTM, deep-LSTM, one-dimensional Convolutional Neural Network (1D-CNN), and TCN-1DSPCNN algorithms to derive attributes. Also, the softmax, random trees, random forest, K-nearest neighbor, artificial neural network, and support vector machine were utilized to categorize delay or non-delay data. Yuan *et al*. [31] attempted to optimize the order-picking method in Automated Drug Dispensing Systems (ADDS) and pharmacists by

concentrating on the SLA problem. However, more optimization necessitates investigating the impact of batching orders. Xu *et al*. [32] developed a multi-objective optimization method to reduce order picking time, delay and picking costs when balancing picker workload in e-commerce warehouses. However, choosing aisle congestion and product scarcity was not considered. Deng *et al*. [33] introduced two novel seed batching techniques that take into account product correlation. Then, tabu search was utilized to enhance the two algorithms. However, its efficiency was inadequate owing to excessive CPU time. Table 2 summarizes the above-discussed approaches in terms of their benefits and limitations. Figure 3 illustrates a comparison of picking time obtained by the recent approaches. It observes that the approaches in [18], [28], and [31] achieved a minimum picking time compared to the other approaches in [13], [22], and [32]. Similarly, Figure 4 demonstrates the picking distance of recent approaches. The ESLAP [24] and GRO [26] achieved low picking distance compared to the GA [22] and tabu search method [33]. So, it revealed that the two-stage SSCA [31] attained lower picking time, whereas the ESLAP [24] attained low picking distance compared to the other recent approaches. However, these approaches still have limitations in adaptability and versatility in real-time order picking environments with larger order sizes.

## CONCLUSION

Due to e-commerce, globalization, increasing consumer expectations, and new market laws, warehouses are now under increased pressure to process more orders in less time. So, for overall performance, it's important to know how individual planning affects performance management's selection of plans, which in turn increases customer service. In this study, a comprehensive literature review of recent studies about improving order picking systems and processes is presented. Numerous solutions have been considered to upsurge the efficacy of picking, minimize the costs of operation, and increase customer satisfaction, such as data-driven visual analytics, heuristic methods, mathematical modelling, and sophisticated AI algorithms. They have realized significant time and distance savings in picking. Nevertheless, they still have limitations, such as a lack of scalability, dependency on complex computation resources, and the inability to handle dynamic or real-world situations in the warehouse. Thus, there is potential to create more scalable, robust, and adaptive order-picking systems in the future that can support the changing needs of e-commerce and drive operational efficiency, customer satisfaction, and lower costs and environmental footprint.

**Table 1: Challenges in Order Picking Planning**

| Categories | Challenges | Description |
|---|---|---|
| Strategic | Storage rank arrangement | Determine the dimensions of storage shelves, as well as pick and cross-aisles, based on the pick area's scope or volume needs. |
| | Technical equipment selection | The use of technology instruments (such as material handling apparatus and pick by voice) to make picking easier. |
| | Depot location | Choosing the quantity of storehouses and the position of the pickup and shipping points to begin and terminate every pick tour. |
| Tactical | Zone place | Way of dividing the selection region into selection zones (including the quantity, their position, and shape). |
| | Zone task | Way of assigning items to select zones depending upon product features or demand characteristics. |
| | Zone picking | Consumer orders go across every pick zone, that might be concurrent or consecutive. |
| | Sorting | Products are consolidated and sorted throughout the pick tour or after selection. |
| | Replenishment | Deciding how and the minute to replenish storing in the order pick region. |
| | Storage assignment | Rules for allocating items to particular storage sites or storage classes (depending on turnover). |
| Operational | Resource planning | Determine the resource level and distribute accessible resources among order selection zones. |
| | Workload planning | Which client orders should be retrieved within what time period? |
| | Order batching | Rules for combining client orders in each pick trip. |
| | Picker routing | To recover all goods on a pick list, storage locations must be visited in a specific order during each pick trip. |
| | Job assignment | Choosing the order in which orders/batches are obtained, and assigning these (batches of) orders to obtainable pickers. |

**Table 2: Summary of Various Approaches for Order Picking Systems or Processes in E-commerce Warehouses**

| No | Authors Name (Year) | Approaches | Findings | Merits | Limitations | Performance Metrics |
|---|---|---|---|---|---|---|
| 12 | Tang *et al*. (2021) | Order Monitor | Visual analytics for online firms real-time order tracking, analysis, and metric intake | enables easy glance of data for fast real-time tracking and decision-making | The main drawback was that it couldn't be linked into other warehouse data like inventory changes and shelf layouts | Processing time = 272 min |
| 13 | Lorenc and Burinskiene | Clustering approach | By shifting goods for order | The picking time was reduced | It relies on the eminence and | Picking time = 0.639 hour |

| | | | | | | |
|---|---|---|---|---|---|---|
| | (2021) | | picking, it cut the picking time by around 17.4-25.6% | significantly | accuracy of WMS information | |
| 14 | Khan *et al*. (2023) | DMAIC | It decreased picking time by 66.7%, increased items per picker per hour by 40.5%, decreased travel distance by 58.5% and reduce cost per order by 9.9%. | It achieved significant improvements in efficiency, utilization, and cost. | It was inapplicable and inefficient because it took more time and effort. | Items per picker/hour = 59, Worker's utilization = 83%, Distance travelled = 340 m, Cost per order = 17.2 AED |
| 15 | Czerniachowska *et al*. (2023) | Logistics ordering model | It developed a model for order-picking with a one-directional conveyor and buffer system | It solved effectively using a commercial solver without complex trick | The commercial solver without the sophisticated solution technique solved this model | Solution time = 601.54 s |
| 16 | Guo *et al*. (2023) | ABCBA | It optimizes the entire picking period to 46% and the usual risk in a virus infection of pickers to 72%. | It concurrently enhanced picking efficiency and safety by minimizing aisles | They expected that a picker stays all aisles required by a job within the assignment time. | No. of aisles visited = 888, Total picking time = 39.8 hr, Picker's average risk = 3313 ps, Travel time = 20.8 hr |
| 17 | Alqahtani (2023) | Hierarchical top-down approach | It focused on optimizing order picking response time in a retail warehouse. | It simplified decision-making by breaking down complex warehouse | Its efficiency and scalability were limited. | Total travel distance = 1750743.521m, Total travel time = 175.0734521 hr, % of savings = 22.18 |
| 18 | D'Haen *et al*. (2023) | Integrated solution strategy | Optimized order picking in lively order onsets by joining, batching, assignment, and anticipation. | It took to dynamic order arrivals and made real-world store actions better. | The relations between the proportion of active trucks and order expectation is non- significant | Total tardiness = 9.31 s, Average order pick time = 96.23 s |

| | | | | | | |
|---|---|---|---|---|---|---|
| 19 | Wang *et al*. (2023) | Enhanced SA | It reduced rack shifting distance by 55.1% and workload imbalance by 100% | It was computationally efficient for both medium and large-scale orders. | Improving efficiency in unpredictable situations requires additional decision-making elements. | Running time = 210.2 s, Rack travel distance = 1100 m |
| 20 | Vijayakumar and Sobhani (2023) | Mathematical model | Optimal robot and zone layouts reduced day labor expenses by 20-30%, energy use by 15-25% for order pickers, and rate of items taken by 10-15% | It increased efficiency and reduced errors. | Various assumptions and limitations must be addressed to create the mathematical model in practice. | Daily cost = 2663 Euro, Order pickers' energy expenditure rate = 2.197 kcal/min, Error rate of order picking operation = 0.25% |
| 21 | Ahmadov and Helo (2023) | DNN and LSTM | For rare online purchases, it raised prediction accuracy by up to as 35% | It reduced prediction error significantly. | No data that does not follow a Poisson exponential trend may be able endure these ideas | Mean absolute error = 9.35 |
| 22 | Zeng *et al*. (2024) | GA | On average, it cut picking time by 22.08% and picking distance by 48.56%. | It significantly reduced picking distance and time by routes. | When dealing with a vast range of order products, the GA may run into local optima issues. | Total picking distance = 270.413 m, Total picking time = 24.11 min |
| 23 | Denizhan *et al*. (2024) | Multi-objective GA | It decreased total travel distance by up to 51%. | Maximized pallet use through better travel and trips | This GA has a low convergence rate and becomes caught in local optima. | Total distance = 240 m |
| 24 | Pawar *et al*. (2024) | ESLAP | It decreased average pick distance by 38%. | It enhanced inventory scattering across and within zones. | To further enhance order-picking value, it's execute a product correlation-based storage plan. | Distance per pick = 49 m |

| | | | | | | |
|---|---|---|---|---|---|---|
| 25 | Kalkha *et al*. (2024) | ISLA method | It lifted the efficiency benefit by 69% and 61% for s-shaped and midway routing schemes, as well | It was cost-effective and much faster up the task of filling orders | It was highly sophisticated and resource-intensive. | Travel distance = 950 m |
| 26 | De Assis *et al*. (2024) | GRO | It decreased picking distances by an average of 14.90%. | It optimized picking routes and reduced picking times. | To get the right balance between accuracy and speed, GRO variables had to be closely set up | Picking distance = 80 m |
| 27 | Chen and Li (2024) | Two-stage optimization method | It reduced total order-picking time by optimizing pod retrievals and human picking efficiency. | It improved order-picking by combining techniques for linked assignment and balancing grasping effort | The key drawback was that human pickers worked at fixed workstations, and the distribution of workload across workstations also had an impact on efficiency. | Total order picking time = 12000000 s, No. of pods' retrievals = 549000, Grabbing time = 200000 sec, Capacity usage on storage level = 94.1% |
| 28 | Zhu *et al*. (2024) | DRL with ACO and GA | It reduced overall pick-up time and arrived at efficient convergence. | More flexible and efficient dynamic warehouses. | Asymmetric situations and has limited versatility GA and ACO. | Picking distance = 16924 m picking time = 1.26 min |
| 29 | Kang *et al*. (2024) | Ensemble machine learning model based on aisle-rack order similarity metric | It can made conscious reservation decisions by predicting the resemblance between present orders and upcoming orders | It reduced distance and time for order picking by allowing the batching of similar orders during distinct times | The service time and travel time remained high. | Turnover time = 465.24 s, Service time = 53589.31 s, Waiting time = 440.15 s, Batch volume = 21.79, Travel time = 16433.31s |
| 30 | Bassiouni *et al*. (2024) | Deep learning models | They dealt with any delay and broke up assets in the supply chain | It achieved high accuracy for predicting late orders | Its forecast ability could use some work, mostly in the area of learn. | Accuracy = 0.9305, Precision = 0.9239, Recall = 0.9295, |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | | | | | F1-score = 0.9267 |
| 31 | Yuan *et al*. (2025) | A math-based, 2-stage SSCA method | It decreased average picking time to 80.74s for large orders. | It reduced cross-machine orders and picking time. | Finding the effects of batching orders is essential for further optimizing. | No. of prescription order size = 900, Average picking time = 80.74 s |
| 32 | Vazquez-Noguerol and Prado-Prado (2025) | MLR | It optimized the usage of resources and facilitated effective virtual order selection scheduling. | It was very capable for online picking design. | The order picking time excludes time spent resolving picking events and controlling stock-outs. | $R^2$ = 0.8167, F-statistic = 22.07 |
| 33 | Xu *et al*. (2025) | NSGA-II | It significantly reduced order selection duration, delay costs, and picking costs | It raised search abilities and range while easing things. | Choosing aisle congestion and product scarcity was not considered. | Picking time = 42.663 min, delay cost = 505.2 yuan |

**ABSTRACT**

T2-weighted (T2W) and FLAIR are key neuro-imaging sequences; T2W offers strong tissue contrast but is limited by bright CSF, while FLAIR suppresses CSF to enhance lesion visibility. This study compared GM and WM signal intensity, SNR, and CNR between T2W and FLAIR on a 1.5T MRI in 50 healthy adults. T2W showed higher GM and WM SNR (21.1 vs. 13.4; 17.2 vs. 11.2) and greater GM-WM CNR (3.9 vs. 2.3, $p<0.001$). Despite T2W's superior tissue differentiation, FLAIR remains vital for pathology detection. Both sequences are complementary in brain MRI.

**Keywords:** MRI, FLAIR, T2W, CSF, GM, WM

## INTRODUCTION

Magnetic Resonance Imaging (MRI), like other imaging methods in medicine, is considered a distinctive technique and emerged as a modern technology in 1946. That year, Dr. Felix Bloch from Stanford University and Dr. Edward Mills Purcell from Harvard University separately discovered the principle of nuclear magnetic resonance (NMR), an achievement that earned them the Nobel Prize in 1952. Until the 1970s, MRI applications were largely confined to

chemical and physical research. In 1971, Dr. Raymond Damadian demonstrated that relaxation times varied between healthy tissues and tumors, sparking interest in MRI as a tool for studying diseases. Over the following two decades, researchers advanced the technology into the clinical imaging system widely used today [1]. A major breakthrough in this progress was the introduction of superconducting magnets, which enabled the generation of the strong magnetic fields essential for MRI. Because these components were necessary, the first human MRI scan was not performed until 1977. With ongoing improvements in computer technology, image acquisition gradually became much faster. A landmark moment arrived in 2003, when Paul C. Lauterbur and Sir Peter Mansfield were awarded the Nobel Prize for their pioneering contributions that established MRI as a powerful diagnostic technique [2].

**Basics of MRI**

MRI is medical imaging process which uses magnet to reconstruct images of body tissues and helping in differentiate between normal tissues and abnormal tissue. MRI is different from the other modalities of radiology department, it is used to assess soft tissue enhancement. MRI is formed by Magnetic Resonance Imaging that because its uses magnetic field to construct images of body tissue by sending RF pulse to specific part of body that energy get excite protons of tissue and these proton release energy to the surrounding that gets observed by RF coils[3]. Magnetic Resonance Imaging (MRI) is pivotal in evaluating brain pathology due to its high sensitivity to tissue composition. T2-weighted (T2W) imaging highlights tissue water content, producing bright signals in grey matter (GM) relative to white matter (WM). However, its diagnostic potential is limited in periventricular and juxtacortical regions due to cerebrospinal fluid (CSF) hyperintensity[4]. The T2 FLAIR sequence mitigates this by employing an inversion recovery pulse with a specific inversion time (TI) to suppress CSF, enhancing lesion conspicuity. Clinically, FLAIR is especially valuable in detecting multiple sclerosis plaques, ischemic stroke changes, and neoplasms near CSF spaces[5]. Although both sequences are standard in brain imaging, few studies have provided quantitative comparisons of GM and WM contrast across T2W and FLAIR using identical acquisition conditions. This study aims to address that gap[6].

**Tissues and their T2 appearance**

- **Bone marrow:-** equal to or higher than that of muscle (fatty marrow is usually bright) Muscles- gray (darker than the muscle signal on T1 images)
- **Fat**–bright(darker than the fat signal on T1 images) White matter - darker than gray matte
- Moving blood-dark Gray matter – gray
- Fluids–bright
- Bone-dark
- Air – dark[7]

## MATERIALS AND METHODS

**Study Population**

We retrospectively analyzed brain MRI scans of 50 healthy adults (30 males, 20 females; age range 25–50 years; mean age 35 years) performed at a single tertiary care center. Subjects had no neurological or psychiatric illness.

**MRI Protocol**

All imaging was performed on a Philips Ingenia 1.5T MRI scanner. Axial brain scans included a T2W turbo spin echo (TSE) and T2 FLAIR sequence. Acquisition parameters are summarized in Table 1.

**Quantitative Analysis**

Regions of interest (ROIs) were manually drawn in frontal/parietal cortical GM, centrum semiovale WM, and background air. Mean signal intensity (SI) and noise (standard deviation of background ROI) were recorded.
$SNR = SI_{tissue} / \sigma_{noise}$
$CNR = |SI_{GM} – SI_{WM}| / \sigma_{noise}$

**Statistics**
Paired t-tests compared GM-WM CNR between T2W and FLAIR. Pearson correlation assessed age associations. A p-value <0.05 was considered significant.

## RESULTS

**Signal Intensities and SNR**
T2W produced higher signal intensities for both GM and WM compared to FLAIR. Mean GM SI was 255.4 AU (T2W) vs. 198.6 AU (FLAIR); WM SI was 208.7 AU vs. 165.2 AU. Noise was slightly higher in FLAIR (14.8 AU) than T2W (12.1 AU). SNR values were greater in T2W (GM: 21.1; WM: 17.2) than FLAIR (GM: 13.4; WM: 11.2).

**Contrast-to-Noise Ratio**
T2W demonstrated significantly higher GM-WM CNR (3.9) than FLAIR (2.3).

**Statistical Analysis**
Paired t-test confirmed the CNR difference was significant ($p<0.001$), favoring T2W for GM-WM differentiation. No correlation was found between age and SI or CNR.

## DISCUSSION

This study quantitatively demonstrates that T2W imaging provides superior GM-WM tissue contrast compared to FLAIR. However, the unique diagnostic value of FLAIR lies not in GM-WM differentiation, but in CSF suppression, which enhances lesion visibility in periventricular and juxtacortical regions. In clinical practice, FLAIR is indispensable in multiple sclerosis, ischemic stroke (DWI-FLAIR mismatch), and glioma subtyping (FLAIR mismatch sign). Our findings explain why FLAIR remains complementary rather than substitutive to T2W.

## LIMITATIONS

This single-center study analyzed only healthy subjects. Further studies should include pathological cohorts (e.g., demyelinating, ischemic, neoplastic conditions) and compare across different field strengths (1.5T vs. 3T).

## CONCLUSION

T2W sequences provide quantitatively superior GM-WM contrast, while FLAIR sequences, despite lower SNR and CNR, are clinically superior for lesion detection due to CSF suppression. Both remain essential in comprehensive brain MRI protocols.

**ABSTRACT**

Food increases the duration of life. The purpose of food is to purify the mind and aid bodily strength. Great authorities in selecting good foods are very dear to those in the mode of goodness. Bhagavad Gita is a Hindu religious book that's a part of the Mahabharata and includes 18 chapters with 700 verses. Lord Kirshna gave instructions to Arjuna on the battle field of Kurusethra. It contains the principles of teaching. Scripture contains the instructions for guna's and food. Qualities of guna are present in all human beings. Based on their guna (behavior), one can be identified and responsible for all actions. The purposes of this study are to explore the subjective quality of guna and food.

**Keywords:** Bhagavad Gita, Arjuna, Kurusethra, guna.

## INTRODUCTION

**Model Transformation in Relation to Mind Nature**

Material nature (Prakriti) is composed of three gunas, namely sattva (purity), rajas (energy), and thamas (inertia). Each and every individual has a mix of these three gunas. Transformation of the body and its mode of action. Prakriti means complex of mind, sense, and organs. Alladi Mahadeva Sastry, (1977) explores the knowledge of questions asked by Arjuna, to which God gave answers one by one, namely the questions mentioned below.

1. What is guna?
2. What are the guna's attachments, and in what way are they attached?
3. How do people bind with these gunas? With a view of these questions, God proceeds to answer them one by one.

Prakriti and Ptirusha are considering eternity. Prakriti and purusha are about matter and spirit. The Lord says there are two types of prakriti, namely superior and inferior, and these two have no beginning.

How does the earth get the energy from the sun and send it back to the sun in an opposite reaction, like how does the quality of guna get from one person and react to another? In what form does it reflect sattva, rajas, or thamas? It shows the cause and effect of guna.

प्रकृतिं पुरुषं चैव विद्ध्यनादी उभावपि |
विकारांश्च गुणांश्चैव विद्धि प्रकृतिसम्भवान् || 20||

prakṛitiṁ puruṣhaṁ chaiva viddhy anādī ubhāv api
vikārānśh cha guṇānśh chaiva viddhi prakṛiti-sambhavān
Chapter 13, Verse 20

**Nature of Mind**

Three types of guna's discussed from this verse sattva guna generate the attachment of pleasure. Rajas guna generate the work of action. The people who have tamas guna have lack of knowledge. This verse helps to understand the nature and functions of gunas. The cause of every action related with gunas. Material causes of all things are based on guna. It helps to identify the predominant of guna.

रजस्तमश्चाभिभूय सत्त्वं भवति भारत |
रज: सत्त्वं तमश्चैव तम: सत्त्वं रजस्तथा || 10||

Rajas tamaśh chābhibhūya sattvaṁ bhavati bhārata
rajaḥ sattvaṁ tamaśh chaiva tamaḥ sattvaṁ rajas tathā
Chapter 14, Verse 10

Priya Pathak *et al*. (2020), stated that all human beings are based on the combination of triguna and the features of individual personality dominated by any one of these three gunas named as sattva, rajas and thamas. The qualities of sattva guna person have good quality of taking care others and mainly related with spiritual quality. The quality of rajas guna person passion with desire and every action of work completed with perfection. Yadav Sumati,(2017), addresses that action is based on quality of threefold of guna. The person who consider good and bad in the same frequency of sense attached with mind is known a sattava guna. Balanced mind with perfection and taking effort for the improvement of society. Mahadev Desai, (1946), stated that guna means 'strand" it explains what the world is is made up of and it covers entire diversity. The individual person does work selflessness that indicates as sattva guna it rise upwards. Those who do the work for calculative mind for selfishness consider as rajas guna. The person do the work for passion and for fun are considering as Tamas guna. It represents the three modes based on triguna reflects with essence of energy and mass.

**Sattvic Action**

Sattva guna people never work for self identity they never do work for appreciation. They do the creative work and not worry for appreciations from anyone. The people do the work with happiness. Sattvic person understand the work clearly and they know how to do the work in right time at the right movement. Gitanjali Roy, (2020), sattva derived from the word "sat" attitude of the people think for others goodness and they target to achieve the goal where they are and where they want to go with highest level of consciousness, they do their work with cheerful joy and ready to face all kind of situation. Anusha Patel K.B., (2019), explores the action of sattava people do the work for happiness not in the aspect of sad mode. They do the joy of work with faith, honest and perfect with energetic action. Sattva mode of action rise knowledge of wisdom. People do the work with dedication of good thoughts. Pulkit Khanna, (2021), stated that sattva qualities person have clear mind, free from attachment of work, determination, cleanliness they treat success and failure in same way. The people who is free from attachment and

not giving place to egotism, anger and fruit of action done for their work, it came's success or failure taking in unaffected way of action.

मुक्तसङ्गोऽनहंवादी धृत्युत्साहसमन्वितः |
सिद्ध्यसिद्ध्योर्निर्विकारः कर्ता सात्त्विक उच्यते || 26||

mukta-saṅgo 'nahaṁ-vādī dhṛity-utsāha-samanvitaḥ
siddhy-asiddhyor nirvikāraḥ kartā sāttvika uchyate
Chapter 18, Verse 26

**Knowledge is consider as understanding of information that transform into action of work three factors that are**

1. **Knowledge = action of doing work**
2. **Object of knowledge = performance of work**
3. **Knower the person who perform with motivation**

प्रवृत्तिंच निवृत्तिं च कार्याकार्ये भयाभये |
बन्धं मोक्षं च या वेत्तिबुद्धिः सा पार्थ सात्त्विकी || 30||

pravṛittiṁ cha nivṛittiṁ cha kāryākārye bhayābhaye
bandhaṁ mokṣhaṁ cha yā vetti buddhiḥ sā pārtha sāttvikī
Chapter 18, Verse 30

The sattivc person know the way of work what to do and what not do in life with clear mind that helps to take right decision at right time. Values of people, place, and time consider equal to all.

धृत्या यया धारयते मनःप्राणेन्द्रियक्रियाः | योगेनाव्यभिचारिण्या धृतिः सा पार्थ सात्त्विकी || 33||

dhṛityā yayā dhārayate manaḥ-prāṇendriya-kriyāḥ
yogenāvyabhichāriṇyā dhṛitiḥ sā pārtha sāttvikī
Chapter 18, Verse 33

Supreme knowledge, which enables breath control and the energy that controls the mind and sense focus to do good things in life, called sattva guna. The person who does the work with determination to fulfill the task of life, never face failure.

**Rajasic Action**

The person who has a desire for their action-oriented result's in attachment. They never care about others and do not consider that their work will harm anyone. They only need their desire for work to be good. They give trouble to others work. Beyond the dharma, the overjoyed and overworked by sadness performed their actions. The people misunderstand and perform their duties like half of the work is only good and the remaining part is completed by others.

रागी कर्मफलप्रेप्सुर्लुब्धो हिंसात्मकोऽशुचिः |
हर्षशोकान्वितः कर्ता राजसः परिकीर्तितः || 27||

rāgī karma-phala-prepsur lubdho hinsātmako 'śhuchiḥ
harṣha-śhokānvitaḥ kartā rājasaḥ parikīrtitaḥ
Chapter 18, Verse 27

U.Ve. Sri Rama Rāmānuja Achari (2013) stated that people do work with motivation to achieve rewards. They do not think about others; they need their success, so they do anything. Rajasic people hurt others, and they do whatever they like for their own enjoyment.

अयुक्तः प्राकृतः स्तब्धः शठो नैष्कृतिकोऽलसः। विषादी दीर्घसूत्री च कर्ता तामस उच्यते ॥ 28॥

ayuktaḥ prākṛitaḥ stabdhaḥ śhaṭho naiṣhkṛitiko 'lasaḥ
viṣhādī dīrgha-sūtrī cha kartā tāmasa uchyate
Chapter 18, Verse 28

**Impulse to Action**

Under the cover of darkness, the truth appears to be untruth, and the untruth appears to be truth. as illusion. It strives always in the wrong direction.

अधर्मं धर्ममिति या मन्यते तमसावृता। सर्वार्थान्विपरीतांश्च बुद्धिः सा पार्थ तामसी ॥ 32॥
adharmaṁ dharmam iti yā manyate tamasāvṛitā
sarvārthān viparītānśh cha buddhiḥ sā pārtha tāmasī
Chapter 18, Verse 32
(Table: 1)

**Unawareness of Mind**

Lack of intelligence the person cannot do her work properly; they have always had fear and delusion. The tama guna is the mode of ignorance.

यया स्वप्नं भयं शोकं विषादं मदमेव च। न विमुञ्चति दुर्मेधा धृतिः सा पार्थ तामसी ॥ 35॥

yayā svapnaṁ bhayaṁ śhokaṁ viṣhādaṁ madam eva chana vimuñchati durmedhā dhṛitiḥ sā pārtha tāmasī
Chapter 18, Verse 35

**The Action of Three Fold Mind**

**Happiness is divided into three parts**

1. Satvic Happiness,
2. Rajasic Happiness, and
3. Tamasic Happiness.

बुद्धेर्भेदं धृतेश्चैव गुणतस्त्रिविधं शृणु। प्रोच्यमानमशेषेण पृथक्त्वेन धनञ्जय ॥ 29॥

buddher bhedaṁ dhṛiteśh chaiva guṇatas tri-vidhaṁ śhṛiṇu prochyamānam aśheṣheṇa pṛithaktvena dhanañjaya
Chapter 18, Verse 29

Individuals with good knowledge do their work perfectly with a focused plan that results with good performance of their action of work speak more. The plans of action that focus to show how to achieve the goal

**Satvic Happiness**

The people do their duty correctly, and in the beginning, it looks like a burden when it becomes regular. On a good path, they enjoy the happiness of the lost movement.

**Example:** If we never pollute environment, it gives rain properly. The former get happiness seeing the rain.

**Rajasic happiness**

The people get attracted and happy in the beginning, but in the end, it ends with a sad moment. Example: doing things for a hobby but being restless ends in unhappiness.

**Tamasic Happiness**

In the initial stage, the work may appear charming, attractive, and tempting, but the end Result is negative feelings. Example: Fast food is bad for kids, but in the end, it results in unhealthy food.

## CONCLUSION

Understanding the three types of mental moods helps to progress our lives in a positive way. The right Time of decision gets the accurate action of work, which helps to lead to ultimate progress to achieve your goal in life. Six factors tie up with three gunas; they are

**Factors: 1.** Knower's 2. Knowledge; 3. Known, 4. Doer, 5. Action and 6. Instrument.

## ABSTRACT

To investigate anti-asthmatic potential of *Mimusops elengi* leaf. Of the many ligands reported in *Mimusops elengi*, 5 ligands were selected (myricetin, quercetin, kaempferol, p-coumaric acid, and ferulic acid) to dock against9 molecular target proteins PARP, EGFR, SRC, AKT, MMP, MAPK, GSK-3, COX, PI3K which are selected from network pharmacology. The molecular docking studies were carried out using Autodock 4.2tool.Studies report that these phytochemicals present in *Mimusops elengi* exhibit anti-inflammatory, antioxidant, immunomodulatory, and adaptogenic activities. Hence these phytochemicals would be a better therapeutic option in asthma.Hence the aim of the present study is to evaluate the phytochemicals present in *Mimusops elengi* for their anti-asthmatic potential through *in-silico* docking studies. 5ligands were obtained from the PubChem database and 9 target proteins were retrieved from the RCSB Protein Data Bank. Five ligands were docked with nine targets of asthma using Autodock software and binding interactions were analysed. The results demonstrated that all selected phytoconstituents exhibited stable binding interactions with the target proteins taken from network pharmacology (yet to be published), with binding energies ranging from −4.42 to −9.48 kcal/mol. p-coumaric acid and ferulic acid displayed comparatively lesser interactions, especially with glycogen synthase kinase-3. Thus, our *In-silico* docking investigation on ligands of ME with molecular targets of asthma conclude that these ligands display anti-asthmatic potential by interaction with molecular targets of asthma.

**Keywords:** Molecular docking, asthma, phytochemicals, *Mimusops elengi*, molecular target proteins.

# INTRODUCTION

**Abbreviations**

ME- Mimusops elengi,PARP **-**Poly (ADP – ribose), EGFR- epidermal growth factor receptor, SRC- SRC protein kinase, AKT- protein kinase B, MMP- matrix metalloproteinases, MAPK- mitogen activated protein kinase, GSK-3 - glycogen synthase kinase – 3, COX- cyclooxygenase, PI3K- phosphoinositide -3, Ki- inhibition constant.

**Asthma**

Asthma is a more prevalent chronic inflammatory disease that affects the airflow. It is characterized by wheezing, cough, dyspnoea, and chest tightness, which eventually progress to airway hyperresponsiveness, reversible airflow obstruction, and recurrent airway passages constriction leading to chronicity and varied forms of asthma.[1]The symptoms of asthma are always got worsen during night and early mornings and can also be induced by allergic substances, pollutants, irritants, and respiratory infections. On the molecular levels, the role of high levels of IgE and cytokine production by eosinophils plays an essential part in sustaining airway inflammation.[2,3]Despite the availability of medications such as corticosteroids, bronchodilators, anti-IgE therapy, leukotriene receptor antagonists, and mast cell stabilizers, the side effects from long term use of these drugs need an herbal alternative.

***Mimusops elengi***

*Mimusops elengi* L., is an evergreen medicinal tree found throughout tropical and subtropical areas of Southeast Asia and India. It is also known as Bakul or Spanish cherry.[4] It belongs to the family Sapotaceae.[5] the bark, leaves, flowers, fruits and seeds of this plant have been used for its anti-inflammatory, antioxidant,[6] antimicrobial, analgesic, antipyretic, [7] anti-convulsive, anti-urolithiatic, antidiabetic, cytotoxic and would healing properties[8] in various traditional system of medicine for management of several respiratory, gastrointestinal, cardiovascular disorders.

**Justification**

In Ayurvedic and Unani system of medicine, *Mimusops elengi* is used as a conventional medicinal plant.[4] Studies reveal that this plant have folklore claim on respiratory diseases, including asthma[4,9]. Literature review suggested that this plant is rich in flavonoids, alkaloids, terpenoids, and phenolic compounds, which are known to modulate airway inflammation, bronchial hyperresponsiveness and reduce oxidative stress associated with asthma. Furthermore, the reported anti-inflammatory, antioxidant, immunomodulatory, and adaptogenic properties of this plant supports its therapeutic relevance in asthma. Several studies have suggested the potential anti-asthmatic activity of *Mimusops elengi*; however, it has not been scientifically screened for this activity. Therefore, the present study aims to systematically investigate the anti-asthmatic potential of *Mimusops elengi* leaf phytoconstituents through *in silico* approaches to elucidate their interactions with key molecular target proteins of asthma[10].

# MATERIALS AND METHODS

**Protein preparation**

3D structures of target protein receptors namely PARP, EGFR, SRC, AKT, MMP, MAPK, GSK-3, COX, PI3K were downloaded from Research Collaboratory for structural bioinformatics protein database (RCSB Pdb) and then the hetero atoms were removed. Followed by, the active sites were predicted using PDB sum tool. The Protein Data Bank Id of these proteins are 8HE7, 6Z4D, 2H8H, 7NH4, 1ZTQ, 5TBE, 1Q41, and 5F19.

**Ligand preparation**

The bioactive ligands selected for the present investigation, namely Myricetin, Quercetin, Kaempferol, *p*-Coumaric acid, and Ferulic acid, were chosen based on previously reported phytochemical and pharmacological studies of *Mimusops elengi*. The chemical structures of these ligands were obtained from the PubChem database.Ligand

geometry optimization and three-dimensional structure generation were performed using Open Babel version 2.3.1, and the optimized ligand structures were saved in PDB format.[12]

**Molecular docking studies**

Molecular docking was conducted using AutoDock Tools version 4.2 (ADT 1.5.6).[11] Receptor proteins were prepared by adding polar hydrogens and assigning Kollman charges, followed by conversion to PDBQT format. A grid box of 60 × 60 × 60 Å was centered on the active site of each protein. Docking was performed using the Lamarckian Genetic Algorithm[13].Docking results were analysed to determine binding energy, inhibition constant (Ki), hydrogen bond interactions, and key amino acid residues involved in ligand–protein binding.[14]

## RESULT

In the present study, all the 5 selected ligands showed excellent binding affinities toward the selected targets, with binding energies ranging from -4.42 to -9.48 kcal/mol (Table1) for stable ligand-target interactions. Among all selected ligands, the strongest binding affinity was seen with kaempferol towards majority of ligands , particularly with EGFR (−9.48 kcal/mol, Ki 0.112 μM) (Figure 1), SRC (−8.45 kcal/mol, Ki 0.642 μM) (Figure 2), MAPK (−8.63 kcal/mol, Ki 0.476 μM) (Figure 3), COX (−8.68 kcal/mol, Ki 0.43 μM) (Figure 4), and PI3K (−7.88 kcal/mol, Ki 1.67 μM) (Figure 5). Quercetin also exhibited strong interactions, especially with EGFR (−9.40 kcal/mol, Ki 0.235 μM)(figure 6), MAPK (−8.65 kcal/mol, Ki 0.455 μM) (Figure 7), and COX (−8.18 kcal/mol, Ki 1.01 μM)(Figure 8). Myricetin showed notable affinity toward MAPK (−8.28 kcal/mol, Ki 0.852 μM) (Figure 9) and PARP (−7.95 kcal/mol, Ki 1.49 μM) (Figure 10), whereas p-coumaric acid, showed comparatively lesser binding affinity but formed stable hydrogen bonds with several targets such as PI3K (3 hydrogen bonds) (Figure 11) and MAPK (2 hydrogen bonds) (Figure 12). Ferulic acid showed relatively lower binding affinity with most targets, but showed appreciable interactions with SRC (Figure 13), AKT (Figure 14), and COX (Figure 15), indicating its potential contribution to multi-target effects. Overall, flavonoids like kaempferol, quercetin, and myricetin showed comparatively higher binding affinity for most of the targets, while the phenolic acids p-coumaric acid and ferulic acid showed lesser interactions by forming 1-2 hydrogen bonds. The results obtained fromour docking thus indicate the potential of selected phytoconstituents to interact with multiple asthma-associated targets, among which flavonoids have shown better binding characteristics.

## DISCUSSION

Asthma progression involves the activation of multiple proteins such as PARP, EGFR, MAPK, PI3K, AKT, SRC, COX, GSK, and MMP, which regulate inflammatory signalling and airway remodelling.[21,22] In the present in-silico investigation showed the interaction of selected phytoconstituents with key proteins involved in asthma pathophysiology. Among the ligands, kaempferol exhibited strong inhibitory potential against PARP with the highest binding affinity (−8.05 kcal/mol), followed by quercetin(-7.76 kcal/mol), myricetin(-7.95 kcal/mol), ferulic acid (-5.47 kcal/mol) and p-coumaric acid (-5.29 kcal/mol). Since PARP is involved in oxidative stress and tissue injury,[15] these findings suggest a protective anti-inflammatory role of flavonoids. Kaempferol demonstrated the highest binding affinity (−9.48 kcal/mol) with EGFR. Quercetin also showed excellent affinity (-9.4 kcal/mol), Myricetin showed moderate interaction (-7.07 kcal/mol), whereas phenolic acids (p-coumaric acid: -5.77kcal/mol and ferulic acid: -5.70 kcal/mol) exhibited lesser binding, suggesting reduced activity. Considering the role of EGFR in airway smooth muscle proliferation, mucus hypersecretion, and remodelling,[16] the above interactions indicatetheir possible role in reducing airway structural changes. For SRC, kaempferol displayed the most favourable interaction (−8.45 kcal/mol), followed by quercetin (−7.83 kcal/mol) and myricetin (−6.77 kcal/mol), with reduced binding observed for ferulic acid (−6.20 kcal/mol)and *p*-coumaric acid (−5.42 kcal/mol). Similarly, AKT showed the highest affinity toward quercetin (−8.00 kcal/mol), closely followed by kaempferol (−7.81 kcal/mol) and myricetin (−7.78 kcal/mol), whereas phenolic acids exhibited lesser binding energies (*p*-coumaric acid −5.99 kcal/mol; ferulic acid −5.83 kcal/mol). Since both SRC and AKT are involved in inflammatory cell activation and cytokine signalling,[17] these interactions suggest the immunomodulatory potential of flavonoids in reducing eosinophilic inflammation and

airway hyperresponsiveness in asthma. In the case of MMP, quercetin showed the strongest binding interaction (−8.00 kcal/mol), followed by kaempferol (−7.81 kcal/mol) and myricetin (−7.78 kcal/mol), while *p*-coumaric acid (−5.99 kcal/mol) and ferulic acid (−5.83 kcal/mol) demonstrated lower binding affinity. Since MMPs contribute to extracellular matrix degradation and airway remodelling,[19] the strong binding observed with quercetin and kaempferol suggests their potential role in limiting airway remodelling and chronic disease progression. Docking analysis against MAPK revealed strong binding interactions for the flavonoids, with quercetin showing the highest affinity (−8.65 kcal/mol), closely followed by kaempferol (−8.63 kcal/mol) and myricetin (−8.28 kcal/mol). In contrast, *p*-coumaric acid (−6.10 kcal/mol) and ferulic acid (−5.20 kcal/mol) exhibited comparatively reduced binding, reflected by higher inhibition constant values. MAPK signalling pathways regulate inflammatory mediator release and immune cell responses.[18] In asthma, MAPK activation enhances the production of cytokines, chemokines, and eosinophilic inflammation, leading to disease progression. For GSK, kaempferol demonstrated the most favourable interaction (−6.91 kcal/mol), followed by quercetin (−6.32 kcal/mol) and myricetin (−5.53 kcal/mol).

Notably, *p*-coumaric acid (−4.44 kcal/mol) and ferulic acid (−4.42 kcal/mol) showed markedly lower binding affinities and higher Ki values, indicating weaker interactions with this target. GSK-3 is involved in immune regulation and inflammatory signalling[20]. Dysregulation of GSK-3 in asthma promotes Th2-mediated immune responses and inflammatory cytokine production, aggravating airway inflammation. COX enzymes catalyse the formation of prostaglandins, which are key mediators of inflammation. For COX, kaempferol demonstrated the most favourable interaction (−8.68 kcal/mol), followed by quercetin (−8.18 kcal/mol) and myricetin (−7.99 kcal/mol). In contrast, p-coumaric acid (−5.57 kcal/mol) and ferulic acid (−5.54 kcal/mol) exhibited markedly lower binding affinities with higher inhibition constant values, indicating weaker interactions with the target protein. Increased COX activity in asthma leads to bronchoconstriction, airway edema, and inflammatory cell infiltration. PI3K regulates immune cell activation, oxidative stress, and airway smooth muscle contraction.[17]Docking studies involving PI3K showed that kaempferol interacted most strongly with the protein (−7.88 kcal/mol), whereas quercetin (−5.88 kcal/mol) and myricetin (−5.66 kcal/mol) exhibited moderate binding affinity. Both *p*-coumaric acid (−5.87 kcal/mol) and ferulic acid (−5.80 kcal/mol) showed relatively lesser interactions, consistent with their higher inhibition constants. Overactivation of PI3K signalling in asthma results in chronic inflammation, airway hyperresponsiveness, and reduced corticosteroid sensitivity. The comparatively weaker binding seen with p-coumaric acid and ferulic acid may be due to their simpler phenolic structure, whereas flavonoids have multiple hydroxyl groups that facilitate stronger hydrogen bonding and stable interactions within the active site. The higher number of hydrogen bonds formed by flavonoids further supports their binding stability. Thus, the Ligands of *Mimusops elengi* exhibit anti-asthmatic activity due to its anti-inflammatory (MMP, COX, AKT, SRC, EGFR, PARP), immunomodulatory (AKT, SRC), and airway hyperresponsiveness(PARP) through the above proteins. Collectively, these findings highlight a multi-target mechanism of *Mimusops elengi*, showing asthma relevance.

## CONCLUSION

Thus, our present *in-silico* study emphasizes that the selected five ligands of *Mimusops elengi* exhibit significant binding affinities for various key molecular targets involved in the pathophysiology of asthma. Nevertheless, extensive in vitro and in vivo investigations are crucial to further validate their efficacy and safety profiles.

**ABSTRACT**

The Harmonic index H(G) of a connected graph G is defined as$H(G) = \sum_{uv\epsilon E(G)} \frac{2}{du + dv}$, where $d_u$ is the degree of a vertex u in G and $d_v$ is the degree of a vertex v in G. In this paper we find the Harmonic Index of Wheel graph ($W_n$), Helm graph ($H_n$), Centepedegraph($P_n^*$),Middle graph of Cycle graph [M($C_n$)] and Middle graph of Path [M($P_n$)].Also we discuss some results on Harmonic index of graphs.

**Keywords:** Harmonic index, Middle Graph of Cycle and Path Graph, Centipede, Wheel, Helm Graphs.

## INTRODUCTION

Let G be a simple connected graph with vertex set V (G) = {$v_1$, $v_2$, . . . , $v_n$} and edge set E(G). Its order is |V (G)|, denoted by n, and its size is |E(G)|, denoted by m. For $v_i \in$ V (G), let NG($v_i$) (or N($v_i$) for short) be the set of vertices which are adjacent to $v_i$ in G, and let $d_G(v_i)$ (or d($v_i$) for short) be the degree of $v_i$ . Clearly, d($v_i$) = |N($v_i$)|. The maximum and minimum degrees of G are denoted by Δ and δ, respectively. The Randi´c index is one of the most successful molecular descriptors in structure-property and structure-activity relationships studies. The Randi´c index of a graph G is defined as the sum of the weights (d($v_i$)d($v_j$ ))−1/2 over all edges $v_iv_j$ of G. The mathematical properties of this graph invariant have been studied extensively (see the recent book [4] and survey [8]). Motivated by the success of the Randi´c index, various generalizations and modifications were introduced, such as the sum-connectivity index [6,7] and the general sum-connectivity index [2, 3].

In this paper, we consider another variant of the Randi´c index, called the harmonic index H(G), which is defined in[5]as H(G) =$\sum_{uv\epsilon E(G)} \frac{2}{du+dv}$, where the summation goes over all edges of graph G.

**Harmonic Index of well known graphs**

**Definition 2.1**
A wheel graph$W_n = K_1 + C_n$is a graph formed by connecting a single universal vertex to all vertices of a cycle$C_n$.

**Example 2.2**
Wheel graph $W_4$
(Figure 1)

**Theorem 2.3**
For a wheel graph$W_n$, H($W_n$) = n$\left[\frac{n+9}{3(n+3)}\right]$, n≥5

**Proof**
Let $W_n$ be the wheel graph with n+1 vertices and 2n edges.
In $W_n$, n edges having the sum of degrees of their vertices 6 and n edges having the sum of degrees of their vertices n+3
Let $E_1$ be the set of edges of $W_n$having the sum of degrees of their vertices 6.
H($W_n$) =$\sum_{uv\epsilon E_1} \frac{2}{du+dv}$

$$= \sum_{uv\epsilon E_1} \left(\frac{2}{6}\right)$$

=n$\left(\frac{2}{6}\right)$

Let $E_2$ be the set of edges of $W_n$ having the sum of degrees of their vertices n+3 .

H($W_n$) =$\sum_{uv\epsilon E_2} \frac{2}{du+dv}$

$$= \sum_{uv\epsilon E_1} \left(\frac{2}{n+3}\right)$$

=n$\left(\frac{2}{n+3}\right)$

Therefore, H($W_n$) =$\sum_{uv\epsilon E(W_n)} \frac{2}{du+dv}$

= $\sum_{uv\epsilon E_1} \frac{2}{du+dv}$ + $\sum_{uv\epsilon E_2} \frac{2}{du+dv}$

=n$\left(\frac{2}{6}\right)$+n$\left(\frac{2}{n+3}\right)$

= 2n$\left(\frac{1}{6}+\frac{1}{n+3}\right)$

=2n$\left(\frac{(n+3)+6}{6(n+3)}\right)$

=n$\left[\frac{n+9}{3(n+3)}\right]$

**Defnition:2.4**
A Helm graph ($H_n$) is the graph obtained from a wheel graph $W_n$by adjoining a pendent edge at each node of the cycle.

**Example:2.5**
Helm graph$H_4$
(Figure 2)

**Theorem:2.6**
For the Helm graph$H_n$, $H(H_n) = n\left[\frac{13n+92}{20(n+4)}\right]$, $n \geq 5$

**Proof**
Let $H_n$ be the Helm graph with (2n+1) vertices and 3n edges.
In $H_n$, n edges having the sum of degrees of their vertices 5,n edges having the sum of degrees of their vertices 8and n edges having the sum of degrees of their vertices n+4
Let $E_1$ be the set of edges in $H_n$ having the sum of degrees of their vertices 5,

$H(H_n) = \sum_{uv\epsilon E_1} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_1} \left(\frac{2}{4+1}\right)$

$= n\left(\frac{2}{5}\right)$

Let $E_2$ be the set of edges in $H_n$ having the sum of degrees of their vertices 8,

$H(H_n) = \sum_{uv\epsilon E_2} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_2} \left(\frac{2}{4+4}\right)$

$= n\left(\frac{2}{8}\right)$

Let $E_3$ be the set of edges in $H_n$ having the sum of degrees of their vertices (n+4),

$H(H_n) = \sum_{uv\epsilon E_3} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_3} \left(\frac{2}{n+4}\right)$

$= n\left(\frac{2}{n+4}\right)$

Therefore, $H(H_n) = \sum_{uv\epsilon E(H_n)} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_1} \frac{2}{du + dv} + \sum_{uv\epsilon E_2} \frac{2}{du + dv} + \sum_{uv\epsilon E_3} \frac{2}{du + dv}$

$= n\left(\frac{2}{5}\right) + n\left(\frac{2}{8}\right) + n\left(\frac{2}{n+4}\right)$

$= 2n\left(\frac{1}{5} + \frac{1}{8} + \frac{1}{n+4}\right)$

$= 2n\left(\frac{8(n+4)+5(n+4)+5\times 8}{8\times 5\times (n+4)}\right)$

$= 2n\left(\frac{13n+92}{40(n+4)}\right)$

$= n\left[\frac{13n+92}{20(n+4)}\right]$

**Definition:2.7**

A Centipede graph $P_n$* is a graph on 2n vertices obtained by appending a single pendant edge to each vertex of a path $P_n$.

**Example:2.8**

A Centipede graph $P_5$*

(Figure 3)

**Theorem:2.9**

For the Centipede graph$P_n$* , H($P_n$*) = $\left[\frac{5n-4}{15}\right]$, n ≥ 5

**Proof**

In $P_n$ ∗,two edges having the sum of degrees of their vertices 3, two edges having the sum of degrees of their vertices 5, (n-3) edges having the sum of degrees of their vertices 6 and (n-2) edges having the sum of degrees of their vertices 4.

Let $E_1$ be the set of edges of $P_n$* having the sum of degrees of their vertices is3,

$H(P_n^*)=\sum_{uv\epsilon E_1}\frac{2}{du+dv}$

$$= \sum_{uv\in E_1} 2\left(\frac{2}{1+2}\right)$$

$=2\left(\frac{2}{3}\right)$

Let $E_2$ be the set of edges of $P_n$*having the sum of degrees of their vertices 5,

$H(P_n^*)=\sum_{uv\epsilon E_2}\frac{2}{du+dv}$

$$= \sum_{uv\in E_2} 2\left(\frac{2}{2+3}\right)$$

$=2\left(\frac{2}{5}\right)$

Let $E_3$ be the set of (n-3)edges of $P_n$* having the sum ofdegreeof their vertices 6,

$H(P_n^*)=\sum_{uv\epsilon E_4}\frac{2}{du+dv}$

$$= \sum_{uv\in E_4(n-3)} \left(\frac{2}{3+3}\right)$$

$=(n-3)\left(\frac{2}{6}\right)$

Let $E_4$ be the set of (n-2)edges of $P_n$ ∗ having the sum of degree their vertices 4,

$H(P_n^*)=\sum_{uv\epsilon E_4}\frac{2}{du+dv}$

$$= \sum_{uv\in E_4} (n-2)\left(\frac{2}{1+3}\right)$$

$=(n-2)\left(\frac{2}{4}\right)$

Therefore,$H(P_n*)=\sum_{uv\epsilon E}\frac{2}{du+dv}$

$=\sum_{uv\epsilon E_1}\frac{2}{du+dv}+\sum_{uv\epsilon E_2}\frac{2}{du+dv}\sum_{uv\epsilon E_3}\frac{2}{du+dv}$

$+\sum_{uv\epsilon E_4}\frac{2}{du+dv}$

$=2\left(\frac{2}{3}\right)+2\left(\frac{2}{5}\right)+(n-3)\left(\frac{2}{6}\right)+(n-2)\left(\frac{2}{4}\right)$

$=2\left(\frac{2}{3}+\frac{2}{5}+\frac{(n-3)}{6}+\frac{(n-2)}{4}\right)$

$=2\left(\frac{2\times20+2\times12+[(n+3)\times10]+[(n-2)\times15]}{60}\right)$

$=\left[\frac{10n-8}{30}\right]$

$=\left[\frac{5n-4}{15}\right]$

**Definition:2.10**

The Middle graph M(G) of a graph G is the graph in which the vertex set is V(G) U E(G) and two vertices are adjacent if and only if either they are adjacent edges of G or one is vertex of G and the other is an edge incident with it.

**Example:2.11**

Middle graph of cycle H(M($C_n$)

(Figure 4)

Middle graph of path H(M($P_n$))

(Figure 5)

**Theorem:2.12**

For the Cyclic graph$C_n$, H(M($C_n$)) = n$\left[\frac{11}{12}\right]$, n ≥ 5

**Proof**

Let $C_n$ be the Cyclic graph,

M($C_n$)be the middle graph of Cycle($C_n$) with 2n vertices and 3n edges.

In $M(C_n)$, 2n edges having the sum of degrees of their vertices 8 and 2n edges having the sum of degrees of their vertices 6.

Let $E_1$ be the set of edgesinM($C_n$) having the sum of degrees of their vertices 8,

$H(M(C_n))=\sum_{uv\epsilon E_1}\frac{2}{du+dv}$

$=\sum_{uv\epsilon E_1}\left(\frac{2}{4+4}\right)$

$=n\left(\frac{2}{8}\right)$

Let $E_2$ be the set of edges in M($C_n$)having the sum of degrees of their vertices 6,

$H(M(C_n))=\sum_{uv\epsilon E_2}\frac{2}{du+dv}$

$=\sum_{uv\epsilon E_2}2\left(\frac{2}{4+2}\right)$

$=2n\left(\frac{2}{6}\right)$

Therefore, $H(M(C_n))=\sum_{uv\epsilon E}\frac{2}{du+dv}$

$= \sum_{uv\epsilon E_1} \frac{2}{du + dv} + \sum_{uv\epsilon E_2} \frac{2}{du + dv}$

$=n\left(\frac{2}{8}\right)+2n\left(\frac{2}{6}\right)$

$= 2n\left(\frac{2}{6} + \frac{1}{8}\right)$

$=2n\left(\frac{3+8}{24)}\right)$

$=n\left[\frac{11}{12}\right]$

**Theorem:2.13**

For be the Path graph $P_n$, $H(M(P_n)) = \left[\frac{385n-264}{420}\right]$, $n \geq 5$

**Proof**

Let $P_n$ be the path graph,

$M(P_n)$ be the middle graph of path with 2(n+1) verticesand 3(n-1) edges.

In $M(P_n)$, two edges having the sum of degrees of their vertices 4, two edges having the sum of degrees of their vertices 5,two edges having the sum of degrees of their vertices 7, 2(n-3) edges having the sum of degrees of their vertices 6 and (n-4) edges having the sum of degrees of their vertices 8.

Let $E_1$ be the two set of edges in$M(P_n)$ havingthe sum of degrees of their vertices 4,

$H(M(P_n)) = \sum_{uv\epsilon E_1} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_1} 2\left(\frac{2}{1+3}\right)$

$=2\left(\frac{2}{4}\right)$

Let $E_2$ be the twoset of edges in$M(P_n)$having the sum of degrees of their vertices 5,

$H(M(P_n)) = \sum_{uv\epsilon E_2} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_2} 2\left(\frac{2}{3+2}\right)$

$=2\left(\frac{2}{5}\right)$

Let $E_3$ be the two set of edges in$(M(P_n)$ having the sum of degrees of their vertices 7,

$H(M(P_n)) = \sum_{uv\epsilon E_3} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_3} 2\left(\frac{2}{4+3}\right)$

$=2\left(\frac{2}{7}\right)$

Let $E_4$ be the set of 2(n-3) edges in$(M(P_n))$ having the sum of degrees of their vertices 6,

$H(M(P_n)) = \sum_{uv\epsilon E_4} \frac{2}{du + dv}$

$= \sum_{uv\epsilon E_4} 2(n-3)\left(\frac{2}{4+2}\right)$

$=2(n-3)\left(\frac{2}{6}\right)$

Let $E_5$ be the set of (n-4) edges in$(M(P_n))$ having the sum of degrees of their vertices 8,

$H(M(P_n)) = \sum_{uv \epsilon E_5} \frac{2}{du + dv}$

$$= \sum_{uv \epsilon E_5} (n-4)\left(\frac{2}{4+4}\right)$$

$=(n-4)\left(\frac{2}{8}\right)$

Therefore, $H(M(P_n)) = \sum_{uv \epsilon E} \frac{2}{du + dv}$

$= \sum_{uv \epsilon E_1} \frac{2}{du + dv} + \sum_{uv \epsilon E_2} \frac{2}{du + dv} \sum_{uv \epsilon E_3} \frac{2}{du + dv} +$

$\sum_{uv \epsilon E_4} \frac{2}{du + dv} + \sum_{uv \epsilon E_5} \frac{2}{du + dv}$

$=2\left(\frac{2}{4}\right)+2\left(\frac{2}{5}\right) + 2\left(\frac{2}{7}\right) + 2(n-3)\left(\frac{2}{6}\right) + (n-4)\left(\frac{2}{8}\right)$

$= 2\left(\frac{420+336+240+105n-420+280n-840}{840}\right)$

$=\left(\frac{385n-264}{420}\right)$

## CONCLUSION

In this paper we determined harmonic index of some special graphs and harmonic index of middle graph of path and cycle graph. Further we can find harmonic index of new graph structures.

## ABSTRACT

Phishing attacks are a rising threat concerning individuals and businesses, as they can cause severe financial losses and damage to reputation. Using blocklists and signature-based methods to find phishing attacks is inefficient, which has given rise to more sophisticated approaches. In the past few years, there has been an increase in the attention received by machine learning and deep learning algorithms and patterns about their ability to assist in Phishing threat detection and mitigation. Some existing methods like Convolutional Neural Network (CNN), Long Short Term Memory (LSTM) that are key components of deep learning frameworks, are more suited to tell the differences between standard data patterns and anomalies, making them stronger in handling advanced phishing attempts. Conducting a structured literature survey critique is key to understand matters of study regarding the application of phishing threat detection with deep learning techniques. This examination synthesizes conclusions from relevant research while identifying different approaches to evaluating deep learning capabilities in identifying phishing threats and challenges that need further exploration. Through the comprehensive critique of the

existing literature approach, this study establishes gaps inflicted by multi-faceted approaches on diverse methodologies, constructive discourse aimed at developing evidence-based perspectives, and refinement of competent methods for foolproof phishing threat detection systems.

**Keywords:** Deep Learning, Phishing Attack, Prediction, Detection Rate, Accuracy

## INTRODUCTION

Phishing is a cyber-attack that aims to obtain sensitive pieces of confidential data, like passwords, credit card numbers, and personal identifiers, from individuals and/or organizations [1]. Phishing attempts are increasing in frequency and becoming more complex, causing severe financial loss and damage to reputation. Despite blocklists, phish detection based on signatures has not been efficient in solving problems arising due to ever-evolving technology, which now requires the development of more effective methods. The last few years have witnessed increased use of AI techniques, encompassing machine learning and deep learning, because it provide an opportunity to improve classic approaches and hence boost accuracy in identifying phishing threats [2]. A commonality among all social network platforms is to carry out phishing attacks via emails or any form of communication to trick people into clicking links or opening documents containing disguised harmful files. Established phishing detection approaches utilize message examining sender details and subject lines and email content analytics to classify strategies used for phishing. With increasing sophistication in attacks, this approach seems less appealing these days [3]. Phishing threat detection leveraging machine learning and deep learning models is rapidly evolving, as these machine learning algorithms adapt through data and adapt more efficiently to new threats compared to previous techniques [4]. The popularity of applying deep learning methodologies in almost all aspects of cybersecurity, such as phishing threat detection, is quite noticeable. Deep learning methods like CNNs and LSTMs significantly enhance phishing threat detection by scrutinizing and parsing the contents and structures of phishing emails and associated online communications. This enables us to capture analytical patterns within data that are difficult for traditional methods to identify [5]. Moreover, deep learning techniques enhance their prediction accuracy with time because they can train on vast datasets.

Literature critique becomes increasingly essential to critically examine published literature and evaluate whether existing literature delivers what it claims when reviewing a research question or problem. The concern about using deep learning technologies stems primarily from this technology's ability to effectively address deficiencies associated with conventional approaches, thus raising reliability beyond expectations [6]. Nonetheless, a systematic, comprehensive critique of contemporary deep learning-driven research is in order, one that could facilitate understanding of the benefits and weaknesses of various deep neural network techniques and guide future research advancement. By consolidating the results of existing works and by pointing out existing limitations [7], a methodical examination of the literature may contribute towards establishing consistent and data-driven insights on deep learning application methods for phishing threat detection. In particular, such an analysis could provide us with 1) insights on assessing and evaluating the performance of different deep learning approach strategies and their shortcomings and 2) areas to develop (from a contrary viewpoint to the limitations of a method/technique) [8] – [10]. Furthermore, a critique can help to determine those areas of the topic where further research is needed or specific areas within the literature that require further investigation. However, there is no overall comprehensive overview of capabilities, limitations, and possibilities for enhancement. Since there has been much research in this area, only a few of them have been dedicated to applying deep/spread learning to detect phishing. As this area continues to develop and given the critical need for reliable detection of phishing attacks, the evidence base must be summarized, gaps in the evidence base must be underscored, and new research must be designed. The advancements of this study are as follows

1. This review is focused on gaining a complete list of the latest advancements and trends that have been reached so far in applying deep learning to identify phishing threats.

2. In the context of this study, discuss the different types of deep learning methodologies applied in phishing threat detection, their performance, and prospective research directions.
3. By summarising the conclusions from related investigations, the critique contributes to understanding the benefits and drawbacks of various methods and insight into the complexities that remain to be overcome to enhance the precision and efficacy of detecting phishing.

The work is organized as follows: section 2 provides a systematic review on various prevailing approaches. The benefits of prevailing approaches are provided in section 3 and limitations are provided in section 4. The future research ideas are provided in section 5 with summary in section 6.

## RELATED WORKS

The author [11] introduced a novel phishing threat detection technique that uses a multi-NN classifier and a character-word-based methodology. The study discussed how each neural network was trained using weight normalization, which employed ASCII character mapping. Their test conclusions revealed a low TNR and a high FPR. To fully assess the classifier's performance, future research for their proposed method will use a larger database sample. The phishing threat detection method proposed by [12] used a hybrid learning strategy that combined predictive modeling with and without labels. Their proposed framework incorporated online learning with adaptive updates that were improved by learning from a static dataset to identify unknown zero-day phishing emails. The goal was to achieve excellent performance metrics, including true positives, true negatives, sensitivity, specificity, precision, and F-measure [13]. According to the researchers, PDENF needed a few rules to classify emails and had a small memory footprint. Comparing the system's benchmarking against leading phishing threat detection technologies and testing it on a larger and more varied dataset [14]. A novel method of a basic neural network approach for spam detection was presented by [15]. Their suggested method was made to distinguish between sending emails, messages, and server parameter values that are legitimate and those that are not. The study asserted that the continuous learning feature of the perceptron algorithm produced positive results [16].

The researchers intend to use a server-based filtering solution leveraging the perceptron algorithm, analyze the filtering approach over an extended period of time, perform additional evaluation and enhance blocking performance through rigorous testing, and integrate by utilizing log data to oversee mail filtering performance in their future research. The accuracy of a number of DL and ML techniques, such as employing ensemble and statistical models (RF, SVM, LR, BART, NN, RT, CT) for phishing email classification, was compared by [17]. This trained and tested the classifiers in their study using 43 features and an information set of 2889 legitimate vs. malicious emails. With an AUC of 0.9448, this asserted that NN performed better than any other technique. Their study's experimental conclusions recommended more research to increase predictive accuracy by expanding the dataset's variables. The author in [18] proposed a phishing threat detection method that used source code analysis to categorize a web page's data protection. Lowering initial security weights assigned to phishing characteristics was able to extract different determinants of website security posture by examining phishing characteristics. Higher percentages indicate regular security updates and patches, while decreased misclassification rates suggest possible online safety best practices, according to their calculation of the overall security percentage [19]. By contrasting the conclusive identification of websites as phishing or authentic, this was able to demonstrate the experimental results of their proposed method. The intent is to use an extensive sample database in the future to evaluate the classifier's performance thoroughly.

Alkaht and Bassel presented a technique for filtering SPAM using a several-stage NN [20]. The study claimed that their approach used fewer computational resources and performed better than others. The study conducted a number of tests with feedforward NNs and self-organizing global ranking. A deep learning model combining CNN and Keras embeddings to distinguish between phishing and legitimate emails was presented by [21]. By combining these two methods, it was able to create dense vector representations of words and then classify machine learning applications for email analysis using hybrid representation. They demonstrate the suggested strong performance in

phishing spam detection and firm performance in analyzing header and non-header components. The researchers proposed that by including more data sources, the accuracy of their developed methodology in detecting phishing emails could be further enhanced. A DBN architecture leveraging random DNNs and rectified linear units was introduced by [22] for spam filtering. Conclusions drawn from the experiment demonstrated that, on three of four datasets, the suggested approach performed more accurately than other spam filters currently in use. With an AUC of 0.961, it found that DBB-RDNN-ReL effectively tackled challenging spam datasets with imbalance and non-linearity. This method's processing time may not be suitable for high-speed practical implementations, which is one of the method's limitations [23]. The performance of the methodology in decision-making under multiple objectives was the focus of their subsequent research.

**Reviews on phishing attacks using machine learning approaches**

A novel RCNN-based phishing spam detection model called THEMIS with multi-granularity vectors and an attention mechanism was proposed by [24]. The writers examined the structure of the emails and created word, character, header, and body-level models. An unbalanced dataset of the ratios of machine learning applications for email filtering was used in their work. The research asserted that their suggested approach had achieved a false positive rate of 0.043% and 99.848% overall accuracy. The researchers aimed to improve the pattern for detecting phishing emails that only contain the body and not the header. Using deep learning techniques like DNN, RNN, and CNN [25] – [26], as well as traditional machine learning techniques like NB, DT, AB, and RF, the author examined the impact of applied random and temporal splitting methods for phishing/malicious URL categorization. According to their experimental conclusions, the tf-idf representation and time split with the DT classifier achieved an accuracy of 88.5%. The study emphasized that Tf-idf representation outperformed feature hashing and embedding in terms of capabilities. This study's use of a small dataset for evaluation is one of its drawbacks [27]. By developing a technique designed for scalability to collect multi-source data integration, future research could focus on scaling up real-world data training. The investigator in [28] suggested a hybrid method that uses a DNN with feature selection and weighting based on genetic algorithms (GA) to predict phishing websites. To identify the essential characteristics and ideal weights that would improve prediction accuracy, used Genetic Algorithms (GA). Their analysis showed that this combined approach yielded a remarkable 95% correct identification rate. Since their method offered a trustworthy way to identify phishing websites, future studies could investigate the application of faster Evolutionary Algorithms (EAs) to improve performance even more.

By examining the structural characteristics of phishing emails as well as the strategies and technical techniques employed in phishing attacks, the author investigated the possibility of identifying phishing prevention strategies [29]. The Agile Scrum methodology, data preprocessing, machine learning techniques, Matlab software implementation, and different neural network algorithms were all included in their proposed study. Their study found that the model's average accuracy level was a remarkable 93.9%. Finding ever-more-advanced cybersecurity threat detection with machine learning in the future is the aim. To counteract email phishing, the author in [30] looked into state-of-the-art text classification models in the field of natural language processing. The researchers proposed a framework that combines LSTM networks with attention mechanisms and a hierarchical structure to enhance sentiment analysis or topic modeling for emails. The research claimed that the precision of their model was 0.90. Attack prediction methods (Fig 1). The researchers used more sophisticated models, such as back propagation NNs, and additional layers to improve neural networks' (NNs') capacity to identify phishing threats. A method for identifying phishing emails that combines RCNN and BERT was proposed by [31]. The research investigated the effectiveness of these advanced methods in detecting email security risks, evaluating different scenarios, and handling unbalanced datasets in machine learning. The discovery that the global RNN-based model saw a 1.8% decrease in accuracy as the number of organizations rose, whereas the BERT model saw a 0.6% increase. The researchers emphasized that while the unequal data distribution was a contributing factor, their suggested approach performed better as the size of the email dataset increased. The goal was to improve their model training and evaluation in the future by tackling the issues caused by skewed email data distributions and investigating how more data analysis can lead to organizational improvements.

The author suggested a novel technique called IPDS to identify and separate legitimate URLs and cyber deception by utilizing CNN and LSTM architectures [32]. To conduct a comprehensive analysis of text and images, it built the IPDS classifier with a deep learning-based approach. The suggested techniques were tested on an information set of 1,000,000 URLs, 13,000 attributes, and 10,000 images derived from legitimate and fraudulent web pages. Despite its comprehensiveness, the dataset's analysis of phishing URLs would be challenging to ensure the quality and accessibility of such datasets. The empirical findings of the research achieved a classification accuracy of 93.28%. The researchers' future goals include improving IPDS's accuracy and creating a warning system for online threats that uses DL to detect security risks quickly. The author in [33] presented a convolutional neural network-based method for phishing detection. The team utilized a large information set of emails, both real and fake. This proposed approach demonstrated encouraging results with a precision of 99.42%. In the years to come, the researchers seek to test the models on a larger dataset, optimize the hyperparameters, and look into other deep-learning architectures. To strengthen the SDS performance, the author in [34] created a container method grounded on an evolutionary framework for extracting features with the EGOA algorithm framework for MLP learning. Using the UK-2011, SpamBase, and SpamAssassin information sets, it evaluated the suggested system and found that it outperformed other accepted methods by as much as 96.4%, 97.5%, and 98.3%, respectively.

Their approach is only effective at identifying spam; more research is required to identify other cyberattacks. The author suggested a technique for detecting phishing emails that uses a Hierarchical CNN-based approach for distinguishing phishing from legitimate content and authentic URLs. The method verified the URL classification without content analysis. The outcomes of their experiments demonstrated the possibility of building a strong security defense against intruders. Future research is required to compare with alternative machine learning methods, as their proposed work is restricted to URL checking based on contextual information. Using state-of-the-art methods, the author in [35] assessed the Profiler's performance on 9000 authentic and enhanced phishing threat detection accuracy datasets against an ML-ensemble strategy. According to their study's experimental conclusions, the Profiler horizontal method produced 25% negatives in email filtering negatives and 30% negatives in email filtering positives compared to the ML-ensemble approach. By testing the profiler on a collection of 3300 phishing emails related to file-sharing, their study also showed that it could manage data distribution shift. Future research is required to address the data distribution shift, as the project is restricted to phishing threat detection in email communications [35]. Table 1 depicts the comparison of various prevailing approaches with its benefits and constraints. URL-based phishing attack [41] (Fig 2).

**Benefits of Existing Approaches**

Statistical models like logistic regression, SVMs, and ensemble methods like random forests are effective for phishing data with structured features, such as webpage attributes, metadata, and URL characteristics. This is because ML models capable of handling large-scale data do the need for specific patterns or characteristics. The ML model, on the other hand, can adjust to a particular type of phishing attack and permits scalability. For example, phishing can occur via email and websites. DL models, like CNN and RNN, are more sophisticated than traditional machine learning models [36]. Through feature engineering, the DL pattern can independently generate the necessary variables without assistance from a human. CNN-based methods, which can be regarded as a fairly robust platform for detecting phishing emails, malicious URLs, and website anomalies, even achieved 98.74% in various phishing threat detection activities [37]. Key features of LSTM and GRU networks include demonstrated remarkable efficacy in detecting phishing attempts via email, particularly in identifying phishing spam through natural language analysis. GANs, particularly PDGAN (Phishing threat detection GAN), represent the pinnacle of phishing threat detection research. Synthetic samples produced by GANs could be very helpful in training the model, particularly in situations where labeled data is complex to come by. GANs may be used to simulate phishing scenarios to increase resilience against adversarial samples or zero-day phishing attacks. When combined with URL analysis, GANs may be able to detect phishing attempts accurately [37].

**Existing Research Limitations**

The review on current literature of deep learning techniques for phishing spam detection has revealed a number of gaps that require further research and development. This section unpacks those limitations and explores the implications of suggested phishing detection strategies. The main problem here is that these models never prioritize privacy preservation. Though their main goal is to identify phishing emails, they can unknowingly leak sensitive user data. More research is required to put identifying a balance between security and user privacy at the top of the priority list in phishing detection. The bias to misclassify phishing emails is an indicator that these models require continuous iterations and enhancements. We are well aware that sometimes completely legitimate emails get flagged as phishing attempts and phishing attempts get correctly claimed as safe. Yielding up-front false alarms and back-end missed detections can erode users' trust in model predictions. To address this concern, researchers must focus on increasing the transparency of their work [38]. The small amount of data used in the research is another drawback of the literature critique. It is challenging to assess the models' performance because the researchers did not offer a thorough description of the dataset used. As a result, future research ought to incorporate a larger dataset and provide a detailed description of its features. There is potential for improvement, as the researches also imply allowing for possible future model improvements.

To improve the capabilities of the models, researchers must investigate novel phishing threat detection techniques, use evolutionary algorithms to streamline the feature selection methodology and expand the number of data points. Additionally, the research shows that the models require little time, which makes them perfect for phishing threat detection in live environments. The models' efficacy in a multilingual setting is diminished by their one-language restriction [38]. Future research should, therefore, investigate ways to improve models' ability to transcend language barriers. According to the researchers, additional evaluation datasets and corresponding feature extraction approaches are required to enhance the model evaluation results. This necessitates that researchers concentrate on gathering and examining a variety of datasets, including various phishing attack types. The generalizability of the research findings across different phishing scenarios is somewhat limited, as it primarily focuses on identifying scams that exploit the pandemic. Additional research is warranted to determine the effectiveness of these models in a variety of real-world scenarios. Moreover, the current research tends to overlook other phishing tactics and techniques, choosing instead to focus exclusively on text-based spam detection. Researchers need to develop models that can recognize a broader range of phishing attack types, including voice-based and image-based threats. With the researchers already operating on a lack of resources and tools, it phish need to dive further down to develop superior phishing threat detection models. These factors point to the need for greater federal investment into developing more robust tools and resources for identifying phishing threats. One of the biggest problems is that the models we have don't adequately adapt to modern phishing tactics.

This in part underscores that researchers need to continually develop more advanced dynamic models to address new threat techniques adopted by phishers. Furthermore, their effectiveness at detecting these sophisticated phishing attacks is limited by their focus on still identifying emails with headers. So, scientists need to create patterns that will seek out bad connections or attachments [39]. The researchers usually choose to downplay or avoid discussing other forms of cyberattack, particularly besides email phishing detection. Now developers and researchers have the responsibility to build better, smarter models that can prevent many kinds of cyberattacks—not just ransom ware and malware. However, it often performs URL validation based on syntax and metadata, which hampers its ability to detect advanced phishing attacks with complex tactics. To enhance their effectiveness, future studies should benchmark the proposed models against existing deep learning and machine learning methods. Additionally, the testing is currently confined to an English corpus, and the research primarily focuses on supervised learning. Other machine-learning approaches should be investigated in future research, and the models' performance should be assessed using a variety of datasets in various languages. Additionally, the research depends on several modules to detect phishing, which raises the system's complexity and expense. For practical deployment in the real world, researchers must create more straightforward models.

## FUTURE RESEARCH DIRECTIONS

The subsequent are some possible potential research opportunities in the area of deep learning-based phishing email, taking into account the limitations mentioned in the literature critique [39].

1. To protect sensitive user data, potential research areas should concentrate on integrating personal data-safeguarding strategies into threat detection systems for phishing emails, which can increase the protection of email communications and shield confidential information from phishing and illegal access by integrating robust encryption, secure communication procedures, and data pseudonymization. This all-encompassing strategy can contribute to making the Internet a safer place for people everywhere.
2. The study needs to optimize feature selection and expand the dataset size to increase capabilities in detecting phishing emails. The dataset should be expanded to include more phishing email variations in future research and the most informative features should be intelligently chosen using evolutionary algorithms. This will improve the accuracy and efficiency of these vital cybersecurity tools.
3. Future research should direct its efforts toward advancing email spam detection by investigating non-textual features while positioning spam filters nearer to central servers and refining behavioral detection techniques through detailed message content analysis. The effectiveness of the spam filters needs improvement by implementing advanced deep learning methods to detect multimedia spam through image and video analysis. The creation of novel approaches to address new spam forms, including voice-based spam and deepfakes, continues to be crucial [40].
4. The development of threat detection systems for email services to combat advanced phishing tactics represents a promising research direction. The ongoing battle in cybersecurity encounters relentless difficulties from modern phishing techniques that perpetually evolve. Research endeavors need to prioritize the development of methods for detecting and segregating phishing emails while also advancing techniques to identify and neutralize these threats that cybercriminals continue to refine. The necessity of adopting proactive measures emerges as critical to shield both individuals and organizations against evolving cyber threat attacks.
5. Tackling this problem of concept drift is paramount, and indeed, by no means will it be the last research needed to keep the email threat detection platform operating efficiently over time. The biggest hurdle to overcome in phishing email detection is concept drift. More than most cybersecurity areas, to stay ahead of developing phishing techniques and trends as it grow, and must create from practice, be agile to transform threats and ongoing change, and operate in loops of iteration and enhancement. This research will, and hope, contribute to better and more robust email security technologies and implementations.
6. An essential step in assessing the suggested pattern's performance in the area of harmful content identification is comparison with cutting-edge methods. To benchmark the model's performance in tackling the difficulties of spotting malicious text patterns, potential extensions should include a thorough model evaluation outcome against those of other cutting-edge approaches. The model's actual potential will be determined with the aid of this comparative analysis, which will also direct future improvements in the search for more reliable and precise detection techniques [40].
7. Near-real-time data processing and insight that allow for more proactive, effective phishing email identification and detection in near real-time should be the kind of things worth investigating further. To help provide faster and more efficient protection against cyberattacks, a phishing defense system helps us proactively defend people and corporations against increasingly sophisticated phishing attacks. Phishing in the digital age, with some broader-than-anti-phishing applications, could significantly reduce the risk and impact of phishing.
8. Detection precision and effectiveness of advanced phishing filters increase through the incorporation of additional data sources. By integrating diverse data sources, including threat intelligence feeds and user behavior patterns, organizations can expand their ability to detect and neutralize phishing threats while enhancing cybersecurity measures.
9. Ensuring that the model's resilience is tested across different email domains would create a more robust model. This rely on this deep analysis of test set performance to establish the model's robustness and flaunt its stellar classification accuracy across a broad swath of potential email accounts. Performing thorough domain analysis,

bias assessment, and model tuning can allow email classification models to be highly accurate and adaptable. It's a more democratic way forward compared to the current process of nerdy black box magic that researchers try to whisk away. This alternative approach would do a tremendous job of building a more trustworthy and robust model, winning the hearts and minds of many more potential users. In the future, opportunities exist for enhanced phishing detection based on deep learning, primarily through research and planned proactive implementation [40]. Improving these systems' functionality and performance will be impossible unless the shortfalls are found in this literature review. Using quantum digital signatures and quantum encryption, the network would be able to protect against the compromise of a phishing email while that very same network continues to defend itself against attack. Future research directions should investigate this in more detail.

## CONCLUSION

This review outlines shortcomings and promising avenues for future research in deep learning-based phishing detection. There is potential for improvement, even though deep learning has demonstrated encouraging enhancements in phishing identification accuracy. Focused on a compact dataset with no explicit explanations of the dataset used, the persistence of inaccurate labeling, the low time consumption, the fact that it is only limited to one language, and the absence of research resources and utilities are some of the main drawbacks. Future research can concentrate on protecting privacy by identifying suspicious keywords and patterns, growing the information set, employing evolutionary algorithms to optimize feature extraction and selection, and extending the study to other languages and crisis types to get around these restrictions. To increase the system's efficiency, further development of datasets and feature extraction models is required. Additionally, spam filters must be placed close to email spam filtering on primary servers and must be expanded to analyze more than just email content must be developed to increase the email phishing identification success rate. Future research should also address concept drift and effectively handle contemporary phishing techniques. Reducing the discrepancy between test and training accuracy is also necessary, as is the utilization of an unbalanced dataset and a limited input sequence length. In order to enhance performance, future research can investigate different machine learning strategies or add more email functionalities. It is necessary to improve the performance analysis of deep learning patterns on larger datasets. The effectiveness of the suggested models ought to be contrasted with that of Internet of Things (IoT) security methods for identifying harmful or abusive language. Components for analyzing malware and DNS logs can be added to increase the phishing threat detection success rate. In conclusion, even though this literature critique has pointed out a number of drawbacks and potential research opportunities in deep learning-based phishing attempt detection, these issues can be resolved. By increasing the precision and phishing spam detection system performance, the suggested changes can eventually improve cybersecurity and shield people and businesses from phishing attacks.

**Table 1: Comparison of existing approaches**

| Ref. | Approaches | Data | Outcomes | Benefits | Constraints |
|---|---|---|---|---|---|
| Masalha *et al*., (2020) | Multi-objective optimization | SpamBase, SpamAssassin, and UK-2011 datasets | Accuracy: 97.5%, 98.3%, and 96.4% | - | Limited to detecting spam |
| Deep CNN (2020) | RCNN | Email Structure | - | Examined emails at multiple levels, including the header, body, character, and words | Limited to detecting phishing emails with header |
| Khoji *et al*., (2021) | DL | Email text | Accuracy: 88–100% | - | Cannot effectively handle modern phishing techniques |
| Teli *et al*., (2014) | ML and DL | Spamassassin | Precision: 95.26%, recall: 97.18%, F1-score: 96% | Focused on the limitations of ML and DL algorithms | Broader email content analysis |
| Nicholson *et al*., (2020) | Deep learning | -- | Accuracy: 92% | Incorporated less explored DL techniques | No details of empirical analysis |
| | GRU-based | Phishing URLs | Accuracy: | Highly accurate | Limited |

| | | | | | |
|---|---|---|---|---|---|
| Ge *et al.*, (2019) | Phishing URL detection | | 98.30% | classifier | detection of phishing attacks during COVID-19 |
| Otomo *et al.*, (2020) | ML-based voting model | -- | Accuracy: 98% | Used various feature retrieval algorithms | Lack of benchmark datasets |
| Kunang *et al.*, (2020) | LSTM and Glove word embedding | Two datasets | Accuracy: 98.39% and 99.49% | Used multiple datasets | Limited to one language |
| Yang *et al.*, (2019) | CCBLA | PhishTank | Accuracy: 98.37% | Improved feature selection through evolutionary algorithms | Low recall rate |
| Kunang *et al.*, (2020) | ML and DL | N/A | Accuracy: 98.5% | BiLSTM classifier performed better | The dataset did not contain a variety of spam emails |
| Ramanatha *et al.*, (2022) | DL+NLP | Text-based and numerical-based datasets | Accuracy: 99% (text-based) and 94% (numerical-based) | Phish Responder is better than other models | Limited data used; no explanation of the dataset employed |

## ABSTRACT

Non-conventional machining processes represent advanced and specialized techniques for shaping, forming, or modifying materials, bypassing traditional manufacturing methods. These processes are critical for producing components using cutting-edge technology. This research seeks to determine the optimal non-conventional machining method by utilizing multi criteria decision making techniques, specifically FPF TOPSIS and EDAS. The investigation examines five key approaches: Laser Beam Machining, Electron Beam Machining, Electrochemical Machining, Electrical Discharge Machining, and Ultrasonic Machining. The assessment criteria encompass Material Removal Rate, Efficiency, Safety, Cost, and Power Requirement. The analytical process involves creating an initial decision matrix, standardizing the data, and determining ideal and non-ideal solutions. The methodology calculates distances to these solutions and then combines relative importance of criteria. Alternatives are then ranked according to their closeness to the ideal solution, offering a thorough evaluation. The outcomes of the FPF TOPSIS and EDAS methods, conducted within a FPF environment, indicate that electrical discharge machining stands out as the most efficient technique.

**Keywords:** Fermatean Picture fuzzy set, FPF TOPSIS method, FPF EDAS method,non-conventional machining processes.

# INTRODUCTION

The concept of FS, first introduced by Zadeh [1], has been significantly expanded over time, including the development of FFS by Senapati *et al*. [2]. Anita Shanthi *et al*. [3] assessed the overall efficiency of storage batteries within the framework of FPF environment. Alahmadi *et al*. [4] proposed MCDM based on Fermatean fuzzy measures of similarity and entropy. Mishra *et al*. [5,6] applied Multi-criteria healthcare waste disposal location selection based on FF WASPAS method and FF CRITIC-EDAS approach by score function for sustainable 3rd party reverse logistics providers. Ganie *et al*. [7] used MCDM based on distance measures and knowledge measures of FFS. Simic *et al*. [8] elected PF MCDM approach for risk assessment of railway infrastructure. Akram *et al*. [9] employed GDM predicated on PF TOPSIS technique.Chakladar *et al*. [10] offered a hybrid approach that combined TOPSIS and AHP for NCMP selection, while Petkovic *et al*. [11] applied MCDM techniques to identify optimal processes for ceramics machining. Cuong *et al*. [12] selected PS sets-a new concept for computational intelligence problems Memari *et al*. [13] applied a multi criteria IF TOPSIS method for sustainability assessment, while Aydemir *et al*. [14] employed FF TOPSIS combined with Dombi aggregation operators in MCDM. Zhang *et al*. [15] created a method for MCGDM using PF information, applying it to green supplier selection. Stevic *et al*. [16] explored carpenter manufacturer selection using the fuzzy EDAS method. The IF EDAS method was applied to solid waste disposal site selection by Kahraman *et al*. [17]. Yurdakul *et al*. [18,19] compared fuzzy and crisp AHP-TOPSIS models for ranking NCMP and proposed an IF ranking model for these applications. This comprehensive exploration of existing research highlights the growing significance of MCDMs and fuzzy set theories in optimizing NCM processes and related applications.

**FPFTOPSIS and EDAS methods**

Definitions of FPF sets and matrices, WANDM are given in [3] and entropy measure in [4].

**FPF TOPSIS method**

**Definition 2.1.** FPF positive and negative ideal solutions (PIS, NIS) are defined as,

FPF PIS is: $F_{PF}P_{\omega}^{+} = \left( \max_i(\mu_\omega)_{ij}, \min_i(\eta_\omega)_{ij}, \min_i(\gamma_\omega)_{ij} \right)$

FPF NIS is: $F_{PF}N_{\omega}^{-} = \left( \min_i(\mu_\omega)_{ij}, \min_i(\eta_\omega)_{ij}, \max_i(\gamma_\omega)_{ij} \right)$.

**Definition 2.2.**Distance for PIS is:

$$F_{PF}P^{+} = \sum_{j=1}^{n} \sqrt{\frac{1}{n}\left[ \left((\mu_\omega)_{ij} - F_{PF}P_{\omega}^{+}\right)^2 + \left((\eta_\omega)_{ij} - F_{PF}P_{\omega}^{+}\right)^2 + \left((\gamma_\omega)_{ij} - F_{PF}P_{\omega}^{+}\right)^2 \right]}$$

Distance for NIS is

$$F_{PF}P^{-} = \sum_{j=1}^{n} \sqrt{\frac{1}{n}\left[ \left((\mu_\omega)_{ij} - F_{PF}N_{\omega}^{-}\right)^2 + \left((\eta_\omega)_{ij} - F_{PF}N_{\omega}^{-}\right)^2 + \left((\gamma_\omega)_{ij} - F_{PF}N_{\omega}^{-}\right)^2 \right]}$$

.

**Definition 2.3.**FPF WNDM for the ideal final solution is defined as,

$F_{PF}T_i = \dfrac{F_{PF}P^{-}}{F_{PF}P^{+} + F_{PF}P^{-}}$. Here $0 \le F_{PF}T_i \le 1$.

**FPF EDAS method**

**Definition 2.4.** Average of FPF WAN matrix is as follows,

$$\sum_{i=1}^{m} F_{PF}(E_{\omega})_{ij} = \left(1-\prod_{i=1}^{m}(1-(\mu_{\omega})_{ij})^{m}, \prod_{i=1}^{m}((\eta_{\omega})_{ij})^{m}, \prod_{i=1}^{m}((\gamma_{\omega})_{ij})^{m}\right)$$

$$F_{PF}(E_{avg})_{j} = \frac{1}{m}\left[\sum_{i=1}^{m}\left(F_{PF}(E_{\omega})_{ij}\right)\right]_{1Xn}$$

$$= \left(1-\prod_{i=1}^{m}(1-(\mu_{\omega})_{ij})^{\frac{1}{m}}, \prod_{i=1}^{m}((\eta_{\omega})_{ij})^{\frac{1}{m}}, \prod_{i=1}^{m}((\gamma_{\omega})_{ij})^{\frac{1}{m}}\right)_{1Xn}.$$

**Definition 2.5.** Positive distance of FPF WAN matrix is,

$$F_{PF}(E_{pd})_{ij} = \begin{cases} \dfrac{\max\left[0, \left((\mu_{\omega})_{ij}, (\eta_{\omega})_{ij}, (\gamma_{\omega})_{ij}\right) - \left(F_{PF}(E_{avg})_{j}\right)\right]}{\left(F_{PF}(E_{avg})_{j}\right)}, if \quad j \in (E_{\omega})_{b}, \\ \dfrac{\max\left[0, \left(F_{PF}(E_{avg})_{j}\right) - \left((\mu_{\omega})_{ij}, (\eta_{\varpi})_{ij}, (\gamma_{\omega})_{ij}\right)\right]}{\left(F_{PF}(E_{avg})_{j}\right)}, if \quad j \in (E_{\omega})_{n} \end{cases}$$

**Definition 2.6.** Aggregate of positive and negative FPF WNM matrix is,

PFPFWNM: $F_{PF}A(E_{pd})_{ij} = \frac{1}{3}\left[F_{PF}(E_{pd})_{ij}\right]$, NFPFWNM : $F_{PF}A(E_{nd})_{ij} = \frac{1}{3}\left[F_{PF}(E_{nd})_{ij}\right]$.

$$F_{PF}(S_{pd})_{i} = \sum_{j=1}^{n}\left(F_{PF}A(E_{pd})_{ij}\right)$$

**Definition 2.7. S**um of APNDFPF WAN matrix is,

$$F_{PF}(S_{nd})_{i} = \sum_{j=1}^{n}\left(F_{PF}A(E_{nd})_{ij}\right).$$

$$F_{PF}(A_{s})_{i} = \frac{\left[F_{PF}(S_{pd})_{i} + F_{PF}(S_{nd})_{i}\right]}{2}.$$

**Definition 2.8.** FPF WAN appraisal score matrix is,

Flow chart of FPF TOPSIS and EDAS methods is given in Fig. 1.

**Procedure for FPF TOPSIS and EDAS methods.**

**Steps for FPF TOPSIS method**

Step 1 : Compose FPF IDM.
Step 2 : Normalize the IDM.
Step 3 : Find the Entropy values.
Step 4 : Evaluate Weights of FPF IDM.
Step 5 : Itemize the FPF WNIDM and WI.
Step 6 : Identify the FPF of positive and negative ideal values(PNIV) using Definition 2.1.
Step 7 : Enumerate FPF WN matrix of PNIS's using the distance formula Definition 2.2.
Step 8 : Determine final ideal solution using Definition 2.3.
Step 9 : Give the rank for the obtained values.

**Procedure for FPF EDAS method**

Step 10 : Calculate the average weight of the alternatives by applying Definition 2.4.
Step 11 : Determine the positive and negative distance from the FPF WAN matrix Definition 2.5.
Step 12 : Compute the aggregate of FPF PNDWAN matrix as per Definition 2.6.

Step 13 : Sum the FPF PNDWAN matrix as per Definition 2.7.
Step 14 :Evaluate the appraisal score of FPF WAN matrix by Definition 2.8.

**Illustrative Example**

Let the Fermatean Picture Fuzzy (FPF) sets represent five Non-Conventional Machining (NCM) processes: $A_1$ =Laser Beam Machining, $A_2$ =Electron Beam Machining, $A_3$ =Electro Chemical Machining, $A_4$ =Electrical Discharge Machining, and $A_5$ =Ultrasonic Machining. These processes are evaluated based on the criteria of Material Removal Rate, efficiency, safety, cost, and power. The objective is to determine the optimal machining process using FPF TOPSIS and EDAS methods within a Fermatean picture fuzzy framework. Validating the rankings using the FPF TOPSIS and EDAS methods. Identifying and justifying the best NCM process based on the combined analysis.

**Application of FPF TOPSIS method**

**Step-1 :** Construct the FPF IDM.

$$F_{PF}\ I = \begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} MRR & C & E \\ (0.10,0.11,0.89) & (0.60,0.13,0.38) & (0.89,0.12,0.10) \\ (0.12,0.23,0.85) & (0.80,0.21,0.19) & (0.89,0.23,0.10) \\ (0.50,0.33,0.49) & (0.82,0.29,0.15) & (0.40,0.31,0.25) \\ (0.85,0.41,0.13) & (0.60,0.42,0.38) & (0.80,0.11,0.18) \\ (0.63,0.11,0.37) & (0.40,0.51,0.58) & (0.80,0.23,0.19) \end{pmatrix}$$

$$\begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} PR & S \\ (0.11,0.12,0.85) & (0.33,0.18,0.54) \\ (0.12,0.22,0.88) & (0.81,0.21,0.18) \\ (0.12,0.24,0.86) & (0.81,0.17,0.18) \\ (0.03,0.11,0.91) & (0.81,0.34,0.18) \\ (0.10,0.21,0.88) & (0.33,0.14,0.54) \end{pmatrix}$$

**Step-2 :** Compute FPF normalized matrix,

$$F_{PF}\ F_n = \begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} MRR & C & E \\ (0.0456,0.0924,0.3200) & (0.1863,0.0833,0.2262) & (0.2354,0.1200,0.1220) \\ (0.0547,0.1933,0.3114) & (0.2484,0.1346,0.1131) & (0.2354,0.2300,0.1220) \\ (0.2278,0.2773,0.1795) & (0.2547,0.1859,0.0893) & (0.1058,0.3100,0.3049) \\ (0.3872,0.3445,0.0476) & (0.1863,0.2692,0.2262) & (0.2116,0.1100,0.2195) \\ (0.2847,0.0924,0.1355) & (0.1242,0.3269,0.3452) & (0.2116,0.2300,0.2317) \end{pmatrix}$$

$$\begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} PR & S \\ (0.2306,0.1333,0.1941) & (0.1076,0.1731,0.3333) \\ (0.2516,0.2444,0.2009) & (0.2616,0.2019,0.0111) \\ (0.2516,0.2667,0.1963) & (0.2616,0.1635,0.0111) \\ (0.0566,0.1222,0.2078) & (0.2616,0.3269,0.0111) \\ (0.2096,0.2333,0.2009) & (0.1076,0.1346,0.0333) \end{pmatrix}$$

**Step-3 :** Entropy values are,

$TE_1 = 0.7265, TE_2 = 0.4617, TE_3 = 0.5650, TE_4 = 0.9294, TE_5 = 0.5354.$

**Step-4 :** Weight values are,

$TW_1 = 0.2257, TW_2 = 0.1435, TW_3 = 0.1756, TW_4 = 0.2888, TW_5 = 0.1664.$

**Step-5 :** FPF WN matrix is,

$$(F_{PF}\ D_{\omega n})_{ij} = \begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \\ \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} \multicolumn{3}{c}{MRR} & \multicolumn{3}{c}{C} & \multicolumn{3}{c}{E} \\ (0.0103,0.0209,0.0736) & (0.0267,0.0120,0.0325) & (0.0413,0.0211,0.0214) \\ (0.0123,0.0436,0.0703) & (0.0356,0.0193,0.0162) & (0.0413,0.0404,0.0214) \\ (0.0514,0.0626,0.0405) & (0.0365,0.0267,0.0128) & (0.0186,0.0544,0.0535) \\ (0.0874,0.0778,0.0107) & (0.0267,0.0386,0.0325) & (0.0372,0.0193,0.0385) \\ (0.0643,0.0209,0.0306) & (0.0178,0.0469,0.0495) & (0.0372,0.0404,0.0407) \\ & \multicolumn{2}{c}{PR} & \multicolumn{2}{c}{S} \\ & (0.0666,0.0385,0.0560) & (0.0179,0.0288,0.0555) \\ & (0.0727,0.0706,0.0580) & (0.0435,0.0336,0.0185) \\ & (0.0727,0.0770,0.0567) & (0.0435,0.0272,0.0185) \\ & (0.0163,0.0353,0.0600) & (0.0435,0.0544,0.0185) \\ & (0.0605,0.0674,0.0580) & (0.0179,0.0224,0.0555) \end{pmatrix}$$

**Step-6 :** FPF positive and negative solutions are,

$$PNIS = \begin{array}{c} \\ PS \\ NS \\ \\ PS \\ NS \end{array} \begin{pmatrix} \multicolumn{3}{c}{MRR} & \multicolumn{3}{c}{C} & \multicolumn{3}{c}{E} \\ 0.0874,0.0209,0.0107 & 0.0178,0.0120,0.0495 & 0.0413,0.0193,0.0214 \\ 0.0103,0.0209,0.0736 & 0.0365,0.0120,0.0128 & 0.0186,0.0193,0.0535 \\ & \multicolumn{2}{c}{PR} & \multicolumn{2}{c}{S} \\ & 0.0163,0.0353,0.0600 & 0.0435,0.0224,0.0185 \\ & 0.0727,0.0353,0.0560 & 0.0179,0.0224,0.0555 \end{pmatrix}$$

**Step-7 :** FPF DPIS's are,

$TP_1^+ = 0.0407, TP_2^+ = 0.0424, TP_3^+ = 0.0388, TP_4^+ = 0.0251, TP_5^+ = 0.0298.$

FPF DNIS's are,

$TN_1^- = 0.0154, TN_2^- = 0.0263, TN_3^- = 0.0341, TN_4^- = 0.0473, TN_5^- = 0.0393.$

**Step-8 :** FPF cumulative solution of the $T_i$ values are,

$T_1 = 0.2746, T_2 = 0.3827, T_3 = 0.4678, T_4 = 0.6534, T_5 = 0.5689.$

**Step-9 :** Rank of $T_i$ is $A_4 - A_5 - A_3 - A_2 - A_1$.

**Application of FPF EDAS method**

**Step-10 :** Itemize the average of FPFWAN matrix,

$$E_{avg} = AVG \begin{pmatrix} \multicolumn{3}{c}{MRR} & \multicolumn{3}{c}{C} & \multicolumn{3}{c}{E} \\ (0.0456,0.0392,0.0370) & (0.0287,0.0257,0.0255) & 0.0352,0.0325,0.0329 \\ & \multicolumn{2}{c}{PR} & \multicolumn{2}{c}{S} \\ & (0.0580,0.0549,0.0577) & (0.0334,0.0317,0.0287) \end{pmatrix}$$

**Step-11 :** PND of FPFWAN matrix,

$$E_{pd} = \begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \\ \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} \multicolumn{3}{c}{MRR} & \multicolumn{3}{c}{C} & \multicolumn{3}{c}{E} \\ (0.0000,0.0000,0.9914) & (0.0691,0.5343,0.0000) & (0.1760,0.0000,0.0000) \\ (0.0000,0.1123,0.9019) & (0.0000,0.2478,0.3644) & (0.1760,0.2435,0.0000) \\ (0.1272,0.5972,0.0964) & (0.0000,0.0000,0.4982) & (0.0000,0.6760,0.6276) \\ (0.9163,0.9844,0.0000) & (0.0691,0.0000,0.0000) & (0.0571,0.0000,0.1719) \\ (0.4090,0.0000,0.0000) & (0.3794,0.0000,0.0000) & (0.0571,0.2435,0.2370) \\ & \multicolumn{2}{c}{PR} & \multicolumn{2}{c}{S} \\ & (0.0000,0.2984,0.0294) & (0.0000,0.0000,0.9332) \\ & (0.0000,0.0000,0.0060) & (0.3047,0.0595,0.0000) \\ & (0.0000,0.0000,0.0180) & (0.3047,0.0000,0.0000) \\ & (0.7181,0.3569,0.0000) & (0.3047,0.7154,0.0000) \\ & (0.0000,0.0000,0.0000) & (0.0000,0.0000,0.9332) \end{pmatrix}$$

$$E_{nd} = \begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} MRR & & & C & & & E & & \\ (0.7746 & 0.4676 & 0.0000) & (0.0000 & 0.0000 & 0.2712) & (0.0000 & 0.3512 & 0.3490) \\ (0.7295 & 0.0000 & 0.0000) & (0.2412 & 0.0000 & 0.0000) & (0.0000 & 0.0000 & 0.3490) \\ (0.0000 & 0.0000 & 0.0000) & (0.2722 & 0.0388 & 0.0000) & (0.4715 & 0.0000 & 0.0000) \\ (0.0000 & 0.0000 & 0.7091) & (0.0000 & 0.5044 & 0.2712) & (0.0000 & 0.4053 & 0.0000) \\ (0.0000 & 0.4676 & 0.1721) & (0.0000 & 0.8268 & 0.9403) & (0.0000 & 0.0000 & 0.0000) \end{pmatrix}$$

$$\begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} PR & & & S & & \\ (0.1484 & 0.0000 & 0.0000) & (0.4631 & 0.0918 & 0.0000) \\ (0.2528 & 0.2863 & 0.0048) & (0.0000 & 0.0000 & 0.3556) \\ (0.2528 & 0.4032 & 0.0000) & (0.0000 & 0.1423 & 0.3556) \\ (0.0000 & 0.0000 & 0.0391) & (0.0000 & 0.0000 & 0.3556) \\ (0.0440 & 0.2278 & 0.0048) & (0.4631 & 0.2937 & 0.0000) \end{pmatrix}$$

**Step-12 :** Compute the aggregate of FPFPNDWAN is,

Aggregate of PD is,

$$AE_{pd} = \begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} LC & C & MTS & R & MR \\ 0.3305 & 0.2012 & 0.0587 & 0.1093 & 0.3111 \\ 0.3384 & 0.2041 & 0.1398 & 0.0000 & 0.1214 \\ 0.2736 & 0.1661 & 0.4345 & 0.0060 & 0.1016 \\ 0.6335 & 0.0230 & 0.0763 & 0.3583 & 0.3400 \\ 0.1363 & 0.1265 & 0.1792 & 0.0000 & 0.3111 \end{pmatrix}$$

Aggregate of ND is,

$$AE_{nd} = \begin{array}{c} \\ LB \\ EB \\ EC \\ ED \\ US \end{array} \begin{pmatrix} LC & C & MTS & R & MR \\ 0.4141 & 0.0904 & 0.2334 & 0.0495 & 0.1850 \\ 0.2432 & 0.0804 & 0.1163 & 0.1813 & 0.1185 \\ 0.0000 & 0.1037 & 0.1572 & 0.2187 & 0.1660 \\ 0.2364 & 0.2585 & 0.1351 & 0.0130 & 0.1185 \\ 0.2132 & 0.5890 & 0.0000 & 0.1922 & 0.2522 \end{pmatrix}$$

**Step-13 :** Calculate the sum of FPFPNDWAN is,

Sum of PD,

$$S_{pd} = \begin{array}{c} MRR \quad C \quad E \quad PR \quad S \\ (0.2021 \quad 0.1607 \quad 0.1964 \quad 0.2863 \quad 0.1506) \end{array}$$

Sum of ND,

$$S_{pd} = \begin{array}{c} MRR \quad C \quad E \quad PR \quad S \\ (0.1945 \quad 0.1479 \quad 0.1291 \quad 0.1523 \quad 0.2293) \end{array}$$

**Step-14 :** Appraisal score of FPFWAN matrix,

$$S_{pd} = \begin{array}{c} MRR \quad C \quad E \quad PR \quad S \\ (0.1983 \quad 0.1543 \quad 0.1627 \quad 0.2193 \quad 0.1900) \end{array}$$

Rank of OWAN matrix is $A_4 - A_1 - A_5 - A_3 - A_2$.

## CONCLUSION

In determining which is more appropriate NCM process for creating a surface of revolution on stainless steel, the crucial factors evaluated are PR, MRR, C, E and S. Among these, MRR, E, and S are considered beneficial attributes with higher values being more desirable, while C and PR are deemed unfavorable attributes where lower values are

preferred. Ranking values of FPF TOPSIS and EDAS methods (Figure.2). According to the calculated relative closeness values, the NCM processes are ranked in the following order: As per FPF TOPSIS method, EDM-USM-ECM-EBM-LBM and as indicated in FPF EDAS method, EDM-LBM-USM-EBM-LBM. As a result, EDM emerges as the most suitable process for this particular machining application. The ranking for the other processes showed variation.

**ABSTRACT**

Oral squamous cell carcinoma (OSCC) is the most common malignancy of the oral cavity and is associated with significant morbidity, particularly in elderly patients. Recurrence following surgical management poses therapeutic challenges, especially when patients are unwilling or unfit for further invasive interventions. In such situations, symptomatic and supportive care becomes the primary objective of management. Ayurveda describes chronic ulcerative and malignant-like conditions under entities such as *Arbuda*, *Dushta Vrana*, and *Mukhagata Roga*, where treatment is aimed at alleviating symptoms, correcting systemic imbalance, and improving quality of life. The present case report describes a 79-year-old female with recurrent oral squamous cell carcinoma who declined further surgical intervention and was managed with Ayurvedic local and internal therapies. Over a follow-up period of three months, improvement was observed in pain, oral discomfort, appetite, and general well-being, although no significant reduction in lesion size was noted. This case highlights the role of Ayurveda as a supportive and palliative care modality in recurrent oral cancer.

**Keywords:** Oral squamous cell carcinoma, Ayurveda, Palliative care, Mukhagata Roga, Rasayana

## INTRODUCTION

Oral squamous cell carcinoma constitutes more than 90% of all oral malignancies and remains a major health concern worldwide[1]. Despite advances in surgical and oncological management, recurrence following definitive treatment is not uncommon and is often associated with pain, impaired mastication, altered taste sensation, and nutritional

compromise[2]. Elderly patients with recurrent disease frequently decline further surgical or oncological interventions due to fear, prior postoperative morbidity, or anticipated poor tolerance. Ayurveda adopts a holistic approach in chronic and debilitating diseases, emphasizing symptom control, maintenance of strength, and improvement of quality of life. Classical Ayurvedic texts describe chronic ulcerative and proliferative lesions under *Arbuda*, *Dushta Vrana*, and *Mukhagata Roga*, wherein management focuses on *Dosha Shamana*, correction of *Agni*, and *Rasayana* therapy[3-5]. The present case report documents the role of Ayurvedic interventions in the symptomatic management of recurrent oral squamous cell carcinoma.

**Case Report**

**Patient Information**

A 79-year-old female patient presented with complaints of difficulty in chewing food, persistent redness and ulceration inside the mouth, bitter taste, restricted mouth opening, poor appetite, and generalized weakness.

**History of Present Illness**

Five years earlier, the patient had been diagnosed with oral squamous cell carcinoma and underwent right hemimandibulectomy with flap reconstruction. Postoperative healing was delayed and extended over nearly one year. After a period of relative stability, the disease recurred as an ulcerative lesion involving the inner aspect of the right angle of the mouth, extending to the lip and cheek mucosa. Further surgical intervention was advised at a tertiary care center; however, the patient declined additional surgery and sought Ayurvedic management for symptomatic relief.

**Past History**

There was no history of diabetes mellitus, hypertension, or other major systemic illnesses. The patient had not received chemotherapy or radiotherapy following the initial surgical intervention.

**Family History**

No family history of malignancy or hereditary disorders was reported.

**Examination Findings**

**General Physical Examination**

The patient was conscious, oriented, and cooperative. She appeared elderly and mildly malnourished.
Vital Parameters (Table 1).

**Local Examination (Oral Cavity)**

Inspection revealed an ill-defined ulcerative lesion involving the inner aspect of the right angle of the mouth, extending to the adjacent lip and cheek mucosa. The surrounding mucosa appeared erythematous with mild edema. Mouth opening was restricted, limiting adequate visualization. Palpation elicited tenderness. The patient complained of pain during mastication and altered taste sensation.

**Ayurvedic Clinical Examination**

Ashtavidha Pariksha (Table 2). Dashavidha Pariksha (Table 3).

**Systemic Examination**

Cardiovascular and respiratory system examinations were within normal limits. Abdominal examination revealed no organomegaly. Central nervous system examination showed no focal neurological deficits. Generalized weakness was noted, attributable to age and chronic illness.

**Investigations**

**Imaging Findings**

**Contrast-enhanced CT (CECT) of Neck and Thorax (05/06/2024)** revealed:

- Status post right hemimandibulectomy with flap in situ
- Ill-defined heterogeneously enhancing soft tissue lesion involving the anterior aspect of the flap at the right angle of the mouth, extending to the skin and subcutaneous tissue
- **Lesion size:** 23 × 13 × 27 mm (AP × ML × CC), suggestive of neoplastic recurrence
- No significant cervical lymphadenopathy
- Nasopharynx, oropharynx, hypopharynx, and larynx appeared normal
- No pulmonary nodules, pleural effusion, or mediastinal lymphadenopathy

These findings suggested localized recurrent oral squamous cell carcinoma without distant metastasis(Fig. 1).

**Ayurvedic Assessment and Samprapti**

Based on clinical presentation, chronicity, and age, the condition was assessed as a chronic ulcerative lesion with predominance of *Pitta* and *Rakta* vitiation, associated with *Mandagni* and *Dhatu Kshaya*. Ayurvedic Samprapti of Recurrent Oral Squamous Cell Carcinoma (Table 4).

**Therapeutic Intervention**

The treatment was planned with a palliative intent, focusing on symptom relief, oral comfort, digestive correction, and general strength.

**Local Treatment**

**G 32-dip Tablet:** Applied locally twice daily
**Tutha Gandoosha:** Twice daily

**Internal Medications**

**Tab Anacarcin:** Two tablets twice daily
**Rasayana Churna:** Six grams at bedtime with water
**Amapachak Vati:** Two tablets twice daily before meals

**Pathya–Apathya**

Spicy, sour, hot, and coarse foods were avoided. Soft, lukewarm, and easily digestible foods were advised along with maintenance of oral hygiene.

**Follow-Up and Outcome**

The patient was followed up for three months. Improvement was observed in pain, oral discomfort, appetite, and ability to chew soft foods. Bitter taste reduced, and mild improvement in general strength was noted. No significant reduction in lesion size was observed.

## DISCUSSION

Recurrent oral squamous cell carcinoma in elderly patients presents a complex therapeutic challenge, particularly when further surgical or oncological interventions are declined. In such situations, the primary objective shifts from disease eradication to symptomatic relief, maintenance of oral function, nutritional support, and improvement in quality of life[2]. From an Ayurvedic perspective, chronic ulcerative and proliferative lesions of the oral cavity are understood as conditions involving *Pitta* and *Rakta Dushti* with associated *Mamsa Dhatu* involvement, compounded by *Mandagni* and *Dhatu Kshaya* due to age and chronic disease[3-5]. The therapeutic strategy adopted in this case focused on local symptom control, correction of internal imbalance, and systemic support through *Rasayana* measures. Local therapies such as application of G 32-dip tablet solution and *Tutha Gandoosha* are traditionally

indicated in *Mukhagata Roga* and *Dushta Vrana*. These measures exert *Shodhana*, *Lekhana*, and *Shamana* effects, helping to reduce *Shotha* (inflammation), *Daha* (burning sensation), and *Shoola* (pain) while maintaining oral hygiene[3,6]. *Tutha* (copper sulfate), used in diluted form for *Gandoosha*, possesses *Kashaya* and *Krimighna* properties, which help in controlling excessive secretions, reducing microbial contamination, and supporting local wound cleanliness[7]. Anacarcin tablet is widely used in Ayurvedic oncology practice and contains formulations traditionally indicated in *Arbuda* and chronic inflammatory conditions. From an Ayurvedic standpoint, it acts by pacifying *Kapha* and *Ama*, regulating abnormal tissue proliferation, and enhancing *Vyadhi Kshamatva* (immune competence)[8]. Although not claimed to be curative in advanced malignancy, it may help in symptom stabilization and systemic support. Rasayana Churna was prescribed considering the patient's *Vriddhavastha* and evident *Dhatu Kshaya*. Rasayana therapy is described to act at the level of *Agni*, *Dhatu*, and *Ojas*, thereby improving tissue nourishment, strength, and vitality while slowing degenerative processes[4,9]. In the present case, Rasayana support contributed to improvement in appetite, reduction in fatigue, and better overall well-being. Amapachak Vati was administered to correct *Mandagni* and eliminate *Ama*, which are considered fundamental pathogenic factors in chronic diseases. By enhancing digestion and metabolism, it improves nutrient assimilation and indirectly supports tissue repair and immune function[3,4]. Thus, the combined Ayurvedic approach addressed *Dosha Shamana*, *Agni Deepana*, *Ama Pachana*, and *Rasayana*, targeting both local pathology and systemic weakness. From a modern biomedical viewpoint, the medicines used in this case primarily contribute throughanti-inflammatory, antimicrobial, antioxidant, and immunomodulatory mechanisms**,** which are particularly relevant in palliative oncology care[2,10]. Local application of medicated formulations and *Gandoosha* may reduce microbial load, limit secondary infection, and decrease inflammatory mediators at the lesion site. Maintenance of oral hygiene and reduction of local inflammation are critical in oral cancer patients to alleviate pain and improve mastication[11]. Ingredients commonly used in formulations like Anacarcin have been reported in experimental studies to exhibit immunomodulatory and cytotoxic activities, which may help modulate inflammatory responses and abnormal cellular behaviour[12]. While such effects cannot reverse established malignancy, they may support symptom control and host resilience. Rasayana drugs have demonstrated antioxidant and adaptogenic properties, helping counter oxidative stress associated with chronic inflammation and malignancy[9,13]. Improvement in digestion through Amapachak formulations supports nutritional status and immune competence, which are crucial determinants of quality of life in elderly cancer patients[14].

## CONCLUSION

Ayurvedic interventions provided meaningful symptomatic relief and improved quality of life in a patient with recurrent oral squamous cell carcinoma who declined further surgical management. While lesion size remained unchanged, improvements in pain, oral function, appetite, and general well-being were evident. Ayurveda may serve as a valuable supportive and palliative care modality in integrative oncology.

## ABSTRACT

Vaginitis is a common inflammatory disorder of the vagina, associated with discharge, itching, and pH alteration. Triphala Kashaya Yoni Dhavana (vaginal wash) and Chandraprabha Vati (oral medication) are traditional formulations with antimicrobial and reju venative properties. To evaluate the clinical efficacy of Triphala Kashaya Yoni Dhavana and Chandraprabha Vati in the management of vaginitis. A 36-year-old married woman (G2P2L2) presented with a 3-month history of excessive vaginal discharge, itching, and irritation. Vaginal pH was 6.5. The patient was treated with Triphala Kashaya Yoni Dhavana twice daily for seven days and Chandraprabha Vati (2 tablets twice daily) for 15 days. Pathya (dietary regulations) and Apathya (restrictions) were advised. After the completion of course of treatment, the patient experienced complete relief from discharge and itching, with normalization of vaginal pH to 4.5. No adverse effects or recurrence were reported during a one-month follow-up. The combined use of Triphala Kashaya Yoni Dhavana and Chandraprabha Vati demonstrated significant improvement in clinical and biochemical parameters of vaginitis. This suggests that Ayurvedic therapy can serve as a safe, effective, and holistic alternative in managing recurrent vaginal infections.

**Keywords:** Vaginitis, Yoni Vyapad, Triphala Kashaya, Chandraprabha Vati, Yoni Dhavana, Ayurveda.

## INTRODUCTION

Vaginitis is one of the most prevalent gynecological conditions affecting women across all age groups. It results from microbial infections such as Candida albicans, Gardnerella vaginalis, or Trichomonas vaginalis, as well as from hormonal imbalance, poor hygiene, or pH disturbances. Conventional treatment protocols rely on antibiotics and antifungal drugs, but recurrence and drug resistance are common.

In practice,Vaginitis (inflammatory/infective conditions of the vagina) presents with abnormal vaginal discharge, pruritus, burning, and sometimes dyspareunia.. Classical Ayurvedic texts describe a group of yoni-vikāras (yoni-vyāpāda) whose features overlap with contemporary vaginitis. Among these, **Kaphaja Yoni Vyāpāda / KaphajaArtava-duṣṭi** is commonly correlated with white, viscous, sticky, and cold discharges and associated local symptoms, making it the closest classical analogue for several forms of vaginitis including candidiasis and non-specific (Kapha-predominant)vaginitis.

In Ayurvedicclassics,various conditions giving rise to *Yonisrava*or white discharge per vaginum have been described. The disorder or Kaphaja Yoni Vyapad described *by Acharya Charaka*and *Sushruta,* can be correlated with vaginitis as it is characterized by *YonigataShwetastrava*(white discharge), *Yonikandu*(vaginal itching).

कफोऽभिष्यन्दिभिर्वृद्धोयोनिंचेद्दूषयेत्स्त्रियाः।

पाण्डुवर्णांतथापाण्डुपिच्छिलार्तववाहिनीम्" ।।१४।। (च० सं० चि० ३०)

*Kapha,* vitiated due to excessive use of *Abhisyandi*(articles producing oozing or serous effusion) substances reaches reproductive system and causes unctuousness, coldness, itching and dull pain in vagina. The woman looks anemic, and discharges pale and mucoid menstrual blood. If these signs and symptoms remain neglected, it may lead to significant infections that harm the overall health and cause psychological disturbances. This study emphasizes a l holistic approach to Ayurvedic management of *KaphajaYonivyapada.*

Triphala Kashaya (a decoction of Amalaki, Haritaki, and Bibhitaki) has antimicrobial and astringent actions, while Chandraprabha Vati is known for its Tridoshahara and Rasayana properties. Their combined use offers local and systemic benefits.

## MATERIALS AND METHODS

**Patient Information**
A 36-year-old married woman (G2P2L2) presented with complaints of excessive vaginal discharge, itching, and irritation for three weeks. Vaginal pH was 6.5. The patient had no history of diabetes or hypertension.

**History of Past illness:** According to the patient, she was suffering from white discharge per vagina since 3 weeks. She was also having the associated complaints of itching, irritation per vagina since then. She was also found to be suffering from constipation. After undergoing management for vaginitis from a local gynaecologist, the patient get lasting relief and therefore decided to approach PAH –PTSR OPD for Ayurvedictreatment.

**History of past illness:** Patient does not have history of diabetes and hypertension
**Past Medical History**: No relevant history was present.

**Past Surgical History**: No surgical illness.

**Drug History**- Patient had taken Allopathic medicines for vaginal discharge.
**Family History:** Nil
**Menstrual History:**
**Age of Menarche:** 14 year, the period was regular, with no associated complaints.
**Marital Status**- married
**Personal history-** She has reduced appetite, disturbed sleep and proper micturition but her bowel habit was constipated.

**GENERAL EXAMINATION**
Built- normal, Weight- 58kg, Height- 155 cm, Pulse rate- 100/min, B.P.- 110/70mm of Hg, Respiration rate- 18/min, Temp- 98.6 F.

**SYSTEMIC EXAMINATION**
CVS**:** Heart sounds (S1S2): Normal
Respiratory system:normal bilateral air entry, no added sounds.
No abnormality found on other system

**Physical Examination**

***Vyaktasthana-*** *Garbhashay, Twak, Mamsa, Meda ,Aartava*

*Samprapti* (Pathogenesis) of *KaphajaArtavadushti* The pathogenesis of **Kaphaja Artavaduṣṭi** begins with chronic exposure to **Kapha-vardhakanidānas**, such as excessive intake of guru, snigdha and śītaahāra; over-consumption of dairy and sweets; day-sleep; and a sedentary lifestyle. These etiological factors lead to **Kaphadoṣaprakopa**, characterized by augmentation of Kapha's guru, snigdha and manda qualities. Concurrently, **agnimāndya** develops at both jāṭharāgni and dhātvāgni levels, resulting in **āma formation**. The combination of āma and aggravated Kapha promotes **srotorodha** due to their obstructive and coating tendencies.

The primary site of vitiation is the **Artavavahasrotas**, along with secondary involvement of **Medovaha** and **Raktavahasrotas**.Rasvahastrotas also get vitiated if there is excessive use of spicy food habits. Further manifests as **Kapha-avarana of Vāta**, wherein Kapha's heaviness and viscosity impede the normal gati of Vāta responsible for artavapravṛtti. This avarana impairs the cyclical transport, maturation, and expulsion of artava. As a result, **Artavadhātu becomes duṣṭa**, showing Kapha-dominant alterations such as increased viscosity, śveta-pāṇḍuvarṇa, and sluggish flow, consistent with textual descriptions of Kaphaja Artavaduṣṭi. At the dūṣya level, **Artava, Meda**, and **Rakta**play major roles. Meda involvement explains the commonly associated metabolic and structural derangements (e.g., srotas-saṅga, ovarian sluggishness), while Rakta participation accounts for qualitative impurities in artava. The **adhiṣṭhāna**of pathology remains the **garbhāśayaand artavavahastrotas**, correlating with ovarian and uterine dysfunction as described in contemporary gynecological interpretations.
Thus, the **samprapti** of KaphajaArtavaduṣṭi can be summarized as:

**Nidāna → Kaphaprakopa → Agnimāndya&Āma → Srotorodha (Artavavaha, Medovaha, Raktavaha) → Kapha-Avarana of Vāta → Duṣṭi of Artavadhātu → Manifestation of KaphajaArtavaduṣṭi**

**INVESTIGATIONS**
**Blood** (On 30-04-2025):- Hb- 11.3 gm%, TLC -7800 /mm3, , Neutrophill- 49%, Lymphocytes-44%, Eosinophil -4%, Monocytes- 3%, Basophils -0%. TSH- 2.333 mcIU/ml, FSH- 2.98mIU/ml, LH- 12.37mIU/m (LH: FSH is >2:1).
Urine Test for Routine and Microscopy- Within normal limits.

**TREATMENT PROTOCOL**
- Triphala Kashaya Yoni Dhavana: Twice daily for 7 days (lukewarm decoction).
- Chandraprabha Vati: 2 tablets twice daily with lukewarm water for 15 days.
- Pathya: Light diet, increased hydration, inclusion of fruits and vegetables.
- Apathya: Avoid spicy, fermented food, stress, sexual intercourse, and junk food.

## RESULTS

After 7 days of Yoni Dhavana and 15 days of Chandraprabha Vati, the patient showed significant improvement. Vaginal discharge reduced, itching subsided, and pH normalized from 6.5 to 4.5. No adverse reactions or recurrence were observed during the one-month follow-up.

## DISCUSSION

The improvement can be attributed to the synergistic actions of Triphala and Chandraprabha Vati. Triphala contains polyphenols and tannins with antimicrobial and astringent effects, restoring vaginal pH and flora. Chandraprabha Vati acts systemically to balance doshas, reduce inflammation, and promote mucosal healing. Mode of Action- The astringent and antimicrobial nature of Triphala helps in reducing excessive vaginal discharge (PichhilaSrava). The tannins present in Triphala have antifungal properties, which help in controlling infections. It also acts as an immunomodulator, enhancing local immunity and preventing recurrent infections.The cleansing action of TriphalaKwath removes excessive KaphaDosha, restoring vaginal pH and maintaining a healthy vaginal

environment. Chandraprabhavati has Katu, Tikta, Kashaya and Madhura Rasa, UshnaVirya and Gunas like Laghu, Ushna, Tikshna and Ruksa. It acts mainly on urinary and genitarysystems.. According to Dosha - ChandrapabhaVati is mainly Tridoshaja more commonly VatakaphaShamaka in nature According to Dhatu - On analyzing the indications and properties this Vati acts on Rasa, Rakta, Mamsa, Medas, Asthi, Majja, ShukraDhatus Studies by Hemavathi et al. (2017) and Sharma & Patil (2019) support these findings, reporting symptom relief and improved hygiene in patients treated with similar regimens. Amirthasingam et al. (2019) demonstrated antimicrobial synergy of Triphala with antibiotics, validating its use as an adjunct in infection control.

## CONCLUSION

The combination of Triphala Kashaya Yoni Dhavana and Chandraprabha Vati proved to be safe and effective in managing vaginitis, restoring vaginal health, and maintaining normal pH without side effects. Larger clinical trials are recommended to validate these findings.

## ACKNOWLEDGMENT

The author expresses gratitude to Parul Institute of Ayurved and the patient for consent to publish this report.

**ABSTRACT**

Schmorl's node (SN) are end plate herniation, usually asymptomatic but may present a higher incidence of back pain. SN is usually treated by conservative therapy with analgesics drugs, resting the part and bracing. Surgical treatment indicated in case of failure conservative treatment. Although physiotherapy has shown potential benefits in managing this condition, the current body of literature remains limited, and standardized physiotherapeutic intervention protocols are largely absent. 13-year-old school-going girl with a history of insidious thoracic and lumbar pain was referred to physiotherapy with a diagnosis of Schmorl's nodes. Thus, the case highlights the value of a holistic physiotherapeutic approach combining electrotherapy, manual therapy, exercise therapy, and postural education. Significant improvement in back pain (Visual analogue scale), Cervical and thoracic Range of Motion, Scapular and back musculature Muscle strength (Manual Muscle Testing), Functional outcomes(The Modified Oswestry Disability Index) were noted after 8 weeks of physiotherapy intervention. Additional research is required to confirm the effectiveness of this approach in a larger patient population.

**Keywords:** Back pain, Dorsal Spine, Physiotherapy, Schmorl's node

## INTRODUCTION

In 1927, pathologist Christian Georg Schmorl described a specific type of vertebral lesion, seen primarily in the thoracolumbar spine, which is now known as Schmorl's node (SN) [1]. The reported prevalence of SN varies greatly from 3.8% to 76% [2]. Schmorl's node (SN) is herniation of an intervertebral disc through a cartilaginous endplate, resulting in a local and irregular depression in the cortical bone [3].their direct cause is unknown, but it was assumed to be due to weakness of the intervertebral disc [4]. several factors can contribute to the weakening of the cartilaginous endplate. These include genetic defects of the spinal column, trauma and degenerative, and/or pathological processes, which are all considered to be risk factors for the occurrence of this lesion [3].even some hypothesis state that schmorl's nodes would be related to abnormalities of the vertebral blood vessels during development, thereby weaken the vertebral endplate and facilitate the herniation of nuclear pulposus into subchondral bone [5]. SN can appear on any spine vertebra, mainly in the lower thoracic and lumbar regions [6]. SN prevalence more commonly found in males (76% cases) compare to female [3].Clinical presentation of Patient with schmorl's nodes will be asymptomatic but may present a higher incidence of lower back pain, Pain is increased with prolonged sitting, coughing, and sneezing; it is often relieved by changing positions and by sleeping on one's side [7], also may increase risk of osteoporotic bone and trabecular bone fracture [8,9]. Treatment for SN includes conservative treatment and surgical treatment [10]. Mostly acute painful SN is usually treated by conservative therapy with analgesics drugs, resting the part and bracing. Surgical treatment indicated in case of failure conservative treatment [11]. There are limited articles on therapeutic approach for SN, Amy J. Swain state that the home exercise program in this case was effective in increasing the patient's strength, but not at decreasing the patient's pain. More research is needed to determine the best physical therapy treatment and optimal home exercise program for adolescents with Schmorl's nodes [12].Prince Rohilla also state that a combined physiotherapy and home exercise programme can effectively manage LBP associated with a lumbar Schmorl's node and improvement in overall Quality of life [13].

## CASE REPORT

The patient was a 13-year-old school-going girl with a history of insidious thoracic and lumbar pain that began 1 month prior to her physical therapy treatment with difficulties in prolonged sitting due to spine pain and also difficulties in helping with house grooming, mostly in floor mopping. She came to the outpatient department at Khyati College of Physiotherapy with radiograph and magnetic resonance imaging reports; it was revealed that there was Schmrol's node formation at the inferior endplate of the D7 to D10, D12 vertebrae and the superior-inferior endplate of the D11 vertebrae (Image 1). The patient was treated conservatively with vitamin D3 (one/week for 4 weeks), calcium (one/day for 30 days), multivitamin and mineral supplements (one tablet/day for 10 days), analgesics (aceclofenac, paracetamol, and serratopeptidase tablets (half tablets 3 times a day for 10 days)), medicines, and physical therapy. The patient presented with bilateral mild protracted shoulders, the left shoulder elevated with ipsilateral slight neck deviation and thoracolumbar kyphosis. Spasm presented over thoracic paraspinal muscles. In motor examination, range of motion was assessed using the universal goniometer as recommended by Cynthia C. Norkin and D. Joyce White (14), and cervical, thoracolumbar, and lumbar regions' ranges of motion were all normal except cervical lateral flexion, cervical rotation, and thoracolumbar extension (Table No. 1). and Manual muscle testing was assessed using the standardized manual muscle testing techniques as described by Daniels and Worthingham [15]. In manual muscle testing of scapular muscles, thoracic muscles were affected most (Table no. 1).

**Physical therapy intervention**

A comprehensive protocol of physiotherapy intervention is documented in Table 2, where the therapeutic goals, intervention methods, and their respective durations are systematically tabulated. The dosage parameters—defined by intensity, frequency, and session length—are also clearly presented for each stage of rehabilitation.

## DISCUSSION

The present case highlights the effectiveness of a structured physiotherapy program in the conservative management of thoracolumbar pain associated with Schmorl's nodes in an adolescent female. Schmorl's nodes, first described by Christian Georg Schmorl in 1927, are herniations of the nucleus pulposus through the vertebral endplate into the vertebral body. Although frequently asymptomatic, they can cause localized pain, paraspinal muscle spasm, and mechanical dysfunction, particularly in young active individuals or adolescents with postural imbalances. In this case, the patient exhibited characteristic postural deviations—protracted shoulders, thoracolumbar kyphosis, and mild neck deviation—accompanied by restricted extension and weakened scapular and thoracic musculature. The physiotherapy protocol emphasized pain reduction, posture correction, and progressive strengthening of the thoracolumbar and scapular muscles through stages focusing on isometric activation, flexibility, core stabilization, and functional strengthening. Over an eight-week period, significant improvements were noted in pain reduction (VAS: 7 → 3), functional ability (Modified Oswestry Disability Index: 40% → 12%), and muscle performance, confirming the clinical efficacy of conservative physiotherapeutic management. These findings support earlier literature. Swain and Evans (2014) demonstrated improvement in strength and function in a young athlete with Schmorl's nodes following a structured home exercise program, though pain persisted. Similarly, Rohilla *et al*. (2025) reported that combined physiotherapy and home exercise improved pain, range of motion, and quality of life in a 30-year-old male with lumbar Schmorl's node. The present case aligns with these outcomes, suggesting that consistent physiotherapeutic intervention can restore function and reduce symptoms even in pediatric population. Conversely, studies such as those by Hasegawa *et al*. (2004) and Neves *et al*. (2013) have shown that in chronic or severe symptomatic cases, conservative treatment may fail, necessitating surgical procedures like lumbar interbody fusion or decompression. This indicates that treatment efficacy depends on the lesion's chronicity, size, and associated structural degeneration. In adolescents, Schmorl's nodes may coexist with Scheuermann's disease, characterized by vertebral wedging, endplate irregularities, and progressive kyphosis. In this case, early physiotherapy intervention likely prevented progression toward kyphotic deformity by emphasizing thoracic extensor and scapular muscle strengthening along with stretching of the pectoralis and anterior shoulder muscles. These targeted exercises may have improved spinal alignment and prevented further biomechanical deterioration, consistent with the findings of Bezalel *et al*. (2019) and O'Donnell *et al*. (2023). Overall, this case adds to the limited body of evidence demonstrating that individualized physiotherapy programs focusing on postural correction, core activation, and neuromuscular re-education can effectively manage symptomatic Schmorl's nodes in adolescents and facilitate return to normal activities.

## CONCLUSION

The findings of this case study indicate that an eight-week, phase-based physiotherapy rehabilitation program effectively reduced pain, improved mobility, enhanced muscle strength, and restored functional independence in an adolescent with Schmorl's nodes of the dorsal spine. The comprehensive approach—including electrotherapy, flexibility training, core stabilization, and progressive strengthening—proved beneficial as a conservative management strategy. Given the scarcity of paediatric case reports, this study supports the early initiation of physiotherapy to prevent postural deviations and potential progression toward Scheuermann-type kyphosis. However, larger longitudinal studies are warranted to establish standardized rehabilitation guidelines and long-term outcomes for adolescents with Schmorl's nodes.

**Table 2: Physical rehabilitation Protocol**

| Treatment phases | Treatment goals | Therapeutic interventions |
|---|---|---|
| Phase 1 (1st and 2nd week) | To educate the patient and her parents about the condition, its effects on peripheral muscles and joints, about the treatment plans. | |
| | 1) To reduce pain and spasm of thoracolumbar region. | • IFT: for lower thoracic region- 4 pole vector, Time:15 minutes<br>• Isometric exercises for thoraco-lumbar extensors muscles- 15 repetitions (reps) |
| | 2) Teach awareness of neck and pelvic position and movement. | • cervical and pelvic tilts, spinal neutral position.<br>• And also give Pelvic tilt |

| | | |
|---|---|---|
| | | exercises cat – camel exercise -15 reps, drawing manuever- 15 reps, Bridging – 15 reps |
| | 3) To improve flexibility of the tight muscles. | • Pectoralis muscle, upper trapezius, levator scapulae, Scalene muscle - manual stretching technique, 3 reps with 20 seconds (secs) hold |
| | 4) Maintain thoraco-lumbar ROM | • Thoraco – lumbar flexion, extension, side flexion and rotation exercises for 15 reps |
| | 5) Initiate neuromuscular activation and control of stabilizing muscles. | • Core activation techniques: drawing-in maneuver, multifidus contraction for 15 reps<br>• Basic stabilization: with arm and leg motions (passive supportif needed, progress to active control).15 reps |
| | 6) Mobility and strengthening of peripheral joints. (cervical, shoulder and hip musculature) | • Neck isometric exercises – 15 reps, 5 secs hold<br>• all the movements of shoulder and hip joints with 500-gram weight cuff for 15 reps each<br>• scapular musculature exercises against gravity with 15 reps |
| Phase 2 (3rd and 4th week) | 1) To improve strength of affected weak muscles | • strengthening of scapular musculature with 500 gram weight cuff 15 reps against gravity movements |
| | 2) To improve strength of thoracolumbar musculature | • Prone without support extension<br>• curl up<br>• strengthening of quadratus lumborum<br>• all for 15 reps |
| | 3) Emphasize spinal control in high-intensity and repetitive activities. | • Repeat core exercises with upper limb movements for 20 reps<br>• superman exercises – 15 reps |
| | 4) To Maintain Thoraco-lumbar and lumbo-pelvic mobility and improve posture. | • Thoraco – lumbar extension exercises with 25 reps<br>• Cat camel exercises, pelvic roll and bridging exercises – 25 reps |

| | | |
|---|---|---|
| | 5) To Maintain chest expansion (for preventive measure) | • Thoracic expansion exercises coordination with breathing – 15 reps |
| Phase 3 (5th and 6th week) | 1) To improve cardiovascular capacity, endurance, balance and coordination | • Marching on floor, step up and step down on stair – 25 reps<br>• push up on wall and plank exercises – 15 reps |
| | 2) To maintain the exercises routine. | • Thoraco-lumbar muscles exercises with 25 reps<br>• Scapular musculature exercises with progression in increase weight of 1 kg for 15 reps |
| | Teach healthy exercise habits for self-maintenance and prepared for home exercises program | |
| Phase 4 (7th and 8th week)<br>Follow up after 8th week | Home exercises program | • Continue with scapular muscle strengthening exercises<br>• in supine thoracic extension exercises with 2 pillows beneath it.<br>• core stabilization exercises<br>• maintained posture in proper alignment. |

## ABSTRACT

The increasing prevalence of falsified medicines, fragmented supply chain data and delayed regulatory reporting undermine medicine quality and patient safety. Blockchain-based distributed ledger systems (DLS) provide a secure and transparent digital infrastructure capable of overcoming these challenges through decentralization, immutability and real-time traceability. This study examines the use of blockchain-powered verification and regulatory reporting in pharmaceutical supply chains by integrating insights from industry frameworks, regulatory standards and documented global implementation. Different blockchain architectures – permissioned, public, hybrid and consortium – are outlined to explain their role in improving substance authenticity, strengthening data integrity and enabling automated compliance through smart contracts. Evidence from major projects such as Pharma Ledger, Medi Ledger, NITI Aayog-Oracle Pilot and IBM's Track-and-Trace system show significant benefits in supply chain visibility, counterfeit prevention and regulatory compliance. While challenges remain in scalability, interoperability, and integration with legacy systems, advances in IoT connectivity, decentralized identity, and AI-enabled analytics continue to expand blockchain's potential. Overall, blockchain emerges as a reliable, future-ready infrastructure to secure pharmaceutical supply chains and support effective regulatory oversight.

**Keywords:** Blockchain; Distributed Ledger Systems; Drug Traceability; Pharmaceutical Supply Chain; Counterfeit Prevention; Regulatory Reporting; Smart Contracts; DSCSA; EU-FMD; India Track and Trace.

# INTRODUCTION

Pharmaceutical supply chains face ongoing challenges such as counterfeit drugs, insufficient traceability, fragmented information systems and delayed regulatory reporting. The World Health Organization reports that 1 in 10 medical products in low- and middle-income countries is counterfeit. Traditional systems rely on manual documentation with poor interoperability and susceptibility to tampering. Blockchain technology-first conceptualized as a decentralized ledger-has emerged as a powerful enabler for a trusted, transparent, and secure pharmaceutical ecosystem. Its ability to store immutable provenance data, automate verification processes and support regulatory workflows in complex multi-stakeholder networks. Several studies, including Pharma Chain [1], Blockchain Medi Ledger [2], Track Chain [3] and Bruin Chain [4] show significant potential to strengthen drug traceability, authenticity verification and real-time reporting across the entire supply chain. This study explores the implementation of blockchain-based DLS for drug verification and regulatory reporting, and analyzes their architecture, benefits, and potential integration into the pharmaceutical ecosystem.

**Background: The need for blockchain-driven verification and regulatory reporting**

The pharmaceutical supply chain faces ongoing challenges related to counterfeit drugs, fragmented data systems and limited visibility into distribution channels. Studies consistently show that traditional verification systems rely on centralized or semi-centralized databases, which are vulnerable to tampering, inconsistent updates and poor interoperability between stakeholders [1,2]. These limitations hinder the reliability of product provenance data, making it difficult to ensure the authenticity of medicines as they move from manufacturers to end users. The increasing complexity of globalized supply chains further increases these risks, as inconsistent record-keeping creates opportunities for counterfeit products to infiltrate legitimate distribution networks. Blockchain-based distributed ledger systems have emerged as a transformative solution to address these gaps by offering immutability, decentralization, and end-to-end traceability. Research such as Pharma Chain and Medi Ledger show that blockchain platforms enable tamper-proof tracking of serial numbers, batch identifiers and handover events with real-time synchronization between all participants [5]. The use of smart contracts automates verification processes during each transaction – production, shipping, storage, distribution – and ensures that no data changes or unauthorized entry can go undetected. This decentralized model increases transparency, reduces administrative burden and strengthens supply chain flexibility. In addition to product verification, blockchain also supports regulatory reporting by generating time-stamped, immutable audit trails accessible through permitted channels. Regulators benefit from automated compliance alerts, consistent traceability data and reliable visibility into non-compliance or recalls [1,4]. Blockchain's shared ledger eliminates delays and discrepancies associated with manual submissions, thereby ensuring compliance with frameworks such as DSCSA, EU-FMD and India's traceability mandate. Together, these features establish blockchain as a critical infrastructure component for secure verification and effective regulatory oversight in modern pharmaceutical supply chains.

**Types of blockchain-based distributedledger systems for pharmaceutical supply chains:**

Blockchain-based distributed ledger system (DLS) provides robust solutions for pharmaceutical supply chain verification and regulatory reporting. On the basis of architecture and access control, DLS can be classified as follows:

**Permissioned (private) blockchains:** Allow only authorized participants to access the network, making them ideal for sensitive pharmaceutical operations. These blockchains are often used for drug traceability, counterfeit prevention and automated regulatory reporting. Examples of permissioned blockchain implementations in the pharmaceutical sector include Hyperledger Fabric (HCSRL, Track Chain), Medi Ledger and Pharma Chain [6,7].

**Public (permissionless) blockchains:** Allow unlimited access and participation in transaction verification. Although less common in pharmaceuticals due to privacy concerns, they are used in experimental transparency-focused projects. Ethereum-based supply chain prototypes are examples of public blockchain implementations [8,9].

**Hybrid blockchains:** Combine the capabilities of private and public networks so that sensitive data can remain private while normal supply chain events remain publicly verifiable. This design supports interoperability between manufacturers, distributors and regulatory authorities, ensuring secure and transparent operation [10]. Hybrid frameworks in pharmaceutical interoperability studies are examples of this.

**Consortium blockchains:** These are semi-decentralized networks that are managed by several stakeholders such as manufacturers, distributors and regulators. They provide collaborative verification, shared rule compliance and increased trust between participants. The Gcoin blockchain and similar multi-organizational frameworks represent real-world applications of consortium blockchains in pharmaceutical supply chains [11,12].

**Smart contract-enabled blockchains:** Integrate programmable protocols that automate verification, supply chain rules and regulatory reporting. Systems such as Hyperledger Fabric, Track Chain, and Pharma Chain use smart contracts to trigger real-time alerts, ensure compliance, and effectively detect counterfeit drugs [13,14].

**Evolution of digitalization in the pharmaceutical supply chain**

The digitization of the pharmaceutical supply chain began as a response to growing concerns about counterfeit drugs, inefficient documentation practices and fragmented data silos. The first initiatives focused on the introduction of electronic track-and-trace systems, centralized ERP platforms and barcode/serialization mechanisms. However, studies have shown that these systems lacked interoperability and remained vulnerable to data manipulation due to their centralized architecture [15,16]. As global supply chains expanded, the pharmaceutical industry recognized the need for a decentralized digital infrastructure that could securely connect manufacturers, distributors, pharmacies and regulators without relying on a single point of control. The introduction of blockchain marked a promising technological upgrade in the second phase of digitization. Pioneering frameworks such as Medi Ledger and Pharma Chain demonstrated how distributed ledgers can provide tamper-proof product histories, immutable transaction records and automated verification using smart contracts [17]. Research further confirmed that Hyperledger-based models such as Track Chain and HCSRL increased transparency and reduced logistics losses by enabling real-time synchronization of data across nodes [3,6]. These blockchain systems addressed long-standing limitations of previous digital solutions by ensuring that every handling event from production to distribution was cryptographically validated and permanently recorded. The latest phase of blockchain digitization includes advanced features such as machine learning-enabled anomaly detection, decentralized identity for supply chain stakeholders, and automated regulatory reporting. Studies highlight the integration of blockchain with IoT sensors for temperature tracking, procurement automation through smart contracts, and regulatory access allowed for real-time compliance [18,19]. Furthermore, contemporary reviews emphasize that blockchain's interoperability models and evolving governance frameworks enable large-scale industry adoption, support global traceability mandates and last-mile verification requirements [10]. Together, these advances demonstrate the clear evolution from basic digital record keeping to a highly secure, intelligent and transparent blockchain-powered ecosystem for pharmaceutical supply chain management.

**Blockchain architecture for drug supply chain verification**

The architecture of a block chain based pharmaceutical supply chain verification system integrates multiple stakeholders, data sources and processes to ensure transparency, traceability and regulatory compliance.

Typically, the architecture consists of four main layers:

**Network layer (Nodes and participants):** The network includes manufacturers, distributors, pharmacies and regulatory authorities as nodes. Each participant maintains a copy of the distributed ledger, ensuring consensus and real-time synchronization. Permissive networks allow limited access to sensitive data, while consortium or hybrid models support multi-stakeholder governance [1,2].

**Data layer (Immutable records):** Immutable blocks are used to record drug information, such as batch numbers, serial numbers, manufacture dates, and shipment events. Timestamps preserve an auditable trail for every transaction, while cryptographic hashing guarantees tamper-evident storage [20].

**Application layer (Smart contracts and automation):** Smart contracts automate validation and regulatory compliance. For example, they can trigger alerts if a batch deviates from storage conditions or an unauthorized transfer occurs. This layer enables automated reporting to regulatory authorities in real time, thereby reducing administrative burden and increasing supply chain integrity [13].

**Integration Layer (IoT and External systems):** IoT devices such as temperature sensors, GPS trackers and ERP systems feed real-time data into the blockchain. The integration ensures end-to-end monitoring from production to last-mile delivery, so that irregularities or counterfeiting attempts can be detected immediately [18].
This architecture provides a secure, transparent and decentralized framework that ensures substance authenticity, prevents counterfeit infiltration and supports automated regulatory reporting. By combining immutable data storage, multi-party consent and smart contract automation, blockchain systems increase trust and efficiency in the pharmaceutical supply chain.

**Blockchain in regulatory reporting**
Regulatory reporting is essential throughout the pharmaceutical supply chain to ensure compliance with local and international standards. Traditional reporting systems often suffer from fragmented data, manual errors and late submissions, compromising timely monitoring and increasing the risk of counterfeit or substandard medicines reaching patients [21]. Blockchain-based distributed ledger systems (DLS) provide a transformative approach by providing immutable, transparent and automated reporting mechanisms [22]. Blockchain ensures that every transaction in the supply chain is cryptographically secure and time-stamped, providing regulators with a tamper-proof record that can be trusted for audits and inspections [15]. This immutable record keeping increases trust and accountability among all stakeholders. In addition, smart contracts enable the automated generation of regulatory reports. When a drug batch reaches a checkpoint or is transferred between stakeholders, a smart contract can automatically log the transaction and update the regulatory book, reducing human error and ensuring timely compliance [11]. Systems such as Hyperledger Composer have been implemented to support such automated reporting in pharmaceutical logistics [3,6]. Blockchain also facilitates end-to-end traceability, allowing regulators to track each drug batch from production to distribution. This real-time visibility enables detection of irregularities, prevents counterfeit products from entering the market, and ensures compliance with Good Distribution Practice (GDP) standards [23]. However, integrating blockchain into regulatory reporting presents challenges, especially with regard to interoperability with different blockchain platforms and legacy IT systems. Standardized reporting formats and consensus on smart contract protocols are essential for effective adoption and regulatory approval [20]. Blockchain provides a secure, transparent and efficient framework for regulatory reporting in pharmaceutical supply chains. By automating compliance, maintaining tamper-proof records, and enabling real-time traceability, blockchain reduces human error, strengthens regulatory compliance, and improves patient safety in the drug supply ecosystem [24].

## METHODOLOGY

This study followed a structured approach to understand the use of blockchain-based distributed ledger systems (DLS) for pharmaceutical supply chain verification and regulatory reporting. Relevant literature, industry documents and regulatory guidelines from the US, EU and India were collected using major scientific databases including PubMed, Scopus, IEEE Xplore and ScienceDirect. Sources were selected based on their relevance to drug traceability, counterfeiting prevention, serialization standards, data integrity, interoperability challenges and compliance requirements at the manufacturing, distribution and distribution stages. The collected material was examined to identify common vulnerabilities in the supply chain, technical limitations in traditional systems and areas where blockchain provides measurable improvements. Regulatory expectations related to transparency, audit readiness,

electronic verification and standardized reporting formats were compared with blockchain features such as immutability, decentralized consensus and automated workflows enabled by smart contracts. Documented practical implementations including Pharma Ledger, Medi Ledger, Track Chain, NITI Aayog-Oracle Pilot and IBM's serialization supported track-and-trace system were analyzed to understand operational results, benefits and barriers. Insights from these sources were synthesized to highlight key trends, challenges and performance indicators shaping blockchain adoption in the pharmaceutical ecosystem. This methodology provides a clear, evidence-based understanding of how distributed ledger technologies increase verification efficiency, regulatory compliance, and supply chain security.

## RESULTS

Results clearly indicate that blockchain-based pharmaceutical supply chains perform better than conventional systems in every assessed category. Following blockchain integration, comparative analysis shows significant gains in data transparency, real-time traceability, counterfeit prevention, reporting speed, data integrity, and audit readiness. Blockchain has a substantial impact on medicine authentication and compliance procedures, as evidenced by the distribution of benefits, which highlights regulatory reporting and counterfeit decrease as the biggest gains. Additionally, the longitudinal evaluation from 2017 to 2024 demonstrates a steady increase in traceability accuracy and regulatory reporting efficiency, demonstrating that blockchain adoption results in long-term improvements in supply chain visibility, data security, regulatory compliance, and overall performance of the pharmaceutical supply chain.

## DISCUSSIONS

**Case studies of various blockchain projects:** [25,26,27,28]

**Case study 1 – Pharma ledger project**

The Pharma Ledger project in Europe focused on using blockchain to secure the pharmaceutical supply chain and support digital health records. The main goal was to track medicines securely and prevent counterfeit medicines. The project implemented a shared blockchain system for batch tracking and digital product labels, allowing stakeholders to access the same reliable information. This results in improved trust between partners, increased supply chain visibility and supported regulatory compliance.

**Case study 2 - FDA Medi ledger DSCSA pilot**

The FDA conducted the Medi Ledger DSCSA pilot in the US to evaluate blockchain for medication tracking. The purpose was to verify the authenticity of the substance and speed up product tracking. A private blockchain platform was used to record drug details at each supply chain stage. The pilot demonstrated faster product verification, improved traceability and effective support for DSCSA requirements.

**Case study 3 – NITI Aayog- Oracle blockchain and IoT pilot (India)**

NITI Aayog and Oracle ran a pilot project in India to track medicines using blockchain combined with IoT technology. The aim was to prevent counterfeit medicines and enable end-to-end tracking. The blockchain recorded medicine information at each step, while IoT sensors monitored storage conditions and detected abnormalities. This approach helped verify medicines, improve the security of sensitive products like vaccines, and showed that blockchain works well for supply chain systems on a national scale.

**Case study 4 – IBM pharmaceutical track-and-trace system**

IBM developed a pharmaceutical track-and-trace system to enhance drug monitoring using serialization, barcodes and RFID. The aim was to prevent counterfeit medicines and support global regulatory requirements. The system

captured each medicine's activity using barcodes and RFID and stored the data in secure electronic records. This results in a reduced risk of counterfeiting, easier tracking of medicines and better support for regulatory compliance.

**Challenges**

- Scalability and transaction latency in public chains.
- Lack of worldwide regulatory harmonization.
- Limited integration with older ERP systems.
- Interoperability gap between stakeholders.
- Costs and structural complexity of consortium blockchain adoption.

**Future directions**

- AI-Blockchain integration for predictive fraud detection.
- Zero proof of knowledge of privacy-preserving regulatory audits.
- Fully interoperable global blockchain network for cross-border compliance.
- Decentralized digital identity (DID) for products, organizations and regulators.
- Using IoT blockchain twins for real-time environmental monitoring of pharmaceutical shipments.

In Conclusion, Blockchain-based distributed ledger systems provide a transformative path to enhance pharmaceutical supply chain security, drug authenticity verification and regulatory reporting. By enabling immutable record-keeping, real-time traceability, automated compliance through smart contracts, and seamless multi-stakeholder interoperability, blockchain effectively addresses the long-standing challenges associated with counterfeit drugs, fragmented data systems, and delayed reporting. Evidence from global case studies, including Pharma Ledger, Medi Ledger, NITI Aayog-Oracle and IBM, show measurable improvements in transparency, verification efficiency and regulatory alignment across different jurisdictions. While challenges related to scalability, interoperability and integration with legacy systems remain, the continued development of digital technologies, such as AI-enabled analytics, IoT integration and decentralized identity frameworks, further strengthens blockchain's potential. Overall, blockchain emerges as a robust, future-ready infrastructure capable of increasing patient safety, supporting regulatory compliance and modernizing pharmaceutical supply chain management on a global scale.

## ACKNOWLEDGEMENTS

I express my gratitude to the Chalapathi institute of pharmaceutical sciences for the support.

**Table 1: Traditional VS Block Chain-Based Supply Chains**

| Parameter | Traditional Supply Chain | Blockchain-Based Supply Chain |
|---|---|---|
| Data Transparency | Low, fragmented | High, shared, tamper-proof |
| Traceability | Manual | Real-time end-to-end |
| Counterfeit Risk | High | Minimal |
| Reporting Speed | Slow | Instant, automated |
| Data Integrity | Poor | Cryptographically secured |
| Audit Readiness | Low | Always audit-ready |
| Compliance Workload | High | Reduced by 50–70% |

Table1 shows that traditional supply chains suffer from low transparency, slow reporting, high risk of counterfeiting and heavy compliance burdens. In contrast, blockchain-based supply chains offer real-time traceability, secure and tamper-proof data, faster regulatory reporting and significantly reduced compliance workload.

**Table 2: Traditional VS Block Chain Supply Chain Metrics**

| Parameters | Traditional Supply chain metrics | Block chain Supply metrics |
|---|---|---|
| Data Transparency | 3 | 9 |
| Traceability | 4 | 10 |
| Counterfeit Prevention | 2 | 9 |
| Regulatory Compliance | 5 | 9 |
| Data Integrity and Security | 4 | 10 |
| Reporting Speed | 3 | 9 |
| Audit and Verification | 4 | 10 |

Table 3: Distribution of Blockchain Benefits in Pharma

| Category | % Contribution |
|---|---|
| Counterfeit Reduction | 30 |
| Regulatory Reporting | 25 |
| Data Security | 20 |
| Supply chain Visibility | 15 |
| Cost Reduction | 10 |

**Table 4: Block Chain Adoption Impact in Traceability and Regulatory Reporting (2017-2024)**

| Year | Traceability Accuracy (%) | Regulatory Reporting Efficiency (%) |
|---|---|---|
| 2017 | 40 | 35 |
| 2018 | 48 | 44 |
| 2019 | 55 | 52 |
| 2020 | 63 | 60 |
| 2021 | 72 | 70 |
| 2022 | 80 | 78 |
| 2023 | 87 | 84 |
| 2024 | 91 | 89 |

**Table 5: Summary of Regulatory Mandates, Existing Gaps, and Blockchain Applicability in Drug Supply Chain Verification Systems in the Us, Eu, and India.**

| Aspect | US | EU | India |
|---|---|---|---|
| Regulation | Drug supply chain security act (DSCSA) | Falsified medical directive (FMD) | CDSCO Track-and-Trace |
| Traceability | Full end-to-end tracking | Serialization and Verification | Mainly export barcoding |
| Current Problem | Fragmented data systems | Cross-country data gaps | Manual and weak digital systems |
| Blockchain Use | Secure and tamper-proof records | Cross-border authentication | Improved traceability |
| Current Frameworks | DSCSA blockchain pilots | EU blockchain models | Hyperledger prototypes |
| Regulatory Support | High | Medium–High | Medium |
| Reporting Benefit | Automated regulatory reports | Automated falsification alerts | Real-time movement reporting |
| Advantages | Prevents counterfeit drugs at the last mile | prevents falsified imports | Reduces counterfeit circulation, supports national e-pharmacy monitoring |

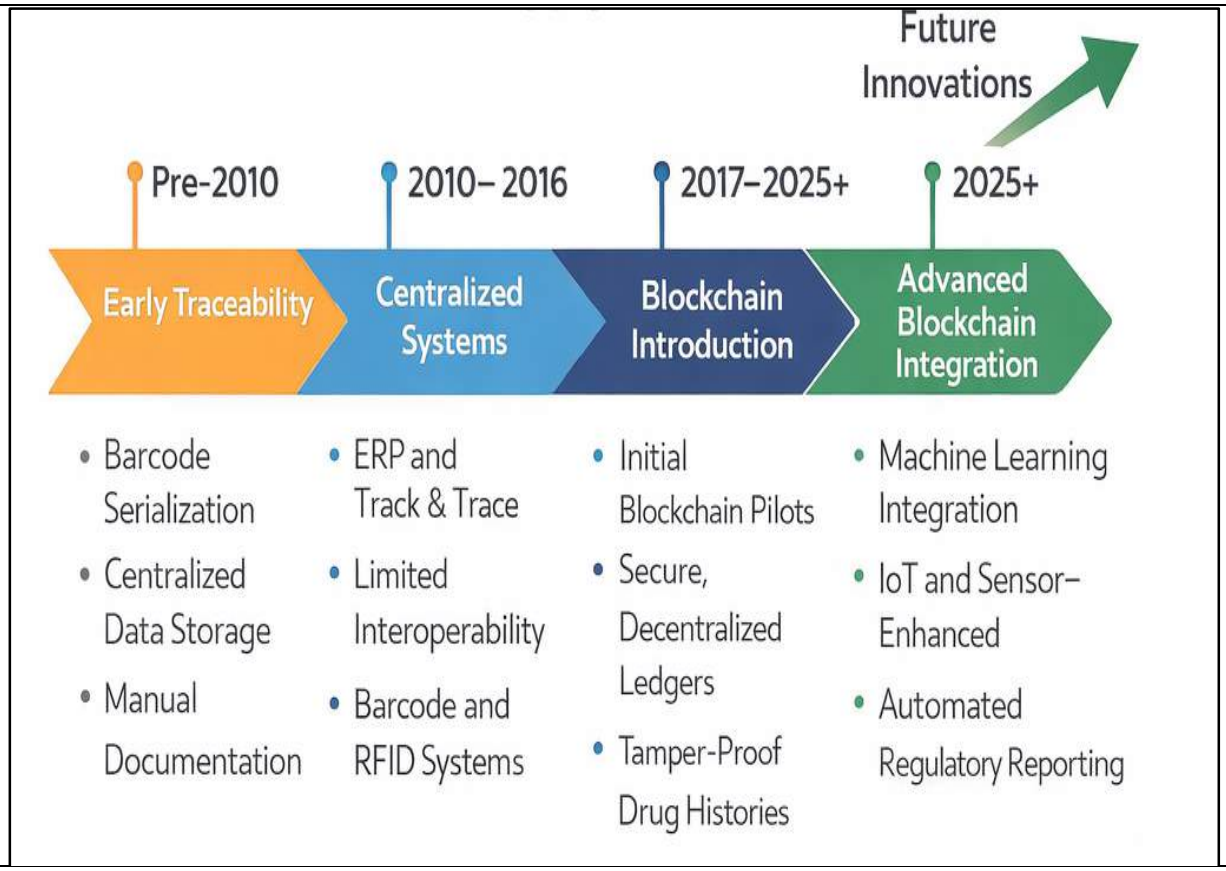

**Fig. 1: Evolution of digitalization in the pharmaceutical supply chain**

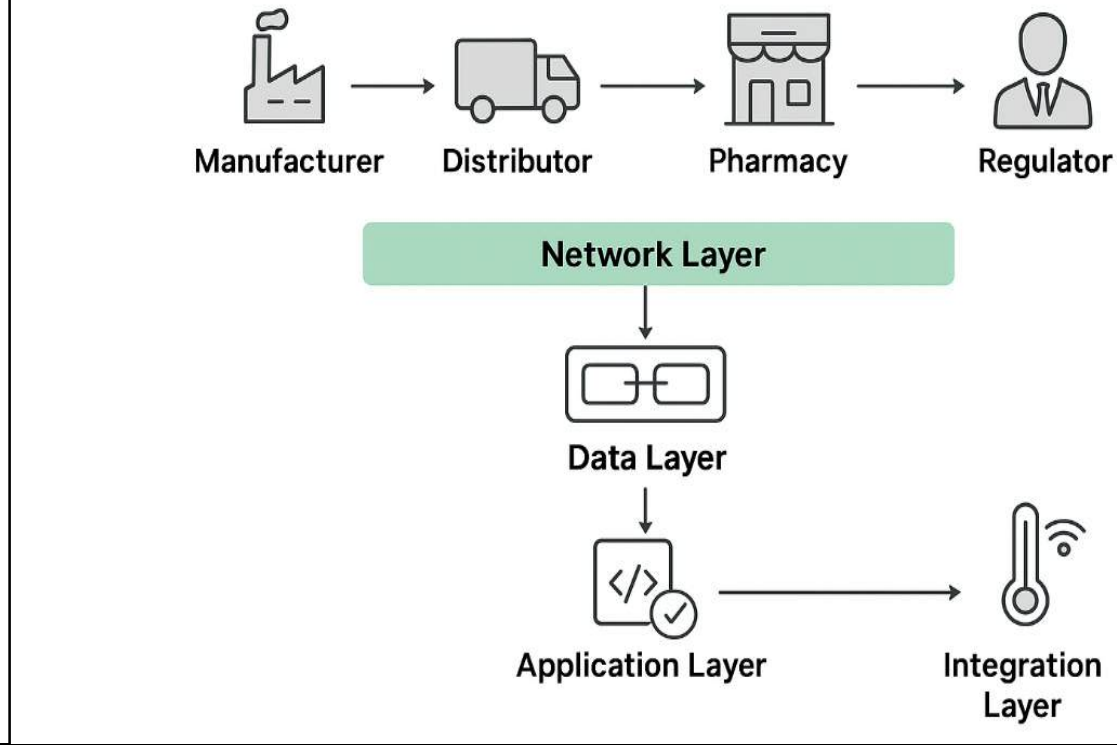

**Fig. 2: Blockchain architecture for drug supply verification**

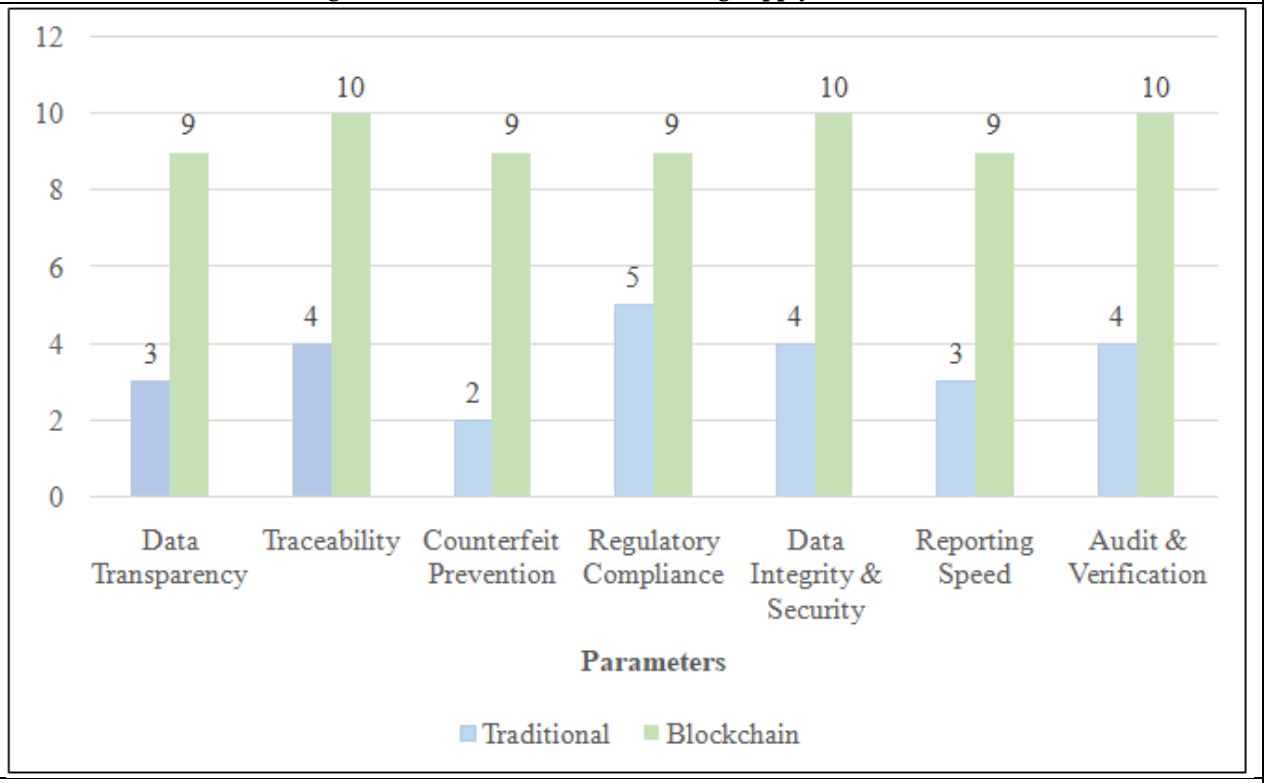

**Fig. 3: Traditional vs block chain supply chain metrics**

**ABSTRACT**

Pandu denotes Paleness in the body is predominant throughout this condition. Pandu means pallor. In Ayurvedic classics, the description of Pandu is available in three forms i.e., Pandu as a disease, Pandu as a complication, and Pandu as a sign of certain diseases. P*andu Roga* is one of the diseases mentioned in *Ayurveda* characterized by changes in the skin colour to white (*Shweta*), yellowish (*Peeta*), greenish (*Harita)* etc. which is one of the "*Varnopalakshita Roga*" i.e., a disease characterized by the change in the colour. *Pandu* is a disease of *Rasa-Vaha Srotas* and it is a *Pitta Pradhan Vyadhi* in which due to *Pitta Pradhan Hetusevana*, *Pitta* dominant *Tri Dosha Prakopa* occurs and causes *Dhatu Shaithilyam* and *Dhatu Gauravam*, further it leads to *Sneha, Bala, Varna*, and *Ojokshaya* and due to this *Rakta* and *Meda Dhatu* decreases and *Vaivarnata* occurs.

**Keywords:** *Dhatu Gauravam, Dhatu Shaithilyam, Pandu, Rasa-Vaha Srotas, Varnopalakshita Roga*

## INTRODUCTION

*Ayurveda*, is an ancient Indian system of medicine that emphasizes a holistic approach to health and well being, focusing on preventing illness and promoting balance in the body, mind, and spirit. *Pandu Roga* is one of the *Varnopalakshita Rogas* mentioned in *Ayurveda characterized* by changes in skin colour Due to the consumption of *Pitta Prakopaka Ahara*, the *Dhatus* is deprived of nutrition. *Twak* and *Mamsa* are vitiated by the *Doshas*, resulting Pandu, Haridra and Harita varna of skin. *Acharya Charak* and *Vagbhatta* accepted *Pandu Roga* as a disease of *Rasavaha Strotas*,

while according to *Sushruta* it is of *Raktavaha Srotas*. *Acharya Charak* has included *Pandu Roga* in *Rasa pradoshaja vikara* and in *Santarpana janya vyadhi* also. It is described with its pathogenesis and treatment in *Ayurvedic* texts *Bruhattrayi* and *Laghutrayi*. It is often seen that *Rakta* gets vitiated by *Dosha*, mainly by *Pitta Dosha* as *Rakta* is *Pittavargiya* and disease like *Pandu Roga* appear. *Pandu Roga* is *Pitta Pradhana Vyadhi*. Due to *Hetu Sevana*, *Pitta Pradhana Tridosha* gets vitiated and circulated in the whole body causing *Shithilata* in all *Dhatu* which ultimately reduces *Rakta* and *Meda Dhatu*. There is *Sneha* and *Rakta Dhatu* are decreased and also *Rupa, Oja Guna, Varna, Bala* are reduced in *Pandu Roga.* A prominent diagnostic feature of *Pandu Roga* is the pallor of the skin which occurs due to the quantitative and qualitative deficiency of *Rakta Dhatu*. Considering *Panduta* as the predominant sign, the disease is termed *Pandu Roga. Vachaspatya* refers *Pandu* as the colour of patient resembles colour of pollen grains of *ketki* flower (*Pandanus odoratissimus*) which is whitish yellow (pale) in appearance *Ayurveda* defines *Pandu Roga* (Anaemia) as *Vataja, Pittaja, Kaphaja, Sanipataja*, and *Mridikabhakshanjaya Pandu.*

## AIMS AND OBJECTIVES

To review the concept of Pandu roga from different ayurvedic literature.

## MATERIALS AND METHODS

Material has been collected from ancient ayurvedic texts, Research Journals and electronic databases, Authoritative Websites Reputed Newspapers, Referred textbooks are *charaka samhita, Sushruta Samhita, Ashtanga Hridaya, Bhaishajya Ratnavali along with the Commentaries.*

## HISTORICAL REVIEW

According to *Rigveda* and *Atharvaveda, Panduroga* is known as *Vilohit, Haribha*, and *Halima*. In *Garuda Purana*, it has been described that *Takra* mixed with *loha churna* is useful in *Panduroga.*

- *Acharya Charak -Pandu Roga* has been described in *Sutrasthana* in *Ashtodariya Adhyaya* as well as in *Chikitsasthana*16th Chapter *"Pandu Roga Chikitsa". Acharya Sushruta* has said *Pandu Roga* in *Uttartantra Adhyaya 44, "Pandu Adhyaya" Sushruta* has mentioned *Kamala, Kumbhavhaya, Lagharak* as the various stages of *Pandu*.
- *Acharya Vagbhatta* has described *Pandu* in *Nidanasthana 13th adhyay Pandu Roga- Shopha Visarpa Nidana* and in *Chikitsasthana 16th Adhyay, (Pandu Roga Chikitsa).*
- In *Madhava Nidana* the description of *Pandu Roga* is in *8th Adhyay Pandu Roga.*
- In *Sharangdhara Samhita* described in *Pradhana Khanda 7th Adhyaya.*
- In *Bhavprakasha* the description of *Pandu Roga* in *Madhyam Khanda 8th Adhyaya.*
- In *Ashtanga Hridaya* has described *Pandu* in *Nidana sthana adhyaya*

## REVIEW OF LITERATURE

**Vyutpatti**

The word *"Pandu"* is derived from the root *"Padi Nashane"* with the *suffix "Ku"* and elaboration through*"Ni"*. The meaning is always taken in the sense of *"Nashana"* and as Pandu has been kept under the group which is classified and named according to the change in colour.

**Nirukti of Pandu**

1. According to *Shabdarnava Kosh 'Pandustu Peetbhagardh Ketaki Dhulisannibham'* means Pandu is like the colour of pollen grains of Ketaki flower which is whitish yellow [11].
2. *Pandutwenuplakshito Rogah Pandu Rogah'* means the disease which resembles *Pandu Varna* is known as *Pandu.*

**Definition of Pandu**

*Sarveshu Chaiteshvih Pandubhavo Yatoadhikoatah Khalu Pandurogah.*(Su.Ut. 44/4)

It is called Pandu Roga because of the predominance of paleness all over the body.

**Synonyms**

According to *Sushruta Kamala, Panki, Lagharak, Alas and Kumbhahwa* are the synonyms of *Pandu* [14].

In *Rigveda* and *Atharvaveda Pandu* has been described by the name of *Vilohit, Halima and Haribha* [15] .

**Types of Pandu Roga**

Acharya Charak described the disease under five categories namely *Vataja, Pittaja, Kaphaja, Sannipataja* and *Mridabhakshanajanya* [16] and *Acharya Sushruta* has accepted only four types of Pandu excluding *Mridabhakshanjanya Pandu* [17], they are:

पाण्डुरोगाःस्मृताःपञ्चवातपित्तकफैस्त्यः।

चतुर्थः सन्निपातेन पञ्चमो भक्षणान्मृदः।।३।।cha.chi.16

1. Vataj Pandu
2. Pittaj Pandu
3. Kaphaj Pandu
4. Sanipataj Pandu
5. Mridikabhakshanjaya Pandu

*Acharya Harita* mentioned eight types of *Pandu* in *Harita Samhita* and described *Kamala, Kumbhakamala, Halimak as* their synonyms.

**Nidana(Causative Factors)**

Nidana of Pandu roga can be classified into the following categories:

***Aharaja Nidana:*** *Acharya Charaka* has described the following etiological factors regarding *Ahara*:

1. 1.Excessive intake of *Kshara, Amla,Lavana, Ati Ushnaanna, Virruddha Bhojana,*and *Asatmya Bhojana.*
2. Excessive intake of *Nishpava, Masha, Pinyaka,* and *Tilataila.*
3. Excessive intake of *Madya*.
4. Excessive intake of *Kashaya, KatuRasa.*

***Viharaj Nidana***

1. Excessive *Diwaswapan, Vyayama* and *Maithun*.
2. *Pratikarma Vaishmaya* (faulty administration of panchakarma) and *Ritu Vaishamya* (faulty management of seasonal regimen)
3. Suppression of natural urge (*Vega Dharan*)

***Mansik Nidana*** *Mansik Nidan* i.e., anxiety, fear, anger, and grief have a major role in the manifestation of *Pandu*.

**Other / Secondary/Nidanarthaka causes**

In *Ayurvedic* literature, there is an indication of a correlation between various diseases and *Pandu Roga* either as a symptom or as *Upadrava*. So, all these can be causes of *Pandu* i.e., *Nidanarthaka Roga* of *Pandu*. E.g., *Raktatipravartana, Raktaarsha, Raktarbuda, Asrigdara* or *Raktapradara, Rajyakshama, PunaraVartaka Jwara*, etc. which can directly or indirectly vitiate *Vata-Pitta Dosha* singly or in combination and manifest as Pandu roga.

**Purvarupa** Prodromal Features of Pandu Roga according to Brihatrayi has been listed below in table 1.

**Rupa(Symptoms):** In Ayurveda, rupa of Pandu Roga are divided in to 2 Categories:

***Samanya Rupa*** (Common clinical Symptoms)

***Vishishta Rupa*** (Symptoms acc.to predominance of Doshas)

**Samanya Rupa**
Samanya rupa of Pandu Roga are only mentioned by Charaka and Vagbhatta Acharya(Table 2).

**Vishishta Rupa (Symptoms acc.to predominance of Doshas)** (Table 3).
**Vataja Pandu**

**Pittaja Pandu**(Table 4).

**Kaphaja Pandu**(Table 5).

**Sannipataja Pandu:** *Signs* and symptoms of all three vitiated *Doshas* are present, and this is extremely intolerable because of developing complications.

**Mridbhakshanjanya Pandu:** *Bala-Varna-Agni Nash* (loss of strength, complexion, and power of digestion metabolism), Ganda-Akshikuta-BhruPad-Nabhi-Mehan *Shotha* (oedema on cheek, eye socket, eyebrow, feet, umbilical region, genital parts), *Krimi Koshta* (Appearance of intestinal worm), *Atisaryet Mala Sasruka Kapha* (diarrhoea associated with blood and mucus).

***Samprapti*** **(Pathogenesis)**
दोषाः पित्तप्रधानास्तु यस्य कुप्यन्ति धातुषु। शैथिल्यं तस्य धातूनां गौरवं चोपजायते।।४।।
ततो वर्णबलस्नेहा ये चान्येऽप्योजसो गुणाः। व्रजन्ति क्षयमत्यर्थं दोषदूष्यप्रदूषणात्।।५।।
सोऽल्परक्तोऽल्पमेदस्को निःसारः शिथिलेन्द्रियः। वैवर्ण्यं भजते, तस्य हेतुं शृणु सलक्षणम्।।६।।
(Cha.chi.16)

*Acharya Charaka* has mentioned the *Samprapti* of *Pandu* in *Chikitsa Sthan*. According to him, due to consumption of *Nidana Pitta* located in the *Hridaya* (Sadhak *Pitta*) gets aggravated and is expelled from *Hridya* by powerful *Vata* and it enters the *DashDhamanya*(attached to the heart) and circulates all over the body. This aggravated Pitta reaches the space between skin and muscle tissue, bringing vitiation in *Kapha*, *Vata*, *Asrika*, *Twaka* and *Mamsa*. This leads to abnormal types of colouration like *Pandu*, *Haridra* and *Harita* on the skin.

***Samprapti Ghataka***
***Dosha -*** *Pitta Pradhan Tridoshaja*
***Pitta -*** *Sadhaka, Ranjaka* and *Bhrajaka*
***Kapha -*** *Avalambaka, Kledaka*
***Vayu*** *- Vyan Vayu, Samana Vayu*
***Dushya -*** *Twaka, Rasa, Rakta, Mamsa* and *Meda.*
***Strotas -*** *Rasavaha, Raktavaha*
***Stroto Dushti -*** *Sanga and Vimarga Gamanam.*
***Agni -*** *Jatharagni and Dhatvagni.*
***Agni Dushti -*** *Mandagni*
***Udbhavasthaan -*** *Amashaya,Hridaya*
***Adhishthana -*** *Twaka Mamsa Abhyantara*
***Vyaktasthaan -*** *Twaka*
***Sancharasthaan -*** *Twaka* and *Mamsa*
***Svabhav -*** *Chirkari*

***Sadhya-Asadhyata***
Patients of persistent chronic *Pandu Roga* whose *Dhatu* gets *Khar* are not cured. Also develops oedema observes all the objects yellowish in colour. *Sharir Dhatus* becomes *Ruksha* and a decrease in *Bala* and *Varna* occurs and *Shotha*

develops. *Rogi* suffers from constipation and passes loose stools with mucus having greenish discoloration and becomes *Deena, who Suffers from murcha and trushna.*

***Chikitsa***

**According to *Acharya Charak***

तत्र पाण्ड्वामयी स्निग्धस्तीक्ष्णैरूर्ध्वानुलोमिकैः। संशोध्यो मृदुभिस्तिक्तैः कामली तु विरेचनैः।।४०।।
ताभ्यां संशुद्धकोष्ठाभ्यां पथ्यान्यन्नानि दापयेत्। शालीन् सयवगोधूमान् पुराणान् यूषसंहितान्।।४१।।
cha.chi 16/40-41

According to *Acharya Charak* in *Sadhya Pandu Rog, Teekshna Vaman* and *Virechana* should be done.

***Upadrava***

According *to Acharya Sushruta Aruchi, Pipasa, Vaman, Jwara, Murdharuja, Agnisada Shopha, Kanthagata Abalatwa, Murcchha, Klama* and *Hrudayapidana* are the *Updrava* of *Pandu Roga.*

***Pathya-Apathya***

***Pathyahara***

**According to *Acharya Charak***

- *Shalianna, Yava, and Godhoom* mixed with *Yusha* prepared from *Mudga, Adhaki* and *Masur*
- *Jangal Mamsa Rasa*
- *Panchagavya Ghrit, Mahatiktaka Ghrit* and *Kalyanaka Ghrit* used for *Snehan Karma.*

**According to *Acharya Sushruta***

- *Pandu Rogi* must use *Arishta* prepared from *Guda, Sharkara* (sugar) and *Shahad* (honey)
- *Asava* prepared from *Mutra* and *Kshara* should be used
- *Jangala Mamsa Rasa* added with *Sneha* (fat) and *Amalaka Swaras* should be used

***Apathyahara :*** In *Bhaisajya Ratnavali* following *Apathya Aahar* are mentioned:

- *Rakta Sruti, Dhoompan, Vaman Vega Dharan, Swedan* and *Maithoon* are to be avoided by *Pandu Rogi.*
- Avoid consumption of *Shimbi, Patrashaak, Masha, Ambupaan,Pinyaka, Tambul, Sarshapa,* and *Sura.*
- Intake of water from rivers like those originating from *Vindhya* and *Sahyadri* Mountains.
- All types of salt, sour edibles, *Virudhha Anna* (incompatible foods), food that is *Guru* (heavy to digest) and *Vidahi* (cause a burning sensation).

## DISCUSSION AND CONCLUSION

Pandu roga, primarily Pitta dominant disorder,involves the vitiation of Pitta which normally governs the body's natural color;its imbalance leads to pallor or Panduta. Shweta Varna, Ketki Dhuli sannibha and Peeta Varna are the given references in Ayurvedic classics.however alongside pitta, *vata Dosha* ,particularly vyana vayu,also contributes significantly to the onset of pandu roga.this condition affects many and is classified in ancient text into five types: *Vatika,Paittika, Kaphaja, Tridoshaja, and Mridbhakshanjanya pandu*, all affecting the rasavaha srotasa. Several factors contribute to *Pandu Roga,* such as irregular daily routines, both mental and physical, as well as poor dietary habits including insufficient and poor-quality food (*Mridikabhakshana*). According to *Charaka,* three warning signs precede its onset: *Hridyaspandanam* (palpitation), *Rokshyam* (dryness), and Shram (fatigue). *Acharya Sushruta* has classified *Panduroga* into four types, while *Acharya Charaka* has added an additional type known as *MridaBhakshanjanya Pandu. Acharya Vagbhatta* has also elaborated on the pathogenesis described by *Acharya Charaka,* emphasizing that *Pandu Bhava* arises from the vitiation of *Twaka* due to the impurity of *Rakta* in individuals engaging in harmful dietary and lifestyle practices. The pathology of *Panduroga* primarily involves the vitiation of *Pitta,* which subsequently affects *Rakta*, leading to the manifestation of *Pandu Bhava. Pitta's* role in the disorder impacts all five of its primary functions, with particular emphasis on *Ranjana* (colouring) and *Bhrajan* (digestion). This disturbance in *Pitta* leads to loosening

and heaviness of the *Dhatus*, causing depletion (*Balakshaya*), loss of complexion (*Varnakshaya*), and reduced vitality (*Ojakshaya*). Eventually, *Panduroga* presents with symptoms such as paleness (*Raktalpata*), weakness (*Medalpata*), dryness (*Nihsarata*), discolouration (*Vivarnata*), and loss of sensory functions (*Shithilendriyata*). *Santarpana*, which refers broadly to anabolic processes, exacerbates the production of *Kapha* and *Ama*, leading to sluggish digestion (*Mandagni*) and changes in complexion, namely pallor (*Panduta*). The vitiation of *Kapha* is responsible for heaviness (*Gaurava*), excessive sleepiness (*Nidraluta*), lethargy (*Alasya*), and reduced appetite (*Alpavaka*). Symptoms such as loss of appetite (*Aruchi*), fever (*Jwara*), pallor (*Panduta*), heaviness (*Gaurava*), and drowsiness (*Tandra*) indicate a disturbance in the *Rasa Dhatu*. Body ache (*Angamarda*) suggests the involvement of both *Rasa* and *Rakta Dhatus*, while emaciation (*Karshya*) indicates impairment of the *Mamsa Dhatu*. Excessive sweating (*Atisveda*) and absence of sweating (*Svedabhava*) suggest the involvement of *Twak* (skin), *Mamsa* (muscle), and *Meda* (fat) *Dhatus*. Thinning and alopecia (*Shirnalomata*) are significant indicators of *Asthi Dhatu* disturbance, while loss of lustre and debility suggest depletion of *Oja*. The *Samhitas* detail the general and specific characteristics of *Pandu Roga*. While treatable, *Pandu Roga* can lead to complications if chronic, underscoring the importance of early intervention. *Charaka* advises aggressive therapies like *Teekshna Vaman* (therapeutic emesis) and *Virechan* (purgation) in their early stages. To effectively diagnose and treat *Pandu Roga*, a physician must possess comprehensive knowledge of various *Samhitas*, ensuring accurate treatment. The clinical presentation of *Pandu* can be correlated with anemia in modern medical terms, characterized by pallor due to blood deficiency, although it remains one of the most under diagnosed conditions.

## ABSTRACT

Young adulthood is the period of time where the individual has the time of dramatic change in basic thinking structures, as well as in the brain (18 to 40) years. *Childhood trauma*, often considered as an adverse childhood experience such as emotional abuse, physical abuse, emotional neglect, physical neglect and sexual abuse. *Resilience* comes from the word "resile" which indicates to bounce back or spring back. The study on resilience may be important for the people who are all dealing with the stressors or health related stressors and illness. An intimate bond is often considered as an intimacy which is created by the emotional closeness and experiences that create a bond between the people. The subjective feelings of ill-being and wellbeing of scale of positive and negative feelings (*SPANE*). The aim is to study the influence of childhood trauma on experiences of positive and negative feelings, resilience and intimate bond among young adulthood. Ex-post facto research method and purposive sampling technique will be used to collect the data. The age group is 18 to 40 years and the sample of 392 has 213 females and 179 males. The data were analyzed by correlation, mean, standard deviation and regression. There is a significant influence of childhood trauma on experiences of positive and negative feelings among young adulthood were seen in this study.

**Keywords:** Childhood trauma, Brief resilience scale, SPANE, Intimate bond, Positive and negative experience and young adulthood.

## INTRODUCTION

Childhood trauma, often considered as an adverse childhood experience, happens to the child from the age group of (0 to 18) years. It refers to violent, dangerous and life-threatening events to the child. It has a serious impact on the person's ability to bounce back in difficult situations or events. On intimate bonds mostly people who experienced more traumatic events in life have struggled to trust or have intimate relationships with people. Living through or experiencing any traumatic events may result in expectations of betrayal, danger, or potential harm in a new or old relationship. They may even feel vulnerable and confused. This leads to difficulty trusting others and also people whom they trusted in the past. So, it may be difficult to maintain an intimate bond or relationship. (2021). Even with positive and negative experiences this is how the person feels and identifies one's emotions. It studies people who experienced trauma in their childhood and has an impact on their experiences of presenting both positive and negative feelings. The need for the study is that childhood trauma has a significant impact on individuals' life, it helps to understand the ability of the person to bounce back and it also helps the individual to identify and increase the positive feeling. This study also helps to understand whether childhood trauma has an impact on the individual's intimate relationships with one another. From the review of literature, the variables childhood trauma, resilience, intimate bond and the experiences of positive and negative feelings. Literature scarcity was seen in most of the variables. Influence of childhood trauma in adulthood were seen in most of the studies and it was correlated and found differences with the variable resilience but not with the other variables such as intimate bond and experience of positive and negative feelings especially, in the Indian population. Childhood trauma in the childhood or in the past has a significant effect on the individuals (young adulthood). it affects the overall wellbeing and subjective being of the individual in their life. also, sexual abuse and physical abuse has significant effects on the individual's intimate relationship especially trusting the partner and consider them as an uncaring and controllable. The scale of negative and positive experiences is less seen in Indian cultures. Furthermore, these papers aim to understand the various influences of these variables: childhood adversity, resilience, intimate bond also SPANE among young adulthood in the Indian population.

## LITERATURES SHOW

Humphreys *et al*., 2020, In this study it focused on child maltreatment and depression: a meta analysis of studies using the childhood trauma questionnaire. Research has been done to document the child traumas related with long term impact on the mental health, it includes challenges of increase in depression. The result shows that childhood trauma or maltreatment is positively related with depression. By its size of effect, it shows that the emotional abuse and emotional neglect shows the strong association. Analysis provided from the study is that the link between depression and child maltreatment, and has specifically large relation between the child dysfunction in childhood. In another study shows Sar *et al*., 2019, This study focused on the fear of happiness among college students: the role of gender childhood psychological trauma and dissociation. The results show that the scores from the FHS, CTQ, and DES scale no gender differences exists though, women scored higher on experiencing fear of cheerfulness and ending up with bad faith and childhood emotional abuse than men in their childhood. The study shows that there is a correlation found between childhood psychological trauma, fear of happiness scales, and dissociation. In the path of obsessional thinking women seem to be more vulnerable and it affects the differences in male and female gender. Also, in Weiss *et al*., 2019, This study focused on the role of childhood trauma in predicting aggression, self-harm, and resilience. The current study assessed these subtypes in college students in relation to self-harm, aggression, and resilience. The result shows that the subjects who experienced current self-harm behaviors had reported greater sexual abuse, physical abuse and emotional neglect. Emotional neglect or abuse was seen as predicted more in self-harm behavior. The results show an important -ve correlated between resilience and childhood trauma. The implication in this study suggests that the childhood trauma experienced in the early developmental stage has significant negative lifelong effects in the individuals. Finally in Beutel *et al*., 2017,This study focused on childhood adversities and distress: the role of resilience in a representative sample. The result indicates that the significant gender differences were found in sexual abuse and also significant differences seen in age related in physical abuse

and in the both neglects. Male participant's also experienced sexual abuse during childhood as twice as many females in the childhood and as resilience and childhood adversity were associated with perceived social support and demographic variables. Thus the intensity of the childhood trauma does not determine psychological health in later life. The negative events in early life disturb the attachment security which leads to insecurity.

## METHODS

## AIM

The aim is to study the influence of childhood trauma on experiences of positive and negative feelings, resilience and intimate bond among young adulthood.

## OBJECTIVES

- To assess the levels of childhood trauma, experiences of positive and negative feelings, resilience and intimate bond among young adulthood.
- To assess the relationship between childhood trauma on experiences of positive and negative feelings, resilience and intimate bonds among young adulthood.
- To assess the influence of childhood trauma on experiences of positive and negative feelings, resilience and intimate bond among young adulthood.

**Research Design**
Ex-post facto research design is used for this study.

**Sample technique**
The purposive sampling technique will be used to collect the data in this study.

**Sample Size**
According to the morgan 1970 table, the sample size was found to be 392 to represent the data of young adulthood from the age group of 18 to 40 years for the study. The sample collected for the present study is 392.

**Sample Description**
The sample consisted of 392 young adults. The age group of the sample range from 18 to 40 years were included in the present study. It consists of 213 female and 179 male subjects in the study.

**Selection Criteria**
**Inclusion criteria**
- Young adults of age from 18 to 40.
- Completely voluntary participation.
- The participants who understood and read English.

**Exclusion criteria**
- Participants are not coming under the age group of 18 to 40.
- Students underlying medical conditions both physical and mental conditions.

**Variables Included in the Present Research Study**
**Independent Variables**
Childhood trauma

**Dependent Variables**
Resilience
Intimate bond
Experience of positive and negative feelings

**Instruments used**
- A personal information schedule was administered to the participants which contains a customized set of questions that will be used to get the demographic details.
- The Brief Resilience Scale (BRS) created by (Smith *et al*., 2008)
- Intimate bonds measure developed by Wilhelm and Parker (1988).
- Scale of positive and negative experiences (SPANE) developed by (Diener *et al*., 2009)
- The Childhood Trauma Questionnaire-Short Form (CTQ-SF) (Bernstein *et al*., 2003)

**Demographic Data Sheet**
The demographic sheet consists of self-administered questions consisting of name/ initials, age, gender, family type, residence, occupation, relationship status and period.

**Procedure of Instruction and Administration**
Questionnaire given to the participants individually. Questionnaires given to the participants are easily understandable and doubts were clarified and explained if any queries arose in subjects. Anonymity and confidentiality were maintained and assured to the subjects. The informed consent collected from the all the participants. Then the following instructions were given to the participants. The participants were asked to read the questions carefully and asked to give the honest answers as much as possible. Subjects in this research study are completely not compulsory to participate so they can come out from study any time if participants want. Age groups from (18 to 40) take this research. There is no known probability for subjects. The participants were to opt to exit the study at any point. The information collected will be used for study purposes only and the responses will be kept confidential. Honest responses will help in improving the results of the research. It will take approximately 10 to 20 minutes to complete the questionnaire. There is no time limit for attending the questions but requested to answer as soon as possible. The subjects were appreciated for the contribution for the research purpose.

**Data Analysis**
Data analyses were done by excel sheet and further results findings were analyzed by percentage obtained. Statistics were done by the SPSS version 20.Descriptive statistics were used along with inferential statistics. The data were correlated, Regression, Mean, Standard deviation were used to survey the information from the subjects.

**Ethical Consideration**
**Confidentiality:** The collected data will be kept confidential.
**Purpose:** The study will be conducted after collected approval by the Institutional Human Ethics Committee IHEC.
**Consent Forms:** Informed consent forms will be collected from all the subjects involved in the research.
**Voluntary Participation:** All participants will be treated equally irrespective of their participation in the study and it is completely voluntary participation.

## RESULTS AND DISCUSSION

**Analysis of Demographic Details**
The total population for the study is 392 out of which 54% (213) females and 46% (179) male young adulthood were present. The relationship status of the subjects was found to be Married participants are 121, whereas for in a relationship 140 participants, widowed 8 participants, separated 5 participants, Divorced 3 participants and single who had relationship in the past is 115 participants. The relationship period of the participants who had less than 6

months are 18.6%, more than 6 months are 13.6%, 1 to 3 years are 27.8% and participants who have more than 3 years are 39.8%. There are two types of family; it includes 270 participants from the nuclear family and 122 participants from the joint family. The childhood trauma has 5 dimensions for each dimension in the childhood trauma 42.60% participants had emotional abuse, 37.40% participants had physical abuse, 32.90% participants had sexual abuse, 71% participants had emotional neglect and 56.90% participants had physical neglect. The intimate bond has the two dimensions of intimate bond are care and control. 69.13% participants preferred Care and 42.79% participants preferred control. Most of the participants prefer their partner to be caring than controlling. The "Scale of positive and negative experience" shows the level of experiences of negative and positive experiences. It shows the 3 dimensions represent the positive 69.00% and negative 52.50% experiences and -16.53% affect balance which indicates the feelings. Most of the participants experienced more +ve feelings than -ve but the effect balance shows -16.53% which indicates that the participants were unhappiest possibly.

**Correlation Analysis**

The r value is .048 which indicates that the correlation is not significant between the resilience and childhood trauma. The r value is -.134** which indicates the small negative relationship between the childhood trauma and scale of positive and negative experience. The r value from the correlation is -.028 which indicates there is no correlation were found between the childhood trauma and intimate bond.

**Regression Analysis**

The calculated P value is .347 which is higher than the absolute P value is 0.05. This indicates that childhood trauma does not significantly analyze or predict the resilience among young adulthood. The calculated P value is .008 which is lesser than the absolute P value is 0.05. This indicates that childhood trauma does significantly analyze or predict the experiences of positive and negative feelings among young adulthood. The calculated P value is .587 which is greater than the absolute P value is 0.05. This indicates that childhood trauma does not significantly analyze or predict the intimate bond among young adulthood.

## DISCUSSION

Correction analysis shows unrelated to trauma with intimate bond and resilience but it not strongly associated with SPANE lower scores but the resilience is highly correlate with the intimate bond and SPANE. Regression analysis shows early adverse experiences weakly predict the negative effect or feelings (SPANE). Overall findings show that the early adverse experiences not directly impact the intimate bond or resilience but it does have little or small impact on SPANE. While resilience has strongly interlinked with present positive feelings and understanding or supportive intimate relationship. There are studies also align with the results (e.g., Weiss *et al*., 2019; Howell *et al*., 2014; Mullen *et al*., 1994)

## LIMITATION

- The sample size is limited to 392 according to the time constraint.
- Age groups from 18 to 40 young adulthood population were limited for the study.
- Not all the variables along with their dimensions were included with the other variables. childhood trauma, resilience, SPANE, intimate bond.
- The participants for this study felt the questionnaire had quite more questions.
- The samples for the study were collected through google forms; it may also be considered as a limitation.

**Implication**

- It helps to understand the ability of the person to bounce back and it also helps the individual to identify and increase the positive feeling.

- This study also helps to understand whether childhood trauma has an impact on the individual's intimate relationships with one another.
- This study provides insight to conduct qualitative research on childhood trauma, intimate bond, resilience and SPANE especially in the Indian population.
- This study helps as an individual and also for the society to develop the awareness and encourage mental health professionals to develop care centers.
- This study makes the therapies and develops the scale to support mental health and helps to decrease childhood trauma by increasing the resilience in an individual.

**Suggestions for Further Studies**

- This study can be done in a larger or greater population.
- The study helps to create the various studies based on these variables especially in the Indian context.
- The study can be done in different age groups or populations.
- To create significance the samples can be obtained directly and get honest answers from the population.

**ABSTRACT**

Let $G = (V, E)$ be a $(p, q)$ graph. Let $S = \begin{cases} 1,2,\dots\frac{p}{2},\frac{1}{2},\frac{1}{3},\dots\frac{2}{p+2} piseven \\ 1,2,\dots\frac{p-1}{2},\frac{1}{2},\frac{1}{3},\dots\frac{2}{p+3} pisodd \end{cases}$. Let $T : V(G) \to S$ be a one-one and onto function. For each edge xy assign the label $\lceil T(x)T(y) \rceil$. $T$is called a fractional product cordial labeling (simply called FP-cordial labeling) if$|\varphi_T(0) - \varphi_T(1)| \leq 1$, where $\varphi_T(1)$ and $\varphi_T(0)$ respectively denotes the number of edges labelled with 1 and not labelled with 1. A graph with a fractional product cordial labeling is called a fractional product cordial graph (Simply FP-cordial graph). In this paper we investigate the fractional product cordial labeling behaviour of certain graphs derived from fan and wheel graph.

**Keywords:** Octopus Graph, Double Fan Graph, Double Wheel Graph.
**2020 AMS Subject Classification:** 05C78

## INTRODUCTION

In 1980, Cahit [1] was introduced the concept of cordial labeling of graphs. In same lines several authors was studied cordial labeling related concepts [4,6,7,8,9,10,15,18]. In [2,6,16,17], the labeling concept was studied. Ponraj and

Sutharson [12] have been introduced the new graph labeling called fractional product cordial labeling of graph. In [11,13,14] they have been investigate the FP-cordial labeling behavior of certain graphs. In this paper we examine the FP-cordial labeling behaviour of some graphs obtained from fan and wheel graph. $[x]$ denotes the smallest integer$\geq x$.The number of vertices of a graph$G$iscalledtheorderof$G$andnumberofedgesiscalledthe size of $G$.$\Omega_{fpc}(G)$denotes the set of all fractional product cordial graphs. Throughout this paper we denote the number $i$ by $l_i(1 \leq i \leq \frac{p}{2})$ and the fractional number $\frac{1}{i}$by $f_i$ $(2 \leq i \leq \frac{p+3}{2})$.

**Preliminaries**

**Definition 2.1.**[15] Let$G_1 = (V_1, E_1)$and$G_2 = (V_2, E_2)$be two graphs. Then $G_1 \oplus G_2$ is called the ring sum graph with vertex set $V_1 \cup V_2$ and edge set $(E_1 \cup E_2) - (E_1 \cap E_2)$.

**Definition 2.3.**[3] Let $F_n, (n \geq 2)$ be a fan graph and $K_{1,n}$ be a star graph.An octopus graph $OG_n, (n \geq 2)$is a graph by joining $F_n$ with $K_{1,n}$ by sharing a central vertex of the star.

**Definition 2.4.**[3] $\overline{K_2} + P_n$is called the double fan graph$DF_n$.

**Definition 2.5.**[15]$2C_n + K_1$is called the double wheel graph$DW_n$.

## MAIN RESULTS

**Theorem 3.1.**Theoctopusgraph,$OG_n \in \Omega_{fpc}$forall $n \geq 3$.

**Proof .**Let the vertex set and the edge set of the $OG_n$ graph is$\{x, x_i, y_i : 1 \leq i \leq n\}$and$\{xx_i, xy_i : 1 \leq i \leq n\} \cup \{y_i y_{i+1} : 1 \leq i \leq n-1\}$ respectively.

**Part (a):** $n$isevenand$n \geq 4$.

Put the number$f_{\frac{n}{2}}$ to the vertex $x$. Now nominate the numbers$l_1, l_2, \dots, l_n$ to the vertices $y_1, y_2, \dots, y_n$ and nominate the numbers$f_2, f_3, \dots, f_{\frac{n-2}{2}}, f_{\frac{n+2}{2}}, \dots, f_{n+2}$ to the vertices $x_1, x_2, \dots, x_n$. Obviously $\varphi_T(0) = \frac{3n-2}{2}$and $\varphi_T(1) = \frac{3n}{2}$.

**Part (b):**$n = 2$

Suppose $OG_2 \in \Omega_{fpc}$. In this part the vertex numbers are $l_1, l_2, f_2, f_3, f_4$. When $l_1, l_2$ are the vertex numbers of the adjacent vertices, we have $\varphi_f(0) = 1$and $\varphi_f(1) = 4$, a contradiction. When $l_1, l_2$ are the vertex numbers of the non-adjacent vertices, we have $\varphi_T(0) = 1$and $\varphi_T(1) = 4$, again a contradiction.

**Part (c):** $n$isodd.

When $n \geq 5$, put the number $f_{\frac{n-1}{2}}$ to the vertex $x$. Now nominate the numbers $l_1, l_2, \dots, l_n$ to the vertices $y_1, y_2, \dots, y_n$ and nominate the numbers $f_2, f_3, \dots, f_{\frac{n-3}{2}}, f_{\frac{n+1}{2}}, \dots, f_{n+2}$ to the vertices $x_1, x_2, \dots, x_n$. Therefore $\varphi_T(0) = \frac{3n-1}{2}$and $\varphi_T(1) = \frac{3n-1}{2}$.

For $n = 3$, $OG_3$ is FP-cordial follows from Figure 1.

**Theorem 3.2.** Thedouble fan graph,$DF_n \in \Omega_{fpc}$for all $n \neq \{2,3,4,5,7\}$.

**Proof.** Let the vertex set and the edge set of the double fan graph is $\{u, v, u_i : 1 \leq i \leq n\}$and$\{uu_i, vu_i : 1 \leq i \leq n\} \cup \{u_i u_{i+1} : 1 \leq i \leq n-1\}$ respectively.

**Part (a):** $n$isevenand$n \geq 6$.

Assume $n \geq 4$, put the numbers $l_{\frac{n+2}{2}}$ and $f_{\frac{n+4}{2}}$ to the vertices $u$ and $v$. Now nominate the numbers$l_1, l_2, \dots, l_{\frac{n}{2}}$ to the vertices $u_1, u_2, \dots, u_{\frac{n}{2}}$ and nominate the numbers$f_2, f_3, \dots, f_{\frac{n+2}{2}}$ to the vertices $u_{\frac{n}{2}+1}, u_{\frac{n}{2}+2}, \dots, u_n$. Hence $\varphi_T(0) = \frac{3n-2}{2}$and $\varphi_T(1) = \frac{3n}{2}$.

For $n = 6$, $DF_6$ is FP-cordial with a FP-cordial labeling given in Figure 2.

**Part (b):** $n$ is odd and$n \geq 9$.
For all $n \geq 11$, put the numbers $l_3$ and $l_4$ to the vertices $u$ and $v$. Now nominate the numbers$l_1, l_2, \ldots, l_{\frac{n-1}{2}}, f_2, l_{\frac{n+1}{2}}$ to the vertices $u_1, u_2, \ldots, u_{\frac{n-1}{2}}$ and nominate the numbers$f_3, f_4, \ldots, f_{\frac{n+5}{2}}$ to the vertices $u_{\frac{n-1}{2}+1}, u_{\frac{n-1}{2}+2}, \ldots, u_n$. Obviously $\varphi_T(0) = \frac{3n-1}{2}$and $\varphi_T(1) = \frac{3n-1}{2}$.
For $n = 9$, $DF_9$ is FP-cordial follow from Figure 3.

**Part (c):** $n \in \{2,3,4,5,7\}$
For $n = 2$, Suppose $DF_2 \in \Omega_{fpc}$. The vertex numbers are $l_1, l_2, f_2, f_3$. When $l_1, l_2$ are the vertex numbers of the adjacent vertices, we have $\varphi_T(0) = 1$ and $\varphi_T(1) = 4$, a contradiction. When $l_1, l_2$ are the vertex numbers of the non-adjacent vertices, we have $\varphi_T(0) = 0$ and $\varphi_T(1) = 5$, again a contradiction.
For $n = 3$, Let $DF_3 \in \Omega_{fpc}$. The vertex numbers are $l_1, l_2, f_2, f_3, f_4$. When $l_1, l_2$ are the vertex numbers of the adjacent vertices, we have $\varphi_T(0) = 1$ and $\varphi_T(1) = 7$, a contradiction. When $l_1, l_2$ are the vertex numbers of the non-adjacent vertices, we have $\varphi_T(0) = 0$ and $\varphi_T(1) = 8$, not possible.
For $n = 4$, Assume that $DF_4 \in \Omega_{fpc}$. The vertex numbers are $l_1, l_2, l_3, f_2, f_3, f_4$. When $l_1, l_2, l_3, f_2$ are the vertex numbers of the adjacent vertices we have $\varphi_T(0) \leq 4$ a contradiction to the size of $DF_4$is 11. When $l_1, l_2, l_3, f_2$ are the vertex numbers of the non-adjacent vertices, we have $\varphi_T(0) \geq 2$ again a contradiction to the size of $DF_4$is 11. It is clear that $DF_4 \notin \Omega_{fpc}$.
For $n = 5$, Let $DF_5 \in \Omega_{fpc}$. The vertex numbers are $l_1, l_2, l_3, f_2, f_3, f_4, f_5$. When $l_1, l_2 l_3, f_2$ are the vertex numbers of the adjacent vertices we have $\varphi_T(0) \leq 4$ a contradiction to the size of $DF_5$is 14. When $l_1, l_2 l_3, f_2$ are the vertex numbers of the non-adjacent vertices, we have $\varphi_T(0) \geq 2$ again a contradiction to the size of $DF_5$is 14.
For $n = 7$, Assume that $DF_7 \in \Omega_{fpc}$. The vertex numbers are $l_1, l_2, l_3, l_4, f_2, f_3, f_4, f_5, f_6$. When $l_1, l_2, l_3, l_4, f_2, f_3$ are the vertex numbers of the adjacent vertices, we have $\varphi_T(0) \leq 8$ a contradiction to the size of $DF_7$is 20. When $l_1, l_2, l_3, l_4, f_2, f_3$ are the vertex numbers of the non-adjacent vertices, we have $\varphi_T(0) \geq 6$ again a contradiction to the size of $DF_7$is 20.

**Theorem 3.3.**Thegraph,$DF_n \oplus K_{1,n} \in \Omega_{fpc}$forall $n \geq 2$.

**Proof.** Let the vertex set and the edge set of the graph $DF_n \oplus K_{1,n}$is$\{u, v, u_i, v_i : 1 \leq i \leq n\}$and$\{uu_i, vu_i, vv_i : 1 \leq i \leq n\} \cup \{u_i u_{i+1} : 1 \leq i \leq n-1\}$ respectively. Put the numbers $f_{n+2}, l_{n+1}$to $u, v$. Nominate the numbers $l_1, l_2, \ldots, l_n$ to the vertices $v_1, v_2, \ldots, v_n$ and nominate the numbers $f_2, f_3, \ldots, f_{n+1}$ to the vertices $u_1, u_2, \ldots, u_n$. Obviously $\varphi_T(0) = \frac{4n-2}{2}$ and $\varphi_T(1) = \frac{4n}{2}$.

**Theorem 3.4.** Thedouble wheel graph,$DW_n \in \Omega_{fpc}$forall $n \geq 4$.

**Proof.** Let $w$ be the apex vertex. Let $w_1, w_2, \ldots, w_n$ be the vertices of inner cycle and $w_1', w_2', \ldots, w_n'$ be the outer cycle of $DW_n$.

**Part (a):** $n \geq 4$.
When $n = 4$, put the label $l_4$ to the apex vertex $w$. Now nominate the numbers$l_1, l_2, l_3, f_2$ to the vertices $w_1, w_2, w_3, w_4$ and nominate the numbers$f_3, f_4, f_5, f_6$ to the vertices $w_1', w_2', w_3', w_4'$ respectively. It is easy to verify that $\varphi_T(0) = 8$ and $\varphi_T(1) = 8$.
When $n \geq 5$, put the label $l_3$ to $w$. Now nominate the numbers$l_1, l_2, l_4, \ldots, l_{n-1}, f_2, l_n$ to the vertices $w_1, w_2, \ldots, w_n$ and nominate the numbers$f_3, f_4, \ldots, f_{n+2}$ to the vertices $w_1', w_2', \ldots, w_n'$ respectively. Therefore $\varphi_T(0) = 2n$ and $\varphi_T(1) = 2n$.

**Part (b):** $n = 3$.
Suppose $DW_3 \in \Omega_{fpc}$. The vertex numbers are $l_1, l_2, l_3, f_2, f_3, f_4, f_5$. When $l_1, l_2 l_3, f_2$ are the vertex numbers of the adjacent vertices we have $\varphi_T(0) = 4$ and $\varphi_T(1) = 8$, a contradiction. When $l_1, l_2 l_3, f_2$ are the vertex numbers of the non-adjacent vertices, we have $\varphi_T(0) = 0$ and $\varphi_T(1) = 12$, not possible.

**Theorem 3.5.**The graph,$DW_n \oplus K_{1,n} \in \Omega_{fpc}$ for all $n \geq 3$.

**Proof.** Let the vertex set and the edge set of the $DW_n \oplus K_{1,n}$ graph is $\{w, w_i, w_i', x_i : 1 \leq i \leq n\}$and$\{ww_i, ww_i', w_1x_i : 1 \leq i \leq n\} \cup \{w_iw_{i+1}, w_i'w_{i+1}' : 1 \leq i \leq n-1\}$ respectively.

**Part (a):** $n$isevenand$n \geq 4$.
Put the label$l_3$ to the vertex $w$. Now assign the numbers $l_1, l_2, \ldots, l_{n+1}$ to the vertices $w_1, w_2, \ldots, w_n$ and assign the numbers $f_2, f_3, \ldots, f_{n+1}$ to the vertices $w_1', w_2', \ldots, w_n'$. We now nominate the numbers $l_{n+2}, l_{n+3}, \ldots, l_{\frac{3n}{2}}$ to the vertices$x_1, x_2, \ldots, x_{\frac{n-2}{2}}$and assign the numbers $f_{n+2}, f_{n+3}, \ldots, f_{\frac{3n+4}{2}}$ to the vertices $x_{\frac{n}{2}}, x_{\frac{n+2}{2}}, \ldots, x_n$. Obviously $\varphi_T(0) = \frac{5n}{2}$and $\varphi_T(1) = \frac{5n}{2}$.

**Part (b):** $n$ is odd and $n \geq 3$.
Put the label$l_1$ to the vertex $w$. Now assign the numbers $l_2, l_3, \ldots, l_{n+1}$ to the vertices $w_1, w_2, \ldots, w_n$ and assign the numbers $f_2, f_3, \ldots, f_{n+1}$ to the vertices $w_1', w_2', \ldots, w_n'$. We now nominate the numbers $l_{n+2}, l_{n+3}, \ldots, l_{\frac{3n+1}{2}}$ to the vertices$x_1, x_2, \ldots, x_{\frac{n-1}{2}}$and assign the numbers $f_{n+2}, f_{n+3}, \ldots, f_{\frac{3n+3}{2}}$ to the vertices $x_{\frac{n+1}{2}}, x_{\frac{n+3}{2}}, \ldots, x_n$. We have $\varphi_T(0) = \frac{5n-1}{2}$ and $\varphi_T(1) = \frac{5n+1}{2}$.

## CONCLUSION

In this paper, we have studied about the fractional product cordial labeling of some graphs like octopus graph, double fan graph,$DF_n \oplus K_{1,n}$ graph, double wheel graph and$DW_n \oplus K_{1,n}$ graph. The investigation of some other special graphs are the open problem for the future research.

## ABSTRACT

The aim of the present study is to identify potential bioactive compounds for Epidermal growth factor receptor from Indian medicinal plants for treating Pancreatic cancer using *in silico* studies. The 3D structure of all the phytocompounds from the different Indian medicinal plants were retrieved from the PubChem database and the 3D structure of target protein, Epidermal growth factor receptor (EGFR)responsible for Pancreatic cancer was retrieved from the PDB database. PyRx 0.8 and Discovery Studio 2024 were used for docking studies. From the results, 10 compounds showed good binding affinity with target protein. Among them, the compounds Chebulinic acid, Terchebin acid and Geraniin from *Phyllanthus emblica* showed very good binding affinity like -10.5, -10.1, -10 kcal/mol, respectively with the target protein. Hence, the current study concludes that the compounds Chebulinic acid, Terchebin Acid and Geraniin may have the potential ability to treat Pancreatic cancer. Further, pre-clinical studies are required to confirm the efficacy of these compounds in treating Pancreatic cancer.

**Keywords:** Pancreatic cancer, Epidermal growth factor receptor (EGFR), Indian medicinal plants, Phytocompounds, Docking studies.

## INTRODUCTION

Located deep within the belly, behind the stomach and in front of the spine, is the pancreas. It produces digestive fluids to aid in the small intestine's food digestion and absorption, as well as hormones like insulin to help cells absorb nutrients and control blood sugar levels. Abnormal DNA mutations in pancreatic cells cause them to grow and divide uncontrollably, resulting in the formation of a tumor. This is the cause of pancreatic cancer. The liver, abdominal wall, lymph nodes, lungs, or bones are among the organs to which this tumor may occasionally spread[1]. According to GLOBOCAN 2018, estimates the pancreatic cancer (PC) ranks 14th globally, with incidence rates varying significantly across regions[2, 3]. In the Indian context, pancreatic cancer is not among the top ten most common cancers. It ranks 21st among men and 17th among women. Among men, the highest age-adjusted rate (AAR) is observed in Mizoram, followed by Mumbai, Thiruvananthapuram, and Delhi. For women, Mumbai reports the highest incidence, followed by Delhi, Bengaluru, and Thiruvananthapuram[4]. Advanced age, nicotine exposure relative risk[5, 6], obesity[5], long-standing type 2 diabetes mellitus[5], and chronic pancreatitis have been found as risk factors for PDAC. Although there are other contributing factors, cigarette smoking and a family history are the most common [7]. Individuals with hereditary pancreatitis are approximately 53 times more likely to develop PC than the general population, with cumulative rates reaching 30 to 40% by the age of 70 [8]. A family history of pancreatic cancer in a first-degree relative is associated with an increased risk of pancreatic cancer. The risk increases as more relatives are affected. The increased risk in family members could be owing to genetic factors and/or lifestyle habits that may be similar in different generations, such as smoking. Genetic predisposition is regarded as one of the major risk factors in the development of cancer.

The development of pancreatic cancer may be associated with inherited mutations in specific genes. These mutations are therefore the cause of various familial cancer syndromes[9]. Although a number of risk factors and environmental factors, including diabetes, chronic inflammation (pancreatitis), alcohol, and cigarette consumption, have been discussed, there is evidence that only tobacco smokers are definitively responsible for the development of pancreatic ductal adenocarcinoma (PDAC), with smokers having a threefold increased risk of developing PDAC compared to non-smokers [10]. Hepatitis B or C virus infection has surfaced as an additional risk factor for PDAC in more recent times[11]. Drugs Approved for Pancreatic cancer are Abraxane (Paclitaxel Albumin-stabilized Nanoparticle Formulation), Afinitor (Everolimus), Capecitabine, Erlotinib Hydrochloride, Everolimus, 5-FU (Fluorouracil Injection), Fluorouracil Injection, Gemcitabine Hydrochloride, Gemzar (Gemcitabine Hydrochloride), Infugem (Gemcitabine Hydrochloride), Irinotecan Sucrosofate, Lynparza (Olaparib), Mitomycin, Olaparib, Onivyde. Common adverse effects of this drugs are mouth sores, nausea, vomiting, diarrhea, and fatigue. Rash Kidney difficulties, liver issues, infections, and blood clots [12]. EGFR (Epidermal growth factor receptor) is a component of one of the main molecular pathways involved in pancreatic carcinogenesis. The majority of pancreatic cancers overexpress EGFR and its ligands EGF and TGF alpha [13, 14], and EGFR expression with its ligands is associated with increased tumor aggressiveness [15, 16]. As a result, EGFR is viewed as a possible therapeutic target in pancreatic cancer, with promising preclinical results [17, 18]. Pomegranate extract was found to reduce angiogenesis in pancreatic (Suit-2) and colon (Colo, 205) cancer cells, demonstrated by a significant decrease in tumor weight and the number of small blood vessels in the CAM (chorioallantoic membrane) model.

It also suppressed FGF2-induced angiogenesis in the CAM. These results suggest that pomegranate and its bioactive compounds may inhibit cancer progression and angiogenesis in this model [19]. *Moringa oleifera* leaf extract effectively inhibited the growth of various pancreatic cancer cell lines, with a marked effect at concentrations of 0.75 mg/ml or higher. Treatment of Panc-1 cells led to increased sub-G1 phase cell populations, decreased expression of p65 and other proteins, and elevated levels of p-IkBaIkBa. The extract was shown to suppress the NF-κBsignaling pathway and enhance chemotherapy effectiveness in pancreatic cancer cells [20]. *Garcinia indica* fruit rind extract showed dose-dependent cytotoxic effects on Balb/c 3T3 mouse fibroblasts. Previous studies demonstrated that garcinol, a component of the fruit, inhibited azoxymethane-induced colonic aberrant crypt foci (ACF). Additionally, garcinol exhibited antiproliferative activity across several cancer cell lines, including HeLa, colorectal, leukemia HL-

60, breast, prostate, and pancreatic cancer cells [21, 22]. The methanol extract from *Achyranthes aspera* leaves is cytotoxic, particularly to pancreatic cancer cells. Previous studies showed that leaf extract suppressed the expression of pro-metastatic and angiogenic genes. The current limited therapy choices for pancreatic cancer are unsuccessful, with a 5-year survival rate of fewer than 5% [23]. *Momordica charantia* have the potential to inhibit Pancreatic cancer (PanC) cell proliferation and induce cell death, thereby suppressing PanCtumor growth and proliferation, as well as inducing apoptosis to limit capillary tube formation in Human Umbilical Vein Endothelial Cells (HUVECs) and reducing angiogenesis in PanCtumor xenografts[24]. For avoiding the side effects of currently using synthetic drugs, in the present study, various Indian medicinal plants such as *Punica granatum*[19], *Moringa oleifera*[20], *Garcinia indica*[25], *Achyranthes aspera*[26], *Alpina officinarium*[27], *Momordica charantina*[24], *Phyllanthus emblica*[28] *Asparagus officinalis* [29], and *Phyllanthus amarus*[30] were taken to find the potential bioactive compounds for treating Pancreatic cancer using *in silico* methods.

## MATERIALS AND METHODS

**Plant and Ligand selection**

Around 200 phytochemical compounds were selected from various Indian medicinal plants such as *Punica granatum*[19], *Moringa oleifera*[20], *Garcinia indica*[25], *Achyranthes aspera*[26], *Alpina officinarium*[27], *Momordica charantina*[24], *Phyllanthus emblica*[28] *Asparagus officinalis* [29], and *Phyllanthus amarus*[30] using literature and the IMPPAT database. These chemicals' 3D structures were obtained from the PubChem database [31].

**Target protein selection**

The target protein, Epidermal growth factor receptor plays a main role in pancreatic cancer. The 3D structure of this target protein was obtained from the PDB database [32] and the target protein's information was obtained from the UniProt database [33].

**Docking studies**

Docking experiments for the target protein epidermal growth factor receptor and the phytocompounds (ligands) were performed using PyRx 0.8 software. Using this program, the target protein was further prepared for docking research. All of the ligands were uploaded using PyRx 0.8's Open Babel option. The grid was created, and docking tests were carried out, using PyRx 0.8's Vina wizard tool [34]. The binding affinity values were kept in an XL file. Using Discovery Studio 2024, the data were assessed, and the docked 2D and 3D images were taken. The best outcomes are indicated by the lowest binding affinity.

## RESULTS AND DISCUSSION

**Plant and Ligand Selection**

Different Indian medicinal plants were selected using literature survey. From the PubChem database, the 3D structure of the ligands (phytocompounds) were obtained.

**Target protein selection**

The 3D structure of the target protein, Epidermal growth factor receptor protein was retrieved from the PDB database and its PDB ID is 1MOX. The protein information was taken from the UniProt database and its UniProt ID is P00533. Figure 1 depicts the target protein's 3D structure.

**Docking studies**

PyRx 0.8 software was used to conduct docking studies for the phytocompounds (ligands) and the target protein Epidermal growth factor receptor. According to the findings, the majority of the compounds interacted with the target protein, among them 10 compounds showed excellent binding affinities with the protein. All the results are shown in Table 1. The 2D and 3D structures of the best-interacted phytocompounds and Synthetic drug with the

target protein Epidermal growth factor receptor are shown in Table 2. From the results (Table 1), among other compounds, 10 compounds showed very good results with the target protein. Of which, the phytocompound Chebulinic acid showed excellent binding affinity (-10.5 Kcal/mol) with the amino acid residues ARG 84, CYS 227, ARG 231, GLU 2, LEU 1, GLU 233, PHE 263, TYR 275, ARG 285, CYS 267, ARG 231, GLN 8, CYS 7, VAL 6, LEU 38 of the target protein. The phytocompound Terchebin Acid also gave excellent binding affinity of -10.1 Kcal/mol with the amino acid residues CYS 267, THR 266, ARG 231, LEU 1, GLU 2, GLU 3, CYS 227, ARG 84, THR 266, GLY 264, ARG 285, GLU 60. The binding affinity -10.0 Kcal/mol was observed between the phytocompound Geraniin and the amino acid residues LYS 322, SER 11, ASN 12, GLY 9, ARG 285, GLN 408, and ASP 344 of the target protein. Among the other compounds, the lowest binding affinity (-9.1Kcal/mol) was observed between the phytocompound Trigonelloside C and the amino acid residues ILE 316, HIS 346, ASP 344, LYS 407, GLY 410, ARG 405, ARG 285 and TYR 275 of the target protein. Besides, the binding affinity of the Synthetic drug Paclitaxel with the target protein was -8.2 Kcal/mol and the interacted amino acid residues were GLY 317, HIS 364, GLN 408, HIS 409, LEU 38, GLN 8. Thus, in the results of the present study, all the phytocompounds showed very good binding affinity when compared to the Synthetic drug Paclitaxel. Of which, the phytocompounds Chebulinic acid, Terchebin Acid, Geraniin showed highest binding affinity among the other phytocompounds. Thus, the present *in silico* docking studies identified that the phytocompound Chebulinic acid, Terchebin acid and Geraniin from *Phyllanthus emblica* had the potential ability to interact with target protein Epidermal growth factor receptor responsible for pancreatic cancer. A prior study found that crude extracts of *Petunia punctata, Alternanthera sessilis,* and *Amoora chittagonga* were cytotoxic to three cancer cell lines, with IC50 values ranging from 20.3 to 31.4 μg/mL, 13.08 to 34.9 μg/mL, and 42.8 to 49.8 μg/mL, respectively. Furthermore, treatment of Panc-1 cells with *Petunia punctata* increased caspase-3 activity, indicating that the observed cytotoxicity was caused by apoptosis [35]. Plumbagin (PL) (5-hydroxy-2-methyl-1,4-napthoquinone) isolated from the roots of *Plumbago zeylanica L* inhibits the growth of Pancreatic Cancer cells both *in vitro* and *in vivo* model systems, inducing apoptosis and inhibiting cell viability of PC cells [36].

Sudha *et al*. (2020)[19] used the chick chorioallantoic membrane (CAM) model to show that pomegranate has an antiangiogenic effect on pancreatic cancer cells. The results revealed that pomegranate fruit extract effectively decreased angiogenesis in the CAM produced by fibroblast growth factor. Berkovich *et al*. (2013)[20] studied the effects of aqueous *Moringa oleifera* leaf extract on cultured human pancreatic cancer cells (Panc-1, p34, and COLO 357). The study found that *Moringa oleifera* leaf extract inhibited pancreatic cancer cell growth and the NF-Kb signaling pathway. The methanol extract of *Achyranthes aspera* leaves (LE) demonstrated cytotoxicity, particularly to pancreatic cancer cells [26]. *Alpinia officinarum* contains high levels of flavonol and galangin, which decrease cell growth and promote cell cycle arrest in pancreatic cancer cells [37]. Kandhari *et al*. (2021) [24]discovered that *Momordica charantia* has the potential to inhibit Pancreatic Cancer cell proliferation and induce cell death, thereby suppressing Pancreatic Cancer tumor growth and proliferation, inducing apoptosis to limit capillary tube formation in Human umbilical vein endothelial cells (HUVECs), and decreasing angiogenesis in Pancreatic Cancer tumor xenografts. According to a previous study, eight terpenoid compounds were selected from n-hexane extract of *Emilia sonchifolia* for molecular docking studies. The eight terpenoid compounds are 4-Terpinenyl Acetate, Caryophyllene Oxide, Curcumene, Octadecanoic Acid, Decanoic Acid, Pentadecanoic Acid, (Z)-1,3-Phytadiene and 2,4- diethoxy-6-hydroxy-8-formyl-3oxa-bicyclocyclononan-7-ene. These bioactive compounds were docked with targeted proteins like RAC-beta serine/threonine-protein kinase (AKT) and Partner and localizer of BRCA2 (BRCA2). The molecular docking results revealed that AKT and BRCA2 complex with 2,4- diethoxy-6-hydroxy-8-formyl-3oxa-bicyclo[4.3.0]-cyclononan-7-ene has good glide score of -5.226 and -5.215 Kcal/mol, respectively [38]. In the present study, Chebulinic acid (-10.5 kcal/mol), Terchebin Acid (-10.1 kcal/mol) and Geraniin (-10.0 kcal/mol) from *Phyllanthus emblica* showed very good binding affinity with target protein, Epidermal growth factor receptor and this study suggests that the compounds Chebulinic acid, Terchebin Acid and Geraniin may have a potential ability to treat Pancreatic cancer. Further, pre-clinical studies are required to confirm the efficacy of these compounds in treating Pancreatic cancer.

## CONCLUSION

In the present study, 200 phytocompounds were taken from the different Indian medicinal plants and they were subjected for docking studies. From the results, in comparison with the synthetic drug Paclitaxel (-8.2 kcal/mol), 10 compounds showed good binding affinity with target protein, Epidermal growth factor receptor responsible for Pancreatic cancer. Among them, the compounds Chebulinic acid (-10.5 kcal/mol), Terchebin Acid(-10.1 kcal/mol) and Geraniin (-10.0 kcal/mol) from *Phyllanthus emblica* showed very good binding affinity with target protein. Hence, the current study concludes that the compounds Chebulinic acid, Terchebin Acid and Geraniin may have the potential ability to treat Pancreatic cancer. Further, *in vitro* and *in vivo* studies are required to confirm the potential of these compounds in treating Pancreatic cancer.

**ABSTRACT**

Kazuo Ishiguro is a Japanese-British author whose works cover a wide range of topics, with a particular emphasis on social issues. In his timeless book *Never Let Me Go*, Kazuo Ishiguro considers the post-human issue of genetically creating "human" beings and builds a "human-machine community" between clones and humans in response. From the viewpoint of the clone Kathy, *Never Let Me Go* is told. The narrative eloquently depicts the everyday lives of humans and clones by detailing Kathy's education in Hail sham, training at the Agricultural Society, and work as a caregiver both nationwide. Furthermore, the work demonstrates the "human-like" qualities of clones from three levels of human form, human feelings, and humanity in an effort to create a true "human-machine community" through humans' protection of clones, their "human-like" emotional bond, and their desire to find their own "human prototype." As a result, this essay uses the community idea to analyze the work *Never Let Me Go* from the viewpoint of post-humans. In order to uncover the essence of the "community" between people and clones, the article will examine the similarities between clones and humans in terms of appearance, emotion, and nature. This article simultaneously urges readers to keep their humanistic concerns in the face of contemporary technology and to accurately comprehend a number of issues facing the "posthuman" period.

**Keywords:** Posthuman, Clones, Human Prototype, Technology, Human Machine.

## INTRODUCTION

The two processes that are the focus of the study piece are memory and narration. In actuality, Kazuo Ishiguro's 2005 book *Never Let Me Go*, which is the subject of this study, is about wandering around in circles trying to figure out who you are. The story's protagonist, Kathy H., describes her life in a diary-style narrative that is reminiscent of the Bildungsroman: Bildungsroman is a type of literature that shows and examines the protagonist's moral and psychological growth. Bildungsroman, a German word, which means "*novel of education" or "novel of formation*."We learn about her life in chronological order, from childhood to adulthood, and we see how she grew up. Kathy H. is thirty-one years old and on the verge of passing away when she tells her experience. In fact, she has been providing care for about twelve years and will soon begin donating her organs, just like the clones of the people she looked after. As she confronts her inevitable death, she reflects on her past and tells us about her life with her two best friends, Tommy and Ruth, who have passed away by the time she begins writing[1]. [2]Britannica, "bildungsroman", https://www.britannica.com/art/bildungsroman (visited on 27/11/21)[2][3]. As they go through the normal phases of life and all that goes along with them—the innocence of childhood, the realization of how their world functions, the rejection of codes, and the pursuit of self-definition—their shared upbringing truly mirrors the Bildungsroman process. Due to jealousy and the fact that they frequently don't communicate effectively with one other, their triangle friendship has numerous problems.

Tommy is always there for Kathy, but Ruth pulls her away from him and hates her. Years go by before Kathy can see Ruth and Tommy again after[4] she chooses to become a caretaker. By the time they cross paths again, they have matured and, with the benefit of hindsight, are able to eliminate the bad, get back together, and do their best to make amends in the limited time they have left. A number of traits in Never Let Me Go allow us to classify it as a dystopia. The fact that the story deals with clones is already a compelling argument in support of this classification, even though it is not set in the future, rather it is set in the past, as we learn right away that it is set in 1990s Englandor in a futuristic setting. *Never Let Me Go's* dystopian aspect has been often questioned. In her paper "Clones are humans: the dystopian elements in Kazuo Ishiguro's *Never Let Me Go*," Kalina Maleska brings up this point of contention on the novel's nature:Most critics do not recognize it as belonging in the utopian (or more specifically dystopian) genre. The reason for this is that the novel is concerned with human experience as we know it, and does not portray a future world in which the landscape has greatly been altered in comparison to the one that exists in the present, but rather portrays an alternative reality which largely resembles the present, with a single, yet essential, difference from our own world[5].

This definition provides traits that are present in the book by Kazuo Ishiguro. The characters in *Never Let Me Go* are the victims of governmental oppression, but the society is not battling environmental destruction or a catastrophic decline. In *Never Let Me Go*, technology has advanced to the point where it is possible to successfully clone people in order to donate organs when necessary. Though speculative, the world depicted in this story has the potential to become our future. This, in my opinion, is enough to qualify the book for this category. Notably, Kalina Maleska highlights a number of dystopian genre components present in the book: "the isolation of the clones from the rest of society because of lack of opportunities for social mobility", "the consequences of technological progress in the world established in the novel", "the clones are completely separated from the rest of the people in the society"2, among numerous others. Although it is undoubtedly an atypical dystopia, the clones' lives—characterized by cramped quarters, the inability to travel and be free, a fate that consists of slowly dying as one's identity is taken away piece by piece, and the awful inevitability of it all—are sufficient justifications for it to be classified as such.

The definition of dystopia given by Merriam Webster's Dictionary is: "an imagined world or society in which people lead wretched, dehumanized, fearful lives"[6]. *Never Let Me Go* was written after the arising of the ethical debates concerning cloning in the 1990s. The birth of Dolly (1996-2003), the scientifically-engineered sheep, shook up people's beliefs and opened the Pandora's box of genetic manipulation. For or against, useful or harmful, ethical or immoral, heated discussions skyrocketed and nowadays' discoveries with eugenics and genetic engineering do not make it any better. In this respect, Kazuo Ishiguro's novel is a smart and unique approach to cloning, as it displays a world in which cloning is established, socially (and legally) accepted, and in which the clones look…exactly like us. To say it differently, nothing physical can differentiate them from human beings. This similarity creates an uncanny feeling in the human beings of the novel, including the Guardians, but also in us readers: what makes a human, human? What does it really mean to be human? Is this definition going to be challenged in the near future? Those are some of the questions that can arise from reading Kazuo Ishiguro.

**About his novel, in an interview, Kazuo Ishiguro says**

Over the last fifteen years I kept writing pieces of a story about an odd group of "students" in the English countryside. I was never sure who these people were. I just knew they lived in wrecked farmhouses, and though they did a few typically student-like things—argued over books, worked on the occasional essay, fell in and out of love—there was no college campus or teacher anywhere in sight. I knew too that some strange fate hung over these young people, but I didn't know what. In my study at home, I have a lot of these short pieces, some going back as far as the early '90s. I'd wanted to write a novel about my students, but I'd never got any further; I'd always ended up writing some other quite different novel. Then around four years ago I heard a discussion on the radio about advances in biotechnology. I usually tune out when scientific discussions come on, but this time I listened, and the framework around these students of mine finally fell in place. I could see a way of writing a story that was simple, but very fundamental, about the sadness of the human condition[7]. Kazuo Ishiguro's primary goal is not to caution us about the advancement of technology. Rather, it addresses our mortality, or the "sadness of the human condition." The society in Never Let Me Go has managed to evade death and defy the laws of nature. The clones, on the other hand, embrace their mortality.

People frequently questioned Kazuo Ishiguro about the clones' resignation because of this contradiction: why don't they flee? Why don't they defend themselves?

In an interview with Film Independent, Kazuo Ishiguro discussed this topic and stated:

I was never interested in looking at that story of slaves who rebel and escape. […] I'm fascinated by the extent to which people don't run away. […] That is the remarkable fact, how much we accept what fate has given us. […] Ultimately, I suppose, […] I was looking for a metaphor for how we face mortality. […] And we can't really escape from that[8]. Even if the clones of Never Let Me Go serve as an example, the search for identity may be applied to everyone: what makes us human? Who are we? Who are we hoping to become? Kathy H. embarks on this search for herself in a detective-like manner, searching her background for hints as she attempts to identify herself while we come to know her. She strives to recover what she always knew, what has always been lurking in plain sight: the reality of her past. By leaving breadcrumbs throughout her story and bouncing back and forth in time, this quest becomes an obsessional and vital search for meaning. But what is that truth? Ishiguro was born in Japan in 1954, although he soon relocated to Britain. Never Let Me Go exhibits this absence of a clear, limited identity, although it undoubtedly also appears in his other books. The first thing that caught my attention when I read Never Let Me Go was how different his writing is from typical dystopian fiction, which is why I decided to work on this book specifically. As if we were here with Kathy, we follow her story and accompany her as she recalls the years. We can only listen to her, hear what she has to say, and then think about ourselves. We are quiet witnesses to her struggles, unable to respond or assist her. This, I believe, is what drew me to Kazuo Ishiguro the most: the narrative style, which never lets us fully understand Kathy's character or fate until she meets Madam with Tommy toward the book's conclusion.

**Constructed Lives and Ethical Dilemmas in Posthuman Societies**

This novel is not mostly about dystopia. Actually, it wasn't Kazuo Ishiguro's main motivation for writing this novel. He concentrated on the concepts that drove his book rather than the categories. His goal was to create a book about resiliency and mortality. As a result, we perceive this book as a distinct dystopia. Unlike Margaret Atwood, for example, who uses speculative fiction to warn us about the future, Kazuo Ishiguro does not explicitly warn us about anything or declare that his novel is dystopian.

Nonetheless, this book nonetheless belongs to the dystopian genre. J. H. de Villiers and M. Slabbert clarify in their paper:

The students have also been brought to life with the predetermined purpose of meeting someone else's demand. […] The theme of dehumanization is introduced in the novel. Living beings are reduced to "mere objects". […] They don't "die" but are rather said to "complete" after three or four donations, once again invoking the image of an object fulfilling its purpose. The dehumanizing effect is inculcated in the students and perpetuated through other peoples' behavior towards them[9]. Despite their striking similarity to people and their ability to exhibit human emotions like love, hate, and despair, the clones are still viewed as nothing more than things that have been given life in order to achieve a specific goal. We believe that Kathy is more like us than the characters in the book think since she is able to feel those human emotions, create art, and write essays, for example. Because of the first-person narrative, we are thrust into her head and get to know her intimately, learning everything that she thinks about through this diary-style account of her life. Madame reacts to the clones in a conflicted way, having sympathy for them while also viewing them as tools. Boarding schools like Hailsham were established with the intention of exposing the brutality of the cloning process. In the third section of the book, one of the guardians, Miss Emily, states: We took away your art because we thought it would reveal your souls. Or to put it more finely, we did it to prove you had souls at all. […] It wasn't something commonly held when we first set out all those years ago. […] Together, we became a small but very vocal movement, and we challenged the entire way the donations programme was being run.

Most importantly, we demonstrated to the world that if students were reared in humane, cultivated environments, it was possible for them to grow to be as sensitive and intelligent as any ordinary human being[10]. The society in Never Let Me Go has not come to terms with its own mortality in this way. They do not want to return because they have discovered a method to live better, longer lives. This example is rather similar to our own societies. Numerous unethical experiments were conducted in an attempt to identify cures and therapies. Nevertheless, people celebrated the outcomes. Although this novel's society may be viewed as harsh and barbaric, it only mirrors our own predicament with regard to life and death: how far would we go to improve our lot in life? A civilization free from the grief of losing loved ones would result from the ongoing debate over genetically modified children, whose parents could select their gender, eye color, and possibly even cure them of ailments before they were born. Despite being published in 2005, this book is still relevant today. The use of an obviously absurd setting to highlight contemporary difficulties in our society is actually a characteristic of dystopias that we constantly come across. Exaggerations of "what could happen" if we pursue our well-being to the utmost, regardless of the costs, are the root cause of dystopias. In an article about Kazuo Ishiguro, Schneider AnaKarina states the following: "Fear of mortality was a force powerful enough to turn the country into a human organ farm. […] Individuals and societies do not fully examine the broad consequences of their decisions."[11] At first glance, Hailsham, the boarding school where the pupils are raised, would seem like an idyllic setting. Others consider the students there to be privileged.

**From the outset, Kathy states**

"people from Hailsham, or one of the other privileged estates" (Ishiguro 4). Two other students, Chrissie and Rodney, tell Kathy, Ruth, and Tommy as they travel to the Cottages, a facility where clones reside until they begin to take their roles as caregivers and donneers: "But you Hailsham lot, you're really lucky" (150). Other clones view Hailsham pupils as privileged because they were nurtured in humane circumstances, in contrast to clones in other locations. Miss Emily actually expresses her gratitude to the Hailsham students by saying: "you'd not sleep for days if you saw what still goes on in some of those places" (p. 260), Comparing Hailsham to other clone-raising locations, we are led to believe that this place is idyllic before learning about the clones' fate: the students can trust their

guardians (the word "guardian" itself conveys a sense of safety and protection), they are encouraged to express their creativity through art, they are not abused, and they are given the proper care. However, a number of factors ultimately cause us to perceive Hailsham as a hypocritical, depressing place: First, the use of euphemisms, such as "guardian" for those who watch over the clones until they are old enough to become carers and donors, gives the students a false sense of security; when they pass away, the clones are said to "complete," as if they accomplished something of which they should be proud, removing the horrifying aspect of this practice. Although the students were always aware of their fate, it was presented to them in a shady, indirect future: Kathy does say to Tommy, when they are children, "but we have been taught about all that" (p. 29).Hailsham is situated distant from civilization on a hill. The students are unable to see a city or anything else no matter where they look. This contributes to their imprisonment and consequently to their isolation. Since Hailsham is their sole point of reference and they have nothing to compare it to, they are unable to hold out hope for anything better. Additionally, the students are required to get weekly medical examinations: "at Hailsham we had to have some form of medical almost every week" (p. 13), which makes us think of the students as being like laboratory rats that require constant supervision and scrutiny. Lastly, the information that the students are given is regulated: they are instructed not to smoke, not to have sex with anyone, and not to harm their health. The main idea in the book is that students are: "told and not told" (p. 79).

**The Interplay of Biology and Technology in Man-Machine Communities**

Kathy is unable to say with certainty when they were provided this information. Like many others, she is unaware of this issue. For this reason, she makes an effort to solve the mystery in the style of a detective throughout the book. This research paper will primarily utilize James Dalrymple's thesis to create this idea. "Jouer au détective chez Kazuo Ishiguro et dans le whodunit métafictionnelbritannique"[12]. In fact, the entire book has the feel of a detective story, where the truth must be revealed and things must be questioned in order to discover the truth. Dalrymple contends: "Les protagonistes se retrouvent à endosser le rôle du détective pour élucider des mystères. La révélation de la vérité est structuréeautour des investigations du héros" (p. 25). Everything becomes a riddle to Kathy, the Gallery, the tokens controversy, the woods whispers, […] and she makes it her goal, her obligation even, to solve the puzzle. For example, Tommy is the subject of her first study. "If it hadn't been for that encounter on the stairs, I probably wouldn't have taken the interest I did in Tommy's problems over the next several weeks. […] I quizzed people until I'd got a more or less full account" (p. 14). Kathy acts like a detective. "I was, as I say, watching the situation closely Kathy acts like a detective. "I was, as I say, watching the situation closely around then […] but I'd spotted other changes, […] keeping an eye on Tommy" (p. 21). She looks into Tommy as though he were a criminal or a piece of evidence that needs to be carefully examined, and Tommy even confronts Kathy about it when he says: "You notice everything, don't you, Kath? […] you're so nosy" (p. 23). Kathy loses it on the book's final page. At that point, emotions take over as she shifts her attention from the past to her inevitable death. No longer is there room for logical reasoning and suppressing feelings, and her humanity—with all of its complexity, fragility, and frailty—cannot be denied.

That was the only time, as I stood there, looking at that strange rubbish, feeling the wind coming across those empty fields, that I started to imagine just a little fantasy thing, because this was Norfolk after all, and it was only a couple of weeks since I'd lost him. I was thinking about the rubbish, the flapping plastic in the branches, the shore-line of odd stuff caught along the fencing, and I half-closed my eyes and imagined this was the spot where everything I'd ever lost since my childhood has washed up, and I was now standing here in front of it, and if I waited long enough, a tiny figure would appear on the horizon across the field, and gradually get larger until I'd see it was Tommy, and he'd wave, maybe even call. The fantasy never got beyond that – I didn't let it – and though the tears rolled down my face, I wasn't sobbing or out of control. I just waited a bit, then turned back to the car, to drive off to wherever it was I was supposed to be [7]. Kathy is suppressing her emotions here: she lived her entire life in a state of emotional denial, refusing to cry, and numbing herself as though it would have been a means of enduring all of the hardships she had to endure. Knowing that she might break if she allows herself to dream more, she even suppresses her fantasy. She ultimately returns to being a thing, an entity with a function, as she moves to her intended location. This is where the novel ends, which gives the conclusion a pitiful turn. Kathy is at a loss for words, or perhaps she is no longer able to. She leaves us wondering what happened to her after that, but it seems that she didn't have what it

took to continue or that it wasn't worth telling. The idea of trash being gathered along the fencing creates a powerful visual impression. This could be a metaphor for how time scatters memories, which are then brought back to her through the dual processes of recounting and remembering (recollecting bits and pieces). The fencing would then represent a transient enclosure of text and memory, enclosing the remnants of the past before they are once more blown away. However, it can only capture parts of it, not the entire thing. In addition, Kathy associates the trash with the things she has lost, including some of her memories in addition to her friends.

**Shared Identity: Kathy as a Symbol of Collective Clones**

Kathy is more than just a single person. In actuality, the clones also share a collective identity: Kathy and Tommy, Ruth and Kathy, and all of the Hailsham students share an identity. Charlwood Catherine writes on that: Being able to share the memories and feelings of their days in Hailsham is a way of affirming its existence as an integral part of their histories…their affirmation of each other's lives through the stories they tell constitutes a mutual or collective recognition of each other[13]. Because their life stories are mutual, Kathy spends a lot of time talking to Ruth or Tommy about them in order to correct the record and compare her version of events with theirs, even if it occasionally conflicts with theirs: "she claimed it had been just a matter of two or three weeks – but that was almost certainly wrong. She was probably embarrassed about it and so the whole thing had shrunk in her memory" (p. 49). She may be more narcissistic since she assumes other people's perspectives, which is similar to her belief that she saw many things that others did not. They are her manner of being and being. This small recording serves as a link to her memory of the past and a means of reliving those memories by reviving them. In reference to that, ChanapaDuangfai writes: Memory or remembering is a self-reflection and this can lead to the recognition of one's own self. […] Memory is shaped by the desire for meaning. When our past, present and future are intrinsically connected, it is possible that we can develop an understanding towards ourselves as a whole. […] The memory of Hailsham becomes collective because it allows Kathy to link up with other clones[14]. As Tommy ends up in Kingsfield, Kathy clings to her pleasant recollections of Hailsham and the Cottages. In actuality, she usually speaks positively about those locations, which influences not only how she remembers but also how she handles her life and experiences. In a society that has cheated death and nature's laws at the expense of the lives of "poor creatures" whose identity is unclear and whose status is questioned by the very people who brought them to life but who refuse to face the consequences of their actions once their interests are met, Kathy demonstrates an intriguing and unique way of dealing with one's mortality by alternating between her search for the truth and her eagerness to make sense of everything that has happened to her: By constructing a society that is essentially indifferent to the subjects from whom vital organs are harvested, Ishiguro demonstrates that humans are perpetually self-interested, to the detriment of other beings.

By using the terms "they" and "their", the Hailsham director Miss Emily implies that she and the directors are detached from the majority sentiment of people in their society who deny the clones' humanity. But even if Miss Emily believes the children are fully human, she ultimately gives up on their cause, which renders her belief meaningless. The head directors of Hailsham, Miss Emily and Madame, suggest that the school was a special project to offer the clones more comfortable lives as they waited for their organs to be harvested. But the self-proclaimed "benevolent" directors never admit to opposing the practice of harvesting organs from clones; they only aim to provide a "more humane and better way of doing things"[16]. Additionally, she works to modify her behavior and become a better friend till the very end by recalling the arguments she had with Ruth. In summary, recollection is crucial to determining a person's identity and life. That's why it's so important to Kathy to write down all of her recollections. At the book's conclusion, she has finally found her identity after searching her entire life. Furthermore, her memories will survive till the end, even if her body parts are gradually removed. She is prepared to cease writing and face death with peace because she has effectively demonstrated her identity, something that others like Madame and Miss Emily were unable to do. Despite her subjectivity, Kathy gives the clones a voice and demonstrates her humanity through her memory, empathy, artistic ability, emotional expression, and, most importantly, by leaving a legacy—the only one she has left. According to Guo Wen: Cave offers four 'immortality narratives' that he suggests explain the four basic forms of human attempts at everlasting life: preserving the physical body by searching for the elixir of life in the past and looking to medical science in the present [as does the society in Never Let Me Go]; hoping

for resurrection; belief in the immortal soul; and leaving a legacy, in such forms as cultural works and biological offspring. […] They (the clones) attempt to leave a legacy by building an identity through structuring and narrating their past experience[17].

## CONCLUSION

In conclusion, it could be argued that memory is unreliable because it is dependent on our subjectivity, the passage of time, and our ability to recall as well as our desire or lack thereof to embellish or darken our past. Nevertheless, Kathy makes an effort to be as truthful as she can, understanding her limitations and admitting that she may have exaggerated certain details, but still wanting to provide us with as many details as possible to give us a complete picture of her life as possible. She and all of the clones exhibit incredible fortitude in the face of impending death, which makes us question whether the compassionate rearing of the clones is truly meaningful given that their fate is the same. Talking to Miss Emily and Madame, Tommy and Kathy are perplexed and disturbed because they don't see the purpose of their education and artwork and believe that their fate will be the same as that of clones grown in different locations. In contrast to Tommy, who goes through everything and suffers immensely as a result, Kathy's response numbing her emotions and exaggerating her pastmay be the most pertinent given the meaninglessness of it all. She embraces nihilism as a means of avoiding suffering from her life. In the final line of the book, which is also the one that makes it all the more significant, Kathy ends the narrative of her life, silences her humanity, and accepts her "purpose" like an object when she says letting go of her life, accepting her fate, having nothing more to say, having no one left in her immediate vicinity, and having fulfilled her purpose by leaving her Neither Tommy nor Ruth resist or flee prior to the organs being removed, nor after realizing that the next donation will probably be their last. Their identities were determined by their artwork, relationships, readings, and memories. Kazuo Ishiguro did not write this book to warn us about cloning or to discuss the morality of the procedure, as many writers and experts have done since the birth of Dolly the Sheep, which began an apparently relentless quest for immortality. His goal was to demonstrate to us how individuals cope with death in a nihilistic, disbelieving world that denies clones their humanity by refusing them access to religion or organs. In this way, Never Let Me Go can still be regarded as a dystopia since we are unable to resist feeling pity and empathy for the clones despite the injustices they endure and anger at their tenacious acceptance of death.

By highlighting the connection between memory and mortality, this book, in my opinion, offers a contemplative and captivating approach to considering our own mortality as well as the transience and shortness of life. It encourages us to treasure our past and cling to our memories, which will ultimately be the only thing we have left. In that way, the title of the novel, Never Let Me Go, shows the importance of holding on, and especially, of holding on to the last thing we will have when facing our own death. As the narrative of Kathy unfolds, so does our own, in a fragmented, uncertain, subjective way. We may be able to section our life into different parts, but they tend to intertwine, and they cannot mean anything unless connected to the others. In this sense, the novel's title*, Never Let Me Go*, emphasizes the value of clinging to what we have left, especially while we are facing death. Our story develops in a fragmented, ambiguous, and subjective manner along with Kathy's. Although we may be able to divide our lives into distinct sections, they usually converge and are meaningless without their connections. Including both the beautiful and the ugly, our memory is a unified whole composed of different pieces that can only resemble something when put together. Rather of erasing her past and preserving only its best elements, Kathy puts it all together. As her body slowly disintegrates, she yearns for her identity to be whole and refuses to let go of her past. Even though her life has been cut short, Kathy has experienced every stage of life that an elderly person goes through: childhood, when she was innocent; adolescence, when she learned about jealousy, anger, and love; adulthood, when she learned about her body, her desires, and her limitations; and, like an elderly person, she has been able to make sense of everything, to connect the dots, to make amends with Tommy and Ruth in particular, and to accept her mortality and be at peace with them and herself. By the time we arrive at the novel's full halt, in its most cruel, unavoidable truth, the circle is complete.

## ABSTRACT

Sanskrit was the main language of ancient India and is the source of many modern Indo-Aryan languages still used today in the Indian subcontinent. While these languages have evolved, many grammatical and meaning-related features still connect back to Sanskrit. In this discussion, we will explore these features and compare classical Sanskrit with today's Hindi, Bengali, and Marathi. We will examine ancient Sanskrit word order, how cases are marked, and how agreement works, as well as how these have influenced or changed in modern languages. Additionally, we will look at important philosophical and cultural terms like dharma, karma, and moksha, along with how their meanings have changed over time. This study uses a comparative approach to analyze ancient texts such as the Vedas and the Mahabharata, as well as modern language examples. The results show how syntax and meaning have changed due to historical, cultural, and religious influences, offering new insights into the ongoing development of the Indo-Aryan language family.

**Keywords:** Syntactic Analysis, Lexical Semantic Analysis, Contextual Semantic Shifts, Semantic Field Analysis, Case Marking.

## INTRODUCTION

Sanskrit is the ancient classical language of India that has greatly influenced modern Indo-Aryan languages. It served as the primary language for religious ceremonies in Hinduism, Buddhism, and Jainism. Many important Indian religious and philosophical texts, like the Vedas, Upanishads, Mahabharata, and Ramayana, were written in Sanskrit. This language is not only a direct ancestor of modern languages such as Hindi, Bengali, and Marathi but also reveals the linguistic roots of these languages. It shows how their structures have changed over time. Sanskrit had a flexible sentence structure, mainly because of its inflectional morphology. The parts of a sentence were related to each other through grammatical cases, which preserved their relations irrespective of the word order imposed. For instance, in a Vedic Sanskrit sentence, the subject, object, and verb could be arranged in a variety of ways without altering the meaning because the case markers were there to indicate the role of each word. Thus, the verb and subject could be switched around rather freely which is perhaps one of the most characteristic features of Vedic Sanskrit. But the modern Indo-Aryan languages have been influenced so heavily by their Sanskrit ancestor that they have developed a fixed word order—usually subject-object-verb (SOV)—a major shift. The languages have also simplified their morphology, especially in reducing the number of case-marking systems. Nowadays, postpositions perform a great deal of the grammatical functions that were once provided by case markers.

From the semantic point of view, the main ideas in ancient Sanskrit, especially those related to religion and philosophy, have survived through the ages. The concepts of dharma, karma, and moksha, among others, are still at the heart of philosophic discussion in India. However, the meanings of these terms have undergone a gradual change over time along with the cultural, social, and religious contexts. The present study sheds light, through the discussion of syntax and semantics, on the vast internal millstone of the Indo-Aryan language family over the ages as well as the external shape changes of the family. This inquiry also aims not only at tracing the epic Bohemian paths of the major philosophical terms but also their peculiar ways as they shifted from ancient Sanskrit up to the diverse modern Indian languages. It questions how the proper semantic areas of these terms were understood in the Kannada or Bengali tongues and how they differed from the spiritual implications linked to the original Sanskrit words. Moreover, the paper will mainly focus on how the phonetic, grammatical, and lexical factors of the historical and modern languages corresponded or diverged from each other.

## LITERATURE REVIEW

Sanskrit syntax has been closely studied since Panini, who created the first detailed explanation of Sanskrit grammar. His work in the 4th century BCE is known for establishing clear rules about how words change form and how sentences are structured. In classical Sanskrit, word order was much more flexible than in today's modern Indo-Aryan languages. This inflectional system allowed for various sentence forms, making it easier to arrange words in different ways without changing the meaning. This flexibility is especially seen in Vedic Sanskrit, where the arrangement of words could differ while still keeping the same meaning, thanks to case markers that clarify how words relate to each other. However, as Sanskrit evolved into its classical form, scholars like Whitney and Kachru noted that the word order became more fixed, with the Subject-Object-Verb (SOV) structure becoming the most common. The evolution of inflectional morphology in Sanskrit led to a regularized structure as the language became more uniformly represented in writings. According to modern Indo-Aryan languages, as Masica noted (1991) [4], the core syntactic flexibility of Sanskrit has been gradually lost in the course of time. The SOV word order has become the primary structure in most Indo-Aryan languages, which include Hindi, Bengali, and Marathi. Nevertheless, these languages have given up the intricate case-marking system that was prevalent in the ancestor Sanskrit. Rather, postpositions have taken over the role of case markers in terms of syntactic function. For instance, in Hindi the instrumental case is conveyed through the postposition "se" rather than an inflectional marker, which indicates the simplification of the case system.

Sanskrit, in phrases, is one of the languages that have the most to offer as it comes to the matter of philosophical terms, with the major ones like dharma, karma, and moksha being the very basis of the whole religious and metaphysical debate. The changes in meaning over time that the terms have gone through have been noticed by experts like Filliozat (1954) [5] as very dramatic ones, that have, so to speak, kept up with the changing social, philosophical, and religious climate of India. For instance, the word dharma was used in the Vedas for cosmic law and righteous duty but later was understood and translated as personal ethics and social responsibility in modern languages such as Hindi. Mishra (2004) [6] and Basu (2009) [7], contemporary linguists, have taken these semantic transformations to a greater extent, exposing the reinterpretation and repurposing of the Sanskrit philosophical terms in modern contexts. Although at one time those words were important for Hindu cosmology, they are now, for example, used in secular and religious discourses in Hindi, Bengali, and Marathi. This change is a strong signal of the lively interaction between language and culture.

## METHODOLOGY

In this research, a comparative linguistic approach is applied, where both syntax and semantics are emphasized to analyze the development of Sanskrit concerning modern Indo-Aryan languages. The study has two main objectives: the first is to investigate the syntactic changes that occurred from Vedic Sanskrit to modern Indo-Aryan languages, and the second is to track the change in meaning of philosophical terms through the centuries. The paper is going to perform a systematic comparison of language change in the two aspects by adopting a data-driven approach which relies on both ancient and modern corpora.

**Data Collection and Corpora Selection**

In the course of syntactic analysis, the investigation mentions ancient Sanskrit manuscripts as the primary source. Among these manuscripts are: Vedic Texts: The Rigveda, Yajurveda, Atharvaveda, and Samaveda are the main sources for the research of early Sanskrit's syntax. Especially Vedic Sanskrit shows a language with very flexible syntactic structures due to its free word order and heavy case marking. Classical Sanskrit Texts: Mahabharata, Ramayana, and Panini's (e.g., his grammar Ashtadhyayi) works provide a smooth transition from Vedic to classical Sanskrit. These texts mark the period of the solidifying of grammars and the concomitant decline of a more stable SOV word order. Moreover, the study considers contemporary Indo-Aryan data from assorted written and spoken corpora of Hindi, Bengali, and Marathi, which are the most typical languages of the Indo-Aryan language family, as the representative languages.

The selection of these languages was based on their strong linguistic ties with Sanskrit, their relevance at present day and their various syntactic and semantic features. The data sources for the mentioned languages are as follows: Literary Works: The less common formal application of language includes Modern Hindi, Bengali, and Marathi novels, plays, and poetry. These writings expose the syntactic structures and the current semantic field of main philosophical notions. Contemporary News and Media: The informal and everyday use of the modern Indo-Aryan languages is provided by the researcher through news articles, magazine pieces, and digital content from online platforms. This enables the researcher to track the infiltration of these philosophical concepts, e.g., karma and dharma, into the common culture. Spoken Corpora: Relaxed discussions and informal interviews in these languages have been transcribed, and the use of informal syntax, as well as the everyday contexts where key terms are applied informally, have been illustrated. The three types of corpora presented above insure that the research involves both written and spoken registers of language use, thereby providing a more thorough understanding of syntactic and semantic changes.

**Syntactic Analysis**

The primary features of sentence structure, especially word order, case marking, and subject-verb agreement, are the main characteristics that syntactic analysis relies on. These properties are selected because they serve as the most fundamental of syntax in both Sanskrit and the modern Indo-Aryan languages.

1. Word Order: The early feature of Sanskrit that allowed for flexible word order was its early diagnosis itself. In Vedic Sanskrit, the position of words was still very free, and quite often, the meter or the poetic structure rather than syntactic necessity determined the order. The analysis would consist of a quantitative comparison of the sentences in Vedic and Classical Sanskrit, as well as modern Indo-Aryan languages, to identify the patterns or shifts. For instance, the research may go into the question of whether the looser word order of Vedic writings is connected with the SOV structure that has become predominant in contemporary languages such as Hindi and Bengali. To illustrate the shifts in word order, syntactic trees will be created for the selected sentences of each language.
2. Case Marking: One of the key syntactic transformations from the case marking in Sanskrit to the modern Indo-Aryan languages was the elimination of grammatical categories. The Indian language brought together the noun phrases and the different grammatical cases (nominative, accusative, instrumental, dative, etc.) as the signals or markers of the role played by the noun in the sentence. The modern Indo-Aryan languages use postpositions which come after the noun, and thus, the case marking system is either less complex or totally simplified. The study will delve into the discrepancies between Sanskrit, where nouns and pronouns bear case markers, and modern languages like Hindi and Marathi, where postpositions are the predominant case markers. The test will assess students on their ability to analyze sentence structure while also tracking the development and elimination of case markers throughout the language.
3. Subject-Verb Agreement: The subject-verb agreement system in Sanskrit was so complicated that it was not only limited to number and person but also included gender and even tense agreements between the subject and the verb of different kinds. The modern Indo-Aryan languages have more or less simplified the subject-verb agreement system and they are still applying this system in a much lesser extent, not laying a heavy emphasis on gender and number matching. The research will critically examine and present parallelisms between the instances of Sanskrit subject-verb agreement and the same in the modern languages, especially the morphological simplifications, if any, that have occurred. The verb conjugation systems of Classical Sanskrit and modern Indo-Aryan languages will be analyzed to see where the development line of verb paradigms lies..

**Semantic Analysis**

The semantic analysis seeks to follow the path of the philosophical and religious terms from their roots in Sanskrit to their modern meanings in the Indo-Aryan languages. The main terms have been prevailing and teaching the philosophical Indian tradition throughout times like dharma, karma, and moksha and have kept their existence in both spoken and written forms.

1. Lexical Semantic Analysis: The analysis will be made on the basis of words used most often such as dharma (righteousness, cosmic law), karma (action, consequence), and moksha (liberation, spiritual release). The study begins by discerning the usage of these terms in their Vedic, Upanishadic, and classical contexts. Lexical field analysis will be the tool to trace the range of meanings that these terms held in ancient Sanskrit and how they have altered in the modern setting. The modern-day languages might apply the meanings of these terms not only in religious or philosophical contexts but in everyday or secular understandings as well.
2. Contextual Semantic Shifts: The research will be based upon historical texts such as the Mahabharata and the Upanishads, and modern-day situations such as the Hindi media, literature, and public lectures, to analyze the variations in the meanings of these key terms along with the context. As an illustration, take the word karma that in the past was regularly applied in Sanskrit to mean actions that were dictated by the cosmic laws, but now the saying 'what goes around comes around' is a closer definition or connotation to the word 'karma' especially in the spoken Hindi or Bengali languages. The research will further look into the overlap of the meanings and uses of these terms via different modes of communication, while also recording their changes in cultural value. Such a practical approach will reveal the different shifts in the usage of these terms in varying society and culture contexts.
3. Semantic Field Analysis: The changes in meanings of the philosophical terms will be traced via the mapping of semantic fields in both the modern Indo-Aryan and Sanskrit languages. Human reasoning and linguistics will be the tools for that research process. The fields will consist of the whole range of meanings and associations of

terms such as karma and dharma in both ancient and contemporary periods. As an illustration, karma in its original sense in Sanskrit was understood as universal causality but it is now frequently linked to individual behavior and personal moral choices in modern contexts. The proposed method will help in the comparison of meanings through both time and linguistic styles.

**Data Analysis and Comparison**

The data analysis will be carried out using a mix of qualitative and quantitative methods. The syntactic analysis will mainly be concerned with the production of syntax trees and the conducting of morphological analysis in order to illustrate the structural transitions from Sanskrit to modern languages. The corpus-based approach will also be implemented to supervise the modern writings of word order, case marking, and verb agreement and to compare them with the instances of classical Sanskrit. In addition to the semantic analysis, the study will focus on the application of contextual analysis and lexical databases to the examination of word usage in various texts. Moreover, it will also consider the number of occurrences of such important words as karma and dharma in modern linguistic corpora in contrast with classical ones, thus giving a quantitative measurement of the temporal change in the frequency and comprehension of these terms..

**Analysis**

Syntactic analysis suggests that free word order was one of the main characteristics of Sanskrit, especially in its Vedic form, and it was mostly due to the language's case marking system. The case system has indeed made the language more complex but at the same time easier to grasp since the inflectional markers indicated to which nouns and verbs the grammatical relations belonged. Tableau phrase "The sage recited the mantra" could be expressed in different ways (e.g., mantra recited the sage or sage mantra recited), but every structure would be semantically the same due to the case markers. On the other hand, modern Indo-Aryan languages such as Hindi and Bengali have been strictly SOV dominated. The case-marking system of Sanskrit enabled the whole range of syntactic structures, while modern languages like Hindi have postpositions which are applied after the noun (for instance, "ko" for the accusative case in Hindi). Hence, the transition marks the reduction in the syntactic complexity and morphological richness of Sanskrit. Besides, the research exposes the obsolescence of the major philosophical concepts of dharma, karma, and moksha, because the meanings have undergone substantial changes. Dharma, which used to mean an unchanging cosmic law or moral order, is very often interpreted as personal duty or righteousness in modern languages. Karma, once connected to actions and their consequences in a cosmic sense only, is now mostly understood as an individual's actions and practical outcomes in daily life. Similarly, moksha, signifying the end of reincarnation is no longer seen as such but rather in a broader, more metaphorical sense, as spiritual liberation or even personal enlightenment.

## DISCUSSION

The results of the study show a quite fast transformation of language character, especially the case of the Indo-Aryan languages. The scenario of the Indo-Aryan languages firmly SOV today reflecting the total linguistic simplifications happening over the years is like a road from Sanskrit where the word order was free. The movement from morphological to syntactic case in the modern languages, at one end, and the worldwide trend of grammar complexity being majorly reduced, at the other end, are among the closely interrelated phenomena. As well as this, the linguistics changes in the meanings of terms such as dharma, karma, and moksha provide proof of the language succumbing to the change in cultural and philosophical contexts. These changes are not only in language but also related to the vast cultural and religious transformations in South Asia. Thus, for example, the individualization of the concepts of karma and dharma is a silent witness to the rise of modernity and generality in ruling India where ancient philosophical thought has been reshaped in accordance with contemporary requirements and values.

## CONCLUSION

The research that is reported in this article has been concerned with the ancient Sanskrit syntax and semantics and their comparison with today's Indo-Aryan languages. The latter gave an important thesis of the evolution of the Indo-Aryan language family. The investigators indicate the transition of syntactic structures from the free word order of Vedic Sanskrit to the fixed SOV order of the modern languages and the change from case-marking to postpositions. On the semantic side, the study reveals how major philosophical concepts such as dharma, karma, and moksha have undergone the same process of shifting from their original meanings to new interpretations in the modern languages. The facts that have been discussed reveal new perspectives on the historical development of the South Asian languages and demonstrate the open partnership between linguistic evolution and the aforementioned and other cultural, philosophical, and social factors. The comparative method enables not only a better understanding of the Indo-Aryan languages but also the insight that human culture influences language change in a similar manner. Future research could focus on the social aspects of language that trigger such changes or even the role that contacts with non-Indo-Aryan languages play in creating the syntax and semantics of the whole South Asian region.

**ABSTRACT**

The work was done to study the effect of plant growth regulators on growth, flowering, yield and cost economics of bitter gourd (*Momordica charantia*l) cv. Anaiyampatti" during the year 2020 – 2021.The observation recordings were maximum vine length and minimum node number of first female flower was noted in NAA @ 200 ppm ($T_4$), maximum fruit length was noted in ethrel @ 500 ppm ($T_{13}$), maximum fruit girth was recorded in CCC @ 400 ppm, maximum number of branches vine$^{-1}$, number of male flowers vine$^{-1}$, and to first male flowering, minimum days to first female flowering, number of female flowers vine$^{-1}$, maximum number of fruit per vine, yield vine$^{-1}$ (kg) and yield per hectare was registered in $T_{12}$.

**Keywords:** Bitter gourd, PGR, NAA, $GA_3$, CCC, Ethrel.

## INTRODUCTION

Globally, vegetables are cultivated in diverse agro-climatic conditions and form a significant part of traditional cuisines [4]. Regular consumption of vegetables has been associated with improved immune function and gastrointestinal health due to their antioxidant and anti-inflammatory properties [21]. Among the cultivated vegetables, Cucurbitaceae family is one of the important vegetable family comprising of more than 1000 species and 20 genera in terms of human nutrition and economic value [5].

Probably native to India, with secondary diversity found in China and Southeast Asia. With almost 23 species in Africa alone, *Momordica charantia* Linn., *Momordica cochinchinesis* Lour., *Momordica balsamina, and Momordica dioica* Roxb. are among the key species that are widely grown in India. In India, bitter gourds are widely grown and eaten as vegetables. Bitter gourds are recognized to be nutritious vegetable because they are high in water (83-92%), protein (1.5-2.0%), carbohydrates (4.0-10.5%), minerals (0.5-1.0%), fiber content (0.8-1.7%), and fat (0.2-1.0%)[1]. The sex expression mechanism in most cucurbitaceous crops with monoecious plants is influenced by genetic, environmental variables [27]. PGR have been shown to boost vegetable productivity significantly. The principle behind sex modification shift in bitter gourd is to shift the flowering sequence and sex ratio. The goal of this study was to deal with the aforementioned issues by spraying PGRs to improve bitter gourd development, flowering, and yield with a high benefit cost ratio.

## MATERIALS AND METHODS

Layout followed was RBD with 13treatmentas well as 3 replications. The seeds used in the trail were collected from Anaiyampatti village located at salem district and sown in pits at the spacing of 1.5 x 1.5 m. Various chemicals used and their concentrations in this study are listed below (Table 1).

## RESULT AND DISSUCION

**Growth Attributes**

Growth was significantly impacted. Among the treatments, highest vine length was recorded in $T_4$ (3.81 m) followed by the treatment $T_3$ (3.69 m). The vine length increased significantly with NAA at 200 ppm and 100 ppm. Several studies have demonstrated that naphthalene acetic acid encourages the growth of whole plants. This is in agreement with the findings of [19], [30],[9], [10],[13],[37],[38]. Maximum number of branches per vine (14.20 no) was recorded in Ethrel @ 250 ppm).It might be the result of antimitotic action [12] and gibberellin antagonist activity [33], which inhibits the vine's apical growth and thus, increases the number of branches. These results are consistent with [2], [18], [13], [24], [35] and [30]. Effect of plant growth regulators on growth, and flowering attributes in bitter gourd (Table 2).

**Flowering attributes**

The treatment $T_{12}$ (Ethrel @ 250 ppm) showed the longest days to produce male flowers in 50.60 days. Number of male flowers was influenced greatly in treatment $T_8$ (357.95), followed by $T_9$ (347.33). The treatment $T_{12}$ (Ethrel @ 250 ppm) showed the earliest days of first female flowering.Similar observation was reported by[13] in ridge gourd, [34] and[6] in bottle gourd. Significantly minimum male to female ratio is recorded in the treatment $T_{12}$ valued 7.68 followed by 8.05 in treatment $T_{11}$.The result obtained are in case accordance with [2] in cucumber. These findings are in conformity with those of [19].These results were also reported by [16], [36], [26]. Female to male flower ratio was observed to be higher in NAA at 200 ppm. It is possible that application of NAA boosts requisite auxin levels in floral primordia, resulting in female flower development. The preceding findings were in close agreement with [22], [19], and [8]. Effect of Plant Growth Regulators on Flowering Attributes in Bitter Gourd (Fig 1).

**Sex ratio and Fruit characters:**

Among all treatments, Ethrel at 250 ppm and 125 ppm was shown to be the most effective in decreasing the sex ratio. Endogenous auxin levels influence sexual differentiation, and the flowering primordial that develops during flowering acts as an anti-gibberellin molecule.The result obtained are in case accordance with earlier workers as [39], [17], [23], [3], [29], [32]. The present research has revealed that different fruit characteristics of bitter gourds, such as length (cm) and girth (cm), differed significantly. All treatments greatly exceeded the control in terms of fruit length (Fig.2).

The highest girth of the fruits was recorded in the treatments $T_{10}$which was found to be on par with $T_9$, followed by $T_1$ which recorded 8.95 cm when compared to the other treatments. Similar findings were reported by with [40], [31], [20], [6], [11], [28], [15], [14], [25] and [7].

**Yield Attributes**

Comparing the yield to the control, all of the plant growth regulator treatments showed a considerable increase.

## CONCLUSION

Results show that application of plant growth regulator Ethrel @ 250 ppm was superior to other treatments in increasing growth and yield characters with high returns which also proves to be cost efficient. Cost economics of bitter gourd under different treatments (Table 3). Effect of plant growth regulators on yield attributes in bitter gourd (Table 4).

### Conflict of Interest

Authors do not have any conflict of interests to declare.

### Ethical Issues

None.

## ABSTRACT

This study evaluates how efficiently Nigerian electricity distribution companies operated from 2017 to 2024 by applying several Data Envelopment Analysis (DEA) models. Using the CCR and BCC frameworks, the research measures both technical and scale efficiency, while the Super-Efficiency DEA model ranks the best-performing companies. The Malmquist Productivity Index (MPI) is used to track changes in productivity over time, and a two-stage DEA approach assesses how external factors—such as regulatory policies and macroeconomic conditions—shape efficiency levels. Results show that Ikeja (IKEDC) and Eko (EKEDC) consistently achieve top efficiency scores, demonstrating strong operational performance. In contrast, Enugu (EEDC) and Jos (JEDC) remain inefficient, revealing deep-rooted operational challenges. Benin (BEDC) and Kaduna (KEDC) display scale-related inefficiencies, indicating that restructuring or resizing could improve their performance. Overall, productivity gains in the sector are primarily driven by technological advancements rather than improvements in efficiency itself. By integrating multiple advanced DEA techniques over a long study period, the research fills a major gap in the literature on Nigeria's distribution sector. The findings provide actionable insights for regulators and industry stakeholders, highlighting the importance of regulatory stability, smart metering expansion, technological upgrades, and targeted investments to ensure improved efficiency and long-term sustainability of the electricity distribution system.

**Keywords:** Data Envelopment Analysis (DEA), Operational Efficiency, Electricity Distribution Companies (DisCos), Malmquist Productivity Index (MPI), Nigerian Power Sector.

# INTRODUCTION

Efficient electricity distribution is essential for the reliability and sustainability of modern power systems. Distribution efficiency reflects how well electricity distribution companies (DisCos) convert inputs—such as network infrastructure, metering systems, and labour—into reliable energy delivery while minimizing technical and commercial losses. In developing economies, these efficiencies are critical because distribution networks often determine overall sector performance [1] ,[2]. Nigeria's distribution segment remains the weakest point in its electricity value chain. Over 40% of total system losses occur at the distribution level[3], driven by ageing infrastructure, insufficient metering, vandalism, energy theft, and weak revenue collection systems. Between 2017 and 2024, Nigeria recorded average technical and commercial losses of approximately 46%, far above the international benchmark of 15% [4]. Revenue collection challenges persist, as only about 70% of billed energy is recovered, undermining the financial viability of DisCos and restricting investments in network upgrades. The widespread use of estimated billing further reduces consumer confidence and contributes to liquidity shortfalls across the market.

Operational inefficiencies are compounded by an unstable regulatory landscape, delays in implementing cost-reflective tariffs, and inconsistencies in policy execution by the Nigerian Electricity Regulatory Commission (NERC). These factors have inhibited long-term planning and contributed to chronic underperformance. As earlier studies on developing countries show, external conditions—including regulatory frameworks, economic constraints, and technological capabilities—significantly shape distribution efficiency[5]. Despite growing interest in Nigeria's power sector, most empirical research has focused on electricity generation rather than distribution [6]. Comprehensive efficiency evaluations using rigorous analytical methods such as Data Envelopment Analysis (DEA) are limited. DEA offers a robust non-parametric framework for comparing firms with multiple inputs and outputs (Charnes, Cooper & Rhodes, 1978), making it particularly suitable for assessing DisCos.

This study addresses these gaps by examining the operational efficiency of Nigerian electricity distribution companies between 2015 and 2025 using CCR and BCC DEA models, Super-Efficiency analysis, and the Malmquist Productivity Index (MPI). By integrating multi-year data with advanced analytical techniques, the research provides evidence-based insights for policymakers, regulators, and investors seeking to strengthen Nigeria's electricity distribution sector.

**Related Work**

Efficiency analysis in the electricity sector has attracted significant global attention, particularly in developing countries where distribution networks often experience chronic operational inefficiencies. Data Envelopment Analysis (DEA), introduced by Charnes, Cooper, and Rhodes in 1978[7], remains one of the most widely used non-parametric techniques for assessing the relative performance of decision-making units (DMUs). Its ability to accommodate multiple inputs and outputs without requiring a predefined functional form makes it especially suitable for evaluating public utilities such as electricity distribution companies. Internationally, several studies have applied DEA to assess electricity distribution performance. In Brazil,[8] examined operational efficiency and found that regulatory environments significantly influence firm behaviour, often determining whether companies maintain or lose their efficiency positions. In India, [9] demonstrated that firms with advanced metering and stronger managerial oversight tend to outperform peers, underscoring the importance of technological investment in reducing losses. Similarly, [10] applied the Malmquist Productivity Index (MPI) in China and showed that productivity gains were mainly driven by technological progress rather than improvements in pure technical efficiency.

Across Africa, the findings of [11]highlight recurring challenges such as electricity theft, poor billing systems, and non-paymentissues that closely mirror the Nigerian context[12]. Their work emphasizes the need for targeted policy reforms and better resource allocation to improve distribution performance.

Within Nigeria, empirical work remains limited. Existing studies have largely focused on electricity generation rather than distribution.

**Our Contributions**

The limited application of DEA in evaluating Nigeria's distribution companies represents a significant gap in the literature. Few studies apply advanced DEA techniques such as super-efficiency analysis or MPI, and even fewer account for contextual variables like regulatory conditions and macroeconomic influences. This gap is particularly important given the central role of distribution companies in the electricity value chain and the persistent inefficiencies that hamper sector reform. This study builds upon the existing literature by providing one of the most comprehensive assessments of Nigerian distribution companies to date. By integrating CCR and BCC DEA models, super-efficiency ranking, and the Malmquist Productivity Index over an extended study period (2017–2024), it contributes new empirical insights into the operational and productivity dynamics of Nigeria's electricity distribution sector. Furthermore, the inclusion of a two-stage DEA approach offers a richer understanding of how external factors shape efficiency, thus advancing current knowledge and informing policy discussions.

# METHODOLOGY

**Explanation of DEA Models (CCR and BCC)**

Data Envelopment Analysis (DEA) is a popular method for determining how well various decision-making units (DMUs) function through comparing the variables they generate. In the case of Nigeria's energy distribution businesses, DEA allows us to assess how efficiently each company allocates its resources to customer services. The two most prevalent DEA models are the CCR (Charnes, Cooper, and Rhodes) and the BCC (Banker, Charnes, and Cooper) models, which differ primarily in how they handle assumptions about returns to scale.

**CCR Model (Constant Returns to Scale)**

The CCR model implies that all DMUs operate with constant returns to scale. This indicates that if you increase the inputs by a given proportion, the outputs will also grow by that proportion. Simply put, a company's efficiency is the same regardless of how large or small its operations are. When the size of a DMU has no impact on its efficiency, the CCR model is adequate. If a distribution firm doubles its inputs, such as employing more employees or expanding its facilities, the CCR model predicts that its outputs, such as energy delivered or revenue collected, will likewise double. In this model, efficiency is established through juxtaposing weighted outputs and inputs. When compared to other companies, a score of 1 (or 100%) indicates that it is entirely efficient.

To put it simply, the CCR model determines efficiency by solving the following linear programming problem:

Max: $\frac{\sum_{r=1}^{s} u_r y_{rj}}{\sum_{i=1}^{m} v_i x_{ij}}$

Subject to,

$\frac{\sum_{r=1}^{s} u_r y_{rj}}{\sum_{i=1}^{m} v_i x_{ij}} \leq 1 \quad \forall j = 1,2,\dots, u_r \geq 0 \quad \forall r \quad \text{and} \quad v_i \geq 0 \quad \forall i$

Where:

- $y_{rj}$ represents the r-th output for DMU j
- $x_{ij}$ represents the i-th input for DMU j
- $u_r$ and $v_i$ are the weights assigned to the outputs and inputs, respectively.

**BCC Model (Variable Returns to Scale)**

The BCC model is based on the premise of variable returns to scale (VRS), which means that a firm's efficiency can differ according to its size. This model allows for the possibility that smaller or larger companies may be more or less efficient. The flexibility provided means that returns to scale can increase or decrease.For example, a tiny distribution company may manage its operations better and more efficiently due to closer location management, or a big firm may take advantage of its size and operate on a more advantageous basis.Whereas the mathematical structure is similar, the BCC model incorporates a convexity requirement that allows it to demonstrate varied returns to scale.
In mathematical terms, the BCC model is represented as follows:

Maximize: $\frac{\sum_{r=1}^{s} u_r y_{rj} + u_0}{\sum_{i=1}^{m} v_i x_{ij}}$

Subject to:
$\frac{\sum_{r=1}^{s} u_r y_{rj} + u_0}{\sum_{i=1}^{m} v_i x_{ij}} \leq 1 \quad \forall j = 1,2,\ldots,n u_r \geq 0 \quad \forall r \quad \text{and} \quad v_i \geq 0 \quad \forall i$

Here in this case,$u_0$is a free variable that helps adapt for operation size, allowing the model to account for varying returns to scale.

**Description of the Data Collected**

The present research is based on variable data from Nigerian power distribution companies for the years 2017 to 2024. The information is based on regulatory filings, corporate financial reports, and performance metrics issued by the Nigerian Electricity Regulatory Commission (NERC). The DEA models have the following variables:

**Input Variables:**

1. **Total number of customers**:
    - Measured as the total number of electricity consumers served by the company.
    - Source: NERC reports.
2. **Number of metered customers**:
    - Represents the number of consumers with functional electricity meters, used to improve billing accuracy.
    - Source: NERC reports.
3. **Number of estimated customers**:
    - The number of consumers billed based on estimated consumption rather than actual metered data.
    - Source: NERC reports.
4. **Tariffs (Naira/kWh)**:
    - Average electricity tariff per kilowatt-hour (kWh), representing the price charged to consumers.
    - Source: Company financial statements.

**Output Variables:**

1. **Revenue collected (Naira)**:
    - The total revenue generated by the company from electricity sales.
    - Source: Company financial statements.
2. **Energy billed (MWh)**:
    - The total amount of energy billed to customers.

Source: NERC reports.

This was a prolonged period of organizational and financial instability that had a significant impact on Nigeria's energy distribution business. Weak network performance, old infrastructure, and inadequate revenue collection kept the companies running inefficiently, resulting in increased energy losses and lower service quality. Because these

issues are so deeply ingrained, there is an urgent need for rigorous investigations to determine how the mechanism keeps performing and whether any efficiency benefits have happened over time.

**Data Analysis**

It is pertinent to organize the results in a structured way to present the results of the efficiency evaluation of Nigerian electricity distribution companies using DEA models. This entails presenting efficiency scores obtained from both CCR (Constant Returns to Scale) and BCC (Variable Returns to Scale) models so that they can be compared. We will summarize the efficiency scores, pinpoint important discoveries and trends, and compare outputs from these two models.

**Efficiency Scores: Presentation in Tables**

The various companies found from 2015 to 2022 can have their results of the DEA analysis shown in table format, just like the scores derived from both CCR and BCC models. The efficiency score of each company measures how well they use their inputs to generate outputs compared to other distribution companies within the same range of services they offer.

Table 1 presents values that were estimated using Data Envelopment Analysis (DEA) based on both the Constant Returns to Scale (CCR) and the Variable Returns to Scale (BCC) models. The latter performed a MATLAB-based efficiency analysis where linear programming problems were solved to compute efficiency scores for each distribution company. Both CCR, constant returns to scale, and BCC, variable returns to scale, models were analyzed in the software programming environment of MATLAB to provide precise efficiency estimations. Moreover, productivity changes over a given period were also established within MATLAB by using super-efficiency DEA and Malmquist Productivity Index MPI methodologies.

As seen in Fig. 1, a bar graph depicting the efficiency scores of the CCR (Constant Returns to Scale) for the year 2024 was produced using MATLAB. MATLAB was also selected because of its wider options for handling large volumes of data and presenting it in bespoke graphs. This bar graph represents distribution companies' efficiency, allowing performance evaluation across the companies within one year. The figure was enhanced with suitable colors, labels on the axes, and gridlines to improve visibility. The bars were created using the bar () function on MATLAB. The image was also saved in high-quality PNG and EPS formats to retain sharpness for presentation and publication.

The efficiency ratings shown in Table 2 are based on the BCC (Variable Returns to Scale) DEA model. The analysis was carried out using MATLAB, which allowed for the evaluation of efficiency scores through the construction of linear programming models relevant to the BCC paradigm. This software enabled accurate estimates by considering the various operating scales of different companies, thereby allowing firms not optimally scaled to still score high on efficiency. The software's adaptability to include customized functions for the DEA training made it possible to monitor changes in efficiency during the period under study (2015–2025).

To depict the BCC (Variable Returns to Scale) efficiency scores of Nigerian electricity distribution companies for the year 2024, the bar chart drawn in Figure 3 has been utilized. The figures shown in the graph were calculated using the Data Envelopment Analysis (DEA) technique, which is the BCC model used to measure the efficiency of every distribution company by comparing its inputs and outputs. MATLAB was also used in this analysis as it incorporated the necessary computational operations for the DEA and produced relevant graphical illustrations. This software also ensured that the efficiency scores were represented effectively, making it possible to show the efficiency of the different distribution companies in Nigeria relatively. A heat map was generated to depict the efficiency score of the Nigerian electricity distribution companies from 2017 to 2024 using BCC (Variable Returns to Scale) – an intensive fractional index descriptive statistic- as shown in Figure 4. The values incorporated in this heat map were derived using Data Envelopment Analysis (DEA), which specifically employed the BCC model to compute the various efficiency scores of each distribution company using its inputs and outputs. The analysis was conducted

using MATLAB, which has capabilities that include computing efficiency scores and presenting these scores in heat map form. This software could show the variations of efficiency over time very well, which was important as it made it easy to observe the distribution companies' performance over the years and how it changed from one distribution company to another within the given years.

**Comparative Analysis of Efficiency Scores: Insights from CCR and BCC Models**

Key findings and trends that arise from CCR and BCC models can be summarized as follows, according to the tables indicated above:

**Consistently Efficient DMUs**

From 2017 to 2024, Eko (EKEDC) and Ikeja (IKEDC) have remained consistently effective in the two models of CCR and BCC, each time scoring an efficiency score of 1 (100%). This indicates that these firms work at maximum efficiency in terms of constant and variable returns to scale, thus utilizing all their available resources to produce outputs. The BCC model in Port Harcourt Electricity Distribution Company (PHED) has been working more efficiently for many years. Yet, it has experienced less effectiveness with the CCR model, which has shown that there was a possibility of some scale inefficiency from 2017.

**Improvements Over Time**

Yola (YEDC) saw improvements in both models, especially in 2023 and 2024, when efficiency scores in the BCC model grew from 0.764 in 2017 to 0.810 in 2024. Hence, it can be concluded that Yola has implemented various operational changes that reflect the size of her operations. This can be seen in Kaduna, where both models are notably enhanced, with KEDC's CCR values increasing from 0.859 in 2015 to 1.000 in 2024.

**Declines in Efficiency**

EEDC, located in Enugu, exhibits a marked decline in efficiency in its two models, notably in the CCR model, where its efficiency plunges from 0.988 in 2017 to 0.539 in 2024. This trend may portray some operational difficulties or possible scaling problems over time. The inefficiency scores of Jos (JEDC) have been declining, especially in the CCR model, which goes down from 0.930 in 2017 to 0.708 in 2024, indicating potential improper exploitation of its, i.e., Resource usage.

**Implications of Efficiency Findings for Nigerian Electricity Distribution**

The efficiency scores obtained from the BCC model generally tend to be higher than those obtained from the CCR model. This is due to the variable returns to scale estimator in the BCC model; hence, companies that are not necessarily operating at their optimal scale can still obtain high-efficiency rates. For example, BEDC (Benin) scores significantly above average in BCC compared to CCR in most years. It means that some firms may not be producing efficiently. For example, Abuja Electricity Distribution Company and Jos Electricity Distribution Company depict this scenario as they perform efficiently in variable returns to scale contexts but not in constant returns to scale contexts.

**Comparative Analysis: CCR vs BCC Models**

Both CCR and BCC models offer different views on the effectiveness of the electricity distribution companies in Nigeria. The CCR model assumes constant returns to scale, meaning that all the firms must have similar conditions of scale at which they operate. It is stricter in that it assumes any deviation from efficiency is due to operational inefficiency rather than differences in scale. The results from the CCR model show that Ikeja, including IKEDC, and Eko, including EKEDC, are highly efficient, maintaining this status for all years. In contrast, others, like Enugu, including EEDC, have consistently performed poorly, particularly in the latter years. The BCC Model permits variable returns to scale, considering the disparities in the size of operations across firms. In this way, under this model, some companies (e.g., Benin (BEDC)) are seen as more efficient than they are according to the CCR model, which implies that their inefficiency could be attributed to non-optimal scale rather than poor operation. The BCC model gives a more lenient measure of efficiency for firms that might fall short of or exceed an ideal size.

**Implications of Efficiency Findings for Nigerian Electricity Distribution**

The findings on the efficiency of Nigerian power distribution companies provide an understanding of their operations' performance. Efficiency trends in scores over a period of time are presented in Figures 7 and 8, which show how the companies have performed under the two models, the CCR model and the BCC model. The efficiency scores of some distribution firms, shown in Figure 6, varied from year to year. In particular, the firms Ikeja (IKEDC) and Eko (EKEDC) showed a trend of achieving high-efficiency scores, implying that they have good practices for managing resources and operations. However, firms like Enugu (EEDC) and Jos (JEDC) have declined in terms of efficiency, with the case worsening after 2020, pointing to continued challenges in the day-to-day running of the businesses.

Figure 7 displays the efficiency scores of the two models (i.e. BCC and CCR) and presents the performance evaluation capabilities of each model. It can be seen in the CCR analysis that there are some firms that operate at an optimal level, while at the same time, in the BCC analysis, there are other firms that appear to scale inefficiently. There are instances where firms such as Kaduna (KEDC) present both model estimates, which shows that they are not working efficiently owing to the different zones in which they could be operating. The data presented in the graphs highlights the importance of bringing in specific measures to increase the operating efficiency of certain inefficient enterprises. Policymakers and players in the industry can engage in strategic enhancements, correspondingly improving the optimal use of resources, improving existing systems, and embracing new technologies that can greatly improve the functionality of the distribution sector. The charts depict the changes in the progress rate of each DMU from 2017 to 2024, making it easy to see either improvement or decline.

Although the CCR and BCC models differ, they imply that some firms are operationally efficient yet not operating at optimal scale. For instance, Enugu Electricity Distribution Company (EEDC) might need to rethink its resource allocation or scale of operations for better performance. Ikeja (IKEDC) and Eko (EKEDC) are known to maintain steady high performances, which indicates that other firms can learn from them. Therefore, regulatory authorities should encourage companies that are efficient in variable returns with low productivity to adjust their outputs and experiment with them. Some companies that have recorded significant progress, such as Kaduna (KEDC), can observe the effectiveness of targeted interventions. Investments in physical facilities, better management strategies, or regulatory reforms may be the main engines for enhancing efficiency in this sector. The presentation of DEA results in tables and graphs provides a reasonable basis for detailed comparisons of the efficiency of Nigerian electricity distribution firms. The main findings showed variations in operational and scale efficiencies, whereby a finer presented way was delineated by using the BCC model for companies that operated below optimal scales. The implications of these results can guide policy and management strategies aiming at improving general efficiency in the sector.

## RESULT AND DISCUSSION

The study evaluates the operational efficiency of Nigerian electricity distribution companies from 2017 to 2024 using DEA models. The CCR and BCC efficiency scores reveal how effectively each company converts inputs into outputs over time. The results highlight clear performance differences across firms and point to structural, managerial, and scale-related challenges within the sector.

**Interpretation of Efficiency Scores**

Under the CCR model, Ikeja (IKEDC) and Eko (EKEDC) consistently achieve an efficiency score of 1, placing them on the efficiency frontier and indicating optimal use of resources. These companies set the benchmark for operational best practices. Conversely, Enugu (EEDC) and Jos (JEDC) show persistent declines in efficiency, especially after 2019, suggesting deep-seated operational, managerial, or infrastructural deficiencies.

The BCC model results show that some firms—such as Benin (BEDC) and Kaduna (KEDC)—perform better under variable returns to scale than in the CCR model. This indicates that their inefficiencies are largely scale-related rather than purely operational. Adjusting operational size or restructuring may therefore improve their efficiency.

The consistently strong performance of IKEDC and EKEDC across both DEA models aligns with international studies that link high efficiency to better infrastructure, effective management, and supportive regulatory environments (de Souza et al., 2014; Kumar & Garg, 2018). The results also reinforce earlier findings about the prevalence of inefficiencies in Nigeria's electricity sector due to infrastructure deficits and inconsistent regulation.

**Practical Implications**

The findings have important implications for policymakers and industry regulators:

I. **Targeted Interventions:** Underperforming companies such as EEDC and JEDC need focused reforms, including metering expansion, network upgrades, and improved management practices. Benchmarking against high-performing firms like IKEDC would help identify actionable improvement paths.

II. **Scale Adjustments:** The mismatch between CCR and BCC results indicates that several firms may be operating at inefficient scales. Mergers, regional consolidation, or redefined service territories could help optimize size and enhance performance.

III. **Regulatory Reforms:** Tariff inconsistencies and unstable regulatory frameworks contribute significantly to inefficiencies. Implementing cost-reflective tariffs and ensuring regulatory uniformity across regions would improve financial stability and encourage investment in infrastructure.

IV. **Technological Upgrades:** High-performing firms have benefited from strong investments in metering and distribution infrastructure. Wider adoption of smart-grid technologiessuch as automated monitoring and fault detection—could significantly reduce technical losses and enhance service reliability across all DisCos.

V. **Sector-Wide Improvement Measures**: Continuous monitoring using DEA, regular publication of performance reports, and industry-wide knowledge-sharing platforms can support transparency and promote best practices. Improved resource utilization, advanced metering, and stronger grid maintenance systems would help low-performing companies close the efficiency gap.

The DEA results reveal substantial variations in efficiency among Nigerian electricity distribution companies, with some firms operating consistently at optimal levels and others hindered by operational inefficiencies or suboptimal scale. The study underscores the need for targeted reforms, technological modernization, and regulatory stability to enhance sector-wide performance. Implementing the findings could significantly strengthen Nigeria's electricity distribution system, support economic development, and improve long-term sector sustainability.

## CONCLUSION

The research in question assesses the performances of Nigerian electricity distribution companies for the years 2017 to 2024. It does use both the CCR and BCC DEA models. There are variations in efficiency measurements among the firms evaluated, with firms such as Ikeja (IKEDC) and Eko (EKEDC) performing optimally. At the same time, other firms such as Enugu (EEDC) and Jos (JEDC) are increasingly becoming less efficient. This analysis shows that firms like Benin (BEDC) and Kaduna (KEDC) are making losses due to large operation scales. Hence, they need to scale down their operations. This implies that efficiencies may be gained from mergers or other forms of localized engagements. Finally, the Nigerian Electricity Regulatory Commission (NERC) authorities and regulators should also consider investing in scale efficiency policies and encourage investors into scale economies. These measures are essential for the enhancement of business coordination as well as for ensuring the viability of the electric power distribution business in Nigeria.

**ABSTRACT**

This paper introduces a cryptographic algorithm based on the Lenakel sequence, a generalized linear recurrence relation. By generating key matrices from sequence terms, the method extends the Hill cipher into a flexible number-theoretic framework. Stepwise examples are presented for the messages ATTACK AT SUNRISE and SEND BACKUP AT DAWN, illustrating encryption and decryption. The results demonstrate the viability of the Lenakel sequence as a tool for cryptography while highlighting the importance of invertibility conditions on the key matrix.

**Keywords:** Lenakel sequence, Cryptography, Encryption, Decryption, Number theory, Diophantine equations, Pell equation

## INTRODUCTION

Modern cryptography often exploits algebraic structures such as groups, fields, and integer sequences. Classical examples include the Fibonacci sequence[1] and solutions to Pell's equations[2], both of which have been used in generating cryptographic keys. Hill introduced the Hill cipher[3], which relies on linear algebra over modular arithmetic. This paper explores the Lenakel sequence, defined by a recurrence relation with adjustable parameters, as a source of encryption–decryption keys. The advantage of this approach lies in its mathematical flexibility and its

potential to generate strong, secure keys. Different choices of $(\alpha, \beta, b)$ generate distinct key matrices, leading to a large family of cryptographic systems.

## MATERIALS AND METHODS

The Lenakel sequence is defined as $L_{n+2} = \propto L_{n+1} - \beta L_n \ , L_0 = 0, L_1 = b \neq 0,$ where $\alpha, \beta > 0$.

**Step 1: Constructing the Key Matrix**

From the first four terms ($L_1$, $L_2$, $L_3$, $L_4$), a 2 × 2 key matrix is formed, as in the Hill cipher[3]

$K = \begin{bmatrix} L_1 & L_2 \\ L_3 & L_4 \end{bmatrix} (\text{mod } 26)$ (Eq. 1)

The determinant is:

$\det(K) = L_1 L_4 - L_2 L_3$ (Eq. 2)

This must satisfy:

$\gcd(\det(K), 26) = 1$ (Eq. 3) to guarantee invertibility of the key matrix[4]

**Step 2: Converting Plaintext into Numbers**

- Each letter is assigned a number: A = 0, B = 1, …, Z = 25[5]. Spaces are removed.
- If the plaintext has an odd length, it is padded with A (= 0).
- The sequence is then grouped into blocks of size 2 to match the key matrix dimension.

**Step 3: Encryption Process**

For each block $m = \begin{bmatrix} m_1 \\ m_2 \end{bmatrix}$ :

$C \equiv K \cdot m \ (\text{mod } 26)$ (Eq. 4) where C is the ciphertext block[1].

**Step 4: Decryption Process**

To decrypt, the inverse of the key matrix is required. The adjoint of K is:

$\text{adj}(K) = \begin{bmatrix} L_4 & -L_2 \\ -L_3 & L_1 \end{bmatrix}$ (Eq. 5)

The modular inverse of det(K) (mod 26) is computed, say $(\det(K))^{-1}$. Then:

$K^{-1} \equiv (\det(K))^{-1} \cdot \text{adj}(K) \ (\text{mod } 26)$ (Eq. 6)

**Example 1: "ATTACK AT SUNRISE"**

Parameters: a = 11, b = 5, c = 3.

The key matrix is:

$K = \begin{bmatrix} 3 & 7 \\ 10 & 23 \end{bmatrix}$, $\det(K) = 25 \equiv -1 \ (\text{mod } 26)$ (Eq. 7)

Thus,

$K^{-1} \equiv K \ (\text{mod } 26)$ (Eq. 8)

**Encryption of plaintext "ATTACK AT SUNRISE" (Table 1).**
**Ciphertext obtained:** DVFIYQDVMQCBUAMO

**Decryption of ciphertext "DVFIYQDVMQCBUAMO" (Table 2).**
**Recovered plaintext:** ATTACKATSUNRISEA (the trailing A is padding).

**Example 2: "SEND BACKUP AT DAWN"**

Parameters: a = 5, b = 3, c = 5.

Since gcd(15, 26) = 1, the key matrix K is invertible according to modular arithmetic principles[1,5].

**Encryption of plaintext "SEND BACKUP AT DAWN" (Table 3).**
**Ciphertext obtained:** IGKV FGAEHRHD PSTP

**Decryption of ciphertext "IGKVFGAEHRHDPSTP" (Table 4).**
**Recovered plaintext:** SEND BACKUP AT DAWN

## CONCLUSION

This paper demonstrates a Lenakel sequence–based encryption scheme. The approach generalizes Hill cipher key construction[3]by linking it to a flexible recurrence relation. Worked examples show that encryption and decryption are consistent whenever det(K) is coprime with 26,consistent with number theory principles[1,4,5]. Future work may extend the method to higher-order Lenakel sequences to generate 3 × 3 or larger key matrices, thereby increasing cryptographic strength.

**ABSTRACT**

Emotional intelligence plays an important role in a student's learning and academic development. It affects how students manage their emotions, handle stress, and interact with others. Students with higher emotional intelligence often perform better in their studies, while those with lower emotional skills may struggle to stay focused and motivated. The main aim of this study is to examine the relationship between emotional intelligence and academic performance using machine learning techniques. Data from students were collected and analysed to understand how emotional factors influence academic success. Machine learning models will be applied to identify patterns and predict performance based on emotional intelligence levels. The results of this study show that students with higher emotional intelligence tend to achieve better academic results. The findings help educators and institutions design effective strategies that promote both emotional growth and academic improvement. This research provides useful insights for improving teaching and learning practices in higher education.

**Keywords:** Emotional Intelligence, Academic Performance, Machine Learning, Random Forest, Schutte Self-Report Emotional Intelligence Test (SSEIT)

## INTRODUCTION

Education plays an important role in shaping a student's future. In recent years, researchers have shown great interest in studying the factors that influence students' academic performance. Emotional intelligence is one such factor that has gained much attention. It refers to a person's ability to understand, express, and manage emotions in

daily life [1]. Students with good emotional intelligence are often better at handling stress. They stay calm in difficult situations and maintain a positive attitude towards learning. They are also more confident and motivated to complete their tasks. Students with low emotional intelligence may find it hard to focus, manage pressure, or work well with others. These challenges can affect their academic performance [2]. In today's learning environment, success is not decided by intelligence alone. Emotional control and social skills also play an important part. A student who can manage emotions effectively is more likely to build good relationships and perform better in studies. Several studies have already shown a relationship between emotional intelligence and academic performance [3]. However, most of these studies used traditional methods. There is still a need to explore this relationship using modern data analysis tools. Machine learning provides a new way to study these factors. It can find hidden patterns in data and show how emotional intelligence affects learning outcomes. The main goal of this research is to investigate the relationship between emotional intelligence and academic success through the use of machine learning methods. The findings can help educators and institutions create effective strategies that promote both emotional well-being and academic achievement.

## LITERATURE REVIEW

Existing research has examined the relationship between emotional intelligence (EI) and academic performance. Gómez and Serrano explained that EI supports sustainable learning by helping students stay engaged and manage their emotions effectively [4]. Shrestha *et al*. found that medical students with higher emotional intelligence achieved better results and showed improved learning attitudes [5]. Zhang *et al*. discussed how EI contributes not only to academic success but also to emotional well-being. Their findings showed that emotionally aware students perform better in studies and maintain a positive mindset [6]. Ali and Morgan also reported a positive link between EI and academic grades among undergraduate students [7]. Khan *et al*. observed a similar trend among medical students, noting that emotionally balanced learners handled stress more efficiently [8]. Saleem *et al*. pointed out that motivation and emotional control are key elements that help students perform well at university [9]. Martinez and Lopez examined the role of test anxiety and found that EI helps reduce stress and improves concentration during examinations [10]. Shrestha explored EI in higher education and highlighted its importance for sustainable learning outcomes [11]. Rodríguez and Fernández added that teacher–student relationships and emotional understanding enhance both EI and academic growth [12]. Finally, Rahman and Gupta conducted a cross-cultural review and confirmed that the positive effect of EI on academic performance is consistent across various learning settings [13]. Existing studies show that emotional intelligence strongly affects students' academic performance. Many of these studies rely on descriptive or theoretical approaches rather than analytical methods. There is still a need for data-based approaches to understand this connection more clearly. This study uses machine learning to explore how emotional intelligence influences academic outcomes.

## METHODOLOGY

The research was carried out in two main stages, as shown in Figure 1. The first stage focused on calculating students' Emotional Intelligence (EI) scores and collecting their Academic Performance (AP) data. The EI scores were obtained using the standardised Schutte Self-Report Emotional Intelligence Test (SSEIT), which has been widely applied in recent educational research to assess emotional ability among learners [14]. The academic data was collected from the students' semester marks. This stage helped in understanding each student's emotional ability and academic achievement. In the second stage, a Random Forest machine-learning model was developed to classify and analyse the relationship between Emotional Intelligence and Academic Performance. The collected EI and AP data were used to train the model. Similar approaches have been used effectively in recent studies to predict and analyse student performance through machine-learning techniques [15][16]. The aim was to identify how different levels of Emotional Intelligence influence students' academic outcomes. The model also helped in predicting performance patterns based on emotional traits. This two-stage design provided both descriptive and analytical insights, offering a deeper understanding of how Emotional Intelligence contributes to academic success. The integration of

standardised EI assessment with data-driven modelling ensures that the analysis remains both scientifically valid and practically relevant.

**Participants and Data Source**

The main focus of this study is to understand the impact of emotional intelligence on students' academic performance. The participants were second-year postgraduate students from our institution. They were selected because they have prior academic experience and show consistent emotional and learning patterns. Each student participated in the Schutte Self-Report Emotional Intelligence Test (SSEIT) to measure their emotional intelligence. The scores from the test were recorded for further analysis. Their semester examination marks were collected to represent academic performance. The emotional intelligence scores and academic marks were organised into a single dataset. This dataset was used to explore the influence of emotional intelligence on academic achievement using machine learning methods.

**Schutte Self-Report Emotional Intelligence Test (SSEIT)**

The Schutte Self-Report Emotional Intelligence Test (SSEIT) was used to measure the emotional intelligence of students. It is a well-known and reliable tool for assessing emotional skills. The test includes 33 statements that reflect different areas of emotional intelligence such as emotion perception, regulation, and use [17]. Students rated each statement on a five-point scale ranging from strongly disagree to strongly agree. The total score represents the overall emotional intelligence level of each student. Higher scores show better emotional awareness, understanding, and control [18]. This test was selected because it is simple, quick to use, and widely accepted in educational research. It provides a clear and structured way to measure emotional intelligence, making it suitable for studies involving large groups of students.

**Machine Learning Technique: Random Forest**

In this study, the Random Forest algorithm was used to analyse the relationship between emotional intelligence and academic performance [19]. Random Forest is a popular supervised learning technique that works by combining multiple decision trees to improve accuracy and reduce overfitting. It performs well with complex and non-linear data, making it suitable for educational datasets where emotional and academic factors interact in many ways. Each tree in the forest makes a prediction, and the final output is decided by majority voting. This approach ensures stable and reliable results even when the dataset contains noise or variations. Random Forest was chosen because it provides good prediction performance and clear insights into the importance of different features. It helps to identify which emotional intelligence factors have the strongest influence on academic outcomes.

**RF Machine Learning Model**

The development of the machine learning model followed the standard machine learning life cycle. The main stages included data preprocessing, model training, testing, evaluation, and prediction. The steps followed in this process are shown in Figure 3. Steps involved in Random Forest (RF) model training and evaluation (Figure 2). The first step in the life cycle was data preprocessing. This step ensured that the dataset was clean and ready for analysis. Missing values were handled categorical data were converted into numerical form. This process helped the model perform more efficiently and accurately. After preprocessing, the dataset was divided into training and testing sets. The training data were used to build the Random Forest model, while the testing data were used to check its performance. This approach helps in assessing how well the model can generalise to unseen data [20]. The Random Forest algorithm works by creating multiple decision trees using random subsets of data and features. Each tree makes a prediction, and the final output is based on majority voting. During model training, parameters such as the number of trees and maximum depth were tuned to improve accuracy. This process improves accuracy and reduces the chance of overfitting [21]. Once the model was trained, it was tested using the testing data to check its predictive ability. The model evaluation was then carried out using performance metrics such as accuracy, precision, recall, and F1-score. These measures helped to assess how well the model predicted academic performance categories. Finally, the model was used to predict academic performance levels based on emotional intelligence scores.

## RESULTS AND DISCUSSION

This section presents the results of the study, which aimed to understand how students' emotional intelligence influences their academic performance. The analysis was performed using data collected through the Schutte Self-Report Emotional Intelligence Test (SSEIT) and students' semester examination marks, as shown in figure3. The dataset was processed and analysed using the Random Forest model. The trained model generated results that helped to identify patterns between emotional intelligence and academic achievement. The following parts explain each stage of the process, including data preprocessing, model training, and performance evaluation, showing how the model established the relationship between emotional intelligence and academic outcomes.

**Data Preprocessing Results**

The dataset was carefully checked and cleaned before model training. This process ensured that the data used for analysis was accurate, consistent, and ready for machine learning. The main steps included handling missing values, normalising the data, and preparing it for model building and evaluation.

**Handling Missing Values**

The dataset contained missing values in several SSEIT items and the 'Total' column. These gaps were handled carefully to maintain data quality. Records with missing 'Total' values were removed since this column represented the students' overall academic performance. After cleaning, 11 rows were removed, leaving 109 valid records for analysis. Removing these few records did not affect the overall results or model performance, as the remaining data was sufficient and well-balanced.

The performance level distribution after preprocessing showed that:

**Average:** 54 students

**Low:** 45 students

**High:** 10 students

This distribution ensured that the dataset was suitable for training the model across different performance levels.

**Data Normalisation**

Data normalisation was an important step in preparing the dataset for model training. It ensured that all feature values were on a similar scale, which improved model performance. The Min–Max normalisation technique was applied to convert each numerical value into a range between 0 and 1. This process reduced the effect of large numerical differences among variables. By bringing all features to a common scale, the Random Forest model could identify patterns more effectively. Normalisation also improved the model's stability and speed, ensuring that every feature contributed equally during learning.

**Model Building and Evaluation**

The Random Forest model was developed to classify students' academic performance as Low, Average, or High based on their emotional intelligence scores. The pre-processed data were divided into training and testing sets in an 80:20 ratio, ensuring fair evaluation. The model was trained on the training data and then tested to measure its accuracy on unseen samples. Figure 4 shows the overall model evaluation results. The Random Forest model achieved an accuracy of 54.55% on the test data. The classification report shows a precision of 0.56 and recall of 0.82 for the Average group, indicating that most students in this category were correctly identified. The Low group had moderate results with precision 0.50 and recall 0.33. The High group scored 0.00 for both precision and recall, showing difficulty in correctly identifying high-performing students. This performance gap was mainly due to the smaller number of students in that group. The confusion matrix in figure 5 clearly shows that most predictions were accurate for the Average group, while a few samples were misclassified between Low and Average categories. This reflects that the model performs reasonably but can improve further with balanced data and additional features. The feature importance graph in Figure 6 highlights the ten most influential emotional intelligence factors. Among them, SSEIT_Total, SSEIT_Item_19, and SSEIT_Item_31 were the most important features contributing to the classification.

This indicates that these components of emotional intelligence have a strong impact on academic performance. The scatter plot in Figure 7 shows the relationship between emotional intelligence and academic performance. Students with higher emotional intelligence scores generally achieved better marks. The pattern confirms a positive correlation between emotional intelligence and academic success.

## CONCLUSION

This study analysed the impact of emotional intelligence on students' academic performance using a Random Forest model. The model achieved an accuracy of 54.55%, showing that emotional intelligence helps predict academic outcomes. Key features such as SSEIT_Total, SSEIT_Item_19, and SSEIT_Item_31 had a strong influence on performance levels. The results showed that students with higher emotional intelligence generally perform better in their studies. Although the model's accuracy was moderate, it highlights the potential of machine learning in understanding the role of emotional intelligence in learning. In the future, this research can improve model accuracy by using advanced machine learning techniques and more detailed emotional intelligence features.

## ACKNOWLEDGEMENT

I sincerely thank St. Joseph's College for supporting this study through the Research Grant (2024–2026) under the Institutional Seed Money for Research Scheme. This assistance was instrumental in enabling this work.

**ABSTRACT**

In this paper, we introduce the concept of a multiplier on a BH-algebra and obtain some properties of multipliers of BH-algebras.

**Keywords:** BH-algebras, multiplier, commutative, positive implicative.
**Subject Classification**: AMS (2000), 06F35, 03G25, 06D99, 03B47

## INTRODUCTION

BCK and BCI-algebras, two classes of algebras of logic, were introduced by Imai and Iseki [1], Iseki [2] and Iseki and Tanaka [3] and have been extensively studied by various other researchers [4, 5]. It is known that the class of BCK-algebras is a proper subclass of the class of BCI -algebras. The notion of d-algebras, another generalization of the notion of BCK-algebras, was introduced by Neggers and Kim [4]. Toumi, M.A. and N. Toumi [5] introduced Structure theorem for d-algebras. Y. B. Jun, E. H. Roh and H. S. Kim[7] are introduced On BH-algebras, Allen, P.J.,[6] introduced Construction of many d-algebras Larsen, B[8] introduced An introduction to the theory of multipliers. In this paper we introduce the concept of a multiplier on a d-algebra and obtain some properties of multipliers of BH-algebras.

## PRELIMINARIES

In this section we describe some definitions and notions that will be used in the sequel.

**Definition 2.1:** [1,2,3]

Let X be a set with binary operation $*$ and a constant 0. Then (X, $*$, 0) is called a BCK-algebra if it satisfies the following axioms:

1. $((x*y)*(x*z))*(z*y) = 0$
2. $(x*(x*y))*y = 0$
3. $x*x = 0$
4. $0*x = 0$
5. $x*y = 0 \; and \; y*x = 0 \; imply \; x = y \; for \; all \; x,y,z \in X.$

**Definition 2.2:** [4,5,6] A d-algebra is a non-empty set X with a constant 0 and a binary operation * satisfying the following axioms:

1. $x*x = 0$
2. $0*x = 0$
3. $x*y = 0 \; and \; y*x = 0 \; imply \; x = y \; for \; all \; x,y \in X$

**Definition 2.3[7]** A nonempty set X with a constant 0 and a binary operation $*$ is called a BH-algebra, if it satisfies the following axioms

(BH1) $x*x = 0$

(BH2) $x*0 = 0$

(BH3) $x*y = 0 \; and \; y*x = 0 \Rightarrow x = y$ for all $x,y \in X$

**Remark 2.4:** It is obvious from above definitions that every BCK-algebra is a BH-algebra. The following shows that converse is not true, in general.

**Example 2.5:** [10] Let X = {0, 1, 2, 3, 4, and 5} with the binary operation $*$ defined by (Table: 1)

Then X is a BH- algebra, but it is not BCK-algebra. This is because condition(2) of Definition (2.1) is not satisfied as shown: (5∗(5∗2))∗2 = (5 ∗3)∗2 = 3∗2 = 1≠ 0

This example shows that the class of BCK-algebras is a proper subclass of the class of BH-algebras.

**Definition 2.6: [7]** Let S be a non-empty subset of a BH-algebra X, then S is called a subalgebra of X if $x*y \in S$ for all$x,y \in S$.

**Definition 2.7: [7]** Let X be a BH-algebra and I a subset of X, then I is called an ideal of X if it satisfies the Following conditions:

1. $0 \in I$
2. $x*y \in I \; and \; y \in I \; imply \; x \in I.$

**Definition 2.8: [7]** Let X be a BH-algebra and I a nonempty subset of X, then I is called a BH-ideal of X if it satisfies the following conditions:

1. $x*y \in I \; and \; y \in I \; imply \; x \in I$ and
2. $x \in I \; and \; y \in X \; imply \; x*y \in I.$

From condition (2) it is obvious that for $x \in I \subseteq X, 0 = x*x \in I$ .

**Definition 2.9: [8]** A self-map f: $X \to X$satisfying $f(x*y) = f(x)*y$, for all$x,y \in X$, is called a multiplier on X.

**Multipliers on BH-Algebras**

In the sequel X will denote a BH-algebra with constant 0 and binary operation $*$, unless otherwise specified. We now prove our results.

**Definition 3.1**

A self-map$f : X \to X$satisfying $f(x*y) = f(x)*y$, for all$x,y \in X$, is called a multiplier on X.

**Example 3.2:** Let X = {0, a, b} be a set with the binary operation * defined by (Table:2)

Then X is a BH-algebra. Let $f$: X→X be defined by
$f(x) = \begin{cases} 0 \ if \ x = 0, a \\ a \ if \ x = b \end{cases}$
Then $f$ is a multiplier on X.

**Remark 3.3:** If X is a BH-algebra with binary operation$*$, then we define a binary relation ≤ on X by: $x \leq y$ *if and only if* $x * y = 0, \ x, y \in X$.

**Proposition 3.4:** Let X be a BH-algebra and $f$ a multiplier on X, then
1. $f(0) = 0$,
2. $f(x) \leq x$For all $x \in X$ and
3. If$x \leq y$ then $f(x) \leq y$ for all $x, y \in X$.

**Proof**
1. $f(0) = f(0 * f(0)) = f(0) * f(0) = 0$.
2. Let x∈X. Then $0 = f(0) = f(x * x) = f(x) * x$. So $f(x) \leq x$.
3. Let $x, y \in X$ *and* $x \leq y$. Then $x * y = 0$.
So, $0 = f(0) = f(x * y) = f(x) * y$.
Thus $f(x) \leq y$.

**Proposition 3.5:** Let $f$ and g be multipliers on X, then their composition $f$og is a multiplier on X.

**Proof:** Let$x, y \in X$.
Then $(f og)(x * y) = f(g(x * y)) = f(g(x) * y)$
$= f(g(x)) * y = (f og)(x) * y$
So $f$og is a multiplier on X.

**Definition 3.6:** A BH-algebra X is said to be positive implicative if $(x * y) * z = (x * z) * (y * z)$For all $x, y, z \in X$.
Let M(X) denotes the collection of all multipliers on X. Obviously O:X→X defined by O(x) = 0 for all x∈X and I: X→X defined by I(x) = x for all x∈X are in M(X). So M(X) is non-empty.

**Definition 3.7:** Let X be a positive implicative BH-algebra and M(X) be the collection of all multipliers on X. We define a binary operation $*$ on M(X) by:
$(f * g)(x) = f(x) * g(x)$*for* $x \in X$ *and* $f, g \in M(X)$.

**Theorem 3.8:** Let X be a positive implicative d-algebra. Then $(M(X), *, 0)$ is a positive implicative BH-algebra

**Proof**
Let X be implicative BH-algebra.
Let $g, f \in M(X)$.
Then $(g * f)(x * y) = (g(x * y)) * (f(x * y))$
$= (g(x) * y) * (f(x) * y)$
$= (g(x) * f(x)) * y = ((g * f)(x)) * y$.
So $g * f \in M(X)$. Let $f \in M(X)$. Then
$(O * f)(x) = O(x) * f(x) = 0 * f(x) = 0 = O(x)$
for all $x \in X$. So $O * f = O$ for all $f \in M(X)$.
Now for $f \in M(X)$, we have
$(f * f)(x) = f(x) * f(x) = 0 = O(x)$

for all $x \in X$. So $f * f = 0$.
Let $g, f \in M(X)$ be such that
$f * g = 0$ *and* $g * f = 0$
This implies $(f * g)(x) = 0$ *and* $(g * f)(x) = 0$for all $x \in X$.
That is, $f(x) * g(x) = 0$*and* $g(x) * f(x) = 0$
Which implies $f(x) = g(x)$ for all $x \in X$. Thus $f = g$.
Hence M(X) is a d-algebra.
Now we show that it is a positive implicative.
Let $f$, g and h∈M(X).
Then $((f * g) * h)(x) = ((f * g)(x)) * h(x) = (f(x) * g(x)) * h(x)$
$= (f(x) * h(x)) * (g(x) * h(x))$
$= ((f * h)(x)) * ((g * h)(x))$
$= ((f * h) * (g * h))(x)$ for all x∈X
Hence $(f * g) * h = (f * g) * (f * h)$
Thus M(X) is an implicative BH-algebra.

**Proposition 3.9:** Let X be a BH-algebra and $f$ a multiplier on X. If $f$ is one-to-one, then $f$ is the identity map on X.

**Proof:** Let $f$ be one-to-one. Let x∈X. Then
$f(x * f(x)) = f(x) * f(x) = 0 = f(0)$
Thus $x * f(x) = 0$, which implies $x \leq f(x)$ . Since
$f(x) \leq x$, by proposition 3.4 (2), for all x, therefore
$f(x) = x$. Hence $f$ is the identity map.
Let $f$ be a multiplier on X. We define $Ker(f)$ by:
$Ker(f) = \{x : x \in X \text{ and } f(x) = 0\}$.

**Proposition 3.10:** Let X be a BH-algebra and $f$ a multiplier on X. Then
(1) $Ker(f)$ is a subalgebra of X and
(2) If $f$ is one-to-one, then $Ker(f) = \{0\}$.

**Proof**
(1) Let $x, y \in Ker(f)$. Then $f(x) = 0$and$f(y) = 0$. So
$f(x * y) = f(x) * y = 0 * y = 0$ . Thus $x * y \in Ker(f)$,
Which implies $Ker(f)$ is a subalgebra of X.
(2) Let $f$ be one-to-one. Let $x \in Ker(f)$. So
$f(x) = 0 = f(0)$. Thus$x = 0$. So $Ker(f) = \{0\}$.

**Definition 3.11:** A BH-algebra X is called commutative if $x * (x * y) = y * (y * x)$ for all $x, y \in X$.

**Proposition 3.12:** Let X be a commutative BH-algebra satisfying $x = 0 = x$, $x$∈$X$ . Let $f$ be a multiplier on X. If $x \in Ker(f)$and$y \leq x$, then $y \in Ker(f)$.

**Proof**
Let $x \in Ker(f)$ and $y \leq x$. Then $f(x) = 0$ and
$y * x = 0$ . Now
$f(y) = f(y * 0) = f(y * (y * x)) = f(x * (x * y))$
$= f(x) * (x * y) = 0 * (x * y) = 0$So $x \in Ker(f)$.

**Theorem 3.13:** Let X be a BH-algebra satisfying x = 0 =x for all x∈X. Let $f$ be a multiplier on X, which is also an endomorphism on X. Then $Ker(f)$ is a BH-ideal of X.

**Proof**
Obviously, $0 \in Ker(\mathfrak{f})$.so$Ker(\mathfrak{f})$ is nonempty.
Let $x * y \in Ker(\mathfrak{f})$ and $y \in Ker(\mathfrak{f})$. Then $\mathfrak{f}(y) = 0$. Also
$f(x * y) = 0$ , which implies
$0 = f(x) * f(y) = f(x) * 0 = f(x)$
Thus $x \in Ker(\mathfrak{f})$.
Let $x \in Ker(\mathfrak{f})$and$y \in X$. Then
$f(x * y) = f(x) * y = 0 * y = 0$
So $x * y \in Ker(\mathfrak{f})$. Hence $Ker(\mathfrak{f})$ is a d-ideal of X.

**Definition 3.14:** Let X be a BH-algebra and $f$ a multiplier on X. Then the set $Fix(f) = \{x : x \in X \text{ and } f(x) = x\}$is called the set of fixed points of $f$.

**Proposition 3.15:** Let X be a BH-algebra and $f$ a multiplier on X. Then $Fix(\mathfrak{f})$ is a subalgebra of X.

**Proof**
Since$\mathfrak{f}(0) = 0$, so$Fix(\mathfrak{f})$ is non-empty. $Let\ x, y \in Fix(f)$ .
Then $f(x) = x, f(y) = y$.
Thus $f(x * y) = f(x) * y = x * y$
So $x * y \in Fix(f)$ .
Hence $Fix(\mathfrak{f})$ is a subalgebra of X.

**Definition 3.16:** Let X be a BH-algebra and $f$ a multiplier on X. $f$ is called idempotent if $fof = f$. $fof$ will be denoted by$f^2$.

**Theorem 3.17:** Let X be a positive implicative BH-algebra which satisfies $x * 0 = x$ for all $x \in X$.
Let $\mathfrak{f}_1$,$\mathfrak{f}_2$ be two idempotent multipliers on X. If $\mathfrak{f}_1 o \mathfrak{f}_2 = \mathfrak{f}_2 o \mathfrak{f}_1$, then $\mathfrak{f}_1$*$\mathfrak{f}_2$ is an idempotent multiplier on X.

**Proof**
By Theorem 3.8, we get that$\mathfrak{f}_1$*$\mathfrak{f}_2$is a multiplier on X. Now$((\mathfrak{f}_1 * \mathfrak{f}_2) o(\mathfrak{f}_1 * \mathfrak{f}_2))(x) = (\mathfrak{f}_1 * \mathfrak{f}_2)((\mathfrak{f}_1 * \mathfrak{f}_2)(x)) = (\mathfrak{f}_1 * \mathfrak{f}_2)(\mathfrak{f}_1(x) * \mathfrak{f}_2(x))$
$(\mathfrak{f}_1(\mathfrak{f}_1(x) * \mathfrak{f}_2(x))) * (\mathfrak{f}_2(\mathfrak{f}_1(x) * \mathfrak{f}_2(x))) = ((\mathfrak{f}_1 o \mathfrak{f}_2)(x) * \mathfrak{f}_2(x)) * ((\mathfrak{f}_2 o \mathfrak{f}_1)(x) * \mathfrak{f}_2(x))$
$= (\mathfrak{f}_1(x) * \mathfrak{f}_2(x)) * ((\mathfrak{f}_1 o \mathfrak{f}_1)(x) * \mathfrak{f}_2(x)) = (\mathfrak{f}_1(x) * \mathfrak{f}_2(x)) *$
$(\mathfrak{f}_1(\mathfrak{f}_2(x) * \mathfrak{f}_2(x)) = ((\mathfrak{f}_1 * \mathfrak{f}_2)(x)) * (\mathfrak{f}_1(0)) = ((\mathfrak{f}_1 * \mathfrak{f}_2)(x)) * 0 = (\mathfrak{f}_1 * \mathfrak{f}_2)(x)$.
Thus $(\mathfrak{f}_1 * \mathfrak{f}_2) o (\mathfrak{f}_1 * \mathfrak{f}_2) = \mathfrak{f}_1 * \mathfrak{f}_2$. Hence $\mathfrak{f}_1 * \mathfrak{f}_2$is idempotent.

## ABSTRACT

This study aims to develop ketoconazole lozenges to improve the oral bioavailability of ketoconazolelozenges, addressing its limitations related to solubility and first-pass metabolism. The objective is to formulate a lozenge that enhances the dissolution and absorption of ketoconazole through the buccal route, while also improving patient compliance and bioavailability for those unable to swallow traditional dosage forms. Heat congealing method was used to create ketoconazole lozenges, and solubilizing excipients including MCC and cross povidone were added to improve drug solubility. The lozenges were assessed for their in vitro dissolving profiles, consistency of medication content, and physical attributes. Pharmacokinetic tests were carried out in a controlled environment to compare the lozenges' bioavailability with that of regular oral tablets. The formulated ketoconazole lozenges exhibited significantly improved solubility and faster dissolution rates compared to traditional oral formulations. The lozenges had greater peak plasma concentrations and a shorter time to achieve maximum concentration in comparison to the oral tablet formulation, indicating a significant increase in bioavailability, according to pharmacokinetic studies.

**Keywords:** Ketoconazole, Bioavailability, Physical parameters, *in -vivo* studies, *in -vitro* studies, cross povidone

## INTRODUCTION

Lozenges are among the most popular forms of dosing. The industry offers a wide variety of dosage options for lozenge formulations. These are consumed orally. Lozenges dissolve slowly in the mouth, allowing for prolonged contact with oral mucosal tissues, which can enhance the local and systemic absorption of the drug. Most of the lozenges are sweetened base .because a sweetening ingredient is used in their preparation. These drugs extensively metabolized by liver. Most of the lozenges are available in the market different forms like hard lozenges, soft lozenges[1,2]. Ketoconazole, a broad-spectrum antifungal drug, is commonly used to treat a variety of fungal infections. Most people nowadays suffer from fungal illnesses like ringworm, jock itch, athletes foot, and some types of dandruff. One of the greatest medications for the above mentioned infections is ketoconazole[3.4]. It is poorly soluble and absorbs unevenly in the gastrointestinal tract, its oral bioavailability is often decreased. To enhance its therapeutic efficacy, innovative formulation strategies are essential. One promising approach is the development of ketoconazole lozenges**.** In addition to improving absorption, this administration method also increases patient compliance, especially for those who might have trouble swallowing pills or capsules. Lozenges dissolve slowly in the mouth, allowing for prolonged contact with oral mucosal tissues, which can enhance the local and systemic absorption of the drug. The formulation of ketoconazole into lozenges represents a significant advancement in antifungal therapy, addressing the challenges of bioavailability and patient adherence. By leveraging the unique properties of lozenge delivery systems, this approach has the potential to optimize therapeutic outcomes for patients requiring antifungal treatment.[5] In summary, the formulation of ketoconazole into lozenges represents a significant advancement in antifungal therapy, has the capacity to increase patient adherence and bioavailability. Continued research and development in this area will be essential to optimize the formulation and evaluate its clinical effectiveness.

## MATERIALS AND METHODS

Asha Analytical Ltd. in Hyderabad provided ketoconazole, LipaChemie PVT LTD in Mumbai provided microcrystalline cellulose and cross povidone, SDFCL Fine Chem Limited in Mumbai provided acacia and starch, and Thermo Fisher Scientific India PVT supplied citric acid and tragacanth. Specifically, the sucrose was analytical grade.

**Preparation of candy lozenges[6,7]**

The formulations were made by dissolving sucrose in water and heating it with a heating mantle until a thick, candy-like solution was created. After that, the solution was boiled for five minutes while cross povidone and microcrystalline cellulose (MCC) were added gradually. Gelatin was next added to the mixture, and then ketoconazole, coloring, and flavorings. An extra ten minutes were spent heating the mixture. The formulation table was represented in Table 1.

**Evaluation tests**

Every formulation was made and assessed for the mechanical, physical, and biological parameters listed below.

**Hardness**

Ten lozenges were randomly selected from the batch. Each lozenge was placed individually on the hardness tester (e.g., Monsanto or Pfizer type). The force required to break each lozenge was recorded in kg/cm² or Newtons. The average hardness was calculated from the readings[8,9].

**Thickness and diameter**

Vernier callipers were used to measure the lozenges' thickness and diameter. Three lozenges were tested, and the standard deviation was computed[10].

**Drug content and uniformity**

To determine the homogeneity of the content, one lozenge was dissolved in 60 milliliters of methanol in a 200 milliliter volumetric flask. The resulting phosphate buffer had a pH of 6.8, and 10 milliliters of this solution were diluted to 100 milliliters using the phosphate buffer 6.8 pH. The UV spectrophotometric approach was used to determine the drug contents of each formulation[11,12].

**Friability**

A friabilator was used to check the friability of each batch of 20 lozenges . @ 25 rpm for 4 minutes. The calculation was used to determine the % weight loss following the dedusting and reweighing of the lozenges[13].

**Percentage friability = [(Initial Weight – Final Weight) /Initial Weight] x 100**

**Weight variation**

The variation in USP weight A digital balance was used to record the weights of the twenty lozenges, both individually and collectively. Determine the loaf's average weight and compare each one to the average. The following formula was used to calculate the percentage deviation[14,15].

**% Deviation = (Individual weight – Average weight) /Average weight x 100**

**Drug excipients Interaction Studies:**

Computer-mediated Fourier transformed infrared spectroscopy (FTIR) research employing the KBr disk method was used to obtain the infrared spectrum for pure ketoconazole. According to this, the medication and the excipient did not interact. Therefore, it was possible to determine whether the medication was compatible with each excipient[16].

***In-Vitro* dissolution studies**

In vitro release studies were carried out with the paddle-type USP-II dissolving apparatus. As a dissolving medium, 900 cc of pH6.8 phosphate buffer at 37 ±0.5 °C was used, and the paddle's 50 rpm was set to 1. The absorbance at 255 nm was measured up to 60 minutes after sample withdrawal. The material was investigated with UV spectroscopy[17].

**Stability studies**

The stability experiments were designed to evaluate the drug's physical and chemical stability, which could affect the organoleptic properties of the lozenges. According to ICH recommendations (zone IV), an accelerated stability study was carried out for seven weeks at 45°C and 75% relative humidity. A sufficient quantity of improved formulations were stored in screw-capped bottles with amber hues at 37°C in an incubator. Samples were collected every 15 days to assess organoleptic qualities and determine the drug content[18].

**Drug release kinetic studies**

In pharmaceutical evaluation studies, drug release kinetics are essential to understand how a drug is released from its dosage form over time, which is critical for ensuring its therapeutic effectiveness. Evaluation testing frequently include in vitro dissolving experiments, in which the release profile of the drug is tracked in a controlled setting, usually utilizing USP dissolution equipment in a variety of physiologically-like environments. The release data is then analyzed using different kinetic models to identify the underlying release mechanisms, such as diffusion, erosion, or a combination of both. Common models include zero-order kinetics (constant release), first-order kinetics (concentration-dependent release), and the Higuchi model (diffusion-based release from matrix systems)[19].

***In-vivo* studies**

The pharmacokinetics of commercially available ketoconazole tablets as the reference formulation and ketoconazole lozenges (test formulation) were compared in an in vivo investigation using healthy adult rabbits weighing 2–3 kg divided into two groups at random (6–8 animals per group). Group B was given the tablet orally with a modest

amount of water, while Group A was given the ketoconazole lozenge, which was made to dissolve and absorb via the mucosa. Each group received a dose of 10 mg/kg based on body weight. An ear or jugular venipuncture was used to obtain 0.5 mL of blood at intervals of 0.5, 1, 2, 4, 6, 8, 12, and 24 hours. After that, the samples were placed in heparinized tubes, spun at 3000 rpm to extract the plasma, and stored for analysis at -80 °C. The amounts of plasma ketoconazole were measured using centrifugation, vortex mixing, protein precipitation with acetonitrile, and High-Performance Liquid Chromatography (HPLC) using an internal standard. Using a mobile phase of 70% acetonitrile and 30% water, samples were examined on a C18 column and detected at 220 nm. To facilitate quantification, calibration curves were created using known ketoconazole concentrations. To compare absorption profiles and assess the bioavailability of the lozenge vs the tablet, pharmacokinetic parameters such as C_max, T_max, and AUC were computed[20].

## RESULTS

**Pre -formulation studies**

**FT-IR studies**

Fourier Transform Infrared (FTIR) spectroscopy is a useful analytical technique for figuring out the infrared spectrum of absorption or emission of a solid, liquid, or gas sample. FTIR's main goal is to identify and describe materials by examining how molecules absorb infrared light and how that light reacts with the material's chemical bonds. FT-IR of Ketoconazole (Fig: 1). FT-IR spectroscopy of ketoconazole + excipients (Fig: 2). Reported and observed FT-IR peaks of pure drug and physical mixture (Table 2). FTIR spectra of the pure drug and its physical mixture reveal several characteristic absorption bands that correlate to key functional groups, including C-H, C=O, C=N, N-H, and C-O. There is no interaction between the drug and the excipients. In this format, the table provides a quick reference to the observed FTIR peaks, while the interpretation section explains the significance of the shifts and what they imply about the interactions in the physical mixture.

**Differential scanning calorimetry (dsc)**

Drug-excipient interactions are the primary use of differential scanning calorimetry (DSC). A distinct endothermic melting peak can be seen at 152.79˚C in the ketoconazole thermogram. The thermogram of ketoconazole with excipients, on the other hand, shows clear endothermic melting peaks at 125.98˚C and 189.70˚C (Fig 7.5). These results suggest that there are no discernible chemical interactions between ketoconazole and the excipients utilized in the formulations. Thermogram of Ketoconazole (Fig 3). Temperature ($^0$c), Thermogram of Ketoconazole and excepients (Fig 4).

**Calibration curve of ketoconazole**

A working standard solution was serially diluted with water and then diluted with phosphate buffer at pH 6.8 to achieve concentrations of 2, 4, 6, 8, and 10µg/ml. These solutions' absorbance was then measured at 280 nm. Absorbance values of ketoconazole (Table 3). Calibration curve for Ketoconazole (Fig 5)

**Design of space**

The effects of two factors, microcrystalline cellulose and cross povidone, were examined using a $3^2$ factorial design. Two levels of testing were performed for each factor: low level (-1) and high level (+1). Resulting in eight experimental runs Table 4

**Response 1: Weight variation**

**Response 2 : Moisture content**

Predicted vs Actual plot for response 2 (Fig 9). Contour plot for response 2 (Fig 10). 3D response surface plot for response 2 (Fig 11). Response 3: % Drug release. Predicted and actual plot for response 3 (Fig 12). 3D response surface plot for response 3 (Fig. 13). Optimized formulation F10 (Table 5). Results of optimized formulation F10 (Table 6)

***In-vitro* studies**

*In-vitro* dissolution study of formulated medicated lozenges of ketoconazole (Table 7).

**Drug release kinetic studies**

Drug release kinetics over a 24-hour period were investigated using in vitro dissolution tests. Plotting the cumulative drug release from the formulations against time is followed by fitting the results to various kinetic models, including zero-order, first-order, Higuchi, and Korsmeyer-Peppas equations. When kinetic models were fitted to the data, the Korsmeyer-Peppas model (R2 = 0.999) produced the best results. This implies that the polymer matrix is characterized by both diffusion and erosion, indicating a non-Fickian diffusion mechanism. This was further supported by the release exponent (n) of 0.993, which indicated that the primary release mechanism was a combination of diffusion and matrix degradation. Drug release studies of Ketoconazole lozenges F10 (Fig.15). Zero order kinetics of F9 (Fig .16). First order kinetics of F9 (Fig .17). koarsemayer's graph of F9 (Fig .18). Higuchi model graph of F9 (Fig 19). Hixson crowell graph of F9 (Fig .20 ).

***In vivo* studies**

In an *in vivo* study comparing the pharmacokinetics of ketoconazole lozenges (test formulation) to marketed ketoconazole tablets Nizoral® (Janssen Pharmaceuticals, Inc.) (reference formulation) in rabbits, the first step involves selecting healthy adult rabbits, typically weighing between 2 to 3 kg. After that, the rabbits are divided into two groups of six to eight at random. Group B was given the marketed tablet, and Group A was given the ketoconazole lozenge. A typical dose of ketoconazole is 10 mg/kg, and the dosage is determined by the rabbit's body weight. To ensure optimal bioavailability, the lozenge is placed in the rabbit's mouth for the test group, allowing for oral dissolution and absorption while maintaining contact with the mucosal membranes. The pill, on the other hand, is taken orally with a little water to help with swallowing. The ear or jugular vein is venipunctured to obtain blood samples at predetermined intervals (e.g., 0.5, 1, 2, 4, 6, 8, 12, and 24 hours post-dose). At each time point, 0.5 mL of blood is drawn and placed in heparinized tubes to avoid coagulation. Blood samples are collected, centrifuged for 10 minutes at 3000 rpm to remove the plasma, and then stored at -80 °C until further analysis. To determine the plasma concentrations of ketoconazole, the stored plasma samples are processed for analysis using High-Performance Liquid Chromatography (HPLC). Each plasma sample is mixed with a suitable internal standard, and the proteins are then precipitated using acetonitrile After centrifugation and vortex mixing, the supernatant is gathered for HPLC examination. Usually, a C18 reverse-phase column is used, with a mobile phase made up of 30% water and 70% acetonitrile. The detection is carried out at a wavelength of 220 nm. Ketoconazole concentrations that are known are used to create calibration curves that make it easier to quantify the plasma samples. After that, the pharmacokinetic parameters—such as Cmax, Tmax, and AUC—are computed for both formulations in order to compare their absorption profiles and assess the lozenge's versus tablet's bioavailability. *In Vivo* Pharmacokinetic Parameters (mean ± SD, n = 6) (Table 8). Comparison of pharmacokinetic parameters of ketoconazole lozenges (Table 9). The pharmacokinetic comparison between ketoconazole lozenges (test formulation)andmarketed ketoconazole tablets (reference formulation) revealed significant differences in the absorption and bioavailability of the two formulations. The C_max for the lozenge formulation was observed to be between 3.2 and 3.5 mcg/mL**,** which is higher than the 2.5–3.0 mcg/mL range for the tablet formulation, indicating a higher peak plasma concentration for the lozenge. Additionally, the T_max for the lozenge occurred significantly earlier at 1.5 hours**,** compared to 3 hours for the tablet, suggesting that the lozenge formulation is absorbed more rapidly. At 17,000 ng·hr/mL as opposed to 8000 ng·hr/mL for the pill, the lozenge's $AUC_{0-\infty}$ was also noticeably higher, indicating a larger overall drug exposure and increased bioavailability. However, the two formulations' half-lives (4.5 hours for the tablet and 4.6 hours for the lozenge) and elimination rate constants (Ke) did not differ significantly ($p > 0.05$). These findings suggest that the ketoconazole

lozenge formulation provides improved absorption and bioavailability, as indicated by the higher C_max, faster T_max, and greater $AUC_{0-\infty}$, without affecting the elimination profile compared to the marketed tablet.

**Stability studies**

Evaluation parameters after the stability studies (Table 10)

## DISCUSSION

In this study, we made ketoconazole lozenges using the heat congealing method. Stability tests conducted over a six-month period at room temperature and under accelerated conditions (40°C/75% RH) showed no discernible changes in the lozenges' medication content, rate of disintegration, or physical appearance. This demonstrates that the formulation is stable, retaining its profile of safety and efficacy over an extended length of time. However, it has been shown that a number of commercially available ketoconazole formulations lose their efficacy when stored in similar conditions. *In vitro* release studies demonstrated, The release kinetics followed a non-Fickian diffusion pattern, suggesting that both diffusion and erosion mechanisms contributed to the release of the drug. Long-term maintenance of therapeutic drug levels is made possible by this controlled release, which may lessen the need for frequent dosage. In comparison, marketed ketoconazole formulations, such as topical creams or oral tablets, often exhibit rapid drug release, leading to fluctuating plasma concentrations. Our formulation's controlled release profile represents a significant improvement, as it ensures steady drug exposure over time, which can be crucial for maintaining antifungal efficacy in the oral cavity. In vivo evaluations using a rat model indicated enhanced bioavailability and therapeutic efficacy against induced fungal infections, with no significant adverse effects observed. Compared to existing ketoconazole formulations, such as topical creams and shampoos, our lozenge formulation offers the advantage of targeted oral delivery and prolonged drug release, potentially improving patient adherence and treatment outcomes."

## CONCLUSION

In conclusion, this study successfully formulated and evaluated ketoconazole lozenges using Design of Experiment (DOE) to optimize formulation parameters. The evaluation of hardness and weight variation and drug release demonstrated that all formulations met pharmacopeial standards, ensuring consistent quality and patient acceptability. The hardness of the lozenges ranged from 10.45±0.6kg/cm², providing adequate structural integrity, while weight variation remained within ±2% of the target weight, indicating precision in manufacturing. According to the medication release experiments, 92.6% of the drugs had a regulated release profile. According to kinetic analysis, the Higuchi model (R2 = 0.96) fit the data the best, indicating that diffusion dominated the drug release. By lowering the frequency of dose and increasing patient compliance, this sustained release profile is perfect for prolonged therapeutic activity. Even though these results are encouraging, more optimization would be needed to assess the lozenges' long-term durability under different storage circumstances. Overall, the findings indicate that ketoconazole lozenges are a viable dosage form, offering controlled drug release, good mechanical properties, and the potential for effective treatment of oral fungal infections. This formulation holds promise for improving patient outcomes, particularly in cases where sustained antifungal action is required.

## ACKNOWLEDGEMENT

The authors thank the Chalapathi Institute of Pharmaceutical Sciences, Lam, Guntur, for providing the necessary laboratory facilities. Furthermore, the authors extend their gratitude tothe institute and management. In addition, the authors acknowledge the Alphamed Formulations located in Hyderabad for providing the API necessary for this study.

## ABSTRACT

Phytocompound research is undergoing a paradigm shift as sustainability and scientific rigor become central priorities in natural-product discovery. This review explores the powerful synergy between cognitive science and green chemistry, highlighting how their integration can transform the design, extraction, optimization, and analysis of bioactive plant-derived compounds. Cognitive science contributes structured reasoning, bias reduction, decision frameworks, and mental-model development that improve experimental planning and interpretation. Green chemistry complements this by promoting environmentally responsible practices, including the use of safer solvents, low-energy extraction techniques, biocatalysis, and green analytical methods. Together, these fields enable more efficient workflows, reduce hazardous waste, improve reproducibility, and accelerate lead identification with fewer experiments. Case studies demonstrate practical applications of cognitive–green integration, while future prospects outline the potential of AI-driven decision systems, digital twins, and interdisciplinary education. By uniting cognitive principles with sustainable chemical practices, this review emphasizes a forward-looking framework for eco-efficient, scientifically robust phytocompound development and provides a foundation for advancing environmentally conscious natural-product research.

**Keywords:** Cognitive science, Green chemistry, Phytocompounds, Sustainable extraction, Decision-support systems.

# INTRODUCTION

**Importance of natural products in modern drug discovery**

Drug discovery has had nature as its foundation over the centuries where structurally diverse and biologically active compounds have been found, which often serve as the precursors of modern therapeutics(1). Their chemical scaffolds are quite different and highly evolved under evolutionary pressures; these are pharmacophores that cannot easily be made by synthetic chemistry(2). The topicality of the natural compounds can be illustrated by the fact that, out of the last 30 years or so, approximately half of all the FDA-approved drugs were founded on, inspired by, or analogous to natural compounds(3). The phytochemicals alkaloids, flavonoids, terpenoids, tannins and polyphenols are still undergoing therapeutic modalities in oncology, infectious diseases and in metabolism and inflammatory diseases(4). Extraction, isolations Adventures in extracting, isolating, metabolomics and dereplication have simply added to the rate of identification of new bioactives in plants(5). In addition, the growing trend in the world towards the use of evidence-based herbal medicine and nutraceuticals has augmented the scientific interest in plant-based compounds(6). The use of natural products can be done in two ways, firstly, they can provide direct therapeutic candidates and secondly, it can serve as a molecular probe to understand biological pathways better(7). Their complexity in structure is likely to be also converted into high specificity of targets and greater biological activity and therefore are indispensable in the contemporary drug discovery process(8). Unrivaled chemical diversity even in natural products is only produced with the challenges of yield and purity being hard to reach even though they still supply the backbone to new drugs(9).

**Challenges in phytocompound identification, purification, and optimization**

Despite its importance, phytocompounds are not free of several challenges that may retard drug development(10). Plants are intricate reservoirs of secondary metabolites whose quantity is influenced by the genetic, environmental, geographic, and seasonal factors and it is difficult to extract them reliably(11). They are typically identified through a significant number of chromatographic separations, advanced spectroscopic techniques as well as bioassay-guided fractionation-processes that are time intensive, as well as resource intensive. Other troublesome issues in the analysis process are co-eluting impurities, resemblance in the structure of the metabolites, and low concentrations of active components(12). The purification solvents are typically toxic organic solvents and this poses environmental and safety concerns. Furthermore, new phytocompounds may have a difficult structural clarification due to stereochemical complexity, instability, or both glycosylated and polymeric structures(13). Natural compounds which are discovered may suffer bad solubility, low bioavailability, high metabolic rate, or low chemical stability, and must be optimised by means of chemical modification or formulation strategies(14).

**Integration of cognitive science**

The cognitive science may also provide valuable information regarding how scientists perceive the issues, formulate the decisions and derive the hypothesis that directly affect the outcome of phytochemical research. Techniques of scientific reasoning that involve pattern recognition, analogy creation, and interpretation of more complex data sets are widespread, and are all vulnerable to cognitive biases such as confirmation bias, anchor effects, and frame dependence(15). Such biases can lead to research designs that are not effective, misinterpretation of the data used to analyse it, and an unsustainable conclusion on the biological activity. The theories of cognitive-science help the investigators adopt more structured models of decision making that facilitate methods of systematic hypothesis formation and steps of eliminating mental shortcuts that influence precision(16). Experimental design, prioritization of extraction/synthesis pathway and interpretation of spectroscopic data or other metabolomic data can be improved through cognitive procedures in research studies on phytocompounds, which are highly data complex and have a large number of variables(17). Also, the synergy of the cognitive models helps in creativity and problem solving due to the capability of the researchers to conceptualize the thought of greener alternatives, finding its latent possibilities, and streamlining the working procedures(18). Tools are related to concept mapping, cognitive-task analysis, and decision matrices, which can be used to support the logical flow of research activities. The introduction of the

cognition- science architecture into phytochemical laboratories will enable scientists to minimize the error, reproducibility is enhanced and better decisions are made that lead to successful discovery and development of bioactive natural products(19).

**Integration of green chemistry**

Green chemistry encourages the process and product development of chemical processes with minimal environmental effects, less hazardous waste, as well as enhanced safety. In phytocompound studies, in which extraction and purification methods may be intensive in the use of organic solvents, energy requirements, and multistep procedures, the idea of green-chemistry can radically improve sustainability(20). Supercritical fluid extraction, microwave-assisted extraction, ultrasound-assisted extraction, and the application of natural deep eutectic solvents (NADES) largely reduce the amount of solvent used, the amount of energy used, and the time used to carry out the process(21, 22). The principles of green-chemistry also promote using less hazardous reagents, renewable feedstocks, and catalytic reactions to stylishly modify the structure of phytochemicals(23, 24). This does not only create environmental friendly research, but it may also enhance efficiency, yield and cost effectiveness. One of the advantages is that it reduces the storage of dangerous residues that can affect the biologic assays or formulation. Moreover, green analytical chemistry encourages miniaturized procedures, solvent-free processes, and energy-saving instrumentation, which make the phytochemical studies more sustainable and meet international regulatory demands(25). This review will explore the overall impact that incorporation of concepts of cognitive science and application of green-chemistry principles can have to improve the design, discovery and development of bioactive phytocompounds. Although the two areas have each played a role in enhancing the efficiency and sustainability of research, their joint application in phytochemistry is under-researched. The proposed review aims to close this gap by identifying the ways in which cognitive frameworks, i.e. structured reasoning, bias reduction, heuristic evaluation, and decision modelling, can be used in complementing environmentally conscious extraction, synthesis, and analytical approaches.

**Cognitive Science in Chemical and Phytochemical Research**

**Foundations of Cognitive Science Relevant to Chemistry**

**Pattern Recognition**

Pattern recognition is a mind process that is vital in helping scientists establish meaningful correlations in the experimental data, chemical structures and patterns of spectrals. Pattern recognition may be applied in phytochemical research to enable the investigators rapidly establish the correlation among chromatographic peaks, NMR fragments, and mass spectral patterns and known molecular structures(26). It is also useful in establishing the tendencies in the efficacy of solvents, extraction yields and bioactivity associations. Experienced and exposed to different datasets, qualified chemists tend to use intuitively and analytically pattern recognition(27). Cognitive science explains how the brain classifies information, how it uses templates stored and takes analogies in finding similarities or abnormalities in the structure(28). However, the application of intuition may lead to the detection of insignificant but important differences. Systematic patterns-recognition tools, e.g., chemometrics, PCA, clustering algorithms, and computational pattern-matching, can be used to minimize the errors and facilitate human cognition. The combination of the principles thinking and analysis approaches leads to the ultimate outcome, which is the improvement in the accuracy of the interpretation and quick discovery of new phytocompounds(29).

**Decision-Making Models**

Cognitive science models of decision-making describe the manner in which people analyze information, compare options and select the most effective strategies(30). Chemical decisions need to be made, and especially within the phytochemistry domain, decisions need to be made regarding which part of the plant should be chosen as a potential extract, the solvents to use in carrying out the extraction, the purification techniques that should be used to isolate the target compounds and how this will be interpreted by the results of the bioactivity studies(31). The rational choice theory of cognitive theories, the heuristic-based decision-making and the dual-process theories (fast vs slow thinking) is handy in explaining chemists who have access to a large amount of information(32). These models underline the

necessity to ensure that the decision processes are organized, and all the steps in the decision-making process are evidence-based rather than intuition-based steps.

**Cognitive Load and Scientific Reasoning**

The cognitive load can be described as the burden of information that should be handled with the mind, especially when dealing with a task that involves handling a complex group of data or when there are numerous variables(33). The studies of phytochemicals often entail simultaneous interpolation of the chromatograms, spectral data, extraction conditions and biological testing- a heavy intellectual load that interferes with the rational thought(34). The oversights can happen as a result of overloading the cognitive problem-solving mechanism, slackening the problem-solving process, or the misclassification of compounds(35). Cognitive science provides remedies to overcome load like presentation and processing of information in the most ideal way. Such concepts as chunking, visual mapping and sequence are used by the scientists in the process of breaking down complex tasks into manageable units. In addition to that, computer tools such as chemoinformatics software, automatic peak-picking, and machine-assisted spectral interpretation can be used to offset the thinking load on the brain and encourage more sound thinking(36).

**Avoiding Cognitive Bias in Experimental Design**

The cognitive bias, which is structured irrationality, has effects on the phytochemical research by applying to the study design, interpretation of data, and the reporting. Confirmation, availability, and anchoring, as well as survivorship biases, could make researchers bias to anticipated results, misunderstand marginal spectral data, or continue using more ecologically inappropriate extractions and solvents rather than switching to greener ones. Cognitive science strives to reduce these biases by means of a blind analysis, peer review, systematic instructions and objective devices like scoring systems and statistical confirmation. The use of green-chemistry decision models helps to increase objectivity as sustainability metrics are measurable. Lessening cognitive bias enhances experimental integrity, innovation and accuracy in experimental phytochemical studies(37).

**Cognitive Tools Used in Natural-Product Research**

**Expert Systems and Rule-Based Decision Tools**

Expert systems are artificial intelligent systems that are applied in computers to simulate the thinking of experts based on the rules of reasoning. Natural-product research In natural-product research, these systems are useful in the decision-making in various stages such as plant selection, extraction optimization, solvent selection and structure elucidation(38). Phytochemistry, pharmacognosy, and traditional medicine experience are represented in the form of rule-based engines and allow to evaluate a variety of variables automatically. An example is that an expert system can propose extraction protocols based on the polarity, stability and thermolability of the target compounds(39). Such tools will require the least use of intuition and the decisions in laboratories will be more standardized to improve reproducibility. Also expert systems may be utilized in the dereplication process in which there would be chromatographic or spectral patterns that are being compared against known databases(40).

**Concept Mapping & Structured Problem Solving**

A concept mapping is a mental map that aids to organize the confused information into connected nodes to facilitate the researcher to get a clear image of the relationship between variables i.e. the plant sources, the methods of extracting them, chemical classes and the biological activities. Concept maps aid in synthesis of multidisciplinary data in research on natural products to determine the gaps in the knowledge, the other potential directions and the potential optimisation pathways(41). After the systematic problem solving methods: The PDCA cycle, root-cause analysis and decision trees assist in the rational step-by-step development of experiments. These thinking aids reduce ambiguity, enhance the degree of clear thought as well as reduce the load on the mind when planning a research(42). Another thing they do to promote teamwork is providing coherent perspective of team discussion. By reducing complex workflows into workable units, concept mapping and systematic problem solving contribute to the effectiveness of the research, prevent unnecessary experimentation, and generate a sustained hypothesis-based phytochemical research(43).

**Cognitive Modelling for Lead Compound Identification**

Cognitive modelling is simulation of the mental processes that a scientist might be required to use to process data, draw hypotheses or to identify a potential lead compound(44). In phytochemical research, cognitive models are used to formalize cognitive styles used by researchers in dereplication, structure-activity relationship and extract/fraction prioritization. Pattern recognition, probabilistic reasoning, and heuristic evaluation are some of the principles that are brought about in these models in order to predict possible compounds that can be developed into desirable bioactivity(45, 46). Cognitive modelling can also be used to elaborate chemoinformatics descriptors, known pharmacophore templates and bioassay outcomes to develop predictive structures of lead identification(47). Cognitive modelling eliminates subjectivity by generalizing the reasoning of experts into the developed algorithms or flow patterns that increase the amount of transparency in the decision(48). The method can be applied to accelerate the early-stage screening and allow the researcher to invest efforts in the most promising phytocompounds(49).

**AI/ML-Based Cognitive Augmentation Tools**

Machine learning (ML) and artificial intelligence (AI) can provide high order cognitive and enhancements by handling hyper dimensional data that cannot be handled by a human being(50). Predicting bioactivity, clustering chemical structures, identifying spectral signatures, and optimizing the extraction parameters can be applied to natural-products studies with the help of AI/ML systems(51). Algorithms that can recognize patterns of concealed evidence and help prioritize compounds and choose pathways are random forests, neural networks, support vector machines, and deep-learning models(52). AI-related predictive models can potentially analyze structural features, which are associated to biological outcomes, quicker lead identification(53). The applications relieve the human load of cognitive burden, reduce human error and contribute to the data-driven decision-making process. In addition to cognitive science, AI/ML can be a powerful analog of human cognition and can provide more accurate and innovative phytochemical studies and enable a more sustainable and efficient working process(54).

**Human Cognitive Processes Involved in Phytochemical Discovery**

**Intuition vs Analytical Reasoning**

The discovery of phytochemicals makes use of a dynamic process between the intuition/analytical thinking intuition. Rapid experience constituted judgment, a swift experience in which scientists can know how to make rapid choices with regard to the choice of plants, extraction conditions or structure potentials based on their previous exposure to the same pattern(55). Such intuitive thinking may be highly effective in filtering complex extracts or in examining clumsy chromatographic profiles(56). However, it is the one that may be prejudiced and miss out on the small but significant details. Analytical reasoning, in turn, is step-by-step evaluation of spectral information, statistical analysis, and step-by-step assessment of evidence through the use of analytical reasoning, which is slow, premeditated, and analytical(57).

**Creativity in Designing Greener Extraction Strategies**

To design greener methods of extraction that will obtain maximum phytochemical output and at the same time cause minimal environmental damage, it will require creativity. Some of the ways in which cognitive science backs this innovation are by allowing divergent thinking, blending of concepts and reframing traditional problems. This results in new directions such as NADES utilization, hybrid techniques as ultrasound-assisted supercritical extraction, or energy-saving microwave-powered techniques. Creative thinking provokes scientists to challenge common practices, test other parts of the plants, streamline the extraction sequences, and incorporate sustainability in the initial stages of designing the methods. Innovation is also improved through the use of visualization tools, brainstorming and reasoning through analogy. Cognitive creativity would enable researchers to come up with safer, more efficient and less expensive ways of extraction in line with the principles of green chemistry(58).

**Cognitive Errors in Phytochemical Identification and Structural Analysis**

The accuracy of the phytochemical identification and structural interpretation may be significantly affected by the systematic errors of cognition. Common biases are confirmation bias (spectral data are made to fit known structures),

anchoring (so the initial assumptions exclude others), the availability bias (whereby the information that can be easily recalled influences judgment). These biases may add to an interpretation of overlapping peaks which is over interpreted, missed impurities or premature structural assignment problems, which are of special interest in natural-product mixtures with high complexity. The cognitive science helps in reducing these errors through the aid of blind data inspection, cross validation, systematic interpretation processes and peer review. Computational analysis such as automated spectral and chemoinformatics databases also diminish the bias that plays a role in reliability and reproducibility in the identification of phytochemicals(19).

**Principles of Green Chemistry Relevant to Phytocompound Design**

**Overview of Green Chemistry Principles**

Green chemistry is a strategy that seeks to reduce environmental effects, enhance safety and efficiency in chemistry. The use of green chemistry is critical in phytocompound studies, in many of which large amounts of organic solvents and energy-intensive techniques are used to extract and purify phytocompounds. A 12-princed green chemistry gives a systematic approach to do sustainable work of phytochemistry.

1. Prevention of Waste: Phytochemistry can generate waste through solvent use, plant residue, and purification by-products. Green methods such as supercritical $CO_2$ extraction help reduce waste generation at the source.
2. Atom Economy: Although many phytochemical processes are extraction-based, derivatization steps should maximize incorporation of all reactants into the final product, reducing side products and unnecessary reagents.
3. Less Hazardous Chemical Syntheses: Chemical modification of phytocompounds, such as esterification or glycosylation, should avoid toxic catalysts and reagents, using enzymatic or biocatalytic systems instead.
4. Designing Safer Chemicals: Phytocompounds and their derivatives should be designed to retain efficacy while exhibiting reduced toxicity, improving their environmental and therapeutic safety profile.
5. Safer Solvents and Auxiliaries: Replacing harmful solvents (e.g., methanol, chloroform) with ethanol, water, ionic liquids, or natural deep eutectic solvents (NADES) is central to green phytochemistry.
6. Energy Efficiency: Energy-intensive techniques like Soxhlet extraction can be replaced with microwave-assisted, ultrasound-assisted, or cold extraction, significantly lowering energy usage.
7. Use of Renewable Feedstocks: Medicinal plants are renewable, but sustainable harvesting, cultivation, and biotechnological plant culture (callus, hairy root) must be emphasized to avoid biodiversity loss.
8. Reduce Derivatives: Avoid unnecessary steps such as protecting-group chemistry when modifying phytocompounds; direct catalytic or enzymatic transformations are preferred.
9. Catalysis: Use of biocatalysts, enzymes, and heterogeneous catalysts increases efficiency and reduces the need for harsh reagents.
10. Design for Degradation: Phytocompound derivatives should degrade into non-toxic by-products after therapeutic use, minimizing environmental persistence.
11. Real-Time Analysis for Pollution Prevention: Green analytical chemistry encourages online monitoring (e.g., miniaturized HPLC, microfluidics) to prevent wasteful trial-and-error processes.
12. Inherently Safer Chemistry for Accident Prevention: Using non-flammable solvents, low-pressure systems, and automated green extraction reduces risks associated with conventional solvent-based methods(59).

**Green Extraction Techniques for Phytocompounds**

**Supercritical $CO_2$ Extraction**

Supercritical CO2 is also an important green method of extraction, which involves separation of bioactive phytocompounds in the presence of carbon dioxide above its critical temperature and pressure. CO2 is a state that acts as a diffusive gas and solvating liquid simultaneously in this state, which makes it act as an efficient permeable gas and selective solvent to target molecules in tissues of the plants. The technique does not use toxic organic solvents and is suitable in compounds that are sensitive to heat like essential oils, carotenoids and terpenoids among other lipophilic phytochemicals. Extraction efficiency is tightly controllable using pressure, temperature and level of co-solvent parameters that are adjustable. Supercritical CO2 extraction produces high-purity extracts at minimal

waste and is well-aligned with the principles of green-chemistry and helps to facilitate clean and sustainable phytochemical processing(60).

**Microwave-Assisted Extraction (MAE)**

Microwave-assisted extraction (MAE) is a form of extraction method that involves utilization of the microwave energy in heating the plant material and solvent to enhance the extraction, shorten the processing time, and reduce the processing time. The microwaves cause the polar molecules and the ions in the plant cells to be influenced leading to a rapid internal heating, cell rupture and release of the phytochemicals. Compared to conventional Soxhlet, MAE consumes a lot less solvent, consumes less energy, and does not deactivate thermolabile compounds. It is highly effective in extraction of polyphenols and flavonoid, alkaloid and other moderately polar constituents. Maximum utilization of microwave power, extraction time, solvent properties and temperature may be employed so as to achieve high selectivity and yield. MAE provides reproducibility of results, reduction of the environment, as well as facilitating sustainable and expedited natural-products extraction(61).

**Ultrasound-Assisted Extraction (UAE)**

In ultrasound-assisted extraction (UAE), acoustic cavitation is employed to destroy plant cell walls by the formation and collapse of microbubbles to increase the transfer of phytochemicals across cell walls into the solvent. The mechanical effect enhances penetration of the solvent and increases solvent release rate of intracellular compounds. UAE is a green method since it saves a lot of time, solvents and energy usage than traditional methods. It can especially be used to extract polyphenols, flavonoids, saponins, glycosides and other moderately polar compounds. Low temperatures will maintain heat-sensitive components. Easy optimization of variables like frequency, power, time, and solvent make UAE scalable and compatible with NADES or enzymes and enables sustainable and efficient phytochemical extraction(62).

**Enzyme-Assisted Extraction**

Enzyme-assisted extraction (EAE) is the extraction process using certain enzymes such as cellulases, pectinases, hemicellulases and proteases to release phytochemicals out of the cell wall of plants. By working under modest conditions that are environmental friendly, EAE does not necessitate the solvents to be harsh and work under high temperatures. Enzymatic hydrolysis is beneficial in enhancing the extraction of polyphenol, flavonoids, alkalids and polysaccharides by increasing mass transfer and reducing the time of extraction. The method normally offers purer extracts and minimizes impurities and shortens the purification procedure. The efficiency involves optimization of the pH, temperature, enzyme concentration and incubation time. EAE is multitask and can be applied to use along with UAE or MAE, as a practical and effective approach of phytochemical extraction(63).

**Natural Deep Eutectic Solvents (NADES)**

The new generation green solvents are the Natural Deep Eutectic Solvents (NADES), which are solvents that have been formed by mixing natural products (organic acids, sugars, amino acids or choline derivatives) in specific ratios. These are non-toxic, non-volatile, renewable, and biodegradable solvents that can be easily tuned in terms of polarity with the aim of extracting easily both hydrophilic and hydrophobic phytochemicals. NADES enhance solubility, the stability of volatile compounds, enhance extracts and shelf life. They possess a great solvation potential and disruption effect on the walls of plant cells, which enhance the degree of extraction efficiency and potentially further enhanced in conjunction with the methods of microwave or ultrasound. Although there is the restriction of high viscosity, it can be diluted or the temperature changed. NADES provide a clean and green process of extracting phytochemicals(64).

**Green Synthesis and Derivatization of Phytocompounds**

**Bio-Catalysis**

The application of enzymes or complete cell systems to achieve chemical changes under mild and eco-friendly conditions is termed biocatalysis. It allows highly selective, regio and stereospecific reactions with enzymes, such as

oxidoreductases, glycosyltransferases, esterases, and lipases, with phytocompounds. They are solubility increasing reactions, founded on atom-economical preparations, green or aqueous solvents. Particularly, biocatalysis has been utilized in the various transformation of flavonoids, terpenoids, alkaloids and polyphenols and this is an environmentally friendly policy of transforming phytochemicals to create value-added products(65).

**Photocatalysis**

Photocatalysis utilises the light energy and a photoactive catalyst or semiconductor to catalyze chemical reactions under solvent-minimal and mild conditions. It does not require the use of high temperatures, powerful oxidizers, and toxic reagents, thus, it is a green technique of modifying phytochemicals. Photocatalysis at visible light is the most selective way of functionalizing phenolics, terpenoids, and aromatic compounds with limited by-products. Recyclable catalysts such as TiO2 and graphitic carbon nitride have increased sustainability, which justifies atom economy, less wastage, and greener deriving of phytocompounds(66).

**Green Solvents**

Green solvents are environmentally-friendly substitutes of traditional organic solvents and are needed to process phytochemicals sustainably. Examples are water, ethanol, supercritical CO 2, ionic liquids, and NADES, which are all low-toxic, biodegradable, and have low environmental influence. They increase reaction selectivity, decrease hazardous wastes and make it easier to recover the product. They have tunable properties and are therefore likely to be applicable in enzymatic and photocatalytic reactions and can safely substitute solvents such as hexane, chloroform and dichloromethane in green synthetic processes(67).

**Flow Chemistry**

Flow chemistry reactions are conducted in continuously flowing microreactors in comparison to the batch system which provide safer, reproducible and efficient process of phytocompounds synthesis. Adjustment of temperature, pressure and residence time is highly fine and inhibits decomposition, increasing selectivity. An increase in mixing and mass transfer will merely increase reactions within a shorter duration of time with minimal by-products and less solvent consumption. Photochemical reactions, enzymatic reactions and catalytic reactions are the reactions best run in flow system which also allows one to handle reagents which are dangerous. It is compatible with the green chemistry, enhancing atom economy, generation of waste, and, in addition, quick and sustainable derivatization of phytochemicals(68).

**Analytical Methods Aligned with Green Chemistry**

**Minimal-Solvent Chromatographic Methods**

The solvent-minimal chromatographic techniques reduce the threat of solvent use, and they offer a high-resolution phytochemical separation. Methods like UHPLC, micro-HPLC, TLC and SFC use less solvent and use less harmful solvents like ethanol or water. The strategies mitigate the impact on the environment, increase the level of safety, reduce the levels of waste and encourage cost-effective and sustainable laboratory practice in the spirit of green chemistry(69).

**Green NMR Protocols**

Green NMR techniques are meant to minimize solvent consumption, eliminate reagents with toxicities and to conserve energy in the process of elucidating phytochemical structures. There are no traditional deuterated solvents (CDCl3 or DMSO-d6) used, instead greener alternatives such as D2O, ethanol-d6, or bio-derived solvents are used with no reduction in spectral quality. Smaller sample volume and low power Microcoil and benchtop NMR have smaller sample volume requirements and lower power requirements. Real time NMR can be used to monitor reactions without the need to undergo purification repeatedly. These advances help to minimize waste, toxicity and cost, preserve accuracy and reproducibility of the analysis(70).

**Biosensor-Based Phytochemical Analysis**

Biosensor based analysis involves the use of biological elements (enzymes, antibodies, aptamers or microbial cells) coupled with transducers to selectively and quickly detect phytochemicals(71). This is a green analytical method that does not require a lot of sample preparation, solvents, or a complex instrumentation. Biosensors have been of great use in the detection of phenolics, flavonoids, alkaloids, antioxidants and enzymatic inhibitors in crude extracts or in minimum processed samples. Electrochemical and optical biosensors include high sensitivity, limit of detection and real time monitoring. They can be easily transported and consume minimum energy, hence they are suitable to be used in the field to analyze the medicinal plants to ensure sustainability in the quality assessment of medicinal plants. Moreover, biosensors produce very little waste and they do not run in harsh conditions but under mild and aqueous conditions, which also minimize environmental consequences. Specificity with environmental-friendly operation offers biosensor-based methods with a strong green alternative to conventional chromatographic and spectroscopic analysis, which increases sustainability in phytochemical analysis(72).

**Integrating Cognitive Science with Green Chemistry**

**How Cognitive Principles Guide Green-Chemistry Decisions**

**Expert Decision Frameworks for Selecting Extraction/Synthesis Routes**

Expert decision frameworks are rule-based approaches that are designed to assist the researcher in choosing environmentally friendly extraction and synthesis pathways. In these systems, there are quantifiable criteria, including solvent toxicity, energy requirement, extraction yield, cost, and sustainability, to objectively assess numerous options. Expert frameworks are applied in phytochemical studies in order to decompose the complex decisions in the form of scoring matrices, flowcharts, and multicriteria analysis tools. As an illustration, deciding between extracting a substance using a supercritical CO2, a microwave-assisted or a standard solvent extraction can be critically considered based on weighted parameters, which are associated with the principles of green chemistry(73). Cognitive science enhances this process by eliminating bias and encouraging logical and step-by-step reasoning. Through the externalization of expert knowledge into decision rules, the researchers do not have to use intuition or trial and error experimentation(74). These frameworks allow efficient, transparent and reproducible decision-making, which eventually enhances efficiency and environmental practice in the research of phytocompounds(75).

**Cognitive Heuristics for Solvent Selection**

Cognitive heuristics application has been a series of mental short-cuts which enable the researchers to simplify the complicated nature of the decision they are supposed to make in a research such as deciding on which solvents to use when extracting or synthesizing green. Green chemistry Heuristics The green chemistry directs scientists towards solvents that are safe, renewable, biodegradable, and energy-efficient. A few of the general heuristics are; prefer polar protic solvents, avoid halogenated solvents as well as prefer solvents that are not conflicting with safety and environmental regulations and policies. These rule-of-thumb will help filter the bad decisions quickly and indicate more promising options like ethanol, water, supercritical CO2 or NADES(76). Cognitive science will ensure that the heuristics are informed with empirical evidence and not prejudice or familiarity. It can be used together with solvent-selection guides, such as the CHEM21 solvent ranking or GSK solvent sustainability index, to make the decision more accurate(77).

**Mental Models for Predicting Reaction Greenness**

Mental models are images of the mind used by scientists in understanding, predicting and evaluating the impact of chemical reactions on the environment. In synthesis of phytocompounds, mental models can be applied to enable the researcher visualize the impact of the reagent selection, catalyst performance, temperature, energy input, and the solvent systems on reaction greenness(78). To give an example, researchers can cogitate by a sequence of how a batch processing system could be reformatted into a flow system or a potent acid catalyst into an enzyme to reduce the level of waste and energy consumption. Scientists can predict potential dangers, approximate atom economy and determine the efficiency of reactions with the assistance of these models and run experiments before they occur.

Cognitive science enhances these models by encouraging a structured evaluation instead of the intuitive assumptions and preventing cognitive biases, which minimize the perceived risks to the environment(79).

**Cognitive-Green Workflows for Phytocompound Research**

**Step-Wise Integrative Framework for Sustainable Design**

The step-wise will involve the combination of cognitive science and the principles of green-chemistry, and hence the step-wise will be the cause of hierarchical and sustainable sequence of the research process in the phytocompound research(80). The first system starts with a statement of the problemobviously define phytochemical target, what will be the purity needed and what will be used. Cognitive tools (decision trees, concept mapping, hypothesis matrices) are then used to research extraction and synthesis choices in a systemic way(81). The green-chemistry measures, such as solvent safety, energy consumption, atom economy and waste minimization, are provided in each step. The choice of the method (e.g. MAE, UAE, supercritical CO2) turns out to be the next stage of the working process but, it does not rely on the intuition only, it is connected with the evidence-based logic(82).

**Case Mapping: Identifying Greener Processes Through Cognitive Matrices**

Case mapping involves the visual comparison of the extraction or synthesis processes through cognitive matrices according to sustainability criteria in terms of solvent toxicity, energy consumption, yield, cost, and environmental impact. The organization of these variables allows the researchers to assess such options as supercritical CO2, NADES, MAE, or UAE and rank them objectively with the help of weighted scores. This pattern-oriented method shows the green options, demonstrates the opportunities of combinations of methods (e.g., UAE + NADES), and facilitates strategic, sustainable decision making in the phytochemical study(83).

**AI-Driven Cognitive Support for Green Chemistry**

**ML for Green Solvent Prediction**

Machine learning (ML) has the ability to suggest appropriate green solvents to use during the extraction of phytochemicals based on the presence of large datasets on solvent properties, toxicity, polarity, boiling points, biodegradability, and extraction efficiency. Random forests, SVMs, and neural networks algorithms are used to find the best and most sustainable solvent choices, which lessen the trial and error and wastefulness. ML also increases the objective and consistent selection of solvents and helps in the greener, more efficient phytochemical processes through the integration of the principles of cognitive science, including structured decision-making and bias reduction, in accordance with the principles of green chemistry(29).

**Cognitive–Computational Models for Phytocompound Optimization**

The alternative is the integration of the human policies of decision-making with the computational supports of cognitive-computational models to optimize the phytocompound design, derivatization, and extraction. They are a combination of pattern recognition, hypothesis testing, chemoinformatics, QSAR analysis and molecular docking which assists in proper prediction of the bioactivity and locating the best reaction conditions. They also have green-chemistry-parameters including atom economy and solvent safety. The hybrid system eases the cognitive load, minimizes the subjective bias and brings about an effective and sustainable optimum of the phytochemical processes(84).

**Digital Twin Systems for Green Extraction Simulation**

Digital twin systems generate computer-based models of extraction processes that enable the simulation of MAE, UAE, EAE, and supercritical CO2 processes without having to carry out any experiments. They aid in testing conditions, anticipatory trouble-shooting, and green workflow optimization, waste reduction, resource saving and sustainable phytochemical research by simulating solvent interactions, mass transfer, use of energy and environmental implication(85).

**Case Studies and Real-World Examples**

Practical phytochemical operations are increasingly becoming comparable to the merging of the concepts of cognitive principles and green-chemistry as shown in Table 1.

## CONCLUSION

The green chemistry and cognitive science synergy is a good paradigm that combines rational scientific reasoning and sustainable lab practices. Cognitive aids such as decision matrices, mental models, and heuristic frameworks have the potential to enhance openness, reduce the number of biases, and make decisions based on evidence when extracting, synthesizing, and analyzing information. This, coupled with the principles of green-chemistry less-toxic solvents, less-energy solvents, biocatalysis and ecologically-friendly methodologies of analysis improves efficiency, reproducibility and environmental responsibility in phytochemical studies. The strategy improves the speed at which the lead is found, reduces the risky wastes, and increases sustainable practices. It has an interdisciplinary nature, which results in the rise of interdisciplinary cooperation between chemists, psychologists, data scientists, and environmental researchers and the introduction of new technology, including AI-suggested decision tools, digital twins, and smart labs. A coordinated teaching and research policy grounded on cognitive-green principles will train future scientists to achieve the design of smart and environmentally sustainable workflow, and make cognitive-green chemistry one of the most significant contributors to the creation of natural products in an environmentally friendly manner.

**Table 1: Green Chemistry Integration in Phytocompound Research**

| Case Study | Description | Green/Cognitive Method Applied | Example Source Citation |
|---|---|---|---|
| Green extraction of curcumin guided by decision-chain analysis | Curcumin extraction optimized using a structured decision chain evaluating solvent safety, energy use, and yield. Supercritical $CO_2$ was selected over ethanol and hexane based on weighted sustainability criteria. | Decision-chain analysis; Multicriteria decision matrices; Supercritical $CO_2$ extraction. | (85) |
| Cognitive modelling–assisted flavonoid isolation techniques | Flavonoid isolation from *Camellia sinensis* improved using cognitive–computational models combining PCA, pattern recognition, and hypothesis mapping to refine solvent choice and extraction order. | Cognitive modelling; PCA-based decision support; UAE/MAE optimization. | (86) |
| NADES-based extraction decisions simplified by heuristic evaluation | NADES formulation (choline chloride–glycerol) chosen for phenolic extraction using heuristic rules such as "prefer biodegradable hydrogen-bond donors" and "maximize polarity–target match." | Heuristic evaluation; Solvent-selection heuristics; NADES green extraction. | (87) |
| Bio-catalytic synthesis of plant terpenoids optimized using cognitive workflows | Enzymatic transformation of monoterpenes optimized using cognitive workflows incorporating decision-trees for enzyme selection, mild reaction conditions, and solvent minimization. | Cognitive decision-tree modelling; Enzymatic catalysis; Aqueous green solvents. | (88) |

**ABSTRACT**

Antibody-drug conjugates have revolutionized breast cancer treatment by delivering potent cytotoxic payloads directly to tumor cells via targeted monoclonal antibodies, minimizing systemic toxicity. Key mechanisms include antigen-specific binding, receptor-mediated internalization, lysosomal payload release, bystander killing, immunomodulation, and therapy-induced senescence, driving efficacy across HER2-positive, HER2-low, and triple-negative breast cancer. Clinical breakthroughs include trastuzumab emtansine, trastuzumab deruxtecan and sacituzumab govitecan, achieving unprecedented progression-free survival and objective response rates in previously treated patients. Innovations in antibody engineering, cleavable/non-cleavable linker technology, payload potency, and site-specific conjugation have significantly enhanced therapeutic indices. Despite success, resistance via antigen loss, multidrug resistance efflux, tumor microenvironment barriers, and toxicities—interstitial lung disease (~15% with T-DXd) and neutropenia (~25% with SG)—remain challenges. Counterstrategies include bispecific ADCs, dual-payload designs, combination therapies with immune checkpoint inhibitors, PARP inhibitors, and TME-modulating agents, plus real-time biomarker monitoring (ctDNA, spatial transcriptomics) and AI-driven personalization. Next-generation ADCs featuring immunostimulatory payloads, nanotechnology-

enhanced penetration, and optimized sequencing promise broader efficacy in HER2-low and resistant tumors. These advances solidify ADCs as a cornerstone of precision oncology, transforming outcomes in aggressive breast cancer subtypes.

**Keywords:** Mechanism, ADC designs, Clinical efficacy, Resistance, Counterstrategies

## INTRODUCTION

Antibody-drug conjugates represent a novel class of anticancer compounds for breast cancer, combining cytotoxic drugs with monoclonal antibodies to precisely target tumor cells while sparing healthy tissues [1]. Modern treatment approaches heavily rely on ADCs, particularly for TNBC and HER2-positive subtypes due to their specificity in reducing off-target toxicity [2]. The success of T-DM1 and T-DXd has driven ADCs to account for over 40% of ADC-related oncology revenue. Growing approval rates and an expanding clinical pipeline are projected to propel the global ADC market, estimated to reach $15–18 billion by 2030 [3]. The United States leads the global FDA-approved ADC market, driven by frequent clinical trials, substantial research and development investments, robust intellectual property protection and favorable regulatory frameworks [3, 4]. ADCs are complex bioconjugates consisting of a monoclonal antibody targeting tumor-associated antigens, a highly potent cytotoxic payload (e.g., DNA-damaging agents, topoisomerase inhibitors or microtubule inhibitors) and a linker connecting the antibody to the payload. This structure ensures systemic stability and controlled drug release at the target site through cleavable or non-cleavable mechanisms [5]. The DAR, a critical factor in assessing efficacy and toxicity measures the number of drug molecules per antibody. Advances in conjugation technology have enabled precise DAR control, improving therapeutic outcomes [6]. ADCs induce tumor cell death through a multi-step mechanism: the monoclonal antibody binds to a tumor cell surface antigen, facilitating internalization of the ADC-antigen complex via receptor-mediated endocytosis followed by lysosomal degradation and cytotoxic payload release. The payload disrupts DNA replication, interferes with microtubule assembly or exerts a bystander effect by diffusing into nearby antigen-negative cells [7-9]. Agents such as T-DM1, T-DXd and SG have demonstrated significant improvements in response rates and PFS in heavily pretreated patients [6, 10]. The therapeutic potential of ADCs has grown due to continuous refinements in their design and applications.

Emerging targets such as Trop-2, EGFR and SSEA-4 along with innovations in valine-citrulline and thioether-based linker chemistry are expanding ADC applicability in HER2-low and TNBC subtypes by minimizing systemic toxicity and optimizing payload release precision. Biomarker-driven methods such as HER2-low expression profiling guide ADC selection [8, 10]. In HER2-positive subtypes, combination therapies with ADCs and immunotherapeutic agents such as anti-PD-1/PD-L1 antibodies show promise in enhancing antitumor immune responses. ADCs are increasingly sequenced with immunotherapy and chemotherapy based on tumor biology and resistance patterns [5, 7, 9, 11-13]. Dual-payload ADCs targeting CDK and EGFR pathways offer new avenues for overcoming resistance, while next-generation payloads enhance efficacy and exhibit strong bystander effects [8, 12, 14]. PK/PD studies have optimized ADC dosing and linker stability to maximize tumor targeting and reduce off-target effects. Novel ADCs targeting specific antigens are undergoing clinical trials, with some showing potential to treat previously intractable subtypes [4]. Despite these advancements, clinical challenges persist including ADC resistance due to antigen down regulation, poor internalization, increased drug efflux via MDR1 pumps, mutations in payload targets (e.g., tubulin) and the need for improved linker stability and payload specificity to mitigate off-target toxicities such as interstitial lung disease (observed with T-DXd) [12-17]. Tumor heterogeneity and low antigen expression further challenge efficacy, sparking interest in pan-cancer ADCs targeting commonly expressed tumor antigens and necessitating innovative payload designs. However, novel approaches including dual-targeting ADCs, combination regimens with immune checkpoint inhibitors, early biomarker identification, collaborative clinical trial models and advanced payloads are being investigated to reduce failure rates in ADC-based treatments [18]. This assessment explores advancements in antibody selection, linker technology, payload selection, mechanisms of action, clinical efficacy,

resistance mechanisms, counterstrategies and future directions. It also discusses the potential of ADCs in combination therapies and their role in personalized medicine for breast cancer treatment.

**Mechanism of Action of Antibody-Drug Conjugates in Breast Cancer Therapy**

ADCs have revolutionized precision oncology by integrating a tumor-targeting mAb, a linker and a cytotoxic payload, preserving healthy tissues while effectively eliminating cancer cells. Their mechanism of action involves a multi-step process: antigen-specific high-affinity binding, receptor-mediated internalization, intracellular trafficking, payload release, direct cytotoxicity, bystander effects, immunomodulation and therapy-induced senescence. The stepwise mechanism is detailed below:

**Antigen-Specific Binding:** The ADC mechanism begins with the mAb selectively binding with high affinity to tumor-associated antigens over expressed on malignant breast cancer cells, minimizing off-target effects. Key targets include HER2 and TROP-2, with emerging targets such as LIV-1, HER3 and SSEA-4 under investigation. HER2 is over expressed in approximately 20% of breast cancers, yet ADCs like T-DXd demonstrate efficacy in HER2-low tumors (immunohistochemistry 1+/2+ without amplification) [11, 19]. TROP-2 is highly expressed in TNBC and other subtypes and is targeted by ADCs like SG which is effective even in low-TROP-2 tumors due to its bystander effect [20]. Emerging targets including LIV-1, HER3 and SSEA-4 are being explored for their potential in TNBC and resistant subtypes [21-25]. The specificity of mAbs ensures precise binding, with antigen characteristics such as expression levels and recycling behavior influencing binding efficiency and internalization rates [26].

**Receptor-Mediated Internalization:** The ADC-antigen complex formed upon binding is internalized into the tumor cell via receptor-mediated endocytosis to deliver the cytotoxic payload intracellularly. This process is driven by caveolae or clathrin-coated pits depending on the antigen and cell type. For instance, HER2 antigens exhibit high internalization rates, facilitating efficient ADC uptake due to rapid recycling, while slower-internalizing antigens require specialized linker technologies for extracellular payload release [27]. Internalization kinetics are influenced by the mAb's binding affinity and antigen specificity; for example, trastuzumab in T-DM1 binds specifically to HER2, enabling efficient endocytosis [28]. Upon internalization, the ADC is encapsulated in an early endosome which matures into a late endosome and fuses with lysosomes, creating an acidic (pH ~4.5–5.0) enzyme-rich environment conducive to payload release [29].

**Intracellular Trafficking and Payload Release:** Within the lysosomal compartment, the ADC undergoes degradation to release its cytotoxic payloaddriven by the linker connecting the mAb to the payload. Linkers are engineered for systemic stability but cleave under intracellular conditions such as low pH, elevated glutathione levels or enzymatic activity. Cleavable linkers such as valine-citrulline and valine-alanine linkers in ADCs like ladiratuzumab vedotin respond to lysosomal proteases like cathepsin B for payload release. pH-sensitive linkers (e.g., hydrazones or carbonates) hydrolyze in the acidic lysosomal environment, commonly used for TNBC subtypes [30, 31]. Glutathione-responsive disulfide-based linkers exploit elevated intracellular glutathione levels as seen in some TROP-2-targeted ADCs. Tetrapeptide-based GGFG linkers used in T-DXd, undergo lysosomal enzyme-mediated cleavage to release DXd [32, 33]. Non-cleavable linkers like the SMCC linker in T-DM1 offer enhanced plasma stability and reduced systemic toxicity but require complete lysosomal degradation of the mAb to release the payload (e.g., lysine-MCC-DM1 complex) [34, 35]. Cytotoxic payloads (100–1000 times more potent than traditional chemotherapeutics) include microtubule inhibitors (e.g., DM1 in T-DM1, MMAE in disitamab vedotin), topoisomerase I inhibitors (e.g., deruxtecan in T-DXd, SN-38 in SG), and DNA-damaging agents (e.g., pyrrolobenzodiazepines, calicheamicins). These disrupt microtubule polymerization, induce DNA double-strand breaks or cause DNA crosslinking respectively [28, 36, 37]. The DAR such as ~8 in T-DXd enhances potency but requires careful management to minimize systemic toxicity through site-specific conjugation and linker stability [38, 39].

**Direct Cytotoxicity:** The released payload induces tumor cell death by disrupting microtubules, causing DNA damage or acting through other mechanisms. Microtubule inhibitors like DM1 and MMAE inhibit microtubule

assembly, arrest the cell cycle at the G2/M phase, disrupt mitotic spindles and promote apoptosis particularly in rapidly dividing breast cancer cells [30, 34]. Topoisomerase I inhibitors such as DXd and SN-38 induce apoptosis by causing DNA double-strand breaks and replication fork collapse in tumors with high replicative stress like TNBC [32, 40]. Novel payloads such as CDK inhibitors and RNA polymerase inhibitors (e.g., $\alpha$-amanitin) arrest the cell cycle or inhibit transcription, offering alternative approaches for resistant tumors [41].

**Bystander Effect:** The bystander effect, a hallmark of ADCs like T-DXd, SG and MMAE-based ADCs enhance efficacy in heterogeneous tumors particularly TNBC by allowing membrane-permeable payloads to diffuse into nearby low-antigen or antigen-negative cells. In T-DXd, the membrane-permeable DXd pay load released via the GGFG linker diffuses into HER2-low or HER2-negative cells [32]. In SG, the CL2A linker mediates SN-38 release which diffuses into TROP-2-negative cells [20]. In MMAE-based ADCs like disitamab vedotin, the lipophilic MMAE enables diffusion into adjacent cells [36]. The bystander effect is influenced by payload hydrophobicity and linker design, with cleavable linkers facilitating diffusion. However, excessive bystander activity can increase off-target toxicity, necessitating optimized DAR and linker design [42].

**Immunomodulatory Effects:** ADCs exert immunomodulatory effects through immunogenic cell death, Fc-mediated effector functions and TME modulation. In immunogenic cell death, payload-induced cell death releases damage-associated molecular patterns (e.g., calreticulin, high-mobility group box 1), activating dendritic cells and T-cell responses. SG's SN-38 payload converts "cold" tumors into immunologically "hot" ones particularly in TNBC [43, 44]. Fc-mediated functions such as ADCC and CDC involve the mAb's Fc region engaging immune cells. T-DM1 and T-DXd retain trastuzumab's ADCC and CDC capabilities, attracting natural killer cells to HER2-positive cells [45, 46]. TME modulation recruits immune effector cells via cytokines from dying cancer cells, amplified in combination therapies like T-DXd with anti-PD-1 inhibitors (e.g., durvalumab in the BEGONIA trial) [13].

**Therapy-Induced Senescence:** Therapy-induced senescence, a distinctive feature of ADCs like T-DM1 contributes to long-term tumor control by inducing permanent growth arrest in tumor cells particularly in neoadjuvant HER2-positive settings. Senescent cells upregulate senescence-associated β-galactosidase and release pro-inflammatory cytokines and chemokines (e.g., interleukin-6, C-X-C motif chemokine ligand 10) as part of the senescence-associated secretory phenotype, enhancing tumor clearance by recruiting immune cells during TME reprogramming. DM1 release from T-DM1 triggers senescence in HER2-positive cells, increasing sensitivity to subsequent treatments and reducing recurrence [47, 48].

**Advancements in ADC Design for Breast Cancer Therapy**

**Linker technology**: Linker technology has dramatically enhanced the therapeutic index of ADCs in both HER2-positive and triple-negative breast cancer (TNBC) by optimizing systemic stability, controlled payload release, and bystander killing while minimizing off-target toxicity. Cleavable linkers exploit tumor-specific stimuli: enzyme-cleavable dipeptide (valine-citrulline, valine-alanine) and tetrapeptide GGFG linkers, as used in trastuzumab deruxtecan (T-DXd) with DAR ≈ 8, enable highly specific release of the topoisomerase-I inhibitor DXd and moderate bystander activity in HER2-positive and HER2-low disease [32, 49–51]; pH-sensitive hydrazone and carbonate linkers remain stable at physiological pH but hydrolyze in the acidic tumor microenvironment (pH 5.5–6.5) or lysosomes (pH 4.5–5.0) [31, 33]; glutathione-responsive disulfide linkers with steric hindrance prevent premature cleavage in plasma [7, 33, 52]; and dual-stimuli (pH + enzyme) designs further reduce systemic toxicity [49, 53]. Non-cleavable linkers, exemplified by the SMCC linker in trastuzumab emtansine (T-DM1), provide superior plasma stability and require complete lysosomal degradation for payload release, significantly lowering off-target effects [28, 34, 54, 55], while hydrophilic PEGylated or sulfonated non-cleavable linkers, such as the CL2A linker in sacituzumab govitecan (SG) targeting Trop-2, improve solubility, reduce aggregation, and enhance pharmacokinetics in TNBC, yielding ≈ 35% objective response rates in heavily pretreated patients via potent bystander killing from the membrane-permeable SN-38 payload [18, 20, 40, 42, 56, 61]. Site-specific conjugation platforms—transglutaminase-mediated ligation, click chemistry, and ThioMab technology—produce homogeneous ADCs with consistent DARs, further decreasing toxicity compared with random conjugation [38, 57–60]. Emerging immunomodulatory and diagnostic

linkers, along with hydrophilic polysarcosine designs, support combination strategies with PD-1/PD-L1 inhibitors and real-time monitoring [49, 53, 62, 63]. Despite these advances, challenges of premature payload release, hydrophobic linker-induced aggregation, tumor heterogeneity, and increased manufacturing complexity persist, necessitating ongoing optimization of cleavage kinetics and conjugation precision to fully realize the potential of next-generation ADCs in breast cancer [52, 64].

**Payload Selection:** Advancements in payload selection, linker technology and resistance management have significantly enhanced the TI, efficacy and safety of ADCs [56, 65]. Linker technology minimizes free payload release, reducing toxicities like neutropenia [12, 31]. ADCs utilize diverse cytotoxic payloads designed to disrupt essential cellular processes, leading to tumor cell death. Modern payloads are 100–1000 times more potent than traditional chemotherapeutics, requiring strategies like payload-binding selectivity enhancers, site-specific conjugation (cysteine/lysine-based) and cleavable linkers responsive to pH or enzymes to avoid off-target toxicity. High DARs (e.g., T-DXd's ~8) increase potency but risk toxicity, while low DARs may reduce efficacy [7, 38, 63]. Microtubule Inhibitors such as DM1 (a maytansinoid in T-DM1), MMAE (in brentuximab vedotin) and MMAF (in disitamab vedotin) are highly effective in HER2-positive subtypes by binding tubulin, blocking microtubule assembly, inducing mitotic arrest and triggering apoptosis. Their membrane permeability enables bystander effects in which the payload diffuses into neighboring antigen-negative cells and is advantageous for heterogeneous tumors [16, 27, 28, 30, 34, 65]. DNA-Damaging Payloads such as DNA alkylators form covalent bonds with DNA to crosslink strands, inhibiting replication and transcription, and are particularly useful in TNBC. Calicheamicins and pyrrolobenzodiazepines induce DNA strand breaks, bypassing efflux pumps like MDR1 to overcome resistance [24, 40, 66, 67]. Other Payloads include CDK inhibitors which halt cell cycle progression; anthracyclines; RNA polymerase inhibitors (e.g., $\alpha$-amanitin) and camptothecin derivatives which show promise in TNBC and HR-positive cancers [41, 66, 68-74]. Payloads like MMAE, DXd, and SN-38 exhibit bystander effects, enhancing efficacy in heterogeneous TMEs, as seen in T-DXd and SG [18, 20].Clinically, T-DXd's cleavable linker, high DAR and DXd payload outperform T-DM1 in HER2-positive breast cancer, while disitamab vedotin uses MMAF for improved efficacy [27, 75, 76]. SG and datopotamab deruxtecan transform TNBC therapy with SN-38, high DAR and bystander effects, targeting less responsive HR-positive tumors via LIV-1 and HER3 [2, 21, 77, 78]. Multi-mechanism payloadslike pyrrolobenzodiazepine dimers, combined with immune checkpoint or PARP inhibitors address resistance from antigen downregulation, efflux pump upregulation and altered trafficking [42, 66, 71, 79]. PK/PD optimization ensures controlled payload release but manufacturing challenges including payload stability and regulatory requirements persist. Adverse effects like interstitial lung disease (T-DXd) and neutropenia (SG) require dose optimization and monitoring [12, 80-82].

**Antibody Engineering:** Advancements in antibody engineering have improved ADC targeting precision and payload delivery while reducing off-target effects in breast cancer. In T-DM1, the maytansinoid DM1 is conjugated to trastuzumab via a non-cleavable thioether linker, targeting HER2 overexpressed in ~20% of breast tumors. Upon binding, T-DM1 is internalized, degraded in lysosomes and releases lysine-MCC-DM1 which binds tubulin, disrupts microtubule polymerization, induces G2/M arrest and triggers apoptosis. Its non-cleavable linker restricts bystander effects, ensuring selectivity for HER2-positive cells while retaining Fc-mediated ADCC and CDC and inducing senescence [28, 34]. However, efficacy is reduced in tumors with heterogeneous or low HER2 expression due to poor internalization or lysosomal degradation [28, 34].T-DXd, targeting HER2 (including HER2-low tumors) uses a cleavable tetrapeptide linker (GGFG) and DXd, a topoisomerase I inhibitor to induce apoptosis, cell cycle arrest and DNA double-strand breaks. Its high DAR and payload permeability enable bystander killing in heterogeneous tumors [18, 32, 63]. SG, a frontline treatment for metastatic TNBC uses a hydrolyzable CL2A linker to conjugate an anti-TROP-2 antibody with SN-38, releasing it in the acidic TME to cause DNA damage, replication fork collapse and apoptosis via bystander effects and immunogenic cell death [20, 40]. Datopotamab deruxtecan, another TROP-2-targeted ADC mimics T-DXd's mechanism with a cleavable tetrapeptide linker and DXd for TROP-2-low tumors [18, 32]. Ladiratuzumab vedotin targets LIV-1 in TNBC, delivering MMAE via a protease-cleavable valine-citrulline linker, disrupting microtubule dynamics and inducing G2/M arrest and apoptosis [30, 36]. Disitamab vedotin uses a cleavable linker with MMAE for HER2-low tumors [30, 36]. SSEA-4-targeted ADCs suppress proliferation and

migration in aggressive TNBC, while EGFR-targeted ADCs with CDK inhibitors overcome resistance by inhibiting EGFR signaling and retinoblastoma protein phosphorylation [23, 84].Traditional ADCs with non-specific conjugation result in heterogeneous DARs, increasing toxicity and reducing efficacy. Site-specific conjugation ensures consistent DARs and improved pharmacokinetics. A novel site-specific anti-HER2 ADC with engineered cysteine residues enhances stability and TI compared to T-DM1 [85]. Shielding payloads within the IgG Fc cavity reduces premature release [86]. Bispecific ADCs targeting dual antigens (e.g., HER2 and TROP-2) improve internalization and efficacy in heterogeneous tumors. Dual immune checkpoint modulators combined with ADCs boost immune responses and cytotoxic delivery in TNBC [13]. Next-generation ADCs like T-DXd enhance efficacy in HER2-low breast cancer with high-DAR designs, while engineered antibodies improve internalization rates and TI [27, 39].

**Resistance in ADC Therapy for Breast Cancer:** ADCs operate through a highly integrated mechanism involving antigen-specific binding to tumor-associated antigens, receptor-mediated internalization via endocytosis, lysosomal payload release through cleavable or non-cleavable linkers, direct cytotoxicity via microtubule inhibition or DNA damage, bystander effects involving payload diffusion to adjacent antigen-negative cells, immunomodulation through immunogenic cell death, Fc-mediated effector functions and therapy-induced senescence for long-term tumor control. However, intrinsic and acquired resistance mechanisms pose significant challenges including antigen loss or downregulation which causes decreased expression of HER2 or TROP-2 due to selective pressure or epigenetic modifications, thereby reducing ADC binding efficacy [40].Tumor heterogeneity is also a factor triggering partial tumour elimination which occurs when only a subset of cells expresses the target antigen (e.g., HER2) [15].Soluble antigen decoys such as HER2 extracellular domains sequester ADCs, reducing their availability to tumor cells [15].Impaired Internalization driven by mutations in endocytic pathways (e.g., clathrin-mediated endocytosis in T-DM1) hinder ADC uptake [16, 27].Disrupted lysosomal trafficking caused by dysfunctional lysosomes or altered transporter proteins impair payload release [15, 16]. Overexpression of multidrug resistance proteins such as P-glycoprotein or multidrug resistance-associated protein 1 expels payloads like DM1, DXd or SN-38, reducing intracellular drug concentrations [17].Payload metabolism involving enzymatic cleavage or detoxification of linker-payload complexes neutralizes cytotoxic effects [7]. Activation of DNA repair pathways such as homologous recombination repairs DNA damage induced by topoisomerase inhibitors like DXd in T-DXd, diminishing efficacy [7]. TME barriers including hypoxia, high stromal density and dense extracellular matrices hinder ADC penetration and diffusion [13]. Diminished immune effector functions resulting from downregulation of immune recognition molecules or immunosuppressive TME components impair ADC-mediated ADCC and CDC[13, 46]. Additionally, impaired bystander effects due to poor linker stability or insufficient payload diffusion limit efficacy in heterogeneous or antigen-negative tumors [41].

**Counterstrategies in ADC Therapy for Breast Cancer:** Antibody-drug conjugates (ADCs) have transformed precision oncology in HER2-positive, HER2-low, and triple-negative breast cancer (TNBC), yet resistance arising from antigen loss, payload efflux, tumour heterogeneity, and stromal barriers limits long-term efficacy. These challenges are being overcome through multifaceted strategies. Bispecific ADCs simultaneously targeting HER2/TROP-2 or HER2/EGFR restore efficacy in heterogeneous or antigen-low tumours [43,84,90], while dual-payload ADCs combining microtubule inhibitors with DNA-damaging agents broaden tumour cell kill and bypass single-payload resistance [42]. Advanced cleavable linkers (e.g., GGFG in T-DXd) and non-cleavable hydrophilic linkers (e.g., CL2A in sacituzumab govitecan, SMCC in T-DM1) optimise stability, lysosomal release, and bystander activity [50]. Combination therapies dramatically enhance outcomes: T-DXd or T-DM1 plus immune checkpoint inhibitors (ICIs) or TKIs (e.g., neratinib) restore HER2 internalisation, boost ADCC, and recruit T-cells [42,99,107,108]; PARP inhibitors sensitise BRCA-mutated cells to topoisomerase inhibitors like DXd [16,40]; MDR efflux-pump inhibitors (e.g., tariquidar) and TME-modulating agents (hyaluronidase, hypoxia-activated prodrugs) improve payload retention and tumour penetration [18,92]. Real-time biomarker monitoring using ctDNA, exosomal HER2, or spatial transcriptomics detects early resistance and guides therapy switching [81,93], while AI-driven models integrating genomic, proteomic, and clinical data predict response and optimise sequencing [94,95]. Strategic sequencing is critical: prior anti-HER2 therapy or chemotherapy can induce cross-resistance via MDR pumps, whereas switching payloads (e.g., T-DM1's DM1 → T-DXd's DXd → SG's SN-38) or combining with non-overlapping

agents (ICIs, PARP inhibitors) sustains efficacy [8,15,98-100]. Clinically, T-DM1 achieves ~9.6-month PFS in HER2-positive metastatic disease [28], T-DXd delivers 25.1-month PFS and 79.7% ORR in HER2-positive and remarkable activity in HER2-low disease [101], and SG yields 35% ORR and 5.6-month PFS in heavily pretreated TNBC [42]. Toxicity (interstitial lung disease ~15% with T-DXd, neutropenia ~25% with SG) is managed through proactive monitoring and dose optimisation [12,39,80,96]. Future directions include immunostimulatory payloads (TLR/STING agonists), nanotechnology-enhanced penetration, non-invasive resistance tracking, and cost-effective formulations, collectively expanding the therapeutic window of ADCs across breast cancer subtypes [65,99,102-106].

**Clinical Efficacy of Antibody-Drug Conjugates in Breast Cancer**

The comprehensive analysis of clinical efficacy focuses on clinical trial data to evaluate the effectiveness of ADCs in improving response rates, including ORR, CRand PR as well as survival outcomes such as PFSand OS across diverse breast cancer subtypes, including HER2-positive HER2-low and TNBC. ADCs such as T-DXd, T-DM1 and SHR-A1811 have demonstrated significant benefits over traditional chemotherapy regimens for these subtypes. In HER2+ breast cancer, ADCs like T-DXd outperform chemotherapeutic agents, including paclitaxel, docetaxel, capecitabine and anthracycline-based regimens, achieving an ORR of 79.7% and a PFS of 25.1 months compared to an ORR of approximately 30% and a PFS of 9 months for chemotherapy [109]. Similarly, the ADC SHR-A1811 increases pCRrates by 20–40% over taxane-based chemotherapy regimens in the neoadjuvant setting by providing targeted HER2 delivery and improved spatial distribution within the TME [93]. In mBC, T-DXd demonstrates superior efficacy compared to traditional chemotherapy drugs, such as capecitabine, eribulin, vinorelbine and gemcitabine with an ORR of 52.3%, a PFS of 10.1 months and an OS of 23.9 months compared to an ORR of approximately 16%, a PFS of 5.4 months and an OS of 16.8 months for chemotherapy [109, 110]. For metastatic TNBC, SG offers notable efficacy in pretreated patients, achieving an ORR of 35%, a PFS of 5.6 months and an OS of 12.1 months compared to an ORR of approximately 5%, a PFS of 1.7 months and an OS of 6.7 months for chemotherapy [109]. In HR-positive/HER2-negative mBC, datopotamab deruxtecan (Dato-DXd) significantly improves patient outcomes over chemotherapy agents like eribulin, capecitabine and vinorelbine with an ORR of 36.4% and a PFS of 6.9 months compared to an ORR of approximately 26% and a PFS of 4.9 months for chemotherapy [109]. In HER2+ and HER2-low advanced breast cancer, SYD985 (trastuzumab duocarmazine) demonstrates superior efficacy over chemotherapy agents such as capecitabine, vinorelbine and eribulin, achieving an ORR of 28–40%, a PFS of 7.0 months and an OS of 15.8 months compared to an ORR of approximately 20% and a PFS of 4.9 months for chemotherapy [94, 109].

**Advances in Antibody-Drug Conjugates for Breast Cancer Therapy**

ADCs are transforming the landscape of breast cancer treatment by improving PFS and OS in patients with HER2-positive, HER2-low, HR+ and TNBC subtypes through advanced designs, combination therapies and personalized approaches based on patient profiles. Three ADCs have been approved by the FDA for BC treatment: T-DM1 (Kadcyla) which contains the microtubule inhibitor DM1 as its cytotoxic payload and targets HER2-positive mBC; T-DXd (Enhertu), approved for both HER2-positive and HER2-low BC which contains deruxtecan with a high DAR and exerts topoisomerase I inhibitory action with a bystander effect and SG (Trodelvy) which delivers SN-38, a topoisomerase I inhibitor, targeting TROP2 in TNBC and HR+/HER2-negative BC [110-115].These ADCs have revolutionized BC treatment by enhancing efficacy and minimizing systemic toxicity, driving research into combination therapies and advancing precision oncology with tailored approaches to overcome resistance and optimize patient outcomes [116]. Clinical trials such as DESTINY-Breast11 and BEGONIA aim to optimize integration with immune checkpoint inhibitors, tyrosine kinase inhibitors and PARP inhibitors, reducing toxicity concerns. ADCs also show significant potential to replace anthracyclines in early-stage therapy. Meanwhile, the development of biosimilars and scalable diagnostic platforms will address economic barriers, ensuring equitable access [117-119]. These advancements are refining precision oncology across diverse subtypes, with ongoing clinical trials, advanced diagnostics and equitable access initiatives poised to overcome current limitations and establish ADCs as a cornerstone of global breast cancer care. Some of the major advances of ADCs in breast cancer treatment are as follows:

**Next-generation ADCs:** Next-generation ADCs have expanded the therapeutic potential due to their specially engineered structures capable of overcoming resistance mechanisms such as antigen downregulation and MDR1 upregulation. Novel designs targeting TNBC subtype includes bispecific ADCs (target dual antigens such as HER2/TROP2), immunostimulatory ADCs with Toll-Like Receptor agonist payloads (enhance immune responses) and dual payload ADCs employing agents like MMAE and topoisomerase inhibitors (broaden the efficacy against TNBC)[103, 116].

**ADCs with Immune Checkpoint Inhibitors:** The integration of ADCs with immune checkpoint inhibitors cause cell death in immunologically "cold" tumours like TNBC. This process releases tumour antigens, enhancing T-cell activation which is further augmented by ICIs particularly anti-PD-1/PD-L1 antibodies. For example, the KATE2 clinical trial demonstrated a 54% ORR in PD-L1-positive, HER2-positive breast cancer with T-DM1 plus Atezolizumab compared to 33% with T-DM1 alone [71]. Similarly, the SGNLVA-002 trial combining SG with Pembrolizumab showed a 35% ORR in metastatic TNBC, despite exhibiting some tolerable effects such as diarrhea (20%) and neutropenia (15%) [120]. The BEGONIA trial also validated the efficacy of T-DXd with Durvalumab in PD-L1-positive TNBC, reporting no interstitial lung disease, suggesting a favourable safety profile [108]. However, challenges such as interstitial lung disease (15% with T-DXd) and immune-related adverse events necessitate close monitoring to optimize therapeutic outcomes [94].

**ADCs with Tyrosine Kinase Inhibitors:** Combining ADCs with tyrosine kinase inhibitors like lapatinib, neratinib and tucatinib facilitates internalization and enhances efficacy by inhibiting HER2 or EGFR pathways, thereby overcoming pathway-driven resistance [185]. The TEAL trial combining T-DM1, lapatinib and nab-paclitaxel reported a 70% pCR rate in neoadjuvant HER2-positive breast cancer, outperforming trastuzumab-based regimens [121].In the TBCRC 022 study,T-DM1 and neratinib achieved a 33% CNS response rate in HER2+ brain metastases [11]. Additionally, the HER2CLIMB-04 trial combining T-DXd with tucatinib demonstrated a 47% ORR in heavily pretreated HER2+ patients while the Phase III HER2CLIMB-02 trials is evaluating long-term patient outcomes [94]. Nevertheless, issues such as hepatotoxicity, diarrhoea, heterogeneous HER2 expression and PI3K/AKT pathway activation necessitates dose optimization and resistance monitoring [122].

**ADCs with Chemotherapy:** Chemotherapy enhances efficacy of ADC by upregulating tumour antigens, inducing immunogenic cell death and reducing toxicity risks through sequential administration. For example, the DESTINY-Breast11 trial is evaluating T-DXd-based regimens versus Anthracycline-based chemotherapy in HER2+ early breast cancer, aiming to establish anthracycline-free protocols [118]. The NCT04039230 trial combining SG with taxanes reported a 40% ORR in TNBC, supported by preclinical data showing enhanced DNA damage [115]. Additionally, a retrospective study showed improved PFS (median 8.2 months) in HER2-low metastatic breast cancer using sequential T-DXd followed by SG [116]. However, challenges such as hematologic toxicities (e.g., 25% neutropenia with SG) necessitate supportive interventions such as granulocyte colony-stimulating factor to improve tolerability[120].

**ADCs with Radiotherapy:** Radiotherapy enhances the efficacy of ADC by upregulating tumour antigens and improving uptake of ADC especially when combined with radio sensitizing payloads like MMAE [112]. Preclinical models showed a 30% increased survival in HER2+ and TNBC using radiosensitizer-ADCs with ongoing trials exploring early-stage applications [113]. However, TME hypoxia may reduce efficacy, necessitating optimized timing and scheduling of radiotherapy and ADC administration [103].

**ADCs with Other Targeted Therapies:** Combining ADCs with targeted therapies such as PARP, PI3K or CDK4/6 inhibitors addresses tumour heterogeneity by modulating alternative pathways [111]. In the NCT04039230 trial, SG combined with talazoparib showed a 45% ORR in TNBC by impairing DNA repair [115]. Preclinical studies also demonstrate that T-DXd combined with PI3K inhibitors enhances efficacy in HR+/HER2-low tumours [182]. However, upregulation of multidrug resistance protein 1 limits its applicability, underscoring the need of biomarker-driven strategies [116].

**ADCs in Personalized Medicine:** ADCs are well-suited for personalized therapies due to their targeted design which facilitates the exploration of biomarkers, molecular subtypes and therapeutic sequencing [123]. A recent study evaluated SHR-A1811 in addressing intratumoral HER2 heterogeneity and modulating the immune microenvironment in neoadjuvant HER2+ breast cancer, highlighting the need for spatial biomarker profiling [93]. Additionally, a preclinical trial using an anti-transferrin receptor ADC demonstrated potent antitumor activity in TNBC [129].

**Biomarker-Driven Patient Selection:** Biomarker-based patient selection is vital for optimizing ADC. T-DM1 and T-DXd both target HER2 with T-DXd demonstrating more efficacy in HER2-low tumours (immunohistochemistry 1+/2+ without amplification) [11, 121]. SG is effective in low-TROP2 tumours due to its bystander effect, reducing the need for stringent pre-testing [115]. Emerging biomarkers like LIV-1 and Claudin-18.2, along with resistance markers such as MDR1 are identified through multi-omic profiling using ctDNA and peripheral blood transcriptomics [129]. Despite the significant contributions made by biomarkers in patient selection, challenges such as tumour heterogeneity and dynamic antigen expression necessitate advanced tools like single-cell sequencing [111].

**Molecular Subtyping and Precision Targeting:** Molecular subtyping facilitates targeted ADC therapy. For instance, T-DXd is effective as a second-line agent in HER2-enriched tumours in HER2+ breast cancer, achieving a median PFS of 16.8 months compared to T-DM1 [11]. SG is effective across all subtypes, with the NeoSTAR trial demonstrating a 55% pCR rate in neoadjuvant therapy [119]. Combination therapies supported by multi-omic profiling identify PI3K mutations in HR+/HER2-negative tumours [117]. However, standardized omics platforms are needed to manage interpatient heterogeneity.

**Therapeutic Sequencing:** Strategic sequencing enhances ADC efficacy. Sequential use of T-DXd followed by SG supports distinct antigen targeting in HER2-low breast cancer, prolonging PFS. In HER2+ breast cancer cases, ADCs are standard second-line trials exploring first line use. SG is typically reserved for later lines in TNBC, though adjuvant trials are investing earlier use [94, 116, 120]. However, cross-resistance between ADCs with identical payloads remains a challenge, necessitating careful sequencing strategies [110].

**Integration with Multi-Omics Profiling:** Multi-omics profiling incorporating genomics, transcriptomics and proteomics predicts treatment response, identifies novel targets and enhances biomarker discovery through AI-based platforms. For example, the CATCH trial demonstrated improved PFS in mBC by leveraging multi-omics profiling. However, high costs burden and data integration challenges limit widespread adoption, underscoring scalable solutions [124]

## CONCLUSION

ADCs have transformed breast cancer management across HER2-positive, HER2-low, hormone receptor-positive and TNBC subtypes by delivering highly potent payloads with precision. Through antigen-specific binding, receptor-mediated internalization, lysosomal payload release, bystander killing, immunomodulation, and therapy-induced senescence, ADCs achieve remarkable efficacy. T-DM1 delivers ~9.6-month PFS, while T-DXd achieves 25.1-month PFS and 79.7% ORR in HER2-positive metastatic disease, with expanding activity in HER2-low tumors; SG yields ~35% ORR in heavily pretreated TNBC. These successes stem from advanced linker technologies, optimized drug-to-antibody ratios, hydrophilic designs, and potent payloads. Despite progress, resistance via antigen loss, multidrug resistance efflux, and TME barriers, alongside toxicities (interstitial lung disease ~15% with T-DXd; neutropenia ~25% with SG), limits durability. Emerging counterstrategies include bispecific ADCs, dual-payload designs, combination regimens with immune checkpoint inhibitors, TKIs, or PARP inhibitors, and real-time monitoring via ctDNA and spatial transcriptomics. AI-driven multi-omic profiling and strategic sequencing further enhance outcomes and minimize cross-resistance. Next-generation ADCs incorporating immunostimulatory payloads, nanotechnology, and cost-effective biosimilars promise broader applicability and accessibility. Ongoing trials (e.g., DESTINY-Breast11,

BEGONIA) continue refining combinations and diagnostics. ADCs are now a cornerstone of precision oncology, redefining standards and offering durable, personalized solutions across breast cancer subtypes.

## ABSTRACT

Agriculture plays vital role in development of country. But Indian agriculture is characterized by risk bearing and uncertainty because of many factors like, lack of technology and lack of knowledge on risk mitigation. Crop insurance is a risk management tool which provides farmers with a minimum amount of protection. Crop insurance also aids in maintaining farm income stable by promoting technology, boosting investment, and increasing flow of credit to the agricultural sector. Pradhan Mantri Fasal Bima Yojana scheme is a kind of a "One Nation-One Scheme" launched in the year 2016. The study was conducted in the year 2023, ex-post-facto research design that was adopted as a strategy of investigation to obtain answer to the research questions. The study was conducted in Cuddalore district of Tamil Nadu state. Proportionate random sampling procedure was applied to select one hundred and twenty respondents from the selected panchayats. About 45.00 per cent of the respondents had expressed moderately favourable attitude towards PMFBY scheme.

**Keywords:** Agriculture, Risk, Insurance, PMFBY.

## INTRODUCTION

Agriculture plays vital role in development of country. The share of agriculture and allied sector in total Gross Domestic Product (GDP) is 16.00 per cent in Indian economy. In India 54.60 per cent of population is engaged in agriculture and allied activities (Census 2011).But Indian agriculture is characterized by risk bearing and uncertainty because of many factors like, lack of technology, lack of knowledge on risk mitigation, irrigation, weather condition, usage of seeds, fertilizers, pesticide, uncertainty in monsoon, lack of input supply facilities, non-availability of proper market facility, pest and diseases, the higher expenditure as compared to production, uncertain income in each year. Agricultural insurance is considered as an important mechanism to address the risk of output and income resulting from various natural and manmade events. The risk-bearing capacity of marginal and small farmers in the country is very limited. To avoid the risk and uncertainty in agriculture at the national and state level, various agricultural development schemes are implemented by the government to bring the development in agriculture and facilities provided to the farmers. Keeping in view the risks involved in agriculture and to insure the farming community against various risks, Ministry of Agriculture, Government of India introduced a crop insurance scheme in 1985 and thereafter brought improvements in the erstwhile scheme(s) from time to time based on the experience gained and views of the stakeholders, States, farming community etc.The erstwhile crop insurance schemes have further been reviewed in consultation with various stakeholders including States/UTs and a new scheme viz., Pradhan Mantri Fasal Bima Yojana (PMFBY) has been approved for implementation from kharif 2016.Pradhan Mantri Fasal Bima Yojana aims to provide insurance coverage and financial support to the farmers in the event of failure of any of the notified crops because of natural calamities, pests, and diseases. Pradhan Mantri Fasal Bima Yojana has been piloted in the country since kharif season of 2016 (June 2016).Pradhan Mantri Fasal Bima Yojana (PMFBY) operates on the concept of "Area Approach." There is a uniform premium of only 2 per cent of sum of insured for all kharif crops and 1.5 per cent for all rabi crops. In case of annual commercial and horticultural crops, the premium to be paid by farmers will be only 5 per cent. The premium to be paid by farmers are very low and balance premium will be paid by the government to provide full insured amount to the farmers against crop loss on account of natural calamities. There is no upper limit on government subsidy. Even if balance premium is 90 per cent, it will be borne by the government.

## RESEARCH METHODOLOGY

The study was conducted in Cuddalore district of Tamil Nadu state. Proportionate random sampling procedure was applied to select one hundred and twenty respondents from the selected panchayats. A well-structured interview schedule was used for collection of data. Allport (1935) defined attitude as a mental state of readiness, organisation through experience, exerting a directive and dynamics influence upon individual's response to all objects and situations with which it is related. To know the attitude of farmers towards PMFBY scheme, schedule was developed. Schedule having fifteen statements (12 positive statements and 3 negative statements) were related to PMFBY scheme. The response of farmers was recorded on three-point continuums as 'Agree, ''undecided,' and 'disagree.' The positive statements were assigned 3 score for agree, 2 for undecided and 1 for disagree and the vice versa in case of negative statement. The respondents were categorized into low, medium, and high by using cumulative frequency. The scoring procedure adopted by Dhande (2017) was used in this study.

## RESULTS AND DISCUSSION

The results on distribution of respondents according to their overall attitude were presented in the Table-1. The results in Table-1, indicated that 45.00 per cent of the respondents had expressed moderately favourable attitude while 34.77 per cent of the respondents had highly favourable attitude and 20.83 per cent of the respondents had less favourable attitude. Nearly half of the respondents had expressed moderately favourable attitude level because of their medium knowledge level about PMFBY scheme. This result is in line with the findings of Meena *et al.*(2022) and

Karthiyaeeni (2020). Distribution of respondents according to their item wise attitude level towards PMFBY scheme (Table: 2).

**Crop insurance saves farmers from risk**

It could be observed from the Table-2, that 79.17 per cent of the respondents had agreed that crop insurance saves farmers from risk followed by 20.83 per cent of the respondents had undecided and no respondents had disagreed about it. This shows that crop insurance helped farmers to overcome their losses during the disaster period.

**Provide relief fund at the time of disaster**

More than half (55.00 per cent) of the respondents had agreed that the scheme provide relief fund at the time of disaster, while 35.00 per cent of the respondents had undecided and 10.00 per cent of the respondents had disagreed about it. This indicates that crop insurance helped famers to manage their economic losses by providing financial aid at the time of disaster.

**Good for big farmers only**

More than half (53.33 per cent) of the respondents had agreed that crop insurance scheme was good for big farmers only while 35.00 per cent of the respondents had undecided and 11.67 per cent of the respondents had disagreed about it. This might be due to big farmers gets more compensation when compared to marginal farmers during crop failure.

**Insurance not good for small produces**

Nearly half(49.17 per cent) of the respondents had agreed that insurance not good for small produces followed by 50.83 per cent of the respondents had undecided and 0.00 per cent of the respondents had disagreed about it. In terms of compensation, the smaller produce gets lesser compensation than the larger produce during crop failure.

**Crop insurance schemes are well defined**

More than three-fifth (62.50 per cent) of the respondents had agreed that crop insurance schemes are well defined followed by 30.83 per cent of the respondents had undecided and 6.67 per cent of the respondents had disagreed about it. This might be due to difficulty in understanding the crop insurance scheme.

**Insurance make a farmer more relax and confident**

39.17 per cent of the respondents had agreed that crop insurance make a farmer more relax and confident followed by 45.83 per cent of the respondents had undecided and 15.00 per cent of the respondents had disagreed about it. This may be due to the constraints faced by the respondents in availing the benefits of crop insurance.

**Follows simple formalities**

43.33 per cent of the respondents had agreed that the scheme follows simple formalities while 29.17 per cent of the respondents had undecided and 27.50 per cent of the respondents had disagreed about it. This may be due to the time taken by the officials to select the suitable farmers for crop insurance.

**Motivation from banks/financial institutions**

About one-fifth, 20.00 per cent of the respondents had agreed that motivation from banks/financial institutions for getting crop insurance was enough followed by 52.50 per cent of the respondents had undecided and 27.50 per cent of the respondents had disagreed about it. This might be due to difficulties faced by respondents in the financial institution while availing the benefits of crop insurance scheme.

**Easily accessible through bank**

24.17 per cent of the respondents had agreed that crop insurance was easily accessible through bank followed by 42.50 per cent of the respondents had undecided and 33.33 per cent of the respondents had disagreed about it. This might be due to crop insurance was easily accessible by respondents through online sources when compared to bank.

**Reasonable premium rate**

Majority (80.83 per cent) of the respondents had agreed that reasonable premium rate for crop insurance was enough followed by 19.17 per cent of the respondents had undecided and 0.00 per cent of the respondents had disagreed about it. Since the premium rate is affordable, majority of the respondents agreed the premium rate.

**Premiums are shared by government**

35.83 per cent of the respondents had agreed that premiums are shared by government followed by 49.17 per cent of the respondents had undecided and 15.00 per cent of the respondents had disagreed about it. Since premiums are shared by government, this will reduce the financial burden of the respondents.

**Good for loanee farmers to save their savings from risk**

Nearly half (47.50 per cent) of the respondents had agreed that crop insurance scheme is good for loanee farmers to save their savings from risk while 39.17 per cent of the respondents had undecided and13.33 per cent of the respondents had disagreed about it. This scheme helped the loanee farmers to save their money at the time of disaster period.

**Not for illiterate farmers**

25.83 per cent of the respondents had agreed that crop insurance scheme was not for illiterate farmers while 27.50 per cent of the respondents had undecided and 46.67 per cent of the respondents had disagreed about it. Since the scheme helped the various farmers irrespective of their education levels, PMFBY scheme encourages every farmer to avail the benefits from it.

**Quick settlement of claims**

17.50 per cent of the respondents had agreed that quick settlement of claims in crop insurance scheme followed by 28.33 per cent of the respondents had undecided and 54.17 per cent of the respondents had disagreed about it. This shows that delay in settlement of claims to the respondents.

**PMFBY is compulsory to farmers**

One-fifth(20.83 per cent) of the respondents had agreed that crop insurance is compulsory to farmers followed by 62.50 per cent of the respondents had undecided and 16.67 per cent of the respondents had disagreed about it. This may be due to the constraints faced by the respondents in availing the benefits of crop insurance.

## CONCLUSION

About 45.00 per cent of the respondents had expressed moderately favourable attitude towards Pradhan Mantri Fasal Bima Yojana scheme. Results of this study indicates that half of the respondents had moderately favourable attitude towards PMFBY. Hence, to convert moderately favourable attitude into highly favourable attitude, timely settlement of claims should be enhanced and maintained. Program experts and other government personnel should visit the farmers to solve the problems they are facing in adopting the PMFBY to sustain their credibility.

**ABSTRACT**

In this work, we bring in the idea of generalized intuitionistic fuzzy metric space. We begin with formulating the definition of generalized intuitionistic fuzzy metric space with example and discuss that the generalized intuitionistic fuzzy metric space is wider than the intuitionistic fuzzy metric space and intuitionistic fuzzy b−metric space. The uniqueness of the limit and other results are proved to support our theorem. Our main result includes the contraction definition in our generalized intuitionistic fuzzy metric space and proving the Banach theorem in our setting, supported by a relevant example. Furthermore, the definition of Ciric quasi-contraction is proposed and the associated fixed point theorem is established. Also, an application in integral equation is derived to bolster our theorem.

**Keywords:** Fixed point, Intuitionistic fuzzy metric space, Contraction mapping, Generalized metric space, integral equation.

## INTRODUCTION

Fréchet unveiled the notion of a metric space in 1906, that subsequently inspired numerous researchers to extend and refine this idea, causing the establishment of various fixed point theorems. Notably, the Banach contraction theorem,

proposed by Banach[1] in 1922, serves as a seminal result in this domain. In the years that followed, a multitude of researchers have sought to generalize this theorem across an array of diverse spaces. Zadeh [2] is recognized for being the first to introduce and define the practical concept of fuzzy sets. His work signified a crucial milestone in the growth and advancement of mathematics. Kramosil and Michalek [3] produced the concept of fuzzy metric space leveraging the notion of continuous t-norm defined by Schweizer and Sklar [4]. Thereafter, George and Veeramani[5] presented revised definition of fuzzy metric space. The study of fuzzy sets in fuzzy metric spaces has evolved as lively area showcasing a variety of applications both in mathematics and in other disciplines. The concept of intuitionistic fuzzy set was produced by Atanassov[6]. The idea of conceptualizing an intuitionistic fuzzy set is remarkably captivating and holds significant utility across a multitude of applications, including sales assessment, promotion of products, negotiation processes, and beyond. Park [7] introduced intuitionistic fuzzy metric space (IFMS) as an extension of fuzzy metric space leveraging the notion of continuous t-norm and continuous t-conorm. A wide array of metric space generalizations permeates the scholarly discourse within mathematical analysis. Generalized metric space of Jleli and Samet [8] inspired M.S.Ashraf *et al*. [9] to present the idea of generalized fuzzy metric space (GFMS) as a broadened concept of some existing fuzzy metric spaces. In this work, influenced by M.S. Ashraf *et al*. [9], GFMS we establish the concept of generalized intuitionistic fuzzy metric space(GIFMS) which encompass intuitionistic fuzzy metric space(IFMS) and intuitionistic fuzzy b-metric space(IFMbS). In our main results, we gave contraction definition in GIFMS and proved Banach Contraction Theorem. Also, Ciric[10] quasi-contraction is defined GIFMS and the corresponding fixed point theorem is proved.

## PRELIMINARIES

**Definition 2.1[4]**Define a binary operation $\Delta: [0,1] \times [0,1] \to [0,1]$, if it meets the subsequent requirements: (c1): $\Delta$ is associate and commutative; (c2): $\Delta$ is continuous; (c3): $c\Delta 1 = c$ for every $c \in [0,1]$and (c4): $c\Delta c_\alpha \leq c_\beta \Delta c_\gamma$ whereas $c \leq c_\beta$ and $c_\alpha \leq c_\gamma$for every $c, c_\alpha, c_\beta, c_\gamma \in [0,1]$ then $\Delta$ is a continuous t-norm (briefly ctnm).

**Definition 2.2[4]**Define a binary operation $\nabla: [0,1] \times [0,1] \to [0,1]$, if it meets the subsequent requirements: (c1): $\nabla$ is associate and commutative; (c2): $\nabla$ is continuous; (c3): $c\nabla 0 = c$ for every $c \in [0,1]$and (c4): $c\nabla c_\alpha \leq c_\beta \nabla c_\gamma$whereas $c \leq c_\beta$ and $c_\alpha \leq c_\gamma$for every $c, c_\alpha, c_\beta, c_\gamma \in [0,1]$ then $\nabla$ is a continuous t-conorm (briefly ctcnm).

**Definition 2.3[7]**Consider a non-void set $\Upsilon$, $\Delta$ is a ctnm and $\nabla$is a ctcnm. Consider $I_1, I_2: \Upsilon \times \Upsilon \times (0,\infty) \to [0,1]$. For all $c_\alpha, m_\alpha \in \Upsilon$ and $\nu, \mu > 0$, with the following conditions:

(If1): $I_1(c_\alpha, m_\alpha, \nu) + I_2(c_\alpha, m_\alpha, \nu) \leq 1$;

(If2): $I_1(c_\alpha, m_\alpha, \nu) > 0$;

(If3): $I_1(c_\alpha, m_\alpha, \nu) = 1 \iff c_\alpha = m_\alpha$;

(If4): $I_1(c_\alpha, m_\alpha, \nu) = I_1(m_\alpha, c_\alpha, \nu)$;

(If5): $I_1(c_\alpha, m_\alpha, \nu + \mu) \geq I_1(c_\alpha, m_\alpha, \nu)\Delta I_1(c_\alpha, m_\alpha, \mu)$;

(If6): $I_1(c_\alpha, m_\alpha, \cdot): (0,\infty) \to [0,1]$ is continuous;

(If7): $I_2(c_\alpha, m_\alpha, \nu) < 1$;

(If8): $I_2(c_\alpha, m_\alpha, \nu) = 0 \iff c_\alpha = m_\alpha$;

(If9): $I_2(c_\alpha, m_\alpha, \nu) = I_2(m_\alpha, c_\alpha, \nu)$;

(If10): $I_2(c_\alpha, m_\alpha, \nu + \mu) \leq I_2(c_\alpha, m_\alpha, \nu)\nabla I_2(c_\alpha, m_\alpha, \mu)$;

(If11): $I_2(c_\alpha, m_\alpha, \cdot): (0,\infty) \to [0,1]$ is continuous.

Then $(I_1, I_2)$ is a intuitionistic fuzzy metric and $(\Upsilon, I_1, I_2, \Delta, \nabla)$ is termed as intuitionistic fuzzy metric space (briefly IFMS).

**Definition 2.4 [11]** Consider a non-void set $\Upsilon$, is a $\Delta$ ctnm and $\nabla$is a ctcnm. Consider $I_{b1}, I_{b2}: \Upsilon \times \Upsilon \times (0,\infty) \to [0,1]$. For all $c_\alpha, m_\alpha \in \Upsilon$, $b \geq 1$ and $\nu, \mu > 0$, with the following conditions:
(Ib1): $I_{b1}(c_\alpha, m_\alpha, \nu) + I_{b2}(c_\alpha, m_\alpha, \nu) \leq 1$;

(Ib2): $I_{b1}(c_\alpha, m_\alpha, \nu) > 0$;

(Ib3): $I_{b1}(c_\alpha, m_\alpha, \nu) = 1 \iff c_\alpha = m_\alpha$;

(Ib4): $I_{b1}(c_\alpha, m_\alpha, \nu) = I_{b1}(m_\alpha, c_\alpha, \nu)$;

(Ib5): $I_{b1}(c_\alpha, m_\alpha, \nu + \mu) \geq I_{b1}\left(c_\alpha, m_\alpha, \frac{\nu}{b}\right) \Delta I_{b1}\left(c_\alpha, m_\alpha, \frac{\mu}{b}\right)$;

(Ib6): $I_{b1}(c_\alpha, m_\alpha, \cdot): (0,\infty) \to [0,1]$ is continuous;

(Ib7): $I_{b2}(c_\alpha, m_\alpha, \nu) < 1$;

(Ib8): $I_{b2}(c_\alpha, m_\alpha, \nu) = 0 \iff c_\alpha = m_\alpha$;

(Ib9): $I_{b2}(c_\alpha, m_\alpha, \nu) = I_{b2}(m_\alpha, c_\alpha, \nu)$;

(Ib10): $I_{b2}(c_\alpha, m_\alpha, \nu + \mu) \leq I_{b2}\left(c_\alpha, m_\alpha, \frac{\nu}{b}\right) \nabla I_2\left(c_\alpha, m_\alpha, \frac{\mu}{b}\right)$;

(Ib11): $I_{b2}(c_\alpha, m_\alpha, \cdot): (0,\infty) \to [0,1]$ is continuous.

Then $(I_{b1}, I_{b2})$ is a intuitionistic fuzzy b-metric and $(\Upsilon, I_{b1}, I_{b2}, \Delta, \nabla)$ is termed as intuitionistic fuzzy b-metric space (briefly IFbMS).

**Definition 2.5[8]**Consider a non-void set $\Upsilon$and a mapping$M_g: \Upsilon \times \Upsilon \to [0,1]$. For each $c_\alpha \in \Upsilon$,we set $S(M_g, \Upsilon, c_\alpha) = \{\{c_n\} \subset \Upsilon: \lim_{n\to\infty} M_g(c_n, c_\alpha) = 0\}$. For every $c_\alpha, f_\alpha \in \Upsilon$ with the followingconditions:
(Mg1): $M_g(c_\alpha, f_\alpha) = 0 \implies c_\alpha = f_\alpha$;

(Mg2): $M_g(c_\alpha, f_\alpha) = M_g(f_\alpha, c_\alpha)$;

(Mg3): there exists $g' \geq 1$ such that if $\{c_n\} \in S(M_g, \Upsilon, c_\alpha)$ then $M_g(c_\alpha, f_\alpha) \leq g' \lim\sup_{n\to\infty} M_g(c_n, f_\alpha)$.

Then $(M_g, \Upsilon)$ is termed as generalized metric space (briefly GMS).

**Definition 2.6[9]**Consider a non-void set $\Upsilon$, is a $\Delta$ ctnm and a mapping $F_g: \Upsilon \times \Upsilon \times (0,\infty) \to [0,1]$. For each $c_\alpha \in \Upsilon$, we set $S(F_g, \Upsilon, c_\alpha) = \{\{c_n\} \subset \Upsilon: \lim_{n\to\infty} F_g(c_n, c_\alpha, \nu) = 1 \ \ \forall \nu > 0\}$. For every $c_\alpha, m_\alpha \in \Upsilon$ and $\nu > 0$, with the following conditions:

(Fg1): $F_g(c_\alpha, m_\alpha, \nu) > 0$;

(Fg2): $F_g(c_\alpha, m_\alpha, \nu) = 1 \implies c_\alpha = f_\alpha$;

(Fg3): $F_g(c_\alpha, m_\alpha, \nu) = F_g(m_\alpha, c_\alpha, \nu)$;

(Fg4): there exists $g' \geq 1$ such that if $\{c_n\} \in S(F_g, \Upsilon, c_\alpha)$ then $F_g(c_\alpha, m_\alpha, \nu) \geq \lim\sup_{n\to\infty} M_g\left(c_n, f_\alpha, \frac{\nu}{g'}\right)$;

(Fg5): $F_g(c_\alpha, m_\alpha, \cdot): (0,\infty) \to [0,1]$ is continuous and $\lim_{n\to\infty} F_g(c_\alpha, m_\alpha, \nu) = 1$.

Then $(F_g, \Upsilon, \Delta)$ is termed as generalized fuzzy metric space (briefly GFMS).

## RESULTS AND DISCUSSIONS

**Definition 3.1** Consider a non-void set $\Upsilon$, $\Delta$ is a ctnm and $\nabla$ is a ctcnm. Consider$F_{g1}, F_{g2}: \Upsilon \times \Upsilon \times (0,\infty) \to [0,1]$. For each $c_\alpha \in \Upsilon$, we set

$S\left(F_{g_{1,2}}, \Upsilon, c_\alpha\right) = \{\{c_n\} \in \Upsilon: \lim_{n\to\infty} F_{g1}(c_n, c_\alpha, \nu) = 1 \text{ and } \lim_{n\to\infty} F_{g2}(c_n, c_\alpha, \nu) = 0 \ \ \forall \nu > 0\}$.

For every $c_\alpha, m_\alpha \in \Upsilon$ and $\nu > 0$, with the following conditions:

(Ig1): $F_{g1}(c_\alpha, m_\alpha, \nu) + F_{g2}(c_\alpha, m_\alpha, \nu) \leq 1$;

(Ig2): $F_{g1}(c_\alpha, m_\alpha, \nu) > 0$;

(Ig3): $F_{g1}(c_\alpha, m_\alpha, \nu) = 1 \implies c_\alpha = m_\alpha$;

(Ig4): $F_{g1}(c_\alpha, m_\alpha, \nu) = F_{g1}(m_\alpha, c_\alpha, \nu)$;

(Ig5): $F_{g1}(c_\alpha, m_\alpha, \cdot): (0,\infty) \to [0,1]$ is continuous and $\lim_{n\to\infty} F_g(c_\alpha, m_\alpha, \nu) = 1$;

(Ig6): $F_{g2}(c_\alpha, m_\alpha, \nu) < 1$;

(Ig7): $F_{g2}(c_\alpha, m_\alpha, \nu) = 0 \ \Rightarrow c_\alpha = m_\alpha$;

(Ig8): $F_{g2}(c_\alpha, m_\alpha, \nu) = F_{g2}(m_\alpha, c_\alpha, \nu)$;

(Ig9): $F_{g2}(c_\alpha, m_\alpha, \cdot): (0,\infty) \to [0,1]$ is continuous and $\lim_{n\to\infty} F_{g2}(c_\alpha, m_\alpha, \nu) = 0$;

(Ig10): there exists $g' \geq 1$ such that if $\{c_n\} \in S\left(F_{g_{1,2}}, \Upsilon, c_\alpha\right)$ then

$F_{g1}(c_\alpha, m_\alpha, \nu) \geq \limsup_{n\to\infty} F_{g1}\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$ and $F_{g2}(c_\alpha, m_\alpha, \nu) \leq \limsup_{n\to\infty} F_{g2}\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$.

Then $\left(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla\right)$ is termed as generalized intuitionistic fuzzy metric space (briefly GIFMS).

**Example 3.2**Let $\left(M_g, \Upsilon\right)$be a GMS and $F_{g1}, F_{g2}: \Upsilon \times \Upsilon \times (0,\infty) \to [0,1]$be a generalized intuitionistic fuzzy metric defined as$F_{g1}(c_\alpha, p_\alpha, \nu) = e^{-\frac{M_g(c_\alpha, p_\alpha)}{\nu}}$and $F_{g2}(c_\alpha, p_\alpha, \nu) = 1 - e^{-\frac{M_g(c_\alpha, p_\alpha)}{\nu}}$

where $c_\alpha, p_\alpha \in \Upsilon$ and $\nu > 0$.

While (Ig1) - (Ig9) follows, we proceed to demonstrate only (Ig10). Let $c_\alpha, p_\alpha \in \Upsilon$and $\{c_n\} \in S\left(M_g, \Upsilon, c_\alpha\right)$ then

$\lim_{n\to\infty} F_{g1}(c_n, c_\alpha, \nu) = \lim_{n\to\infty} e^{-\frac{M_g(c_n, c_\alpha)}{\nu}} = 1$ and

$\lim_{n\to\infty} F_{g2}(c_n, c_\alpha, \nu) = \lim_{n\to\infty} 1 - e^{-\frac{M_g(c_n, c_\alpha)}{\nu}} = 0$.

Thus, $\{c_n\} \in S\left(F_{g_{1,2}}, \Upsilon, c_\alpha\right)$. Consequently,

$F_{g1}(c_\alpha, p_\alpha, \nu) = e^{-\frac{M_g(c_\alpha, p_\alpha)}{\nu}} \geq e^{-\frac{g' \limsup_{n\to\infty} M_g(c_n, p_\alpha)}{\nu}} \geq \limsup_{n\to\infty} e^{-\frac{M_g(c_n, p_\alpha)}{\frac{\nu}{g'}}}$ and

$F_{g2}(c_\alpha, p_\alpha, \nu) = 1 - e^{-\frac{M_g(c_\alpha, p_\alpha)}{\nu}} \leq 1 - e^{-\frac{g' \limsup_{n\to\infty} M_g(c_n, p_\alpha)}{\nu}} \leq \limsup_{n\to\infty} 1 - e^{-\frac{M_g(c_n, p_\alpha)}{\frac{\nu}{g'}}}$

which intern

$F_{g1}(c_\alpha, p_\alpha, \nu) \geq \limsup_{n\to\infty} F_{g1}\left(c_n, p_\alpha, \frac{\nu}{g'}\right)$ and

$F_{g2}(c_\alpha, p_\alpha, \nu) \leq \limsup_{n\to\infty} F_{g1}\left(c_n, p_\alpha, \frac{\nu}{g'}\right)$.

Therefore, $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ is a GIFMS with $a_1 \Delta b_1 = a_1 b_1$ and $a_1 \nabla b_1 = max\{a_1, b_1\}$.

**Proposition 3.3**The set $S(F_{g_{1,2}}, \Upsilon, c_\alpha)$is non empty iff $F_{g1}(c_\alpha, c_\alpha, \nu) = 1$ and $F_{g2}(c_\alpha, c_\alpha, \nu) = 0$.

**Proof.:** First, consider $S(F_{g_{1,2}}, \Upsilon, c_\alpha) \neq \emptyset$ which implies there is a sequence $\{c_n\} \in \Upsilon$ with $\lim_{n\to\infty} F_{g1}(c_n, c_\alpha, \nu) = 1 \; and \; \lim_{n\to\infty} F_{g2}(c_n, c_\alpha, \nu) = 0 \;\; \forall \nu > 0$.

Using the definition of GIFMS 3.1,

$F_{g1}(c_\alpha, c_\alpha, \nu) \geq \limsup_{n\to\infty} F_{g1}\left(c_n, c_\alpha, \frac{\nu}{g'}\right)$=1 and

$F_{g2}(c_\alpha, c_\alpha, \nu) \leq \limsup_{n\to\infty} F_{g2}\left(c_n, c_\alpha, \frac{\nu}{g'}\right) = 0$.

Conversely, consider $F_{g1}(c_\alpha, c_\alpha, \nu) = 1$ and $F_{g2}(c_\alpha, c_\alpha, \nu) = 0$. Let $\{c_n\} \in \Upsilon$ as $c_n = c_\alpha$ then

$\lim_{n\to\infty} F_{g1}(c_n, c_\alpha, \nu) = 1 \; and \; \lim_{n\to\infty} F_{g2}(c_n, c_\alpha, \nu) = 0 \;\; \forall \nu > 0$.

Therefore, $\{c_n\} \in S(F_{g_{1,2}}, \Upsilon, c_\alpha)$, that is, $S(F_{g_{1,2}}, \Upsilon, c_\alpha) \neq \emptyset$.■

Next, we demonstrate an example of GIFMS encompasses larger class than GFMS.

**Example 3.4** Let $\Upsilon = [0,1]$. Define a set
$S(F_{g_{1,2}}, \Upsilon, c_\alpha) = \{\{c_n\} \in \Upsilon: \lim_{n\to\infty} F_{g1}(c_n, c_\alpha, \nu) = 1 \; and \; \lim_{n\to\infty} F_{g2}(c_n, c_\alpha, \nu) = 0 \;\; \forall \nu > 0\}$ for every $c_\alpha \in \Upsilon$ and $\nu > 0$.

Define the mapping $F_{g1}, F_{g2}: \Upsilon \times \Upsilon \times (0,\infty) \longrightarrow [0,1]$ by

$$F_{g1}(c_\alpha, m_\alpha, \nu) = \begin{cases} e^{-\frac{c_\alpha + m_\alpha}{\nu}} & if \; c_\alpha, m_\alpha \neq 0; \\ e^{-\frac{c_\alpha}{4\nu}} & if \; m_\alpha = 0; \\ e^{-\frac{m_\alpha}{4\nu}} & if \; c_\alpha = 0. \end{cases}$$

$$F_{g2}(c_\alpha, m_\alpha, \nu) = \begin{cases} 1 - e^{-\frac{c_\alpha + m_\alpha}{\nu}} & if \; c_\alpha, m_\alpha \neq 0; \\ 1 - e^{-\frac{c_\alpha}{4\nu}} & if \; m_\alpha = 0; \\ 1 - e^{-\frac{m_\alpha}{4\nu}} & if \; c_\alpha = 0. \end{cases}$$

Referring to Proposition 3.3, if $c_\alpha \in \Upsilon$ satisfies $F_{g1}(c_\alpha, c_\alpha, \nu) = 1$ and $F_{g2}(c_\alpha, c_\alpha, \nu) = 0$ then it can be concluded that $c_\alpha = 0$. Let $\{c_n\}$ be a sequence in $\Upsilon$ such that $\lim_{n\to\infty} F_{g1}(c_n, 0, \nu) = 1$ and $\lim_{n\to\infty} F_{g2}(c_n, 0, \nu) = 0$. For every $n \in \mathbb{N}$ and $m_\alpha \in \Upsilon$, we obtain

$$F_{g1}(c_\alpha, m_\alpha, \nu) = \begin{cases} e^{-\frac{c_n + m_\alpha}{\nu}} & if \; c_n, m_\alpha \neq 0; \\ e^{-\frac{c_n}{4\nu}} & if \; m_\alpha = 0; \\ e^{-\frac{m_\alpha}{4\nu}} & if \; c_\alpha = 0. \end{cases}$$

$$F_{g2}(c_\alpha, m_\alpha, \nu) = \begin{cases} 1 - e^{-\frac{c_n + m_\alpha}{\nu}} & if \; c_n, m_\alpha \neq 0; \\ 1 - e^{-\frac{c_n}{4\nu}} & if \; m_\alpha = 0; \\ 1 - e^{-\frac{m_\alpha}{4\nu}} & if \; c_\alpha = 0. \end{cases}$$

As $m_\alpha \leq c_n + m_\alpha$ and for $\nu > 0$. We possess, $\frac{m_\alpha}{4\nu} < \frac{c_n + m_\alpha}{\nu} \Longrightarrow e^{-\frac{m_\alpha}{4\nu}} > e^{-\frac{c_n + m_\alpha}{\nu}}$,then

$F_{g1}(0, m_\alpha, \nu) = e^{-\frac{m_\alpha}{4\nu}} \geq \limsup_{n\to\infty} e^{-\frac{c_n + m_\alpha}{\nu}} = \limsup_{n\to\infty} F_{g1}(c_n, m_\alpha, \nu)$ and

$F_{g2}(0, m_\alpha, \nu) = 1 - e^{-\frac{m_\alpha}{4\nu}} \leq \limsup_{n\to\infty} 1 - e^{-\frac{c_n + m_\alpha}{\nu}} = \limsup_{n\to\infty} F_{g2}(c_n, m_\alpha, \nu)$

which intern

$F_{g1}(0, m_\alpha, \nu) \geq \limsup_{n\to\infty} F_{g1}\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$and

$F_{g2}(0, m_\alpha, \nu) \leq \limsup_{n\to\infty} F_{g2}\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$ where $g' = 1$.

Thus, $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ is a GIFMS, although it is not a IFMS as (If5) and (If10) are not satisfied.■

**Proposition 3.5** Every IFMS is a GIFMS.

**Proof.** We limit our proof to demonstrating that $(I_1, I_2)$ adheres (If5) and (If10) of definition 2.3. For $c_\alpha, m_\alpha \in \Upsilon$ and $\{c_n\} \in S(F_{g_{1,2}}, \Upsilon, c_\alpha)$.

$I_1(c_\alpha, m_\alpha, \nu) \geq I_1\left(c_\alpha, c_n, \frac{\nu}{2}\right) \Delta\, I_1\left(c_n, m_\alpha, \frac{\nu}{2}\right)$

$\geq 1\, \Delta \limsup_{n\to\infty} I_1\left(c_n, m_\alpha, \frac{\nu}{2}\right) = \limsup_{n\to\infty} I_1\left(c_n, m_\alpha, \frac{\nu}{2}\right)$ and

$I_2(c_\alpha, m_\alpha, \nu) \leq I_2\left(c_\alpha, c_n, \frac{\nu}{2}\right) \nabla\, I_2\left(c_n, m_\alpha, \frac{\nu}{2}\right)$

$\leq 0\, \nabla \limsup_{n\to\infty} I_2\left(c_n, m_\alpha, \frac{\nu}{2}\right) = \limsup_{n\to\infty} I_2\left(c_n, m_\alpha, \frac{\nu}{2}\right)$

which implies, $I_1(c_\alpha, m_\alpha, \nu) \geq \limsup_{n\to\infty} I_1\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$ and

$I_2(c_\alpha, m_\alpha, \nu) \leq \limsup_{n\to\infty} I_2\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$ where $g' = 2$.■

**Proposition 3.6**Every IFbMS is a GIFMS.

**Proof.** We limit our proof to demonstrating that $(I_{b1}, I_{b2})$ adheres (Ib5) and (Ib10) of definition 2.4. For $c_\alpha, m_\alpha \in \Upsilon$ and $\{c_n\} \in S(F_{g_{1,2}}, \Upsilon, c_\alpha)$.

$I_{b1}(c_\alpha, m_\alpha, \nu) \geq I_{b1}\left(c_\alpha, c_n, \frac{\nu}{2b}\right) \Delta\, I_{b1}\left(c_n, m_\alpha, \frac{\nu}{2b}\right)$

$\geq 1\, \Delta \limsup_{n\to\infty} I_{b1}\left(c_n, m_\alpha, \frac{\nu}{2b}\right) = \limsup_{n\to\infty} I_{b1}\left(c_n, m_\alpha, \frac{\nu}{2b}\right)$ and

$I_{b2}(c_\alpha, m_\alpha, \nu) \leq I_{b2}\left(c_\alpha, c_n, \frac{\nu}{2b}\right) \nabla\, I_{b2}\left(c_n, m_\alpha, \frac{\nu}{2b}\right)$

$\leq 0\, \nabla \limsup_{n\to\infty} I_{b2}\left(c_n, m_\alpha, \frac{\nu}{2b}\right) = \limsup_{n\to\infty} I_{b2}\left(c_n, m_\alpha, \frac{\nu}{2b}\right)$

which implies, $I_{b1}(c_\alpha, m_\alpha, \nu) \geq \limsup_{n\to\infty} I_{b1}\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$ and

$I_{b2}(c_\alpha, m_\alpha, \nu) \leq \limsup_{n\to\infty} I_{b2}\left(c_n, m_\alpha, \frac{\nu}{g'}\right)$ where $g' = 2b$.■

**Definition 3.7**Let$(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a GIFMS.

i. A sequence $\{c_n\} \in \Upsilon$is termed as $F_I - convergent$ if $\{c_n\} \in S(F_{g_{1,2}}, \Upsilon, c_\alpha)$ for $c_\alpha \in \Upsilon$.

ii. A sequence $\{c_n\} \in \Upsilon$ is termed as $F_I - Cauchy$ sequence if

iii. $\lim_{n\to\infty} F_{g1}(c_p, c_{p+q}, \nu) = 1$ *and* $\lim_{n\to\infty} F_{g2}(c_p, c_{p+q}, \nu) = 0 \ \ \forall \nu > 0$.

iv. Whenever all $F_I - Cauchy$ sequence is $F_I - convergent$ then GIFMS is termed as $F_I - complete$.

**Proposition 3.8**Let$(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a GIFMS. If a sequence $\{c_n\} \in \Upsilon$ is $F_I - convergent$ to $c_\alpha$ and $m_\alpha$ then $c_\alpha = m_\alpha$.

**Proof.** By hypothesis, $\lim_{n\to\infty} F_{g1}(c_n, c_\alpha, \nu) = 1$ *and* $\lim_{n\to\infty} F_{g2}(c_n, c_\alpha, \nu) = 0$;

$\lim_{n\to\infty} F_{g1}(c_n, m_\alpha, \nu) = 1$ *and* $\lim_{n\to\infty} F_{g2}(c_n, m_\alpha, \nu) = 0$.

By applying (Ig10) of definition 3.1, $F_{g1}(c_\alpha, m_\alpha, \nu) \geq \limsup_{n\to\infty} F_{g1}\left(c_n, m_\alpha, \frac{\nu}{g'}\right) = 1$ and

$F_{g2}(c_\alpha, m_\alpha, \nu) \leq \limsup_{n\to\infty} F_{g2}\left(c_n, m_\alpha, \frac{\nu}{g'}\right) = 0$

resulting in $c_\alpha = m_\alpha$. ■

**Definition 3.9** Let $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a GIFMS. A mapping $\mathcal{F}: \Upsilon \longrightarrow \Upsilon$ is a $\varrho -$ contraction if for $c_\alpha, m_\alpha \in \Upsilon$ and $\varrho \in (0,1)$,

$F_{g1}(\mathcal{F}(c_\alpha), \mathcal{F}(m_\alpha), \varrho\nu) \geq F_{g1}(c_\alpha, m_\alpha, \nu)$ and $F_{g2}(\mathcal{F}(c_\alpha), \mathcal{F}(m_\alpha), \varrho\nu) \leq F_{g2}(c_\alpha, m_\alpha, \nu)$ for all $\nu > 0$.

**Proposition 3.10**Let $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a GIFMS and$\mathcal{F}: \Upsilon \longrightarrow \Upsilon$ is a $\varrho -$ contraction. If a fixed point $p_\alpha$of $\mathcal{F}$ satisfies $F_{g1}(p_\alpha, p_\alpha, \nu) > 0$ and $F_{g2}(p_\alpha, p_\alpha, \nu) < 1$ then $F_{g1}(p_\alpha, p_\alpha, \nu) = 1$ and $F_{g2}(p_\alpha, p_\alpha, \nu) = 0$.

**Proof.** Using $\varrho -$ contraction, for $p_\alpha \in \Upsilon$

$F_{g1}(p_\alpha, p_\alpha, \nu) = F_{g1}(\mathcal{F}(p_\alpha), \mathcal{F}(p_\alpha), \nu) \geq F_{g1}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho}\right) \geq \cdots \geq F_{g1}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho^n}\right) \longrightarrow 1$ as $n \to \infty$;

$F_{g2}(p_\alpha, p_\alpha, \nu) = F_{g2}(\mathcal{F}(p_\alpha), \mathcal{F}(p_\alpha), \nu) \leq F_{g2}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho}\right) \leq \cdots \leq F_{g2}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho^n}\right) \longrightarrow 0$ as $n \to \infty$.

Therefore, $F_{g1}(p_\alpha, p_\alpha, \nu) = 1$ and $F_{g2}(p_\alpha, p_\alpha, \nu) = 0$.■

**Remark 3.11** For $p_n \in \Upsilon$ and $n \in \mathbb{N} \cup 0$ we define

$\zeta_1(F_{g1}, \mathcal{F}, q_n, \nu) = sup\, F_{g1}(\mathcal{F}(q_{n+i}), \mathcal{F}(q_{n+j}), \nu)$,

$\zeta_2(F_{g2}, \mathcal{F}, q_n, \nu) = sup\, F_{g2}(\mathcal{F}(q_{n+i}), \mathcal{F}(q_{n+j}), \nu)$

where $i, j \in \mathbb{N}$and $\nu > 0$.

**Theorem 3.12** Let $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a $F_I -$complete GIFMS and$\mathcal{F}: \Upsilon \to \Upsilon$ is a $\varrho -$ contraction.Suppose $q_0 \in \Upsilon$ for which $\zeta_1(F_{g1}, \mathcal{F}, q_0, \nu) > 0$ and $\zeta_2(F_{g2}, \mathcal{F}, q_0, \nu) < 1$. Then $\{\mathcal{F}(q_n)\}$ converge toward a unique fixed point of $\mathcal{F}$.

*Proof.*Using $\mathcal{F}$ is $\varrho -$ contraction,$F_{g1}(\mathcal{F}(q_{n+i}), \mathcal{F}(q_{n+j}), \nu) \geq F_{g1}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n-1+j}), \frac{\nu}{\varrho}\right)$ and

$F_{g2}(\mathcal{F}(q_{n+i}), \mathcal{F}(q_{n+j}), \nu) \leq F_{g2}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n-1+j}), \frac{\nu}{\varrho}\right)$.

Applying supremum on two sides of the preceding inequalities,

$\zeta_1(F_{g1}, \mathcal{F}, \mathcal{F}(q_n), \nu) \geq \zeta_1\left(F_{g1}, \mathcal{F}, \mathcal{F}(q_{n-1}), \frac{\nu}{\varrho}\right)$ and

$\zeta_2(F_{g2}, \mathcal{F}, \mathcal{F}(q_n), \nu) \leq \zeta_2\left(F_{g2}, \mathcal{F}, \mathcal{F}(q_{n-1}), \frac{\nu}{\varrho}\right)$.

Following this approach,

$\zeta_1(F_{g1},\mathcal{F},\mathcal{F}(q_n),\nu) \geq \zeta_1\left(F_{g1},\mathcal{F},q_0,\frac{\nu}{\varrho^n}\right)$ and

$\zeta_2(F_{g2},\mathcal{F},\mathcal{F}(q_n),\nu) \leq \zeta_2\left(F_{g2},\mathcal{F},q_0,\frac{\nu}{\varrho^n}\right)$.

Employing above inequalities, for all $n,p \in \mathbb{N}$,

$F_{g1}(\mathcal{F}(q_n),\mathcal{F}(q_{n+p}),\nu) \geq \zeta_1(F_{g1},\mathcal{F},\mathcal{F}(q_n),\nu) \geq \zeta_1\left(F_{g1},\mathcal{F},q_0,\frac{\nu}{\varrho^n}\right)$ and

$F_{g2}(\mathcal{F}(q_n),\mathcal{F}(q_{n+p}),\nu) \leq \zeta_2(F_{g2},\mathcal{F},\mathcal{F}(q_n),\nu) \leq \zeta_2\left(F_{g2},\mathcal{F},q_0,\frac{\nu}{\varrho^n}\right)$.

For $\varrho \in (0,1)$, considering that $\zeta_1\left(F_{g1},\mathcal{F},q_0,\frac{\nu}{\varrho^n}\right) > 0$ and $\zeta_2\left(F_{g2},\mathcal{F},q_0,\frac{\nu}{\varrho^n}\right) < 1$,we obtain

$\lim_{n\to\infty} F_{g1}(\mathcal{F}(q_n),\mathcal{F}(q_{n+p}),\nu) = 1$ and $\lim_{n\to\infty} F_{g2}(\mathcal{F}(q_n),\mathcal{F}(q_{n+p}),\nu) = 0$.

Then the sequence $\{\mathcal{F}(q_n)\}$ is a $F_I - Cauchy$. Considering that $(\Upsilon,F_{g1},F_{g2},\Delta,\nabla)$ is a $F_I$ −complete GIFMS, accordingly there is a $q_\alpha \in \Upsilon$ for which the sequence $\{\mathcal{F}(q_n)\}$ converges to $q_\alpha$.

$F_{g1}(\mathcal{F}(q_{n+1}),\mathcal{F}(q_\alpha),\nu) \geq F_{g1}\left(\mathcal{F}(q_n),q_\alpha,\frac{\nu}{\varrho}\right) \geq \cdots \geq F_{g1}\left(\mathcal{F}(q_0),q_\alpha,\frac{\nu}{\varrho^n}\right)$ and

$F_{g2}(\mathcal{F}(q_{n+1}),\mathcal{F}(q_\alpha),\nu) \leq F_{g2}\left(\mathcal{F}(q_n),q_\alpha,\frac{\nu}{\varrho}\right) \leq \cdots \leq F_{g2}\left(\mathcal{F}(q_0),q_\alpha,\frac{\nu}{\varrho^n}\right)$.

When $n \to \infty$, we arrive

$\lim_{n\to\infty} F_{g1}(\mathcal{F}(q_{n+1}),\mathcal{F}(q_\alpha),\nu) = 1$ and $\lim_{n\to\infty} F_{g2}(\mathcal{F}(q_{n+1}),\mathcal{F}(q_\alpha),\nu) = 0$.

Then the sequence $\{\mathcal{F}(q_n)\}$ converges to $\mathcal{F}(q_\alpha)$. Employing proposition 3.8, we get $\mathcal{F}(q_\alpha) = q_\alpha$. Consequently, $q_\alpha$ is a fixed point of $\mathcal{F}$. Suppose $q_\beta \in \Upsilon$ be one more fixed point of $\mathcal{F}$. Using $\mathcal{F}$ is $\varrho$ −contraction,

$F_{g1}(q_\alpha,q_\beta,\nu) = F_{g1}(\mathcal{F}(q_\alpha),\mathcal{F}(q_\beta),\nu) \geq F_{g1}\left(q_\alpha,q_\beta,\frac{\nu}{\varrho}\right) \geq F_{g1}\left(q_\alpha,q_\beta,\frac{\nu}{\varrho^2}\right) \geq \cdots \geq F_{g1}\left(q_\alpha,q_\beta,\frac{\nu}{\varrho^n}\right) \longrightarrow 1;$

$F_{g2}(q_\alpha,q_\beta,\nu) = F_{g2}(\mathcal{F}(q_\alpha),\mathcal{F}(q_\beta),\nu) \leq F_{g2}\left(q_\alpha,q_\beta,\frac{\nu}{\varrho}\right) \leq F_{g2}\left(q_\alpha,q_\beta,\frac{\nu}{\varrho^2}\right) \leq \cdots \leq F_{g2}\left(q_\alpha,q_\beta,\frac{\nu}{\varrho^n}\right) \longrightarrow 0.$

Hence, $q_\alpha = q_\beta$,$\mathcal{F}$ holds a unique fixed point.■

**Corollary 3.13**Let $(\Upsilon,F_{g1},F_{g2},\Delta,\nabla)$ be a IFMS and $\mathcal{F}:\Upsilon \longrightarrow \Upsilon$is defined such that $c_\alpha,m_\alpha \in \Upsilon$ and

$\varrho \in (0,1)$,

$I_1(\mathcal{F}(c_\alpha),\mathcal{F}(m_\alpha),\varrho\nu) \geq I_1(c_\alpha,m_\alpha,\nu)$ and $I_2(\mathcal{F}(c_\alpha),\mathcal{F}(m_\alpha),\varrho\nu) \leq I_2(c_\alpha,m_\alpha,\nu)$for all $\nu > 0$.

If there exists $q_0 \in \Upsilon$ such that $\zeta_1(I_1,\mathcal{F},q_0,\nu) > 0$ and $\zeta_2(I_2,\mathcal{F},q_0,\nu) < 1$.Then $\{\mathcal{F}(q_n)\}$ converge toward a unique fixed point of $\mathcal{F}$.

**Proof.** Proof is a consequence of Theorem 3.12 and Proposition 3.5. ■

**Remark 3.14**Similar to Corollary 3.13, fixed point theorem for $\varrho$ − contraction in IFbMS can be derived.

**Example 3.15**Consider$\Upsilon = [0,1]$ and $F_{g1},F_{g2}:\Upsilon \times \Upsilon \times (0,\infty) \to [0,1]$ as

$$F_{g1}(c_\alpha,c_\beta,\nu) = \begin{cases} e^{-\frac{|c_\alpha - c_\beta|}{\nu}}, & if\ c_\alpha \neq c_\beta; \\ 1, & if\ c_\alpha = c_\beta \end{cases} \quad \text{and} F_{g2}(c_\alpha,c_\beta,\nu) = \begin{cases} 1 - e^{-\frac{|c_\alpha - c_\beta|}{\nu}}, & if\ c_\alpha \neq c_\beta; \\ 0, & if\ c_\alpha = c_\beta \end{cases}$$

where $c_\alpha, c_\beta \in \mathcal{F}$ and $\nu > 0$. Let $\mathcal{F}: \Upsilon \to \Upsilon$ as $\mathcal{F}(u) = \frac{\varrho u}{18}$ for $\varrho \in (0,1)$.

First, we derive $\mathcal{F}$ is a $\varrho -$ contraction,

$$F_{g1}(\mathcal{F}(c_\alpha), \mathcal{F}(c_\beta), \varrho\nu) = F_{g1}\left(\frac{\varrho c_\alpha}{18}, \frac{\varrho c_\beta}{18}, \varrho\nu\right) = e^{-\frac{\left|\frac{\varrho c_\alpha}{18} - \frac{\varrho c_\beta}{18}\right|}{\varrho\nu}} = e^{-\frac{\varrho|c_\alpha - c_\beta|}{18\,\varrho\,\nu}} \geq e^{-\frac{|c_\alpha - c_\beta|}{\nu}}$$

$$\geq F_{g1}(c_\alpha, c_\beta, \nu)$$

$$F_{g2}(\mathcal{F}(c_\alpha), \mathcal{F}(c_\beta), \varrho\nu) = F_{g2}\left(\frac{\varrho c_\alpha}{18}, \frac{\varrho c_\beta}{18}, \varrho\nu\right) = 1 - e^{-\frac{\left|\frac{\varrho c_\alpha}{18} - \frac{\varrho c_\beta}{18}\right|}{\varrho\nu}} = 1 - e^{-\frac{\varrho|c_\alpha - c_\beta|}{18\,\varrho\,\nu}} \leq 1 - e^{-\frac{|c_\alpha - c_\beta|}{\nu}}$$

$$\leq F_{g1}(c_\alpha, c_\beta, \nu).$$

For $c_\alpha = 0 \in \Upsilon$ and $i, j \in \mathbb{N}$

$$\zeta_1(F_{g1}, \mathcal{F}, 0, \nu) = supF_{g1}(\mathcal{F}(0_i), \mathcal{F}(0_j), \nu) = sup\ \{e^{-\frac{|\mathcal{F}(0_i) - \mathcal{F}(0_j)|}{\nu}}\} = 1 > 0$$

$$\zeta_2(F_{g2}, \mathcal{F}, 0, \nu) = supF_{g2}(\mathcal{F}(0_i), \mathcal{F}(0_j), \nu) = sup\left\{\{1 - e^{-\frac{|\mathcal{F}(0_i) - \mathcal{F}(0_j)|}{\nu}}\right\} = 0 < 1.$$

Therefore, all hypothesis of Theorem 3.12 holds, we obtain $c_\alpha = 0$ is a unique fixed point of $\mathcal{F}$.

**Definition 3.16**Let $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a GIFMS. A mapping $\mathcal{F}: \Upsilon \longrightarrow \Upsilon$ is aCiric quasi$\varrho -$ contraction if for $c_\alpha, \mathrm{c} \in \Upsilon, \nu > 0$ and $\varrho \in (0,1)$,

$F_{g1}(\mathcal{F}(\mathrm{c}), \mathcal{F}(c_\alpha), \varrho\nu) \geq min\{F_{g1}(\mathrm{c}, c_\alpha, \nu), F_{g1}(\mathrm{c}, \mathcal{F}(c), \nu), F_{g1}(c_\alpha, \mathcal{F}(c_\alpha), \nu),$

$F_{g1}(\mathrm{c}, \mathcal{F}(c_\alpha), \nu), F_{g1}(c_\alpha, \mathcal{F}(\mathrm{c}), \nu)\}$ and

$F_{g2}(\mathcal{F}(\mathrm{c}), \mathcal{F}(c_\alpha), \varrho\nu) \leq max\{F_{g2}(\mathrm{c}, c_\alpha, \nu), F_{g2}(\mathrm{c}, \mathcal{F}(c), \nu), F_{g2}(c_\alpha, \mathcal{F}(c_\alpha), \nu),$

$F_{g2}(\mathrm{c}, \mathcal{F}(c_\alpha), \nu), F_{g2}(c_\alpha, \mathcal{F}(\mathrm{c}), \nu)\}$.

**Proposition 3.17** Let $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a GIFMS and $\mathcal{F}: \Upsilon \longrightarrow \Upsilon$ is Ciric quasi a $\varrho -$ contraction. If a fixed point $p_\alpha$of $\mathcal{F}$ satisfies $F_{g1}(p_\alpha, p_\alpha, \nu) > 0$ and $F_{g2}(p_\alpha, p_\alpha, \nu) < 1$ then $F_{g1}(p_\alpha, p_\alpha, \nu) = 1$ and $F_{g2}(p_\alpha, p_\alpha, \nu) = 0$.

**Proof.** Using Ciric quasi$\varrho -$ contraction, for $p_\alpha \in \Upsilon$

$$F_{g1}(p_\alpha, p_\alpha, \nu) = F_{g1}(\mathcal{F}(p_\alpha), \mathcal{F}(p_\alpha), \nu)$$

$$\geq min\{F_{g1}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho}\right), F_{g1}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right), F_{g1}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right), F_{g1}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right),$$

$$F_{g1}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right)\}$$

$$\geq F_{g1}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho}\right) \geq \cdots \geq F_{g1}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho^n}\right) \longrightarrow 1 \text{ as } n \to \infty.$$

$$F_{g2}(p_\alpha, p_\alpha, \nu) = F_{g2}(\mathcal{F}(p_\alpha), \mathcal{F}(p_\alpha), \nu)$$

$$\leq max\{F_{g2}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho}\right), F_{g2}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right), F_{g2}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right), F_{g2}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right),$$

$$F_{g2}\left(p_\alpha, \mathcal{F}(p_\alpha), \frac{\nu}{\varrho}\right)\}$$

$$\leq F_{g2}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho}\right) \leq \cdots \leq F_{g2}\left(p_\alpha, p_\alpha, \frac{\nu}{\varrho^n}\right) \longrightarrow 0 \text{ as } n \to \infty.$$

Therefore, $F_{g1}(p_\alpha, p_\alpha, \nu) = 1$ and $F_{g2}(p_\alpha, p_\alpha, \nu) = 0$.■

**Theorem 3.18**Let $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ be a $F_I$ −complete GIFMS and $\mathcal{F}: \Upsilon \longrightarrow \Upsilon$ is a Ciric quasi$\varrho$ − contraction. Suppose $q_0 \in \Upsilon$ for which $\zeta_1(F_{g1}, \mathcal{F}, q_0, \nu) > 0$ and $\zeta_2(F_{g2}, \mathcal{F}, q_0, \nu) < 1$. Then $\{\mathcal{F}(q_n)\}$ converge toward a unique fixed point of $\mathcal{F}$.

**Proof.** Using$\mathcal{F}$ is Ciric quasi$\varrho$ − contraction,

$F_{g1}(\mathcal{F}(q_{n+i}), \mathcal{F}(q_{n+j}), \nu) \geq min\{ F_{g1}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n-1+j}), \frac{\nu}{\varrho}\right), F_{g1}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n+i}), \frac{\nu}{\varrho}\right),$

$F_{g1}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n+j}), \frac{\nu}{\varrho}\right), F_{g1}\left(\mathcal{F}(q_{n-1+j}), \mathcal{F}(q_{n+j}), \frac{\nu}{\varrho}\right),$

$F_{g1}\left(\mathcal{F}(q_{n-1+j}), \mathcal{F}(q_{n+i}), \frac{\nu}{\varrho}\right)\}$and

$F_{g1}(\mathcal{F}(q_{n+i}), \mathcal{F}(q_{n+j}), \nu) \leq max\{ F_{g2}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n-1+j}), \frac{\nu}{\varrho}\right), F_{g2}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n+i}), \frac{\nu}{\varrho}\right),$

$F_{g2}\left(\mathcal{F}(q_{n-1+i}), \mathcal{F}(q_{n+j}), \frac{\nu}{\varrho}\right), F_{g2}\left(\mathcal{F}(q_{n-1+j}), \mathcal{F}(q_{n+j}), \frac{\nu}{\varrho}\right),$

$F_{g2}\left(\mathcal{F}(q_{n-1+j}), \mathcal{F}(q_{n+i}), \frac{\nu}{\varrho}\right)\}$

Applying supremum on two sides of the preceding inequalities,

$\zeta_1(F_{g1}, \mathcal{F}, \mathcal{F}(q_n), \nu) \geq min\{ \zeta_1(F_{g1}, \mathcal{F}, \mathcal{F}(q_{n-1}), \frac{\nu}{\varrho}), \zeta_1(F_{g1}, \mathcal{F}, \mathcal{F}(q_n), \frac{\nu}{\varrho})\}$ and

$\zeta_2(F_{g2}, \mathcal{F}, \mathcal{F}(q_n), \nu) \leq max\{ \zeta_2(F_{g2}, \mathcal{F}, \mathcal{F}(q_{n-1}), \frac{\nu}{\varrho}), \zeta_2(F_{g2}, \mathcal{F}, \mathcal{F}(q_n), \frac{\nu}{\varrho})\}.$

then

$\zeta_1(F_{g1}, \mathcal{F}, \mathcal{F}(q_n), \nu) \geq \zeta_1\left(F_{g1}, \mathcal{F}, \mathcal{F}(q_{n-1}), \frac{\nu}{\varrho}\right)$ and $\zeta_2(F_{g2}, \mathcal{F}, \mathcal{F}(q_n), \nu) \leq \zeta_2\left(F_{g2}, \mathcal{F}, \mathcal{F}(q_{n-1}), \frac{\nu}{\varrho}\right).$

Continuing as Theorem 3.12, we arrive, the sequence $\{\mathcal{F}(q_n)\}$ is a $F_I - Cauchy$ sequence. Considering that $(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla)$ is a $F_I$ −complete GIFMS, accordingly there is a $q_\alpha \in \Upsilon$ for which the sequence $\{\mathcal{F}(q_n)\}$ converges to $q_\alpha$.

$F_{g1}(\mathcal{F}(q_{n+1}), \mathcal{F}(q_\alpha), \nu) \geq min\{F_{g1}\left(\mathcal{F}(q_n), q_\alpha, \frac{\nu}{\varrho}\right), F_{g1}\left(\mathcal{F}(q_n), \mathcal{F}(q_{n+1}), \frac{\nu}{\varrho}\right), F_{g1}\left(q_\alpha, \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right),$

$F_{g1}\left(\mathcal{F}(q_n), \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right), F_{g1}\left(q_\alpha, \mathcal{F}(q_{n+1}), \frac{\nu}{\varrho}\right)\}$

$F_{g1}(\mathcal{F}(q_{n+1}), \mathcal{F}(q_\alpha), \nu) \geq F_{g1}\left(\mathcal{F}(q_n), q_\alpha, \frac{\nu}{\varrho}\right) \geq F_{g1}\left(\mathcal{F}(q_{n-1}), q_\alpha, \frac{\nu}{\varrho}\right) \geq \cdots \geq F_{g1}\left(\mathcal{F}(q_0), q_\alpha, \frac{\nu}{\varrho^n}\right)$ and

$F_{g1}(\mathcal{F}(q_{n+1}), \mathcal{F}(q_\alpha), \nu) \leq max\{F_{g2}\left(\mathcal{F}(q_n), q_\alpha, \frac{\nu}{\varrho}\right), F_{g2}\left(\mathcal{F}(q_n), \mathcal{F}(q_{n+1}), \frac{\nu}{\varrho}\right), F_{g2}\left(q_\alpha, \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right),$

$F_{g2}\left(\mathcal{F}(q_n), \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right), F_{g2}\left(q_\alpha, \mathcal{F}(q_{n+1}), \frac{\nu}{\varrho}\right)\}$

$F_{g2}(\mathcal{F}(q_{n+1}), \mathcal{F}(q_\alpha), \nu) \leq F_{g2}\left(\mathcal{F}(q_n), q_\alpha, \frac{\nu}{\varrho}\right) \leq F_{g2}\left(\mathcal{F}(q_{n-1}), q_\alpha, \frac{\nu}{\varrho}\right) \leq \cdots \leq F_{g2}\left(\mathcal{F}(q_0), q_\alpha, \frac{\nu}{\varrho^n}\right).$

When $n \to \infty$, we arrive

$\lim_{n\to\infty} F_{g1}(\mathcal{F}(q_{n+1}), \mathcal{F}(q_\alpha), \nu) = 1$ and $\lim_{n\to\infty} F_{g2}(\mathcal{F}(q_{n+1}), \mathcal{F}(q_\alpha), \nu) = 0.$

Then the sequence $\{\mathcal{F}(q_n)\}$ converges to $\mathcal{F}(q_\alpha)$. Employing proposition 3.8, we get $\mathcal{F}(q_\alpha) = q_\alpha$. Consequently, $q_\alpha$ is a fixed point of $\mathcal{F}$. Suppose $q_\beta \in \Upsilon$ be one more fixed point of $\mathcal{F}$. Using $\mathcal{F}$ is Ciric quasi $\varrho$ −contraction,

$F_{g1}(q_\alpha, q_\beta, \nu) = F_{g1}(\mathcal{F}(q_\alpha), \mathcal{F}(q_\beta), \nu)$

$\geq min\{F_{g1}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho}\right), F_{g1}\left(q_\alpha, \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right), F_{g1}\left(q_\beta, \mathcal{F}(q_\beta), \frac{\nu}{\varrho}\right), F_{g1}\left(q_\alpha, \mathcal{F}(q_\beta), \frac{\nu}{\varrho}\right),$

$F_{g1}\left(q_\beta, \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right)\}$

$\geq F_{g1}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho}\right) \geq F_{g1}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho^2}\right) \geq \cdots \geq F_{g1}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho^n}\right) \longrightarrow 1$ and

$F_{g2}(q_\alpha, q_\beta, \nu) = F_{g2}(\mathcal{F}(q_\alpha), \mathcal{F}(q_\beta), \nu)$

$\leq max\{F_{g2}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho}\right), F_{g2}\left(q_\alpha, \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right), F_{g2}\left(q_\beta, \mathcal{F}(q_\beta), \frac{\nu}{\varrho}\right), F_{g2}\left(q_\alpha, \mathcal{F}(q_\beta), \frac{\nu}{\varrho}\right),$

$F_{g2}\left(q_\beta, \mathcal{F}(q_\alpha), \frac{\nu}{\varrho}\right)\}$

$\leq F_{g2}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho}\right) \leq F_{g2}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho^2}\right) \leq \cdots \leq F_{g2}\left(q_\alpha, q_\beta, \frac{\nu}{\varrho^n}\right) \longrightarrow 0.$

Hence, $q_\alpha = q_\beta, \mathcal{F}$ holds a unique fixed point.■

**Remark 3.19** From the established Theorem 3.16, it follows that fixed point theorems for Ciric quasi $\varrho$ −contraction can also be derived for IFMS and IFbMS.

**Application to Integral Equation**

Let $\Upsilon = \mathrm{C}[0, \mathrm{I}]$ be the set of continuous functions on a bounded interval $\iota = [0, \mathrm{I}]$ where $I > 0$. Consider the integral equation

$$c_\alpha(u) = \int_0^I g(u,r)G\big(u, r, c_\alpha(r)\big)dr, \qquad (4.1)$$

where $s: \iota \longrightarrow \mathbb{R}$, $g: \iota \times \iota \rightarrow \mathbb{R}$ and $G: \iota \times \iota \times \mathbb{R} \rightarrow \mathbb{R}$are continuous functions. Define a $F_I$ −complete GIFM $F_{g1}, F_{g2}: \Upsilon \times \Upsilon \times (0, \infty) \rightarrow [0,1]$ as

$F_{g1}(c_\alpha, c_\beta, \nu) = e^{-\frac{\sup_{r \in \iota}\left|c_\alpha(r) - c_\beta(r)\right|}{\nu}}$ and $F_{g2}(c_\alpha, c_\beta, \nu) = 1 - e^{-\frac{\sup_{r \in \iota}\left|c_\alpha(r) - c_\beta(r)\right|}{\nu}}$

For every$c_\alpha, c_\beta \in \Upsilon$ with $a_1 \Delta b_1 = a_1 b_1$ and $a_1 \nabla b_1 = max\{a_1, b_1\}$then$\big(\Upsilon, F_{g1}, F_{g2}, \Delta, \nabla\big)$ is a $F_I$−complete GIFMS. Assume the following conditions hold:

i. $\left|G\big(u, r, c_\alpha(r)\big) - G\left(u, r, c_\beta(r)\right)\right| < \left|c_\alpha(r) - c_\beta(r)\right|$ for every $u, r \in \iota$ and $c_\alpha, c_\beta \in \Upsilon$.

ii. $\sup_{r \in \iota}\left|\int_0^I g(u,r)dr\right| \leq \varrho < 1$ for every $u, r \in \iota$.

Then the integral equation (4.1) possesses a solution $w \in \Upsilon$.

**Proof.** Define an integral operator $\mathcal{F}: \Upsilon \rightarrow \Upsilon$ as

$$\mathcal{F}\big(c_\alpha(u)\big) = s(u) + \int_0^I g(u,r)G\big(u, r, c_\alpha(r)\big)dr$$

For $w \in \Upsilon, \nu > 0$ and$i, j \in \mathbb{N}$,

$$\zeta_1(F_{g1}, \mathcal{F}, w, \nu) = sup\, F_{g1}\big(\mathcal{F}(w_i), \mathcal{F}(w_j), \nu\big) = sup\left\{e^{-\frac{\sup_{r \in \iota}\left|\mathcal{F}\left(w_i(r)\right) - \mathcal{F}\left(w_j(r)\right)\right|}{\nu}} > 0\right\}$$

$$\zeta_2(F_{g2}, \mathcal{F}, w, \nu) = sup\, F_{g2}\big(\mathcal{F}(w_i), \mathcal{F}(w_j), \nu\big) = sup\left\{1 - e^{-\frac{\sup_{r \in \iota}\left|\mathcal{F}\left(w_i(r)\right) - \mathcal{F}\left(w_j(r)\right)\right|}{\nu}} < 1.\right\}$$

Next, we derive $\mathcal{F}$ is $\varrho$ − contraction. For every $c_\alpha, c_\beta \in \Upsilon$,

$$F_{g1}(\mathcal{F}c_\alpha, \mathcal{F}c_\beta, \varrho\nu) = e^{-\frac{\sup_{r\in\iota}\left|\mathcal{F}(c_\alpha(u))-\mathcal{F}(c_\beta(u))\right|}{\varrho\nu}}$$

$$= e^{-\frac{\sup_{r\in\iota}\left|\int_0^I g(u,r)G(u,r,c_\alpha(r))dr-\int_0^I g(u,r)G\left(u,r,c_\beta(r)\right)dr\right|}{\varrho\nu}}$$

$$\geq e^{-\frac{\sup_{r\in\iota}\left|\int_0^I g(u,r)dr\right|\int_0^I\left|G(u,r,c_\alpha(r))-G\left(u,r,c_\beta(r)\right)\right|dr}{\varrho\nu}}$$

$$\geq e^{-\frac{\varrho\int_0^I\left|c_\alpha(r)-c_\beta(r)\right|dr}{\varrho\nu}}$$

$$\geq e^{-\frac{\varrho\sup_{r\in\iota}\int_0^I\left|c_\alpha(r)-c_\beta(r))\right|dr}{\varrho\nu}} = e^{-\frac{\sup_{r\in\iota}\int_0^I\left|c_\alpha(r)-c_\beta(r))\right|dr}{\nu}}$$

$$\geq F_{g1}(c_\alpha, c_\beta, \nu).$$

$$F_{g2}(\mathcal{F}c_\alpha, \mathcal{F}c_\beta, \varrho\nu) = 1 - e^{-\frac{\sup_{r\in\iota}\left|\mathcal{F}(c_\alpha(u))-\mathcal{F}(c_\beta(u))\right|}{\varrho\nu}}$$

$$= 1 - e^{-\frac{\sup_{r\in\iota}\left|\int_0^I g(u,r)G(u,r,c_\alpha(r))dr-\int_0^I g(u,r)G\left(u,r,c_\beta(r)\right)dr\right|}{\varrho\nu}}$$

$$\leq 1 - e^{-\frac{\sup_{r\in\iota}\left|\int_0^I g(u,r)dr\right|\int_0^I\left|G(u,r,c_\alpha(r))-G\left(u,r,c_\beta(r)\right)\right|dr}{\varrho\nu}}$$

$$\leq 1 - e^{-\frac{\varrho\int_0^I\left|c_\alpha(r)-c_\beta(r)\right|dr}{\varrho\nu}}$$

$$\leq 1 - e^{-\frac{\varrho\sup_{r\in\iota}\int_0^I\left|c_\alpha(r)-c_\beta(r))\right|dr}{\varrho\nu}} = 1 - e^{-\frac{\sup_{r\in\iota}\int_0^I\left|c_\alpha(r)-c_\beta(r))\right|dr}{\nu}}$$

$$\leq F_{g2}(c_\alpha, c_\beta, \nu).$$

Therefore, all hypothesis of Theorem 3.12 holds. Thus, the integral equation 4.1 has a solution.■

## CONCLUSION

In conclusion, we have introduced the concept of GIFMS and explained the collection of GIFMS is broader than IFMS and IFbMS. Fixed point theorems were established using contraction mapping and Ciric quasi contraction mapping which ensures both existence and uniqueness of fixed points. Our theorem generalizes several known results in IFMS and IFbMS. Our results contribute to the development of fixed point theory and broadening its applicability. As an application, solution for integral equation is derived.

**ABSTRACT**

Agriculture plays an important role in the Indian Economy. According to the projection by the National Statistical Office of India, in financial year 2023–24 the contribution of agriculture to India's GDP was approximately 17.7%. Around 70% of rural India primarily depends on agriculture. This shows that the majorities of Indian farmers depend on farming and allied agriculture activities to sustain their lives. The present study is conducted in two districts—the Latehar and Palamau districts of Jharkhand. In the present study we see that acquisition of land, irrigation facilities, daily labourers, fertilizers, improvised equipment, bullocks, tractors, etc. helps to increase agricultural production.

**Keywords:** Agriculture, Development, Economy, farmer, GDP, Production.

## INTRODUCTION

Indian agriculture is becoming a global leader from a production, export and consumer point of view. Since independence it has played a pivotal role in food self-sufficiency, poverty alleviation, employment and Indian GDP. About 52% of rural households (about 70 % of the population) primarily depend on agriculture as an employment source, which strengthens the rural population. India has achieved a world-class status in agriculture and allied sectors through continuous efforts by means of the Green, White, Blue, Yellow and Red revolutions, which resulted in a 6-fold increase in food grain production from 50 million tons during 1950-51 to 314 million tons in 2021-22, making India self-sufficient in food grain and achieving a per capita food grain availability of 185.4 kg per year (144.1 kg/capita/year in 1950-51). It also ensures calorie intake availability both from crop origin and animal origin, leading to nutritional security. However, the population growth rate is higher in India (1.88) as compared to China (1.08) and

the world average of 1.51, now adding 1.93 % annual growth in India, threatening a population outburst. It is also seen that non-agricultural households possess plenty of agricultural land; the maximum land is with the OBC population (42.8%), followed by SC (28.4%), ST (10%) and others (18.8%). Whereas, among the agricultural households, OBC has the highest land holding (45.8%), followed by SC (15.9%), ST (14.2%) and others (24.1%). But 86% of farmers are still small and marginal farmers holding less than one hectare of land and possessing 46% of total operational land. It leads to income variability, causing 50.2% of agricultural households to have an average outstanding loan of about Rs.74121/- (SAS report based on NSO Data-2019). 70% of agricultural households in India do not get the national average income, which indicates 70% of agricultural households depend on other income sources. The average monthly income (NSO-2019 Data) of an agriculture household was Rs. 10829/-, out of which Rs. 3798/- was from crop cultivation and Rs. 1582/- from allied farming during 2019. However, a recent study revealed that farmers' income increased through multiple sources, 40 % of which came from salaries or wages and 38 % from crop production and more income came only from large farmers who have more than 10 hectares of land holdings. Different factors have reduced the agricultural share in Indian GDP from 61.72 % (1950-51) to 16.27 % (2020-21). Whereas, the share of the agricultural labour force increased from 19.58% (1950-51) to 54.6 % (2011 Census). In (2020-21) 30.54 % of the total workforce in the country is related to agricultural operations (NABARD). It is very important to understand several reasons for choosing agriculture as an occupation, which might be helpful in establishing a policy for the betterment of Indian agriculture. 86.4% of farmers choose it as a traditional occupation, 52.5 % are proud to be farmers, 38% believe it has good social value, 37.2% believe there is no other employment available, 25.2 % believe they have a good income, 22.3% believe agriculture has a good future and 12.8% opted for agriculture due to family pressure (NABARD).

## LITERATURE REVIEW

Singh *et al*. (2020) conducted research on the topic "Role of Agriculture in Making India $5 Trillion Economy under Corona Pandemic Circumstances". The research abstract states that at present, India is an emerging economy, which is constantly striving to achieve a $5 trillion economy. Pointing out the extensive contribution of the agriculture sector to the Indian economy, the research paper states that the contribution of the agriculture sector to the entire Indian economy is about $400 billion, which is the highest in the world after China. To achieve the broad goal of achieving a $5 trillion economy, every sector of the economy will have to perform excellently. The research abstract explains that to achieve the target, total annual exports should be at least $1 trillion, in which the contribution of agriculture and allied sectors should be about 10 percent. Describing the economic importance of the agriculture sector, the research paper states that smart agriculture will play a very important role in achieving $100 million in exports and maintaining our products at the international level. The research paper states that agritech startups can play an important role in this sector. If the Indian agriculture sector succeeds in doing this, then per capita income will double. If I am successful, then the person's income will double.

Balakrishna, A., *et al*. (2023) conducted research work on the research titled "A Comprehensive Analysis of the Advances in Indian Digital Agricultural Architecture". A suggestion was presented to equip the agriculture sector with digital capabilities. The research paper emphasizes changing the traditional structure of the agricultural sector through ICT-based innovations and refining it into a modern, advanced digital agriculture structure. The research paper describes important suggestions and facts for upgrading traditional agricultural systems based on smart agriculture and ICT-based interventions. Provided-driven technologies such as remote sensing, smart sensors, and IoT-based devices based on AI/ML algorithms have become an integral part of current agriculture, which helps farmers to make important decisions related to the agricultural system. The ICT revolution is currently empowering farmers in relation to agricultural management by improving crop yield, pest control, soil health etc. In the research paper, the researchers have done a comprehensive and in-depth review of the current state and direction of Indian agriculture.

Khan, M.A. (2021) conducted research on the topic "Impact of Agriculture Sector on the Sustainable development of the Indian Economy: An Analysis". After reviewing the research paper published by the researcher and understanding the deep meanings of the abstract of the research paper, it can be described that India has been a village-dominated nation since ancient times. The researcher described that about 67 percent of the population of India lives in rural areas, whose main occupation is agriculture. The agricultural sector is an integral part of the Indian economy, and agriculture is the means of livelihood for more than 70 percent of the population. According to the researcher, although the contribution of agriculture to the Indian GDP is only one-fifth of the entire economy, even after this, the agricultural sector employs 50 percent of the Indian workforce. Despite the remarkable growth rates of the present time, India is facing agricultural challenges. The objective of this study of the researcher is to focus on agricultural productivity and its prospects. The presented research work is based on secondary data related to government policies and schemes. The main objective of this research study is to gain more information about the current status of the Indian agricultural system and to understand the status of the extensive contribution of the agricultural sector to the Indian economy.

Charishma, K.S. (2024) conducted research on the topic "Contribution of Agriculture Sector in Exports of India: An Economic Analysis". The researcher clarified the thematic concept on the basis of content analysis. According to the researcher, about 50 percent of India's population is associated with the agricultural sector, which indicates the agricultural sector as a major economic sector. The agricultural sector is also called the backbone of the Indian economy; about 16 percent of India's total GDP and about 10 percent of gross exports come from the agricultural sector. India ranks second in the world in the field of agricultural production . Along with the cultivation of various types of crops in India, agriculture-related businesses like milk production, animal husbandry, poultry industry, and fisheries on a large scale by farmers play an important role in employing a large number of people, which has a positive impact on the economy of India.

Arumugam, U., and Manida, M. (2023) conducted a study on the topic "Agripreneurship for sustainable economic development in India." According to the researcher, integrating the principles of Agripreneurship into the agriculture sector leads to a transformative attitude. In this paper, the researcher explores the concept of agricultural entrepreneurship and its potential to provide a suitable solution to the most complex obstacles facing the Indian economy, including rural unemployment, food security, and environmental sustainability. In the paper, the researcher described that a characteristic of India's agricultural economy is that a large part of the rural demography is engaged in agriculture, yet it suffers from the problem of low productivity, fragmented holdings, and universal access to modern advanced agricultural technology. According to the researcher, agricultural entrepreneurship offers a promising solution by encouraging farmers to adopt new methods, value-addition techniques, and market-oriented approaches. This paper reviews India's successful agricultural entrepreneurship model and many aspects related to it.

Muralidharan, T. (2023)in his study "Strengthening the institutional mechanism of agricultural credit; Policies and practice – 1960s to 2019 – A review".In this paper the researcher reviewed the history of financial access for farmers and the agriculture sector in the last few years. The researcher analyzed the basic concepts and facts related to agriculture and the Indian economy and described that about 60 percent of the Indian population is directly or indirectly associated with agriculture for earning their livelihood. Keeping in view the broad relationship between agriculture and economy, financial institutions have been formed in the past years, significant changes, strengthening, and promotion have been made in banking systems, and many types of policy changes have been made. The important impact of the effective changes made through improvement in agricultural systems and policy transformation is to reduce the dependence of farmers on moneylenders and middlemen for financial assistance. According to the researcher, even after the above facilities, the dependence of farmers on moneylenders and middlemen has not completely ended. 39 percent of farmers, especially small and marginal farmers, who are the backbone of the Indian economy, are deprived of it.

Chengappa, P. G., Manjunatha, A. V., and Devika, C. M. (2023) in their research work "Secondary agriculture: Boosting the rural economy in India". The researcher has described in the research paper that secondary agriculture is seen as a supplement to primary agriculture, which is seen as an agenda to increase the income of farmers. This concept has prominence on the agenda of increasing farmer income. The principles of secondary agriculture lie in value addition and creation. According to the researcher, secondary agriculture provides value addition in many areas of primary agriculture, including different types of crops, animal husbandry, fisheries, and poultry, by providing facilities for primary processing and management. According to the researcher, the value creation strategy depends on such types of products or services that are different or special from the mainstream. In this research paper, the concept of the development of opportunities for integration and convergence of stakeholders in various institutions and schemes to implement secondary agriculture for generating more income in rural areas has been analyzed.

Haldhar, S. M., *et al*. (2023) in their study "Entrepreneurship opportunities for agriculture graduates and rural youth in India: A scoping review" depicts Entrepreneurship opportunities for agriculture graduates and rural youth in India, in a scoping review. While clarifying the topic, by the researcher said that most of the world's population lives in rural areas. If we talk about India, then about 73 percent of the population here is dependent on agriculture and related work for their livelihood. According to the researcher, entrepreneurship in rural areas is one of the most important initiatives towards national development, despite the adverse effects of climate change. According to the researcher, entrepreneurship is an important feature for the sustainable existence of small-scale agriculture in the ever-growing international economy. On the contrary, the majority of rural entrepreneurs of developing nations have to face complex problems of a lack of basic facilities. The presented research paper discusses such points, which are very important for India's self-reliant campaign.

Chouhan, N., and Wehrden, H.V. (2025)in their study entitled "A critical analysis of the policy potential for Sustainable agriculture in India". Describing the essence of the research work, the researcher wrote that aligning the progress of policy making in India with the changing climate is essential to make and develop the agricultural system more robust and environmentally friendly, especially for a country like India, which contributes about 18 percent to the GDP. The researcher described that according to the Census (2011), 54.6 percent of the total population of India is dependent on agriculture as their primary livelihood. Under the presented research study, the researcher emphasizes finding out the main themes of the policies being implemented in the agricultural sector in India at present. This research paper is an attempt to find out the extent of policy themes, climate change, and adaptation. MXQDA has been used as an analysis tool in the methodology.

## METHODOLOGY

The descriptive survey method is used in the present investigation. The study was carried out in the districts of Latehar and Palamau in the Indian state of Jharkhand. The total sample size for the study was 1000 farmers from 10 villages in each district, who worked in various agricultural fields such as crop husbandry, vegetable cultivation, piggery, poultry, and fishing. A structured interview schedule was created, which included both multiple choice and open-ended questions. The interview schedule was produced in English and translated into Hindi for the respondents, and it was utilized to obtain information systematically from them. To obtain trustworthy data, personal interviews were conducted at respondents' residences.

**Research Objectives**

To study the income generation through agriculture and allied sectors in the Latehar and Palamau districts of Jharkhand.

**Sample of Study**

General Information about Selected Villages of Latehar District (Table 1). The Latehar district's Mahuadanr block is where the sample was gathered. Ten villages were chosen at random to gather the data from the 101 communities that make up the Mahuadanr block. All 10 of the villages in the Mahuadanr block have more than 50% ST residents, with Gothgaon having the biggest population at 1465. The average household size was about five people. General Information about Selected Villages of Palamau District (Table 2). The sample is collected from the Chainpur block of the Palamau district. The Chainpur block consists of 169 villages; out of that, 10 villages were selected randomly to collect the data. From the above field study, three villages with ST populations below 50 percent were found; Rabda was the largest in terms of population, i.e., 4511. The population of ST in Rabda is around 94 percent, and around 6 percent are OBC. The average size of the household was around 5.

## RESULT AND DISCUSSION

Table 3 shows that only one percent of farmers in Palamau owned land larger than ten acres, compared to more over two percent of sample farmers in Latehar district. Training is critical in both community and agricultural development. Less than 26% of farmers in both regions own land. Palamau had a higher percentage of landless farmers (34%) than Latehar district, which had just about 18%. Farmers with land sizes less than one acre were also more common in Palamau, accounting for 20% of the total, compared to 18% in Latehar. According to the data, nearly 59% of farmers in Palamau district held land less than 5 acres, while 67% of farmers in Latehar district did. Compared to Palamau, the Latehar district has a higher proportion of farmers with land larger than 5 acres. According to the data in Table 4, in Latehar, over 25 percent of farmers earned less than Rs. 20,000 per year. Only 9% of farmers in the Palamau district had an annual income of less than Rs. 20,000. In both areas, an average of 17 percent of farmers earned less than Rs. 20,000 per year. In these districts, more than 72% of sample farmers earned less than Rs. 50,000 on average each year. Less than 5% of farmers had an annual income of Rs. 90,000 to 1,00,000. In the sample area, on average, 5.5% of farmers earned more than Rs. 1.0 lakh per year. The average yearly income of the sample farmers in both districts in 2023-24 was Rs. 44,023/- from agriculture and agricultural-related sectors. Compared to Palamau, where the average annual farmer income was just Rs. 39,570/-, Latehar district had a greater average annual farmer income of Rs. 48,475/-. The explanation for this is that Latehar district has more market settings and more consumption due to its large population, but Palamau district has fewer market setups, lower market value, and less consumption due to its small population. Table 5 shows that in Palamau district, more than 16 percent of the people worked with cattle, whereas in Latahar district, less than 8 percent of farmers did the same. At the same period, the Latehar district had a higher proportion of its inhabitants involved in beekeeping than the Palamau district. Engagement in forestry work was 8% greater in the Latahar district than in the Palamau district, or 5%. The crop husbandry employs the most people (32%), followed by vegetable cultivators (23%), in both districts. The population involved in poultry farming amounted to only 8%. Latehar has a greater overall crop husbandry proportion (38%) than Palamau district (26%).

## CONCLUSION

According to the study's sample, the annual income in Latehar district is 48,475/-, whereas in Palamau district it is 39,570. In the year 2023-24, the sample farmers in both districts earned an average yearly income of Rs. 44,023/- from agriculture and agriculture-related sectors. Latehar districts have better incomes due to land acquisition and a well-developed market, as well as the fact that the majority of scheduled tribe inhabitants work in agriculture.The sample of the study shows that both districts, Palamau and Latehar, have more than 50 percent of the population from the Scheduled Tribe, and they are mostly engaged in agricultural work. Further, we see from the sample of study that in Palamau district 34 percent of people are landless and in Latehar district 18 percent of people are landless. It means the people not having land are involved in other agriculturally allied sectors such as poultry, forestry, piggery, beekeeping, etc.

## ABSTRACT

Sesamol (3,4-methylenedioxyphenol), a natural phenolic compound derived from *Sesamum indicum* L., represents one of the most bioactive constituents of sesame oil, contributing to its remarkable oxidative stability. Its unique benzodioxole structure with a reactive hydroxyl group confers strong antioxidant and free radical-scavenging abilities. Preclinical research highlights sesamol's multifunctional therapeutic potential, encompassing antioxidant, anti-inflammatory, anticancer, cardioprotective, neuroprotective, hepatoprotective and antidiabetic effects. Mechanistically, sesamol modulates key molecular pathways including NF-κB, MAPK, and Nrf2/HO-1, thereby regulating oxidative stress, apoptosis and inflammatory signaling. In vitro studies reveal its capacity to enhance endogenous antioxidant enzymes such as superoxide dismutase, catalase, and glutathione peroxidase, while in vivo evidence confirms protective roles in cardiovascular, hepatic and neurological disorders. Additionally, sesamol exhibits anti-proliferative effects in cancer models through caspase activation and VEGF inhibition and improves metabolic homeostasis via PPARγ activation and insulin sensitization. Its amphiphilic nature enhances cellular permeability and pharmacokinetic performance, supporting its application as a nutraceutical candidate. Owing to its natural origin, safety profile and physicochemical stability, sesamol bridges

traditional medicine and modern pharmacology. Collectively, sesamol emerges as a multifunctional bioactive molecule with significant pharmacological promise in preventing and managing chronic diseases. Advancing formulation strategies and clinical validation will be crucial to harness its full therapeutic and nutraceutical potential.

**Keywords:** Sesamol, *Sesamum indicum,* Redox homeostasis, Natural phenolic compound.

## INTRODUCTION

Sesamol is a naturally occurring phenolic compound primarily isolated from *Sesamum indicum*(L.), a plant belonging to the family Pedaliaceae. *S. indicum,* commonly known as sesame or gingelly, is among the oldest oilseed crops, with its cultivation dating back over 3000 years in India and other tropical regions. Traditionally, sesame seeds and oil have been widely utilized in Ayurvedic and Unani medicine for their nutritive, protective, and therapeutic properties, particularly in the management of oxidative stress-related disorders, inflammation and hepatic ailments [1,2]. Chemically, sesamol (3,4-methylenedioxyphenol) is a benzodioxole derivative and one of the most potent antioxidative constituents of sesame oil. It is generated either naturally through the hydrolysis and oxidation of sesame lignans such as sesamolin and sesamin, or thermally during roasting of sesame seeds [3,4]. Its presence accounts for the remarkable oxidative stability and long shelf life of sesame oil, distinguishing it from other edible oils [5].From a pharmacological perspective, sesamol exhibits a broad range of biological and therapeutic activities, including antioxidant, anti-inflammatory, anticancer, neuroprotective, cardioprotective, and hepatoprotective effects [6-9]. Mechanistically, sesamol exerts its beneficial actions through modulation of redox homeostasis, scavenging of reactive oxygen and nitrogen species, inhibition of nuclear factor kappa B (NF-κB) and Mitogen activated protein kinase (MAPK) pathways, and activation of Nuclear factor erythroid 2–related factor 2 (Nrf2)/Heme oxygenase-1 (HO-1) pathway (Nrf2/HO-1) signaling [10-12]. Owing to its amphiphilic structure, sesamol readily penetrates biological membranes, allowing for effective cellular protection against oxidative injury and inflammation [13].Recent investigations have also revealed sesamol's potential in metabolic and inflammatory disorders, including diabetes mellitus, atherosclerosis, and ulcerative colitis, where it mitigates oxidative tissue damage and suppresses pro-inflammatory cytokines such as Tumor Necrosis Factor-alpha(TNF-α) and Interleukin (IL-6)[14-16]. Moreover, preclinical studies highlight sesamol's safety profile and its synergistic potential when combined with conventional therapeutics, positioning it as a promising nutraceutical and pharmacological candidate for chronic disease management [17, 18]. Sesamol represents a bioactive phenolic compound of herbal origin that bridges traditional medicine and modern pharmacology, offering diverse therapeutic applications supported by growing experimental and clinical evidence represented in Figure 1.

**Chemistry**

The comprehensive chemical attributes and structural characteristics supporting these functional roles are systematically summarized in Table 1.

**Pharmacodynamic insights into the mechanistic and pharmacological pathways of sesamol**

Research over the past decades has extensively explored sesamol through *in vitro* and*in vivo* models, uncovering its multifaceted biological actions. It functions as a powerful antioxidant and anti-inflammatory agent while also exerting anticancer, neuroprotective, and hormone-regulating effects [20]. Its therapeutic efficacy is mediated by NF-κB inhibition, apoptotic signaling activation, and enhancement of endogenous antioxidant systems, positioning sesamolas a promising phytochemical for numerous chronic disorder as depicted in Table 2.

**Preclinical Evaluation of Sesamol Therapeutic Potential**

Extensive preclinical investigations have revealed the multitarget pharmacological potential of sesamol across diverse biological systems [21-23]. The compiled findings summarize itsantioxidant, anti-inflammatory, anticancer,

cardioprotective, neuroprotective, antidiabetic, hepatoprotective and osteoprotective activities demonstrated in both *in vitro* (cell-based) and *in vivo* (animal-based) models [24-26]. Sesamol exerts potent antioxidant effects through reactive oxygen species (ROS) scavenging, lipid peroxidation inhibition, and upregulation of endogenous antioxidant enzymes such as superoxide dismutase (SOD), catalase (CAT), and glutathione peroxidase (GPx)[27,28]. It effectively suppresses NF-κB activation and downregulates cyclooxygenase-2 (COX-2), inducible nitric oxide synthase (iNOS), and pro-inflammatory cytokines including TNF-$\alpha$, IL-1β, and IL-6, while activating Nrf2 and HO-1 pathways responsible for maintaining redox homeostasis [29 -31]. In cancer models, sesamol promotes apoptosis (programmed cell death) through caspase activation, tumor suppressor p53 upregulation, and inhibition of vascular endothelial growth factor (VEGF), phosphatidylinositol-3-kinase (PI3K) and protein kinase B (Akt) signaling [32, 33]. Cardiometabolic studies indicate improved endothelial nitric oxide synthase (eNOS) activity, enhanced peroxisome proliferator-activated receptor gamma (PPARγ) signaling, and increased insulin sensitivity, confirming strong cardiometabolic studies indicate improved endothelial nitric oxide synthase (eNOS) activity, enhanced peroxisome proliferator-activated receptor gamma (PPARγ) signaling and increased insulin sensitivity, confirming strong cardiometabolic protection[34,35]. In neurological models, sesamol regulates extracellular signal-regulated kinase 1/2 (ERK1/2) signaling and promotes neuronal regeneration (neurogenesis), contributing to neuroprotective outcomes [36,37]. It also exhibits estrogen receptor alpha/beta (ER-$\alpha$/β) modulation, inhibits osteoclast differentiation and improves bone mineral density (BMD) in reproductive and skeletal models [38, 39]. Moreover, in hepatic and iron-overload studies, sesamol reduces lipid peroxidation and iron accumulation, demonstrating hepatoprotective and anti-anemic activities [40]. Altogether, these experimental insights support sesamol as a multifunctional therapeutic molecule with broad pharmacological significance as described in Table 3.

## CONCLUSION

Sesamol represents a chemically stable and biologically potent phenolic compound derived from *Sesamum indicum* L. Its unique benzodioxole structure, along with the presence of a reactive hydroxyl group, contributes to its exceptional antioxidant and free radical-scavenging capacity. The compound's physicochemical properties, including moderate lipophilicity and high thermal stability, enhance its bioavailability and shelf-life in pharmaceutical and nutraceutical applications. Experimental evidence supports sesamol's protective effects against oxidative stress, inflammation, and cellular damage in multiple biological systems. Its solubility profile and strong resonance stabilization make it suitable for formulation development and biomedical use. Furthermore, sesamol's safety, natural origin and multifunctional activity highlight its potential as a therapeutic and preventive agent. The structural and functional attributes collectively establish sesamol as a valuable bioactive molecule for health-promoting and pharmacological purposes. Overall, its comprehensive chemical profile supports future exploration in drug design, antioxidant therapy and functional food innovation.

## ACKNOWLEDGEMENTS

The authors would like to thank the Head of the Institution and Management of Gokaraju Rangaraju College of Pharmacy for their cooperation and contribution.The authors acknowledge the assistance of Open AI tool in improving the grammar and language clarity of the manuscript.

**Table 1: Chemical profile of Sesamol [19]**

| Parameter | Description |
|---|---|
| Common name | Sesamol |
| IUPAC name | 1,3-Benzodioxol-5-ol |
| Chemical formula | $C_7H_6O_3$ |
| Molecular weight | 138.12 g/mol |
| Chemical structure | A benzene ring substituted with a hydroxyl group (-OH) at position 5 and a methylenedioxy (-O-$CH_2$-O-) bridge between C3 and C4. |
| SMILES notation | OC1=CC2=C(C=C1)OCO2 |
| Appearance | White to off-white crystalline solid |
| Melting point | 62-65 °C |
| Boiling point | 297 °C |
| Solubility | Ethanol, methanol, ethyl acetate, chloroform (Soluble); Water (Slightly soluble) |
| Log P (octanol/water) | 1.35 ± 0.2 (moderate) |
| pKa value | ~9.7 (phenolic OH group) |
| UV absorption (λmax) | 290–297 nm (in methanol) |

| | |
|---|---|
| Density | 1.38 g/cm³ |
| Functional groups | Phenolic hydroxyl (-OH), methylenedioxy (-O-$CH_2$-O-) |
| Stability | Thermally and oxidatively stable; resistant to rancidity; stable under neutral and slightly acidic conditions |
| Molecular characteristics | Aromatic, planar structure enabling resonance stabilization and radical scavenging |

**Table 2: Pharmacological spectrum and mechanistic insights of Sesamol [20]**

| Therapeutic use / Disease | Mechanism of action | Key findings / effects |
|---|---|---|
| Antioxidant activity | Scavenges ROS; enhances SOD, CAT, GPx activity; chelates metal ions | Reduces oxidative stress; prevents lipid peroxidation and cellular damage |
| Anti-inflammatory activity | Inhibits NF-κB pathway; reduces TNF-α, IL-1β, IL-6 production | Lowers inflammatory cytokines; decreases inflammation and tissue damage |
| Neuroprotective effects | Reduces oxidative stress; modulates neurotransmitters; promotes neurogenesis; protects against excitotoxicity | Protects neurons from apoptosis; improves cognitive and motor functions (Alzheimer's, Parkinson's, stroke) |
| Cardioprotective effects | Antioxidant and anti-inflammatory actions; reduces infarct size; modulates Akt/eNOS and NO pathways | Protects myocardium from ischemia/reperfusion injury; reduces cardiac injury markers; improves heart function |
| Anticancer activity | Induces apoptosis (caspase activation); inhibits angiogenesis (↓VEGF); arrests cell cycle; enhances tumor suppressor genes | Inhibits cancer cell growth and metastasis; synergistic with chemotherapy |
| Antidiabetic effects | Improves insulin sensitivity; reduces ROS; protects β-cells | Lowers blood glucose and oxidative stress; reduces diabetic complications (neuropathy, nephropathy) |
| Wound healing | Antioxidant and anti-inflammatory effects; promotes collagen synthesis and cell proliferation | Enhances wound closure and tissue regeneration |
| Arthritis | Inhibits TNF-α, IL-1β, IL-6; suppresses MMPs; reduces oxidative stress | Decreases inflammation and cartilage degradation; improves joint function |
| Hypertension | Modulates nitric oxide (NO) pathway; reduces oxidative stress | Lowers blood pressure and vascular inflammation |
| Atherosclerosis | Inhibits LDL oxidation; reduces arterial inflammation | Prevents plaque formation; improves lipid profile |
| Liver protection | Reduces oxidative stress and inflammation; promotes regeneration | Protects hepatocytes from toxin- or alcohol-induced damage |
| Kidney protection | Reduces oxidative and inflammatory stress in renal tissue | Preserves renal function; protects against diabetic nephropathy |
| Respiratory disorders | Anti-inflammatory action in airway tissues | Reduces airway hyperresponsiveness and inflammation (asthma) |

**Table 3: *In vitro* and *in vivo* validation of Sesamol bioactivities [20]**

| Study Type | Model / System | Mechanism of action | Application /Therapeutic area |
|---|---|---|---|
| *In vitro* | $H_2O_2$, DPPH, NO, lipid peroxidation assays | Scavenges ROS; enhances SOD, CAT, GPx activity; chelates metal ions | Antioxidant activity |
| *In vitro* | Human lymphocytes | Free-radical quenching; increases SOD, GSH, CAT | Radioprotection |

| | | | |
|---|---|---|---|
| *In vivo* | Swiss albino mice (γ-irradiation) | Quenching of free radicals; enhanced antioxidant defense | Radioprotective |
| *In vivo* | Endotoxin-treated rats | Inhibition of NO-mediated lipid peroxidation | Anti-inflammatory |
| *In vitro / in vivo* | H9c2 cardiomyoblasts and rat models | Activation of PPARγ/α and eNOS; NF-κB inhibition | Cardioprotection |
| *In vivo* | Diabetic rats | Improves insulin sensitivity; reduces ROS; protects β-cells | Antidiabetic |
| *In vivo* | Rat arthritis model | Inhibits TNF-α, IL-1β, IL-6; suppresses MMPs; reduces oxidative stress | Anti-arthritic |
| *In vivo* | Rat and mouse models | Reduces oxidative stress; modulates ERK1/2 and neurogenesis | Neuroprotection (Alzheimer's, Parkinson's, stroke) |
| *In vivo / in vitro* | Myocardial ischemia models and HUVEC cells | Activation of Akt/eNOS; inhibition of NF-κB | Cardiovascular protection |
| *In vitro / in vivo* | Cancer cell lines and animal models | Caspase activation; VEGF down-regulation; p53 up-regulation; NF-κB inhibition | Anticancer (breast, colon, leukemia, prostate) |
| *In vivo* | Ovariectomized rats | Estrogen receptor modulation (ER-α/β), NF-κB inhibition, antioxidant | Hormone replacement, bone protection |
| *In vivo* | Ovariectomized + osteoporotic rats | Inhibits osteoclast differentiation, enhances calcium deposition | Osteoporosis prevention, bone mineral density improvement |
| *In vivo* | Iron-overloaded mice | Reduces oxidative stress, lipid peroxidation, and iron accumulation | Hepatoprotection, anemia management |
| *In vitro / in vivo* | MCF-7, MDA-MB-231 cells, mice xenografts | Caspase-3 activation, VEGF inhibition, PI3K/Akt suppression | Anticancer (breast cancer) |
| *In vitro* | Colon epithelial and immune cells | Suppresses COX-2, iNOS, cytokines | Anti-inflammatory, chemopreventive |

## ABSTRACT

The present research work was carried out to study the formulation of the margarine extract the microbiological analysis of the margarine sample to determine the microorganisms loaded in the margarine extract through total heterotrophic bacterial count and coliform count and fungal enumeration of the sample. Proximate and physiochemical analysis of margarine formulated from coconut and papaya to identify the nutritional supplement of the compound of the extract. Phytochemical assay to evaluate that compounds present in the sample. The antimicrobial activity of the margarine extraction that was tested by pathogen organisms from margarine extract showed the inhibition of growth in pathogen organisms. Antioxidant activity also shown the radial antioxidant ability. The margarine extract can be used as a natural additive to enrich table spread margarine without affecting its properties while improving its oxidation stability. Anti- inflammatory shown the healing property to able to treat with margarine and so one can develop drugs for the treatment of inflammatory-related disease and its has the good healing properties to treat the injurious substances.

**Keywords:** Margarine Extract, Microbiological, Coliform, Phytochemical, injurious substances.

## INTRODUCTION

Traditional medicine is especially common in underdeveloped countries because of its historical and cultural significance. For the treatment of a wide range of illnesses, they employ natural medicines and plant extracts. The World Health Organization's recognition of the extensive use of traditional medicine demonstrates its continued importance in global healthcare. One of the main benefits of conventional medicine is the application of plant extracts and their active components (Davis, 1994). Coconut oil, extensively used in both culinary and industrial realms, is distinguished by its high medium-chain fatty acid content, ranging from 46% to 48% (Marina *et al*., 2009). Coconuts offer nutraceutical advantages. Coconut juice demonstrates estrogenic effects and possesses antibacterial, antiviral, antidote, antioxidant, and antithrombotic properties (Esquenazi*et al*., 2002). These attributes make coconut-derived dietary supplements valuable for averting nutrient deficiencies and promoting overall health. Papaya is also known for its digestive benefits and is rich in manganese, offering advantages in preventing osteoporosis and bone fractures. The intake of papaya seed oil with a notable oleic acid composition has been associated with improved plasma lipid status. Oleic acid, found in the oil, has demonstrated potential in reducing cholesterol and plasma triacylglycerol levels without affecting plasma Low-Density Lipoprotein (LDL) cholesterol concentration. (Yao; Xu, 2021). Margarine, initially developed by French chemist Hippolyte MegeMouries in the 1860s, originally relied on animal-derived fats, notably bovine fat. By the early 20th century, this progression culminated in the exclusive use of 100% vegetable oil, sourced from options like coconut, palm, melon, papaya and other sources. This transformation mirrored evolving consumer preferences and economic considerations within the margarine industry (Chrysan, 2005). As per the Codex International standard established in 2001, margarine is defined as a water-in- oil emulsion primarily composed of edible oils and fats.

This standard outlines that margarine should consist of a minimum of 80% fats and a maximum of 16% water. It is a common practice to blend two or more different oils in margarine production, providing a customized approach to meet specific preferences and requirements (Codex, 2001).The formulation of margarine endetails blending water, additives like salt, and emulsifiers to maintain its quality. Emulsifiers serve three pivotal functions in the margarine production process, as elucidated (Hamilton, 1994). Firstly, they aid in establishing a stable emulsion, ensuring the harmonious integration of water droplets within the vegetable oil. Secondly, emulsifiers modify the crystalline structure of the vegetable oil, contributing to the desired texture of the end product. Lastly, they play a crucial role in preventing the coalescence of water droplets and minimizing splattering during the heating of margarine. The global production and consumption of margarine are experiencing an upward trend due to its lower saturated fat content compared to butter and its cholesterol-free attributes. The combination of coconut and papaya oils in margarine production offers opportunities to optimize resource utilization and product value, these oils present a promising alternative for margarine production, potentially enhancing its health benefits. This study aims to assess the microbiological quality and determine the physicochemical and proximate composition of the resulting margarine (Akubuenyi; Odey, 2022). Margarine finds application as a fat spread, in cooking, and in the production of bakery items (Reyes-Hernandez *et al*., 2007 and Lee *et al.,* 2008)**.** The current study serves as an initial screening phase focused to isolate and identify specific antibacterial compounds that exhibit plant-derived broad-spectrum antimicrobials and is a pioneering work on the antioxidant, anti-inflammatory and phytochemical analysis on the nature of margarine sourced from coconut and papaya extracts.

## MATERIALS AND METHODS

**Sample collection**

The sample of fresh coconut and papaya sample were collected from local market. Coconut sample are coconut and flower and entire papaya sample were taken for extraction and analytical standard.

**Extraction of margarine: (Sayed *et al.*, 2009)**

Margarine was produced from 100% coconut and papaya extract using the method described by Sayed *et al*., 2009. A basic recipe that include 81.7% oil blend, 0.3% emulsifier, 0.8% salt,0.9% skim milk powder, 0.2% flavour, 0.01% antioxidant and 0.003% colour was used for margarine production. Emulsifier, antioxidant, flavor and colour was dissolved in the heated oil phase. Salt and skim milk powder were dissolved in water phase. The water phase was added gradually to the oil phase while agitating it to form a nice emulsion. For the solidification of margarine, the emulsion was stirred for 10 minutes and then cooled in ice bath containing 10% sodium chloride (NaCl). The emulsion was then mixed and solidified at a temperature of $110^0$ C. the margarine sample stored in a refrigerator at $4^0$C.

**Microbiological Analysis**

**Preparation of peptone salt saline**

Microorganism were isolated by serial dilution technique. 10µg of sample was suspended in 90ml of Peptone Salt Saline and mixed for 2minutes.

**Determination of total heterotrophic bacterial count**

Serial dilution ($10^{-1}$ -$10^{-5}$) was prepared from margarine oil samples. 0. 1 ml was transferred from each selected dilution ($10^{-2}$,$10^{-3}$ and $10^{-4}$) into sterile petri dishes in triplicates. The molten sterilized agar (Nutrient agar) were poured into the plates, swirled for even distribution of the inoculum within the agar medium and allowed to solidify and then incubated at 37°C for 24 hours. Thereafter, plates with colony growth were counted and expressed in colony forming unit per millimeter (CFU/ml).

**Enumeration of total coliform count**

Total coliform count of the samples was determined using the spread plate method on MacConkey agar medium. 0.1ml of the diluent from the samples was aseptically transferred into sterile petri dishes containing already sterilized MacConkey agar, and were swirled for even distribution. They were incubated at ambient temperature for 3-4 days. Plates with colony growth were counted and expressed in colony forming unit per millimeter (CFU/ml).

**Determination of total fungal count**

Total fungal count was examined using the spread plate method on Sabouraud dextrose agar (SDA). Exactly 0.1ml of the diluent from the samples was aseptically transferred into sterile petri dishes containing already sterilized SDA, and was swirled for even distribution. They were incubated at ambient temperature for 3-4 days. Plates with colony growth were counted and expressed in colony forming units per millimeter (CFU/ml).

**Determination of Proximate Composition (Standard AOAC method)**

The sample was analyzed for the various nutrient's constituent such as analysis of ash, sugars, carbohydrates, calcium, total solids, carbohydrates, calcium, acidity, crude lipid, crude protein, crude fibre, moisture, pH, energy and vitamin $B_{12}$ by the methods of the Association of official Analytical Chemists.

**Physicochemical Parameters (Standard IS method)**

Physicochemical properties of oils are determine the acidity, Calcium and colour to know the quality, purity and identification of the margarine extract.

**Antimicrobial Activity: (Kirby and Bauer 1950)**

The disk diffusion method of Kirby and Bauer has been standardized and is a viable alternative to broth dilution methods for laboratories without the resources to utilize the newer automated methods for broth microdilution testing.

**Antibacterial activity**

The inoculum was standardized at 1 x $10^6$ CFU/ml comparing with turbidity standard (0.5 MacFarland tube).A supply of cotton wool swabs on wooden applicator sticks was prepared. They were sterilized in tins, culture tubes, or on paper, either in the autoclave or by dry heat.The Assay was performed by agar disc diffusion method. For Bacteria: Muller Hinton Agar (MHA) and Blood agar medium is poured in to the petriplate. After the medium was solidified, the inoculums were spread on the MHA plates with sterile swab moistened with the bacterial suspension of *Staphylococcus aureus, Bacillus pumilus, Escherichia coli, Salmonella sp*with a standard of Ampicillin (20µl/disc). Sterile samples (Disc form) and 20µl of Standard antibiotic (Ampicillin) disc as positive control were placed in MHA plates. The plates were incubated at 37ºC for 24 hrs. The antimicrobial activity was determined by measuring the diameter of zone of inhibition.

**Antifungal activity (Seetharaman *et al.*,2021)**

Stock cultures were maintained at 4°C on Sabouraud Dextrose agar Slant. Active cultures for experiments were prepared by transferring the stock cultures into the test tubes containing Sabouraud Dextrose broth, that were incubated at 48hrs at room temperature. The assay was performed by agar disc diffusion method. Antifungal activity of the extracts was determined by disc diffusion method on Sabouraud Dextrose agar (SDA) medium. Sabouraud Dextrose agar (SDA) medium is poured in to the petriplate. After the medium was solidified, the inoculums were spread on the solid plates with sterile swab moistened with the fungal suspension of *Candida sp*, *Aspergillus niger*with a standard of Amphoterin B (20µl/disc). Samples were placed over the plate. Amphotericin-B is taken as positive control. The plates were incubated at 37ºC for 24 hrs. Then antifungal activity was determined by measuring the diameter of zone of inhibition.

**Antioxidant activity: (NazninAra and Hasan Nur 2009)**

Antioxidant activity assay is based on the reduction of 1, 1-diphenyl-2-picrylhydrazyl (DPPH). Due to the presence of an odd electron it gives a strong absorption maximum at 517nm.As the electron becomes paired off in the presence of a hydrogen donor, i.e., free radical scavenging antioxidant, the absorption strength is decreased, and the resulting decolourizationistoichiometric with respect to the number of electrons captured, the ability of the extract to scavenge DPPH radical was determined by the method described by NazninAra and Hasan Nur (2009).

**Anti-Inflammatory assay: (Shinde*et al.*, 1999)**

Fresh blood was collected from the healthy volunteers. The collected blood w as mixed with equal volume of sterilisedAlsever solution which act as an anticoagulant The sample was then centrifuged at 3000 rpm for 5 min and packed cells were washed with isosaline (0.85%, pH 7.2) and a suspension was made with isosaline (10% v/v). This was taken as HRBC suspension. The assay mixture contained 1.0 ml of phosphate buffer (0.15 M, pH 7.4), 2.0 ml of hyposaline (0.36%), 0.5 ml HRBC suspension and 1.0 ml of various concentrations of sample (200, 400, 600, 800 and 1000 µg/ml). For control solution, instead of hyposaline, 2.0 ml of double distilled water was added. The mixtures were incubated at 37°C for 30 min and centrifuged at 3000 rpm.

**Qualitative Phytochemical analysis: (Seetharaman *et al.*, 2022)**

Coconut and papaya plant extracts were analysed for the presence of the following phyto constituents such as tannins, saponin, flavonoids, alkaloids, quinones, glycosides, terpenoids, anthocyanine and Betacyanine, phenols, cumarins, starch, acids, cyanins, cardiac glycosides, proteins and carbohydrates using modified and standard protocol.

## RESULTS

**Bacterial and fungal count of margarine produced from papaya and coconut oils**

The enumeration of the total heterotrophic bacterial counts of the samples showed that the self- made margarine had no bacterial load. The result of the total coliform count also revealed of no coliform contamination. The total fungal count also followed the same trend in fig.1,2,3.

**Evalution of proximate and physiochemical composition**

The results of the proximate analysis as contained in Table 1 revealed that the energy content was determined as 161.6, protein content 1.2, Lipid (fat) content 2.04, carbohydrate content 65.9, moisture content 12% and so on. The result of the physicochemical analysis of the produced margarine revealed that it as shown colour 2 hazen, total soluble solid 100.5%,total titratable acidity4.11g/100g,viscocity 85g/100g , calcium 3.45mg/l, pH 7.09.in Table 2.

**Antimicrobial activity**

**Antibacterial activity**

Six microorganisms were tested for the antimicrobial activity of the margarine extraction were done and showed varying degree of inhibition activity. Gram negative organisms such as *E.coli* (15mm), *Salmonella* (10mm), and *Bacillus pumilus* (13mm) showed a moderate inhibitory activity, whereas the gram positive microorganisms showed a maximum inhibitory activity with *Staphylococcus aureus* (19mm) in table 3.

**Antifungal activity**

The antifungal activity was minimal in *Aspergillus niger* (4mm) and *Candida sp*(6mm) shown minimal inhibitory activity against the extract of margarine. Results indicated that the Gram positive microorganisms were shown the maximum inhibition than Gram negative organisms and the poor zone of inhibition was observed for the fungal strains in table 4.

**Antioxidant activity (517nm)**

Antioxidant potential of margarine extract from the plant sources were measured by DPPH radial scavenging method with different concentration (1000 µl, 500 µl, 250 µl, 150 µl) showed increased activity in extract concentration. The margarine extract showed 93% antioxidant at1000µl concentration, 90% antioxidant at 500µl concentration, 86% antioxidant at 250µl concentration and 48% antioxidant at 150µl concentration. Results were expressed as percentage inhibition of DPPH in table 5.

**Anti-inflammatory activity (560nm)**

Anti-inflammatory activity of margarine extract of the plant sources was measured by Human Red - Blood Cells (HRBC) methods with different concentration (1000µl, 500µl, 250µl, 125µl) showed the increases activity of the activity. The margarine extract showed 83.72% of anti-inflammatory at 1000µl concentration, 81.17% of anti-inflammatory at 500 µl, 77.05% of anti-inflammatory at 250µl, 38.84% of anti-inflammatory at 125µl. Results were expressed as percentages of anti-inflammatory activity in table 6.

**Phytochemical analysis**

The margarine extract of the plant source was analysed for the phytochemical screening. The presence of acids, alkaloids, anthrocyanine and betacyanine, carbohydrates, cardiac glycosides, flavonoids, quinones,saponins, tannins and Terpenoids and absence of coumarins, glycosides, phenols, proteins and starch have beenreported and the results were tabulated. Among them, alkaloids, carbohydrates, flavonoids and glycosides are of high amount, and proteins, phenols, starch are absent in table 7.

## DISCUSSION

The present study suggests that the physiochemical parameter, proximate composition, microbiological quality and antioxidant properties of margarine produced from oil extract of coconut and papaya. Odey, 2022 stated the potential of margarine production from blends of melon, coconut and palmkernel oil, and the microbiological qualities and physiochemical composition such as moisture (15.0±0.5), ash (35.0±0.5), crude (17.50±0.25), lipid (22.50±0.03), protein (1.218±0.01), and carbohydrate (7.78±0.01). The physicochemical analysis of the melon, coconut and palm kernel oil showed the low acid value of 1.159. The enumeration of total heterotrophic bacterial count revealed a low microbial count $2.6\times10^{-3}$ CFU/g, total coliform count was $2.5\times10^{-2}$ CFU/g and total fungal count $2.4\times10^{-2}$ CFU/g from this study showed that the melon coconut and palm kernel oil extract have greater potential as industrial raw material beyond been consumed directly or indirectly as ingredient in food. The current investigation indicates that upon microbiological assessment, no bacteria suspected of causing infection were detected, and there were no isolated fungi present. This suggest that the microbial environment being examined displayed no signs of bacterial or fungal presence, possibly indicating a sterile or well-controlled environment. The edibility of margarine in s being safe for human food consumption is brought through the above finding of antimicrobial activity. Therefore margarine extracted from organic source can be an ideal food for daily Recommended Dietary Allowance. Physiochemical and proximate composition of ash content in the sample was measured at 27%. Ashing serves as a valuable methods for the analyzing the mineral composition of papaya and coconut extraction. According to the Recommended Dietary Allowance (RDA), adults are advised to consume a fat content of 10%, while infants require a slightly higher intake at 15%. However, a lipid (fat) content of 20% is beneficial in diets as it aids in the absorption of fat-soluble vitamins. With a calcium content of 3.45mg/l, these oils contribute to the building and maintenance of strong bones. The crude fiber content of 16.6% supports the maintenance of internal distention necessary for normal peristaltic movement of the intestinal tract. Additionally, the carbohydrate content of 75g suggests that coconut and papaya oil provide a low source of energy. An increase in the acid value often corresponds to the development of unpleasant flavors and aromas. As per the Codex standard, the maximum acceptable acid level in cooking oil or oil intended for consumption is 4mg KOH/g. The outcomes of this study suggest that margarine made from papaya and coconut oil could be considered suitable for consumption, indicating that the acidity levels are within acceptable bounds.

Abbas, 2019 reported that the efficacy of goat margarine was examined against four distinct bacteria, revealing varied results in terms of inhibition zones. *Salmonella typhimurium* exhibited the highest zone of inhibition, while *Escherichia coli* showed the lowest. However, it's noteworthy that certain individuals have allergies to casein, a milk protein, which can trigger severe allergic reactions, including anaphylaxis. The current study investigated the antimicrobial activity, revealing potent effects against pathogenic strains of both Gram-positive and Gram-negative microorganisms. Among the bacteria tested, *Staphylococcus aureus* exhibited the highest susceptibility, while *Salmonella sp.* showed the lowest the lowest. Conversely, when compared to bacterial strains, the fungal strains displayed minimal zones of inhibition, with *Aspergillus niger*and *Candida sp*. exhibiting the least inhibition zones. The study suggests that coconut and papaya margarine extracts possess natural antioxidant stability. Date kernel oil extracts, both cold and heat-treated, showed a moderate capacity (approximately 93%) for reducing free radicals in terms of anti-DPPH effect. Additionally, the study explores the anti-inflammatory activity of margarine extracts from coconut and papaya, indicating their potential healing abilities against harmful substances. Preliminary phytochemical analysis revealed the presence of various compounds such as alkaloids, anthocyanins, betacyanine, cardiac glycosides, tannins, terpenoids, and flavonoids in the margarine extracts from coconut and papaya. The study investigated using date kernel oil as a natural additive to enhance table margarine without changing its properties, while also boosting its oxidative stability. Date kernel oil contains potent antioxidants like phenolics, flavonoids, and carotenoids. Incorporating this oil into margarine enriched its antioxidant content without affecting its properties. Additionally, it improved the margarine's oxidative stability, as evidenced by a reduction in the DPPH radical. The study suggests that coconut and papaya margarine extracts possess natural antioxidant stability. Date kernel oil extracts, both cold and heat-treated, showed a moderate capacity (approximately 93%) for reducing free radicals in terms of anti-DPPH effect. Additionally, the study explores the anti-inflammatory activity of margarine

extracts from coconut and papaya, indicating their potential healing abilities against harmful substances. Preliminary phytochemical analysis revealed the presence of various compounds such as alkaloids, anthocyanins, betacyanins, cardiac glycosides, tannins, terpenoids, and flavonoids in the margarine extracts from coconut and papaya.

## ACKNOWLEDGEMENT

The authors are thankful to the Management and Principal, Valliammal College for Women, Anna Nagar East, Chennai, Sasaam biologicals Pvt. ltd. for the facilities provided and continuous support.

## ABSTRACT

This paper focuses on how important diversity and inclusion (D&I) strategies are in today's global workforce and how they impact how well companies perform. As businesses enlarge across countries , creating an inclusive work surrounding has become pivotal for attracting and retaining skilled employees, boosting creativity, and improving overall outcomes . The study investigates strategies across the globe and better practices followed by leading companies such as Accenture, Microsoft, and Salesforce. It signifies how inclusive leadership, fair hiring practices, support teams for employees, and being culturally conscious lead to better employee involvement, innovation, and also business growth. Based on recent research and real- world examples from the past five years , the project highlights that D & I efforts aren ' t just the right thing to do; they also give companies a competitive edge . The findings of this secondary research make it clear that making diversity and inclusion part of a company's culture is essential for building successful and future-ready global businesses

**Keywords:** Talent Management, Organizational Culture, Innovation, Employee Engagement, Strategic Advantage, Best Practices, Multinational Organizations, Workplace Equity, Human Resource Management, etc.

## INTRODUCTION

In today's connected and multicultural world, diversity and inclusion (D&I) have become essential for global companies that want to stay competitive , creative, and socially responsible . The workforce is no longer limited by borders-it includes people of different races, genders, religions, ages, abilities, sexual orientations, and cultures. Due to this , generating an open and principled workplace and implementing powerful diversity efforts isn ' t just the right thing to do-it also assists companies in performing better, keeping employees committed, and upholding long-term growth.

Diversity refers to having a mixture of different people, whether those differences are visible (like gender or ethnicity) or invisible (like beliefs, experiences, or ways of thinking). Inclusion involves making a conscious, ongoing effort to ensure everyone feels respected, valued, and able to contribute fully to the organization. While diversity can be achieved through representation and hiring, inclusion requires behavioral change, inclusive leadership, and the creation of psychologically safe environments where every voice is heard and counted . As businesses expand transnationally, culturally responsive D&I strategies become more critical.

What works in one country or region may not work as well-or may not be permissible- in another. Diversity and inclusion (D&I) objectives look very dissimilar depending on the region. For instance, gender issues in South Asia are not the same as those in Western Europe , and concepts like LGBTQ + rights, racial equality , or disability inclusion often rely on local customs, practices, and laws. Because of this, global D&I programs need to balance a shared overall vision with sensitivity to local cultures and conditions . Changes in society, advancements in technology , and increasing expectations from employees, customers, investors, and regulators are also forcing companies to concentrate more on D&I. Businesses today are expected to care not just about profits, but also about making a positive impact on society and promoting fairness and inclusion . To do this, companies are adopting many different strategies-like fair hiring practices, support networks for employees (called employee resource groups), inclusive technologies, and leadership programs for underrepresented groups.

This study examines how global companies are utilizing these types of D&I tactics across various regions. It also investigates how they are aligning their inclusion goals with culture, business requirements , and global best practices . Key areas of concentration encompass leadership assistance , inclusive policies , diverse workforce , training and awareness programs , ways to analyze inclusion, and how committed employees feel within the organization .

Furthermore , the research will ascertain the impact of such approaches on innovation, teamwork , and job satisfaction , thereby providing insights into overall organizational performance . Through a review of best practices, challenges, and examples, this project will provide insights into how multinational corporations can create diverse and inclusive work environments in a way that is authentic, effective, and sustainable. As the global workforce becomes increasingly diverse, embracing diversity and fostering inclusion is no longer optional-it is a business necessity that stems from a commitment to the values of equity, respect, and human dignity.

## REVIEW OF LITERATURE

Effectiveness of D **&** I Interventions

A systematic review meta - review by Zhao et al . (2025) reviewed 37 reviews and identified 12 forms of D&I interventions, such as diversity training and workplace accommodations. Diversity training was observed to raise awareness, but its efficacy in influencing recruitment diversity was limited. Workplace accommodations and job training were found to have positive impacts, particularly in the context of age and disability facets. The review emphasizes that organizations must create a portfolio of interventions designed to impact multiple diversities to achieve profound change.

Barriers and Facilitators of Workplace Inclusion

Rezai et al. (2023) utilized a scoping review of 39 qualitative studies to determine the facilitators and barriers of inclusion at the workplace . The study acknowledges that the majority of the barriers occur at an organizational level , for example , ineffective HR policies and the lack of inclusive practice. Alternatively, facilitators are predominantly linked to leadership commitment and flexible organizational systems. The study underlines the importance of organizational systems and leadership in workplace inclusion.

Trends and Research Gaps in D **&I**

A bibliometric analysis done by the Journal of Business Ethics in 2023 examined 2,510 academic articles on D & I with a strong inclination towards the themes of diversity management , diversity on the board, and diversity within teams. The analysis highlights gaps in research on inclusion targeting dimensions broader than gender . It requires a wider consideration within the topic area of D & I research to disentangle the interplay among diversity, inclusion, and impact on organizational performance.

**D& I and Organizational Innovation**

Finance Research Letters (2025) evidence indicates that firms with a higher employee-perceived D&I rating are more innovative. The study establishes causality between D&I practices and innovation outcomes , for example , greater patent counts and citations . The effect is more pronounced in large firms and firms where employees exert active influence in the innovation process.

Impact on Firm Performance

A study by MDPI (2024) examined the impact of D&I on firm performance from evidence obtained from listed firms around the world from 2017 to 2021. Based on the results, an inclusive and diverse workforce positively contributes to firm performance, as reflected through parameters such as Tobin's Q and return on assets (ROA). The study points out that the integration of diversity and inclusion has the ability to produce better decision-making and competitive success.

Strategies for Effective Implementation

Leuhery et al . (2024) integrated workplace diversity and inclusion research, concluding that the most important strategies to implement are leadership support, inclusive policies, diversity training, and employee resource group development. The study underlines that organizations with effective D&I strategies enjoy more innovation, improved decision-making, and a better work culture.

Technological Considerations in D **&I**

Bano et al. (2024) identified the application of D&I practice in AI-dependent recruitment software. They established that omitting D & I from the formula of AI technology may render it easier for there to be greater replication of biases and more discriminatory outcomes of hiring . It supports the need for adapted D & I policy and continuous counsel in implementing effective utilization of inclusive AI solutions for recruitment.

Challenges and Backlash

Political backlash has been experienced in recent years against DEI efforts, mainly in the U .S. The Guardian (2025) and Financial Times (2024) articles illustrate how companies have been compelled to reconsider or terminate DEI efforts due to court action and political pressure . However, all of the organizations still underscore how critical DEI is toward driving innovation and staff retention.

Types of Workplace Diversity

In the globalized workplace of the present , diversity is not merely physical but involves a vast diversity of human experiences and characteristics. Understanding categories of diversity assists in fostering an environment of individuality while promoting collaboration and equity.

Demographic Diversity

• Demographic diversity includes attributes such as age, gender, race, ethnicity, and national origin. These are the most identified elements of diversity.
• For instance, gender diversity provides women, men, and non-binary employees with representation in the workplace, reversing former disparities and ensuring equality (Shore et al., 2018).
• Age diversity unites multigenerational teams, combining the youth of younger employees with the experience of older employees (Post et al., 2019).

**Cognitive Diversity**
This includes variability in thinking styles , problem- solving styles , learning, and creativity .
• Cognitive diversity enhances decision-making and innovation since it foregrounds various modes of thinking (Rock & Grant, 2016).
• It is particularly valuable in cross-functional teams and in creative industries where outside-the-box thinking is a competitive advantage.

Experiential Diversity
• Experiential diversity encompasses diversity of life experience, background, education, work experience, and socioeconomic status.
• Different people with varied life experiences can contribute contextually to enhance products, customer service, and community engagement (Jehn et al., 1999).

Functional Diversity
• This category encompasses variance in functional departments , occupational skills , and work positions.
• Functional diversity is most critical for interdisciplinary teams, where inputs from engineering, marketing, accounting, and operations are needed to solve challenging problems (Bunderson & Sutcliffe, 2002).

Cultural Diversity
• Cultural diversity refers to the variations in values, beliefs, traditions, languages, and communication styles resulting from culture.
• Cultural diversity promotes international business activities, increases market scope, and boosts intercultural competence (Cox & Blake, 1991).

Linguistic Diversity
• It refers to the diversity of languages spoken within an organization.
• Encouraging language diversity can improve customer communication in multilingual economies and reduce communication barriers among employees globally (Lauring, 2008).

Disability and Accessibility Diversity• It includes individuals with physical , mental, sensory, or intellectual disabilities .
• Companies that invest in accessible workplaces and assistive technology make affirmative inclusion and regulatory compliance a reality (Schur et al., 2014).

Global issues in managing diversity in the workplace
In today's age of globalization and technology, organizations are adopting the strategic advantage of diversity and inclusion (D&I) as a means of driving innovation, improving employee engagement, and enhancing firm performance. However, managing the diversity of a global workforce is a complex matter requiring deep insight and visionary action.

Cultural Differences and Misunderstandings
One of the biggest challenges in managing a multicultural workforce is dealing with differences. Multicultural employees come with varying norms of communication , work ethics , and beliefs. Cultural differences can lead to

confusion, hurt teamwork, and even cause conflict if not controlled properly . For instance , some people used to speak very directly , while others communicate in an indirect way . This can result in misunderstandings . To prevent this, companies should provide training to help employees learn about different cultures and build a respectful, understanding workplace where everyone feels valued.

**Cross-** Border Legal and Regulatory Compliance

Global companies often find it hard to apply their diversity and inclusion (D&I) efforts across different countries because each place has its own set of laws and rules. For instance, an affirmative action plan that ' s legal in a specific country might be banned in another country . A survey made by the Society for Human Resource Management (SHRM) discovered that 68 % of global companies struggle to retain their D&I policies in line with domestic laws. In order to control this, companies must adjust their tactics to meet their domestic legal needs while still holding their core values and commitment to inclusion.

Resistance to Diversity **Efforts**

Even though the advantages of having a diverse workforce are well known, many entities still witness pushback when attempting to execute diversity and inclusion (D&I) plans. People often resist diversity and inclusion (D&I) efforts because of hidden biases , fear of change , or worries that these efforts might affect the job security of those in majority groups . Research shows that people in higher positions sometimes see D & I programs as a threat and are less likely to support them. To deal with this , companies need to clearly explain why diversity matters , have leaders who lead by example, and ensure everyone feels included and supported throughout the D&I journey.

Implicit Bias in Decision **–Making**

Unconscious favoritism leads to a larger effect on hiring , promotions, and team decisions . These unknown biases, frequently based on perceptions , can leave certain teams overlooked and prevent the company from becoming truly inclusive . In order to minimize this , firms can utilize distinct decision - making processes , propose bias awareness training , and create diverse hiring panels to build fairness for everyone.

Communication Barriers

In a global workplace, cultural differences and varied ways of communicating can cause problems. Misunderstandings can lead to mistakes, lower productivity, and tension between team members. Proper communication plans must be ensured by organizations, language support provided where necessary, and a comfortable communication environment must be established where employees feel comfortable communicating.

Integration of Technology and D **&** I Efforts

The integration of technology into D&I initiatives presents both opportunities and challenges . On one hand, technologies such as AI can help make unbiased hiring a reality, while on the other, they can reinforce established biases if handled carelessly . Careful planning and implementation of technological tools, keeping inclusivity in mind, can help avoid the reinforcement of prevailing biases . Periodic auditing and refreshing of such systems can ensure that they remain effective and fair.

Measuring the Impact of D **&I Initiatives**

Measuring the effect of efforts on D&I is always a challenging activity. Traditional methods usually cannot identify all the nuances of an employee's experience or the enduring cultural shifts that take place within the organization . Developing integrated framework models for quantitative and qualitative data alignment can provide a more complete picture of progress and where improvement must occur.

Generational Diversity and **Inclusion**

Today's workforce consists of different generations of workers with diverse values, work approaches, and requirements. Acknowledging and accepting these differences helps bridge generational gaps. For example, whereas younger workers might value flexibility and purpose in their work , older workers might value stability and

conventional structures. Creating policies that address the needs of different age groups can help improve teamwork and retain employees for the long term.

**Reducing 'Diversity Fatigue'**

If companies talk about diversity and inclusion (D&I) continuously but do not exhibit tangible outcomes, employees begin to feel fatigued, and trust is lost-this refers to "diversity fatigue." To mitigate this, D&I efforts must produce real change, not just look good on the surface . Organizations must share their progress regularly , be sincere about challenges, and involve employees in shaping D&I plans. This assists in rebuilding trust and enhances employee commitment.

Managing Political and Social **Backlash**

In recent years, diversity and inclusion (D&I) efforts have faced political and social pushback across various regions. Some new laws have even forced companies to adjust or reduce their diversity goals . This creates a tough situation - companies need to follow the law while still staying true to their values . To handle this , it helps to have open conversations with stakeholders and seek legal advice to ensure decisions are both legally correct and ethically sound.

Global Diversity and Inclusion Strategies and Best Practices

Creating a Global D **&** I Vision and Framework

The creation of a common Diversity & Inclusion (D&I) vision is one of the main strategies for diversity management in global organizations. The organization should focus on equality, principles, and respect. The framework of global D& I focuses on structure and direction for projects across regions and departments . Unilever is one of the companies that implements D&I in their business with a mission of making themselves one of the most diverse and inclusive organizations in the world . The objective of D&I is connected with the business for productivity and responsibility. Global D & I organizations are formed to accomplish this mission . The authority of D & I insists on the consistent establishment and efficiency of local regional requirements.

Cultural Sensitivity through Localizing D **&I**

Global D& I goals aim to balance a common mission and localized execution. Beliefs, values, and legal processes differ among countries, and what is inclusive in one country may not be acceptable in another. Appointing regional D&I authorities helps localize global objectives and adapt to cultural nuances . Localization also consists of adapting cultural and regional festivals and accepting different practices to meet various requirements.

Inclusive Recruitment and Talent Management

A global D&I strategy includes recruitment that offers equal opportunities . Companies must ensure that job announcements and recruitments are not biased and should confirm equality in the hiring process. Best initiatives include :

- Blind recruitment by eliminating names, gender, and age from resumes to minimize bias .
- Diversity on the interview panels
- Training for managers to recognize and overcome their subconscious biases
- Along with recruitment, talent development is also important. Organizations should provide mentorship, promotions, and opportunities for developing leadership skills for underrepresented groups. Accenture is ensuring that when they look for people to step into important leadership roles, they consider a mix of different candidates right from the start . They also check if their choices for these roles are fair and inclusive.

Leadership Accountability

When leaders are truly on board with D &I, it makes a huge difference and sustains commitment . When people at the top show that it matters, everyone else gets the message. More companies are monitoring how well leaders are performing with diversity while making decisions, so it's becoming a real responsibility. For instance , Intel links

some of their executive pay to hitting diversity goals. Companies are also making it normal for leaders to receive training on inclusivity , understanding different perspectives, and improving their skills in collaborating with people from diverse backgrounds. This helps them build teams where everyone feels included and helps them understand what different employees need.

Creating an Inclusive Culture

Building a workplace where everyone feels they truly belong isn ' t just about having a mix of people . It' s about ensuring everyone feels respected , safe, and that they can genuinely make a difference. Best practice methods include :

- Creating a place where people feel comfortable expressing their thoughts without fearing reprisals .
- Encouraging open discussions about sensitive topics like race, gender, or differing perceptions .
- Celebrating every tradition and culture to foster mutual learning and understanding .

Companies also play a critical role in advocating for policy changes, recruitment outreach, and internal training . Flexible work policies help drive inclusion-providing remote options, religious accommodations, and inclusive parental leave policies ensures that diverse needs are honored.

Education and Awareness

Training and education are central to changing attitudes and building inclusive behaviors . Most organizations begin with unconscious bias training, but best-in-class organizations take it further with constant programs specific to departments and regions.

Successful D **&** I training modules include **:**

- Inclusive leadership
- Cultural competence
- Allyship and advocacy
- Anti- discrimination and bystander intervention Google' s Bias Busting @ Work initiative is one of the first large - scale, interactive training programs that prepares employees with the tools and skills to identify and address bias in their own work. They are most powerful when preceded by plans of action, coaching, and reinforcement through performance reviews.

Measurement and Transparency

What gets measured gets managed. Businesses must obtain and analyze data along various dimensions-gender, ethnicity, age, disability, sexual orientation, and so forth-to track D&I progress.

Some of the key metrics include:

- Workforce demographics
- Hiring and promotion rates by segment
- Pay equity analysis
- Inclusion scores from employee engagement surveys
- Attrition rates by demographic segment

Companies like Coca-Cola and HP publish their diversity reports, not only their numbers but also their strategy and development over time. Open reporting builds stakeholder trust and increases organizational accountability.

Emerging organizations also use people analytics to identify barriers and opportunities in real-time.

Accessible Technology and Accessibility

With hybrid work and digital platforms becoming the new way of working, inclusive technology has become a key D&I strategic priority. Digital tools are now required to be accessible to all employees, regardless of disability status or non - native speaker status . Best practices involve :

- Building accessibility guidelines (e.g., WCAG) into internal systems and platforms .
- Having screen reader accessibility, voice command functionality, and high contrast layouts .
- Applying multi - lingual interfaces for global inclusivity .

• Utilizing AI tools in hiring or performance tracking to detect algorithmic bias .
Firms such as Apple and SAP are leaders in inclusive tech design , injecting inclusivity into all stages of the product and system life cycle.

Supplier and Community Diversity
Industry leaders take their D&I initiatives outside of internal operations to suppliers and into the community. Supplier diversity initiatives promote economic inclusion among minority-owned, women-owned, and underrepresented firms. IBM, for instance, has specific programs in place for accessing multicultural suppliers worldwide, monitoring spend and capacity development for them. Partnerships with NGOs, schools, and government agencies also contribute significantly to broadening talent pools and driving systemic change. Outreach programs improve education, employability, and social justice within underprivileged groups.

Innovation and Continuous Improvement
D& I is changing globally . Businesses have to be agile , innovative, and responsive to changing worker aspirations and social activism. The COVID-19 pandemic, #MeToo, and Black Lives Matter protests have accelerated demands for corporate accountability . Organizations are using more employee input, design thinking, and pilot trials to test new inclusion concepts. Regular climate surveys help measure what is effective and where weaknesses are. Leveraging others' learning and D&I benchmarking initiatives (e.g., DiversityInc, Bloomberg Gender Equality Index) further helps discover worldwide best practices and areas for improvement.

Case Studies of Effective Diversity and Inclusion Strategies
**Accenture Overview:**
Accenture, a worldwide professional services firm , has infused D & I into its values and operations in over 120 countries.

Main Strategies **:**
• Accenture introduced the " Inclusion Starts with I " initiative to build awareness of unconscious bias.
• They established public diversity objectives , like becoming gender - balanced by 2025 .
• Accenture developed a Global Disability Inclusion program , enhancing accessibility and training for hiring managers.

**Outcomes**
• 47% of Accenture ' s workforce are women as of 2023.
• Accenture has been listed on DiversityInc' s Top 50 Companies for Diversity for several consecutive years.

**Microsoft Overview**
Microsoft has developed an ambitious global diversity and inclusion strategy grounded in accountability, transparency, and innovation.
Key Strategies
• Published yearly Diversity & Inclusion Reports with workforce demographics.
• Assembled the Employee Advocacy Council to represent employee voices in D&I discussions.
• Created inclusive product design principles to enable technology to be accessible (e.g., Xbox adaptive controller).
**Results:**
• Microsoft saw year -over- year growth in representation of Black , African American, and Hispanic employees in the United States.
• Their Global Allyship Program registered high participation , particularly in APAC and Europe.

**Unilever Overview:**
Unilever operates in over 190 countries and uses D & I as a business growth strategy through its Unilever Compass.

Key Strategies:
• Committed to having 50% of its management globally made up of women.
• Promotes pay equity and has made public efforts to end the gender pay gap.
• Operates local programs such as the # Unstereotype program to end gender stereotypes in advertising.
Results:
• Women now hold 50% of management roles at Unilever globally.
• More than 60 nations have introduced tailored D &I training.

**SAP (Systems, Applications &** Products in Data Processing **) Overview:**
SAP, a German multinational software company, is recognized for its neurodiversity hiring initiative and inclusive tech community.
Key Strategies:
• The Autism at Work Program recruits neurodivergent talent into technical and analytical roles.
• D& I is integrated into product development , with digital accessibility as a priority.
• Publicly reports sustainability and equity metrics through annual impact reports.
Results:
Over 200 neurodivergent employees hired since the program's inception. Rewarded by the World Economic Forum for inclusive work practices.

**IBM Overview**
IBM is an old friend of diversity, the first major corporation to have a female vice president (1943) and the first of the big corporations to include sexual orientation in its Equal Opportunity policy (1984).
Key Strategies:
• Monitors D&I progress with detailed dashboards available to executives.
• Launched SkillsBuild, an upskilling initiative for underrepresented groups.
• Global Business Resource Groups (BRGs) with over 250 chapters worldwide .
Results:
• IBM has been ranked year after year on the Human Rights Campaign's Best Places to Work for LGBTQ+ Equality.
• Their Returnship programs allow women and caregivers to re - enter the workforce .

## CONCLUSION

Diversity and Inclusion (D&I) are no longer merely corporate jargon-but integral cornerstones in building a winning, resilient, and future- ready global talent pool. As businesses expand internationally across borders and grapple with increasingly diverse employee pools, strategic and sustainable D & I initiatives have never been so much at center stage . This research has navigated the intricate phenomenon of diversity and inclusion, global organizations' evolving strategies, best practices adopted, and the measurable effects these programs have on business culture and performance. The research identifies that effective D & I efforts begin with a vision and also with leadership buy-in. Organizations with diversity integrated into their cultural fabric typically have inclusive leadership at the leadership level, which provides guidance for the transformative change within the organization. Diversity and inclusion (D&I) work best when they are represented by the entire company, not only by seniors. Practices such as diversity councils, local representatives, and open policies ensure that D&I are part of regular work, everywhere.

It is also essential to accept D & I initiatives in local cultures . What is acceptable for one country may not be acceptable or adoptable by another. Companies like Unilever and Microsoft tailor their D&I efforts to local contexts to make their work environments more productive and diverse. Promotions and hiring need to be equal for all. Blind hiring and diversity in interview panels help individuals in career growth and development according to their talent and performance, not because of biased decisions. Businesses that implement this have more innovation, improved

collaboration, and individuals who are eager to stay. D&I also enhances a company's reputation and performance. It's something that companies must continue to work on by having open dialogue , learning, and backing . Done effectively , it creates happier employees, more diverse leadership, and improved outcomes for all. As the world evolves, so must D&I approaches. Businesses that embrace differences and make people feel a sense of belonging will be more resilient, innovative, and prosperous in the long term. D&I is not only about recruiting different people from different places. It's about making actual change happen, being equitable, and creating a brighter future for all.

**ABSTRACT**

The removal of the complete orbit or a portion of the eye may result in eye defects. The eye is a vital organ and an important part of facial expression. Loss of the eye results in visual, aesthetic, and psychological handicaps. It affects one's social and professional life. The expert who creates the ocular prosthesis is known as an ocularist. The ocular prosthesis is made using a variety of materials and methods. In addition to restoring his facial symmetry, the prosthetic eye gave him newfound confidence and self-worth. Ophthalmologists, ocularists, optometrists, ophthalmoplastic surgeons, and psychologists have all contributed to the advancement of ocular prosthesis research in recent decades. A prosthetic eye offers many benefits beyond appearance. They help keep the eyelids in their normal position, reduce the risk of infection, and improve the patient's psychological and emotional well-being by restoring a sense of normalcy. Modern prosthetic eyes are made from acrylic, which is durable, safe, and lightweight. In recent years, technological advancements such as 3D printing, digital imaging, and porous implants have improved the design, comfort, and mobility of prosthetic eyes. Although bionic eyes that restore vision are still in the early stages of research, they represent a promising future direction.

**Keywords:** Prosthetic eye, Evisceration, cosmetic shell, Slit lamp, Polymethyl methacrylate

## INTRODUCTION

The eyes are one of the most expressive and important features of the human face. They are not only essential for vision but also play a major role in emotional expression, communication, and facial balance. Eyes, they say, are the

"windows to the soul." Loss or absence of any part of the face, especially the eye, can cause severe physical and psychological trauma. It is because of trauma, congenital defect, painful blind eye, malignancies, or sympathetic ophthalmia. The literature has a variety of materials and methods for creating ocular prostheses. It may be using a stock eye, modifying stock eye on the positive replica of the ocular defect or fully customized ocular prosthesis. In custom ocular prosthesis, sclera and iris are bothcustom-made(Guttal *et al.*, 2011).Eye loss can be caused by a hereditary disorder, painful blindness, irreparable trauma, malignancy, or sympathetic ophthalmia. Evisceration, enucleation, or exenteration are the three surgical methods that may be used, depending on the extent of the involvement. Eyes are the "windows to the soul." Loss or absence of any part of the face, especially the eye, can cause severe physical and psychological trauma. It could be because of trauma, congenital defect, painful blind eye, malignancies, or sympathetic ophthalmia. The medical field offers a solution in the form of a prosthetic eye, also called an ocular prosthesis. A prosthetic eye is an artificial device that replaces a missing natural eye. While it does not restore vision, it helps restore the cosmetic appearance and supports the proper function of the eye socket and eyelids. Each eye is custom-made by a specialist called an ocularist, who carefully paints the iris and blood vessels to match the person's healthy eye. This makes the artificial eye look very natural. The use of prosthetic eyes is not new it dates back thousands of years to ancient civilizations like Egypt. However, today's prosthetics are far more advanced and realistic. Prosthetic eyes are an important part of rehabilitative eye care. They help people regain a sense of normalcy, confidence, and comfort after losing an eye. As technology continues to improve, future possibilities may even include bionic eyes that can restore partial vision, offering hope to millions around the world. By the early 20th century, cryolite glass had become the most widely used material for prosthetic eyes, with Germany serving as the global manufacturing center. However, when German cryolite glass eyes became unavailable at the onset of the Second World War, countries outside the German-speaking region, particularly the USA, adopted polymethyl methacrylate as a substitute. These developments introduced new production methods and procedures that changed prosthetic eyes from handcrafted creative masterpieces into extremely accurate medical equipment, shifting prosthetic eye treatment toward a more medical and technical foundation.

**History of the Prosthetic Eye**

The earliest known prosthetic eye was discovered in a 5,000-year-old grave in Iran. It was made of bitumen paste and gold and worn on the outside of the eyelid. In ancient Egypt, artificial eyes were made of painted clay or wood and were also worn externally. These were likely used for religious or ceremonial purposes, especially during burial. The Romans are believed to have used prosthetic eyes made of painted clay or glass, but these were worn outside the socket rather than inserted. Due to religious and cultural factors, there was little advancement in prosthetic technology during the 500-1500CE period. Medical knowledge stagnated in much of Europe, although some Islamic scholars preserved and enhanced classical medical texts. In France, the first in-socket prosthetic eyes were created. They were made of blown glass, and the French became leaders in prosthetic eye production. Venice, famous for its glassmaking, produced high-quality glass eyes. These were more realistic and fitted into the eye socket, although they were fragile. In 19$^{TH}$Century, German craftsmen perfected techniques using cryolite glass, a white opaque glass ideal for matching sclera color. Germany became the dominant producer of ocular prostheses. In the 1940s onwards, the invention and use of polymethyl methacrylate revolutionized ocular prosthetics. Acrylic is durable, lightweight, and easier to shape and paint. In the 20$^{th}$Century, modern prosthetic eyes were made from medical-grade acrylic, offering a lifelike appearance, comfort, and durability. Iris details are hand-painted to match the remaining eye. Today, many patients receive orbital implants surgically inserted into the eye socket. These can be coupled with the prosthetic eye to allow some movement, enhancing realism. Cutting-edge techniques include 3D printing, digital iris imaging, and improved biocompatible materials, which reduce manufacturing time and increase customization. In the 21st Century, prosthetic eyes are made from medical-grade acrylic and are custom-designed by ocularists using detailed imaging, digital scans, and even 3D printing Improved fit, comfort, mobility, and realism are made possible by new materials and methods. Some patients receive motility implants that allow the artificial eye to move more naturally. While traditional prosthetic eyes do not restore vision, research is ongoing in bionic eyes, which aim to give limited vision through electronic implants.

**Applied anatomy of the eye**

The eyeball occupies only the anterior part of the orbit. The globe of the eye is a slightly asymmetrical sphere, somewhat flattened from above downwards. The adult eyeball measures about 2.5cm (one inch) in diameter. The globe is widest at its anteroposterior diameter (24mm) and is flattened from above downwards. The corneoscleral envelope is fibrous and anterior sixth is perfectly transparent, while its posterior five-sixths, the sclera, is white

**Digital Prosthetic Eye**

A misalignment that many wearers find deforming results from the prosthetic eye's restricted mobility compared to the healthy eye's natural movement. A computerized prosthetic eye enhances the beauty of the face while acting as a sensory organ. The prosthesis, made from acrylic, is digitally matched in size and color to the patient's remaining natural eye(Goiato *et al*., 2010). Congenital abnormalities, irreversible injuries, and tumors are among the situations that might result in surgical intervention and the regrettable loss or absence of an eye. A multidisciplinary team approach and management are essential in providing accurate and effective rehabilitation of the ocular defect. In addition to providing vision, the eye is an essential component of face expression, making it an important organ. A person's self-esteem is significantly impacted by losing an eye, and this has an equal effect on social and professional relationships. Custom-made cosmetic eye prostheses help these people reintegrate into society and gain social and professional acceptability. Ocularists and eye surgeons have collaborated for ages to produce prosthetic eyes that are as lifelike as possible. Several researchers have proposed ideas to solve this problem. But thus far, none of these inventions have proven to be truly successful. A novel kind of prosthetic was designed with assistance from computer science professor Ian G. Harris and ophthalmology professor Dr. Jeremiah Tao. They postulated that pupil movement tracking algorithms may be combined with digital micro-screen technology, which is often seen in smartphones and smart watches. By doing this, they may create an ocular prosthetic that is more dynamic and moves in time with a healthy eye. Although more work needs to be done to make the digital eye appear more realistic, Tao and Harris think their real-time image processing combined with the neural network could result in a practical next-generation eye prosthesis for patients.

**Clinical considerations**

A patient's history, including the details of the nature of the disease, its mode of onset with reference to the visual status, and recurrence, should be taken. Family history is important, including congenital or hereditary anomalies, such as cataract, albinism, and iris deformities etc. During the postoperative period, the patient must wear a conformer. The presence of a conformer will aid in the preservation of the cul-de-sac of the fornices and in stabilization of the implant during healing. The construction of a custom conformer may be indicated when the construction of a definitive ocular prosthesis will be delayed because of slow patient recovery, medical complications, or patient preference. The socket is examined to determine the presence of an implant and the degree of mobility. Mobility may be noted by observing the movement of the tissue bed when the natural eye moves. If the patient has previously worn any prosthesis, the type, tolerance, and difficulties, if any, experienced are also noted. A growing child will require periodic enlargement of the prosthesis gradually over a period of years to aid in the development of the lids and other soft tissues lining the orbital bone margins which must be stretched to enhance the development of the fornices, which is necessary for good cosmetic result. During the examination, it is especially important to assess the quantity of orbital adipose tissue present, the degree of muscle and other tissue atrophy resulting from the removal of the eye, and the shape and tonus of the eyelids.

**Types of Eye Removal Surgery**

**Enucleation**

Enucleation is the surgical removal of the entire eyeball, including the globe and optic nerve, while preserving surrounding tissues like the extraocular muscles, Tenon's capsule, and conjunctiva. Once the eye is removed, a spherical implant of acrylic, hydroxyapatite, porous polyethylene, or siliconeis placed in the orbit to restore volume and enable future prosthetic movement. The muscles are reattached to this implant, and the conjunctiva and Tenon's capsule are meticulously closed over it.The conformer is typically worn for 6–8 weeks, after which a custom-fitted ocular prosthesis is crafted and inserted by an ocularist (Figure 1).

**Evisceration**

Evisceration is a surgical procedure in which the internal contents of the eye, including the cornea, iris, lens, and retina, are removed. Still, the outer shell of the eye (sclera) and the extraocular muscles are preserved. This procedure is typically performed when the eye is blind and painful due to conditions like endophthalmitis ortrauma. Evisceration is generally preferred over enucleation when there is no risk of cancer or optic nerve involvement, as it offers faster recovery, less tissue disruption, and improved prosthetic. Evisceration typically results in better postoperative prosthetic movement and quicker recovery than enucleation(Kord *et al*., 2014)(Figure 2).

**Pthesis Bulbi**

Phthisis bulbi is a serious and irreversible condition of the eye that represents the end stage of various severe ocular diseases or injuries. It becomes atrophic, shrinks, and loses in normal shape, structure, and function. The condition can result from a variety of causes, including traumatic injury, longstanding intraocular inflammation, and infections. Over time, the eye affected by phthisis bulbi typically becomes soft due to a loss of intraocular pressure, a condition known as ocular hypotony. Vision in the phthisical eye is usually severely reduced or completely absent, and although some cases are painless, others can cause chronic discomfort or cosmetic concerns (Figure 3).

**Orbital exenteration**

It is a radical and disfiguring surgical procedure involving the removal of the entire contents of the eye socket, including the eyeball, surrounding muscles, fat, connective tissue, and sometimes the eyelids or parts of the bony orbit. This surgery is usually only done for serious, life-threatening issues like aggressive orbital cancers, invasive fungal infections, and other harmful orbital diseases that can't be treated with simpler methods. Depending on the extent of the disease, the surgery may be classified as total, subtotal, or extended.

**Types of Ocular Prosthesis**

**Artificial eye**

The artificial eye is a curved disc of plastic having a center thickness of 2 mm or greater. It is fitted to replace the lost volume of the socket and to restore natural appearance and movement.

**Shell Eye**

A shell eye is a type of prosthetic eye designed to fit over a blind or disfigured natural eye that has not been surgically removed. It is typically used in cases where the natural eye is shrunken, scarred, or otherwise cosmetically unsatisfactory but not painful or infected. It is removable for cleaning and maintenance and provides a non-surgical way to improve facial symmetry and appearance. Shell eyes help support the eyelids and maintain the structure of the eye socket.

**Cosmetic Shell**

A cosmetic shell is a thin, custom-made artificial eye designed to improve the appearance of a disfigured or blind natural eye that remains in the socket. It is typically used when the eye is lost its natural color or shape but is not painful or infected. Made from lightweight, medical-grade acrylic, the cosmetic shell is carefully painted to match the healthy eye and is fitted over the existing eye, providing a natural and symmetrical appearance. It is a non-surgical solution for patients seeking to restore confidence in their appearance without undergoing eye removal. Cosmetic shells are removable and easy to maintain, offering both aesthetic and functional support by helping to maintain the shape of the eyelids and surrounding tissues.

**Corneal Prosthetic Lens**

A corneal prosthetic lens is a specially designed ocular device used to restore the appearance and, in some cases, partial function of a damaged or irregular cornea. Unlike standard contact lenses, these lenses are custom-made to cover and mask corneal opacities, scars, or deformities that may result from injury, disease, or congenital conditions. corneal prosthetic lenses can be either soft or rigid and are tinted or painted to match the natural eye color for a more lifelike look. While they are primarily used for cosmetic purposes, some versions may also improve vision if the

underlying eye retains some function. They offer a non-surgical solution for individuals seeking to enhance eye symmetry and self-confidence when the cornea is visually unappealing but the eye itself does not require removal.

**Scleral Shell**

A scleral shell is a type of ocular prosthesis designed to fit over a damaged, disfigured, or blind natural eye that remains in the socket. A scleral shell is typically used when the natural eye is irregular in shape, but not painful or actively infected. The shell covers the entire visible surface of the eye, including the sclera, and may help protect the underlying tissue while also supporting the eyelids and surrounding structures. Scleral shells are removable for cleaning and are a non-surgical option for patients who want to restore the cosmetic appearance of their eye without undergoing enucleation or evisceration.

**Hydrophilic Prosthetic Lens**

A hydrophilic prosthetic lens is a soft, water-absorbing ocular device designed to enhance the cosmetic appearance of a disfigured eye, particularly when the cornea is damaged or opaque. Made from biocompatible, moisture-retaining materials, this type of lens is more comfortable for patients with sensitive or irregular ocular surfaces. Hydrophilic prosthetic lenses are often custom-tinted or hand-painted to match the color and pattern of the healthy eye, effectively masking corneal scars, leukomas, or iris defects.

**Self-Lubricating Prosthesis**

The Self-Lubricating Prosthesis (SLP) is a patented modification to a new or existing ocular prosthesis. It provides a continual release of lubricant, eliminating dry eye syndrome as well as burning and itching. These disorders are more frequently linked to those who use prosthetic eyes and are unable to close their eyelids over the device. Lubricant is kept in a chamber that is included into the prosthesis of the SLP. It slowly released on to the front surface of the prosthesis, providing moisture and comfort to the inner lining of the eyelids.

**Facial Prosthesis**

An artificial device used to replace a missing or deformed face feature is called a facial prosthesis. A person in need of a prosthesis may have lost a part of his or her face due to cancer, trauma, or because of a congenital birth anomaly(Lal *et al*., 2007).

**Therapeutic Prosthesis**

If a child is born with either anophthalmia (no eyes) or microphthalmia, the eye socket needs to be expanded to ensure that there is no facial distortion as the child grows up. The socket is expanded by various in-house means over a period of days and weeks, depending on the individual case to a point where a cosmetic prosthesis can be provided. This process needs to be repeated frequently to match the growth and simulate socket expansion.

**Method of Examination and prosthetic procedures step by step**

**Slit lamp examination**

A slit lamp examination of a prosthetic eye is an essential part of routine follow-up to ensure the health of the ocular socket and proper function of the prosthesis. The examination begins with taking a detailed history from the patient regarding any discomfort, redness, discharge, or changes in the fit or appearance of the prosthetic eye. Using the slit lamp under diffuse illumination, the examiner first inspects the external structures, including the eyelids, eyelashes, and surrounding skin, looking for signs of irritation, infection, or lid abnormalities such as ptosis or entropion. The conjunctiva and socket lining are then evaluated under focused light for inflammation, discharge, or signs of conditions like giant papillary conjunctivitis, which can result from chronic irritation caused by the prosthesis. The surface of the prosthetic eye itself is assessed for any scratches, protein deposits, or damage, which can contribute to discomfort or infection. The position and movement of the prosthesis are also observed by asking the patient to look in different directions to determine whether the prosthesis moves adequately and remains properly centered. If necessary, the prosthesis may be removed to examine the inner surface and the socket more thoroughly, sometimes

using fluorescein dye to detect abrasions or ulcers. Regular slit lamp examinations help detect early complications and ensure the prosthesis remains comfortable, functional, and cosmetically acceptable for the patient (Figure 4).

**Impression tray (Conformer)**

Select an acrylic ocular impression tray or old conformer according to the fit of the socket. Patient needs to be in be relaxed position to drape the natural contours of the tissues of the socket. Impression tray can be modified according to the size of the socket. The margins can be smoothened with the help of Finishing bur to prevent any irritation inside the socket (Figure 5).

**Impression by Alginate powder**

Alginate powder is a commonly used impression material in the fabrication of ocular prostheses due to its excellent detail reproduction, biocompatibility, and ease of use. It is a naturally derived material, typically obtained from alginic acid salts, and is widely used in dentistry and maxillofacial prosthetics. In ocular applications, alginate powder is mixed with water to form a smooth, viscous paste that sets quickly to capture the fine anatomical details of the eye socket. Once mixed, the alginate is loaded into a custom impression tray or directly injected into the eye socket using a syringe, with the patient asked to perform gentle eye movements to ensure a functional impression is recorded (Figure 6). The material sets within 1–2 minutes, forming an elastic, rubbery mold that can be easily removed from the socket without causing discomfort. Its ability to reproduce fine surface detail makes it ideal for creating an accurate negative mold, which is then used to fabricate a properly fitting prosthetic eye. Alginate is also non-toxic, relatively inexpensive, and readily available, making it a preferred choice for initial impressions in clinical and educational settings. An impression procedure is typically performed by an ocularist using a soft, biocompatible material that is gently inserted into the socket. Once the material sets, it captures the precise contours, depth, and unique anatomy of the socket. This impression is then used to fabricate a personalized prosthesis that fits comfortably and looks natural. The impression process is crucial for achieving optimal comfort, stability, and cosmetic appearance, as it allows the prosthetic to move more naturally with the existing eye and avoid irritation or poor fit.

**Impression in Flask with POP (Plaster of Paris)**

Plaster of Paris (POP) is a widely used material in the fabrication of prosthetic eyes, particularly during the molding and flasking stages. It is a fine white powder made from calcium sulfate hemihydrate, which, when mixed with water, forms a thick paste that quickly sets into a hard, stable mass (Figure 7). For flasking, POP is mixed to a smooth consistency and poured into the lower half of an ocular flask. The impression is placed into this layer before it fully sets, ensuring correct alignment. After the first layer hardens, a separating medium is applied, and the second half of the flask is filled with POP to encase the impression completely. Once fully set, the flask is opened carefully, and the impression material is removed, leaving behind a negative mold of the socket. This mold is used to create a wax pattern or directly fabricate an acrylic ocular prosthesis.

**Impression in Flask with PMMA (Poly methyl Metha acrylate)**

Polymethyl methacrylate (PMMA) is the primary material used in the fabrication of prosthetic eyes due to its excellent biocompatibility, durability, and aesthetic properties. PMMA is a clear, hard acrylic resin that can be tinted and layered to closely replicate the natural appearance of the human eye. During the fabrication process, once the wax pattern of the prosthesis has been approved for shape and fit, it is replaced with PMMA through a process called heat curing. The resin is mixed with a monomer liquid to form a dough-like consistency and then packed into the mold created from Plaster of Paris. The mold is sealed in a flask and subjected to controlled heat in a water bath or curing unit, which polymerizes the PMMA and gives the prosthesis its final solid form (Figure 8). One of the key advantages of PMMA is its optical clarity, allowing for a realistic, glass-like finish once polished. It is also lightweight, non-toxic, and resistant to moisture, making it ideal for long-term use inside the sensitive ocular socket. Once the POP sets and the flask is opened, the impression material is removed, leaving behind a negative mold. Into this mold, a wax pattern is poured or sculpted to simulate the future prosthesis. The wax model is then tried in the patient's socket for assessment of fit, alignment, and aesthetics. If satisfactory, the wax model is invested again in the

flask, and the wax is eliminated through a dewaxing process in boiling water. The mold is then packed with heat-cured PMMA resin, which is pre-mixed with pigment to match the sclera and iris colors, depending on the stage of fabrication. The flask is closed and subjected to controlled heat curing in a water bath or curing unit, allowing the PMMA to polymerize completely. After curing, the flask is cooled and opened, and the hardened PMMA prosthesis is removed. It is then trimmed, polished to a high gloss, and finished with any final aesthetic touches such as vascularization or tinting. The resulting prosthetic eye is durable, biocompatible, and aesthetically realistic, providing both functional and cosmetic restoration for the patient.

**Painting or Iris button**

Painting on a prosthetic eye is a delicate and artistic process that plays a vital role in making the artificial eye appear natural and lifelike. Once the prosthetic eye is fabricated from PMMA and shaped to fit the patient's socket, the painting process begins with careful observation of the patient's healthy eye. The iris is painted first, typically on a pre-made convex iris button or directly onto the prosthesis. Using fine brushes and oil-based or acrylic paints, the prosthetist recreates the unique color patterns, striations, and flecks of the natural iris. Multiple layers of color may be applied to capture depth and detail, and the pupil is painted in the center, usually a uniform black around 3 to 4 millimeters in diameter. After the iris is completed, the sclera—the white part of the eye—is painted to match the patient's natural eye color, which may range from bright white to slightly tinted shades. Fine red and bluish veins are then added with a very thin brush to mimic the vascular patterns of the real eye. Once the painting is completed and thoroughly dried, the entire prosthesis is sealed with a layer of clear heat-cured PMMA through a re-flasking and curing process. This encases the artwork, protects it from damage, and gives the prosthesis a glossy, realistic appearance. The final step involves polishing the prosthesis and fitting it into the patient's socket, ensuring it matches the natural eye in both appearance and movement. This combination of medical precision and artistic skill results in a custom ocular prosthesis that restores the patient's facial symmetry and confidence.

**Colors and Brushes**

In painting a prosthetic eye, selecting the right colors and brushes is essential to create a realistic and natural-looking appearance. For the iris, a variety of pigments are used to match the patient's natural eye color, including shades of brown like burnt umber and raw sienna, blues such as ultramarine and cobalt, and greens. These colors are carefully blended and layered to capture the complex patterns and depth of the iris, with black paint used to define the pupil. The sclera is typically painted in off-white or ivory tones, with delicate additions of red, pink, or even bluish hues to replicate blood vessels and subtle discolorations found in a natural eye. Fine red or maroon pigments are applied with ultra-fine brushes to the sclera (Figure 9). Brushes used in this detailed work include very fine sable brushes, often sizes 000 or 00, for painting the intricate iris striations and pupil edges. Thin liner brushes, known as riggers, are ideal for creating realistic blood vessels, while flat or filbert brushes are used for applying and blending broader areas of color. Sometimes nylon threads dipped in pigment are placed on the sclera for more lifelike veins. Both oil-based and acrylic paints are commonly used, with oil-based paints favored for their slow drying and blending qualities, and acrylics for faster drying times. Careful use of these colors and brushes, combined with artistic skill and attention to detail, results in a prosthetic eye that closely mimics the natural eye's appearance, restoring both aesthetics and confidence for the wearer

**Final finishing**

Final polishing of a prosthetic eye is the last step in its fabrication and is essential to ensure the prosthesis is smooth, glossy, and comfortable for the patient to wear. After curing the prosthetic eye, it is carefully trimmed to the desired shape using rotary tools or fine abrasive instruments. All sharp edges are rounded off to avoid irritation in the socket. Once the shape is finalized, the surface of the prosthesis is gradually smoothed (Figure 10). Polishing is typically done using a buffing wheel or a soft polishing mop along with a suitable polishing compound, such as pumice, followed by high-shine pastes. The goal is to achieve a smooth, high-gloss surface natural sheen of the human eye. During this process, care is taken not to overheat the prosthesis, as excessive heat can distort its shape or damage the painted details sealed within the clear PMMA. A well-polished prosthetic eye not only enhances its aesthetic appearance but also improves comfort by reducing friction against the sensitive conjunctival tissues in the

socket. It helps prevent mucus buildup, irritation, and abrasions. After polishing, the eye is cleaned thoroughly, disinfected, and lubricated before being tried in the patient. Proper final polishing ensures the prosthetic eye is visually realistic, biocompatible, and ready for long-term wear.

**Removing and fitting in socket**

The process of removing and fitting a prosthetic eye should be done gently and hygienically to ensure the comfort and safety of the wearer. To remove the prosthetic eye, the person should first wash their hands thoroughly. Standing over a soft surface or towel to prevent damage if the eye is dropped, the lower eyelid is gently pulled down using one hand while the other hand presses lightly on the upper eyelid. Tilting the head forward slightly, gentle pressure is applied above the upper eyelid to slide the prosthesis forward and down into the hand or onto the towel. Some patients may also use a small suction cup tool specifically designed for prosthetic eyes to assist in removal. To fit the prosthetic eye back into the socket, it is first cleaned with sterile saline or warm water to remove any debris and moisten the surface, which helps with comfort during insertion. Holding the prosthesis with the convex (outer) side facing outward, the upper eyelid is lifted and the top edge of the prosthetic eye is gently slipped under the upper lid. Then, the lower eyelid is pulled down slightly to allow the lower edge of the prosthesis to slide into place. Once in the socket, the eye is adjusted slightly with a fingertip to ensure it is seated comfortably and moves naturally with the remaining eye. Proper insertion and removal techniques help maintain the condition of the prosthesis and ensure the health of the surrounding tissues.

## DISCUSSION

The eye, with its complex structure and vital role in visual perception, plays a crucial part in our daily lives. Individuals who experience eye loss due to various reasons face not only physical but also psychological challenges(Sabel *et al*., 2018).The procedure of creating an ocular prosthesis is intricate and calls for both technical and creative abilities. Various techniques have been described in the literature to make the fabrication process easier and more efficient. The use of a relining material to adapt an existing custom ocular prosthesis to achieve an acceptable fit has also been suggested. The custom tray fabrication in this case was simple and quick. Most techniques have fundamental similarities. On the other hand, an even distribution of weight and volume provided by a custom-made ocular prosthesis enables orbital fat to correctly attach to the prosthesis. This improves the socket's conditioning and reduces mucus discharge in the socket. On the other hand, mucus and tears accumulate in stock eye prostheses because they do not offer sufficient apposition. In comparison to the contralateral eye, the former has a better cosmetic look in terms of color and contour. It has certain benefits, such as reducing discomfort, blepharoptosis, and deep superior sulcus (Raj *et al*., 2016). The creation of three-dimensional printed prostheses, which are tailored to fit the patient's eye socket and give a more natural appearance, is one of the most recent developments in ocular prostheses. Other advances include the use of electronic components to provide feedback to the patient, allowing them to control the movement of the prosthesis. In addition, new materials such as silicone and polymers are being used to create more realistic prostheses. Finally, new technologies such as augmented reality and virtual reality are being used to help patients adjust to their new prostheses.

## CONCLUSION

Custom ocular prosthesis fabrication is a complex process that requires precision and accuracy. However, with the help of digital photography, this process can be simplified and made more efficient. This article describes a novel technique for custom ocular prosthesis fabrication using digital photography that can save time and effort for clinicians. This technique provided a comfortable and secure fit for the wearer while still maintaining a natural-looking appearance. Acrylic resin is typically utilized to create ocular prosthesis for the prosthetic rehabilitation of ocular abnormalities. As the thickness of clear acrylic over the iris is increased on the ocular prosthesis, the size of the iris is also increased, due to magnification through the clear resin. This study will help minimize iris size error during the fabrication, relining, and adjustment of the ocular prosthesis by offering guidance for iris magnification using the

thickness of transparent acrylic resin. The results of this study can also be applied to the magnification of any object in clear resin and are not limited to the iris in the ocular prosthesis.

## ACKNOWLEDGEMENT

I express my deepest gratitude to Subharti College of Allied and Healthcare, Swami Vivekanand Subharti University, Meerut, for providing continuous support throughout this research work. My sincere appreciation goes to my colleagues and fellow researchers for their helpful discussions and cooperation.

## ABSTRACT

*Taila Kalpana*subset of *Sneha kalpana*, it is a crucial concept in *Ayurvedic* pharmaceutical processing, involves the preparation of oleaginous medicaments by extracting and solubilizing the active principles from medicinal herbs into oils. This method is vital in creating therapeutic oils used for various applications such as oral intake, massage, nasal administration, and enemas. The process incorporates substances like *Kalka* (paste), *Kwatha* (decoction), and *Drava Dravyas* (liquid ingredients) in precise proportions, subjected to controlled heating patterns to enhance the therapeutic potency. Key ingredients, such as *Tila* (*Sesamum indicum*), *Sarshapa* (*Brassica nigra*), and *Eranda* (*Ricinus communis*), are used, while the preparation follows a general ratio of *Sneha Kalpana* that is, *Kalka*, *Taila*, and *Drava Dravya* in 1:4:16. The preparation method, including stages like *Taila Murchana*, *Taila Paka*, and *Taila Paka Siddhi*, ensures optimal medicinal properties. Several types of *Taila Paka*, including *Aditya Paka* and *Patra Paka*, utilize different heating techniques. The shelf life of *Taila*as per classical text is 16 months, depending on the type. This review highlights the intricate steps involved in *Taila Kalpana* and its significance in *Ayurvedic* treatment.

**Keywords:** *Taila Kalpana*, *Ayurveda*, Pharmaceutical processing, Oil preparation.

## INTRODUCTION

In *Ayurveda*, various formulations are used for therapeutic purposes, including solid dosage forms like *Vati* and *Churna*, liquid dosage forms such as *Taila*, *Asava*, and *Arishta*, and semisolid dosage forms like *Ghrita* and *Avaleha*. Among these, Taila Kalpana holds significant importance. This formulation is versatile, being utilized in all four modes of drug administration: *Pana* (oral intake), *Abhyanga* (massage), *Nasya* (nasal application), and *Basti* (enema). Although internal applications of *Taila* are well-documented, detailed descriptions of their usage after undergoing specific Samskara (pharmaceutical processing) are relatively scarce in the available literature. *Taila Kalpana*, a subset of *Sneha Kalpana*, is a sophisticated pharmaceutical process. It is the process where the active principles from the raw drugs are transferred into *Taila*. *Taila Kalpana*, by definition, involves preparing oleaginous medicaments using substances such as *Kalka* (paste), *Kwatha* (decoction), and *Drava Dravyas* (liquid ingredients) in precise proportions. These ingredients undergo a unique heating pattern and duration to achieve specific pharmaceutical parameters. This meticulous process ensures the transformation of the active therapeutic properties into the solvents, making them soluble in fats, water, or even media like Kanji (fermented gruel) and buttermilk, depending on therapeutic needs.

## MATERIAL AND METHODS

References regarding *Taila kalpana* were collected from various Classical and Ayurveda published works, published research papers from PubMed, Google Scholar and compilation was done. Concept of *Taila kalpana* was studied in detail and conclusion was drawn.

## REVIEW OF LITERATURE

Taila Kalpana, a pharmaceutical process rooted in Sneha Kalpana, is a process that involves the extraction and solubilization of both hydrophilic and lipophilic active principles from herbomineral ingredients, utilizing a specific oil as the solvent, to create efficacious formulations.

**Sources of Taila Kalpana[1]**
In Ayurveda, the sources of Taila Kalpana are predominantly plant-based. Some significant examples are listed in Table no. 01

**Essential ingredients for *Taila Kalpana[2]***
***Kalka Dravya***
It is the solid part of the drug used in the preparation. If wet drugs are taken, then they are pounded and made into *Kalka* and in case of dry drugs the fine powder of drugs is added with required quantity of water or liquid specified and made into *Kalka.*

***Drava Dravya***
It is the liquid part used in the *Taila Kalpana*, the following liquids can be employed: *Jala* (water), *Swarasa* (freshly extracted juice), *Kwatha* (decoction), *Ksheera* (milk), *Kanji* (fermented preparation), *Takra* (buttermilk) etc.

***Taila Dravya* (oil)**
Among oils, *tila taila* is commonly used. The *Taila* used for the purpose of *Taila Paka* should be preferably new one as it may undergo rancidity.

***Gandha Dravya***
To impart a pleasant aroma, perfuming substances like: *Ela, Twak, Patra, Karpoora, Lavanga* etc. may be added where ever required at the end of the process.

**General ratio of *Sneha Kalpana***

According to *samhitas*, if the essential ingredients for the preparation of *Taila Kalpana* is not mentioned then *Kalka Dravya*, *Taila*, and *Dravadravya*, which are typically combined in a specific ratio of 1:4:16, respectively[3]. *Bhaishajya Ratnavali* has mentioned detailed description of *Gandha Dravyas* that is the quantity of *Gandha Dravyas* has to be 1/16th part of oil[4].

**Instruments required**

The preparation of *Sneha Paka* necessitates the use of specific instruments to ensure optimal results.

***Sneha patra*:** Firstly, a wide-mouthed, deep *Sneha Patra* (vessel) is required, capable of withstanding temperature fluctuations and preventing oil spillage. Prior to use, the vessel must be thoroughly cleaned and dried.

***Darvi*:** Additionally, a *Darvi* (ladle) is employed to stir the mixture constantly and carefully, thereby preventing the *Kalka* from adhering to the vessel's bottom.

***Agni*:** Lastly, a controlled heat source, referred to as *Agni*, is utilized, with the preparation necessitating the use of *Mrudu* (mild) and *Madhyama* (moderate) *Agni*. Specifically, *Mrudu Agni* is applied during the initial and final stages, while *Madhyama Agni* is employed to facilitate the optimal *Paka* of *Sneha Dravyas*.

**Steps for Preparation of *Taila Kalpana***

*Taila Paka* process may be divided into three phases.

a. *Taila Murchana*
b. *Taila Paka*
c. *Paka Siddhi*

***Taila Murchana***

*Taila Murchana* is a unique procedure where raw *Taila* is boiled with the fine powders of selected medicinal drugs and desired quantity of water to get rid of *Ama Dosha* and bad odour present in it. This procedure helps in increasing potency and absorption capacity of the *Taila.* The concept of *Murchana* is found in *Dipika* commentary of *Sharangadhara Samhita* which was written in later part of 14th century. *Bhaishajya Ratnavali* deals in detail about the *Taila Murchan[5]* (*Tila Taila, Eranda Taila* and *Sarshapa Taila*).

## PROCEDURE

- The raw taila is taken in a vessel which is strong with thick bottom and clean.
- Vessel is placed over mildfire till the appearance of foam.
- Fire is lit off and waited until *Nisphena bhava* (disappearance of foam) and *shaitya bhava* (room temperature)
- *Taila* is heated again in mild fire and added with required quantity of water and *kalka* of *aushadha dravyas* specified.
- Boiling is continued in mild fire with frequent stirring until the appearance of *Taila siddhi lakshana.*

The ingredients for specific taila used in the murchana are as follows

***Tila taila Murchana***

*Tila taila, Manjishta, Haridra, Lodhra, Musta, Nalika,Triphala, Sucipushpaula rasa, Jala.*

***Sarsapa taila Murchana***

*Sarshapa taila, Vayastha, Rajanai. Mustaka, Bilva, Dadima, Nagakesara, Krishna jeeraka, Hribera, Nalika, Bibhitaka, Manjishta, Jala.*

***Eranda taila Murchana***

*Eranda taila, Vikasa, Mustaka, Dhana, Triphala, Jayanti, Hribera, Vanakharjura, Vatashringha, Nisha yugma, Nalika, Ketaki, Dadhi, Kanjika.*

***Taila Paka***

According to the source of heat *Taila Paka* can be classified as

- *Niragni Taila Paka*
- *Sagni Taila Paka*

***Niragni Taila Paka***

***Aditya paka[6]***

Aditya Paka, also known as *Surya Paka* or *Bhanu Paka*, is a unique method for preparing medicated oils. This technique involves placing a mixture of *Kalka* (herbal paste) and *Taila* (oil) in a vessel, which is then exposed to direct sunlight for a specified period. This gentle, heat-free method is ideal for preparing oils from volatile and heat-sensitive herbs. While there are no specific guidelines for determining the completion of this process (*Siddhi Lakshanas*), certain formulations provide detailed instructions regarding the duration of exposure, type of vessel, and expected changes in the oil's color. This method offers a delicate and effective way to harness the therapeutic properties of heat sensitive herbs.

**Patra Paka[7]**

It is technique employed to extract the bioactive compounds, particularly the volatile constituents, from medicinal herbs and spices. This process involves placing a soluble or miscible powder of the desired drug in a vessel, followed by the addition of hot oil. The heat from the oil facilitates the release of the flavorful and aromatic compounds from the powder, which are then infused into the oil.

**Eg.:** *Manjishtadya suryapakhi Taila[8], Adityapakaguduchi Taila[9].*

***Sagni Taila Paka***

The *Taila* is added with specified amount of *Kalka* and *Drava Dravya*, it is subjected to moderate heat until the liquid portion gets evaporated. There is various opinion available regarding the method as well as time for addition of *Kalka* and *Taila* during *Taila Paka*. According to *Sushruta Samhita* and *Astanga Sangraha Kalka* and *Drava Dravya* must be mixed in *Taila* and processed. *Acharya Sharangadara* has not specified the order in which the *Kalka, Taila* and *Drava Dravya* is to be added. According to Keraliya Vaidyas the *Kalka* is first mixed in *Drava Dravya* later poured into slightly heated *Taila* and *Taila Paka* is done. This will facilitate in uniform distribution of active principle in *Taila* which in turn enhances its efficacy.

**Duration of *Taila Paka***

*Acharya Sharangadhara* states that preparation of *Taila* should not be completed within one day, as longer duration of preparation gives better acquisition of properties of drug into them, which in turn enhances the potency of *Taila. Bhaishajya Ratnavali* has mentioned duration of *Taila paka* according to the nature of liquid media. Table no. 2: Number of days *Paka* has to be done according to the medium used [10]

**Types *of Taila Paka***

As per various classical literatures many types of the *Taila Pakas* are mentioned in the *Samhithas* (Table No. 03)**.** As per *Charaka* and *Sushrutha Samhitha* the *Paka* are of three types. *Haritha* has mentioned four types of *Pakas*. Whereas *Vaghbatta, Sarangadhara* and *Govinda Acharya* has mentioned 5 types of *Taila Paka.*

***Taila* Paka Siddhi Lakshana[17]**

- *Taila Kalka* attains wick shape when rolled between thumb and index finger.
- When the *Kalka in taila* is placed over fire, no sound is produced indicating the loss of moisture in it.
- The foam appears at the time of completion of *Taila Paka*.

- Desired colour, odour and taste of the ingredients become appreciable when the *Taila* attains its *Siddhi Lakshana.* (Table No. 04)

**Characteristics of each *Paka***

a. *Ama Paka* is the first stage of *Taila Paka.* Here the word *Ama* indicates reduced or decreased digestive capacity of *Taila* that means medicated ghee or oil has not been sufficiently assimilated with medicinal properties due to the short duration of heat treatment of *Taila*. It is *Guru* in nature and causes *Agnimandya[*18], so it cannot be used for therapeutic purposes.
b. When the processed *Taila* is in *Mridu Paka* stage the *Kalka* is sticky on touch due to the presence of traces of water. It is indicated for internal administration such as *Nasya[19].*
c. In *Madhyama Paka* stage, the *Kalka* is devoid of water and is soft to touch, it can be rolled into wick when rubbed between two fingers. It is indicated for both internal as well as external application. *Charaka Samhita* as well as *Astanga Hridaya[*20] had advised it for *Basti* and *Pana. Sushruta[21]* had indicated it for *Nasya* and *Abhyanga* where as *Sharangadhara* and *Bhaishajya Ratnavall [*22] had mentioned it for *Sarva Karma.*
d. Further heating of *Madhyama Paka* leads to *Khara Paka.* In this stage *Kalka* is hard and rough to touch, it cannot be made into wick, it used for external application. *Charaka*, *Astanga Hridaya, Bhaishajya Ratnavalli[23]* and *Sarangadhara* had indicated it for *Abhyanga*, *Sushruta Samhith[24]* has mentioned it for *Vasti* and *Karna Purana.*
e. *Dagdha Paka* is the final stage of *Taila Paka.* Here content of *Taila* is burnt, it is contraindicated for therapeutic use: if used may cause burning sensation.

**After *Taila Paka***

- Once the desired *Taila Paka* is attained the *Taila* has to be filtered immediately, it is done in order to prevent *Taila* from exceeding the desired *Paka* by absorbing the heat from the vessel as it may lose its efficacy.
- A clean cotton cloth has to be used for filtering of the *Taila*. It should be double layered as it has to withstand the heat and to prevent tearing of the cloth during squeezing.
- After filtering the *Kalka* has to be squeezed again in order to obtain maximum amount of *Taila* from it. Later it has to be discarded.
- Where ever *Lavana* and *Ksharas* has been mentioned, they have to be added to the *Taila* and then filtered
- If *Sharkara* (Sugar) is mentioned in *Taila Paka*, it has to be added to the final product in powder form, when it is cooled.
- The filtered *Taila* has to be stored in a clean, dry air tight container.

**Gandha Dravyas**

It is the procedure in which *Sneha* is augmented by certain aromatic substance. The fine powder of the drugs is placed in the vessel into which the lukewarm *Sneha (Taila)* is filtered and mixed well. These drugs are generally taken in the quantity of 1/16$^{th}$ part of *Sneha* and all drugs should be taken in equal quantity. To render the *Taila* fragrant substances such as are *Samanga, Nakha, Kankola, Nalika, Jatikosa, Kunduru, Karpura, Twak, Lavanga, Kesara, Kasturi[25],* etc are used. According to *Bhaishajya Ratnavali Gandha Dravya should be* 1/16 part of *Sneha*. *Gandha Dravyas* mentioned are to be taken in equal quantity and powdered, after the preparation of *Taila* this powder is placed in the clean cloth and made into *Pottali.* This *Pottali* is immersed in *Sneha* for ten days. After tenth day *Pottali* is removed and *Snhea* is preserved in air tight container. It enhances the therapeutic efficacy of *Sneha paka*.

**Shelf Life**

*Acharya Sharangadhara* has mentioned that *Taila* losses its potency after 16 months[26] According to CCRAS guidelines the shelf life of *Taila* is 3 years and *Ghrita* is 2 years[27]

**Dose**

*Acharya Sharangadhara* has mentioned a common dose for medicated *Taila* for internal use as 1 *Pala* (48gm/ml)[28]. The dose can be adjusted by looking into *Rogi* and *roga bala* (strength of patient and disease).

**Benefits of Taila [29]**

Taila use is highly recommended in *Pravrit rutu* (Early monsoon season). It has ability to alleviate vitiated *vata* without aggravating *kapha*, instead enhancing overall strength. *Taila* is also highly beneficial for the skin, boosting *ushna virya* properties that promote stability and warmth. Furthermore, it serves as *Yoni vishodhana* (cleanse the vagina and uterus), making it an excellent addition to one's wellness routine.

**Indication [30]**

Those having excessive *shleshma* and *medas*(fat), and have *sthula galodara* (plump neck and abdomen); those of *vatika prakriti* and suffering from disorders of *vata*, desirous of strength, leanness, lightness, sturdiness, firmness/steadiness of body parts, unctuous, smooth and thin body skin, suffering from (intestinal infestations/infections), *krura koshta*(hard-bowel), and *nadi* (sinuses), these persons fit to take oil should consume it during *sheetala kala* (winter/cold period).

## DISCUSSION

*Taila Kalpana* (Oil Preparation), a fundamental practice in Ayurvedic pharmaceutics, involves combining plant-based oils, *Kalka* (herbal pastes), *Kwatha* (decoctions), and *Drava Dravyas* (liquids) to create medicated oils with therapeutic potential. Oils like *Tila* (Sesame), *Sarshapa* (Mustard), and *Eranda* (Castor) are known for their emollient, anti-inflammatory, and antioxidant properties, acting as solvents to extract bioactive compounds from plant materials. The process of *Taila Paka* (oil preparation) mirrors modern drug formulation principles, where controlled heating and the integration of specific ingredients lead to the solubilization of active compounds into the oil matrix. The precise ratios of *Kalka* (paste), *Taila* (oil), and *Drava Dravyas* (liquids) ensure the effective incorporation of therapeutic properties into the oil. The addition of *Gandha Dravyas* (aromatic substances) not only enhances the fragrance but also contributes additional therapeutic benefits such as anti-inflammatory, antimicrobial, or soothing effects. This preparation aligns with the principles of extraction chemistry, where oils extract lipophilic compounds, while water-based decoctions (*Kwatha*) and juices (*Swarasa*) extract hydrophilic compounds, supported by modern studies validating the oils' therapeutic efficacy.

## CONCLUSION

The preparation of medicated oils in *Ayurveda* through *Taila Kalpana* is a well-structured, time-tested process that integrates traditional knowledge with modern scientific understanding. The careful selection of oils, the controlled application of heat, and the inclusion of various medicinal plant extracts facilitate the extraction and solubilization of bioactive compounds, ensuring the therapeutic potency of the final formulation. The shelf life of the oil depends on various factors such as the type of oil, the ingredients used, and storage conditions. Proper filtering and storing techniques are essential to preserve the oil's potency and prevent its degradation. This process parallels modern drug delivery systems, where the choice of solvent and the method of extraction are crucial to the efficacy of the product. The scientific basis behind the oil preparation, including the extraction of lipophilic and hydrophilic compounds, aligns with the principles of modern pharmacology. Continued scientific research and clinical studies are essential to further elucidate the molecular mechanisms behind these formulations.

**ABSTRACT**

Sarcopenia is a disease which related to muscle mass loss, muscle strength reduction and less physical performance. This disease is seen majorly with other diseases and comorbid conditions in older individuals. There were multiple guidelines to assess sarcopenia. AWGS criteria was suitable to find the level of sarcopenia in Asian population. To study the prevalence of sarcopenia in community dwelling older individuals. An observational study was conducted to screen sample population by following AWGS guidelines. Total 192 participants with positive SARC-F questionnaire assessed with calf circumference for muscle mass, grip strength for muscle strength and 5 times chair stand test for physical function. Their demographic details noted and according to cutoff values result analysis done. The prevalence of sarcopenia was observed increasing as the age increases. 60-69,70-79 and more than 80 years showed 17.7%, 28.8%, and 77.7%, accordingly. There were total moderate to high prevalence shown to sample of older individuals of community. There was specific need to develop other prevalence in specific condition like chronic kidney disease, diabetes and etc.

**Keywords :** Sarcopenia, Community dwelling older individuals, muscle strength, Physical performance

## INTRODUCTION

Sarcopenia is a disorder related to musculoskeletal system defined by progressive loss of muscle mass, muscle strength and function in especially elderly population. In elderly life, the person becomes frail and weak because of changes in body due to aging[1]. The changes in elderly life starts with 4$^{th}$ decade of life which can lead to loss of independence, frailty, falls and fractures. This condition led to hospitalization, dependence and other complications[2].

The sarcopenia is mainly multifactorial, with environmental causes, post chronic disease like chronic obstructive pulmonary disease(COPD), rheumatoid arthritis, kidney disease, diabetes, cancer and HIV also shows changes like sarcopenia. Physical inactivity and obesity likely to be primary role in developing sarcopenia in older ages[2]. Alteration in hormonal level, malnutrition and inadequate protein intake factors also places subordinate role in causing sarcopenia. The changes in the skeletal muscle with advance in age causes decline in size and number of skeletal muscle fibres. Due to these changes in the body, the patients feel weakness, fatigue. The muscle flash less and thin, the work becomes slow. Decrease in muscle size and strength causes troubles in daily physical activities which leads to poor balance and frequent falls[3].

There are multiple guidelines available to diagnose sarcopenia like EWGSOP(European Working Group for Sarcopenia), IWGS(International Working Group on Sarcopenia), AWGS(Asian Working Group for Sarcopenia), FNIH(Foundation for the national Institutes of Health), ISI(International Sarcopenia Initiative). Hence, the Indian population matches the AWGS Guidelines, it was followed for the study. AWGS consensus in 2014 defined sarcopenia and set specific cutoffs for each diagnostic component. In AWGS consensus in 2019 retained the definition but revises the diagnostic algorithm. AWGS 2019 also introduced the term "possible sarcopenia" in order to address the problem of obstacles to disseminating the diagnosis and treatment of sarcopenia. Possible sarcopenia allows early detection and treatment of the disease leading to improved prevention, delay of onset and treatment of sarcopenia[4].

The diagnosis of the abnormal muscle mass is the main cornerstone for diagnosing the disease. Multiple techniques are available for measurement of muscle mass but the gold standard technique which comprise reliability, validity and affordable cost. Anthropometry, CT, MRI are measurements but limitations like limited accuracy, time consuming and expensive relatively. BIA and DEXA have issues like no availability of machines, normative data. However, in recent timeframe, muscle mass through BIA, muscle strength through handheld dynamometer and physical performance through gait speed is feasible tool for diagnosis of sarcopenia in community dwelling older people[3,4]. Hence to diagnose sarcopenia is crucial action before treating the condition. It is basic process to move further in the treatment of frailty and delay the process of sarcopenia. So the aims of the study was to diagnose the disease sarcopenia in community dwelling independently ambulatoryolder individuals.

## METHODOLOGY

An observational study was conducted in Ahmedabad to find out the level of sarcopenia in community dwelling healthy older individuals. After taking ethical approval from institutionalethical committee screening was started. Individuals with an older age more than 60 years of age, both male and female, having independent walking without assistive aids included in the study. The participant who not want to participate, or having any serious medical, neurological or surgical condition excluded from the study. Total 192 individuals were assessed by the AWGS 2019 guidelines. They were first assessed with SARC-F questionnaire. The SARC- F questionnaire used as a screening tool to identify people with sarcopenia. It is self-reported questionnaire which includes 5 components questions like decrease in strength, walking, rising from chair, climbing stairs and experience of falls in previous year. Each component receive scale from 0 – minimum score to 2- maximum score. The maximum score is 10. A score equal to greater than 4 is suggestive of sarcopenia and poor outcome. If SARC-F is suggestive of sarcopenia or risk of poor outcome then calf muscle circumference(CC), muscle strength(grip strength) and physical function measurement measured to confirm possible sarcopenia. The calf circumference cutoff values <34 for men and <33 for women recommended by AWGS 2019 criteria for sarcopenia. If the calf circumference achieved by the recommended value then grip strength and physical function measurement test as a 5 times chair stand test measured. Total 192 participants who got less calf circumference and positive outcome in SARC-F questionnaire screened for grip strength and 5 times chair stand test. The demographic details of 192 participants shown in table 1. The recommended cut off values for grip strength in males <28 kg and females <18 kgs. The time duration for physical function test- 5 sec chair stand test is <12 sec. An individual with less SARC-F score, less calf circumference with either less grip strength or SPPB score considered as possible sarcopenia. Individuals with less SARC-F, less calf

circumference with less muscle mass and either grip strength or SPPB score reduced considered as Sarcopenia. Individuals with less SARC-F score, less calf circumference with less muscle mass and less grip strength along with less SPPB score considered as severe sarcopenia. According to the cut off values the possible sarcopenia, sarcopenia and severe sarcopenia participants identified.[5-9]

## RESULT

All data were analysed and processed. The total prevalence of possible sarcopenia, sarcopenia, and severe sarcopenia is presented in Table 2 and Graph 1. The prevalence of sarcopenia increased progressively with age. In the age groups 60–69, 70–79, and ≥80 years, the prevalence of total sarcopenia was 17.7%, 28.8%, and 77.7%, respectively. A chi-square test demonstrated a statistically significant association between age group and sarcopenia status ($\chi^2$ = 17.70, df = 2, p = 0.00014), indicating that sarcopenia was significantly more common in the older age groups.

## DISCUSSION

The study was cross sectional prevalence study 192 individuals. The overall prevalence noted was 17.7%, 28.8%, and 77.7% respectively in the 60-69,70-79 and above 80 years. The rate of the disease increase with age more in males then in females. On other hand sarcopenia is more often observed close relation with comorbidities. Obesity and diabetes mainly seen major risk factor for this pathology. The physical function mainly got reduced as the disease develops as severity increases. [10] A cross-sectional study done by Gauri Bhat et. Al. with 745 adults from urban and rural area near pune, india. According to AWS-2019 criteria the overall prevalence was 10% and severe sarcopenia was 4.2%. sarcopenia prevalence much higher in rural individuals than their urban counterparts, and higher prevalence in men as compared to women. In this study, along with increasing age, lower socio-economic status and low protein intake were found to be significant risk factors for sarcopenia.[11]A cross-sectional study done by Abhijith Rao concluded that Multiple sociodemographic factors were significantly associated with sarcopenia. Total 26,780 community dwelling adults screed using Asian Working Group for Sarcopenia(AWGS) 2019 criteria. This study concluded that significant associations between sarcopenia and various sociodemographic factors, comorbidities, and geriatric syndromes in older adults in India, suggesting potential areas to target for intervention.[12]A consensus study done to aim to identify features of sarcopenia in Indians using the modified Delphi method. 13 experts made panels who done comprehensive literature review and online survey, online survey to procure responses from the experts. The prevalence of sarcopenia among the elderly(>60 years) was 39.2%. physical activity measures and a protein rich diet in at risk populations. [13] Roger A. Et. Al. done a multicentre observational study in patients aged 65 years and above screed for sarcopenia. They concluded that a geriatric population at risk of functional decline over 6 months using specific cutoffs. The sarcopenic subjects were at high risk of functional decline within 6 months. [14] Ameta-analysis done by Pacifico Et. Al. concluded that sarcopenia is highly prevalent in individuals with CVD, dementia, diabetes mellitus and respiratory disease. Higher prevalence of sarcopenia noted in individuals with CVD compared to individuals with dementia, DM and respiratory disease. They also documented risk factors like sedentary behaviour, low physical activity, inflammation, malnutrition responsible to develop sarcopenia in these age-related diseased individuals.[15] One more cross-sectionalstudy done on prevalence with crucial disease, the chronic kidney disease and patients under treatment of haemodialysis. Yang Y. concluded that (64.1%) a high prevalence of probable and confirm sarcopenia among patient with chronic kidney disease undergoing maintenance haemodialysis. Lower physical activity, BMI and inorganic phosphorus were the probable risk factor for developing the disease. [16] Another meta- analysis from China about to find the prevalence and risk factors in older adults. The showed (20.7%) higher prevalence in the older adult aged 60 and above individuals. Aging, Low BMI, low calf circumference, smoking, depression, osteoporosis, malnutrition were the risk factors of sarcopenia[17-19]. Rishabh Gupta et. Al. done a study titled association of sarcopenia with gender and occupational activity from India. A cross-sectional study conducted at Bhopal hospital, found 37.6% cases found sarcopenia. Gender(male), low physical activity are significant risk factors of sarcopenia.[20]. Zengin A. et. Al. published an article to study the prevalence of sarcopenia

and relationships between muscle and bone in Indian men and women and gave conclusion that positive associations between muscle parameters and aBMD(areal bone mineral density) in Indian men and women; were stronger in women than in men. As India has over one-third of world's population aged > 60 years, nutritional and exercise interventions for maintaining lean mass and strength during ageing will facilitate healthy ageing and reduce its economic healthcare burden.[21] Limpawattna P. et. Al. conducted a review article on sarcopenia in Asia and suggested that the prevalence of sarcopenia in Asia is diverse due to the difference in its definitions and methodological studies. Exercise especially PRE and adequate nutritional support are the key components of management.[22]

This study shows the prevalence of sarcopenia in Ahmedabad, according the aim of the study. The study had followed the checking criteria was AWGS, which was suitable for Indian populations. The limitation of the study was that the muscle mass was not studied by DXA scan, which is the gold standard measurement. The nutritional values or diet was not assessed which played a significant role in developing sarcopenia. Further studies should be done with larger sample size, covering all the aspects responsible for sarcopenia.

## CONCLUSION

The level of sarcopenia is moderate to high as the age grows. The Sarcopenia is a slowly progressive disease, which affects independency of older individuals. It affects muscle mass, strength which reduce the efficiency of muscle to do function. Comorbidities, dietary and sedentary behaviour plays major role in developing the disease. Regular daily mild to moderate physical activities needed to maintain physical health of body. As the aged people keener for their comorbidity's checkup, they also should be aware about regular physical capacity analysis. The future studies should be done to get prevalence in other comorbid conditions like diabetes, chronic kidney disease and in more larger samples with long time follow-ups.

**ABSTRACT**

The objective of this study was to evaluate the prevalence and frequency of knee problems among female college students. A secondary objective was to assess the level of public awareness and understanding of these injuries. This cross-sectional study was conducted using a survey distributed to female college students at Galgotias University, Greater Noida, Uttar Pradesh, India. A total of 1002 students participated, completed the questionnaire, and met the inclusion criteria. The collected data were analyzed using SPSS software. Knee injuries are prevalent among the young population. Unnoticed or untreated injuries during early adulthood can contribute to the early onset of osteoarthritis. This survey helped identify the prevalence of knee injuries among young females and highlighted that strengthening knee musculature may play a role in delaying the onset of early osteoarthritis. Our findings indicate a significant prevalence of knee injuries in the studied population and underscore the importance of increasing awareness and education regarding knee health and injury prevention.

**Keywords:** Knee-injury, Prevalence, KOOS score, College female students.

## INTRODUCTION

The knee joint is one of the most commonly injured and complex structures in the human body and is frequently affected in young females [1]. It is primarily stabilized by several ligaments, including the anterior cruciate ligament (ACL), which plays a key role in maintaining joint stability [2, 3, 4, 5]. Other important ligaments in the knee include the medial collateral ligament (MCL), posterior cruciate ligament (PCL), and lateral collateral ligament (LCL) [6]. Athletes involved in high-impact sports such as running are more prone to developing knee osteoarthritis [7]. In such

cases, the long-term goal of treatment is to manage and slow the progression of osteoarthritis [8]. A study conducted in northern India that examined sports-related knee injuries found that the majority of these injuries (35.6%) were caused by non-contact mechanisms [9]. Knee injuries, particularly ACL tears, are prevalent. ACL reconstruction (ACL-R) is a common surgical procedure with a success rate of 75–97%. However, complications such as infection, hemarthrosis, deep vein thrombosis (DVT), and pulmonary embolism have been reported, with incidence rates ranging from 1% to 15% [10]. To prevent anterior knee pain, the most effective interventions are strengthening and stretching exercises. Improved flexibility in the muscle-tendon unit can enhance performance and reduce the risk of injury [11, 12, 13, 14]. However, a systematic review evaluating the effectiveness of stretching exercises in injury prevention found that while stretching offered no significant benefits, strengthening exercises were more effective in reducing the likelihood of sports injuries [15]. Resuming physical activity after an injury is challenging for athletes. Physical inactivity following injury can lead to complications such as joint stiffness [16]. Therefore, it is recommended that individuals remain physically active and that greater attention be given to knee issues in order to reduce injury rates [17]. Knee sprains are among the most common injuries in athletes, particularly in high-level competition settings, where the risk of such injuries increases [18]. Football is one of the most popular sports globally, and knee injuries are especially common in this sport due to its high level of physical exposure and varying intensity levels [19]. Knee injuries increase the risk of developing osteoarthritis later in life; thus, preventing such injuries is essential to reducing the likelihood of osteoarthritis [20]. Preventive programs should be introduced at the early stage of knee pain to reduce the risk of future injuries [21]. The prevalence of knee joint injuries in today's society is largely due to the wide range of sports activities in which athletes engage, which increases the risk of knee problems. The objective of this study is to explore ways to prevent knee injuries among Indian females and raise awareness about these injuries. Female participants were included in this study because women are now actively participating in various sports. They are as involved in athletic activities as their male counterparts.

## METHODOLOGY

**Study design and subjects**

A cross-sectional investigation was carried out to find out the incidence, risk factors, knowledge, and practices of knee problems among female college students in 2022. 1063 participants received a hard copy questionnaire; 1002 students responded, yielding a response rate of 94.26 percent.

**Place:** Galgotias University, Greater Noida

**Inclusion criteria**

The following criteria were used to choose the individual in the research: (1)
Femalecollege student,
[2]18-25 years.

**Exclusion criteria**

1. Any congenital abnormality.
2. History of any Degenerative conditions.
3. Previous history of fracture or ligament injury.

## METHOD

A standardised, self-administered questionnaires that achieved the objectives of the study was used to collect the data. All participants agreed to participate in the study after reading a written informed consent that detailed its objectives and guaranteed the confidentiality of their personal data.

**Questionnaire and variables**

The researchers created the questionnaire after analysing the literature and other questionnaires.

The questionnaire was divided into six sections:

1. Demographic data which includes Name, age, height, and address;
2. Pain assessment
3. Symptoms
4. ADL
5. Sports and recreation function and
6. Knee-related QOL.

This questionnaire was calculated on a scale of 0 (poor) to 100 (excellent).

The ages of the participants were divided into three groups: 18–20 and 21–23 and 24-25

**Data Analysis**

The questionnaire was completed and returned in order to be considered for the research. Filled survey forms that did not match the criteria for inclusion were discarded, leaving 1002 questionnaires that were valid. SPSS 21.0 version was used to code, enter, and analyse the data. Descriptive statistics, such as frequency, categorical variables, means, and standard deviation, were used to present the data. To see if there was any correlation, a T-test and an independent sample test were utilised. Table: 1 (Frequency table), Table: 2 (Mean and Standard Deviation), Table:3 (Mean and Standard Deviation between Group 1 and 2), Table: 4 (Significant value of group 1 and 2), Table: 5(Mean difference and Standard error difference), Table: 6 (Variance table), Table: 7 (Mean and Standard Deviation between Group 1 and 3), Table: 8 (Significant value of group 1 and 3), Table: 9 (Mean difference and Standard error difference), Table: 10 (Variance table), Table: 11(Mean and Standard Deviation between Group 2 and 3), Table: 12(Significant value of group 2 and 3), Table: 13(Mean difference and Standard error difference), Table: 14 (Variance table),

* S.D – Standard deviation
* EVA - Equal variance assumed
* EVNA - Equal variance not assumed

## RESULT

The research received 1063 responses from female students, of which 1002 people were participated in this study after meeting the criteria for inclusion.

The mean value and standard deviation of category one is 80.91 and 12.491 respectively; the mean value and standard deviation of category two is 80.39 and 13.593 respectively.

When we compare category one and category two then we found significant value is 0.030.

The difference between comparison one is less in compared to comparison two and three, as the prevalence of knee injury is more.

The mean value and standard deviation of category three is 75.52 and 10.931 respectively.

When we compare category one and category three then we found significant value is 0.004.

The difference between comparison two is less in compared to comparison one and three, as the prevalence of knee injury is more.

When we compare group two and group three then we found significant value is 0.000.

The difference between comparison three is more in compared to comparison one and

After finding the results we see that as age is increasing the value of KOOS score is decreasing subsequently.

## DISCUSSION

The current study focused on various aspects of knee injuries, including awareness and occurrence among female college students. Previous research conducted among university students in Delhi, India, reported a 13.5%

prevalence of knee injuries [27]. Another study conducted by the University of Central Lancashire, Preston, showed that 31.8% of students were suffering from knee pain [17]. Females undergo several physical changes after reaching puberty, and hormonal changes often necessitate lifestyle adjustments. Most injuries are associated with a lack of aerobic activity in daily routines, indicating that a sedentary lifestyle increases the risk of sports-related injuries. Moderate to vigorous aerobic exercises are essential for the adult population to maintain a healthy lifestyle. The most frequent complaint reported was knee discomfort, followed by swelling, cracking sounds, and a catching sensation in the knee. Only about half of the students who experienced injuries sought medical attention, with the most common diagnosis being contusion, often accompanied by meniscus or ACL injuries. In the USA, football-related knee injuries are most frequently caused by sprains [31, 19, 35, 24]. The present study aimed to determine the prevalence of knee injuries in young females using the Knee Injury and Osteoarthritis Outcome Score (KOOS) scale. Data analysis revealed that Group 1 (ages 18–20] had the highest KOOS scores, indicating that their knees were in good condition and that they had a lower risk of knee injury. As age increased, KOOS scores decreased, suggesting that knee condition deteriorated with age and the prevalence of knee injuries increased accordingly. Warming up and stretching exercises were the most commonly cited methods for managing sports-related injuries in our study population. Approximately one-third of individuals with knee problems performed warm-up exercises before engaging in sports activities. However, there was no significant difference in injury rates between those who performed warm-ups as a precautionary measure and those who did not.

## CONCLUSION

Knee injuries are among the most common injuries in our society. Among various sports, soccer is the most prominent sport associated with knee injuries. These injuries are often treated conservatively. There is a need to raise awareness about proper footwear usage and the importance of aerobic exercise training. Many females are unaware of the structure and function of the knee joint. To prevent such injuries, proper training is essential. Performing warm-up and stretching exercises before starting, and cool-down exercises after finishing a game or physical activity, are highly effective in preventing knee injuries. Further research is needed to determine the frequency and causes of knee injuries in females.

## ACKNOWLEDGEMENT

I extend my deepest gratitude to my supervisor, Professor Megha Yadav, for her unwavering support and insightful critiques throughout my research journey. Her deep commitment to academic excellence and meticulous attention to detail have significantly shaped this dissertation. constructive feedback and essential suggestions that enhanced the quality of my work. My appreciation also goes to the faculty and staff in the Department of Physiotherapy, whose resources and assistance have been invaluable. Their collective wisdom and encouragement have been a cornerstone of my research experience. Finally, my sincere thanks to the technical staff whose expertise in managing data was crucial for my experiments. Their patience and readiness to assist at all times have left a profound impact on the completion of my project.

### FUTURE SCOPE OF STUDY

By giving treatment, stretching and strengthening exercises we can prevent the frequency of knee-injury.

### CONFLICT OF INTEREST

None

**ABSTRACT**

This paper examines a Markovian queueing system with limited capacity, where both arrival and service rates depend on the system's state. In this article, a mathematical model to study a single server queueing model system with finite capacity with reneging is introduced. Assumed that patients may leave the queue if waiting time surpasses certain limit. This model is defined using infinitesimal generator matrix for analysis, a group generalized inverse of an infinitesimal generator is used. Using the group generalized inverse, steady state probabilities ar obtained analytically. Performance measures are derived and a few numerical examples are given.

**Keywords:** Finite capacity Markovian queueing system, Single server, Queueing Discipline, State-dependent rates, Infinitesimal generator matrix, Group generalized inverse, Steady state probabilities, and Performance measures.

## INTRODUCTION

Queueing systems provide a good framework for efficient design and analysis of practical situations. Along with other assumptions, it is customary to consider approach and assistance rates are constant. However, in many practical situations, approach and assistance rates are state-dependent. The assumption of independence and approach and assistance rates in an M/M/1 system can be relaxed to the extent of making apiece of the state-dependent rates, that is $\lambda_n$ and $\mu_n$ respectively (Cox and Smith (1961)). In this study, we focus on a finite capacity

single server queueing system with reneging. The queueing system comprises a single server that servers custromers arriving at different rates and requesting service with reneging. Reneging is a significant factor affecting the efficiency of queueing systems. It occurs when individuals decide to leave the queue before receiving service, often due to prolonged waiting times. The dynamics of the system and patient satisfaction may be greatly impacted by this behavior. Accurately evaluating the system's performance and putting into practice efficient patient flow management techniques. Reneging plays a crucial role in influencing the effectiveness of queueing systems. This phenomenon occurs when people opt to exit the queue before being served, typically due to extended wait times. The queuing system comprises a single server that serves patients arriving at different rates and requesting service with varying service rates. However, the system's capacity is limited, meaning it can only accommodate a finite number of patients simultaneously. The primary aim of this study is to create a mathematical model that incorporates both the limitations of finite capacity and the behavior of patients who renege. Through this approach, we seek to evaluate the system's performance across various arrival and service rate conditions and to examine how reneging affects the system's overall efficiency. To achieve this, we will derive the steady-state probabilities and performance metrics for the queueing system, including the average number of patients in the queue, the average waiting time, and the probability of reneging. Additionally, we will conduct simulation experiments to study how variations in the system parameters influence queue dynamics and patient behaviour.

Some special cases that received considerable attention based on physical situations in the literature are

$$\lambda_i = \begin{cases} i\lambda, & i > 0 \\ \dfrac{\lambda}{i+1}, & i \geq 0 \end{cases} \tag{1}$$

$$\mu_i = \begin{cases} i\mu, & i \geq 1 \\ \mu, & i \geq 1 \end{cases} \tag{2}$$

## LITERATURE REVIEW

Notable references are Conway and Maxwell(1961), Harris (1967), Scott(1970), Natvig(1973), Hadidi(1974), Conolly(1975), Boxma *et.al*(2005), Kalyanaraman and Pattabiraman (2011) and Kalyanaraman and Sundaramoorthy (2019). In queueing theory, the majority of studies focus on systems with unlimited waiting lines. However, in many practical queueing scenarios, the capacity of the waiting line is limited. In models where the waiting area is restricted, incoming patients will exit the system if the queue is at full capacity. This type of model is referred to as a loss model, a concept first explored by Erlang in 1917. Some more works in this line are Fortet (1948), Vaulot (1954), Takacs(1969), Jagerman (1974), Harel (1987), Berezner *et al.*,(1995) and Kalyanaraman and Pattabiraman (2010). A queuing system involves the interaction between a service user and a service provider. In real-world scenarios, consumer behaviors such as balking and reneging are common in these systems. Due to impatience, consumers might decide not to enter the queue (balking) or to leave the queue after joining it (reneging) without receiving the service. Numerous researchers study queuing systems that account for impatient behaviors like reneging, balking, and jockeying, as these actions impact the system's overall performance. Reneging occurs when patients experience prolonged waiting times or perceive the queue as too slow-moving, leading them to leave the queue before receiving service. In a queuing system, patients s arrive at a service facility and join a waiting line (queue) to receive service. As waiting times grow longer, some patients may become dissatisfied with the service process and decide to leave the queue. This behavior, known as reneging, can be shaped by several elements, including how quickly they believe services are being delivered, the size of the queue, personal preferences, and the urgency of their needs. Reneging has notable consequences for the performance of the queuing system, influencing average patient wait times, how effectively the service facility is utilized, and the overall efficiency of the system. Understanding and modelling reneging is critical for service providers to optimize resource allocation, manage patient expectations, and design strategies to reduce reneging rates. To analyze the properties of the proposed model, we apply the approach of group

generalized inverses. The notion of a group inverse for square matrices was first introduced by Hunter (1969), who showed that the rank of matrix GGG is identical to the rank of its square. The use of group inverses has been widely studied in earlier works, such as those by Adi-Ben Israel and Greville (1974), Boullion and Odell (1971), and Campbell and Meyer (1979). Meyer (1975) further developed a procedure for determining the group inverse of an infinitesimal generator in mmm-state ergodic processes, which allowed for the computation of the system's stationary probability vector. Moreover, Kemeny and Snell (1960) as well as Hunter (1969) examined the mean first passage time matrix for mmm-state ergodic processes, providing valuable insights into system dynamics. In this research, we extend the application of the group generalized inverse method to evaluate the effects of reneging behavior within a finite-capacity Markovian queuing system. Our focus is on examining how the likelihood of patients leaving the queue influences system stability, average waiting durations, and service utilization levels. By incorporating state-dependent arrival and service rates, the model seeks to more closely represent practical, real-world conditions.

## METHODOLOGY

Let $\{(X_i, Y_i), i \geq 0\}$, a Markov process on the state $S = \{(i, j) : 0 \leq i \leq N, 1 \leq j \leq a_i\}$ with the following block tridiagonal infinitesimal generator

$$\boldsymbol{Q} = \begin{pmatrix} B_0 & A_0 & 0 & \cdots & \cdots & 0 & 0 \\ C_1 & B_1 & A_1 & 0 & \cdots & 0 & 0 \\ 0 & C_2 & B_2 & A_2 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \ddots & \vdots & \vdots \\ \vdots & \vdots & \vdots & \ddots & \ddots & A_{N-2} & 0 \\ 0 & 0 & 0 & \cdots & C_{N-1} & B_{N-1} & A_{N-1} \\ 0 & 0 & 0 & \cdots & 0 & C_N & B_N \end{pmatrix}$$

Let $B_0, B_1, \ldots, B_N$, be square matrices of order $a_0, a_1, \ldots, a_N$, respectively. Their diagonal entries are strictly negative, while all other elements are non-negative. The matrices $A_0, A_1, \ldots, A_{N-1}$ and $C_1, C_2, \ldots, C_N$,are rectangular in shape and contain only non-negative values. Furthermore, each row of Q, sums to zero.

That is

$B_0 e + A_0 e = 0$

$C_i e + B_i e + A_i e = 0 : 1 \leq i \leq N - 1,$

$C_N\, e + B_N e = 0$

Where **e** denotes element 1 each of the column matrix.

To derive the stationary probability distribution, it is helpful to consider the following realization of the Markov chain. Observe the process during the interval of time spent at the level n, before the original process enters the level n+1 for the first time. Let $P_n$, represent this realization of the process, whose state space is $S_n = \{(n, j) : 1 \leq j \leq a_n\}$,. Each $P_n, 0 \leq n \leq N$, corresponds to a transient Markov chain. Meanwhile, the process $P_N$, with state space $S_N = \{(N, j) : 1 \leq j \leq a_N\}$, serves as the realization of process $P_n, 0 \leq n \leq N$, and forms an ergodic Markov chain. Let $W = (w_0, w_1, w_2, \ldots, w_N)$, denote the infinitesimal generator associated with process $W_n$,.

**Implementation**

**Algorithm**

Based on the method described in the above section the following algorithm is to find the analytical solution for the model defined.

**Step:1** Write $R=\begin{pmatrix} U & c \\ d' & \alpha \end{pmatrix}$ where $R= -Q$ , U is $(m-1)\times(m-1)$ matrix.

**Step:2** Check the rank of $R$ = rank of $R^2$ , if it is true $R^{\#}$ exists.

**Step:3** Calculate $\beta = 1 - h'j$ where $\beta$ is nonzero

**Step: 4** Calculate $W'=\frac{1}{\beta}[-h',1]$

**Model**

The queuing model examined in this study consists of a single-server system with a finite waiting capacity of size N. Arrivals occur according to a Poisson process with rate $\lambda_i$, while the service times of consecutive patients are assumed to follow an exponential distribution with rate $\mu_i$ , where i denotes the number of patients present in the system at the time of arrival and service.

In the reneging model, we extend the previous system by believing the possibility of patients leaving the queue prematurely due to impatience [21] [22] [23]. If a waiting patient finds at least two patients before waiting for him, he may become impatient and leave without getting service, that is, reneging from the system. It has been assumed that $r\Delta t$ is the 1st-order probability that a patient will renege in the time interval $(t,t+\Delta t)$. The reneging model introduces a new dimension to the analysis of the queuing system, as it considers not only the arrival and service processes but also the patient's behavior. The likelihood of reneging depends on several factors, including the rate of arrivals, the speed of service, and the length of the queue.By incorporating the reneging behavior, the queuing model becomes more realistic and supplies effective visions for patient satisfaction, queue management, and resource allocation. Analyzing the reneging model helps service providers understand how patient impatience affects the queuing system's performance and allows for the development of strategies to reduce reneging rates and enhance overall system efficiency.

**The Analysis**

The model defined in the article can be identified using the above construction [21] [22] [23] . For a solution, a technique of group inverse is adopted (Kalyanaraman and Pattabirman (2020)).The Markov chain is $\{(X_i, Y_i), i \geq 0\}$ with state space $S = \{(i,j) : 0 \leq i \leq N, j = a_0, a_1, a_2\}$

$R=\begin{bmatrix} U & C \\ d' & \alpha \end{bmatrix}$, $R = -Q$

The [ ] matrix is.

$$Q = \begin{bmatrix} -\lambda_0 & \lambda_0 & 0 & 0 & \cdots & 0 & 0 & 0 \\ \mu_1 & -(\lambda_1+\mu_1) & \lambda_1 & 0 & \cdots & 0 & 0 & 0 \\ 0 & \mu_2+r & -(\lambda_2+\mu_2+r) & \lambda_2 & \cdots & 0 & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & \cdots & \mu_{N-1}+r & -(\lambda_{N-1}+\mu_{N-1}+r) & \lambda_{N-1} \\ 0 & 0 & 0 & \cdots & \cdots & 0 & \mu_N+r & -(\mu_N+r) \end{bmatrix}$$

where

$a_0 = \{0\}$ $a_1 = \{1,2,...,N-1\}$ and $a_2 = \{N\}$

$$U=\begin{bmatrix} \lambda_0 & -\lambda_0 & 0 & \cdots & 0 \\ -\mu_1 & \lambda_1+\mu_1 & -\lambda_1 & \cdots & 0 \\ 0 & -(\mu_2+r) & \lambda_2+\mu_2+r & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & \lambda_{N-1}+\mu_{N-1}+r \end{bmatrix}$$

$$c=\begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ \cdots \\ \cdots \\ -\lambda_{N-1} \end{pmatrix}$$

$$d'=\begin{bmatrix} 0 & 0 & 0 & \ldots & \ldots & 0 & -(\mu_N+r) \end{bmatrix} \text{ and } \alpha=[\mu_N+r]$$

We analyse the above model using the algorithm described in Section IV

$U^{-1}$ is given by,

$$U^{-1}=\left[U_{ij}\right]_{(N-1)\times(N-1)}$$

$$u_{ij}=\frac{1}{\lambda_{j-1}}\left[1+\frac{\mu_1}{\lambda_1}\left(1+\sum_{k=j}^{n-3}\prod_{l=j}^{k}\frac{\mu_{l+1}+r}{\lambda_{l+1}}\right)\right] \quad \text{for } i\leqslant j \tag{3}$$

$$u_{ij}=\frac{1}{\lambda_{j-1}}\left[\frac{\mu_1}{\lambda_1}\left(1+\sum_{k=j}^{n-3}\prod_{l=j}^{k}\frac{\mu_{l+1}+r}{\lambda_{l+1}}\right)\right] \text{for } i>j \tag{4}$$

$$W'=\frac{1}{\beta}(W_0, W_1, ..., W_N) \tag{5}$$

$$K=(\mu_1+\lambda_0)\prod_{j=2}^{N}(\mu_j+r)+\sum_{k=1}^{N-1}\left[\prod_{j=0}^{k-1}\lambda_j\prod_{j=k+2}^{N}(\mu_j+r)\right]+\prod_{j=0}^{N-1}\lambda_j$$

$$\beta=\frac{1}{\prod_{j=0}^{N-1}\lambda_j}\left[(\mu_1+\lambda_0)\prod_{j=2}^{N}(\mu_j+r)+\sum_{k=1}^{N-1}\left[\prod_{j=0}^{k-1}\lambda_j\prod_{j=k+2}^{N}(\mu_j+r)\right]+\prod_{j=0}^{N-1}\lambda_j\right] \tag{6}$$

$$W_0=\frac{1}{K}\left[(\mu_j+\lambda_0)\prod_{j=2}^{N}(\mu_j+r)\right] \tag{7}$$

$$W_j=\frac{1}{K}\left(\prod_{j=0}^{k-1}\lambda_j\prod_{j=k+1}^{N}(\mu_j+r)\right) \tag{8}$$

$$W_N=\frac{1}{K}\prod_{j=0}^{N-1}\lambda_j \tag{9}$$

**Some Performance Measures**

We present some performance measures related to the model discussed in this article.

1. The average no. of clients is $L=\sum_{i=1}^{N} iW_i$

2. The probability of the server being idle is $W_0$

The blocking probability $p_\beta = 1 - W_i$

**Numerical Analysis**

We look at three details about the models in section III (represented by Models I, II, and III). In this investigation, we take $\lambda_i = \frac{1}{i+1}, \mu_i = \frac{1}{2i}$

**Model I**: $M^{(i)}/M^{(i)}/1/5$

$\mu_1 = 0.5, \mu_2 = 0.25, \mu_3 = 0.167, \mu_4 = 0.125, \mu_5 = 0.1$ Reneging rate r = 1 / 2 = 0.5

$\lambda_0 = 1, \lambda_1 = 0.5, \lambda_2 = 0.333, \lambda_3 = 0.25, \lambda_4 = 0.2$

$$R = \begin{pmatrix} 1 & -1 & 0 & 0 & 0 & 0 \\ -1 & 1.5 & -0.5 & 0 & 0 & 0 \\ 0 & -0.75 & 1.083 & -0.333 & 0 & 0 \\ 0 & 0 & -0.667 & 0.917 & -0.25 & 0 \\ 0 & 0 & 0 & -0.625 & 0.825 & -0.2 \\ 0 & 0 & 0 & 0 & -0.6 & 0.6 \end{pmatrix}$$

$$U^{-1} = \begin{pmatrix} 57.079 & 56.079 & 36.053 & 16.5 & 5.0 \\ 56.079 & 56.079 & 36.053 & 16.5 & 5.0 \\ 54.079 & 54.079 & 36.053 & 16.5 & 5.0 \\ 49.574 & 49.574 & 33.05 & 16.5 & 5.0 \\ 37.556 & 37.556 & 25.038 & 12.5 & 5.0 \end{pmatrix}$$

Rank of (R) =rank ($R^2$) = 5

$d' = (0 \quad 0 \quad 0 \quad 0 \quad -0.6)$

$h' = (-22.5336 \quad -22.5336 \quad -15.0228 \quad -7.5 \quad -3)$

β = 71.56

$W' = (0.316 \quad 0.316 \quad 0.210 \quad 0.105 \quad 0.042 \quad 0.014)$

$L = 1.289, \quad W_0 = 0.316, \quad p_\beta = 0.986$

**Model II**: $M^{(i)}/M^{(i)}/1/6$

$\mu_1 = 0.5,\ \mu_2 = 0.25,\ \mu_3 = 0.167,$

$\mu_4 = 0.125,\ \mu_5 = 0.1,\ \mu_6 = 0.083,$

$\lambda_0 = 1,\ \lambda_1 = 0.5,\ \lambda_2 = 0.333,$

$\lambda_3 = 0.25,\ \lambda_4 = 0.2,\ \lambda_5 = 0.1667$

Reneging rate r = 1 / 2 = 0.5

then,

## CONCLUSION

This study introduces a finite-capacity Markovian queuing model with reneging, motivated by queuing scenarios in healthcare systems. The model is formulated through an infinitesimal generator matrix, and its analysis employs the group generalized inverse of this matrix. By applying this method, the steady-state probabilities are derived analytically. Based on these results, various performance measures are evaluated. In addition, the paper presents selected numerical examples to highlight the practical relevance of the proposed model.

**ABSTRACT**

The current research outlines the findings from testing flat ferrocement panels enhanced with varying numbers of wire mesh layers and differing panel thicknesses. The primary aim of these experimental tests is to investigate how varying the number of wire mesh layers and thickness affects the flexural strength of flat ferro cement panels, as well as to evaluate the impact of different wire mesh layer counts on the ductility and ultimate strength of this kind of ferrocement structure. In this research, the specimens were categorized into four groups to examine the strength and behavior of ferrocement flat panels under two-point loading. The employed quantity of wire mesh layers includes one, two, three, and four layers; panel thicknesses are also 20mm, 30mm, and 40mm.

## INTRODUCTION

Ferro cement, also known as ferro-cement, is a method of applying layers of metal, such as chicken wire, woven or expanded metal (iron) mesh or fibers, and sometimes closely spaced small-diameter steel rods, like rebar, to reinforced mortar or plaster (lime or cement, sand, and water). It is used to create comparatively thin, robust, and rigid structures in a variety of shapes for uses like water tanks, boat hulls, and shell roofing. Reinforced concrete has

its roots in ferro cement, which was developed in France in the 1840s. It has a wide range of additional uses including sculpture and prefabricated building components. Other composite materials, including some that don't contain any cement or ferrous element, have been referred to as "Ferro cement" by extension.

The way the reinforcing components are distributed and placed is the main way that ferro cement, a type of reinforced concrete, varies from traditional reinforced concrete. It is made up of several layers of tightly spaced mesh or fine rods that are entirely embedded in cement mortar. A composite material is created that reacts differently from traditional reinforced concrete in terms of strength, deformation, and possible uses; as a result, it is categorized as a unique material. Ferro cement reinforcement, in contrast to traditional concrete, can be constructed into the final shape that is desired, and the mortar can be plastered in place without the need for formwork.

**Uniqueness of Ferrocement**

Ferro cement is a thin building material that uses rich cement mortar and has a thickness of 10–25 mm (3/8–1 in.). It does not use coarse aggregate, and its reinforcement is made up of one or more layers of continuous, small-diameter steel wire or weld mesh netting. It uses little to no formwork and doesn't require specialized labor for casting. The wire mesh reinforcement just below the surface of ferro cement absorbs the cracking stresses, preventing the cement matrix from cracking. Ferro cement is being investigated as a building material to replace stone, brick, RCC, steel, pre-stressed concrete, and wood. It is also being investigated as a structural component for walls, floors, roofs, beams, columns, slabs, water and soil retaining wall structures, and window and door frames.

**Characteristics of Ferrocement**

Even in the most impoverished societies, ferro cement is a high-quality structural material that may be used for a variety of construction applications due to its straightforward composition and manufacture. It is in some ways more advanced than pre-stressed concrete, but it is by no means a lower-quality product designed for low-cost applications. A freestanding wire mesh frame that is mortared in situ on the job site is typically used with ferro cement. The required shape (domes, simple curves, or complicated curves) is created from the wire mesh.

**Ferrocement for Low-Cost Roofing**

The panel concluded that ferro cement might be a suitable material for low-cost roofing in developing countries. This area must be carefully considered for field testing and techno-economic study by technical assistance organizations and applied science labs in developing countries. The essential element of sufficient shelter, which is a basic human need, is a roof. However, the materials currently on the market are insufficient to meet the demand for roofing. Housing shortages caused by internal migration, population growth, and occasionally natural calamities and war plague the world's more than 80 developing countries. For most dwellings in developing countries, the largest expense is a strong roof. Roofs made with cheap local materials, such as thatch, scrap metal, or earth products (rock, mud, and sand), are usually temporary and hazardous. A secondary concern is the need for adequate and durable supporting structures. Roofs made with cheap local materials, such as thatch, scrap metal, or earth products (rock, mud, and sand), are usually temporary and hazardous. A secondary concern is the need for adequate and durable supporting structures.

**Cracking Behaviour of Ferrocement**

Ferro cement is distinguished by its increased resistance to cracking; compared to reinforced concrete, ferro cement cracks are more numerous and thinner. However, the elements will break if there are persistent overloads or structural settlement, which will impact the ferro cement panels' structural action and necessitate a replacement or structural overlay. When there are several voids in the internal layers, delamination can occasionally happen at or close to the neutral axis upon impact or flexure.

**Ferrocement Construction Process**

Ferro cement has been used as thin structural elements in many different applications, from engineered structures to architectural applications (Paramasivam, 2011). These applications include sheets, boards, shells, hulls, sandwich

type construction using thin skins, and constructions where the development of very fine crack widths, improved water permeability, and reduction of self-weight are crucial.

**Mould Preparation**

Steel mold: If the steel mold used to make concrete pipe is readily available, it can be used to make roofing channels. Alternatively, it can be used to make expensive steel molds for channels that need to be cast.

**Mud mold:** This type of permanent, fixed structure is constructed in the shape of a roofing channel using mud and bricks. The entire structure is covered with cement mortar that is roughly 10 mm thick once the correct shape has been prepared. Proper curing is necessary to prevent cracks during the roof channel casting process. Sand paper is used to wipe the whole surface of the mold throughout the construction's curing processand coated with engine oil this procedure is repeated until the cement stops absorbing the oil.

**Steel and Mesh Preparation**

The two bottom steel rods have a thickness of 8, 10, or 12 mm. It varies based on the channel's span and load. Steel rods with a thickness of 6 or 8 mm are utilized on top. Binding wire is used to secure weld mesh and chicken mesh longitudinally to the steel rods. The following materials make up the steel reinforcement utilized in the ferro cement roof channel:

- Two bottom steel rods with a thickness of 8, 10, or 12 mm. The span of the channel and the load it must support determine how the two bottom rods are adjusted. One 6 mm thick top steel rod or two 4 mm GI steel wires. At both ends of the roof channel are two cross layers of GI mesh (1/2" x 22 gauge x 3") and one longitudinal layer of GI hexagonal wire mesh (12 mm x 071 mm x 0.90 m).
- The steel rods are cut to the proper size and straightened.
- If needed, a steel rammer is used to evenly flatten the mesh once it has been cut off from the roll to the required length.
- The steel rods are positioned on top of the stretched mesh. the top steel rod in the center and the two bottom rods on the outside. Binding wire is used to fasten the steel rods to the mesh.

**Casting Procedure**

The mud mould is coated with a layer of waste engine oil.

- A 0.45:1:2 ratio of water to cement sand is used to make the entire amount of mortar mix that is needed. The mud mold that has already been coated with the leftover motor oil is covered with the first layer of the cement mixture.
- This layer of cement should cover the entire surface of the mud mold and be around 5 meters thick. To avoid spreading cement mortar combined with previously applied waste oil, some caution and training are required. It is important to learn how to apply the first layer directly and correctly.
- It is best to discard areas where the oil and cement mortar got mixed up. The first layer of cement mortar is covered with the steel and mesh frame that has been prepared.
- Several irregular lines (serrations) are made on the lower portion of both sides of the roof channel in order to facilitate the bonding process with a concrete mix while joining the channels together.
- In case the roof channel is used as a roof, some final polishing is done with the mason trowel. This is not necessary in case the roof channel is used as a floor or filled up for heat insulation.
- The last and second coat of cement mortar is applied to the steel framework. Using a template is useful at this step to maintain a consistent thickness across the ferro cement roof channel.

**Demoulding Procedure**

The roof channel is demoulded after 48 hours (those with more handling expertise may even attempt to demould the very following day). To do this, the mud is removed from the carefully designed small crevices in the bottom of the mould, which provide an easier grip during the demoulding process. Using the spaces directly beneath the element's border, one side of the roof channel is gently raised, the other side is raised, and the entire channel is then moved to the curing area.

**Installation Procedure**

• The channels should be handled carefully, and there should be enough personnel to lift them. Typically, two individuals per running meter are adequate.

• Small scaffolding is typically used to assist in lifting on top of the wall. The building's floor and roof dimensions are determined by the roof channel's measurements. Calculations are made to account for the space between the channels during installation.The channels are positioned adjacent to one another, and the 1:2:4 concrete mix is poured into the valley between them before finishing is completed.

• Since the structure must serve as a roof, adequate curing practices or methods should be used for at least seven days. The most crucial part of this process is properly curing the linked channels.When it comes to floor application, the entire floor structure is surrounded by a brick border whose height corresponds to the overall filling's selected thickness.

•Conduit pipes for power can also be laid in the valleys before they are filled.

• Cement plaster or tiles should be used as the final layer, and it is advised to include a rainwater slope for drainage.

Leaks and cracks are caused by improper curing. They are a minor financial catastrophe and require energy-intensive repair methods. The best and least expensive solution is still to do it correctly the first time. When it comes to floor applications, the height of the brick border that surrounds the entire floor structure is determined by the thickness of the overall filling that is selected.

**Pre-Cast Ferrocement Channels**

FC Channels are pre-cast shell units reinforced with a continuous layer of chicken mesh and steel bars at both ends. They are made using rich cement mortar (1:2 to 1:3). These shell modules are either manually cast on a masonry mold or mechanically cast on steel molds fixed on a table vibrator. Either load-bearing masonry or a steel or RCC frame structure supports the ends of the channels.

**Restraining Beams**

The thrust of the neighboring channel balances any lateral motion and deflection of the FC channel. In the event of any instability in the support structure, restraining beams must be installed to prevent differential movement of the FC roof and balance the channel movement at the ends. Particularly in disaster-prone areas, the restraining beam will be a component of the RCC bands needed for structural strengthening.

**Concrete Filling**

Concrete infill of at least M15 grade (1:2:4) set to a thickness of 150 mm is used to unite the channels once they have been positioned side by side. This concrete completes the FC Channels' T-beam structural activity and produces a simple roof. If there is an intermediary floor, the rest of the valley can be filled with lightweight material, brick jelly lime concrete, or lean concrete before a floor is installed.

**Structural Applications**

- Ferro cement can be applied to a variety of structural components that are subjected to different kinds of stresses. Ferro cement can be used to cast hollow columns with horizontal stiffeners as a compression member.
- Ferro cement can be used to encase columns or walls made of concrete, RCC, stone, or brickwork to increase their strength due to confinement.
- Members that are subjected to membrane stresses, such as shells, domes, or pyramids, can be cast in ferro cement very easily. Because ferro cement is a homogenous material, the entire section of the member is used to resist the membrane stresses.
- Ferro cement could be used more frequently in water-retaining structures and other comparable structures where crack width is a design criterion.
- Ferro cement offers excellent leakage characteristics for applications in water tanks due to its superior extensibility and very small crack widths under service load. Additionally, if pressure increases, ferro cement stretches to allow higher leakage and acts as a safety valve, preventing failure.

- Only in the past 20 years has ferro cement construction become widely used, and its utilization is still relatively new. Insufficient long-term experience with ferro cement structures has been gathered and examined to evaluate the effectiveness of the structures that have already been constructed.
- Boats, silos and tanks, and roofing are the three principal uses of ferro cement construction.
- Ferro cement exhibits excellent cracking behavior and a very high tensile strength-to-weight ratio. Ferro cement may therefore be a desirable material for boats, barges, mobile houses, or other moveable structures that need to be lightweight, impact-resistant, and waterproof.
- Even if ferro cement is more efficient pound for pound, it is less expensive to construct big structures using traditionally reinforced concrete; building components that are rarely moved place only a small premium on lightness in weight. This is particularly true in industrialized nations, where ferro cement's use is restricted to specific applications because to its high material cost and labor-intensive nature.
- Geodesic domes, wind tunnels, roof shells, mobile homes, modular housing, tanks, and swimming pools are a few examples. Even for these uses, ferro cement is unlikely to be widely used in developed nations due to the convenient availability of mobile cranes and effective technologies for precasting, prestressing, and erecting reinforced concrete structures of any size. Ferro cement can successfully compete with steel or fiberglass laminates. Ferro cement is less expensive than steel for building wind tunnels and less expensive than steel or fiberglass for building hot water storage tanks, according to two recent feasibility studies.

**Roofing Applications**

- Flat or corrugated roofing systems are very common, and ferro cement seems to be an affordable substitute material for roofing.
- Ferro cement roofing materials can be made in-situ in villages or mass-produced in prefabricated form in factories, which is best suited to the concentrated demands of urban areas.
- It is well known that hundreds of ferro cement roofs were built for impoverished areas of India; the majority of these roofs were dome-shaped and had a span of 3 to 6 meters (10 to 20 feet); large ferro cement roofs measuring 17 meters (56 feet) and a thickness of 30 mm (1.2 inches) were also built in Italy.
- Many European and South American nations have found success using ferro cement as roofing for wide span structures with internal ribs. In Jordan, domes with internal ribs have been built using ferro cement that is 25 mm (1 in) thick.
- Extreme Structural Strength: Because of the monolithic body and flawless homogeneity
- Light Weight: Compared to RCC, it is thinner and lighter, making it easier to handle and erect.
- Completely waterproof: There are no leaks or slippages. Not even perspiration or moisture are present. Perfect for moisture-resistant and water-retaining constructions.
- Endearing insulation is significantly less conductive than RCC and steel. Thus, warm in the winter and cool in the summer. minimal condensation.
- Long durability: keeps getting stronger, especially when in touch with moisture or water. nearly eternal life.
- Jointless structure: Due to its single-bodied, monolithic design, it lacks joints.
- Thus, there is no possibility of opening up.
- Outstanding resistance to explosions and fire: nearly total fire resistance. No effect has been observed at temperatures as high as 170 degrees Celsius.
- No maintenance: There is no ongoing cost or inconvenience. Build, erect.

**Need for Repair of RCC Structures**

Cracking (caused by poorly constructed joints, inadequate compaction, segregation, poor curing, and high water content) and spalling (caused by corrosion in the reinforcing bars hastened by inadequate cover) are some of the main causes of the degradation of RCC structures. The internal corrosion of the steel reinforcement used in RCC elements may be facilitated by the development of cracks in the concrete as a result of improper structural design or low-quality materials. Over time, the cracks deepen due to increased corrosion, which causes the concrete to peel or spall.

**Ferrocement Repair Techniques**

According to Jumaat et al. (2006), a well-executed repair boosts the functionality and performance of structures, restores and increases their strength and stiffness, improves the appearance of the concrete surface, provides water tightness, and keeps hostile species from penetrating the steel surface. In RCC constructions, ferro cement repairs and rehabilitation can strengthen columns, beams, and slabs by up to 30% and help prevent crack formation. Ferro cement, which can be produced using non-formwork construction methods, has a number of advantages over other repair and strengthening methods, including increased toughness and crack resistance, quick construction without the need for heavy machinery, minimal additional weight, and cost-effectiveness when it comes to rehabilitation and general applications.

**Ferrocement Repair Methodology**

The primary reinforcement in slabs, beams, columns, and stirrups—where appropriate cover is not maintained and reinforcement is exposed in the cover area—is often where corrosion of RCC structures occurs. To restore the original strength of the RCC, patchwork repair can be applied using ferrocement to the damaged concrete surfaces in slabs, beams, and columns.

## CONCLUSION

Based upon the experimental test results of the ferrocement panels the following conclusions can be drawn:

- The flexural loads at first crack and ultimate loads depend on number of reinforcing mesh layers used in ferrocement panel.
- Increasing the number of layers of wire mesh from 2 to 4 layers significantly increases the ductility and capability to absorb energy of the panels. Increase in number of mesh layers improves the ductile behavior of ferrocement slabs.
- Increasing the thickness also affected the final breaking load for slab panels. Therefore, increasing the thickness of ferrocement panels from 20 mm to 50 mm significantly increases the ductility and capability to absorb energy the panels.
- Increase in thickness of slab panels and increase in mesh layer, central deflection of slab panel goes on reducing.

**ABSTRACT**

This paper delves into the critical issues surrounding rural healthcare accessibility in India, highlighting persistent disparities between urban and rural medical services. Conducted as part of a Community Connect initiative, the study is rooted in direct field engagement—surveys, interviews, and on-ground observations—to capture the lived experiences of rural residents, healthcare workers, and community leaders. Findings reveal a significant lack of infrastructure, a shortage of medical professionals, inadequate access to essential medicines and diagnostics, and low utilization of government health schemes despite widespread awareness. Cultural beliefs, economic hardships, and transportation barriers further hinder timely medical intervention. The report concludes with targeted policy recommendations focused on infrastructure development, health education, human resource allocation, and collaborative public-private models. It aims to inform stakeholders and drive strategic action toward building an inclusive and resilient rural healthcare ecosystem.

**Keywords:** medical, schemes, Cultural, economic, policy

## INTRODUCTION

Healthcare is one of the most fundamental pillars of human well-being, yet millions of people in rural areas continue to struggle with limited access to essential medical services. While urban centers are equipped with advanced hospitals, specialized doctors, and modern healthcare technologies, rural communities often rely on small, under-resourced clinics or traditional healers to meet their medical needs. The disparity between urban and rural healthcare systems is a long-standing issue that directly impacts the quality of life, life expectancy, and overall well-being of rural populations.

This report is an outcome of a Community Connect initiative that aimed to understand the realities of rural healthcare from a ground-level perspective. Rather than relying solely on secondary data and existing reports, we engaged directly with individuals living in rural areas—patients, healthcare workers, local authorities, and community members—to gain firsthand insights into their experiences, concerns, and challenges. Through surveys, interviews, and observations, we explored critical aspects such as the availability of healthcare facilities, the accessibility of doctors and medicines, the prevalence of diseases, and the level of awareness about preventive healthcare measures.

One of the most pressing issues uncovered through this initiative is the shortage of medical professionals in rural areas. Many villages lack even a single full-time doctor, forcing residents to travel long distances for even basic medical consultations. This not only delays treatment but also increases healthcare costs, making it financially burdensome for families who are already struggling with economic hardships. In some cases, a simple ailment that could have been treated with early intervention escalates into a severe condition due to the lack of timely medical attention.

Another major concern is the lack of proper infrastructure in rural healthcare centers. Many of these facilities suffer from inadequate medical supplies, outdated equipment, and an insufficient number of beds to accommodate patients. Emergency medical services, such as ambulances and trauma care, are often unavailable, leading to high mortality rates in cases of accidents, maternal complications, and other critical conditions. In addition to physical infrastructure, awareness and health education remain major gaps in rural healthcare. Preventable diseases such as malnutrition, tuberculosis, and waterborne infections continue to affect large sections of the rural population due to a lack of proper knowledge about hygiene, nutrition, and vaccination. Traditional beliefs and cultural practices also play a role in shaping healthcare-seeking behaviors, sometimes leading to delays in accessing formal medical treatment.

Despite these challenges, many rural communities have shown remarkable resilience and adaptability. The role of community health workers, self-help groups, and government schemes has been crucial in improving healthcare access at the grassroots level. Initiatives such as mobile medical units, telemedicine services, and awareness campaigns have made a noticeable difference in bridging the healthcare gap, although much work remains to be done. Through this report, we aim to highlight not just the challenges but also the potential solutions and policy recommendations that can help strengthen rural healthcare. The findings presented here reflect the voices of people who are directly affected by these issues, making it a crucial resource for policymakers, healthcare professionals, and organizations working toward equitable healthcare access. Addressing rural healthcare challenges requires a collaborative effort involving government bodies, NGOs, healthcare institutions, and local communities, and we hope that this study contributes to the ongoing discourse on building a healthier and more inclusive future for all.

## LITERATURE REVIEW

Banerjee [1] highlights that India's aging population faces significant healthcare disparities, particularly between rural and urban areas. Studies highlight that urban elderxly have better healthcare access due to higher economic status, education, and infrastructure, while rural areas struggle with limited facilities and financial constraints. Research confirms a strong link between socio-economic factors and healthcare utilization, with education and income explaining a major part of the disparity. Addressing this gap requires strengthened public healthcare, increased investment, and social security measures to ensure equitable access for all. Healthcare in rural India is shaped by a diverse mix of providers, with informal practitioners playing a dominant role. A study across 1519 villages by Das et al. [2] revealed that while 75% of villages have at least one provider, 86% of them operate in the private sector, and 68% lack formal medical training. Interestingly, the quality of care varies significantly across states, and formal qualifications do not always guarantee better medical knowledge. Wealthier regions tend to offer higher-quality care at lower costs, highlighting disparities in medical education and healthcare markets. Community

Health Workers (CHWs) play a crucial role in rural India's healthcare system, bridging the gap between medical services and underserved populations. Kalne et al. [3] highlight that key frontline workers provide promotive, preventive, curative, and rehabilitative healthcare. Studies highlight their effectiveness in improving maternal and child health while being a cost-effective alternative to trained medical professionals. However, their performance depends on factors like training, incentives, and workload. Strengthening their role is vital for enhancing primary healthcare accessibility in rural India. Kumar &Shobana [4] emphasizedthat India's rural healthcare system is crucial for ensuring healthcare access to a large segment of the population, especially underserved communities. However, rural areas face significant challenges, including inadequate infrastructure, limited medical services, and disparities in health outcomes. Studies emphasize the need to assess the effectiveness of these schemes to guide future healthcare policies. Strengthening rural healthcare infrastructure and optimizing government programs remain key to improving health equity in India.

**Data Description**

The data for this research were collected through structured surveys and focus group discussions with individuals residing in rural areas. The dataset provides valuable insights into healthcare accessibility, affordability, quality of services, and the effectiveness of government health schemes.

**Survey Results**

The chart shows how healthcare service ratings vary by distance from the facility:

- Most poor ratings (15 cases) were given by individuals who live 1–5 km away from the facility.
- People living less than 1 km away gave a mix of average and poor ratings.
- Those living more than 10 km away provided only average ratings, with no poor ratings reported.

This suggests that moderate distance (1–5 km) is associated with the highest dissatisfaction, possibly due to accessibility issues or service expectations. Interestingly, individuals farthest from facilities didn't report poor ratings, which may reflect lower service usage or expectations.

**Healthcare Factor Correlations**

The heatmap reveals key relationships among healthcare factors:

- Distance and Poor Rating show a moderate negative correlation (-0.49), indicating that people farther from healthcare facilities tend to give poorer ratings.
- Distance and Staff Shortage have a weak negative correlation (-0.31), suggesting slightly better staff availability in distant areas.
- Poor Rating and Staff Shortage show a very weak positive correlation (0.085), implying a minimal direct relationship.
- Correlations involving Medicine Shortage are not shown, possibly due to insufficient or missing data.

Overall, distance appears to significantly influence patient perception, while staff and medicine shortages need further exploration.

**Staff Availability by Facility Type**

The chart indicates that government hospitals/clinics frequently face staff unavailability, with 10 respondents reporting that staff are never available. In contrast, private hospitals/clinics show better consistency, though their presence is limited. Some respondents also reported the need to travel to other villages or cities for staff support, especially when local government facilities are lacking in availability. This suggests a critical gap in staff presence, particularly in government-run facilities, impacting timely healthcare access.

## CONCLUSION

The survey underscores urgent systemic reforms to achieve equitable healthcare in rural areas. By addressing infrastructure gaps, enhancing trust in public systems, and empowering communities, policymakers can turn these insights into actionable progress.

## ABSTRACT

This study proposes a rule based Mamdani-type fuzzy modeling framework to examine the relationship between job strain, perceived stress and cortisol secretion patterns across the day. Unlike conventional data-driven approaches, the model integrates knowledge from published studies, expert opinions and existing datasets to define membership functions and rule sets. The system predicts fuzzy classification of cortisol responses (e.g., high/low secretion) and quantifies uncertainty using entropy and modified Hamming distance measures. Validation with teacher's participants revealed that high job strain is associated with elevated cortisol levels in the morning, but not with reduced variability throughout the day. The model highlights the moderating role of anger expression and offers a knowledge-driven predictive tool to assess stress-related health risks. By incorporating fuzzy logic, the framework addresses ambiguity in biological and psychological data and provides a flexible approach to stress-response modeling.

**Keywords :** Fuzzy Modeling, Fuzzy logic, Cortisol secretion, Stress, Hamming distance.

# INTRODUCTION

This work suggests a Mamdani fuzzy modelling scheme to validate the data obtained, as seen in figure 1. The rules are developed using a range of knowledge sources, such as databases and models that have already been published, current literature, expert opinion and intuition. A Mamdani-type model's result or outcome is represented as a fuzzy set. In order to assess the model's effectiveness, defuzzification methods such as the centroid, weighted average, maximum membership principle and mean membership principle are commonly employed to give a precise estimate of the outcome [12]. Depending on the shape of the output fuzzy set, defuzzification methods might not fully capture the output with the pertinent ambiguity associated with the forecast. Alternatively, an ordinal set representing a three-point fuzzy categorization (low and high) may be inferred from the output's real values. Distance measures might then be used to compare this ordinal set to the real fuzzy categorization. Moreover, the uncertainty around the expected fuzzy sets may be measured using entropy[5]. This study aimed to create generalized rule-based fuzzy models from various information sources in order to test the hypothesis that high job demands and low job control (job strain) are associated with higher free cortical levels early in the working day and less variability throughout the day. By comparing defuzzified outputs to real values from test data and comparing projected and actual fuzzy classifications, it also evaluated the part that rage expression plays in this pattern and evaluated its effectiveness. The whole approach taken in this study is shown in Figure 2. The procedure begins with knowledge collection and progresses to model creation and performance testing.In the context of fuzzy modeling, the proposed technique for converting the actual crisp value and the anticipated fuzzy output into fuzzy classification sets is not well-established in the literature.

**Mamdani-Type Fuzzy Modeling**

As systems get more complicated, fuzzy logic becomes an increasingly valuable modelling tool. There may be very little numerical data available for very complex systemsand only imprecise and ambiguous information and knowledge may be available. Fuzzy logic can be used to approximate interpolation between input and output circumstances [12]. The two main types of fuzzy modelling systems are the Takagi–Sugeno model and the fuzzy relational model. The Takagi–Sugeno scheme is a data-driven approach that builds membership functions and rules using a training data set. The rules and membership function parameters are then optimized to reduce training error. Each rule illustrates the link using a localized linear function [1]. The outcome is a weighted average of a set of different values. Each rule in the Mamdani scheme, a type of fuzzy relational model, is represented by an IF-THEN link.

It is sometimes referred to as a linguistic model because the antecedent and consequent are both ambiguous assertions [1]. The model structure is made by hand and the final model is neither trained nor optimized. A Mamdani model yields a fuzzy membership function based on the criteria established. Since this approach is not only reliant on a data collection, it is possible to generate a generalized model for precise future forecasts with sufficient understanding of the system in issue. Examine a simple fuzzy model of the Mamdani type that has one output and two inputs. The rule structure is shown in Figure 1A user-created IF-THEN rule is composed of each row of membership functions. The values used determine how much the input membership functions are activated. The output that each rule produces reflects this degree of activity. The consequence of superposing individual rule actions is a fuzzy set(Figure 1).

**Defuzzification Methods**

The fuzzy output is created by combining the outcomes of firing the rules. By using further defuzzification techniques on the fuzzy result, a crisp value is produced. We provide a brief overview of two widely used defuzzification strategies: area-based methods and maximal approaches. Several of these techniques are described by Ross[12].

**Maxima Methods**

The regions with the highest membership are identified by the maximum methods. The crisp value (Figure 2B) is the average of all the points with the highest membership or one of these points is selected as the defuzzified value (Figure 2A). The advantages of the maximal methods are their speed and ease of use. Since only maximal activation rules are considered, the main disadvantage is information loss.

**Area-Based Methods**

One popular area-based defuzzification method is the centroid approach. The output membership function point that splits the region in half is, as the name implies, the crisp value (Figure 2C). This method does not work, though, when the output membership function has non-convex characteristics. Depending on how the output's membership function is structured, defuzzification processes could not provide positive numbers for the expected output. However, the ambiguity is not captured by the mean-max membership method that was used to defuzzify the value. The centroid approach is limited when the output membership function is non-convex (Figure 2B).The defuzzified value has a low membership point. To overcome these limitations, a different approach to model validation is proposed. It uses a distance measure to compare expected and actual fuzzy classifications composed of three-point ordinal groupings.

**Distance Measures Between Fuzzy Sets**

An ordinal measure of dissimilarity The Hamming distance for two fuzzy sets A and B in the same universe is [14]. The definition of the Hamming distance (HD) is:

$$\mathrm{HD(A,B)} = \sum_{i=1}^{n} \left| \mu_A(x_i) - \mu_B(x_i) \right| \qquad \text{..... (1)}$$

where $\mu_A(x_i)$ is the membership of point $x_i$ in A and $\mu_B(x_i)$ is the membership of point $x_i$ in B, and n is the number of points that comprise the fuzzy sets A and B. Fuzzy sets that are more similar have a smaller Hamming distance than fuzzy sets that are less similar.

When comparing the actual fuzzy set to the expected fuzzy set, a small Hamming distance is ideal. The model-testing portion of our work included comparing the actual fuzzy classifications (low and high) with the anticipated ones. In terms of discriminating among categorization levels, the proposed distance measure performs better than the Hamming distance, as shown in Table 1. For the different expected fuzzy classifications in cases e and f, the Hamming distance (HD) was same. The proposed modified Hamming distance offered distinct values that sufficiently distinguish between both situations.

**Entropy of A Fuzzy Set**

A fuzzy set's fuzziness is measured by its entropy. The inability to distinguish between a fuzzy set and its complement is a measure of fuzziness. Entropy [7] for a fuzzy set A is computed as:

$$\mathrm{E(A)} = 1 - \frac{1}{n} \sum_{i=1}^{n} \left| 2\mu_A(x_i) - 1 \right| \qquad \text{.....(2)}$$

where n is the number of points that define A and $\mu_A(x_i)$ is the membership of point $x_i$ in A. In this work, the concept of entropy was used to quantify the uncertainty around the expected fuzzy outputs. In essence, entropy values are a measure of how confident one is in the outcomes that a fuzzy model forecasts in the absence of actual values.

**Proposed Distance Measure**

As stated in the theory section, a modified Hamming distance is recommended to enhance discrimination between different categorization levels (see to Tables 1 and 2). The definition of the suggested distance measure D(A, P) is:

$$D(A,B)=\frac{1}{4}\left(\sum_{i=1}^{n}\left|\mu_A(x_i)-\mu_B(x_i)\right|+\sum_{i,k=1(i\neq k)}^{n}(2(2|i-k|-1)\mu_A(x_i)\mu_P(x_k)\right) \text{.....(3)}$$

If A is the actual fuzzy classification and P is the expected fuzzy classification, n is the number of classes that define A and P, and $\mu_A(x_i)$is the membership of point $x_i$ in A and $\mu_P(x_k)$is the membership of point $x_k$ in P.

**Example**

A previously published study on the association between occupational strain and cardiovascular risk collected data over a 12-month follow-up period [13]. The original sample consisted of 162 instructors from junior and high schools. A work stress test (37) was used to select them, and they were categorized as either having low (32 men and 50 women) or high (28 men and 52 women) job strain scores of them, 77 (47.5%) worked in various administrative capacities, while 85 (52.5%) were classroom teachers. 137 instructors (84.6%) participated in the 12-month phase, which included ambulatory blood pressure monitoring, cortisol measurements and a mental evaluation (to be reported elsewhere). Seven were pregnant or extremely ill, one had equipment failure, seven did not respond to our offer, and ten of the twenty-five who did not participate at the 12-month point had retired or stopped teaching. Between the 137 participants and the 25 who dropped out of the study, there were no appreciable differences in gender, job strain scores, age, employment grade, or negative affect or angry expression scores. 15 additional participants out of the 137 refused to give saliva samples throughout the workday, mostly because they were worried that gathering data at school would be unpleasant or challenging. Again, statistical comparisons between these individuals and the others showed no differences in demographic or psychological traits.

Figures 3 and 5's fuzzy function is defined as

$$f(x)=\begin{cases}-5x+1.5, x\in[0,0.2]\\ 0.5x, x\in[0.2,0.4]\\ -x+0.9, x\in[0.4,0.7]\end{cases}$$

$$A_1(x)=\begin{cases}5x, x\in[0,0.2]\\ 2-5x, x\in[0.2,0.4]\\ 0, otherwise\end{cases}$$

$$A_2(x)=\begin{cases}5x-1, x\in[0.2,0.4]\\ -3.33x+0.33, x\in[0.4,0.7]\\ 0, otherwise\end{cases}$$

Corresponding Fuzzy diagram of given figure 3 and figure 5

Table 1: Comparing the fuzzy mean concentration of saliva free cortisol with the proposed modified Hamming distance l with the Hamming distance in groups with high and low job strain throughout the day and evening Three questions dealt with perceived job control (e.g., "I have freedom to decide what I do in my job"), four items dealt with skill utilization (e.g., "My job involves me in learning new things"), and three items indexed workplace requirements (e.g., "My job requires a very high pace of work"). A scoring system consisting of four points, from "strongly disagree" to "strongly agree," was employed for every problem. The score for each dimension ranged from 0 to a maximum of 10.

Job demands divided by (job control + skill utilization) equals job strain, according to the developed job strain index. A job strain score of 10 indicates that demands and control are perfectly balanced. while higher numbers imply strong demand combined with low control and skill utilization.

A working day at schools was used for the saliva sampling. Eight saliva samples were requested from the participants at 2-hour intervals, with a 30-minute window allotted for each sample. Before the saliva sample was collected, participants were instructed to abstain from food, caffeine, and citrus beverages for at least sixty minutes. Thus, 8:00 to 8:30, 10:00 to 10:30, 12:00 to 12:30, 14:00 to 14:30, 16:00 to 16:30, 18:00 to 18:30, 20:00 to 20:30, and 22:00 to 22:30 hours were the scheduled sample sequences.

After the investigators had explained the process, Schools were always the site of the day's first sample collection. Saliva samples were collected using salivates and stored at -30°C until analysis. A time-resolved immunoassay with fluorescence detection was used for triplicate analysis using 100 µl of the supernatant. after samples were defrosted and spun for five minutes at 3000 rpm. [3].

**Analysis of Mamdani Models**

The fuzzy inference systems were constructed using fuzzy logic [16]. Based on the information acquired from the various sources, membership functions were created for every input, output and ensuing rules were created for every model. The fuzzy inference method for suitable rule modifications was then demonstrated to the expert and membership functions. By comparing the actual and anticipated fuzzy categorization and defuzzifying the expected outputs to get clear values for correlating estimates with published values, the model's quality was assessed. It is suggested to compare the actual and expected fuzzy categorization using a modified version of the Hamming distance metric. The ambiguity related to the anticipated fuzzy outputs is described by an entropy measure. The current model demonstrated lower entropy than Rule Based Mamdani type fuzzy modelling, according to a comparison of the models.

## CONCLUSION

Early in the working day, job stress is linked to higher levels of free cortisol, but not to less cortisol variability. Individual traits may modify the effects of ongoing work-related stress on the hypothalamic-pituitary-adrenocortical system, as demonstrated by the connection to visible displays of anger. The two Mamdani-type models developed to predict the properties of the sample are summarized in Figures 3 and 5. The high and low job strain groups did not differ in terms of age, occupational grade, gender distribution, or cigarette smoking percentage. The components of job pressure, job expectations, job control, and skill use varied significantly between the groups. In contrast to the low job strain group, the high job strain group reported more expectations, less control, and lower skill utilization as inputs. Those experiencing high levels of job stress had significantly higher anger-in scores and bad affect. The anger-out scores of the groups were identical. To generate generalized models that were not specific to a given data set, membership functions and rules were developed using a range of information sources. In addition to correlation estimates of real and defuzzified predictions, another investigation was carried out that compared actual and predicted fuzzy classifications. A distance measure was used to compare fuzzy and actual classifications. A version of the Hamming distance, which is commonly used to compare fuzzy set distances, is the proposed metric. The Mamdani model is a knowledge-driven forecasting model that is uncommon in skill utilization, job demands, job control, and job strain and its components. This modelling method has the important advantage of enabling the use of entropy measurements to assess the uncertainty associated with future projections.

**ABSTRACT**

Riparian zone plays a valuable role in an ecosystem. In this study, analysis of floristic composition along the Narmada River using phytosociological attributes has been carried. A quadrat-cum transact approach was employed where12 quadrat of 30 x 30 sq. m. were laid out. 58 species belonging to 33 families was recorded form the study area. The study revealed varying species density and distribution pattern across different vegetation layer, with some species dominating each layer. *Tectona grandis* was most densely distributed species out of 23 tree species. In herbaceous layers *Mesosphaerum suaveolens* was dominant while *Hemidesmus indicus* was dominant among shrub and climber layer. The alpha diversity of the riparian flora indicated a relatively good status of species richness and diversity. The distribution pattern of the tree and herbaceous species showed clumped nature whereas shrub and climber layer exhibited a regular distribution. To further understand the interactions between various vegetation layers, a dendrogram and cluster analysis were conducted to determine the similarity index. The research can be useful in assessing the current state of riverine areas and identifying species used for propagation.

**Keywords:** Phytosociological Attributes, Riverine Area, Narmada River.

## INTRODUCTION

Rivers have been closely associated with culture and history since the beginning of human civilization [1]. In the Indian subcontinent, a massive network of river spans approximately 1,953 km² in total annual discharge flows through most densely populated regions [2]. This network is characterized by diverse hydrological and geomorphic features [2, 3]. The word riparian or riparia is derived from the Latin word "riparius" which means "belonging to the bank of a river or lake" [4, 5 and 6]. Riverine areas are remarkable because they are highly associated and influence several habitats surrounding the nearby waterways, hence they are referred as "keystone ecosystems" [7, 8]. The vegetation around riparian areas play a pivotal role to ecosystems as they improves river health by filtering nutrients, pesticides, sediments, and prevent high in-stream nutrient levels from mixing with water bodies [9]. Riparian zones are significant, they are home to floral and faunal diversity ranging from aquatic, grassland, woodland and wetland ecosystem [10]. However riparian area have seen numerous modifications caused by human activity such as changes in hydrology, geomorphology, and vegetation [11]. Studies on Narmada River and its tributaries highlight significant environmental degradation primarily due to anthropogenic activities. Agricultural practices often dominate the riparian area, leading to a loss of vegetation and aquatic surroundings. This phenomenon was evidently observed in places like Chandni Nalla and Kaliyadeh stream, where conditions are threatened due to farming practices and lack of native species [12, 13, 14 and 15]. Kumar *et.al*., 2019 [16] studied basin area of Hoshangabad and Harda districts, over 60% of zone were in poor to extremely poor condition, dominated by agricultural land use. The Sip River's riparian quality a tributary of Narmada was adversely affected by human activities such as construction and mining [17].

The water quality assessments in the upper Narmada basin, covering areas like Amarkantak, Dindori, Mandala, Jabalpur, Narsinghpur and Hoshangabad indicated varied settings from excellent to very poor, influenced by domestic sewage and agricultural runoff [3]. Decadal land use changes from 1980 to 2018 in the upper catchment area of the Narmada River, studied by Thakur *et.al.* 2020 [18] revealed an increase in agricultural, open and commercial land, with decreased forest cover. Remote sensing studies have shown a declining trend in monsoon rainfall from 2015–2018, but no significant NDVI and soil moisture content change has been observed only in some months of 2017–2018 the change was observed [19]. Further studies on the effects of climate change revealed a trend towards higher maximum and lowest temperatures, pointing to a general warming trend and thermal stress on agriculture [20]. Natural landscapes that are transformed into agricultural land and areas inhabited by people frequently experience soil erosion, biodiversity loss and an increase in pollutants, all of which have a detrimental effect on the ecosystem of rivers. To evaluate the status of riparian vegetation, it is essential to obtain comprehensive information on the current condition of the river [21]. In India, surveys on riparian vegetation are limited. Although several scientific studies have examined the ecological status of the Narmada River, very few works specifically focuses on the composition of riverine vegetation. Phytosociological studies provide detailed information on the composition, structure, diversity and growth of plant communities [22, 8]. The present study aims to analyse the riparian floral diversity of the Narmada lower sub-basin, using phytosociological attributes. The objective of this study is to note riparian flora, evaluate species composition, diversity indices and structure of plant communities.

## MATERIALS AND METHODS

**Study Area and Site selection**

The Narmada River Basin is the seventh largest in India, spans an area of 92,672.42 km², lying between longitudes 72°38' to 81°43'E and latitudes 21°27' to 23°37'N [20]. It is the fifth-longest river in the country, stretching 1,312 km and fed by 41 tributaries. The river originates from Amarkantak in the Anuppur district of Madhya Pradesh and flows into the Arabian Sea at the Gulf of Khambhat in the Bharuch district of Gujarat [12, 23]. The basin is divided into three sub-basins: Narmada Upper, Narmada Middle and Narmada Lower. The present study was carried out in the riparian area of the Lower Narmada basin in the Narmada District of Gujarat and the Nandurbar district in Maharashtra. The vegetation in this region is primarily of the tropical dry to deciduous type [13].

**Sampling Design and Field Survey**

To conduct the vegetation survey riparian buffer map was created. The exact width of a buffer necessary for riparian corridor study and protection is widely disputed [12]. A 5 km river buffer was created and sampling plots for field survey was within 1 km of created buffer area. River line vector-based data was obtained from Gupta *et.al.* 2021 [3] and QGIS GIS 3.4.21 software was used to create these buffers. For vegetation analysis, satellite-based Landsat 8 data from 2022 was utilized to calculate the Normalized Difference Vegetation Index (NDVI) (https://earthexplorer.usgs.gov/). Based on the NDVI map, we identified sampling plots, which was 0.025 % of vegetation cover. The sampling locations were determined by considering the higher NDVI values and accessibility factors. Total 12 distinct sampling plots were laid for the floristic study. A 30 × 30 m quadrat was used to ensure spatial consistency with 30 m spatial resolution as Landsat imagery, thereby facilitating accurate field to satellite data integration. The nested quadrat was used for data collection of herb, shrub, and climber species (Table 1). 5 x 5 m quadrats were laid out for the enumeration of climbers and shrubs, while 1 x 1 m quadrats were used for the enumeration of herbs and tree sapling. The field analysis was carried in the month of December 2024 and January 2025.

**Quantitative Analysis**

At each sampling location trees, shrubs, climbers and herbs were identified up to the family and species levels. The collected riparian vegetation data were analyzed for density, frequency, abundance and their relative values were used to calculate the Importance Value Index (IVI) using the different formulas by Raunkiaer, 1934 and Mishra, 1968 [24, 25] . Additionally the A/F ratio was used to determine the distribution pattern, which indicates regular distribution (<0.025), random distribution (0.025 to 0.050), and contagious distribution (>0.050) mentioned by Curtis and Cottam, 1956 [26] and Jhariya and Singh, 2020 [27].

**Diversity Indices**

Diversity indices measures the relationship between environment and biodiversity. Plant diversity indices was calculated by using different standard equations such as Shannon-Weaver (1963) Index [28], Simpson (1949) diversity Index [29], Evenness Index (Pielou 1966) [30] and Species richness index (Marglef 1958) [31].

**Data Analysis**

To analyze the inter-relationships between various layers of stratified riparian vegetation, cluster analysis and correspondence analysis was performed. The Bray-Curtis similarity index- cluster analysis to detect similar groups among the species and dendrogram plot were used to visualize the similarity on basis of Importance Value Index (IVI) with respect to different species. Furthermore, Multivariate -correspondence analysis was conducted for each habit layer to explore relationships between various phytosociological attributes and species. This analysis was performed using the Paleontological Statistics Software Package (PAST 4.03) [32, 8].

## RESULT AND DISCUSSION

**Floral Diversity**

A total of 57 Angiosperm and 01 Pteridophyte species belonging to 33 Families were recorded from sampling area. Angiosperm plant diversity includes 52 species of dicotyledon and 05 monocotyledons. During the study Asteraceae and Acanthaceae was the dominant family among dicotyledon represented by 05 species followed by 04 species Euphorbiaceae family.

**Phytosociological Attributes**

**Tree Layer**

The quantitative analysis of tree layer comprises of 23 species representing 07 families. Total density of trees in studied area was individual 210.19 ind/ha and the maximum density was recorded of *Tectona grandis* L.f. (79.6 ind/ha) followed by *Butea monosperma* (Lam.) Kuntze (30.6 ind/ha). The lowest density 0.9 ind/ha was observed in

Bridelia *retusa* (L.) A.Juss, *Madhuca longifolia* var. latifolia (Roxb.) A. Chev., *Mallotus polycarpus* (Benth.) Kulju and Welzen, *Manilkara hexandra* (Roxb) Dubard. The value of frequency ranged from 91.7% to 8.3% for individual tree species (Table 2). The leading dominant tree species for IVI was *Tectona grandis* L.f. 68.54 followed by *Butea monosperma* (Lam.) Kuntze (IVI-33.42) followed by *Terminalia anogeissiana* Gere and Boatwr. IVI 23.73, while five species with least IVI of 3.73 was reported (Table 2). *Aegle marmelos* (L.) Correa, *Lagerstroemia parviflora* Roxb., *Morinda pubescens* Sm.ex Rees and *Wrightia tinctoria* (Roxb.) R.Br. showed random distribution while all other tree species showed contagious distribution.

**Shrub and Climber layer**

During the quadrate study 11 shrub and climber species were recorded. Highest density was measured in *Hemidesmus indicus* (L.) R.Br. (1233 ind/ha) followed by *Holarrhena pubescens* Wall. ex G.Don (900 ind/ha) and *Abrus precatorius* L. (433 ind/ha). On the other hand, the lowest density 66.7 ind/ha was of *Cocculus hirsutus* (L.) W.Theob and *Argyreia nervosa* (Burm.f.) Bojer (Table 3). The highest frequency was found in *Hemidesmus indicus* (L.) R.Br. 58% followed by *Holarrhena pubescens* Wall. ex G.Don 33.3% both this species also dominated in abundance and IVI values. A/F ratio ascertained that all climber and shrub species of the study area showed regular distribution pattern <0.025 (Table 3).

**Herb Layer**

In the herbaceous layer, a total of 22 species were enumerated during the quadrat study. The highest density was measured in *Mesosphaerum suaveolens* (L.) Kuntze (12.7 ind/ sq.m), followed by *Strobilanthes pavala* (Roxb.) J.R.I.Wood (7.3 ind/sq.m). On the other hand, the lowest density 0.3 ind /sq. m was of *Adiantum caudatum* L. and *Commelina diffusa* Burm. F. (Table 4). The frequency value varied from 75% to 8.3% for individual's herbaceous species. The IVI Values ranged from 52.6 to 4.0. Highest IVI Values were record in *Mesosphaerum suaveolens* (L.) Kuntze and lowest in *Adiantum caudatum* L. and *Commelina diffusa* Burm. F. All the herbaceous vegetation were distributed contagiously.

**Sapling Layer**

In the sapling layer only tree sapling layer has been analyzed a total 04 species was observed in the field analysis, *Nyctanthes arbor-tristis* L. had highest density of 11.17 ind/sq.m followed by *Tectona grandis* L.f. (5 ind/sq.m), *Dendrocalamus strictus* (Roxb.) Nees (1.67 ind/sq.m), and *Sapindus trifoliatus* L. (0.3 ind/sq.m). Frequency ranged from 25% to 75%. The highest IVI value was of *Nyctanthes arbor-tristis* L (160.86) and *Sapindus trifoliatus* L. (80.33). A/F ratio of all species was contiguous except *Sapindus trifoliatus* which showed random distribution (Table 5).

**Vegetation Overview**

The majority of the species fell into classes A (53.3%) and B (28.3%) according to Raunkiaer's frequency classification, indicating a less frequent occurrence of the species in the region this data is also supported by the diversity indices values. Tree species exhibited >20 IVI values, such as *Butea monosperma, Tectona grandis* and *Terminalia anogeissiana*, whereas only five species displayed <5 IVI values. From the herbaceous vegetation, 12 species had <5 IVI, indicating a fragile nature that could be under threat and 4 species >20 IVI. None of the Shrub and climber layer showed <5 IVI. The distribution pattern of the tree and herbaceous species showed clumping nature which very common distribution is caused by fair differences in environmental conditions [33]. Shrub and climber species showed regular distribution which indicates homogenous nature of species or can occur due to competition between organisms [34]. This distribution may indicate microhabitat variability within the riparian zone, where certain species capitalize on favourable conditions.

**Diversity Index**

Based on field survey 1,115 individuals and 58 species were recorded for the plant community's dominance and diversity indexes calculation. A much diversified plant community is showed by the Simpson's Diversity Index (D-1) value of 0.1, which denotes low dominance indicating no single species is extremely prevalent. On the other hand, a high degree of diversity is indicated by the Simpson's Diversity Index (D-1) value of 0.9, which implies a high likelihood that two randomly selected individuals will be distinct species. With a value of 3.2, the Shannon-Wiener

Diversity Index indicates a steady and well-balanced habitat structure. On the other hand, the 0.4 species evenness value specifies that the distribution of individuals is not uniform across the species. In spite of this, the community high species diversity is noted by 8.1 species richness index.

**Statistical Analysis**

The following list includes the list of different codes used for botanical names of riparian flora used in the statistical analysis: TL1 *Aegle marmelos*, TL2 *Bombax ceiba*, TL3 *Bridelia retusa*, TL4 *Butea monosperma*, TL5 *Casearia graveolens*, TL6 *Cassia fistula*, TL7 *Diospyros melanoxylon*, TL8 *Ficus racemosa*, TL9 *Ficus religiosa*, TL10 *Lagerstroemia parviflora*, TL11 *Lannea coromandelica*, TL12 *Madhuca longifolia*, TL13 *Mallotus polycarpus*, TL14 *Manilkara hexandra*, TL15 *Mitragyna parvifolia*, TL16 *Morinda pubescens*, TL17 *Nyctanthes arbor-tristis*, TL18 *Syzygium cumini*, TL19 *Tectona grandis* ,TL20 *Terminalia anogeissiana*, TL21 *Terminalia arjuna*, TL22 *Terminalia elliptica*, TL23 *Wrightia tinctoria*, HL1 *Mesosphaerum suaveolens*, HL2 *Strobilanthes p*avala, HL3 *Dicliptera paniculata*, HL4 *Sida acuta*, HL5 *Parthenium hysterophorus*, HL6 *Apluda mutica*, HL7 *Ageratum conyzoides*, HL8 *Spagnoticola triloba*, HL9 *Cyanthillium cinereum*, HL10 *Synedrella nodiflora*, HL11 *Triumfetta rhomboidea*, HL12 *Euphorbia thymifolia*, HL13 *Sida cordifolia*, HL14 *Acalypha indica*, HL15 *Blumea lacera*, HL16 *Eranthemum roseum*, HL17 *Physalis angulata*, HL18 *Aristida adscensionis*, HL19 *Urena lobata*, HL20 *Haplanthodes verticillata*, HL21 *Adiantum caudatum*, HL22 *Commelina diffusa*, SCL1 *Hemidesmus indicus*, SCL2 *Holarrhena pubescens*, SCL3 *Abrus precatorius*, SC 4 *Ampelocissus latifolia*, SCL5 *Woodfordia fruticosa*, SCL6 *Mucuna pruriens*, SCL7 *Argyreia nervosa* , SCL8 *Asparagus racemosus*, SCL9 *Cocculus hirsutus*, SCL10 *Helicteres isora* and SCL11 *Tinospora cordifolia.* [Where HL -Herb layer, SCL -shrub climber layer, HL herb layer.]

**Bray-Curtis Dendrogram Analysis**

The dendrogram in Figure 2 indicates the hierarchy of similarity among species. At a similarity level near 0.65, the dendrogram groups shows three main clusters. Cluster 1 to the left contains TL19, SCL1, HL1, SCL2, TL13, TL3 and TL5. The middle- Cluster 2 comprises most of species: TL12, TL14, HL14, HL21, HL22, TL6, TL22, SCL7, SCL9, HL9, HL10, TL21, HL13, HL11, HL7, HL12, TL1, TL8, HL14, HL15, HL17, HL16, TL15, HL18, HL19, TL17, TL2, TL9, TL18 and HL20. Cluster 3 right side comprises of HL2, SCL3, TL4, SCL5, SCL4, HL3, HL4, TL20, SCL6, HL5, SCL8, HL8, TL11, TL16, TL10, SCL11 ,SCL10, HL6, TL23 and TL7. Among all species in cluster similarity levels higher than 0.975 were observed between some members like HL2 and SCL3 which indicates that they are highly related. These primary clusters were joined at the lowest similarity level, approximately 0.3, showing maximum dissimilarity among the member of the primary cluster form this hierarchical arrangement a detailed view of the relationships and similarities among the species can be understood.

**Correspondence Analysis (CA)**

The Figure 3 shows the correspondence scatter plot of tree species indicating TL4, TL7, TL11, TL17, TL20 are centrally positioned in relation with the phytosociological attributes indicating a strong association while TL 6 and TL22 are distantly located suggesting a weak relationship with the measured vegetation parameters. Figure 4 illustrates shrub and climber species CA analysis indicating that species like SCL1, SCL2, SCL3, SCL4 and SCL5 are centrally situated with respect to phytosociological attributes, indicating a significant association; in contrast SCL7, SCL9, SCL10 and SCL11 are distantly located, indicating lack of relationship with the phytosociological features. Figure 5 indicates that herbaceous species HL3, HL6, and HL10 exhibits strong association with all measured attributes. Species HL17, HL14, and HL15 are comparable to one another and appear less close to the centre suggesting moderate attribute value. While HL1 and HL8 is unique because of its lower attribute values. The scatter plot in Figure 6 visually represents the relationship between tree sapling with various phytosociological attributes suggesting a strong association of SL2 with density, abundance, frequency IVI and A/F. Other species SL1, SL3, SL4 are also influenced by different attributes but to a slightly lesser degree. There are no significant outliers in this plot, all species are relatively close to the central cluster of attributes.

## CONCLUSION

During the present study on the riparian area of Narmada River, it is found that floral diversity and community structure is highly variable. Similar results are found by Kujur *et.al*. 2022 [8] while studying the riparian diversity of Maini River and Machhli River of Chhattisgarh. The study showed insights that dominant tree species were present with fragile herbaceous species so to avoid local extinctions, management strategies should give priority to the conservation of species with low IVI values. The results have significant effects for management and conservation in the riparian zones of the Narmada River. Key species and regions with significant biodiversity are identified by the study, which offers important insights for the preservation and protection of ecosystems. To keep these ecosystems healthy and stable, dominant native species like *Butea monosperma* and *Tectona grandis* must be protected. Species with higher density and abundance at riparian locations are recommended for restoration. The study also highlights the need for additional research to examine how seasonal variations affect species distribution and diversity as well as the effects of anthropogenic activities on riparian vegetation. More thorough research is required to establish suitable management techniques and guarantee the regeneration of native species in the riparian zones of the Narmada River, as a result of the study's limitation to small sampling areas.

## ACKNOWLEDGMENTS

The authors are grateful to the Department of Science and Technology (DST), New Delhi, India, for providing financial assistance as INSPIRE Fellowship [IF210088] and Forest Department of Gujarat for providing permission for field survey and assistance.

## ABSTRACT

*Nelumbo nucifera*, or *Nelumbium speciosum* Willd, is more commonly known as Indian Lotus, Sacred Lotus, or Asian Lotus. *Nelumbo nucifera* Gaertn is a water plant of perennial nature, that is grown in Asian countries as an ornamental plant and is grown for its edible seeds and rhizomes both for nutritional as well as medicinal health benefits. Lotus stem is rich in fibre, vitamins, minerals, and various phytochemicals including flavonoids, alkaloids and polyphenols, which contribute to its diverse pharmacological properties. Traditionally, Lotus is used extensively in Ayurvedic and Chinese medicine for managing diabetes, obesity, hypertension, stress, liver and cardio-vascular disorders. Owing to its diverse used in Asian cuisine, it is used as a functional food, as a food additive, in traditional confectionery, and breakfast. Various morphological and nutritional health benefits of Lotus plant have been described in the article. This review includes the nomenclature, harvesting, post-harvest handling, history, cultural influence, and various cuisines in which lotus is and can be used along with the nutritional and therapeutic activity of various parts of lotus plant.

**Keywords:** *Nelumbo nucifera*, Indian Lotus, Nutrients, Sacred Lotus, Rhizome, Medicinal Plant, Aquatic Crop, Cultural Influence.

## INTRODUCTION

Indian lotus or *Nelumbo nucifera* Gaertn of family Nymphaeaceae is a stout creeper, with a whitish yellow to the yellowish-brown colored rhizome. It is aquatic in nature. Indian lotus leaf tastes sweet, bitter, and neutral. It has a distinct smell and appears bluish green. It blooms flowers of different colors [1]. Seeds, rhizomes, leaves, and flowers are used extensively in India and China as food and as a medicinal plant [2]. *Nelumbo nucifera* Gaertn or commonly known as Lotus, belongs to the genus Nelumbonaceae. It is an aquatic and perennial plant. Because of its medicinal properties, Lotus is consumed extensively in India and China as food and as a medicinal plant [3]. Lotus can be grown in conditions unfavorable for other crops as a vegetable and medicinal herb [4]. Lotus is grown over a large belt distributed widely in South-East Asia, particularly in India, ranging from Kashmir to Kanyakumari. Botanists have recorded many varying phenotypes of the plant, ranging from different sizes, shapes, shade, number, and arrangement of petals [5]. The growth of Lotus takes place through anaerobic sediments at the bottom of the water body by the rhizome. Rhizomes bear nodes and internodes and are generally covered with longitudinal smooth dark brown striations. From each node, a new leaf arises. The rhizome is fibrous, tough and shows a pattern of large cavities surrounded by several larger ones [6]. Almost all parts of Lotus are edible including stem, leaves, or tender rhizome [7]. Parts can be pickled in vinegar, soaked in syrup, or even cooked in various recipes along with other vegetables [8]. Tender rhizome exhibits a mild flavor, while stem tastes like beet [9,10]. Lotus stem is used in various salads, and in making lotus stem chips. Lotus stem is used in the preparation of various traditional recipes. Stem or rhizome can be pickled, deep-fried to form chips, boiled, and braised. It can be cooked and added to soups, custards, salads, rice, and even some snacks. The dried and powdered form is used as herbal medicine for various ailments [11]. Seeds can be eaten as dry or can be powdered and used in making bread and chapattis. Seeds can also be popped like popcorn. Dry roasted seeds when grounded into fine powder can be used as a substitute for coffee [12]. Lotus stem exhibits various health benefits. Consumption of lotus stem aids Weight Loss [13], Improves Digestion, Improves Blood Circulation [14], Reduces Stress [15], Regulates Blood Pressure [16].

Lotus stem is rich in various nutrients like Carbohydrates, Proteins, Amino acids, Starch, Dietary Fiber, Vitamins, and Minerals like Vitamin A [17], Thiamine, Riboflavin, Pantothenic acid, Vitamin B6, Vitamin C, Zinc, Potassium, Copper, Phosphorous, Iron, Manganese Calcium, and Sodium [18,19], as well as various metabolites like Flavonoids, Steroids, Triterpenoids, Alkaloids, Glycosides, and Polyphenols [20]. It is commonly used in Asian countries to make salads, pickles, fried food, and confectionery items [21]. Lotus is considered a medicinally active plant, because of its numerous medicinal properties. The whole plant possesses Anti-Obesity, Anti-Diabetic, Hypocholesterolaemia, Antioxidant, Hepatoprotective, Anti-Stress [22], antipyretic, antifungal, and cardio-tonic properties, while it acts as a diuretic, astringent, sudorific, and emollient. Lotus is also used extensively in the treatment of haemostasis, diarrhoea, and tissue inflammation [23]. Figure 1: Cuisines of Lotus: Lotus being nutritionally rich is consumed in various parts of Asia, highlighted above are the cuisines in which lotus is commonly consumed. Various parts of lotus plants are used in preparing these cuisines. Lotus root is commonly known as Kamal Kakdi in India, Renkon in Japan, Yeonguen in Korea, and Lian Ou in China. Lotus is consumed widely in Asian countries for its known nutritional and health benefits. The most popular cuisines include Indian, Thai, Chinese, Japanese and Korean. Lotus stem is consumed widely as pickle, chips, and as main dish (kamal kakdi Sabzi) in North Indian cuisines. It is also consumed as Lo Han Jai or Buddhist Delight and is consumed as Nadru Yakhni in Kashmiri cuisine. While it is consumed as baked renkon, Kinpira renkon (served as starter and side dish), as salad, and even main course dish in Japanese cuisine. It is consumed as Yeongeun Jorim (side dish) in a typical Korean dish. While on the other hand, it is consumed as soup (Lotus Root Soup with Pork Ribs), as side dish (Chinese Stir Fry with Wood Ear Mushrooms), as sweet dish (Lotus Root Stuffed with Glutinous Rice), as tea, and as New Year's traditional dish namely, Ma La Xiang Guo (Spicy Numbing Stir Crispy Stuffed Lotus Root with Pork) in Chinese Cuisine [24].

**Classification and Nomenclature**

The lotus can be classified as follows-

Kingdom- Plantae- Plants; Subkingdom- Viridiplantae- Green plants; Infrakingdom- Streptophyta- Land plants; Superdivision- Embryophyta; Division- Tracheophyta- Vascular plants, tracheophytes; Subdivision- Spermatophytina- spermatophytes, seed plants; Class- Magnoliopsida; Superorder- Proteanae; Order- Proteales; Family- Nelumbonaceae- Indian lotus; Genus- Nelumbo- lotus; Species- *Nelumbo nucifera* Gaertn- Sacred lotus [25]. *Nelumbo nucifera*, or *Nelumbium speciosum* Willd, is more commonly known as Indian Lotus, Sacred Lotus, or Asian Lotus. Other names also include East Indian Lotus, Lotus root (rhizome), Egyptian Lotus, Lin Ngau, and Lian Ou in Chinese. The Japanese name for Indian Lotus is Renkon and Hasu, translating to edible storage rhizome in Japanese [26]. Other regional names for the plant in various languages are, Assamese- Padam; Bengali- Komol, Padma; Gujarati- Suriyakamal; Hindi- Kamal; Kannada- Kamala, Tavare-gadde; Kashmiri- Pampos; Khasi- Soh-lapudong; Malayalam- Tamara; Manipuri- Thambal; Marathi- Kamal; Odiya- Padam; Punjabi- Kanwal, Pampos; Sanskrit Ambuja, Kamala, Padma, Pankaja; Tamil- Ambal, Tamarai; Telugu- Erra-tamara; and Urdu- Nilufer [27].

**Morphology of *Nelumbo nucifera***

*Nelumbo nucifera* Willd is an aquatic plant with spongy cylindrical rhizomes that produces thick tubers in autumn. The plant grows well in water depths of 2-7 feet. Most plants first grow in shallow water and then proceed further into deeper waters. N. lutea grows from June to September, with light creamy yellow flowers opening on a single stalk. They range from 3-8 inches in diameter upon full opening. One single bloom lasts from 3-4 days [3]. *Nelumbo nucifera* Gaertn is a water plant of perennial nature, that is grown in Asian countries as an ornamental plant and is grown for its edible seeds and rhizomes. For slow moving streams, thick and tuberous rhizomes grow at the bottom of the ponds [28]. The leaves have a large diameter with a nearly round shape. The stems have thorns and are long. Especially when young, they float in the water. The leaves rise high in shallow waters, depending upon cultivars. One cycle of the plant completes in less than a year. The plant generally takes 4-6 months for budding, leafing, flowering, bearing fruit, forming the rhizome, maturing, and reaching a period of dormancy [29]. Flowers are hermaphrodite, solitary and sweet scented and vary in color from rosy to white. The average diameter of the flower is 10- 25 cm, with an ovoid and glabrous flower [30]. Upon successful pollination of a flower, most holes contain a single and round developing seed. The woody receptacle that looks like a showerhead contains the seeds. The seeds are hard, brown and approximately a centimeter in diameter, and can survive for long periods of time. Seeds that ripen are released due to bending of the pod in the water. Leaves carry an orbicular shape containing crenulate margins. Their diameters range from 1-2 feet with the petiole being attached to the leaf at its center. The palmate and peltate leaves are slightly concave, giving the impression of shallow bowl-like structures. Leaves grow directly out of the rhizome, and they can either be on the surface of the water or rise 1-1.5 feet above the surface [3]. Roots are tuberous and eight inches long with a diameter of 2 inches. The outer skin of the lotus root is smooth and green color, whereas the inner part has air pockets running through the length of the tuber, which are required for floating in the water [30].

**Origin and Geographical Distribution of *Nelumbo nucifera***

Figure 3: Geographical Distribution of Lotus, orange depicting native cultivars, while yellow depicting introduced cultivars in various regions of the world, figure depicting major cultivation in Asian continent. Lotus comes from the Nymphaeaceae family and is of the genus Nelumbo. There are just two species in this genus, namely *Nelumbo lutea* found in North and South America and *Nelumbo nucifera* Gaertn, found in Asia and Oceania [31]. The species belonging to America, named *Nelumbo lutea*, also known as *Nelumbo pentapetala* or *Nelumbium luteum* is more commonly called the American Lotus, Yellow Lotus, or the Water-Chinquapin. It is native to the central and eastern portions of the United States, ranging from Wisconsin to Maine and from Texas to Florida. It is an endangered plant in Pennsylvania and New Jersey and is threatened in Delaware and Michigan [3].

**History**

The lotus plant is honored in the history of three countries: India, Egypt, and China [32]. These countries' cultures have captured the lotus plant beautifully in cultural representations of the countries through artworks as a symbol of purity, perfection, and beauty. The dietary aspect of lotus is focused on diverse cuisines of the said places, owing to the rich culture. The Nile Riverbanks had sacred blue lotus (*Nymphaea caerula*) spread widely throughout them [33].

Egyptians are also known to have worshipped different parts of the lotus plant, as depicted amply by their architectural design. The horticulture of lotus in western Europe was initiated by Sir Joseph Banks in 1787, in the form of a house water lily, although it is now widespread in modern herbal gardens. Lotus plants are most popular in China, India, Japan, Korea, and Australia [34].

**Cultural Influence**

American Indian tribal groups dealt with their native Lotus as a sacred plant that had mystical powers, whereas the Dakota, Comanche, Meswaki, Omaha, Ojibwa, Huron, and Potawatomi used different parts of Lotus as supplemental food. The Asian lotus and its flowers have been appreciated by all kinds of people in China. There have been artworks by artists, painting lotus, poems and essays about the plant written by poets and authors alike. The Chinese are known to have developed a liking for the Lotus flowers. A Hindu belief portrays the birth of Buddha in the heart of Lotus. A Brahmin claim from Indian culture supports the birth of Lord Brahma, the creator of the universe, from a Lotus blossom. Lotus is considered the symbol of life in Japan due to its edible parts. The plant has depicted sincerity and nobility in Japanese legends and religious developments in the past because of its annual emergence in still waters [29].

**Planting and Harvest**

Early maturing varieties are planted closer than those that are produced later in China. Australia has certified rhizomes planted in early spring with 2-3 segments. Angled placement of the propagules is performed in the mud. The ponds have a depth of 30-50 cm, and the recommended water level is kept at 10 cm. Rhizomes are planted in rows, placed at distances of 1.8-2.7 m was between one another. A distance of 0.7-0.9 m is kept between plants. Seed rhizomes are better planted in grids with orientations for meristem heads to be in the direction of the pond within its row [35]. The diversity of the plant can vary from 4,115 to 7,936 plants in a hectare. The time for harvest and the methods are dependent on the conditions, which may vary depending upon the variety and the country of cultivation. For example, China has rhizomes harvested from August to March, whereas Cambodia collects leaves and flowers in April and seeds in August before the water level rises. In Taiwan, the harvest season ranges from June to November. In South Korea, the rhizomes are picked up from August to December [35]. In Japan, rhizome harvesting is carried out from late summer to the next spring [36]. Harvesting can be done after 120 days in warm climates and after approximately 150-180 days upon the death of the leaves in colder climates. During harvest, water is drained, and the rhizomes are dug up [37]. Yields vary depending upon the location, variety and practices used in cultivation. Australian yields have reported a production of 8-40 tons per hectare [35,38]. China has an average production of approximately 22.5 tons per hectare, with South Koreans producing 31.8 tons per hectare [35].

**Packaging and Post-harvest Handling**

A 20-day shelf life was reported by Tian *et al*., 2008, at room temperature. In Australia, fresh rhizomes kept for the market lasted 2-3 weeks in a non-refrigerated environment [35]. Sugar degradation and flesh browning are observed due to accelerated enzymatic activity under these conditions [39]. Lotus can be kept at temperatures of approximately 370C, with lower temperatures causing surface scarring and chilling injuries. Recently, Tian *et al*. conducted trials to check the effect of different materials on the extension of the shelf life of the rhizomes. By storing the roots at 50C, the shelf life could be extended to 45 days. Temperatures higher than 150 C caused weight loss, hastened disease development (*Botrytis*, *Colletotrichum* and *Pseudomonas*) and dormancy of the rhizome, leading to carbohydrate degradation [40].

**Plant Uses**

There are several organs of Nelumbo that are edible. Leaves and young stems are cooked and consumed. The large tuberous roots of the plant were baked like sweet potato, with the leaves being eaten like spinach. The root is starchy and becomes sweet and mealy after steeping in water for removal of bitterness. Hard seeds were consumed like nuts and used for thickening soups, while also being roasted like chestnuts. They can also be added to flour for making bread by drying and grinding. The seeds contain up to 19% protein, with potential for the extraction of edible oil as well. The flowers are quite fragrant with the pods having a striking aroma, resulting in their use in flower

arrangements [3]. Pickling, drying, slicing and roasting are some of the methods used for the consumption of starchy rhizomes. They can also be fried as chips or used to produce starch. Seeds that have a resemblance to corn are an oriental delicacy. They can be boiled, pickled, roasted, ground as meal, can dried or eaten raw. The leaf stalks, young leaves and flowers are consumed as vegetables. The use of flowers, leaves and rhizomes is observed in savory dishes (*Nelumbo nucifera* Gaertn., Plants of the World Online, Kew Science). Flowers are also used for perfume production [41]. The fruit, an enlarged receptacle, contains multiple embedded seeds [28]. Culinary preparations also bring into use the immature leaves and seed pods. Xueming also reported the usage of all parts of the Lotus plant in Chinese medicine, in one form or another [29]. Padmammadhu or Makaranda is honey made by bees visiting lotus flowers, which is considered a tonic and is used to treat many eye disorders in India [42].

## CONCLUSION

Indian lotus or *Nelumbo nucifera* Gaertn of family Nymphaeaceae is one of the plants which possess exceptional nutritional, medicinal and cultural influence. Seeds, rhizomes, leaves, and flowers are consumed extensively not only in Asian cuisine but also serves as a potent source of bioactive compounds with therapeutic potential. Lotus stem is loaded with nutrients including dietary fibre, vitamins, and minerals like thiamine, pantothenic acid, vitamin B1, B2, B6, vitamin C, zinc, potassium, copper, phosphorous, iron, and manganese. It is consumed fresh, salted, boiled, lotus rhizome starch, drinks, teas, and used in diet. The plant's pharmacological activities, including antioxidant, antidiabetic, and hepatoprotective effect. Beyond its biological attributes, lotus holds a profound cultural influence across various civilizations and religions as a symbol of purity, enlightenment and resilience. Hence, *Nelumbo nucifera* is considered as a multipurpose plant bridging nutrition, medicine, and spirituality, warranting further research into its bioactive constituents and commercial applications.

## ABSTRACT

The fast proliferation of AI, in particular generative AI– has added to the urgency of faculty capacity development in higher ed. SF colleges in Bengaluru are highly stressed (workload, infrequent assessments, placements, paperwork), so AI could be beneficial but challenging due to low skills, ethical concerns (bias and privacy), lack of support from institutions and uncertain policy climate. Drawing on technology acceptance logic (TAM/UTAUT) and AI literacy, this study develops a quantitative model that investigates the relationship between AI training needs, adoption barriers, and the intention to adopt AI while also accounting for enabling conditions such as self-efficacy with using AI and institutional support. Based on the findings, a structured questionnaire was developed to address (i) training needs in AI foundations, prompt engineering, assessment design, research support and ethics; (ii) barriers such as lack of time, infrastructure gaps, policy uncertainty, invasion of privacy and fear of academic misconduct; and (iii) adoption intention and use. It is a cross-sectional, descriptive-explanatory study of self-finance faculty in various disciplines in Bengaluru. Data analysis is specified using (a) chi-square tests to examine associations between faculty development exposure and barrier levels, (b) correlation analysis to assess relationships among constructs, and (c) multiple regression to estimate predictors of adoption intention. Findings (illustrative example) show that prior AI training is significantly associated with lower perceived adoption barriers, training needs positively relate to adoption intention, and barriers negatively influence intention, while institutional support and AI self-efficacy emerge as strong positive predictors. The paper concludes with actionable recommendations for

institution-level training architecture, policy clarity, workload-sensitive professional development, and ethical AI governance to bridge the AI skill gap in Bengaluru's self-finance higher education ecosystem.

**Keywords:** AI skill gap, faculty development, generative AI, training needs, adoption barriers, self-finance colleges, Bengaluru, UTAUT, TAM

## INTRODUCTION

Artificial intelligence has moved from being a specialized computational topic to a general-purpose capability that influences teaching preparation, assessment design, student support, research productivity, administrative tasks, and institutional competitiveness. In higher education, faculty are central to responsible adoption: they select tools, design learning activities, set integrity norms, and decide whether AI becomes a learning accelerator or a credibility risk. At the same time, AI adoption is not automatic. Faculty adoption depends on (i) capability (AI literacy and practical skills), (ii) conditions (infrastructure, access, and institutional support), and (iii) confidence and clarity (ethical guidance, acceptable-use policies, assessment redesign strategies). UNESCO's AI Competency Framework for Teachers explicitly positions teachers' AI competencies across human-centered mindset, ethics, AI foundations, AI pedagogy, and AI for professional learning, organized into progression levels (Acquire–Deepen–Create). This directly supports the idea that bridging the AI skill gap is not only about tool training but about professional agency, ethics, pedagogy, and governance.

**Why focus on self-finance faculty in Bengaluru?**

Bengaluru—India's technology hub—hosts a dense ecosystem of private and self-finance higher education institutions. Faculty in self-finance colleges often experience high teaching loads and compliance-driven academic work, potentially increasing interest in AI productivity tools while simultaneously limiting time for learning and experimentation. This creates a practical tension: high potential value but high adoption friction.

**Theoretical grounding: adoption logic + skill gap logic**

Faculty AI adoption can be explained through established technology acceptance models such as:

**TAM** (Perceived usefulness, perceived ease of use)

**TAM2** (adds social influence and cognitive instrumental processes)

**UTAUT/UTAUT2** (performance expectancy, effort expectancy, social influence, facilitating conditions; extended constructs in UTAUT2)

AI-specific education research shows acceptance is commonly shaped by self-efficacy, perceived benefits, institutional support, and concern-related inhibitors (privacy, ethics, misuse). For example, science teachers' acceptance of AI has been shown to correlate positively with self-efficacy and ease of use, and negatively with certain anxiety dimensions.

## LITERATURE REVIEW

This section reviews research around (i) AI literacy and capability building, (ii) faculty/teacher acceptance of AI and generative AI, (iii) barriers and institutional readiness, and (iv) Indian higher education capability context. Each study is summarized with key contribution and gap relevance.

**Foundational adoption models applied to educational technology**

Davis (1989) introduced TAM, demonstrating that perceived usefulness and perceived ease of use predict user acceptance of information technology. The study found that for faculty AI adoption, usefulness may relate to lesson design efficiency, assessment support, research assistance, and administrative reduction; ease of use relates to prompt skills, workflow integration, and tool accessibility. An extension of TAM (TAM2) by Venkatesh and Davis

(2000) stresses the influence of social and instrumental cognitive processes on perceived usefulness, and actual use behaviour. According to the study, faculty in embedded peer networks and institutional norms; perceived legitimacy and peer endorsement can drive adoption. Venkatesh *et al*. (2003) Unified Theory of Acceptance and Use of Technology (UTAUT) was one such theory, which accumulated the precedents technology acceptance models showing performance expectancy, effort expectancy, social influence and facilitating conditions. The study closely reflected the faculty AI environment, in which enabling conditions (access, policy, support) are important. Venkatesh *et al* (2012) expanded UTAUT to UTAUT2, and included constructs of habit and hedonic motivation for consumer environment. It was concluded that exposure to AI on a regular basis, for faculty, led to generation of habit which increases sustained usage. Ng (2021) that defined AI literacy using an exploratory review and suggested areas in the field such as AI Awareness, Using/Applying with AI, Evaluating/Creating with AI and Ethic Issues. The research showed that AI literacy is multi-faceted; not simply "tool training." One important finding, according to the study, is that many institutions do not have formal AI literacy pathways for faculty. UNESCO (2024) released the AI Competency Framework for Teachers that defined 15 competences with its five dimensions structured by progression levels: Acquire-Deepen-Create. The study gave a global competency map with an organization for teacher training programmes. Institutions tend to offer 'unbundled' sessions rather than competence-based routes the study discovered.

**Teacher/faculty acceptance of AI in education (empirical evidence)**

Al Darayseh (2023) in turn studied how the acceptance of AI by high school science teac hers maintains a high degree and has been reported to have positive relationships with self-efficacy, ease of use, expected benefits attitudes and behavioral intentions. Self-efficacy-enhancing training can enhance adoption intention. Cabero-Almenara *et al*. (2024) explored teacher's acceptance of educational AI and the role of variables, and pedagogical beliefs. The adoption is not only technical, it is also related to teaching beliefs and pedagogy orientation which was proven in the study. Baig *et al*. (2024) (Computers and Education: AI) investigated acceptance in AI environments, suggesting that acceptance is influenced by perception and situation rather than just presence. The research concluded that employ AI tools alone do not ensure adoption (no training guidance or policy). Ayaz and Yanartaş (2020) used UTAUT in teachers' technology adoption and emphasized on expectancy and facilitation conditions. The research showed that enabling conditions (support, infrastructure and time) can be critical especially in self-fund situations. Kim *et al*. (2025) highlighted the role of attitudes and readiness in AI acceptance at universities. The readiness was found as a catalyst of adoption Faculty readiness is an adoption driver and skill gap expands resistance.

**Generative AI and higher education: policy and faculty practice**

McDonald *et al*. (2025) studied generative AI policy advice for HE and concluded that themes included communication, curriculum based guidance. The research reveals that academic resistance barriers are exacerbated by unclear and inconsistent policy. Rasool (2025), examined attitudes towards generative AI for teaching and learning in higher education using UTAUT + pedagogical framing, identifying perceived benefits as well as concerns. Adoption barriers, such as ethical confusion and evaluative anxiety were identified in the study.

**Barriers to AI adoption: what stops educators?**

Emerald (2025) focused on internal (self-efficacy/competence) and external barriers (institutional hurdles) for AI in teaching. The work added by validated multi-barrier construction, not "no-tools only." Taheri 2025) synthesized the drivers and inhibitors for AI adoption from the educators' point of view, bringing to light reoccurring themes as ethical consideration, data privacy, and transparency throughout AI adoption frameworks. Recurring barriers to adoption, according to the study, are trust and governance. Bergdahl (2025) studied attitude and AI self-efficacy as well; results indicate that confidence and perceived efficiency are related to positive outcomes. The results of the study suggest that self-efficacy is a key lever for adoption intention, and that training has to construct it. ecure schools philosophers Like, Nealon *et al* TragaPhilippakos(2025) explored teachers' use of AI tools, confidence, PD needs and barriers by explicitly connecting the adoption barriers with PD needs. The study indicated that training requirements are quantifiable and pragmatically actionable. Hazzan-Bishara (2025) expanded TAM to explain the adoption of generative AI and emphasized the influence of institutional support, information credibility, self-efficacy;

motivation. The study found that institutional support is not a "nice-to-have" — it is predictive. Zhang (2025) examined the teachers' acceptance and persistent use of AI-triggered tools with TAM and the post-adoption rationale over continuing-use enablers. The study reports that training must not be a once-only occurrence; continued adoption requires ongoing support.

**India and Bengaluru context: capability and digital competence baseline**

Padhi (2018) employed UTAUT to explore faculty perception and acceptance of OER in Indian HE. The results indicated that prior to AI, faculty adoption in India is contingent upon facilitating conditions and perceived usefulness, AI may be no different with even ethical hazards involved. Srivastava and Dangwal (2021) measured digital competence of higher education teachers and found diversity in digital readiness, suggesting the necessity of a structured development of competences. The research revealed that AI upskilling needs to address digital skills base inequality. Srinivas and Yadav (2025) Findings Training-related problems were said to have affected technology use and engagement as highlighted in some earlier studies, which confirm that faculty capacity building continues to be a challenge within Indian higher education system.

**Research gap emerging from the review**

**Across global and Indian evidence**

a. AI readiness is being measured in studies more and more, but rarely it concentrates on self-finance faculty members who have certain unique preoccupations (workload and resources).
b. Multiple studies describe barriers in general terms, but few develop operational indices of barriers related to training needs and use them within a single quantitative model.
c. Although Bengaluru has a strong technology culture … there is wide difference in institutional preparedness and faculty training ecosystems, there is context specific requirement for local empirical evidences.

**Statement of the Problem**

Yet, despite fast AI proliferation and the growing urgency for professors to update teaching and research processes, self-financed professors in Bengaluru experience a quantifiable AI skills gap and adoption challenges. Institutions may foster AI use with informal cultural practices, but faculty often don't have well-veined pathways of formal AI literacy, protected time for professional learning or clear direction to policy about ethical/appropriate use. As a result, AI diffusion varies greatly, which could exacerbate performance gaps across faculty and ultimately courses in terms of the quality of teaching, integrity of testing and productivity in research.

## OBJECTIVES OF THE STUDY

i. To assess the level and pattern of AI training needs among self-finance faculty in Bengaluru across teaching, research, assessment, and ethics-related competencies.
ii. To identify and measure key AI adoption barriers (individual, institutional, and governance-related) perceived by self-finance faculty.
iii. To examine the relationship between training needs, adoption barriers, and AI adoption intention, using chi-square, correlation, and regression analysis.

**Scope of the Study**

**Population:** Faculty working in self-finance (unaided/private) higher education institutions in Bengaluru.
**Coverage:** Multiple disciplines (Management, Commerce, Arts, Science/IT, Engineering).
**Focus constructs:** Training needs, adoption barriers, AI self-efficacy, institutional support, adoption intention.
**Exclusions:** Government/aided colleges (unless they have a self-finance wing), purely online-only institutions (optional), and students.

## RESEARCH METHODOLOGY (DETAILED)

**Research Design**
A quantitative, cross-sectional, descriptive-explanatory research design is proposed:
**Descriptive:** measure current training needs and barrier perceptions.
**Explanatory:** test relationships and predictive effects on adoption intention.

**Sampling Technique**
Stratified random sampling is recommended:
- Strata by discipline (e.g., Management/Commerce/Arts/Science-IT/Engineering) and optionally by designation (assistant/associate/professor).
- This improves representation and reduces sampling bias typical of convenience-only surveys.

**Sample Size**
A target sample of N = 320 is appropriate for:
- stable chi-square contingency tables,
- correlation stability,
- multiple regression with 6–10 predictors.

**Sample Unit**
One faculty member employed in a self-finance higher education institution in Bengaluru = one sampling unit.

**Sample Area**
Bengaluru Urban district (Bengaluru), Karnataka, India.

**Data Collection**
**Primary data:** structured questionnaire (Google Form + limited paper-based distribution to increase response diversity).
**Secondary data:** published research, UNESCO frameworks, policy notes, and institutional guidelines.

**Instrument Design**
5-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree) for barrier, support, self-efficacy, and intention constructs.
Training needs can be measured as perceived importance/need for training modules (1 = Not Needed to 5 = Highly Needed).

**Statistical Tools Used**
**Chi-square test (association):** e.g., prior AI training × barrier level (High/Low).
**Correlation analysis (Pearson r):** relationships among Training Needs, Adoption Barriers, Adoption Intention, Self-Efficacy, Support.
**Multiple regression analysis (OLS):** predictors of Adoption Intention.

**Reliability and Validity Plan**
**Content validity:** expert review by 2–3 senior faculty + 1 AI/EdTech expert.
**Pilot study:** 25–30 faculty; refine ambiguous items.
**Reliability:** Cronbach's alpha ≥ 0.70 acceptable; ≥ 0.80 good.

## ETHICAL CONSIDERATIONS

Informed consent, voluntary participation, anonymity, no institutional-identifiers in raw dataset, secure storage.

**Hypotheses**

**Chi-square hypothesis**

**$H0_1$:** Prior AI training and adoption barrier level are independent (no association).

**$H1_1$:** Prior AI training and adoption barrier level are associated (significant association).

**Correlation hypotheses**

**$H0_2$a:** Training needs have no significant relationship with AI adoption intention.

**$H1_2$a:** Training needs have a significant relationship with AI adoption intention.

**$H0_2$b:** Adoption barriers have no significant relationship with AI adoption intention.

**$H1_2$b:** Adoption barriers have a significant relationship with AI adoption intention.

**Regression hypothesis**

**$H0_3$:** Training needs, adoption barriers, AI self-efficacy, and institutional support do not significantly predict adoption intention.

**$H1_3$:** At least one predictor significantly predicts adoption intention.

**Data Analysis and Interpretation (Illustrative example tables)**

**Demographic profile (N = 320) (Table 1).**

**Interpretation:** The sample reflects a typical self-finance faculty mix with strongest representation from Management/Commerce and mid-career experience groups. Two-thirds report no prior AI training, supporting the relevance of the "AI skill gap" focus.

**Reliability (Cronbach's alpha) (Table 2).**

**Interpretation:** Reliability is acceptable to good for most constructs; "Institutional Support" is slightly below 0.70, which is often acceptable in exploratory contexts but should be improved by refining items during pilot testing.

**Descriptive statistics (Table 3).**

(Scale range: 1–5)

**Interpretation:** Moderate averages indicate neither extreme readiness nor extreme resistance—suggesting that targeted institutional interventions could shift adoption intention meaningfully.

**Chi-square test (Hypothesis test)**

**Association between Prior AI Training and Adoption Barrier Level (Table 4).**

Barrier level categorized as **High** vs **Low** (median split).

**Chi-square:** $\chi^2(1) = 18.807$, $p < 0.001$, $\Phi = 0.242$

**Decision ($H0_1$ vs $H1_1$):** Since $p < 0.05$, reject $H0_1$.

**Interpretation:** Prior AI training is significantly associated with barrier perception. Faculty who received AI training show a much higher proportion in the "Low Barriers" group.

This supports a direct institutional implication: training functions as a barrier-reduction mechanism, not merely skill enhancement.

**Correlation analysis (Hypothesis test)**

**Pearson correlation matrix (Table 5).**

(*p < .05, **p < .01, ***p < .001)

**Decision ($H0_2a$):** Training needs vs intention shows $r = 0.273$ ($p < .001$) → reject $H0_2a$.
**Meaning:** Faculty who report higher training needs also report higher adoption intention—suggesting a "readiness-to-learn" orientation rather than disengagement.
**Decision ($H0_2b$):** Barriers vs intention shows $r = -0.498$ ($p < .001$) → reject $H0_2b$.
**Meaning:** Higher barriers significantly reduce adoption intention. Barrier reduction is therefore a high-impact intervention target.

**Regression analysis (Hypothesis test)**
**Model**
**Dependent variable:** Adoption Intention
**Predictors:** Training Needs, Adoption Barriers, AI Self-Efficacy, Institutional Support, plus controls (Age, Experience, Prior Training)

**Multiple regression results (OLS) (Table 6).**
Model fit: $\mathbf{R^2 = 0.466}$, $F = 38.885$, $p < .001$

**Decision ($H0_3$ vs $H1_3$):** Overall model $p < .001$ → reject $H0_3$.
**Interpretation (predictor-wise)**

i. Institutional Support has the highest positive influence (B = 0.407). This is consistent with the "facilitating conditions" logic of UTAUT: adoption increases when institutional arrangements minimize friction.
ii. AI Self-Efficacy has high significant effect on Intention (B = 0.297) that supports the educational acceptance literature focus on confidence and ability.
iii. **Re of Adoption Barriers:** the influence of Adoption Barriers on intention is very negative (B = −0.391), indicating that barrier management is vital.
iv. The impact of Training Needs is also small, but positive and significant (B = 0.115), which suggests that those who have training needs are more inclined to adopt—significant for targeting training programs.
v. Age, years at work and prior training wane to non-significance once self-efficacy and support are included in the model – indicating that it's not demographic category that counts but capability + conditions.

## FINDINGS OF THE STUDY

i. A large proportion of faculty report no prior AI training, supporting the "AI skill gap" premise.
ii. Prior AI training is significantly associated with lower adoption barriers (chi-square supported).
iii. Adoption barriers are strongly and negatively related to AI adoption intention.
iv. Institutional support and AI self-efficacy are strong positive predictors of adoption intention.
v. Training needs correlate positively with intention, indicating latent readiness—faculty want structured pathways.

**Suggestions of the study**
**Institution-level interventions (high impact)**

- Adopt a competency-based AI faculty development pathway aligned to UNESCO's Acquire–Deepen–Create progression.
- Issue a clear "Responsible AI Use Policy" (teaching, assessment, research, data privacy) and communicate with examples and allowed/disallowed cases (reduces policy uncertainty barrier).
- Provide approved tool access (institutional licenses, secure accounts) and basic infrastructure support (Wi-Fi, devices, secure platforms).
- Create workload-sensitive training: short micro-modules (60–90 minutes), asynchronous content, discipline-based cohorts.

**Faculty development design (training architecture)**

**Deliver training in four bundles**

i. AI foundations and limitations (hallucinations, verification, bias)
ii. Prompt engineering and workflow integration (lesson planning, case writing, rubrics)
iii. Assessment redesign and integrity (authentic assessment, oral checks, process-based rubrics)
iv. Ethics, privacy, copyright and citation (responsible use norms)

**Department-level adoption supports**

- Peer mentoring circles ("AI Teaching Clinics"), showcase sessions, and shared prompt libraries.
- Encourage transparent AI-use disclosure norms for faculty materials to reduce student trust gaps and integrity backlash (aligned with emerging policy debates).

**Policy recommendations for self-finance ecosystem**

- Local consortia among self-finance colleges in Bengaluru to share training resources and common policy templates.
- Include AI capability indicators in IQAC/NAAC internal quality systems (as professional learning evidence).

## LIMITATIONS OF THE STUDY

1. Cross-sectional design limits causal inference.
2. Self-reported measures may introduce social desirability bias.
3. The study focuses on Bengaluru self-finance faculty; generalization to government/aided institutions may be limited.
4. Rapidly changing AI tools and policies may shift barrier profiles over time (temporal instability).
5. If convenience sampling is used in practice, representativeness may reduce.

## CONCLUSION

Bridging the AI skill gap among self-finance faculty in Bengaluru is not only a training problem but a combined capability–conditions–confidence challenge. The reviewed literature shows that educator AI adoption depends on self-efficacy, perceived usefulness, facilitating conditions, and governance clarity, while the UNESCO competency framework provides a structured route for teacher capability building. The empirical model of the research (in terms of chi-square, correlation and regression)reveals that AI adoption barriers is a significant inhibitor factor while institutional support + self-efficacy are strong drivers for intention to AI adoption. For self-finance colleges, the implication in practice is straightforward: Invest in competency-based AI upskilling; address barriers through clear policy and infrastructure; and build faculty confidence with ongoing mentoring and assessment redesign support. Once institutionalized, such practices could transform AI from an informal productivity hack into a responsible-academic-capability.

**ABSTRACT**

This paper investigates how regression analysis can be used to identify and forecast sales trends. Statistical methods were employed to model the relationship between sales and influencing factors by using historical sales data. The study aims to provide insight into the various factors that affect sales(such as time, profit, discount, quantity sold,and customer segmentation).The results can assist businesses in optimizing their strategy through data-driven decision-making.

**Keywords**: forecasting, data analytics, regression analysis, sales trend, and predictive modeling.

## INTRODUCTION

Sales trend analysis is the act of analyzing sales data over time to find trends, patterns, and insights that can guide company choices. It helps businesses track the success of their products over time and forecast future demand. It entails analyzing past sales performance in order to better understand sales operations, consumer behavior, and market conditions.There are different types of statistical analysis, such as Descriptive, Inferential, Regression, Correlation, Time series Analysis, etc.One of the statistical analysistechniques for figuring out how variables relate to one another is regression analysis. Regression analysis will be used in this project to find patterns in the sales dataset, figure out how the various factors influencing sales are related, how the variables relate to one another, and forecast future sales.This analysis will help the company make data-driven decisions to maximize its inventory and marketing plans for the future.

This study aims toanalyze sales trends over a specified period (2019 - 2022) using regression analysis and forecast future sales based on historical data. This aim can be achieved through the following objectives;

**Objectives**

1. Compile& clean historical sales data for a specified time frame (yearly).
2. Employ regression models to ascertain the relationship between sales and other variables (such astime, profit, discount, quantity sold, customer segments).
3. Use statistical techniques to examine sales trends over time.
4. Create a forecasting model that uses historical trends to predict future sales.
5. Assess the prediction model's accuracy and make recommendations for enhancements.
6. Give actionable information based on the results.

## LITERATURE REVIEW

Understanding and predicting sales trends is a challenge that many businesses face, and regression analysis has been a powerful method for tackling this task. Over time, it has proven effective across various sectors, like in retail, finance, and economics,for uncovering patterns in historical sales data and forecasting future outcomes. In one notable study, Smith et al. [1] explored the application of multiple regression techniques to retail sales and found them to be particularly effective when multiple factors were involved. Their research showed that incorporating variables like marketing expenditure, seasonal trends, and pricing strategies allowed for a more accurate forecast. They emphasized that this method not only improves predictive accuracy but also helps businesses understand how different factors interact to influence sales outcomes. Building on this, Johnson and Lee [2] added another layer by integrating economic indicators into time series regression models. Their approach considered broader economic variables such as interest rates, inflation, GDP, and unemployment, and showed that these external elements have a significant impact on consumer behavior. By factoring them into regression models, they were able to generate forecasts that were more reflective of real-world dynamics. Meanwhile, Kumar et al. [3] took a comparative approach, analyzing how traditional regression methods stack up against newer machine learning-based models. While algorithms like Support Vector Regression and Random Forest Regression performed well in capturing complex, nonlinear patterns, the authors noted that the classical regression models were easier to interpret and implement. They suggested that a hybrid approach could strike a balance between model transparency and predictive power. Fernandez and Williams [4] focused on industries characterized by rapid changes, like fashion and tech, and investigated the use of polynomial regression. They found that this method helped capture more intricate sales patterns that linear models might miss. However, they also cautioned about overfitting, advocating for validation techniques to ensure the models remained reliable across different data sets. Lastly, Gupta and Verma [5] looked at how pricing strategies, particularly discounts, influence sales. Their research revealed that the effects of promotions vary depending on the product category, and that regression models can be instrumental in identifying and quantifying these differences. Their work provides valuable insights for businesses looking to fine-tune their pricing tactics to drive revenue. In summary, it is clear across these reviewed studies that regression analysis is supported to be use in sales forecasting. Whether through the traditional linear models or the advanced machine learning algorithms, it provides businesses with a valuable toolkit for making informed, data-driven decisions. As the field evolves, more emphasis is likely to be placed on combining the strength of the traditional statistical methods with the flexibility of the machine learning algorithms to enhance forecasting accuracy.

## METHODOLOGY

**Data Collection**

The dataset used in this study consists of the superstores' historical sales datacovering a period of five years from 2019 to 2022. Additional variables to be considered include profit, discount, and customer segment.

**Regression Model Selection:**
Use simple or multiple linear regression models to identify relationships between sales and independent variables such as sales,profit, discount, and customer segment.

**Model Evaluation Metrics**
The performance of the regression model is assessed using;

- R-squared ($R^2$): This measures the proportion of variance explained by the model.
- Mean Absolute Error (MAE): This assesses prediction accuracy.
- Root Mean Square Error (RMSE): This evaluates the overall model performance.

## RESULTS AND DISCUSSION

**The 5-year dataset was cleaned and became:**
**The Summary Statistics are as shown below:**

**What these summary statistics mean:**
Good Model Fit: Since $R^2 = 0.865$, the model explains most of the variation in sales.
Moderate Statistical Significance: Since P-value = 0.069, it means that the predictor is not strongly significant but close to being significant.
**The regression equation used was;**

**The built-in Excel function used was;**
=FORECAST.LINEAR(unknown xs, known ys, known xs)

**The values for the forecasted sales are as shown below:**

**Model Accuracy Evaluation:**

- $R^2 = 1$ means the model fits the data well.

R-squared ($R^2$) is a measure of the Goodness of Fit. This measures how well the independent variables explain the variability in the dependent variable.

- RMSE= 62.19% is a high value, which means the model has a high prediction error, suggesting that the forecasted values are not very reliable.

Root Mean Squared Error (RMSE) is a type of Model Error. This measures the average difference between actual and predicted values. A Lower RMSE (which ranges from 10 – 20%) means better predictions.
Graphical Representation of Data:

## CONCLUSION

This paper confirmed the efficacy of regression analysis in sales trend forecasting. Businesses can leverage these models to make data-driven decisions, optimize marketing strategies, and anticipate market changes. Future research may explore more models combining regression with machine learning techniques for improved accuracy.

## ABSTRACT

Selenium is an essential trace element and a key component of physiologically important selenoproteins that regulate oxidative balance and support normal cellular functions. Selenium nanoparticle (SeNP) green production employing plant extracts offers advantages over chemical and microbial approaches, owing to its eco-friendly and biocompatible nature. In this study, SeNPs were synthesized using *Moringa oleifera* leaf aqueous extract (MOSeNPs) and biophysical characterization carried out by UV–Vis.Spectroscopy, FTIR, XRD, SEM and TEM. Characteristic absorption pattern of the MOSeNPs, confirmed by FTIR indicates the involvement of phytochemicals such as phenols, polysaccharides, and proteins in reduction and stabilization. XRD and TEM analyses revealed spherical to polygonal particles with a size distribution of 86–158 nm.The biological properties of MOSeNPs were extensively evaluated. Antioxidant assays showed significant elevation of glutathione, superoxide dismutase, and catalase activity, alongside reduced lipid peroxidation, confirming their strong free radical scavenging potential. Cytotoxicity assays indicated minimal toxicity toward peripheral blood mononuclear cells (PBMCs; $LC_{50}$ = 2222.22 µg/mL), while sulforhodamine B assays revealed potent anticancer activity against MCF-7 breast cancer cells ($EC_{50}$ = 148.37 µg/mL). A high selectivity index (SI = 14.98) highlighted preferential cytotoxicity toward cancer cells. Furthermore, scratch assays confirmed concentration-dependent inhibition of MCF-7 migration, underscoring the anti-metastatic potential of MOSeNPs. Collectively, these results confirm the successful green synthesis of biogenic selenium nanoparticles with strong

antioxidant, selective anticancer, and anti-metastatic properties. MOSeNPs emerge as promising candidates for future biomedical applications, particularly in cancer therapeutics(Graphical Abstract).

**Keywords:** *Moringa oleifera*; Selenium nanoparticles; Green synthesis; Phytochemical capping; Antioxidant activity; Anticancer activity; MCF-7 cells; Nanobiotechnology.

## INTRODUCTION

Inflammatory disorders, oxidative stress–related diseases, and cancer continue to rise globally, compounded by the emergence of multidrug-resistant cancer cells and the adverse effects associated with synthetic drugs and chemotherapy [1]. Advances in nanotechnology have therefore enabled the development of nanomaterials for diagnosis, treatment, and biological regulation, offering new therapeutic opportunities [2]. Selenium (Se), a chalcogen present in several oxidative states such as selenide, selenate, and selenite [3], holds particular relevance due to its essential role in cellular homeostasis [4]. As a component of key antioxidant enzymes—including thioredoxin reductase, glutathione peroxidase, and deiodinase—Se contributes to metabolism, redox balance, and detoxification [5], while Se deficiency has been associated with cancer, immune dysfunction, and neurological disorders [6]. Selenium nanoparticles (SeNPs) exhibit biocompatibility, reduced toxicity, and multifunctional bioactivities, including antibacterial, antioxidant, anti-inflammatory, anticancer, and drug-delivery properties [7, 8]. Synthesis of SeNPs can be possible through chemical, physical, or biological routes [9]; however, chemical and physical methods often involve toxic reagents and poor biocompatibility [7]. Biological approaches, particularly those employing plant extracts and microorganisms, offer a greener, more sustainable alternative [10, 11]. Plant-mediated synthesis is especially advantageous because extracts naturally contain phenols, flavonoids, tannins, alkaloids, and saponins that act as both reducing and stabilizing agents [12]. The genus *Moringa* comprises 13 species distributed across tropical regions [13, 14], recognized for their nutritional richness and pharmacological significance [15]. Among them, *Moringa oleifera* Lam., the "miracle tree," exhibits diverse therapeutic activities, including antidiabetic, anti-inflammatory, antioxidant, hepatoprotective, and antimicrobial effects [16–19]. Extracts of *M. oleifera* have previously supported the green synthesis of Ag and Zn nanoparticles with notable bioactivities [20,21]. Despite its extensive traditional and pharmacological relevance [22–24], the potential of *M. oleifera* for the green synthesis of selenium nanoparticles remains underexplored. The present study focuses on green biosynthesis and phyto-decoration of selenium nanoparticles (SeNPs) utilizing aqueous leaf extracts of *Moringa oleifera*. Also carry out detailed physicochemical characterization of the synthesized SeNPs, followed by a comprehensive evaluation of their antioxidant, anticancer, anti-metastatic, anti-proliferative, and cytotoxic activities. The findings provide valuable insights into the potential biomedical applications of plant-mediated selenium nanoparticals.

## MATERIALS AND METHODS

**Plant collection and extraction procedure**

Fresh green leaves of *M. oliefera* plant(Family Moringacae, Order Brassicales) had been collected during the winter season from the Pulgaon-Nachangaon region (GPS Lat. $20.707802^0$ N, Long. $78.326263^0$E) of the Wardha district, Maharashtra. The plant materials were taxonomically identified and authenticated by a Senior Taxonomist. Voucher specimens were prepared and deposited at the Department under the reference numbers A.C./B.C./1/2022–23.500 mL of sterile double-distilled water was used to immerse 50 g of powdered leaves. The reaction mixture was continuously stirred in a water bath at 60°C for 30–40 minutes. Then it was allowed to cool to room temperature. Whatman No. 1 filter paper (HiMedia, India) was used to filter the mixture. The obtained filtrate was further centrifuged at 1000 rpm for 5 minutes using centrifuge (Remi, India) to remove residual coarse particles. The resulting aqueous extract was then stored at 4°C until further use [21].

**Qualitative phytochemical studies**

Major phytoconstituents in the aqueous extract of *Moringa oleifera* were preliminarily identified using thin-layer chromatography (TLC) following established protocols [25]. The developed chromatographic spots were examined under UV light at 254 and 366 nm [26]. Flavonoids detection done by spraying ethanolic aluminum chloride solution, whereas phenols, terpenes, and sugars visualized by using p-anisaldehyde/sulfuric acid reagent. The screening of alkaloids was confirmed by Dragendorff's reagent [27].

**Quantitative phytochemical analysis**

Quantitative phytochemical profiling of the *Moringa oleifera* leaf aqueous extract was performed using HPTLC (High-Performance Thin Layer Chromatography). Aliquots of the extract, along with quercetin and berberine HCl standards, were applied as 8-mm bands onto silica gel 60 F254 plates using a Linomat applicator. Chromatographic separation for quercetin estimation was carried out in a mobile phase of toluene:acetic acid:methanol (4.10:2:0.5, v/v/v), whereas berberine quantification employed toluene:ethyl acetate:methanol:formic acid (3:3:0.5:0.5, v/v/v/v). Plates were developed up to 80 mm, air-dried, and scanned densitometrically at 254 nm for quercetin and at both 254 nm and 366 nm for berberine using winCATS software. Peak identity was confirmed by matching Rf values and UV absorption spectra with respective standards. Quantification was achieved by comparing sample peak areas with calibration curves constructed from known concentrations of quercetin and berberine HCl.

**Se-nanoparticles (SeNPs) synthesis and characterization**

Selenium nanoparticles (SeNPs) were synthesized using sodium selenite ($Na_2SeO_3$, 10 mM; HiMedia, India) following a previously described protocol [31] with minor modifications. Different volumes (2–10 mL) of *Moringa oleifera* leaf extract were added dropwise to 10 mL of 10 mM $Na_2SeO_3$ under stirring with magnetic stirrer, and optimal synthesis was obtained using 4 mL of leaf extract. The reaction was kept at room temperature and given a full 24h to occur in the dark at 37 ± 2 °C (~150 rpm), SeNP production was indicated by the solution's transformation from pale yellow to brick red at this time.UV-Vis spectrophotometry (Shimadzu UV-1900i, Japan; 200–400 nm) was used to track the reaction's development. After centrifuging the resultant MOSeNPs for 30 minutes at 15,000 × g, they were repeatedly cleaned with distilled water and ethanol, dried overnight, and then ground manually into a fine powder for storage at 4 °C. MOSeNPs' optical, structural, and morphological properties were then examined. The UV-Vis absorption spectra were noted [32], compared with references and found correct. FTIR analysis (Thermo Nicolet Avatar 370, USA) was performed in the range of 400–4000 $cm^{-1}$ to identify functional groups involved in nanoparticle stabilization. A Bruker AXS D8 Advance diffractometer (CuK$\alpha$, $\lambda$ = 1.5405 Å) was used to obtain XRD patterns with a 2θ range of 20°–80°, and the Scherrer equation was utilized for estimating crystallite size. Morphology was examined using SEM (JSM-6390LV, JEOL, Japan), followed by high-resolution TEM (JEM-2100, JEOL, Japan) for detailed lattice imaging, as described previously [33]. All characterization analyses were conducted at the Sophisticated Test and Instrumentation Centre (STIC), Kochi.

**Bioactivity potential Screening of MOSeNPs**

***In-vitro* Cell Culture Study**

***MCF-7 Breast Cancer Cell Culture***

In poly-L-lysine-coated flasks, MCF-7 breast cancer cells (NCCS, Pune, India) were cultivated in MEM/DMEM (HiMedia, India),10% FBS and 1% antibiotic-antimycotic solution (10,000 units/mL penicillin, 10 mg/mL streptomycin, and 25 μg/mL amphotericin B) were added as supplements. Culture cells were incubated at 37 °C and 5% CO2. [34]. The Ficoll–Histopaque method [35] was used to separate the peripheral blood mononuclear cells (PBMCs) from whole blood. In flasks coated with poly-L-lysine, they were later cultured in DMEM supplemented with 10% FBS and 1% antibiotic–antimycotic solution (10,000 units/mL penicillin, 10 mg/mL streptomycin, and 25 μg/mL amphotericin B) [36].

**Drug formulation of Nanoparticles (MOSeNPs)**

Drug formulation i.e *Nanoparticles* MOSeNPswere prepared by Mr. Vivek Jedhe as a part of doctoral work. The nanoparticles were in powder form. 100 mg of MOSeNPs was dissolved in 10 ml of the nutrient mixture media and

allowed to get solvate for 24 hr.The following day, a 0.22 micron syringe filter was used to filter it. The recovered filtrate was utilized as a 10 mg/ml stock for additional research [37].

**Measurement of cell viability: Trypan blue exclusion assay**

To put it briefly, 50 µL of cleaned cell suspension, 400 µL of PBS, and 50 µL of Trypan blue were added to a hemocytometer chamber. Viable (unstained) and non-viable (blue-stained) cells were counted under a light microscope. The following formula was used to calculate the cell concentration (cells/mL): average number of cells per large square × dilution factor × 104; unless further correction was required, the dilution factor was 2 (1:1 dilution with Trypan blue) [38].

**Measurement of cytotoxicity**

The XTT test, which evaluates mitochondrial enzyme activity in living cells by reducing XTT to a soluble formazan product proportionate to cell viability, was used to evaluate cytotoxicity [39]. In 48-well plates, PBMCs were seeded at a density of $2 \times 10^2$ cells/15 µL per well, treated with MOSeNPs at five different doses (controls excluded), and then incubated at 37 °C for 48 hours. After adding 10 µL of XTT reagent to each well and incubating at 37 °C for four hours, the absorbance at 450 nm was measured [40].In addition to the Sulforhodamine B experiment to measure cellular protein content and cell density following 48 hours of drug exposure, the assay was repeated to analyze the anticancer activity of MOSeNPs against MCF-7 cells. Cell viability was represented as a percentage of untreated controls (100%), and nonlinear regression (curve fitting) was used to calculate $EC_{50}$ and $LC_{50}$ values [41].

**Scratch test**

Cell migration was evaluated using the scratch assay, in which a wound gap is introduced into a confluent cell monolayer and closure is monitored over time [40, 41]. In 48-well plates MCF-7 cells were seeded at a density of $2 \times 10^4$ cells per well, and then after 24 hrs, at the center of each well, a linear scratch was created. Washing was used to remove detached cells. After adding MOSeNPs at doses of 6, 12.5, 25, 50, and 100 µg/mL, the cells were incubated for 48 hours.

**Sulphorhodamine dye assay**

The *in vitro* anticancer efficacy of MOSeNPs against MCF-7 cells was evaluated using the Sulforhodamine B (SRB) test as outlined by Vichai and Kirtikara [40, 41]. After being seeding in 96-well plates (HiMedia), the cells were exposed to MOSeNPs and incubated for 48 hours. After applying 100 µL of 10% trichloroacetic acid to each well, growth was stopped. Adherent cells were fixed by incubation for one hour at 4 °C. Wells were washed with distilled water and air-dried. Then stained for 30 minutes at room temperature using a 0.05% SRB solution in 1% acetic acid. After washing with 1% acetic acid to get rid of extra pigment, the bound dye was dissolved in 100 µL of 0.01 M Tris-HCl buffer (pH 10.4). A microplate reader (Robonik Readwell Touch, India) was used to measure absorbance at 540 nm.

**Morphological Observation**

An inverted tissue culture microscope (Metzer, India) was used to take photomicrographs of the morphological alterations in MCF-7 cells after they were treated with MOSeNPs.

**Selectivity Index**

The Selectivity Index (SI) was calculated as the ratio of cytotoxicity against normal fibroblast cells to cytotoxicity against cancer cells. The formula used to determine the SI was; *SI = $IC_{50}$ (normal fibroblast cells) / $IC_{50}$ (cancer cells*). Values greater than 1 indicate selective activity toward cancer cells *in vitro* [42].

**Statistical Analysis**

To guarantee statistical reliability and reproducibility, every experiment was carried out in triplicate. The findings were presented as a percentage or mean ± standard deviation. The t-test in MedCalc statistical software (version 10) was used to compare groups; $p < .05$ was deemed statistically significant.

**Antioxidant study**

**Lipid peroxidation (LPO/MDA)**

Malondialdehyde (MDA), a major end-product of lipid peroxidation, forms a 1:2 chromogenic adduct with thiobarbituric acid (TBA), enabling its spectrophotometric quantification as thiobarbituric acid reactive substances (TBARS). Cellular oxidative stress increases TBARS levels, whereas antioxidants reduce them over time. Lipid peroxidation (LPO/MDA) in the culture supernatant was estimated following the modified method of Satoh *et al*. (1978) [43]. Briefly, 100 µL of sample or distilled water (blank) was mixed with 750 µL of 20% acetic acid and 750 µL of 0.8% TBA, and the final volume was adjusted to 2 mL. The reaction mixture was heated at 95 °C for 60 min, cooled under running water to allow pink chromophore formation, and centrifuged at 10,000 rpm for 10 min. Absorbance of the supernatant was recorded at 532 and 600 nm, and MDA concentration (nM/mL) was calculated as:

$$\text{Concentration of MDA } \left(\frac{\text{nM}}{\text{mL}}\right) = \frac{(\text{Absorbance at } 532) \; - \; (\text{Absorbance at } 600)}{155} X \; 100$$

**Reduced Glutathione (GSH)**

The reduced glutathione (GSH) content was estimated using the DTNB-based colorimetric method, wherein 5,5′-dithiobis(2-nitrobenzoic acid) reacts with sulfhydryl groups to yield a yellow chromophore, 5-thio-2-nitrobenzoic acid (TNB), measurable at 412 nm. GSH levels were quantified following the modified procedure of Moron *et al*. (1979) [44] using a standard curve prepared from 4–256 µM GSH.

**Catalase Activity**

Catalase activity was assessed using the method of Sinha (1972) [45], based on the heat-induced reduction of dichromate in acetic acid to chromic acetate by residual $H_2O_2$. The resulting green chromophore was measured at 583 nm, and catalase activity was expressed as µmol $H_2O_2$ decomposed per min per mL.

**Superoxide Dismutase (SOD) Activity**

Superoxide dismutase (SOD) activity was determined using the pyrogallol autoxidation assay described by Marklund and Marklund (1972) and modified by Li (2021) [46]. Samples were mixed with Tris–HCl–EDTA buffer and pyrogallol, and the rate of autoxidation was monitored at 325 nm for 5 min. SOD activity (U/mL) was calculated from the percentage inhibition of pyrogallol oxidation, where 50% inhibition corresponds to 1 U of enzyme

**DPPH Assay**

The antioxidant potential of MOSeNPs was further evaluated using the DPPH radical-scavenging assay according to established methods [47–49]. MOSeNPs (6–100 µg/mL) were incubated with DPPH solution (0.04 mg/mL in methanol) for 30 min in the dark, and absorbance was recorded at 517 nm. Radical-scavenging activity was calculated as % inhibition = $((A_0 – A_s)/A_0) \times 100$, using ascorbic acid (1 mg/mL) as the reference antioxidant.

## RESULTS AND DISCUSSION

**Phytochemical analysis of *Moringa oleifera* leaves aqueous extract**

Preliminary phytochemical screening of the aqueous extract of *Moringa oleifera* by thin-layer chromatography demonstrated the presence of multiple classes of secondary metabolites. Several well-defined spots were detected under UV light at 254 and 366 nm, indicating a chemically rich matrix. Derivatization with ethanolic aluminum chloride produced strong yellow fluorescence, confirming the abundance of flavonoids. Application of p-anisaldehyde–sulfuric acid revealed prominent purple and blue bands corresponding to phenols, terpenes, and carbohydrates, suggesting a diverse array of primary and secondary metabolites. Dragendorff's reagent yielded only faint orange coloration, indicating that alkaloids are present at trace levels, consistent with the known phytochemical profile of *Moringa* leaves. To substantiate these findings and quantify marker constituents, HPTLC analysis was performed using quercetin and berberine HCl standards. The chromatographic fingerprint obtained at 254 nm

showed ten resolved peaks, reflecting substantial phytochemical diversity. A distinct band co-migrating with quercetin appeared at Rf 0.73, and densitometric evaluation revealed that this peak contributed 4.80% of the total peak area, confirming quercetin as a characteristic flavonol component of the aqueous extract. The moderate intensity of the quercetin peak aligns with previous literature reporting *Moringa* as a flavonoid-rich species with notable antioxidant potential. In contrast, evaluation of alkaloid content using berberine HCl as a standard showed only minimal correspondence. At 366 nm, a weak fluorescent peak at Rf 0.47 matched the berberine standard; however, the low peak area indicated that berberine or berberine-like alkaloids occur only in negligible quantities. This observation corroborates the TLC findings and supports the chemotaxonomic expectation that *Moringa oleifera* is predominantly a source of phenolic and flavonoid metabolites rather than isoquinoline alkaloids. Collectively, the TLC and HPTLC results confirm that the aqueous leaf extract of *Moringa oleifera* is characterized by high phenolic and flavonoid content, with quercetin serving as a key bioactive marker, while alkaloids are present only at trace levels.

**Biosynthesis and characterization of MOSeNPs**

The bioreduction of $Na_2SeO_3$ to elemental selenium ($Se^0$) by the *M. oleifera* extract was visually confirmed by the characteristic color transition of the reaction mixture from colorless to brick red, indicating successful SeNP formation (Figure 1A). The UV–Vis spectrum of the biosynthesized MOSeNPs (Figure 1 B) exhibited clear optical features confirming successful nanoparticle formation and phytochemical involvement. A strong absorption peak at 210–230 nm indicated $\pi \rightarrow \pi^*$ transitions associated with proteins, peptides, and other organic constituents from *Moringa oleifera* extract, reflecting their role in reducing and stabilizing selenium. A broad shoulder appearing at 260–280 nm corresponded to aromatic phytochemicals, including phenolics and flavonoids, suggesting effective phytochemical capping on the nanoparticle surface. The gradual decline in absorbance from 300 to 400 nm, with no visible-range plasmon resonance, is characteristic of non-metallic, biogenic selenium nanoparticles. Collectively, these spectral features confirm efficient phytoreduction and surface functionalization by *M. oleifera* bioactive compounds, yielding stable MOSeNPs with optical properties consistent with previously reported plant-mediated SeNP systems[5, 10, 33-36]. Figure1.(A) Showing successful synthesis of MOSeNPs. (B) UV–Vis absorption spectrum of MOSeNPs showing an increase in absorbance intensity of reaction mixture after 24h. The structural and morphological characteristics of the biosynthesized MOSeNPs were assessed using SEM, TEM, and XRD analyses (Figure 2). The SEM micrograph (Figure 2A) revealed aggregated, irregularly shaped nanoparticles with a heterogeneous surface texture, which is typical of phytochemically synthesized selenium nanoparticles due to biomolecule-mediated stabilization. TEM imaging (Figure 2B) further confirmed the formation of selenium nanoparticles exhibiting irregular polyhedral to quasi-spherical morphologies, with particle sizes ranging from 86–158 nm. The observed polydispersity reflects the influence of diverse reducing and capping phytochemicals present in *Moringa oleifera* extract, which modulate nucleation and growth dynamics during synthesis. The nanoparticles showed high electron density, indicating well-developed core structures enveloped by organic residues. The XRD pattern (Figure 2C) displayed broad, low-intensity peaks characteristic of nanocrystalline to partially amorphous selenium, consistent with the limited long-range order often observed in green-synthesized nanoparticles. These results align with previous studies on plant-mediated SeNPs, where broad XRD peaks were consistently reported, confirming their nanocrystallinity [50,51]. Collectively, the combined microscopic and diffraction analyses validate the successful green synthesis of MOSeNPs with stable morphology, moderate size variation, and partially amorphous structural characteristics suitable for biological applications.

**Figure 2.** Structural and morphological characterization (SEM, TEM, XRD) of MOSeNPs

(A) SEM micrograph (10,000×) showing morphology the nanoparticles (B) TEM analysis verifies the formation of selenium nanoparticles with irregular polyhedral nanoparticles with sizes ranging from approximately 86–158 nm (C) XRD pattern reveals the nanocrystalline / amorphous structure of the nanoparticles.

The FTIR spectra of the *Moringa oleifera* aqueous extract and the synthesized MOSeNPs are presented in Figure 3. The spectrum of the crude extract (Figure 3A) showed a broad absorption band around 3270–3350 $cm^{-1}$, corresponding to O–H stretching of hydroxyl groups, indicating the presence of phenolics and carbohydrates. Peaks observed at 2920–2850 $cm^{-1}$ were associated with C–H stretching of aliphatic groups, whereas the band near 1630–1650 $cm^{-1}$ represented C=O stretching of amide or carbonyl functional groups. Additional signals in the range of 1000–1100

$cm^{-1}$ corresponded to C–O and C–O–C stretching vibrations of polysaccharides. These functional groups are known to play key roles in the reduction and stabilization of metal nanoparticles during green synthesis. In comparison, the FTIR spectrum of MOSeNPs (Figure 3B) showed clear shifts in the major functional groups, along with changes in intensity, confirming their involvement in nanoparticle formation. The reduced intensity of the O–H band suggests its participation in the reduction of selenium ions. Shifts in the carbonyl- and amine-related peaks indicate their role in capping and stabilizing the nanoparticle surface. Notably, the appearance of a characteristic band at approximately 549 $cm^{-1}$, corresponding to Se–O/Se–Se vibrations, confirms the successful synthesis of selenium nanoparticles. The observed spectral modifications clearly demonstrate that biomolecules present in *M. oleifera* extract act as natural reducing and stabilizing agents in the formation of MOSeNPs [52].

**Biological activities of MOSeNPs**

**Result of cytotoxicity assay of MOSeNPs in PBMCs**

Figure 4 depicts the result of *Cytotoxicity evaluation of* MOSeNPs*in PBMCs and* $LD_{50}$ *determination* increasing concentrations (6–100 μg/mL). We found that MOSeNPs showed minimal cytotoxicity in normal PBMC cells across all tested concentrations. MOSeNPs shows $LD_{50}$ value2222.22 μg/mL indicating a more potent effect but still within biocompatible limits.

**Result of Anticancer activity of MOSeNPs in MCF-7 cells**

Microscopic analysis revealed dose-dependent morphological changes in treated cells, including cell shrinkage, rounding, and detachment, indicative of cytotoxicity. The effect was more pronounced at higher concentrations (as shown in Figure 5).

**Figure 5.** Morphological assessment of MCF7 cells treated with different concentrations of MOSeNPs. MCF7 cells were treated with varying concentrations (6, 12.5, 25, 50, and 100 μg/mL) of MOSeNPs for 48 hours (Untreated cells served as the control). The cytotoxic effect of nanoparticles MOSeNPs on MCF-7 breast cancer cells was assessed using the Sulforhodamine B (SRB) assay across a concentration range of 6 to 100μg/mL. As shown in Figure 6-A, MOSeNPsshowed lower cytotoxicity at lower concentrations (6–25 μg/mL) but demonstrated a marked increase in inhibition at higher concentrations, particularly at 50 and 100 μg/mL. Notably, MOSeNPs achieved a higher percentage of inhibition at the maximum tested dose, suggesting a stronger dose-dependent response. To evaluate the potency of nanoparticle formulations, $EC_{50}$ values were determined using linear regression analysis. For MOSeNPs (Figure 6-B), the regression equation ($y = 0.3375x$, $R^2 = 0.9889$) indicated a strong linear relationship between concentration and % inhibition, with an $EC_{50}$ value calculated as 148.368 μg/mL. These findings suggest that MOSeNPs exhibit anticancer activity, and also shows potency in inhibiting MCF-7 cell proliferation. To determine the preferential cytotoxicity of the nanoparticle toward cancerous cells over normal cells the Selectivity Index (SI) [42] was calculated. This was done using the $LC_{50}$ value for the normal PBMC cell line and the $EC_{50}$ value for the MCF-7 cancer cell line, following the protocol described by Bułakowska *et al*. (2023).The Selectivity Index (SI) was calculated to determine their selectivity toward cancer cells.SI = $LC_{50}$ (PBMC cells) / $EC_{50}$ (MCF-7 cells).The results are summarized in the Table 1 below. MOSeNPs demonstrated an $LC_{50}$ of 2222.22 μg/mL for PBMC and an $EC_{50}$ of 148.37 μg/mL for MCF-7 cells, yielding a high SI of 14.98. This value exceeds the benchmark of SI > 10, identifying MOSeNPs as a promising anticancer agent worthy of further development. These findings suggest that MOSeNPs possess selective cytotoxicity toward cancer cells. Also shows strong promise for further investigation and optimization due to its high selectivity index.

**Table 1**: The selectivity index values in relation to MCF-7 cells for MOSeNPs.

**Note:** SI > 2 indicates potential selectivity toward cancer cells; SI > 10 is often considered very promising for further development.

**Result of Anti-metastasis activity of MOSeNPs on MCF cells**

Figure 5 show the Result of Anti-metastasis activity of MOSeNPs in MCF-7 cells, as inhibitory index for spread of cancer. Scratch assay is a wound healing assay used to evaluate cell migration and assess the anti-metastatic potential

of compounds *in vitro* [47]. The scratch wound healing assay results shows a distinct difference in cell migration across various concentrations of MOSeNPs over 48 hours (Figure.5). In the control group, there was significant wound closure by 24 and 48 hours, indicating active cell proliferation and migration. At a low concentration of 5 μg/ml of MOSeNPs, some degree of cell migration was still evident, though reduced compared to the control. As the concentration increased to 12.5μg/ml and 25μg/ml, a marked reduction in wound closure was observed, suggesting a concentration-dependent inhibition of cell motility. At higher concentrations of 50μg/ml and 100μg/ml, there was minimal to no observable migration, and the scratch remained largely open even after 48 hours, indicating a strong inhibitory effect on cell migration. These findings suggest that MOSeNPs has promising potential as an anti-metastatic agent in breast cancer therapy, capable of impeding the migration of cancer cells and thereby potentially limiting cancer progression and metastasis. Figure 5: Depicts scratch wound healing assay performed on MCF-7 breast cancer cells to evaluate the anti-metastatic potential of MOSeNPsat varying concentrations over 48 hours. The assay tracks cell migration and wound closure at 0, 24, and 48 hours. The dotted lines indicate the scratch margins at 0 hours. Result of antioxidant activity of MOSeNPs against MCF7 using LPO/MDA, GSH, SOD, Catalase and DPPH Assay respectively. LPO/MDA, GSH, SOD, and Catalase assays assess oxidative stress and antioxidant defense status in cells by measuring lipid peroxidation, glutathione levels, superoxide dismutase, and catalase activity, respectively. [48-50]. Treatment of MCF-7 cells with varying concentrations of MOSeNPsinduced significant changes in oxidative stress markers. The lipid peroxidation levels, measured as malondialdehyde (MDA) concentration, showed a marked reduction upon treatment with MOSeNPs compared to the untreated control group.

At 6 μg/mL, the nanoparticles significantly reduced MDA levels. This trend continued at 12.5 μg/mL and 25 μg/mL concentrations, where MOSeNPs maintained lower MDA levels, indicating superior inhibition of lipid peroxidation. At 50 μg/mL, MOSeNPs again resulted in a more notable decline in MDA levels. However, at the highest concentration tested (100 μg/mL), MDA levels showed a slight increase in the treatment, suggesting a possible concentration-dependent threshold beyond which antioxidant efficacy may plateau or decline. Overall, MOSeNPs demonstrated better protective effects against oxidative lipid damage (figure 7a).The levels of reduced glutathione (GSH), a critical intracellular antioxidant, varied significantly between MOSeNPstreatments across the tested concentrations (figure 7b). In the untreated control group, GSH levels were similar the nanoparticles. Upon treatment, MOSeNPsconsistently elevated GSH levels in a concentration-dependent manner, peaking at 12.5 μg/mL, and maintaining high levels across all subsequent concentrations, indicating its role in enhancing antioxidant defense. Overall, MOSeNPs demonstrated a more robust and consistent enhancement of cellular GSH levels. Figure 7: Evaluation of oxidative stress parameters in MCF-7 cells treated with different concentrations of MOSeNPs. (a) Lipid peroxidation levels were assessed by measuring malondialdehyde (MDA) concentration (nM/mL), (b) Intracellular reduced glutathione (GSH) levels (μM), (c) Superoxide dismutase (SOD) activity (U/mL),(d) Catalase activity, expressed as μmoles of $H_2O_2$ consumed per minute per mL. Data are expressed as mean ± standard deviation (SD) from three independent replicates. *$P < 0.05$ compared to respective control*. Superoxide dismutase (SOD) activity, an essential marker of cellular antioxidant defense, was assessed across varying concentrations of MOSeNPs (figure 7c). In the control group, MOSeNPs treatments showed comparable SOD activity.

Upon exposure, a general increasing trend in SOD activity was observed for MOSeNPs with increasing concentrations. depicts MOSeNPs -treated samples exhibited a gradual and consistent rise in SOD activity from 12.5 μg/mL onwards, peaking at 50 μg/mL, followed by a slight decrease at 100 μg/mL. Although the overall increase was slightly lower than that observed with MOSeNPs. Notably, at 50 μg/mL, MOSeNPs induced the highest SOD activity among all groups, indicating a potentially stronger antioxidant response. These findings suggest that MOSeNPs can stimulate antioxidant enzyme activity with higher efficacy. Fig 7-d shows catalase activity, measured as the decomposition rate of hydrogen peroxide ($H_2O_2$), was evaluated in response to varying concentrations of MOSeNPs. The treatment groups showed similar catalase levels in the control condition. Upon nanoparticle exposure, MOSeNPs displayed relatively stable catalase activity across all tested doses, SeNP5 induced a dose-dependent increase, peaking at 100 μg/mL. This suggests that MOSeNPs may effectively enhance catalase-mediated antioxidant defense under oxidative stress conditions. Figure 8 shows the result of DPPH assay. The deep violet color of the DPPH solution, indicative of the presence of free radicals, faded upon the addition of antioxidant agents,

demonstrating their radical scavenging ability. Visual observation showed a clear color change in all treated samples, and spectrophotometric analysis at 517nm further confirmed these findings. Ascorbic acid showed the highest antioxidant activity, as reflected by the lowest absorbance value, indicating effective quenching of DPPH radicals. The nanoparticles, MOSeNPs exhibited lower antioxidant activity than Ascorbic acid, as evidenced by a lower absorbance value, suggesting a significant radical scavenging efficiency. MOSeNPs formulations showed antioxidant potential, highlighting its promise as a potent antioxidant agent.

## CONCLUSION

In summary, the present study provides the first comprehensive evaluation of the bio-reductive synthesis of selenium nanoparticles using the aqueous leaf extract of *Moringa oleifera* (MOSeNPs). The findings demonstrate that MOSeNPs possess significant, antioxidant and anti-breast cancer activities, while maintaining compatibility with normal cells. The surface phytodecoration achieved through plant-derived biomolecules offers a clear and clever advantage over chemically or microbially synthesized nanoparticles, resulting in enhanced stability, improved cellular uptake, and superior bioactivity. These attributes highlight the potential of green-synthesized SeNPs as safer and more effective alternatives to conventional chemotherapeutic agents. Overall, the study supports the application of MOSeNPs as promising natural candidates for future use in food, biomedical, and pharmaceutical industries.

## ACKNOWLEDGMENTS

The authors gratefully acknowledge the Principal, Dr. Ambedkar College, Nagpur, and Dr. Utpal Dongre, Head, Department of Biochemistry, for providing research laboratory facilities. Sincere thanks are extended to Ph.D. guide Dr. Bhuwaneshwari Mehere for continuous technical and moral support. The authors also thank Prof. Dr. Dongarwar (RTM Nagpur University) and Dr. Kshirsagar and Dr. Jadhao (ASC, Pulgaon) for plant identification. The support of STIC, Kochi, Kerala, for XRD, SEM, TEM, and FTIR analyses, and Qualichem Laboratories, Nagpur, for phytochemical analysis, is gratefully acknowledged.

### CONFLICTS OF INTEREST

The authors declare no conflict of interest.

## ABSTRACT

Fracture of metal-ceramic fixed partial dentures (FPDs), particularly at the connector–pontic interface, remains a significant clinical complication despite high long-term survival rates. Stress concentration at gingival embrasures is the most common biomechanical cause. Optimizing framework geometry may mitigate these failures. To evaluate the effect of connector cross-sectional area, and fillet radiuson stress distribution and deformation in three-unit metal-ceramic FPDs using finite element analysis (FEA). A three-dimensional, linear-elastic FEA model of a mandibular four-unit FPD replacing the second premolar and first molar was constructed from μCT-derived geometry. A control (3 × 3 mm connector, Fillet 0.25 mm) and a modified variants (4 × 4 mm connector, 0.75 mm fillet radius) with Ni–Cr alloy and veneering porcelain were modeled as isotropic elastic materials. Models were meshed with quadratic tetrahedral elements, convergence verified at ≤ 5% stress change. Physiologic boundary conditions were applied with a 200 N vertical and a 150 N oblique load at 30°. Outcomes included peak von Mises stress, total deformation, and high-stress surface area (≥ 80% of maximum). The control model exhibited a peak stress of 83.23 MPa and maximum deformation of 4.249 μm, and the modified model exhibited a peak stress of 15.56MPa and maximum deformation of 1.026μm. The modified design reduced peak stress by 81% and deformation by 76%, with a seven-fold reduction in high-stress area. Geometric modifications substantially enhance stress distribution and structural resilience of metal-ceramic FPDs. Optimized framework design may reduce fracture risk and improve long-term prosthesis survival.

## INTRODUCTION

Fixed partial dentures (FPDs), particularly porcelain-fused-to-metal (PFM) restorations, have long been considered the gold standard in the replacement of missing teeth—especially in posterior regions where both strength and aesthetics are paramount. Their clinical success over decades is attributed to the balance between the rigidity of the metal substructure and the aesthetic appeal of veneering ceramics. However, despite high survival rates of over 90% at 5 years, PFM FPDs are not immune to mechanical failures, with connector fractures and porcelain chipping being among the most common technical complications (1-3). These failures, though often considered minor, carry significant clinical and economic implications. In many cases, a fractured connector or de-bonded veneer necessitates complete prosthesis replacement, increased chair time, and potential re-preparation of abutment teeth—ultimately affecting patient satisfaction and long-term outcomes (4). Understanding how to redistribute stresses and improve the mechanical design of FPD frameworks is therefore essential to minimizing these risks.

Multiple clinical studies have shown that the most frequent origin of FPD fractures is the connector area—particularly at the gingival embrasure of the pontic–retainer interface. This location is biomechanically the most vulnerable under functional loading (5). A systematic review by *Pjetursson et al.* reported that up to 27% of all technical failures in PFM FPDs could be attributed to framework-related problems, and nearly 13% to veneer fractures (1). These fractures often start as microcracks due to fatigue or stress concentration and eventually propagate under repeated chewing cycles (6). Once initiated, fracture progression in metal-ceramic frameworks tends to be unpredictable. In vitro and in vivo analyses of failed prostheses have confirmed that microstructural flaws at the metal–ceramic junction, suboptimal framework geometry, and inadequate stress dissipation contribute to early failure, particularly when occlusal forces exceed 200 N—a common value in posterior functional loading (7). Biomechanically, an FPD functions similarly to a cantilevered beam under masticatory loading. As occlusal forces were applied to the pontic, compressive forces occur on the occlusal surface, while tensile forces develop at the gingival connector—particularly at the mesial embrasure (8). The geometry of this region, including the cross-sectional area (CSA) and the radius of curvature of the gingival embrasure, directly affects how stress is transferred and distributed across the structure.

Finite element studies have shown that even small reductions in connector height or curvature can increase stress by over 50%, making these sites more susceptible to fatigue failure (9). Furthermore, designs lacking adequate curvature or reinforcement at high-stress regions exhibit concentrated von Mises stress zones exceeding the yield threshold of commonly used alloys like cobalt–chromium or nickel–chromium (10). Despite prior studies (11-13) exploring individual geometric factors, there remains a lack of comprehensive analysis that simultaneously Investigates under realistic three-dimensional loading conditions in a validated Finite Element Analysis (FEA) model. No existing literature provides a comparative evaluation of how these features interact to alter both the magnitude and distribution of stress and deformation.

The aim of this study was to investigate how specific design modifications in the metal framework of posterior FPDs influence stress magnitude, distribution, and deformation patterns using finite element analysis. The null hypothesis was no significant effect of geometric design modifications on the stress distribution or deformation characteristics of metal frameworks in FPD sunder simulated masticatory loading.

## MATERIALS AND METHODS

**Study Design**

This investigation was conducted as a three-dimensional, linear-elastic finite element analysis (FEA). Linear elasticity was chosen to isolate the influence of geometry on stress flow and deformation without the complicating effects of

plasticity or time-dependent creep. All modelling and post-processing were performed with ANSYS 2024 R1 (Academic/Student Edition) on a 16-core workstation running Windows 10.

**Model Development**

**Geometry acquisition**

An edentulous left mandibular second premolar &first molar site was digitised from a high-resolution micro-CT scan (voxel size = 30 μm) of a fresh, de-identified human mandible obtained from a licensed tissue bank. The DICOM data were exported to Mimics® (Materialise NV, Belgium) for segmentation of cortical bone, cancellous bone, periodontal ligament (PDL), and teeth. The resulting STL files were smoothed (0.2 mm tolerance) and imported into SpaceClaim® for final clean-up and preparation of the prosthetic saddle.

**Framework construction**

A metal-ceramic fixed partial denture (FPD) replacing the left mandibular second premolar & first molar was designed in exocad® DentalCAD 3.1. The retainers on the first premolar and second molar were full-coverage crowns with a uniform 0.5 mm metal coping and a 1.0 mm porcelain veneer. All geometries were exported as Parasolid files for meshing. The details of Metal frameworks were as follows:

- Control design (Model D2) Connector cross-section 3 mm × 3 mm (≈9 $mm^2$) with a gingival embrasure fillet radius of 0.25 mm.
- Modified designs (Model D1) Two variables were changed singly and in combination (Table 1)

**Material Properties**

Because both the coping alloy and veneering porcelain behaved predominantly elastically up to their proportional limits, they were treated as isotropic, homogeneous materials (Table 2).

**Meshing and Convergence**

**Element type**

All solids were discretised using quadratic tetrahedral elements (SOLID187) with midside nodes, suitable for capturing curved surfaces and stress gradients at connectors.

**Global seed size**

A global element edge length of 0.25 mm was selected after pilot tests. Critical regions (connectors, and gingival fillets) were automatically refined to 0.10 mm using proximity and curvature controls.

**Convergence criterion**

Mesh convergence was checked by successively halving the global size (0.50 → 0.25 → 0.125 mm) until the change in peak von Mises stress at the connector fell below 5 %. The 0.25 mm mesh produced < 3 % change versus further refinement and was therefore adopted for all models. Final element counts were ranged from 1.8 to 2.1 million, with an average of 1.9 million nodes.

**Boundary and Loading Conditions**

**Physiologic constraints**

The inferior border of the mandible was fixed in all three translational axes (Ux = Uy = Uz = 0). The PDL–tooth interface was assumed perfectly bonded, and the FPD–cement interface was also set as bonded to mimic ideal adhesion. To replicate clinical support, the distal root of the second molar abutment was restrained against rotation ($\theta x = \theta y = \theta z = 0$), representing periodontal ligament damping and preventing rigid-body motion.

**Loading protocol**

Two static load cases simulated peak masticatory forces:

1. Vertical load: 200 N was applied uniformly to a 1 mm² area on the central fossa of the pontic.
2. Oblique load: 150 N was applied at 30° buccolingually to the same area to replicate lateral excursion forces.

Both loads were applied separately; results were later combined using a von Mises envelope to identify worst-case stresses.

**Output parameters**

- Total deformation (μm) of the entire framework.
- Equivalent (von Mises) stress distribution (MPa) within the Ni–Cr coping and the connector region.
- High-stress surface area: percentage of metal surface experiencing ≥ 80 % of the peak von Mises value.
  Peak and average values from each design were exported to Excel for descriptive statistics and percentage change calculations relative to the control model (D2).

**Ethical Considerations**

The mandible used for μCT scanning was sourced from an accredited bone bank under a blanket donor consent that permits anonymised research. No living human subjects were involved, so institutional review board approval was not required.

**Software Validation**

ANSYS results for the control model were benchmarked against a previously published FEA of a similar Ni–Cr FPD (15). Peak connector stress differed by < 7 %, confirming methodological consistency.

**Statistical Analysis**

Because FEA outputs are deterministic, no inferential statistics were needed. Instead, percentage reduction or increase in peak stress, average stress, and deformation were calculated for each modified design versus the control. A ≥ 10 % change was deemed mechanically relevant.

**RESULTS**

**Mesh Characteristics and Convergence Validation**

All models were meshed using second-order tetrahedral elements (SOLID187) with a global seed size of 0.25 mm, and local refinement in critical regions (connectors and embrasures) to 0.10 mm. Final element counts ranged from 1.82 to 2.14 million, with corresponding node counts between 1.68 and 1.95 million, depending on complexity. To ensure accuracy of stress values, mesh convergence tests were performed on the control model (D2). Refinement from 0.50 mm to 0.25 mm and 0.125 mm revealed <5% change in peak von Mises stress. The convergence curve plateaued below 3%, confirming numerical stability (Figure 2).

**Stress Distribution: Color Maps Under Loading**

Labelled stress contour maps for each model under vertical (200 N) and oblique (150 N at 30°) loading reveals clear differences in stress magnitude and spatial distribution.

- Model D2 (control) showed a high concentration of von Mises stress (up to 83.23 MPa) at the distal connector's gingival embrasure, consistent with clinical fracture locations.
- Model D1, incorporating all design enhancements (larger CSA, wider fillet), exhibited dramatically lower peak stress (15.56 MPa) with stress spread over a broader area.

Color maps (Figures 3A–3B) clearly illustrate how stress "hot zones" shrink and shift with geometric refinements. Oblique loading consistently produced higher stress peaks than vertical loading across all models.

**Quantitative Comparison: Peak Stresses and Deformation**

The table below summarizes the peak von Mises stress, average stress, and maximum deformation for each design. Results are reported for the most critical load case (oblique) (Table 3).

To better visualize how stress was distributed—not just its peak magnitude—a new metric was introduced. This was plotted for each model (Graph 1). Key findings:

- D2 had the largest critical area, with ~8.3% of its surface exposed to extreme stress.
- D1 showed <1.2% surface involvement—a 7-fold reduction, indicating better stress dissipation.

**Failure Risk Zones**

Regions exceeding 50–60 MPa were flagged as potential fatigue-prone zones, as this range approaches the fatigue endurance limit of commonly used Ni–Cr alloys under intraoral conditions (1).

- D2 exceeded 80 MPa in the connector's gingival edge under oblique loading—a level where microcracks are likely to initiate over repeated cycles.
- D1 maintained peak stresses well below 30 MPa, which is considered safe for long-term function and far below the alloy's yield strength (~450 MPa) or fatigue limit (~200 MPa).
- None of the models breached the ultimate tensile strength, indicating no risk of immediate brittle fracture—but fatigue failure remains a major concern in designs like D2 without optimization.

## DISCUSSION

This study set out to discover whether simple, build-friendly changes in metal-framework geometry could meaningfully reduce the mechanical "hot-spots" that trigger connector fractures in porcelain-fused-to-metal fixed partial dentures (FPDs). Relative to the control (D2), the fully modified design (D1)—larger connector cross-section (4 × 4 mm), wider gingival fillet (0.75 mm), cut peak von Mises stress by 81 % and maximum deformation by 76 %. Equally important, the surface area operating at ≥ 80 % of the peak stress shrank seven-fold, indicating that stress was redistributed rather than merely suppressed at one point. Intermediate designs that altered only one or two variables delivered partial improvements, confirming a cumulative or "stacking" effect among the geometric factors.

Our findings dovetail with earlier finite element studies showing that connector bulk and embrasure curvature govern stress concentration (2,9,14). Inoue et al. reported a 50 % rise in fracture load when zirconia-FPD connectors grew from 9 mm² to 16 mm² (11), a trend mirrored here with Ni–Cr frameworks. Likewise, Oh and Anusavice demonstrated that widening the gingival fillet from 0.25 mm to 0.90 mm almost doubled fracture resistance in alumina bridges (12); we observed a comparable drop in peak stress. Where our data diverge is the magnitude of benefit: combining all tweaks reduced high-stress surface to < 1.2 %, a variable rarely quantified in previous work. This highlights the importance of looking beyond "peak" values to the size of the danger zone, as suggested by Kelly and Thompson in their review of FEA pitfalls (16,17).

A posterior FPD behaves like a curved beam. Increasing the connector cross-section raises the area moment of inertia (I), making the beam stiffer and lowering tensile strain at the gingival surface. Smoothing the gingival fillet eliminates the sharp corner where the stress gradient is steepest, akin to adding a generous radius at the base of an aircraft wing root. These changes therefore act synergistically: bulk counters bending, curvature spreads strain. Because all models remained in the linear-elastic range, the biomechanical gains are attributable to shape optimisation, not changes in material strength. For laboratory technicians and clinicians, the message is practical. Connector sizing aim for a 4 × 4 mm (≈ 16 mm²) connector in posterior Ni–Cr or Co–Cr bridges whenever space and hygiene permit. When vertical room is limited, width may be increased selectively. Embrasure contour targets a ≥ 0.75 mm gingival fillet radius; small burr adjustments during wax-up can achieve this without compromising emergence profile. If space restricts full implementation, prioritise fillet rounding, followed by CSA enlargement, each step offers incremental protection. Adopting these guidelines could reduce remake frequency and veneer chipping, translating to lower patient costs and chair-time.

To translate these numerical gains into clinical certainty, several avenues need exploration: (1) Dynamic FEA and fatigue simulation that incorporate time-dependent loads and thermal cycling. (2) Alternative alloys and polymer frameworks (Ti, PEEK, fibre-reinforced composites) to test whether the same geometric rules apply. (3) In-vitro chewing-simulator studies to validate crack initiation sites and fatigue life predicted by the models. (4) Patient-specific FEA that accounts for variable abutment alignment, periodontal support and opposing dentition, enabling truly customised framework designs.

## CONCLUSIONS

Our results confirm that intelligent geometric optimization—rather than use of bulkier materials—significantly reduces mechanical risk in metal-ceramic FPDs. Enlarging the connector and rounding the gingival embrasure redistributed stress and slashed peak von Mises values by more than 80 % compared with a conventional 3 × 3 mm design. Crucially, the area of framework operating near its fatigue limit shrank seven-fold, suggesting a lower probability of crack initiation and porcelain chipping over time. Within the limits of a linear-elastic, static FEA, these findings confirm that shape optimisation, not additional bulk or exotic alloys is the most efficient route to longer-lasting metal-ceramic bridges. Clinicians and technicians who adopt a 4 × 4 mm connector, and a 0.75 mm fillet can expect better mechanical resilience without sacrificing aesthetics or cleanability.

## ACKNOWLEDGEMENTS

The authors gratefully acknowledge the generous support of the Er. Rohit Bhaskar, Assistant professor, K. K. Wagh Institute of Engineering Education and Research, Nashik whose software assistance and simulation license under the ANSYS Academic Research Program were instrumental in carrying out the finite element analysis with high fidelity and efficiency.

**Conflict of interest statement**

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

## ABSTRACT

Ayurveda, which is one of the oldest systems of medicine in India, has been a flourishing global industry solely depending on the natural, plant-based healthcare solutions. However, the extensive collection of herbs, and the combination of the traditional and modern methods of production have raised serious issues not only in terms of product safety but also of efficacy and uniformity. Consequently, the application of Quality Management System (QMS) becomes necessary as it provides a framework of Good Manufacturing Practices (GMP), comprehensive documentation, validated testing methods, and continuous process improvement. The article presents a detailed discussion of Quality Management Systems in the Indian Ayurvedic manufacturing sector which encompasses the current regulatory scenario, raw material standardization, analytical methods, risk management approaches, and problems faced by the industry, among others. It is based on a careful review of the existing literature, relevant regulations, and case studies. It demonstrates inadequate application of Quality Management Systems among small, medium, and large-scale manufacturers. Subsequently, it presents basic recommendations for QMS adoption penetration such as supply chain digitalization, workforce enhancement, infrastructure upgrading, regulation reform, and inter-sectoral collaboration promotion. In the long run,

an integrated quality management system could be the catalyst for the massive growth of global acceptance and marketability of Ayurvedic products.

## INTRODUCTION

**Ayurveda and Modern Product Scenario**

Ayurveda, the age-old medicinal system of India, has been a practice for 5,000 years and has evolved into a multi-billion-dollar industry worldwide selling the classical formulations, proprietary medicines, health supplements, cosmetics, nutraceuticals, and wellness products. In India, there are approximately 9,000 licensed Ayurvedic manufacturers, and they vary from small-scale and traditional pharmacies to large-scale production units that export to over 100 countries and are fully automated. The Indian Ayurvedic products market is a real mix of styles since the better and old-fashioned producers always work with the old ways while the bigger companies have already set up industrial-grade machines, and very strict quality-control labs are behind that. The rapid commercialization of Ayurveda has led to a lot of controversies regarding the standardization, authenticity, and safety of the products. Thus, the implementation of quality management systems has to be as strict as in the pharmaceutical sector in order to overcome these issues.

**Quality of Ayurvedic Medicines and Products**

Quality is the most important factor in Ayurvedic medicinal products, as it is the only thing that could guarantee the product's potency and safety at the same time. The raw materials used come from nature, hence the therapeutic effect of the plants may greatly vary. Among the factors leading to this inconsistency are plant species, soil conditions, climate, harvesting time, and drying methods. Quality controls that are not uniform can result in mixtures with very low potency or even causing adverse effects due to the presence of unrecognized components. During quality testing, the contamination of the market samples with heavy metals, pesticides, microbial pathogens, and adulterants is another hazard that quality testing incurs.

**Regulatory Framework in India**

Ayurvedic medicines produced in India have been brought under the operation of the Drugs and Cosmetics Act (1940) and Rules (1945) loudest in sections that deal with ASU medicines. The monitoring authority is divided between the AYUSH ministry and the state licensing authorities (SLAs). Among the major elements are Schedule T (GMP for ASU drugs) indicating the requirements for designing, hygiene, raw-material standards, process controls, documentation, and quality-control at the facility. Ayurvedic Pharmacopoeia of India (API) setting the quality standards for raw herbs, extracts, and formulations. Pharmacopoeia Commission for Indian Medicine and Homoeopathy (PCIM and H) consistently generates analytical monographs and regulatory standards. Nevertheless, the situation is not optimal as the issue of enforcement and compliance still prevails with the small and medium-sized enterprises (SMEs) being the most affected group due to high compliance costs, lack of knowledge, and non-availability of testing laboratories.

**Role of Quality Management Systems (QMS)**

The QMS concept as a whole gives a possibility to achieve quality at all stages of the Ayurvedic product manufacturing process. The QMS approach is different from the traditional quality control in that it includes not only testing at the end of production, but it also covers preventive actions, risk assessment, process validation, supplier qualification, and documentation systems ensuring continuous compliance. When the QMS has been efficiently managed, it not only improves the international market readiness but along with it increases consumer trust,

decreases variability and empowers Indian Ayurvedic manufacturers with compliance to WHO-GMP and international phytopharmaceuticals standards.

## LITERATURE REVIEW

**Raw Material Variability and Standardization Issues**

The variability of phytoconstituents in medicinal plants is a repeatedly mentioned issue in scientific literature. A range of factors such as the geographical origin of the plant, seasonal changes, its maturity, and the methods used for post-harvest handling have been shown to cause variation in the concentration of active compounds. Mukherjee (2019) states that due to improper botanical authentication, substitution or adulteration is very common in the herbal markets. A study published in the Journal of Herbal Medicine points out that even the authenticated herbs have chemical variability and thus it becomes a challenge to carry out standardization.

**Analytical Challenges in Ayurvedic Formulations**

The presence of multi-herb combinations in Ayurvedic products makes it difficult to apply the chemical standardization process. Patwardhan (2010) mentions that while the new analytical techniques such as HPLC and HPTLC are able to quantify the presence of marker compounds, there are still many herbs without universally accepted markers. To add to this, mineral or metal-based formulations (Rasa Shastra) require highly sensitive analytical techniques such as ICP-MS for safety assessment, which is often not available in many manufacturing units.

**GMP Implementation and Compliance**

Barriers Research indicates that there are huge differences in the degree of compliance with Schedule T GMP norms in the Ayurvedic sector. Ravishankar (2021) observes that the majority of the units are only partially compliant and give priority to licensing rather than complete QMS implementation. Infrastructure deficiencies, lack of control over the environmental conditions, no process validation and poor documentation are among the common problems.

**Safety Concerns and Public Health Implications**

Scientific studies show the presence of bacteria, heavy metals (Pb, As, Hg), and chemical residues in some samples of Ayurvedic products. The FDA has warned about the imported Ayurvedic drugs that contain metal toxins at levels which are not safe. Gupta *et al*. (2017) mention that the main reasons for this situation are unstandardized production and poor storage conditions.

**Need for QMS Modernization**

The World Health Organization recommendations suggest that the highest quality management system (QMS) for herbal medicines be implemented in order to meet international standards of quality. The study very briefly points out the necessity of using contemporary testing methods, digital tracking systems, and risk-driven quality approval strategies in making herbal medicine production equivalent to that of the world market.

**Quality Management Systems for Ayurvedic Manufacturing**

Quality management systems are an essential part of the quality assurance process for Ayurvedic medicinal products. They are exactly the opposite of synthetic drugs; ayurvedic treatments use plants as the basis which inherently vary, and also involve lengthy traditional processing; therefore, only QMSs adapted to such situations can realize these QMSs. To build a strong QMS necessitates the adoption of government compliance practices, scientific standardization, validated analytical methods, trustworthy documentation, and continuous improvement divisions. The next sections will discuss in detail the important aspects of QMS that are related to the Ayurvedic manufacturing process.

**Good Manufacturing Practices (GMP) and Schedule T Compliance**

GMP, the least requirement for the Schedule T of the Drugs and Cosmetics Rules (1945), is the chief regulation governing the manufacturing of Ayurvedic, Siddha, and Unani (ASU) medicines in India. The minimum requirements depicted in Schedule T include specifications for personnel, equipment, facility design, hygiene, documentation, quality control, and storage, etc. The first aspect is that GMP demands the manufacturers to design the facilities in such a way that both cross-contamination and environmental contamination are reduced to the lowest possible level. The areas for production will be divided according to the type of operations carried out; these operations include raw-material washing, drying, pulverization, mixing, extraction, heating, and packaging. The environmental conditions that influence each area should be controlled precisely and include proper ventilation, temperature, and humidity that will protect the delicate herbal materials from loss of quality. The second point is that GMP requires regular cleaning and sanitizing of not only the equipment but also the whole area. The cleaning process will be continually conducted until it is validated that residues or cleaning agents that could contaminate the next batch are not left on the equipment surfaces. As for the third point, personnel are to be trained in proper procedures for hygienic practices, documentation, and safety measures since human labor is more required in Ayurvedic processing than in highly automated pharmaceutical lines. The last point, albeit not the least, is that GMP demands the manufacturers by Schedule T to establish vigorous quality-control systems, maintain complete batch records, and the raw materials and finished products used are those that meet.

**Raw-Material Authentication, Procurement, and Qualification Systems**

Raw materials are the basis of quality in Ayurvedic medicines. There is a lot of variation in the quality of herbs due to different factors such as climate, season of growth, method of harvest, and even how the plants are collected. The QMS system demands strict authentication of raw-materials to ascertain the right botanical identity and purity before embarking on the quality process. One of the manufacturer's duties is to establish a supplier-qualification system consisting of supplier audits, GACP verification, and screening of quality at interval. Besides authentication, there are multiple levels of evaluation such as macroscopic (color, texture, smell) and microscopic (cell compartments and trichomes) examination, and increasingly DNA barcoding is being used for species identification. The chromatographic fingerprints for chemical profiling help in revealing the substitution and adulteration which are widespread in the commercial herbal markets. Only after the herbs have been subjected to identification, physicochemical and contaminants testing can they be declared fit for use. Raw materials are to be stored in controlled conditions to prevent moisture absorption, microbial growth or loss of active ingredients due to degradation..

**Analytical Quality Control and Standardization Techniques**

Analytical quality control (QC) is regarded as an important part of a Quality Management System (QMS) because it ensures that the products are fulfilling the requirements of either the Ayurvedic Pharmacopoeia of India (API) or internal monographs. The advent of new analytical tools is the main factor in standardization since herbal formulations of Ayurveda consist of various plants with intricate phytochemical matrices.

**Pharmacognostic and physicochemical testing**

These refer to the assays which cover macroscopy, microscopy, ash values, extractive values, and pH measurement. They are the first tier of quality evaluation.

**Chromatographic and spectroscopic methods**

State-of-the-art techniques such as High-Performance Liquid Chromatography (HPLC), High-Performance Thin-Layer Chromatography (HPTLC), Gas Chromatography–Mass-Spectrometry (GC–MS), and Liquid Chromatography–Mass-Spectrometry (LC–MS/MS) are extensively used to prepare chemical fingerprints and to quantify the marker compounds. These techniques are immensely significant as most of the Ayurvedic herbs do not have a single “active” molecule but instead, through a mechanism of synergistic phytocomplexes, they exert their therapeutic effect.

**Microbial and contamination testing**

Ayurvedic products must not contain any pathogenic microorganisms. Quality Control (QC) consists of total aerobic microbial count, fungal counts, and detection of pathogens (*E. coli*, *Salmonella*, *Pseudomonas*, *Staphylococcus aureus*). Heavy metals like lead, arsenic, cadmium, and mercury must specifically be measured using AAS or ICP-MS in the case of metal-based formulations (Rasa Shastra preparations). The same applies to pesticide residues and aflatoxins which are to be checked for compliance with international safety standards.

**Stability studies**

Through Stability testing, changes in the physical, chemical, and microbiological aspects of the product are evaluated by means of controlled environmental factors up to its end of life. Therefore, the potency and safety of Ayurvedic products are assured during their lifespan.

**Process Standardization, Validation, and Control Strategies**

Ayurvedic therapy methods are based on the wisdom of centuries and thus require a huge amount of standardization for uniformity throughout the process. Product validation will make sure that every operation, be it decoction preparation, fermentation (asava–arishta), calcination (bhasma preparation), or tableting, will invariably produce the desired product. Validation consists of: Installation Qualification (IQ): Confirms that the installation of the equipment was performed correctly. Operational Qualification (OQ): Lets the equipment is yielding the output as per the expectation. Performance Qualification (PQ): Demonstrates that all production batches are producing the same product. The most crucial factors like temperature, time, pH, moisture level, and mixing speed have to be established and kept under surveillance. Statistical process control (SPC) techniques can be applied for variation detection and to ensure high quality in all the batches.

**Documentation, Traceability, and Record Control**

The QMS is fundamentally built upon quality documentation. It aids in tracing the product, makes it easier to perform regulatory audits, and minimizes errors. The most important documents are: Raw material inspection logs, Standard Operating Procedures (SOPs), Batch Manufacturing Records (BMRs), Batch Packaging Records (BPRs), Reports of quality control tests, Records of equipment cleaning and maintenance, Deviation, CAPA, and change-control records. The entire documentation process of a batch ensures the complete traceability from raw materials to finished product distribution. This practice is important in recall cases, monitoring of adverse drug reactions, and in gaining recognition from regulators. To a large extent, electronic batch manufacturing records (eBMRs) are being implemented to cut down human error and increase transparency.

**Quality Assurance (QA) and Quality Risk Management**

Quality Control concentrates on testing the final product, in contrast to Quality Assurance (QA) that guarantees the whole system is free of defects via methods and designs. The activities in QA involve conducting audits, process reviews, updating SOPs, compliance monitoring, training program design and implementation, and managing vendor qualifications. The concept of Quality Risk Management (QRM) which was shaped by ICH Q9 has introduced a methodology for risk identification, assessment, and mitigation that spans the entire life cycle of the manufacturing process. The use of techniques like FMEA, risk matrices, and HACCP has addressed a wide range of risks including contamination, mix-ups, equipment failure, and variation of raw materials, and these risks have even been ranked by manufacturers according to the severity and likelihood of occurrence.

**Packaging, Labeling, and Storage Controls**

The products must be registered at every place they are sold. The QMS should provide the materials required for packing, sealing accurately, preventing tampering, and also protecting against air, light, and heat. Along with being a means of communication between the producer and the consumer, labels also have to comply with regulations which involve indicating the names of the ingredients, instructions for use, manufacturer's address, batch number, and shelf life, as well as noting precautionary statements among others. Storage should control not only the temperature but also the humidity in the areas where the most delicate herbal materials and finished goods are kept. The

employment of FIFO (First-In-First-Out) and FEFO (First-Expiry-First-Out) systems for inventories will significantly help in managing storage.

**Change Management and Continuous Improvement**

A fully developed Quality Management System (QMS) will have orderly systems of change-control that will consider all changes in materials, equipment, suppliers, formulation processes, or testing methods. Only after risk assessment, validation, and approval, the changes will be implemented. The quality metrics, internal audits, product reviews, deviation investigations, and feedback loops that are used have a role in the process of continuous improvement. The application of the PDCA (Plan–Do–Check–Act) cycles and the Kaizen models are common among the industry leaders in their systems of continuous improvement.

**Regulatory and International Harmonization**

The QMS practices must be completely and consistently aligned with the international standards, as Ayurveda's global market continues to expand exponentially. Herbal medicines' WHO-GMP guidelines are considered a global standard. Manufacturers who seek international certification commonly follow the ISO 9001 (quality management), ISO 22000 (food safety), and ISO 17025 (laboratory competence) standards simultaneously. Complying with the global phytopharmaceutical standards can enhance the acceptability of exports in the European, USA, and ASEAN markets.

**Challenges in Implementing QMS**

The application of Quality Management Systems (QMS) in Ayurvedic manufacture is plagued by multiple and major obstacles, which are primarily the result of the traditional nature of Ayurveda as a medical system, the wide range of plant materials, the complexity of the production method, and the lack of standard techniques. Also, these problems are compounded by inadequate infrastructure, varying degrees of regulatory enforcement, and some groups' reluctance to accept change. Below are mentioned some of the key challenges that hinder the successful incorporation of QMS in the Ayurvedic production sector.

**Inconsistent Raw-Material Quality**

The very first challenge of introducing the QMS of Ayurveda is the raw materials' variability. On the one hand, the synthetic pharmaceuticals' chemical compounds are made from standardized ones, while on the other hand, Ayurvedic preparations are largely dependent on natural herbs, animal, and mineral-based substances. The following major quality fluctuations are typical of the raw materials: Geography and Seasonality: The chemical composition of plants can differ due to the geographical region, climate, soil conditions, and time of harvesting. For instance, the potency of the active ingredients in Ashwagandha (*Withania somnifera*) might be different based on the soil type and the time of harvest. The Quality of Raw Materials is Affected by Post-Harvest Treatment And Storage: Raw material quality may deteriorate due to inadequate drying, contamination during collection, and storage at improper temperatures and humidity levels. For example, improper storage may lead to microbial contamination or the loss of volatile compounds that are necessary for the medicinal efficacy of the plant.

**Lack of Standardized Sourcing:** Very often the un-standardized and unified procurement system is the reason for the sourcing of raw materials from different suppliers without sufficient checks on authenticity and quality, thus leading to adulteration, substitution, or contamination. To solve these problems, a strong raw material qualification system needs to be built, which will involve the implementation of Good Agricultural and Collection Practices (GACP), supplier audits, and the establishment of traceability systems from the farm to the factory. However, small and medium enterprises (SMEs) frequently do not have the financial and technical capability to create these systems.

**Limited Access to Advanced Analytical Testing Facilities**

The products obtained from Ayurveda are very hard to analyze and one of the main reasons for this is their complex nature that includes main and inactive ingredients. That is why the highest quality standards cannot be attained without applying advanced analytical techniques. Despite this situation, the majority of Ayurvedic manufacturers or

at least the SMEs do not have the ability or means to perform testing and quality analysis: Lack of Infrastructure: State-of-the-art testing methods such as HPLC (High-Performance Liquid Chromatography), HPTLC (High-Performance Thin-Layer Chromatography), GC-MS (Gas Chromatography-Mass Spectrometry), and ICP-MS (Inductively Coupled Plasma Mass Spectrometry) play a very important role in the entire process of active ingredient identification, contamination (such as heavy metals or pesticides) detection, and validation of the herbal product's consistency. Nevertheless, the capital cost of building such laboratories could be a significant barrier to smaller companies. Skilled Manpower: The need for qualified chemists, pharmacognosists, and microbiologists is exceptionally high, but at the same time, there is a lack of expertise in the Ayurvedic manufacturing sector. The Ayurvedic industry has often been short of professionals with the required skill set to operate and analyze the sophisticated tests. Outsourcing Challenges: Many small manufacturers resort to outsourcing testing services. This leads to delays in production and costs. Furthermore, outsourcing often results in a lack of direct control over the quality assurance process, which can lead to discrepancies in testing standards and results. Government and private cooperation could offer shared laboratory space for smaller manufacturers as the solution and government incentives or subsidies could lighten the financial burden of investing in analytical testing infrastructure**.**

**Traditional Manufacturing Practices vs. Modern QMS Integration**

The neoteric Quality Management Systems (QMS) that are applied in the Ayurvedic industry are the cause of a crisis of confidence or a problem that has been with the industry for a long time because of the ancient practices of the profession. In the case of Ayurvedic medicines, the whole production process is sometimes done manually and by artists. Therefore, there is a fear that any change towards mechanization or automated production will result in loss of quality of the medicines. Some of the main problems are: Change Resistance in Culture: The producers of the smaller scale believe that they are doing the right thing by maintaining the old ways of production. They think that that's how authenticity and the spiritual aspect of Ayurveda are kept. Thus, there is a refusal to accept modern pharmaceutical practices, automated systems, or even rigorous QMS protocols, which they consider to be interfering with the traditional ways. Limited Awareness: It might come as a surprise that producers of traditional Ayurvedic medicines regard Quality Management Systems and regulatory compliance as mere tricks of the trade. Such ignorance may even result in the larger Ayurvedic firms not fulfilling the requirement of having quality assurance and control systems in place. As a result, the market may witness the presence of poor-quality goods that, besides causing health problems for the consumers, also limit the international competitiveness of Ayurveda. Financial and Training Challenges: The cost of shifting to totally automated or partially automated production, especially for such traditional items as Bhasmas (herbo-metallic preparations) or Asava-Arishta (fermented formulations), can be very high. Additionally, the requirement for training due to the new machinery the workers will have to operate and the quality processes that are new to them adds to the problem for small manufacturers. Ayurvedic manufacturers could slowly but surely change production systems rather than doing a complete overhaul in order to overcome these challenges. They might take the example of introducing automated batch control systems or implementing quality check procedures as the highly disruptive yet still helpful product quality situation.

**Regulatory Enforcement Gaps and Compliance**

The regulatory net for Ayurvedic products while implying a strong resistance has, in reality, a very difficult path to go through from the very beginning. Among the hurdles are: Nonuniform Enforcement: The Drugs and Cosmetics Act (1940) and Schedule T (the latter outlines GMP for ASU drugs) provide a clear regulatory setup, but enforcement very much varies from place to place, particularly in rural areas or with small manufacturers. The licensing authorities do not have enough staff to inspect the facilities that often and thus compliance is not that good.

**Regulatory Training Needs:** Sometimes the regulatory farmers and inspectors are not well-grounded in understanding Ayurvedic manufacturing, which is vastly different from conventional pharmaceutical production. This may result in their inability to inspect and audit the facilities properly and hence non-compliance occurs. Difficulty in Multi-ingredient Formulations: Ayurvedic medicines, by default, comprise many herbs and minerals thus making it difficult to classify them like single-ingredient drugs. Quality control for such complex formulations is going to be very hard, especially in terms of setting standards and quality benchmarks. Also, the ancient knowledge

of Ayurveda can sometimes contradict the modern scientific principles of quality assurance, thereby making the whole regulatory process more difficult. For regulatory compliance to improve, the inputs of the regulators and manufacturers via capacity-building, along with clearer guidelines and periodic inspections, will be indispensable. Besides, digital platforms for tracking and managing the compliance may offer better supervision and see-through-ness.

**Human Resource and Skill Limitations**

The Ayurvedic sector and the manufacturing of Ayurvedic products need a very efficient and expert staff, able to operate in the fields of traditional knowledge as well as modern quality control practices. The industry has nevertheless to cope with severe problems concerning human resources: Shortage of Modern QA/QC Skill: The personnel in the modern Quality Assurance and Quality Control (QA/QC) practices constitute a major shortage in the industry. The adoption of advanced techniques—like spectrophotometry, chromatography, and statistical process control—demands that highly educated and experienced professionals carry out the functions. Unfortunately, such highly skilled personnel are not available in the Ayurvedic sector. Nonexistent GMP Training: While the large-scale producers in the Ayurvedic industry may have their own teams responsible for training on GMP and other regulatory practices, the small-scale manufacturers generally do not have any support. It is necessary to conduct training programs for all workers—from raw-material handlers through factory floor employees—in order for the GMP principles to be properly understood and hence followed.

**Knowledge Transfer and Documentation Practices:** Key knowledge in a number of small Ayurvedic firms is still being passed from one generation to another either orally or through informal training methods. These informal methods of knowledge transfer can give rise to product quality errors, failures in documentation and challenges in tracing the product back to the source. It is very important but often poorly implemented to have the Comprehensive Standard Operating Procedures (SOPs) and batch records in place since poor documentation practices and insufficient attention to detail often do not allow it. It is necessary to take a lot of different actions like the development of training programs, a partnership with universities, and the introduction of digital instruments to upskill the workforce, improve knowledge management, and raise the documentation standards in order to solve the aforementioned issues.

**Cost Implications for SMEs**

Ayurvedic manufacturing-QMS implementation can be a costly process and especially so in the case of SMEs that lack the financial support for infrastructural facilities, and equipment or trained personnel among others. The major cost-related problems are, Investment in Equipment and Infrastructure: Small producers might find it impossible to bear the cost of installing quality testing equipment, establishing clean-room environments, or upgrading facilities to meet GMP requirements. Ongoing Operational Costs: Regular training, internal audits, process validations, and third-party testing may significantly increase operational costs and thereby might make it hard for SMEs to compete, particularly when larger firms avail themselves of the economies of scale. Certification Costs: Gaining certification for WHO-GMP, ISO 9001, or ISO 17025 standards often involves great initial costs related to documentation, process improvements, and training, which might not always be affordable for small companies. In order to alleviate these issues, the government may offer subsidies, A shared laboratory and testing facility could be established, and there might be some collaborative manufacturing where the financial load on SMEs would be lightened.

**Case Examples of QMS Implementation in Ayurvedic Manufacturing**

This section showcases a set of case illustrations that highlight not just the successful QMS implementations but also the difficulties encountered in the Ayurvedic manufacturing industry. The presented cases reflect the different ways that different manufacturers, from small to large, have come up with to satisfy the regulatory standards, improve the quality of products and make the production processes more efficient.

**A Case Study of Patanjali Ayurved Ltd. - A Large-Scale QMS Integration**

Patanjali Ayurved Limited has a recognition as one of the largest and best Ayurvedic brands in India. The company has implemented a full-scale Quality Management System (QMS) not only for its manufacturing area but also for the whole company that the integration of modern Quality Management Systems in Ayurvedic manufacturing has been a success story in their case. The company which is famous for range of herbal products among others the medicines, food items, and cosmetics has adopted a QMS to not only make consistency of its products but also keep them safe.

**Highlights of Implementation**

**Compliance with GMP Standards:** Patanjali has taken its manufacturing procedures to the level of Good Manufacturing Practices (GMP), in particular, observing the requirements laid down by the Ayurvedic Drugs and Cosmetics Rules (Schedule T). This means that the members of the staff are constantly trained and the production is thoroughly documented with the running of strict tests for contaminants and heavy metals.

**Cutting-Edge Testing Facilities:** The firm has made a huge capital investment in laboratories that have the latest testing methods and are provided with modern analytical equipment like HPLC, HPTLC, and FTIR (Fourier-transform infrared spectroscopy) to bring uniformity in the chemical profiles of its herbal products. Patanjali does not compromise when it comes to testing the raw materials that will be used in manufacturing, thus they do purity, identity, and potency tests on all the raw materials.

**In-House Quality Control (QC):** Patanjali has a separate Quality Control Department that checks and controls the whole production process from the raw material to the end product. The company applies strict procedures for testing microbial contamination, pesticide residues, and heavy metals (e.g., lead, mercury) as part of its QC protocols.

**Compliance with International Standards:** Patanjali has made ISO 9001 and ISO 22000 certifications, which are the International Standards for quality management and food safety respectively, a part of its export strategy. This not only increases their market but also allows them to send their products to the United States and the European Union where herbal products are subject to strict regulatory standards.

**Challenges Faced**

The journey of Patanjali, though very successful, did not go without the issues in consistency of quality giving the wide product range. Having to ensure that every single product batch complies with international quality standards, particularly as the company is getting bigger, has necessitated the QMS to be frequently updated to deal with the complications that come with increased production volumes. In addition, the procurement of raw materials from different parts of India results in different quality being introduced into the process which must be effectively controlled by quality checks.

**Case 2: Himalaya Drug Company – Evolution of QMS**

Himalaya Drug Company, which is one of the most important players in the global Ayurvedic market, has been a good example of a big company that has successfully incorporated QMS into its operations. Himalaya, which was established in 1930, is a company that has made a name for itself as a leading brand primarily associated with herbal remedies and health products. The company has continuously upgraded its QMS through the years, starting from traditional Ayurvedic methods and moving to more organized approaches that are compatible with modern quality assurance practices.

**Some notable aspects of the implementation:** Raw Material Standardization: Himalaya does not spare any expense on the standardization of raw materials and thus the quality of the ingredients is guaranteed to be at least up to the specific pharmacognostic, physicochemical, and biological standards. One of the strategies of the company is to own its own farms where they perform Good Agricultural and Collection Practices (GACP) which then leads to a more uniform quality of raw materials. Advanced Analytical Techniques: The company employs modern techniques like HPLC, UV VIS spectroscopy, and GC MS as the main tools for measuring and verifying the active substances of its

herbal products. This not only enhances the company's ability to produce products with the same strength all the time but also makes sure that no harmful substances like heavy metals and germs are present.

**Certification and Compliance:** Himalaya is a company certified with quality management system ISO 9001 and food safety ISO 22000 certifications. The certifications are evidence of the company's commitment to the high-quality manufacturing processes that are in line with international standards. Employee Training and Documentation: Himalaya is a strong believer and advocate of universal education and training in GMP and HACCP for all its employees, from the top management down to the lower level workers. The company follows strict Standard Operating Procedures (SOPs) throughout the production and maintains detailed records for traceability and regulatory compliance.

**Challenges Pulled**

**Maintaining Raw Material Quality Constant:** The use of natural raw materials by Himalaya sometimes leads to difficulty in maintaining the quality of the final product. For example, the active ingredients in herbs may change their concentration depending on different factors like soil, temperature, and harvesting time. In addition, Himalaya is mitigating this issue by entering into contract farming agreements and sourcing from suppliers that adhere to strict cultivation standards.

**Global Market Expansion and Compliance with Regulations:** Himalaya's global expansion led to regulatory problems in the US, Germany, and Australia, where the FDA and EMA impose very strict regulations for herbal medicines. The company had no choice but to adapt its Quality Management System (QMS) to the various regulatory regimes while still being able to showcase the authenticity and traditional knowledge that Ayurveda has been inbuilt.

**Case 3: Charak Pharma – Overcoming Hurdles through GMP Compliance**

Charak Pharma is recognized as one of the most trustworthy Ayurvedic medicine producers in India with a total commitment to natural products in the health care industry. The firm has already established a powerful QMS that is completely based on GMP rules and sees it as a two-way process to carry on with its production. Moreover, the company is very concerned about the safety of the end products and has the support of the robust QMS in that respect. Implementation Highlights: GMP and Modern Manufacturing Practices: Charak Pharma is always on the side of the law with respect to its manufacturing activities as it repeatedly obtains the approval of Schedule T regulations and international GMP standards. The company faithfully follows the well-defined processes of manufacturing that include cleanroom standards for certain production activities and batching, along with proper documentation for traceability. Quality Control Measures: Charak Pharma has a wide variety of QC protocols for its products. These include microbiological testing, heavy metals screening, and botanical authenticity tests. Additionally, the company has already taken the initiative to invest in state-of-the-art testing systems such as HPTLC for chemical fingerprinting and UV-VIS spectrophotometry for the measurement of active ingredients in products. Focus on Traceability: Charak's traceability of raw materials is one of its competitive advantages. Charak reduces the risk of contamination or adulteration by carrying out strict supplier audits and testing each batch of raw materials for quality before use. This traceability keeps on going the same way during the whole production process, starting from the arrival of raw materials to the final package. Product Innovation and Documentation: The firm does not only check the quality of its items but also by very imaginative ways in the domain of Ayurveda. Charak has a vast number of patented compositions and is in close cooperation with researchers to discover new medicinal uses for Ayurvedic herbs. The powerful and very strict documentation which is connected with all the R and D activities not only creates transparency but also ensures compliance with the law.

**Challenges Faced**

**Compliance with International Standards:** One of the major hurdles that Charak Pharma had to deal with was the changing of its production process to meet the high demands of the worldwide regulators. The company has been

successful in having the ISO 9001 and ISO 13485 (for medical devices) certifications, however, the product quality that the global market demands has been a never-ending process of learning and adapting.

**Modern QMS and Traditional Practices Co-existence:** Charak has had the difficulty of combining the ancient Ayurvedic methods with the modern quality management system. The manufacturing of certain formulations, such as Rasa Shastra (the ones that have metals and minerals), is a process that requires highly skilled knowledge and expertise and cannot be completely automated or standardized as in the case of the production of modern drugs.

**Case 4: The small Ayurvedic manufacturers** have resource constraints, but they manage to overcome them When compared to the big companies like Patanjali, Himalaya, and Charak, which are already having a strong QMS, the small Ayurvedic manufacturers hardly ever get to implement the QMS at all due to the budgets, infrastructure, and expertise limitations. One instance of a tiny ayurvedic medicinal plant situated in rural India is that it mainly manufactures local medicinal formulations for the local market. Implementation Highlights: Simplified QMS Practices: The small manufacturer used simplified QMS principles first that did not demand the costly sophisticated testing facilities or large-scale automation. Although their quality control was quite basic, it was nevertheless efficient and consisted of the quality sourcing of raw materials, the basic GMP training with record-keeping for tracing. Collaborations for Testing: The local company collaborated with local research institutes and third-party testing labs for the required quality checks that included microbial testing, pesticide residue analysis, and heavy metal screening. Employee Involvement: The factory owner provided the staff with regular training sessions on basic hygiene, safe handling of herbs, and awareness of contamination risk. The company's quality culture was further strengthened through the employees' direct involvement in the QMS process. Challenges Faced: Limited Financial Resources: The primary disadvantage was the inability to obtain the best testing equipment and purchase raw materials of the highest quality due to financial constraints. The company also had to forego export opportunities due to the lack of necessary international certifications and, consequently, the inability to meet the stringent standards required for exports..

**Regulatory Pressure**

The company found it hard to understand the complicated regulation requirements for Ayurvedic products in India, particularly in the area of Schedule T compliance. It adhered to the local requirements but did not have any formal training or consulting support to acquire a thorough understanding of the intricacies of the regulatory needs.

## CONCLUSION

The implementation of Quality Management Systems (QMS) in the production of Ayurvedic medicines is a condition that ensures the safety, efficacy, and uniformity of the medicines. The Ayurvedic sector is going up, and it is gaining global recognition, which implies that the most stringent quality controls will have to be implemented to meet both the domestic and international standards. However, the dilemma of a powerful QMS implementation in this old practice has its own issues stemming from the nature of Ayurvedic treatments, the irregularity of the raw materials, and the use of the very old-fashioned manufacturing methods that have been handed down through generations..

**Main Points**

**Raw Material Standardization:** The raw material inconsistency that is natural is among the most complex problems Ayurvedic producers have to solve. Quality control for the herbs, the minerals, etc. that are used in Ayurvedic treatments largely depends on factors like where they are produced, when they are harvested and how they are treated after harvesting. This variability in quality makes it difficult to have a product with the same quality every time. As a result, a consistent source of the materials with the support of GACP (Good Agricultural and Collection Practices) and supplier inspections is very important for quality assurance right from the start of the production line.

**Integration of Modern Analytical Tools:** It is true that numerous Ayurvedic firms have deployed modern testing technologies such as HPLC, HPTLC, GC-MS, and UV spectrophotometry, but there is still a long way to go for small- and medium-sized enterprises (SMEs) in terms of access to such technologies. The case study of Patanjali and Himalaya indicates that larger companies have completely absorbed advanced testing protocols into their QMS that not only help them to meet the most stringent regulatory requirements but also ensure product uniformity. However, many smaller firms cannot put similar systems in place due to financial and infrastructure constraints.

**Regulatory Compliance:** The regulatory issue is still one of the biggest hurdles that Ayurvedic producers have to overcome. The Drugs and Cosmetics Act (1940) and Schedule T are the rules that govern Ayurveda in India, but the way these rules are applied differently in various places, especially rural areas, makes it possible for compliance to be completely different. This is the same situation as with Charak Pharma and small manufacturers; the whole process of navigating through the regulatory landscape—especially for global exports—gets complicated all the time. Moreover, the manufacturers have to do documentation and provide traceability which is the main concern of compliance with international standards like ISO 9001, ISO 22000, and WHO-GMP.

**Traditional vs. Modern Practices:** One of the biggest controversies that the Ayurvedic sector has to face is the cultural resistance to using modern QMS frameworks, as the general belief is that the use of modern methods will lead to a decline in the authenticity and potency of Ayurvedic medicines. The clash between the artisanal quality of the traditional and the modern quality control needs creates the situation where the production and processes cannot be automated and uniform across the board. On the other hand, the case of Charak Pharma shows that the combination of gradual changes in manufacturing processes and the retention of the core traditional formulations can lead to both improving product quality and increasing operational efficiency..

**Challenges in QMS Implementation**

Despite the remarkable progress in QMS implementation throughout the Ayurvedic sector, it still had to face some challenges:

**Raw Material Variability:** Inconsistent quality across the board in the raw materials still annoy manufacturers and it becomes a barrier to produce uniform and standard products. Besides, the potency of herbs is varied and on top of that, there are contaminants such as heavy metals, pesticides, and microbial pathogens present in the materials that require thorough testing during the entire production process.

**Infrastructural Barriers for SMEs:** Big infrastructural and financial barriers have to be confronted by the small suppliers of the Ayurvedic industry. Most of the small suppliers do not have sufficient funds to buy sophisticated analytic apparatus, install automation in production, or hire skilled staff which are all necessary for the establishment and upkeep of a QMS.

**Regulatory Gaps:** On the one hand, the non-uniformity in regulatory enforcement, and on the other hand, the unavailability of trained personnel who are familiar with the Ayurvedic production methods, and the lack of applied scientific and technical knowledge and understanding do not guarantee proper compliance with GMP throughout. Moreover, the regulatory standards for the Ayurvedic industry in different parts of the world are still changing, which creates uncertainty among the manufacturers who want to enter the global market.

**Resistance to Change:** Generations after generations, traditional Ayurvedic practices are being passed on and thus some of the manufacturers do not want to change their production methods or formulations. Non-acceptance of modernity can be a slow down factor in the adoption of contemporary quality management techniques which are compulsory for the fulfillment of both domestic and international standards.

## FUTURE DIRECTIONS

Despite the difficulties mentioned, a few important measures could smooth the incorporation of QMS in the Ayurvedic manufacturing industry:

**Raw Materials Standardization**: It is a must to lay down the generic standards for the whole industry regarding raw materials sourcing and quality assurance in order to allow the Ayurvedic products to be graded consistently. The growers of herbs along with their suppliers and manufacturers should be encouraged to form close ties that would enable the observance of the aforementioned qualities in the raw material collection by making them the foremost priorities.

**Testing Facility Development:** Join forces to build available laboratory space for the smaller manufacturers, Government agencies, and private sector. Conventional lab for small-scale manufacturers can help in getting the advanced testing and the quality assurance tools that smaller companies are unable to buy. Moreover, staff training on the latest analytical techniques should also be given high priority.

**Support for SMEs:** The government may offer financial incentives, subsidies, and tax relief for those investing in quality control systems and regulatory compliance to assist small and medium Ayurvedic manufacturers in their QMS implementation. Moreover, low-cost certification programs could allow SMEs to obtain ISO certifications and satisfy the criteria for international markets.

**Awareness and Education:** Raising the issue of QMS and compliance to the regulators as well as the suppliers and manufacturers in Ayurveda is the most important task. The latter would be through the arrangement of workshops, seminars, and cooperation with the universities. The higher education of modern QMS principles will not only help to elevate the quality of the products but also to win the trust of the consumers and the regulators.

**Public-Private Partnerships:** Not only would the collaboration of the government, industry players, and academic institutions be a big step forward in Ayurvedic innovation, but it would also provide solutions for regulatory, infrastructural, and financing barriers that manufacturers face. Amongst such collaborations would be the setting up of a common testing regime, the betterment of raw material sourcing, and the facilitation of global market access.

**Incremental Implementation:** It would be wise for the manufacturers to take the gradual route in switching to QMS, starting with the very basic measures like making sure hygiene is up to the standard, inventory is being monitored, and employee training is being provided. Ultimately, these little moves will be together and will lead to a comprehensive QMS which is acceptable by both traditional and modern standards.

## CONCLUSION

To sum up the whole discussion, the application of Quality Management Systems in the production of Ayurveda is a must to guarantee the safety, effectiveness, and uniformity of the Ayurvedic products. Although the industry is embroiled in big challenges like changing nature of materials, lack of regulations, obsolete infrastructure, and reluctance to change, still, there are some ways out. By making a technology investment, overcoming the issue of raw material, cooperating with the authorities, and lending a hand to the small and medium enterprises, the Ayurvedic industry will not only gain the trust of the consumers but also be able to make it in the global market. The combination of age-old practices with state-of-the-art QMS systems will be the main factor in the upliftment of the Ayurvedic product quality and the international market's acceptance and demand.

**ABSTRACT**

This study explores the impacts of alcohol consumption and smoking habits on health, families, and society. Smoking habits and alcohol consumption have a huge impact on family and health. This study is going to investigate how alcohol and smoking habits are affecting or are going to affect the health of individuals and families, with some critical impact on property and reputation. Family and health are observed as the first and most important for socialization, connection, and child development. Through surveys, focus group discussions, and personal interviews, the project digs into the interconnectedness of alcohol and smoking habits with different aspects of community life. Findings from the study disclose the serious impact of these habits on individual health, including the increase in chronic diseases and mental health challenges.

**Keywords:** Health consequences, Consumption of alcohol, Domestic violence, Alcohol or smoking habits, Consuming alcohol.

## INTRODUCTION

Consumption of alcohol has a vastly negative impact on society because alcoholism leads to some serious problems like public violence, domestic violence, divorce, marital problems, and child abuse. It is also one of the major reasons behind the increasing strain in relationships between partners or between the parent and child. Alcohol addiction causes some serious disorders like memory loss, affection in brain damage, emotional damage, and mental disorders. Moreover, this also affects health in various ways; some of the common serious conditions like kidney, heart, and liver damage also cause anxiety and many other disabilities and fatal diseases. Consumption of alcohol destroys the relationship between neighbors, relatives, and the community. It also decreases the social status of the family. Domestic violence is one of the major issues that is an undesirable situation in any family; it mostly arises from the

influence of alcohol. Drinking and driving leads to major accidents, which are also influenced by alcohol consumption. If we discuss the graph, alcohol consumption is increasing rapidly, as reported by Medical News Today. Over the years from 1990 to 2017, the amount of alcohol people drank worldwide went up by 70%. That means it jumped from about 21 billion liters a year to almost 36 billion liters a year. According to the WHO, the chance of domestic violence due to alcohol abuse between partners is 55%. Tobacco use has negative consequences on society. All forms of tobacco are deadly. Smoking causes some injurious health diseases which can lead to lung cancer, mouth cancer, heart diseases, asthma, stroke, reproductive health issues in women, blindness, diabetes, cataracts, and some other types of cancer: liver, pancreatic, and stomach cancer. According to the WHO, tobacco use is responsible for 25% of all cancer deaths globally. It also affects the health of your loved ones, friends, and family – not just you. When you buy tobacco products, you are financially supporting an industry that utilizes farmers and children and kick starting sickness and death. Tobacco causes over 20 types of cancer. Smokers are more likely to lose their vision and hearing. So there are so many reasons to quit tobacco and smoking habits. In this research, we are going to discuss the major consequences of alcohol consumption and smoking habits with the help of some community connections.

# LITERATURE REVIEW

Chinnusamy et al. [1] conclude that alcohol abuse has caused lots of trouble for family members. This can lead to domestic violence, financial difficulties, and psychological disturbances, along with increasing the risk of developing multimorbidity tied to alcohol abuse by the individual, which can make things more stressful for the family. Singh [2] concludes that it is obvious that alcohol affects not only an alcoholic's behavior but also the behavior of those close to him. Treatment for this alcohol addiction issue is therefore essential. The majority of studies have found that drinking patterns, including type, quantity, timing, duration, frequency, context (alone or with others, with or without food, etc.), and drinking situations, are more problematic in rural areas, towns, and slums, as well as among illiterate people and those from lower socioeconomic strata.

Gruber et al. [3] studied the survey done in 2004 in which there were 702 students in high school. This study wanted to detect the relationship between parents who include alcohol or smoking habits and the occurrence of dangerous drinking or smoking among their children. They conclude that the more parents smoke, the more likely their children are to start smoking or drinking. Kadri et al. [5] conclude that among 560 people involved in drinking or smoking habits, most of them were between the age group of 26–35 years old (46%). Most of them lived in Ahmedabad city. 82.1% of abusers had looked for consultation after the age of 25 years, but almost half (46.4%) of them started using alcohol and smoking before they were 20 years old. The most common substance used by them was alcohol, used by 70.2% of them after brown sugar (13.8%). 26.1% of them said that other members of their family had a drug addiction. The age of starting the habit was earlier (<20 years) in those with a positive family history of addiction, as compared to abusers without a positive family history, see references [4, 6, 7, 8, 9, 11].

Grube et al. [10] conclude that alcohol or beer advertisements may lead to an increase in drinking habits in young people. They also conclude that to prevent young people from developing drinking habits, they should pay attention to counter the effects of alcohol or beer advertisements.

### Objectives

- Analyse the long-term health consequences that are associated with alcohol consumption and smoking habits.
- Explore the impacts on society that broadly come into play due to alcohol consumption and smoking habits, which include productivity loss, economic costs, and strain on the healthcare system.
- Explore the role of alcohol and smoking habits on family relationships, parent-child relationships, and sibling dynamics.

# RESEARCH METHODOLOGY

A survey was conducted using a questionnaire in a village named "Dadupur" situated in Uttar Pradesh. We met the villagers and asked them to give their opinion regarding our survey topic, "Impact of alcohol and smoking habits on health, families, and society," and fill out a questionnaire. The survey had questions about things like how old you are, whether you smoke or drink, whether your parents smoke or drink, and how much money your family has. Some questions needed a simple "Agree" or "Disagree" response, while others asked you to pick just one answer from a few options. To investigate this whole survey, we visualize the data collected through this survey in Excel by creating pivot tables and different types of charts.

**Data Description**

We collected the primary data through a survey for this study. We surveyed a village named 'Dadupur' in Greater Noida. This survey was completed in 1 day only. We took 35 personal interviews in our survey. Interviews were taken with people of different age groups, of which 28 were males and the rest, i.e., 7, were females. The youngest male respondent is 17 years old, the eldest male respondent is 65 years old, the youngest female respondent is 21 years old, and the eldest female respondent is 65 years old. In this paper, we conclude that the biggest or maximum impact of alcohol and smoking habits on family dynamics is on strained relationships. 65% of people think there is a negative impact on children who are affected by parents engaging in alcohol or smoking behaviors. 31% of the people think that there is a significant role of education in preventing the initiation of alcohol and smoking habits, and 42% of people think that there is a limited impact on the role of education in preventing the initiation of alcohol and smoking habits.

The impact of alcohol and smoking on the household economy is increasing financial strain. 82% of people say that there is a negative impact of alcohol and smoking on health, and these habits can cause lung cancer. The long-term health effects of smoking include an increased risk of chronic diseases. There is a 65% chance that children will be affected by parents engaging in alcohol or smoking behaviors. 62% of people think that there is a negative impact of consuming alcohol and smoking on society, which can lead to public violence. Elderly individuals are more often at a higher risk of the negative impacts of alcohol and smoking habits.

**ABSTRACT**

Domestic waste management in rural West Bengal is undergoing slow but critical transformation amid rising concerns over environmental and public health issues. Traditionally characterized by unsegregated disposal and limited infrastructure, rural waste systems are now the focus of decentralized, sustainable strategies. This paper explores the types of household waste generated, existing practices, challenges, and successful models in selected districts. Through field observations, stakeholder interviews, and secondary data, this study underlines the urgent need for behavioral change, participatory governance, and technological interventions for efficient rural sanitation. It advocates for integrated, community-based models supported by policy, education, and innovation to build a sustainable domestic waste management framework.

**Keywords:** Rural Waste, Segregation, Sanitation, Community Participation, West Bengal

## INTRODUCTION

In the context of rural India, particularly in states like West Bengal, the issue of domestic waste management has long been overlooked despite its significance to environmental health and sustainable rural development. Unlike urban regions where organized systems exist for the collection, segregation, transportation, and treatment of household waste, most rural areas continue to rely on traditional and frequently hazardous methods of disposal. These include open dumping along roadsides and village peripheries, the burning of household refuse in backyards, and the unregulated composting of organic materials near water bodies and residential areas. These practices, while entrenched in habit, pose serious threats to public health and ecological stability. Recent data from the Central Pollution Control Board (CPCB, 2023) reveals that approximately 55% of domestic waste generated in rural India remains either untreated or inappropriately disposed of. This untreated waste often leaches into the soil, leading to the contamination of groundwater resources, which are the primary sources of drinking water in many villages. Moreover, decomposing waste fosters breeding grounds for disease-carrying vectors, contributing to periodic

outbreaks of waterborne and respiratory illnesses. The cumulative environmental burden also includes the degradation of agricultural lands, pollution of local water sources, and the release of harmful gases from burning plastic and other synthetic materials. In response to this growing challenge, the Government of West Bengal has initiated several schemes aimed at improving sanitation and waste management in rural areas. Prominent among these are Mission Nirmal Bangla and the rural extension of the Swachh Bharat Abhiyan. These programs have focused on constructing toilets, reducing open defecation, and, more recently, establishing village-level solid and liquid waste management systems. Despite these initiatives, the practical implementation on the ground reveals several shortcomings. These include insufficient allocation of funds, lack of trained manpower, poor monitoring mechanisms, and the absence of active community participation. Many gram panchayats lack the necessary infrastructure, including waste collection carts, compost pits, segregation units, and sanitary landfills. Furthermore, public awareness about the dangers of improper waste handling and the benefits of scientific waste management remains low. Given this backdrop, there is a pressing need to reassess and redesign current rural waste management strategies to ensure their effectiveness, scalability, and sustainability. Solutions must be context-specific and should integrate local knowledge systems, decentralized governance, and active community involvement. Educational outreach, financial incentives, and the development of local enterprises focused on recycling and composting can play an instrumental role. This study therefore seeks to critically examine existing domestic waste management practices in the villages of West Bengal and propose a comprehensive, sustainable model that addresses both environmental concerns and the socio-economic realities of rural communities.

**Types and Sources of Domestic Waste in Villages**

The nature and composition of domestic waste in rural areas differ significantly from that of urban regions due to lifestyle patterns, occupational activities, and socio-cultural practices. In the villages of West Bengal, domestic waste is broadly categorized into three types: biodegradable, non-biodegradable, and hazardous or sanitary waste. Each of these waste streams originates from distinct sources and requires specific handling approaches.

**Biodegradable Waste**

Biodegradable waste constitutes the largest portion of household refuse in rural areas. This category includes organic materials that can decompose naturally, such as vegetable peels, leftover food, fruit skins, tea leaves, garden waste, and cow dung. In agricultural households, kitchen waste often gets mixed with organic matter from backyard farming or livestock sheds. For example, in the villages of Purba Bardhaman, a significant portion of daily waste consists of rice husks, banana leaves, and hay swept in from nearby paddy fields. Cow dung, a common by-product in most rural homes with cattle, is frequently left in open areas or along pathways for sun drying before use as fuel, creating temporary sanitation issues during the monsoon. Although biodegradable in nature, improper disposal—such as dumping in drainage canals—leads to blockages, water stagnation, and mosquito breeding.

**Non-Biodegradable Waste**

The proliferation of consumer goods has introduced a growing volume of non-biodegradable waste into rural households. This waste includes plastic carry bags, food packaging, aluminum foils, broken glass, tin cans, empty shampoo sachets, cosmetic containers, and disused electronics. In Murshidabad, for instance, weekly village markets (haats) contribute significantly to the presence of multilayer plastic packaging, which is often discarded in nearby bushes or ponds due to the absence of waste bins. Children frequently collect and burn these items near their homes, unaware of the harmful fumes emitted during combustion. Additionally, as rural consumption patterns change with the advent of e-commerce and packaged goods, the quantity of such synthetic waste continues to increase. Unlike organic matter, these items do not decompose and remain in the environment for years, affecting soil fertility and blocking water channels.

**Sanitary and Hazardous Waste**

This category comprises waste that poses direct health risks if not handled carefully. Sanitary napkins, disposable diapers, expired tablets, used syringes, pesticide containers, and broken CFL bulbs fall under this group. In districts like South 24 Parganas, where households often share close proximity with kitchen gardens and water sources, these

materials are frequently thrown into open pits or ponds. A 2023 health survey by the district administration found that improper disposal of used sanitary products was linked to increased cases of skin infections and gastrointestinal illnesses, particularly among children. The issue becomes more pronounced during the rainy season, when rising water levels cause hazardous waste to float and spread into adjoining residential areas. Moreover, pesticide bottles and chemical fertilizers used in farming, when carelessly dumped or reused for household purposes, present significant threats to both human health and the environment.

**Overlapping Waste from Agriculture**

An additional source of domestic waste in rural areas stems from agricultural practices. In most villages, the proximity of households to farmlands results in overlapping zones where domestic and agricultural waste mix. In places like Ausgram or Ketugram blocks of Purba Bardhaman, crop residue such as stalks, husks, and weed cuttings are often piled near homes before being burnt or used as cattle fodder. While some of this material is biodegradable, its uncontrolled accumulation alongside non-biodegradable household waste—such as pesticide sachets and seed packets—complicates segregation efforts. Estimates from the Public Health Engineering (PHE) Department of West Bengal (2024) indicate that daily waste generation in rural households ranges between 250 and 300 grams per capita. Though seemingly modest in volume, the cumulative burden on village ecosystems becomes substantial, especially when no formal collection or treatment mechanisms are in place. Without clear segregation, waste of different types ends up in the same disposal sites, diminishing the potential for composting, recycling, or safe incineration. The sources and types of domestic waste in rural West Bengal are diverse and closely tied to the socio-economic life of the population. From kitchen leftovers and cow dung to plastics and chemical residues, these materials require a multi-pronged approach for effective and sustainable management. Without adequate infrastructure, community awareness, and localized waste treatment solutions, these waste streams continue to pose serious threats to health, hygiene, and the rural environment.

**Current Waste Management Practices in Rural West Bengal**

In most rural regions of West Bengal, household waste management remains an unstructured and community-neglected process. The absence of proper municipal support and waste disposal infrastructure has led to the continued reliance on rudimentary practices that often harm public health and the environment. The methods followed vary from village to village but generally fall into a few common categories. These include open dumping, burning of refuse, composting in pits, and reusing food waste as animal feed. While each method has its own rationale based on convenience, cultural practice, or lack of alternatives, the overall approach remains unsystematic and inconsistent.

**Open Dumping of Household Waste**

One of the most widely observed practices in rural areas is open dumping. Residents routinely discard household refuse in backyards, unused plots of land, roadside corners, and alongside canals or irrigation ditches. This includes a mixture of kitchen waste, plastics, broken utensils, and even medical waste. In the Canning subdivisions of South 24 Parganas, for instance, village lanes often accumulate heaps of waste that are neither collected nor treated, especially near market areas. The lack of designated disposal spots or community bins leads to indiscriminate dumping, which results in clogged drains during the rainy season, waterborne diseases, and foul odors. Children and domestic animals are frequently seen playing or foraging near these dumps, increasing their exposure to health hazards.

**Burning of Waste Materials**

Burning is another prevalent method for waste disposal, particularly for items that cannot be composted or reused. This includes plastic carry bags, used clothes, synthetic wrappers, packaging materials, and even rubber footwear. Burning is often done in small open spaces near the home, by the roadside, or at the corner of kitchen gardens. In villages of Purulia and Jhargram, such burnings are a common early-morning activity, carried out by women before beginning daily chores. Although residents view it as a way to reduce the visible volume of waste, the smoke released from burning plastics and synthetic materials contributes to local air pollution and respiratory problems,

especially among the elderly and children. Despite its health risks, the practice continues in the absence of any formal alternative for waste removal.

**Pit Composting of Organic Waste**

In agricultural households, composting is frequently practiced, albeit in an unscientific and localized manner. Kitchen waste such as vegetable peels, leftover rice, and fruit scraps, along with garden waste and cow dung, are usually dumped into shallow pits behind the house. These pits are often uncovered and unmanaged, depending entirely on natural decomposition. In Hooghly and Purba Bardhaman, farmers commonly use the resulting compost to fertilize kitchen gardens or paddy fields. While the practice promotes organic recycling, it is not always done properly. Many pits are dug too close to water sources or are left overflowing during the monsoon, creating breeding grounds for flies and mosquitoes. Without technical knowledge or regular monitoring, the full benefits of composting are not realized, and risks to hygiene persist.

**Feeding Food Waste to Livestock**

A traditional practice still widely followed in rural households is the use of food waste as animal feed. Leftover chapatis, rice, vegetable ends, and stale food are fed to cows, goats, pigs, and poultry. This practice is seen as practical and resource-saving, especially in agrarian homes. In districts such as Nadia and Murshidabad, it is common for families to maintain separate containers for food scraps that are specifically kept aside for feeding animals. While this reduces the volume of waste needing disposal, it is only suitable for certain biodegradable items and does not address other types of waste. Furthermore, the risk of feeding contaminated or spoiled food to livestock can pose health threats to both animals and, indirectly, to humans consuming animal products.

**Lack of Organized Collection and Segregation**

Only a small number of Gram Panchayats in West Bengal have functional systems for door-to-door waste collection or public awareness campaigns on waste segregation. Even where services exist, such as in a few semi-urbanized villages near Durgapur or Siliguri, waste is usually collected in bulk without sorting into biodegradable, recyclable, or hazardous categories. As a result, compostable waste often gets mixed with plastics and sanitary materials, making recycling or safe disposal nearly impossible. Color-coded bins are rarely found, and awareness of waste categories is minimal among the rural population. Without clear guidelines or financial support, Panchayats are often unable to maintain regular waste collection or establish transfer points.

**Community-Based Models by NGOs**

In some locations, non-governmental organizations have stepped in to fill gaps left by the public sector. Groups such as PRADAN and BASIX have piloted small-scale waste management initiatives based on decentralized collection and local participation. For instance, in selected villages of Birbhum and Bankura, women's self-help groups have been trained to collect waste from households, segregate it, and compost organic materials for sale as manure. PRADAN's initiative in Illambazar block, for example, encouraged composting kitchen waste in community pits, while also collecting plastics for recycling. Although these models show promise, they are still limited in scale. The lack of continuous funding, low technical support, and limited market linkages for recycled products have hindered their expansion to other areas.

**Challenges in Rural Waste Management**

Domestic waste handling in rural West Bengal remains beset by deep-rooted challenges that limit progress toward effective and sustainable sanitation. Inadequate facilities, limited awareness, uneven funding, weak institutional structures, and entrenched social practices all combine to undermine efforts. Below is a detailed examination of these key barriers, supported by recent statistics and data.

**Lack of Infrastructure**

**Absence of basic facilities:** Most villages lack essential infrastructure—waste bins, collection vehicles, composting units, or treatment plants. The State of Environment Report from the West Bengal Pollution Control Board finds that rural areas largely do not have organized solid waste services.

**No transfer points:** There are no common storage or segregation centres, forcing residents to resort to open dumping near homes or water bodies.

**Low Levels of Awareness**

**Waste is not viewed as a resource:** Despite growing waste volumes, rural communities seldom regard waste as a source of compost, recyclables, or income.

**Limited education programmes:** National sanitation efforts under Swachh Bharat Mission-Gramin have invested heavily in building toilets, yet less than 1% of their budget was allocated toward information, education, and communication—vital for behaviour change (Mordorintelligence.comprsindia.org+7en.wikipedia.org+7pmc. ncbi.nlm. nih.gov+7.).

**Non-compliance with rules:** A recent investigation by Sabuj Mancha shows that none of West Bengal's 128municipal bodies have fully implemented the 2016 Waste Management Rules, leading to rampant dumping in water Bodies (timesofindia.indiatimes.com)..

**Insufficient Funding**

Delayed and diverted grants: Although the Department of Drinking Water and Sanitation received ₹7,192 crore in 2023-24, only 9% was allocated to the Swachh Bharat Mission-Gramin, with a history of under-expenditure and Re-allocation to other priorities (bluekraft.in+8prsindia.org+8prsindia.org+8.).

**Delayed releases:** Many Panchayat-level projects experience late receipt of funds, constraining timely action. A study by Karnataka health officials found that similar funding shortfalls disrupted sanitation works in multiple rural districts .

**Lack of local revenue:** No village-level user fees or community funds exist to support ongoing maintenance, leading to the collapse of many initiatives once state or central grants lapse.

**Weak Institutional Mechanisms**

**Limited staffing and capacity:** Gram Panchayats often lack staff trained in waste logistics, segregation, or hazardous waste handling. There is little operational authority below block or district levels.

**Fragmented governance:** Responsibilities for sanitation are divided among Panchayats, rural development and health departments, causing duplication or gaps. Where door-to-door collections were piloted, inconsistent execution resulted from poor coordination en.wikipedia.org.

**Poor monitoring data:** No village-level records exist for waste generation, collection amounts, or disposal methods—making planning or corrective action impossible.

**Cultural Practices and Social Stigma**

**Caste-based stigma:** Waste-related work—particularly clearing drains or managing dung and garbage—is often performed by Scheduled Caste or Scheduled Tribe individuals, reinforcing social exclusion and poor service quality.

**Sanitation shaming:** Disposal tasks are considered 'dirty', deterring community involvement or ownership.

Traditional habits: Practices like open dumping, burning, and backyard feeding to livestock continue unchallenged. Despite construction of rural toilets under Swachh Bharat (with over 100 million toilets installed), open defecation persists, especially among marginalized groups (wbpcb. gov.in+1researchgate.net+ 1pmc.ncbi.nlm.nih.gov+1en. wikipedia.org+1.). **(Table 1)**

**Successful Interventions: Case Studies**

**Case 1: Nadia District – Mission Nirmal Bangla**

Nadia became the first open defecation-free district in India (2015), with a concurrent focus on household waste segregation. With the help of self-help groups (SHGs), biodegradable waste was collected in green bins and composted locally. This model led to the reduction of vector-borne diseases by 37% over three years (Nadia Zilla Parishad, 2022).

**Case 2: Bhangar-II Block, South 24 Parganas**

An NGO-led pilot introduced low-cost biogas digesters to convert kitchen waste into cooking gas. Households reported savings of ₹120–₹180 per month in LPG use and cleaner surroundings.

**Towards a Sustainable Model for Rural Waste Management**

To move rural waste management beyond traditional practices, a multi-pronged model—anchored in local participation, simple tech, financial mechanisms, and enforcement—is essential. Here is a detailed framework:

**Segregation at Source**

**Color-coded bins** for households and public spaces (green for biodegradable, blue for recyclables, red or yellow for sanitary/hazardous waste)

**Behavior-change drives** via village meetings, school eco-clubs, miking campaigns

**Inspiration from Punjab's Bharta Kalan**: Panchayats issued green and blue bins to homes and conducted IEC sessions, resulting in visible uptake of source segregation
reddit.com+11sbmgramin.wordpress.com+11downtoearth.org.in+11

**Community Participation**

**Inclusion of SHGs, eco-clubs, and youth groups** in awareness, monitoring, and operations

**Empowerment through income-generation**: In Purba Bardhaman, 86 SHGs and over 5,500 members now run 12 Solid Waste Management units producing and selling compost and vermi-compost sbmgramin.wordpress.com

**Educational engagement**: Eco-clubs in schools can organize clean-up drives, track plastic collection, and maintain cleanliness audits

**Decentralized Composting Solutions**

**Vermicomposting pits or rotary drums** placed at the community or cluster level

**Evidence of impact**: Self-help groups in Andaman's Shivapuram GP generated vermicast that improved crop yield and produced income through SHG-led enterprises sbmgramin.wordpress.com+1ebook.icar.gov.in+1

**Success in West Bengal**: Districts like North 24 Parganas have initiated community compost systems, collectively producing over 52 tonnes of compost and selling nearly half
wbxpress.com+2sbmgramin.wordpress.com+2ebook.icar.gov.in+2

**Plastic Waste Management**

**Buy-back and barter systems**: Examples like "plastic-for-meals" in Haryana or UP encourage plastic inputs through food or pad incentives dailypioneer.com+2hindustantimes.com+2theprint.in+2

**Dedicated collection centres** in Panchayats to aggregate plastics and transmit them to recycling firms or aggregators, aligned with Central Plastic Waste Management Rules (2016) reddit.com+2hindustantimes.com+2wbxpress.com+2

**Urban–rural partnerships**: Such as Karnataka's material recovery centres (MRCs) serving clusters of villages reddit.com+9downtoearth.org.in+9hindustantimes.com+9

**Safe Sanitary Waste Disposal**

**Local incinerators or deep burial pits** installed near health centres or schools

**Karnataka pilot**: 32 sanitary-napkin incinerators have been installed under SBM-G newsclick.insbmgramin.wordpress.com+2sbmgramin.wordpress.com+2deccanherald.com+2

**Need for rural rollout**: Support from gram panchayats to include small-capacity incinerators in health departments

**Policy Enforcement and Panchayat Integration**

**Inclusion in Gram Panchayat Development Plans (GPDPs)**: Structured plans with budget outlines, performance metrics, and monitoring by village-level committees

**Formal responsibilities**: Under Mission Nirmal Bangla and SWM Rules (2016), Panchayats are mandated to provide door-to-door collection, segregate waste, and set up material recovery spaces hindustantimes.comwbxpress.com

**Monitoring and regular audits**: Monthly sanitation inspections, social audits, and local accountability portals

**How These Pieces Fit Together**

**The Way Ahead**

The future of rural domestic waste management in West Bengal must rest on an integrated and locally rooted approach that blends traditional environmental practices with context-appropriate technological solutions. While past efforts have largely focused on isolated interventions, the need of the hour is a well-coordinated system that values both indigenous knowledge and scientific planning. Villages have long managed biodegradable waste through time-tested practices like composting with cow dung, leaf litter, and ash. These must be preserved, documented, and refined—not abandoned—in the drive toward sanitation reform. A hybrid model can thus emerge as a practical solution. This would combine community-based composting and livestock feeding of organic waste with modern techniques such as biogas units, vermiculture, and materials recovery facilities (MRFs) for segregated waste processing. In areas like Bankura and Hooghly, where cattle-rearing is prevalent, household biogas systems can effectively utilize cow dung and kitchen waste to produce clean energy for cooking while also generating nutrient-rich slurry for agriculture. At the same time, small-scale MRFs near Gram Panchayat offices or haats can collect, sort, and prepare recyclable materials like plastics, glass, and metals for transport to recycling industries. To ensure such a model succeeds, partnerships between the public sector, local institutions, and private entrepreneurs are vital. These collaborations can address gaps in infrastructure, logistics, and technical expertise. For instance, private agencies could be engaged for operating compost plants, supplying color-coded bins, or maintaining data registers. Government schemes such as the Rural Infrastructure Development Fund (RIDF), National Rural Livelihood Mission (NRLM), and Mission Nirmal Bangla could be leveraged to finance the necessary infrastructure and training programs. A crucial element in this transformation is the involvement of rural youth. Young people possess the energy and adaptability to promote sustainable practices within their communities. Village-based youth groups and school eco-clubs can take ownership of campaigns promoting segregation at source, plastic collection drives, and composting techniques. With proper mentorship and access to capacity-building programs, they can

become community waste champions. If these efforts are supported through digital tools—such as mobile applications for waste reporting or dashboards for tracking plastic use—and linked with microfinancing options for entrepreneurial ventures, rural waste handling can shift from being a neglected task to a livelihood opportunity. Additionally, strong local governance mechanisms must be established. Gram Panchayats should include waste management explicitly in their Development Plans, and regularly conduct village sanitation audits to assess performance. Introducing incentives for villages achieving milestones in waste segregation, composting, or clean environment benchmarks can encourage healthy competition and innovation. Transparency and regular monitoring are also essential. Real-time data on waste generation, disposal patterns, and system failures should be maintained and reviewed during Panchayat meetings. Monthly review sessions involving women's groups, SHGs, farmers' collectives, and teachers can improve accountability and ensure that waste management is not treated as a peripheral issue but as a key determinant of village health and dignity.

## CONCLUSION

Villages across West Bengal today stand at a crucial juncture, where the transition from unmanaged waste to sustainable sanitation systems is both necessary and achievable. This transformation, however, requires a shift in mindset—waste must no longer be viewed merely as an unwanted by product but as a valuable resource with economic, environmental, and health-related potential. When handled wisely, domestic waste can generate rural employment through compost production, recycling operations, and local waste management services. It can reduce the disease burden by eliminating breeding grounds for mosquitoes and other vectors, and it can restore ecological balance by preventing soil, air, and water contamination. The path to such transformation must be shaped from the ground up. Empowering Gram Panchayats to design, implement, and monitor waste management strategies is essential. They are best placed to understand local habits, seasonal variations in waste generation, and the available land or labor resources. Decentralized planning must be supported with technical training, funds, and autonomy so that Panchayats can integrate waste management into broader rural development agendas—whether through agriculture, public health, or education. Additionally, integrating domestic waste into livelihood frameworks holds immense promise. Women's self-help groups can manage compost units and recycling centers. Youth can be trained as green entrepreneurs, operating waste collection or segregation services. Farmers can benefit from organic manure produced through village composting. In this way, waste management becomes an instrument not only of hygiene but also of economic empowerment and skill development. This approach strengthens rural self-reliance while reducing dependence on external contractors or irregular government services. Yet, the success of such efforts depends on more than infrastructure and funding—it hinges on social cooperation and cultural acceptance. Traditional norms around purity, caste, and cleanliness must be addressed through education and sustained dialogue. Behavioral change campaigns need to be participatory and respectful, not imposed from outside. Schools, religious institutions, and local festivals can all serve as platforms for spreading awareness. Above all, long-term engagement, rather than short-term schemes, must guide the process. Domestic waste management in rural Bengal, therefore, is not solely a technical or logistical issue. It is a social and cultural endeavor that calls for collective responsibility, inclusive planning, and consistent institutional backing. When communities are actively involved and supported by a responsive state system, sustainable waste management becomes not only possible but transformative. In this lies the hope for cleaner villages, healthier families, and a more resilient rural Bengal.

**Table 1 Challenges**

| Challenge | Description and Impact |
|---|---|
| **Infrastructure** | No bins/transport/compost plants; rural regions lack formal disposal mechanisms. |
| **Awareness** | Waste seen merely as rubbish; underinvestment in education and rule enforcement. |
| **Funding** | Grants are delayed or diverted; SBM-G under-spent, no local financial models. |
| **Institutional Weakness** | Panchayats underpowered, monitoring is weak, inter-agency roles unclear. |
| **Socio-cultural Stigma** | Waste work is caste-linked, poor public participation, continued open dumping. |

**Table 2: How These Pieces Fit Together**

| Strategy | Mechanism | Outcome |
|---|---|---|
| **Bins + awareness** | Color-coded + IEC sessions | Reduced mixing; better recycling |
| **Community-driven SHGs** | Local participation and compost sales | Income and social ownership |
| **Decentralized composting** | SHG-operated vermi-pits | Organic manure, reduced waste |
| **Plastic buy-back** | Incentive-based collection | Lower littering, local recycling |
| **Sanitary incinerators** | Installed near PHCs/schools | Safe menstrual waste treatment |
| **Policy alignment** | GPDP + SWM Rules | Institutional backing, sustainable budgeting |

**ABSTRACT**

The result of this development in the finance world nowadays is that individuals are practically left with no choice but to make informed decisions, which will assist in their tax planning. Financial Intelligence and in particular with regards to your tax, or is the rise of Artificial Intelligence (AI) in financial forecasting? has already enhanced two trends: financial awareness and tax strategy optimisation. Outlined by primary data which are obtained by means of interviewing 200 participants, the report is expected to quantify the level of awareness, identify deficiencies, and determine the extent of AI integration in Tax planning. This study will strive to get to know the extent of financial literacy in the area of tax planning between the common assessee and the further extent of AI tools in this aspect.

**Keywords:** Tax Planning, Financial Awareness, Artificial Intelligence, Financial Forecasting, Personal Finance, AI in Taxation

## INTRODUCTION

**Background**

Economical knowledge has become a modern element of economic sustainability and general financial prosperity foundation. As individuals have to work through an incredibly complicated financial landscape filled with ever more tax systems, and more and more pressure to allocate among family members decision-making roles and economic roles to administer the tax structures, best of all, tax literacy unquestioningly is required to enable taxpayers and their relatives to make sound choices to maximise household fiscal gainage. Taxpayer Advocate Service. In an annual report submitted to Congress, the Taxpayer Advocate Service (2024) found that in 2023 alone, without financial literacy, Americans lost over 388 billion US dollars, or about 1,506 per adult on the average, which represents quite a

significant financial liability of having financial illiteracy. The concept of financial literacy is not individually limited to the economic impacts but larger ones in the society. Global Financial Literacy Excellence Center (GFLEC)Graduate School of Business - Lusardi and Mitchell (2014). Earlier studies on explaining the indirect impact of financial literacy indicate that financial literacy affects not just building of wealth, but also retirement planning, risk-taking, and borrowing. In their original study, rather few older adults- only 34% of them- could give clear responses to simple questions concerning typical financial literacy terms, and they claimed that they have long-term consequences on their financial security later in life. Financial management particularly tax planning is a very tricky topic to understand without expertise and knowledge since it can be confused with taxation, investment, and financial forecasting. The tax schemes are being made more complicated today with various categories of deductions (in the example of Section 80C instruments) and National Pension Fund (NPS) provisions, as well as, Housing Rent Allowance (HRA) benefits and tax planning schemes must be far more refined. Public Provident Fund (PPF), Employee Provident Fund (EPF), and life insurance plans and other classic instruments of tax planning need time and allocation decisions that are well informed and enhanced by financial literacy.

**Problem Statement**

The financial awareness is still immeasurably low, in particular, tax planning, despite unparalleled access to online financial products and sources of information. In the context of planning financial services that a taxpayer might have under the law, per Taxpayer Advocate Service survey data (2024) Some shocking differences in taxpayer knowledge: - 61% of those surveyed actually failed to satisfy the simplest tax knowledge test - 64% of them were not able to determine the difference between a tax credit of 1000 dollars and a deduction When it comes to financial services to do with individual taxation, the maturation of Artificial Intelligence poses both the potential and the danger.

**Research Questions**

- What is the financial awareness level of tax planning among people?
- Are tax planning behaviours patternable in the R-based data analysis?
- What is the role of AI literacy in making the process of financial planning effective?

**Objectives**

- Determine the consciousness of financial awareness with the help of AI technology in tax planning.
- To Investigate Financial awareness in terms of tax planning behavior.
- To examine demographic and behavioural patterns of the Individual Assessee.

**Scope and Significance**

Based on primary data of 200 respondents across numerous demographic lines, the current study is one of the rather few that would offer a thorough analysis of the financial literacy and tax planning behavior. The value that the current research has to offer is a combination of the time-tested financial literacy measurement and the newest trend of AIT integration, which offers a new shade of digital transformation to personal management of finances. The research contributes to the dearth of empirical evidence on the subtopics of tax planning areas in the larger literature on financial literacy. By utilizing R programming as a statistical analysis tool and assessing the ways to AI tools are adopted, this research fills the gap between the traditional study of financial literacy and its use currently, using AI tools in personal finance. The findings can offer practical advice to financial teachers, policymakers, and technology creators on where the intervention can be done to enhance individual tax planning ability through better-designed taxation aids. The research methodology is an example of how advanced analytics can be applied in research of the financial behavior and might result in numerous studies in the specific domain in the future.

## LITERATURE REVIEW

**Financial Awareness and Tax Planning**

Their theoretical structure adopts the concept of financial knowledge as human capital investment, which assumes that individuals make decisions to optimize knowledge accumulation with respect to the expectation of return from knowledge investment compared to the cost of attaining such knowledge. A framework that describes how individuals go about deciding between tax planning education and implementation is the theoretical base for this research. The Lusardi-Mitchell model shows that financial literacy follows a hump-shaped path over the lifecycle, accumulating mainly during working years and depreciating in later life. Such behaviour is directly reflected in their manner of tax planning, as optimum tax strategies usually involve a considerable degree of foresight and complexity in the instruments used. Research by Warmath *et al*. Capuano (2020) also extended this argument to indicate that formative measurement approach presents a more comprehensive measure of financial capacity, which integrates cognitive knowledge, affective self-efficacy, and psychomotor abilities. Tax planning consideration incorporates types of financial instruments with an aim of minimising taxations. Section 80C is a tax-saving deduction highlighting one the EPF, PPF, NSC, and life insurance premiums (capped at [?]1.5lakhs aggregate) although there are other alternatives like health insurance (80D), education loan interest (80E), and the National Pension Scheme (NPS) adding another [?]50,000 deduction under Section 80CCD(1B). As indicated in (2024) data, there exist huge differences in demographic tax literacy. The same survey data indicates that less than one-third of them identify the top-income tax rate correctly, and not a majority of them learn about the principles of a progressive tax. It is these knowledge deficiencies that eventually lead to poor financial decisions with the least financially literate 29% of all credit card users doing 42% of the behaviours that generate fees at a 50 per cent higher cost than the financially literate.

**AI in Financial Forecasting and Tax Planning**

Tax planning and financial forecasting have become the other two key areas in finance services, where artificial intelligence has kept taking traditional approaches and put forward more efficient and advanced services. According to new research from Bloomberg Tax, the four major applications of AI in tax planning include generative AI tools to increase the accuracy of research, compliance and risk management automation, workflow automation, and predictive analytics to improve strategic decision-making. Tax planning—Generative AI applications have big potential for individual taxpayers. As evidenced by Fava (2023) [Financial Planning Association], AI can simulate thousands of tax scenarios across wide-ranging assumptions, enabling the identification of optimal strategies. Ultimately, what the technology does is to predict regulation changes, and then, based on these predictions, it provides guidance and suggestions of what the companies should do to adjust; it allows a shift from static planning to anticipatory planning. Predictive analytics capabilities help those AI systems foresee what the market is doing and how that will affect their taxes, giving individuals access to high-end planning tools that were once only available to institutional investors. Robo-advisors are seen as the most obvious ones with regard to AI in personal financial management. An analysis by NerdWallet shows that Wealth front and Betterment, two of the most popular robo-advisors, offer more sophisticated tax optimization strategies, such as tax-loss harvesting and asset location optimization, without a minimum balance requirement. They democratise access to complex tax planning approaches that would traditionally require humans and a level of wealth to benefit from. However, adoption challenges persist. Research from Scale Venture Partners indicates firms within financial services are falling behind on AI adoption, even though the sector is rich in data, heavy on process, and ripe for automation. Barriers to adoption: consumer trust, regulatory constraints, and complexity in implementation

**Data Analytics in Finance: R Programming Applications**

R programming has become a reliable source to question the mean, due to its wide-ranging statistical modeling, cleaning, visualization, mess, and predictive analysis functions. As identified by F9 Finance, R is uniquely designed for statistical computing and has a wide range of packages that are tailored for financial practitioners, making R a perfect match for finance professionals. Essential R packages used for financial behavior analysis include ggplot2 for

visualization, dplyr for data manipulation, psych for psychology and psychometrics-focused packages, caret for classification and machine learning, and cluster for clustering analysis. Such tools allow conducting advanced analysis of financial behaviors, such as correlation analysis, regression modeling, and even behavioral segmentation by means of clustering methods. This PubMed Central article exemplifies high-level clustering analysis application in behavioral data using R — and also the K-means, PAM using Gower's, and weighted K-means methods that identify unique clusters of consumers in terms of well-being, knowledge, and skills. This led to four distinct segments, labelled: three financially comfortable and knowledgeable, financially coping and knowledgeable, financially coping but unknowledgeable, and financially stressed and unknowledgeable. Beyond descriptive statistics, we can also use R for modeling tax behavior. Tax planning patterns can be forecasted with time series analysis abilities, while regression analysis can help provide insight into the factors that drive behaviors surrounding tax planning. Using R-based machine learning algorithms like random forests or support vector machines, optimal tax strategies are predicted given the individual characteristics, history of tax returns, and other personal information.

## RESEARCH GAP

Most of the literature is set in developed markets, whilst there is very little empirical evidence from developing economies with tax systems that may differ greatly in their structure and complexity. Prior studies have conceptualized financial literacy in a unidimensional framework and captured its measure using knowledge-based assessments. Pairing behavioral measures with AI literacy assessment and actual tax planning consequences is an underexplored domain ripe for empirical investigation. Moreover, individual tax behavior research has limited published work that adopts sophisticated analytical methods. However, none of the variables in this equation have been studied within our context — namely, how awareness of and use of tax-planning AI tools uniquely contribute to tax-planning outcomes. In terms of methodology, most studies to date use cross-sectional survey data without longitudinal behavior tracking or sophisticated statistical techniques.

## METHODOLOGY

**Research Design**

The research design for this paper is descriptive and exploratory, using quantitative analysis to identify levels of financial awareness and tax planning behaviour. Having integrated the primary data collection from the structured surveys, with inferential statistical data analysis tools using the R programming language to detect the patterns, correlations, and behavioural segments in the population of study. Its quantitative nature promotes systematic measurement of financial literacy constructs, AI adoption patterns, and tax planning behavior, and therefore statistical inference and greater generalizability of the findings to larger populations. Its exploratory nature also permits the identification of previously unknown relationships between dimensions and new insights relating to the influence of financial literacy and technology acceptance in the tax planning context.

**Sampling Technique**

We focus on working individuals within the study population, which includes salaried employees, self-employed professionals, and small business owners. Such a selection of the population ensures that we have representation of varying needs and complexities of tax planning needs, as the needs change drastically across employment categories. Using power analysis calculations, a sample size of 200 respondents (100 patients with schizophrenia and 100 paired significant others) was initially set to be reached in order to achieve adequate statistical power for planned analyses (correlation analyses, regression modeling, and clustering procedures). NEFE research indicates that 200-600 respondents provide adequate power for validating the financial literacy scale and performing behavioral analysis, states National Endowment for Financial Education (NEFE) Gender and various demographic categories (age groups- 25–35, 36–45, 46–55, 55+, income levels- below ₹ 5 lakhs, ₹ 5–10 lakhs, ₹ 10–20 lakhs, above ₹ 20 lakhs, educational qualifications- undergraduate, graduate, postgraduate, and geographic regions- urban, semi-urban,

rural) were controlled for with airtight stratified random sampling process. This stratification model not only gives a desirable socio-economic mix, but also a statistically significant mix.

**Data Collection Tools**

Method A structured questionnaire employing several measurement modalities is mobilized for the collection of the data to represent the multifaceted nature of financial awareness and behavior constructs. The questionnaire design is based on accepted guidelines of formative scale development methodology, National Endowment for Financial Education (NEFE).

## RESULTS AND ANALYSIS

**Demographics Overview**

With a sample of 200 respondents, our study sample will cover the representative diversity of the most significant demographic aspects, which will enable a solid analysis of the financial awareness pattern and tax planning habits. There was an age distribution of 32% of the respondents between the ages 25 and 35, 35% between 36 and 45, 22% between 46 and 55 and 11% above 55 but representing the working population and the peaks in the prime earning age groups. The percentage of male and female respondents (58 and 42) is close to the rates of participation in the workforce. The sample is also well-educated, 25% has undergraduate, 48% graduate, and 27% postgraduate levels, which means that qualification is high and allows operating with complicated financial concepts. The distribution of income is very even over the target - 28% below [?]5 lakhs/year; 34% between [?]5-10 lakhs; 26% between [?]10-20 lakhs and 12% above [?]20 lakhs. The tax complexity care delivery on basis of employment category is 62% salaried employees, 23% self employed professionals, 15% small business owners. The urbanisation patterns of India are reflected in the geographic distribution of 65% urban, 25% semi-urban, and 10% rural with the population segments provided with different levels of access to financial services. The R visualisation package is used with the ggplot2 package to create demographic profile charts to depict these distributions in pie charts and bar graphs using individual categories.

**Financial Awareness Score Distribution**

To gauge taxpayer awareness, an index derived from both standard literacy questions of the Global Financial Literacy Excellence Center (GFLEC) and items testing knowledge about the tax itself is developed. The composite score runs from 0 to 100; a higher score indicates higher financial literacy. Overall financial awareness scores showed a normal distribution (mean score = 64.2 (SD = 18.7)), with moderate financial literacy in the national sample. But between demographic groups or special fields, there was a very high degree of difference. This means financial literacy still has some way to go; in fact, only 23% of people were able to get a score higher than 80. Knowledge levels with respect to tax range are not very encouraging: only 31% of respondents gave the correct answer on Section 80C's deduction limits; 28% were aware that under Section 80CCD(1B), NPS also receives extra benefits; 19% understood the most practical methods for calculating HRA. During the R statistics, analysis of the financial awareness scores revealed that their distribution is positively skewed, and almost all the respondents have scores in the middle range (50-70) rather than higher. Box-plot analysis shows quite a large number of extreme outliers on both sides, which means that knowledge distribution is disparate; one method will not work for all groups. Descriptive statistics in R indicated positive skewness of the financial awareness score, and histogram visualization demonstrated clustering within the range from 50-70 (including more than two-thirds of all respondents). Box-plot analysis demonstrates that there are strong outliers and thus indicates that there is a need to apply dissimilar intervention protocols to particular subgroups, and also indicates the imbalance of knowledge. Upon the age analysis, the financial-literacy levels bid a curvilinear trend where the highest level was found to be in the 36 to 45 age bracket (mean = 68.4), but this is not a sustainable age given the lifecycle theory. Financial awareness scores are most closely related with the educational attainment- the correlation coefficient between them is significantly high ($r = 0.67$, $p < 0.001$) when compared to other variables. The average of the graduates was 73.2 and the average of the undergraduates was 58.1.

**Tax Planning Behavior Analysis**

Tax planning activity evaluation operations use frequency analysis and BPI by R programming cross-tabulation functions. The results show habits of poor tax planning: only 34% of respondents engaged in systematic annual tax planning; 42%, ad-hoc planning only during filing season. The timing of decisions reflects habits of procrastination, where 67% of tax planning is pushed to coincide with January-February every year. This concentration, rather than forecasting an anticipation, makes plans ahead of time and in a grand manner or with both time and spatial synergism for optimization of the move, can occur at any step along the way to success. Fund allocation patterns detail a high concentration of capital in traditional options: 78 percent use Employee T-Based Funds, 45 percent invest in Public Provident Fund, and 52 percent purchase life insurance for tax benefits. But only 23 per cent took the trouble to place such monies into their NPS Tier II accounts; 18 per cent pursued optimization of their HRA declarations, and a mere 12 per cent took the opportunity for education loan benefits under Section 80E of the IT Act. Analysis of demographic variables and planning behaviors crossed in R frequency tables shows that both variables are two aggregations-insightful and revealing. Systematic Planning modes are more prevalent in higher income groups ($x2 = 24.7$, $df = 3$, $p < 0.01$) and there exists a significant positive correlation between educational level and instrument diversification Figure 2. Frequency tables also found that employment brand attitude has a convergence relationship with measures attitudes The responses of men to ELSS, the tax savings schemes which are attractive and unusual for male respondents but not so much females, illustrates how risk tolerance and sex differ.

**Correlation and Regression Analysis**

**Correlation Matrix(Table: 1)**

Analysis of the relationship between financial knowledge and demographic factors and taxes using R's cor() function to calculate correlations and ggplot application for ggcorrplot visualizations. Systematic planning behavior had a strong positive relationship with financial knowledge ($r = 0.72$, $p < 0.001$), frequency of seeking professional consultation ($r = 0.58$, $p < 0.001$), and diversification of instruments ( $r = 0.65$, $p < 0.001$).

**Prediction Model for Tax Behavior Scoring from Tax Factor Model:** Multiple Linear Regression Analysis. Use Financial Knowledge, Demographics, and AI Adoption Measures as Independent Variables: Child: The model R tells us is:

$12.4 + 0.67 \times$ Financial knowledge $+ 0.34 \times$ income level $+ 0.28 \times$ education $+ 0.19 \times$ age $+ 0.31 \times$ AI adoption $+ \varepsilon =$ Tax behavior score

Model statistics show that the model has a strong explanatory power ($R^2 = 0.74$, $F = 89.3$, $p < 0.001$) and all coefficients are statistically significant. We can see that financial knowledge is the most significant predictor ($\beta = 0.67$, $p < 0.001$), followed by income level ($\beta = 0.34$, $p < 0.01$) and education ($\beta = 0.28$, $p < 0.01$). The AI adoption index positively correlated with the effectiveness of tax planning ($r = 0.43$, $p < 0.001$), which is indicative that those who understand adaptable technology can be better planners. But while our respondents are certainly full of enthusiasm, in reality, we only see limited use, with our correlation analysis revealing a clear gap ($r = 0.38$, $p < 0.001$) between awareness and utilization, with respect to actual use of AI indices of awareness.

**Regression Analysis Results**

We diagnosed the residuals from our regression analysis using plots. This allowed us to verify that all of our assumptions have been satisfied. The results of our diagnostic analysis are displayed in Figure 4. The residual plots that we have examined conform to these expected patterns and exhibit proper variance structures, suggesting their valid use for checking model assumptions. Discussion of both leverage and Cook's distance measures on the ith observation sheds some light, insofar as possible visual representations can go towards an understanding of influential points; however, there are few such outbreaks evident, Patient 88 (see Leverage Plot), Time Period 23 (see Lag Plot), and VWAP 30 Min Periodically (see Cook's Distance Plot).In cross-validation samples of what is almost the same size as the original sample, 10-fold cross-validation results in parameter estimates that are very similar to those from our original estimate. Both k and d have little variability across these validation samples, varying only slightly. One of the most significant differences between the two genders is the relationship between financial literacy and tax planning. This relationship is worth understanding in its own right, as well as for policy reasons. Analysis of gender

differences reveals that the effects of financial literacy on tax planning Drive Female Participation to reach down early as learning mechanisms and the influence of third parties (r=0.78, n = 289) are altogether different from those on Male planning intentions. This suggests targeted treatments might be necessary for both sexes. In the case of the K cluster process by using the-means algorithm, Euclidean distance was employed, and the following variables were standardized: financial literacy scores, tax planning behavior index, AI adoption measure, and demographics from PubMed Central. The elbow method and silhouette analysis are used to determine the optimal number of clusters for behaviour segmentation, and we find that four distinctive forms characterize this process.

**Cluster 1: Advanced Planners(22% of sample):** High financial literacy(Mean = 81.3), they are people who will engage in methodical planning behavior. They make wide use of instruments and have a relatively high AI adoption rate. In this segment, you see forward planning for taxes and professional advice beforehand, demographics are tabulated, which shows earnings are higher than average (Mean = ₹14.2 lakhs), most educational attainment is postgraduate level ( 65%), and living quarters are urban all the way ( 89%).

**Cluster 2: Moderate Planners (n = 177; 35% of sample):** These people have a certain feel for the value of money (Mean = 67.8) and cling to convention in tax planning. They are largely inclined towards the traditional investment vehicles like the Employees Provident Fund (EPF), Public Provident fund (PPF) as a tax instrument, and diversification is also quite limited. Artificial intelligence is a relatively new phenomenon that is yet to find its way into mainstream implementation. The demographic attribute is moderately featured with the average income being 8.4 lakh rupees/anually, the level of education, where 78 percent have postgraduate education, and the people living in in most peripheral townships.

**Cluster 3: Reactive Planners (28% of sample):** Low financial understanding(Mean = 54.2), and nearly all tax planning is reactionary during the season. Low AI adoption or even ambivalence towards it. Prefer traditional RA forms of planning--this group has minimal tool lineups and no professional instruction. We see demographics consistent with lower middle income (mean income = ₹6.1 lakhs), educational level undergraduate(52%), and a wider geographic spread.

**Cluster 4: Non-Planners (15% of sample):** Low financial understanding(Mean = 41.7) and little systematic tax planning. Like their PE-based counterparts, they engage in heavy reliance on employer-default options accompanied by minimal initiative to inspire active use. Growing AI penetration and professional consultancy. Income is below average (mean = ₹4.8 lakhs), mixed education, and more in the countryside were amongst the coordinates that indicate background.

Ward's hierarchical clustering can prove the solution to a four-cluster system with identical segments identified. Mean distance silhouettes are all 0.12, demonstrating that the four clusters consist of a virtually homogeneous group of customers, not only according to this fact but also reflected in observation trends for single-distance silhouettes. Silhouette analysis showed an average width of 0.67. This drop in width not only leapt (for Ceramothecos) but also reflected an excellent overlapping of the two curves. The projection of the data onto the space built by principal component analysis very plainly makes visible clusters with minimal overlap, ensuring validity for segmentation. Demographic associations among the larger clusters are tested via chi-square tests. Advanced Dwellers are clustered in higher income brackets, and they are also an influential force in education. Typical "new kids on the block," including Non-Planners, however, have more than their share of low incomes (40% as opposed to 29%). Financial Planners are found mainly in medium or even upper income sectors; fewer still come from other socioeconomic strata, such as lowly paid, unskilled workers. These patterns have direct consequences for financial education programs targeted at specific segments and interventions targeting specific groups. The clustering results provide financial service providers and educators with valuable insights for adapting their approach to each behavioral segment. The blueprints of these advanced planners are also potential obstacles on the road to divine AI-driven praiseworthy classic essays and complex tax strategies; non-planners offer rich ground for crude low-literacy financial casts.

## DISCUSSION

**Key Findings**

Knowledge too, as opposed to actual practise shows a significant gap in these two since the level of awareness (23%) against the engagement rate (75%) on the already available tax optimisation opportunities is considerably high. These statistics are congruent with IRAS studies that record a high level of income-tax illiteracy amongst numerous age groups. This theoretical framework is supported by the correlational analyses which conducted evidence that the knowledge acquisition predicts improved financial decision-making. In particular, financial awareness correlates with systematic tax-planning behaviour ($r = 0.72$, p <|human|>In particular, financial awareness is strongly related to systematic tax-planning behaviour ($r = 0.72$, p <|human|>To be more specific, financial awareness is associated with systematic tax-planning behaviour ($r = 0.72$, p <|human|>In particular, financial awareness is highly related with systematic tax-planning Another alarming gap in the survey between the conscious people and thorough arrangement of strategies, especially intricate plans of taxes and intricate timing is also spotted. The AI adoption patterns indicate that there has been an uneven level of awareness and action. Sixty-eight percent concur to be aware of decision support solutions, but only one out of 4 shop reports to be actively using and even 8 percent report using full integrated AI based tax-planning systems. This demonstrates obstacles that have nothing to do with awareness such as issues of trust, perceived complexity, and the incongruency of tools with consumer preferences which is opposed with findings of the Financial Planning Association that AI represents a significant opportunity in terms of tax optimisation with high-net-worth clients. The topic of connexions between financial literacy and planning competence would lead to digital literacy as a natural extension. Among respondents with more significant digital literacy levels, a positive financial-planning investment ($b=0.31$, $p=0.01$) can be observed, which makes it possible to speak about the possibility of technology to promote financial expertise and to bring some extra revenue. The results are in line with the previous studies that have been documented in the ScienceDirect, which hypothesises that digital-literacy skills in finance are positively connected with corporate performance nationalising a mutual linkage between technological expertise and performance in finance. A cluster analysis that yields four product development needs and corresponding AI adoption opportunities. This reflects remaining inequality in access to financial market wealth, with one conspicuous feature distinguishing those who are at higher altitudes of the socioeconomic ladder from another class (advanced planners = 22% of the total sample) and a large non-planner group (15%). It offers an empirical basis for targeted interventions, not general ones.

**Alignment with Literature**

In terms of tax-specific fields, however, and in the context of AI (Artificial Intelligence) adoption as a whole, our results contribute other new content to previous studies that have reported such findings. Our framework thus also provides an illustration of how validation might take place. We find within relationships identified between elements of basic financial literacy and tax planning behavior aspects that are not demonstrated by the knowledge investment will lead to more money axioms. Demographic patterns within financial literacy research indicate that different groups of people are affected by it in different ways. This study confirms the existing literature that shows higher literacy among those who are educated, earn more money, and are men, but also shows an alarming divide between these groups and various entrenched ones. On the other hand, figure 1 shows that if a deeper understanding is not achieved into how men and women learn about financial awareness in different ways (and apply it), then female respondents with greater awareness-behavior relationships stand alone among all groups represented here. So we have only just begun to explore gender differentials in financial education. The results of clustering this applied to the behavioral segmentation model both validate the methodology and extend its application into the realm of tax planning. We identify four clusters quite different from each other, based on earlier research, which has found that there exist different segments with distinct financial capabilities; here, we also provide a new characterization specific to tax, thus enabling focused intervention design when the complexity for planning is no longer undifferentiated in its targets or solutions. Awareness-Adoption Gap: This finding is dutifully reported in the technology literature. It does little to cast doubt on recent research which has found widespread difficulties in implementing what were

initially such high-flying hopes for financial services. Consumer acceptance needs more than just technological capability-trust-building, UX design, and step-by-step adoption pathways also play a big role here.

**Implications**

**Educational Implications**

The search findings, thus, recommend more comprehensive tax and financial literacy programmes that are concerned with implementation strategies beyond the simple information. The reality that merely 31 percent of individuals comprehend Section 80 C restricts can allude to the fact that limited education ought to be provided regarding individual sorts of tax assets, and how to utilise them to the most advantage. That involves the use of hands-on planning drills, trainings using digital tools and gradual advance in difficulty that matches the ability of the pupil. The differentiation of the behavioural segments would mean different education. To perform long-term comprehensive financial planning, trained and certified planners must receive training in professional qualifications in using complex tools of AI and complex strategies, whereas non-planners must receive general knowledge on financial literacy formation and simplified financial planning process. Such a form of segmentation approach is capable of offering optimisation of resources and effectiveness of the intervention.

**Technological Implications**

The gap of the AI adoption indicates that these tools should be redesigned on a basic level to address the needs of consumers and eliminate the impression of complexity. Of course AI has potential in complex tax computation that could be enormous but it should be able to simplify the user interface to be easily used regardless of whether it succeeds or not as a course. By bringing together the two discoveries, one can integrate or hybridise between the conventional financial education and AI-assisted software which leverage the technology functions yet the use remains guided by the human touch. These two results suggest that there can be synergistic positive outcomes of combined digital and financial education programmes since we observe a positive correlation between digital literacy (the capacity to access, comprehend, create, and engage actively in the process of shaping knowledge in an information society) and planning skills.

**Policy implications**

The huge financial ignorance levels we record imply that the government needs to step in by imparting to the population tax planning-related skills. The proposed research gives empirical evidence of the level and the extent of these deficits and therefore gives credence to the systematic programmes of tax literacy suggested. A regulation strategy to support the use of AI in financial service should strike a balance between safeguarding the interest of individual consumers and trying to engage in innovation. Specific accreditation schemes and transparency requirements as well as consumer education efforts that aid in developing trust regarding AI-based financial services and include a decent level of regulatory oversight may also help in resolving the problem of trust that are found in the premises thereof. Disparities in the access to the financial capability services of specific groups of demographics suggest that the underserved are in need of certain outreach interventions. Specific policy interventions are needed to address disparities in the allocation of financial education and AI tool access to lower the disparities, especially regarding those who plan less: lower-income, rural respondents.

## CONCLUSION

The paper is the first in-depth examination of the financial awareness, tax planning and adoption of artificial intelligence (AI) in India. It puts forward an innovative correlation between the measures of financial literacy and an open-source R system to provide the possibility to conduct research based on robust mathematical methodologies and to replicate it. The results show that there is a strong negative knowledge gap regarding taxes; 23 per cent of the respondents are high-performing, and implementation gap can be evidenced by the lack of awareness of creating an effective plan. In addition, there is still a visible awareness-adoption gap when it comes to AI-powered financial tools. Segmentation analysis provides the information about the behaviour of consumers, pointing out that the

specific interventions might significantly increase the level of financial literacy and use of services. The paper suggests creation of AI-based tax literacy applications in conjunction with financial companies and institutions of higher learning, mitigation of concerns of trust and complexity and development of interfaces of RFD dashboard applications by tax collection bodies to gain a better insight on behaviours of taxpayers. Additionally, the authors recommend collaborations between educational institutions, government organisations, and fintech companies to enhance the levels of transparency and effectiveness in high-end tax advisory systems.

## ABSTRACT

Orthodontic wires were used by dentist such as SS 316, Ni-Cr and SS 18/8, etc., to regulate the arrangement of teeth. They corrode when food, drinks, and tablets are consumed orally. These foods can corrode the orthodontic wire aside from saliva. The Stainless Steel 18/8 alloy's corrosion resistance in artificial saliva has been examined using the Polarization technique and Alternating current impedance spectra, both in the presence and absence of Glucon-D juice. The thing assumed that in the existence of Glucon-D reduces the decay protection of Stainless Steel alloy 18/8 in artificially made saliva. Therefore it is demonstrated by a drop of the following values: Linear_Polarization_Resistance, impedance, decomposition current, capacitance using Double_Layer(Cdl) and Charge_transfer resistance. Additionally, noted that erosion potential changes (from -276 to -616 mV) VS SCElectrode when Glucon-D is present. It follows that the Cathodic process is primarily monitored when Glucon-D is present. The LPR value drops from 3488228 to 575361 $\Omega cm^2$ in presence of Glucon-D. Corrosion current rises from $1.447 \times 10^{-8}$ A/$cm^2$to $7.382 \times 10^{-8}$. The ion transfer resistance (Rt) decreases from 37796 to 5194 Ohm$cm^2$, The double layer capacitance value increases to $9.819 \times 10^{-10}$ F/$cm^2$ from $1.349 \times 10^{-10}$. Therefore, it suggests that individuals who have dental orthopaedic braces (SS 18/8 alloy) clipped ought to refrain from

ingesting Glucon-D. Dentists and patients who have ortho_dontic wires made of SS18/8 alloy clipped will find value in the study's findings.

**Keywords:** SS18/8, orthodontic wires, Glucon-D, artificial saliva, Corrosion resistance.

## INTRODUCTION

Teeth that sparkle are appealing. Some people have irregular tooth arrangements. As time progressed, scientifically based orthodontics evolved, and with it came many innovations in material science, computational methods, and new treatment approaches. Orthodontics, being the oldest dental specialty, has undergone remarkable transformation over the past few decades. Entering the 21st century, the field continues to experience significant changes in treatment modalities and esthetic concepts. Unlike in the past, there has been a substantial increase in the number of adult patients seeking orthodontic treatment. To meet functional and structural needs, bio-implants have been developed. These implants are designed to replace, assist, or support natural organs in the human body. Today, bio-implants are widely used in various forms such as brain or neural implants, sensory implants, spinal implants, organ stimulation devices, subcutaneous implants, dental implants, cosmetic implants, and other structural supports like stents, braces, rods, heart valves, bone and spinal implants, hip prostheses, as well as eye, ear, skull, and knee replacements. In the correction of dental irregularities, Dr. Edward Angle—considered the father of modern orthodontics—was the first to use wires made of nickel-silver alloys combined with gold, a commonly used material at that time. Later, in the 1940s, Arthur J. Wilcock and Raymond Begg developed heat-treated stainless steel wires, which became widely adopted. For long-term orthodontic treatments, brackets and wires played a central role. Eventually, nickel-titanium (NiTi) wires were introduced, offering greater flexibility and reduced angular friction, thereby enhancing the efficiency of treatment. In order to correct the irregularities in the position of teeth, Dentists use orthodontic wire composed of various alloys, including SS316, Ni1 -Cr, SS18/8, thermos active alloy, Gold 22K, Gold 20K, etc., to control the growth of teeth. Individuals who have had orthodontic wires clipped take a lot of pills, foods, drinks by mouth. These foods can corrode the orthodontic wires aside from saliva. Therefore it is necessary to determine the extent to which these cables are impacted and corrode. By using electrochemical techniques like Polarization Studies and impedance spectroscopy (AC-EIS), the current research aims to examine the corrosion resistance of orthodontic arc metal composed of SS 18/8 alloy in artificial saliva when Glucon-D (drink) is present.

## LITERATURE REVIEW

In this regard, a number of research papers have been published. Kamiński *et al*[1] studied the impact of glimmer perform nitriding on the disintegration resistance of rustless steel. A comparative study of high and low temperature plasma nitriding was conducted. For this, polarisation studies and Alternative Current spectra was used. We measured, micro hardness both initial and final state of the analysis. Erwansyah and Susilowati [2] looked into the effect of salak palm extricate (Salaccazalacca) on preventing the release of Ni and Cr ions from stainless steel orthodontic wire into saliva. The discharge of Cr and Ni ions was measured by means of Atomic Absorption Spectro_Photometry. Both treatment and control groups were the subjects of the investigation. There were pre- and post-tests administered. An extract from snake fruit seeds effectively prevents the release of nickel ions from stainless steel orthodontic wire at 300 ppm, as this study demonstrates. The impact of probiotic supplements on the corrosion stability of different types of NiTi orthodontic wires and stainless steel has been studied by Musa Trolic *et al*. [3]. Probiotic supplements are advised for use in orthodontic patients. Using an AC impedance spectrum and polarization analysis, the corrosion resistance was determined. Probiotic supplements and L. reuteri have been shown to have an impact on both the chance of pitting corrosion occurring and the overall rate of corrosion. It was also observed that the kind of alloy and coating used determines their impact. Since 316L stainless steels have good corrosion resistance, low magnetic susceptibility, high ductility, and acceptable biocompatibility, they are frequently used in biomedical applications. To predict the behaviour of the materials used in orthodontic applications,

electrochemical analysis have been conducted in vitro to identify the erosion reactions. The deterioration of braces wires within the anatomy is a resulting mechanical activity and breakdown. However, these applications require the steel to be resistant to pitting corrosion [4][1]. Agnes Brigitta *et al* has studied the influence of a drugs on orthopaedics braces of stainless steel 316L alloy in synthetic salivary environment [5]. The electrochemical studies like AC impedance spectra and polarization to investigate the effects of certain medicine on the breakdown protection of 316L grade stainless steel alloy in manmade saliva [6]. Through electrochemical investigations, Renita D'souza *et al*. investigated the resistivity to corrosion of alloy SS 316 L in artificially made sputum when toothpaste is present [7]. In artificial saliva, Agnes Brigitta *et al*. examined the erosion protection of Gold 22 karat, SS 18/8,SS 316L alloy and Gold18 karat in the presence and absence of 500mg vitavionfort drug [8]. Saranya and Rajendran used electrochemical studies to examine the effect of D- glucose on the decomposition protection of SS 316 L in contact with manmade sputum environment [9]. Zhang *et al*. looked into how heat treatment affected the mechanical and corrosion characteristics of CoCrMo alloy made by selective laser melting [10]. Savencu *et al*.'s study [11] examined the corrosion behaviour of Co-Cr dental wires in the solution of artificial saliva has been processed using alternative CAD/CAM 3 technologies. Mehkri *et al*. have conducted "A Study of the Tribocorrosion occurring at the implant and implant alloy Interface: Dental implant materials" [12]. The electrochemical corrosion characteristics of LDX 2101® was studied by Rosalbino *et al*. [13] fluoride-containing environment. For dental implant applications, Mindivan *et al*. investigated the structure and biomedical implants performance of the casting Co-Cr wire that has been plasma nitrided [14]. Recent innovations, such as the development of instant beer powder, highlight the expanding application of nanotechnology in the formulation, preservation, and delivery of beverages by Betsy Clarebel *et al*., *Nanotechnology in the Beverage Industry*.[15]Corrosion behaviour of Co-Cr dental alloys processed by alternative CAD/CAM technologies in artificial saliva solutions has been studied by Savencu *et al*. [16]. Feng *et al*. have studied the Corrosion Resistance of SLM Denture Scaffold in Simulated Oral Environment [17]. Corrosion of Dental Alloys Used for Mini Implants in Simulated Oral Environment has been investigated by Curkovic *et al*. [18]. Several research papers have been published in this regard[19-28].

## MATERIALS AND METHODOLOGY

**Metal Specimen Making Procedure**

For this work, a wire made of Stainless steel alloy 18/ 8 is used as sample material. The alloy's composition is shown as: 8% Ni,18 % Cr and the remaining 8% Fe. The Teflon rod contained the orthodontic wire. It was utilized for electrochemical research after being polished to a mirror shine.

**Making of Artificial(Non – Natural)Saliva**

Artificial Saliva was prepared using the FusaYama Meyer Artificial Saliva. The following ingredients were used to prepare Non natural saliva in a lab:

**Urea** (1 g/dm$^3$),
**KCl** - 0.4 g/dm$^3$,
**NaCl** - 0.4 g/dm$^3$,
**$CaCl_2.2H_2O$** - 0.906 g/dm$^3$,
**$NaH_2PO_4.2H_2O$** - 0.690 g/dm$^3$,
**$Na_2S.9H_2O$** - 0.005 g/dm$^3$, and
**$NaH_2PO_4.2H_2O$** - 0.690 g/dm$^3$.

**Glucon-D**

The main users of dissolved glucon-D powder in water are athletes and growing kids in need of quick energy boosts. Although it is an energy drink, it is not a medication and should not be used to treat any illnesses. In addition, it is frequently used in the summer's intense heat to restore energy lost from the heat and avoid heatstroke fatigue, especially for those who work outside.

**Chemical composition of Glucon-D**

Dextrose monohydrate, or glucose, is the full name. It is a simple sugar, or monosaccharide, made mostly from the starch of corn (maize).

**Potentiodynamic Polarization Study**

An electrochemical workstation (Model CHI 660) was utilized to carry out the potentio _dynamic polarization experiments. The experiments were conducted utilizinga conventional three-electrode cell system, where the saturated calomel electrode (SCE) functioned as the reference electrode, a platinum connector acted as the counter, and stainless steel 18/8 (SS18/8) was employed as the working terminal. After completing IR compensation, the polarization scans were performed with a sweep rate of 0.01 V/s. During the experiment, key corrosion parameters were recorded, including the decay current density (Icorr), oxidation potential (Ecorr), Tafel slopes for Anodic(ba) and Cathodic(bc) reactions, and Linear_Polarization_Resistance (LPR).

**Alternating current impedance spectra**

The polarization investigation employed a similar three-electrode cell arrangement, and the same experimental setup was served to collect electrochemical impedance spectra (EIS).The real part (Z′) and the imaginary part (–Z″)components of impedance were obtained in ohms (Ω).in a specific frequency range. The ion Transfer Resistance (Rt) and Double-Layer Capacitance (Cdl) were calculated using these values. The system required approximately 5 to 10 minutes to stabilize and reach an open-circuit potential. Impedance values were obtained at varying frequencies, specifically tracking the actual - Z′ and unreal –Z″ parts. The measurement parameters included an initial potential of 0 V, a high frequency of $1 \times 10^5$ Hz, a low frequency of 1 Hertz, an amplitude of 0.005 Volt, and a quiet time of 2 secs. These settings were employed to record the AC impedance spectra. The Nyquist plot was used to extract the values of Rt and Cdl.

The ion-transfer resistance (Rt) was calculated using the expression:

$R_t = [R_s + R_t] - R_s$

Where $R_s$=Solution Resistance

The double-layer capacitance (Cdl) was calculated by the following equation:

$C_{dl} = 1/ 2 \times \pi \times R_t \times f_{max}$

Where $f_{max}$ represents the frequency at which the imaginary part of the impedance reaches its maximum.

**Consequence and analysis**

**Effect of Glucon-D on decay protection of alloy SS 18/8 in artificially made sputum**

Orthodontic wires are commonly used by dental professionals to aid in the proper alignment of teeth. However, with the increased consumption of artificially flavored beverages, concerns have arisen regarding their effect on oral materials. Among these, flavored saliva substitutes such as those containing Glucon-Dmay contribute to the corrosion of orthodontic appliances. This study investigates the corrosion resistance of stainless steel 18 / 8 (SS18/8) in Non-Natural saliva (NNS), with and without Glucon-D. The Impact of Glucon-D on SS18/8 was assessed using polarization techniques along with Alternative Current impedance spectra. These electrochemical methods help evaluate the oxidative behaviour of metals and alloys in multifarious test environments. Results indicated that increased corrosion resistance is associated with higher values of impedance, Ion Transfer resistance (Rt), linear_ polarization_ resistance (LPR), and overall corrosion resistance. Conversely, decreases were observed in double-layer capacitance (Cdl) and corrosion current (Icorr). A reduction in corrosion resistance demonstrated the opposite pattern lower impedance and resistance values, accompanied by increased capacitance and current.

**Polarization Study**

Polarization measurements in this study were conducted using a Electrochemical Analyzer, model 660A, which includes an automated infra-red IR compensation feature. The experiment is evaluated using a standard cell with configuration. Figure 1 illustrates the polarization curves of stainless steel 18/8 alloy exposed to artificial saliva (AS), both in the presence and absence of 500 ppm Glucon-D. The corresponding corrosion parameters derived from the research are summarized in Table 1. Through Table 1, in existence of Glucon-D, the decay resistance of Stainless-steel

18/8 in Artificial Sputum drops. This is evidenced by the decrease in the LPR value of stainless steel 18/8 from 3,488,228 to 575,361 Ω·cm² (Figure 2), along with an increase in the corrosion current density from $1.447 \times 10^{-8}$ to $7.382 \times 10^{-8}$ A/cm² in the presence of Glucon-D. Additionally, it is noted that the Decay potential changes [from -276 to -616 mV] versus SCElectrode when Glucon-D is present. It follows the cathodic reaction is primarily controlled when Glucon-D is present.

**Implication**

When Glucon-D is present, the resistance to current of the SS 18/8 in non - natural saliva decreases. Therefore, individuals who have orthopedic braces wire made of alloy SS 18 / 8 clipped must refrain from consuming Glucon-D orally.

**AC Impedance spectra**

The Alternate Current Impedance spectra were documented in the current investigation using the same instrument setup that was utilized for the polarization study. Alternating current impedance spectroscopy of the Stainless-steel alloy 18 / 8 in Artificially made Saliva in the presence and absence of 500 ppm of Glucon-D is represented in Figures 3, 4, 5, 6, and 7. Figures 3 and 4 present the Nyquist plots. Figures 6 and 7 display the Bode plots. Table 2 lists the corrosion parameters, including double_ layer_ capacitance (Cdl) values, impedance value, and ion transfer resistance (Rt). Table 2 shows that the decomposition protection of SS 18/8 in artificially made Saliva falls when Glucon-D is present. In presence of Glucon-D causes the following changes in impedance value (from 4.857 to 3.956), Rt value (Figure 5) to decrease from 37796 to 5194 Ohmcm2, and value of Capacitance of double layer ranges from $1.349 \times 10^{-10}$ to $9.819 \times 10^{-10}$ F/cm2.

**Implication**

The presence of Glucon-D in non - natural saliva was found to reduce SS 18/8 alloy's oxidative resistance. Based on these findings, it is advisable that individuals with ortho_dontic appliances made using SS 18/8 alloy must avoid the oral consumption of Glucon-D or similar glucose-based drinks, as they may accelerate material degradation.

## CONCLUSION

This study systematically investigated the corrosion behavior of SS 18/8 alloy in artificial saliva, with and without Glucon-D, using Potentiodynamic polarization and electrochemical impedance spectroscopy (EIS). Results demonstrated that Glucon-D significantly reduces the corrosion resistance of the alloy. (Table.3, Fig.8)

**Key observations include**

- Linear_ Polarization_ Resistance (LPR) is reduced.
- A reduction in ion transfer resistance (Rt)
- Lower overall alternative current values
- Oxidative current is maximum(Icorr)
- A rise in Double-layer-Capacitance (Cdl)

These electrochemical indicators confirm that Glucon-D negatively impacts the protective properties of the SS 18/8 alloy in the oral environment. Therefore, it is strongly recommended that individuals with braces or dental appliances made from this alloy refrain from consuming Glucon-D-based beverages to prevent accelerated corrosion and potential appliance failure. Summary of the decay guidelines of Stainless-steel of 18/8 alloy immersed in different trial solution (Table 3). Corrosion Behaviour of SS 18/8 alloy dipped in multifarious solution media (Figure 8).
