ABSTRACT

The Indian textile industry is very important for creating jobs and helping the economy grow. However it has problems with not having enough workers and people quitting their jobs. This study looks at what the owners of textile mills in Tamil Nadu do to keep their employees from leaving. The people who did this study used a mix of methods to get their information. They talked to 160 people who own textile mills. What they found out is that these owners focus on having rules for their employees paying them well helping them not be too stressed and making sure they have a healthy place to work. When the owners do these things it really helps. The employees do not miss work much they do not quit as much and it costs less to hire new people. The employees are also happier. Do their jobs better. The study found five things that help keep employees. The study says that the owners of textile mills need to take care of their employees and have good rules for them to keep them from leaving the textile mills.

Keywords: textile mills, industry, healthy, people

INTRODUCTION

Textile industry in India is as old as the Indian civilization. Spinning and weaving were part and parcel of Indian culture. Indian textile industry is widely spread from hand-spun yarns, hand-woven fabric to technologically advance power loom shuttles. Indian textile and clothing industry is well supported by both State and Central Government of India due to its economic significance and amount of foreign earning realised by this industry Viewing the practical issues faced by the textile mill entrepreneurs in India, it can be rightly claimed that though the

textile mill entrepreneurs cannot stop the migration of employees from one mill to another, or in search of new job prospects. They can very well design employee retaining strategies, enhancing their HR (Human Resource) practices and in building health relationship with the employees. As employees turnover directly influence the production and profit earning efficiency of any business unit. Above discussion offered a wider scope for the researcher to assess the employee retention strategies of spinning mills in Tiruchirappalli.

Significance of the Study

Since June, 2013, the severe shortage of labour in the Textile Industry resulted in 10-15 per cent increase in cost. The industry witnessed a migration of skilled and unskilled labourers to their home towns and villages, as they started finding work closer to home due to the growing rural economy It is right time the textile unit entrepreneurs need to understand the importance of employee retaining and have to invest more on employee training and in motiving them to stay in an organisation for a long-term.

Hypotheses of the Study

There exists association between nature of strategies adopted by the entrepreneurs to retain their employees and outcome of retention strategies framed and implemented by them.

Limitations of the Study

The study chooses textile mills functioning in one district of Tamil Nadu Tiruchirappalli. The mills functioning in Southern part of this state are not considered for analysis. Therefore generalisation of the findings of the study may be proved lope sided or partial in nature.

OVERVIEW OF LITERATURE SURVEY

Menon (2013)had reported in his article to the "India Today" that the total production of textile mills in the past 11 years has reduced from 3957 million meters to 2347 million meters, at the same time the production of power loomhas increased from 3399 million meters to 5441 million meters in the past 11 years. The main reason for the reduction in the production of the textile mills is the adoption of automation by the power looms in spinning and weaving. An ordinary machine that requires twenty men to manage its spinning operation now requires just two men to operate it. The numbers of power loom in Bhiwandi, Ichalkaranji, Bombay, Ahmedabad, Surat, Coimbatore and Bangalore have risen from 3.29 lakhs in 1977-78 to six lakhs with five year i.e., by 1982-83

Research Methodology Design

To define the research methodology of this study well defined research techniques were assessed. Based on the knowledge gathered the study has applied a mixed combination of qualitative (explorative or library research and descriptive i.e., filed analysis). The study adopted clustered based random sampling and justified sampling technique. For selection of sample geographic region the researcher adopted clustered based random sampling (Probability Sampling Technique) and for collection of data from the sample entrepreneurs justified sampling technique (Non-Probability Sampling Technique).

Labour shortage is an acute issue faced by the textile mill entrepreneurs across Tamil Nadu. To retain the existing workforce employers adopt different strategies, the same has been discussed in the above table. The sample textile mill employers have opined that they are primarily framed sound HR policies, designing attractive salary and benefit package, reduce stress levels of workers at various levels and provide good work environment with adequate infrastructure facilities to retain their existing work force. In the second, level of data analysis, it has been inferred that the sample textile mill owners have attempted to identify reasons for employees' attrition, there by adoption of effective employees' performance appraisal practices, provision of timely resolving of conflicts and showing preference for recruiting local workers, as their employee's retention strategies. Sample employers also offer right compensation to their workers during layoff, ensuring job security, promote the concept of employer commitment,

ensuring healthy relationship among employer, provision of canteen and housing facilities, conduct of training and development programmes, ensuring healthy relationship between superior, sub-ordinates and others, in order to retain the existing work force. These variables are ranked in the second, third, fourth, fifth and seventh places with the average score of 4.58 to 4.05, respectively. At the same time it has been observed that a group of textile mill owners have least focused on provision of recreation and entertainment facilities, offering of group insurance facilities, adoption of effective talent pool practices, focus of family well-being and adoption of employers participate environment, as their employees retention practices. Entrepreneurs have ranked these variables in the seventeenth, eighteenth, nineteenth, twentieth and twenty first places with the average score value of 4.03, 3.99, 3.98, 3.96 and 3.91. Further, group of employers' show minimal focus on the process of rehiring of temporary employers, promoting of team sprit among the workers, ensure work-life balance and promoting temporary employers into permanent workers. These strategies are placed in the twenty second, twenty third, twenty fourth and twenty fifth places with the mean score of 3.84, 3.72, 3.70 and 3.66 respectively.

H1: There exists association between size of the mill and the nature of strategies adopted by the entrepreneurs to retain their employees.

Success of any strategies framed and implemented is spelled out through the outcome i.e., the end results realised by the strategy framer. In the current study, it has been inferred that by adoption of effective retention strategies employers primarily succeed in cutting down their employee's turnover ratio; A group of textile mill owners' had realised number of benefits by adoption of effective employee retention strategies like: reduce employees absentees reduce recruitment cost and to support employees by strengthening the trust on management. Entrepreneurs have ranked these strategies success rate in first to third places with the mean score of 3.99 to 3.81. Batch of textile mill owners framed retention effective strategies thereby they succeed in reduction of wastage during production, enhanced co-operation among employees and have succeed in improving employees' morality. These strategic outcomes are placed in the fifth, sixth and seventh places with the mean score of 3.76, 3.69 and 3.68. Moreover, batch of employers had succeeded in increasing their production levels and to reduce new employees training cost, as existing worker were successfully retained. These strategic outcomes factors are ranked in the ninth and tenth ranks on an average score of 3.63 and 3.27 respectively.

Interpretation

The above empirical study found that 65.62 per cent of the employers are males and 46.88per cent of the sample populations established their business 1991-2000. The study observed that 46.25 per cent of the proprietors' gained more than 20 years of experience in textile business and 51.88 per cent of the employers' annual earning ranges between 11Crore – 20 Crore. As per the study results, 70 per cent of the textile mill owners preferred to recruit experienced workers. The study observed that textile mill entrepreneurs (39.38 per cent) experiences 11-15 employees on an average turnout per year. Majority of the textile mill owner have claimed that employees leave their job as they are paid very less. About, 61.88per cent of the sample textile mill entrepreneurs surveyed in the three districts exhibit efficiency in retaining their existing workforce.The sample textile mill employers have opined that they are primarily framed sound HR policies (91.60 per cent), designing attractive salary and benefit package (91.20 per cent), reduce stress levels of workers at various levels (89.80 per cent) and provide good work environment with adequate infrastructure facilities (87.60 per cent) to retain their existing work force. The study observed that only 56.25 per cent of the employers have expressed high level of perception with success rate of their retention strategies and 77.50 per cent of the sample population are interested in framing employees' retention strategies for the future.

SUMMARY OF FINDINGS AND CONCLUSION

Based on the knowledge gathered the study has applied a mixed combination of qualitative (explorative or library research and descriptive i.e., filed analysis). The study adopted clustered based random sampling and justified sampling technique. For selection of sample geographic region the researcher adopted clustered based random sampling (Probability Sampling Technique) and for collection of data from the sample entrepreneursjustified

sampling technique (Non-Probability Sampling Technique). Out of the 339 textile mills functioning in Tamil Nadu, nearly 51.62 per cent of the mills are located in three geographical regions i.e., Coimbatore, Tiruchirappalli and Tirupur. These three regions are considered as the sample data collection regions. The researcher computed proportionate distribution of the textile mills in three regions for fixing samples i.e., 96 mills from Coimbatore, 42 mills from Tirupur region and 22 mills from Tiruchirappalli, i.e., in total 160 textile mill entrepreneurs were surveyed.

Summary of the Study Findings of the Study

- The study observed that only 56.25 per cent of the employers have expressed high level of perception with success rate of their retention strategies.
- The study observed that 77.50 per cent of the sample population are interested in framing employees' retention strategies for the future.

Future Scope for the Study

The study had chosen only textile mills functioning in one district of Tamil Nadu and it had failed to focus on textile mills functioning in other parts of Tamil Nadu like Dindugal or other Southern regions. Based on the realised fact, it is suggested to the future researchers to focus on this area or include these areas in their study with extended sample population.

ABSTRACT

Financial inclusion has emerged as a key strategy to ensure that all sections of society have access to formal financial services. It aims to integrate the economically weaker and underserved into the organized financial system by providing affordable and easily accessible banking facilities. They provide various services like savings accounts, money transfers, insurance and digital money transfer facilities to people from different socio-economic backgrounds. In this context, post offices have emerged as a key institution in providing financial services to the underserved population due to their vast rural network and reach. Therefore, this study seeks to examine the role and contribution of the Postal Bank in promoting financial inclusion in the selected study area. Descriptive research method and simple random sampling method were used to identify sample customers from rural area. Since the researcher purposively selected Melaiyur Village Panchayat, 200 customers were used as sample respondents. The findings of the study indicate that India Postal Payments Bank is playing a key role in promoting financial inclusion in rural areas through easily accessible and affordable financial services. Its extensive postal network helps rural households conveniently access savings, remittances and digital banking services. While customer satisfaction levels are relatively high, issues such as low digital literacy, insufficient awareness and technological barriers continue to hamper the effective implementation of financial inclusion initiatives.

Keywords: Financial Inclusion, Rural India, Post Bank, Post office, customer satisfaction, level of awareness

INTRODUCTION

Financial inclusion has emerged as a key strategy to ensure that all sections of society have access to formal financial services. It aims to integrate the economically weaker and underserved into the organized financial system by providing affordable and easily accessible banking facilities. Both developed and developing countries consider financial inclusion to be essential for achieving inclusive economic growth and social development. In India, the primary objective of financial inclusion initiatives is to extend financial services to people living in rural, remote and unbanked areas. Many financial institutions contribute to this objective; however, the postal network, which is spread across the country, plays a significant role. India Post introduced savings deposit services in 1882 and has been continuously expanding its financial services over the years. A major milestone was achieved with the establishment of the India Postal Payments Bank (IPPB) on 30 January 2017. This strengthened the capacity of post offices to provide banking and digital financial services, especially to the rural population. In many villages and remote areas, post offices function as the most accessible formal financial institution for the local people. They provide various services like savings accounts, money transfers, insurance and digital money transfer facilities to people from different socio-economic backgrounds. Therefore, it is of utmost importance to examine the role of post offices in promoting financial inclusion in rural areas. In this context, this study titled "Financial Inclusion in Rural India through India Post Payments Bank" has been conducted with special focus on Poompuhar village in Mayiladuthurai district.

REVIEW OF LITERATURE

Tamilmaran R (2025) studied that the customer satisfaction with India Postal Payments Bank services in Tamil Nadu. The researcher found that rural users generally prefer institutions that offer simple procedures, affordable services and easy access for their banking needs, and that the wide reach of post offices and the familiarity of postal employees create trust among rural customers. However, issues such as technical barriers, delayed services and lack of adequate awareness programs still hamper the efficient use of India Postal Payments Bank services. Suresh M P (2024) studied on customer satisfaction on using digital banking services. The researcher pointed out that awareness, literacy level, accessibility and trust are the key factors affecting the use of digital financial services in rural areas. The study also found that rural customers faced several challenges such as low digital literacy, lack of adequate internet connectivity, delayed services, lack of believe on digital financial services, and lack of awareness about online financial services.

Srinivasan R (2016) studied that the contribution of postal banking services compares with commercial banks in the study area. The researcher observed that post offices are more accessible to rural people than commercial banks in many villages. The study also found that the postal payment bank services to reach unbanked areas in rural and marginalised communities throughout the country. The study concluded that postal financial services make a significant contribution to mobilizing rural savings and improving financial access. Usha T (2009) studied that the role of banks and post office to reach the unbanked and rural areas. The study found that that, majority of the households are opined that both the banks i.e., nationalised and private sector banks are not reach the marginalised and unbanked rural areas. Due to that majority of the sample respondent opined that the lack of banking facilities in rural areas leads to financial exclusion and dependence on informal credit sources. The study also found that expanding banking infrastructure and improving financial literacy are essential for inclusive growth.

Rangarajan C (2008) studied that financial inclusion and its contribution to vulnerable groups. The researcher found that the financial inclusion is the process of ensuring that vulnerable groups, such as the weaker sections and low-income households, have access to appropriate financial products and services at affordable prices. The study further emphasized that financial inclusion is essential for reducing poverty and promoting economic growth in rural areas.

Statement of the Problem

Before the implementation of financial inclusion initiatives in India, a large section of the rural population relied mainly on informal and semi-formal sources such as moneylenders, pawn shops, relatives, friends and local financiers for their savings and credit needs. The limited presence and accessibility of formal banking institutions in rural areas created significant challenges in maintaining safe and regulated financial transactions. As a result, rural people often faced problems such as low awareness of proper saving habits, misuse of savings, lack of adequate credit facilities, charging high interest on loans and financial exploitation by informal lenders. Despite various measures introduced to improve access to banking services, many rural households still face difficulties in effectively utilizing formal financial institutions. In this context, post offices have emerged as a key institution in providing financial services to the underserved population due to their vast rural network and reach. Therefore, this study seeks to examine the role and contribution of the Postal Bank in promoting financial inclusion in the selected study area.

Objectives of the Study

1. To analyse the awareness level among the rural population regarding the financial services provided by India Post Payments Bank.
2. To study the level of customer satisfaction towards the services provided by India Postal Payments Bank.
3. To identify the problems and challenges faced by rural customers in availing India Postal Payments Bank services.

Research Methods used

Research Design: Due to the nature of this study, both qualitative and quantitative data were used to complete this study. Descriptive research method and simple random sampling method were used to identify sample customers from rural area. Since the researcher purposively selected Melaiyur Village Panchayat, 200 customers were used as sample respondents. A structured interview schedule was used to collect data from the sample customers. It included socio-economic details, awareness level about postal bank financial inclusion services and their satisfaction with India Postal Payments Bank service.

Data Analysis: Simple percentage analysis and Chi-square test were used to analyze the collected information.

Conceptual model:

RESULTS AND DISCUSSIONS

Table 1: Relationship between the level of awareness of sample customers about financial services offered by India Postal Payments Bank and their demographic details

Table 2: Status of usage and accessibility of financial services offered India Postal Payments Bank

Table 3: Customer satisfaction about use of financial services offered by India Postal Payments Bank

Table 4: Problems faced by customers about the use of financial services offered by India Postal Payments Bank

CONCLUSION AND RECOMMENDATION

The government of India has taken enormous effect to implementing the financial inclusion in different parts of the country, especially in rural and unbanked areas. In part of this the nationalised commercial banks and post office is played at gross root level to provide formal financial services to rural and unbanked areas. Therefore, this study is undertaken to know the contribution of postal banks to promoting formal financial services in rural and unbanked areas. The findings of the study indicate that India Postal Payments Bank is playing a key role in promoting financial inclusion in rural areas through easily accessible and affordable financial services. Its extensive postal network helps rural households conveniently access savings, remittances and digital banking services. While customer satisfaction

levels are relatively high, issues such as low digital literacy, insufficient awareness and technological barriers continue to hamper the effective implementation of financial inclusion initiatives.

The following recommendations are made to strengthen India Postal Payments Bank services. Majority of the customers states that they faced lack of knowledge about digital literacy and infrastructure to effectively avail the digital financial services offered by India Postal Payments Bank. Hence, it is essential to conducting awareness campaigns at grassroot level in different aspects. Further there is a huge need to improves the internet infrastructure facilities and increase digital training to customers will enhance to reach and avail the digital financial services offered by India Postal Payments Bank rural India.

Majority of the customers opined that they didn't avail and used all the digital financial services offered India Postal Payments Bank. Further, majority of the customers opined that there is a lack of financial literacy and knowledge on digital financial services offered India Postal Payments Bank. Hence it is essential to conduct extensive awareness programmes in rural areas to create awareness and education to all types of people on different digital financial services offered by India Post Payments Bank.

In last, majority of the customers felt that there is a lack of strong institutional support to get digital financial services offered by India Post Payments Bank. Hence, there is a need to formation of collaboration among the local self-help groups, rural development institutions and India Postal Payments Bank. It will increase the level of financial awareness among the rural households and effective utilisation of these services.

Table 1: Relationship between the level of awareness of sample customers about financial services offered by India Postal Payments Bank and their demographic details

S.N	Demographic particulars	Chi-Square	Results and Interpretation
1.	Gender	16.01 / Significant	There is a relationship between the gender of sample customers and their level of awareness about financial services offered by India Postal Payments Bank. It means that the level of awareness on financial services offered by India Postal Payments Bank is based on the gender of customers.
2.	Age	19.89 / Significant	There is a strong relationship between the age of sample customers and their level of awareness about financial services offered by India Postal Payments Bank. It means that the level of awareness on financial services offered by India Postal Payments Bank is highly based on the age of customers.
3.	Education	21.04/ Significant	There is a strong relationship between the education of sample customers and their level of awareness about financial services offered by India Postal Payments Bank. It means that the level of awareness on financial services offered by India Postal Payments Bank is highly based on the level of education of customers.
4.	Occupation	14.26/ Significant	There is a relationship between the occupation of sample customers and their level of awareness about financial services offered by India Postal Payments Bank. It means that the level of awareness on financial services offered by India Postal Payments Bank is based on the different types of occupation of customers.

Table 2: Status of usage and accessibility of financial services offered India Postal Payments Bank

S.N	Particulars	Results and Interpretation
1.	**Usage of;** Savings Account Money Transfer Digital Payments Insurance Services Bill Payments	The majority of respondents use India Postal Payments Bank mainly for savings account services. Money transfer and digital payment services are also increasingly utilized by rural customers. Insurance and bill payment services show comparatively lower usage due to limited awareness and digital literacy. However, the rural households are using other services like money transfer, digital payments and bill payments at limited level. It may be due to that the lack of knowledge on these services provides by India Postal Payments Bank.
2.	**Accessibility of India Postal Payments Bank services;** Highly Accessible Accessible Neutral Difficult to Access	The most respondents in the study area are believes that the India Postal Payments Bank services are accessible in rural areas due to the wide network of post offices. Only a small percentage reported difficulty in accessing services, mainly because of internet connectivity issues and lack of technological knowledge. However, the considerable percentage of customers opined that they have moderately accessed the India Postal Payments Bank services.

Table 3: Customer satisfaction about use of financial services offered by India Postal Payments Bank

Level of Satisfaction	Results and Interpretation
Highly Satisfied Satisfied Neutral Dissatisfied	Majority of sample customers are satisfied with the services offered by India Post Payments Bank. The high satisfaction level may be due to the trustworthiness, easy accessibility, and doorstep banking services provided by post offices. However, the considerable percentage of customers are neither nor satisfied and dissatisfied on financial services offered by India Postal Payments Bank. It may be due to that poor internet connection; employees not clearly explained about different financial services offered by post office to customers.

Table 4: Problems faced by customers about the use of financial services offered by India Postal Payments Bank

Problems faced	Results and Interpretation
Lack of Digital Literacy Poor Internet Connectivity Technical Issues Lack of Awareness Delay in Services	Majority of the sample customers states that they highly faced the problems of lack of digital literacy to access the financial services offered by India Postal Payments Bank. Followed by the second big problems faced by sample customers is poor internet connectivity to access the financial services offered by India Postal Payments Bank. Also, the sample customers faced the other mentioned problems such as technical issues, lack of awareness and delay in services. Further, the sample customers states that due to these challenges their effective utilization of India Post Payment Banks digital financial services at difficult to rural households. Therefore, it is essential to improves the digital education to rural households and create necessary infrastructure facilities to strengthening financial inclusion to entire country.

ABSTRACT

Population ageing has emerged as a significant demographic and socio-economic challenge in India, increasing the demand for accessible and affordable healthcare services. This study examines the status, determinants, and utilization of health insurance among the elderly population (aged 60 years and above) in Tiruchirappalli District, Tamil Nadu using a scientific and empirical approach. A quantitative research design was adopted, and primary data were collected from 385 respondents through a structured interview schedule using random sampling techniques. The study employs descriptive statistics, Chi-square test, one-way ANOVA, and binary logistic regression analysis to assess the level of health insurance coverage and identify key influencing factors. The findings reveal that 56.66% of the elderly population remains uninsured, indicating low insurance penetration. The logistic regression results demonstrate that awareness, income, and affordability are significant positive determinants of health insurance enrolment, while age shows a negative association, reflecting structural barriers such as pre-existing condition exclusions. Gender-based analysis indicates a disparity in access, with female elderly respondents exhibiting lower coverage levels. Further, the analysis of healthcare expenditure highlights that out-of-pocket (OOP) expenditure accounts for nearly 84.9% of total hospitalization costs, suggesting that existing insurance schemes provide limited financial protection. The Chi-square test confirms a statistically significant relationship between gender and reasons for non-enrolment ($p < 0.05$), emphasizing the role of socio-demographic factors. The study concludes that despite the presence of government-sponsored schemes, particularly the dominance of public insurance programs, gaps persist due to low awareness, affordability constraints, and policy limitations. The research contributes to the

literature by providing empirical evidence on the determinants of health insurance adoption and underscores the need for targeted policy interventions, including awareness campaigns, subsidized insurance schemes, and inclusive coverage policies to achieve universal health security for the elderly population.

Keywords: Elderly Population, Health Insurance, Healthcare Access, Out-of-Pocket Expenditure, Insurance Coverage, Logistic Regression, Socio-economic Determinants, Financial Protection

INTRODUCTION

Population ageing has become one of the most significant demographic transitions across the globe, particularly in developing countries like India. Improvements in healthcare, increased life expectancy, and declining fertility rates have collectively contributed to a rapid increase in the proportion of elderly individuals aged 60 years and above [1]. This demographic shift presents both opportunities and challenges, especially in the domains of healthcare, social security, and economic sustainability. In the Indian context, the ageing population is expected to grow substantially in the coming decades, leading to increased demand for healthcare services and financial protection mechanisms [2]. The elderly population is particularly vulnerable to various health-related issues due to physiological ageing, higher prevalence of chronic diseases, and reduced immunity [3]. Non-communicable diseases such as cardiovascular disorders, diabetes, arthritis, and respiratory illnesses are more common among older adults, requiring continuous medical attention and long-term treatment. As a result, healthcare expenditure for the elderly is significantly higher compared to other age groups [4]. In a country like India, where a large proportion of healthcare expenses are financed through out-of-pocket (OOP) payments, elderly individuals often face severe financial strain, especially in the absence of stable post-retirement income [5].

Health insurance plays a crucial role in mitigating financial risks associated with healthcare expenditure [6]. It provides financial protection by covering hospitalization costs, medical treatments, diagnostic tests, and other healthcare services. In addition, health insurance enhances access to quality healthcare by reducing the burden of immediate cash payments. However, despite its importance, health insurance penetration among the elderly population in India remains considerably low [7]. Several structural and socio-economic factors contribute to this issue, including lack of awareness, high premium costs, exclusion due to pre-existing conditions, and limited coverage of insurance policies [8]. In recent years, the Government of India has introduced several health insurance schemes aimed at improving healthcare accessibility and affordability, particularly for vulnerable populations [9]. Initiatives such as publicly funded health insurance programs have expanded coverage to economically weaker sections of society. However, these schemes often have limitations in terms of eligibility criteria, coverage scope, and awareness among beneficiaries. While government-sponsored programs have increased enrolment among below-poverty-line (BPL) populations, a significant proportion of middle-income elderly individuals remain excluded due to affordability constraints and lack of targeted policy interventions [10].

Another critical issue in the Indian healthcare system is the high level of out-of-pocket expenditure [11]. Studies indicate that a substantial share of healthcare financing in India is borne directly by households, which can lead to catastrophic health expenditure and impoverishment. Even among insured individuals, inadequate coverage, co-payments, and exclusions often result in significant residual expenses [12]. This raises concerns about the effectiveness of existing health insurance schemes in providing comprehensive financial protection to the elderly population. The district of Tiruchirappalli, located in the state of Tamil Nadu, presents a relevant context for examining these issues. Tamil Nadu is known for its relatively advanced healthcare infrastructure and the implementation of state-sponsored health insurance programs [13]. Despite these advantages, disparities in insurance coverage and healthcare access persist, particularly among elderly populations. Understanding the status of health insurance coverage and the factors influencing enrolment in this region can provide valuable insights for

policy formulation and program implementation [14]. From a scientific and analytical perspective, it is essential to examine health insurance coverage not merely as a descriptive phenomenon but as a function of multiple socio-economic determinants. Variables such as age, gender, income, awareness, and affordability play a significant role in influencing insurance adoption. Employing statistical techniques such as descriptive analysis, Chi-square tests, ANOVA, and logistic regression models enables a deeper understanding of these relationships and helps identify the most significant predictors of insurance enrolment. Such an empirical approach enhances the reliability and validity of the findings and contributes to evidence-based policymaking [15].

Furthermore, the issue of gender disparity in health insurance coverage deserves special attention. In many parts of India, elderly women face additional disadvantages due to lower financial independence, limited access to information, and socio-cultural constraints. This often results in lower insurance coverage among female elderly compared to their male counterparts. Addressing these disparities requires targeted interventions that consider gender-specific challenges in accessing healthcare and financial services. The present study is therefore undertaken to analyze the status of health insurance among the elderly population in Tiruchirappalli District, with a focus on identifying the key determinants of insurance coverage and assessing the extent of financial protection provided by existing schemes. By integrating statistical and econometric techniques, the study aims to provide a comprehensive and scientifically robust understanding of the issue. In summary, the growing elderly population, combined with rising healthcare costs and inadequate insurance coverage, poses a significant challenge to the healthcare system in India. There is an urgent need to strengthen health insurance mechanisms, improve awareness, and design inclusive policies that cater specifically to the needs of the elderly population. This study contributes to the existing body of knowledge by offering empirical evidence and policy recommendations to enhance health insurance coverage and ensure financial security for the ageing population.

Problem Statement and Research Gap

Population ageing has emerged as a critical socio-economic and public health issue in India, with a rapidly increasing proportion of individuals aged 60 years and above. This demographic shift has intensified the demand for healthcare services, particularly for chronic and non-communicable diseases that predominantly affect the elderly population. However, the healthcare financing system in India continues to rely heavily on out-of-pocket (OOP) expenditure, placing a substantial financial burden on elderly individuals who often lack stable income sources after retirement. Health insurance is widely recognized as an essential mechanism for reducing financial vulnerability and improving access to healthcare services. Despite the availability of various public and private health insurance schemes, insurance penetration among the elderly population remains significantly low. Even among those who are insured, the extent of financial protection is often inadequate due to limited coverage, exclusions of pre-existing conditions, co-payments, and procedural complexities in claim settlement. In the context of Tiruchirappalli, which is known for relatively better healthcare infrastructure and the presence of government-sponsored insurance schemes, disparities in insurance coverage persist among the elderly population. Preliminary evidence indicates that a large proportion of elderly individuals remain uninsured, while those enrolled under insurance schemes continue to incur high OOP expenditure during hospitalization. This raises critical concerns regarding the effectiveness, accessibility, and inclusiveness of existing health insurance mechanisms.

Furthermore, socio-economic factors such as income level, gender, awareness, and affordability significantly influence health insurance enrolment. Elderly women, in particular, are often more vulnerable due to lower financial independence and limited access to information. Middle-income groups also face exclusion due to high premium costs and lack of targeted schemes. Despite these challenges, there is insufficient empirical evidence that systematically examines the determinants of health insurance coverage and evaluates the adequacy of financial protection among the elderly at the regional level.

⇒ Lack of Micro-Level Empirical Studies
⇒ Lack of Micro-Level Empirical Studies
⇒ Inadequate use of Advanced Statistical Techniques
⇒ Gap in Awareness and Behavioural Analysis

⇒ Lack of Evaluation of Financial Protection
⇒ Lack of Evaluation of Financial Protection

RESEARCH OBJECTIVES

⇒ To examine the level of health insurance coverage among the elderly population in the study area using descriptive statistical analysis.
⇒ To analyze the socio-demographic characteristics (age, gender, income, and education) influencing health insurance enrolment among the elderly.
⇒ To evaluate the impact of awareness and affordability on the adoption of health insurance using regression analysis.
⇒ To assess the relationship between socio-economic variables and health insurance coverage using inferential statistical techniques such as Chi-square and ANOVA.
⇒ To identify the major determinants of health insurance enrolment among the elderly population using logistic regression modelling.
⇒ To examine the type and source of health insurance schemes utilized by the elderly population (public vs private).
⇒ To analyze the extent of financial protection provided by health insurance by comparing insurance claims and out-of-pocket expenditure.
⇒ To investigate the reasons for non-enrolment in health insurance among uninsured elderly individuals.
⇒ To examine gender-based disparities in access to and utilization of health insurance.
⇒ To evaluate the effectiveness of government-sponsored health insurance schemes in improving healthcare access among the elderly.
⇒ To study the influence of income groups on insurance coverage and identify gaps in middle-income population coverage.
⇒ To provide policy recommendations for improving health insurance penetration and financial security among the elderly population.

RESEARCH METHODOLOGY

This chapter outlines the scientific framework and methodological procedures adopted to examine the status, determinants, and effectiveness of health insurance among the elderly population (aged 60 years and above) in Tiruchirappalli. The study employs a quantitative and analytical research approach, integrating statistical and econometric techniques to ensure empirical rigor and reliability of findings.

Research Design

The study adopts adescriptive and analytical research design.

- Descriptive component: To assess the current status of health insurance coverage among the elderly.
- Analytical component: To identify determinants and relationships between socio-economic variables and insurance enrolment.

The research follows a cross-sectional design, where data are collected at a single point in time from the selected respondents

Nature of the Study

- Type of Study: Quantitative
- Approach: Empirical and hypothesis-driven
- Objective Orientation: Exploratory and explanatory

This design enables the study to move beyond simple description and provide causal and inferential insights.

Sample Size

⇒ Total Sample Size: 385 respondents

⇒ The sample size is considered statistically adequate for representing the elderly population.

Sampling Techniques

- Sampling Method: Random Sampling
- Selection Criteria:
- Age ≥ 60 years
- Willingness to participate
- Both male and female respondents included

STATISTICAL TECHNIQUES

The study adopts a comprehensive statistical and econometric approach to analyze the status and determinants of health insurance coverage among the elderly population in Tiruchirappalli. The use of multiple statistical techniques ensures robustness, reliability, and scientific validity of the findings. The analysis is carried out using both descriptive and inferential statistical methods, along with regression-based modelling.

Descriptive Statistical Analysis

Descriptive statistics are used to summarize and present the data in a meaningful way.

Techniques Used

- Frequency Distribution
- Percentage Analysis
- Mean and Standard Deviation

Application in Study

- Distribution of insured vs uninsured elderly
- Gender-wise and income-wise classification
- Type of insurance coverage

Interpretation

Descriptive analysis provides a **baseline understanding** of patterns and trends in health insurance coverage.

Chi-Square Test of Independence

To examine the association between categorical variables.

Mathematical Expression

$$\chi^2 = \sum \frac{(O-E)^2}{E}$$

Application

- Gender vs Insurance Awareness
- Income vs Insurance Coverage
- Reasons for non-enrolment

Decision Rule

- p-value < 0.05 → Reject Null Hypothesis

Interpretation
This test identifies whether socio-demographic variables significantly influence insurance adoption.

One-Way ANOVA (Analysis of Variance)
To compare mean differences among multiple groups.

Mathematical Representation

$$F = \frac{\text{Between Group Variance}}{\text{Within Group Variance}}$$

Application

- Comparison of insurance coverage across income groups
- Variation in healthcare expenditure

Interpretation
ANOVA determines whether **group-level differences are statistically significant**.

Correlation Analysis
To measure the strength and direction of relationships between variables.

Pearson Correlation Coefficient

$$r = \frac{\sum(X - \bar{X})(Y - \bar{Y})}{\sigma_X \sigma_Y}$$

Application

- Awareness vs Insurance Coverage
- Income vs Financial Protection

Interpretation

- r > 0 → Positive relationship
- r < 0 → Negative relationship

Logistic Regression Analysis
To identify determinants of health insurance coverage where the dependent variable is binary.

Model Specification

$$P(Y = 1) = \frac{1}{1 + e^{-(\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5)}}$$

Data Analysis and Interpretation
Table 1 depicts the Descriptive Statistics of the study. The mean age of the respondents is 68.42 years, indicating that the sample predominantly consists of elderly individuals in the early stages of ageing. The average income level (mean = 2.11) suggests a concentration of respondents in the middle-income category. The awareness score (mean = 3.02) reflects a moderate level of awareness, while affordability (mean = 2.74) indicates financial constraints among respondents. The mean value of insurance coverage (0.42) confirms that less than half of the respondents are insured, highlighting low penetration of health insurance.

Table 2 gives the Chi-Square analysis of the study. The Pearson Chi-Square value of 12.54 with a significance level of p = 0.023 (< 0.05) indicates a statistically significant association between gender and reasons for non-enrolment in health insurance. This implies that male and female respondents differ significantly in their reasons for not

possessing insurance. The result confirms that gender plays a crucial role in influencing awareness and access to health insurance, thereby rejecting the null hypothesis.

Table 3 depicts the Correlation Matrix. The correlation results reveal important relationships among variables:

- **Awareness (r = 0.602)** shows a strong positive correlation with insurance coverage, indicating that higher awareness significantly increases the likelihood of enrolment.
- **Income (r = 0.418)** also has a positive relationship, suggesting that individuals with higher income are more likely to purchase insurance.
- **Affordability (r = 0.322)** moderately influences insurance adoption.
- **Age (r = -0.221)** has a negative correlation, indicating that older individuals are less likely to be insured.

These findings suggest that **awareness is the most influential factor**, followed by income and affordability.

Table 4 gives the One-Way ANOVA analysis. The ANOVA results show an F-value of 245.67 with a significance level of p = 0.000 (< 0.05), indicating a statistically significant difference in health insurance coverage across different income groups. This confirms that income level is a key determinant of insurance adoption, with higher-income groups having better access to health insurance compared to lower and middle-income groups Table 5 gives the Logistic Regression summary of the study. The Nagelkerke R Square value of0.468indicates that approximately46.8% of the variation in health insurance coverageis explained by the independent variables included in the model. This reflects amoderately strong explanatory power, which is acceptable for socio-economic studies involving human behaviour. Table 6 gives the Hosmer and Lemeshow Test. The significance value of 0.449 (> 0.05) indicates that the model fits the data well. This suggests that there is no significant difference between observed and predicted values, confirming the goodness-of-fit of the logistic regression model.

Table 7 depicts the Classification Table. The classification accuracy of 79.1% indicates that the logistic regression model correctly predicts health insurance coverage status for a large proportion of respondents. This demonstrates that the model has strong predictive capability and can reliably identify insured and uninsured individuals. Table 8 gives the Logistic Regression Coefficients. Awareness (Exp(B) = 1.80) is the most significant predictor, indicating that a one-unit increase in awareness increases the likelihood of insurance enrolment by 80%.Income (Exp(B) = 1.49) shows that higher income increases the probability of insurance adoption by 49%.Affordability (Exp(B) = 1.36) suggests that reduced financial burden enhances enrolment.Gender (Exp(B) = 1.20) indicates that males are 20% more likely to be insured compared to females.Age (Exp(B) = 0.806) shows a negative effect, meaning that increasing age reduces the likelihood of insurance enrolment.All variables are statistically significant (p < 0.05), confirming their importance as determinants of health insurance coverage.

Table 9 depicts the Multiple Regression Summary. The R Square value of 0.507 indicates that 50.7% of the variation in out-of-pocket expenditure is explained by the independent variables. This suggests a strong explanatory power, indicating that the model effectively captures the determinants of healthcare expenditure. Table 10 depicts the ANOVA (Regression Model). The F-value of 592.34 with p = 0.000 confirms that the regression model is statistically significant. This implies that the independent variables collectively have a significant impact on out-of-pocket expenditure. Table 11 gives the Regression Coefficients (OOP Expenditure). Insurance (-0.402) has a negative coefficient, indicating that having insurance reduces out-of-pocket expenditure significantly.Income (-0.298) suggests that higher income reduces financial burden.Awareness (-0.214) indicates that informed individuals manage healthcare expenses better.Age (0.189) shows that older individuals incur higher healthcare expenses.All variables are statistically significant (p < 0.05), confirming their influence on financial burden.

CONCLUSION

Logistic regression analysis confirms that awareness, income, and affordability significantly influence insurance enrolment. Age shows a negative relationship with insurance coverage. Chi-square test indicates a significant relationship between gender and reasons for non-enrolment. ANOVA results confirm income-based disparities in insurance coverage. The study highlights that health insurance coverage among the elderly population remains inadequate despite the presence of multiple insurance schemes. The findings reveal that a significant proportion of elderly individuals are uninsured, and those who are insured continue to face high out-of-pocket healthcare expenses. This indicates that existing health insurance mechanisms are insufficient in providing comprehensive financial protection. The study identifies awareness, income, and affordability as the key determinants influencing insurance adoption. Among these, awareness emerges as the most critical factor, emphasizing the need for targeted educational initiatives. The presence of gender disparities and the exclusion of middle-income groups further underline the structural inequalities within the healthcare system.

Although government-sponsored schemes have played a vital role in expanding coverage, particularly among economically weaker sections, their effectiveness is limited by inadequate coverage and operational inefficiencies. The persistence of high out-of-pocket expenditure suggests that health insurance in its current form does not fully achieve its objective of financial risk protection. From a policy perspective, there is a pressing need to move towards universal health coverage for the elderly, supported by inclusive, affordable, and comprehensive insurance schemes. Strengthening awareness, reducing premium costs, and expanding coverage for chronic illnesses are essential steps in this direction. In conclusion, ensuring health insurance coverage for the elderly is not merely a healthcare issue but a broader socio-economic necessity. A well-structured and inclusive insurance system can significantly reduce financial vulnerability, improve healthcare access, and enhance the overall quality of life for the ageing population. The study provides empirical evidence and policy insights that can guide future interventions aimed at achieving equitable and sustainable healthcare for the elderly.

ABSTRACT

The study investigates customer attitudes and inclinations toward the buying of clean energy bikes in Karur District, Tamil Nadu. The study collected 400 sample through structured questionnaire, descriptive research design, and simple random sampling. The questionnaire consists of four sections such as demographics, attitudes, inclinations, and the influence on buying decisions. The reliability of the questionnaire is guaranteed through a pilot study. The data is summarized using statistical techniques such as factor analysis, regression, chi-square, and descriptive analysis. The result demonstrates that the impact of customer attitudes on comfortable clean energy bikes to ride. The hypothesis is validated and the importance of customer attitude in influencing drive comfort and buying decisions is highlighted by the statistical significance found across variables. Customer choices are influenced by a variety of criteria, including pricing, environmental appeal, and ease of charging. A prominence on the multifaceted character of customer decisions and the interplay of environmental, performance, brand, and economic

considerations, the study develops a thorough examination of factors influencing clean energy bike buying.

Keywords: Customer, Attitude, Inclination, Clean Energy Bike, Buying Decisions.

INTRODUCTION

The clean energy bike is a bicycle that runs on sustainable and eco-friendly energy sources for its impetus. Electric bikes, or e-bikes, are the most popular kind of sustainable energy bikes. Electric bikes have a rechargeable battery-powered electric motor that helps the user pedal. Compared to conventional, combustion engine-powered vehicles, these bikes have a lower environmental impact because they emit no pollutants while in use, making them clean energy choices. In order to improve their sustainability, clean energy bikes can also have creative designs that incorporate additional renewable energy sources, including solar panels or regenerative braking systems (Thakur et al., 2024). Offering an environmentally beneficial form of transportation while encouraging energy efficiency and lowering dependency on fossil fuels is the main objective of clean energy bikes. The automotive sector has seen a revolutionary transition towards clean energy solutions in a time of growing environmental concerns and demand for sustainable alternatives (Gujarathi et al., 2018). Among these, clean energy bikes have become a well-known and eco-friendly form of transportation.

The dimensions of customer attitude and inclinations related to the buying of clean energy bikes is the main motive for investigation. Realization of the elements influencing customers' decisions to buying clean energy bikes is vital as society grows more conscious of environmental issues. These insights go beyond personal inclinations to influence more general environmental regulations, commercial tactics, and societal paradigms (Vashisth and Gupta, 2021). Electric or hybrid-powered clean energy bikes are a sustainable mode of transportation that lessens the environmental impact of conventional cars. The various facets of customer behavior in selecting clean energy bikes is becoming increasingly important as international efforts to fight climate change and lower carbon footprints escalate (Selva and Arunmozhi, 2020). In order to provide important insights into the changing environment of sustainable transportation, the study attempts to examine the interactions of elements have effect oncustomers'attitudes and inclinations.

Evolution of Clean Energy Bike Market*:*
The market for clean energy bikes has evolved as a result of the global movement towards sustainable practices. Identification of customerinclinations are shifting, manufacturers are investing in cutting-edge designs, technology, and marketing tactics to take advantage of this new market. Additionally, governments are encouraging sustainable mobility solutions, coordinating regulations with environmental objectives, and providing incentives for the use of clean energy transportation (Ranjan et al., 2022). In the larger framework of sustainable transportation, it acknowledges the revolutionary potential of clean energy bikes. It clarifies the mutually beneficial interaction between customerinclinations and market pressures and provides insights that help direct the clean energy bike industry's course (Rajesh et al., 2022).

Attitude and Inclination Dynamics*:*
Adopting sustainable energy bikes encompasses a wide range of customer considerations and attitudes, going beyond simple functionality. Examining how people understand the technological characteristics, environmental advantages, and general allure of clean energy bikes is necessary to recognize the dynamic activities of attitude (Acharya, 2019). Customer inclinations, on the other hand, focus on the particular qualities, styles, and features that influence people to select clean energy bikes over traditional options. Environmental awareness, acceptance of technology, and the perceived advantages of leading a sustainable lifestyle are all factors that affect perspective (Shabir and Balan, 2025). Inclination criteria include things like the overall economic viability of clean energy bikes,

performance expectations, charging infrastructure accessibility, and design aesthetics (Liao, 2017). The study goal is to analyze these components in order to fully understand the factors that influence customers' decisions.

Impact of Attitude on Buying Decisions:

Customer attitude has a significant influence on clean energy bike purchases,it influences the direction of sustainable mobility. Customers' decisions to adopt renewable energy bikes are heavily influenced by their attitudes, beliefs, and inclinations. Customers' increased awareness of the environment is one of the key factors causing this influence (Yegin and Ikram, 2022). The allure of clean energy bikes as an environmentally friendly substitute is growing as people become more conscious of the environmental impact of conventional automobiles. Customers choose clean energy bikes because they believe they will have less of an impact on the environment and produce fewer carbon emissions, which aligns their transportation choices with a larger commitment to sustainability (Sathya et al., 2025).Furthermore, customer attitude includes elements like technological performance and acceptance in addition to environmental considerations. Customers' trust in switching is influenced by the efficiency and perceived dependability of renewable energy bike technology (Ram, 2020).

The convenience of charging infrastructure, affordability, and long-term cost savings all influence views and, in turn, buying decisions. Clean energy bikes are an appealing option as customers look for more environmentally friendly and cutting-edge modes of transportation (Purwanto and Irawan, 2024). Customer attitude affects not just personal decisions but also market trends and industry traits on a broader scale (Das, 2020). In response to these misconceptions, both manufacturers and legislators invest in sustainable technologies, improve features, and create laws that promote the use of clean energy bikes. The shift to greener and more sustainable forms of transportation is essentially driven by customerattitude (Jose et al., 2022).

Problem Statement

Adoption of clean energy bikes is an important step in the direction of sustainable mobility, but there is still much to learn about the factors impacting customer choices. The active factors influencing attitudes and inclinations for the buying of clean energy bikes are at the center of the problem description. Even while eco-friendly transportation options are becoming more and more popular worldwide, there is still a lack of understanding of the particular factors that influence customer decisions in this dynamic industry. It is necessary to look into how environmentally concerned prospective buyers of clean energy bikes are. Sustainable decisions are influenced by larger environmental issues, but it's unclear how much of an impact this has on specific decision-making processes. It is necessary to investigate the technology influence on customerinclinations. In order to match their products with customer expectations, manufacturers and legislators must acknowledge the degree of technological adoption, concerns, and expectations surrounding clean energy bikes. Economic factors, such as long-term savings and cost-effectiveness, raise serious concerns regarding the viability and appeal of clean energy bikes to prospective buyers. In order to better recognize the benefits and constraints of promoting sustainable transportation options, the study intends to provide information about the factors influencing customer decisions surrounding the buying of clean energy bikes.

Need for Study

The study is becoming more and more important to speed the shift to sustainable transportation and understand the factors that influence customers' decisions to buying clean energy bikes. Recognition of the variables that encourage people to adopt eco-friendly alternatives becomes crucial as environmental worries approach critical levels. Additionally, there is an urgent need to investigate technology acceptance and how these developments meet customer expectations as renewable energy bikes become more popular. In order to provide manufacturers, legislators, and companies looking to increase the attractiveness of clean energy bikes with useful information, the study aims to investigate the economic factors impacting buying decisions. The study guide industry practices, inform sustainable transport policies, and foster a wider cultural shift towards eco-conscious mobility as a result of identifying the unique factors influencing customer attitudes and inclinations within the regional and global context. Essentially, the conclusions are expected to provide a substantial contribution to the domains of customer behavior, regional development, and sustainable transportation.

REVIEW OF LITERATURE

A thorough examination of the variables influencing customer choices in sustainable mobility is revealed by the assessment of the literature on customer attitude and inclination about the buying of clean energy bikes. The observable influence of environmental consciousness on customer decision-making is a recurring issue in research (Selvi and Gideon, 2023). People are becoming more conscious of how their transportation choices affect the environment, and clean energy bikes are becoming a popular choice because of their low carbon emissions (Tantau and Gavriluscu, 2019). Positive customer attitudes are shaped in large part by the alignment with environmental values (Chawla et al., 2023). The significant factor is technological acceptability, which reflects the significance of perceived dependability and effectiveness of electric or hybrid technologies (Hoang et al., 2022). The correlation between customer inclinations and technological attributes indicates that customer trust is greatly impacted by the perceived dependability of such technology (Bhatia et al., 2021). Customers' opinions and responsiveness to clean energy bike options are largely influenced by the technology environment (Kumar and Tashwanth, 2022).

The decision-making process is heavily influenced by economic factors, such as the cost and long-term savings of clean energy bikes (Mruzek et al., 2016). Customers consider the financial effects of switching to clean energy bikes in comparison to more conventional options, highlighting the importance of affordability and viability in shaping decisions (Jansson et al., 2017). The significance of customizing interventions and strategies to fit the different cultural and economic contexts is acknowledged by the distinctive fundamental forces of a given location (Khurana et al., 2020). Identification of the contextual factors that impact sustainable transportation choices, the regional lens helps to foster a deeper acceptance of customerattitudes in a variety of situations (Sinha and Bangia, 2020). Additionally, the significance of design aesthetics in shaping customerinclinations (Gore et al., 2024). It shows that elements like visual attractiveness, ergonomic design, and general aesthetics greatly influence customer decisions, going beyond environmental and financial concerns (Rezvani et al., 2015). The multidimensional approach on inclinations implies that both functional and aesthetic factors play a role in the decision-making process (Morton et al., 2016). There is agreement that more thorough study that incorporates several components into a comprehensive framework is necessary, even though current studies provide insightful information (Malagi and Ramya, 2022). To stay up to date with the most recent advancements in this dynamic industry, constant research is required due to the dynamic nature of technology, market trends, and customer behavior (Buhmann and Criado, 2023).

Purpose

The study is initiated to test the following objective.

1. To assess the demographic profile of customers buying clean energy bikes.
2. To investigate the impact of customer attitude on bike buying decisions.
3. To examine the customer attitude towards drive comfort of clean energy bikes.
4. To measure the customer inclination towards the use of clean energy bikes.

METHODOLOGY

The objective of the study is to investigate customers' attitudes and inclinations about the buying of clean energy bicycles. The study is being conducted in Tamil Nadu's Karur District, where a sizable section of the populace is interested in buying renewable energy motorcycles. The survey comprised 400 customers from various parts of the district. A descriptive research design forms the basis of the study, and data is gathered via a field survey using a questionnaire. To gather data, probability sampling methods, more especially, simple random sampling are used. The questionnaire is divided into four sections, the first focuses on demographic data; the second examines customers' opinions of clean energy bikes; the third explores customers'inclinations for clean energy bikes; and the fourth examines how customer opinions affect the decision to buy clean energy bikes. To make sure the

questionnaire was thorough, clear, and reliable, a pilot study with 50 customers was carried out before the major data collection. The collected data is summarized using a variety of statistical techniques, such as regression, factor analysis, descriptive analysis, chi-square test, and simple percentages. The scale used in the questionnaire is 1 to 5, with 1 denoting strong agreement and 5 denoting extreme disagreement.

RESULTS AND DISCUSSIONS

Analysis of Demographic Profile

The demographic profile of customers is analyzed and presented in table 1.

Table 1 shows the demographic profile of clean energy bike customers. Gender-wise clean energy bike customer shows that there are 71.75% men and 28.25% women. The age distribution shows that 33.00% are under 30, 40.75% are between 30 and 50, and 26.25% are over 50. Academic background of customers found that 26.75% have finished their schooling, 44.25% have completed their undergraduate courses, and 29.00% have earned a postgraduate degree. Monthly income reveals that 38.50% make less than Rs.50,000, 34.25% make between Rs.50,000 and Rs.100,000, and 31.25% make more than Rs.100,000. Occupation reveals that 31.00% work in agriculture, 37.25% in business, and 31.75% in government or private organizations. Dwelling place discloses that 28.00% of people live in rural areas, 33.25% in semi-urban areas, and 38.75% in urban areas.

Customer Attitude on Bike Buying Decisions

The are several factors affect the customers' attitude about buying sustainable energy bikes. Decisions are influenced by environmental factors, such as ecological effect awareness and charging infrastructure. Performance and characteristics like comfort, safety, and acceleration are important. Buying decisions are also influenced by style inclinations, brand reputation, and economic considerations including ride smoothness and cost-effectiveness. The following conceptual framework is proposed to test, which is shown in figure 1.

The subsequent hypotheses are presented to investigate the impact of customer attitude towards clean energy bike buying decisions.

H_1: Customer attitude has significant impact on clean energy bike buying decisions.

The impact of customer attitude on clean energy bike buying decisions are measured using factor analysis and regression co-efficient. Subsequently, the results of KMO and Bartlett's tests are shown in table 2.

Table 2 exhibits the adequacy of the sample in the KMO metric. The data have value of 0.841, it is deemed enough to perform factor analysis. The Bartlett's test shows a highly significant result (0.000), it confirms the flawless nature of the factor analysis outcomes.

Table 3 presents the findings of the rotating matrix, which demonstrates that all of the antecedents of buying decisions, such as the environment effect, performance, brand and style, and economyare acknowledged. Environmental impact awareness, accessibility to charging infrastructure, expectations for battery performance and range, government incentives and subsidies, and noise levels when riding a bike are all included in the first category, environment effect. Acceleration and speed performance, braking effectiveness and safety considerations, ergonomic design and comfort, and technical advancements and features comprise the second aspect. Three aspects are covered by the third factor brand reputation, resale value and depreciation rates; design aesthetics and style inclinations; and brand reputation and dependability. The attitude of overall ride smoothness, community and peer influence, and long-term cost-effectiveness make up the fourth factor cost savings. These factors are connected and provide enough values for factor loading. The score assigned to any one attribute is partially influenced by other attributes.

Table 4 reveals the results of the Durbin-Watson and R-Square tests. For regression analysis, the calculated R-Square test score of 0.711 is deemed acceptable. Furthermore, the Durbin-Watson test results in a score of 1.823, which suggests that there is significant variance between the two variables or that autocorrelation is getting close to zero for customer attitude on clean energy bikes.

Table 5 reveals that the results of ANOVA, it shows that four precursors to customer attitude differ significantly and can be used to predict the dependent variable, buying decisions, it is substantiated by the high F-value 78.885 ($p<0.000$), it confirms significant level of below 1%. Table 6 reveals the comprehensive information about the statistical significance of factors influencing decisions to buy clean energy bikes. High beta values (0.389, 0.286, 0.376, and 0.268) and matching t-values (5.685, 5.921, 4.268, and 4.856) support the significant statistical significance ($p<0.000$) of all variables. The VIF values, which are constantly less than 10, confirm each variable's distinct contribution and allay worries about multi-collinearity. Buying decisions for clean energy bikes are significantly influenced by a number of elements, it consists of economic considerations, brand and style, performance, and environmental impact. The null hypothesis is rejected when a closer look at the t-statistics for these variables shows a significant correlation ($p<0.000$). The validation emphasizes how important customerattitude is in influencing choices about buying renewable energy bikes. The study essentially shows that customerattitudes, which include brand and appearance inclinations, performance expectations, environmental concerns, and economic factors, have a major influence on and contribute to the decision-making process surrounding the buying of clean energy bikes.

Attitude on Drive Comfort

The opinion of customers about the comfortable nature of clean energy bikes to ride is assessed. Therefore, the chi-square test is used to examine the relationship between customers' attitudes and drive comfort of clean energy bikes. According to the premise, customers' attitudes and drive comfort of clean energy bikes are significantly and favorably correlated. The summary of the findings is presented in table 7.

Table 7 reveals that customer opinions about the drive comfort of renewable energy bikes are strongly correlated. The calculated data validate the hypothesis by showing statistical significance at a 1% level of significance. Customers' opinions and the drive comfort of clean energy bikes are therefore found to be significantly and favorably correlated. It confirms that the drive comfort of renewable energy bikes is greatly and favorably influenced by user attitude. As a result, all of these factors work together to prove that customer opinion significantly and favorably influences the drive comfort of clean energy bikes. Thus, in the context of clean energy bikes, such authentication emphasizes the complex relationship between customer attitudes and the aspects of drive comfort.

Customer Inclination on Clean Energy Bikes

Customers' choices while buying clean energy bikes are influenced by a variety of circumstances, thus an investigation into their inclinations is carried out. Finding the characteristics that encourage customers to choose sustainable energy bikes is the main goal. The calculated mean value obtained from customers' opinions is evaluated using the t-test. The estimated mean value of the customers is compared to the expected mean value of three in this statistical analysis to determine the significance value. The results are presented in table 8.

Table 8 shows the driving elements for clean energy bikes have mean values ranging from 2.43 to 4.19. Notably, a number of factors have mean values greater than 3, including charging accessibility and convenience, affordability and cost savings, expectations for battery efficiency and range, government incentives and subsidies, brand reputation and dependability, ease of maintenance and serviceability, resale value, and depreciation rates. Customer agreement is demonstrated by t-values more than three (16.862, 19.835, 10.956, 24.863, 31.620, 18.659, and 14.468), all of which are statistically significant at the 1% level. Therefore, it can be concluded that a wide range of factors influence customer inclinations for clean energy motorcycles.

DISCUSSION

Customer attitudes of clean energy bikes' driving comfort are consistent with the wider understanding of what motivates people to adopt sustainable modes of transportation. This goal aims to reveal the factors influencing customers' experiences with clean energy bikes by investigating aspects of ride comfort, such as suspension efficiency, seat comfort, vibration levels, noise impact, handling, acceleration, braking, riding posture, and overall smoothness. Customer inclinations investigate the factors that influence people's decision to select renewable energy bikes over conventional options. It is consistent with previous research that highlights the importance of elements like simplicity of charging, affordability, environmental appeal, range expectations, government incentives, brand reputation, design aesthetics, technological features, ease of maintenance, and resale value. Realization of these inclinations gives manufacturers, legislators, and companies looking to increase the appeal of sustainable energy bikes useful information. Customerattitude affects buying decisions is essential to understanding the wider ramifications of personal decisions. It validates the hypothesized positive relationship, reinforcing the notion that customer attitudes significantly influence the adoption of clean energy bikes. The combination of such goals leads to a thorough understanding of the important factors impacting customer decisions in the clean energy bike market.

CONCLUSION

The drive comfort of clean energy bikes is statistically significantly impacted by customer attitude. The hypothesis is confirmed when all variables exhibit a high correlation. It highlights the multidimensional influence of these factors on buying decisions and the critical role that customer attitude plays in favorably influencing the drive comfort experienced with clean energy bikes. For clean energy motorcycles, a variety of factors affect customer inclinations. Findings confirm that factors like brand dependability, price, environmental appeal, and charging convenience influence customer decisions. These results highlight the complexity of impacts in the decision-making process and support the premise that a variety of factors greatly influence customerinclinations for clean energy bikes. Environmental effect, performance, brand and style, and economics are all major factors in buying decisions. The factors have sufficient values for factor loading, showing interrelatedness, each of which contains unique features. Environmental impact, performance expectations, brand inclinations, and economic concerns all play a part in influencing customer decisions when it comes to buying sustainable energy bikes. Decisions are heavily influenced by performance, brand and style, economic considerations, and environmental impact. It confirms how important customerattitude is when buying sustainable energy bikes. The study highlights the complex impact of customerattitudes by demonstrating how environmental influences, performance expectations, brand inclinations, and economic factors all play a substantial role in decision-making.

Research Implications

The research ramifications go beyond personal customer decisions, providing insightful understandings for a range of stakeholders. The results can be used by manufacturers to improve product designs by highlighting aspects like price, ease of charging, and attractive design that appeal to customers. As a result of learning more about the variables affecting the uptake of clean energy bikes, policymakers can create rules and incentives that are specifically targeted. Additionally, companies in the clean energy transportation industry might modify their marketing plans to highlight the primary drivers. All things considered, the study advances the conversation about sustainable mobility by providing a more thorough analysis of the variables influencing the shift to clean energy bikes and assisting policymakers and industry participants in making well-informed decisions.

ABSTRACT

The Fast-Moving Consumer Goods (FMCG) sector has become highly competitive due to the rapid growth of digital communication, social media influence, and changing consumer perceptions. In recent years, anti-branding activities such as negative campaigns, unfavorable customer reviews, social criticism, and online complaints have significantly affected the reputation of FMCG brands and altered consumer purchasing patterns. This study aims to examine the effects of anti-branding on consumer buying behaviour and loyalty towards FMCG products with special reference to Tiruchirappalli district. The research specifically investigates the influence of anti-branding campaigns on consumer buying behaviour, the relationship between anti-branding perception and consumer loyalty, and the impact of negative social media reviews on purchase decisions. The study adopts a descriptive and analytical research design using both primary and secondary data sources. Primary data are collected from consumers of FMCG products through a structured questionnaire. Statistical techniques such as percentage analysis, correlation analysis, regression analysis, and chi-square tests are proposed to evaluate the hypotheses and identify the significance of relationships among the variables. The research focuses on understanding how consumers react to anti-branding messages and how such perceptions influence their loyalty, trust, and purchasing intentions. The findings of the study are expected to reveal that anti-branding campaigns and negative social media reviews significantly influence consumer purchase decisions and reduce customer loyalty towards FMCG brands. The study also highlights the growing role of digital platforms in shaping consumer opinions and purchasing behaviour. The results

may help FMCG companies develop effective branding, customer relationship, and reputation management strategies to minimize the negative impact of anti-branding activities. The research contributes to the existing literature on consumer behaviour and brand management by providing insights into the relationship between anti-branding perception, buying behaviour, and loyalty in the FMCG sector.

Keywords: Anti-branding, Consumer Buying Behaviour, Consumer Loyalty, FMCG Products, Social Media Reviews, Brand Perception, Purchase Decision, Customer Satisfaction, Brand Switching

INTRODUCTION

The Fast-Moving Consumer Goods (FMCG) industry plays a vital role in the economic development of every country by providing essential daily-use products to consumers [1]. FMCG products include food items, beverages, toiletries, cleaning products, cosmetics, personal care products, and other household necessities that are purchased frequently by consumers. The sector is highly competitive because numerous brands compete continuously to attract and retain customers through pricing strategies, promotional activities, product quality, and customer satisfaction. In the modern business environment, branding has become one of the most influential factors that determine the success and sustainability of FMCG companies [2]. A strong brand image helps organizations build customer trust, increase loyalty, and improve long-term profitability [3]. However, in recent years, the growth of digital communication and social media platforms has created new challenges for FMCG companies. Consumers today actively share their experiences, opinions, and feedback through online platforms such as Facebook, Instagram, YouTube, Twitter, and review websites. While positive reviews enhance brand reputation, negative publicity and anti-branding activities can seriously damage the image of a company [4]. Anti-branding refers to activities, campaigns, opinions, or communications that negatively portray a brand and influence consumer perception against the brand. These activities may arise due to poor product quality, unethical business practices, misleading advertisements, customer dissatisfaction, environmental concerns, or negative social media discussions [5].

Anti-branding has become a major concern for FMCG companies because consumers are highly influenced by online information and peer opinions before making purchase decisions [6]. Negative comments, unfavorable reviews, boycott campaigns, and criticism shared through digital platforms can reduce customer trust and alter consumer buying behaviour. In many cases, consumers tend to switch to competing brands after being exposed to anti-branding content [7]. Such activities not only affect sales performance but also reduce customer loyalty and brand attachment. Therefore, companies must understand the extent to which anti-branding influences consumer perceptions and purchasing decisions [8]. Consumer buying behaviour refers to the process through which individuals select, purchase, use, and evaluate products and services to satisfy their needs and wants. Buying behaviour is influenced by several factors such as price, quality, promotional strategies, social influence, personal preferences, cultural values, and brand reputation [9]. In the FMCG sector, consumer decisions are often made quickly because products are purchased frequently. Hence, negative information regarding a brand can immediately influence purchase intentions and create hesitation among consumers. Loyal customers who previously trusted a brand may also change their attitudes due to repeated exposure to anti-branding messages [11].

Customer loyalty is another important factor in the FMCG market because loyal consumers contribute to repeat purchases, positive word-of-mouth communication, and long-term business growth [12]. Anti-branding activities may weaken consumer loyalty by creating negative perceptions and reducing emotional attachment towards the brand [13]. Social media reviews and online discussions have become powerful tools that influence public opinion and consumer confidence [14]. Therefore, it is essential for FMCG companies to identify the impact of anti-branding on customer loyalty and develop effective reputation management strategies to maintain consumer trust [15] [16].

The present study focuses on examining the effects of anti-branding towards consumer buying behaviour and loyalty in FMCG products with special reference to Tiruchirappalli district. The study aims to understand how anti-branding campaigns, negative social media reviews, and consumer perceptions influence buying decisions and customer loyalty. The research also attempts to identify the relationship between anti-branding perception and consumer behaviour in the FMCG sector. The findings of the study may help FMCG companies improve their branding strategies, strengthen customer relationships, and effectively manage negative publicity in the digital era.

RESEARCH GAP

Several studies have been conducted on consumer buying behaviour, brand loyalty, customer satisfaction, and branding strategies in the FMCG sector. Existing research has mainly focused on factors such as product quality, pricing, advertising effectiveness, customer preferences, and promotional strategies influencing consumer purchase behaviour. Similarly, many studies have examined the role of social media marketing and digital branding in enhancing customer engagement and loyalty. However, only limited studies have specifically focused on the concept of anti-branding and its impact on consumer buying behaviour and loyalty in the FMCG sector. Most previous research has concentrated on positive branding strategies rather than the negative influence created by anti-branding campaigns, negative reviews, and unfavorable online discussions. Furthermore, earlier studies have not adequately explored how anti-branding perception affects customer trust, purchase intention, and repeat buying behaviour in FMCG products.

Another major research gap identified is that existing studies have given less attention to the impact of negative social media reviews and online anti-branding activities on consumer loyalty. The rapid growth of digital communication platforms has significantly changed consumer behaviour, yet empirical studies examining the relationship between anti-branding perception and loyalty in the FMCG industry remain insufficient.

In addition, there is a lack of region-specific studies related to anti-branding effects in Tiruchirappalli district. Consumer behaviour may vary based on demographic, cultural, social, and economic factors, and therefore findings from other regions may not be directly applicable to this area. Hence, the present study attempts to fill this gap by analyzing the influence of anti-branding campaigns and negative social media reviews on consumer buying behaviour and loyalty towards FMCG products in Tiruchirappalli district.

Research Objectives

⇒ To examine the influence of anti-branding campaigns on consumer buying behaviour towards FMCG products.
⇒ To analyze the relationship between anti-branding perception and consumer loyalty towards FMCG brands.
⇒ To identify the impact of negative social media reviews on consumer purchase decisions.
⇒ To evaluate the effect of anti-branding activities on customer trust and brand image in the FMCG sector.
⇒ To study the level of consumer awareness regarding anti-branding campaigns and online negative publicity.
⇒ To examine whether demographic factors such as age, gender, income, education, and occupation influence consumer reactions towards anti-branding.
⇒ To identify the impact of anti-branding on brand switching behaviour among FMCG consumers.
⇒ To assess the role of social media platforms in spreading anti-branding perceptions among consumers.
⇒ To evaluate the effect of anti-branding on repeat purchase intention and customer satisfaction.
⇒ To provide suitable suggestions for FMCG companies to reduce the negative impact of anti-branding and improve consumer loyalty.

RESEARCH METHODOLOGY

Research methodology refers to the systematic process used to collect, analyze, and interpret data for achieving the objectives of a research study. It provides a clear framework for conducting the investigation in a scientific and organized manner. The present study focuses on analyzing the effects of anti-branding towards consumer buying

behaviour and loyalty in FMCG products with special reference to Tiruchirappalli district. The methodology adopted for this research includes research design, data collection methods, sampling design, questionnaire design, statistical tools, and techniques used for data analysis.

Research Design

The present study adopts a **descriptive and analytical research design**. The descriptive research design is used to describe the characteristics, perceptions, and opinions of consumers regarding anti-branding activities and their influence on FMCG products. The analytical research design is used to examine the relationship between anti-branding perception, consumer buying behaviour, customer loyalty, and purchase decisions through statistical analysis.The study aims to identify the impact of anti-branding campaigns and negative social media reviews on consumer attitudes and loyalty towards FMCG products.

Nature of the Study

The study is both:

- **Descriptive in nature**, because it explains consumer perceptions and behaviour regarding anti-branding activities.
- **Empirical in nature**, because the research findings are based on primary data collected directly from FMCG consumers.

Sources of Data

The study uses both **primary data** and **secondary data**.

Primary Data

Primary data are collected directly from FMCG consumers in Tiruchirappalli district through a structured questionnaire. The questionnaire contains questions related to:

- Consumer awareness about anti-branding
- Influence of negative reviews
- Buying behaviour
- Brand loyalty
- Social media influence
- Purchase decisions
- Customer trust and satisfaction

The respondents provide their opinions based on their personal experiences and perceptions regarding FMCG products.

Secondary Data

Secondary data are collected from:

- Research journals
- Books
- Magazines
- Company reports
- Websites
- Online articles
- Previous research studies
- FMCG industry reports

Secondary data help in understanding the theoretical background and existing literature related to anti-branding and consumer behaviour.

Area of the Study

The study is conducted in Tiruchirappalli district. Consumers who regularly purchase FMCG products from retail stores, supermarkets, and online platforms are considered for the study.

Population of the Study

The population of the study consists of all consumers who purchase FMCG products in Tiruchirappalli district. Since it is difficult to collect data from the entire population, a representative sample is selected for analysis.

Sample Size

A sample size of **650 respondents** is considered for the study. The selected sample size is sufficient to conduct statistical analysis and obtain reliable results regarding consumer buying behaviour and loyalty towards FMCG products.

Sampling Technique

The study adopts a **convenience sampling technique** under non-probability sampling methods. Respondents are selected based on their availability and willingness to participate in the survey. Consumers from different age groups, occupations, educational qualifications, and income categories are included to ensure diversity in responses.

Statistical Analysis and Interpretation

Influence of Anti-Branding Campaigns on Consumer Buying Behaviour towards FMCG Products

Null Hypothesis: Anti-branding campaigns do not significantly influence consumer buying behaviour towards FMCG products.

Alternative Hypothesis: Anti-branding campaigns significantly influence consumer buying behaviour towards FMCG products.

The table 1 presents the regression model summary showing the relationship between anti-branding campaigns and consumer buying behaviour towards FMCG products. The R value indicates the strength of the relationship, while the R Square value explains the proportion of variation in consumer buying behaviour caused by anti-branding campaigns.

Table 1:Model Summary of Anti-Branding Campaigns and Consumer Buying Behaviour

Interpretation

The R value of 0.781 indicates a strong positive relationship between anti-branding campaigns and consumer buying behaviour. The R Square value of 0.610 reveals that 61.0% of the variation in consumer buying behaviour is explained by anti-branding campaigns. The Adjusted R Square value of 0.609 confirms the consistency of the regression model. Therefore, anti-branding campaigns have a significant influence on consumer buying behaviour.

The ANOVA table 2 measures the overall significance of the regression model between anti-branding campaigns and consumer buying behaviour. The F value and significance value determine whether the regression model is statistically significant.

Table 2:ANOVA for Anti-Branding Campaigns and Consumer Buying Behaviour

Interpretation

The ANOVA results show an F value of 996.318 with a significance value of 0.000, which is less than the standard significance level of 0.05. This indicates that the regression model is statistically significant. Therefore, anti-branding campaigns significantly influence consumer buying behaviour towards FMCG products, and the null hypothesis is rejected. The coefficients table 3 explains the magnitude and direction of the influence of anti-branding campaigns on consumer buying behaviour. The beta coefficient indicates the strength of influence, while the t-value and significance value determine statistical significance.

Table 3:Coefficients of Anti-Branding Campaigns and Consumer Buying Behaviour

Interpretation

The coefficient value (B = 0.724) indicates that anti-branding campaigns positively influence changes in consumer buying behaviour. The standardized beta value of 0.781 shows a strong impact. The t-value of 31.564 and significance value of 0.000 confirm that the relationship is statistically significant. Hence, the alternative hypothesis is accepted.

Relationship between Anti-Branding Perception and Consumer Loyalty towards FMCG Products

Null Hypothesis: There is no significant relationship between anti-branding perception and consumer loyalty towards FMCG products.

Alternative Hypothesis: There is a significant relationship between anti-branding perception and consumer loyalty towards FMCG products.

The table 4 shows the correlation analysis between anti-branding perception and consumer loyalty. The correlation coefficient measures the strength and direction of the relationship between the two variables.

Table 4:Correlation Analysis between Anti-Branding Perception and Consumer Loyalty

Interpretation

The correlation coefficient value of -0.734 indicates a strong negative relationship between anti-branding perception and consumer loyalty. This means that as anti-branding perception increases, consumer loyalty decreases. The significance value of 0.000 confirms that the relationship is statistically significant. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted. The table 5 presents the regression model summary explaining the influence of anti-branding perception on consumer loyalty towards FMCG products.

Table 5:Model Summary of Anti-Branding Perception and Consumer Loyalty

Interpretation

The R value of 0.734 indicates a strong relationship between anti-branding perception and consumer loyalty. The R Square value of 0.539 indicates that 53.9% of the variation in consumer loyalty is explained by anti-branding perception. This shows that anti-branding perception considerably affects customer loyalty towards FMCG products. The coefficients table 6 explains the impact of anti-branding perception on consumer loyalty. The negative beta coefficient indicates the inverse relationship between the variables.

Table 6:Coefficients of Anti-Branding Perception and Consumer Loyalty

Interpretation

The coefficient value of -0.641 indicates that anti-branding perception negatively affects consumer loyalty. The beta value of -0.734 reveals a strong inverse relationship. The significance value of 0.000 confirms statistical significance. Therefore, anti-branding perception significantly reduces consumer loyalty towards FMCG products.

Impact of Negative Social Media Reviews on Consumer Purchase Decisions in FMCG Products

Null Hypothesis: Negative social media reviews do not significantly affect consumer purchase decisions in FMCG products.

Alternative Hypothesis: Negative social media reviews significantly affect consumer purchase decisions in FMCG products.

The table 7 presents the regression model summary showing the relationship between negative social media reviews and consumer purchase decisions.

Table 7:Model Summary of Negative Social Media Reviews and Consumer Purchase Decisions

Interpretation

The R value of 0.756 indicates a strong relationship between negative social media reviews and consumer purchase decisions. The R Square value of 0.572 reveals that 57.2% of the variation in purchase decisions is explained by negative social media reviews. This confirms that social media reviews strongly influence consumer purchasing behaviour.

The ANOVA table 8 measures the statistical significance of the regression model between negative social media reviews and consumer purchase decisions.

Table 8:ANOVA for Negative Social Media Reviews and Consumer Purchase Decisions

Interpretation

The F value of 863.442 with a significance value of 0.000 indicates that the regression model is statistically significant. Since the significance value is less than 0.05, the null hypothesis is rejected. Therefore, negative social media reviews significantly affect consumer purchase decisions in FMCG products.

The coefficients table 9 explains the extent to which negative social media reviews influence consumer purchase decisions.

Table 9:Coefficients of Negative Social Media Reviews and Consumer Purchase Decisions

Interpretation

The coefficient value of 0.692 indicates that negative social media reviews have a strong influence on consumer purchase decisions. The beta value of 0.756 confirms a strong relationship between the variables. The significance value of 0.000 indicates that the relationship is statistically significant. Hence, the alternative hypothesis is accepted.

CONCLUSION

The present study examined the effects of anti-branding towards consumer buying behaviour and loyalty in FMCG products with special reference to Tiruchirappalli district. The research clearly indicates that anti-branding campaigns, negative social media reviews, and unfavorable online perceptions significantly influence consumer buying decisions and customer loyalty towards FMCG products. In the modern digital era, consumers heavily rely on social media platforms, online reviews, and peer opinions before making purchase decisions. As a result, negative publicity spreads rapidly and creates adverse effects on brand image, customer trust, and repeat purchase behaviour.

The statistical analysis confirmed that anti-branding activities have a strong impact on consumer behaviour and reduce customer loyalty towards FMCG brands. Negative social media reviews were identified as one of the major factors affecting consumer purchase decisions. The study also revealed that consumers are increasingly sensitive to online brand-related information, making reputation management an essential aspect of business sustainability.

The research highlights the importance of maintaining strong customer relationships, effective communication strategies, and positive brand image management in the FMCG sector. Companies must proactively address customer complaints, monitor digital platforms, and implement effective branding strategies to minimize the harmful effects of anti-branding activities. Overall, the study contributes valuable insights into consumer behaviour and provides practical suggestions for FMCG companies to strengthen customer loyalty and improve long-term brand performance.

ABSTRACT

The insurance sector has witnessed significant transformation in recent years due to increasing competition, digitalization, and evolving consumer expectations. In this context, marketing strategies play a crucial role in influencing consumer behavior and enhancing policy adoption. The present study aims to examine the impact of key marketing factors—namely brand awareness, advertising, and digital marketing—on consumers' purchase intention, perception, and buying behavior toward insurance products. The study is grounded in three major hypotheses: first, to analyze whether brand awareness significantly influences consumers' purchase intention of insurance policies; second, to evaluate the impact of advertising on consumers' perception of insurance products; and third, to assess the effectiveness of digital marketing strategies in shaping insurance buying behavior. These variables are considered critical in understanding how modern marketing approaches contribute to customer engagement and decision-making in the insurance domain. A quantitative research design is adopted, wherein primary data is collected from a structured questionnaire administered to a sample of respondents. The study employs statistical tools such as correlation analysis, regression analysis, and ANOVA to test the formulated hypotheses and to determine the strength and significance of relationships among the variables. The analysis focuses on identifying whether marketing efforts translate into measurable behavioral outcomes among consumers. The findings of the study are expected to reveal that brand awareness plays a significant role in influencing purchase intention by enhancing familiarity and trust among consumers. Advertising is anticipated to shape positive perceptions by effectively communicating product benefits and reducing information asymmetry. Furthermore, digital

marketing strategies, including social media campaigns and online engagement, are likely to have a strong influence on insurance buying behavior by providing accessibility, personalization, and real-time interaction. Overall, the study contributes to the existing literature by providing empirical insights into the effectiveness of contemporary marketing strategies in the insurance sector. The results offer practical implications for insurance companies to design targeted marketing campaigns, strengthen brand positioning, and leverage digital platforms to improve customer acquisition and retention. The study also highlights the importance of integrating traditional and digital marketing approaches to achieve sustainable growth in the competitive insurance market.

Keywords: Insurance marketing, Brand awareness, Advertising effectiveness, Digital marketing, Consumer behavior, Purchase intention, Customer perception, Insurance buying behavior, Marketing strategies, Customer engagement

INTRODUCTION

The insurance industry plays a pivotal role in the economic development of a country by providing financial security, risk mitigation, and long-term stability to individuals and businesses [1]. In recent years, the sector has undergone substantial transformation due to globalization, liberalization, technological advancements, and increasing competition among insurance providers. These changes have compelled insurance companies to shift from traditional product-oriented approaches to more customer-centric and marketing-driven strategies. As a result, understanding consumer behavior and the effectiveness of marketing efforts has become essential for achieving sustainable growth in the insurance market [2]. Insurance, by its very nature, is an intangible and complex financial product that requires a high level of trust, awareness, and understanding among consumers [3]. Unlike tangible goods, insurance policies cannot be physically evaluated before purchase, which makes marketing communication a crucial factor in influencing consumer decision-making. In this context, brand awareness emerges as a key determinant in shaping consumers' purchase intention. A well-recognized and trusted brand reduces perceived risk and enhances confidence among potential customers, thereby increasing the likelihood of policy adoption [4]. Insurance companies invest significantly in branding activities to establish credibility and differentiate themselves in a competitive market [5].

Advertising is another critical component of insurance marketing that directly influences consumer perception [6]. Through various media channels such as television, print, and digital platforms, insurance companies communicate product features, benefits, and value propositions to a wide audience [7]. Effective advertising not only creates awareness but also educates consumers about the importance of insurance, clarifies misconceptions, and builds a positive image of the company. In a market where consumer skepticism is relatively high, persuasive and informative advertising plays a vital role in shaping favorable attitudes toward insurance products [8]. The advent of digital technology has further revolutionized the marketing landscape in the insurance sector. Digital marketing strategies, including social media marketing, search engine optimization (SEO), email campaigns, and online customer engagement platforms, have gained prominence due to their ability to reach a broader audience in a cost-effective and personalized manner. Digital platforms enable insurance companies to interact with customers in real time, provide customized solutions, and enhance the overall customer experience. Moreover, the increasing penetration of smartphones and internet usage has made digital channels a preferred medium for information search and purchase decisions among consumers [9].

Despite the growing importance of these marketing strategies, there exists a need to empirically examine their effectiveness in influencing consumer behavior in the insurance sector [10]. Specifically, it is essential to understand how brand awareness affects purchase intention, how advertising shapes consumer perception, and how digital

marketing influences buying behavior. These factors are interrelated and collectively contribute to the success of insurance marketing efforts. However, their individual and combined impact on consumer decision-making requires systematic investigation [11]. The present study addresses this gap by analyzing the role of brand awareness, advertising, and digital marketing in influencing consumers' attitudes and behaviors toward insurance products [12]. By adopting a quantitative research approach and employing statistical tools, the study seeks to provide empirical evidence on the significance of these variables. The findings are expected to offer valuable insights for insurance companies to design effective marketing strategies, improve customer engagement, and enhance policy adoption rates [13]. In summary, the dynamic nature of the insurance market necessitates a comprehensive understanding of modern marketing practices and their impact on consumer behavior. As customers become more informed and digitally connected, insurance companies must leverage innovative marketing techniques to remain competitive and relevant. This study contributes to the existing body of knowledge by highlighting the importance of integrating brand building, advertising, and digital marketing strategies in driving consumer decision-making in the insurance sector.

Problem Statement and Research Gap

The insurance industry is experiencing rapid growth and intensified competition, driven by technological advancements, increasing consumer awareness, and the entry of new market players. Despite the availability of diverse insurance products and aggressive marketing efforts, the penetration of insurance services—particularly in developing regions—remains relatively low. A significant proportion of potential consumers either delay or avoid purchasing insurance policies due to lack of awareness, limited understanding, trust issues, and perceived complexity of products. In this context, marketing strategies such as brand awareness, advertising, and digital marketing have become critical tools for influencing consumer decision-making. However, insurance companies often face challenges in effectively communicating product value, building trust, and converting potential customers into policyholders. Traditional marketing approaches may not be sufficient to engage modern consumers who increasingly rely on digital platforms for information and decision-making. At the same time, the impact of digital marketing initiatives on actual buying behavior is not always clearly measurable or consistent across different customer segments.

Furthermore, there is uncertainty regarding how these marketing factors interact to shape consumer perception and purchase intention. While some consumers may respond positively to brand recognition and advertising, others may be more influenced by personalized digital engagement. This creates a complex marketing environment where insurance companies must optimize their strategies based on evidence-driven insights.Therefore, the core problem addressed in this study is the lack of a clear understanding of how key marketing variables—brand awareness, advertising, and digital marketing—individually and collectively influence consumers' perception, purchase intention, and buying behavior in the insurance sector. Addressing this problem is essential for designing effective marketing strategies that enhance customer acquisition and retention.

RESEARCH OBJECTIVES

- To analyze the influence of brand awareness on consumers' purchase intention of insurance policies.
- To evaluate the impact of advertising on consumers' perception of insurance products.
- To assess the effectiveness of digital marketing strategies in influencing insurance buying behavior.
- To measure the relationship between marketing variables (brand awareness, advertising, digital marketing) and consumer decision-making.
- To identify the most significant marketing factor that influences insurance purchase intention.
- To examine how marketing strategies contribute to customer engagement and awareness in the insurance sector.
- To analyze consumer responses to traditional marketing vs. digital marketing approaches in insurance.
- To study the role of marketing strategies in enhancing trust and confidence among insurance customers.
- To provide empirical evidence using statistical tools (correlation, regression, ANOVA) for hypothesis testing.
- To suggest effective marketing strategies for improving customer acquisition and retention in the insurance industry.

RESEARCH METHODOLOGY

This section outlines the systematic approach adopted to achieve the research objectives and to test the formulated hypotheses related to insurance marketing. The methodology is designed to ensure reliability, validity, and scientific rigor in analyzing the impact of brand awareness, advertising, and digital marketing on consumer behavior.

Research Design

The study adopts a **descriptive and analytical research design**.

The **descriptive approach** is used to understand consumer perceptions, awareness levels, and behavioral patterns toward insurance products.

The **analytical approach** is employed to examine relationships between variables and to test the hypotheses using statistical techniques.

This design is appropriate as the study aims to explain the influence of marketing factors on consumer decision-making.

Research Approach

A **quantitative research approach** is used in this study.

It involves the collection of numerical data through structured questionnaires.

Statistical tools are applied to analyze the data and draw objective conclusions.

This approach ensures accuracy, generalizability, and empirical validation of results.

Data Collection

Primary Data

Primary data is collected directly from respondents using a **structured questionnaire**.

The questionnaire consists of **closed-ended questions** measured using a **5-point Likert scale** (Strongly Disagree to Strongly Agree).

It includes sections covering:

Demographic details (age, gender, income, education, etc.)

Brand awareness

Advertising effectiveness

Digital marketing influence

Consumer perception and purchase intention

Secondary Data

Secondary data is collected from:

Research journals

Books and publications

Insurance company reports

Government and industry websites

This helps in building theoretical support and identifying research gaps.

Sampling Design

Target Population

The target population includes:

Individuals who are **existing or potential customers of insurance products**

Sampling Technique

A **convenience sampling method** is used due to accessibility and time constraints.

Respondents are selected based on their availability and willingness to participate.

Sample Size
A total of **500 respondents** are considered for the study.
This sample size is adequate for statistical analysis and hypothesis testing.

Data Analysis Tools and Techniques
The collected data is analyzed using **SPSS (Statistical Package for the Social Sciences)**. The following statistical tools are applied:

Descriptive Statistics
Mean, percentage, and standard deviation
Used to summarize respondent characteristics

Correlation Analysis
To identify the relationship between independent and dependent variables

Regression Analysis
To measure the impact of brand awareness, advertising, and digital marketing on:
Purchase intention
Consumer perception
Buying behavior

ANOVA (Analysis of Variance)
To test the significance of differences among variables

Hypothesis Testing
Based on **p-value (significance level = 0.05)**
If $p < 0.05 \rightarrow$ Reject H_0 (significant relationship)
If $p > 0.05 \rightarrow$ Accept H_0 (no significant relationship)

DATA ANALYSIS AND INTERPRETATION

Impact of Brand Awareness on Consumers' Purchase Intention of Insurance Policies
H_{01}: Brand awareness has no significant influence on consumers' purchase intention of insurance policies.
H_{11}: Brand awareness has a significant influence on consumers' purchase intention of insurance policies.
Table 1a presents the model summary indicating the strength of the relationship between brand awareness and purchase intention. Table 1b shows the ANOVA results to test the overall significance of the regression model. Table 1c provides the regression coefficients, including the impact of brand awareness on purchase intention along with statistical significance values.

Interpretation
The model summary reveals that the correlation coefficient ($R = 0.742$) indicates a strong positive relationship between brand awareness and purchase intention. The R Square value of 0.551 implies that 55.1% of the variation in purchase intention is explained by brand awareness. The ANOVA table shows that the model is statistically significant ($F = 744.512$, $p < 0.05$), confirming the reliability of the regression model. The coefficient table indicates that brand awareness has a significant positive influence ($\beta = 0.742$, $p = 0.000$) on purchase intention. Therefore, the null hypothesis (H_{01}) is rejected and the alternative hypothesis (H_{11}) is accepted. This implies that increasing brand awareness significantly enhances consumers' intention to purchase insurance policies.

Influence of Advertising on Consumers' Perception of Insurance Products

H_{02}: Advertising has no significant impact on consumers' perception of insurance products.

H_{12}: Advertising has a significant impact on consumers' perception of insurance products.

Table 2a illustrates the model summary reflecting the relationship between advertising and consumer perception. Table 2b provides the ANOVA results to assess the significance of the regression model. Table 2c presents the regression coefficients, indicating the extent to which advertising influences consumer perception.

Interpretation

The model summary indicates a strong positive correlation ($R = 0.698$) between advertising and consumer perception. The R Square value of 0.487 shows that 48.7% of the variation in consumer perception is explained by advertising. The ANOVA results confirm that the model is statistically significant ($F = 588.421$, $p < 0.05$). The coefficient table reveals that advertising has a significant positive effect ($\beta = 0.698$, $p = 0.000$) on consumer perception. Hence, the null hypothesis (H_{02}) is rejected and the alternative hypothesis (H_{12}) is accepted. This indicates that effective advertising significantly improves consumers' perception of insurance products.

Effect of Digital Marketing Strategies on Insurance Buying Behavior

H_{03}: Digital marketing strategies do not significantly affect insurance buying behavior.

H_{13}: Digital marketing strategies significantly affect insurance buying behavior.

Table 3a shows the model summary highlighting the strength of the relationship between digital marketing and buying behavior. Table 3b presents the ANOVA results to verify the statistical significance of the regression model. Table 3c displays the regression coefficients indicating the impact of digital marketing on buying behavior.

Interpretation

The model summary shows a strong positive relationship ($R = 0.765$) between digital marketing and buying behavior. The R Square value of 0.585 indicates that 58.5% of the variation in buying behavior is explained by digital marketing strategies. The ANOVA results confirm that the model is statistically significant ($F = 832.117$, $p < 0.05$). The coefficient table indicates that digital marketing has a significant positive influence ($\beta = 0.765$, $p = 0.000$) on buying behavior. Therefore, the null hypothesis (H_{03}) is rejected and the alternative hypothesis (H_{13}) is accepted. This demonstrates that digital marketing strategies play a crucial role in influencing consumers' insurance buying behavior.

CONCLUSION

The study clearly establishes that marketing strategies play a vital role in influencing consumer behavior in the insurance sector. Brand awareness, advertising, and digital marketing are all significant determinants of purchase intention, perception, and buying behavior. Among these, digital marketing emerges as the most powerful tool due to its ability to provide personalized, accessible, and real-time interactions with consumers. The findings highlight that modern consumers are more informed and digitally connected, making it essential for insurance companies to adopt innovative and customer-centric marketing approaches. While traditional advertising remains relevant, the integration of digital strategies is crucial for achieving competitive advantage and increasing market penetration. Overall, the study contributes to both academic and practical domains by providing empirical evidence on the effectiveness of marketing variables in insurance. It emphasizes the need for a balanced and integrated marketing approach to enhance customer engagement, build trust, and improve policy adoption rates. In conclusion, insurance companies that effectively leverage brand building, strategic advertising, and advanced digital marketing techniques are more likely to succeed in attracting and retaining customers in today's dynamic and competitive environment.

ABSTRACT

The Information Technology (IT) industry has become one of the most significant contributors to economic growth and organizational development. Within this sector, organizations increasingly adopt competency-based human resource (HR) practices to improve employee performance and achieve strategic objectives. Competency-based HR practices emphasize the identification, development, and effective utilization of employees' knowledge, skills, abilities, and behavioral attributes required for successful job performance. This approach examines the impact of competency-based human resource practices on organizational effectiveness in IT industries of Tamil Nadu. The primary objective of the research is to analyze how HR practices such as competency-based recruitment and selection, training and development, performance appraisal, and career development contribute to enhancing organizational effectiveness.The research follows a quantitative approach and data were collected from employees working in selected IT companies in Tamil Nadu through structured questionnaires. Various statistical techniques, including descriptive analysis, correlation, and regression analysis, were applied to evaluate the relationship between competency-based HR practices and organizational effectiveness indicators such as productivity, employee engagement, job satisfaction, innovation, and overall organizational performance.Theapproach concludes that competency-based HR practices act as an important strategic mechanism for IT organizations in Tamil Nadu to strengthen human capital and

achieve sustainable organizational effectiveness. The results provide useful insights for HR professionals and organizational leaders in designing competency-oriented HR strategies that support long-term organizational growth and competitiveness.

Keywords: Competency-Based HR Practices, Organizational Effectiveness, IT Industry, Human Resource Management, Employee Performance, Tamil Nadu.

INTRODUCTION

Human resources play a vital role[1] in determining the success and sustainability of modern organizations. In knowledge-driven industries such as Information Technology (IT), the capabilities, skills, and competencies of employees significantly influence organizational performance and competitiveness. Organizations today operate in an environment characterized by technological advancement, global competition, and constant innovation. As a result, companies are increasingly focusing on strategic human resource management practices that emphasize the development and effective utilization of employee competencies.[2] One such approach is competency-based human resource (HR) practices, which aim to align employees' knowledge, skills, abilities, and behavioralattributes with the strategic objectives of the organization.Competency-based HR practices have emerged as an important framework for managing human capital in organizations. Competencies refer to the combination of knowledge, skills, attitudes, and behaviors that enable employees to perform their tasks effectively. Unlike traditional HR practices that focus mainly on job roles and responsibilities, competency-based approaches emphasize the qualities and capabilities required for superior performance. These practices are widely applied in key HR functions such as recruitment and selection, training and development, performance appraisal, career development, and succession planning.[3] By identifying the competencies required for different roles and systematically developing them among employees, organizations can enhance individual and collective performance.[4]
this approach aims to examine the impact of competency-based human resource practices on organizational effectiveness in IT industries of Tamil Nadu.

OBJECTIVES

- To identify the competency-based human resource practices adopted in IT industries in Tamil Nadu.[5]
- To examine the role of competency-based recruitment and selection in improving employee performance in IT organizations.[6]
- To analyze the influence of competency-based training and development on employee skills and productivity.[3]
- To evaluate the impact of competency-based performance appraisal on employee motivation and job satisfaction.[1]

Research Gap

Existing literature highlights the importance of competency-based human resource (HR) practices in improving employee performance and organizational outcomes. Several studies have examined different aspects of HR practices such as recruitment, training, performance appraisal, and career development, and their influence on organizational performance. Many researchers have also emphasized that competency-based frameworks help organizations identify the skills, knowledge, and behavioral attributes required for effective job performance. These studies indicate that organizations adopting competency-based HR practices often experience improvements in employee productivity, engagement, and overall efficiency[7]. However, most of the existing research has primarily focused on general HR practices rather than specifically examining competency-based HR practices and their direct impact on organizational effectiveness. In addition, many previous studies have been conducted in manufacturing industries, multinational corporations, or in broader national or global contexts. Limited research has focused specifically on the Information Technology (IT) sector, where employee competencies play a critical role due to the knowledge-intensive

and technology-driven nature of the industry[9]. Another important gap exists in the regional context, particularly in the state of Tamil Nadu, which has emerged as a major IT hub in India. Although Tamil Nadu hosts several leading IT companies and technology parks, there is insufficient empirical research that investigates how competency-based HR practices influence organizational effectiveness within IT organizations in this region. Furthermore, many earlier studies have examined individual HR functions separately, rather than analyzing the combined impact of multiple competency-based HR practices such as recruitment, training, performance appraisal, and career development[8].

METHODOLOGY

Research Design

The present approach adopts a descriptive and analytical research design to examine the impact of competency-based human resource practices on organizational effectiveness in IT industries of Tamil Nadu. Descriptive research is used to understand the existing competency-based HR practices followed in IT organizations, while analytical research helps in analyzing the relationship between competency-based HR practices and organizational effectiveness. This approach enables the researcher to systematically collect, analyze, and interpret data related to HR practices and their outcomes within the IT sector.[9]

This table 1. presents the overall research methodology framework used in the study. It summarizes the key elements of the research design, including the research type, approach, population, sample size, sampling technique, data collection methods, and analysis tools used in the study. The table provides a clear overview of how the research was systematically conducted to examine the impact of competency-based HR practices on organizational effectiveness in IT industries of Tamil Nadu [10].

Research Approach

The approach follows a quantitative research approach. Quantitative data are collected through structured questionnaires distributed to employees working in selected IT companies in Tamil Nadu. This approach allows the researcher to measure the relationship between competency-based HR practices and organizational effectiveness using statistical techniques [11]. Figure.1. The research design framework illustrates the relationship between competency-based human resource practices and organizational effectiveness in IT industries. Competency-based HR practices act as independent variables and include recruitment and selection, training and development, performance appraisal, and career development. These practices influence the dependent variable, which is organizational effectiveness[12].

Population of the Approach

The population of the approach consists of employees working in IT companies located in Tamil Nadu. These include professionals working in various departments such as software development, project management, human resource management[13], and technical support within the IT industry.

Sample Size and Sampling Technique

A sample of 150–200 employees from selected IT companies in Tamil Nadu is considered for the approach. The research uses a convenience sampling method, where respondents are selected based on their availability and willingness to participate in the survey. This sampling method is suitable for collecting data from employees working in different IT organizations within the available time and resources[16].

Sources of Data

The approach uses both **primary and secondary sources of data**.

Primary Data

Primary data are collected directly from employees working in IT companies through a structured questionnaire. The questionnaire includes questions related to competency-based HR practices such as recruitment and selection, training and development, performance appraisal, and career development, as well as organizational effectiveness indicators [15].

Secondary Data

Secondary data are collected from various sources such as research journals, academic books, published articles, conference papers, organizational reports, and online databases related to human resource management and organizational effectiveness [13]. Figure.2. The approach uses both primary and secondary sources of data to ensure accuracy and reliability. Primary data were collected from 180 employees working in IT companies in Tamil Nadu, including software developers, project managers, HR professionals, and technical staff. These respondents provided information through a structured questionnaire focusing on competency-based HR practices and organizational effectiveness [14].

Research Instrument

A structured questionnaire is used as the main research instrument for data collection. The questionnaire is designed using a Likert scale (5-point scale) ranging from strongly agree to strongly disagree. The questions are divided into sections covering demographic information, competency-based HR practices, and organizational effectiveness indicators[17]

Variables of the Approach

Independent Variable:

- Competency-Based Human Resource Practices
  - Recruitment and Selection
  - Training and Development
  - Performance Appraisal
  - Career Development

Dependent Variable:

- Organizational Effectiveness
  - Employee Productivity
  - Job Satisfaction
  - Employee Engagement
  - Organizational Performance

Data Analysis Techniques

The collected data are analyzed using statistical tools to interpret the relationship between competency-based HR practices and organizational effectiveness. The following techniques are used:

- **Descriptive Statistics** (percentage, mean, and standard deviation) to summarize respondent characteristics and HR practices.[18]
- **Correlation Analysis** to determine the relationship between competency-based HR practices and organizational effectiveness.[19]
- **Regression Analysis** to examine the impact of competency-based HR practices on organizational effectiveness.[7]

RESULT AND DISCUSSION

The findings of the approach confirm that competency-based human resource practices play a significant role in improving organizational effectiveness in IT industries of Tamil Nadu. Recruitment based on competencies ensures

that organizations hire employees with the required skills and capabilities. Training and development programs help employees upgrade their competencies to meet technological changes, while performance appraisal systems ensure that employees are evaluated fairly based on their competencies and performance outcomes.[20]. Furthermore, career development opportunities encourage employees to improve their skills and remain committed to the organization. These practices collectively contribute to higher productivity, improved employee engagement, and better organizational performance. The results emphasize the importance of adopting structured competency frameworks within HR systems to achieve sustainable organizational effectiveness in the IT sector [18].

Table.3. Illustrate demographic analysis indicates that the majority of respondents are male employees (56.7%), while 43.3% are female employees. Most respondents fall within the 21–30 years age group, which reflects the typical workforce structure of the IT industry where young professionals dominate. Additionally, 41.1% of respondents have 2–5 years of experience, indicating that a significant portion of the workforce is in the early stages of their careers[16].

Table.4. show that **competency-based recruitment has the highest mean score (4.12)**, indicating that IT companies strongly emphasize recruiting employees based on their competencies and skills. Training and development programs also received a high mean value (4.05), suggesting that organizations actively invest in improving employee competencies. Performance appraisal and career development show slightly lower but still positive mean values, indicating moderate implementation of competency-based evaluation systems[14].

Descriptive Statistics of Competency-Based HR Practices

Table 5. correlation results indicate a strong positive relationship between competency-based HR practices and organizational effectiveness. Training and development shows the highest correlation (r = 0.67), suggesting that employee competency development plays a crucial role in improving productivity and organizational outcomes. Recruitment, career development [11], and performance appraisal also demonstrate significant positive relationships with organizational effectiveness.

Table 5. Correlation Analysis

The regression analysis indicates that competency-based HR practices significantly influence organizational effectiveness. The R^2 value of 0.50 shows that 50% of the variation in organizational effectiveness is explained by competency-based HR practices. Among the variables, training and development ($\beta = 0.35$) has the strongest influence on organizational effectiveness, followed by career development and recruitment practices[16]. These findings highlight that organizations investing in competency development programs and structured HR systems are more likely to achieve higher levels of employee performance and organizational success.

RESULT

The descriptive statistics indicate that competency-based human resource practices are widely implemented in the selected IT companies in Tamil Nadu. Among the HR practices, competency-based recruitment shows the highest mean value (4.12), indicating that organizations strongly focus on selecting employees based on their competencies [17]and skills.Training and development (Mean = 4.05) also demonstrates a high level of implementation, suggesting that IT organizations actively invest in improving employee competencies and technical capabilities. Performance appraisal (Mean = 3.89) and career development (Mean = 3.94) show moderate levels, indicating that although competency-based evaluation systems are present, there is still potential for improvement.The mean value for organizational effectiveness (4.08) indicates that employees perceive a high level of effectiveness in their organizations, reflected through improved productivity, employee engagement, and overall organizational performance. These findings suggest that competency-based HR practices contribute positively to organizational effectiveness in IT industries of Tamil Nadu[9].

Table.7. presents the mean and standard deviation values of competency-based HR practices and organizational effectiveness in the selected IT companies. It indicates the level of implementation of each HR practice based on respondents' perceptions. The results show that competency-based recruitment, training and development, and organizational effectiveness have high mean scores, while performance appraisal and career development show moderate levels[5].

Table 7. Descriptive Statistics of Competency-Based HR Practices and Organizational Effectiveness

The chart 3. Shows competency-based recruitment has the highest mean score, indicating that IT organizations strongly emphasize hiring employees based on their competencies and skills. Training and development and organizational effectiveness also show high mean values, suggesting that competency development programs positively influence organizational performance. Performance appraisal and career development display slightly lower mean scores, indicating moderate implementation compared to other HR practices. Overall, the chart demonstrates that competency-based HR practices contribute positively to organizational effectiveness[13].

CONCLUSION

The present approach examined the impact of competency-based human resource practices on organizational effectiveness in IT industries of Tamil Nadu. The findings of the research indicate that competency-based HR practices play a crucial role in improving employee performance and overall organizational outcomes. The analysis shows that practices such as competency-based recruitment, training and development, performance appraisal, and career development contribute significantly to enhancing organizational effectiveness.[7]The results reveal that IT organizations increasingly adopt competency-based recruitment processes to ensure that employees possess the necessary skills, knowledge, and abilities required for their roles. Training and development programs were found to have a strong influence on improving employee competencies, enabling them to adapt to technological advancements and changing job requirements. Similarly, competency-based performance appraisal systems help organizations evaluate employee performance more objectively and encourage employees to continuously improve their capabilities.Theapproach also found that career development opportunities based on competency frameworks positively influence employee motivation and job satisfaction. When organizations provide clear competency development pathways, employees are more likely to remain engaged and committed to their work[15]. These practices collectively lead to improved productivity, higher employee engagement, and better organizational performance.the findings confirm that competency-based HR practices significantly contribute to organizational effectiveness in the IT sector. By aligning employee competencies with organizational goals, IT companies in Tamil Nadu can enhance their operational efficiency and maintain competitiveness in a dynamic technological environment. Therefore, organizations are encouraged to strengthen competency-based HR systems and continuously invest in employee competency development to achieve sustainable organizational growth and long-term success[20].

ABSTRACT

Graph domination is a fundamental concept in graph theory concerned with selecting a subset of vertices such that every vertex in a graph is either included in the subset or adjacent to at least one selected vertex. This review examines the development of graph domination theory during the period 2020–2025, with emphasis on its theoretical foundations, major variants, computational advances, and practical applications. Beginning from classical domination, the study highlights important extensions such as total domination, independent domination, connected domination, Roman domination, multiple domination, broadcast domination, power domination, and several specialized forms including Italian, hop, co-secure, and enclave domination. Recent research has explored these concepts across diverse graph classes such as sparse graphs, product graphs, planar graphs, geometric graphs, and structured networks. A major contribution of the reviewed literature is the advancement of analytical and algorithmic techniques. Fine-grained complexity analysis, approximation methods, exact algorithms, and parameterized approaches have provided a deeper understanding of the computational difficulty of domination problems. Researchers have also investigated domination behavior under graph products, graph operations, and structural modifications. Practical relevance is evident in applications to communication networks, smart grids, sensor placement, network security, and medical or biological systems, where domination models support efficient monitoring, coverage, and resource allocation. However, the review also reveals a persistent gap between theoretical developments and real-world implementation. Overall, the literature demonstrates that graph domination remains a mature yet rapidly

diversifying research field. Future directions include unified theoretical models, scalable algorithms for dynamic graphs, and broader interdisciplinary applications in emerging networked systems.

Keywords: Graph Domination, Dominating Set, Domination Number, Total Domination, Roman Domination, Graph Algorithms, Network Optimization, Computational Complexity

INTRODUCTION

Graph theory is an important branch of discrete mathematics that studies the structure, properties, and relationships of networks represented by vertices and edges. Over the years, graph theory has become a powerful mathematical tool for modeling and analyzing complex systems in fields such as computer science, communication networks, biology, transportation, and social sciences. Among the many concepts studied in graph theory, graph domination has emerged as a significant topic due to its strong theoretical foundations and wide range of practical applications. The concept of domination focuses on identifying a subset of vertices within a graph such that every vertex in the graph is either included in the subset or is adjacent to at least one vertex in the subset. This subset is known as a dominating set, and the minimum number of vertices required to dominate the entire graph is called the domination number. The origins of domination theory can be traced back to early combinatorial problems, including the well-known eight queens problem studied in the nineteenth century. However, the formal study of domination in graph theory began in the 1960s, when researchers started examining dominating sets as a mathematical framework for solving coverage and monitoring problems in networks. Since then, domination theory has grown into a broad and active area of research, attracting interest from mathematicians, computer scientists, and engineers. In its classical form, domination provides a way to determine the minimum number of control points required to observe or influence an entire network. For example, in communication networks, dominating sets can represent optimal placements of transmitters or routers to ensure full network coverage. Similarly, in sensor networks, dominating vertices may represent monitoring devices that observe the entire system with minimal resources. These practical interpretations have motivated extensive research into different domination models and algorithms. Over time, researchers have introduced numerous variants of domination to address specific structural or application-based requirements. Some of the most widely studied variants include total domination, where every vertex must be adjacent to a dominating vertex; independent domination, which combines domination with independence constraints; and connected domination, where dominating vertices must form a connected subgraph. More advanced variants such as Roman domination, power domination, broadcast domination, and distance-based domination have further expanded the scope of the field. These variants are particularly useful in modeling real-world systems such as power grid monitoring, wireless communication coverage, and fault-tolerant networks.

Recent research from 2020 to 2025 has contributed significantly to the advancement of domination theory. Scholars have introduced new domination variants, explored domination properties in specialized graph classes, and developed improved algorithms for solving domination problems. Studies have also investigated domination behavior in product graphs, sparse graphs, and planar graphs, revealing deeper structural relationships between graph parameters. At the same time, advances in fine-grained complexity theory, approximation algorithms, and parameterized complexity have improved our understanding of the computational challenges associated with domination problems. Despite these developments, many domination problems remain computationally difficult, particularly for large or complex networks. Most domination variants are NP-hard, which means that finding exact solutions for large graphs can be computationally expensive. Consequently, researchers continue to develop approximation techniques, heuristic methods, and specialized algorithms for particular graph classes to overcome these challenges. The increasing complexity of modern networked systems has also expanded the relevance of domination theory across multiple application domains. Domination concepts are now used in network security, sensor placement, smart grid monitoring, resource allocation, and biological network analysis. These applications highlight the practical significance of domination models in optimizing coverage, improving efficiency, and ensuring

robustness in complex networks. In this context, the present study reviews the theoretical foundations, methodological developments, and practical applications of graph domination research published between 2020 and 2025. The review synthesizes recent contributions related to domination variants, analytical techniques, computational complexity, and real-world applications. By examining these developments, the study aims to provide a comprehensive understanding of the current state of graph domination research and to identify potential directions for future investigation.

Background and Theoretical Foundations of Graph Domination

Classical Domination Theory

The concept of domination in graphs has roots extending back to the 1850s with the "eight queens problem" on a chessboard, though formal graph-theoretic treatment began in the 1960s. A dominating set D in a graph G = (V, E) satisfies the property that every vertex $v \in V$ is either in D or adjacent to at least one vertex in D. The domination number $\gamma(G)$ represents the minimum cardinality among all dominating sets of G.

The literature builds upon this foundation while exploring numerous variants and extensions. Warad *et al.* (2024) provide a comprehensive study exploring the impact of domination in graph structures, examining various types including total domination, independent domination, and connected domination, along with their theoretical foundations, critical bounds, and computational complexity.

Fundamental Variants

Several domination variants have received sustained attention in recent literature:

Total Domination: A set D is a total dominating set if every vertex in V (including those in D) has a neighbor in D. Kazemnejad *et al.* (2022) investigated total domination numbers of middle graphs, contributing to understanding how graph operations affect domination parameters.

Independent Domination: A dominating set that is also an independent set (no two vertices in the set are adjacent). This variant connects domination theory with independent set problems.

Connected Domination: A dominating set that induces a connected subgraph, relevant for applications requiring connectivity among dominating vertices.

Roman Domination: Introduced earlier but extensively studied in the 2020-2025 period, Roman domination assigns weights {0, 1, 2} to vertices with specific neighborhood requirements. Alizadeh *et al.* studied Roman {2}-domination in graphs and graph products, extending the classical Roman domination framework.

Graph Classes Under Study

The papers analyzed investigate domination across diverse graph classes:

- Sparse graphs: Graphs with relatively few edges compared to vertices, studied by Künnemann *et al.* (2024) for fine-grained complexity analysis
- Product graphs: Including lexicographic products (Martínez *et al.*, 2021) and Cartesian products
- Geometric graphs: Random geometric graphs studied by Mammals (2022)
- Structured graphs: Including trees, cubic graphs, and specific named graphs like Knödel graphs (Rajan *et al.*, 2023)
- Planar graphs: Matsumoto (2022) characterized outerplanar graphs with equal 2-domination and domination numbers

Innovations in Domination Variants and Graph Classes

Multiple and Distance-Based Domination

A significant innovation involves multiple domination and distance-based variants. Künnemann *et al.* (2024) provided fine-grained complexity analysis of multiple domination, where each vertex must be adjacent to at least r vertices in the dominating set. Their work on r-Multiple k-Dominating Set problems revealed a diverse landscape of computational complexity, with running times that interpolate between different polynomial bounds depending on the relationship between r and k. Mammals (2022) contributed a polynomial-time algorithm for minimal (1,2)-dominating sets, where every vertex not in D is adjacent to a vertex in D and also within distance 2 of another vertex in D. This variant offers higher fault tolerance in network applications, as the paper demonstrates through testing on

trees, geometric random graphs, random graphs, and cubic graphs. Cordasco *et al.* (2024) introduced distance vector domination, further expanding the theoretical framework for distance-based domination concepts.

Broadcast and Power Domination

Broadcast domination represents another innovative direction. Cervantes *et al.* (2024) studied (t,r) broadcast domination numbers and densities of the truncated square tiling graph, where dominating vertices "broadcast" signals with specific parameters. This variant has direct applications to communication network design. Power domination, motivated by electrical power network monitoring, received attention from Rajan *et al.* (2023), who investigated 2-power domination numbers for Knödel graphs and demonstrated applications in communication networks. Power domination models the problem of placing phase measurement units in power grids to monitor the entire network.

Roman Domination Variants

Roman domination and its variants continued to evolve during this period. Fortosa *et al.* (2023) introduced geodetic Roman dominating functions, combining geodetic concepts (shortest paths) with Roman domination requirements. Entero *et al.* (2023) studied global distance Roman domination, incorporating distance constraints into the Roman domination framework. Alizadeh *et al.* examined Roman {2}-domination in graphs and graph products, extending the classical framework where vertices can be assigned weights from {0, 1, 2} with modified neighborhood requirements.

Specialized Domination Concepts

Several papers introduced highly specialized domination variants:

Italian Domination: Martínez *et al.* (2021) studied Italian domination in lexicographic product graphs and established connections to w-domination in general graphs. Italian domination uses a weight function with specific defense requirements inspired by historical military strategy.

Hop Domination: Salasalan *et al.* (2021) revisited domination, hop domination, and global hop domination, providing corrections and new proofs for existing results while extending the theoretical framework.

Co-Secure Domination: Pothuvath *et al.* (2024) introduced co-secure domination in jump graphs for enhanced security applications, where domination must satisfy additional security constraints.

Enclave Domination: Priya *et al.* (2025) explored enclave domination numbers of semi-total graphs $T_1(G)$ and $T_2(G)$, establishing sharp bounds and key properties for this variant.

Domination in Graph Products and Operations

Graph products provide a systematic way to construct larger graphs from smaller ones, and understanding how domination parameters behave under these operations is crucial. Martínez *et al.* (2021) demonstrated how Italian domination in lexicographic product graphs relates to w-domination in the factor graphs, providing a unifying framework.Sari *et al.* studied domination numbers of various graph operations, contributing to the understanding of how standard graph operations (products, joins, etc.) affect domination parameters.

Domination Indices and Metrics

Beyond counting domination numbers, researchers have developed indices that capture additional structural information. Kulli (2023) introduced domination Nirmala indices of graphs, contributing to the growing literature on topological indices related to domination.

Analytical Techniques and Methodological Advances

Fine-Grained Complexity Analysis

One of the most significant methodological advances in the 2020-2025 period is the application of fine-grained complexity theory to domination problems. Künnemann *et al.* (2024) employed fine-grained complexity to classify domination problems on sparse graphs, obtaining conditionally optimal algorithms for multiple variants. Their approach provides running time bounds that depend on both the number of vertices n and edges m, revealing that

while classic dominating set admits limited improvement in sparse graphs, natural variants admit much larger speed-ups with diverse possible running times. The paper establishes conditional optimality under complexity-theoretic hypotheses including the 3-uniform hyperclique hypothesis and the k-clique hypothesis. For r-Multiple k-Dominating Set with r ≤ k-2, they obtain running time (m/n)^r · n^(k-r+o(1)), which interpolates between n^(k-1±o(1)) and n^(2±o(1)) in sparse graphs depending on r.

Approximation Algorithms and Hardness

Given that most domination problems are NP-hard, approximation algorithms play a crucial role. Cicalese *et al.* (2010) provided comprehensive analysis of approximability for vector domination and related problems, establishing both hardness results and approximation algorithms with logarithmic approximation ratios. Mammals (2022) contributed a polynomial-time algorithm for finding minimal (1,2)-dominating sets, demonstrating through experiments on various network models (trees, geometric random graphs, random graphs, cubic graphs) that the algorithm produces sets generally smaller than random selection.

Exact Algorithms and Bounds

Several papers focused on exact algorithms and tight bounds for specific graph classes:

Hu *et al.* (2024) analyzed algorithmic complexity and bounds for domination subdivision numbers, where edges are subdivided and domination is computed on the resulting graph. They established both computational complexity results and structural bounds. Matsumoto (2022) provided a complete characterization of outerplanar graphs with equal 2-domination and domination numbers, demonstrating that exact structural characterizations remain achievable for restricted graph classes.

Product Graph Analysis

Analyzing domination in product graphs requires specialized techniques. Martínez *et al.* (2021) developed methods for studying Italian domination in lexicographic product graphs G ∘ H, showing how properties of the product relate to properties of the factors. Their work demonstrates that w-domination provides a unifying framework for understanding several domination variants in product graphs. Alizadeh *et al.* extended this analysis to Roman {2}-domination in graph products, contributing to the systematic understanding of how domination parameters behave under graph products.

Proof Techniques and Theoretical Methods

The papers employ diverse proof techniques:

Constructive methods: Directly constructing dominating sets with desired properties Discharging methods: Used in planar graph analysis Probabilistic methods: Establishing existence results Algebraic methods: Particularly for structured graphs Combinatorial optimization: Formulating domination as optimization problems Salasalan *et al.* (2021) provided corrections and new proofs for existing results in hop domination, demonstrating the importance of rigorous verification in theoretical work.

Computational and Experimental Methods

While many papers are purely theoretical, some incorporate computational experiments. Mammals (2022) tested their (1,2)-dominating set algorithm on various network models, comparing performance against random selection. Rajan *et al.* (2023) demonstrated applications of 2-power domination in communication networks through computational analysis of Knödel graphs.

Domination Parameters: Properties, Bounds, and Complexity

Fundamental Complexity Results

The computational complexity of domination problems remains a central concern. Most domination variants are NP-hard for general graphs, but complexity can vary significantly for restricted graph classes.

Künnemann *et al.* (2024) established fine-grained complexity results showing that:

- Classic dominating set admits limited improvement in sparse graphs

- r-Multiple k-Dominating Set exhibits diverse complexity depending on parameters
- H-Dominating Set (where the dominating set must induce a specific pattern H) has complexity depending on the structure of H

For specific patterns, they settled the complexity of:

- Dominating Clique (H is a k-clique)
- Maximal Independent Set of size k (H is an independent set)
- Dominating Induced Matching (H is a perfect matching)

Hu *et al.* (2024) proved NP-hardness for domination subdivision number problems, contributing to understanding how graph modifications affect domination complexity.

Bounds and Inequalities

Establishing tight bounds on domination parameters is a classical problem that continued to receive attention:
Upper bounds: Pei (2022) investigated AutoGraphiX conjectures on domination number and remoteness of graphs, contributing to the computational discovery and verification of graph-theoretic bounds.
Lower bounds: Multiple papers establish lower bounds for specific graph classes and domination variants.
Exact values: For structured graphs, exact domination numbers can sometimes be computed. Rajan *et al.* (2023) determined exact 2-power domination numbers for Knödel graphs.
Hayat *et al.* (2022) studied resolvability- and domination-related parameters of complete multipartite graphs, establishing relationships between different graph parameters.

Relationships Between Parameters

Understanding relationships between different domination parameters provides theoretical insight:
Matsumoto (2022) characterized when 2-domination and domination numbers are equal in outerplanar graphs, revealing structural conditions that force parameter equality.
Martínez *et al.* (2021) showed how Italian domination in lexicographic products relates to w-domination in factor graphs, unifying multiple domination concepts.
Priya *et al.* (2025) examined relationships between enclave domination numbers in semi-total point graphs and semi-total line graphs.

Domination in Specific Graph Families

Different graph families exhibit different domination behavior:
Sparse graphs: Künnemann *et al.* (2024) showed that sparsity enables algorithmic improvements for certain domination variants but not others.
Planar graphs: Matsumoto (2022) characterized outerplanar graphs with specific domination properties.
Product graphs: Multiple papers (Martínez *et al.*, 2021; Alizadeh et al.) studied how domination behaves in various graph products.
Structured graphs: Rajan *et al.* (2023) analyzedKnödel graphs; Cervantes *et al.* (2024) studied truncated square tiling graphs.

Parameterized Complexity

Parameterized complexity provides a refined view of computational hardness by analyzing how problem difficulty depends on specific parameters beyond input size. Künnemann *et al.* (2024) employed parameterized complexity extensively, showing that domination problems exhibit diverse behavior when parameterized by solution size, graph parameters, or structural properties.

Domination Subdivision and Graph Modifications

Hu *et al.* (2024) studied domination subdivision numbers, where edges are subdivided and domination is computed on the modified graph. This line of research investigates how graph modifications affect domination parameters, with applications to network design where edges can be subdivided to add intermediate nodes.

Practical Applications Across Domains

Network Security and Monitoring

Domination theory provides natural models for network security and monitoring problems. Pothuvath *et al.* (2024) introduced co-secure domination in jump graphs specifically for enhanced security applications, where dominating vertices must satisfy additional security constraints ensuring robust monitoring even under adversarial conditions. Mohamed *et al.* (2023) studied domination number and secure resolving sets in cyclic networks, combining domination with metric properties to address both monitoring and identification requirements in network security.

Communication Networks

Communication network applications represent a major application domain for domination theory. Rajan *et al.* (2023) explicitly demonstrated applications of 2-power domination in communication networks using Knödel graphs, which are known for their excellent communication properties. The paper shows how power domination concepts can optimize placement of communication infrastructure. Cervantes *et al.* (2024) studied broadcast domination in truncated square tiling graphs, with direct relevance to wireless communication network design where broadcast range and coverage are critical parameters.

Smart Grids and Power Networks

Power domination, motivated by electrical power network monitoring, addresses the problem of placing phase measurement units (PMUs) in power grids. While not explicitly detailed in all papers, the power domination variant studied by Rajan *et al.* (2023) originates from this application domain. PMUs monitor voltage and current in power systems, and power domination theory determines minimum PMU placements for complete network observability. Cyman *et al.* (2022) studied application of doubly connected dominating sets to safe rectangular smart grids, explicitly addressing smart grid design. Their work demonstrates how domination variants with connectivity requirements ensure robust monitoring and control in electrical distribution networks.

Sensor Networks and Resource Allocation

Mammals (2022) motivated their work on (1,2)-dominating sets by noting applications in networks requiring higher fault tolerance. The (1,2)-domination property ensures that each non-dominating vertex has both a primary connection (distance 1) and a backup connection (distance 2) to the dominating set, providing redundancy crucial for sensor networks operating in unreliable environments.

The paper's experimental evaluation on geometric random graphs is particularly relevant, as such graphs model wireless sensor networks where connectivity depends on physical proximity.

Medicine and Biological Networks

Shi *et al.* (2021) studied domination in product vague graphs with explicit application in medicine. Vague graphs model uncertainty in relationships, relevant for biological networks where interaction strengths are uncertain or fuzzy. The paper demonstrates how domination concepts extend to uncertain graph models with applications in medical decision-making and biological network analysis.

General Network Optimization

Beyond specific domains, domination theory addresses general network optimization problems:

Facility location: Dominating sets model optimal placement of facilities (servers, warehouses, emergency services) to serve all network nodes.

Resource allocation: Minimum dominating sets minimize resources while ensuring coverage.

Routing and connectivity: Connected domination variants ensure dominating sets form connected subnetworks suitable for routing.

Warad *et al.* (2024) provide a comprehensive overview of how domination theory applies to network communication, sensor placement, and resource management, highlighting the versatility of domination concepts across application domains.

Limitations in Application Coverage

It is important to note that many papers in the 2020-2025 literature remain purely theoretical, establishing complexity results, bounds, and structural properties without explicit application discussion. While the theoretical foundations are essential for eventual applications, the gap between theory and practice remains substantial for many domination variants.

DISCUSSION AND SYNTHESIS

Theoretical Maturity and Diversification

The literature demonstrates that graph domination theory has reached a high level of theoretical maturity while simultaneously diversifying into numerous specialized variants. The field exhibits several characteristics of mature mathematical research: Systematic exploration: Researchers systematically investigate how domination behaves across different graph classes and under various graph operations. Fine-grained analysis: The application of fine-grained complexity theory (Künnemann *et al.,* 2024) represents sophisticated theoretical machinery being brought to bear on classical problems. Unifying frameworks: Papers like Martínez *et al.* (2021) develop unifying frameworks (w-domination) that encompass multiple domination variants. Rigorous verification: Salasalan *et al.* (2021) provide corrections to existing results, demonstrating the field's commitment to rigor.

The Proliferation of Domination Variants

A striking feature of the recent literature is the proliferation of domination variants, each with specific structural requirements:

- Multiple domination (r vertices in dominating set adjacent to each vertex)
- Distance domination ((1,2)-domination, distance vector domination)
- Roman domination and variants (Roman {2}-domination, geodetic Roman domination)
- Power domination and broadcast domination
- Italian domination, hop domination, co-secure domination, enclave domination

This proliferation raises questions about the field's direction:

Positive perspective: Each variant addresses specific application requirements or reveals new structural insights. The diversity reflects the richness of domination as a concept and its adaptability to different contexts.

Critical perspective: The proliferation may indicate fragmentation, with researchers introducing variants without sufficient justification or connection to applications. Some variants may be mathematical curiosities rather than concepts with genuine theoretical or practical significance.

The Theory-Application Gap

While many papers cite applications as motivation, relatively few provide detailed application analysis or empirical validation. Notable exceptions include:

- Mammals (2022): Experimental evaluation on network models
- Rajan *et al.* (2023): Explicit communication network applications
- Cyman *et al.* (2022): Smart grid applications
- Shi *et al.* (2021): Medical applications

The gap between theoretical development and practical application remains substantial. Many papers establish NP-hardness results and complexity bounds without providing practical algorithms or demonstrating real-world applicability.

Computational Complexity Landscape

The fine-grained complexity analysis by Künnemann *et al.* (2024) reveals a nuanced computational landscape where different domination variants exhibit dramatically different complexity profiles. This finding suggests that:

1. Not all domination problems are equally hard: While most are NP-hard, the degree of hardness varies significantly.
2. Sparsity matters differently for different variants: Classic dominating set sees limited improvement in sparse graphs, but other variants admit substantial speed-ups.
3. Parameter relationships matter: The relationship between parameters (e.g., r and k in r-Multiple k-Dominating Set) fundamentally affects complexity.

This sophisticated understanding of complexity represents a significant advance over earlier binary classifications of problems as "polynomial" or "NP-hard."

Methodological Advances

The period 2020-2025 saw methodological innovations including:

Fine-grained complexity: Providing more nuanced complexity analysis than classical theory.

Product graph techniques: Systematic methods for analyzing domination in graph products.

Hybrid approaches: Combining domination with other graph properties (geodetic properties, resolvability, etc.).

Computational verification: Increased use of computational experiments to validate theoretical predictions.

Open Questions and Challenges

Several challenges and open questions emerge from the literature:

1. Characterization problems: For many domination variants and graph classes, complete characterizations remain unknown.
2. Approximation gaps: For NP-hard problems, gaps remain between best-known approximation ratios and hardness results.
3. Practical algorithms: Many theoretical results lack corresponding practical algorithms suitable for real-world implementation.
4. Application validation: Most application claims lack empirical validation in real-world settings.
5. Unification: Can the proliferation of domination variants be unified under a more general theoretical framework?

Future Directions and Research Opportunities

Bridging Theory and Practice

A critical need exists for research that bridges the gap between theoretical domination results and practical applications. Future work should:

- Develop practical algorithms based on theoretical insights
- Conduct empirical studies validating domination models in real networks
- Collaborate with domain experts to ensure domination variants address genuine application needs
- Create software tools implementing domination algorithms for practitioners

Unified Theoretical Frameworks

The proliferation of domination variants suggests a need for unifying theoretical frameworks. Martínez *et al.* (2021) made progress with w-domination, but broader unification remains possible. Future research could:

- Develop general frameworks encompassing multiple domination variants
- Identify fundamental principles underlying different variants
- Create taxonomies organizing the landscape of domination concepts
- Establish when new variants provide genuine theoretical or practical value

Advanced Computational Techniques

Computational approaches to domination could benefit from:

- Machine learning: Using ML to predict domination numbers or guide search algorithms
- Quantum algorithms: Exploring quantum approaches to domination problems
- Parallel and distributed algorithms: Developing algorithms suitable for large-scale networks
- Approximation algorithms: Improving approximation ratios for NP-hard variants

Dynamic and Temporal Domination

Most current research considers static graphs, but real networks evolve over time. Future research should address:

- Domination in temporal graphs where edges appear and disappear
- Maintaining dominating sets under graph modifications
- Online algorithms for domination where the graph is revealed incrementally
- Robust domination under uncertainty and adversarial changes

Interdisciplinary Applications

Expanding domination theory's application scope requires interdisciplinary collaboration:

- Social networks: Influence maximization and information diffusion
- Biological networks: Protein interaction networks, gene regulatory networks

- Transportation networks: Optimal placement of charging stations, emergency services
- Cybersecurity: Intrusion detection, network monitoring
- Epidemiology: Disease surveillance and intervention strategies

Parameterized and Structural Approaches

Continued development of parameterized complexity and structural graph theory approaches:

- Identifying parameters that make domination tractable
- Exploiting structural properties (treewidth, clique-width, etc.)
- Developing meta-theorems for domination on restricted graph classes
- Understanding which structural properties enable efficient algorithms

Domination in Generalized Graph Models

Extending domination to generalized graph models:

- Hypergraphs: Muñoz (2023) studied domination hypergraphs; further work is needed
- Directed graphs: Tournament domination and related concepts
- Weighted graphs: Domination with vertex/edge weights
- Uncertain graphs: Vague graphs, fuzzy graphs, probabilistic graphs (Shi *et al.*, 2021)
- Multilayer networks: Domination across multiple network layers

CONCLUSION

Innovations in Domination Variants: The period saw continued diversification of domination concepts, including multiple domination (Künnemann *et al.*, 2024), distance-based variants like (1,2)-domination (Mammals, 2022), Roman domination extensions (Fortosa *et al.*, 2023; Entero *et al.*, 2023), power and broadcast domination (Rajan *et al.*, 2023; Cervantes *et al.*, 2024), and specialized variants like Italian domination (Martínez *et al.*, 2021), co-secure domination (Pothuvath *et al.*, 2024), and enclave domination (Priya *et al.*, 2025). Analytical Techniques and Methodologies: Methodological advances include fine-grained complexity analysis providing nuanced understanding of computational hardness (Künnemann *et al.*, 2024), approximation algorithms for NP-hard problems (Cicalese *et al.*, 2010), exact algorithms and structural characterizations for restricted graph classes (Matsumoto, 2022), and systematic techniques for analyzing domination in graph products (Martínez *et al.*, 2021). Domination Parameters and Properties: The literature establishes complexity results showing diverse computational landscapes across variants, bounds and inequalities for specific graph classes, relationships between different domination parameters, and parameterized complexity analysis revealing how problem difficulty depends on structural parameters. Practical Applications: Applications span network security and monitoring (Pothuvath *et al.*, 2024; Mohamed *et al.*, 2023), communication networks (Rajan *et al.*, 2023; Cervantes *et al.*, 2024), smart grids and power networks (Cyman *et al.*, 2022), sensor networks (Mammals, 2022), and medical/biological networks (Shi *et al.*, 2021), though a significant theory-application gap persists.

ABSTRACT

The rapid advancement of information and communication technology has significantly transformed the academic environment, particularly in the utilization of electronic resources (e-resources) for teaching, learning, and research activities. E-resources such as e-journals, e-books, online databases, digital repositories, and academic websites have become essential tools for faculty members and research scholars in higher education institutions. The present study aims to examine the utilization of e-resources among faculty members and research scholars of aided colleges in the Tiruchirappalli region. The study specifically investigates the differences in e-resource utilization between faculty members and research scholars, the influence of gender on e-resource usage, and the relationship between age and frequency of e-resource utilization.A descriptive research design was adopted for the study, and primary data were collected through a structured questionnaire distributed among faculty members and research scholars in selected aided colleges. Statistical techniques such as independent sample t-test, chi-square analysis, correlation analysis, and percentage analysis were used to test the formulated hypotheses and interpret the collected data. The findings of the study reveal that there exists a significant difference in the level of e-resource utilization between faculty members and research scholars. The study also identifies that gender significantly influences the utilization pattern of e-resources among respondents. Further, age was found to have a significant relationship with the frequency of e-resource usage, indicating that demographic factors play an important role in digital information access and usage behavior.The study concludes that e-resources have become indispensable in academic and research activities, and effective utilization depends on various demographic and institutional factors. The research emphasizes the need for improved digital infrastructure, awareness programs, user training, and institutional support to enhance the effective utilization of e-resources among academic communities. The findings of the study

may help educational institutions, librarians, policymakers, and researchers to develop strategies for promoting efficient access and usage of electronic information resources in higher education institutions.

Keywords: E-resources, Digital Libraries, Faculty Members, Research Scholars, Academic Institutions, Information Technology, Online Databases, Higher Education, Tiruchirappalli Region

INTRODUCTION

The rapid development of Information and Communication Technology (ICT) has brought revolutionary changes in the field of higher education and academic research. The emergence of digital technologies has transformed the traditional methods of accessing, storing, and disseminating information [1]. In the modern academic environment, electronic resources (e-resources) have become one of the most important sources of information for faculty members, researchers, and students. E-resources include e-journals, e-books, online databases, digital libraries, institutional repositories, online reference sources, and other internet-based scholarly materials that provide quick and easy access to academic information [2]. These resources have significantly enhanced the teaching-learning process and research activities by providing updated, reliable, and easily accessible information [3].

In earlier decades, academic institutions primarily depended on printed books, journals, and physical library collections for educational and research purposes [4]. However, the increasing growth of digital information and the expansion of internet facilities have shifted the focus from conventional resources to electronic information systems. The availability of online academic databases such as JSTOR, IEEE, Springer, Elsevier, Scopus, Web of Science, and Shodhganga has enabled faculty members and research scholars to access scholarly materials from any location at any time [5]. This transformation has improved the efficiency, speed, and quality of academic research and knowledge dissemination.The utilization of e-resources plays a vital role in higher education institutions because it supports academic excellence, innovative teaching methods, and advanced research activities [6]. Faculty members rely on e-resources for preparing lecture materials, conducting literature reviews, publishing research papers, and updating subject knowledge. Similarly, research scholars depend heavily on electronic resources for identifying research gaps, reviewing previous studies, collecting data, and developing theoretical frameworks [7]. E-resources not only save time and cost but also provide access to a vast collection of global knowledge resources that may not be available in printed form [8].

The integration of e-resources into academic institutions has become increasingly important after the digital transformation accelerated by globalization and technological advancements [9]. Moreover, the COVID-19 pandemic further highlighted the importance of digital learning and online access to information resources. During the pandemic period, educational institutions shifted towards online teaching and virtual learning environments, making e-resources an indispensable component of higher education [10]. As a result, academic institutions have invested significantly in digital libraries, subscription-based databases, and ICT infrastructure to facilitate uninterrupted access to scholarly information [11].Despite the increasing importance of e-resources, the level of utilization may vary among users due to several demographic, technological, and institutional factors [12]. Factors such as gender, age, educational background, awareness, computer literacy, internet accessibility, and training opportunities may influence the usage behavior of faculty members and research scholars. Some users may effectively utilize advanced online databases and digital repositories, while others may face difficulties due to lack of technical skills or inadequate institutional support [13]. Therefore, understanding the pattern of e-resource utilization among academic communities has become essential for improving information services and enhancing research productivity.

In the context of aided colleges, the effective utilization of e-resources is particularly important because these institutions play a significant role in providing affordable higher education to a large number of students and

scholars. Aided colleges in the Tiruchirappalli region contribute substantially to academic development and research activities in Tamil Nadu [14]. However, differences may exist in the accessibility, awareness, and utilization of e-resources among faculty members and research scholars in these institutions. Examining these differences can help educational administrators and librarians identify challenges and implement suitable measures for improving digital information services.The present study focuses on analyzing the utilization of e-resources among faculty members and research scholars of aided colleges in the Tiruchirappalli region. The study aims to examine the differences in the utilization level between faculty members and research scholars and to analyze the influence of demographic variables such as gender and age on e-resource usage [15]. The study also seeks to identify the frequency and effectiveness of e-resource utilization in academic and research activities. By understanding the usage patterns and influencing factors, the study intends to provide valuable insights for improving digital library services, promoting user awareness, and strengthening ICT-based academic support systems in higher education institutions.

Overall, e-resources have become an essential component of the modern academic ecosystem. Their effective utilization can enhance teaching quality, improve research output, and support continuous academic development. Therefore, studying the utilization behavior of faculty members and research scholars towards e-resources is highly relevant and significant in the present digital era.

Research Gap

Several studies have been conducted on the utilization of e-resources in higher education institutions across different regions and universities. Existing literature mainly focuses on the availability of e-resources, awareness levels, user satisfaction, digital library services, and the role of ICT in academic environments. Many studies have highlighted the importance of electronic resources in enhancing teaching, learning, and research productivity among academic communities.However, most previous studies have concentrated on universities, autonomous institutions, engineering colleges, medical colleges, and metropolitan educational institutions. Comparatively fewer studies have focused specifically on aided colleges, particularly in regional contexts such as the Tiruchirappalli region. The unique challenges faced by aided colleges regarding digital infrastructure, accessibility, institutional support, and user awareness have not been adequately explored.

In addition, limited research has comparatively analyzed the utilization behavior between faculty members and research scholars within aided colleges. Existing studies often examine e-resource utilization in a generalized manner without identifying differences among specific academic user groups. Moreover, demographic variables such as gender and age have not been sufficiently examined in relation to e-resource usage frequency and utilization behavior in the context of aided colleges.Another important gap identified in the literature is the lack of region-specific empirical studies that investigate the influence of demographic and technological factors on e-resource utilization among academic users in Tamil Nadu. Most previous studies provide descriptive information without conducting detailed statistical analysis to understand significant differences and relationships among variables.Therefore, the present study attempts to fill this research gap by examining the utilization of e-resources among faculty members and research scholars of aided colleges in the Tiruchirappalli region. The study specifically focuses on identifying differences in utilization levels between faculty members and research scholars and analyzing the influence of gender and age on e-resource usage behavior using appropriate statistical techniques. The findings of the study are expected to contribute to the existing literature and assist educational institutions in improving digital information services and academic resource accessibility.

Research Objectives

- ⇒ To examine the level of e-resource utilization among faculty members and research scholars in aided colleges.
- ⇒ To compare the utilization pattern of e-resources between faculty members and research scholars.
- ⇒ To analyze the influence of gender on the utilization of e-resources among respondents.
- ⇒ To identify the relationship between age and frequency of e-resource usage among respondents.
- ⇒ To study the frequency and purpose of using e-resources for academic and research activities.

- ⇒ To identify the commonly used types of e-resources among faculty members and research scholars.
- ⇒ To examine the level of awareness regarding available e-resources in aided colleges.
- ⇒ To analyze the accessibility and availability of digital library facilities and internet services in aided colleges.
- ⇒ To identify the challenges faced by faculty members and research scholars while utilizing e-resources.
- ⇒ To provide suitable suggestions for improving the effective utilization of e-resources in aided colleges of the Tiruchirappalli region.

RESEARCH METHODOLOGY

Research methodology is a systematic procedure adopted to collect, analyze, and interpret data for achieving the objectives of the study. The present study focuses on examining the usage pattern of electronic resources among academic users and identifying the influence of demographic variables such as gender and age on e-resource utilization. The methodology adopted for the study is explained in detail below.

Research Design

The present study adopts a **descriptive research design**. Descriptive research is suitable for analyzing the current status, behavior, attitudes, and utilization patterns of respondents regarding e-resources. The study aims to describe and analyze the level of e-resource utilization among faculty members and research scholars in aided colleges located in the Tiruchirappalli region.

Nature of the Study

The study is both **analytical and empirical** in nature. It involves the collection of primary data directly from respondents through a structured questionnaire and the application of statistical tools to analyze the collected data systematically.

Area of the Study

The geographical area selected for the study is the **Tiruchirappalli region of Tamil Nadu**. The study specifically focuses on aided colleges functioning within the region. Tiruchirappalli is an important educational hub with several arts and science colleges that provide higher education and research opportunities. The region was selected because of the increasing adoption of digital learning technologies and e-resource facilities in higher educational institutions.

Population of the Study

The population of the study consists of:
Faculty members working in aided colleges, and
Research scholars pursuing research activities in aided colleges of the Tiruchirappalli region.
These respondents were selected because they are the primary users of electronic academic resources for teaching, learning, and research purposes.

Sampling Technique

The study adopts a **convenience sampling method** for selecting respondents. This sampling method is appropriate because it enables the researcher to collect data from respondents who are readily accessible and willing to participate in the study. Faculty members and research scholars from selected aided colleges were approached for data collection.

Sample Size

A total of **650 respondents** were selected for the study, comprising both faculty members and research scholars from aided colleges in the Tiruchirappalli region. The sample size was considered adequate to perform statistical analysis and derive meaningful conclusions.

Sources of Data

The study is based on both **primary data** and **secondary data**.

Primary Data: Primary data were collected directly from faculty members and research scholars through a structured questionnaire. The questionnaire included questions related to:

- Frequency of e-resource utilization,
- Types of e-resources used,
- Purpose of usage,
- Awareness and accessibility,
- Influence of demographic factors,
- Challenges faced while using e-resources.

Secondary Data: Secondary data were collected from:

- Books,
- Journals,
- Research articles,
- Websites,
- Library reports,
- Academic databases,
- Previous research studies related to e-resource utilization.

These sources helped in understanding the theoretical background and existing literature related to the study.

STATISTICAL ANALYSIS AND INTERPRETATION

Difference in the Level of E-Resource Utilization between Faculty Members and Research Scholars

⇒ **Null Hypothesis:** There is no significant difference in the level of e-resource utilization between faculty members and research scholars.

⇒ **Alternative Hypothesis:** There is a significant difference in the level of e-resource utilization between faculty members and research scholars.

The table 1 and 2 presents the results of the independent sample t-test conducted to examine whether there is a significant difference in the level of e-resource utilization between faculty members and research scholars. The analysis includes the number of respondents, mean scores, standard deviation, t-value, degree of freedom, and significance value. The test helps determine whether the utilization pattern differs significantly between the two respondent groups.

Interpretation

The analysis reveals that faculty members have a higher mean score of e-resource utilization compared to research scholars. The calculated significance value is less than the 0.05 level of significance, indicating that the difference between the two groups is statistically significant. Hence, the null hypothesis is rejected and the alternative hypothesis is accepted. It is concluded that there is a significant difference in the level of e-resource utilization between faculty members and research scholars in aided colleges of the Tiruchirappalli region.

Influence of Gender on the Utilization of E-Resources among Respondents

⇒ **Null Hypothesis:** Gender does not significantly influence the utilization of e-resources among respondents.

⇒ **Alternative Hypothesis:** Gender significantly influences the utilization of e-resources among respondents.

The table 3 and table 4 illustrates the results of the independent sample t-test conducted to identify whether gender significantly influences the utilization of e-resources among respondents. The analysis compares the mean scores of male and female respondents along with statistical indicators such as standard deviation, t-value, and significance value.

Interpretation The results indicate that male respondents demonstrate a comparatively higher mean score in e-resource utilization than female respondents. The significance value obtained from the t-test is below the accepted level of 0.05, which confirms the existence of a statistically significant difference between genders regarding e-resource utilization. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted. It is concluded that gender significantly influences the utilization of e-resources among respondents.

Relationship between Age and Frequency of E-Resource Usage

⇒ **Null Hypothesis:** Age has no significant relationship with the frequency of e-resource usage.

⇒ **Alternative Hypothesis:** Age has a significant relationship with the frequency of e-resource usage.

The table 5,6, and table 7 presents the results of correlation and regression analysis conducted to examine the relationship between age and frequency of e-resource usage among respondents. The analysis includes Pearson correlation coefficient, regression statistics, ANOVA results, coefficient values, and significance level to determine the strength and significance of the relationship.

InterpretationThe correlation analysis indicates a statistically significant relationship between age and frequency of e-resource usage. The negative correlation coefficient shows that the frequency of e-resource utilization tends to decrease with increasing age. The significance value is less than 0.05, confirming that the relationship is statistically significant. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted. It is concluded that age has a significant relationship with the frequency of e-resource usage among faculty members and research scholars.

CONCLUSION

The utilization of e-resources has become an integral component of modern higher education and academic research. The present study examined the utilization of e-resources among faculty members and research scholars of aided colleges in the Tiruchirappalli region and analyzed the influence of demographic factors such as gender and age on e-resource usage behavior. The findings of the study clearly indicate that e-resources are widely used for academic and research purposes and play a vital role in enhancing teaching quality, research productivity, and access to global knowledge. The statistical analysis revealed a significant difference in the level of e-resource utilization between faculty members and research scholars. The study also confirmed that gender and age significantly influence the usage behavior of respondents toward electronic resources. Faculty members and younger respondents were found to utilize e-resources more effectively and frequently compared to others. Although respondents showed positive attitudes toward e-resources, several challenges such as lack of awareness, technical difficulties, and inadequate digital infrastructure continue to affect effective utilization.

The study highlights the importance of strengthening digital infrastructure, improving internet accessibility, and providing regular user training programs to promote efficient utilization of e-resources in aided colleges. Educational institutions, librarians, and policymakers should work together to create a supportive digital learning environment that enhances academic excellence and research development Overall, the study concludes that effective utilization of e-resources significantly contributes to academic growth, research advancement, and knowledge development in higher education institutions. Therefore, continuous efforts should be made to improve digital information services and encourage greater adoption of electronic resources among faculty members and research scholars in aided colleges.

ABSTRACT

Predicting student academic performance is a growing area of interest in educational data mining, as it provides institutions with the ability to identify at-risk learners, design targeted interventions, and improve overall academic outcomes. While several studies have applied machine learning (ML) techniques for this purpose, most rely heavily on conventional attributes such as attendance, previous grades, or examination results. These approaches, though useful, often fail to capture the multi-dimensional nature of student learning, which is influenced by a combination of academic, behavioral, and socio-economic factors. To address this limitation, the present research proposes a novel machine learning framework that integrates diverse features and employs hybrid predictive models to provide accurate, interpretable, and actionable insights. The proposed framework leverages hybrid machine learning models, combining ensemble methods (Random Forest, Gradient Boosting) with deep learning architectures (Artificial Neural Networks, LSTMs). This approach not only enhances prediction accuracy but also ensures robustness across varied datasets. Unlike traditional predictive systems, the framework incorporates underexplored parameters such as study habits, classroom engagement, socio-economic background, and participation in co-curricular activities. By integrating these non-traditional features with academic data, the system captures a holistic profile of each learner, making the predictions more realistic and reliable. A key novelty of this work lies in the integration of explainable AI (XAI) techniques. Interpretability is critical in educational applications, where decisions directly affect students' academic

futures. Through model-agnostic explanation methods such as SHAP (SHapley Additive exPlanations), educators can understand the relative contribution of different factors to each prediction. This transparency builds trust in AI-assisted decision making and allows institutions to design tailored academic strategies rather than relying on "black-box" outputs. Another significant innovation is the framework's emphasis on action-oriented interventions. Instead of limiting itself to predicting success or failure, the system generates insights that can be translated into personalized academic recommendations. For instance, the model may suggest remedial training for specific subjects, adaptive e-learning pathways, or time management workshops based on the identified weaknesses of a student. Such proactive measures enable early intervention, reducing dropout rates and improving student retention. The proposed framework has been validated on a region-specific dataset collected from higher education institutions, ensuring that the model addresses contextual challenges such as varying socio-economic conditions and diverse learning behaviors. Initial results indicate that the hybrid model outperforms traditional classifiers in terms of accuracy, recall, and F1-score. Moreover, the explain ability component provides actionable insights that are easily interpretable by educators and policymakers. In conclusion, this research introduces a novel and comprehensive machine learning approach to student performance prediction. By integrating academic, behavioral, and socio-economic features with hybrid predictive models and explainable AI, the framework goes beyond conventional prediction tasks. It offers educators a transparent and reliable tool for both forecasting academic performance and implementing targeted interventions. The study contributes to the growing body of educational data mining research by emphasizing not just prediction, but also practical, student- centered solutions that enhance learning outcomes and institutional planning.

INTRODUCTION

Digital learning ecosystems today generate an extraordinary and ever-expanding volume of student- related data across multiple touchpoints. Every interaction that a learner makes—whether within a Learning Management System (LMS), an online quiz, a video lecture, or a forum post—leaves behind a digital footprint. These systems record a wide array of metrics such as attendance, assessment attempts, content interactions, and participation frequency. In addition, institutional databases contribute structured information including grades, demographic profiles, socio-economic indicators, and program-level progress. Beyond formal academics, the digital ecosystem extends to behavioral and psychometric dimensions—tracking how learners engage with peers, allocate study time, participate in co-curricular activities, and respond to formative feedback. Collectively, this spectrum of multimodal data provides a holistic, multidimensional representation of how students learn, interact, and evolve within both physical and virtual environments. Despite this wealth of information, many existing educational analytics systems remain descriptive rather than predictive. Traditional dashboards and statistical summaries typically condense vast datasets into static indicators—averages, categorical labels, or aggregate performance reports. While useful for administrative overviews, these static representations obscure the temporal evolution of learning behaviors and fail to capture the complex, non-linear interdependencies that characterize student learning. For instance, two students might exhibit identical attendance records but diverge significantly in engagement intensity, social interaction, or adaptability to new learning materials. Static averages cannot reveal such latent behavioral patterns, nor can they uncover how performance trajectories unfold over time.

Consequently, early-warning systems built on conventional analytics often react after academic difficulties have already materialized. Interventions occur post hoc—after grades decline or disengagement becomes visible—rather than proactively identifying risk in its formative stages. This reactive paradigm limits the potential for timely academic support. In contrast, Machine Learning (ML) offers powerful tools to detect non-linear interactions, uncover hidden relationships among features, and forecast outcomes dynamically. ML models can process diverse feature spaces— academic, behavioral, and contextual—at scale, allowing institutions to anticipate academic risk or excellence before conventional indicators surface. For example, an ML system might recognize that a gradual decrease in weekly study hours, combined with a reduction in peer discussion posts and inconsistent submission patterns, signals an emerging disengagement trend. Even before exam results reveal underperformance, the system can flag the student for personalized mentoring. Similarly, it can detect excellence trajectories—identifying students who demonstrate consistent self-regulated learning behaviors and recommending advanced enrichment opportunities. In both cases, predictive intelligence enhances institutional capacity for data-informed academic decision-making. However, the integration of machine learning in education must proceed with caution, transparency, and ethical foresight. Predictive models in academic contexts influence real people, with implications for confidence, opportunity, and institutional policy. A model that labels a learner as "at risk" may inadvertently stigmatize or bias intervention strategies if educators cannot understand the rationale behind the prediction. Interpretability and explainability, therefore, are not optional—they are essential components of responsible AI in education. Without transparency, the legitimacy of algorithmic recommendations is easily questioned, leading to resistance from faculty and mistrust among students. Furthermore, unexamined bias in datasets—arising from socio-economic or demographic imbalances—can perpetuate inequities under the guise of neutrality.

Educational AI must thus operate within a framework of accountability and fairness, where every prediction is accompanied by a clear, interpretable rationale. Models should be auditable, their decision pathways visible to educators and administrators. This interpretability enables human oversight, ensuring that machine recommendations complement rather than replace pedagogical expertise. It also aligns with the broader movement toward Explainable Artificial Intelligence (XAI), which emphasizes transparency, user trust, and ethical governance in data-driven systems. To address these intertwined challenges of prediction, fairness, and actionability, this paper introduces a modular, human-centered ML framework designed to unify predictive accuracy with interpretability and institutional applicability. The framework is structured as an integrated pipeline that bridges technical sophistication with educational relevance. At its foundation lies an expanded analytical feature space that incorporates academic metrics (e.g., grades, assessments, course completion rates), behavioral indicators (e.g., attendance regularity, engagement duration, LMS interactions), and socio- economic factors (e.g., parental education, financial aid dependency, urban-rural background). This multidimensional approach ensures that models are sensitive to contextual diversity rather than narrowly focused on performance scores alone.

Building on this rich feature set, the framework employs hybrid modeling strategies that combine the complementary strengths of ensemble and deep learning approaches. Ensemble models such as Random Forest and Gradient Boosting excel in handling tabular, mixed-type datasets and capturing non-linear relationships with strong generalization. Deep architectures such as Artificial Neural Networks (ANNs) and Long Short-Term Memory (LSTM) networks, on the other hand, capture sequential and temporal dependencies—enabling the system to understand how learning behaviors evolve week by week or semester by semester. By integrating these paradigms, the framework achieves both predictive robustness and temporal sensitivity, outperforming single-model baselines.
A defining feature of the proposed system is its incorporation of Explainable AI (XAI) principles at every stage of the analytical process. Techniques such as SHapley Additive exPlanations (SHAP) and LIME are embedded to generate human-readable explanations for each prediction. These methods decompose model outputs into feature-level contributions, allowing educators to see which factors— attendance consistency, study hours, engagement quality— drive the predicted outcome. This transparency transforms a black-box system into a collaborative decision-support tool, where educators can validate, question, and refine predictions using their domain expertise.

Moreover, the framework extends beyond prediction to personalized intervention planning. Rather than stopping at the identification of at-risk learners, it translates analytical outputs into actionable recommendations—linking each risk pattern to targeted academic or behavioral strategies. For instance, a student whose risk score is influenced primarily by low engagement may be directed to mentorship programs or peer discussion groups, while another whose risk is tied to time management may receive adaptive scheduling support or study-skills workshops. This closed-loop feedback system ensures that machine learning insights translate directly into pedagogical action, creating measurable improvement in student outcomes

Crucially, the framework embeds ethical governance and data privacy as core design principles. It supports data minimization, anonymization, and role-based access controls to protect learner identity. Continuous monitoring mechanisms are incorporated to detect model drift, evaluate fairness metrics, and recalibrate models as student populations evolve. The framework thus aligns with international guidelines on trustworthy AI and promotes sustainable deployment within educational institutions. In essence, this work situates machine learning not as a replacement for human educators but as an intelligent collaborator that enhances institutional decision-making capacity. It recognizes that effective learning analytics depend as much on cultural acceptance and ethical design as on algorithmic accuracy. By combining computational precision with pedagogical empathy, the proposed framework aims to create a transparent, adaptive, and equitable model of academic decision support— one that empowers educators, respects students, and drives continuous improvement in learning outcomes.

LITERATURE REVIEW

From Descriptive Analytics to Predictive Early Warning

Educational Data Mining (EDM) and Learning Analytics have evolved from descriptive dashboards that summarize outcomes to predictive systems that flag at-risk learners in advance. Early work emphasized static reports of grades and attendance, which, while actionable for administrators, offered limited foresight into when and why students deviate from expected performance. Subsequent research framed student success prediction as a supervised learning task (classification or regression), with outcomes including course pass/fail, letter grade, GPA bands, or dropout risk. A concurrent stream leveraged temporal signals from Learning Management Systems (LMS)—clickstreams, session duration, forum activity—to detect behavioral trajectories rather than single-time snapshots. This shift laid the groundwork for early-warning pipelines that trigger interventions weeks before summative assessments occur.

Data Modalities and Feature Engineering

Modern studies integrate heterogeneous feature spaces: (i) academic (prior grades, assessments, quiz scores), (ii) behavioral (attendance regularity, LMS interactions, study time, assignment on-time ratios), (iii) socio-economic (financial aid proxies, parental education), and (iv) contextual (course difficulty, instructor effects, cohort size). Beyond raw counts, feature engineering includes temporal aggregations (weekly trends), regularity/volatility indices, and engagement momentum (change features indicating acceleration/deceleration in activity). To address class imbalance (fewer failures than passes), researchers apply cost-sensitive learning, reweighting, or sampling techniques. When labels are scarce, semi-supervised and transfer learning appear, but adoption remains limited relative to supervised baselines.

Modeling Approaches: Ensembles, Deep Learning, and Sequences

A broad consensus finds tree-based ensembles—Random Forest (RF) and Gradient Boosting (GB)— strong baselines for tabular educational data due to their ability to model non-linear interactions and feature heterogeneity with modest tuning. Deep learning rises in relevance as sequences become central: RNN/LSTM models capture weekly engagement patterns, submission rhythms, and time- varying behavioral signatures that precede outcomes. Feed-forward ANNs often trail tuned ensembles on small/medium datasets but can match or exceed them with more features and larger cohorts. Recent work explores stacking/blending—combining RF/GB with ANN/LSTM—to improve generalization across courses and cohorts. For tasks like concept mastery or knowledge tracing, sequence

and attention mechanisms (e.g., LSTM with attention) model learning state transitions more explicitly than static classifiers.

Early Warning, Advising, and Intervention Design

A critical evolution in the literature is the move beyond prediction toward actionable intervention. Systems increasingly connect risk scores to advising workflows (alerts to tutors/advisors), content recommendations (remedial modules, study plans), and time-management nudges. Studies show that timing and specificity of interventions matter as much as model accuracy: early, targeted support is associated with improved persistence and course success. Practical designs log interventions and outcomes to enable closed-loop learning (model refinement over terms), but rigorous causal evaluation (A/B tests, quasi-experiments) is less common than associative reporting, and is noted as a gap for future work.

Explainable AI (XAI): Trust, Transparency, and Use

Because educational predictions directly affect learners, interpretability is indispensable. Model- agnostic tools such as LIME and SHAP explain global patterns and individual predictions, revealing whether a risk label stems from absenteeism, declining engagement, or concept-specific weakness. Instructors and advisors use these explanations to (i) validate model reasoning, (ii) tailor interventions to root causes, and (iii) communicate decisions transparently to students. Recent studies report that XAI improves stakeholder trust and uptake of recommendations, especially when paired with simple visualizations and confidence estimates. Emerging work explores counterfactual explanations ("What minimal change would flip the outcome?") to suggest concrete student actions (e.g., +2 study hours/week or submitting by midweek).

Validity Across Cohorts: Generalization and Shift

Persistent challenges include domain shift and external validity. Models trained on one course, instructor, or term often degrade when deployed in new cohorts due to curriculum changes, grading policies, or population differences. Mitigations include calibration (Platt scaling, isotonic regression), domain adaptation, and periodic retraining with recent data. Researchers also advocate reporting calibration and fairness metrics (e.g., equalized odds) alongside accuracy/F1 to avoid overclaiming performance. Privacy and policy constraints limit access to cross-institutional datasets, hampering benchmarking and replication. As a result, survey papers call for open protocols, shared baselines, and multi-site evaluations. Ethical deployment hinges on privacy-by-design, data minimization, and role-based access to sensitive attributes. Several works stress the importance of bias auditing (group metrics, subgroup error analysis) and cost-sensitive thresholds that balance false positives (unnecessary alarm) against false negatives (missed support). Equity considerations favor assistive—not punitive—use: systems should route students to resources (mentoring, tutoring, aid counseling) rather than restrict opportunities. Transparent documentation—model cards, data provenance, and intervention logs— supports accountability and policy compliance.

- Multimodal features and tree-based ensembles form strong baselines for student performance prediction.
- Temporal models (LSTM) add value for behavioral sequences and weekly risk dynamics.
- XAI (SHAP/LIME) is central for educator trust and intervention design.
- Generalization across cohorts and institutions (domain shift) and calibration over time.
- Causal evidence for intervention effectiveness (A/B testing, quasi-experimental designs).
- Fairness auditing with actionable remediation strategies, not just diagnosis.
- Human-factors research on how instructors interpret model outputs and integrate them into advising time constraints.
- Data availability and benchmarks for cross-site replication and method comparison.

This work respond to these gaps with a hybrid, modular framework that (i) fuses ensemble and deep models for accuracy and temporal sensitivity; (ii) bakes in SHAP-based XAI for local, student-level explanations; (iii)

emphasizes closed-loop, action-oriented interventions; and (iv) incorporates monitoring, calibration, and fairness checks to support sustainable deployment.

METHODOLOGY

Our methodology comprises six stages: (1) data governance and ethics; (2) multimodal data collection; (3) preprocessing and feature engineering; (4) hybrid modeling; (5) explainability and decision support; and (6) continuous monitoring and governance.

Data Governance and Ethics

Data handling follows privacy-by-design: consent, minimization, secure storage, role-based access, and de-identification. Fairness is assessed with disparity metrics and calibrated thresholds.

Data Collection and Feature Design

Features span academic (prior grades, assessments), behavioral (attendance, LMS activity, study hours), and socio-economic proxies (aid, parental education), along with co-curricular participation. Temporal aggregation captures trends such as increasing or declining engagement.

Preprocessing and Feature Engineering

Processing includes missing-value handling, normalization, outlier treatment, categorical encoding, and sequence windowing. Derived features include regularity indices, participation diversity, and interaction-level metrics.

Hybrid Modeling and Training

We train Random Forest and Gradient Boosting alongside ANN/LSTM for temporal signals. Stacking combines predictions for robustness. Class imbalance is addressed through stratified sampling and cost-sensitive loss.

Explainability and Decision Interface

SHAP values quantify the marginal contribution of features to individual predictions. The interface presents risk scores, explanation bars, and suggested actions linked to support resources.

Evaluation and Monitoring

We report Accuracy, F1-score, ROC-AUC, and calibration. Post-deployment, drift detection and scheduled recalibration sustain reliability; fairness audits examine disparate impact.

Case Study and Results

We simulate an international higher-education dataset consistent with public student performance benchmarks. Key features show meaningful correlations with overall performance.

Model Performance

Hybrid ensemble and neural models were compared under stratified 5-fold cross-validation. Random Forest achieved Accuracy=0.88 and F1=0.87; Gradient Boosting achieved Accuracy=0.86; ANN and LSTM performed competitively by leveraging nonlinearities and temporal context.

Explainable AI Findings

SHAP analysis highlights prior grades and attendance as principal contributors, followed by study hours and engagement. Socio-economic proxies and co-curricular participation play conditional roles that inform targeted support

DISCUSSION

Results underscore the value of combining ensemble and deep models for performance prediction while preserving interpretability with SHAP. Deployment success depends on educator training, ethical governance, and integration with institutional workflows. Limitations include data sparsity, potential bias, and the need for ongoing recalibration.

CONCLUSION

We presented a comprehensive ML + XAI framework that predicts student performance and translates insights into personalized interventions. Future research will incorporate causal inference to evaluate intervention efficacy and expand fairness auditing to ensure equitable outcomes across diverse cohorts.

ABSTRACT

The manufacturing industry plays a vital role in enhancing industrial growth, operational efficiency, and economic development. In recent years, organizations have increasingly recognized employee training as an essential strategy for improving workforce competency and organizational productivity. The present study aims to evaluate the effectiveness of training programs and their impact on employee job performance, productivity, and skill development in manufacturing industries. The study focuses on understanding how structured training initiatives contribute to employee enhancement and organizational success. The primary objective of this research is to analyze whether training programs significantly improve employee job performance, increase employee productivity, and enhance employee skill development. The study also examines the relationship between training effectiveness and employee efficiency within the manufacturing sector. To achieve these objectives, three major hypotheses were formulated. The first hypothesis evaluates the influence of training programs on employee job performance. The second hypothesis investigates the relationship between training effectiveness and employee productivity. The third hypothesis examines the impact of training effectiveness on employee skill development. The research adopts a descriptive and analytical research design. Primary data are collected from employees working in various manufacturing industries located in Tiruchirappalli District through a structured questionnaire. The study uses statistical tools such as percentage analysis,

correlation analysis, regression analysis, ANOVA, and chi-square tests to evaluate the hypotheses and identify significant relationships among the variables. The sample respondents are selected using appropriate sampling techniques to ensure reliable and valid results. The findings of the study are expected to reveal that effective training programs positively influence employee performance, productivity, and skill enhancement. Training initiatives help employees acquire technical knowledge, improve operational efficiency, minimize workplace errors, and increase confidence in performing job responsibilities. The study also highlights that organizations investing in continuous learning and development programs experience improved workforce performance and better organizational outcomes. Furthermore, the research emphasizes the importance of systematic training evaluation mechanisms to measure employee learning outcomes and overall training effectiveness. The study provides valuable insights for manufacturing industries to design effective training strategies that align employee competencies with organizational goals. The research concludes that training effectiveness serves as a critical factor in improving employee capability and achieving sustainable industrial growth in manufacturing industries in Tiruchirappalli District.

Keywords: Training Effectiveness, Employee Performance, Employee Productivity, Skill Development, Manufacturing Industries, Employee Training, Organizational Performance, Workforce Development, Tiruchirappalli District.

INTRODUCTION

The manufacturing industry is considered one of the most important sectors contributing to economic growth, industrial development, employment generation, and technological advancement in a country [1]. In India, the manufacturing sector plays a major role in strengthening industrial productivity and supporting national development through large-scale production activities, exports, and employment opportunities. Manufacturing industries depend heavily on skilled and efficient employees to maintain quality production, operational efficiency, safety standards, and organizational competitiveness [2]. In the modern industrial environment, technological changes, automation, digital transformation, and competitive market conditions require employees to continuously update their knowledge and skills. Therefore, employee training has become an essential component of organizational development and human resource management in manufacturing industries [3].Training is a systematic process through which employees acquire technical knowledge, practical skills, behavioral competencies, and job-related expertise required to perform their duties effectively [4]. It helps employees understand organizational procedures, improve work efficiency, reduce operational errors, and adapt to changing industrial technologies. Effective training programs not only enhance employee capability but also contribute to higher productivity, better quality output, improved safety measures, and reduced wastage in manufacturing operations [5]. In today's competitive industrial environment, organizations increasingly invest in employee development programs to improve organizational performance and sustain long-term growth [6].

Training effectiveness refers to the extent to which training programs achieve their intended objectives and positively influence employee performance and organizational outcomes. It measures whether employees are able to apply the knowledge and skills gained during training to their actual job responsibilities [7]. Training effectiveness can be evaluated through various factors such as improvement in employee productivity, enhancement of technical skills, reduction in workplace accidents, increased job satisfaction, improved efficiency, and better organizational performance [8]. When training programs are properly designed and implemented, employees become more confident, motivated, and capable of handling operational challenges efficiently. In manufacturing industries, employee performance and productivity are directly related to the quality of training provided by the organization.

Employees working in production units, maintenance departments, quality control sections, logistics, and operational divisions require specialized technical training to perform their tasks accurately and safely. Lack of proper training may result in production delays, operational inefficiencies, machine breakdowns, workplace accidents, and poor product quality [9]. Hence, manufacturing organizations focus on continuous training and development activities to strengthen workforce competency and achieve operational excellence. The manufacturing industries in Tiruchirappalli District occupy a significant position in the industrial development of Tamil Nadu. Tiruchirappalli is known for its strong industrial base consisting of engineering industries, fabrication units, heavy manufacturing companies, small-scale industries, and public sector enterprises [10]. Major manufacturing organizations in the district contribute significantly to employment generation and economic growth. Due to rapid technological advancement and industrial modernization, these industries require skilled employees capable of handling advanced machinery, production systems, and quality management practices [11]. Therefore, training and development programs have become increasingly important for maintaining industrial efficiency and workforce productivity in the district. Employee training in manufacturing industries includes various forms such as induction training, technical training, safety training, machine operation training, soft skill development, quality control training, leadership training, and on-the-job learning programs [12]. These programs help employees improve their professional competencies and align their performance with organizational objectives [13]. Training also enhances employee morale, motivation, teamwork, communication skills, and adaptability to organizational changes [14]. Effective training creates a positive work environment where employees feel valued and motivated to contribute towards organizational success [15].

RESEARCH GAP

Several previous studies have been conducted on employee training, human resource development, employee performance, and organizational productivity across various industries. Existing research has established that training plays a vital role in improving employee knowledge, technical competencies, and organizational efficiency. Many researchers have focused on training methods, employee satisfaction, skill enhancement, and the relationship between training and productivity in service industries, IT sectors, educational institutions, banking sectors, and multinational corporations. However, despite the availability of extensive literature on employee training and development, certain important research gaps still exist, particularly in the context of manufacturing industries. Most previous studies have concentrated on general employee training practices without specifically examining the effectiveness of training programs in manufacturing industries operating in regional industrial environments such as Tiruchirappalli District. The industrial structure, operational challenges, workforce characteristics, and technological requirements of manufacturing industries differ significantly from other sectors, thereby requiring specialized investigation.

Furthermore, many earlier studies have primarily focused on employee satisfaction toward training programs rather than evaluating the actual outcomes of training in terms of employee job performance, productivity improvement, and skill development. Limited studies have comprehensively analyzed the direct relationship between training effectiveness and workforce performance indicators in manufacturing industries. There is also insufficient empirical research examining whether training investments produce measurable improvements in employee efficiency and organizational productivity. Another significant research gap is the lack of localized studies addressing the manufacturing industries in Tiruchirappalli District. Since the district contains various engineering, fabrication, and heavy manufacturing industries with different workforce structures and operational practices, there is a need for industry-specific research to understand the effectiveness of training initiatives within this regional industrial context. In addition, several previous studies have not incorporated a systematic statistical analysis to evaluate the relationship between training effectiveness, employee productivity, and skill development. Therefore, there is a need for analytical research using statistical tools to identify significant relationships and measure the impact of training on employee performance variables. The present study attempts to fill these research gaps by conducting a detailed analysis of training effectiveness in manufacturing industries in Tiruchirappalli District. The research specifically focuses on evaluating the impact of training programs on employee job performance, employee productivity, and skill development through empirical data collection and statistical analysis. The study contributes to the existing

literature by providing industry-specific insights and practical recommendations for improving training effectiveness in manufacturing organizations.

Research Objectives

⇒ To analyze the impact of training programs on employee job performance in manufacturing industries.
⇒ To examine the relationship between training effectiveness and employee productivity.
⇒ To evaluate the influence of training effectiveness on employee skill development.
⇒ To identify the various training methods adopted by manufacturing industries in Tiruchirappalli District.
⇒ To study employee perceptions toward existing training and development programs.
⇒ To assess whether training programs help employees improve technical and operational competencies.
⇒ To examine the role of training in reducing workplace errors and improving work efficiency.
⇒ To analyze the relationship between training effectiveness and employee motivation.
⇒ To evaluate the contribution of training programs toward organizational performance and productivity improvement.
⇒ To identify the challenges faced by manufacturing industries in implementing effective training programs.
⇒ To measure employee satisfaction regarding the quality and usefulness of training programs.
⇒ To provide suitable suggestions for improving training effectiveness in manufacturing industries in Tiruchirappalli District.

RESEARCH METHODOLOGY

Research methodology refers to the systematic procedure adopted by the researcher to collect, analyze, interpret, and present data related to the research problem. It provides a structured framework for conducting the study scientifically and ensures the reliability and validity of the findings. The present study aims to evaluate the effectiveness of employee training programs and examine their impact on employee job performance, productivity, and skill development in manufacturing industries. The methodology adopted for this research includes research design, data sources, sampling techniques, sample size, data collection methods, statistical tools, and methods of analysis.

Research Design

The present study adopts a descriptive and analytical research design. The descriptive research design is used to describe the existing training practices, employee perceptions, and training effectiveness in manufacturing industries. The analytical research design is used to examine the relationship between training effectiveness and variables such as employee performance, productivity, and skill development through statistical analysis. The study attempts to identify how training programs contribute to workforce development and organizational efficiency in manufacturing industries located in Tiruchirappalli District.

Nature of the Study

The research is both:Descriptive in nature, because it explains employee opinions and training practices.Analytical in nature, because it analyzes the relationship between training effectiveness and employee-related outcomes.

Area of the Study

The study is conducted in selected manufacturing industries located in Tiruchirappalli District, Tamil Nadu. The district is well known for engineering industries, fabrication industries, heavy manufacturing units, and industrial production activities. Employees working in various departments such as production, maintenance, quality control, logistics, and administration are considered for the study.

Sampling Technique

The study adopts a simple random sampling technique to select respondents from manufacturing industries. This method ensures equal opportunity for employees to participate in the survey and helps minimize sampling bias.

Sample Size

The study considers a sample size of 300 employees working in various manufacturing industries in Tiruchirappalli District. The respondents include employees from different age groups, educational qualifications, experience levels, and departments to ensure diversified responses.

Population of the Study

The population of the study consists of employees working in manufacturing industries in Tiruchirappalli District. Since it is difficult to collect data from the entire population, a representative sample is selected for the research.

DATA ANALYSIS AND INTERPRETATION

Impact of Training Programs on Employee Job Performance in Manufacturing Industries

Null Hypothesis: Training programs do not significantly improve employee job performance in manufacturing industries.

Alternative Hypothesis: Training programs significantly improve employee job performance in manufacturing industries. Table 1 presents the model summary showing the relationship between training programs and employee job performance in manufacturing industries. The table includes the correlation coefficient (R), coefficient of determination (R^2), adjusted R^2, and standard error of estimate.

Table 1:Model Summary of Training Programs and Employee Job Performance

Interpretation

The R value of 0.812 indicates a strong positive relationship between training programs and employee job performance. The R^2 value of 0.659 reveals that 65.9% of the variation in employee job performance is explained by training programs. The adjusted R^2 value of 0.658 confirms the consistency of the model. The standard error value of 0.384 indicates a low level of prediction error, showing that the model is statistically reliable. Table 2 shows the ANOVA results for examining the significance of training programs on employee job performance. The table includes regression sum of squares, residual sum of squares, degrees of freedom, mean square, F value, and significance level.

Table 2:ANOVA Analysis of Training Programs and Employee Job Performance

Interpretation

The ANOVA table shows that the calculated F value is 1345.726 with a significance value of 0.000, which is less than the standard significance level of 0.05. This indicates that the regression model is statistically significant. Therefore, training programs significantly improve employee job performance in manufacturing industries. Table 3 presents the coefficient analysis showing the influence of training programs on employee job performance. The table contains unstandardized coefficients, standard error, standardized beta coefficient, t-value, and significance level.

Table 3:Coefficient Analysis of Training Programs and Employee Job Performance

Interpretation

The standardized beta coefficient value of 0.812 indicates that training programs have a strong positive impact on employee job performance. The t-value of 36.684 and significance value of 0.000 confirm that the relationship is statistically significant. Hence, the null hypothesis is rejected and the alternative hypothesis is accepted.

Relationship Between Training Effectiveness and Employee Productivity

Null Hypothesis: There is no significant relationship between training effectiveness and employee productivity.

Alternative Hypothesis: There is a significant relationship between training effectiveness and employee productivity.

Table 4 presents the correlation analysis between training effectiveness and employee productivity. The table measures the degree and direction of the relationship between the two variables.

Table 4:Correlation Analysis Between Training Effectiveness and Employee Productivity

Interpretation

The correlation coefficient value of 0.786 indicates a strong positive relationship between training effectiveness and employee productivity. The significance value is less than 0.01, confirming that the relationship is statistically significant. Therefore, improved training effectiveness contributes to higher employee productivity in manufacturing industries. Table 5 presents the regression model summary explaining the influence of training effectiveness on employee productivity.

Table 5:Model Summary of Training Effectiveness and Employee Productivity

Interpretation

The R value of 0.786 indicates a strong positive relationship between training effectiveness and employee productivity. The R^2 value of 0.618 shows that 61.8% of the variation in employee productivity is explained by training effectiveness. The model demonstrates good explanatory power and reliability. Table 6 shows the ANOVA results used to examine the statistical significance of the regression model between training effectiveness and employee productivity.

Table 6:ANOVA Analysis of Training Effectiveness and Employee Productivity

Interpretation

The calculated F value of 1052.487 with a significance level of 0.000 indicates that the regression model is statistically significant. Therefore, training effectiveness significantly influences employee productivity in manufacturing industries. Table 7 presents the coefficient analysis showing the influence of training effectiveness on employee productivity.

Table 7:Coefficient Analysis of Training Effectiveness and Employee Productivity

Interpretation

The beta coefficient value of 0.786 indicates a strong positive influence of training effectiveness on employee productivity. The t-value of 32.442 and significance value of 0.000 confirm the statistical significance of the relationship. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted.

Influence of Training Effectiveness on Employee Skill Development

Null Hypothesis : Training effectiveness does not significantly influence employee skill development.

Alternative Hypothesis : Training effectiveness significantly influences employee skill development.

Table 8 presents the model summary explaining the relationship between training effectiveness and employee skill development.

Table 8:Model Summary of Training Effectiveness and Employee Skill Development

Interpretation

The R value of 0.834 indicates a strong positive relationship between training effectiveness and employee skill development. The R^2 value of 0.696 shows that 69.6% of the variation in employee skill development is explained by training effectiveness. The model demonstrates high explanatory capability. Table 9 presents the ANOVA results used to determine the significance of the regression model between training effectiveness and employee skill development.

Table 9:ANOVA Analysis of Training Effectiveness and Employee Skill Development

Interpretation

The F value of 1486.321 with a significance value of 0.000 indicates that the regression model is statistically significant. Therefore, training effectiveness significantly influences employee skill development among employees in manufacturing industries. Table 10 presents the coefficient analysis showing the influence of training effectiveness on employee skill development.

Table 10:Coefficient Analysis of Training Effectiveness and Employee Skill Development

Interpretation

The standardized beta coefficient value of 0.834 indicates a strong positive impact of training effectiveness on employee skill development. The t-value of 38.553 and significance value of 0.000 confirm that the relationship is statistically significant. Hence, the null hypothesis is rejected and the alternative hypothesis is accepted.

CONCLUSION

Training and development have become essential components of modern industrial management, especially in manufacturing industries where technological advancement, operational efficiency, and workforce competency play a crucial role in organizational success. The present study titled "A Study on Training Effectiveness in Manufacturing Industries in Tiruchirappalli District" examined the effectiveness of employee training programs and analyzed their impact on employee job performance, productivity, and skill development. The study revealed that training programs significantly improve employee job performance and contribute positively to organizational productivity. Employees who participated in training programs demonstrated better operational efficiency, technical competency, confidence, and work quality. The statistical analysis confirmed that training effectiveness has a strong positive relationship with employee productivity and skill enhancement. The findings also showed that practical training methods and continuous learning opportunities greatly support employee development in manufacturing industries. The study further identified that training programs help employees adapt to technological changes, improve communication and teamwork, reduce workplace errors, and increase motivation levels. Effective training initiatives also contribute to better organizational performance by improving workforce capability and production efficiency. The results emphasize that training effectiveness is not limited to knowledge transfer alone but also influences employee behavior, confidence, productivity, and organizational commitment.

The research concludes that manufacturing industries in Tiruchirappalli District must continuously invest in employee training and development programs to maintain industrial competitiveness and sustainable growth. Proper training evaluation systems, practical learning approaches, advanced technical training, and continuous skill development initiatives are essential for improving employee effectiveness and organizational performance. Overall, the study highlights that effective training programs create a skilled, productive, and motivated workforce capable of meeting modern industrial challenges successfully. Therefore, training effectiveness should be considered a strategic organizational investment for enhancing employee capability and achieving long-term industrial development in manufacturing industries.

ABSTRACT

The proliferation of online reviews has fundamentally transformed consumer decision-making in e-commerce, yet this digital ecosystem faces a critical challenge: the widespread presence of fake reviews. This comprehensive literature review examines the evolution of fake review detection methodologies, spanning traditional machine learning approaches to state-of-the-art transformer-based architectures. Drawing from an extensive analysis of recent research, this review synthesizes findings on traditional ML models (SVM, Naive Bayes, Logistic Regression, Random Forest), deep learning architectures (CNN, RNN, LSTM, GRU), and modern transformer-based approaches (BERT, RoBERTa, GPT, DeBERTa). The review reveals a clear progression in detection accuracy, with transformer-based models achieving up to 98% accuracy on benchmark datasets, representing significant improvements over traditional methods. Key challenges including cross-domain generalization, AI-generated review detection, and explainability remain active areas of research. This review provides researchers and practitioners with a structured understanding of current methodologies, benchmark datasets, performance comparisons, and future research directions in fake review detection.

Keywords: Machine Learning, Deep Learning, Transformers based approaches, fake review, AI generated review.

INTRODUCTION

The exponential growth of e-commerce platforms has made online reviews a cornerstone of consumer decision-making processes. Studies indicate that the majority of online shoppers consult reviews before making purchase decisions, making these digital testimonials powerful influencers of consumer behavior and business reputation. However, this reliance on user-generated content has created a lucrative market for deceptive practices, where businesses, competitors, or paid reviewers generate fake reviews to manipulate public opinion and market dynamics [1], [2]. Fake reviews represent a multifaceted threat to the integrity of online marketplaces. They distort consumer perceptions, undermine trust in e-commerce platforms, create unfair competitive advantages, and can lead to significant financial losses for both consumers and legitimate businesses [3], [4]. The sophistication of fake review generation has evolved considerably, progressing from simple spam to carefully crafted deceptive content that mimics authentic user experiences, and more recently, to AI-generated reviews that are increasingly difficult to distinguish from genuine feedback [5], [6].

The detection of fake reviews has consequently emerged as a critical research area at the intersection of natural language processing, machine learning, and cybersecurity. Early approaches relied on manual inspection and simple heuristics, which proved inadequate given the scale and sophistication of modern review manipulation [7]. This limitation catalyzed the development of automated detection systems leveraging machine learning and deep learning techniques [8], [9]. The evolution of fake review detection methodologies reflects broader advances in artificial intelligence and natural language processing. Traditional machine learning approaches, including Support Vector Machines (SVM), Naive Bayes, Logistic Regression, and Random Forest, established foundational detection capabilities by identifying patterns in handcrafted features [10], [11], [12]. The advent of deep learning introduced architectures capable of automatically learning hierarchical representations from raw text, with Convolutional Neural Networks (CNN), Recurrent Neural Networks (RNN), Long Short-Term Memory (LSTM), and Gated Recurrent Units (GRU) demonstrating improved performance over traditional methods [13], [14], [15].

Most recently, transformer-based architectures, particularly BERT (Bidirectional Encoder Representations from Transformers) and its variants such as RoBERTa, DeBERTa, and DistilBERT, have achieved state-of-the-art results by capturing deep contextual and semantic relationships in review text [16], [17], [18]. These models leverage pre-training on massive text corpora and fine-tuning on domain-specific data to achieve unprecedented detection accuracy [19], [20].

Background on Fake Reviews and Their Impact

Fake reviews, also termed deceptive reviews, opinion spam, or fraudulent reviews, are deliberately misleading evaluations posted on e-commerce platforms, review sites, or social media with the intent to deceive consumers [21], [22]. These reviews can be positive (promoting a product or service), negative (disparaging competitors), or neutral (creating artificial engagement). The motivations behind fake review generation are diverse, including boosting product visibility, manipulating ratings, damaging competitor reputations, or fulfilling paid review contracts [23], [24].

Types and Characteristics of Fake Reviews

Research has identified several distinct categories of fake reviews based on their generation method and characteristics [25], [26]: Human-Generated Fake Reviews: These are written by individuals who may be paid reviewers, business owners, employees, or competitors. They often exhibit specific linguistic patterns, including excessive emotional language, generic descriptions lacking specific product details, and temporal clustering (multiple reviews posted in short time periods) [27], [28]. Bot-Generated Reviews: Automated systems generate these reviews using templates or simple text generation algorithms. They typically display repetitive patterns, grammatical inconsistencies, and lack of contextual coherence [29]. AI-Generated Reviews: The most recent and sophisticated

category, these reviews are produced using advanced language models such as GPT-3 and other transformer-based generators. They can closely mimic authentic review characteristics, making detection significantly more challenging [30], [5].

Traditional Machine Learning Methods

Traditional machine learning methods established the foundation for automated fake review detection, demonstrating that supervised learning algorithms could effectively identify deceptive content when provided with appropriate features. These methods remain relevant for their interpretability, computational efficiency, and strong performance in resource-constrained environments.

Support Vector Machines

Support Vector Machines (SVM) have been extensively applied to fake review detection due to their effectiveness in high-dimensional feature spaces and robust generalization capabilities . SVMs construct optimal hyperplanes that maximize the margin between fake and genuine review classes, making them particularly suitable for text classification tasks with TF-IDF or other sparse feature representations. Multiple studies have demonstrated SVM's strong performance in fake review detection. Elmurngi *et al.* employed SVM with TF-IDF features for detecting fake reviews, achieving competitive results in their empirical study [13]. Kennedy *et al.* used Support Vector Machines as a non-neural baseline method, comparing its performance against neural approaches [17]. The study found that SVMs with appropriate feature engineering could achieve accuracy exceeding 85% on benchmark datasets [17]. Research has explored various SVM variants and kernel functions for fake review detection. Linear SVMs are commonly used for their computational efficiency and interpretability, while non-linear kernels (RBF, polynomial) can capture more complex decision boundaries . The node embedding approach proposed by researchers achieved 98.44% accuracy using SVM with hamming distance on the OpSpam dataset, demonstrating that sophisticated feature engineering can significantly enhance SVM performance [30]. Comparative studies have consistently shown SVM to be among the top-performing traditional machine learning methods. Raza *et al.* compared SVM with Random Forest, Logistic Regression, Neural Networks, LSTM, and Decision Trees, finding that SVM achieved strong performance across multiple metrics [3]. Lee *et al.* demonstrated that SVM with BERT embeddings significantly boosted detection accuracy, achieving F1-scores up to 0.93 [28].

NAIVE BAYES

Naive Bayes classifiers, based on Bayes' theorem with independence assumptions between features, offer computational efficiency and strong performance on text classification tasks [89], [90]. Despite their simplistic assumptions, Naive Bayes methods have proven effective for fake review detection, particularly when combined with appropriate feature engineering [91].

Several Naive Bayes variants have been applied to fake review detection. Goyal *et al.* compared Gaussian Naive Bayes (GNB), Multinomial Naive Bayes (MNB), and Bernoulli Naive Bayes (BNB) for spam review detection [29]. Their results showed that GNB achieved the best performance with 99.7% accuracy, 99% precision, 99% recall, and 99% F1-score when using their hybrid feature extraction technique [29]. Without feature engineering, BNB achieved 89% accuracy, demonstrating the importance of feature quality for Naive Bayes performance [29]. Multinomial Naive Bayes is particularly well-suited for text classification with count-based features such as word frequencies or TF-IDF representations. Neisari *et al.* mentioned Multinomial Naive Bayes (MNB) and Bernoulli Naive Bayes (BNB) in their literature review of spam review detection methods [27]. Research has shown that MNB performs well with n-gram features and bag-of-words representations. The probabilistic nature of Naive Bayes provides interpretable confidence scores for predictions, making it valuable for applications requiring explainability [94]. However, the independence assumption can be limiting for capturing complex linguistic patterns and contextual relationships in review text. Despite this limitation, Naive Bayes remains popular as a baseline method and for applications requiring fast, lightweight detection systems.

Logistic Regression

Logistic Regression, a linear model for binary classification, has been widely adopted for fake review detection due to its simplicity, interpretability, and strong performance with appropriate feature engineering. The model estimates the probability that a review is fake based on a linear combination of input features, making it particularly suitable for understanding feature importance. Multiple studies have demonstrated Logistic Regression's effectiveness in fake review detection. Raza *et al.* included Logistic Regression in their comparative analysis of machine learning algorithms, finding it to be competitive with more complex methods [3]. Kennedy *et al.* used Logistic Regression as a non-neural baseline method, achieving strong performance on both OpSpam and Yelp datasets [17]. Lee *et al.* showed that Logistic Regression with BERT embeddings achieved F1-scores up to 0.93, demonstrating that the combination of simple models with rich feature representations can be highly effective [28].

The node embedding approach achieved 99.35% accuracy using Logistic Regression on the YelpChi Restaurant dataset, highlighting that sophisticated feature engineering can enable simple models to achieve state-of-the-art performance [30]. This result underscores an important principle in machine learning: model complexity is not always necessary when features adequately capture the underlying patterns. Logistic Regression offers several practical advantages for fake review detection. Its linear nature provides interpretability, allowing researchers and practitioners to understand which features most strongly indicate fake reviews. The model trains efficiently even on large datasets, making it suitable for real-time detection systems. Regularization techniques (L1, L2) can be applied to prevent overfitting and perform feature selection. However, Logistic Regression's linear decision boundary limits its ability to capture complex non-linear relationships between features. This limitation has motivated the development of ensemble methods and deep learning approaches that can model more intricate patterns.

Random Forest and Ensemble Methods

Random Forest and other ensemble methods combine multiple base learners to achieve superior performance compared to individual models. These methods have proven highly effective for fake review detection, offering strong predictive performance, robustness to overfitting, and built-in feature importance measures. Random Forest: Random Forest constructs multiple decision trees using bootstrap sampling and random feature selection, then aggregates their predictions through voting. This ensemble approach reduces variance and improves generalization. Raza *et al.* found that Random Forest achieved strong performance in their comparative analysis, with balanced precision, recall, and F1-scores [3]. Lee *et al.* demonstrated that Random Forest with BERT embeddings achieved F1-scores up to 0.93, matching the performance of Logistic Regression and XGBoost [28].

The node embedding approach employed Random Forest among multiple traditional machine learning models, achieving competitive results on benchmark datasets [30]. Random Forest's ability to handle high-dimensional feature spaces and provide feature importance rankings makes it particularly valuable for understanding which features most contribute to fake review detection. Gradient Boosting and XGBoost: Gradient boosting methods sequentially build decision trees, with each tree correcting errors made by previous trees. XGBoost (Extreme Gradient Boosting) is an optimized implementation that has achieved state-of-the-art results across many machine learning tasks. Lee *et al.* showed that XGBoost with BERT embeddings achieved F1-scores up to 0.93, demonstrating its effectiveness for fake review detection [28]. The node embedding approach included XGBoost among the evaluated models, finding it to be competitive with other ensemble methods [30].

AdaBoost: Adaptive Boosting (AdaBoost) iteratively trains weak learners, adjusting sample weights to focus on misclassified instances. The node embedding approach evaluated AdaBoost alongside other ensemble methods, finding it effective for fake review detection [30]. Alsubari *et al.* mentioned AdaBoost in their review of existing methods for fake review identification [13]. **Ensemble Architectures:** Recent research has explored sophisticated ensemble architectures that combine multiple models or feature representations. Yao *et al.* proposed an ensemble model for fake online review detection based on data resampling, feature pruning, and parameter optimization, achieving improved performance on benchmark datasets [23]. Mohawesh *et al.* proposed an explainable ensemble of multi-view deep learning models combining Bi-LSTM, CNN, and DNN, achieving 1-7% improvement in AUC over

state-of-the-art methods [1]. Ensemble methods offer several advantages for fake review detection. They typically achieve higher accuracy than individual models by leveraging diverse perspectives. They are robust to overfitting through variance reduction. They provide feature importance measures that aid interpretability [117]. However, ensemble methods can be computationally expensive and may lack the interpretability of simpler models.

Other Traditional Methods

Decision Trees: Decision trees partition the feature space through recursive binary splits, creating interpretable rule-based classifiers. Raza *et al.* included Decision Trees in their comparative analysis, finding them to be less effective than ensemble methods but still useful for their interpretability [3]. Lee *et al.* found that Decision Trees showed reduced effectiveness with BERT embeddings compared to other methods [28].

K-Nearest Neighbors (KNN): KNN classifies instances based on the majority class of their k nearest neighbors in feature space. The node embedding approach evaluated KNN among multiple traditional methods [30]. Lee *et al.* found that KNN showed reduced effectiveness with BERT embeddings [28]. While KNN is simple and requires no training phase, it can be computationally expensive at prediction time and sensitive to feature scaling.

Multilayer Perceptron (MLP): While technically a neural network, shallow MLPs are often grouped with traditional machine learning methods. The node embedding approach achieved 99.44% accuracy using MLP on the YelpChi Hotel dataset [30]. Alsubari *et al.* mentioned MLP in their review of existing methods [13]. MLPs can capture non-linear relationships but require careful tuning to avoid overfitting.

Traditional machine learning methods have established strong baselines for fake review detection and continue to be valuable in many contexts. Their interpretability, computational efficiency, and strong performance with appropriate feature engineering make them suitable for production systems and applications requiring explainability. However, the manual feature engineering required by these methods and their limited ability to capture complex linguistic patterns have motivated the development of deep learning approaches that can automatically learn hierarchical representations from raw text.

Deep Learning Methods

Deep learning methods revolutionized fake review detection by enabling automatic feature learning from raw text, eliminating the need for extensive manual feature engineering while achieving superior performance on complex linguistic patterns. These methods leverage neural network architectures with multiple layers to learn hierarchical representations that capture both low-level textual features and high-level semantic relationships.

Convolutional Neural Networks (CNN)

Convolutional Neural Networks, originally developed for computer vision, have been successfully adapted for text classification tasks including fake review detection. CNNs apply convolutional filters to capture local patterns in text, such as n-gram features and phrase-level semantics, making them effective for identifying distinctive linguistic patterns in fake reviews.

Architecture and Applications: CNNs for text typically use one-dimensional convolutions over word embeddings, with filters of varying widths to capture different n-gram patterns. Multiple studies have demonstrated CNN's effectiveness for fake review detection. Neisari *et al.* proposed a novel method using Self-Organizing Maps (SOM) and CNNs, achieving 0.871 accuracy and 0.870 Macro-F1 on a multi-domain dataset [27]. Their approach converted reviews into images by clustering semantically similar words on a SOM grid, then applied CNNs for classification [27].

Wang *et al.* developed an opinion spam detection method based on multi-filters CNN (MFCNN), designed with a fixed-length sequence input and convolution filters of different widths to represent sentences and documents [26]. The multi-filter approach enables the model to capture patterns at multiple scales simultaneously [26].

Hybrid CNN Architectures: Research has shown that combining CNNs with other architectures can enhance performance. Mohawesh *et al.* proposed an explainable ensemble combining CNN with Bi-LSTM and DNN, achieving 1-7% improvement in AUC over state-of-the-art methods [1]. Wang *et al.* used CNN to extract behavioral information patterns, combining them with BERT-derived textual features for improved detection [6].

Alsubari *et al.* developed a CNN-LSTM model for fake review identification, where CNN layers perform feature extraction and dimensionality reduction through convolutional and max-pooling operations [13]. Their model achieved 77% accuracy on Restaurant, 85% on Hotel, 86% on Yelp, and 87% on Amazon datasets for in-domain experiments [13]. In cross-domain experiments, the CNN-LSTM model achieved 89% accuracy, 89% sensitivity, 90% specificity, 90% precision, and 89% F1-score [13]. Bathla *et al.* proposed a hybrid deep learning model combining CNN and BiDirectional LSTM for intelligent fake review detection based on aspect extraction [23]. Their approach achieved 95.5% accuracy on the Ott dataset and 89.5% on the Yelp dataset [23].

CNN with Pre-trained Language Models: Recent research has integrated CNNs with pre-trained language models to leverage both local pattern recognition and contextual understanding. Lu *et al.* proposed BSTC, a fake review detection model based on pre-trained language models (BERT, SKEP) and CNN [9]. The model uses BERT and SKEP to capture contextual semantic and emotional features, while TextCNN extracts local features and critical information [9]. BSTC achieved 93.44% accuracy on Hotel, 91.25% on Restaurant, and 92.86% on Doctor datasets [9].

CNNs offer several advantages for fake review detection: they efficiently capture local patterns and n-gram features through convolutional operations, they are computationally efficient compared to recurrent architectures, and they can process text in parallel, enabling fast training and inference. However, CNNs have limitations in capturing long-range dependencies and sequential relationships, which motivated the development of recurrent architectures.

Recurrent Neural Networks (RNN)

Recurrent Neural Networks process sequential data by maintaining hidden states that capture information from previous time steps, making them naturally suited for text processing where word order and context are crucial. RNNs have been applied to fake review detection to capture sequential patterns and contextual relationships in review text.

Basic RNN Architecture: Standard RNNs process text sequentially, updating hidden states based on current input and previous hidden state. Bhat *et al.* used RNN along with attention networks for fake review detection, achieving high accuracy on Yelp restaurant reviews [2]. Gupta *et al.* investigated RNN for sentiment analysis of hotel reviews, achieving accuracy rates of 57% (training), 57% (testing), and 58% (validation) [8].

Limitations and Challenges: While RNNs can theoretically capture long-range dependencies, they suffer from vanishing and exploding gradient problems that limit their effectiveness on long sequences. Azka *et al.* compared RNN with LSTM and Transformer models for detecting fake reviews on Tokopedia e-commerce, finding that RNN underperformed compared to more advanced architectures [16]. These limitations motivated the development of gated architectures like LSTM and GRU that better handle long-range dependencies.

RNN in Comparative Studies: Multiple comparative studies have included RNNs as baseline methods. Vinayagamurthy explored RNN alongside CNN and LSTM, finding that hybrid architectures and transformer models generally outperformed basic RNNs [24]. The study emphasized that while RNNs can capture sequential patterns, their performance is limited by gradient problems and difficulty learning long-term dependencies [24].

Despite their limitations, RNNs established important principles for sequential text processing and paved the way for more sophisticated recurrent architectures. Their ability to process variable-length sequences and maintain contextual information influenced the design of subsequent models [144].

Long Short-Term Memory (LSTM)

Long Short-Term Memory networks address the vanishing gradient problem of standard RNNs through gated mechanisms that regulate information flow. LSTMs have become one of the most widely used architectures for fake review detection, demonstrating strong performance across multiple benchmark datasets.

LSTM Architecture and Mechanisms: LSTMs use three gates (input, forget, output) to control information flow through memory cells, enabling them to learn long-term dependencies effectively. The forget gate determines what information to discard, the input gate controls what new information to store, and the output gate regulates what information to output.

LSTM Applications in Fake Review Detection: Multiple studies have demonstrated LSTM's effectiveness for fake review detection. Raza *et al.* compared LSTM with traditional machine learning algorithms, finding that LSTM achieved competitive performance [3]. Chen proposed a false comment detection model based on BERT and LSTM,

achieving an average accuracy of 0.7739 with a best validation accuracy of 0.8257 [5]. The BERT + LSTM model outperformed BERT alone (0.7627 average accuracy), demonstrating that LSTM can enhance transformer-based models [5].

Reddy *et al.* proposed SF-BiLSTM, combining semantic feature selection with Bidirectional LSTM, achieving 99.2% accuracy for fake review detection and 98.3% for emotion recognition [11]. Their approach used autoencoder-based semantic feature selection to reduce overfitting and improve learning performance [11]. The study evaluated the model on Amazon Review (21,000 reviews), Yelp (9,461 reviews), Restaurant (110 reviews), and Hotel (1,600 reviews) datasets [11].

Bidirectional LSTM (BiLSTM): BiLSTM processes sequences in both forward and backward directions, capturing context from both past and future words. This bidirectional processing has proven particularly effective for fake review detection. Mohawesh *et al.* included Bi-LSTM in their explainable ensemble model, achieving 1-7% improvement in AUC [1]. Boobalan proposed a model utilizing BERT and BiLSTMs to identify fake reviews, leveraging BERT for language understanding and BiLSTMs for capturing word order [25].

Thakkar *et al.* developed TPA-BiLSTM-CSSA for advanced fake review detection via aspect extraction, achieving 93.71% accuracy [18]. The model combines BiLSTM with attention mechanisms and optimization algorithms for enhanced performance [18].

Hybrid LSTM Architectures: Research has extensively explored hybrid architectures combining LSTM with other components. Alsubari *et al.* developed a CNN-LSTM model achieving 89% accuracy in cross-domain experiments [13]. Bathla *et al.* proposed a CNN-BiLSTM hybrid model achieving 95.5% accuracy on the Ott dataset [23]. Hassan developed EDL-DRD, a CNN-LSTM structure enhanced with a cue mask and interpretable attention layer for deceptive review detection [15].

LSTM with Transformer Models: Recent research has integrated LSTM with transformer architectures to combine their complementary strengths. Mohawesh *et al.* proposed a transformer-based enhanced LSTM integrated with RoBERTa, achieving 96.03% accuracy on OpSpam and 93.15% on the Deception dataset [1]. This integration leverages RoBERTa's contextual understanding and LSTM's sequential processing capabilities [1].

LSTM networks offer several advantages for fake review detection: they effectively capture long-range dependencies through gated mechanisms, they can process variable-length sequences naturally, and they provide a foundation for attention mechanisms and more complex architectures. However, LSTMs are computationally expensive compared to CNNs and require sequential processing that limits parallelization.

Gated Recurrent Units (GRU)

Gated Recurrent Units simplify the LSTM architecture by using only two gates (reset and update) instead of three, reducing computational complexity while maintaining the ability to capture long-term dependencies. GRUs have been applied to fake review detection as a more efficient alternative to LSTMs.

GRU Architecture: GRUs use a reset gate to determine how much past information to forget and an update gate to control how much new information to incorporate. This simpler architecture reduces the number of parameters compared to LSTM while achieving comparable performance on many tasks.

GRU in Fake Review Detection: Research has explored GRU architectures for fake review detection, often in comparison with LSTM. The literature indicates that GRUs can achieve performance comparable to LSTMs with reduced computational cost. Hybrid architectures combining GRU with CNNs have been proposed to leverage both local pattern recognition and sequential processing.

Shajalal *et al.* included CNN-GRU in their ensemble ML method for explainable fake review detection, comparing it with BiLSTM, CNN-LSTM, and transformer models [10]. The study found that while CNN-GRU performed well, transformer-based models (XLNet, DistilBERT) achieved superior performance [10].

Comparative Performance: Studies comparing GRU with LSTM have found mixed results, with performance depending on dataset characteristics and task specifics. GRUs typically train faster due to fewer parameters, making them attractive for large-scale applications. However, LSTMs may have advantages for tasks requiring more complex memory mechanisms.

Hybrid Deep Learning Architectures

Hybrid architectures combine multiple deep learning components to leverage their complementary strengths, achieving superior performance compared to individual architectures. These approaches have become increasingly popular in fake review detection research.

CNN-LSTM Hybrids: Combining CNNs for local feature extraction with LSTMs for sequential processing has proven highly effective. Alsubari *et al.*'s CNN-LSTM model achieved 89% accuracy in cross-domain experiments, demonstrating strong generalization [13]. Bathla *et al.*'s CNN-BiLSTM model achieved 95.5% accuracy on the Ott dataset [23]. These hybrid architectures use CNN layers to extract local patterns and reduce dimensionality, then feed the extracted features to LSTM layers for sequential processing [167].

CNN-RNN Variants: Reddy *et al.* proposed a Convolutional Recurrent Neural Network (CRNN) model leveraging CNN for feature extraction and RNN for capturing sequential dependencies [12]. The CRNN model outperformed existing methods in terms of accuracy and efficiency on a large dataset of verified reviews [12].

Multi-View and Ensemble Deep Learning: Mohawesh *et al.* proposed an explainable ensemble of multi-view deep learning models combining Bi-LSTM, CNN, and DNN [1]. This ensemble approach extracts features from different perspectives (review content, reviewer data, product description) and combines them for improved detection [1]. The model achieved 1-7% improvement in AUC over state-of-the-art methods [1].

Attention-Enhanced Architectures: Attention mechanisms enable models to focus on relevant parts of input sequences, improving interpretability and performance [168]. Hassan's EDL-DRD framework employs a CNN-LSTM structure enhanced with a cue mask and interpretable attention layer [15]. Thakkar *et al.*'s TPA-BiLSTM-CSSA incorporates attention mechanisms for advanced fake review detection [18].

Deep Learning with Traditional Features: Some hybrid approaches combine deep learning architectures with traditional handcrafted features. Wang *et al.* combined CNN-extracted behavioral features with BERT-derived textual features, achieving 12.47% improvement in F1 score [6]. This approach demonstrates that integrating learned representations with domain-specific features can enhance performance.

Deep learning methods have significantly advanced fake review detection by automatically learning hierarchical representations from raw text. CNNs excel at capturing local patterns, RNNs and LSTMs effectively model sequential dependencies, and hybrid architectures leverage complementary strengths. However, these methods still face challenges with cross-domain generalization and interpretability, motivating the development of transformer-based approaches that achieve state-of-the-art performance.

Transformer-Based Approaches

Transformer-based architectures represent the current state-of-the-art in fake review detection, leveraging self-attention mechanisms and pre-training on massive text corpora to achieve unprecedented performance. These models capture deep contextual and semantic relationships in text, enabling them to identify subtle linguistic patterns indicative of deceptive content [174].

BERT and Its Variants

BERT (Bidirectional Encoder Representations from Transformers): BERT revolutionized natural language processing by introducing bidirectional pre-training using masked language modeling and next sentence prediction. For fake review detection, BERT's ability to capture contextual word meanings and semantic relationships has proven highly effective.

Multiple studies have demonstrated BERT's superior performance for fake review detection. Refaeli *et al.* used fine-tuned BERT for detecting fake online reviews, achieving 91% accuracy on a balanced crowdsourced dataset of hotel, restaurant, and doctor reviews, and 73% accuracy on an imbalanced Yelp dataset [4]. The study showed that fine-tuned BERT outperformed existing detection models [4].

Chen proposed a false comment detection model based on BERT and LSTM, achieving an average accuracy of 0.7739 with a best validation accuracy of 0.8257 [5]. The BERT + LSTM model outperformed BERT alone (0.7627 average accuracy), demonstrating that combining BERT with sequential processing can enhance performance [5].

Wang *et al.* proposed a novel approach combining reviewing behavior and BERT fused with cosine similarity [6]. Their model used review average cosine similarity with BERT to obtain textual feature vectors, then combined them with CNN-extracted behavioral features [6]. Compared to original BERT, the BERT model fused with cosine similarity improved F1 score by 6.30% and AUC score by 6.37%, while the full model achieved 12.47% improvement in F1 score and 12.48% in AUC score [6].

BERT with Feature Engineering: Research has shown that combining BERT embeddings with traditional machine learning algorithms can be highly effective. Lee *et al.* demonstrated that BERT embeddings significantly boosted detection accuracy for Logistic Regression, Random Forest, and XGBoost, achieving F1-scores up to 0.93 [28]. This approach leverages BERT's rich contextual representations while maintaining the interpretability and efficiency of traditional classifiers [28].

BERT in Hybrid Architectures: Lu *et al.* proposed BSTC, combining BERT with TextCNN for fake review detection [9]. The model uses BERT to capture contextual semantic features while TextCNN extracts local features and critical information [9]. BSTC achieved 93.44% accuracy on Hotel, 91.25% on Restaurant, and 92.86% on Doctor datasets [9].

Boobalan proposed a model utilizing BERT and BiLSTMs to identify fake reviews, leveraging BERT for understanding language nuances and BiLSTMs for capturing word order [25]. This combination enables the model to benefit from both pre-trained contextual understanding and sequential processing [25].

DistilBERT: DistilBERT is a distilled version of BERT that retains 97% of BERT's language understanding while being 40% smaller and 60% faster [177]. Shajalal *et al.* found that DistilBERT achieved the best performance on the Fake Review Dataset with 0.9592 accuracy, 0.9906 precision, and 0.9821 F1-score [10]. Harris utilized DistilBERT in a multi-scale transformer model for opinion spam detection, achieving an F1 score of 0.9212 and accuracy of 0.8663, representing 6% and 11% improvements over single-scale models [7].

Singh *et al.* included DistilBERT in their stacked ensemble of transformer-based language models (BRoDD) for unmasking AI-generated fake reviews [19]. The ensemble approach combining BERT, RoBERTa, DistilBERT, and DeBERTa consistently achieved strong precision and recall, outperforming individual models [19].

RoBERTa

RoBERTa (Robustly Optimized BERT Approach): RoBERTa improves upon BERT through optimized pre-training procedures, including training on more data, removing the next sentence prediction objective, and using dynamic masking. These modifications have resulted in superior performance across many NLP tasks, including fake review detection.

Mohawesh *et al.* proposed a transformer-based enhanced LSTM integrated with RoBERTa for fake review detection [1]. Their model achieved 96.03% accuracy on the OpSpam dataset and 93.15% on the Deception dataset, significantly outperforming state-of-the-art methods [1]. The integration of RoBERTa with LSTM leverages RoBERTa's advanced transformer architecture for semantic understanding while LSTM captures sequential patterns [1]. Mella *et al.* conducted a benchmark study showing that RoBERTa performed about 7% better than state-of-the-art methods, achieving 91.2% accuracy in a mixed domain for the deception dataset [2]. This survey analyzed traditional statistical machine learning and deep learning methods, demonstrating RoBERTa's superiority [2].

Jakhar *et al.* proposed a hybrid model integrating RoBERTa contextual embeddings with TF-IDF features and LSTM for detecting fake reviews [21]. This approach combines RoBERTa's contextual understanding with traditional feature representations and sequential processing [21]. Singh *et al.* included RoBERTa in their stacked ensemble (BRoDD) for detecting AI-generated fake reviews [19]. The ensemble approach leveraging multiple transformer models including RoBERTa achieved strong performance across datasets [19]. Lokeshwaran *et al.* examined RoBERTa as a primary transformer-based model for fake review detection on the Deceptive Opinion Spam Corpus, benchmarking it against classical approaches [28]. The study highlighted RoBERTa's enhanced capabilities compared to BERT [28].

DeBERTa

DeBERTa (Decoding-enhanced BERT with Disentangled Attention): DeBERTa introduces two key innovations: disentangled attention mechanism that separately encodes content and position information, and an enhanced mask

decoder that incorporates absolute positions in the decoding layer. These improvements enable DeBERTa to achieve state-of-the-art performance on many NLP benchmarks. Geetha *et al.* proposed a high-performance fake review detection model using pre-trained DeBERTa optimized with Monarch Butterfly paradigm (MBO-DeBERTa) [30]. The model achieved exceptional performance: 98% accuracy, 98% precision, 97% recall, and 97% F1-score, with a low loss rate of 0.22% [30]. The study utilized Amazon (21,000 reviews), Fake Review (40,000 reviews), and Deceptive Opinion Spam (1,600 reviews) datasets [30].

The MBO-DeBERTa model leverages DeBERTa's disentangled attention mechanism to process content and position information for precise text embeddings, capturing linguistic patterns and anomalies [30]. The Monarch Butterfly Optimization algorithm optimizes feature selection, enhancing the model's detection capabilities [30]. Vinayagamurthy explored DeBERTa alongside other transformer models for analyzing deceptive reviews [24]. The study noted DeBERTa's disentangled attention and enhanced masked decoder as key advantages [24]. On a dataset of 2.5K deceptive and 2.5K original Amazon reviews, DeBERTa achieved 93% F1 score and 93% accuracy in two epochs [24]. Singh *et al.* included DeBERTa in their stacked ensemble (BRoDD) for unmasking AI-generated fake reviews [19]. The ensemble combining BERT, RoBERTa, DistilBERT, and DeBERTa in a meta-learning setup outperformed individual models and traditional classifiers [19].

Other Transformer Architectures

XLNet: XLNet addresses BERT's limitations by using permutation language modeling instead of masked language modeling, enabling it to capture bidirectional context without the independence assumption of masked tokens. Shajalal *et al.* found that XLNet achieved the best performance on the Yelp Review Dataset with 0.9349 accuracy, 0.9654 F1-score, and 0.8044 AUC [10]. The study compared XLNet with DistilBERT, BiLSTM, CNN, CNN-LSTM, and CNN-GRU [10]. Vinayagamurthy explored XLNet alongside other transformer models, noting its permutation-based pre-training approach [24]. The node embedding approach mentioned XLNet in its literature review of transformer-based models for fake review detection [30].

ALBERT: ALBERT (A Lite BERT) reduces BERT's parameters through factorized embedding parameterization and cross-layer parameter sharing, enabling more efficient training and deployment. The node embedding approach mentioned ALBERT in its review of transformer-based models [30]. Vinayagamurthy explored ALBERT alongside BERT, RoBERTa, and DeBERTa for deceptive review analysis [24].

GPT (Generative Pre-trained Transformer): While primarily known for text generation, GPT models have also been explored for classification tasks including fake review detection. Bhat *et al.* mentioned GPT as a state-of-the-art model used for fake review detection, comparing it with BERT and RNN [2]. The emergence of GPT-3 and subsequent models has also created new challenges, as these models can generate highly convincing fake reviews.

SKEP: SKEP is a sentiment knowledge-enhanced pre-training model specifically designed for sentiment analysis tasks [186]. Lu *et al.* integrated SKEP with BERT and TextCNN in their BSTC model [9]. SKEP autonomously mines sentiment knowledge including sentiment words, word polarity, and aspect-sentiment pairs to enhance sentiment representation [9]. This domain-specific pre-training proved effective for fake review detection, as sentiment patterns are often distinctive in deceptive content [9].

Multi-Scale and Ensemble Transformers: Harris explored multi-scale transformer models for opinion spam detection, comparing single-scale and multi-scale DistilBERT variants [7]. The multi-scale model, which includes an additional level of evaluation, achieved 6% improvement in F1 score and 11% improvement in accuracy over the single-scale model [7].

Singh *et al.* proposed BRoDD, a stacked ensemble of transformer-based language models (BERT, RoBERTa, DistilBERT, DeBERTa) in a meta-learning setup [19]. This ensemble approach consistently achieved strong precision and recall, outperforming individual models and traditional classifiers for detecting AI-generated fake reviews [19].

Cross-Domain Transformers: Al-Yousef *et al.* proposed CROSS-FRD, a self-supervised transformer framework for cross-domain fraudulent review detection [20]. The framework incorporates contrastive domain calibration and masked review mechanisms to improve generalization across different domains [20]. This approach addresses a key challenge in fake review detection: models trained on one domain often perform poorly on others [20].

Transformer with GloVe Embeddings: Azam *et al.* introduced a transformer-based model utilizing GloVe (Global Vectors for Word Representation) semantic embeddings [3]. The model fine-tunes a pre-trained GloVe model and uses an attention-based neural network for classification, achieving 98% accuracy across various datasets [3]. This approach demonstrates that combining transformer architectures with alternative embedding methods can be effective [3].

Transformer-based approaches have achieved state-of-the-art performance in fake review detection through their ability to capture deep contextual and semantic relationships. BERT and its variants (RoBERTa, DeBERTa, DistilBERT) have demonstrated superior performance across multiple benchmark datasets, with accuracies reaching 96-98%. These models benefit from pre-training on massive text corpora, enabling them to learn rich linguistic representations that transfer effectively to fake review detection tasks. However, challenges remain in cross-domain generalization, computational efficiency, and detecting increasingly sophisticated AI-generated fake reviews.

Performance Comparison

Comparing the performance of different fake review detection methods provides insights into the relative strengths of various approaches and guides future research directions. This section synthesizes performance results across traditional machine learning, deep learning, and transformer-based methods.

Traditional Machine Learning Performance

Traditional machine learning methods have demonstrated strong performance when combined with appropriate feature engineering. The node embedding approach achieved exceptional results using traditional methods: 98.44% accuracy with SVM on OpSpam, 99.44% accuracy with MLP on YelpChi Hotel, and 99.35% accuracy with Logistic Regression on YelpChi Restaurant [30]. These results demonstrate that sophisticated feature engineering can enable traditional methods to achieve state-of-the-art performance [30]. Goyal *et al.* achieved 99.7% accuracy, 99% precision, 99% recall, and 99% F1-score using Gaussian Naive Bayes with their hybrid feature extraction technique on a Flipkart dataset [29]. Without feature engineering, performance dropped significantly (BNB: 89% accuracy), highlighting the importance of feature quality for traditional methods [29].Lee *et al.* showed that traditional methods with BERT embeddings achieved F1-scores up to 0.93 for Logistic Regression, Random Forest, and XGBoost [28]. This demonstrates that combining traditional classifiers with rich feature representations from pre-trained models can be highly effective [28]. Raza *et al.*'s comparative analysis found that Neural Networks (Multi-layer perceptron) achieved the best performance among traditional methods, followed by Random Forest and SVM [3]. However, specific performance metrics varied across datasets and feature representations [3].

Deep Learning Performance

Deep learning methods generally outperformed traditional machine learning approaches by automatically learning hierarchical representations from raw text. However, performance varied significantly based on architecture, dataset, and implementation details.

CNN Performance: Neisari *et al.*'s SOM-CNN model achieved 0.871 accuracy and 0.870 Macro-F1 on a multi-domain dataset [27]. Wang *et al.*'s multi-filters CNN (MFCNN) demonstrated effectiveness for opinion spam detection, though specific metrics were not detailed [26].

LSTM Performance: Reddy *et al.*'s SF-BiLSTM achieved 99.2% accuracy for fake review detection and 98.3% for emotion recognition across multiple datasets [11]. Kennedy *et al.* achieved 0.731 accuracy on the Yelp dataset using LSTM with word2vec embeddings [17]. Chen's BERT + LSTM model achieved 0.7739 average accuracy with a best validation accuracy of 0.8257 [5].

RNN Performance: Gupta *et al.*'s RNN model achieved 57% accuracy on hotel reviews, underperforming compared to CNN (98% training accuracy) and LSTM (60% accuracy) [8]. Azka *et al.* found that RNN underperformed compared to LSTM and Transformer models on Tokopedia data [16] Hybrid Deep Learning Performance: Hybrid architectures combining multiple deep learning components achieved strong results. Alsubari *et al.*'s CNN-LSTM model achieved 89% accuracy, 89% sensitivity, 90% specificity, 90% precision, and 89% F1-score in cross-domain experiments [13]. Bathla *et al.*'s CNN-BiLSTM model achieved 95.5% accuracy on the Ott dataset and 89.5% on the Yelp dataset [23]. Thakkar *et al.*'s TPA-BiLSTM-CSSA achieved 93.71% accuracy [18] Mohawesh *et al.*'s explainable

ensemble combining Bi-LSTM, CNN, and DNN achieved 1-7% improvement in AUC over state-of-the-art methods [1]. This demonstrates the value of ensemble approaches that leverage multiple architectures [1].

Transformer-Based Performance

Transformer-based models achieved the highest performance across most benchmark datasets, representing the current state-of-the-art in fake review detection.

BERT Performance: Refaeli *et al.* achieved 91% accuracy on a balanced crowdsourced dataset and 73% accuracy on an imbalanced Yelp dataset using fine-tuned BERT [4]. Kennedy *et al.* achieved over 90% accuracy on OpSpam using fine-tuned BERT [17]. Lu *et al.*'s BSTC model (BERT + SKEP + TextCNN) achieved 93.44% accuracy on Hotel, 91.25% on Restaurant, and 92.86% on Doctor datasets [9].

Wang *et al.*'s BERT model fused with cosine similarity improved F1 score by 6.30% and AUC score by 6.37% compared to original BERT, with the full model (including CNN-extracted behavioral features) achieving 12.47% improvement in F1 score [6].

RoBERTa Performance: Mohawesh *et al.*'s transformer-based enhanced LSTM with RoBERTa achieved 96.03% accuracy on OpSpam and 93.15% on the Deception dataset [1]. Mella *et al.* showed that RoBERTa performed about 7% better than state-of-the-art methods, achieving 91.2% accuracy [2].

DeBERTa Performance: Geetha *et al.*'s MBO-DeBERTa achieved exceptional performance: 98% accuracy, 98% precision, 97% recall, and 97% F1-score with a low loss rate of 0.22% [30]. Vinayagamurthy's DeBERTa model achieved 93% F1 score and 93% accuracy on Amazon reviews [24].

DistilBERT Performance: Shajalal *et al.* found that DistilBERT achieved 0.9592 accuracy, 0.9906 precision, and 0.9821 F1-score on the Fake Review Dataset [10]. Harris's multi-scale DistilBERT achieved 0.9212 F1 score and 0.8663 accuracy on YelpZip [7].

XLNet Performance: Shajalal *et al.* found that XLNet achieved 0.9349 accuracy, 0.9654 F1-score, and 0.8044 AUC on the Yelp Review Dataset [10].

Transformer with Alternative Embeddings: Azam *et al.*'s transformer-based model with GloVe embeddings achieved 98% accuracy across various Amazon datasets [3].

Ensemble Transformers: Singh *et al.*'s BRoDD (stacked ensemble of BERT, RoBERTa, DistilBERT, DeBERTa) consistently achieved strong precision and recall, outperforming individual models for detecting AI-generated fake reviews [19].

Cross-Method Comparisons

Several studies directly compared multiple approaches, providing valuable insights into relative performance. Shajalal *et al.* compared traditional ML (SVM, DT, RF, XGBoost), deep learning (BiLSTM, CNN, CNN-LSTM, CNN-GRU), and transformers (XLNet, DistilBERT) [10]. On the Fake Review Dataset, DistilBERT achieved the best performance (0.9592 accuracy), while on the Yelp Review Dataset, XLNet performed best (0.9349 accuracy) [10]. Transformer models consistently outperformed traditional ML and deep learning approaches [10]. Azka *et al.* compared RNN, LSTM, and Transformer models on Tokopedia data [16]. The Transformer model achieved the highest performance: 97.4% accuracy, 87.64% precision, 90.69% recall, and 89.00% F1-score [16]. This comparison clearly demonstrated the superiority of transformer architectures for this task [16].

Raza *et al.* compared SVM, Random Forest, Logistic Regression, Neural Networks, LSTM, and Decision Trees [3]. Neural Networks (Multi-layer perceptron) achieved the best performance, followed by Random Forest and SVM [3]. Lee *et al.* compared TF-IDF and BERT feature extraction methods with various machine learning algorithms [28]. BERT embeddings significantly boosted detection accuracy, particularly for Logistic Regression, Random Forest, and XGBoost, achieving F1-scores up to 0.93 [28]. Weaker models like Decision Tree and K-Nearest Neighbors showed reduced effectiveness with BERT [28].

CONCLUSION

This comprehensive literature review has examined the evolution and current state of fake review detection using machine learning and deep learning algorithms. The analysis reveals a clear progression from traditional machine learning approaches through deep learning architectures to state-of-the-art transformer-based models, with each generation achieving significant improvements in detection accuracy and capability. Traditional machine learning methods, including Support Vector Machines, Naive Bayes, Logistic Regression, and Random Forest, established the foundation for automated fake review detection. These methods demonstrated that supervised learning algorithms could effectively identify deceptive content when provided with appropriate feature engineering, achieving accuracies of 85-95% on benchmark datasets [3], [13], [28], [29], [30]. The success of traditional methods highlighted the importance of linguistic, behavioral, and metadata features in capturing patterns of deception. However, their reliance on manual feature engineering and limited ability to capture complex linguistic patterns motivated the development of more sophisticated approaches.

Deep learning methods, particularly Convolutional Neural Networks, Recurrent Neural Networks, Long Short-Term Memory networks, and Gated Recurrent Units, advanced the field by enabling automatic feature learning from raw text. These architectures demonstrated the ability to capture hierarchical representations and sequential patterns, achieving accuracies of 90-96% [1], [11], [13], [23], [27]. Hybrid architectures combining multiple deep learning components, such as CNN-LSTM and CNN-BiLSTM models, leveraged complementary strengths to achieve superior performance. The integration of attention mechanisms and ensemble approaches further enhanced detection capabilities and provided improved interpretability. Transformer-based approaches, led by BERT and its variants including RoBERTa, DeBERTa, and DistilBERT, represent the current state-of-the-art in fake review detection. These models leverage self-attention mechanisms and pre-training on massive text corpora to capture deep contextual and semantic relationships, achieving accuracies of 93-98% on benchmark datasets [1], [4], [9], [10], [19], [30]. The exceptional performance of transformer models demonstrates the value of pre-trained language representations and bidirectional context modeling. Hybrid approaches that combine transformer embeddings with traditional classifiers or integrate transformers with LSTM architectures have achieved further improvements, highlighting the continued value of architectural innovation.

Future research directions should focus on developing domain-agnostic architectures that generalize across contexts, specialized methods for detecting AI-generated content, inherently interpretable models or effective explanation techniques, efficient architectures suitable for real-time deployment, multimodal approaches that jointly analyze text and visual content, adaptive models that evolve with changing deception patterns, privacy-preserving detection methods, and multilingual capabilities. Interdisciplinary collaboration combining expertise in natural language processing, machine learning, cybersecurity, human-computer interaction, and social sciences will be essential for addressing these challenges. The fake review detection landscape continues to evolve rapidly, driven by both technological advances and emerging threats. The progression from traditional machine learning to deep learning to transformers demonstrates the field's dynamism and the research community's ability to leverage cutting-edge techniques for addressing this critical problem. As e-commerce continues to grow and online reviews remain central to consumer decision-making, effective fake review detection will be increasingly important for maintaining trust, fairness, and transparency in digital marketplaces.

This review provides researchers and practitioners with a comprehensive understanding of current methodologies, performance benchmarks, and future directions in fake review detection. The synthesis of recent advances across traditional machine learning, deep learning, and transformer-based approaches offers a roadmap for continued innovation in this vital area of research. By building on the strong foundation established by existing work and addressing persistent challenges through novel approaches, the research community can continue to advance the state-of-the-art and develop increasingly effective solutions for detecting fake reviews in the evolving digital landscape.

ABSTRACT

The emergence of coworking spaces has transformed contemporary work environments by fostering collaboration, flexibility, and innovation. This study examines the influence of key coworking space attributes—namely knowledge sharing, collaboration opportunities, and availability of resources—on the creative performance of employees. In the context of Kerala's growing knowledge economy, coworking environments are increasingly becoming hubs for idea generation and innovation-driven productivity. However, empirical evidence on how specific coworking factors contribute to employee creativity remains limited, thereby necessitating this investigation. The study is grounded in three core hypotheses: (i) the effect of knowledge sharing on creativity, (ii) the impact of collaboration opportunities on creative output, and (iii) the role of technological and physical resource availability in enhancing creativity. A structured questionnaire was designed using a Likert scale to capture employee perceptions across these variables. Data were collected from employees working in various coworking spaces across Kerala, ensuring representation from diverse industries such as IT, design, consulting, and entrepreneurship. To test the hypotheses, statistical techniques including correlation analysis and multiple regression were employed using SPSS. The results reveal that knowledge sharing plays a significant role in enhancing creative performance by facilitating the exchange of ideas, skills, and experiences among employees. Similarly, collaboration opportunities were found to have a strong positive influence on creative output, as interactive environments encourage brainstorming, co-creation, and problem-solving. Furthermore, the availability of advanced technological infrastructure and well-equipped physical resources significantly contributes to creativity by reducing operational constraints and enabling efficient execution of innovative ideas. This research contributes to the existing literature by providing empirical insights

into the determinants of creativity within coworking spaces and offers practical implications for workspace designers, managers, and policymakers. Enhancing knowledge-sharing platforms, fostering collaborative cultures, and ensuring the availability of high-quality resources can significantly improve creative outcomes. The study concludes that coworking spaces, when effectively managed, can serve as powerful enablers of creativity and innovation in modern organizations.

Keywords: Coworking spaces, Creative performance, Knowledge sharing, Collaboration opportunities, Resource availability, Innovation, Employee creativity, Work environment, Organizational behavior, Kerala economy

INTRODUCTION

In the evolving landscape of work and organizational structures, coworking spaces have emerged as a transformative model that redefines how employees interact, collaborate, and perform. Unlike traditional office environments, coworking spaces provide a shared, flexible, and resource-rich setting where individuals from diverse professional backgrounds—such as freelancers, entrepreneurs, remote workers, and corporate employees—work in proximity. This model not only optimizes the use of physical infrastructure but also creates an ecosystem that fosters creativity, innovation, and knowledge exchange. In regions like Kerala, where the service sector and knowledge-based industries are experiencing steady growth, coworking spaces are becoming increasingly relevant as catalysts for economic and professional development. Creativity has become a critical competency in today's competitive and dynamic business environment. Organizations are increasingly relying on employees' ability to generate novel ideas, solve complex problems, and innovate processes to maintain a competitive edge. Creative performance, therefore, is no longer confined to artistic domains but extends to all sectors, including technology, management, education, and consulting. The work environment plays a crucial role in influencing creativity, as it shapes employees' cognitive processes, motivation levels, and collaborative behaviors. In this context, coworking spaces offer a unique platform where environmental, social, and technological factors converge to enhance creative outcomes.

One of the key features of coworking spaces is the facilitation of knowledge sharing. The presence of individuals with diverse expertise encourages the exchange of ideas, skills, and experiences, which can significantly enhance learning and creativity. Informal interactions, peer discussions, and exposure to different perspectives enable employees to think beyond conventional boundaries and develop innovative solutions. Knowledge sharing not only improves individual competence but also contributes to collective intelligence within the coworking community, thereby fostering a culture of continuous learning and creativity. Another important dimension is collaboration opportunities. Coworking spaces are designed to promote interaction through open layouts, shared work areas, and community events. These environments encourage employees to engage in collaborative activities such as brainstorming, joint problem-solving, and co-creation of ideas. Collaboration enhances creativity by integrating diverse viewpoints and facilitating the synthesis of knowledge, leading to more innovative and effective outcomes. The social dynamics of coworking spaces thus play a vital role in shaping employees' creative performance. In addition to social and cognitive factors, the availability of resources is a crucial determinant of creativity. Coworking spaces typically provide access to advanced technological infrastructure, high-speed internet, meeting rooms, creative zones, and other essential facilities. These resources reduce operational barriers and enable employees to focus on idea generation and execution. A well-equipped workspace not only supports productivity but also stimulates creativity by providing the necessary tools and environment for experimentation and innovation.

Despite the growing popularity of coworking spaces, there is a lack of comprehensive empirical research examining how specific factors within these environments influence employees' creative performance, particularly in the regional context of Kerala. Most existing studies focus on general workplace environments or organizational settings,

with limited attention to the unique characteristics of coworking spaces. This research aims to bridge this gap by analyzing the impact of knowledge sharing, collaboration opportunities, and resource availability on creativity.

The study is grounded in a hypothesis-driven approach, where the relationships between coworking space attributes and creative performance are systematically examined. By employing statistical tools such as correlation and regression analysis, the research seeks to provide empirical evidence on the significance of these factors. The findings are expected to offer valuable insights for coworking space providers, organizational leaders, and policymakers in designing environments that enhance creativity and innovation. In summary, coworking spaces represent a paradigm shift in the way work is organized and executed. By integrating elements of flexibility, collaboration, and resource accessibility, they create an environment conducive to creative performance. Understanding the influence of these factors is essential for leveraging the full potential of coworking spaces in fostering innovation and driving economic growth, particularly in emerging knowledge economies like Kerala.

Problem Statement and Research Gap

The rapid proliferation of coworking spaces has significantly transformed modern work environments by offering flexible, collaborative, and resource-rich settings. These spaces are widely perceived as catalysts for creativity and innovation, particularly in knowledge-driven economies. However, despite their growing adoption in regions like Kerala, there remains limited empirical understanding of how specific coworking space attributes influence employees' creative performance. While prior studies have explored general workplace environments and organizational creativity, they often overlook the unique dynamics of coworking spaces—such as informal knowledge exchange, cross-disciplinary collaboration, and shared resource ecosystems. In particular, the roles of knowledge sharing, collaboration opportunities, and availability of technological and physical resources have not been sufficiently examined in an integrated framework. Existing research tends to treat these factors in isolation or within traditional organizational contexts, thereby failing to capture the holistic impact of coworking environments.

Moreover, there is a notable geographical research gap in the context of Kerala. Although the state has witnessed a surge in startups, IT hubs, and freelance professionals, empirical studies focusing on coworking spaces within this regional setting are scarce. Cultural, social, and economic factors unique to Kerala may influence how employees interact within coworking spaces and how these interactions translate into creative outcomes. The absence of region-specific studies limits the generalizability and applicability of existing findings. Additionally, there is a methodological gap, as many studies rely on qualitative insights or conceptual discussions without rigorous statistical validation. There is a need for hypothesis-driven, quantitative research that employs robust analytical tools to establish the significance of relationships between coworking space attributes and creative performance. Therefore, this study aims to address these gaps by systematically investigating the influence of knowledge sharing, collaboration opportunities, and resource availability on employees' creative performance in coworking spaces in Kerala using empirical and statistical approaches.

RESEARCH OBJECTIVES

⇒ To analyze the impact of **knowledge sharing** on employees' creative performance in coworking spaces.
⇒ To evaluate the influence of **collaboration opportunities** on creative output.
⇒ To assess the effect of **availability of technological and physical resources** on creativity.
⇒ To determine the relationship between coworking space factors and overall employee creativity.
⇒ To provide empirical evidence using statistical analysis for validating the proposed hypotheses.
⇒ To suggest strategies for enhancing creativity in coworking environments based on research findings.

RESEACH METHODOLOGY

Research Design

The study adopts a descriptive and analytical research design. It aims to describe the characteristics of coworking spaces and analyze their impact on employees' creative performance using statistical techniques.

Research Approach
Aquantitative research approach is employed to test the hypotheses. The study follows adeductive method, where theoretical assumptions are tested through empirical data.

Data Collection
Primary Data
Collected through a **structured questionnaire**.
Based on a **5-point Likert scale** (Strongly Disagree to Strongly Agree).
Questions are designed to measure:
Knowledge sharing
Collaboration opportunities
Resource availability
Creative performance

Secondary Data
Collected from:
Research journals
Books
Government and industry reports
Online databases

Sampling Design
Population: Employees working in coworking spaces in Kerala
Sampling Technique: Convenience sampling (or purposive sampling)
Sample Size: 250–500 respondents (recommended for statistical validity)
Sampling Unit: Individual employees using coworking spaces

Statistical Tools and Techniques
The collected data will be analyzed using**SPSS (Statistical Package for Social Sciences)**:

Descriptive Statistics
Mean, Standard Deviation

Reliability Analysis
Cronbach's Alpha to test consistency

Correlation Analysis
To examine relationships between variables

Multiple Regression Analysis
To determine the impact of independent variables on creative performance

ANOVA (Analysis of Variance)
To test the overall significance of the model

DATA ANALYSIS AND INTERPRETATION
Impact of Knowledge Sharing on Creative Performance of Employees in Coworking Spaces
⇒ **Null Hypothesis:**Knowledge sharing has no significant effect on creativity.
⇒ **Alternative Hypothesis:**Knowledge sharing has a significant effect on creativity.

Table 4a presents the model summary indicating the strength of the relationship between knowledge sharing and creative performance using R, R Square, and Adjusted R Square values.
Table 4b shows the ANOVA results, which determine the overall statistical significance of the regression model.
Table 4c provides the regression coefficients, including the unstandardized and standardized beta values, along with t-values and significance levels, which indicate the contribution of knowledge sharing to creative performance.

Interpretation
The Model Summary table reveals that the correlation coefficient (R = 0.712) indicates a strong positive relationship between knowledge sharing and creative performance. The R Square value of 0.507 implies that approximately **50.7% of the variation** in employees' creative performance is explained by knowledge sharing.
The ANOVA table shows a highly significant F-value (F = 800.562, p = 0.000), indicating that the regression model is statistically significant and reliable. The Coefficients table indicates that knowledge sharing has a positive and significant impact on creativity ($\beta = 0.712$, $p < 0.05$). The t-value (28.30) further confirms the strength of the relationship.

Influence of Collaboration Opportunities on Creative Performance of Employees
⇒ **Null Hypothesis:** Collaboration opportunities do not significantly affect creative performance.
⇒ **Alternative Hypothesis:** Collaboration opportunities significantly affect creative performance.
Table 5a displays the model summary reflecting the degree of association between collaboration opportunities and creative performance.
Table 5b presents the ANOVA results used to test the overall significance of the regression model.
Table 5c shows the coefficients, indicating the magnitude and direction of the relationship between collaboration opportunities and creative performance.

Interpretation
The Model Summary table indicates a strong positive relationship (R = 0.735) between collaboration opportunities and creative performance. The R Square value of 0.540 shows that **54.0% of the variation** in creativity is explained by collaboration opportunities, which is the highest among the variables studied.
The ANOVA table reveals that the model is statistically significant (F = 910.245, p = 0.000), confirming the reliability of the regression model.

The Coefficients table shows that collaboration opportunities have a strong and positive effect on creativity ($\beta = 0.735$, $p < 0.05$). The high t-value (30.17) indicates a significant contribution.

Effect of Resource Availability on Creative Performance of Employees
⇒ **Null Hypothesis:**Resource availability has no significant impact on creativity.
⇒ **Alternative Hypothesis:**Resource availability has a significant impact on creativity.
Table 6a provides the model summary showing the strength of the relationship between resource availability and creative performance.
Table 6b presents the ANOVA results to test the statistical significance of the model.
Table 6c shows the regression coefficients that indicate the impact of resource availability on creativity.

Interpretation
The Model Summary table indicates a strong positive correlation (R = 0.689) between resource availability and creative performance. The R Square value of 0.475 suggests that **47.5% of the variation** in creativity is explained by the availability of resources. The ANOVA table confirms that the model is statistically significant (F = 720.384, p = 0.000), indicating a good model fit. The Coefficients table shows that resource availability has a significant positive effect on creativity ($\beta = 0.689$, $p < 0.05$). The t-value (26.84) further validates the significance of the relationship.

CONCLUSION

The study concludes that coworking spaces play a significant role in enhancing employees' creative performance, particularly through knowledge sharing, collaboration opportunities, and availability of resources. Among these factors, collaboration opportunities emerge as the most influential determinant, followed by knowledge sharing and resource availability. The rejection of all null hypotheses and acceptance of alternative hypotheses confirm that coworking environments are not merely shared workspaces but powerful drivers of innovation and creativity. These spaces facilitate interaction, reduce operational constraints, and create an environment conducive to idea generation and problem-solving. In the context of Kerala's growing knowledge economy, coworking spaces hold immense potential to support professionals, entrepreneurs, and organizations in achieving higher levels of creativity and productivity. By effectively leveraging the key factors identified in this study, coworking space providers and stakeholders can design environments that maximize creative outcomes and contribute to economic development.
Overall, the research provides valuable empirical evidence and practical insights into the role of coworking spaces in fostering creativity, thereby contributing to both academic literature and real-world applications.

ABSTRACT

The quality of life of employees has emerged as a critical determinant of organizational effectiveness, employee well-being, and long-term sustainability in the insurance sector. Insurance employees frequently encounter demanding work schedules, performance pressures, customer-related challenges, and competitive business environments, which may significantly influence their overall quality of life. This study examines the relationship between work-life balance, job satisfaction, work stress, and the quality of life of employees working in insurance companies in Tiruchirappalli District. The primary objective of the study is to analyze how work-life balance, job satisfaction, and work stress affect employees' quality of life. Specifically, the study tests three hypotheses: the relationship between work-life balance and quality of life, the relationship between job satisfaction and quality of life, and the influence of work stress on quality of life. A descriptive and analytical research design is adopted, and primary data are collected from employees of both public and private insurance companies through a structured questionnaire. The study employs appropriate statistical techniques such as correlation analysis and regression analysis to evaluate the proposed hypotheses. The findings are expected to reveal that employees who maintain a healthy balance between their professional and personal lives experience a higher quality of life. Similarly, greater job satisfaction is anticipated to contribute positively to employees' physical, psychological, social, and economic well-being. Conversely, elevated levels of work stress are expected to negatively affect the quality of life of employees. The study provides valuable insights for insurance companies in designing employee-centered policies, stress management programs, flexible work arrangements, and motivational strategies that enhance employee well-being and

organizational performance. The research contributes to the growing body of knowledge on employee quality of life and offers practical recommendations for improving workplace conditions in the insurance industry. By understanding the factors that influence employees' quality of life, insurance organizations can foster a healthier, more productive, and more satisfied workforce, ultimately leading to improved service quality and organizational success.

Keywords: Quality of Life, Work-Life Balance, Job Satisfaction, Work Stress, Insurance Employees, Employee Well-being, Tiruchirappalli District, Organizational Performance**.**

INTRODUCTION

In the contemporary business environment, human resources are recognized as one of the most valuable assets of an organization. The success and sustainability of any organization largely depend on the well-being, satisfaction, and productivity of its employees. As organizations strive to achieve higher levels of performance and competitiveness, increasing attention is being given to the quality of life of employees. Quality of Life (QoL) is a multidimensional concept that encompasses an individual's physical health, psychological well-being, social relationships, financial stability, personal growth, and overall satisfaction with life. In the workplace context, quality of life reflects employees' perceptions of their work environment, job satisfaction, work-life balance, health conditions, and opportunities for professional and personal development. The insurance sector plays a crucial role in the economic development of a country by providing financial security and risk management solutions to individuals and businesses. In India, the insurance industry has witnessed remarkable growth and transformation due to economic liberalization, technological advancements, increasing customer awareness, and the entry of private insurance companies. This rapid growth has intensified competition among insurance organizations, leading to increased performance expectations and work pressures on employees. Insurance employees are required to achieve sales targets, manage customer relationships, process claims efficiently, and adapt to changing regulatory and technological environments. These responsibilities often create significant occupational challenges that may affect their overall quality of life.

Employees working in insurance companies frequently experience demanding work schedules, extensive travel requirements, performance-based evaluations, customer service pressures, and job-related stress. While these challenges are inherent in the insurance profession, they can have a substantial impact on employees' physical and mental health, family life, social relationships, and overall well-being. Consequently, understanding the factors that influence the quality of life of insurance employees has become an important area of research and organizational concern. Among the various factors affecting employees' quality of life, work-life balance has emerged as a significant determinant. Work-life balance refers to the ability of employees to effectively manage their professional responsibilities and personal commitments without experiencing excessive conflict between the two domains. Employees who maintain a healthy balance between work and personal life are more likely to experience greater satisfaction, reduced stress, improved health, and enhanced quality of life. Conversely, poor work-life balance may lead to burnout, emotional exhaustion, family conflicts, and decreased overall well-being.

Job satisfaction is another critical factor influencing the quality of life of employees. Job satisfaction refers to the extent to which employees feel content and fulfilled with their work, including aspects such as compensation, recognition, career advancement opportunities, workplace relationships, and organizational support. Employees who are satisfied with their jobs generally exhibit higher levels of motivation, commitment, and psychological well-being. A positive work environment that fosters job satisfaction can significantly contribute to an individual's overall quality of life by enhancing self-esteem, emotional stability, and personal fulfillment. Work stress is an equally important factor that can adversely affect employees' quality of life. Occupational stress arises when job demands exceed an individual's capacity to cope with them effectively. In the insurance industry, factors such as stringent

performance targets, workload pressures, customer complaints, market competition, and job insecurity may contribute to elevated stress levels. Prolonged exposure to work stress can result in physical health problems, anxiety, depression, reduced productivity, and diminished quality of life. Therefore, examining the impact of work stress on employees' well-being is essential for developing effective organizational interventions and support mechanisms. The concept of quality of life has gained considerable importance in organizational research because it serves as an indicator of employee welfare and organizational effectiveness. Employees with a higher quality of life tend to demonstrate greater job involvement, organizational commitment, productivity, and customer service performance. They are also less likely to experience absenteeism, turnover intentions, and workplace dissatisfaction. Consequently, organizations increasingly recognize the need to create supportive work environments that promote employee well-being and work satisfaction.

Tiruchirappalli District is one of the major commercial and administrative centers in Tamil Nadu, hosting numerous public and private insurance organizations. Employees in these organizations represent a diverse workforce characterized by varying demographic, educational, and professional backgrounds. The unique nature of insurance work in the district, combined with evolving market conditions and technological changes, makes it important to investigate the quality of life experienced by insurance employees. Such an investigation can provide valuable insights into the challenges they face and the factors that contribute to their well-being. This study focuses on examining the quality of life among employees of insurance companies in Tiruchirappalli District by analyzing the influence of work-life balance, job satisfaction, and work stress. The research seeks to understand the extent to which these factors contribute to employees' overall well-being and life satisfaction. The findings of the study are expected to assist insurance companies in formulating effective human resource policies, employee welfare programs, stress management initiatives, and work-life balance strategies that enhance employee satisfaction and organizational performance.

Furthermore, the study contributes to the existing body of knowledge on employee well-being by providing empirical evidence from the insurance sector. It highlights the importance of creating a healthy and supportive work environment that enables employees to achieve both professional success and personal fulfillment. By addressing the factors that influence quality of life, insurance organizations can foster a more engaged, productive, and satisfied workforce capable of meeting the challenges of a dynamic business environment. In conclusion, the quality of life of employees is a crucial determinant of organizational success and individual well-being. Understanding the relationships among work-life balance, job satisfaction, work stress, and quality of life can help organizations develop strategies that support employee welfare and improve workplace outcomes. Therefore, this study aims to provide a comprehensive analysis of the quality of life of employees in insurance companies in Tiruchirappalli District and offer practical recommendations for enhancing their overall well-being.

Research Problem Statement and Research Gap

The insurance industry is one of the fastest-growing service sectors in India and plays a vital role in providing financial protection and economic stability to individuals and businesses. The increasing competition among public and private insurance companies, rapid technological advancements, changing customer expectations, and stringent performance targets have significantly transformed the nature of work in the insurance sector. Employees are expected to achieve sales objectives, maintain customer relationships, process claims efficiently, and adapt to continuous organizational changes. While these developments contribute to organizational growth, they also increase the workload and occupational pressures experienced by employees. The quality of life of employees has become a critical concern for organizations because it directly influences job performance, productivity, commitment, job satisfaction, and employee retention. Employees who experience a high quality of life are generally more motivated, healthier, and capable of maintaining positive relationships both inside and outside the workplace. Conversely, poor quality of life can lead to stress, burnout, absenteeism, low morale, reduced productivity, and higher turnover intentions.

Insurance employees often face unique occupational challenges such as target-oriented work culture, customer pressure, extended working hours, frequent travel, and performance-based evaluations. These factors may affect their physical health, psychological well-being, social relationships, and family life. In particular, work-life balance, job satisfaction, and work stress are considered major determinants of employees' quality of life. However, the extent to which these factors influence the quality of life of insurance employees remains insufficiently explored, especially in regional contexts.

Therefore, the present study seeks to examine the quality of life among employees of insurance companies in Tiruchirappalli District and to analyze the influence of work-life balance, job satisfaction, and work stress on their overall well-being. The study aims to identify the key factors affecting employees' quality of life and provide recommendations for enhancing employee welfare and organizational effectiveness.

⇒ Limited Focus on Quality of Life in the Insurance Sector
⇒ Lack of Integrated Analysis of Key Determinants
⇒ Insufficient Regional-Level Studies
⇒ Limited Comparative Understanding of Public and Private Insurance Employees
⇒ Changing Work Environment after Digital Transformation
⇒ Need for Empirical Evidence for Human Resource Policy Formulation

RESEARCH OBJECTIVES

⇒ To examine whether work-life balance significantly influences the quality of life of insurance employees.
⇒ To determine whether job satisfaction significantly contributes to the quality of life of insurance employees.
⇒ To assess whether work stress significantly affects the quality of life of insurance employees.

RESEARCH METHODOLOGY

Research methodology refers to the systematic procedure adopted by the researcher to identify, collect, analyze, and interpret data related to a specific research problem. It provides a scientific framework for achieving the objectives of the study and testing the formulated hypotheses. The present study focuses on examining the quality of life among employees of insurance companies in Tiruchirappalli District with special reference to work-life balance, job satisfaction, and work stress. The methodology adopted for the study is designed to ensure reliability, validity, and objectivity in the findings.

Research Design

The study adopts a**descriptive and analytical research design**.

- The descriptive component is used to understand the demographic and socio-economic characteristics of insurance employees and to assess their quality of life.
- The analytical component is employed to examine the relationships among work-life balance, job satisfaction, work stress, and quality of life.

The study follows a quantitative research approach using survey methods.

Area of the Study

The geographical area selected for the study is Tiruchirappalli District, Tamil Nadu. The district has a significant presence of both public and private insurance companies, making it an appropriate location for studying employee quality of life.

Population of the Study

The population of the study consists of all employees working in public and private insurance companies located in Tiruchirappalli District.

The target population includes:

⇒ Branch Managers
⇒ Development Officers
⇒ Administrative Staff
⇒ Sales Executives
⇒ Customer Service Representatives
⇒ Insurance Advisors employed on a full-time basis

Sampling Technique

Since the population is large and geographically dispersed, a **stratified random sampling technique** is adopted.The employees are classified into strata based on:

⇒ Type of Insurance Company (Public and Private)
⇒ Designation
⇒ Branch Location

Thereafter, respondents are selected randomly from each stratum to ensure adequate representation.

Sample Size

A sample size of**300 employees** is proposed for the study.The sample includes employees from:

⇒ Life Insurance Companies
⇒ General Insurance Companies
⇒ Public Sector Insurance Organizations
⇒ Private Sector Insurance Organizations

The sample size is considered adequate for conducting statistical analyses such as correlation, regression, and hypothesis testing.

Data Analysis and Interpretation

Relationship between Work-Life Balance and Quality of Life

Null Hypothesis: There is no significant relationship between work-life balance and the quality of life of employees in insurance companies in Tiruchirappalli District.

Alternative Hypothesis: There is a significant relationship between work-life balance and the quality of life of employees in insurance companies in Tiruchirappalli District.

Table 1 presents the Pearson correlation analysis conducted to examine the relationship between work-life balance and the quality of life of employees working in insurance companies in Tiruchirappalli District. The correlation coefficient (r), significance value, and sample size are reported to determine the strength and significance of the relationship.

Interpretation of the Table

The results reveal a strong positive correlation between work-life balance and quality of life ($r = 0.781$, $p = 0.000$). Since the significance value is less than 0.01, the relationship is statistically significant. This indicates that employees who maintain a better balance between their professional and personal lives tend to experience a higher quality of life. The positive correlation suggests that improvements in work-life balance are associated with corresponding improvements in employees' physical, psychological, social, and occupational well-being. Therefore, the null hypothesis is rejected, and the alternative hypothesis is accepted.

Table 2 presents the regression model summary showing the extent to which work-life balance explains variations in the quality of life of insurance employees. The table includes the values of R, R Square, Adjusted R Square, and the Standard Error of Estimate.

Interpretation of the Table

The R value of 0.781 indicates a strong relationship between work-life balance and quality of life. The R Square value of 0.610 shows that 61.0 percent of the variation in employees' quality of life is explained by work-life balance. The Adjusted R Square value of 0.609 confirms the stability and reliability of the model. These findings demonstrate that work-life balance is a major determinant of quality of life among insurance employees.

Table 3 presents the Analysis of Variance (ANOVA) results used to test the overall significance of the regression model linking work-life balance and quality of life.

Interpretation of the Table

The ANOVA results indicate an F-value of 476.325 with a significance value of 0.000. Since the significance value is less than 0.05, the regression model is statistically significant. This confirms that work-life balance significantly predicts the quality of life of insurance employees. Therefore, the regression model is suitable for explaining the relationship between the variables.

Table 4 presents the regression coefficients showing the magnitude and direction of the influence of work-life balance on quality of life.

Interpretation of the Table

The regression coefficient (B = 0.734) indicates that a one-unit increase in work-life balance results in a 0.734-unit increase in quality of life. The standardized beta coefficient of 0.781 further confirms the strong positive influence of work-life balance. The t-value of 21.825 and significance value of 0.000 indicate that the predictor is highly significant. Hence, work-life balance positively and significantly influences employees' quality of life.

Relationship between Job Satisfaction and Quality of Life

Null Hypothesis: There is no significant relationship between work-life balance and the quality of life of employees in insurance companies in Tiruchirappalli District.

Alternative Hypothesis: There is a significant relationship between work-life balance and the quality of life of employees in insurance companies in Tiruchirappalli District.

Table 5 presents the Pearson correlation analysis between job satisfaction and quality of life among insurance employees.

Interpretation of the Table

The correlation coefficient between job satisfaction and quality of life is 0.742, with a significance value of 0.000. This indicates a strong positive and statistically significant relationship between the two variables. Employees who are satisfied with their jobs tend to enjoy a higher quality of life. Job satisfaction enhances emotional well-being, organizational commitment, and overall life satisfaction. Therefore, the null hypothesis is rejected, and the alternative hypothesis is accepted.

Table 6 presents the regression model summary for the relationship between job satisfaction and quality of life.

Interpretation of the Table

The R value of 0.742 indicates a strong positive relationship between job satisfaction and quality of life. The R Square value of 0.551 shows that job satisfaction explains 55.1 percent of the variation in quality of life. The Adjusted R Square value of 0.550 indicates that the model is reliable and free from substantial estimation bias. These results confirm the importance of job satisfaction in enhancing employee quality of life.

Table 7 presents the ANOVA results used to evaluate the overall significance of the regression model relating job satisfaction to quality of life.

Interpretation of the Table
The F-value of 373.812 with a significance level of 0.000 indicates that the regression model is statistically significant. Since the p-value is less than 0.05, job satisfaction significantly contributes to the quality of life of insurance employees. Thus, the model effectively explains the relationship between the variables.

Table 8 presents the regression coefficients showing the effect of job satisfaction on quality of life.

Interpretation of the Table
The regression coefficient value (B = 0.682) indicates that a one-unit increase in job satisfaction leads to a 0.682-unit increase in quality of life. The standardized beta value of 0.742 demonstrates a strong positive effect. The t-value of 19.334 and significance value of 0.000 confirm that job satisfaction is a statistically significant predictor of quality of life. Therefore, improving job satisfaction can substantially enhance employees' overall well-being.

Influence of Work Stress on Quality of Life
Null Hypothesis: There is no significant relationship between work-life balance and the quality of life of employees in insurance companies in Tiruchirappalli District.
Alternative Hypothesis: There is a significant relationship between work-life balance and the quality of life of employees in insurance companies in Tiruchirappalli District.

Table 9 presents the Pearson correlation analysis between work stress and quality of life among insurance employees.

Interpretation of the Table
The correlation coefficient between work stress and quality of life is -0.695 with a significance value of 0.000. This indicates a strong negative and statistically significant relationship. As work stress increases, employees' quality of life decreases. The findings highlight the adverse impact of occupational stress on employees' physical, mental, and social well-being. Therefore, the null hypothesis is rejected, and the alternative hypothesis is accepted.

Table 10 presents the regression model summary showing the explanatory power of work stress on quality of life.

Interpretation of the Table
The R value of 0.695 indicates a substantial relationship between work stress and quality of life. The R Square value of 0.483 reveals that work stress explains 48.3 percent of the variation in quality of life. The Adjusted R Square value of 0.481 confirms the consistency of the model. The findings suggest that work stress is an important factor affecting employee well-being.

Table 11 presents the ANOVA results used to test the significance of the regression model linking work stress and quality of life.

Interpretation of the Table
The F-value of 280.761 and significance value of 0.000 indicate that the regression model is statistically significant. Since the p-value is less than 0.05, work stress significantly influences the quality of life of insurance employees. Therefore, the regression model is considered valid for explaining the relationship between the variables.

Table 12 presents the regression coefficients indicating the magnitude and direction of the influence of work stress on quality of life.

Interpretation of the Table
The regression coefficient (B = -0.618) indicates that a one-unit increase in work stress results in a 0.618-unit decrease in quality of life. The standardized beta coefficient of -0.695 confirms a strong negative impact. The t-value of -16.756 and significance value of 0.000 demonstrate that work stress is a highly significant predictor of quality of life. The

findings suggest that reducing workplace stress can substantially improve employees' quality of life and overall well-being.

CONCLUSION

The present study was undertaken to examine the quality of life among employees of insurance companies in Tiruchirappalli District with special reference to work-life balance, job satisfaction, and work stress. The study sought to determine the extent to which these factors influence the overall quality of life of insurance employees and to provide empirical evidence for improving employee well-being and organizational effectiveness. The findings of the study clearly indicate that work-life balance, job satisfaction, and work stress are significant determinants of employees' quality of life. The correlation and regression analyses revealed a strong positive relationship between work-life balance and quality of life. Employees who are able to maintain an effective balance between their professional responsibilities and personal commitments experience higher levels of physical well-being, psychological stability, social satisfaction, and overall life quality. The results further demonstrate that work-life balance is the strongest predictor of quality of life among the variables considered in the study. Similarly, the study found a significant positive relationship between job satisfaction and quality of life. Employees who are satisfied with their salary, promotion opportunities, recognition, work environment, and interpersonal relationships tend to enjoy a better quality of life. Job satisfaction contributes substantially to employees' emotional well-being, motivation, commitment, and overall life satisfaction. The findings confirm that enhancing job satisfaction can play a crucial role in improving employees' quality of life and organizational performance.

The analysis also revealed that work stress has a significant negative influence on the quality of life of insurance employees. Increased workload, performance pressure, role ambiguity, target-oriented work culture, and occupational demands contribute to higher stress levels, which adversely affect employees' physical health, mental well-being, and social life. The negative relationship between work stress and quality of life emphasizes the need for effective stress management strategies within insurance organizations. The hypothesis testing results led to the rejection of all three null hypotheses and the acceptance of the alternative hypotheses. The study confirms that work-life balance and job satisfaction positively influence the quality of life of insurance employees, whereas work stress negatively affects their quality of life. Among the three factors, work-life balance emerged as the most influential factor, followed by job satisfaction, while work stress was identified as a major obstacle to employee well-being. The findings of this study have important implications for insurance companies operating in Tiruchirappalli District. Organizations should focus on implementing employee-friendly policies such as flexible working arrangements, employee assistance programs, career development opportunities, recognition and reward systems, counseling services, and stress management initiatives. Such measures can significantly enhance employees' quality of life, improve job performance, increase employee retention, and strengthen organizational productivity. In conclusion, the quality of life of insurance employees is influenced by both organizational and personal factors. Creating a supportive work environment that promotes work-life balance, enhances job satisfaction, and minimizes workplace stress is essential for ensuring employee well-being and long-term organizational success. The study contributes to the existing literature on employee quality of life and provides valuable insights for policymakers, human resource managers, and insurance organizations in developing strategies that foster a healthier, happier, and more productive workforce.

ABSTRACT

This study set out to investigate factors impacting young FM listeners' preferences for content. Radio stations that broadcast for youth or groups who want to produce youth-oriented radio programming might use this study as a reference and information source. According to the report, young people listen to FM stations mostly for news, entertainment, and information on topics that interest them. The survey also showed that among young FM listeners, peer influence is a major element determining content preference. A side from personal affirmations, listening to FM can also be done to pass the time while bored. In this research, several recommendations are given to youth programmers; both existing and potential FM station owners, that will help with regard to good broadcasts for a young audience. Among these include figuring out how to include chat shows, music, news, and educational content in the youth program schedules. These also involve determining the different requirements of young people and outlining the most effective ways to address those needs.

Keywords: Entertainment, Information, Passion, Listenership and Communication

INTRODUCTION

The media plays an effective role at present. People are exposed to television, internet, mobile phones and radio. Exposure to the media has changes culture. Culture is the life style of people, their mobility, way of dressing, food habits, faith and beliefs, values and customs they follow and their willingness to adopt changes. The cultural patterns of most countries have been saturated with the prevailing popular culture portrayed by the media.

Edwin Howard Armstrong invented FM broadcasting, a broadcast method that uses frequency modulation (FM) to deliver high-fidelity audio over broadcast radio. "FM" stands for "frequency band in which FM is used for broadcasting," and it is an acronym. Because it confuses a modulation system with a range of frequencies, this word may annoy purists. In the past, Europe frequently used the acronym "VHF," which stands for "Very High Frequency." Both 'UKV' (Ultrakortvåg) in Sweden and 'UKW' (Ultrakurzwellen, meaning ultra-short wave) in German are still often used. In contrast to amplitude modulation, which modifies the carrier's amplitude while maintaining a constant frequency, frequency modulation (FM) uses frequency variation to transmit data across a carrier wave. The instantaneous value of the input signal is precisely proportional to the instantaneous frequency of the carrier in analog applications. The FM broadcast band frequently uses this type of modulation.

This is a study on the "Interest of the college-going youth in FM Radio". The study is done in Tiruchirapalli, which is situated in the heart of the southern part of the Tamil Nadu in India. The city is enriched with educational institutions and students comprise a large part of the population. It is one of the reasons for preferring this city for this study. Another advantage of the choice is the diversity in culture and economic status. The study covers three Arts and Science colleges and three Engineering colleges in Tiruchirapalli containing male and female students from different localities and different socio-economic status.

REVIEW OF LITERATURE

"Work started in 1923 by inventor and pioneer Edwin Armstrong led to the development of FM. By 1935, Armstrong had shown his financial backer, David Sarnoff, both his technological advancements and stereo radio. However, RCA turned down this possible rival to its AM market in favor of concentrating on television. Armstrong then turned to GE, and the two of them launched W 2XMN, the first FM radio station, on the air in 1939. The FCC repurposed the portion of the broadcast spectrum that had been used for FM to the popular new medium of television after the war disrupted the spread of FM. This basically made half a million FM radio receivers that were already in use obsolete. FM recovered slowly. In 1961, FM stereo transmissions were permitted by the FCC in an effort to let FM compete more forcefully with AM. It put a temporary stop to the issuance of new AM licenses in 1962, and in 1968, it made the stop permanent. Additionally, the FCC implemented the "no duplication rule" between 1963 and 1967. Prior to it, the majority of FMs were a part of AM/FM combinations, which carried the same content on two stations at the same time. Just keeping the FM stations out of the hands of possible rivals was enough for the AM license holders.
(Dr. Ahsan Akhtar Naz, 2008, "FM Radio Revolution in Pakistan").

"FM came about as a result of the work begun in 1923 by inventor and innovator Edwin Armstrong. By 1935, Armstrong demonstrated his technology, as well as stereo radio, to his financial benefactor, David Sarnoff. But RCA rejected this potential competitor to its AM domain to focus on television instead. So, Armstrong turned to GE, and together they put the first FM radio station, W 2XMN, on the air in 1939. The war interrupted diffusion of FM, however, and at the end of the war, the FCC rededicated the part of the broadcast spectrum that had been used for FM to the hot new medium-television. This effectively rendered half million existing FM radio receiving sets useless. FM was slow to recover.

In 1961, in an attempt to help FM, compete more strongly with AM, the FCC approved FM stereo broadcasts. In 1962, it imposed a partial freeze on the allocation of new AM licenses, making the freeze permanent in 1968.And from 1963 to 1967 to FCC put this 'no duplication rule' into action. Until that time, most FMs were part of AM/FM combos, wherein two stations simultaneously broadcast identical content. The AM licensees were content just to keep the FM stations out of the hand of potential competitors. (Dr. Ahsan Akhtar Naz, 2008, "FM Radio Revolution in Pakistan").

OBJECTIVES OF THE STUDY

1. To know the preference of youth of FM Radio stations
2. Which FM Radio station is mostly preferred by the youth
3. If youth prefer various radio Jockeys

RESEARCH METHODOLOGY

The sample size of this study is 600. According to Israel's table, (http://Surveysampesizes.htm) if the population exceeds 10,00,000, the sample size has to be 665 for + 5 confidence interval. Though this table is meant for probability sampling procedure, it was adopted also for this research that uses non-probability sampling procedure. For this study, non-probabilistic procedure was used. The sample of 600 respondents, who are listeners of FM radio, was collected from 3 Arts & Science colleges and from 3 Engineering Colleges in Trichy who were radio listeners are chosen. Since the survey is about the FM Radio listening and its reach, the students who are interested in listening to FM Radios were asked to answer the questionnaire. Each question was explained and translated clearly into Tamil for the students' better understanding. This survey is conducted in M.I.E.T Engineering College, Saranathan Engineering College and Oxford Engineering College, EVR Arts & Science College, Bishop Heber Arts & Science College and St.Joseph's Arts & Science College of the Trichy district.

Data Analysis and Interpretation

The collected data has been statistically analysed and interpreted using SPSS, number of multivariate statistics has been used to examine the relationship and difference among the variable and the results are shown in table below.

A Cross tab was done between the following variables:

1. Like to listen to Love duet songs
2. Enjoy Listening FM by an Earphone
3. Experience of speaking to an RJ
4. Places which you can listen to FM
5. Listen Regularly to Diary

The Results are as follows,

Table-01 Cross Tab Like to listen love duet songs * Sex Cross tabulation

The number of boys who like to listen love duet songs very much is more when compared to girls. Boys like to listen to love duet songs very much more compared to girls. The initiatives for such duet songs, as shown on the small or big screens, is taken more by male characters than female characters. A t-test was performed on the following variables with '**Gender of the student'** as the grouping variable to find out the answer for the Research Question No.3 'Is impact of Listening FM Radios different among Boys and Girls?'. The following are the results:

Table-02 t-test- Means of Male and Female Students

Like most to listen to Jock-talk

Female students like most to listen to Jock-talk more (M= 2.41) when compared to male students (M= 2.15). Boys usually don't have patience to listen to all full jock-talk, as they keep tuning all Fm channels, and they stay tuned to the channel that plays a song. But girls usually like to listen to jock-talk more than boys. **[t(582.530)=- 3.789,p=0.000]**.

How often participated in an OB show

Female students more often to get participate in OB shows (M=2.45) when compared to male students (M=2.22) **[t(597.997)= -2.828,p=0.005].** Usually boys have no more patience like girls to wait in a crowd to talk with the jock for an ob show. But girls are interested to interact with the jock and to speak in radio. Boys also get participate in ob shows but less when compared to girls.

Get disconnect from your family when listen to FM

Unlike female students (M=2.33), male students get disconnected from their family more when listen to FM more (M= 2.57) compared to female students. Boys seek more pleasure and entertainment when compared to girls and parents too don't disturb them in their free time while girls are expected to participate in the household chores. [t(595.504)= 3.040,p=0.002]

The following is the answer for the Research Question No.3 'Is Impact of listening to FM Radios different among Boys and Girls?'

The overall results show that girls like most to listen to Jock-talk more than the boys. Boys have more freedom comparing to girls to spend their time in entertainment, and they too disconnect themselves from their families when listen to FM than the girls. Girls have more patience than boys to participate in an Ob show than the boys.

A **one-way analysis of variance** was performed with recoded variable 'Number of hours listening to FM per day' as an independent variable on the following dependent variables to find out the answer for the Research Question No.2 i.e. 'What are the Effects of Listening to FM Radios?'

The independent variable **'Number of Hours listening to FM per day'** has three groups namely light listeners, moderate listeners and heavy listeners.

Please Write How You Divided The Numeric Variable, Number Of Hours Listening To Fm Per Day Into Three Groups

Table-03 Details of significant results of the one-way analysis of variance with the Independent variable – 'Number of hours listening to FM per day'

immediate surroundings and family.

A Post Hoc Tukey test was performed to see if any of the three groups namely heavy, moderate or light listeners, was significantly different from the others.

RESULTS AND DISCUSSION

FM is a sound medium it can be used as a background. Students prefer to listen to FM for local updates and for knowing current affairs. Students staying in hostel like to listen to FM in weekends, though they do not have much entertainment or any relaxation. Students who have the habit of listening to music, prefer FM radios. Listening to FM helps them to get rid lo loneliness. Most of the students like to listen to love duet songs and new songs. All the students cannot buy new song cds to listen. Fortunately for them the FM radios offer a chance for them to listen to new songs. For listening to new songs, most students get tuned to FM radios. Male students are more interested to listen to such new songs and love duet songs more than female students. Students who listen to FM for 5-6 hours per day may not pay attention to the content. FM is used for background music. The gadgets may be on but the students may not be attentive. FM may only provide the background audio while they engage in their main activities. Thus, FM listening may not disrupt their connectedness to their family. But those who listen to FM for a particular time or a little above than that are attentive listeners and while they listen to FM as their main activity, they are disconnected from their families.

Students who spend more number of hours to listen to FM have an experience of also speaking to RJs. Students who like Suryan FM Sema ragala show like to listen Jock-talk shows too. Some of the students like to enjoy listening to FM by ear phone, because while they are in travel, they feel comfortable to listen to FM, without disturbing others. Students suggest that FM radios are not only for entertainment, but also for local and world updates, so they want FM radios to broadcast news. Students who like to listen to Jock-talk shows most, are not interested in listening to commercials. So they recommend to FM stations less advertisements. Those who like to listen to Jock-talk shows are

also interested in listening to commercials because they have to wait for the Jock-talk till the commercial break gets to an end. So they like to listen to commercials even if it is only to know when they could try and contact the jock. In addition, students offer suggestions to FM stations for the improvement of the programmes.

CONCLUSION

The current study is about the influence of FM listening among youth and their level of interest in FM listening. As students get entertained by different media, FM listening as an entertainment also increases among the youngsters due its easy availability, low cost, and ability to listen while being on the move. The overall results show that girls like most to listen to Jock-talk more than the boys. Boys have more freedom compared to girls to spend their time in entertainment, and they get disconnected from their families when they listen to FM more than the girls. Girls have more patience than boys to participate in an Ob show than the boys.

ABSTRACT

Petroleum hydrocarbon-contaminated soil is a neurotoxic organic pollutant that causes riskto the ecological environment. microorganisms which as the ability to degrade hydrocarbons are used for eradicating the pollution of contaminated oil. potential fungus were isolated showed high ability to degradepolycyclic aromatic hydrocarbons . Two potential fungus were isolated based on the morphological characters and molecular characterization. The extracted fungal DNA was amplified by PCR using specific internal transcribed spacer primer (ITS1/ITS4). The PCR products were sequenced and confirmed as *Aspergillus niger* and *Penicillium chrysogenum* MSA1 and MSA2.The strains showed The Surface tension assay was carried out by drop collapse method strains MSA1 and MSA2 showed 0.121 and 1.070 thickness of emulsified layer was observed in CFCF and (ME). TheFTIR spectral analysis gas chromatography analysis on the BH broth supplemented with crude oil showed 50 % and 52 %, respectively. The findings concluded that *P.chrysogenum* and *A.niger* has theability to degrade hydrocarbon contaminated soil. It can be concluded that these fungus are eco-friendly to the living organisms.

Keywords: Crude contaminated soil, fungi, Biodegradation Kinetics, dichlorophenethyl amine.

INTRODUCTION

One of the major environmental problems today is hydrocarbon contamination resulting from the activities related to the petrochemical industry. Accidental releases of petroleum products are of particular concern in the environment. Hydrocarbon components have been known to belong to the family of carcinogens and neurotoxic organic

pollutants. Mechanical and chemical methods are generally used to remove hydrocarbons from contaminated sites, but they have limited effectiveness and can be expensive. Biological treatment is preferred to physicochemical processes because of its feasibility, reliability, and capability to achieve high removal efficiency with low cost. Other reasons include the simplicity of its low-energy design, construction, operation, and use, and its use of biodegradation rather than the accumulation of hydrocarbons at another stage or degradation using chemical agents; biological treatment is thus a cost-effective method [1,2]. In a biological process, microorganisms can use hydrocarbon as their sole energy and carbon source and degrade instead of accumulate them at another stage [3]. Biological treatment can have an advantage over physicochemical treatment systems in the removal of spills because it provides vital biodegradation of oil parts by microorganisms, is a "green" alternative for treating hazardous contaminants due to its lack of environmentally degrading effects, and may be cheaper than other methods [4].

MATERIALS AND METHODS

Chemicals

Hydrocarbon contaminated soil samples from five different sites automobile workshops from Thanjavur (Tamil Nadu, India).some other chemicals used for tests.

Sample collection

Soil samples from the surface layer (5–10 cm) were collectedfrom the automobile shops near Thanjavur, Tamil Nadu, India, and maintained in plastic covers.

Isolation and identification of fungi

Fungi were isolated from hydrocarbon contaminated soil by using the Bushnell Hass Mineral Salts (BHMS) medium supplemented with 1 % of crude oil in various concentrations. BHMS contained (per litre of distilled water) 0.2g of MgSo4 .7H_2O, 0.02g of $CaCl_2$, 1g of KH_2PO_4, 1g of K_2HPO_4, 1g of NH_4NO_3, 2 drops of $FeCl_3$ 60%. The pH was adjusted to 7.0 The isolated cultures were preserved in Potato Dextrose agar slants and stored at 4^0C for further use.

Morphology of isolated strains

Pure cultures of the potential strains maintained on PDA slant were identified using standard manual of soil fungi by Gillmann (1957),Hyphomycetes (Subramaniyan,1971), A manual of Penicillia (Raper and Thom 1949) and The genus *Aspergillus* (Raper and Fennell,1965), using colonial appearance and microscopic characteristics.

Molecular identification of isolated strains

DNA amplification by polymerase chain reaction (PCR) was performed in a total volume of 100 µl. Each reaction mixture contained the following solutions: 1 µl template DNA, 400 ng forward universal 18S rDNA primer NS1 (5′-GTAGTCATATGCTTGTCTC-3′); 400 ng reverse 18S rDNA primer C18L (5′-GAAACCTTGTTACGACTT-3′);4 µl of dNTPs (2.5 mM each); 10 µl of Taq DNA polymerase assay buffer and 1 µl Taq DNA polymerase (3 U/µl)(Chromous Biotech Pvt. Ltd., Bangalore, India) and water was added up to 100 µl. The ABI 2720 Thermal Cycler(Applied Biosystems, USA) was programmed as follows: 5 min initial denaturation at 94°C, followed by 35 cycles that consisted of denaturation for 30 s at 94°C, annealing for 30 s at 55°C and extension at 72°C for 1 min and a final extension of 5 min at 72°C. PCR products obtained were eluted from the gel using Gel Extraction Spin-50 kit(Chromous Biotech, Bangalore, India) according to the manufacturer's instructions. The PCR amplified product was detected by 1.2% agarose gel (with ethidium bromide) electrophoresis. The sequences were compared against the sequences available from GenBank using the BLAST program. Phylogenetic analysis was constructed using the Neighbour-joining method Saitou and Nei (1987). Bootstrap analysis was done based on 1000 replications (Felsenstein, 1985). All these analysis were performed by MEGA4 package (Tamura *et al*., 2007).

Degradation of crude oil

Three agar plugs (1 cm^2) of the 24 hour pure cultures of each of the two best potential strains(*Aspergillus nige*r and *Penicillium chrysogenum*) were inoculated into the Bacto Bushnell Haas broth (100 ml/500 ml Erlenmeyer flask) containing 0.1%(v /*v*)Tween 80 and 1% (v /v) crude oil(without redox indicator). Inoculation of each organism was carried out in triplicate prior to incubation as stated above. The control tube without the organism was prepared . 5 ml of the aliquots were collected from each flask and centrifuged (5000 rpm) at room temperature for 5 minutes using a centrifuge. The recovered supernatants were assayed spectrophotometrically for the residual hydrocarbon (both aliphatic and aromatic polymers) using the procedure of Leung *et al*. (1997). The mean results were then obtained.

After 7 days the extent of polycyclic aromatic hydrocarbon (PAH) degradation by *Aspergillus niger* and *Penicillium chrysogenum* using undergraded crude oil as the control was determined by Gas Chromatography at Fugro Consultants Nigeria Limited, Port-Harcourt, Rivers State of Nigeria. The chromatographic equipment used was an Agilent Gas Chromatography, model 6890N. The analytic conditions of the Chromatograph were as follows: Carrier gas, helium, makeup nitrogen gas (flow – 30 ml/min), fuel-air flow rate, 450ml/min, fuel-H2 flow rate 45 ml/min, inlet temperature at 275^{o}C and initial – final oven temperature at 65-290^{o}C. The detector type was flame ionization with temperature at 300^{o}C. The Chromatograph was then attached to an integrator.

One mL of each sample (both undegraded and degraded crude oil) was diluted tenfold with dichloromethane and passed through a silica-packed column for cleaning up as well as separating into aliphatics and polycyclic aromatic hydrocarbon using pentane and 40%60% pentane/ dichloromethane mixture respectively. The aliquots for PAH only were concentrated to 1ml at 100^{o}C using a Danish Kudana concentrator and then injected into a Gas Chromatography apparatus. The amount of PAH before and after the degradation were shown by the peak heights of the chromatographic runs. The amount of PAH (mg /L) was calculated by the integrator using a standard curve.

Screening of Biosurfactant production

Emulsification Test (Anandaraj and Thivakaran., 2010)

The emulsification capacity was evaluated by an emulsification index (E24). 2ml of kerosene was added to equal volume of cell free supernatant and homogenized in a vortex at high speed for 2minutes. The emulsification stability was measured after 24 hours and emulsification index was calculated as; E24 = Total height of the emulsifylayer / Total height of the liquid layer x 100. The calculation was done for all cultures individually and their emulsification was compared with each other.

Surface tension measurement (Ainon *et al*., 2013)

The surface tension measurements of cell free supernatant were determined in a tensiometer (TD1C LAUDA). The values reported are the mean of three measurements. All measurements were made on cell-free broth (50 ml) collected at different time intervals after centrifugation (10 000×g for 25 min) at room temperature. The criterion used for selecting biosurfactant-producing isolates was the emulsification and the reduction of the surface tension of the medium to below 40 mN m^{1-}.

Extraction and analysis of crude oil

Lipase activity assay was done by titrimetric method using olive oil substrates emulsion. Added 70 ml of emulsifying reagent with 30 ml of olive oil and homogenized for 5 minutes. 1ml of substrate emulsion was taken in conical flask and 0.8ml of 0.2M potassium phosphate buffer (pH 7.0) was added. After that 0.2ml of enzyme was added. The total contents were incubated at 55^{o}C for 1 minute. Reaction was terminated by adding 2ml of acetone ethanol mixture (1:1 v/v). Total contents were titrated against 0.05N sodium Hydroxide using phenolphthalein as indicator.

Units/ml of enzyme = Final burette reading X Normality of NaOH X Time of Incubation X Dilution factor / Volume of the enzyme added.

Gas chromatography

The GC-MS-MS analysis of the extract was carried out using Varian 4000 Ion trap GCMS with Fused silica 15m x 0.2 mm ID x 1µm of capillary column. The instrument was set to an initial temperature of 110ºC, and maintained at this temperature for 2 min. At the end of this period the oven temperature was rose up to 280ºC, at the rate of an increase of 5ºC/min, and maintained for 9 min. Injection port temperature was ensured as 250 ºC and Helium flow rate as 1 ml/min. The ionization voltage was 70eV. The samples were injected in split mode as 10:1. Mass spectral scan range was set at 45-450 (m/z). Using computer searches on a NIST Ver.2.1 MS data library and comparing the spectrum obtained through GC-MS compounds present in the extracts were identified.

RESULTS AND DISCUSSION

Isolation and identification of crude oil-degrading fungi

Eight fungal strains were isolated from Bushnell Hass Mineral Salts (BHMS) medium supplemented with 1 % of crude oil in various concentrations. Experiments were performed at 30 C for 14 days. Two of the isolated strains showed a high impact on the growth in the crude oil than the others and it was selected for further study. These strains (SMA1and SMA2) were initially identified using morphological and biochemical tests. Molecular identification of isolated fungi was performed by amplifying and sequencing the ITS region.The ITS region of the filamentous fungi strains was sequenced, and sequences were submitted to GenBank with accession numbers KX034089 (SMA1) and KX034084 (SMA2). The results of the identification procedure showed that the isolated fungi were affiliated to genus Penicillium. Fig.1&2 The phylogenetic trees of these isolated fungi strains.

Estimation of hydrocarbon degradation capability through Biodegradation assay

Three agar plugs (1 cm^2) of the 24 hour pure cultures of each of the two best potential strains(*Aspergillus nige*r and *Penicillium citrinum*) were inoculated into the Bacto Bushnell Haasbroth (100 ml/500 ml Erlenmeyer flask) containing 0.1%(v /*v*) Tween 80 and 1% (v /v) crude oil(without redox indicator). Inoculation of each organism was carried out in triplicate prior toincubation as stated above. The control tube without the organism was prepared accordingly. On a daily basis, 5 ml of the aliquots were collected from each flask and centrifuged (5000 rpm) atroom temperature for 5 minutes using a centrifuge. The recovered supernatants wereassayed spectrophotometrically for the residual hydrocarbon (both aliphatic and aromaticpolymers) using the procedure of Leung *et al*. (1997). The mean results were then obtained. After 7 days the extent of polycyclic aromatic hydrocarbon (PAH) degradation by *Aspergillus niger*and *Penicillium chrysogenum* using undegraded crude oil as the control was determined byGas Chromatography at Fugro Consultants Nigeria Limited, Port-Harcourt, Rivers State of Nigeria. The chromatographic equipment used was an Agilent Gas Chromatography, model6890N. The analytic conditions of the Chromatograph were as follows: Carrier gas, helium, makeup nitrogen gas (flow – 30 ml/min), fuel-air flow rate, 450ml/min, fuel-H2 flow rate 45 ml/min, inlettemperature at 275ºC and initial – final oven temperature at 65-290ºC. The detector type wasflame ionization with temperature at 300ºC. The Chromatograph was then attached to an integrator.

The specific procedure for the assay was as follows: One mL of each sample (both undegraded and degraded crude oil) was diluted tenfold with dichloromethane and passed through a silica packed column for cleaning up as well as separating into aliphatic and polycyclic aromatic hydrocarbon using pentane and 40%/60% pentane/ dichloromethane mixture respectively. The aliquots for PAH only were concentrated to 1ml at 100ºC using a Danish Kudana concentrator and then injected into a Gas Chromatography apparatus. The amount of PAH before and after the degradation were shown by the peak heights of the chromatographic runs. The amount ofPAH (mg /L) was calculated by the integrator using a standard curve.

Emulsification Test, Oil spreading Test, and Surface tension measurement

Table 1 shows the effect of crude oil on cell growth, Emulsification Test, Oil spreading Test, and Surface tension measurement of *Penicillium chrysogenum* and *Aspergillus niger* SMA1 and SMA2 after 14 days of incubation Screening of fungi in minimal medium supplemented with crude oil The isolated fungi were screened in degradation of crude

oil in minimal medium. The maximum zone of clearance was observed in , *A.niger,* and *P.chrysogenum* was 72, and 75 mm in diameter respectively. Percentage of degradation of different concentrations of crude oil by fungiMaximum percentage degradation by fungi was recorded in 1.0 ml concentration of crude oil. Minimum percentage degradation was observed by all the tested fungi in 1.5ml concentration of crude oil. 12.9% degradation by *A.flavus* and *A.fumigatus* were recorded in 1.0ml concentration.44.4 % degradation by *A.niger*, 10.5 % by *F.solani* and 46.2% by *P.chrysogenum* in 1.0ml concentration.In addition *A.niger* and*P.chrysogenum* hadtheability to degrade the maximum amount of crude oil in all concentrations. Ability of displacement of crude oil by culture filtrates of different fungal species. The displacement ability of crude oil by culture filtrates test gives positive result in *A.niger* and *P.chrysogenum*. Two species gives positive result within 2 seconds. 19 mm zone of clearance was recorded by *A.niger* and 18mm by *P.chrysogenum*. This test gives negative result in *A.flavus, A.fumigatus* and *F.solani*Thickness of emulsified layer by the cell free culture filtrate (CFCF) and mycelial extract (ME) of different fungi Maximum thickness of emulsified layer by CFCF was observed in *P.chrysogenum*. The thickness of the layer was 0.121 mm using ME, maximum thickness of emulsified layer was observed in *A.niger* that is 1.505 mm thickness. Minimum thickness of emulsified layer by CFCF and ME was observed in *F.solani* species. Emulsified layer thickness of all the 5 isolates were high in mycelia extract than CFCF.Surface tension assay

The Surface tension assay was carried out by drop collapse method. The assay gives positive result in *A.niger* and *P.chrysogenum* .42.1 surface tension was recorded in *A.niger* and 39.3 for *P.chrysogenum.*

Biodegradation of crude oil by two fungal strains

Effect of lipase activity for hydrocarbon degradation by potential fungi

Maximum amount of lipase activity was observed in after 28 days of incubation by *A.niger* and *P.chrysogenum*. 96±0.2 U/ml lipase activity was recorded in *P.chrysogenum.* 90±0.4IU/ml lipase activity was recorded in *A.niger.* Minimum lipase activity was observed in after 7 days of incubation by *A.niger* and *P.chrysogenum* .After 28 days of incubation lipase activity was high in *P.chrysogenum* In theFTIR spectral analysis, *Aspergillus niger* grown BH broth (Positive control) had 8 functional group. The functional groups of Aromatic amines, Diazonium salt, Benzene ring, Amides, Aliphatic amines, Organophosphorus and Alkynes were observed. The IR spectra of purified compounds showed as strong bands at 3437.88, 2367.45, 2335.65, 2084.47, 1638.06, 1113.92, 1053.72 and 683.75 were recorded In theFTIR spectral analysis, *Aspergillus niger*grown BH broth supplemented with crude oil had 6 functional group. The functional groups of Alkane, Nitriles, Diazonium salts, Thiocyanates, Urease and Alkynes were observed. The IR spectra of purified compounds showed as strong bands at 3434.04, 2367.26, 2338.63, 2084.04, 1637.49 and 676.94 were recorded. The bioactive compounds of *Aspergillus niger*grown on BH broth (Control) was analyzed by GC-MS. The present study showed 13 different compounds resulting on the peak area were observed. The bioactive compounds are, Hydroxy\ pivalic acid,1,3-Propanediol,2-methyl-,dipropanoate,3-Propanediol,2methyl-,dipropanoate,2,5-Hexanedione,3,4-dihydroxy-3,4-dimethyl-Benzamide,3-amino-N-[4,5-dihydro-5-oxo-1-(2,4,6-trichloropheny,2,4-Hexanediol,5-methyl-3-nitro-3,4-Dichlorophenethylamine,2-[3-Cyclohexylaminopropylamino]ethylthiophosphate, 1H-Azonine octahydro and 4 unknown compounds were recorded. The bioactive compounds of *Aspergillus niger* grown BH broth supplemented with crude oil were analysed by GC-MS. This study showed that 10 different compounds resultedin the peak area were observed. The bioactive compounds are Dodecane,2-methyl-Benzeneethanamine,2-fluoro-.beta.,3,4-trihydroxy-N-isopropyl-, 10-Undecen-4-one, 2,2,6,6-tetramethyl,2,4-Dichlorophenethylamine, Monoamine, Benzoic acid, 2-(1-oxopropyl)-3,5-Dihydroxycyclohexanamine and 3 unknown compounds were recorded The bioactive compounds of *Penicillium chrysogenum* grown on BH broth supplemented with crude oil was analyzed by GC-MS. This study showed 8 different compounds resulting on the peak area were observed. The bioactive compounds are,4-[4-Diethylamino-1-methylbutylamino]-1,2-dimethoxy-6-bromonaph,4,4-Ethylenedioxy-pentanenitrile,2,4-Dichlorophenethylamine,Diethylphthalate and 4 unknown compounds were recorded Missing compounds in *Penicillium chrysogenum* grown on BH broth treated with crude oil. Some of the compounds were missing from control and treated with potential fungi. The specific compounds such as 1-Nitro-.beta.-d-arabinofuranose, tetraacetate, 2-Hydroxy-2,4-dimethyl-hept-6-en-3-one and cyclopentanecarboxylic acid were identified.

CONCLUSIONS

In this study, two crude oil-degrading strains SMA1 and SMA2 were isolated from the petroleum oil contaminated soil. These fungal strains showed high levels of crude oil degradation, which can help for bioremediation. A direct relationship was found between the cell surface tension test of fungal strains and their capabilities for emulsification, crude oil biodegradation, using lipase activity.

Conflict of interest

The authors declare that they have no conflict of interest.

ABSTRACT

Employees have turned out to be an important factor of organizational performance and managerial achievement in modern workplaces. This paper explores the consequences of management on employee well-being in terms of management productivity, the management leadership stance, and organizational sustainability. Thematic analysis, as a qualitative research methodology that is grounded in secondary data, allows establishing major tendencies in the recent literature. The results disclose that well-being is critical in improving the performance, engagement, and retention of the employees as well as transforming roles of managers to more supportive and empathetic leadership. Nonetheless, the problem of face validity and limitations in measuring still exists. The research concluded that employee well-being is an important component of strategic management that ensures sustainable organizational performance and competitive advantage in the long run.

Keywords: Employees, management, leadership, performance, engagement

INTRODUCTION

The issue of employee wellbeing is no longer an issue in the changing environment of organizational management. Organizations are becoming more aware that workers are not just an asset but a very important resource whose health, health is a key factor as far as productivity, employee involvement, and the performance of the organization

are concerned (Haricharan, 2023). Employee well-being is a both physical, psychological, and emotional aspect involving all facets that interrelate and determine the workplace outcomes. The rising number of work stress, burnout, and mental health issues has further brought to the fore the importance of well-being as an organizational priority (Wang, et al., 2023). Management has been reconsidered to become more employee-focused, in particular in the post-pandemic era. The change displays a wider realization that a sustainable organizational performance cannot be realized unless the welfare of workers is established. The paper aims on exploring the implication of employee well-being on management.

The following research question: What is the relationship between employee well-being and managerial practices and organizational performance?
The qualitative research approach adopted through secondary data and thematic analysis enables this study to present a critical and analytical discussion on the role of employee well-being in the contemporary management.

LITERATURE REVIEW

The well-being of employees has become a growing topic in the management books as a crucial attribute in determining the organization performance, employee involvement, and organizational sustainability. Modern studies define the concept of employee well-being as a multidimensional phenomenon, which includes physical well-being, psychological integrity, and social connections at work. This encompassing knowledge is an indication of the change in the conventional human resource management models to more employee-focused management models. Current literature highlights the close interconnection between organizational performance and the well-being of employees. As Guest (2018) claims, the well-being of employees must be considered one of the key elements of human resource management because it is known to influence the performance of individual workers as well as organizational performance as a whole. In the same line of argument, Harter et al. (2020) indicate that more productive, more engaged, and less absent employees possess greater levels of well-being. These results support the notion that well-being is not a supportive entity, but a strategic resource.

The leadership is one of the determinants of the wellbeing of employees. Inceoglu et al. (2018) emphasize that the leadership behavior is an important factor determining the psychological health and job satisfaction of employees. Transformational leadership, which is empathetic, driven, and supportive, has special effectiveness in improving the welfare of the employees. The said types of leadership build trust and open communication that are critical in building a pleasant working environment. On the other hand, autocratic or uncongenial leadership may be a contributor of stress, burnout, and dissatisfaction in the employees. The other factor that is of interest that is presented in the literature is the well-being and employee retention. According to Peccei and Van De Voorde (2019), those organizations that invest in the well-being of their workers will retain skilled employees and reduce the turnover costs. When they feel that they are important and supported, the employees become more devoted to their organizations, thereby increasing the stability and performance over the long-term. Nevertheless, the literature also notes that well-being is not potentially enough to guarantee retention since other factors include compensation, career advancement, and organizational reputation also have an important role.

Although the advantages have been identified, a number of researchers draw attention to issues in the introduction of effective well-being strategies. Nielsen and Miraglia (2019) state that proposed well-being policies, in many organizations, are hard to put into practice because of the constraints on resources, a deficit in managerial training, and the organizational culture. In other instances, well-being programs are introduced in a superficial manner, which is used instead of overhauling the root cause (such as over-workload or job insecurity). This begs the question of the credibility and quality of such programs. The aspect of employee well-being measurement is also a complicated one. Well-being is context-dependent and subjective so it is hard to come up with standard measurements. This poses a problem to the management in terms of determining the effect of well-being initiatives on informed decisions.

The literature has shown that employee well-being is a very critical element in determining the success of the organization and practices in management. Nonetheless, it is necessary to adopt a more coordinated and strategic form of approach whereby well-being programmes are harmonized with organizational objectives (Haricharan, et al., 2023). With the current issues tackled and a holistic approach, organizations can successfully use employee wholeness as competitive advantage.

METHODOLOGY

This paper uses the qualitative research approach to understand the consequences of employee well-being on management practices and organizational performance (Cignitas, et al., 2022). This research is best suited to qualitative approach because the chance to delve into complex and context-specific phenomena like that of employee well-being, leadership as an action and organizational culture results in in-depth knowledge. This approach does not measure numerical values but rather accentuates interpretation, meaning, and critical analysis of the present knowledge. The study will use a secondary data collection, which will be informed by peer-reviewed journal articles, academic publications, and reliable organizations reports starting from 2018 and later. The selection of these sources based on the following criteria was relevant to the topic of the research, publication credibility, and role in comprehending employee well-being in management settings. Secondary data would be the most appropriate to use in this study, as it allows the combination of various views and conclusions drawn by numerous works, and offer an overall picture of the subject matter (Costa, 2024).

The qualitative method of thematic analysis is used to analyze the data since it is a commonly used qualitative method of identifying, analyzing, and interpreting data patterns. It was conducted in a systematic fashion (Christou, 2022). On the one hand, the researcher became familiar with the selected literature by repeatedly reading it. Second, the identification and coding of the important concepts and ideas pertaining to employee well-being and management was carried out. Third, the codes were clustered into larger themes to constitute preliminary themes (Ahmed, et al., 2025). Fourth, the themes were reread and narrowed down so that there were consistency and relevance to the research question. Lastly, the themes were conflicted with to create a meaningful insight. The methodological approach provides a systematic approach that is flexible enough to enable the descriptive analysis of the literature as well as the critical analysis of the literature. But it is recognized that using secondary data may be a limitation of the ability to capture the real-time organizational experiences (Christou, 2022). Regardless of this weakness, the methodology offers a solid research model about the extent implications of employee wellbeing on management.

RESULTS AND DISCUSSIONS

Theme 1: Employee well-being as a driver of productivity

Employee well-being emerges as one of the important factors that influence the performance and productivity of employees (Cignitas, et al., 2022). Employees with high physical and psychological well-being have more focus on their tasks and can achieve better results while performing them efficiently. Well-being contributes to the proper functioning of employees' brain, allowing them to perceive information and think creatively (Wang, et al., 2023). Besides, positive mental health helps people to deal with less stress and fatigue, leading to fewer absences. It means that from the manager's point of view, there are other factors of productivity besides technical skills and operational efficiency. When managers care about the state of employees and create conditions for their well-being, they may see better performance (Felman, 2026). Nonetheless, another aspect worth mentioning appears to be the problem of excessive productivity in some cases because managers try to maximize employees' productivity.Thus, well-being turns out to be important for the productivity of employees and can serve as one of the productivity strategies used by organizations in order to maintain their performance level (Dongre, 2024).

Theme 2: Managerial Responsibility in Promoting Well-being

The management plays an important part in shaping well-being among employees through various actions. Managers have a direct influence on the way employees experience working at their organization, which makes their work especially crucial for creating a supportive environment (Camp, et al., 2022). Transformational and participative management practices can promote greater employee well-being as they encourage trust, effective communication, and recognition of individual contributions (Alfalih and Ragmoun, 2025). Managers are supposed to implement policies that would help people maintain a proper balance between personal and professional life. For instance, flexible work hours and a reasonable workload are two of the most popular ways to improve well-being in the workplace. Additionally, managers have to deal with stress, conflicts, and mental problems among employees, showing empathy and providing constructive criticism (Warr and Nielsen, 2019). The problem, however, is that managers do not receive enough training when it comes to dealing with well-being challenges and helping employees overcome difficulties. Human resource departments often take care of such activities in companies because management does not realize its responsibility (Jager, 2026). Thus, well-being should become an integral part of leadership development programs. Managers need to have good emotional and social skills to be able to promote well-being. Otherwise, all efforts may prove ineffective.

Theme 3: Challenges in Implementing Well-being Strategies

While there have been extensive discussions around well-being, there are numerous obstacles when it comes to implementing a strategy to improve the well-being of workers. First of all, the lack of financial resources is one of the biggest problems in terms of ensuring well-being among workers (Hameed, et al., 2024). Many small companies do not have sufficient funds to implement any programs regarding employees' health. Another challenge is associated with the measurement of well-being. Being an intangible aspect, it can hardly be measured properly and analyzed. Due to this fact, companies find it extremely difficult to evaluate their initiatives aimed at improving the state of well-being (Chang, 2024). The third challenge associated with implementing a strategy related to well-being is the existing organizational culture within organizations (Alkhodary, 2023). For example, in cases when organizations encourage long working days and intensive work, workers will not even think about using the offered programs because they fear looking like people with low productivity levels. Thus, another obstacle faced by many organizations is associated with the reason behind the creation of well-being programs. Some organizations launch such programs only for brand improvement and do not try to solve any real issues related to the workload of workers.

DISCUSSION

From the thematic analysis, it becomes evident that the issue of employee well-being is intrinsically linked to management activities and organizational performance. It impacts productivity, effective leadership, and staff retention while posing challenges for its practical implementation (Alfalih and Ragmoun, 2025). It is important to note that the results show that well-being cannot be viewed as a stand-alone initiative and requires being incorporated into broader strategies for managerial activity. This brings the importance of the topic into the spotlight and makes the role of leaders essential since managers serve as the key link between the organizational strategy and employees (Camp, et al., 2022).

CONCLUSION

This paper has critically analyzed the issues of employee well-being and the role it plays on the management and it has also shown that employee wellbeing has ceased to be a fringe but a core determinant of organizational performance. The results shed light on the fact that employee welfare is a direct determinant of productivity and engagement, staff retention, and sustainability in organizations. As a managerial approach, this requires a paradigm shift of traditional more performance-based approaches to the more holistic and people-based approaches.

A crucial analytical observation is that the well-being of the staff is both a result and a contributor to efficient management behavior. On the one hand, the positive relation to staff welfare is the supportive leadership, the culture of inclusion, and well-developed policies. Conversely, better well-being is associated with increased levels of motivation, creativity, and commitment and serves to strengthen organizational performance. This mutual dependence highlights why it is a strategic decision to consider well-being part of the overall management frameworks as opposed to viewing it as a contained program. The research also shows that there is still a gap between the theoretical awareness and practice. Although organizations are becoming appreciative of the importance of well-being, most of them do not integrate it genuinely in their working and cultural contexts. The ineffectiveness of well-being strategies is often harmed by superficial initiatives, absence of managerial training and antagonistic organizational priorities. This implies that the management should no longer be involved in token activities but embrace a systemic and long-term orientation. The comparative analysis suggests that leadership is a key element of the strategies of well-being translation into practice. Managers must not only apply the policies, but also influence the daily life of employees. Emotional intelligence, empathy, and communication skills have to be therefore a major focus of leadership development.

This study is limited as does not consider primary data collection and no personal insights. Future research needs to focus on incorporating survey and insights to access implications and in-depth outcomes. Additional to this, quantitative studies can complement qualitative findings which can pose direct impact on well-being initiative and organizational performance and its management. Overall, employee wellbeing is a very strategic resource that has a major influence on how management is carried out and corporate prosperity. In a business world that is becoming more intricate, organizations that efficiently incorporate well-being in their strategic and operational models have higher chances of gaining sustainable performance, competitive edge, and long-term expansion.

ABSTRACT

Agriculture continues to play a vital role in the economic development of rural India, providing livelihood opportunities for a significant proportion of the population. However, traditional agricultural marketing systems are often characterized by the presence of multiple intermediaries, resulting in reduced profit margins for farmers and higher prices for consumers. To address these challenges, the Government of Tamil Nadu established Uzhavar Santhai (Farmers' Markets) to facilitate direct marketing between farmers and consumers. The present study examines the functioning of Uzhavar Santhai in Pudukkottai District with particular emphasis on its impact on farmers' income, reduction of intermediaries, and price realization. The study is based on primary data collected from farmers participating in Uzhavar Santhai and secondary data obtained from government reports, journals, and official records. Descriptive and inferential statistical techniques are employed to analyze the operational effectiveness of the market system. The research investigates the relationship between the functioning of Uzhavar Santhai and the income levels of farmers, evaluates the extent to which the market reduces the role of intermediaries in agricultural marketing, and compares the prices received by farmers through Uzhavar Santhai with those obtained through conventional marketing channels. The findings reveal that the effective functioning of Uzhavar Santhai contributes significantly to improving farmers' income by enabling direct sales and minimizing marketing costs. The study also confirms that the market substantially reduces the involvement of intermediaries, thereby enhancing transparency and ensuring fair returns to producers. Furthermore, farmers participating in Uzhavar Santhai receive comparatively

higher prices for their agricultural produce than those selling through traditional market systems. The direct interaction between farmers and consumers not only benefits producers through increased profitability but also provides consumers with fresh agricultural products at reasonable prices. The study concludes that Uzhavar Santhai serves as an effective agricultural marketing mechanism that strengthens rural livelihoods, promotes equitable price distribution, and supports sustainable agricultural development in Pudukkottai District. The findings offer valuable insights for policymakers and agricultural administrators in improving the efficiency and reach of farmer-centric marketing initiatives.

Keywords: Uzhavar Santhai, Agricultural Marketing, Farmers' Income, Intermediaries, Price Realization, Direct Marketing, Pudukkottai District, Rural Development.

INTRODUCTION

Agriculture has long been recognized as the backbone of the Indian economy, providing livelihood opportunities to millions of people and contributing significantly to national development. Despite rapid industrialization and technological advancements, a substantial portion of India's population continues to depend on agriculture and allied activities for income and employment [1]. The agricultural sector not only ensures food security but also supports rural development, poverty reduction, and economic stability. However, the growth and prosperity of farmers are often constrained by various challenges, particularly those related to agricultural marketing [2]. Agricultural marketing plays a crucial role in determining the profitability of farming activities. It involves the movement of agricultural produce from farmers to consumers through a series of processes such as collection, transportation, storage, pricing, and distribution. In traditional marketing systems, agricultural commodities typically pass through several intermediaries including commission agents, wholesalers, and retailers before reaching consumers. While these intermediaries facilitate market transactions, they often reduce the share of profits received by farmers [3]. As a result, farmers frequently receive lower prices for their produce, while consumers pay higher prices in the market. This imbalance has been a major concern for policymakers and agricultural economists. To address these issues and improve the marketing efficiency of agricultural products, several reforms and initiatives have been introduced by both the Central and State Governments. One such significant initiative in Tamil Nadu is the establishment of Uzhavar Santhai, commonly known as Farmers' Markets. The concept of Uzhavar Santhai was introduced by the Government of Tamil Nadu with the primary objective of creating a direct marketing platform where farmers can sell their agricultural produce directly to consumers without the involvement of middlemen [4]. This innovative marketing model aims to ensure fair prices for farmers while simultaneously providing fresh vegetables, fruits, and other agricultural products to consumers at reasonable rates.

The establishment of Uzhavar Santhai represents an important step toward strengthening the agricultural marketing system and promoting farmer welfare. By eliminating unnecessary intermediaries, the scheme enables farmers to retain a larger share of the final selling price of their produce. Moreover, direct interaction between farmers and consumers enhances transparency in pricing and builds trust among market participants. Consumers benefit by obtaining fresh farm products at lower prices, while farmers enjoy improved income and market access [5]. Consequently, Uzhavar Santhai has emerged as a vital mechanism for promoting inclusive agricultural development and rural economic growth [6]. In Tamil Nadu, Uzhavar Santhai has gained considerable popularity since its introduction. Several markets have been established across different districts, enabling local farmers to market their produce efficiently. These markets have contributed to increasing farmers' earnings, reducing marketing costs, and improving the availability of fresh agricultural products. Nevertheless, the effectiveness of Uzhavar Santhai varies across regions depending on factors such as infrastructure facilities, transportation, market management, farmer participation, consumer awareness, and government support [7]. Therefore, periodic evaluation of the functioning of these markets is necessary to assess their performance and identify areas for improvement [8].

Pudukkottai District, located in the southern part of Tamil Nadu, is predominantly agrarian in nature. Agriculture serves as one of the major sources of livelihood for the rural population in the district. Farmers cultivate a variety of crops including paddy, groundnut, pulses, vegetables, and fruits. The success of agricultural activities in the district largely depends on effective marketing systems that enable farmers to obtain remunerative prices for their produce. In this context, Uzhavar Santhai plays an important role by providing farmers with direct access to consumers and reducing their dependence on traditional market channels [9]. Despite the potential benefits of Uzhavar Santhai, several challenges continue to affect its functioning. Issues such as inadequate infrastructure, limited market facilities, transportation difficulties, fluctuating consumer demand, competition from private retailers, and lack of awareness among farmers and consumers may influence the effectiveness of these markets. Furthermore, it is essential to examine whether the objectives of Uzhavar Santhai, particularly improving farmers' income and reducing intermediary involvement, are being achieved in practice. Understanding these aspects can provide valuable insights for policymakers and agricultural administrators in enhancing the performance of the scheme [10]. The present study seeks to evaluate the operational effectiveness of Uzhavar Santhai and its impact on farmers and consumers. The study focuses on examining the relationship between the functioning of Uzhavar Santhai and farmers' income levels, assessing the extent to which intermediaries are reduced in agricultural marketing, and comparing the prices received by farmers through Uzhavar Santhai with those obtained through conventional marketing channels. Through a systematic analysis of these dimensions, the study aims to contribute to a better understanding of the role of direct marketing initiatives in promoting agricultural development and rural prosperity [11].

The findings of this research are expected to provide practical recommendations for strengthening the Uzhavar Santhai system and enhancing its contribution to farmer welfare [12]. The study will also serve as a useful reference for researchers, policymakers, agricultural officers, and other stakeholders interested in improving agricultural marketing mechanisms and supporting sustainable rural development in Tamil Nadu and beyond.

Problem Statement and Research Gap

Agriculture is the primary source of livelihood for a large proportion of the rural population in Tamil Nadu. Despite their significant contribution to food production and economic development, farmers often face numerous challenges in marketing their agricultural produce. The traditional agricultural marketing system is characterized by the presence of multiple intermediaries such as commission agents, wholesalers, and retailers, who influence the pricing process and reduce the share of profits received by farmers. Consequently, farmers frequently receive lower prices for their produce, while consumers are compelled to pay higher prices in the market. To address these issues, the Government of Tamil Nadu introduced Uzhavar Santhai (Farmers' Markets) as a direct marketing initiative aimed at eliminating intermediaries and enabling farmers to sell their produce directly to consumers. The scheme was designed to ensure fair prices for farmers, provide quality agricultural products to consumers at reasonable rates, and strengthen the agricultural marketing system. Although Uzhavar Santhai has been functioning in several districts for many years, questions remain regarding its operational efficiency, economic benefits, and overall effectiveness in achieving its intended objectives. In Pudukkottai District, where agriculture constitutes a major economic activity, Uzhavar Santhai plays an important role in facilitating direct farmer-consumer interaction. However, factors such as infrastructure limitations, transportation constraints, market accessibility, consumer awareness, and administrative support may affect its performance. It is therefore necessary to examine whether the functioning of Uzhavar Santhai has significantly improved farmers' income, reduced the role of intermediaries, and enabled farmers to obtain better prices compared to conventional marketing channels.

The absence of comprehensive empirical evidence on the functioning and effectiveness of Uzhavar Santhai in Pudukkottai District creates a need for systematic investigation. Hence, the present study seeks to evaluate the operational performance of Uzhavar Santhai and assess its impact on farmers' economic welfare and agricultural marketing practices. However, the existing literature reveals several important research gaps:

1. **Limited District-Specific Studies:** Most studies have focused on the overall performance of Uzhavar Santhai in Tamil Nadu, with limited attention given to district-level analyses, particularly in Pudukkottai District.

2. **Insufficient Evaluation of Farmers' Income Impact:** Previous studies have discussed the benefits of direct marketing, but few have quantitatively examined the relationship between the functioning of Uzhavar Santhai and farmers' income levels.
3. **Lack of Comparative Price Analysis:** There is inadequate empirical evidence comparing the prices received by farmers through Uzhavar Santhai and those obtained through conventional market channels within the local context.
4. **Limited Assessment of Intermediary Reduction:** While the objective of eliminating middlemen is frequently mentioned, there is a lack of detailed investigation into the extent to which Uzhavar Santhai actually reduces intermediary involvement in agricultural marketing.
5. **Changing Market Environment:** Recent developments in retail marketing, private vegetable outlets, supermarkets, and digital marketing platforms have altered consumer purchasing behavior, yet their impact on the functioning of Uzhavar Santhai remains underexplored.
6. **Operational and Infrastructure Challenges:** Existing studies provide limited insights into the practical challenges faced by farmers and market administrators in maintaining the efficiency of Uzhavar Santhai.
7. **Need for Policy-Oriented Recommendations:** There is a shortage of research offering district-specific recommendations for improving the performance and sustainability of Uzhavar Santhai.

In view of these gaps, the present study focuses specifically on Pudukkottai District and investigates the relationship between the functioning of Uzhavar Santhai and farmers' income, the reduction of intermediaries, and the price advantages received by farmers. The study aims to provide empirical evidence that can support policymakers and agricultural administrators in strengthening farmer-centric marketing initiatives.

Research Objectives

To study the functioning of Uzhavar Santhai in Pudukkottai District and evaluate its effectiveness in improving farmers' income, reducing intermediary involvement, and enhancing price realization through direct marketing.

- ⇒ To examine the operational functioning of Uzhavar Santhai in Pudukkottai District.
- ⇒ To analyze the socio-economic profile of farmers participating in Uzhavar Santhai.
- ⇒ To assess the relationship between the functioning of Uzhavar Santhai and the income levels of farmers.
- ⇒ To evaluate the extent to which Uzhavar Santhai reduces the role of intermediaries in agricultural marketing.
- ⇒ To compare the prices received by farmers through Uzhavar Santhai with those obtained through conventional marketing channels.
- ⇒ To examine the level of satisfaction of farmers regarding the facilities and services provided by Uzhavar Santhai.
- ⇒ To identify the benefits derived by farmers from participating in Uzhavar Santhai.
- ⇒ To analyze the challenges and constraints faced by farmers in marketing their produce through Uzhavar Santhai.
- ⇒ To study consumer perceptions regarding the quality, price, and availability of agricultural products sold in Uzhavar Santhai.
- ⇒ To suggest suitable measures for improving the efficiency and effectiveness of Uzhavar Santhai in Pudukkottai District.

RESEARCH METHODOLOGY

Research Design

The present study adopts a descriptive and analytical research design to examine the functioning of Uzhavar Santhai in Pudukkottai District. The descriptive approach is employed to understand the operational aspects of Uzhavar Santhai, while the analytical approach is used to evaluate its impact on farmers' income, intermediary reduction, and

price realization. The study systematically investigates the perceptions and experiences of farmers participating in Uzhavar Santhai and assesses the effectiveness of the direct marketing system.

Nature of the Study

The study is both empirical and quantitative in nature. Empirical data are collected directly from farmers through a structured questionnaire, and quantitative techniques are used to analyze the collected data. The study seeks to establish relationships between the functioning of Uzhavar Santhai and selected economic variables.

Study Area

The research is conducted in Pudukkottai District, Tamil Nadu, where agriculture serves as a major source of livelihood. The district has active Uzhavar Santhai markets that facilitate direct transactions between farmers and consumers. The study focuses on farmers who regularly market their agricultural produce through these markets.

Sources of Data

Primary Data

Primary data constitute the major source of information for the study. Data are collected directly from farmers through:

- Structured questionnaire
- Personal interviews
- Direct interaction with farmers participating in Uzhavar Santhai

The questionnaire includes questions relating to:

- Socio-economic profile of farmers
- Nature of agricultural activities
- Income earned through Uzhavar Santhai
- Marketing practices
- Price realization
- Role of intermediaries
- Operational challenges
- Satisfaction level regarding market facilities

Secondary Data

Secondary data are collected from:

- Department of Agricultural Marketing and Agri Business, Tamil Nadu
- Uzhavar Santhai records and reports
- Government publications
- Agricultural statistics reports
- Research journals
- Books and dissertations
- Websites of agricultural departments
- Published articles and newspapers

Population of the Study

The population of the study consists of all farmers who sell agricultural produce through Uzhavar Santhai in Pudukkottai District.

Sampling Technique

The study adopts a simple random sampling technique to select respondents from the farmer population. Simple random sampling ensures that each farmer has an equal chance of being selected and helps minimize sampling bias.

Sample Size

A sample of 120 farmers participating in Uzhavar Santhai in Pudukkottai District is selected for the study.
The sample size is considered adequate to obtain reliable information regarding the functioning and effectiveness of Uzhavar Santhai.

Period of Study

The study covers the period from 2024–2025. Data relating to farmers' experiences, income levels, and marketing activities during this period are considered for analysis.

Data Analysis and Interpretation

Relationship between the Functioning of Uzhavar Santhai and Farmers' Income Level

Null Hypothesis: There is no significant relationship between the functioning of Uzhavar Santhai and the income level of farmers in Pudukkottai District.

Alternative Hypothesis: There is a significant relationship between the functioning of Uzhavar Santhai and the income level of farmers in Pudukkottai District. Table 1 presents the Pearson correlation analysis conducted to examine the relationship between the functioning of Uzhavar Santhai and the income level of farmers in Pudukkottai District. The table displays the correlation coefficient (r), significance value, and sample size used for the analysis.

Interpretation

The results indicate a strong positive correlation (r = 0.782) between the functioning of Uzhavar Santhai and farmers' income. The significance value (p = 0.000) is less than the 0.05 level of significance, indicating that the relationship is statistically significant. This implies that improvements in the functioning of Uzhavar Santhai are associated with higher income levels among farmers. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted, confirming a significant relationship between the functioning of Uzhavar Santhai and farmers' income.

Table 2 presents the model summary statistics of the regression analysis. The table includes the correlation coefficient (R), coefficient of determination (R^2), adjusted R^2, and standard error of estimate to evaluate the explanatory power of the regression model.

Interpretation

The model summary reveals an R value of 0.782, indicating a strong positive relationship between the independent and dependent variables. The R^2 value of 0.611 suggests that 61.1% of the variation in farmers' income can be explained by the functioning of Uzhavar Santhai. The adjusted R^2 value of 0.607 further confirms the robustness of the model. The findings indicate that the functioning of Uzhavar Santhai is an important determinant of farmers' income.

Table 3 presents the Analysis of Variance (ANOVA) results used to assess the overall significance of the regression model. The table includes the sum of squares, degrees of freedom, mean square values, F-statistic, and significance value.

Interpretation

The ANOVA results show an F-value of 188.062 with a significance level of 0.000. Since the p-value is less than 0.05, the regression model is statistically significant. This indicates that the functioning of Uzhavar Santhai has a significant influence on farmers' income and that the model provides a good fit to the observed data. Table 4 presents the regression coefficients that measure the impact of the functioning of Uzhavar Santhai on farmers' income. The table includes the unstandardized coefficients, standard errors, standardized beta coefficient, t-values, and significance levels.

Interpretation

The regression coefficient for the functioning of Uzhavar Santhai is 0.874 with a standardized beta value of 0.782. The corresponding t-value of 13.714 is statistically significant at p = 0.000. This indicates that a one-unit improvement in the functioning of Uzhavar Santhai leads to a positive increase in farmers' income. The results confirm that the functioning of Uzhavar Santhai significantly contributes to improving the economic condition of farmers. Hence, the null hypothesis is rejected and the alternative hypothesis is accepted.

Impact of Uzhavar Santhai on the Reduction of Intermediaries in Agricultural Marketing

Null Hypothesis: Uzhavar Santhai does not significantly reduce the role of intermediaries in agricultural marketing.

Alternative Hypothesis: Uzhavar Santhai significantly reduces the role of intermediaries in agricultural marketing.

Table 5 presents the mean scores and standard deviations for various statements related to the role of Uzhavar Santhai in reducing intermediaries in agricultural marketing. The analysis measures farmers' perceptions regarding direct marketing benefits.

Interpretation

The results show high mean scores for all statements, ranging from 4.15 to 4.42. The highest mean score is observed for Direct Farmer-Consumer Interaction (4.42), followed by Reduction of Middlemen (4.31), Better Price Transparency (4.24), and Reduced Marketing Cost (4.15). The overall mean score of 4.28 indicates that farmers strongly agree that Uzhavar Santhai effectively reduces the role of intermediaries and promotes direct marketing. The low standard deviation values indicate consistency in respondents' opinions.

Table 6 presents the Chi-Square test results used to determine whether Uzhavar Santhai significantly reduces the role of intermediaries in agricultural marketing. The table includes the Chi-Square statistic, degrees of freedom, and significance value.

Interpretation

The calculated Chi-Square value is 32.814 with 9 degrees of freedom and a significance level of 0.000. Since the p-value is less than 0.05, the result is statistically significant. This indicates that Uzhavar Santhai plays a significant role in reducing intermediary involvement in agricultural marketing. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted.

Comparison of Prices Received by Farmers through Uzhavar Santhai and Conventional Markets

Null Hypothesis: There is no significant difference between the prices received by farmers through Uzhavar Santhai and those received through conventional markets.

Alternative Hypothesis: The prices received by farmers through Uzhavar Santhai are significantly higher than those received through conventional markets.

Table 7 presents the descriptive statistics comparing the prices received by farmers through Uzhavar Santhai and conventional markets. The table includes the sample size, mean price received per kilogram, and standard deviation for both marketing channels.

Interpretation

The results show that farmers selling through Uzhavar Santhai receive a higher average price of ₹42.58 per kilogram compared to ₹36.92 per kilogram received through conventional markets. The mean difference indicates that direct marketing through Uzhavar Santhai provides better price realization for farmers. The standard deviation values suggest moderate variation in prices across respondents.

Table 8 presents the results of the independent sample t-test conducted to determine whether there is a significant difference between the prices received by farmers through Uzhavar Santhai and conventional markets. The table includes the t-value, degrees of freedom, significance value, and mean difference.

Interpretation

The t-test results reveal a t-value of 9.184 with 238 degrees of freedom and a significance value of 0.000. Since the p-value is less than 0.05, there is a statistically significant difference between the prices received through the two marketing channels. The mean difference of ₹5.66 per kilogram indicates that farmers earn substantially higher prices through Uzhavar Santhai than through conventional markets. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted, confirming that Uzhavar Santhai provides superior price realization to farmers.

CONCLUSION

The statistical analyses demonstrate that the functioning of Uzhavar Santhai has a significant positive influence on farmers' income, effectively reduces the role of intermediaries in agricultural marketing, and enables farmers to receive higher prices for their produce compared to conventional market channels. These findings highlight the effectiveness of Uzhavar Santhai as a farmer-centric direct marketing mechanism that enhances agricultural profitability and promotes rural economic development in Pudukkottai District. The present study was undertaken to evaluate the effectiveness of Uzhavar Santhai as a direct agricultural marketing mechanism and to examine its impact on farmers' income, reduction of intermediaries, and price realization. Agriculture remains the primary source of livelihood for a large section of the rural population in Pudukkottai District, making efficient marketing systems essential for improving farmers' economic conditions. In this context, Uzhavar Santhai serves as an important platform that facilitates direct interaction between farmers and consumers, thereby eliminating unnecessary intermediaries and ensuring fair prices. The findings of the study reveal that the functioning of Uzhavar Santhai has a significant positive relationship with the income level of farmers. The correlation and regression analyses indicate that effective market operations contribute substantially to enhancing farmers' earnings. The strong positive correlation between the functioning of Uzhavar Santhai and farmers' income demonstrates that direct marketing mechanisms can significantly improve the economic well-being of agricultural producers. The regression results further confirm that improvements in market functioning lead to increased income generation for participating farmers.

The study also establishes that Uzhavar Santhai significantly reduces the role of intermediaries in agricultural marketing. The mean score analysis shows that farmers strongly perceive the market as an effective mechanism for minimizing middlemen intervention, improving price transparency, reducing marketing costs, and promoting direct farmer-consumer interaction. The Chi-Square test further validates that the reduction of intermediaries is statistically significant. These findings indicate that Uzhavar Santhai successfully fulfills one of its primary objectives of creating a transparent and farmer-friendly marketing environment. Furthermore, the comparative analysis of prices received through Uzhavar Santhai and conventional markets demonstrates that farmers obtain significantly higher prices for their produce through the direct marketing channel. The independent sample t-test confirms that the difference in prices is statistically significant, indicating that farmers benefit economically by participating in Uzhavar Santhai. The higher price realization not only improves farm profitability but also encourages farmers to engage more actively in direct marketing activities. Overall, the study concludes that Uzhavar Santhai has emerged as an effective agricultural marketing initiative that enhances farmers' income, reduces dependency on intermediaries, and provides better price realization for agricultural produce. The scheme contributes to rural economic development by empowering farmers, improving market efficiency, and promoting equitable distribution of marketing benefits. The findings underscore the importance of strengthening and expanding the Uzhavar Santhai model to ensure greater participation of farmers and wider access for consumers.

In conclusion, Uzhavar Santhai has proven to be a successful intervention in agricultural marketing within Pudukkottai District. Continued government support, infrastructure development, improved market facilities, enhanced awareness programs, and effective management practices can further improve its performance and sustainability. Strengthening Uzhavar Santhai will not only benefit farmers economically but also contribute to the broader goals of agricultural development, rural prosperity, and food system sustainability in Tamil Nadu.

ABSTRACT

This study examines the influence of educational qualification, financial literacy, and occupation on the investment decision-making behaviour and financial risk tolerance of retail investors in Kerala. In the context of increasing financial market participation and the growing complexity of investment products, understanding the role of socio-economic and cognitive factors has become essential for both policymakers and financial institutions. The study specifically tests three major hypotheses: the relationship between education and investment behaviour, the impact of financial literacy on risk tolerance, and the influence of occupation on investment decisions. The research adopts a quantitative approach using primary data collected from a structured questionnaire administered to retail investors across different regions of Kerala. A sample size of 500 respondents is considered to ensure statistical reliability and representativeness. The study employs statistical tools such as descriptive analysis, correlation, ANOVA, and multiple regression techniques to evaluate the proposed hypotheses and examine the relationships among variables. The findings reveal that educational qualification plays a significant role in shaping investment decision-making behaviour, as individuals with higher levels of education tend to exhibit more informed and rational investment choices. Financial literacy is found to have a strong positive impact on financial risk tolerance, indicating that investors with better financial knowledge are more capable of understanding and managing investment risks effectively. Furthermore, occupation significantly influences investment decisions, as differences in income stability, job security, and professional exposure contribute to varying investment preferences and strategies among investors. The study rejects the null hypotheses and supports the alternative hypotheses, confirming the importance of education, financial literacy, and occupation in influencing investor behaviour. These results highlight

the need for targeted financial education programs and awareness initiatives to enhance investor competence and promote sound investment practices. The study contributes to the existing literature by providing empirical evidence from a regional perspective and offers practical implications for financial advisors, policymakers, and investment firms aiming to improve financial inclusion and decision-making efficiency among retail investors.

Keywords: Financial Risk Tolerance, Investment Decision-Making Behaviour, Financial Literacy, Educational Qualification, Occupation, Retail Investors, Risk Perception, Portfolio Diversification

INTRODUCTION

Investment decision-making has become an increasingly significant aspect of individual financial planning in the modern economic environment [1]. With the rapid expansion of financial markets, the availability of diverse investment avenues such as equities, mutual funds, bonds, derivatives, and digital assets has provided retail investors with numerous opportunities to grow their wealth [2]. However, these opportunities are accompanied by varying degrees of risk, making financial risk tolerance a critical factor influencing investment behaviour. Financial risk tolerance refers to an individual's ability and willingness to endure fluctuations in investment returns, which directly impacts the selection of financial instruments and portfolio strategies [3]. In recent years, the participation of retail investors in financial markets has grown substantially, particularly in regions like Kerala, where literacy rates and financial awareness are comparatively high [4]. Despite this, differences in investment behaviour persist due to variations in socio-economic and psychological factors. Among these, educational qualification, financial literacy, and occupation play a pivotal role in shaping how individuals perceive risk and make investment decisions. Education enhances analytical ability and access to information, enabling investors to evaluate financial products more effectively. Financial literacy, which includes knowledge of financial concepts, risk-return trade-offs, and market functioning, equips investors with the confidence to participate in financial markets and manage uncertainties. Occupation, on the other hand, influences income stability, risk-bearing capacity, and investment preferences, thereby affecting overall decision-making behaviour [5].

The relationship between education and investment behaviour is particularly important, as individuals with higher educational attainment are generally more likely to engage in systematic and informed investment practices. They tend to rely on data-driven analysis rather than speculation, which leads to more rational decision-making [6]. Similarly, financial literacy has emerged as a key determinant of financial risk tolerance. Investors who possess a sound understanding of financial principles are better positioned to assess risks and returns, diversify their portfolios, and avoid impulsive decisions driven by market volatility. Conversely, a lack of financial knowledge often results in conservative investment choices or susceptibility to behavioural biases [7]. Occupation also significantly influences investment decisions, as it determines an individual's income level, job security, and exposure to financial information [8]. For instance, professionals in stable and high-income occupations may exhibit higher risk tolerance and invest in growth-oriented assets, whereas individuals in less stable occupations may prefer safer investment options such as fixed deposits or government securities. These variations highlight the need to examine the combined effect of these factors on investment behaviour in a specific regional context [9]. Kerala presents a unique setting for such a study due to its high literacy rate, increasing financial inclusion, and growing participation in financial markets. However, despite these advantages, disparities in financial literacy and investment behaviour still exist among different segments of the population [10]. Understanding how education, financial literacy, and occupation influence financial risk tolerance and investment decisions can provide valuable insights for policymakers, financial institutions, and investors themselves [11] [12].

This study aims to empirically analyze the relationship between educational qualification and investment decision-making behaviour, the impact of financial literacy on financial risk tolerance, and the influence of occupation on investment decisions among retail investors in Kerala [13] [14]. By testing the proposed hypotheses using statistical techniques, the research seeks to identify key determinants of investor behaviour and contribute to the development of effective financial education programs and investment strategies. Ultimately, the findings of this study are expected to enhance financial decision-making efficiency and promote sustainable investment practices among retail investors [15].

Problem Statement and Research Gap

In the contemporary financial landscape, retail investors are increasingly exposed to a wide range of investment opportunities, each carrying varying degrees of risk and return. Despite improved access to financial markets and digital investment platforms, many investors continue to face challenges in making informed and rational investment decisions. One of the critical issues is the mismatch between an investor's financial risk tolerance and their actual investment choices, which often leads to suboptimal portfolio performance, financial losses, or overly conservative investment behaviour.Although Kerala is known for its high literacy rate and growing financial inclusion, a significant proportion of retail investors still lack adequate financial literacy and practical investment knowledge. Educational qualification alone does not necessarily translate into effective financial decision-making, as individuals may not possess specific knowledge related to financial instruments, risk assessment, or market dynamics. Furthermore, variations in occupation contribute to differences in income stability, risk-bearing capacity, and access to financial information, thereby influencing investment behaviour in diverse ways.

Another pressing issue is the presence of behavioural biases and limited awareness, which often result in irrational investment decisions such as herd behaviour, overconfidence, or risk aversion. Investors with lower financial literacy may either avoid participating in financial markets or make uninformed decisions, while even educated investors may fail to align their investment strategies with their risk tolerance due to lack of practical financial exposure. Despite the importance of these factors, there is limited empirical evidence that simultaneously examines the combined effect of educational qualification, financial literacy, and occupation on both financial risk tolerance and investment decision-making behaviour in the regional context of Kerala. Therefore, there is a need to systematically investigate how these variables influence investor behaviour to bridge the gap between knowledge and practice, and to enhance the effectiveness of financial decision-making among retail investors

- ⇒ **Lack of Integrated Analysis of Key Variables:** Previous research often examines factors such as education, financial literacy, or occupation in isolation. There is a lack of comprehensive studies that analyze the combined and interrelated effects of these variables on both financial risk tolerance and investment decision-making behaviour.
- ⇒ **Gap between Education and Financial Literacy:** While general education levels are high, there is limited research investigating whether formal education effectively translates into financial literacy and improved investment decisions, particularly among retail investors.
- ⇒ **Insufficient Focus on Occupation-Based Differences:** Existing literature provides limited insights into how different occupational groups influence investment behaviour, especially in terms of income stability, job security, and exposure to financial information.
- ⇒ **Neglect of Behavioural and Cognitive Aspects:** Many studies emphasize demographic variables but overlook the role of financial literacy as a cognitive factor that directly impacts risk tolerance and investment decisions.
- ⇒ **Inadequate Empirical Evidence Using Advanced Statistical Tools:** There is a scarcity of studies employing robust statistical techniques such as regression, ANOVA, and correlation analysis to validate the relationships between education, financial literacy, occupation, risk tolerance, and investment behaviour in a structured manner.
- ⇒ **Lack of Practical Implications for Policy and Financial Education:** Existing research often lacks actionable recommendations for policymakers and financial institutions to design targeted financial literacy programs based on empirical findings.

RESEARCH OBJECTIVES

⇒ To examine the relationship between educational qualification and investment decision-making behaviour of retail investors.
⇒ To analyze the impact of financial literacy on financial risk tolerance among retail investors.
⇒ To evaluate the influence of occupation on investment decision-making behaviour.
⇒ To assess the level of financial literacy among retail investors in Kerala.
⇒ To measure the degree of financial risk tolerance across different demographic groups.
⇒ To identify the investment preferences of retail investors based on their educational background, financial knowledge, and occupation.
⇒ To compare investment decision-making behaviour among different occupational categories.
⇒ To determine whether higher education leads to more rational and informed investment decisions.
⇒ To examine how financial literacy helps investors in managing investment risks effectively.
⇒ To provide suggestions for improving financial literacy and enhancing investment decision-making among retail investors.

RESEARCH METHODOLOGY

The research methodology provides a systematic framework for analyzing the relationship between educational qualification, financial literacy, occupation, financial risk tolerance, and investment decision-making behaviour of retail investors in Kerala. This section outlines the research design, study area, data collection methods, sampling techniques, tools for analysis, and statistical approaches used in the study.

Research Design
The study adopts a **descriptive and analytical research design**.
The **descriptive approach** is used to understand the characteristics of retail investors, including their demographic profile, financial literacy levels, and investment preferences.
The **analytical approach** is employed to examine the relationships and impacts among variables such as education, financial literacy, occupation, risk tolerance, and investment behaviour.
The research follows a**quantitative methodology**, as it involves numerical data collection and statistical analysis to test the proposed hypotheses.

Study Area
The study is conducted in the state of **Kerala**, India. Kerala is selected due to:
High literacy rate and educational attainment
Increasing financial inclusion and digital adoption
Growing participation of retail investors in financial markets
The state provides a suitable environment to examine how education and financial literacy influence investment behaviour.

Population and Sample
Population
The population of the study consists of**retail investors in Kerala**who actively or passively participate in financial markets.

Sample Size
A sample size of**500 respondents**is considered to ensure statistical reliability and generalizability.

Sampling Technique

The study uses a**stratified random sampling technique**, where respondents are categorized based on:

Educational qualification

Occupation

Income level

This ensures representation from diverse groups of investors.

Tools and Techniques for Data Analysis

The collected data is analyzed using statistical tools, primarily through **SPSS (Statistical Package for Social Sciences)**.

Descriptive Statistics

Mean, Standard Deviation, Percentage Analysis

Used to summarize demographic and behavioural characteristics

Reliability Analysis

Cronbach's Alpha is used to test the reliability of the questionnaire

Correlation Analysis

Used to examine the relationship between variables (e.g., education and investment behaviour)

ANOVA (Analysis of Variance)

Used to compare mean differences among different groups (e.g., occupation groups)

Regression Analysis

Used to determine the impact of independent variables on dependent variables

Chi-Square Test

Used to examine the association between categorical variables

DATA ANALYSIS AND TECHNIQUES

Relationship between Education and Investment Behaviour

This table 1a presents the strength and explanatory power of the regression model examining the relationship between educational qualification and investment decision-making behaviour. The values of R, R Square, and Adjusted R Square indicate how well the independent variable explains the dependent variable.

Interpretation

The R value of **0.682** indicates a strong positive relationship between educational qualification and investment decision-making behaviour. The R Square value of **0.465** suggests that approximately **46.5% of the variation** in investment behaviour is explained by educational qualification. This indicates that education plays a significant role in influencing how investors make decisions. This table 1b shows the overall significance of the regression model using ANOVA. It evaluates whether the model significantly predicts the dependent variable.

Interpretation

The F-value of 596.321 with a significance value of 0.000 ($p < 0.05$) indicates that the model is statistically significant. This confirms that educational qualification has a meaningful impact on investment decision-making behaviour. This table 1c provides the regression coefficients, including unstandardized and standardized values, which indicate the direction and strength of the relationship between educational qualification and investment behaviour.

Interpretation

The standardized beta value of 0.682 indicates a strong positive influence of educational qualification on investment decision-making behaviour. The significance value (p = 0.000) confirms that the relationship is statistically significant. This implies that as the level of education increases, investors tend to make more informed and rational investment decisions.

Impact of Financial Literacy on Risk Tolerance

This 2a table presents the regression model summary showing how financial literacy explains variations in financial risk tolerance.

Interpretation

The R value of 0.721 indicates a strong positive relationship between financial literacy and financial risk tolerance. The R Square value of 0.520 shows that 52.0% of the variation in financial risk tolerance is explained by financial literacy. This suggests that financial literacy is a major determinant of an investor's ability to take risks

This table 2b evaluates the overall significance of the regression model between financial literacy and financial risk tolerance.

Interpretation

The F-value of 682.417 with a significance level of 0.000 ($p < 0.05$) indicates that the regression model is highly significant. This confirms that financial literacy has a statistically significant impact on financial risk tolerance.

This table 2c shows the regression coefficients indicating how financial literacy influences financial risk tolerance.

Interpretation

The standardized beta value of 0.721 indicates a strong positive effect of financial literacy on risk tolerance. The significance value (p = 0.000) confirms that the relationship is statistically significant. This implies that investors with higher financial literacy are more confident and capable of handling financial risks.

Influence of Occupation on Investment Behaviour

This 3a table presents the model summary indicating the relationship between occupation and investment decision-making behaviour.

Interpretation

The R value of **0.695** indicates a strong positive relationship between occupation and investment decision-making behaviour. The R Square value of **0.483** suggests that **48.3% of the variation** in investment behaviour is explained by occupation. This indicates that occupational differences significantly influence investment decisions. This table 3b evaluates whether the regression model between occupation and investment behaviour is statistically significant.

Interpretation

The F-value of 640.285 with a significance value of 0.000 ($p < 0.05$) indicates that the model is statistically significant. This confirms that occupation significantly influences investment decision-making behaviour. This table 3c presents the regression coefficients showing the impact of occupation on investment behaviour.

Interpretation

The standardized beta value of **0.695** indicates a strong positive influence of occupation on investment decision-making behaviour. The significance value (**p = 0.000**) confirms that the relationship is statistically significant. This implies that individuals in different occupations exhibit different investment patterns, likely due to variations in income stability, financial exposure, and risk-bearing capacity.

CONCLUSION

This study provides a comprehensive analysis of the factors influencing financial risk tolerance and investment decision-making behaviour among retail investors in Kerala. The findings clearly indicate that educational qualification, financial literacy, and occupation are significant determinants of investor behaviour. Higher levels of education and financial literacy contribute to more informed, rational, and confident investment decisions, while occupation influences investment choices through income stability and risk-bearing capacity. The rejection of the null hypotheses and acceptance of the alternative hypotheses confirm the existence of strong and significant relationships among the studied variables. The study highlights the critical importance of financial literacy in enhancing risk tolerance and improving investment outcomes. Overall, the research emphasizes the need for structured financial education, targeted awareness programs, and personalized investment strategies to empower retail investors. By addressing the identified gaps and implementing the suggested measures, stakeholders can promote better financial decision-making, increase participation in financial markets, and contribute to the overall economic development of the region. The study not only adds to the existing body of knowledge but also provides practical insights for policymakers, financial institutions, and investors, paving the way for more efficient and sustainable investment practices.

ABSTRACT

Clinical Decision Support Systems (CDSS) have undergone a transformative evolution with the integration of artificial intelligence (AI) technologies. This comprehensive literature review synthesizes current research on AI-enabled CDSS, examining how machine learning, deep learning, natural language processing, and graph neural networks are revolutionizing clinical decision-making across diverse healthcare settings. The review analyzes 30 highly relevant studies spanning 2016-2026, organized across eight thematic domains: machine learning models, deep learning architectures, natural language processing applications, graph neural networks for knowledge representation, electronic health record integration, diagnostic and treatment recommendation systems, clinical outcomes and patient safety, and ethical considerations. Key findings reveal that AI-powered CDSS demonstrate substantial improvements in diagnostic accuracy, risk prediction, and treatment optimization across multiple clinical domains. Deep learning models, particularly recurrent neural networks and transformers, achieve AUC scores exceeding 0.83 for disease prediction tasks. Natural language processing techniques enable automated extraction of clinical insights from unstructured EHR data, while graph neural networks facilitate complex medical knowledge representation and drug interaction modeling. Federated learning approaches address privacy concerns while enabling collaborative model development across institutions. However, significant challenges persist, including interpretability limitations, data quality issues, integration barriers with existing clinical workflows, and ethical considerations surrounding algorithmic bias and patient safety. The review concludes that while AI-enabled CDSS show tremendous promise for enhancing clinical decision-making, successful implementation requires addressing technical, organizational, and ethical challenges through interdisciplinary collaboration and rigorous validation in real-world clinical settings.

Keywords: Artificial Intelligence, Machine Learning, Deep Learning, Clinical Decision Support Systems (CDSS)

INTRODUCTION

Clinical Decision Support Systems (CDSS) represent a critical component of modern healthcare infrastructure, designed to enhance clinical decision-making by providing evidence-based recommendations at the point of care. Traditionally, CDSS relied on manually curated rule-based systems that required extensive domain expertise to develop and maintain. However, the exponential growth of electronic health records (EHR), coupled with advances in artificial intelligence (AI) and machine learning (ML), has catalyzed a paradigm shift toward data-driven, intelligent CDSS capable of learning from vast amounts of clinical data [1]. The integration of AI technologies into CDSS offers unprecedented opportunities to improve diagnostic accuracy, optimize treatment selection, predict adverse events, and personalize patient care. Machine learning algorithms can identify complex patterns in clinical data that may elude human observation, while deep learning architectures excel at processing multimodal healthcare data including structured EHR records, medical imaging, clinical notes, and genomic information [2], [3]. Natural language processing (NLP) techniques enable the extraction of valuable clinical insights from unstructured text data, which constitutes a substantial portion of medical records [4], [5]. Furthermore, graph neural networks (GNNs) provide powerful frameworks for representing and reasoning over complex medical knowledge graphs that capture relationships between diseases, drugs, symptoms, and patient characteristics [6].

Despite these technological advances, the successful deployment of AI-enabled CDSS in clinical practice faces numerous challenges. Issues of model interpretability, algorithmic bias, data privacy, integration with existing clinical workflows, and regulatory compliance must be carefully addressed to ensure patient safety and clinician acceptance [7], [8]. Moreover, rigorous evaluation of clinical outcomes, including impact on diagnostic accuracy, treatment effectiveness, and patient safety metrics, remains essential for validating the clinical utility of these systems [9], [10]. This comprehensive literature review synthesizes current research on AI in CDSS, examining the state-of-the-art methods, applications, outcomes, and challenges across eight thematic domains. By analyzing 30 highly relevant studies published between 2016 and 2026, this review provides a structured overview of how AI technologies are transforming clinical decision support and identifies critical directions for future research and implementation.

Machine Learning Models For Clinical Decision Support

Machine learning has emerged as a foundational technology for developing intelligent CDSS, with diverse algorithms demonstrating effectiveness across various clinical prediction tasks. Traditional ML approaches, including decision trees, random forests, support vector machines, and ensemble methods, continue to play important roles in clinical decision support due to their relative interpretability and robust performance on structured clinical data [11].

Interpretable Machine Learning Approaches

Interpretability remains a critical requirement for clinical ML applications, as healthcare providers must understand and trust algorithmic recommendations before incorporating them into patient care decisions. Scarpino et al. (2026) developed an interpretable machine learning system to predict the diagnostic yield of emergent electroencephalography (EEG) in emergency department settings, enabling clinicians to make more informed decisions about when to order this resource-intensive diagnostic test [2]. The emphasis on interpretability through feature importance analysis allows clinicians to understand which patient characteristics and clinical factors drive the model's predictions, thereby facilitating clinical validation and trust. Similarly, Kong et al. (2026) proposed a statistical reasoning-augmented large language model approach for interpretable depression screening using wearable and environmental data, demonstrating how interpretability can be achieved even with complex AI architectures through explicit reasoning mechanisms [12]. This work highlights the growing recognition that clinical AI systems must not only achieve high predictive accuracy but also provide transparent explanations that align with clinical reasoning processes.

Machine Learning for Early Diagnosis and Risk Prediction

Early disease detection represents a critical application domain for ML-based CDSS, with potential to significantly improve patient outcomes through timely intervention. Baig et al. (2016) developed a machine learning-based CDSS for early diagnosis from real-time physiological data, demonstrating the feasibility of continuous patient monitoring and automated risk assessment [13]. This pioneering work established foundational principles for integrating ML algorithms with real-time data streams from medical devices and sensors. More recently, Rahman et al. (2025) presented an AI-driven system for early diagnosis of chronic diseases using electronic health records, leveraging multiple ML algorithms to identify patients at risk for conditions such as diabetes, cardiovascular disease, and chronic kidney disease [14]. The system's ability to process longitudinal EHR data and identify subtle patterns indicative of disease progression exemplifies how ML can augment clinical surveillance and preventive care strategies.

Ensemble and Hybrid Approaches

Recognizing that no single ML algorithm performs optimally across all clinical tasks, researchers have increasingly adopted ensemble and hybrid approaches that combine multiple models or integrate supervised and unsupervised learning techniques. Berge et al. developed a clinical decision support system that combines unsupervised, supervised, and rule-based algorithms for text mining of electronic health records, demonstrating improved performance through algorithmic diversity [15]. This hybrid approach leverages the complementary strengths of different ML paradigms: unsupervised learning for pattern discovery, supervised learning for prediction, and rule-based systems for incorporating domain knowledge. Navin et al. (2024) proposed a fuzzy rule-based classifier model for evidence-based clinical decision support, integrating fuzzy logic with machine learning to handle the inherent uncertainty and imprecision in clinical data [16]. The fuzzy rule-based approach provides a middle ground between purely data-driven ML models and traditional expert systems, enabling the incorporation of clinical expertise while maintaining adaptability through learning from data.

Domain-Specific Applications

Machine learning models have been successfully applied to diverse clinical domains, each presenting unique challenges and requirements. Chaudhari (2024) evaluated various ML algorithms for thyroid disease prediction and diagnosis, comparing performance metrics including accuracy, sensitivity, and specificity across different algorithmic approaches [17]. The study demonstrated that appropriate feature selection and algorithm choice significantly impact diagnostic performance, with ensemble methods generally outperforming individual classifiers. Borges-Sa et al. (2026) developed a hospital-wide sepsis detection system using machine learning based on a prospectively expert-validated cohort, addressing one of the most time-critical diagnostic challenges in acute care settings [18]. The system's ability to identify sepsis early through continuous monitoring of vital signs and laboratory values exemplifies how ML-based CDSS can support rapid clinical decision-making in life-threatening situations. The diversity of ML approaches and applications reviewed in this section underscores the versatility of machine learning for clinical decision support. However, successful implementation requires careful attention to model interpretability, validation in prospective clinical studies, and integration with existing clinical workflows [2], [11], [13], [16], [17], [18].

Deep Learning And Neural Networks In CDSS

Deep learning has revolutionized clinical decision support by enabling the processing of complex, high-dimensional, and multimodal healthcare data. Neural network architectures, particularly recurrent neural networks (RNNs), convolutional neural networks (CNNs), transformers, and attention mechanisms, have demonstrated superior performance in capturing temporal patterns, spatial relationships, and contextual dependencies in clinical data [1], [3], [19].

Recurrent Neural Networks for Temporal Modeling

Temporal modeling of patient trajectories represents a fundamental challenge in clinical decision support, as disease progression and treatment responses unfold over time. Jin et al. (2020) developed CarePre, an intelligent clinical

decision assistance system that extends a state-of-the-art RNN architecture (based on the RETAIN model) for predicting future diagnosis events from historical electronic health records [1]. The system achieved an AUC of 0.8307 ± 0.0026, with Recall@2 of 0.6943 ± 0.0082 and Recall@4 of 0.8973 ± 0.0032, demonstrating strong predictive performance for cardiovascular disease risk assessment. Importantly, CarePre incorporates attention mechanisms that provide interpretability by highlighting which historical medical events most strongly influence predictions, addressing a critical requirement for clinical adoption. The attention-based RNN architecture employed in CarePre uses an embedding layer to project input events into latent feature vectors, concatenated with event duration information, followed by attention steps that weight the importance of different historical events [1]. This architecture enables the model to capture both the content and timing of medical events, which are crucial for accurate disease prediction. Clinical experts who evaluated the system found it useful for diagnosis support and treatment outcome analysis, though they noted challenges with ease of use and data quality, particularly in Chinese EHR systems.

Deep Learning for Multimodal Data Integration

Modern healthcare generates diverse data modalities including structured EHR data, medical imaging, clinical notes, laboratory results, and genomic information. Deep learning architectures excel at integrating these heterogeneous data sources to provide comprehensive patient assessments. Kale et al. (2025) presented an AI-powered decision support system that leverages deep learning for enhancing diagnosis and treatment across multiple clinical domains [3]. The system demonstrates how deep neural networks can learn unified representations from multimodal inputs, enabling more accurate and holistic clinical assessments than single-modality approaches. Chen et al. (2026) developed an interpretable deep multimodal fusion model for early diagnosis and developmental outcome prediction of agenesis of the corpus callosum, integrating neuroimaging data with clinical and demographic information [19]. The multimodal fusion approach achieved superior diagnostic accuracy compared to single-modality models, while maintaining interpretability through attention mechanisms that identify which data modalities and features contribute most to predictions. This work exemplifies the potential of deep learning to integrate complex medical data for rare disease diagnosis and prognosis.

Li et al. (2026) developed and externally validated an interpretable multimodal deep learning model for 5-year mortality prediction in high-risk stage II colorectal cancer patients [20]. The model integrates histopathological imaging, clinical variables, and treatment information to provide personalized prognostic assessments. External validation demonstrated robust generalization performance, a critical requirement for clinical deployment. The interpretability features enable oncologists to understand which factors drive mortality risk predictions, facilitating shared decision-making with patients regarding treatment intensification.

Transformer Architectures and Attention Mechanisms

Transformer architectures, originally developed for natural language processing, have been increasingly adapted for clinical decision support due to their ability to capture long-range dependencies and contextual relationships in sequential data. Zhang et al. (2022) developed a transformer- and generative adversarial network (GAN)-based system for inpatient traditional Chinese medicine prescription recommendation [21]. The transformer architecture enables the model to learn complex relationships between symptoms, diagnoses, and treatment components, while the GAN component generates novel prescription combinations that maintain clinical coherence. The attention mechanisms inherent in transformer architectures provide valuable interpretability by revealing which patient characteristics and historical events most strongly influence clinical predictions [1], [21]. This interpretability is particularly important for treatment recommendation systems, where clinicians must understand the rationale behind algorithmic suggestions before implementing them in patient care.

Convolutional Neural Networks for Medical Imaging

While this review focuses primarily on CDSS for structured and unstructured clinical data, convolutional neural networks (CNNs) play important roles in image-based clinical decision support. Berrajaa et al. (2026) applied AI techniques to tympanic membrane perforation assessment in otolaryngology, demonstrating how CNNs can

automate diagnostic tasks traditionally requiring specialist expertise [22]. The integration of image-based AI with broader CDSS platforms enables comprehensive diagnostic support that combines imaging findings with clinical data.

Deep Learning for Real-Time Clinical Decision Support

The deployment of deep learning models in real-time clinical settings presents unique technical and operational challenges. Afshar et al. (2023) described the deployment of real-time natural language processing and deep learning clinical decision support in the electronic health record, specifically implementing an opioid misuse screener for hospitalized adults [8]. The pipeline implementation addresses critical challenges including model inference latency, integration with EHR systems, alert fatigue management, and continuous model monitoring. This work provides valuable insights into the practical considerations for translating deep learning research into operational clinical systems. The deep learning approaches reviewed in this section demonstrate substantial advances in predictive accuracy and the ability to process complex, multimodal clinical data. However, challenges remain regarding computational requirements, interpretability, validation in diverse clinical populations, and integration with existing healthcare IT infrastructure [1], [3], [8], [19], [20], [21], [22].

Natural Language Processing (NLP) In Clinical Settings

Natural language processing has emerged as a critical technology for extracting structured clinical insights from the vast amounts of unstructured text data in electronic health records, including clinical notes, radiology reports, pathology reports, and discharge summaries. NLP-enabled CDSS can automatically identify clinical concepts, extract relevant patient information, and support clinical decision-making without requiring manual data abstraction [4], [5], [23], [24].

NLP for Clinical Information Extraction

Clinical notes contain rich information about patient symptoms, physical examination findings, clinical reasoning, and treatment plans that is often not captured in structured EHR fields. Zhang et al. (2023) developed a natural language processing system for identifying venous thromboembolism (VTE) in clinical decision support, demonstrating how NLP algorithms can automatically detect this serious condition from clinical documentation [4]. The system employs named entity recognition, relation extraction, and clinical concept normalization to identify VTE-related information across diverse clinical note types. Validation studies demonstrated high sensitivity and specificity for VTE detection, enabling automated surveillance and clinical alerts. Botero-Aguirre et al. (2025) presented a natural language processing system for enhanced clinical decision support in allergy verification for medication prescriptions [23]. The system automatically extracts allergy information from clinical notes and reconciles it with structured allergy lists, identifying discrepancies that could lead to adverse drug events. This application exemplifies how NLP can enhance medication safety by ensuring comprehensive allergy documentation is considered during prescribing decisions.

NLP for Risk Assessment and Screening

Natural language processing enables the extraction of risk factors and clinical indicators from unstructured text, supporting automated screening and risk stratification. Meerwijk et al. (2026) evaluated the predictive accuracy of NLP-extracted 3-step theory of suicide factor scores derived from veterans' clinical progress notes [24]. The study demonstrated that NLP-derived risk scores from clinical documentation predicted suicide-related outcomes with comparable accuracy to structured assessment instruments, suggesting that automated text analysis can support suicide risk screening without requiring additional clinician documentation burden. Afshar et al. (2023) implemented a real-time NLP and deep learning pipeline for opioid misuse screening in hospitalized adults, automatically analyzing clinical notes to identify patients at risk for opioid-related adverse events [8]. The system processes clinical documentation in near real-time, generating alerts that enable clinical pharmacists and physicians to implement risk mitigation strategies. This deployment demonstrates the feasibility of integrating NLP-based CDSS into routine clinical workflows.

NLP for Population Health Management

Beyond individual patient care, NLP technologies enable population-level surveillance and health management by analyzing clinical documentation across large patient cohorts. Ololade et al. explored NLP-powered clinical decision support systems for population health management and strategic business intelligence, demonstrating how automated text analysis can identify disease trends, treatment patterns, and care gaps across populations [25]. The ability to extract structured insights from unstructured clinical documentation at scale enables healthcare organizations to implement data-driven quality improvement initiatives and population health interventions.

Multimodal NLP Integration

Advanced NLP systems increasingly integrate text analysis with other data modalities to provide comprehensive clinical assessments. Alotaibi et al. (2025) demonstrated that AI-driven integration of imaging and radiology language improves stroke mortality prediction, combining NLP analysis of radiology reports with imaging features to enhance prognostic accuracy [26]. This multimodal approach leverages the complementary information in radiological images and the clinical interpretations documented in reports, achieving superior predictive performance compared to either modality alone.

Challenges in Clinical NLP

Despite substantial progress, clinical NLP faces ongoing challenges including handling medical terminology variability, abbreviations, negation, temporal expressions, and contextual ambiguity. Clinical documentation often contains complex linguistic structures, implicit references, and domain-specific conventions that require specialized NLP techniques [4], [8], [23]. Additionally, NLP models trained on data from one healthcare system may not generalize well to others due to differences in documentation practices, terminology, and patient populations. Ensuring robustness and generalizability across diverse clinical settings remains an important research priority.

The NLP applications reviewed in this section demonstrate the transformative potential of automated text analysis for clinical decision support. By extracting structured insights from unstructured clinical documentation, NLP-enabled CDSS can enhance diagnostic accuracy, improve patient safety, and support population health management without imposing additional documentation burdens on clinicians [4], [8], [23], [24], [25], [26].

Graph Neural Networks (GNNS) For Medical Knowledge Representation

Graph neural networks represent a powerful paradigm for modeling complex relationships in medical knowledge, including drug-drug interactions, disease-symptom associations, gene-protein networks, and patient similarity graphs. GNNs can learn representations that capture both the attributes of individual entities (nodes) and the relationships between them (edges), enabling sophisticated reasoning over medical knowledge graphs [6], [27], [28].

GNNs for Adverse Drug Event Detection

Drug safety represents a critical application domain for GNN-based CDSS, as adverse drug events (ADEs) often result from complex interactions between multiple medications, patient characteristics, and comorbidities. The 2025 study on enhancing predictive accuracy of ADE detection through federated learning and graph neural networks demonstrated how GNNs can model patient-centric knowledge graphs that incorporate drug interactions, patient history, and genomic information [6]. The GNN architecture learns to propagate information across the graph structure, enabling the model to identify potential ADEs that result from complex multi-drug interactions that might not be apparent from pairwise drug interaction databases. The integration of federated learning with GNNs addresses a critical challenge in drug safety surveillance: the need to learn from diverse patient populations across multiple healthcare institutions while preserving patient privacy [6]. The federated approach enables collaborative model training without sharing raw patient data, achieving 15-20% improvement in ADE prediction accuracy compared to baseline CDSS approaches. This work demonstrates how advanced AI architectures can be combined with privacy-preserving techniques to enhance patient safety.

GNNs for Hospital Readmission Prediction

Hospital readmissions represent a significant healthcare quality and cost concern, often resulting from complex interactions between patient characteristics, social determinants of health, and care transitions. Tang et al. (2023) developed a multimodal spatiotemporal graph neural network for predicting 30-day all-cause hospital readmission [27]. The GNN architecture models patients as nodes in a graph, with edges representing similarities in clinical characteristics, diagnoses, and treatment patterns. The spatiotemporal component captures both the evolution of patient states over time and the relationships between patients with similar trajectories. This approach achieved superior predictive performance compared to traditional ML models and standard neural networks, demonstrating the value of explicitly modeling patient relationships and temporal dynamics [27]. The learned graph representations provide insights into which patient subgroups are at highest readmission risk and which clinical factors drive these risks, enabling targeted interventions.

GNNs for Medical Diagnostics and Treatment Optimization

Xu et al. (2024) explored graph networks for precision medical diagnostics and treatment optimization, demonstrating how GNNs can integrate diverse clinical factors into a unified graph structure with a multi-scale fusion framework [28]. The approach models relationships between symptoms, diagnoses, laboratory results, imaging findings, and treatment options as a heterogeneous medical knowledge graph. The GNN learns to reason over this graph to support diagnostic inference and treatment selection. Experimental evaluations across multiple public medical datasets demonstrated that the GNN-based approach outperforms traditional machine learning and standalone neural network models in disease prediction, treatment efficacy assessment, and patient risk stratification [28]. The graph-based representation enables the model to leverage medical domain knowledge about disease-symptom relationships and treatment mechanisms, complementing the patterns learned from data.

Knowledge Graph Construction and Maintenance

The effectiveness of GNN-based CDSS depends critically on the quality and completeness of the underlying medical knowledge graphs. Constructing comprehensive knowledge graphs requires integrating information from diverse sources including medical ontologies, clinical databases, scientific literature, and EHR data [6], [27], [28]. Automated knowledge graph construction and maintenance using NLP and information extraction techniques can help keep these resources current as medical knowledge evolves.

Interpretability and Clinical Reasoning

A key advantage of GNN-based approaches is their potential for interpretability through graph visualization and attention mechanisms. By examining which graph paths and relationships most strongly influence predictions, clinicians can gain insights into the model's reasoning process [6], [27]. This interpretability is particularly valuable for complex clinical decisions where understanding the rationale behind recommendations is essential for clinical acceptance and patient safety.The GNN applications reviewed in this section demonstrate the power of graph-based representations for capturing complex medical knowledge and relationships. By explicitly modeling the interconnected nature of medical concepts, GNN-based CDSS can support more sophisticated clinical reasoning and decision-making [6], [27], [28].

AI In EHR Integration and Patient Data Management

The successful deployment of AI-enabled CDSS requires seamless integration with electronic health record systems and effective management of diverse patient data sources. EHR integration challenges include data interoperability, real-time data access, alert delivery, workflow integration, and maintaining model performance as data distributions evolve [7], [8], [29].

Comprehensive EHR Integration Platforms

Boulanger (2026) presented MedROAD V2, an AI-integrated electronic medical record system with advanced clinical decision support capabilities [7]. The system demonstrates a comprehensive approach to EHR integration, incorporating multiple AI models for diagnosis support, treatment recommendation, risk prediction, and clinical

documentation assistance. The platform architecture addresses key integration challenges including data standardization, real-time inference, alert management, and user interface design that fits naturally into clinical workflows. MedROAD V2 employs a modular architecture that allows individual AI components to be updated or replaced without disrupting the overall system [7]. This design principle is critical for maintaining long-term system viability as AI technologies evolve. The system also implements sophisticated alert management strategies to minimize alert fatigue, including risk-based alert prioritization, contextual alert delivery, and mechanisms for clinician feedback on alert appropriateness.

Real-Time Data Processing and Decision Support

Real-time clinical decision support requires processing streaming data from multiple sources including vital sign monitors, laboratory systems, medication administration records, and clinical documentation. Afshar et al. (2023) described the technical pipeline for deploying real-time NLP and deep learning clinical decision support in the EHR, addressing challenges including data extraction, preprocessing, model inference latency, and alert delivery [8]. The implementation achieved near real-time processing with latency under 15 minutes from clinical documentation to alert generation, enabling timely clinical interventions. The pipeline architecture employs distributed computing and model optimization techniques to achieve the performance requirements for real-time decision support [8]. Continuous monitoring of model performance and data quality ensures that the system maintains accuracy as patient populations and clinical practices evolve. This work provides valuable technical insights for organizations seeking to implement AI-enabled CDSS in production clinical environments.

Heterogeneous Data Integration

Clinical decision support increasingly requires integrating data from diverse sources beyond the traditional EHR, including wearable devices, patient-reported outcomes, social determinants of health, and genomic data. The AI-driven clinical decision support system described in the 2022 IEEE Access paper demonstrates integration of heterogeneous health data from laboratory tests, basic patient information, health records, and social media data [29]. The system employs data fusion techniques to create unified patient representations that capture multiple dimensions of health status. Kong et al. (2026) demonstrated integration of wearable and environmental data for depression screening, showing how AI systems can incorporate continuous monitoring data from consumer devices into clinical decision support [12]. This expansion beyond traditional clinical data sources enables more comprehensive and timely assessment of patient health status, particularly for conditions that manifest in daily activities and behaviors.

Data Quality and Preprocessing

The quality of AI-enabled CDSS depends fundamentally on the quality of input data. EHR data often contains missing values, errors, inconsistencies, and biases that can degrade model performance and lead to incorrect clinical recommendations [1], [7]. Robust data preprocessing pipelines that handle missing data, detect outliers, normalize values, and validate data consistency are essential for reliable CDSS operation. Jin et al. (2020) noted that data quality concerns, particularly in Chinese EHR systems, represented a significant limitation of the CarePre system [1]. Clinicians expressed concerns about basing clinical decisions on predictions derived from incomplete or inaccurate data. This highlights the need for transparent data quality indicators and mechanisms for clinicians to review and validate the data underlying AI recommendations.

Interoperability and Standards

Healthcare data interoperability remains a significant challenge for AI-enabled CDSS deployment across diverse healthcare settings. Adoption of standards such as HL7 FHIR (Fast Healthcare Interoperability Resources) facilitates data exchange and model portability across different EHR systems [7], [8]. However, semantic interoperability—ensuring that clinical concepts are interpreted consistently across systems—requires careful attention to terminology standards, data models, and clinical context. The EHR integration challenges and solutions reviewed in this section underscore that technical AI capabilities must be complemented by robust data management, system integration, and workflow design to achieve successful clinical deployment [1], [7], [8], [12], [29].

AI For Diagnosis and Treatment Recommendations

Diagnostic support and treatment recommendation represent core applications of AI-enabled CDSS, with potential to improve clinical accuracy, reduce diagnostic errors, and optimize therapeutic decisions. AI systems can assist with differential diagnosis generation, diagnostic test selection, treatment option evaluation, and personalized therapy optimization [1], [9], [11], [17], [21], [30].

AI-Assisted Differential Diagnosis

Generating comprehensive differential diagnoses represents a cognitively demanding task that requires integrating patient symptoms, physical examination findings, laboratory results, and medical knowledge. Miyachi et al. developed a computer-aided clinical decision support system based on learning-to-rank for differential diagnosis, demonstrating collaboration between physicians and machine learning [30]. The learning-to-rank approach frames differential diagnosis as a ranking problem, where the system learns to order candidate diagnoses by likelihood based on patient presentation. This formulation aligns naturally with clinical reasoning processes and enables the system to suggest diagnoses that clinicians might not have initially considered. The AI-driven clinical decision support system described in the 2022 IEEE Access paper employs word embedding and semantic similarity to predict diagnoses based on symptoms and patient history [29]. The approach achieved considerable precision and recall rates on the MIMIC-III dataset, with performance improving as the number of top predicted diagnoses increased. The system's ability to predict multiple concurrent diagnoses addresses the clinical reality that patients often present with multiple conditions simultaneously.

Disease-Specific Diagnostic Systems

AI-enabled CDSS have been developed for numerous specific diseases and clinical conditions, each requiring specialized knowledge and data. Chaudhari (2024) evaluated machine learning algorithms for thyroid disease prediction and diagnosis, comparing performance across different algorithmic approaches [17]. The study demonstrated that appropriate feature selection and algorithm choice significantly impact diagnostic accuracy, with ensemble methods generally outperforming individual classifiers. Berrajaa et al. (2026) applied AI techniques to tympanic membrane perforation assessment in otolaryngology, demonstrating how specialized diagnostic AI can support clinical decision-making in focused clinical domains [22]. Chen et al. (2026) developed a deep learning system for early diagnosis of agenesis of the corpus callosum, a rare congenital condition, showing how AI can assist with challenging diagnoses that require specialized expertise [19].

Treatment Recommendation Systems

Beyond diagnosis, AI-enabled CDSS can support treatment selection by predicting treatment outcomes, identifying optimal therapies, and personalizing treatment plans based on patient characteristics. Zhang et al. (2022) developed a transformer-based system for traditional Chinese medicine prescription recommendation, demonstrating how AI can support complex treatment decisions involving multiple therapeutic components [21]. The system learns relationships between patient presentations and effective treatment combinations from historical data, generating personalized prescription recommendations. Lee et al. developed a machine learning-based clinical decision support system for treatment recommendation and overall survival prediction of hepatocellular carcinoma across multiple centers [9]. The system integrates patient demographics, tumor characteristics, liver function, and treatment history to recommend optimal therapeutic approaches and predict survival outcomes. Multi-center validation demonstrated robust generalization performance, a critical requirement for clinical deployment across diverse healthcare settings.

Personalized Medicine and Precision Oncology

Personalized medicine represents a key application domain for AI-enabled treatment recommendation, particularly in oncology where treatment decisions depend on complex interactions between tumor biology, patient characteristics, and treatment toxicity profiles. Li et al. (2026) developed a multimodal deep learning model for mortality prediction in colorectal cancer, integrating histopathological imaging, clinical variables, and treatment information to provide personalized prognostic assessments [20]. These prognostic predictions can inform treatment intensification decisions, helping oncologists and patients weigh the benefits and risks of aggressive therapy.

Kodali explored leveraging AI for real-time clinical decision support systems in oncology, utilizing machine learning for cancer diagnosis, prognosis, and treatment optimization [31]. The integration of multiple AI capabilities—diagnostic support, prognostic assessment, and treatment recommendation—into unified oncology CDSS platforms enables comprehensive decision support throughout the cancer care continuum.

Clinical Validation and Decision Support Effectiveness

The clinical value of AI-enabled diagnostic and treatment recommendation systems depends on rigorous validation demonstrating improved clinical outcomes, not merely algorithmic performance metrics. Miyachi et al. evaluated the effectiveness of their learning-to-rank CDSS through collaboration studies with physicians, assessing whether the system improved diagnostic accuracy and efficiency [30]. Such human-AI collaboration studies are essential for understanding how AI recommendations influence clinical decision-making in practice. The diagnostic and treatment recommendation systems reviewed in this section demonstrate substantial progress in AI capabilities for supporting clinical decisions. However, successful clinical adoption requires not only accurate predictions but also appropriate integration into clinical workflows, clear communication of uncertainty, and mechanisms for clinician oversight and judgment [1], [9], [17], [19], [20], [21], [22], [29], [30], [31].

Clinical Outcomes, Patient Safety, and Evaluation

The ultimate measure of AI-enabled CDSS success is their impact on clinical outcomes and patient safety. Rigorous evaluation requires assessing not only algorithmic performance metrics but also real-world clinical effectiveness, including diagnostic accuracy, treatment outcomes, adverse event rates, healthcare utilization, and patient satisfaction [9], [10], [18], [26], [27].

Impact on Diagnostic Accuracy and Timeliness

AI-enabled CDSS have demonstrated improvements in diagnostic accuracy across diverse clinical domains. Scarpino et al. (2026) showed that interpretable machine learning could improve the appropriate utilization of emergent EEG in emergency departments by predicting diagnostic yield, potentially reducing unnecessary testing while ensuring timely diagnosis for patients who would benefit [2]. This application exemplifies how AI can enhance both diagnostic accuracy and resource utilization efficiency. Borges-Sa et al. (2026) developed a hospital-wide sepsis detection system that enables earlier identification of this life-threatening condition through continuous monitoring and machine learning analysis [18]. Early sepsis detection is critical for patient outcomes, as timely antibiotic administration and supportive care significantly reduce mortality. The system's prospective validation on an expert-validated cohort provides strong evidence for clinical effectiveness.

Mortality and Survival Prediction

Accurate mortality and survival prediction enables informed clinical decision-making, appropriate care intensity, and realistic patient and family expectations. Li et al. (2026) developed and externally validated a multimodal deep learning model for 5-year mortality prediction in high-risk colorectal cancer patients, achieving robust performance across independent validation cohorts [20]. External validation is particularly important for mortality prediction models, as overfitting to development cohorts can lead to miscalibrated predictions that misinform clinical decisions. Alotaibi et al. (2025) demonstrated that AI-driven integration of imaging and radiology language improves stroke mortality prediction, enabling more accurate prognostic assessments that can guide treatment intensity and care planning decisions [26]. The multimodal approach achieved superior predictive accuracy compared to models using imaging or clinical data alone, highlighting the value of comprehensive data integration.

Hospital Readmission Prevention

Hospital readmissions represent a significant quality and cost concern, with 30-day readmission rates serving as a key performance metric for healthcare systems. Tang et al. (2023) developed a multimodal spatiotemporal graph neural network for predicting 30-day all-cause hospital readmission, enabling targeted interventions for high-risk patients [27]. The GNN-based approach achieved superior predictive performance compared to traditional models, potentially enabling more effective readmission prevention programs. Effective readmission prediction must be

coupled with actionable interventions to realize clinical value [27]. AI-enabled CDSS can not only identify high-risk patients but also suggest specific risk factors and interventions, such as medication reconciliation, follow-up appointment scheduling, patient education, and social support services.

Adverse Event Detection and Prevention

Patient safety represents a paramount concern for AI-enabled CDSS, with adverse event detection and prevention being critical applications. The federated learning and GNN-based system for ADE detection demonstrated 15-20% improvement in predictive accuracy compared to baseline CDSS approaches, potentially preventing serious drug-related adverse events [6]. The system's ability to identify complex multi-drug interactions that might not be apparent from standard drug interaction databases exemplifies how AI can enhance medication safety. Afshar et al. (2023) implemented a real-time opioid misuse screening system that enables clinical pharmacists and physicians to implement risk mitigation strategies for hospitalized patients [8]. The deployment of this system in routine clinical practice demonstrates the feasibility of AI-enabled adverse event prevention at scale.

Clinical Outcome Evaluation Methodologies

Rigorous evaluation of AI-enabled CDSS requires appropriate study designs and outcome metrics. Prospective validation studies, randomized controlled trials, and pragmatic implementation studies provide the strongest evidence for clinical effectiveness [2], [9], [18], [20]. Outcome metrics should include not only algorithmic performance (sensitivity, specificity, AUC) but also clinical process measures (time to diagnosis, appropriate test utilization) and patient outcomes (mortality, morbidity, quality of life, patient satisfaction). Lee et al. conducted multi-center validation of their hepatocellular carcinoma treatment recommendation system, demonstrating robust performance across diverse clinical settings [9]. Multi-center validation is particularly important for assessing generalizability and identifying potential biases or limitations that might not be apparent in single-center studies.

Limitations and Safety Considerations

Despite promising results, several studies have identified important limitations and safety considerations for AI-enabled CDSS. Data quality concerns, particularly incomplete or inaccurate EHR data, can degrade model performance and lead to incorrect recommendations [1]. Alert fatigue from excessive or inappropriate alerts can lead to clinician desensitization and alert override, potentially compromising patient safety [7], [8]. Model performance degradation over time due to changes in patient populations, clinical practices, or data collection procedures requires continuous monitoring and model updating. The clinical outcomes and patient safety evidence reviewed in this section demonstrates that AI-enabled CDSS can improve diagnostic accuracy, predict adverse events, and support better clinical decision-making. However, realizing these benefits in routine clinical practice requires rigorous validation, careful implementation, continuous monitoring, and attention to potential safety risks [2], [6], [8], [9], [18], [20], [26], [27].

Challenges, Ethical Considerations, and Future Directions

While AI-enabled CDSS demonstrate substantial promise for improving clinical decision-making, numerous challenges and ethical considerations must be addressed to ensure safe, effective, and equitable implementation. These challenges span technical, organizational, regulatory, and ethical domains [1], [6], [7], [8].

Interpretability and Explainability

Model interpretability remains a critical challenge for clinical AI systems, as healthcare providers must understand and trust algorithmic recommendations before incorporating them into patient care decisions. While some studies have made progress on interpretability through attention mechanisms, feature importance analysis, and reasoning-augmented approaches [1], [2], [12], many deep learning models remain "black boxes" that provide predictions without clear explanations. The tension between model performance and interpretability represents a fundamental challenge: more complex models often achieve higher predictive accuracy but are more difficult to interpret [2], [12]. Developing AI architectures that maintain both high performance and interpretability remains an important research

priority. Additionally, the form of explanations must be tailored to clinical users, providing insights that align with clinical reasoning processes rather than purely statistical or computational explanations.

Data Quality and Bias

Data quality issues, including missing values, errors, inconsistencies, and biases, can significantly degrade AI model performance and lead to incorrect clinical recommendations [1], [7]. EHR data is collected primarily for clinical care and billing purposes rather than research or AI development, leading to systematic biases and gaps. Underrepresented patient populations may have less complete data or may be underrepresented in training datasets, potentially leading to algorithmic bias and health disparities. Addressing data quality and bias requires multi-faceted approaches including robust data preprocessing, bias detection and mitigation techniques, diverse and representative training datasets, and continuous monitoring of model performance across patient subgroups [6], [7]. Transparency about data limitations and model uncertainties is essential for appropriate clinical use.

Privacy and Security

Healthcare data privacy represents a paramount concern, with strict regulatory requirements (HIPAA in the United States, GDPR in Europe) governing the collection, storage, and use of patient information. The federated learning approach demonstrated in the ADE detection study provides one promising solution, enabling collaborative model development across institutions without sharing raw patient data [6]. However, federated learning introduces technical complexities and may not be feasible for all applications. Secure data storage, access controls, audit logging, and de-identification techniques are essential for protecting patient privacy [6], [7]. Additionally, AI models themselves may inadvertently memorize sensitive patient information, requiring careful evaluation of privacy risks before deployment.

Clinical Workflow Integration

Successful AI-enabled CDSS implementation requires seamless integration into existing clinical workflows without imposing excessive burden on healthcare providers. Poorly designed systems that disrupt workflows or generate excessive alerts can lead to clinician frustration, alert fatigue, and system abandonment [7], [8]. User-centered design approaches that involve clinicians throughout the development process are essential for creating systems that fit naturally into clinical practice. Jin et al. (2020) noted that clinicians found the CarePre system useful but identified ease-of-use challenges that would need to be addressed for broader adoption [1]. Afshar et al. (2023) described sophisticated alert management strategies to minimize alert fatigue while ensuring timely delivery of critical information [8]. These implementation experiences provide valuable lessons for future CDSS development.

Regulatory and Liability Considerations

AI-enabled CDSS may be subject to regulatory oversight as medical devices, requiring demonstration of safety and effectiveness before clinical deployment. The regulatory landscape for clinical AI is evolving, with agencies such as the FDA developing frameworks for evaluating and approving AI/ML-based medical devices [7], [8]. Liability questions regarding responsibility for AI-generated recommendations—whether the AI developer, healthcare institution, or individual clinician bears responsibility for errors—remain incompletely resolved.

Ethical Considerations

Ethical considerations for AI-enabled CDSS include ensuring equitable access to AI-enhanced care, avoiding algorithmic bias that could exacerbate health disparities, maintaining patient autonomy and informed consent, and preserving the physician-patient relationship [6], [7]. The use of AI in clinical decision-making raises questions about the appropriate balance between algorithmic recommendations and human judgment, particularly for complex or value-laden decisions. Transparency with patients about the use of AI in their care, including limitations and uncertainties, is an important ethical consideration [7]. Patients should understand when AI systems contribute to clinical decisions and have opportunities to ask questions or express preferences about AI use in their care.

Future Directions

Future research directions for AI-enabled CDSS include:

1. Improved interpretability methods that provide clinically meaningful explanations aligned with medical reasoning [2], [12]
2. Federated and privacy-preserving learning approaches that enable collaborative model development while protecting patient privacy [6]
3. Continuous learning systems that adapt to evolving patient populations and clinical practices without requiring complete retraining [7], [8]
4. Multimodal integration of diverse data sources including imaging, genomics, wearables, and social determinants of health [12], [19], [20], [26]
5. Human-AI collaboration frameworks that optimize the complementary strengths of human clinicians and AI systems [30]
6. Prospective clinical trials evaluating the impact of AI-enabled CDSS on patient outcomes, healthcare quality, and costs [9], [18], [20]
7. Standardized evaluation frameworks for assessing AI system performance, safety, and clinical utility across diverse settings [2], [9]
8. Equity-focused AI development that ensures benefits are distributed fairly across patient populations and does not exacerbate health disparities [6], [7]

The challenges and ethical considerations reviewed in this section underscore that technical AI capabilities must be complemented by careful attention to interpretability, data quality, privacy, workflow integration, regulation, and ethics to achieve safe and effective clinical implementation [1], [2], [6], [7], [8], [12].

CONCLUSION

This comprehensive literature review has examined the current state of artificial intelligence in clinical decision support systems across eight thematic domains, synthesizing evidence from 30 highly relevant studies published between 2016 and 2026. The review demonstrates that AI technologies—including machine learning, deep learning, natural language processing, and graph neural networks—have achieved substantial advances in supporting clinical decision-making across diverse healthcare applications.

Key findings include:

1. Machine learning models provide interpretable and effective approaches for clinical prediction tasks, with particular success in early disease detection, risk stratification, and diagnostic support [2], [11], [13], [14], [16], [17], [18].
2. Deep learning architectures, particularly recurrent neural networks with attention mechanisms, achieve high predictive accuracy (AUC > 0.83) for disease prediction and risk assessment from longitudinal EHR data [1], [3], [19], [20], [21].
3. Natural language processing enables automated extraction of clinical insights from unstructured text, supporting applications including disease surveillance, risk screening, allergy verification, and multimodal data integration [4], [8], [23], [24], [25], [26].
4. Graph neural networks provide powerful frameworks for modeling complex medical knowledge and relationships, achieving 15-20% improvements in adverse drug event detection and superior performance in readmission prediction [6], [27], [28].
5. EHR integration remains a critical challenge, requiring robust data management, real-time processing capabilities, alert management strategies, and workflow-appropriate user interfaces [1], [7], [8], [12], [29].
6. Diagnostic and treatment recommendation systems demonstrate potential to improve clinical accuracy and optimize therapeutic decisions across diverse clinical domains, though rigorous validation and appropriate clinical integration remain essential [9], [17], [19], [20], [21], [22], [29], [30], [31].
7. Clinical outcomes evidence shows that AI-enabled CDSS can improve diagnostic accuracy, enable earlier disease detection, predict adverse events, and support better clinical decision-making, though prospective validation studies remain limited [2], [6], [8], [9], [18], [20], [26], [27].

8. Significant challenges persist regarding interpretability, data quality and bias, privacy protection, workflow integration, regulatory compliance, and ethical considerations that must be addressed for safe and equitable implementation [1], [2], [6], [7], [8], [12].

The evidence reviewed in this literature review indicates that AI-enabled CDSS represent a transformative technology with substantial potential to enhance clinical decision-making, improve patient outcomes, and increase healthcare efficiency. However, realizing this potential requires continued research addressing technical challenges, rigorous prospective validation demonstrating clinical effectiveness, careful attention to implementation factors including workflow integration and user experience, and thoughtful consideration of ethical implications including equity, privacy, and the appropriate balance between algorithmic recommendations and human judgment. Future progress will depend on interdisciplinary collaboration among AI researchers, clinicians, health informaticians, ethicists, regulators, and patients to develop AI-enabled CDSS that are not only technically sophisticated but also clinically useful, safe, interpretable, equitable, and aligned with the values and needs of healthcare providers and patients. As AI technologies continue to evolve and mature, their integration into clinical decision support systems promises to fundamentally transform healthcare delivery, enabling more precise, personalized, and effective care for diverse patient populations.

ABSTRACT

Nowadays, digital technology has emerged as a powerful driving force for the social and economic development of people in the modern world. The rapid growth of internet connectivity, social media platforms, digital payment systems, smartphones and e-commerce has created numerous opportunities for employment generation, better communication, new enterprises and more. However, these benefits do not reach all communities equally, especially the marginalized and socially excluded communities. Therefore, this study explored the role of digital inclusion in promoting economic development of Narikuravas communities. Descriptive research methodology was followed and simple random sampling method was used to identify sample households from the sample districts. The researcher selected four districts from Tamil Nadu namely Mayiladuthurai, Nagapattinam, Thiruvarur and Cuddalore. Furthermore, 400 Narikuravas were selected from the sample districts. The study reveals that, there is strong relationship between access to digital financial services and economic empowerment among Narikuravas among their socio-economic particulars, the socio-economic particulars of Narikuravas have strong association between the level of awareness about digital inclusion, and majority of the Narikuravas opined that their economic status increased due to using digital financial services.

Keywords: Digital Inclusion, Economic Empowerment, Narikuravas, Digital Financial Services, Influence.

INTRODUCTION

In the modern world, digital inclusion using technology has become an essential component of socio-economic development of marginalized communities. The rapid expansion of internet services, social media platforms, smartphones and digital financial systems has enabled people to communicate with each other, access information, increase business activities and enhance their livelihoods. In particular, the Government of India has introduced several initiatives such as Digital India, online banking services, digital payments and e-governance schemes to promote digital inclusion among all sections of society. However, the benefits of digitalization are not shared equally among marginalized and socially excluded communities. In Tamil Nadu, the Narikuravars community is one of the most socially and economically excluded tribal groups. Traditionally dependent on hunting, bead making, handicrafts and small-scale trading activities, they have long experienced poverty, low literacy, unemployment, social discrimination and limited access to formal economic opportunities. In recent years, the introduction of digital technologies and social media platforms has created new opportunities for marginalized communities to improve their economic status.

LITERATURE REVIEWS

Conceptual Review

S.N	Content	Meaning
1.	**Digital Inclusion**	It is the process of ensuring that all individuals and group of people have accessing equitable to and use digital technologies in meaningful way.
2.	**Economic Empowerment**	It is the process of equipping individuals with the resources, skills, and raise their financial resources and control their future financial status.
3.	**Awareness among Narikuravas**	It involves the Narikuravas knowledge about digital inclusion and its role on doing marketing activities through online platforms like internet, social media and others.
4.	**Impact**	It identifies the contribution of digital inclusion on improvement of Narikuravas socio-economic status.
5.	**Influence of Digital Inclusion**	The various factors may influence the Narikuravas to use of digital commerce through online platforms like, quick access, online payment, quick delivery and service, wide market, different consumers, government support, and more.

Statement of the Problem

Nowadays, digital technology has emerged as a powerful driving force for the social and economic development of people in the modern world. The rapid growth of internet connectivity, social media platforms, digital payment systems, smartphones and e-commerce has created numerous opportunities for employment generation, better communication, new enterprises and more. In particular, the Government of India has launched various schemes in digital content to ensure digital access and technological support to all sections of the population. However, these benefits do not reach all communities equally, especially the marginalized and socially excluded communities. The Narikuravas community is one of the most socially and economically excluded communities in Tamil Nadu. They were traditionally engaged in hunting, handicrafts, beadwork and small-scale trading. As a result, they have long

suffered from illiteracy, unemployment, poor living conditions and social discrimination. Despite the growth of digital content, only a small number of people from the Narikuravas community use smartphones and digital platforms to market their products.However, they faced challenges such as poor internet access, digital illiteracy, financial constraints, lack of or low awareness of digital services, and lack of adequate technical skills. Therefore, many researchers have been studying the Narikuravas community in various aspects such as socio-economic conditions, challenges faced in marketing, attitudes and awareness towards the use of modern marketing tools, digital inclusion, digital commerce, mobile commerce, and many more. However, there is no comprehensive study on the role of digital inclusion in the economic development of Narikuravas. Therefore, this study examines the role of digital inclusion in the economic development of Narikuravas in Tamil Nadu.

Research Objective

The primary objective of the study is to examine the role of digital inclusion in promoting the economic empowerment of Narikuravas communities.

Hypothesis

H1:"There is no significant relationship between access to digital financial services and economic development among the Narikuravas".

H2:"The level of awareness about digital content is not determined by the socio-demographic characteristics (age, gender, and education) of the Narikuravas".

H3:"Digital Inclusion and Economic Empowerment among Narikuravas does not have significant relationship".

METHODOLOGY

Research Design: Both qualitative and quantitative data were used for the purpose of this study. Descriptive research methodology was followed and simple random sampling method was used to identify sample households from the sample districts. The researcher selected four districts from Tamil Nadu namely Mayiladuthurai, Nagapattinam, Thiruvarur and Cuddalore. Furthermore, 400 Narikuravas were selected from the sample districts i.e., 100 households from each of the four sample districts. In-depth interview schedule was used to collect information from the sample Narikuravas and the schedule included socio-economic details, awareness and perception level towards digital inclusion, and their economic development.

Data Analysis: Chi-square test and Multiple Linear Regression models were used to analyze the association and relationship between digital inclusion and economic empowerment of Narikuravas.

Limitations of the Study

1. The study is limited to four districts of Tamilnadu namely Mayiladuthurai, Nagapattinam, Thriuvarur, and Cuddalore.
2. This study used limited socio-economic particulars and level of awareness about digital inclusion in economic empowerment; hence, its results may differ in other studies.
3. The sample Narikuravas perception and attitude about digital inclusion on their economic empowerment is subjective and may vary on other Narikuravas perception and attitude.

RESULTS AND DISCUSSION

H1:There is no significant relationship between access to digital financial services and economic development among the Narikuravas.

SL. N	Particulars	Chi-square value	p-value and Result	Discussion / Interpretation
1.	Age	15.04	0.059 / Significant	There is a relationship between the access to digital financial services and economic empowerment among Narikuravas in their age group. It means that irrespective of the age group the Narikuravas are using digital financial services.
2.	Gender	19.49	0.014 / Significant	There is a relationship between the access to digital financial services and economic empowerment among Narikuravas in their gender.It means that irrespective of the gender the Narikuravas are using digital financial services.
3.	Educational level	20.14	0.001 / Significant	There is a relationship between the access to digital financial services and economic empowerment among Narikuravas in their education. It means that irrespective of education the Narikuravas are using digital financial services.
4.	Digital inclusion and economic empowerment	R square 0.713	0.001 / Significant	There is strong relationship between access to digital financial services and economic empowerment among Narikuravas among their socio-economic particulars. Hence, the framed hypothesis is rejected.

H2:The level of awareness about digital inclusion is not determined by the socio-demographic characteristics (age, gender, and education) of the Narikuravas.

SL. N	Particulars	MLR	p-value and Result	Discussion / Interpretation
1.	Age	-2.813	0.059 / Significant	Lower age group i.e., less than 25 years Narikuravas have higher level of awareness about digital inclusion. It means that compare with higher age group majority of the lower age group Narikuravas are highly used digital financial services.
2.	Gender	2.944	0.047 / Significant	Majority of the female Narikuravas have higher level of awareness about digital inclusion. It means that compare with male majority of the female Narikuravas are highly used digital financial services.
3.	Educational level	3.289	0.001 / Significant	The degree and above level educated Narikuravas have higher level of awareness about digital inclusion. It means that compare with lower level educated i.e., illiterate and school level education, majority of the degree and above level educated Narikuravas are highly used digital financial services.
4.	Digital inclusion and economic empowerment	2.907	0.024 / Significant	The overall socio-economic particulars of Narikuravas have strong association between the level of awareness about digital inclusion. Hence, the framed hypothesis is rejected.

H3: Digital Inclusion and Economic Empowerment among Narikuravas does not have significant relationship.

SL. N	Particulars	Chi-square value	p-value and Result	Discussion / Interpretation
1.	Age	-19.54	0.007 / Significant	Lower age group i.e., less than 25 years Narikuravas have opined that they benefited from digital inclusion.
2.	Gender	18.05	0.054 / Significant	Majority of the female Narikuravas have states that the digital inclusion has increased their economic status.
3.	Educational level	25.01	0.001 / Significant	The degree and above level educated Narikuravas states that the digital inclusion has increased their economic status.
4.	Digital inclusion and economic empowerment	17.51	0.008 / Significant	The sample Narikuravas opined that their economic status increased due to using digital financial services. Hence, the framed hypothesis is rejected.

CONCLUSION AND RECOMMENDATIONS

In recent years, digital content has been promoting socio-economic development among marginalized communities. The government of India has given much importance to include all types of people into digital inclusion, particulars socially excluded and marginalized communities. However, benefits of digital inclusion do not reach all communities equally, especially socially excluded and marginalized communities. Many studies found that the Narikuravas community is one of the most socially excluded communities in Tamil Nadu. Therefore, this study explored the role of digital inclusion in promoting economic development of Narikuravas communities.The study reveals that, there is strong relationship between access to digital financial services and economic empowerment among Narikuravas among their socio-economic particulars, the socio-economic particulars of Narikuravas have strong association between the level of awareness about digital financial services, and majority of the sample Narikuravas opined that their economic status has increased due to using digital financial services.

Based on findings of the study the following recommendation are given;

1. Majority of the lower age group i.e., less than 25 years Narikuravas have higher level of awareness about digital inclusion. Hence, the government may conduct awareness campaign to all age groups to 100 percent achievement.
2. Majority of the female Narikuravas have higher level of awareness about digital inclusion. Hence, the government should give special training and awareness campaign to male Narikuravas also.
3. The degree and above level educated Narikuravas have higher level of awareness about digital inclusion. Hence, the government and NGO's should conduct gross root level awareness campaign about digital inclusion to all types of Narikuravas, particulars to cover illiterate people.
4. In overall the limited number of Narikuravas are using digital financial services due to lack of knowledge, local support and modern marketing skills. Hence, the government and NGO's should give much concentration to give awareness campaign and training to Narikuravas about the modern marketing skills (includes mobile commerce, internet commerce, social media marketing and more) to get sustainable income.

ABSTRACT

FM radio has been around for a long time, even though technology has changed a lot. It will continue to be around in the future as well, as long as people learn how important it is in times of war and disaster. Radio has been around for a long time and will continue to be around for a very long time since it is an antiquated method of reaching large audiences.FM radio plays significant role in enhancing the lives of young mind through tapping need for enhancement of skills not only for good jobs but also sustaining in competitive world. The participation is identical in both male FM listeners and female listeners. It has been identified that female FM radio listeners are more benefited than male in enhancing their skills. Hence the present study explore the empowering the social mobilisation of youth through FM Radio. The study used non-probability sampling method in collected data from young FM listeners in Chennai city, around 210 samples were collected and statistically analysed. The results of the study show Exploration of Ideas, Safety and well-being, Ethical leadership, Professionalism, Confidentiality, and Informed consent are the major factor determining the social mobilisation of youth through FM Radio. Results shows ICF, UCF and LCF have significant and positive impact on social mobilisation of youth through FM Radio. Female shows higher supportiveness from radio listening compare to male listeners. It is highly suggested that FM radio would significantly contributes in empowering young generation through required skills.

Keywords: Technology, Empowerment, Leadership, Professionalism and Confidentiality

INTRODUCTION

A modulation technique called frequency modulation (FM) changes a carrier wave's frequency in order to deliver data. Amplitude modulation (AM), on the other hand, modifies the carrier wave's amplitude while maintaining a constant frequency. The amplitude of the (audio) input signal, which is directly proportional to the frequency variation from the assigned carrier frequency at any given time, determines the instantaneous frequency of the broadcast signal in FM. This modulation approach is often used in conjunction with the higher frequencies (VHF or UHF) used by television, the FM broadcast band, and land mobile radio systems since transmitted FM signals require a significantly larger bandwidth than AM signals. Private radio stations in India are exclusively authorized to transmit signals in the FM frequency band. There are already 388 private FM stations operating in more than 100 cities, and it is expected that this number will grow in the near future. These broadcasts are in addition to the terrestrial radio services provided by All India Radio (AIR)/Prasar Bharati, a public service broadcaster operating in the MW, SW, and FM bands. Additionally, for non-commercial use, community radio stations are allowed to broadcast on the FM frequency. In the early stages, standalone radio receivers were employed for the purpose of listening to FM Radio broadcasts. Since its inception, radio has been the earliest type of electronic media that has served humanity. Radio's primary purpose is to distribute information and provide education. It was introduced to India during the British colonial period and has continued to advance steadily after gaining independence. The Indian broadcasting system, known as 'All India Radio' (AIR), is currently an independent organization under Prasar Bharati. Its primary goals are to disseminate information, provide entertainment, and offer education. Air India Radio (AIR) aired a variety of official and informal educational programs catering to both general and specialized audiences. Both formal and informal education encompass a social message and have a common objective of fostering social growth. Formal educational programs primarily consist of subject or curriculum-based curricula, with a particular emphasis on Literature and Arts, as well as numerous subjects such as Science and Mathematics, Economics, Social Science, Mass Communication, and Education, among others. Additionally, it has shown numerous carrier-oriented programs aimed at benefiting the younger demographic. Education-related programs were initially broadcasted in Bombay in 1929, albeit in an intermittent and informal manner. AIR has consistently incorporated this feature since its inception. AIR disseminated instructional programming through its network of 73 stations nationwide, offering programming in several languages. Each program has a duration ranging from 15 to 30 minutes. These programs are significantly informative and inspiring. The programs are making concerted efforts to enhance the foundation of the Indian educational system.

REVIEW OF LITERATURE

FM operates as a decentralized public broadcaster that is an extension of the SABC, defying the traditional concept of a community radio station. (Brilliant Mhlanga, 2009). FM radio serves as a medium for underrepresented voices to be acknowledged and their narratives to be disseminated, so fostering social inclusiveness and empowerment. The capacity of FM radio to effectively reach a broad audience and deliver programming tailored to specific regions renders it a potent instrument for social mobilization. (Diedong & Naaikuur, 2015). The efficacy of radio in resource-constrained environments and the beneficial influence of faith-based groups in fostering community involvement. Furthermore, the identification of strategic alliances has been recognized as a helpful strategy for accessing pertinent capacities and resources (Gillespie et al., 2016). FM stations have the ability to actively involve communities in order to tackle social problems and advocate for beneficial transformation. One crucial element pertains to the content broadcasted on these radio stations, wherein deliberations on societal matters and endeavours have the potential to ignite conversations and galvanise listeners towards collaborative endeavours (Tareen, 2021). FM stations have the potential to benefit from the implementation of effective health promotion initiatives that have effectively engaged target audiences through the use of electronic and mobile phone-based interventions (Nour et al., 2016).FM stations have the ability to efficiently facilitate upward social mobility and cater to the requirements of marginalized communities. This inclusivity can foster the development of a fairer society by offering a forum for viewpoints that

are frequently marginalized (Harvey, 2023). The notion of accountability, which arises from the observation of one's behaviour, holds significant influence in the context of social mobilization. Motivation can exert a significant influence when the individuals observing behaviours are the direct recipients of these behaviours. However, it can also impact behaviour even in cases where the spectators are not the direct beneficiaries (Kraft-Todd et al. 2015). The efficacy of social mobilization endeavours can be augmented by capitalizing on the profound interplay between individuals' identities and their actions. Individuals possess multiple conflicting identities. The individual in question may possess multiple roles, including as a US citizen, father, son, spouse, vegetarian, student, Marine Corps

veteran, decent person, and Philadelphian. Different behavioural tendencies are associated with each of these identities. (Swann & Bosson 2010).

OBJECTIVES OF THE STUDY

The study's aim is delineated based on young FM listener's social mobility through FM channels in Chennai city which are framed as follows:

1. To examine the latent dimensions of Determinants of Radio Supportiveness to Youth.
2. To examine the latent dimensions of Determinants of Social Mobilisation of Youth Through FM Radio.
3. To examine the significant difference among socio economic profile of the Radio Listeners in factors of Determinants of Radio Supportiveness to Youth.
4. To assess the impact of socio economic profile of the FM radio listeners and factors of Determinants of Radio Supportiveness to Youth on overall Determinants of Social Mobilisation of Youth Through FM Radio.

RESEARCH METHODOLOGY

The primary data has been collected using structured questionnaire from the youth FM radio listeners in Chennai city. The participants are young age group FM radio listeners living in Chennai city. There are average of 10 FM radio channels in Chennai. Stratified sampling method has been used in collecting data from 210 FM radio listeners by segregating Chennai into four major zones. The structured questionnaire holds Likert5 point scale which are with the weightage of 5,4,3,2 and 1 respectively and assessed with option of Strongly agree to Strongly disagree.

Data Analysis and Results Exploration

The collected data are statistically analysed and interpreted using SPSS, number of multivariate statistics has been used to examine bonding and deviations among the variables and the results are presented in table below:

Variables has been brought down into three dominant factors which account for 50.960% of overall deviations. The value of mean and standard deviation indicating strong measures of mean values as the standard deviation are lower than mean values. The KMO value of 0.855 along with χvalue of 1094.852 with Df value of 120 and P value of 0.000 explicates that 16 DRSY variables can be factorised into dominant factors. The communalities values are 0.408 to 0.735 which indicating the 16 DRSY variables can be factorised into dominant factors. The first dominant factor one which is account for 17.365% of deviation in DRSY and it holds six DRSY variables namely Radio serves local communities, introducing listeners to new music and performers while delivering programming specific to interests and languages in the area. Radio encourages listeners to use their imaginations, which helps them picture stories, Delivery of literacy programmes being broadcast, awareness on hygiene and sanitation issues and delivering advertising to the users based on the relative affiliation of variables and relative place it labelled as Innovation and Communication Factor (ICF). The second factor which is factor 2 explaining 16.947% of deviations in DRSY and it account for six variables namely Provide real-time news and information, giving quick updates during emergencies or breaking news, Cost Effective, Help in recruitment, cover youth reach and selective reach of audiences, Widely available and affordable and Leveraging social media participation it has been referred to as such based on the relationship and relative position among the variables.

Upgradation and Costing Factor (UCF). The factor 3 explaining 16.645% of variance in DRSY and it holds of four variables namely Create future community leaders, Build confidence and participate, deepen community understanding of social issues and Helps communities discuss and address youth needs based on the relative position and importance it has been named as Leadership and Confidence Factor (LCF).

Table 2 shows factorisation of 10 Determinants of Social Mobilisation of Youth Through FM Radio (DSMYFMR) variables, the 10 DSMYFMR variables has been brought down into two dominant factors which account for 52.430% of overall variance. The Average value and standard deviation shows strong measures of mean as the standard deviation are lower than mean. The KMO value of 0.821 along with χ value of 664.471 with Df of 45 and P value of 0.000 explicates that the 10 DSMYFMR variables can be factorised to pull out dominant independent factors. The values of communalities are lies between 0.438 to 0.781. The first dominant factor one which is account for 35.167%of variance in DSMYFMR and it consist of Collaborating with NGOs on youth programming, no exploitation Safety and well-being, Ethical leadership, Professionalism, Confidentiality, Informed consent and Developmentally-appropriate activities based on the relationship and relative importance it has been labelled as Collaboration and Exploration Factor (CEF). The Factor two which account for 17.258% of differences in DSMYFMR and it holds two variables namely Enhancing moral education and Social inclusion based on the relationship and relative significance it termed as Moral Education and Social Inclusion Factor(MESIF).

Table 3 shows the linear participation of Socio economic profile and Factors of Determinants of Radio Supportiveness to Youth [DSMYFMR(209)= F(107.435, P value<0.000)]. The Co-efficient value of 0.781 which defining 61% of deviation in relationship between dependent and independent variables. ICF have positive impact on DSMYFMR as the β value of 0.402 indicates that the partial impact of ICF on DSMYFMR holding other variables as constant. DSMYFMR would grow by 0.402 unit for every one standard unit deviation in ICF. UCF have positive influence on DSMYFMR as the β of 0.269 indicates that the partial impact of UCF on DSMYFMR is significant and holding other variables as constant. DSMYFMR would develop by 0.269 unit for every one standard unit diversion in UCF. LCF have positive influence on DSMYFMR as the β of 0.267 indicates that the partial impact of LCF on DSMYFMR is significant and holding other variables as constant. DSMYFMR would grow by 0.267 unit for every one standard unit diversion in LCF. Gender of the radio listener have significant and negative influence on DSMYFMR. Female shows higher supportiveness from radio listening compare to male listeners.

Table 4 shows significant of difference among Socio- economic profile of FM radio listeners in factors of DRSY and overall DRSY. Gender has significant difference in Leadership and Confidence Factor (LCF). Age of the FM radio listeners have significant variance in Upgradation and Costing Factor (UCF) and Leadership and Confidence Factor (LCF). Educational qualification of the FM radio listeners has significant variance in Innovation and Communication Factor (ICF), Upgradation and Costing Factor (UCF) and Leadership and Confidence Factor (LCF).

RESULTS AND DISCUSSION

16 DRSY variables has been brought down into three dominant factors which account for 50.960% of overall variance, The first dominant factor consist of six variables namely Radio serves local communities, introducing listeners to new music and performers while delivering programming specific to interests and languages in the area. Radio encourages listeners to use their imaginations, which helps them picture stories, Delivery of literacy programmes being broadcast, awareness on hygiene and sanitation issues and delivering advertising to the users based on relationship among the variables and relative significance it has been labelled as Innovation and Communication Factor (ICF). The second dominant factor 2 consist of six variables namely Provide real-time news and information, giving quick updates during emergencies or breaking news, Cost Effective, Help in recruitment, cover youth reach and selective reach of audiences, Widely available and affordable and Leveraging social media participation based on the relationship among the variables and relative importance it has been labelled as Upgradation and Costing Factor (UCF). The third dominant factor 3 consist of four variables namely Create future community leaders, Build

confidence and participate, Deepen community understanding of social issues and Helps communities discuss and address youth needs based on the relative position and importance it has been named as Leadership and Confidence Factor (LCF).

10 DSMYFMR variables has been brought down into two latent factors which account for 52.430% of overall deviations. The first dominant factor one consist of Collaborating with NGOs on youth programming, no exploitation Safety and well-being, Ethical leadership, Professionalism, Confidentiality, Informed consent and Developmentally-appropriate activities based on the relationship among the variables and relative significance it labelled as Collaboration and Exploration Factor (CEF). The second dominant factor two consist of two variables namely Enhancing moral education and Social inclusion based on the relationship and importance it termed as Moral Education and Social Inclusion Factor(MESIF). ICF have positive impact on DSMYFMR. DSMYFMR would grow by 0.402 unit for every one's standard unit change in ICF. UCF have positive influence on DSMYFMR and would develop by 0.269 unit for every one standard unit change in UCF. LCF have positive influence on DSMYFMR and it would increase by 0.267 unit for every one standard unit change in LCF. Gender of the radio listener have negative influence on DSMYFMR. Female shows higher supportiveness from radio listening compare to male listeners.

CONCLUSION

This study demonstrates that FM radio has persisted through the ages, regardless of technological advancements, and will continue to do so in the future, provided that future generations are educated about its importance and worth in times of war and calamity. Because it is one of the more traditional forms of mass communication, radio has been around for a long time and will continue to be for many more. Exploration of Ideas, Safety and well-being, Ethical leadership, Professionalism, Confidentiality and Informed consent are the major factor determining the social mobilisation of youth through FM Radio. Results shows ICF, UCF and LCF have significant and positive impact on social mobilisation of youth through FM Radio. Female shows higher supportiveness from radio listening compare to male listeners.

ABSTRACT

This study examines and compares government and private sector credit programs for fisheries development in India, focusing on their impact on income levels in fishing communities. Fisheries contribute significantly to economic development through food security, employment generation, and export earnings. However, fisherfolk often face financial constraints due to limited access to capital, high interest rates, and rigid loan conditions. Government initiatives provide subsidized loans with flexible repayment options, while private sector programs offer tailored financial services through banks and microfinance institutions. The study analyzes respondents' perceptions using a five-point scale, supported by mean and standard deviation analysis. Results indicate that credit programs play a vital role in improving the standard of living, achieving the highest mean score (3.84), followed by income from fishing activities (3.54) and financial assistance (3.41). Correlation analysis reveals a significant positive relationship between credit program dimensions—government funding, private sector investment, regulatory framework, interest rates, and loan terms—and income levels, with r-values ranging from 0.404 to 0.763. Multiple regression analysis confirms that credit programs significantly influence income levels, with an R-square value of 0.822. Government funding and private sector

investment show strong positive effects, with beta values of 0.180 and 0.477, respectively. The findings highlight that financial support mechanisms substantially enhance the economic conditions of fishing communities. The study concludes that strengthening government funding and encouraging private investment are essential for sustainable fisheries development and improved livelihoods.

Keywords: Fisheries Development, Credit Programs, Government Funding, Private sector Investment, Income levels and Fisher communities**.**

INTRODUCTION

Fisheries play a vital role in the economic development of many countries by generating employment opportunities and contributing significantly to food security (FAO, 2022). However, the growth and sustainability of this sector largely depend on access to adequate financial support (Kumar et al., 2021). In India, both the government and private sector have implemented various credit programs to facilitate fisheries development and support fisher businesses (Sharma et al., 2020). These programs are designed to provide financial assistance and promote the growth and sustainability of fisheries activities. Understanding the structure, accessibility, and effectiveness of these credit programs is crucial for stakeholders within the industry (Rao et al., 2019).This study presents a comparative analysis of government and private sector credit programs for fisheries development in India. It examines their respective roles in providing financial assistance, evaluates the regulatory frameworks governing these initiatives, and compares interest rates and loan terms offered by each sector (Patel et al., 2021). Furthermore, the study identifies gaps and limitations within existing credit systems. By analyzing these aspects comprehensively, the research aims to determine whether government funding or private sector investment is more effective in promoting sustainable growth in the fisheries sector (Singh et al., 2022).The study also addresses critical research gaps in understanding how credit programs influence the success of fisher businesses. Based on the findings, it offers recommendations to improve existing credit mechanisms and develop more inclusive and efficient financial support systems tailored to the needs of fisher communities (Kumar et al., 2021).

Role of Economic development of fisheries

Economic development of fisheries is crucial for the sustainable growth and prosperity of coastal communities, as the sector generates employment, enhances food security, and contributes to foreign exchange earnings through exports (FAO, 2022). With the rising global demand for fish and fish products, the fisheries sector holds significant potential for economic advancement (World Bank, 2020). However, achieving this potential requires adequate financial support to strengthen infrastructure, promote technology adoption, and build capacity among stakeholders (Kumar et al., 2021). Investments in modern fishing vessels, cold storage facilities, processing units, and transportation networks can enhance productivity and improve market access, thereby benefiting fishermen and generating employment across the value chain (Sharma et al., 2020).Furthermore, the economic development of fisheries contributes to increased income levels within coastal communities, creating a multiplier effect on local economies as higher disposable income stimulates demand in sectors such as retail and tourism (Rao et al., 2019). Sustainable development in fisheries can be achieved by promoting responsible fishing practices and implementing effective regulatory frameworks that ensure resource conservation without compromising environmental sustainability (FAO, 2022).A comprehensive approach to fisheries development requires coordinated financial support through government credit programs and private sector investments. Establishing an enabling regulatory environment with favorable interest rates and flexible loan terms can significantly enhance access to finance and support the long-term growth of the sector (Patel et al., 2021). Such initiatives are essential to ensure the sustainability and resilience of fisheries for future generations (Singh et al., 2022).

Financial support for fisheries work

Financial support plays a crucial role in the development of fisheries activities, as adequate funding is essential for establishing new fishing enterprises, upgrading equipment, and expanding operations to ensure sustainable growth and profitability (Kumar et al., 2021). The economic development of fisheries largely depends on access to financial resources from multiple sources, particularly government funding programs and private sector investments (FAO, 2022).Government credit programs for fisheries development provide essential capital at subsidized interest rates and offer flexible repayment terms, thereby promoting entrepreneurship within the fishing industry (Sharma et al., 2020). These programs often include additional support mechanisms such as loan guarantees, subsidies, and technical assistance, which enhance their accessibility and effectiveness for small-scale fishers (Rao et al., 2019).In addition, private sector credit programs play a significant role in supporting fisheries development by offering customized financial products tailored to the specific needs of fisher businesses (Patel et al., 2021). Financial institutions, including banks and microfinance organizations, provide alternative funding options that complement government initiatives, although they may involve different eligibility criteria and lending conditions (Singh et al., 2022).Both government-funded and private-sector credit programs operate within a structured regulatory framework designed to ensure transparency, accountability, and fair lending practices. This framework establishes guidelines related to interest rates, loan terms, eligibility requirements, and monitoring mechanisms, thereby facilitating balanced and sustainable growth within the fisheries sector (World Bank, 2020)

Financial Role of Fisher Business in India

The fishery sector plays a significant role in the Indian economy by providing employment opportunities and contributing to the country's GDP (FAO, 2022). Within this sector, fisher businesses are crucial for driving economic growth and supporting livelihoods, as they engage in fishing, aquaculture, processing, marketing, and exporting of fish products (Kumar et al., 2021). These enterprises contribute not only to local consumption but also to foreign exchange earnings through exports, generating income for fishermen and their families and thereby improving living standards through better access to healthcare, education, housing, and other essential services (Rao et al., 2019).Fisher businesses also help reduce poverty levels in coastal communities by creating direct employment opportunities within the sector and indirect opportunities through associated industries such as ice production, distribution networks, and transportation services (Sharma et al., 2020). Access to credit is critical for the growth and sustainability of these enterprises, as it enables investment in modern fishing equipment, vessel maintenance, process optimization, and diversification into value-added products (Patel et al., 2021). Affordable credit programs provided by government agencies or private financial institutions can significantly support small-scale entrepreneurs, facilitating business expansion, skill development, and technological advancements (Singh et al., 2022).However, limited awareness about available credit programs often restricts fisher businesses from fully leveraging financial resources. Stringent eligibility criteria, high-interest rates, lack of collateral, complex loan procedures, and bureaucratic hurdles further impede access to credit (Rao et al., 2019). To overcome these challenges, government initiatives should focus on simplifying loan application procedures, reducing paperwork, offering entrepreneurship training programs, and establishing dedicated guidance centers or helplines for fishers (Sharma et al., 2020)

Government Credit Programs for Fisheries Development

Financial support plays a crucial role in promoting the economic development of fisheries. In India, the fishery sector contributes significantly to employment generation and the development of rural communities (FAO, 2022). Recognizing this importance, the Indian government has implemented various credit programs to facilitate fisheries development. These programs provide vital financial assistance to fisher businesses, addressing their specific needs such as access to working capital, purchase of fishing equipment, construction or repair of fishing vessels, and development of marketing infrastructure (Sharma et al., 2020).The government's regulatory framework ensures that interest rates are reasonable and loan terms are favorable, helping alleviate financial burdens faced by small-scale fishermen who often operate with limited resources (Rao et al., 2019). Moreover, these programs focus on creating awareness among fisher folk regarding sustainable fishing practices and offer training opportunities to enhance skills. Such initiatives not only benefit individual fishermen but also contribute to the long-term conservation of fishery resources (Kumar et al., 2021).Through these initiatives, the government aims to promote inclusive growth in

the fisheries sector by empowering local communities and enhancing their livelihoods. Access to affordable credit facilities enables fishermen to improve productivity, expand business operations, invest in modern technologies, and adopt sustainable practices. Consequently, government credit programs play a vital role in fostering fisheries development by addressing critical financial challenges, promoting sustainable practices, and supporting a prosperous future for India's fisheries industry (Singh et al., 2022)

Private Sector Credit Programs for Fisheries Development

The private sector plays a pivotal role in driving economic growth and development in fisheries. Private sector credit programs have emerged as an effective tool to provide financial support and promote sustainable fisheries development (Patel et al., 2021). One key advantage of these programs is their ability to leverage private investment and expertise, enabling fisher businesses to access essential capital for infrastructure development, equipment acquisition, and working capital requirements. By providing timely credit, these programs help enterprises expand operations, improve productivity, generate employment, and contribute to overall economic growth (Kumar et al., 2021).Another benefit of private-sector credit programs is their flexibility compared to government-funded initiatives. This flexibility allows fisher businesses to select loan options that suit their operational needs without being constrained by rigid regulations (Sharma et al., 2020). Additionally, private lenders often provide competitive interest rates, which can significantly lower borrowing costs for fisher enterprises. Many private-sector programs are complemented by technical assistance and training services, enhancing the capacity of fisher businesses in areas such as business management, market analysis, value chain integration, and sustainability practices (Singh et al., 2022).However, challenges persist in the private credit system. Limited awareness among fisher communities often reduces participation in such programs, and stringent eligibility requirements can restrict access for small-scale or emerging entrepreneurs (Rao et al., 2019).

Need for the Study

A study on credit programs for fisheries development is critical to address the unique challenges and opportunities faced by fisher businesses in India. Fisheries are vital for coastal economic development, providing employment and ensuring food security. However, insufficient financial resources often limit the growth potential of this sector (FAO, 2022). Both government and private sector credit programs offer financial support, yet it is necessary to analyze and compare their effectiveness in providing accessible, affordable, and suitable financing for fisher businesses. The regulatory framework surrounding these programs, including interest rates and loan terms, directly affects accessibility and affordability (Patel et al., 2021).Given the fisheries sector's seasonality, fluctuating income patterns, and varying capital requirements, tailored credit solutions are essential. A comparative study of government and private sector credit programs can reveal gaps in current initiatives, evaluate their effectiveness, and provide evidence-based recommendations for improvement. Enhancing access to affordable credit will enable fisher businesses to grow sustainably, ensuring economic prosperity while maintaining responsible resource management practices (Sharma et al., 2020; Singh et al., 2022).

Scope of the Study

This study focuses on analyzing and comparing credit programs available for fisheries development in India across government and private sectors. It examines the role of financial support in promoting fisheries development, including infrastructure, technology adoption, and skill enhancement for fisher businesses. By evaluating government credit programs, this research will assess program structures, regulatory frameworks, interest rates, and loan terms to determine their effectiveness. Similarly, private-sector credit programs will be analyzed in terms of eligibility criteria, interest rates, and repayment conditions, highlighting differences from government schemes (Kumar et al., 2021; Patel et al., 2021).Through this comparative analysis, the study aims to identify strengths, weaknesses, and gaps within both systems. The findings will inform recommendations for improving existing credit programs or designing new initiatives tailored to fisher communities' needs, ultimately supporting sustainable economic growth in India's fisheries sector (Sharma et al., 2020; Singh et al., 2022)

Research Gap of the Study

Identifying existing gaps in the literature is a critical component of any research study. In the context of credit programs for fisheries development, there is a notable lack of comprehensive studies that compare and analyze both government and private sector initiatives (Patel et al., 2021). While many studies discuss individual credit programs or provide general information about funding options, few offer an in-depth comparative analysis of these programs' effectiveness and efficiency in promoting fisheries development (Kumar et al., 2021). This gap limits the ability of policymakers and stakeholders to make informed decisions regarding financial support for fisher businesses. Additionally, failing to address this gap can prevent valuable insights from successful credit initiatives from being shared across different regions or countries facing similar challenges. Disseminating best practices could lead to more effective resource allocation, enhanced program design, and improved economic outcomes within the fisheries sector (Sharma et al., 2020). Therefore, conducting a study that bridges this research gap is essential. Such research will provide a deeper understanding of the strengths and weaknesses of various credit programs and identify areas for improvement. Addressing this gap will support evidence-based decision-making and maximize the impact of credit programs on economic growth and sustainable development within the fisheries sector (Singh et al., 2022).

Statement of the Problem

A major challenge faced by fisheries in India is limited access to adequate financial resources. This restricts the ability of fisher businesses to invest in equipment, infrastructure, and other operational needs (Rao et al., 2019). Although both government and private sector credit programs exist to address this issue, analyzing and comparing their effectiveness is essential. Government-funded initiatives often involve complex regulatory frameworks, which can be difficult and time-consuming for fishers to navigate. Moreover, the interest rates and loan terms offered by government programs may not always be favorable for small-scale fisher enterprises (FAO, 2022). In contrast, private-sector credit programs may offer more competitive interest rates and flexible loan terms, but they can have stricter eligibility criteria or limited availability (Patel et al., 2021). Understanding these challenges is vital for identifying gaps and potential improvements in both government and private sector credit schemes. Conducting a comparative analysis will provide insights into which programs best support fisheries development and ensure sustainable financial access for fisher businesses. This research also addresses existing gaps in the literature by providing an updated analysis of current data, trends, and challenges in India's fisheries sector, thereby guiding policymakers, stakeholders, and fisher entrepreneurs in making informed decisions (Singh et al., 2022)

REVIEW OF LITERATURE

Adelegan (2018) conducted a study on the effectiveness of government credit programs for fisheries development in India, finding that access to credit significantly enhanced the financial stability of fisher businesses and enabled investment in modern fishing equipment. Similarly, Akani and Onyema (2017) evaluated private-sector credit programs, highlighting that private investment not only provided financial support but also introduced valuable expertise and technology, resulting in increased productivity and profitability in the fisheries industry. Ganz and Faunce et al. (2019) examined the regulatory framework for fisheries credit programs in India's coastal regions, emphasizing that clear guidelines and streamlined processes are essential for efficient fund distribution, reducing delays, and promoting transparency. Abina (2020) investigated interest rates offered under both government-funded and private-sector fisheries credit programs, underscoring that competitive rates are critical, as high borrowing costs can hinder repayment capacity. Anyanwu, Ananwude, and Okoye (2017) focused on loan terms provided by government schemes targeting small-scale fishers, finding that flexible repayment options are crucial for the effective utilization of credit facilities. Jones et al. (2018) reviewed various government initiatives supporting sustainable fishing practices and concluded that financial assistance programs play a pivotal role in conserving marine resources while improving the livelihoods of fishing communities. Yuliana, Fahrudin, et al. (2016) demonstrated that private sector investments have significantly upgraded infrastructure within the Indian seafood industry, allowing for modernization and increased operational efficiency. Finally, Zharif, Rizal, et al. (2022) explored public-private partnerships across multiple countries, illustrating that such collaborations are effective in balancing government

funding with private sector investment, thereby enhancing overall fisheries development

RESEARCH METHODOLOGY OF THE STUDY

The research methodology provides a structured and systematic approach to collect and analyze data, ensuring the accuracy and reliability of findings in this comparative study of government and private sector credit programs for fisheries development. This study adopts **a** quantitative research design, focusing on numerical data to evaluate the financial support mechanisms available to fisher businesses. Primary data will be collected through structured questionnaires administered to fisher businesses in Nagapattinam District, Tamil Nadu. A total of 417 fisheries participated as the study sample. The questionnaire is designed to cover key aspects, including the type and extent of financial support received, interest rates offered by different credit programs, loan terms, and the overall impact on business operations. The use of structured questionnaires allows for standardized data collection, facilitating comparison across respondents (Kumar, Singh, & Devi, 2021; Rao, Reddy, & Naidu, 2019). Secondary data will be obtained from government reports, academic journals, and other relevant sources, providing context and insights into India's regulatory framework for fisheries development and credit programs (FAO, 2022; Sharma, Gupta, & Verma, 2020).

The sample size was determined using appropriate statistical techniques to ensure representativeness of the population. A random sampling method was employed to select fisher businesses from different areas of Nagapattinam District, minimizing selection bias and ensuring a diverse and representative dataset (Patel, Mehta, & Joshi, 2021). Data analysis will involve both descriptive and inferential statistical techniques. Descriptive statistics, including mean and standard deviation, will summarize the data, while inferential statistics such as chi-square tests or t-tests will be applied to identify significant differences between government-funded credit programs and private sector investment options for fisheries development. This combined approach ensures a robust evaluation of the effectiveness and impact of financial support mechanisms on fisher businesses (Singh, Kaur, & Das, 2022)

Frame work of The Study

Table 1 reveals that the respondents' opinions towards income levels in fishing communities, such as the current income level from fishing activities and financial assistance through credit programs, have contributed to improving the standard of living. The respondents' opinions were collected on a five-point scale for each statement. Then, the mean and standard deviation were calculated for each statement.

From the mean scores, it is noted that most of the respondents have given importance to the credit programs that have contributed to improving the standard of living (3.84). The corresponding standard deviation value also notes that there is no deviation within the group of respondents. The current income level from fishing activities secured a mean value of 3.54, followed by financial assistance through credit programs (3.41). Among the various income levels in fishing community's statements, credit programs have improved the standard of living and obtained the highest mean value than other income levels in fishing communities – related statements. It is found that fisheries are highly accepted, with credit programs contributing to improving living standards. It is observed that the fishermen are living in an affordable and comfortable economic zone through their income.

Table 2 explains the relationship between credit programs for fisheries development dimensions and income levels in fishing communities.

H0: There is no relationship between credit programs for fisheries dimensions and income levels in fishing communities.

To test the stated hypothesis, Pearson correlation analysis was performed. The calculated p-values were found to be significant; therefore, the hypothesis is rejected. The correlation coefficients (r-values) are positive, indicating that credit program dimensions in the fisheries sector—such as government funding, private sector investment,

regulatory framework, interest rates, and loan terms—are positively associated with income levels in fishing communities. The r-values range from 0.404 to 0.763. Among these variables, interest rates, regulatory framework, and government funding show a stronger positive relationship with income levels, whereas loan terms and private sector investment exhibit comparatively weaker positive associations with income in fishing communities.

The researcher has measured credit programs for fisheries development offisheries with five dimensions, namely government funding, private sector investment, regulatory framework, interest rates, and loan terms. Further income levels in fishing communities are measured with three statements. Then, the total score of the three statements is considered as overall income levels in fishing communities with the fisheries. The research aims to measure the effect of credit programs for fisheries development on income levels in fishing communities with workers. For that, multiple regressions have been applied. The regression result is displayed in the table 3.

Ho: There is no effect of credit programs for fisheries development on income levels in fishing communities.
From the model summary, it has been stated that the hypothesis is rejected because the calculated f-value is 475.954, which is significant at a one percent level (p-value = 0.001). Here, the r-square value indicates the percentage level of effect among the independent variables on the dependent variable. Here, private sector investment, regulatory framework, interest rates, and loan terms are treated as independent variables, and fishing communities' income levels are considered dependent. The r-square value is found to be 0.822; it is inferred that dependent variables significantly influence independent variables at an 82.0 percent level. Further, the standardized co-efficient beta value indicates the relative importance of the independent variables on the dependent variable. The equation expresses it.

The equation explains that government funds and private sector investment positively affect fishing communities' income levels. To have one one-unit increase in fishing communities' income levels, the credit program's government fund and private sector investment services are likely to increase at 0.180 and 0.477, respectively, while other factors remain constant. From the above discussion, it is found that income levels significantly influence the credit programs for fisheries development dimensions in fishing communities of fishing workers. However, government funds and private sector investment, interest rates, and loan terms are the dimensions that have more impact on income levels in fishing communities. Hence, the fisheries mainly emphasize government funds and private-sector investment aspects.

Recommendations and suggestions of the study

Enhancing Government Funding
To promote sustainable fisheries development, increased government funding for credit programs is essential. Enhanced financial allocation can facilitate access to capital for fisher enterprises, enabling investment in modern equipment, infrastructure, and skill development initiatives (FAO, 2020).

Streamlining the Regulatory Framework:
Simplification of regulatory procedures related to credit access is necessary to improve participation among fishers. Reducing bureaucratic complexities can encourage timely loan applications and ensure efficient processing and disbursement of funds (World Bank, 2019).

Provision of Competitive Interest Rates
Credit schemes offered by both public and private sectors should incorporate affordable and competitive interest rates. Lower interest rates can reduce the financial burden on fishers and promote greater investment in fisheries activities (OECD, 2018).

Flexible Loan Terms

Designing loan products with flexible terms is crucial to accommodate the seasonal and uncertain nature of fisheries. This includes longer repayment periods, provision of grace periods during off-seasons, and options for loan restructuring in response to market or environmental fluctuations (FAO, 2020).

Capacity-Building Initiatives:

Strengthening the capabilities of fisher communities through targeted capacity-building programs is vital. Collaborative efforts between government agencies, private stakeholders, and industry bodies can deliver training in financial literacy, sustainable fishing practices, market analysis, and entrepreneurship (UNDP, 2021).

Improved Awareness Campaigns

Effective dissemination of information regarding available credit schemes is necessary, particularly at the grassroots level in coastal regions of India. Awareness campaigns should focus on eligibility criteria, application procedures, and benefits to enhance participation and ensure inclusive sectoral growth (Government of India, 2022).

Strengthening Public–Private Partnerships (PPPs)

Promoting public–private partnerships can significantly contribute to fisheries development. Through PPPs, private sector entities can provide financial resources, technological expertise, and innovative practices, complementing government initiatives to enhance productivity and sustainability in the fisheries sector (World Bank, 2019).

CONCLUSION

This study demonstrates that both government and private sector credit programs play a critical role in promoting fisheries development and improving the livelihoods of fishing communities in India. The analysis shows that government initiatives, through subsidized loans and flexible repayment options, provide accessible financing that enables fisherfolk to expand operations, invest in modern equipment, and adopt sustainable practices. Meanwhile, private sector programs, driven by market incentives, offer tailored financial services and flexible loan terms, complementing government efforts and addressing specific business needs. Empirical findings indicate that credit programs significantly impact income levels and living standards in fishing communities. The highest mean score was observed for improvements in the standard of living (3.84), followed by income from fishing activities (3.54) and financial assistance (3.41). Correlation and regression analyses confirm a strong positive relationship between credit program dimensions—government funding, private sector investment, regulatory framework, interest rates, and loan terms—and income levels, with multiple regression results showing an R-square value of 0.822. Government funding and private investment had particularly strong positive effects, with beta values of 0.180 and 0.477, respectively.

Overall, the study highlights that strengthening government credit mechanisms and promoting private sector investment are essential strategies for sustainable fisheries development. By enhancing financial accessibility and flexibility, these programs not only improve income levels and living standards but also contribute to the long-term economic growth and sustainability of India's fisheries sector

ABSTRACT

The study conducts a bibliometric analysis of Tissue Culture research from 2021 to 2025, encompassing 6,856 publications. It identifies a gradual increase in productivity, peaking in 2025, with journal articles as the dominant publication type. English is the primary language used, with significant contributions from Portuguese and Spanish-speaking regions. Major funding originates from agencies in Japan and China, emphasizing global investment. The subject areas focus on plant sciences and biotechnology, with interdisciplinary inputs from agriculture and molecular biology. Authorship reflects a collaborative research landscape, indicating a growing global interest in Tissue Culture research.

Keywords: Tissue Culture, Web of Science, Scientometric Analysis.

INTRODUCTION

Tissue and cell culture is a technique involving the sterile growth and propagation of cells, tissues, and organs in vitro, utilizing nutrient media to support clonal expansion in an artificial environment. This method allows for the mass production of mature, disease-free tissues and was introduced around the 1950s as a response to the limitations

of conventional breeding techniques, which struggled to meet crop demands. Tissue culture enables the generation of multiple copies of a plant from various parts, leveraging the totipotency of cells—where any cell can potentially develop into a complete organism. The procedure represents a significant advancement in breeding practices, facilitating rapid multiplication and disease-free production of crops.

Uses of Tissue Culture

Tissue culture, a method for developing thousands of genetically identical plants from a single parent, is known as micropropagation. This technique allows for the production of disease-free plants by utilizing meristems (apical and axillary) from diseased specimens as explants. Micropropagation has been extensively used for commercially significant crops, such as tomatoes, bananas, and apples, leading to increased availability of these plants. A notable application of this method is in orchid farming, where tissue culture has dramatically increased the production of plantlets, making them widely accessible.

Scientometrics

Scientometric analysis refers to the quantitative assessment of the growth and development of a specific subject through scientometric indicators and statistical methodologies. It encompasses the measurement of various forms of published knowledge and quantifies written communication, as defined by Tague-Sutcliffe (1992), who characterizes scientometrics as the examination of the quantitative features of science as both a discipline and an economic endeavor. This field is interwoven with the sociology of science and plays a role in science policy-making, involving quantitative investigations of scientific activities, which include publications and exhibit some overlap with bibliometrics.

Web of Science

The Web of Science Database encompasses records from 1900 to the present and is maintained by Clarivate Analytics. It specializes in citation indexing, providing access to information based on authors, topics, subject keywords, abstracts, journal titles, authored details, and publication years. Covering the fields of Science, Social Sciences, Arts, and Humanities, the database includes 256 disciplines. Formats available include full-text articles, reviews, editorials, abstracts, proceedings, and technical papers, totaling approximately 90 million records dedicated to scientific citation searches.

REVIEW OF RELATED LITERATURE

Shivani Negi (2024), Plant tissue culture (PTC) is an essential and sustainable method for addressing challenges like over-extraction of plants and habitat destruction. This article reviews global trends and research in PTC from 1933 to 2023, utilizing a bibliometric analysis of 2,498 papers from the Scopus database. It found that 2022 was the most productive year and India led in publications. The analysis reveals a steady rise in PTC research output and identifies the United States as having extensive international connections. This study aims to highlight significant research topics and inform future investigations in the field of PTC. Garg &Kumar (2019) Studying the scientometric portrait of Hari Chand Sharma, a distinguished agricultural scientist, reveals insights based on an analysis of 595 documents, with 45% being journal articles. These publications primarily originate from the UK, USA, and the Netherlands, predominantly appearing in medium impact factor journals. The study indicates that Sharma's work is characterized by extensive collaboration, having partnered with over 1,000 authors, as reflected in a high collaboration coefficient of 0.66 and a collaboration rate of 1.00 across numerous years.

Dhawan &Kolle (2019) This study conducts a scientometric analysis of global research on electronic journals, utilizing data from the Scopus database from 1990 to 2017. Key metrics evaluated include average annual growth, citations per paper, international collaborative papers, relative citation index, and activity index. Findings indicate an 18.46% growth in global research during this period, with an average citation impact per paper of 5.28, and only 26 papers achieving high citation rates over the span of 28 years. The USA is identified as the leader in electronic journals

research, contributing 45.28% of global publications, followed by the U.K. at 12.18% and India at 5.49%. Manoranjitham & Shivraj (2014) The study conducted on Plant Biology Research Output at a global level is a scientometric analysis covering data from the Scopus database from 1980 to 2013. It highlights trends in scientific output within the discipline of plant biology, noting the highest number of journals and international collaborations. Key findings include authorship patterns by subject, year-wise relative growth rate, and doubling time of records. The research primarily focuses on plant biotechnology, plant biology, agricultural plants, and plant science, with a total of 26,111 records analyzed over 44 years. The paper aims to provide insights into the expansion of literature, identify leading authors, assess publication sources, and examine affiliations associated with prolific research in plant biology globally.

The year-wise distribution of Tissue Culture publications from 2021 to 2025 shows consistent growth in research output, totaling 6,856 publications. In 2021, there were 1,368 publications (19.95% of the total), which slightly decreased to 1,304 in 2022 (19.02%). However, 2023 saw a recovery to 1,361 publications (19.85%). A notable increase occurred in 2024, with publications rising to 1,401 (20.43%). The peak was reached in 2025, with the highest output of 1,422 publications (20.75%). This data reflects a gradual upward trend in Tissue Culture research, indicating increasing interest and sustained development in the field over the investigated years. Straight line equation is applied to arrive at projections for future growth under Time Series analysis.

Straight Line equation:

$Y_c = a + bX$

Since $\sum x = 5$

$a = \sum Y/N = 6856/5 = 1371.20$

$b = \sum XY/\sum x^2 = 205/10 = 20.50$

Estimated literature in 2040 is when X = 2040 – 2023= 17

= 1371.20 + 20.50* 17 = 1371.20+348.50 = **1719.70**

on the application of the formula of time series analysis and subsequently, from the results obtained separately for the years 2040, it is found that the future trend of tissue culture publication analysis output may take an increasing trend during the years to come. The inference is that there is a positive growth at the global level in research literature output in tissue culture research.

The above table shows that the total published papers per year to the tissue culture researchfor the period of two decades along with its percentages, It is very much obvious at the beginning of this study, whereas the maximum documents witnessed in the year 2025 (1422 records) and the annual growth rate was 4.13 percent. This result clearly shows that there were fluctuations in the trend, moreover decreasing trend due to various reasons and one such reason can be attributed drastic decline in faculty strength recently.

Annual Growth Rate (AGR) Calculation

To know the annual growth rate of the publication output we can apply the below said formula:

$$AGR = \frac{\text{End Value - First Value}}{\text{First Value}} \times 100$$

It implies the end value (succeeding value) can be subtracted from the first value (preceding value) the divided by the first value further multiply by 100, so the growth rate per year can be known.

The analysis of document types in Tissue Culture research publications reveals that journal articles are the predominant form of scholarly communication, comprising 5,982 out of 6,856 total publications (87.25%). This preference underscores the significance of detailed, peer-reviewed studies for researchers in the field. Conference proceedings contribute moderately with 412 publications (6.01%), while editorial materials represent 265 records

(3.87%), indicating expert opinions and discussions. Book chapters account for 157 publications (2.29%), demonstrating involvement in academic collaborative writing. Other types, such as book reviews (25; 0.36%), data papers (10; 0.15%), and letters (5; 0.07%), collectively represent a negligible portion of the overall output. The findings emphasize that journal articles overwhelmingly dominate the landscape of Tissue Culture research dissemination, with other formats significantly less influential.

The analysis of the top ten authors in Tissue Culture research reveals a dispersed pattern of contributions. Da Silva JAT leads with 79 publications (0.61%), followed by Wang Y with 71 (0.54%) and Li Y with 61 (0.47%). Other notable contributors include Otoni WC (59; 0.45%), Wang J (55; 0.42%), Kumar S and Liu Y (54 each; 0.41%), Van Staden J (47; 0.36%), Li J (46; 0.35%), and Zhang H (43; 0.33%). Despite their rankings, all authors' contributions are below 1% of the total output, indicating that Tissue Culture research is characterized by broad collaboration among a diverse array of researchers rather than being dominated by a few individuals. This highlights the inclusive nature of the research landscape in this field.

Tissue Culture research publications predominantly feature English, with 5,891 out of 6,856 publications (85.92%) in this language, underscoring its status as the primary medium of scientific communication. Portuguese follows with 410 publications (5.98%), and Spanish has 229 (3.35%), indicating significant contributions from their respective regions. Other languages show lesser representation: Polish (101; 1.47%) and Korean (92; 1.34%) reflect moderate activity, while Chinese (54; 0.79%), Japanese (27; 0.39%), Russian (18; 0.26%), German (13; 0.19%), French (11; 0.16%), and Indonesian (10; 0.15%) contribute minimally. This analysis highlights the clear preference for English in the field, alongside noteworthy multilingual contributions from various global regions.

The analysis of the leading funding agencies for Tissue Culture research publications reveals their crucial role in enhancing research output globally. The top contributor is Japan's Ministry of Education, Culture, Sports, Science and Technology (MEXT), which supports 559 publications (8.15%). Following closely is the Japan Society for the Promotion of Science (JSPS) with 490 publications (7.15%) and KAKENHI Grants-in-Aid for Scientific Research, contributing 364 publications (5.31%). This illustrates Japan's substantial investment in Tissue Culture research. Additionally, the National Natural Science Foundation of China (NSFC) has a significant presence with 312 publications (4.55%), showcasing China's increasing influence in this field. Brazilian funding agencies like CNPq (230 publications; 3.35%) and CAPES (172 publications; 2.51%) also make important contributions. Other notable supporters include the National Science Foundation (NSF) with 170 publications (2.48%), the University Grants Commission (UGC) (144 publications; 2.10%), and the Council of Scientific and Industrial Research (CSIR) with 120 publications (1.75%). The European Commission adds to the support with 118 publications (1.72%). Overall, the data reflects a globally diversified funding landscape, highlighting significant contributions from Japan, China, Brazil, the United States, India, and Europe, thereby emphasizing the collaborative and international essence of Tissue Culture research.

The distribution of research in tissue culture primarily focuses on plant sciences and biotechnology. Plant Sciences leads with 359 records (5.24%), followed by Biotechnology and Applied Microbiology with 342 records (4.99%). Significant contributions also come from Agriculture (312 records, 4.55%) and Biochemistry and Molecular Biology (298 records, 4.35%), alongside Cell Biology (274 records, 4.00%). Moderate representation is noted in Science and Technology (235 records, 3.43%) and Environmental Sciences (221 records, 3.22%). Lesser focus areas include Developmental Biology (127 records, 1.85%) and Life Sciences (110 records, 1.60%). Overall, the research is heavily concentrated in plant sciences and biotechnology, with a notable multidisciplinary presence across various life science fields.

The distribution of top organizations in tissue culture research shows a dominance of government-funded bodies and leading academic institutions. The Chinese Academy of Sciences leads with 320 publications (4.67%), followed by the Indian Council of Agricultural Research (ICAR) with 296 records (4.32%). The United States Department of Agriculture (USDA) ranks third with 281 publications (4.10%), while Japan's University of Tokyo contributes 266

records (3.88%). Other notable institutions include CSIR from India, Riken, Kyoto University, and Nagoya University from Japan, and the Egyptian Knowledge Bank (EKB), reflecting a global collaboration in tissue culture research across these significant contributors. Overall, the analysis highlights a cooperative international effort in this field, particularly from China, India, the US, and Japan.

FINDINGS

- Study identifies key findings in Tissue Culture research trends.
- Annual publication output growth rate is 4.13%, with fluctuations in certain years.
- Journal articles dominate publications at 87.25%, while other types like conference proceedings and book chapters contribute less.
- Research is highly collaborative; top authors contribute less than 1% of total publications.
- English is the primary language for over 85% of publications, with some contributions in Portuguese and Spanish.
- Significant funding from agencies, with Japan as a leading contributor (MEXT, JSPS), followed by China, Brazil, the US, and India.
- Core research areas include Plant Sciences and Biotechnology, alongside Agriculture, Biochemistry, and Cell Biology.
- Major institutions include Chinese Academy of Sciences, ICAR, and USDA, reflecting strong governmental and academic involvement.

CONCLUSION

Tissue Culture research has demonstrated significant growth and global importance, characterized by a high volume of journal publications and diverse authorship, alongside robust international funding. This indicates a mature and collaborative field, particularly in plant sciences and biotechnology, which are vital for agriculture, medicine, and environmental sustainability. Leading countries such as China, India, the United States, and Japan contribute to a balanced global research ecosystem. Despite minor fluctuations in publication trends, the overall direction points to continued development and heightened interest in Tissue Culture research, which is recognized as a dynamic, multidisciplinary area with substantial potential for future scientific advancements and applications.

ABSTRACT

The integration of the Internet of Things (IoT) into health monitoring systems has transformed patient care by enabling real-time data collection and remote health management. However, the sensitivity of health data demands robust security measures to prevent unauthorized access and preserve data integrity. This research examines the convergence of IoT health monitoring with blockchain technology, focusing on role-based dashboards that incorporate advanced hybrid hashing for data security. The proposed framework uses blockchain's decentralized ledger to deliver immutable and transparent health records, while role-based access control ensures that only authorized stakeholders can view or modify data. Advanced hybrid hashing algorithms combine cryptographic hash functions to strengthen data authenticity and resist tampering. System performance, scalability, and security are evaluated through simulations and a real-world pilot deployment. Quantitative evaluation shows that the hybrid hash achieves 58,420 ops/sec in simulation (52,300 ops/sec in production) with 2^{128} security, and a real-world pilot maintained 99.5% uptime with zero data breaches. This work contributes to the secure digital transformation of healthcare by offering a scalable, transparent, and privacy-preserving solution for IoT-based health monitoring.

Keywords: IoT Health Monitoring, Blockchain, Data Security, Access Control, Healthcare Data Privacy, Decentralized ledger, Cryptographic Integrity.

INTRODUCTION

IoT technologies have revolutionized healthcare via real-time monitoring and remote patient management [1]. Wearable and implantable IoT devices [2, 3] generate sensitive health data but expose systems to security risks [4, 5], where breaches cause identity theft and patient harm [6, 7]. Blockchain provides a decentralized immutable ledger enhancing data transparency and trust [8, 9], enabling secure storage without central authority [10, 11]. Blockchain–IoT integration improves data provenance, auditability, and tamper resistance [12-14]. Role-based dashboards enforce access control [15] by tailoring interfaces to user privileges [16], mitigating unauthorized exposure [17]. Hybrid hashing combines cryptographic functions to resist attacks while maintaining efficiency for resource-constrained IoT devices [18, 19] and real-time processing [20, 21]. However, few frameworks address IoT constraints, permissioned blockchain scalability, and fine-grained auditable access control. This research integrates IoT monitoring, blockchain, role-based access control, and a novel hybrid hashing algorithm to develop a secure, scalable health data management framework, validated via simulation and real-world testing to demonstrate a privacy-preserving digital healthcare ecosystem.

LITERATURE REVIEW

A typical integrated framework in this domain consists of four layers [1, 4, 5]. First, IoT devices such as wearable biosensors and smart medical equipment generate raw health data [2, 8]. Second, a security core applies role-based access control (RBAC) and a hybrid hashing module to create tamper-proof digital fingerprints [9, 17, 18]. Third, a blockchain-based layer records cryptographic hashes and access events, while smart contracts automate policy enforcement like consent management [13, 23, 25]. Finally, an authorized data consumer layer grants role-permitted access to stakeholders [15, 17]. Together, these layers ensure privacy, integrity, and controlled access for IoT-generated healthcare data [1, 6, 11]. In response to security and trust deficits in centralized healthcare, blockchain offers decentralization, immutability, and enhanced auditability [1, 4, 7]. It secures patient records, pharmaceutical supply chains, clinical trials, and insurance claims [6, 13, 24]. Cryptographic and distributed ledgers provide tamper-evident transactions, preventing data fraud and unauthorized alteration, thereby fostering trust among patients, providers, and insurers via secure, transparent data sharing without a central authority [1, 3, 14]. Smart contracts automate consent and access rules, reducing administrative overhead [13, 17, 23]. However, scalability is limited by consensus mechanisms such as Proof of Work, reducing throughput and increasing latency, which hinders real-time IoT data processing [1, 2, 20]. Public blockchains' transparency conflicts with healthcare's confidentiality, necessitating privacy-preserving techniques like hybrid architectures or off-chain storage [3, 19, 22]. Integration with legacy healthcare IT systems poses challenges, and regulatory uncertainty persists [2, 10, 21]. To address these issues, Role-Based Access Control (RBAC) integrated with hybrid hashing ensures granular access and data integrity [15, 17, 18]. RBAC assigns permissions to roles, enforcing least privilege, while hybrid hashing improves collision resistance and generates tamper-proof fingerprints [9, 15, 19]. This synergy guarantees authorized access and data authenticity, though challenges remain in dynamic role hierarchies, context-aware policies, and IoT device overhead [2, 12, 20].

Research Gap and Contribution of This Study

Existing IoT-healthcare systems lack data provenance and scalable access control [4,6]; blockchain solutions face latency and permissioning challenges [1,13,24]. No prior work combines a three-stage hybrid hash (SHA-256→SHA-512→BLAKE2) with permissioned blockchain and smart-contract RBAC for IoT health monitoring. This study introduces Healthchain Connect with three contributions: (1) multi-stage hybrid hashing, (2) smart-contract RBAC with emergency access, and (3) real-world validation (10,000+ users, 99.5% uptime).

Proposed Framework: Healthchain Connect

Healthchain Connect is a secure, scalable, and privacy-preserving healthcare data management system that integrates Internet of Things (IoT) data streams with blockchain technology [6, 8, 20]. The proposed framework

ensures data integrity, access control, and auditability through a novel hybrid hashing mechanism and role-based dashboards [2, 4].

System Architecture: IoT Data Flow, Blockchain Network, and Role-Based Dashboards

The architecture of Healthchain Connect is designed as a three-tiered system comprising the Data Acquisition Layer, Blockchain Processing Layer, and Application Layer, as shown in Figure 1 [9, 22].

The system uniquely incorporates edge gateways that aggregate, filter, and preprocess IoT data locally to reduce latency and bandwidth, and a hybrid hashing algorithm generates a secure hash digest of the health data, as represented in Figure 1. The system uses a permissioned blockchain (e.g., Hyperledger Fabric), which ensures that only authenticated entities can participate, with smart contracts enforcing access control and data consent. For end users, role-specific dashboards provide tailored interfaces: clinician dashboards enable real-time monitoring and alerts, patient dashboards allow record viewing and permission management, and administrator dashboards offer network monitoring, role management, and compliance reporting. An immutable audit trail cryptographically links each transaction, making records tamper-evident.

Advanced Hybrid Hashing: Algorithm Explanation and Comparison with Traditional Methods

To enhance data integrity and resist collision attacks, Healthchain Connect uses an advanced hybrid hashing algorithm that combines SHA-256, SHA-512, and BLAKE2 sequentially. The algorithm processes IoT sensor data in three steps: first, SHA-256 produces a 256-bit digest (H_1); second, SHA-512 transforms H_1 into a 512-bit intermediate hash (H_2), increasing entropy and mitigating length-extension attacks; third, BLAKE2b-256 compresses H_2 into a final 256-bit digest (H_final). This compact output is stored immutably on the blockchain as a verifiable data fingerprint without raw data storage. The 256-bit size balances efficiency with 2^{128} security. SHA-256 provides baseline speed, SHA-512 defeats differential cryptanalysis, and BLAKE2 offers fast, salt-resistant compression. This non-commutative layering ensures that compromising any single algorithm still preserves overall hash integrity.

To evaluate the efficiency and security of the proposed hybrid hashing algorithm, we compared it against standard cryptographic hash functions commonly used in IoT healthcare systems. Table 1 reports the output size, intermediate state size, throughput, collision resistance, and suitability for resource-constrained IoT devices. The proposed hybrid method combines SHA-256, SHA-512, and BLAKE2b-256 to achieve very high collision resistance while maintaining practical speed (≈58,420 ops/sec) and a compact 256-bit output, making it optimal for blockchain-based health monitoring [4].

Role-based Access Control Implementation: Role Definitions, Enforcement, and Dashboard Functionalities

Healthchain Connect implements a fine-grained role-based access control (RBAC) model to ensure that only authorized personnel can access specific datasets.

Table 2 defines the permission boundaries for each user role. Patients maintain autonomy over their data, clinicians access only authorized records, researchers work with anonymized data, and administrators have system-wide oversight with emergency access capabilities. Smart contracts enforce access control by validating roles before data retrieval. The dashboard provides real-time abnormal reading alerts, a toggle-based consent management UI, interactive audit timeline visualization, and role-based data export to Health Level 7 Fast Healthcare Interoperability Resources (HL7 FHIR).

Performance Evaluation: Simulation Setup and Parameters

Simulation hardware: Intel Core i7, 16 GB RAM, NVIDIA GTX 1660 GPU; blockchain on Hyperledger Fabric 2.4. Dataset: real-world MIT-BIH Arrhythmia Database. Throughput measured in hash operations per second; latency in milliseconds from data generation to blockchain commit. Scalability assessed by increasing network nodes from 10 to 500 and batch sizes from 1 to 5,000 records. Security strength evaluated via collision and pre-image resistance.

As shown in Table 3, the hybrid construction's effective security level for collision resistance is conservatively estimated at 2^{128}, which aligns with NIST recommendations for long-term data protection (e.g., for records requiring security beyond 2030). The preimage resistance is similarly estimated at 2^{128}, meeting the requirements of healthcare data under regulations such as HIPAA and GDPR. The hybrid's effective security is conservatively estimated at the strength of its strongest component (SHA-512's 2^{128} classical security), as cascade constructions do not increase the security level beyond the most robust primitive.

As represented in Table 4, hybrid hashing achieves very high resistance against collision and preimage attacks, outperforming individual algorithms. Unlike SHA-256, hybrid hashing is fully resistant to length extension attacks, matching SHA-512 and BLAKE2. It also provides enhanced man-in-the-middle (MITM) detection compared to the base hash functions. Overall, the hybrid model offers the strongest and most balanced cryptographic defense across all attack types evaluated.

Implementation Architecture and System Integration

Comprehensive Technology Stack and Deployment Architecture

Healthchain Connect uses a microservice architecture with distinct layers and tight API integration [1]. Node.js/Express provides asynchronous processing for concurrent IoT data streams. Python with Pandas and Scikit-learn performs anomaly detection on patient vital signs. Go delivers efficient cryptographic hashing [2,3]. Hyperledger Fabric 2.4 configures a permissioned network of four organizations (hospitals, clinics, labs, insurers), each using CouchDB and private data collections [17]. Go chaincode implements access control, consent management, and data provenance [23]. The InterPlanetary File System (IPFS) stores large medical files (e.g., MRI scans) off-chain, storing only cryptographic hashes on-chain for integrity verification [11, 25].

The four-layer architecture of Healthchain Connect, showing the flow from IoT data collection through processing and blockchain integration to end-user applications, is shown in Figure 2. Each layer employs optimized technologies for its specific function while maintaining seamless integration through standardized APIs. Table 5 presents comprehensive performance metrics across different implementation languages. Our Go implementation achieves an optimal balance between throughput, memory efficiency, and code maintainability, making it suitable for healthcare environments requiring both performance and security.

Smart Contract Implementation for Role-based Access Control

Healthchain Connect implements RBAC through Go chaincode on Hyperledger Fabric. The chaincode defines user roles (PATIENT, DOCTOR, ADMIN, EMERGENCY) and manages consents using a state database. Key functions include grantAccess() for time-limited consent, emergencyAccess() for a 15-minute break-glass override, and canAccess() to verify active consent.

Performance Visualization and Real-time Monitoring Dashboard

The Healthchain Connect dashboard provides a comprehensive visualization of system performance, security metrics, and patient data trends. The implementation employs WebSocket connections for real-time updates and Canvas-based rendering for high-performance visualization of large datasets.

Deployment and Real-world Validation

The system was deployed in a controlled six-month pilot program across three healthcare institutions, processing real patient data from 1,240 IoT devices. The implementation demonstrated robust production performance, achieving scalability that successfully handled over 10,000 concurrent users without degradation, 99.5% system uptime with no unplanned downtime exceeding two hours, zero security incidents or data breaches, an average hybrid hashing throughput of 52,300 operations per second on production hardware (Intel Xeon Gold 5218, 32 GB RAM) closely matching simulation results of 58,420 ops/sec, and 100% adherence to HIPAA, GDPR, and local healthcare regulations.

CONCLUSION

This research introduced Healthchain Connect, a comprehensive framework that securely integrates IoT health monitoring with blockchain technology. By employing role-based dashboards for controlled access and an advanced hybrid hashing algorithm (SHA-256, SHA-512, and BLAKE2) for data integrity, the system addresses critical security and privacy challenges in modern healthcare. The implementation demonstrates practical deployment feasibility through a microservice architecture, optimized cryptographic algorithms, and production-ready smart contracts for access control. Performance evaluation shows that the framework maintains high throughput (58,420 operations/second) and scalability. The dashboard backend supports up to 500 concurrent active sessions (e.g., clinicians viewing live data) with sub-second response times. The user management system handles over 10,000 registered accounts without authentication delays while providing robust resistance against common cryptographic attacks. The hybrid hashing approach balances security strength and computational efficiency, making it suitable for resource-constrained IoT environments. Real-world deployment validated the system's reliability, achieving 99.5% uptime with no unplanned outage exceeding two hours and full compliance with HIPAA, GDPR, and local regulations. Healthchain Connect offers a viable, transparent, and privacy-preserving model for secure health data management. The implementation details enable replication and further development, paving the way for trustworthy digital healthcare ecosystems. Future work will focus on quantum-resistant cryptography, federated learning for privacy-preserving analytics, and expanded interoperability with emerging healthcare standards.

Table 1: Performance Comparison of Hashing Algorithms

Algorithm	Output Size (bits)	Intermediate Size (bits)	Speed (Ops/sec)	Collision Resistance	Suitability for IoT
SHA-256	256	N/A	~68,970	High	Moderate
SHA-512	512	N/A	~34,579	Very High	Low (high latency)
BLAKE2b-256	256	N/A	~123,305	High	High
Hybrid (Proposed)	256	512	~58,420	Very High	High (optimized)

*Intermediate size refers to the output of the second stage (SHA-512).

Table 2: Role-Based Access Control Permissions Matrix

User Role	Data View	Modification Rights	Special Permissions
Patient	Own records only	Grant/Revoke access	Full control over consent
Clinician	Permitted patient records	Add annotations (no original data alteration)	Real-time alert receipt
Researcher	Aggregated, anonymized data only	None	Request deidentified datasets
Administrator	System metadata & logs	User role management	Audit log generation, emergency override

Table 3: Estimated security levels for collision and preimage resistance

Algorithm	Target	Best Known Attack Complexity (bits)
SHA-256	Collision	$2^{66.5}$ (theoretical) / 2^{128} (practical)
SHA-512	Collision	2^{128} (classical)
BLAKE2b-256	Collision	2^{128}
Hybrid (Composite)	Collision	$\geq 2^{128}$ (estimated)
Hybrid (Composite)	Preimage	$\geq 2^{128}$ (estimated)

Table 4: Attack Resistance Comparison (MITM = man-in-the-middle)

Attack Type	SHA-256	SHA-512	BLAKE2	Hybrid Hashing
Collision	Moderate	High	High	Very High
Preimage	High	Very High	High	Very High
Length Extension	Vulnerable	Resistant	Resistant	Resistant
MITM Detection	Yes	Yes	Yes	Enhanced

Table 5: Performance Comparison of Hashing Implementations across Programming Languages

Implementation Language	Throughput (Ops/sec)	Memory Usage (MB)	Latency P95 (ms)	Energy Efficiency (Ops/J)	Code Complexity (Cyclomatic)
Go (Our Implementation)	58,420	42.7	2.3	12,450	18
Python 3.9	8,750	189.2	15.6	1,230	24
C++ 20	72,890	28.5	1.1	15,820	35

ABSTRACT

This study examines the relationship amid terrestrial improvements and patterns of social change in Thanjavur district during the period 1967–1987, situating the analysis within the broader framework of post-Green Revolution agrarian transformation in Tamil Nadu. The implementation of land ceiling legislation, tenancy regulation, and redistribution measures is evaluated in relation to shifts in land ownership, agrarian class structure, and rural power relations. The analysis draws attention to the persistence of intermediary dominance notwithstanding formal redistribution, as well as the emergence of new agrarian elites shaped by access to irrigation, capital, and state support. Particular emphasis is placed on the changing conditions of agricultural labour, including the gradual decline of traditional forms of labour control and the rise of wage-based employment, unionization, and politicization among marginalized groups. The study also considers the role of caste in structuring access to land and resources, noting both continuities and reconfigurations in social hierarchy. While legislative reforms altered the legal framework of landholding, their uneven implementation produced differentiated outcomes across regions and social groups.

Keywords: Land Reforms, Thanjavur District, Agrarian Structure, Social Change, Tenancy, Land Ceiling, Agricultural Labour, Caste Relations, Green Revolution,

INTRODUCTION

The agrarian history of Thanjavur district occupies a distinctive position within the wider economic and social transformations of South India, particularly in the decades following Indian independence. Characterized by its fertile deltaic ecology sustained by the Kaveri river system, Thanjavur developed into a region marked by intensive wet cultivation, high population density, and historically entrenched agrarian hierarchies [1] By the mid-twentieth century, the district exhibited a complex landholding pattern shaped by mirasdari rights, tenancy arrangements, and caste-based control over productive resources [2]. These structural features rendered it a critical site for examining the implications of state-led land reforms and their interaction with ongoing agrarian change [3]. The period between 1967 and 1987 represents a significant phase in Tamil Nadu's political and economic history, marked by the consolidation of Dravidian parties in power and the expansion of redistributive and welfare-oriented policies. Within this context, land reform legislation including land ceiling acts, tenancy protection measures, and attempts at surplus land redistribution was framed as a mechanism to address rural inequality and dismantle traditional forms of landlord dominance. However, the implementation of these policies occurred within a setting already undergoing transformation due to technological interventions associated with the Green Revolution, particularly the expansion of irrigation, high-yielding varieties, and increased use of inputs such as fertilizers and mechanization. In Thanjavur, where agrarian relations had long been mediated by customary rights and localized power networks, the introduction of statutory reforms did not simply replace older systems but interacted with them in complex ways [4].

The persistence of concealed tenancy, fragmentation of holdings, and the strategic adaptation of landed elites to legislative constraints raise important questions regarding the efficacy of reform measures. Equally significant is the transformation of rural labour relations during this period. The gradual erosion of attached labour systems and the rise of wage-based employment coincided with increased political mobilization among agricultural workers, often aligned with left-oriented movements and trade unions [5]. These developments altered the balance of power within the countryside, though not uniformly across all segments of society. Caste continued to structure access to land, credit, and employment, even as new forms of collective assertion emerged among historically marginalized communities [6]. This study adopts a historically grounded and empirically oriented approach, drawing upon land records, legislative debates, agricultural data, and field-based observations to analyse the extent to which land reforms contributed to social change in Thanjavur district. Rather than treating reform as a singular policy intervention, the analysis considers it as part of a broader process involving state action, technological change, and local socio-political dynamics. By focusing on the period 1967–1987, the study captures a phase in which formal redistribution policies and agrarian modernization overlapped, producing outcomes that were uneven, negotiated, and contingent upon regional specificities [7]. The inquiry, therefore, seeks to move beyond normative assessments of success or failure and instead reconstruct the layered transformations in land relations and rural society, situating Thanjavur within the larger discourse on agrarian change in postcolonial India.

Agrarian inequality and the mirasi legacy

Thanjavur represented one of the most stratified agrarian regions in South India, shaped by the *mirasi* tenure system, concentration of wetland ownership, and entrenched caste hierarchies. By the late 1960s, a small group of dominant landholders controlled a disproportionate share of irrigated delta land, while tenants and agricultural labourers often from Scheduled Castes remained dependent. Examining land reforms in this setting provides a concrete case to assess whether legislative intervention could disrupt historically accumulated inequalities [8]. The period after 1967 coincides with intensified implementation of land ceiling laws and tenancy protections under the Government of Tamil Nadu. Thanjavur offers a measurable field to evaluate policy outcomes: redistribution of surplus land, security of tenure, and regulation of rents. The district allows comparison between statutory intent and administrative execution, revealing gaps such as benami transfers, land fragmentation, and bureaucratic delays [9]. Land in Thanjavur was not merely an economic resource but a basis of caste dominance and local political authority. Changes in ownership patterns affected village power structures, access to common resources, and control over labour.

Thanjavur, located in the fertile Cauvery delta, underwent simultaneous technological change, including the spread of high-yielding varieties and irrigation intensification. Land reforms intersected with these developments. The question arises whether redistribution improved productivity by empowering smallholders or whether larger holdings retained advantages in capital access and input use [10]. The late 1960s and 1970s saw increased mobilization of tenants and labourers, often supported by left-oriented organizations and local unions. Land reform debates in Thanjavur were closely tied to these struggles. Studying this period helps explain the relationship between state policy and grassroots pressure, and the extent to which collective action shaped implementation outcomes [11].

Rural labour relations and wage dynamics

Changes in landownership influenced labour demand, wage negotiations, and patterns of seasonal employment. In some areas, redistribution and tenancy security contributed to higher bargaining capacity for labourers; in others, mechanization and land fragmentation altered labour absorption. This makes Thanjavur a useful site for analysing transitions from semi-feudal labour relations to more monetized rural economies. Where reforms did not adequately secure livelihoods, sections of the rural population moved towards non-agricultural employment or migrated to urban centres [12]. Tracking these patterns helps link agrarian policy to broader demographic and occupational change within Tamil Nadu. Thanjavur serves as a regional case within the national framework shaped by institutions such as the Planning Commission. Its experience informs comparative evaluation with other states, highlighting variations in implementation, political will, and socio-economic outcomes. It provides empirical grounding for debates on whether land reforms in India were redistributive in substance or largely symbolic. Understanding the successes and limitations of reforms between 1967 and 1987 contributes to present-day policy discussions on land access, tenancy regulation, and rural inequality [13]. It also informs contemporary debates on farmer distress, land leasing liberalization, and agrarian sustainability.

Legislative Intent and Policy Framework

The restructuring of agrarian classes in Thanjavur must be situated within the legal architecture of the Tamil Nadu Land Reforms (Fixation of Ceiling on Land) Act and its subsequent amendments. The policy objective was twofold first, to impose ceilings on landholdings and release surplus land; second, to protect tenants and expand peasant proprietorship [14]. The introduction of "standard acres," exemptions for plantations, and delayed enforcement provisions created a regulatory environment in which formal compliance coexisted with practical evasion. From a policy standpoint, the law emphasized redistribution, but enforcement mechanisms remained administratively weak, producing a gap between legislative intent and field-level outcomes [15]. One of the primary reasons for limited transformation lies in administrative capacity. Revenue records in Thanjavur were often outdated or contested, complicating the identification of surplus land. Field-level surveys indicate that nearly 20–30 percent of land records required revision during the early implementation phase. District-level land tribunals were burdened with litigation, leading to delays that extended into the late 1970s. As a result, although approximately 3.5 lakh acres were declared surplus across Tamil Nadu, only 60–65 percent was actually distributed. This administrative lag allowed landholders to reorganize property holdings before enforcement. Dominant landholding groups retained control through adaptive strategies grounded in both legal loopholes and informal practices. Pre-emptive intra-family transfers accounted for roughly 30–40 percent of cases prior to ceiling enforcement, while benami transactions constituted about 15–20 percent of declared holdings. These practices were facilitated by policy provisions that permitted land division among family members and lacked stringent verification mechanisms. The persistence of such strategies indicates that the reform process operated within a negotiated legal space rather than through strict state enforcement [16].

Technological Adaptation and Green Revolution Linkages

The period of land reform coincided with the expansion of Green Revolution technologies in the Cauvery delta. Fertilizer consumption increased by over 300 percent between 1967 and 1985, and mechanization expanded steadily, with tractor density reaching approximately one per 150–200 acres. These changes enabled dominant landholders to shift from extensive land control to intensive production systems. From a policy perspective, state investment in irrigation, credit, and input subsidies indirectly reinforced the economic position of larger cultivators, even as land

ceilings reduced their formal holdings. Although tenancy legislation aimed to secure tenant rights, enforcement remained limited. The initial rise in registered tenancy (20–25 percent between 1969 and 1975) was followed by a transition to informal tenancy, which accounted for 60–70 percent of arrangements by the early 1980s [17].

The absence of strict tenancy recording mechanisms, combined with landlord resistance, resulted in concealed leasing practices. Policy provisions existed to regulate tenancy, but the lack of institutional monitoring weakened their effectiveness, thereby altering tenancy relations without eliminating landlord influence [18]. The persistence of agrarian hierarchy is closely tied to caste-based control over local institutions. Dominant agrarian castes maintained influence over panchayats, cooperative credit societies, and market networks. This social authority constrained the implementation of redistributive policies and limited the ability of beneficiaries to assert ownership rights. Even when land was redistributed estimated at 35,000–45,000 acres in Thanjavur—the average allotment size (0.5–1.5 acres) remained below viable levels, and beneficiaries often depended on former landlords for credit and market access [19].

Economic Non-Viability of Redistribution Units

Policy design did not sufficiently address the economic viability of redistributed land. In irrigated delta conditions, a minimum of 2.5–3 acres was typically required for sustainable cultivation, whereas most beneficiaries received significantly smaller plots. As a result, nearly 25–35 percent of redistributed land reverted to informal leasing arrangements within a decade. The absence of complementary support such as institutional credit (accessible to only 30–40 percent of beneficiaries) and assured irrigation (lacking in about half of redistributed plots) further limited the capacity of new landholders to retain control. Another key reason for continuity lies in the ability of dominant groups to diversify economically. By the early 1980s, approximately 20–25 percent of large landholders had invested in non-agricultural sectors such as rice milling, transport, and urban real estate. This shift reflects a broader structural adaptation in which agrarian elites maintained their economic position despite reductions in landownership. Policy frameworks did not restrict such diversification, allowing elites to retain influence across multiple sectors [20]. The evidence indicates that land reforms in Thanjavur were shaped by a combination of legislative intent, administrative limitations, and socio-economic power structures. While policy interventions altered ownership patterns in statistical terms, their transformative capacity was constrained by weak enforcement, economic non-viability of redistributed holdings, and the adaptive strategies of dominant groups.

Agrarian Class Relations: Landlords, Tenants, and Labourers

The implementation of land reforms under the framework of the Tamil Nadu Land Reforms (Fixation of Ceiling on Land) Act generated measurable, though uneven, shifts in agrarian class relations in the Thanjavur delta. Prior to reform, around 1965, the top 7–10 percent of landholders controlled nearly 45–50 percent of cultivable land, indicating a highly concentrated agrarian structure. Following the enforcement of ceiling provisions in the late 1970s, the share of large holdings exceeding 15 standard acres declined to approximately 18–22 percent of total land area. This reduction, however, did not dismantle landlord dominance; instead, it led to the fragmentation of large estates into legally permissible units, often redistributed within kinship networks, thereby retaining effective control despite formal compliance with the law. Tenancy relations also underwent a significant transformation during this period. In the immediate aftermath of tenancy regulation measures, registered tenants increased, with formal tenancy registration rising by an estimated 20–25 percent between 1969 and 1975. However, this trend proved temporary. By the early 1980s, informal and unrecorded tenancy arrangements accounted for nearly 60–70 percent of leasing practices [21]. This transition reflects a structural shift from visible, legally protected tenancy to concealed tenancy systems, which reduced tenants' security and weakened the regulatory intent of reform policies. At the same time, the proportion of landless agricultural labour households expanded considerably, rising from about 38 percent in the 1961 Census estimates for the delta region to nearly 48–52 percent by 1981. Although daily wage rates increased nominally by 2.5 to 3 times during this period, real wage improvements remained limited to roughly 10–15 percent after adjusting for inflation. This indicates that while the rural economy moved toward a labour-dominated structure, this shift was not accompanied by substantial gains in asset ownership or long-term economic stability for

agricultural labourers. This allowed dominant groups to retain economic dominance despite reduced land size, shifting from extensive control to intensive productivity.

The scale of land redistribution in Tamil Nadu between 1961 and 1985 reflects a significant but incomplete transfer of land under the framework of the Tamil Nadu Land Reforms (Fixation of Ceiling on Land) Act. During this period, approximately 3.5 lakh acres were declared as surplus land, of which about 2.1 to 2.4 lakh acres roughly 60–65 percent were actually distributed. In the specific context of Thanjavur district, the estimated redistributed land ranged between 35,000 and 45,000 acres, benefiting approximately 60,000 to 75,000 households. While these figures indicate a substantial effort at redistribution, the actual impact depended on the size and economic viability of the allotted holdings [22].

The average allotment size per beneficiary household ranged from 0.5 to 1.5 acres. In contrast, the minimum viable holding required for sustainable cultivation in the irrigated delta region was approximately 2.5 to 3 acres. This disparity meant that redistribution often resulted in subsistence-level landholding rather than economically independent peasant proprietorship. Beneficiaries frequently lacked the scale necessary to generate surplus income, limiting the transformative potential of land ownership. Several structural constraints further restricted effective control over redistributed land. Access to institutional support remained limited, with only about 30–40 percent of beneficiaries able to obtain formal credit, while nearly half of the redistributed plots lacked assured irrigation facilities [23]. In addition, field-level evidence suggests that 25–35 percent of redistributed land reverted to former landlords through informal leasing arrangements within a decade, indicating the persistence of pre-existing power relations. Social factors also played a decisive role, as dominant caste groups retained control over local administrative institutions and market networks, constraining enforcement and reducing the bargaining capacity of beneficiaries in both input and output markets. The cumulative evidence indicates that land reforms did not dismantle agrarian hierarchy; instead, they reconfigured it into a layered structure Land reforms in Thanjavur between 1967 and 1987 produced quantifiable redistribution and legal restructuring, yet the deeper agrarian power relations exhibited continuity through adaptation [24].

Class Category	Pre-Reform Structure	Post-Reform Transformation
Large Landlords	Dominant land controllers	Reduced holdings but retained economic power
Tenants	Semi-secure sharecroppers	Shift to informal, insecure tenancy
Small/Marginal Farmers	Limited presence	Expanded numerically but economically fragile
Agricultural Labourers	Significant minority	Became majority, with limited upward mobility

- Redistribution altered ownership patterns statistically, but not decisively in terms of control.
- Dominant groups adjusted through legal, economic, and technological strategies, maintaining influence.
- Marginalized groups gained symbolic and partial material access to land, but structural constraints credit, irrigation, and social hierarchy restricted transformative outcomes.

In effect, the reforms generated a hybrid agrarian system: one where formal equality increased, but substantive inequality persisted in modified forms.The implementation of land reforms in the Cauvery delta, particularly in Thanjavur, produced a layered restructuring of agrarian relations that can be more precisely understood when supported by measureable indicators.

Fragmentation and the Formation of Smallholding Classes

Land ceiling legislation and tenancy reforms in Tamil Nadu redistributed a limited but measurable extent of agricultural land, with approximately 3.5 lakh acres declared as surplus between 1961 and 1985, of which around 2.1 to 2.4 lakh acres (about 60–65%) were actually distributed. In Thanjavur district alone, the redistributed land is estimated at roughly 70,000 to 90,000 acres. This process generated a large number of small beneficiaries, with average allotments ranging from 0.5 to 1.5 acres per household. As a result, the share of small and marginal farmers

(holding ≤2 hectares) increased significantly over time, rising from about 62–65% of operational holdings in 1971 to around 78–80% in 1991, and reaching nearly 92% by 2011, reflecting sustained fragmentation of landholdings [25]. In the delta regions, this fragmentation was further intensified by inheritance practices and tenancy transfers, leading to highly dispersed and economically suboptimal plot sizes.

The viability of these newly formed agrarian units remained constrained, as seen in cost–return structures. During the 1980s–1990s, the average cost of paddy cultivation in the Tamil Nadu delta ranged between ₹4,000 and ₹6,000 per acre, later increasing to over ₹15,000 in subsequent decades. Average yields for irrigated paddy stood at approximately 2.5 to 3.5 tons per hectare, though these were highly dependent on the reliability of water supply. Net returns for marginal farmers were often negligible or only marginally positive, particularly when family labour inputs were factored in. Structural inequalities persisted in access to resources, with institutional credit reaching less than 40% of small and marginal farmers during the 1980s, and pump-set ownership remaining below 20%, thereby reinforcing dependence on canal irrigation or rented water sources [26]. These conditions indicate that many redistributed holdings operated at subsistence or semi-commercial levels, with income instability shaped by irrigation uncertainty and fluctuations in input costs. At the same time, dominant landholding groups exhibited a clear shift toward non-agricultural accumulation.

The share of rural non-agricultural income in Tamil Nadu rose from approximately 20–25% in the 1970s to 35–40% in the 1990s, and exceeded 50% by the 2010s. This diversification included the expansion of rice mills and agro-processing units, with the Thanjavur delta witnessing the growth of hundreds of private rice mills by the 1990s. The proportion of rural households engaged in non-farm activities increased from about 30% in 1971 to nearly 55–60% by 2011, while migration and salaried employment also expanded, with over 25–30% of rural households in delta regions having at least one member in government or private sector employment by the early 2000s.These transformations reshaped rural class structure and economic power distribution [27]. The land Gini coefficient in Tamil Nadu agriculture declined moderately from around 0.65 in the 1960s to about 0.55 in the 1990s, indicating partial redistribution but continued inequality.

The average size of operational holdings fell from roughly 2.5 hectares in 1970 to about 1.0 hectare or less by the 2010s, reinforcing the dominance of small-scale cultivation. Despite these changes, the share of agricultural labour in the rural workforce remained high at 40–50%, signalling the persistence of wage dependence alongside smallholder expansion. Together, these trends reflect a restructured but still stratified agrarian economy, where land redistribution expanded ownership numerically while economic power increasingly shifted toward those controlling capital, markets, and diversified income streams [28]. Expansion of small and marginal holdings with limited economic viability Consolidation of economic power through diversification into trade, finance, and local governance the result was not an egalitarian agrarian order but a reconstituted hierarchy. Landownership became more dispersed numerically, yet control over capital, markets, and institutional structures remained concentrated. Smallholders persisted within a semi-proletarian condition, while dominant groups retained influence through their transition into non-agricultural sectors and rural-urban linkages. Land reforms in Tamil Nadu achieved a measurable, though partial, redistribution of agrarian assets. Around 2.1–2.4 lakh acres were transferred to beneficiaries, leading to a substantial increase in the numerical presence of small and marginal farmers, whose share rose to nearly 90%+ of operational holdings over time. However, the limited scale of surplus land and uneven implementation meant that redistribution did not significantly alter the concentration of high-quality irrigated land. The outcome was a diffusion of ownership without a proportional equalisation of productive capacity, especially in canal-irrigated delta regions.

Tenurial Security and Institutional Change

Tenancy reforms contributed to greater security of tenure for sections of cultivating tenants, particularly intermediate tenants who were able to secure ownership or protected rights. This reduced arbitrary eviction and formalised certain agrarian relations. At the same time, informal tenancy persisted outside legal frameworks, indicating that institutional reform remained incomplete. The policy outcome, therefore, combined legal recognition with continued

extra-legal practices, especially in regions with high land pressure. The impact on productivity was uneven. While some beneficiaries gained access to land and state-supported inputs, the small size of holdings constrained capital investment and mechanisation. In delta agriculture, where irrigation management and input intensity are decisive, smallholders faced structural disadvantages.

Rural Livelihoods and Income Stability

Land reforms expanded access to land as a livelihood base, but did not ensure stable or sufficient income. Many small and marginal farmers continued to rely on wage labour, seasonal migration, or state welfare schemes. The persistence of a 40–50% agricultural labour share in the rural workforce indicates that land redistribution did not eliminate labour dependence. Instead, it produced a class of semi-proletarian cultivators combining self-cultivation with wage employment. One of the most significant policy outcomes was indirect: the encouragement of diversification among dominant agrarian groups. As land ceilings limited accumulation in agriculture, surplus capital shifted into trade, agro-processing, transport, finance, and urban employment. Rural non-agricultural income rose to over 50% of total rural income by the 2010s [28]. This reorientation altered the basis of economic power, moving it away from land alone toward control over markets, capital flows, and institutions. Despite moderate reductions in land inequality (with the Gini coefficient declining from ~0.65 to ~0.55), structural disparities persisted. Better-irrigated lands, access to credit, and integration with markets remained concentrated among socially and economically dominant groups. Smallholders often depended on these groups for inputs, credit, and marketing channels.

The policy outcome was not the dismantling of hierarchy but its reconstitution in new forms, where economic dominance extended beyond landownership. The effectiveness of land reforms was shaped by administrative capacity and political negotiation. Delays in land identification, legal disputes, and loopholes (such as benami transfers and land fragmentation within families) limited the extent of redistribution. In delta regions, the complexity of irrigation-linked land rights further constrained implementation. Thus, policy outcomes reflected both legislative intent and the limits of enforcement [29]. In the long run, land reforms contributed to a transition from a landlord-dominated agrarian structure toward a more differentiated rural economy. However, this transformation did not produce a self-sustaining peasant economy. Instead, it facilitated a shift toward a mixed rural structure characterised by smallholder cultivation, wage labour dependence, and expanding non-farm sectors. Economic power became increasingly linked to diversification and institutional access rather than landownership alone.

CONCLUSION

Land reforms in the Cauvery delta, particularly in Thanjavur, produced a limited redistribution of land that expanded the numerical base of small and marginal farmers without fundamentally restructuring agrarian power. The transfer of surplus land and tenancy regulation enabled sections of cultivators to acquire ownership or greater security, yet the small size and fragmented nature of holdings restricted their economic viability, especially within an irrigation-dependent delta system. Many of these new agrarian units operated at subsistence or semi-commercial levels, combining cultivation with wage labour and remaining vulnerable to fluctuations in water availability, input costs, and market prices [30]. At the same time, dominant agrarian groups adjusted to the changing policy environment by redirecting capital into non-agricultural sectors such as trade, agro-processing, transport, and salaried employment. This shift reduced their dependence on land as the primary source of accumulation while allowing them to retain influence through control over markets, credit, and local institutions. As a result, rural hierarchy did not disappear but was reorganised, with economic power increasingly detached from direct landownership. Instead, they contributed to a reconfiguration of inequality, where ownership became more dispersed but control over resources and economic opportunities remained unevenly distributed.

RESEARCH FINDINGS

The empirical evidence indicates that land reforms in the Cauvery delta, especially in Thanjavur, led to the expansion of small and marginal holdings without dismantling structural inequality. While approximately 2.1–2.4 lakh acres were redistributed across Tamil Nadu, the average allotment size remained between 0.5 and 1.5 acres, resulting in a proliferation of economically fragile units. By 2011, nearly 90%+ of operational holdings fell within the small and marginal category, demonstrating a clear shift toward fragmented landownership. However, this numerical redistribution did not correspond to proportional control over high-quality irrigated land, which remained unevenly distributed. Field-level indicators suggest that most redistributed holdings functioned at subsistence or semi-commercial levels. Paddy cultivation in the delta required significant input investment, with costs rising from ₹4,000–₹6,000 per acre in the 1980s–1990s to substantially higher levels in later decades. Yield levels of 2.5–3.5 tons per hectare remained contingent on irrigation access, placing tail-end farmers at a disadvantage. Net returns for marginal farmers were often negligible once family labour was accounted for. Limited access to institutional credit (below 40%) and low ownership of irrigation assets such as pump-sets (below 20%) further constrained productive capacity. These findings indicate that landownership alone did not ensure economic sustainability.

The long-term structural outcome was the emergence of a mixed rural economy characterised by smallholder agriculture, wage labour dependence, and expanding non-farm sectors. The proportion of rural households engaged in non-agricultural activities increased from about 30% in 1971 to nearly 55–60% by 2011. This transition reflects a broader restructuring in which agriculture ceased to be the sole basis of livelihood and accumulation. However, the benefits of diversification were unevenly distributed, with dominant groups better positioned to capture new economic opportunities. The findings also highlight significant gaps in policy implementation. Only about 60–65% of declared surplus land was ultimately redistributed, indicating administrative and legal constraints. Practices such as benami transfers, intra-family land division, and delayed land identification reduced the effective impact of reforms. In delta regions, the complexity of irrigation-linked land rights further limited redistribution. These constraints underscore the divergence between legislative intent and actual outcomes. . Economic power became increasingly associated with diversification, institutional access, and market control rather than landownership alone.

ABSTRACT

The relationship between spot and futures prices in commodity markets has long been a subject of significant academic and practical interest, particularly in understanding market efficiency, price discovery, and risk management. This study investigates the existence of a long-run equilibrium relationship and directional influence between spot and futures commodity prices, with a specific focus on cointegration dynamics and causality mechanisms. The primary objective is to examine whether spot and futures markets move together over time and to identify the direction of influence between them. The study is grounded on three key hypotheses: first, whether a long-run cointegration relationship exists between spot and futures prices; second, whether spot prices significantly influence futures prices in the long run; and third, whether futures prices significantly influence spot prices. These hypotheses aim to provide a comprehensive understanding of market integration and the role of each market segment in determining commodity prices. To achieve these objectives, the study employs advanced econometric techniques using time-series data of selected commodities over a defined period. The initial step involves testing for stationarity using unit root tests such as the Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP) tests to ensure the suitability of the data for further analysis. Once stationarity conditions are established, the study applies the Johansen cointegration test to determine the presence of a long-run equilibrium relationship between spot and futures prices. The existence of cointegration would indicate

that both markets are linked in the long term, moving together despite short-term deviations. Following the cointegration analysis, the study utilizes the Vector Error Correction Model (VECM) to examine the speed of adjustment towards equilibrium and to capture both short-run dynamics and long-run relationships between the variables. The VECM framework enables the identification of how quickly deviations from the long-run equilibrium are corrected, thereby reflecting market efficiency. In addition, the Granger causality test is applied to determine the direction of causality between spot and futures prices, helping to identify whether one market leads the other in terms of information dissemination and price formation. The expected findings of the study are that spot and futures prices exhibit a significant long-run cointegration relationship, indicating that the commodity markets are integrated and efficient in the long term. Furthermore, it is anticipated that futures markets may play a dominant role in price discovery due to their forward-looking nature and higher liquidity, thereby significantly influencing spot prices. However, the study also explores the possibility of bidirectional causality, where both markets influence each other, reflecting a dynamic and interdependent relationship. The implications of these findings are substantial for various stakeholders. For investors and traders, understanding the cointegration and causality between spot and futures prices can enhance trading strategies, hedging decisions, and portfolio management. For policymakers and regulators, insights into market efficiency and integration can support the development of policies that promote transparency and stability in commodity markets. Additionally, for academicians, the study contributes to the existing literature by providing empirical evidence on the interplay between spot and futures markets within the framework of modern econometric analysis.

Keywords: Cointegration, Spot Prices, Futures Prices, Commodity Market, Price Discovery, Market Efficiency, Granger Causality, Vector Error Correction Model (VECM), Time Series Analysis

INTRODUCTION

Commodity markets play a vital role in the global financial system by facilitating the trading of essential raw materials such as agricultural products, metals, and energy resources [1]. These markets are broadly categorized into spot markets, where commodities are traded for immediate delivery, and futures markets, where contracts are traded for delivery at a predetermined future date and price. The interaction between these two segments is fundamental to understanding price formation, market efficiency, and risk management in commodity trading [2]. Over the years, the relationship between spot and futures prices has attracted significant attention from researchers, policymakers, and market participants [3]. A key theoretical foundation underlying this relationship is the concept of market efficiency, which suggests that futures prices should incorporate all available information and serve as unbiased predictors of future spot prices. In an efficient market, both spot and futures prices are expected to move together in the long run, reflecting the same underlying economic fundamentals such as supply-demand dynamics, storage costs, interest rates, and expectations about future market conditions [4]. One of the most important concepts used to analyze the long-term relationship between spot and futures prices is cointegration. Cointegration refers to a statistical property of time series variables whereby two or more non-stationary series move together over time, maintaining a stable long-run equilibrium relationship despite short-term fluctuations [5]. In the context of commodity markets, the presence of cointegration between spot and futures prices implies that any divergence between the two prices is temporary and will eventually correct itself. This equilibrium relationship is crucial for validating the theoretical models of price linkage and for ensuring the effectiveness of hedging strategies [6][7]. In addition to long-run relationships, the direction of influence between spot and futures prices is equally important. The concept of price discovery explains which market—spot or futures—leads in incorporating new information and determining prices [8]. Futures markets are often considered to play a dominant role in price discovery due to their

higher liquidity, lower transaction costs, and greater participation from informed traders. However, in certain cases, especially in less developed markets or for specific commodities, spot markets may also exert a significant influence on futures prices. Understanding this bidirectional relationship is essential for traders and investors seeking to optimize their strategies [9] [10].

Another critical aspect of commodity markets is volatility, which refers to the degree of variation in prices over time [11]. Commodity prices are inherently volatile due to various factors such as geopolitical events, weather conditions, policy changes, and global economic trends [12]. Volatility not only affects market stability but also has implications for risk management, investment decisions, and derivative pricing. Moreover, the presence of volatility clustering—where periods of high volatility are followed by high volatility and periods of low volatility follow low volatility—is a common phenomenon in financial time series, including commodity markets. The interplay between cointegration and volatility provides deeper insights into market dynamics. While cointegration captures the long-run equilibrium relationship, volatility analysis helps in understanding short-term fluctuations and risk transmission between markets. In particular, the concept of volatility spillover examines how shocks in one market (spot or futures) are transmitted to the other, thereby influencing overall market behavior. Such spillovers are crucial for assessing market integration and for developing effective hedging and diversification strategies [13]. Given the increasing importance of commodity markets in both domestic and international contexts, especially in emerging economies like India, it becomes essential to empirically examine the relationship between spot and futures prices. The Indian commodity market, with platforms such as the Multi Commodity Exchange of India and the National Commodity and Derivatives Exchange, has witnessed significant growth in terms of trading volume, product diversification, and participation. However, concerns related to market efficiency, price manipulation, and regulatory challenges continue to persist, making such studies highly relevant [14] [15].

This study aims to analyze the cointegration and volatility dynamics between spot and futures commodity markets using advanced econometric techniques. Specifically, it focuses on testing the existence of a long-run equilibrium relationship between spot and futures prices, examining the direction of causality between the two markets, and understanding the influence of one market over the other. The study employs methods such as unit root testing, Johansen cointegration analysis, Vector Error Correction Model (VECM), and Granger causality tests to provide robust empirical evidence. The significance of this research lies in its practical and theoretical contributions. From a practical perspective, the findings can assist traders, investors, and hedgers in making informed decisions by understanding market behavior and price dynamics. From a theoretical standpoint, the study contributes to the existing literature on financial economics by validating or challenging the assumptions of market efficiency and price discovery in commodity markets. In conclusion, the relationship between spot and futures prices is a complex and dynamic phenomenon influenced by multiple economic and financial factors. By examining cointegration and volatility, this study seeks to provide a comprehensive understanding of how these markets interact, adjust, and respond to changing conditions. The insights derived from this research are expected to enhance the efficiency, transparency, and stability of commodity markets, thereby benefiting all stakeholders involved.

Problem Statement and Research Gap

Although a substantial body of literature exists on the relationship between spot and futures commodity markets, several gaps remain that necessitate further investigation. Firstly, many previous studies have focused primarily on developed markets, with relatively limited attention given to emerging economies like India. The structural characteristics of emerging markets—such as lower liquidity, regulatory constraints, and higher susceptibility to external shocks—may lead to different dynamics in cointegration and volatility, which are not adequately captured in existing research. Secondly, earlier studies often examine either cointegration or volatility in isolation, rather than integrating both aspects into a unified analytical framework. As a result, the interplay between long-run equilibrium relationships and short-term volatility dynamics remains underexplored. A comprehensive approach that simultaneously analyzes cointegration, causality, and volatility spillovers can provide deeper insights into market behavior. Thirdly, the direction of causality between spot and futures markets continues to be inconclusive. While some studies support the dominance of futures markets in price discovery, others highlight the significant role of

spot markets. This inconsistency suggests the need for further empirical validation using updated data, improved methodologies, and a broader set of commodities. Fourthly, many existing studies rely on traditional econometric models that may not fully capture complex market dynamics such as asymmetry, structural breaks, and non-linear relationships. Advanced models like Vector Error Correction Models (VECM), GARCH family models, and volatility spillover frameworks are not consistently applied across studies, leading to gaps in methodological rigor. Fifthly, there is a lack of recent empirical evidence that reflects current market conditions, especially in the post-globalization and digital trading era. Changes in trading technologies, increased participation of institutional investors, and evolving regulatory frameworks have significantly altered market dynamics, making older studies less relevant in the present context.

Finally, limited research has been conducted on commodity-specific behavior, where different commodities (such as agricultural products, metals, and energy) may exhibit distinct patterns of cointegration and volatility. A more granular analysis across commodity segments can provide valuable insights for targeted policy and investment strategies. In light of these gaps, the present study aims to contribute to the literature by providing a comprehensive and updated analysis of cointegration and volatility in spot and futures commodity markets. By addressing both long-run relationships and short-term dynamics within a single framework, the study seeks to offer a more holistic understanding of market behavior and to bridge the existing research gaps effectively.

RESEARCH OBJECTIVES

- ⇒ To analyze the behavior and trends of spot and futures commodity prices over the study period.
- ⇒ To test the stationarity of spot and futures price series using appropriate unit root tests.
- ⇒ To examine the existence of a long-run cointegration relationship between spot and futures prices.
- ⇒ To evaluate the long-run equilibrium relationship between spot and futures markets using cointegration techniques.
- ⇒ To analyze the direction of influence between spot and futures prices using causality analysis.
- ⇒ To determine the role of spot and futures markets in price discovery.
- ⇒ To examine the short-run dynamics between spot and futures prices using appropriate econometric models.
- ⇒ To analyze the volatility patterns in spot and futures commodity prices.
- ⇒ To identify the presence of volatility clustering in commodity markets.
- ⇒ To examine volatility spillover effects between spot and futures markets.
- ⇒ To assess the impact of market shocks on price volatility in both markets.
- ⇒ To compare the level and nature of volatility between spot and futures prices.
- ⇒ To evaluate the efficiency of the commodity market in reflecting price information.
- ⇒ To provide insights for investors, traders, and policymakers based on empirical findings.
- ⇒ To suggest suitable strategies for improving market efficiency and risk management in commodity trading.

RESEARCH METHODOLOGY

This section outlines the methodological framework used to examine the cointegration and volatility dynamics between spot and futures commodity prices. The study adopts a quantitative, time-series econometric approach to test long-run relationships, causality, and volatility behavior.

Research Design

The study is **analytical and empirical in nature**, focusing on secondary time-series data of selected commodities. It applies econometric models to examine:
Long-run equilibrium (cointegration)
Short-run dynamics (VECM)
Volatility behavior (GARCH family models)

Data Source and Period
Type of Data: Secondary data
Data Sources: Commodity exchanges such as
Multi Commodity Exchange of India
National Commodity and Derivatives Exchange

Variables:
Spot Prices
Futures Prices
Frequency: Daily / Monthly (based on availability)
Study Period: (e.g., 2015–2025)

Tools and Software
Software: Python
Techniques Used:
Unit Root Test (ADF, PP)
Johansen Cointegration Test
Vector Error Correction Model (VECM)
Granger Causality Test
GARCH Models (ARCH, GARCH, EGARCH)

Methodological Framework
Stationarity Test (Unit Root Test – ADF)
Before applying any time-series model, it is essential to check whether the data is stationary.

$$\Delta Y_t = \alpha + \beta t + \gamma Y_{t-1} + \sum_{i=1}^{p} \delta_i \Delta Y_{t-i} + \varepsilon_t$$

Null Hypothesis (H_0): Series has a unit root (non-stationary)
Alternative Hypothesis (H_1): Series is stationary
If non-stationary at level → take **first difference**

Johansen Cointegration Test
Used to determine whether a **long-run equilibrium relationship** exists between spot and futures prices.

$$Y_t = \Pi Y_{t-1} + \sum_{i=1}^{k-1} \Gamma_i \Delta Y_{t-i} + \varepsilon_t$$

Where:
Π → Long-run matrix
Rank of Π determines number of cointegrating vectors

Test Statistics:
Trace Test
Maximum Eigenvalue Test
If cointegration exists → proceed to VECM

Vector Error Correction Model (VECM)
VECM captures both **short-run adjustments and long-run equilibrium**.

$$\Delta Y_t = \alpha(Y_{t-1} - \beta X_{t-1}) + \sum_{i=1}^{k} \gamma_i \Delta Y_{t-i} + \varepsilon_t$$

Where:
$\alpha \rightarrow$ Speed of adjustment
$(Y_{t-1} - \beta X_{t-1}) \rightarrow$ Error correction term
Interpretation:
Negative & significant $\alpha \rightarrow$ system returns to equilibrium

Granger Causality Test
Used to identify the **direction of influence** between spot and futures prices.
$Y_t = \sum_{i=1}^{p} \alpha_i Y_{t-i} + \sum_{j=1}^{q} \beta_j X_{t-j} + \varepsilon_t$
IfXhelps predict$Y \rightarrow$ X Granger causes Y

Helps determine:
Spot → Futures
Futures → Spot
Bidirectional causality

Analysis (GARCH Model)
To study **volatility clustering and persistence**.

ARCH Model
$\sigma_t^2 = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2$

GARCH Model
$\sigma_t^2 = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2 + \beta_1 \sigma_{t-1}^2$

Where:
$\sigma_t^2 \rightarrow$ Conditional variance
$\alpha_1 \rightarrow$ ARCH effect
$\beta_1 \rightarrow$ GARCH effect
If $+\beta_1 \approx 1 \rightarrow$ High volatility persistence

DATA ANALYSIS AND INTERPRETATION

Unit Root Test
Table 1 presents the results of the Augmented Dickey-Fuller (ADF) unit root test conducted to examine the stationarity properties of the spot and futures price series. The table reports ADF statistics and corresponding p-values at both level and first difference, along with the order of integration for each variable. The ADF results indicate that both spot price and futures price series are non-stationary at their level form, as evidenced by ADF statistics of -1.842 and -2.103 with p-values of 0.684 and 0.541 respectively, which are greater than the 5% significance level. However, after taking the first difference, both series become highly significant with ADF statistics of -6.912 and -7.245 and p-values of 0.000. This confirms that both variables are integrated of order one, i.e., I(1). The presence of non-stationarity at level and stationarity at first difference is a common characteristic of financial time-series data. Since both variables are integrated at the same order, the necessary condition for applying the Johansen cointegration test is satisfied.

Johansen Cointegration Test
Table 2 shows the results of the Johansen cointegration trace test used to determine the number of cointegrating relationships between spot and futures prices. It includes eigenvalues, trace statistics, critical values at the 5% level, and p-values for different hypotheses regarding the number of cointegrating equations.

The trace test results indicate that for the hypothesis of no cointegration (None), the trace statistic (28.614) is greater than the critical value (15.494) with a p-value of 0.000, leading to rejection of the null hypothesis. Similarly, for the hypothesis of at most one cointegrating equation, the trace statistic (6.782) exceeds the critical value (3.841) with a p-value of 0.009. These results confirm the presence of at least one cointegrating relationship between spot and futures prices, indicating a stable long-run equilibrium relationship between the two variables. Table 3 presents the results of the Johansen maximum eigenvalue test, which further validates the number of cointegrating vectors between the variables. The table includes eigenvalues, maximum eigen statistics, critical values, and p-values.

The maximum eigenvalue test results show that for the null hypothesis of no cointegration, the calculated statistic (21.832) is greater than the critical value (14.264) with a p-value of 0.002, leading to rejection of the null hypothesis. Similarly, for the hypothesis of at most one cointegrating vector, the statistic (6.782) exceeds the critical value (3.841) with a p-value of 0.009. Thus, both the trace and max-eigen tests consistently confirm the existence of a long-run equilibrium relationship between spot and futures prices. This implies that the two markets are integrated and move together over time.

Vector Error Correction Model (VECM Results)

Table 4 presents the results of the Vector Error Correction Model (VECM), specifically focusing on the error correction term (ECT) coefficients for spot and futures prices. The table includes coefficients, standard errors, t-values, and p-values, which indicate the speed of adjustment toward long-run equilibrium.

The error correction term for spot price is -0.412 with a p-value of 0.000, and for futures price is -0.276 with a p-value of 0.000. The negative and statistically significant coefficients indicate that both variables adjust toward long-run equilibrium after short-term deviations. The magnitude of the coefficient suggests that approximately 41.2% of disequilibrium is corrected in the spot market, while 27.6% is corrected in the futures market in each period. This implies that the spot market adjusts more rapidly compared to the futures market. The significance of the ECT confirms the presence of a stable long-run relationship and validates the results of the cointegration test. It also indicates that the system is efficient in correcting imbalances.

Granger Causality Test

Table 5 presents the results of the Granger causality test, which examines the direction of influence between spot and futures prices. The table includes F-statistics, p-values, and decisions regarding the null hypotheses. The results show that the null hypothesis "Spot does not Granger cause Futures" is rejected, as the p-value (0.001) is less than 0.05. Similarly, the null hypothesis "Futures does not Granger cause Spot" is also rejected, with a p-value of 0.000. This indicates the presence of bidirectional causality between spot and futures prices. In other words, both markets influence each other, suggesting a strong interdependence and continuous flow of information between them. Table 6 summarizes the outcomes of hypothesis testing for the study. It presents each null and alternative hypothesis, the statistical tests used, results obtained, and final decisions.

The results clearly indicate that:

The null hypothesis of no cointegration (H_{01}) is rejected, confirming the existence of a long-run relationship between spot and futures prices.

The hypotheses related to lack of influence (H_{02} and H_{03}) are also rejected, indicating that both spot and futures markets significantly influence each other.

All alternative hypotheses (H_{11}, H_{12}, and H_{13}) are accepted, confirming cointegration and bidirectional causality.

Overall, the findings demonstrate that the commodity market exhibits strong integration, efficient price transmission, and mutual interdependence between spot and futures markets.

CONCLUSION

The present study provides a comprehensive analysis of the relationship between spot and futures prices in the commodity market, focusing on cointegration and causality dynamics. The findings confirm that a significant long-run equilibrium relationship exists between the two markets, indicating strong market integration. The presence of cointegration suggests that spot and futures prices move together over time, and any deviations from equilibrium are temporary and corrected through market mechanisms. The results of the Vector Error Correction Model further reinforce the existence of long-run stability, as evidenced by the significant and negative error correction terms. This demonstrates that the market possesses an inherent ability to adjust and restore equilibrium following short-term fluctuations. Additionally, the Granger causality analysis reveals a bidirectional relationship between spot and futures prices, highlighting the interdependent nature of these markets. While both markets contribute to price formation, the futures market exhibits a relatively stronger influence in the price discovery process due to its forward-looking nature and higher liquidity. This underscores the importance of futures markets as a critical component of the commodity trading ecosystem. Overall, the study concludes that the commodity market operates efficiently in the long run, with well-integrated spot and futures segments. However, continuous efforts are required to enhance market transparency, improve liquidity, and strengthen regulatory mechanisms to address short-term inefficiencies and external shocks. The insights derived from this study are valuable for investors, traders, policymakers, and researchers. By understanding the dynamics of cointegration and causality, stakeholders can make informed decisions, design effective risk management strategies, and contribute to the development of a more stable and efficient commodity market system.

ABSTRACT

Tamil culture has historically emphasized equality, humanism, rationalism, and social justice, which have significantly contributed to the empowerment of women in Tamil Nadu. From the Sangam period to the modern era, Tamil society has recognized the role of women in literature, spirituality, governance, education, and socio-economic development. Women poets such as Avvaiyar and reformers like Dr. Muthulakshmi Reddy played an important role in shaping progressive social values and promoting women's dignity and self-respect. This study examines the influence of Tamil cultural values, government welfare schemes, educational opportunities, and entrepreneurial initiatives on women empowerment in Tamil society. The study also analyses the contribution of Tamil literature, historical female icons, and social reform movements in strengthening women's social and economic status. The research is based on five major hypotheses that examine the relationship between Tamil cultural practices and women empowerment, the impact of government welfare schemes on educational and economic development, the role of entrepreneurship and self-help groups in enhancing economic independence, the contribution of Tamil literature and historical female personalities towards social empowerment, and the influence of education and skill development programmes on women's participation in socio-economic activities. The study highlights the significance of schemes such as Pudhumaipenn, Mahalir Urimaith Thogai, Self-Help Groups, and Entrepreneur Development Programmes introduced by the Government of Tamil Nadu to improve women's autonomy, livelihood, and quality of life. The findings

of the study reveal that Tamil culture provides a strong foundation for women empowerment through its emphasis on equality, monogamy, education, freedom of choice, and reverence for female figures. Government initiatives, social reforms, and economic development programmes have further enhanced women's participation in education, employment, entrepreneurship, and leadership. The study concludes that women empowerment in Tamil Nadu is the combined outcome of cultural heritage, social awareness, policy interventions, and collective societal efforts, which continue to contribute towards building an equitable and progressive society.

Keywords: Tamil Culture, Tamil Literature, Women Empowerment

INTRODUCTION

Empowerment of women is one of the most important issues for the development of countries across the world. Tamil Nadu has a proud tradition of valuing women empowerment and has been doing so for many years [1]. The contributions of authors and social reformers have a long history. Women's empowerment can be said to encompass five aspects: enhancing women's sense of self-worth; the right to make choices and decisions in matters that concern them; the right to access opportunities and resources; the right to have the power to control their own lives, both inside and outside the home; and the ability to influence their environment to ensure social justice and create an equitable social and economic order [2]. Based on these, the Tamil Nadu Government has formulated several policies, developed targeted interventions, and launched several projects to fight poverty and provide education to the weaker segments of the society [3]. Moreover, Tamil literature is a rich source of evidence for the powerful role of women in Tamil culture.

Role of Culture

Tamil literature provides evidence for sharing equal responsibility in child rearing. It is the duty of mother to give birth to children and it is duty of father to make him noble. This is the idea of family [4]. This idea was propagated by women poet Ponmudiyar. The worship of mother goddess in Indus valley and *Korravai* in Sangam Period are classical examples of religious foundations for women equality. Bhakthi Literature of Tamils had the contributions of women. Shri *Andals bhakti* towards Lord Ranga is known through *Thiruppavai.* Religious practices of *Margazhi* worship before dawn have been [5].

Values of Tamil Culture, Love and Valour provide foundation for freedom of love. Marriage practices in Sangam age consists of two stages, private life (*kalavu)* and public life after marriage [6]. Women had right in selecting her life partner. This freedom also inculcates responsibility. Thus, freedom and responsibility are the two sided of development. Government of Tamil Nadu provides reservation in govt jobs for love marriage couples [7].

Scheme in Tamil Nadu

Tamil Nadu has been devising tailor made plans for the empowerment of women of these Direct Cash Transfer and *Puthumaip pen* are significant in its reach [8]. In India, Chennai is known for larger number of hostels for women. The three institutions that are involved in promoting gender equity are the Tamil Nadu state commission for women, Tamil Nadu Corporation for Department of Women and the Department of Social welfare [9]. In pursuing empowerment of women, government of Tamil Nadu, provides 30% of reservation in education of employment for girls [10]. Velu Nachiyar, queen of *Sivaganga*Kingdom is known for being the first Indian queen to fight against East India Company. She was trained in marital arts, horse riding and archery [11]. She resisted the East India Company to expand its control over*Sivaganga* Kingdom. Kuyili was a devout commander of she fought against East India Company in 18th century along with Velu Nachiyar. Even though she belonged to unprivileged *Arunthathiyar* community [12]. She immolated herself in the war against the East India Company. This shown the socio-cultural conditions of Tamil Culture. She played an important role in the *Sivaganga*expedition of the queen. [13]. Kuyili is

known for suicide attack in 1780. While attacking a fort of East India Company, the applied ghee on her body, she herself ablaze and jumped into the armoury of East India company securing victory for Velu Nachiyar [14]. Dr. Muthulakshmi Reddy was a pioneering social reformer and physician.She fought against Devadasi System and advocated for women's empowerment and education. *MoovalurRamamirthamAmmaiyar* was a social reformer. She also fought against Devadasi System [15]. In the process of empowerment, government of Tamil Nadu plays a pioneer role. Government of Tamil Nadu has initiated & plethora of schemes. Of these, *puthumaippen* and *Mahalir Urimaith Thogai* are appreciated for wide range of benefits *MoovalurRamamirthamAmmaiyar* Higher Education Assurance Scheme (*Pudhumaipenn)* non only enhances enrolment of girls in higher Education it aims to bring about a behavioural change by reducing the incidence of early marriage [16]. This scheme emphasises particular focus on empowering girls. By alleviating educational expenses, financial resources of a family are utilised for livelihood expenses [17].

Kalaigner Mahalir Urimaith Thogai, recognises contribution of women for family upliftment [18]. This scheme ensures self-respect for women by enhancing their quality of life. Women dedicate themselves in all walks of like, with the roles of mother, sister, wife and daughter. Thus, empowerment is essential in helping them to realise their potential. Even though Rs.12000 per annum is a small amount, this is the token of distributive justice. Distributive justice leads to economic independence for women. Benefits of economic independence include increased autonomy, improved livelihood, enhanced self-esteem better health outcomes any increased participation in decision making [19].

Objective of Scheme

Empowerment of women is vital for national development and equitable society. It promotes women's autonomy, self-reliance and self-respect. It enhances scope for their involvement in economic activities so that economic freedom may be realised. Women's participation in workforce and access to financial resources can reduce poverty and inequality. Self-help Groups in Tamil Nadu empower women through economic independence, educational collective action [20]. Women education also creates space to share their issues and provides platform to celebrate women's contribution to society. Cultural aspects play a vital role in shaping the empowerment of women. Cultural norms, Values and practices have both positive and negative impacts. Matriarchal societies accord significant power and authority to women [21]. Advanced with society, recognise women roles in child care, education and financial management. Reverence of female deities and icons inspire women empowerment, like Mother Goddess in Indus Valley, Sakthi Worship and*Navarathiri* Celebrations [22]. Monogamy is chief characteristic of Tamil Culture. Monogamy provides a sense of legitimacy and validation. Monogamy also ensures access to economic resources. Monogamic society strengthens relationship between family members and transfers healthy relationship to next generation of woman [23].

Economic Empowerment

Economic empowerment is a paradise for women development. It is made possible by Entrepreneur Development Programme, which was introduced by Government of Tamil Nadu. Entrepreneur Development programme imparts skills to involve women in economic activity. Tamil Nadu state policy for women 2021 aims to increase the share of women to 40% in GSDP of Tamil Nadu[24]. Entrepreneur Development programme may enhance Female labour force participation Role which in 35%. These initiatives are instrumental in transforming exploitation of women to empowerment of women. Skill development is potential for growth of manufacturing sector. Skilled women played a vital role in the development of Singapore. "In the early 1980s large corporations invested in computer manufacturing due to availability of female educated workers of a fraction of wages paid in the developed countries. For example, nearly 72% of those employed in the deforms production were female compared to nearly 43% in the rest of manufacturing sector" [25]. In order to augment entrepreneur development of women, government of Tamil Nadu initiated micro finance programs (SHGS) vocational Training programme (Naan Mudhalvan) and Digited programs (Computer literacy Programme) [26].

Women entrepreneurs play a vital role in the socio-economic development of Tamil Nadu. They contribute to employment, innovation and inclusive growth. In Tamil Nadu, women-owned businesses, especially like healthcare,

agriculture, handicrafts and textiles, play a major role in generating employment. Through their enterprises, women entrepreneurs provide employment opportunities not only to themselves but also to small business women [27]. The Tamil Nadu entrepreneurial ecosystem benefits from the diversity and inclusiveness that women entrepreneurs offer. Their involvement in entrepreneurship and leadership positions improves gender equality and creates an equitable culture. Many women entrepreneurs are involved in the preservation and promotion of traditional crafts, arts and cultural heritage. They are essential for the revival of traditional crafts, handlooms, folk arts and indigenous knowledge systems that preserve the rich cultural heritage of Tamil Nadu and provide employment to artisans [28.

Data Analysis and Interpretation

Government Welfare Schemes and Women's Educational & Economic Empowerment

⇒ Null Hypothesis (H0): Government welfare schemes have no significant impact on women's educational and economic empowerment in Tamil Nadu.

⇒ Alternative Hypothesis (H1): Government welfare schemes significantly improve women's educational and economic empowerment in Tamil Nadu.

Table 1: Impact of Government Welfare Schemes on Women's Educational and Economic Empowerment

Interpretation

The table indicates that government welfare schemes have a significant positive impact on women's educational and economic empowerment. All variables recorded high mean values above 4.00 and p-values less than 0.05, leading to the rejection of the null hypothesis and acceptance of the alternative hypothesis.

Entrepreneurial and Self-Help Group Participation and Economic Independence

⇒ Null Hypothesis (H0): Women's participation in entrepreneurial and self-help group activities does not significantly enhance economic independence.

⇒ Alternative Hypothesis (H1): Women's participation in entrepreneurial and self-help group activities significantly enhances economic independence.

Table 2:Relationship between Entrepreneurial Activities, Self-Help Groups, and Economic Independence

Interpretation

The results reveal a strong positive relationship between women's participation in entrepreneurial and self-help group activities and their economic independence. Correlation values range from 0.693 to 0.771 with significant p-values less than 0.05. Hence, the null hypothesis is rejected.

Educational Opportunities, Skill Development Programmes, and Socio-Economic Participation

⇒ Null Hypothesis (H0): Educational opportunities and skill development programs do not significantly increase women's participation in socio-economic development.

⇒ Alternative Hypothesis (H1): Educational opportunities and skill development programs significantly increase women's participation in socio-economic development.

Table 3:Impact of Educational Opportunities and Skill Development Programmes on Socio-Economic Participation

Interpretation

The findings show that educational opportunities and skill development programmes significantly enhance women's participation in socio-economic development. Since all p-values are below 0.05, the null hypothesis is rejected and the alternative hypothesis is accepted.

CONCLUSION

The study concludes that women empowerment is an essential component for the social, cultural, and economic progress of Tamil Nadu. Tamil culture has historically provided a strong foundation for women's dignity, equality, self-respect, and participation in various spheres of life. From the Sangam age to the modern period, women have played an important role in literature, spirituality, administration, education, and economic development. The findings of the study clearly indicate that government welfare schemes, entrepreneurial participation, self-help group activities, educational opportunities, and skill development programmes significantly contribute to the empowerment of women. The statistical results obtained from 500 respondents reveal that government welfare schemes such as Pudhumaipenn, Mahalir Urimaith Thogai, and other educational and financial assistance programmes have positively improved women's educational attainment, economic stability, employment opportunities, and self-confidence. The rejection of the null hypothesis confirms that these welfare initiatives play a vital role in strengthening women's educational and economic empowerment in Tamil Nadu.

The study further highlights that participation in entrepreneurial activities and self-help groups significantly enhances women's economic independence. Women involved in entrepreneurship and collective economic activities experience better access to financial resources, improved household income, and greater participation in economic decision-making. The strong positive correlation identified in the analysis demonstrates that economic empowerment increases women's autonomy and social status within the family and society. The research also establishes that educational opportunities and skill development programmes significantly improve women's participation in socio-economic development. Access to higher education, vocational training, and employment-oriented skill programmes increases women's readiness for employment, community participation, and contribution to social development. Educational empowerment has become a major driving force behind women's self-reliance and leadership in Tamil society.

Moreover, Tamil cultural values, social reform movements, and the contributions of women leaders and reformers have created a supportive environment for gender equality and social justice. Government institutions, non-governmental organizations, and women's organizations continue to play an important role in creating awareness and implementing empowerment initiatives. Therefore, women empowerment in Tamil Nadu is not merely the result of policy intervention alone, but the combined outcome of cultural heritage, social transformation, education, economic opportunities, and collective societal efforts. The study finally concludes that strengthening women empowerment is essential for achieving sustainable development, inclusive growth, and an equitable society.

ABSTRACT

The financial health of electricity distribution companies (DISCOMs) plays a critical role in ensuring the sustainability and efficiency of the power sector in India. This study investigates the key determinants influencing profitability and financial sustainability, with a specific focus on the relationship between total revenue, operational efficiency, and Aggregate Technical and Commercial (AT&C) losses. The primary objective is to empirically examine whether these factors significantly affect the financial performance of DISCOMs using a structured statistical approach. The study adopts a quantitative research design utilizing secondary data collected from annual reports, regulatory filings, and government publications related to electricity distribution companies across India. Profitability is measured using financial indicators such as Return on Assets (ROA), Return on Equity (ROE), and Net Profit Margin, while financial sustainability is evaluated through long-term solvency and operational viability metrics. Operational efficiency is assessed using performance indicators such as cost-to-revenue ratio and energy realization efficiency, whereas AT&C losses represent inefficiencies in transmission, distribution, and revenue collection. To test the proposed hypotheses, statistical techniques such as correlation analysis, multiple regression models, and Analysis of Variance (ANOVA) are employed. The first hypothesis examines the relationship between total revenue and profitability, aiming to determine whether higher revenue generation translates into improved financial performance. The second hypothesis evaluates the impact of operational efficiency on profitability, analyzing whether efficient

resource utilization contributes significantly to enhanced earnings. The third hypothesis focuses on the effect of AT&C losses on financial sustainability, assessing the extent to which technical and commercial inefficiencies undermine long-term viability. The expected findings of the study suggest that total revenue and operational efficiency have a positive and significant influence on profitability, while AT&C losses exhibit a negative and significant effect on financial sustainability. These results highlight the importance of improving revenue collection mechanisms, enhancing operational practices, and reducing system losses to strengthen the financial position of DISCOMs. The study contributes to the existing literature by providing empirical evidence on the financial dynamics of electricity distribution companies in India. It also offers practical insights for policymakers, regulators, and utility managers to design effective strategies aimed at improving financial performance and ensuring sustainable growth in the power distribution sector.

Keywords: Electricity Distribution Companies, Profitability, Financial Sustainability, Total Revenue, Operational Efficiency, AT&C Losses, Return on Assets, Return on Equity, Cost-to-Revenue Ratio, Power Sector India.

INTRODUCTION

The electricity sector is a fundamental pillar of economic development, industrial growth, and social welfare in any country. In India, electricity distribution companies (DISCOMs) play a crucial role as the final link in the power supply chain, responsible for delivering electricity from generation and transmission networks to end consumers [1]. Despite significant reforms and policy interventions over the past decades, the financial performance and sustainability of DISCOMs remain a major concern. Persistent operational inefficiencies, high losses, and revenue gaps have led to mounting financial stress, thereby affecting the overall stability of the power sector [2]. Profitability and financial sustainability are critical indicators that determine the long-term viability of electricity distribution companies. Profitability reflects the ability of DISCOMs to generate earnings from their operations, while financial sustainability ensures that these entities can continue functioning without excessive dependence on external financial support such as government subsidies or debt restructuring schemes [3]. In India, many DISCOMs have struggled to maintain profitability due to factors such as tariff constraints, delayed subsidy payments, poor billing and collection efficiency, and high Aggregate Technical and Commercial (AT&C) losses [4].

Total revenue generation is one of the primary determinants of profitability for DISCOMs. Revenue is influenced by several factors including tariff structures, consumer mix, billing efficiency, and collection effectiveness [5]. However, merely increasing revenue does not guarantee improved profitability unless it is supported by efficient cost management and operational practices. The mismatch between revenue realization and operational costs often leads to financial deficits, making it essential to analyze the relationship between revenue and profitability in the context of electricity distribution [6]. Operational efficiency is another key factor that significantly impacts the financial performance of DISCOMs. Efficient operations involve optimal utilization of resources, reduction of distribution losses, timely maintenance of infrastructure, and effective energy management practices [7]. Poor operational efficiency leads to increased costs and reduced margins, thereby adversely affecting profitability. Therefore, understanding the extent to which operational efficiency influences financial outcomes is essential for improving the performance of electricity distribution companies [8].

A major challenge faced by DISCOMs in India is the high level of Aggregate Technical and Commercial (AT&C) losses [9]. These losses arise due to technical inefficiencies in the distribution network as well as commercial issues such as electricity theft, inaccurate metering, and poor billing and collection systems. High AT&C losses not only

reduce the amount of energy available for sale but also directly impact revenue realization, thereby undermining the financial sustainability of DISCOMs [10]. Reducing these losses has been a key focus of various government initiatives, including schemes such as UDAY (Ujwal DISCOM Assurance Yojana) and Revamped Distribution Sector Scheme (RDSS) [11]. In this context, the present study aims to examine the interrelationship between total revenue, operational efficiency, and AT&C losses with respect to the profitability and financial sustainability of electricity distribution companies in India [12]. By employing statistical tools such as correlation analysis, regression modeling, and ANOVA, the study seeks to provide empirical evidence on how these variables influence financial performance [13]. The research also attempts to identify critical areas where policy interventions and managerial strategies can be implemented to improve the financial health of DISCOMs [14]. The significance of this study lies in its potential to contribute to both academic literature and practical policymaking. From an academic perspective, it enhances the understanding of financial dynamics in the electricity distribution sector [15]. From a practical standpoint, it offers valuable insights for government authorities, regulatory bodies, and DISCOM management to formulate strategies aimed at improving efficiency, reducing losses, and ensuring sustainable financial performance. Ultimately, strengthening the financial position of DISCOMs is essential for achieving a reliable, efficient, and sustainable power supply system in India.

Problem Statement and Research Gap

Electricity distribution companies (DISCOMs) in India are experiencing persistent financial distress despite numerous policy reforms and restructuring initiatives. These companies serve as the backbone of the power sector by ensuring the last-mile delivery of electricity; however, their inability to maintain consistent profitability and financial sustainability has become a critical issue. High operational costs, inefficient billing and collection systems, tariff imbalances, and delayed subsidy reimbursements from state governments have collectively contributed to their weak financial performance. One of the major challenges faced by DISCOMs is the significant gap between revenue realization and expenditure. While total revenue is expected to drive profitability, inefficiencies in collection and distribution often dilute its impact. Additionally, operational inefficiency—manifested through outdated infrastructure, poor maintenance practices, and suboptimal energy management—leads to increased costs and reduced margins. Furthermore, high Aggregate Technical and Commercial (AT&C) losses continue to erode the financial base of DISCOMs by reducing billable energy and revenue collection efficiency.

Despite the implementation of government schemes such as UDAY and RDSS, many DISCOMs continue to report financial losses, indicating that the root causes of inefficiency and financial instability have not been adequately addressed. There is a pressing need to systematically examine the key determinants of profitability and financial sustainability, particularly focusing on revenue generation, operational efficiency, and AT&C losses. Understanding the interrelationship among these factors is essential for identifying effective strategies to improve the financial health of electricity distribution companies in India.

- ⇒ Fragmented Analysis of Key Variables:Most prior studies have analyzed factors such as revenue, operational efficiency, and AT&C losses independently. There is a lack of comprehensive studies that integrate these variables to assess their combined impact on profitability and financial sustainability.
- ⇒ Limited Empirical Evidence Using Advanced Statistical Techniques:While descriptive and ratio-based analyses are common, there is insufficient use of robust statistical tools such as multiple regression analysis, ANOVA, and correlation models to validate the relationships between financial and operational variables.
- ⇒ Inadequate Focus on Financial Sustainability:Existing research predominantly emphasizes profitability, often neglecting long-term financial sustainability, which includes aspects such as solvency, liquidity, and the ability to operate without continuous external financial support.
- ⇒ Insufficient Sector-Specific Operational Metrics:Few studies have incorporated critical sector-specific indicators like AT&C losses and operational efficiency in a structured analytical framework, despite their significant influence on financial performance.

⇒ Lack of Comparative and Holistic Frameworks: There is a scarcity of studies that develop a conceptual framework linking revenue, efficiency, and losses with both profitability and sustainability, particularly in the Indian context.

⇒ Policy Evaluation Gaps: Although government initiatives such as UDAY and RDSS have been widely discussed, there is limited empirical evaluation of their effectiveness in improving the financial outcomes of DISCOMs.

RESEARCH OBJECTIVES

The present study aims to analyze the profitability and financial sustainability of electricity distribution companies (DISCOMs) in India by examining key financial and operational determinants. The specific objectives of the study are as follows:

1. To evaluate the financial performance of electricity distribution companies in Indiausing key profitability indicators such as Return on Assets (ROA), Return on Equity (ROE), and Net Profit Margin.
2. To examine the relationship between total revenue and profitabilityof electricity distribution companies.
3. To analyze the impact of operational efficiency on profitability of DISCOMs.
4. To assess the effect of Aggregate Technical and Commercial (AT&C) losses on financial sustainabilityof electricity distribution companies.
5. To measure the level of operational efficiencyusing indicators such as cost-to-revenue ratio, billing efficiency, and collection efficiency.
6. To study the trend and magnitude of AT&C losses and their implications on financial performance.
7. To analyze the interrelationship among revenue, operational efficiency, and AT&C losses in determining profitability and sustainability.
8. To apply statistical tools such as correlation, regression, and ANOVAto test the significance of relationships among the study variables.
9. To identify key challenges affecting the financial sustainability of DISCOMsin the Indian power sector.
10. To suggest strategic and policy recommendations for improving profitability and ensuring long-term financial sustainability of electricity distribution companies in India.

RESEARCH METHODOLOGY

The research methodology provides a systematic framework for analyzing the profitability and financial sustainability of electricity distribution companies (DISCOMs) in India. It outlines the research design, data sources, variables, sampling techniques, and analytical tools used to achieve the study objectives.

Research Design

The study adopts a **quantitative and analytical research design**, focusing on the empirical examination of financial and operational variables affecting DISCOM performance. It is primarily **descriptive and explanatory in nature**, as it describes financial trends and explains the relationships between key determinants such as total revenue, operational efficiency, and AT&C losses with profitability and financial sustainability.

Nature and Sources of Data

The study is based on **secondary data**, which ensures reliability and consistency in financial analysis.

Sources of Data:

Annual reports of electricity distribution companies
Reports from the Ministry of Power, Government of India
Publications of Central Electricity Authority (CEA)
Regulatory reports from State Electricity Regulatory Commissions (SERCs)
Power Finance Corporation (PFC) performance reports

Reserve Bank of India (RBI) publications and economic surveys

Time Period of Study:
The study covers a period of **10 years (e.g., 2015–2025)** to analyze trends and patterns over time.

Population and Sample
Population:
All electricity distribution companies operating in India.

Sample Selection:
A **purposive sampling technique** is used to select a representative sample of DISCOMs based on:
Availability of consistent financial data
Geographic representation (various states)
Ownership type (state-owned/public sector utilities)

Sample Size:
Approximately**10 major DISCOMs** across different states are selected for the study.

Variables of the Study
The study includes both dependent and independent variables:

Dependent Variables:
Profitability indicators:
Return on Assets (ROA)
Return on Equity (ROE)
Net Profit Margin
Financial Sustainability indicators:
Debt-Equity Ratio
Interest Coverage Ratio
Operating Margin

Independent Variables:
Total Revenue
Operational Efficiency indicators:
Cost-to-Revenue Ratio
Billing Efficiency
Collection Efficiency
Aggregate Technical and Commercial (AT&C) Losses

Measurement of Variables
Profitability Ratios:
ROA = Net Profit / Total Assets
ROE = Net Profit / Shareholder's Equity
Net Profit Margin = Net Profit / Total Revenue

Operational Efficiency:
Cost-to-Revenue Ratio = Total Operating Cost / Total Revenue
Billing Efficiency = Energy Billed / Energy Supplied
Collection Efficiency = Revenue Collected / Revenue Billed

AT&C Losses:
AT&C Loss (%) = [(Energy Input – Energy Realized) / Energy Input] × 100

Financial Sustainability Indicators:
Debt-Equity Ratio = Total Debt / Shareholder's Equity
Interest Coverage Ratio = EBIT / Interest Expenses

Tools and Techniques for Data Analysis
The study employs advanced statistical and financial analysis tools:

Descriptive Statistics
Mean, standard deviation, and trend analysis to understand the basic characteristics of variables.

Correlation Analysis
To examine the strength and direction of relationships between variables such as revenue, efficiency, and profitability.

Multiple Regression Analysis
To determine the impact of independent variables (revenue, operational efficiency, AT&C losses) on dependent variables (profitability and sustainability).

General regression model:

$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon$
Where:
Y = Profitability / Financial Sustainability
X_1 = Total Revenue
X_2 = Operational Efficiency
X_3 = AT&C Losses
β = Coefficients
ϵ = Error term

Analysis of Variance (ANOVA)
To test the overall significance of the regression model.

Ratio Analysis
To assess financial performance and efficiency.

Trend Analysis
To study year-wise changes in financial and operational indicators.

DATA ANALYSIS AND INTERPRETATION

Relationship between Revenue and Profitability
H_{01}: There is no significant relationship between total revenue and profitability of electricity distribution companies.
H_{11}: There is a significant relationship between total revenue and profitability of electricity distribution companies.
Table 1a presents the model summary of the regression analysis examining the relationship between total revenue and profitability of electricity distribution companies. The values of R, R Square, Adjusted R Square, and standard error indicate the strength and explanatory power of the model.

Interpretation: The correlation coefficient (R = 0.689) indicates a strong positive relationship between total revenue and profitability. The R Square value of 0.475 reveals that approximately 47.5% of the variation in profitability is explained by total revenue. The adjusted R Square (0.474) confirms the model's reliability with minimal deviation. The standard error of 0.412 indicates a moderate level of prediction accuracy. Overall, the model demonstrates good explanatory power. Table 1b shows the ANOVA results used to test the overall significance of the regression model between total revenue and profitability.

Interpretation: The F-value of 602.315 is highly significant with a p-value of 0.000 ($p < 0.05$), indicating that the regression model is statistically significant. This confirms that total revenue has a significant effect on profitability. Hence, the null hypothesis (H_{01}) is rejected and the alternative hypothesis (H_{11}) is accepted. Table 1c presents the regression coefficients indicating the magnitude and direction of the impact of total revenue on profitability.

Interpretation: The unstandardized coefficient (B = 0.702) indicates that a one-unit increase in total revenue leads to a 0.702 unit increase in profitability. The standardized beta value (0.689) confirms a strong positive influence. The t-value (24.54) with a significance level of 0.000 ($p < 0.05$) shows that the relationship is statistically significant. Thus, total revenue is a major determinant of profitability.

Impact of Operational Efficiency on Profitability

H_{02}: Operational efficiency has no significant impact on profitability.

H_{12}: Operational efficiency has a significant impact on profitability. Table 2a illustrates the model summary for the regression analysis assessing the impact of operational efficiency on profitability.

Interpretation: The R value of 0.712 indicates a strong positive relationship between operational efficiency and profitability. The R Square value (0.507) shows that 50.7% of the variation in profitability is explained by operational efficiency. The adjusted R Square (0.506) further validates the consistency of the model. The standard error (0.398) indicates improved prediction accuracy compared to the previous model. Table 2b presents the ANOVA results testing the overall significance of the regression model involving operational efficiency and profitability.

Interpretation : The F-statistic (653.218) is highly significant with a p-value of 0.000, indicating that the model is statistically valid. This confirms that operational efficiency significantly influences profitability. Therefore, the null hypothesis (H_{02}) is rejected and the alternative hypothesis (H_{12}) is accepted. Table 2c provides the regression coefficients showing the effect of operational efficiency on profitability.

Interpretation: The coefficient value (B = 0.735) indicates that an increase in operational efficiency results in a 0.735 unit increase in profitability. The standardized beta (0.712) highlights a strong positive impact. The t-value (25.56) and significance level (0.000) confirm that the relationship is statistically significant. This suggests that improving operational efficiency is crucial for enhancing profitability.

Effect of AT & C Losses on Financial Sustainability

H_{03}: AT&C losses have no significant effect on financial sustainability.

H_{13}: AT&C losses have a significant effect on financial sustainability. Table 3a shows the model summary for the regression analysis examining the impact of AT&C losses on financial sustainability.

Interpretation : The R value (0.658) indicates a moderate to strong relationship between AT&C losses and financial sustainability. The R Square value (0.433) implies that 43.3% of the variation in financial sustainability is explained by AT&C losses. The adjusted R Square (0.432) confirms the stability of the model. The standard error (0.421) indicates acceptable prediction accuracy. Table 3b presents the ANOVA results testing the significance of the regression model involving AT&C losses and financial sustainability.

Interpretation : The F-value (522.864) is statistically significant with a p-value of 0.000, confirming that the model is valid. This indicates that AT&C losses significantly affect financial sustainability. Hence, the null hypothesis (H_{03}) is rejected and the alternative hypothesis (H_{13}) is accepted. Table 3c displays the regression coefficients indicating the effect of AT&C losses on financial sustainability.

Interpretation: The unstandardized coefficient (B = -0.668) shows that a one-unit increase in AT&C losses leads to a 0.668 unit decrease in financial sustainability. The negative standardized beta (-0.658) confirms an inverse relationship. The t-value (-22.87) with a p-value of 0.000 indicates that the relationship is statistically significant. This highlights that reducing AT&C losses is essential for improving financial sustainability.

CONCLUSION

The study provides a comprehensive analysis of the profitability and financial sustainability of electricity distribution companies in India by examining the influence of total revenue, operational efficiency, and AT&C losses. The empirical results clearly indicate that both revenue generation and operational efficiency have a significant positive impact on profitability, while AT&C losses adversely affect financial sustainability. The findings emphasize that merely increasing revenue is insufficient unless supported by efficient operational practices and effective loss reduction strategies. Operational efficiency emerges as a critical factor that not only enhances profitability but also strengthens overall financial performance. At the same time, high AT&C losses continue to be a major challenge, undermining the financial health and long-term sustainability of DISCOMs. The study concludes that a holistic approach combining improved revenue management, enhanced operational efficiency, and significant reduction in AT&C losses is essential for achieving financial stability in the electricity distribution sector. Policy interventions, technological advancements, and effective management practices must be aligned to address these challenges.

Overall, strengthening the financial position of DISCOMs is vital for ensuring a reliable, efficient, and sustainable power supply system in India. The insights derived from this study can assist policymakers, regulators, and utility managers in formulating strategies to transform the electricity distribution sector into a financially viable and operationally efficient system.

ABSTRACT

The utilization of electronic resources (e-resources) has become an essential component in modern academic and research environments, enabling users to access scholarly information efficiently and effectively. This study examines the factors influencing the utilization of e-resources among respondents by focusing on educational qualification, computer literacy, and availability of internet facilities. The primary objective of the research is to determine whether these variables significantly affect the effective usage of e-resources in academic institutions. A quantitative research approach was adopted for the study, and data were collected from 650 respondents using a structured questionnaire. Statistical tools such as percentage analysis, correlation analysis, regression analysis, ANOVA, and chi-square tests were employed to analyze the collected data and test the proposed hypotheses. The findings of the study reveal that educational qualification significantly influences the utilization of e-resources, indicating that respondents with higher educational qualifications demonstrate greater awareness and usage of digital information sources. The study also identifies a strong positive relationship between computer literacy and effective utilization of e-resources, emphasizing that technical knowledge and digital competency play a crucial role in accessing and utilizing online academic materials efficiently. Furthermore, the availability of internet facilities was found to have a significant impact on the use of e-resources, highlighting the importance of stable and accessible internet connectivity in promoting digital learning and research activities. The study concludes that educational background, technological competence, and internet accessibility are critical determinants of effective e-resource utilization. The research emphasizes the need for educational institutions and libraries to improve digital infrastructure, provide computer literacy training programs, and ensure uninterrupted internet access to enhance the usage of e-resources

among users. The outcomes of this research contribute to the understanding of digital resource adoption and offer practical recommendations for improving academic information access in higher educational institutions.

Keywords: E-resources, Digital Libraries, Educational Qualification, Computer Literacy, Internet Facilities, Information Access, Academic Research, Electronic Information Systems, User Awareness, Higher Education Libraries.

INTRODUCTION

The rapid advancement of information and communication technology has transformed the traditional methods of accessing, storing, and disseminating information in academic institutions and research environments [1]. In the modern digital era, electronic resources (e-resources) have become one of the most significant components of academic learning, teaching, and research activities. E-resources refer to digital materials that are available in electronic form, including e-journals, e-books, online databases, digital libraries, institutional repositories, and other web-based academic resources [2]. These resources provide users with instant access to a vast amount of scholarly information without geographical or time limitations, thereby improving the efficiency and quality of education and research. The emergence of e-resources has significantly changed the functioning of libraries and information centers [3]. Traditional libraries that relied heavily on printed books and journals are now integrating digital technologies to meet the growing demands of users. Academic institutions across the world are increasingly investing in digital library infrastructure to provide better information access to students, faculty members, and research scholars. E-resources not only save time and physical storage space but also enable users to access updated and multidisciplinary information conveniently [4]. The availability of online academic content has enhanced independent learning, collaborative research, and knowledge sharing among users.

In higher educational institutions, the utilization of e-resources plays a crucial role in supporting academic excellence and research productivity [5]. Students and researchers depend heavily on online journals, research databases, and digital repositories for preparing assignments, conducting literature reviews, publishing research papers, and improving subject knowledge. The use of e-resources also promotes self-learning and helps users stay updated with recent developments in their fields of study. As educational institutions continue to adopt digital learning practices, effective utilization of e-resources has become essential for academic success and professional development [6]. Despite the numerous advantages of e-resources, their effective utilization depends on several influencing factors. Educational qualification is considered an important factor because users with higher educational backgrounds generally possess better research skills, information-seeking behavior, and awareness of digital resources [7]. Similarly, computer literacy significantly affects the ability of users to access, search, evaluate, and utilize electronic information effectively. Individuals with strong technical skills are more capable of navigating online platforms and using advanced digital tools for academic purposes [8]. In addition, the availability of internet facilities is another major determinant influencing e-resource utilization. Reliable internet connectivity and adequate technological infrastructure are essential for uninterrupted access to online academic materials [9].

Although educational institutions have made substantial efforts to provide access to digital resources, many users still face challenges related to inadequate technical knowledge, limited internet access, lack of awareness, and insufficient training in the use of e-resources [10]. These barriers reduce the effective usage of available digital resources and affect academic performance. Therefore, it becomes necessary to examine the factors influencing e-resource utilization and identify the challenges faced by users in accessing electronic information systems [11] [12]. The present study focuses on analyzing the impact of educational qualification, computer literacy, and internet facilities on the utilization of e-resources among respondents. The study aims to understand whether these variables

significantly influence the effective use of electronic information resources in academic institutions. By examining these relationships, the research intends to provide valuable insights for educational administrators, librarians, and policymakers to improve digital infrastructure, organize user training programs, and enhance awareness regarding the effective use of e-resources [13] [14] . The findings of the study are expected to contribute to the development of efficient digital learning environments and strengthen the overall academic and research capabilities of users in higher education institutions.

RESEARCH GAP

Several studies have been conducted on the utilization of e-resources in academic institutions, focusing on aspects such as user awareness, digital library services, accessibility of online databases, and information-seeking behavior. Previous research has highlighted the importance of e-resources in enhancing academic performance and research productivity. Many studies have also examined the challenges faced by users in accessing electronic information systems, including lack of technical skills, insufficient training, and poor internet connectivity. However, a detailed examination of the combined influence of educational qualification, computer literacy, and availability of internet facilities on e-resource utilization remains limited in the existing literature. Most earlier studies have focused on individual factors affecting e-resource usage rather than analyzing the interrelationship among these variables in a comprehensive manner. In addition, many previous studies were conducted in specific institutional settings or concentrated only on students or faculty members, thereby limiting the generalizability of the findings across diverse respondent groups. Another noticeable research gap is the limited use of statistical approaches to measure the significance and relationship between demographic, technical, and infrastructural variables influencing e-resource utilization. Few studies have employed comprehensive quantitative analyses such as correlation analysis, regression analysis, ANOVA, and chi-square tests to examine the impact of educational qualification, computer literacy, and internet accessibility on effective utilization of e-resources.

Furthermore, rapid advancements in digital learning environments and increased dependence on online academic platforms after the growth of virtual education have created new challenges and opportunities related to e-resource usage. Existing literature does not adequately address the changing digital behavior of users in the current technological environment. Therefore, there is a need for an updated empirical study that investigates the major determinants influencing e-resource utilization in higher educational institutions. The present research attempts to fill this gap by analyzing the significant influence of educational qualification, computer literacy, and internet facilities on the utilization of e-resources among respondents using a structured quantitative approach. The study aims to provide practical insights that can help academic institutions, librarians, and policymakers improve digital infrastructure, user training, and accessibility of electronic information systems.

RESEARCH OBJECTIVES

⇒ To analyze the impact of educational qualification on the utilization of e-resources among respondents.
⇒ To examine the relationship between computer literacy and effective utilization of e-resources.
⇒ To evaluate the influence of internet facilities on the use of e-resources.
⇒ To study the level of awareness and accessibility of e-resources among respondents.
⇒ To identify the challenges faced by users in accessing and utilizing e-resources effectively.
⇒ To assess the frequency and purpose of e-resource usage for academic and research activities.
⇒ To determine whether technical competency affects the efficiency of digital information retrieval.
⇒ To examine the role of digital infrastructure in promoting the utilization of e-resources.
⇒ To evaluate user satisfaction with available electronic information resources and online library services.
⇒ To provide suitable recommendations for improving the effective utilization of e-resources in academic institutions.

RESEARCH METHODOLOGY

Research methodology refers to the systematic process adopted by the researcher to collect, analyze, and interpret data for achieving the objectives of the study. It provides a structured framework for conducting research in a scientific and reliable manner. The present study focuses on examining the factors influencing the utilization of e-resources among respondents, particularly with reference to educational qualification, computer literacy, and availability of internet facilities. The methodology adopted for this study includes research design, population, sampling technique, data collection methods, questionnaire design, statistical tools, and techniques used for data analysis.

Research Design

The present study adopts a **descriptive and analytical research design**. Descriptive research is used to describe the characteristics, behavior, awareness, and utilization patterns of respondents regarding e-resources. Analytical research is employed to analyze the relationship and influence of educational qualification, computer literacy, and internet facilities on effective utilization of e-resources. The study follows a **quantitative research approach** because numerical data were collected and statistically analyzed to test the proposed hypotheses and achieve the research objectives.

Nature of the Study

The study is empirical in nature and is based on primary data collected directly from respondents through a structured questionnaire. The research aims to identify significant relationships and influences among the selected variables affecting e-resource utilization.

Area of the Study

The study was conducted among respondents in higher educational institutions, including students, faculty members, and research scholars who utilize electronic resources for academic and research purposes.

Population of the Study

The population of the study consists of users of e-resources in higher educational institutions. The respondents include undergraduate students, postgraduate students, research scholars, and faculty members who regularly access digital academic resources such as e-journals, e-books, online databases, and institutional repositories.

Sample Size

A total of **650 respondents** were selected for the study. The sample size was considered adequate to ensure reliable statistical analysis and meaningful interpretation of the research findings.

Sampling Technique

The study employed a **simple random sampling technique** to select respondents from the target population. This method ensures equal opportunity for all respondents to participate in the study and minimizes sampling bias.

Sources of Data

The study utilized both **primary data** and **secondary data**.

Primary Data: Primary data were collected directly from respondents using a structured questionnaire. The questionnaire was designed to gather information regarding:

- Educational qualification
- Computer literacy level
- Availability of internet facilities
- Awareness and accessibility of e-resources
- Frequency and purpose of e-resource utilization

- Challenges faced in using e-resources

Secondary Data: Secondary data were collected from:

- Books
- Journals
- Research articles
- Conference papers
- Library reports
- Websites
- Online databases
- Previous studies related to e-resource utilization

STATISTICAL ANALYSIS AND INTERPRETATION

Impact of Educational Qualification on the Utilization of E-Resources

⇒ Null Hypothesis: Educational qualification does not significantly affect the utilization of e-resources.

⇒ Alternative Hypothesis: Educational qualification significantly affects the utilization of e-resources.

The table 1 presents the model summary showing the relationship between educational qualification and utilization of e-resources among respondents. The table includes statistical measures such as correlation coefficient (R), coefficient of determination (R Square), adjusted R Square, and standard error of estimate.

Table 1:Model Summary of Educational Qualification and E-Resource Utilization

Interpretation

The R value of 0.764 indicates a strong positive relationship between educational qualification and utilization of e-resources. The R Square value of 0.584 reveals that 58.4% of the variation in e-resource utilization is explained by educational qualification. The adjusted R Square value of 0.582 confirms the consistency of the model. Hence, educational qualification has a significant influence on the utilization of e-resources. The ANOVA table 2 examines the overall significance of the regression model between educational qualification and utilization of e-resources. It measures whether the regression model significantly predicts the dependent variable.

Table 2:ANOVA for Educational Qualification and E-Resource Utilization

Interpretation

The calculated F value of 941.372 with a significance value of 0.000 is less than the 0.05 significance level. Therefore, the regression model is statistically significant. The null hypothesis is rejected, and the alternative hypothesis is accepted. This confirms that educational qualification significantly affects the utilization of e-resources. The coefficients table 3 shows the extent and direction of influence of educational qualification on the utilization of e-resources. The table includes regression coefficients, beta values, t-values, and significance levels.

Table 3:Coefficients of Educational Qualification and E-Resource Utilization

Interpretation

The standardized beta coefficient value of 0.764 indicates a strong positive impact of educational qualification on e-resource utilization. The significance value of 0.000 confirms that the influence is statistically significant. Thus, respondents with higher educational qualifications tend to utilize e-resources more effectively.

Relationship between Computer Literacy and Effective Utilization of E-Resources

⇒ Null Hypothesis: There is no significant relationship between computer literacy and effective utilization of e-resources.

⇒ Alternative Hypothesis: There is a significant relationship between computer literacy and effective utilization of e-resources.

The table presents 4 the correlation analysis between computer literacy and effective utilization of e-resources. It measures the strength and direction of the relationship between the two variables.

Table 4:Correlation Analysis between Computer Literacy and E-Resource Utilization

Interpretation

The correlation coefficient value of 0.801 indicates a strong positive relationship between computer literacy and utilization of e-resources. Since the significance value is less than 0.01, the relationship is statistically significant. Therefore, higher levels of computer literacy contribute to better utilization of e-resources. The model summary table 5 explains the predictive relationship between computer literacy and effective utilization of e-resources using regression analysis.

Table 5:Model Summary of Computer Literacy and E-Resource Utilization

Interpretation

The R value of 0.801 shows a strong positive relationship between computer literacy and utilization of e-resources. The R Square value of 0.642 indicates that 64.2% of the variation in utilization of e-resources is explained by computer literacy. This confirms that computer literacy is an important determinant of effective e-resource usage. The ANOVA table 6 evaluates the statistical significance of the regression model between computer literacy and utilization of e-resources.

Table 6:ANOVA for Computer Literacy and E-Resource Utilization

Interpretation

The F value of 1291.554 with a significance value of 0.000 indicates that the regression model is statistically significant. The null hypothesis is rejected, and the alternative hypothesis is accepted. This confirms that computer literacy has a significant relationship with utilization of e-resources. The coefficients table 7 explains the influence of computer literacy on utilization of e-resources and provides regression statistics for the predictor variable.

Table 7:Coefficients of Computer Literacy and E-Resource Utilization

Interpretation

The beta coefficient value of 0.801 indicates that computer literacy has a strong positive influence on utilization of e-resources. The significance value of 0.000 confirms that the relationship is statistically significant. Hence, improved computer literacy leads to effective utilization of e-resources.

Influence of Internet Facilities on the Utilization of E-Resources

⇒ Null Hypothesis: Availability of internet facilities does not significantly influence the use of e-resources.

⇒ Alternative Hypothesis: Availability of internet facilities significantly influences the use of e-resources.

The model summary table 8 explains the relationship between internet facilities and utilization of e-resources among respondents.

Table 8:Model Summary of Internet Facilities and E-Resource Utilization

Interpretation

The R value of 0.783 indicates a strong positive relationship between internet facilities and utilization of e-resources. The R Square value of 0.613 shows that 61.3% of the variation in e-resource utilization is explained by internet facilities. This indicates that availability of internet facilities strongly influences e-resource usage. The ANOVA table 9 tests the significance of the regression model between internet facilities and utilization of e-resources.

Table 9:ANOVA for Internet Facilities and E-Resource Utilization

Interpretation

The F value of 1115.824 and significance value of 0.000 indicate that the regression model is statistically significant. The null hypothesis is rejected, and the alternative hypothesis is accepted. Therefore, internet facilities significantly

influence the utilization of e-resources. The coefficients table 10 shows the extent of influence of internet facilities on utilization of e-resources.

Table 10:Coefficients of Internet Facilities and E-Resource Utilization

Interpretation

The standardized beta coefficient value of 0.783 indicates a strong positive effect of internet facilities on e-resource utilization. The significance value of 0.000 confirms that the influence is statistically significant. Thus, better internet facilities contribute to increased utilization of e-resources among respondents.

CONCLUSION

The present study examined the influence of educational qualification, computer literacy, and internet facilities on the utilization of e-resources among respondents in higher educational institutions. The findings of the study clearly indicate that all the selected variables significantly affect the effective usage of electronic resources. Educational qualification plays an important role in enhancing awareness, research capability, and digital information utilization among users. Similarly, computer literacy was identified as a major factor influencing the ability of respondents to access and effectively use electronic academic resources. The study also established that availability of internet facilities significantly contributes to increased utilization of e-resources by enabling uninterrupted access to online information systems. The statistical analysis confirmed strong positive relationships between the independent variables and e-resource utilization, thereby rejecting all the null hypotheses and accepting the alternative hypotheses. The results demonstrate that effective digital infrastructure, technical competency, and educational exposure are essential for promoting digital learning environments and improving academic and research productivity.

The study further revealed that although e-resources offer numerous benefits such as accessibility, convenience, updated information, and time efficiency, several challenges still hinder their effective utilization. Issues such as inadequate computer skills, limited awareness, insufficient training, and poor internet connectivity continue to affect users in accessing digital resources efficiently. Overall, the research concludes that enhancing computer literacy, improving internet infrastructure, and promoting awareness regarding e-resources are essential for maximizing the benefits of digital academic resources. Educational institutions, libraries, and policymakers must take proactive measures to strengthen digital learning support systems and create user-friendly academic information environments. The findings of the study contribute valuable insights for improving e-resource utilization and support the development of technologically advanced educational institutions in the modern digital era.

ABSTRACT

This study provides a scientometricsanalysis of the Defence Research and Development Organisation's publications from 1957 to 2026. Findings indicate a steady increase in research output, particularly after 2009, which witness over two-thirds of total publications outcome. The research spans multiple disciplines, with Engineering, Materials Science, and Physics being prominent. Journals represent 77.96% of the total publications output, with the Defence Science Journal as the lead source of publication. English dominates the language of publication at 99.897%. This analysis highlights DRDO's significant advancements in defence science and technology in India through collaborative and multidisciplinary efforts.

INTRODUCTION

DRDO (Defence Research and Development Organisation), established in 1958, serves as India's premier defense research agency under the Ministry of Defence. It has significantly enhanced India's defense capabilities through indigenous technological innovation, operating over fifty laboratories in diverse fields like aeronautics, missiles, and artificial intelligence. DRDO has developed crucial strategic technologies, including missile systems and cybersecurity applications, with a focus on self-reliance in technology. The current study utilizes scientometric analysis to evaluate DRDO's research output, measuring indicators such as publication productivity and citation impact. This method gives insights into DRDO's research productivity, collaboration patterns, and major scientific contributions. The analysis covers publication trends, citation patterns, preferred journals, and subject distribution of DRDO's indexed publications. Ultimately, the study aims to assess DRDO's research performance and impact on national and international scientific communities, further evaluating its role in advancing India's defense science and technology ecosystem.

Scientometrics

Scientometrics is the quantitative study of scientific literature and research activities, introduced by V. V. Nalimov in 1969. It employs mathematical and statistical methods to analyze the growth, structure, and impact of scientific research. Key components include evaluating research publications, citations, authorship patterns, collaboration networks, and institutional productivity, primarily using bibliographic databases like Scopus and Web of Science. Common indicators such as publication count, citation analysis, and h-index measure scientific productivity. Recently, due to the surge in scientific publications, scientometric studies have become vital for assessing research performance, identifying trends, and informing decisions on funding and policy within academia and research organizations.

Defence Research and Development Organisation (DRDO)

The Defence Research and Development Organisation (DRDO) is India’s foremost research and development agency, operating under the Ministry of Defence since its establishment in 1958. It was formed by merging the Technical Development Establishment and the Defence Science Organisation with the aim of bolstering India's defense capabilities through homegrown research and technological innovation. Headquartered in New Delhi, DRDO encompasses over fifty laboratories, each focused on various domains of defense science and technology, including aeronautics, missiles, electronics, combat vehicles, naval systems, artificial intelligence, cybersecurity, and advanced materials.

The core mission of DRDO is to design, develop, and produce cutting-edge defense technologies for the Indian Armed Forces. Among its notable achievements are the Agni and Prithvi missile systems, the Akash air defense system, Tejas combat aircraft technologies, radar systems, electronic warfare tools, and unmanned aerial vehicles. Additionally, DRDO has made significant strides in areas such as defense medicine, food technology, and protective gear for soldiers in extreme conditions. Collaboration is a key aspect of DRDO's operations, partnering with academic institutions, industries, public sectors, and international entities to foster innovation in defense technology. These efforts align with the Government of India's commitment to self-sufficiency in defense production, particularly through initiatives like "Atmanirbhar Bharat." Ultimately, DRDO's continued research and development initiatives are crucial for strengthening national security, advancing technology, and promoting scientific progress in India.

REVIEWS

Amandeep Singh, (2025). Striking a balance between innovation and deployment is essential for the success of defense research projects, particularly within complex environments like the Defence Research and Development Organisation (DRDO). This paper introduces a change approach designed to evaluate this balance through an

extensive analysis of 2,961 multidomain projects. It employs the Innovation Orientation Index (IOI) to classify projects based on investment dynamics into three categories: disruptive, co-developed, and deployment-centric. Additionally, it utilizes Cost Escalation Attribution (CEA) to assess inherent risk exposure and the Share Delay Correlation Index (SDCI) to analyze schedule volatility. The portfolio distribution reveals 22.1% disruptive projects, 48.8% collaborative ventures, and 29.1% deployment-oriented projects, each with varying risk profiles. Real-world applications in military research and development highlight that high-innovation projects are more vulnerable to cost and schedule volatility, while collaborative models effectively mitigate risks and reduce delays. This framework bridges theoretical principles with operational decision-making, thereby enhancing planning and adaptability in defense technology development.

Sonika, (2025)evaluated the research output of the DESIDOC Journal of Library and Information Technology (DJLIT) from 2016 to 2025, using Scopus data. Analysis was performed with MS-Excel and biblioshiny, while author cooperation was visualized through VOSviewer. Key bibliometric metrics, including yearly publication distribution and collaboration trends, revealed publication fluctuations, peaking in 2018 with 16 contributions. Articles comprised 92.91% of total publications. Abhishek Kumar was identified as the leading author, and the University of Delhi was the top institution with 42 publications. India was the primary contributor, accounting for 81.41% of the total 425 publications.

Ajay Kumar Pande, (2024). Application of AI and machine learning in defense systems is escalating, focusing on automation and modern technology integration in military operations. This article conducts a scientometric analysis of 417 peer-reviewed articles from 1991 to 2023, covering AI and ML applications across military domains, including equipment, intelligence, cybersecurity, decision-making, operations, and defense medical systems. Findings emphasize the push for advanced technologies in weapon development and military strategies, alongside legal and ethical considerations. The study also explores authorship trends, document types, country production over time, and citation patterns, using Bradford's scattering law and Lotka's law for analysis.

Objectives

- ✓ Distribution of Year wise publication by the *Defence Research and Development Organization's* research output in indexed journals
- ✓ To find out the highly productive authors among the DRDO Publications in indexed journals
- ✓ To reveal the subject proliferation of research areas of publications by DRDO.
- ✓ Analyze the source wise pattern of publication out come by DRDO scientists.
- ✓ To reveal the distribution of document type wise Publications outcome.
- ✓ Identifying the prominent journals that publish the research outcome of DRDO.
- ✓ To identity distribution of Language in the DRDO Published literature.

The Defence Research and Development Organisation (DRDO) has shown consistent growth in scientific publications over the decades. In the early years (1957-1968), DRDO produced only 45 publications (0.20% of total output) as it established its research capabilities. This increased to 401 publications (1.80%) in 1969-1978, and 1,036 publications (4.65%) in 1979-1988, reflecting gradual progress in defence research. A significant rise occurred from 1989-1998 with 2,010 publications (9.02%), and further growth to 3,734 publications (16.76%) from 1999-2008, driven by enhanced collaboration and investments. The peak productivity period was 2009-2018, with 8,097 publications (36.35%), indicating rapid growth and increased funding. From 2019-2026, the output remains high at 6,955 publications (31.22%), maintaining strong research performance. Overall, over two-thirds of DRDO's total publications were brought out over the past 15 years ie. 2009 onwards, underscoring the vital role of scientific research in advancing India's defence capabilities.

The analysis of the top ten authors from the Defence Research and Development Organisation (DRDO) reveals key contributors to its research output. A.K. Mishra leads with 284 publications (1.27%), followed by A.S. Bawa (220 publications, 0.99%) and A.K. Singh (204 publications, 0.92%). Other notable authors include S.B. Singh (185 publications, 0.83%), S.V. Kamat (179 publications, 0.80%), P. Ghosal (166 publications, 0.75%), and R.K. Sharma (153 publications, 0.69%). Additional contributors in the top ten are C. Prakash (149 publications, 0.67%), A. Bhatnagar (144 publications, 0.65%), and P. Saravanan (139 publications, 0.62%). Collectively, these authors underscore the significant scholarly involvement and productivity in defence research, demonstrating the collaborative nature of DRDO's scientific efforts in India.

Defence Research and Development Organisation (DRDO)showcases a multidisciplinary approach through its publication distribution. Engineering leads with 1,995 publications (8.96%), highlighting focus areas such as technology development and aerospace engineering. Materials Science follows with 1,838 publications (8.25%), emphasizing advanced materials and protective technologies. Physics and Astronomy rank third with 1,735 publications (7.79%), indicating involvement in optics and radar systems. Computer Science accounts for 1,503 publications (6.75%), reflecting growth in areas like Artificial Intelligence and Cybersecurity. Other notable contributions include Chemistry (1,495) publications, (6.71%), Chemical Engineering (1,396, 6.27%), and Medicine (1,120, 5.03%). While moderate contributions of DRDO research in the fields of Agricultural Sciences (487) and Mathematics (177) are noted, DRDO's output spans engineering, physical and chemical sciences, and Medicine and life sciences, emphasizing technological innovation and interdisciplinary collaboration for national security.

The analysis indicates that Journal dominate as the source of scholarly communication, with 17,367 records (77.96% of total publications), highlighting researchers' preference for peer-reviewed and credible information. Conference proceedings follow as the second-largest source at 3,397 records (15.25%), underscoring their role in disseminating emerging findings. Book series and books account for 760 (3.41%) and 683 records (3.06%) respectively, serving specialized and foundational research needs. Trade journals are the least utilized, with only 71 records (0.32%), suggesting limited reliance on industry publications. Overall, there is a strong preference for journal literature in academic research.

The analysis of publications types reveals that journal articles dominate with 73.10% of the total output, totaling 16,285 records. Conference papers follow as the second-largest category at 18.80%, with 4,188 records, highlighting their role in presenting new research before formal journal publication. Book chapters account for 3.34%, and review papers for 2.89%, underscoring their importance in specialized discussions and literature evaluations, respectively. Other document types, include letters, editorials, and errata, make up negligible percentages, reflecting their supplementary roles in scholarly communication. This data emphasizes a clear preference for journal articles and conference presentations in academic publishing.

The Defence Science Journal leads in publication volume with 862 records (3.87%), reinforcing its key role in defence science and technology research. It is followed by Materials Science and Engineering A (293 records, 1.32%) and Proceedings of SPIE (239 records, 1.07%), indicating an emphasis on materials science and optical engineering. Other notable contributors include Transactions of the Indian Institute of Metals and Journal of Applied Polymer Science (217 and 215 records, both 0.97%), highlighting active research in metallurgy and polymer science. The Journal of Alloys and Compounds (209 records, 0.94%) and Materials Today Proceedings (195 records, 0.88%) also underscore the significance of materials research. Additionally, Journal of Food Science and Technology (183 records, 0.82%), AIP Conference Proceedings (165 records, 0.74%), and Lecture Notes in Mechanical Engineering (160 records, 0.72%) reflect the interdisciplinary nature of research in applied sciences and engineering. Overall, the findings illustrate a concentration in defence science, materials science, engineering, and applied technology as primary dissemination channels for scholarly output.

The analysis highlights that English dominates scholarly communication, constituting 99.897% of 22,255 total publications. This prevalence emphasizes its role as the primary medium for disseminating scientific research

globally, owing to its wide acceptance in the academic community. Only a minimal number of publications in other languages were noted. German (19 records, 0.087%) and negligible contributions from Chinese, French, Korean, and Spanish (1 record each, 0.004%). The findings reflect a strong preference for English, indicating limited impact from non-English publications in the international research landscape.

FINDINGS

- ✓ The Defence Research and Development Organisation (DRDO) has shown significant growth in scientific research output, especially from the last decade.
- ✓ A gradual increase in publications aligns with improved research infrastructure, increased funding, and enhanced collaboration.
- ✓ Over two-thirds of total publications were produced after 2009, highlighting a focus on innovation and technological advancement in defense research.
- ✓ Key contributors include prolific researchers like A.K. Mishra, A.S. Bawa, and A.K. Singh, indicating a collaborative community within DRDO.
- ✓ Dominant research areas include engineering, materials science, physics, computer science, chemistry, and chemical engineering.
- ✓ Journals are the preferred medium for scholarly communication, followed by conference proceedings; original research articles are prevalent.
- ✓ Publications are mainly found in defense science, materials science, engineering, and applied technology journals.
- ✓ English is the dominant language of publication, reaffirming its role in global scientific communication. DRDO has established itself as a leading scientific research organization, significantly contributing to India's defense and technological advances.

Future Studies

Future research should aim at a comparative scientometricsanalysis of the Defence Research and Development Organisation (DRDO) alongside other defence research entities to assess global research performance and collaboration patterns. Key areas include citation analysis, h-index evaluations, and impact factor studies to gauge publication quality. Investigations may also focus on institutional collaboration networks, international partnerships, and funding patterns, particularly in emerging fields like artificial intelligence, cybersecurity, nanotechnology, and autonomous defence systems. Additionally, patent analysis and technology transfer assessments could elucidate the practical applications of DRDO's research. Social media visibility and altmetric analyses are recommended for broader societal impact insights, while author collaboration networks and keyword co-occurrence mappings can help identify key research clusters and emerging technological trends.

CONCLUSION

The study concludes that the Defence Research and Development Organisation (DRDO) has become a leading scientific research entity in India, significantly impacting defence science and technology through an increasing number of scholarly publications. This rise in publication output over the years reflects DRDO's growing research capacity, innovation in technology, and dedication to national security advancement. The prevalence of journal articles and conference papers suggests a strong focus on formal scholarly communication and the dissemination of knowledge. The concentration of research in fields such as engineering, materials science, physics, and computer science underscores DRDO's strategic priority on advanced defence technologies and interdisciplinary studies. Furthermore, the majority of publications in English indicates DRDO's aim to attain international recognition and visibility in the global scientific arena.Thescientometricsanalysis affirms that DRDO plays a vital role in enhancing India's scientific and technological capabilities, with its research productivity and collaborative efforts contributing to the modernization and self-reliance goals of the Indian defence sector.

ABSTRACT

This study investigates the socio-economic and health status of beneficiaries residing in an adopted village, seeking to provide a comprehensive assessment of their well-being. The research focuses on understanding the socio-economic conditions and health indicators prevalent within the community, shedding light on the challenges and opportunities that impact the beneficiaries. Utilizing a mixed-methods approach, the study incorporates both quantitative and qualitative data to present a multifaceted analysis. Through surveys, interviews, and demographic profiling, the socio-economic landscape of the adopted village is depicted, encompassing aspects such as income levels, educational attainment, employment opportunities, and access to essential services. Additionally, the health dimension of the beneficiaries is examined, encompassing factors such as healthcare access, prevalent illnesses, immunization coverage, and overall well-being. By delving into these critical dimensions, this study aims to provide valuable insights into the nuanced complexities of the beneficiaries' lives, thereby contributing to the development of targeted interventions and policies. Furthermore, the findings from this research hold the potential to inform community-centric initiatives, ultimately fostering sustainable improvements in the socio-economic and health status of the adopted village, thereby positively impacting the lives of its beneficiaries. This study is valuable not only for academia but also for policymakers, non-governmental organizations, and other stakeholders dedicated to advancing the well-being of communities through evidence-based approaches.

Keywords: Socio-Economic, Health Status, Beneficiaries, Well-being, Rural Development, Sustainable Growth.

INTRODUCTION

This study focuses on the socio-economic and health status of an adopted village, aiming to provide a comprehensive understanding of the impact of such initiatives. Adopted villages often benefit from targeted interventions designed to address specific local needs. These interventions typically encompass various aspects, such as education, healthcare, infrastructure development, and vocational training. By leveraging the resources and expertise of the adopting institution, these programs seek to enhance the overall well-being of the village population. This study aims to assess the effectiveness of these interventions in improving the socio-economic and health conditions of the adopted village. Key indicators such as income levels, employment rates, educational attainment, access to healthcare, and general quality of life will be examined to provide a holistic view of the village's progress. Through a detailed analysis of these indicators, the study will identify the strengths and weaknesses of the ongoing programs. It will also explore the challenges faced by the villagers and suggest potential areas for further intervention. By highlighting both successes and areas needing improvement, the study aims to contribute valuable insights to the broader discourse on rural development and the role of institutional adoption in fostering sustainable community growth.

A country that fails to develop the knowledge and skills of its people and to make the best use of them is likely to lag behind. Socio-economic status can be developed in many ways, but development will be handicapped as long as the village population remains marginalized, illiterate, powerless, and deprived of just and equitable status, with education being the most important factor. Nowadays, literacy and education among the rural population have come to mean more efficient fulfillment of changing roles and statuses, better quality of life, and freedom from ignorance, diseases, poverty, malnutrition, etc. Ultimately, the healthy and balanced growth of a nation depends on the proper socio-economic development of its rural areas. The present study focuses on the socio-economic and health status of beneficiaries in Kumaravayalur, an Extension Wing adopted Village of Bishop Heber College, in Tiruchirappalli District.

Abbreviations and Acronyms

EWAVBHC - Extension Wing adopted Village of Bishop Heber College
EWAV - Extension Wing adopted villages
EWD - Extension Wing department

Objective of the Study

The following are the objectives of the present study;

1. The specific objectives of the present study are Socio Economic and Health Status of EWAV.
2. To evaluate the level of socio – economic and Health status of villages adopted by EWD.
3. To analyze the level of educational attainment among beneficiaries and access to educational facilities.
4. To evaluate access to healthcare services, availability of medical facilities, and the quality of healthcare received.
5. To assess the problems and prospects for the upliftment of households of adopted villages.
6. To give suggestions and recommendations for strengthening socio economic and health status of adopted villages.

Research Question

In a study focusing on the socio-economic and health status of beneficiaries in an adopted village, crafting the research questions is a critical step in defining the scope and direction of the study.

1. Among the various socio-economic conditions of the respondents such as age, religious, educational qualification and marital status are not associated with the various problems faced by the respondents like economic, working condition, health issues and wage benefits.
2. There is no significant relationship between the overall economic development of respondents and their problems in the selected sample respondents in the present research study.

3. There is no significant difference in the prevalence of health issues and occupational hazards between of the respondents,
4. There is a significant association between size of family of the respondents and their overall opinion about major expenses.
5. There is a significant difference in the economic conditions, including wages, benefits, and job satisfaction among the respondents.

LITERATURE REVIEW

This review analyses the literature on the socioeconomic status (SES) of healthcare units in adopted villages, including the economic status determinants of their sustainability, household economies, poverty alleviation analysis, legal protection, health and wellness, Health hazards and the current status of providing access to training and skill development programs, and promoting formal employment opportunities with adequate benefits and protections existing at the national and international levels are as follows; Black (1982) The report is commonly referred to as the Black Report after Sir Douglas Black, chair of the Research Working Group, Department of Health and Social Security, U.K. The papers were groundbreaking and ushered in an era of profound intellectual and pioneering work to understand the effects of socioeconomic status on health. A reading of Pathways to Health today shows that the 1980 Black Report3 (Black, 1982) stimulated the thinking of many social scientists because it had found that gaps in health had widened since the establishment of the National Health Service in 1948. The Black Report became the underpinning of the belief that health care does not play a very important role in health.

According to Dutton and Levine (1989), socio-economic status is "a composite measure that typically incorporates economic status, measured by income; social status, measured by education; and work status, measured by occupation" Bekele (1998) shared an Ethiopian experience about the Village Level Resource Management Project. The project started to alleviate the accelerated resource degradation and stabilized the living conditions of the population. Similarly, Morse, et al. (2001) discusses the integration of sustainability indicators by draining upon the result of a 6 years research project based in African villages. The project looked at the issue that comprises livelihood sustainability, and in particular how the villagers themselves view this concept and what they deem to be important within it. Local visions of sustainability were recorded and sustainability indicators metrics applied to the 28 villages. It is concluded that an element of qualitative integration incorporating value judgments and subjectivity is inevitable with a concept such as sustainability.

Fiszbein and Schady, 2009. Integrated approaches to healthcare in rural areas have proven beneficial. In Latin America, the "Conditional Cash Transfer" programs, which provide financial incentives to low-income families for adhering to health and education requirements, have led to improved health outcomes and reduced poverty rates Evans et al., 2012 In Thailand, the Universal Coverage Scheme has significantly increased access to healthcare services for rural populations, leading to improved health indicators across various metrics Yunus, 2007. The Comparative studies across different regions have identified best practices that can be adapted to various contexts. The "Grameen Bank" model of microfinance in Bangladesh has been successfully replicated in numerous countries, demonstrating the potential for financial services to uplift rural communities. (Wong, 2012)Similarly, community-driven development programs in East Asia, which emphasize local participation and empowerment, have shown sustainable impacts on rural development.

Pretty et al., 2011. These study focus on Environmental sustainability is increasingly recognized as crucial in rural development. Studies from Southeast Asia highlight the importance of integrating environmental conservation with socio-economic development. Programs focusing on sustainable agriculture and forest management have not only improved livelihoods but also preserved biodiversity and natural resources. Dr.SinghSukhvinder (2012) studies the rural development and socio-economic status of rural households in Haryana, with a case study of two villages-Kurukshetra and Kaithal. The major indicators used in this study are literacy level, occupation, income, savings and

investment pattern of the households. The primary objective of the study is to find out as to how far the residents of these villages have been affected by the process of all round economic development and various other social and economic forces operating on or as a consequence of specific government policy measures. Findings from the study show that kaithal village fares better than kurukshetra with respect to income, savings and investment pattern. Kurukshetra seems to have a better literacy rate than kaithal village.

R.Suresha and B C Mylarappa (2012) studied the socio-economic status of rural scheduled caste female students in higher education. The main objective of the study is to analyze the socio-economic background of the rural scheduled caste female students in higher education with special reference to demographic and status characteristics such as age, marital status, caste, education, parental education, occupation and income. The study points out that the socio economic status of the students has a direct impact on the education of the students. Higher the socio economic status, higher the preference of educating the female children. Meganathan and Arumugam (2012) studied the socio economic impact of micro finance on rural development in Puduchery. The study aims to study the social and economic impact of micro finance in the development of rural puduchery. The study has been undertaken by collecting the primary data by sampling method from 120 members of SHGs. The major findings of the study shows that social impact of self help group on rural women, on comparison with economic impact such as income, savings, expenditure, loans and type of house is very high as a majority of the sample population have been a member of the self-help groups for over a decade.

Roy, 2014. In Sub-Saharan Africa, initiatives focusing on girl's education have demonstrated significant socio-economic benefits, contributing to higher literacy rates and improved health outcomes (UNESCO, 2019). Educational interventions have been central to rural development strategies worldwide. The success of programs like the "Barefoot College" in India, which trains rural women as solar engineers, illustrates the transformative power of education. This model has been replicated in several African countries, showcasing its global applicability and effectiveness in empowering women and improving socio-economic conditions. Sundararaman and Muraleedharan (2015) have shown that community health worker programs significantly improve healthcare delivery in rural regions, reducing maternal and infant mortality rates. Similarly, vocational training and microfinance initiatives have been effective in enhancing employment opportunities and income levels, as evidenced by the work of Banerjee and Duflo (2011).

METHODS

The study uses both primary and secondary data for analysis. The Bishop Heber College Deanery of Extension Wing has adopted 23 the villages which come under Eight Panchayats namely, NavalurKuttapattu, Ariyavur, KumaraVayalur, Palur, Allur, Pothavur, Andhanalur and Kodiyalam based. The present study is proposed to KumaraVayalurPanchayat. There are Four village areas in kumaravayalurpanchayat, including K.Vayalur, Bhrathi Nagar, Kothataiand Kurunji Nagar The total universe of the population is around 2100, 724 Family in KumaraVayalur village. Observational methods and Schedule data collection method were adopted. A random sampling method will be taken the samples. 145samples (20% of the total universe of the family) were taken for analysis. The study is an exploratory study. The study follows both primary and secondary data. The structured schedule was served and collected primary data from the respondents. The sampled data were analysed using statistical software such as SPSS and other tools such as MS Excel. Secondary data was also collected from the internet and records available in the Manikadam block office and KumaraVayalur Gram Panchayat office.

RESULTS

Figures and Tables

Place of work is an important element of workers' socio economic characteristics. It influences day to day activities of Beneficiaries and also their socio economic conditions.

BHC – DEWAV: Bishop Heber College- Deanery of Extension Wing adopted Village

Shows that in KumaraVayalur village total number of families is total number of family 1724 and Sample size 145

The distribution of families across four villages highlights proportional sampling, ensuring equal representation from each community. K. Vayalur**,** with 279 families, contributes the largest sample size (56 families), while **Bharathi** Nagar**,** Kothatai**,** and Kurunji Nagar contribute 51, 20, and 18 families, respectively. This approach reflects diverse socio-economic conditions across the villages. Previous research suggests that rural livelihoods are significantly influenced by agricultural practices and proximity to urban centers, which affect access to resources and employment opportunities. Seasonal variations, such as monsoon dependency, may explain differences in work patterns and agricultural productivity. For instance, a farmer from K. Vayalur may benefit from irrigation access during dry seasons, enhancing yield compared to rain-dependent farmers in Kothatai.

The demographic profile of the respondents reveals a predominantly middle-aged population (46-60 years, 61%), with a limited representation of younger individuals (18-30 years, 5%), indicating a trend of youth migration to urban areas for better education and employment opportunities. This aligns with prior studies suggesting an aging rural workforce. Females represent a majority (59%) of the population, reflecting their significant role in household management and agriculture, with men likely migrating for work. The population is predominantly Hindu (66%), and the majority are married (68%), with a notable percentage of widows (18%), highlighting the social vulnerabilities they face. Educational attainment shows moderate levels, with 26% having completed high school, yet 14% remain illiterate, pointing to the need for adult education and skill development. Farming remains the primary occupation (45%), with 62% of families owning land, though 48% earn less than ₹5,000 monthly, reflecting the financial insecurity common in rural areas. These findings underscore the need for targeted interventions, such as improving educational opportunities, addressing financial insecurity, and promoting alternative livelihoods to ensure sustainable economic growth, particularly in the context of youth migration, gender roles, and agricultural dependence.

Overall, the demographic profile points to a population that is predominantly middle-aged, female, and married, with educational gaps that need to be addressed. The high dependency on agriculture, along with low income and limited educational opportunities, suggests that there is a need for targeted interventions to improve education, economic stability, and healthcare for the community. Addressing the migration of youth, promoting women's empowerment, and providing vocational training and alternative livelihood options could help improve the overall socio-economic conditions in the village. The socio-economic status of the respondents reveals significant disparities in living conditions, with 49% residing in concrete houses, 40% in tiled houses, and 11% in thatched houses, reflecting diverse levels of housing infrastructure. 60% of respondents own their homes, while 19% benefit from government-provided housing, indicating a mix of financial autonomy and reliance on public assistance. Family sizes predominantly range from 3-5 members (57%), with 62% of families owning land, reflecting the community's agricultural dependence. Despite this, 48% of respondents earn less than ₹5,000 per month, underscoring financial insecurity despite land ownership. Additionally, 71% lack regular savings, highlighting the challenges of financial management in the face of low income and seasonal agricultural fluctuations. The primary reasons for debt—children's education (45%) and marriage expenses (26%)—point to the financial burden of these social obligations. This highlights the need for affordable education, financial literacy programs, and access to microfinance, vocational training, and government schemes to help improve financial stability and reduce the economic strain on households. Overall, while there are positive indicators such as homeownership and land ownership, significant challenges

remain, particularly related to income inequality, debt, and limited access to financial resources, which require targeted interventions for sustainable community development.

Overall, the socio-economic status of the community reflects a mix of positive trends, such as **homeownership** and **land ownership**, but also significant challenges, particularly in terms of **income inequality**, **financial insecurity**, and **educational expenses**. The findings suggest that the community would benefit from targeted interventions in areas like **financial literacy**, **income diversification**, **agricultural modernization**, and **education accessibility** to help improve financial stability and overall well-being. Providing microfinance options, vocational training, and better access to **government schemes** could further alleviate some of the financial pressures facing these rural households.
Health status of the adopted village of the respondents information data indicates moderate health outcomes in the village, with **55%** of respondents rating their health as good and **15%** reporting poor health, which highlights the need for improved healthcare access and continuous health education. The findings also reveal that **47%** of individuals seek health checkups occasionally, and **16%** rarely visit healthcare facilities, exposing gaps in preventive care that could be addressed through better infrastructure, more regular medical camps, and health awareness programs. Chronic conditions, such as asthma (**31%**), are prevalent and may be aggravated by seasonal environmental factors like dust and pollen. While **97%** of respondents have access to healthcare within 5 km, **22%** rate the quality of services as poor, pointing to significant deficiencies in rural health infrastructure, as also highlighted in previous research. The lack of **health insurance** for **83%** of the population leaves many vulnerable to financial strain in the face of medical emergencies, emphasizing the need for broader coverage and accessible healthcare services. Seasonal illnesses, such as those related to the monsoon, could further stress the healthcare system, and individuals relying on government hospitals may experience delays in treatment, particularly during peak outbreaks like **dengue**, underscoring the need for a more robust, efficient healthcare system in rural areas.

limiting financial protection against medical emergencies. Seasonal illnesses, such as monsoon-related diseases, may further strain health systems. For example, an individual relying on a government hospital might face delays in treatment during peak seasonal outbreaks like dengue. Community engagement in Bishop Heber College (BHC) programs is high, with all respondents participating in initiatives such as employment creation, health promotion, and green programs, and showing significant involvement in **organic farming (80%)** and **water management (76%)**. These initiatives reflect a strong interest in sustainable agricultural practices and resource management, although participation in **Self-Help Groups (SHGs)** is mixed, with 48% involvement, suggesting that some individuals may need further encouragement. High satisfaction levels (80%) indicate that the BHC programs have positively impacted the community, but further focus is needed on enhancing **income-generating opportunities** through **microfinance**, **vocational training**, and **market linkages** to address economic vulnerabilities, particularly during seasonal challenges like water scarcity. This focus can help ensure the long-term sustainability of these community-driven initiatives.

DISCUSSION

ANOVA:
(H0): There is no association between Educational level and monthly income

Interpretation:
Since the p-value (0.01) is less than the significance level (0.05), the null hypothesis is rejected at the 5% level of significance. This indicates that there is a significant difference between the educational level and monthly income of the beneficiaries in Kumaravayalur. The study also reveals that respondents and beneficiaries face various socio-economic and health challenges, including Financial Issues: Limited access to financial resources for their livelihood and agricultural activities. Agricultural Problems: Seasonal dependency affecting income stability, Difficulty in adopting modern farming techniques and preventive measures. Limited availability and access to quality raw materials. Challenges in implementing diversified agricultural practices. Technological Gaps: Lack of access to and

knowledge about advanced agricultural technology. Health Concerns: Prevalence of respiratory issues likely due to occupational or environmental factors. Marketing and Business Knowledge: Inadequate understanding of market dynamics and consumer behavior. Lack of confidence in marketing and business dealings. Consumer Discrimination: Instances of unfair treatment during transactions. These findings underscore the need for targeted interventions to improve educational opportunities, financial support, agricultural practices, technological access, healthcare services, and marketing skills among the beneficiaries.

Seasonal Considerations and Future Interventions

A key factor influencing both **health** and **socio-economic conditions** in rural communities like this one is the **seasonal dependency on agriculture**. The study indicates that families relying on **monsoon-dependent crops** are particularly vulnerable during off-seasons, which may impact their financial stability. Thus, **diversified agricultural practices**, such as **multi-cropping** or adopting **modern farming techniques**, could be explored to reduce seasonal financial strain. Similarly, seasonal illnesses, such as **waterborne diseases** during the monsoon or **respiratory issues** in dry seasons, may affect the general health status of the population. Addressing these seasonal health risks through **preventive measures** (such as vaccination and sanitation improvements) could significantly reduce the disease burden.

Suggestions

The study reveals substantial progress in some areas, such as community participation in development programs, while also highlighting significant challenges in areas such as income generation, education, healthcare, and overall well-being. To build on these findings, the following recommendations are proposed:

Socio-Economic Development

- **Vocational Training Programs**: Offer training in income-generating skills like tailoring, handicrafts, organic farming, and small-scale entrepreneurship to improve household income.
- **Micro-Finance and Credit Access**: Facilitate access to micro-finance services for small businesses and agriculture, helping villagers become economically self-reliant.
- **Job Placement and Employment Support**: Collaborate with local businesses and industries to provide job placements or internships for skilled workers in the village.
- **Women's Empowerment Initiatives**: Create programs that empower women with financial literacy, skill development, and leadership training to contribute to the household and community economy.
- **Market Access for Local Products**: Organize markets or tie-ups with local stores to sell products made by villagers, ensuring a steady income stream and encouraging entrepreneurship.
- **Education and Literacy Programs**: Implement adult literacy and education programs to improve literacy rates and enable better economic opportunities for villagers.
- **Improve financial security**: Expand income diversification programs, introduce microfinance options, and provide vocational training to reduce dependency on agriculture.
- **Focus on sustainable agriculture:** Promote modern farming practices, multi-cropping systems, and water conservation techniques to reduce seasonal dependence on crops.

Health and Hygiene Improvement

- **Regular Health Camps**: Conduct periodic medical camps with screenings for common diseases, maternal and child health, and vaccinations.
- **Health Education Sessions**: Educate villagers on essential health topics like nutrition, maternal health, family planning, and mental health to improve overall well-being.
- **Sanitation and Clean Water Access**: Ensure access to clean drinking water and proper sanitation facilities, reducing the spread of waterborne diseases.
- **Community Hygiene Programs**: Encourage community-wide hygiene practices, such as regular handwashing, waste disposal, and use of toilets, to prevent illness.

- **Awareness Campaigns on Preventive Healthcare**: Promote preventive health measures, including vaccination, periodic health check-ups, and awareness about common diseases.
- **Nutritional Support Programs**: Distribute nutritious food supplements to children, pregnant women, and the elderly to combat malnutrition.
- **Promote Mental Health and Counseling Services**: Address mental health needs by organizing counseling sessions and workshops to support emotional well-being.
- **Collaboration with Local Health Centers**: Partner with local health centers and clinics to provide regular medical services and emergency support when needed.
- **Increase community participation:** Encourage more active participation in self-help groups and community-driven development projects to foster economic self-reliance and resilience.

Promoting Environmental Awareness

From the beginning of the inception of the BHC, the extension programmed of BHC concentrates on imparting environmental consciousness and protecting and promoting environmental awareness in all adopted villages by planting and distributing saplings. It is the need and necessary of the time do service in the villages to serve towards the development of environmental consciousness in these days. Through all the villages have developed rapidly in the field of education and environment, now BHCADP has to focus actively the area which is still lacking behind on the same. Till today most of the adopted village has not got enough awareness regarding environment, hygienic and social growth. Especially, the people of the village such as Kumaravalur need awareness on culture and hygienic situation. To improve this, students of extension programme may organize some special programmes, such as a serous of lectures and discussions health and hygienic besides their regular activities. With the help and support of students of deportment of Micro-biology and bio-technology the BHCEW department can also take some effective steps to organize medical awareness camps to impart hygiene awareness in the entire village. This will help the villages to concentrate on the growth of their environment and society along with hygiene and sanitation development. In order to encourage students about the environmental issue, outdoor learning modules need to be designed, like nature sampling, expedition, organization of training programmes and workshop, etc, environmental education (EE) related activities should be conducted or regular basis. Extension programme and EE should be made compulsory in all there year/semester of the under graduate degree courses in all the higher education institutions including progression educational institutions.

CONCLUSION

The st1udy indicates that the implementation of the village adoption program has led to significant improvements in the socio-economic conditions and health of the adopted village. Initiatives such as mental health awareness campaigns, women's empowerment workshops, anti-alcohol drives, and free health check-ups have greatly assisted the local populace in leading healthier lives. However, the ongoing issue of frequent floods has detrimental effects on agricultural lands and livestock in the area, prompting residents to seek additional employment opportunities beyond farming. Consequently, many individuals have become casual laborers in nearby urban centers. While the average income appears relatively high, it does not accurately represent the economic status of all community members. Consistent with previous studies, the data shows a positive correlation between educational attainment and household income. The village boasts a commendable literacy rate of 92.6%, yet the average educational attainment, equivalent to the 8th grade, is insufficient. Thus, there is a pressing need to enhance educational standards. Additionally, the villagers have not embraced modern agricultural technologies or advanced cropping patterns, resulting in suboptimal productivity and cultivation intensity. To uplift the community and address the growing local food shortages, the modernization of agricultural practices and the adoption of multi-cropping systems are essential. Furthermore, it is suggested that the college organize programs in the adopted village that specifically focus on enhancing income-generating opportunities. This would enable the local population to directly benefit and foster their overall development.

ABSTRACT

Change management has become an essential component in modern Human Resource Management (HRM), particularly in large public sector organizations such as the Southern Railway, where administrative efficiency and employee adaptability play a critical role in organizational performance. The present study examines the attitude of ministerial staff towards the implementation of change management practices for effective HRM in Trichy Division. The research primarily focuses on evaluating how change management initiatives influence employee job satisfaction, communication effectiveness, and employee participation in decision-making processes within the organization. In the context of rapid technological advancement, policy modifications, and administrative restructuring, understanding employee perception towards organizational change has become highly important for maintaining operational efficiency and workforce stability. The study is based on three major hypotheses that investigate the relationship between change management practices and employee-related outcomes. The first hypothesis examines whether change management practices significantly influence employee job satisfaction among ministerial staff. The second hypothesis evaluates the relationship between communication effectiveness and employee acceptance of change management. The third hypothesis investigates whether employee participation in decision-making significantly affects the successful implementation of change management initiatives. These hypotheses provide a structured framework to assess employee behavioral responses and organizational adaptability during periods of administrative

transformation. The research adopts a descriptive and analytical research design. Primary data are collected from ministerial staff working in the Trichy Division of Southern Railway through a structured questionnaire. The study employs convenient and stratified sampling techniques to obtain responses from employees belonging to different age groups, educational qualifications, work experiences, and departmental categories. Statistical tools such as percentage analysis, mean score analysis, correlation analysis, regression analysis, chi-square test, and ANOVA are utilized to analyze the collected data and test the hypotheses systematically. The findings of the study are expected to reveal that effective change management practices positively influence employee job satisfaction and organizational commitment. It is anticipated that transparent communication systems improve employee acceptance of organizational changes by reducing uncertainty and resistance among staff members. Furthermore, employee participation in decision-making is expected to enhance trust, cooperation, and successful implementation of HRM-related changes. The study also emphasizes that employee-centered HRM strategies can improve adaptability and create a supportive work environment during organizational transitions. The research contributes to the existing literature on change management and HRM by providing empirical evidence from the Indian railway sector, particularly focusing on ministerial staff who play a significant administrative role in organizational functioning. The study will be beneficial for railway administrators, HR managers, policymakers, and researchers in understanding the importance of employee involvement, communication, and satisfaction during organizational change processes. Finally, the study recommends strengthening participative management practices, improving internal communication mechanisms, and providing continuous support and training to employees for achieving effective and sustainable HRM practices in Southern Railway.

Keywords: Change Management, Human Resource Management, Southern Railway, Ministerial Staff, Employee Attitude, Job Satisfaction, Communication Effectiveness, Employee Participation, Organizational Change, HRM Effectiveness

INTRODUCTION

In the modern organizational environment, change has become an inevitable and continuous process for achieving efficiency, competitiveness, and sustainability. Organizations across both public and private sectors are increasingly adopting change management strategies to respond effectively to technological advancements, globalization, administrative reforms, workforce expectations, and policy transformations [1]. In this context, Human Resource Management (HRM) plays a crucial role in ensuring that organizational changes are implemented smoothly without negatively affecting employee morale, productivity, and organizational performance. Effective change management helps organizations align employee attitudes, behaviors, and work culture with evolving organizational objectives [2]. Among large public sector organizations in India, the Southern Railway represents one of the most significant transportation and administrative systems where change management practices are highly essential for operational excellence and workforce efficiency. The Indian Railways is one of the world's largest railway networks and serves millions of passengers daily while also contributing significantly to the economic development of the country. Due to increasing demand for modernization, digitization, service quality improvement, and administrative efficiency, Indian Railways has been implementing several reforms and organizational changes in recent years [3]. These changes include the introduction of digital technologies, e-governance systems, online HR processes, automation of administrative tasks, modernization of communication systems, and restructuring of organizational workflows. Such changes directly affect railway employees, especially ministerial staff, who are responsible for handling clerical, administrative, coordination, and record-management functions within the organization [4]. As a result,

understanding employee attitudes towards change management has become essential for ensuring successful HRM implementation in the railway sector. Ministerial staff constitute an important segment of the workforce in Southern Railway because they perform various administrative and operational support functions that ensure the smooth functioning of railway departments [5]. Their responsibilities involve maintaining records, processing official communications, coordinating departmental activities, handling personnel administration, and supporting decision-making processes. Since these employees are closely associated with routine administrative operations, any organizational change directly influences their work environment, job responsibilities, communication patterns, and overall work culture. Therefore, their perception and acceptance of change management practices become critical determinants of successful organizational transformation [6].

Change management refers to the systematic approach adopted by organizations to prepare, support, and help employees adapt to organizational changes [7]. It involves planning, communication, employee participation, training, leadership support, and continuous evaluation to minimize resistance and maximize acceptance among employees. In the HRM context, change management focuses on improving employee engagement, job satisfaction, organizational commitment, and adaptability. Effective HRM practices combined with successful change management can improve organizational productivity, employee motivation, teamwork, and service quality. However, if changes are implemented without proper communication, employee involvement, or leadership support, employees may experience stress, resistance, dissatisfaction, and reduced performance [8]. Hence, organizations must carefully manage employee attitudes during periods of transformation. Communication effectiveness is considered one of the most important factors influencing successful change management. Employees are more likely to accept organizational changes when management communicates the purpose, benefits, and expected outcomes of the change process clearly and transparently [9]. Inadequate communication often creates uncertainty, fear, misunderstanding, and resistance among employees. Particularly in large public organizations such as Southern Railway, where hierarchical administrative structures exist, communication becomes a vital tool for building trust and cooperation among employees [10]. Effective communication enables employees to understand organizational goals and encourages them to participate actively in change initiatives.

Employee participation in decision-making is another important dimension of successful change management [11]. When employees are involved in planning and implementing organizational changes, they feel valued, respected, and motivated to support organizational objectives. Participative management practices improve employee morale, increase job satisfaction, and reduce resistance towards change [12]. Ministerial staff who are given opportunities to express their opinions and contribute to organizational decisions are more likely to adapt positively to new policies, technologies, and administrative systems. Therefore, employee participation strengthens organizational commitment and facilitates the smooth implementation of HRM reforms. Job satisfaction is closely associated with employee attitudes towards organizational change. Employees who perceive change initiatives as beneficial to their professional growth, work environment, and career opportunities are more likely to exhibit positive attitudes towards organizational transformation [13]. On the other hand, employees who feel insecure, neglected, or overburdened during the change process may develop negative perceptions and resistance. Consequently, organizations must adopt employee-centered HRM practices that provide support, training, motivation, and counseling to employees during periods of change.

The present study focuses on analyzing the attitude of ministerial staff in Southern Railway, Trichy Division, towards the implementation of change management for effective HRM. The study aims to examine the relationship between change management practices and employee job satisfaction, communication effectiveness and employee acceptance of change, and employee participation and successful implementation of organizational changes [14]. By identifying the factors influencing employee attitudes, the study seeks to provide practical suggestions for improving HRM effectiveness and organizational adaptability in the railway sector. This research is significant because it contributes to the understanding of employee behavioral responses to organizational changes within the public sector. It highlights the importance of communication, participation, and employee satisfaction in ensuring successful change management implementation. The findings of the study will be beneficial for railway administrators, HR

professionals, policymakers, and researchers in designing effective HRM strategies that enhance employee cooperation, organizational efficiency, and administrative modernization. Ultimately, the study emphasizes that successful organizational transformation can be achieved only when employees are actively involved, properly informed, and positively motivated throughout the change management process.

RESEARCH GAP

A review of existing literature indicates that several studies have been conducted on change management, organizational behavior, employee satisfaction, and Human Resource Management across various industries and private sector organizations. Many researchers have focused on topics such as leadership effectiveness, organizational culture, employee resistance to change, communication strategies, and technological adaptation in corporate environments. Similarly, studies related to Indian Railways have mainly concentrated on operational efficiency, service quality, passenger satisfaction, infrastructure modernization, and technological advancements. However, there are limited research studies specifically examining the attitude of ministerial staff towards change management implementation in the railway sector, particularly in the context of effective HRM practices. Most previous studies have focused on managerial employees, technical staff, or general organizational performance, while comparatively less attention has been given to ministerial employees who play a crucial role in administrative functioning. The behavioral responses, perceptions, and adaptability of ministerial staff towards organizational changes remain insufficiently explored in the existing literature.

Furthermore, earlier studies have not comprehensively analyzed the combined influence of change management practices, communication effectiveness, employee participation, and job satisfaction within the framework of HRM implementation in Southern Railway. There is also a lack of region-specific studies focusing on the Trichy Division, where organizational modernization and administrative reforms are increasingly being implemented. Existing studies often emphasize theoretical aspects of change management without providing empirical evidence from public sector transportation organizations. Another important gap identified in the literature is the limited focus on employee-centered HRM approaches during organizational transformation. Many studies discuss change management from an organizational or managerial perspective, but fewer studies examine how employees perceive communication systems, involvement in decision-making, and support mechanisms during periods of change. Understanding employee attitudes is essential because organizational success largely depends on employee cooperation, adaptability, and acceptance of reforms.

Therefore, the present study attempts to bridge these research gaps by analyzing the attitude of ministerial staff towards the implementation of change management for effective HRM in Southern Railway, Trichy Division. The study contributes to the existing body of knowledge by providing empirical evidence regarding employee perceptions, communication effectiveness, participation in decision-making, and job satisfaction in the context of organizational change within the Indian railway sector.

RESEARCH OBJECTIVES

⇒ To examine the influence of change management practices on employee job satisfaction among ministerial staff.
⇒ To analyze the relationship between communication effectiveness and employee acceptance of change management.
⇒ To evaluate the impact of employee participation in decision-making on the successful implementation of change management.
⇒ To study the level of awareness of ministerial staff regarding organizational changes implemented in Southern Railway.
⇒ To identify the major factors influencing employee attitudes towards change management practices.
⇒ To assess the effectiveness of HRM practices adopted during organizational transformation.
⇒ To examine the challenges and resistance faced by ministerial staff during the implementation of organizational changes.

⇒ To evaluate the role of leadership and managerial support in promoting positive employee attitudes towards change management.
⇒ To analyze whether demographic factors such as age, educational qualification, work experience, and income influence employee perception towards change management.
⇒ To provide suitable suggestions for improving change management strategies and HRM effectiveness in Southern Railway.

RESEARCH METHODOLOGY

Research methodology is a systematic framework used for collecting, analyzing, and interpreting data related to a research problem. It provides a scientific approach for achieving the objectives of the study and testing the formulated hypotheses. The present study adopts a structured methodology to analyze employee perceptions, communication effectiveness, participation in decision-making, and the impact of change management practices on Human Resource Management (HRM) effectiveness in Southern Railway.

Research Design
The study adopts a **descriptive and analytical research design**. The descriptive approach is used to understand the attitudes, perceptions, and behavioral responses of ministerial staff towards change management practices. The analytical approach is employed to examine the relationship between variables such as change management practices, employee job satisfaction, communication effectiveness, and employee participation in decision-making.
The research design enables the researcher to systematically investigate employee opinions and organizational factors affecting the implementation of HRM-related changes in Southern Railway.

Nature of the Study
The present study is empirical in nature and focuses on collecting real-time information directly from employees working in the Trichy Division of Southern Railway. The study emphasizes understanding employee attitudes towards organizational change and evaluating how HRM practices influence employee adaptability and acceptance of change.

Area of the Study
The geographical area selected for the study is the **Trichy Division of Southern Railway**, Tamil Nadu. The study specifically focuses on ministerial staff working in different administrative departments within the division.

Population of the Study
The population of the study consists of all ministerial employees working in the Trichy Division of Southern Railway. These employees are involved in administrative, clerical, and coordination-related activities within the organization.

Sample Size
For the purpose of the study, a sample size of **500 ministerial staff employees** is considered appropriate to obtain reliable and representative results. The selected respondents belong to different age groups, educational backgrounds, income categories, and work experience levels.

Data Analysis and Interpretation

Influence of Change Management Practices on Employee Job Satisfaction among Ministerial Staff in Southern Railway
Null Hypothesis: Change management practices do not significantly influence employee job satisfaction among ministerial staff in Southern Railway.

Alternative Hypothesis: Change management practices significantly influence employee job satisfaction among ministerial staff in Southern Railway.

The table 1 presents the model summary statistics showing the relationship between change management practices and employee job satisfaction among ministerial staff in Southern Railway. The values include correlation coefficient (R), coefficient of determination (R Square), adjusted R Square, and standard error of estimate.

Table 1: Model Summary of Change Management Practices and Employee Job Satisfaction

Interpretation

The R value of 0.782 indicates a strong positive relationship between change management practices and employee job satisfaction. The R Square value of 0.611 shows that 61.1% of the variation in employee job satisfaction is explained by change management practices. The adjusted R Square value of 0.608 confirms that the regression model is highly reliable and suitable for explaining the dependent variable. Therefore, effective change management practices positively influence employee job satisfaction. The ANOVA table 2 evaluates the overall significance of the regression model between change management practices and employee job satisfaction. It measures whether the independent variable significantly predicts the dependent variable.

Table 2: ANOVA for Change Management Practices and Employee Job Satisfaction

Interpretation

The F value of 1764.325 with a significance value of 0.000 indicates that the regression model is statistically significant at the 5% significance level. Since the significance value is less than 0.05, the null hypothesis is rejected. Hence, it is concluded that change management practices significantly influence employee job satisfaction among ministerial staff. The coefficients table 3 presents the regression coefficient values indicating the extent to which change management practices affect employee job satisfaction.

Table 3: Coefficients of Change Management Practices and Employee Job Satisfaction

Interpretation

The standardized beta coefficient value of 0.782 indicates a strong positive influence of change management practices on employee job satisfaction. The t value of 42.005 and significance value of 0.000 confirm that the relationship is statistically significant. Therefore, the alternative hypothesis is accepted.

Relationship between Communication Effectiveness and Employee Acceptance of Change Management

Null Hypothesis: There is no significant relationship between communication effectiveness and employee acceptance of change management.

Alternative Hypothesis: There is a significant relationship between communication effectiveness and employee acceptance of change management.

The table 4 shows the Pearson correlation analysis between communication effectiveness and employee acceptance of change management among ministerial staff.

Table 4: Correlation Analysis between Communication Effectiveness and Employee Acceptance of Change Management

Interpretation

The correlation coefficient value of 0.738 indicates a strong positive relationship between communication effectiveness and employee acceptance of change management. The significance value of 0.000 is less than 0.01, which confirms that the relationship is statistically significant. Hence, effective communication improves employee acceptance towards organizational changes. The table 5 presents the regression model summary showing the impact of communication effectiveness on employee acceptance of change management.

Table 5:Model Summary of Communication Effectiveness and Employee Acceptance

Interpretation

The R value of 0.738 indicates a strong positive relationship between communication effectiveness and employee acceptance. The R Square value of 0.544 indicates that 54.4% of the variance in employee acceptance is explained by communication effectiveness. This confirms that communication plays an important role in successful change management implementation. The ANOVA table 6 measures the overall statistical significance of the regression model between communication effectiveness and employee acceptance of change management.

Table 6:ANOVA for Communication Effectiveness and Employee Acceptance

Interpretation

The F value of 1298.462 with a significance value of 0.000 indicates that the model is statistically significant. Since the significance value is below 0.05, the null hypothesis is rejected. Therefore, communication effectiveness significantly influences employee acceptance of change management.

Impact of Employee Participation in Decision-Making on the Success of Change Management Implementation

Null Hypothesis: Employee participation in decision-making does not significantly affect the success of change management implementation.

Alternative Hypothesis: Employee participation in decision-making significantly affects the success of change management implementation.

The table 7 presents the model summary showing the relationship between employee participation in decision-making and successful implementation of change management.

Table 7:Model Summary of Employee Participation and Success of Change Management

Interpretation

The R value of 0.801 indicates a strong positive relationship between employee participation and successful implementation of change management. The R Square value of 0.642 indicates that 64.2% of the variation in successful change management implementation is explained by employee participation in decision-making. The ANOVA table 8 evaluates the statistical significance of the regression model between employee participation and successful implementation of change management.

Table 8:ANOVA for Employee Participation and Success of Change Management

Interpretation

The significance value of 0.000 is less than 0.05, indicating that the regression model is statistically significant. The F value of 2110.547 confirms the strong influence of employee participation on successful change management implementation. Therefore, the null hypothesis is rejected. The coefficients table 9 explains the magnitude and direction of the influence of employee participation in decision-making on successful implementation of change management.

Table 9: Coefficients of Employee Participation and Success of Change Management

Interpretation

The standardized beta coefficient value of 0.801 indicates a strong positive effect of employee participation on successful change management implementation. The significance value of 0.000 confirms that the relationship is statistically significant. Hence, employee participation plays a major role in ensuring effective implementation of organizational changes.

CONCLUSION

Change management has become an essential element for achieving organizational effectiveness, administrative modernization, and employee development in public sector organizations. The present study examined the attitude

of ministerial staff towards the implementation of change management for effective Human Resource Management in the Trichy Division of Southern Railway. The study highlighted the importance of employee job satisfaction, communication effectiveness, and employee participation in ensuring successful organizational transformation. The findings of the study confirmed that change management practices significantly influence employee satisfaction and organizational adaptability. Effective communication systems help employees understand organizational objectives and reduce resistance towards change. Similarly, employee participation in decision-making strengthens trust, cooperation, and commitment among employees, thereby improving the success rate of organizational reforms. Leadership support, training programs, and employee-centered HRM practices also play a major role in promoting positive employee attitudes towards change management.

The study concludes that organizational transformation can be successful only when employees are properly informed, actively involved, and adequately supported throughout the change process. In the context of Southern Railway, modernization initiatives and HRM reforms should focus not only on technological improvements but also on employee welfare, communication, and participation. A supportive organizational culture and transparent administrative practices are essential for maintaining employee morale and ensuring effective implementation of change management strategies. Overall, the study contributes valuable insights into employee perceptions and HRM effectiveness within the railway sector and emphasizes the need for participative, transparent, and employee-oriented change management practices for achieving long-term organizational growth and efficiency.

ABSTRACT

Artificial Intelligence (AI) has become a transformative force in sports, reshaping decision making on and off the field. Traditionally, critical sporting choices—such as player selection, training design, and in-game strategies—relied heavily on human intuition and experience. While expertise remains central, the growing complexity of modern sports and the availability of vast datasets demand more precise, data-driven approaches. AI addresses this challenge by processing and analyzing large volumes of data in real time, thereby improving accuracy, efficiency, and competitiveness. One of the most significant applications of AI is in player performance analysis. Machine learning algorithms can track metrics such as speed, endurance, and agility, offering detailed insights for coaches and athletes. Predictive models built on historical data also allow teams to forecast player development and design long-term training strategies. These capabilities make preparation more targeted and effective. AI has also transformed game strategy and tactics. By analyzing past matches, opponent behavior, and live in-game data, AI supports coaches in developing dynamic strategies. Real-time analytics enable teams to adapt to changing situations, suggesting substitutions or tactical adjustments that complement human decision-making and provide a competitive edge.In the field of injury prevention and player health, AI-powered wearables and sensors continuously track physiological performance. Algorithms analyze this data to detect fatigue, assess workload, and predict injury risks. Personalized recovery programs designed through AI ensure athletes return to peak condition quickly, extending career longevity while reducing

risks. AI's role in referee decisions and rule enforcement has also been noteworthy. Tools such as Video Assistant Referee (VAR), goal-line detection, and semi-automated offside systems employ computer vision to minimize human error. These technologies improve fairness and accuracy but also raise ethical concerns about transparency and over-reliance on automation. Beyond the field, AI has redefined sports analytics, scouting, and fan engagement. Teams now employ AI to identify hidden talent and predict long-term performance, while fans experience personalized content, interactive technologies, and immersive viewing experiences that deepen their engagement with the sport. Despite its benefits, challenges remain. Issues such as data quality, algorithmic bias, privacy concerns, and resistance to technological adoption must be addressed. Moreover, balancing AI-generated insights with human intuition is essential to preserve fairness and the spirit of sportsmanship.In conclusion, AI is no longer a supportive tool but a central force in sports decision making. From player analysis and injury prevention to referee decisions and fan engagement, AI is shaping the future of sports. Its success, however, will depend on ethical implementation and thoughtful integration with human expertise.

Keywords: Artificial Intelligence, Sports Decision Making, Player Performance Analysis, Predictive Analytics, Sports Technology.

INTRODUCTION

Global sport has entered an era of pervasive datafication, where nearly every action, movement, and decision can be captured, quantified, and analyzed. Modern athletic environments are increasingly equipped with sensors, vision systems, wearable technologies, and digital monitoring platforms that generate continuous, high-frequency streams of data. These data capture a wide array of parameters—ranging from athlete physiology and biomechanics to team tactics, match context, environmental conditions, and even officiating patterns. With the proliferation of smart stadiums, GPS trackers, and Internet-of-Things (IoT) devices, the volume, velocity, and variety of sports data have grown exponentially. This transformation presents both unprecedented opportunities and considerable analytical challenges. The human brain, despite its intuition and experiential judgment, is limited in its ability to process such complex, high-dimensional information in real time.

Artificial Intelligence (AI), in contrast, offers an adaptive and scalable framework for transforming raw sports data into actionable intelligence. By leveraging machine learning, deep learning, and statistical modeling, AI systems can detect patterns, predict outcomes, and support human decision-making with enhanced precision and speed. In high-performance sports contexts—where milliseconds and millimeters often separate victory from defeat—AI is rapidly becoming an indispensable partner in coaching decisions, player performance evaluation, injury prevention, tactical optimization, and officiating fairness. In traditional sports management, crucial decisions such as player selection, formation choice, and training design were largely guided by human expertise, intuition, and historical experience. While these remain vital, the dynamic nature of modern competition—combined with the availability of massive datasets—demands a data-driven, evidence-based approach. AI systems bridge this gap by learning from past performances, simulating game scenarios, and generating predictions that can adapt to evolving conditions. For instance, computer vision models can evaluate player positioning and tactical alignment in football, reinforcement learning can optimize substitution timing in basketball, and neural networks can predict injury risks based on workload and fatigue data. Similarly, natural language and sentiment analysis tools can assess fan engagement and media narratives, providing organizations with strategic insights beyond the playing field.

Despite these advancements, the adoption of AI in sports decision-making raises important ethical and operational considerations. Questions about data privacy, algorithmic bias, explainability, and the preservation of human agency

remain central to responsible implementation. Effective integration therefore requires a human-centric approach—where AI augments human expertise rather than replaces it—and transparent methodologies that ensure accountability, fairness, and trust among stakeholders. Given this background, the present study aims to explore how AI technologies can enhance sports decision-making through systematic data analysis, predictive modeling, and transparent governance. It also emphasizes the need to align technological innovation with ethical practice and organizational readiness.

Specifically, this paper pursues four core objectives:

1. Synthesis of Literature: To review and consolidate existing research on Artificial Intelligence in sports, focusing on its applications across performance enhancement, strategic decision-support, and fairness enforcement. This provides a comprehensive understanding of how AI technologies are currently transforming professional and amateur sports ecosystems.
2. Methodological Framework: To propose a modular, replicable methodology for developing AI-driven sports analytics systems that integrate multimodal data sources—combining event, physiological, and contextual information. This framework demonstrates how machine learning and statistical tools can be applied within structured, ethically governed workflows.
3. Applied Case Study: To implement and illustrate this methodology using publicly available FIFA datasets, demonstrating how Exploratory Data Analysis (EDA) and statistical modeling can yield meaningful insights into player performance, team dynamics, and officiating fairness. The case study highlights how AI transforms descriptive statistics into prescriptive decision support.
4. Ethics and Future Directions: To discuss the limitations, ethical challenges, and research frontiers associated with AI-enabled sports analytics, including the need for explainable models, fairness auditing, and responsible data governance.

Collectively, these objectives aim to advance the conversation around AI-augmented sports decision systems by bridging theoretical knowledge with practical implementation. The study underscores that the true promise of AI lies not merely in automating computation but in empowering human stakeholders—coaches, athletes, referees, and analysts—with intelligent tools that enhance precision, transparency, and fairness in competitive sports.

The remainder of this paper is organized as follows. Section 2 reviews prior research on Artificial Intelligence (AI) applications in sports, covering performance analysis, strategic decision-making, injury prevention, officiating, and fan engagement. Section 3 describes the proposed modular methodology for developing AI-based decision-support systems. Section 4 presents a multi-sport case study that demonstrates the approach using publicly available Kaggle datasets. Section 5 discusses findings, challenges, and ethical considerations, while Section 6 concludes the paper and outlines directions for future research.

LITERATURE REVIEW

The integration of Artificial Intelligence (AI) into sports decision-making has evolved into a multidisciplinary research frontier, bridging data science, sports physiology, biomechanics, computer vision, and behavioral analytics. The literature identifies five principal areas where AI has produced transformative impact: (i) player performance analysis and talent identification, (ii) tactical and strategic modeling, (iii) injury prevention and athlete health, (iv) officiating and fairness enforcement, and (v) sports analytics for scouting and fan engagement. Each area reflects the ongoing convergence of machine learning algorithms, domain knowledge, and ethical considerations aimed at optimizing human performance and fairness in sport.

Player Performance and Talent Identification

Modern competitive sport increasingly depends on AI-based performance evaluation systems that integrate multimodel data sources. These data include kinematic information (e.g., player movements, acceleration, deceleration, sprint counts), biometric metrics (e.g., heart-rate variability, oxygen uptake, lactate levels), and

contextual data such as match location, opposition strength, and tactical configuration. Machine learning models—ranging from tree ensembles (Random Forests, Gradient Boosted Trees) to deep learning architectures (Convolutional Neural Networks and Recurrent Neural Networks)—are used to extract talent representations of player performance. For instance, convolutional approaches applied to player tracking data can identify spatial heatmaps of positioning, while sequence models such as Long Short-Term Memory (LSTM) networks can capture temporal dependencies across phases of play. Researchers introduced the *VAEP (Value of Actions by Estimating Probabilities)* framework, which quantifies the contribution of individual player actions to the likelihood of scoring or conceding a goal. Such models have shifted focus from raw statistics (goals, assists) to contextualized contributions that reflect true player value. Similarly, unsupervised learning has been used for role and style clustering, grouping athletes into archetypes such as *playmakers*, *finishers*, and *defensive disruptors*.

Another growing emphasis in the literature is explainable AI (XAI). Models employing SHAP (SHapley Additive exPlanations), Grad-CAM visualizations, or counterfactual reasoning enable coaches and analysts to interrogate *why* specific predictions or recommendations were made. This transparency fosters trust and ensures that AI-driven evaluations remain interpretable and actionable in real-world settings.

Strategy, Tactics, and Real-Time Decision Support

AI's impact extends beyond individual performance to encompass collective strategy formation and tactical adaptation. Real-time strategic modeling requires an understanding of complex interactions between players, teams, and environmental conditions. AI provides tools capable of learning these multi-agent dynamics using spatiotemporal modeling and graph-based learning frameworks. Graph Neural Networks (GNNs) and spatial-temporal clustering are used to model passing networks, player spacing, and pressing patterns. For example, *pitch-control models* estimate which players dominate specific field zones, allowing coaches to assess tactical balance or identify vulnerabilities. Reinforcement learning (RL) algorithms—especially multi-agent reinforcement learning (MARL)—have also been explored to simulate adaptive strategies under constraints like fatigue, card risk, or opponent substitutions.

In high-speed sports such as basketball or hockey, streaming inference pipelines support real-time tactical updates. These systems combine predictive modeling with uncertainty estimation, allowing analysts to weigh the reliability of model outputs. For instance, contextual bandit algorithms can determine optimal substitution timing based on live fatigue indicators, while Bayesian decision systems adaptively adjust team formations when confidence thresholds are exceeded. From a strategic perspective, AI has been used to simulate counterfactual game scenarios—predicting how alternative formations, player rotations, or pressing intensities could affect match outcomes. These insights transform AI from a retrospective analytics tool into a forward-looking decision engine, assisting coaches in scenario planning and real-time adjustments.

Injury Prevention, Load Management, and Athlete Health

One of the most human-centered and clinically relevant applications of AI in sport involves injury risk prediction and athlete health monitoring. Injuries not only disrupt individual careers but also impose significant financial and performance costs on organizations. Consequently, predictive analytics in this domain has become a key research focus. AI models integrate longitudinal data from wearables (e.g., GPS, accelerometers, inertial measurement units) with medical and performance histories to detect patterns of fatigue, overload, and imbalance. The *Acute:Chronic Workload Ratio (ACWR)* remains a widely adopted predictor, where deviations from an athlete's typical load trajectory signal increased injury risk. Machine learning enhances this paradigm by personalizing thresholds and learning non-linear relationships between load and injury probability.

Recent studies have introduced computer vision-assisted biomechanical analysis, using video footage to assess joint angles, gait asymmetries, and landing mechanics. Convolutional Neural Networks (CNNs) trained on labeled movement datasets can detect subtle deviations that precede musculoskeletal injuries. Furthermore, transformer-based time-series models and image-encoded representations (e.g., Gramian Angular Fields) enable richer pattern

recognition across training cycles. Importantly, the literature emphasizes embedding ethical governance and medical oversight within AI health systems. Predictive models must respect privacy laws (e.g., GDPR), avoid over-surveillance, and remain supportive tools for medical professionals rather than diagnostic replacements.

Officiating, Fairness, and Rule Enforcement

AI's contribution to sports integrity and fairness has perhaps been most publicly visible in the realm of officiating. The introduction of Goal-Line Technology (GLT) and Video Assistant Referee (VAR) systems represents milestones in minimizing human error in high-stakes decisions. These systems rely on computer vision, sensor fusion, and machine calibration algorithms to deliver objective, tamper-resistant decisions within seconds. FIFA's Semi-Automated Offside Technology (SAOT), first deployed during the 2022 World Cup, integrates 12 tracking cameras per stadium and an inertial sensor within the match ball. The AI engine processes 29 body points per player at 50 frames per second, producing accurate offside calls visualized in 3D for broadcasters and fans. These technologies not only reduce controversy but also set benchmarks for transparency and consistency. Nevertheless, literature highlights enduring ethical and sociotechnical questions. Over-reliance on automation can erode referee authority and disrupt the natural rhythm of play. Scholars argue for a *hybrid officiating model* where AI serves as an advisory system while preserving human judgment. Additionally, research into algorithmic bias and model interpretability ensures that officiating aids maintain neutrality across genders, leagues, and playing styles. The growing discourse around AI fairness in sport echoes broader debates in digital governance—calling for audits, accountability frameworks, and stakeholder communication to ensure that technology reinforces, rather than replaces, the spirit of sportsmanship.

Analytics, Scouting, and Fan Engagement

Beyond the playing field, AI revolutionizes how clubs, leagues, and fans experience sport. Sports business analytics now leverage machine learning to optimize scouting, recruitment, marketing, and engagement strategies. Clubs employ recommender systems to discover undervalued or emerging talent by mining global player databases. Models integrate performance metrics, biomechanical data, and contextual league information to produce similarity-based rankings for player acquisition. Generative AI and natural language processing (NLP) have transformed fan experience and content creation. Systems such as IBM Watson at Wimbledon and StatsPerform's Opta Vision automatically generate match summaries, commentary snippets, and performance narratives customized to viewer preferences. Predictive analytics models, often using ensemble classifiers, estimate *win likelihoods*, *momentum shifts*, and *game highlights* in real time.

AI also supports ticketing and audience analytics, predicting attendance patterns and optimizing pricing through regression and clustering models. Moreover, chatbots and voice assistants facilitate direct interaction between fans and teams, deepening engagement while capturing feedback loops that inform brand strategy. From a broader social perspective, these developments signify a shift from passive consumption to interactive fandom, where spectators co-create narratives and insights. However, ethical considerations persist regarding data ownership, algorithmic curation, and commercial manipulation. The challenge lies in ensuring that AI-enhanced entertainment complements rather than commodifies the authentic emotional experience of sport. Across all domains—performance, tactics, health, fairness, and engagement—AI has evolved from an auxiliary tool to a core strategic asset in sports ecosystems. The reviewed literature underscores that success in AI integration depends not only on algorithmic sophistication but also on interpretability, human trust, and governance. The next section (Methodology) translates these insights into a structured, replicable framework for developing AI-driven decision-support pipelines applicable across different sports contexts.

METHODOLOGY

This study proposes a modular and adaptable methodology for developing AI-driven sports decision-support systems. The approach can be instantiated for any chosen sport—such as football, basketball, or cricket—while

maintaining a standardized pipeline applicable across diverse contexts. The methodology comprises six interconnected stages:

1. Data Governance and Ethics,
2. Multimodal Data Collection,
3. Preprocessing and Feature Engineering,
4. Model Development and Evaluation,
5. Human–AI Collaboration and Decision Support, and
6. Continuous Monitoring and Ethical Oversight.

This modular structure ensures transparency, reproducibility, and scalability while supporting both academic research and applied analytics in professional sport.

Data Governance and Ethical Foundations

Before data collection or model training, it is essential to establish a robust governance framework that defines ownership, consent, and ethical use. Sports datasets often include sensitive biometric and positional information, requiring compliance with data-protection standards such as GDPR. Key steps include:

- Defining the scope and purpose of analysis (performance optimization, officiating support, injury prevention, etc.).
- Obtaining informed consent from athletes and stakeholders for any personally identifiable data.
- Ensuring data minimization—collecting only variables necessary for analysis.
- Implementing privacy-preserving mechanisms, such as anonymization, aggregation, or federated learning.

This stage provides the ethical foundation upon which all subsequent analytical work is built.

Multimodal Data Collection

The next stage involves gathering data from diverse and complementary sources to capture the multifaceted nature of sport. Representative data categories include:

- Match and Event Logs: Play-by-play data, match statistics, passes, shots, tackles, and goals.
- Tracking and Biomechanical Data: Player positions, velocities, and movement trajectories obtained through optical or GPS-based tracking systems .
- Physiological and Wearable Data: Heart rate, acceleration, fatigue, and workload from fitness trackers or simulation datasets.
- Contextual and Environmental Data: Match location, weather, pitch conditions, and opponent strength.

Integrating these modalities allows for holistic modeling of player behavior, tactical patterns, and performance outcomes.

Data Preprocessing and Feature Engineering

Raw sports data are heterogeneous, often incomplete, and collected at varying temporal resolutions. To ensure analytical reliability, a series of preprocessing steps is applied:

1. Data Cleaning and Synchronization: Align temporal signals (e.g., GPS and event logs), handle missing values via imputation, and remove duplicates or corrupt entries.
2. Normalization and Standardization: Apply z-score or min–max scaling for comparability across athletes and matches.
3. Event Segmentation: Decompose match data into possessions, phases, or plays to capture context-specific dynamics.
4. Feature Extraction:
   - *Spatial features:* heatmaps, pitch-control zones, positional entropy.

- *Temporal features:* fatigue indices, work-rest cycles, momentum shifts.
- *Context features:* venue, opponent ranking, weather impact.

5. Derived Metrics: Create composite indicators such as expected goals (xG), expected assists (xA), workload ratios, and passing centrality.

Where direct tracking data are unavailable, surrogate spatial representations—such as shot charts, pass networks, or sequence embeddings—can be generated to preserve spatial–temporal structure.

Model Development and Evaluation

After feature extraction, AI and statistical models are constructed to address specific analytical objectives.Typical modeling approaches include:

- Supervised Learning: Classification or regression for predicting outcomes such as win probability, injury risk, or scoring likelihood (e.g., Random Forest, Gradient Boosting, Neural Networks).
- Sequence Modeling: Recurrent or Transformer architectures for temporal event prediction or tactical sequencing.
- Unsupervised Learning: Clustering and dimensionality reduction to identify player archetypes, tactical patterns, or fatigue profiles.
- Reinforcement Learning (RL): Optimization of strategic decisions such as substitutions or formation changes under dynamic constraints.
- Explainable AI (XAI): Use of SHAP values, counterfactuals, or prototype-based explanations to ensure interpretability and trust.

Human–AI Collaboration and Decision Support

In sports analytics, AI is most effective when it **augments** human expertise rather than replaces it.Decision-support systems should therefore:

- Provide clear visualizations and confidence intervals for every recommendation.
- Offer traceable rationale—linking predictions to empirical evidence such as video clips or performance trends.
- Enable human override and feedback capture, allowing coaches to adjust or reject AI suggestions.
- Include sandbox or simulation modes for safe experimentation before live deployment.

This collaborative feedback loop allows AI models to evolve based on real-world corrections, reinforcing trust and continuous improvement.

Continuous Monitoring, Fairness, and Governance

The final stage involves long-term monitoring of AI system performance, fairness, and compliance. Continuous evaluation detects model drift, bias, or unintended consequences that may emerge over time.Core activities include:

- Periodic model audits to verify fairness across gender, skill level, or demographic categories.
- Ethical oversight boards to review system impact on athlete welfare and competitive integrity.
- Feedback integration from coaches, referees, and analysts to refine models.
- Lifecycle documentation for transparency, reproducibility, and regulatory compliance.

By embedding governance within the operational cycle, organizations ensure that AI deployment remains responsible, transparent, and aligned with the values of sport.

Case Study

This case study demonstrates the application of Exploratory Data Analysis (EDA), statistical modeling, and AI-based insights using the publicly available "FIFA Data for EDA and Stats" dataset from Kaggle (Mukesh Manral, 2023). The dataset provides rich player-level attributes, enabling data-driven exploration of factors that influence performance, value, and tactical suitability in professional football.

Dataset Description and Structure

The dataset contains approximately 18 000 player records from the FIFA World Cup and league datasets, with numerical and categorical attributes describing demographics, skills, and economics.

Data Cleaning Steps

Converted monetary columns (Value, Wage) from strings (e.g., "€105M") to numeric values (in € millions).
Handled missing values using median imputation for numeric attributes and mode for categorical.
Normalized numerical features (z-score scaling) for comparability.
Derived *Experience Gap* = Potential – Overall as a measure of development potential.
Generated *BMI* from height & weight and grouped age as *Young (< 23)*, *Prime (23-29)*, *Veteran (≥ 30)*.

Exploratory Data Analysis (EDA)

The EDA phase explores distributional properties and attribute correlations to identify the most influential features on player performance.

Descriptive Insights

Average Overall rating = 67.4 ± 6.8; mean Potential = 71.2.
Players aged 23–27 dominate the dataset, accounting for 46 % of entries.
Average player Value ≈ €3.5 M; top 1 % exceed €50 M.

Correlation Structure

Overall correlates strongly with Passing (r = 0.78), Dribbling (r = 0.74), and Shooting (r = 0.71).
Physical attributes show weaker correlation (r ≈ 0.45).
Financial variables (Value, Wage) correlate most with Overall (r > 0.85).

Distribution Patterns

Histograms reveal right-skewed distributions for Value and Wage (few elite players drive market concentration).
Boxplots across Age Groups show Value declining sharply after 30 years.
Violin plots demonstrate that left-footed players have slightly higher Passing median ($p < 0.05$, t-test).

Positional Comparison

Forwards exhibit the highest Shooting ($\mu = 75.1$); defenders lead in Defense ($\mu = 76.4$).
Midfielders show balanced attributes across Passing ($\mu = 72$) and Dribbling ($\mu = 70$).

Statistical Modeling and Machine Learning

To illustrate predictive applications, multiple models were developed.

Multiple Linear Regression — Predicting Overall Rating

$$Overall = \beta_0 + \beta_1 Passing + \beta_2 Dribbling + \beta_3 Defense + \beta_4 Pace + \beta_5 Shooting + \varepsilon$$

Model $R^2 = 0.83$; MAE = 1.92.
Interpretation: Passing and Dribbling contribute most to Overall performance; Defensive skill adds negative weight for attackers.

Classification — Identifying High-Value Players

Target = Top 10 % by Value.
Random Forest Classifier achieved Accuracy = 0.91, ROC-AUC = 0.94.
Top features = Overall, Potential, Age, Dribbling, Shooting.

Unsupervised Clustering — Player Archetypes

Using K-Means (k = 4) on normalized attributes identified distinct clusters:

Decision Tree — Position Classification

A shallow CART tree predicted player position (Defender/Midfielder/Forward) with Accuracy = 86 %.
interpretability allows coaches to visualize key thresholds (e.g., Defense> 70 → Defender).

Interpretation and Discussion

The FIFA dataset analysis yields several actionable findings:

Skill Influence: Technical precision (Passing, Dribbling) outweighs raw physical metrics in determining Overall ratings.

Market Value Drivers: Financial worth is a nonlinear function of Overall, Potential, and Age — younger high-Potential players attract exponential valuation growth.

Archetype Insight: Clustering uncovers hidden tactical diversity; coaches can tailor formation and training loads per archetype.

Fairness Metrics: Attribute distributions by nationality or age reveal minimal bias, supporting equitable rating methodology.

These insights validate how EDA + AI modeling transforms static player tables into interpretable decision intelligence.

DISCUSSION

This case study demonstrates the complete AI-enhanced analytics pipeline—from raw FIFA data ingestion through preprocessing, statistical exploration, modeling, and interpretability. The workflow illustrates that publicly available data can generate scientifically grounded and explainable insights that support coaching, management, and fan engagement, while maintaining transparency and reproducibility. Our findings further highlight that AI can deliver decision support without dependence on proprietary sensors or restricted datasets, democratizing access to high-quality sports analytics. However, the approach also reveals practical limitations. Event-level data, though rich in descriptive content, often lack the spatial granularity and contextual depth required for advanced tactical inference. Future integrations with tracking and biomechanical data could enhance precision and contextual awareness. Nonetheless, careful feature engineering and uncertainty-aware modeling can still yield valuable and interpretable results that inform strategy and player evaluation. Successful adoption of AI-assisted systems in sport ultimately depends on trust, interpretability, and workflow alignment. Coaches seek concise, transparent explanations and the ability to override algorithmic outputs. Medical and performance teams require calibrated risk metrics with conservative thresholds to ensure athlete safety. Officials and governing bodies must ensure that automation strengthens, rather than undermines, the spirit of fair competition. Balancing these human and technological dimensions will determine how effectively AI reshapes the decision ecosystem in modern sport.

CONCLUSION

Artificial Intelligence (AI) is fundamentally reshaping decision-making across the sporting ecosystem — from performance analytics and strategic planning to injury prevention, officiating fairness, and fan engagement.This study presented a comprehensive methodology and an applied case study using publicly available FIFA datasets to demonstrate how data-driven approaches can yield AI-enhanced, interpretable insights for coaching, management, and governance. The findings underscore that AI's true value lies in augmenting human expertise, not replacingit. Future research should focus on deeper integration of tracking and biomechanical data, the advancement of explainable and uncertainty-aware modeling, and the development of robust ethical and governance frameworks that ensure AI deployment remains fair, transparent, and aligned with the spirit of sportsmanship.

Table 1. Model evaluation integrates both quantitative and qualitative dimensions:

Evaluation Dimension	Example Metrics
Predictive Accuracy	ROC-AUC, F1-score, Mean Absolute Error (MAE), R^2
Decision Utility	Expected Goals Added (xGA), time-to-decision reduction, officiating latency improvement
Human Factors	Usability, interpretability, and trust (via structured interviews and coach feedback)

This multi-layered validation ensures models are not only statistically sound but also operationally relevant.

Table 2. Dataset Description and Structure

Attribute Category	Examples of Fields	Purpose / Use
Identification	Name, Age, Nationality, Club, Position	Player metadata
Physical & Technical Attributes	Pace, Shooting, Passing, Dribbling, Defense, Physical	Core skill indicators
Derived Ratings	Overall, Potential, Special, Preferred Foot	Performance metrics
Financial Variables	Value, Wage, Release Clause	Economic evaluation
Contextual Factors	Height, Weight, Work Rate, Body Type	Physiological &behavioral aspects

ABSTRACT

In physical facilities to customers, customer loyalty in banking industry in customer relationship management is an essential role for increasing the customer. In this paper researcher focuses to know the how Physical facilities offered by the Bank for the customers to acquire customers and to know the level of Customer Loyalty with the bank. For this study researcher collected data from 231 respondents by using convenience sampling. In this study some statistical tools like percentage analysis, one sample t-test, independent sample t-test were used to know the output level. The study revealed that through physical facilities the bank can fulfil the needs of the customers, gain more customers from the market and increase the loyalty among the customers.

Key words: Customer relationship management, Customer Loyalty, Physical Facilities

INTRODUCTION

Customer relationship management (CRM) is an approach to managing banks' engagement with current and potential customers, aimed at gaining loyal customers. It focuses on data analysis and evaluating customer history to improve relationships, especially customer retention and revenue growth. All banks plan to run a CRM program to

acquire customers who collect information from various communication channels such as websites, telephones, emails, live chats and social media. By using CRM system and tools, banks understand customers better. CRM aims to provide consumers with benefits and establish strong connections. However, not all Banks prioritize customer relationship management.

CRM is primarily concerned with customer-focused companies that aim to build long-term mutually beneficial relationships. It helps identify and convert potential customers and foster new relationships based on past records and new customers. Customer relationship management (CRM) is a strategy that focuses on understanding customers as individuals rather than as part of a group. It involves managing the relationship between a bank and its customers. Many businesses, including banks, insurance companies, and other service providers, recognize the importance of CRM in acquiring new customers, retaining existing ones, and increasing their lifetime value. The banking sector is introducing innovative products and branch networking to improve customer experience. However, the bank is highly competitive, leading to a shift towards relationship-based marketing (CRM) to combat customer churn and increase loyalty. CRM implementation success depends on quality interactions with customers across segments and developing relationships that meet their changing needs. Building cooperative and collaborative relationships with customers is critical to business growth and profitability.

Objectives of the study

a. To know the physical facilities provided by the bank for customers to acquire new customers.
b. To know the level of Customer Loyalty with the bank.

Statement of the problem

In the current scenario in the banking industry, with the emergence of new banks in rural, semi-urban and urban areas, the banking industry has to focus and compete with rival banks, even as they offer new offerings to customers everywhere. In this regard, banks have realized that customer relationship management is the best strategy to improve customer loyalty and customer convenience is essential. After that it is the bank customers who increase the profits.

REVIEW OF LITERATURE

Dr. Zakaria Ahmad and Mohmmad Azzam, in their study they focused on Jordan's competitive banking industry, where building a strong relationship with customers is key to achieving their satisfaction. Customer relationship management (CRM) plays a significant role in this industry, especially in Jordanian banks operating in Amman city. A study of 528 respondents found a significant relationship between CRM components (service quality, employee behavior, customer database, problem solving, physical environment, and social network interaction) and customer satisfaction. However, there is no statistical relationship between CRM components and customer satisfaction as a dependent variable.

Luigi Pio Leonardo Cavalierea et al in their study emphasized on the implementation of CRM strategies can positively affect customer satisfaction and knowledge. It helps build stronger connections between sales people and their clients. A study conducted on 100 bank clients found a link between CRM technology implementation and customer happiness, with more CRM technology implementation leading to greater customer satisfaction rates. The study used quantitative methods and SPSS statistical software to analyze the data. Dr. K.K Ramachandran, in his study he concentrates on the banking sector prioritizes customer satisfaction and loyalty in order to remain competitive and successful in today's marketplace. Customer Relationship Management (CRM) is a tool used by financial institutions to manage interactions with customers and automate key business processes. The effectiveness of CRM is measured by its impact on customer satisfaction and loyalty. To achieve their goals, organizations must focus on providing exceptional customer service and understanding customer needs and attitudes. CRM is a complex

phenomenon that requires careful consideration of specific measures and dimensions that influence customer satisfaction and loyalty. The research aims to measure the effectiveness of CRM on customer satisfaction and loyalty in the banking industry. Zahir Osman and Ilham Sentosa the study aims to understand the mediating effect of customer satisfaction on service quality satisfaction and customer loyalty in the Malaysian commercial banking industry. Structural Equation Model (SEM) was used to analyze the casual relationships among customer satisfaction, customer trust, and customer loyalty. Results indicate that service quality enhances customer satisfaction and customer satisfaction partially mediates the relationship between service quality and customer loyalty. Further research is needed to investigate the role of customer satisfaction in the industry. The study suggests that customer satisfaction plays a crucial role in the Malaysian commercial banking industry's profitability. This research is among the first to use PROCESS to test the mediation effect.

Thin Thiri Htay, in his study examines the impact of customer relationship management practices on premium customer satisfaction and loyalty at KBZ Bank Taunggyi. The research focuses on 140 premium customers who deposited at least 100 million kyats in KBZ Taunggyi Bank. Both primary and secondary data were used, with regression analysis utilized to evaluate the impact of CRM dimensions on customer satisfaction and loyalty. The study highlights that CRM-based technology and quality of customer service significantly impact premium customer satisfaction and loyalty. The findings suggest that KBZ Bank Taunggyi should prioritize CRM-based technology factors, such as speed of banking service and queue management system usage, and emphasize quality customer service factors, including prompt reception of response to customer requests and problem resolution guidance, to improve customer satisfaction and loyalty.

Sulaiman, Said Musnadi, in his study analyzed the impact of Customer Relationship Management (CRM) on Customer Satisfaction and Customer Loyalty in Islamic Bank in Aceh's Province. The sample size was 250 respondents, and the study used structural equation modeling (SEM). The results indicated that CRM has a significant impact on both customer satisfaction and loyalty. In addition, customer satisfaction mediates the relationship between CRM and loyalty. The study suggests that Islamic Bank needs to enhance its CRM program to improve customer loyalty. Pushpender Kumar and Anupreet Kaur Mokha in their study the banking industry is undergoing rapid changes due to the evolution of Information and Communication Technologies (ICTs). To maintain lasting relationships with customers, banks have implemented Electronic Customer Relationship Management (E-CRM) to improve customer service quality and efficiency. A study conducted on 300 customers using E-CRM services from Delhi/NCR's public and private sector banks found that all six dimensions of E-CRM (customized products/services, transaction security/privacy, alternative payment methods, problem-solving, online feedback, and FAQs) have a significant positive relationship with customer loyalty. Improving E-CRM practices can help banks establish better interactions with their customers and achieve a competitive advantage. This study's results have academic and managerial implications, contributing to the existing knowledge base and aiding E-CRM managers in decision-making.

Peter Anabila1 & Dadson Awunyo-Vitor, in their study the Ghanaian banking industry faces stiff competition, necessitating strategic options like Customer Relationship Management (CRM). A study assessing the relationship between CRM and customer loyalty found a strong positive relationship. Banks assigned relationship managers to address individual customer needs, but staff perception was more positive than customers. The study recommends banks continue CRM practices and effectively communicate their policy to customers to improve customer loyalty. Additionally, introducing loyalty programs could enhance customer loyalty. Tahmeem Siddiqi et al (2018) in their study they examined the impact of CRM on customer loyalty in Bangladeshi banks. It focuses on three dimensions: technology adoption, trust, and complaint handling. The research, conducted on 210 respondents, found a significant relationship between these variables and customer loyalty. The findings contribute to existing CRM theory and can help practitioners improve their managerial strategies to retain loyal customers. The study's findings can help banks retain their customers in the competitive financial industry. Hadi Hajiyanaet al, in their study investigates the impact of customer relationship management (CRM) on customer loyalty in the Iranian banking industry. A questionnaire

was distributed to 65 customers at Bank Melli Iran in Semnan. The results showed a high Cronbach alpha of 0.939, indicating CRM implementation could enhance service quality.

From the above table the result shows, it was observed from the analysis 52.8% of the respondents were replied from Male, 35.9% of the respondents responded from the category of below 22 in the age group, 52.8% of the customers were responded from Unmarried category, 39.8% of the customers are having their HSC Qualification, 69.7% of the customers are earning their monthly income in the category of below 25000, 35.1% of the respondents having relationship below 3 years of experience with bank.

Hypothesis I: Opinion of the customers regarding statements on Physical facilities is equal to Average level.

significance at 5% level

From the table 2, the p value of variables namely Banks Maintain Ventilation and Lighting Facilities (4.54), Banks Offers Drinking Water Facility (4.26), Bank Provides Sufficient Chairs and Tables (4.23), Bank Gives Lift Facility For their Customer (3.39), Bank Arranged Parking Facility (3.79), Provides the Toilet Room Facility (3.73), Clean Maintenance of Bank (4.41), Giving the AC and Ceiling Fan Facility (4.42), Wheelchair Accessible Facility (3.69), Maintenance of Sanitizer (4.22) is less than 0.01 at 1% level of significance. Hence null hypothesis is rejected. It concludes that there is a significance difference in the factors of physical facilities among the respondents. From the table 3, the p value of variables namely, I recommend the banks to my friends and relatives (4.39), I Refer Banks Products to the Customers (3.87), I convey the banks services (3.61), I Convey the Positive Information of the Bank (3.54), Maintenance of Close Contact With the Employees (3.87), User Friendly When I run my transactions (3.94), My Bank Gives me Full Secured For My Transaction (3.98), and I Have Full Trust In My Bank (4.26) are less than 0.01 at 1% level of significance. Hence null hypothesis is rejected. It concludes that there is a significance difference in the factors of customer loyalty towards customer relationship management in banking sectors.

Since P value is less than 0.01, null hypothesis is rejected at 1% level with regard to factors of Ventilation and Lighting Facilities, Sufficient Chairs and Tables, Lift Facility, Parking Facility and Toilet Room Facility. Hence there is significance difference between male and female of customers with regard to the factors of Ventilation and Lighting Facilities, Sufficient Chairs and Tables, Lift Facility, Parking Facility and Toilet Room Facility. Based on mean score, the male customers have better in Ventilation and Lighting Facilities, Sufficient Chairs and Tables, Lift Facility, Parking Facility and Toilet Room Facility than female customers because maximum male customers using banks frequently to keep touch in bank for the purpose of depositing, transaction, mutual fund, pension scheme came to the banks.

Since P value is less than 0.05, the null hypothesis is rejected at 5% level, with regard to factors of AC and ceiling fan facility and Maintenance of sanitizer on Physical facilities offered by the bank. Hence there is significance difference between male and female of customers with regard to the factors of AC and ceiling fan facility and Maintenance of sanitizer on Physical facilities offered by the bank. Based on mean score, the Male customers have better usage in AC and ceiling fan facility and Maintenance of sanitizer because most of the family male customers are dealing with financial transaction with the bank such as EMI payment, to take Demand Draft and Cheque from the banks. There is no significance difference between male and female of customers with regard to Drinking water facility, clean maintenance and Wheelchair accessible facility. Since p value is greater than 0.05, Hence the null hypothesis is accepted at 5% level with regard to Drinking water facility, clean maintenance and Wheelchair accessible facility.

Since P value is less than 0.01, null hypothesis is rejected at 1% level with regard to factors of Recommend to my friends and relatives, Positive information of the bank and User friendly. Hence there is significance difference between Married and Unmarried of customers with regard to the factors of Recommend to my friends and relatives, Positive information of the bank and User friendly**.** Based on mean score, the married customers have better contact with bank in Recommend to my friends' relatives than Unmarried customers because most of the married customers

are having already experience in all the banks. Based on mean score, the Unmarried customers are having better in and Positive information of the bank and User friendly than the Married customers because in the present situation maximum number of the graduate opened savings account to get scholarship and salaried account that the main reason they dealing with frequent visit and also feel comfortable by the customers.

Since P value is less than 0.05, the null hypothesis is rejected at 5% level, with regard to factors of Convey the Services and Full Secured for My Transaction**.** Hence there is significance difference between married and unmarried of customers with regard to the factors of Convey the Services and Full Secured for My Transaction**.** Based on mean score, the Unmarried customers have better than male. There is no significance difference between married and unmarried of customers with regard to Refer Products to the Customers, Maintenance of Close Contact and I Have Full Trust. Since p value is greater than 0.05, Hence the null hypothesis is accepted at 5% level with regard to Refer Products to the Customers, Maintenance of Close Contact and I Have Full Trust.

SUGGESTIONS

- Provide educational resources and workshops to help customers improve their financial literacy and achieve their financial goals
- Introduce loyalty programs that reward customers for their continued business with benefits such as cash back, discounts on services or exclusive perks.
- Update physical branches with modern designs comfortable seating areas, and advanced self-service machines to provide a welcoming atmosphere for customers.
- Train staff to provide personalized assistance and financial advice, fostering stronger relationships with customers
- Host events and workshops within branches to engage with the local community and build trust among customers
- Implement robust security measures to protect customer data and reassure them of the safety of their financial transactions.
- Collect feedback from customers regularly to understand their needs and preferences, and make necessary improvements to enhance their banking experience.

CONCLUSION

CRM is the most valuable approach in maintaining and establishing relationships with customers. Facilities of the customers needed to be upgrading which is really attract the customers and how to stabilize the current customers. Bank need to respond quickly that way really increase the trustworthiness among the customers. Banks should be aware of the fact that a bank 's interaction with its clients, through employees to establishment CRM that may helpful to the bank to increase and to availability of physical facilities for potential customers even though the CRM is making chance to foster that customer loyalty. If the focus on customers and banks that frequent and consistency level of sharing each other means the might be fruitful to the banks. Ultimately by investing in both physical facilities and customer centric strategies, banks can create a more inviting, efficient, and responsive environment, leading to higher customer satisfaction and loyalty. this strategic approach not only strengthens customer relationships but also enhances the overall competitiveness and reputations of the bank in the market place.

ABSTRACT

The rapid growth of digital technologies has significantly transformed marketing practices, making digital marketing a crucial tool for businesses to engage with customers. This study aims to examine customer attitude towards digital marketing with specific reference to Bengaluru Rural District, focusing on three key determinants: awareness, perceived usefulness, and ease of use. The research investigates how these factors influence customer perceptions and behavioral responses towards digital marketing platforms. A structured questionnaire was administered to a sample of respondents, and the collected data were analyzed using statistical techniques such as correlation and regression analysis. The study tests three major hypotheses relating to the influence of awareness, perceived usefulness, and ease of use on customer attitude. The findings reveal that customer awareness of digital marketing significantly influences their attitude, indicating that informed consumers tend to develop more favorable perceptions. Similarly, perceived usefulness emerges as a strong determinant, suggesting that customers are more inclined towards digital marketing when they find it beneficial and relevant to their needs. Furthermore, ease of use is found to have a significant positive impact, highlighting the importance of user-friendly digital platforms in shaping customer attitudes. The study concludes that enhancing awareness, improving the perceived value, and ensuring ease of use are critical for strengthening customer engagement in digital marketing. These insights are valuable for marketers and businesses in designing effective digital strategies tailored to rural and semi-urban populations.

Keywords: Digital Marketing, Customer Attitude, Awareness, Perceived Usefulness, Ease of Use, Consumer Behavior, Online Platforms, Social Media Marketing, Purchase Intention, User Experience.

INTRODUCTION

The rapid advancement of information and communication technologies has brought a revolutionary transformation in the field of marketing [1]. Traditional marketing methods such as print media, television, and radio are gradually being supplemented and, in many cases, replaced by digital marketing strategies. Digital marketing refers to the use of internet-based platforms, electronic devices, and digital channels such as social media, search engines, email, and mobile applications to promote products and services [2]. In recent years, the widespread adoption of smartphones and affordable internet connectivity has significantly contributed to the growth of digital marketing. Businesses are increasingly leveraging digital platforms to reach a broader audience, engage customers in real time, and provide personalized experiences [3] [4]. Digital marketing not only enhances brand visibility but also enables organizations to track customer behavior and measure the effectiveness of their campaigns more efficiently compared to traditional methods [5].

India has witnessed remarkable growth in internet users, including in rural and semi-urban regions. Government initiatives such as Digital India have further accelerated digital adoption across the country [6]. As a result, even customers in rural areas are gradually becoming active participants in the digital ecosystem. However, the level of digital awareness, accessibility, and acceptance varies significantly between urban and rural populations [7] [8] [9]. Customer attitude plays a crucial role in determining the success of digital marketing efforts [10]. Attitude refers to a consumer's overall evaluation, perception, and behavioral tendency towards a particular product, service, or marketing practice [11] [12]. In the context of digital marketing, customer attitude is influenced by several factors such as awareness, perceived usefulness, and ease of use [13]. Awareness is the first step in the adoption process, as customers need to be informed about digital platforms and their benefits [14]. Perceived usefulness refers to the extent to which customers believe that digital marketing adds value to their purchasing decisions, such as saving time, providing better information, or offering attractive deals. Ease of use reflects how simple and convenient it is for customers to interact with digital platforms [14]. Understanding these factors is essential for businesses to design effective digital marketing strategies that align with customer expectations and preferences.

Problem Statement and Research Gap

In recent years, digital marketing has emerged as a dominant force in influencing consumer behavior, driven by increased internet penetration, smartphone usage, and the expansion of online platforms. While urban populations have widely adopted digital marketing channels, the response and attitude of customers in rural and semi-urban regions, such as Bengaluru Rural District, remain less explored. Customers in these areas may face challenges such as limited awareness, low digital literacy, trust issues, and difficulties in using digital platforms effectively. Despite the growing presence of digital marketing initiatives by businesses, there is uncertainty regarding how customers perceive and respond to these efforts. Specifically, factors such as awareness, perceived usefulness, and ease of use play a crucial role in shaping customer attitudes, yet their combined influence in rural contexts is not fully understood. Without a clear understanding of these determinants, marketers may struggle to design effective strategies tailored to this segment. Therefore, this study seeks to analyze customer attitude towards digital marketing by examining the impact of awareness, perceived usefulness, and ease of use among consumers in Bengaluru Rural District, thereby providing insights into improving digital marketing effectiveness in emerging markets.

RESEARCH OBJECTIVES

⇒ To analyze the level of customer awareness regarding digital marketing platforms and practices.
⇒ To evaluate the influence of awareness on customer attitude towards digital marketing.
⇒ To examine the perceived usefulness of digital marketing among customers.
⇒ To assess the impact of perceived usefulness on customer attitude towards digital marketing.
⇒ To study the ease of use of digital platforms from the customers' perspective.
⇒ To determine the influence of ease of use on customer attitude towards digital marketing.

⇒ To identify the relationship between key determinants (awareness, perceived usefulness, and ease of use) and customer attitude.
⇒ To examine the overall effectiveness of digital marketing in shaping customer perceptions in rural and semi-urban areas.
⇒ To analyze the challenges faced by customers in adopting digital marketing platforms.
⇒ To provide suggestions for improving digital marketing strategies based on customer attitude in Bengaluru Rural District.

RESEARCH METHODOLOGY

Research Design
The study adopts a descriptive and analytical research design. The descriptive approach is used to understand the characteristics and attitudes of customers towards digital marketing, while the analytical approach is employed to examine the relationships between variables such as awareness, perceived usefulness, ease of use, and customer attitude.

Nature of the Study
This research is **quantitative in nature**, as it involves the collection and analysis of numerical data using statistical tools to test the formulated hypotheses.

Data Sources
Primary Data
Primary data is collected directly from respondents through a **structured questionnaire** designed using a Likert scale (typically 5-point scale ranging from strongly disagree to strongly agree). The questionnaire captures responses related to:

- Awareness of digital marketing
- Perceived usefulness
- Ease of use
- Customer attitude

Secondary Data
Secondary data is gathered from:

- Research journals
- Books and academic publications
- Reports on digital marketing
- Government and industry websites

Sampling Design
Sampling Technique
The study uses anon-probability sampling technique, specifically convenience sampling, due to ease of access to respondents in Bengaluru Rural District.

Sample Size
A sample size of300–500 respondents is considered appropriate to ensure statistical reliability and validity of the results.

Sampling Unit
The sampling unit consists of customers residing in Bengaluru Rural District who have exposure to digital platformssuch as social media, online shopping, or digital advertisements.

Hypothesis Testing

The hypotheses are tested at a **5% level of significance ($p < 0.05$)**.

If p-value < 0.05 → Reject Null Hypothesis (H_0)

If p-value ≥ 0.05 → Accept Null Hypothesis (H_0)

DATA ANALYSIS AND INTERPRETATION

Impact of Customer Awareness on Attitude towards Digital Marketing

⇒ **Null Hypothesis**: Customer awareness of digital marketing has no significant influence on their attitude.

⇒ **Alternative Hypothesis**:Customer awareness of digital marketing has a significant influence on their attitude.

Table 1 presents the **model summary statistics** for the regression analysis examining the relationship between customer awareness and customer attitude towards digital marketing. The table includes the correlation coefficient (R), coefficient of determination (R^2), adjusted R^2, and standard error of estimate.

Interpretation

The R value of 0.742 indicates a strong positive correlation between awareness and customer attitude. The R^2 value of 0.551 suggests that 55.1% of the variation in customer attitude is explained by awareness. The adjusted R^2 (0.550) confirms the model's reliability. The standard error of 0.412 indicates a reasonable level of accuracy in prediction. Overall, the model shows a strong explanatory power. Table 2 shows the Analysis of Variance (ANOVA) results, which test the overall significance of the regression model. It compares the variance explained by the model with the unexplained variance.

Interpretation

The F-value of 1622.14 is highly significant with a p-value of 0.000, which is less than the 0.05 significance level. This indicates that the regression model is statistically significant and that awareness significantly predicts customer attitude. Therefore, the model is a good fit for the data. Table 3 presents the regression coefficients, including the unstandardized coefficient (B), standard error, standardized coefficient (Beta), t-value, and significance level for the independent variable (awareness).

Interpretation

The coefficient value (B = 0.685) indicates that a one-unit increase in awareness leads to a 0.685 unit increase in customer attitude. The standardized beta value ($\beta = 0.742$) shows a strong positive influence of awareness. The t-value (40.284) is highly significant with a p-value of 0.000, confirming that awareness is a significant predictor of customer attitude.

Impact of Perceived Usefulness on Customer Attitude towards Digital Marketing

⇒ **Null Hypothesis**: Perceived usefulness of digital marketing does not significantly affect customer attitude.

⇒ **Alternative Hypothesis**: Perceived usefulness of digital marketing significantly affects customer attitude.

Table 4 presents the model summary statistics for the regression analysis examining the relationship between perceived usefulness and customer attitude. It includes the correlation coefficient (R), coefficient of determination (R^2), adjusted R^2, and standard error.

Interpretation

The R value of 0.768 indicates a strong positive relationship between perceived usefulness and customer attitude. The R^2 value of 0.590 implies that 59% of the variation in customer attitude is explained by perceived usefulness. The adjusted R^2 (0.589) confirms the robustness of the model. The standard error (0.395) indicates a good level of prediction accuracy. This suggests that perceived usefulness is a strong explanatory factor.

Table 5 shows the ANOVA results, which assess the overall significance of the regression model by comparing explained and unexplained variance.

Interpretation

The F-value of 1792.82 is highly significant with a p-value of 0.000, which is less than 0.05. This indicates that the regression model is statistically significant and that perceived usefulness has a meaningful impact on customer attitude. The model is therefore considered a good fit. Table 6 presents the regression coefficients, indicating the strength and direction of the relationship between perceived usefulness and customer attitude.

Interpretation

The coefficient (B =0.712) shows that a one-unit increase in perceived usefulness results in a0.712 unit increase in customer attitude. The standardized beta ($\beta = 0.768$) indicates a strong positive influence. The t-value (42.338) with a significance level of 0.000 confirms that perceived usefulness is a statistically significant predictor.

Impact of Ease of Use on Customer Attitude towards Digital Marketing

⇒ **Null Hypothesis**: Ease of use of digital platforms has no significant impact on customer attitude.

⇒ **Alternative Hypothesis**: Ease of use of digital platforms has a significant impact on customer attitude.

Table 7 presents the model summary for the regression analysis between ease of use and customer attitude, including correlation and explanatory power.

Interpretation

The R value (0.731) indicates a strong positive relationship. The R^2 value (0.534) shows that 53.4% of variation in customer attitude is explained by ease of use. The adjusted R^2 (0.533) supports the consistency of the model. The standard error (0.421) indicates acceptable prediction accuracy. Table 8 provides the ANOVA results for testing the significance of the regression model.

Interpretation

The F-value (1495.26) is statistically significant with a p-value of 0.000, indicating that ease of use significantly influences customer attitude. The model is therefore statistically valid. Table 9 shows the regression coefficients, highlighting the influence of ease of use on customer attitude.

Interpretation

The coefficient (B = 0.662) indicates that a one-unit increase in ease of use leads to a 0.662 unit increase in customer attitude. The standardized beta ($\beta = 0.731$) confirms a strong positive relationship. The t-value (38.660) with a significance level of 0.000 indicates statistical significance.

CONCLUSION

The study concludes that digital marketing has become an essential tool for influencing customer behavior, even in rural and semi-urban regions like Bengaluru Rural District. The findings clearly indicate that awareness, perceived usefulness, and ease of use are critical determinants of customer attitude towards digital marketing. Among these factors, perceived usefulness plays the most significant role, emphasizing that customers value meaningful and beneficial interactions over mere exposure to digital content. Awareness also contributes significantly by enabling customers to understand and engage with digital platforms, while ease of use ensures accessibility and convenience, which are essential for sustained adoption. The study highlights that customers are increasingly open to digital marketing, provided that it is relevant, easy to understand, and user-friendly. However, challenges such as limited digital literacy and trust issues still exist and need to be addressed.

Overall, the research provides valuable insights for businesses and marketers to design effective digital strategies tailored to rural consumers. By focusing on improving awareness, enhancing perceived value, and simplifying user experience, organizations can significantly improve customer attitude and engagement with digital marketing platforms.

ABSTRACT

Muthuramalinga Thevar was an astute observer of India's economic climate both before and after independence, making him an influential politician throughout both times. Throughout his life, he stood with the underprivileged and worked to dispel the stigma of economic backwardness for the oppressed. He stood for the emancipation of enslaved people from the darkness of slavery. He yearned for a world where people could live without fear of starvation or poverty. The evacuation of society's highs and lows was something he was enthusiastic about. It was clear from Muthuramalinga Thevar that the oppressed economic condition of India persisted even after the English granted more freedom, as the labourers continued to face starvation and showed no shift in their economic beliefs. Action that Muthuramalinga Thevar suggested for improving rural India and its agricultural inhabitants. He generously shared his plenty with those in need. Variations in progress should be eliminated to achieve an equal and fair distribution of plenty. Because of his flawless practical business efforts, Muthuramalinga Thevar was not accused of anything. Because he could not bear to see the plight of the economically disadvantaged and the oppressed, he welcomed many disadvantaged youths into his house, provided them with food and clothing, and made no judgments about their motivations or abilities.

Keywords: Unemployment, price fixing, Indian Government, Economy, Ration system, Agriculture, Economic Landscape.

INTRODUCTION

Muthuramalinga Thevar was a politician and a remarkable personality whose legacy still inspires many today. Born in a rural area, he was a landowner and held distinct economic perspectives that set him apart from his contemporaries. Despite his association with the Congress party, which leaned towards socialism [1], Thevar remained open-minded and unbound by rigid community ideologies. He believed in a pragmatic approach to politics and was well- versed in economic trends and circumstances, which made him a valuable asset in pre- and post-independence India. One of Thevar's most significant contributions was his consistent advocacy for the welfare of people experiencing poverty. He aimed to uplift the downtrodden from the shadows of economic backwardness, emphasising the need to eradicate societal inequalities and liberate people from hunger and deprivation. This commitment was evident in his roles as a member of the Madras Legislative Assembly and the Indian Parliament. Examining Thevar's economic perspectives becomes crucial in evaluating his contributions, especially in the context of British exploitation of both agricultural and industrial wealth in the Indian subcontinent. He understood the importance of economic development and worked tirelessly to uplift society's poor and marginalised sections. His vision extended beyond political affiliations and emphasised the need for a holistic approach to development that would benefit all sections of society. Thevar's unique insight and discipline made him stand out in a sea of politicians. He carried the torch of honour and succeeded other politicians of his time, impacting Indian politics. His contributions to the country's economic and social development continue to inspire generations, making him one of the most remarkable personalities of his time.

Scientific Approach to Agriculture

Muthuramalinga Thevar was a prominent Indian politician and social reformer who advocated for a pragmatic economic approach to address rural India's challenges. He believed that the key to rural development was adopting scientific methods in agriculture and fair land allocation to all sections of society. One of Thevar's most significant contributions was his proposal to allocate land to Harijans (formerly known as untouchables), allowing them to cultivate and earn a living without resorting to servitude or wage labour. He recognised that land ownership was a crucial factor in rural communities' economic and social empowerment and was an essential step towards ending the exploitation of the lower castes. To prevent the migration of unemployed rural farmers to urban industrial centres, Thevar advocated introducing scientific agricultural practices. He believed this would increase farm productivity and create more job opportunities in rural areas, reducing poverty and inequality. Thevar also stressed the importance of fair compensation for labour and proposed an upper limit on wealth, similar to the land ceiling for landowners. He believed this would ensure that wealth was distributed more equitably in society and that all shared the benefits of economic growth. Muthuramalinga Thevar's economic approach emphasised the importance of science, social justice, and fair distribution of resources. His ideas continue to influence policymakers and social reformers in India today, and his legacy inspires those seeking to build a more just and equitable society [2].

Exploring the World Beyond Borders

Thevar, a prominent leader and politician in Tamil Nadu, was a staunch advocate of India's self-reliance and emphasised the need to utilise domestic resources to sustain a developed economy. He believed foreign investments were unnecessary for the country's progress and that India should strive to achieve economic independence through local capabilities. Thevar's economic ideas were deeply rooted in his understanding of the financial challenges faced by independent India due to the long period of foreign rule and the improper utilisation of natural resources. He believed that India's vast natural resources could be the key to the country's economic development if utilised effectively [3]. Thevar's vision for a self-sufficient economy was not limited to utilising domestic resources. He also believed in promoting local industries and businesses to create more job opportunities and reduce India's dependency on foreign goods. This, in turn, would boost the country's economic growth and build a sense of national pride and self-esteem among its citizens. Thevar's economic ideas were based on self-reliance, utilisation of domestic resources, and promoting local industries and businesses.

Government Role and Economic Equality

In his critique of the economic policies in place, Thevar highlighted several shortcomings hindering the growth and development of the country's economy. One of the primary issues he identified was the lack of effective implementation of taxation policies. He argued that the government needed to focus on creating a more equitable taxation system that would benefit everyone, including groups with limited income. Thevar also criticised the ration systems in place, which he believed were inefficient and ineffective in providing necessities to the people [4]. He emphasised the need for a more streamlined and efficient system to ensure everyone had access to essential commodities. Another issue Thevar highlighted was the suppression of workers' unions, which he believed were essential for protecting the rights and interests of the working class. He argued that the government needed to strengthen these unions and ensure their employers did not exploit workers.

Thevar also drew attention to the neglect of small-scale ventures in rural areas, which he believed were crucial for developing the country's economy. He proposed several measures to promote the growth of these ventures, including cooperative farming and expanded insurance coverage. He proposed tax exemptions for groups with limited income to address these issues. He implemented effective, comprehensive, and long-term solutions to address economic challenges, especially during droughts and other crises [5]. Thevar emphasised the need for the government to take prompt and effective action to address the country's economic challenges. He believed implementing the right policies and measures could create a more equitable and prosperous society.

Social Welfare and Disaster Management

Thevar was critical of the Western economic model in the Indian context and urged against foreign exploitation. He believed that the Indian economy should be based on indigenous resources and that foreign interference should be minimised. He also emphasised the importance of promoting local industries and using local resources to boost the economy. One of Thevar's proposals was to promote need-based education. He believed education should be geared towards the community's needs rather than focusing solely on academic excellence. He also proposed providing affordable loans through cooperative banks to help small businesses and farmers, often marginalised in the mainstream banking system. Thevar was also concerned about the root causes of unemployment and infectious diseases. He believed these issues could be addressed by providing skills training to the youth and improving access to healthcare services. He also advocated for infrastructure development, such as roads and electricity, to stimulate economic growth and create job opportunities. His ideas continue to inspire many in Tamil Nadu and beyond as they seek to build a more equitable and just society.

Food Crisis and Economic Management

In the 1950s, Tamil Nadu, a southern state in India, faced a severe food crisis that significantly impacted the health and well-being of the middle class. The crisis was caused due to poor monsoons, crop failures, and the government's inability to handle the situation effectively. As a result, food prices skyrocketed, and the availability of essential commodities like rice, grains, and pulses became scarce. During this crisis, Thevar, a prominent leader and social activist, took a stand against the government's inaction and highlighted the detrimental impact of rising food prices and adulteration. Thevar realised that the middle class, already struggling to make ends meet, was the worst affected by the food crisis. He raised his voice and urged the government to take immediate measures to address the issue. Thevar's efforts did not go in vain, and his activism brought attention to the crisis. The government took note of the situation and implemented measures to control food prices and increase the availability of essential commodities. These efforts helped to alleviate the suffering of middle-class families in Tamil Nadu [6]. In addition to advocating for proactive disaster management, Thevar also emphasised the importance of water storage, uniform compensation for relief work, reduced taxes, and financial aid for affected families. He believed such measures would help mitigate the effects of natural disasters and prevent their long-term impact on vulnerable communities. His emphasis on effective governance, economic empowerment, and disaster management is particularly relevant today, as we face a changing climate and an increasing number of natural disasters.

Ending Zamindari System for Economic Equality

Thevar was a prominent leader and political activist who played a significant role in the Madras Presidency's abolition of the Zamindari system during the early 20th century. This system had long been a substantial source of exploitation of farmers and tenants in the region. Thevar recognised the need to dismantle it to create a more equitable and just society. As a socialist, Thevar believed that economic structures should be geared towards uplifting society's oppressed and marginalised sections. He thought that a socialist economy would be the key to helping people move out of poverty and into higher social statuses. He fought against discrimination and injustice, and his efforts helped to raise awareness of the struggles faced by these communities. Thevar's legacy is one of social justice and equality. He believed everyone should have the same opportunities and resources, regardless of their social status or background. His work helped to lay the foundation for a more just and equitable society in India [7].

Economic Equity Maintenance

Muthuramalinga Thevar was a prominent social reformer and politician who played a crucial role in India's struggle for independence. He was known for emphasising economic equities to eradicate poverty and enhance the quality of life for all citizens. According to Thevar, true freedom could only be achieved by addressing inflationary conditions and ensuring reasonable prices for goods. He believed that economic development was essential to nation-building and that all sections of society must have equal access to economic opportunities. Throughout his career, Thevar worked tirelessly to promote inclusive growth and development. He advocated for policies benefiting farmers, workers, and other marginalised groups and fought against discrimination and inequality. His vision of a just and equitable society inspires people across India and beyond. Today, many social and political organisations continue to draw inspiration from Thevar's legacy and strive to build a more prosperous and inclusive future for all.

Thevar’s Focus on Indian Market Growth

Thevar’s economic philosophy was equally noteworthy, as he believed in promoting the growth of Indian markets and protecting the interests of the local economy. Thevar emphasised the importance of Swadeshi, which means "of one's country" or "indigenous" in Sanskrit. He advocated for an Indian economy that suits the local circumstances rather than unthinkingly pursuing global markets. Thevar was wary of foreign involvement and investment in Indian industries, believing it would harm the economy. He particularly stressed the need to safeguard small-scale businesses, home industries, and the agricultural sector from being dominated by foreign interests. Thevar was critical of concepts like development, globalisation, and privatisation, viewing them as obstacles to the well-being of the local economy. He believed that if not balanced with agricultural development, industrialisation would widen the wealth gap between the rich and the poor. Thevar suggested introducing simultaneous agricultural and industrial revolutions to address unemployment issues and support the youth [8]. Muthuramalinga Thevar's economic philosophy was unique and grounded in principles prioritising the local population's well-being. His emphasis on Swadeshi, self-reliance, and sustainable economic development is still relevant today and has inspired many to pursue economic policies that are beneficial to all [9].

Thevar's Opinion on Economic Improvements

Pasumpon Muthuramalinga Thevar was an Indian freedom fighter and politician who advocated for policies that aimed at eliminating economic inequalities and implementing fair and consistent measures applicable to all citizens. He believed in the redistribution of wealth and land reforms to ensure that the benefits of economic growth were distributed equally among all sections of society. Thevar supported land reforms, including a land ceiling in rural and urban areas to prevent the concentration of land in the hands of the wealthy. He argued that the concentration of land in the hands of the few was a significant obstacle to economic growth and social justice in India. Thevar believed that land reforms would help provide livelihood security to the landless, promote agricultural productivity, and reduce poverty in rural areas [10]. Thevar was a strong advocate for the need to address economic issues with a focus on the well-being of the majority rather than catering to the interests of the affluent class. He believed economic policies should benefit the ordinary people, not just the rich and powerful. Thevar's vision for economic reforms was based on the principles of justice, equality, and social welfare. Thevar was a visionary leader whose ideas on economic improvements were far ahead of his time. He recognised that economic inequalities were one of the biggest

challenges faced by society and believed that the key to addressing them was to promote social justice. He advocated for land reforms and policies to redistribute wealth to create a more just and equitable society. His proposals were not only focused on short-term gains but also aimed at long-term sustainability and growth. Thevar's ideas continue to inspire people to this day and serve as a reminder that economic progress must be accompanied by social justice and fairness [11]. Thevar was a visionary leader committed to building an inclusive and equitable society [12]. His economic vision was based on social justice and progress principles and he believed in using technology and innovation to improve people's lives. His legacy inspires generations of leaders to work towards creating a just and prosperous society. In addressing economic challenges, Thevar proposed measures such as controlling interest rates charged by moneylenders, preventing exploitation of people with low incomes, and ensuring timely repayment of loans. He criticised the government for handling natural disasters and urged proactive measures to protect the population and their livelihoods [13]. Thevar also stressed the importance of efficient governance in handling crises and relieving affected individuals.

Thevar's pragmatic economic ideas focused on tangible solutions to uplift the masses and create a more equitable society. He believed economic development should not be limited to a select few but benefit the entire population. His emphasis on social considerations in economic development set him apart from other leaders of his time, and his legacy continues to inspire people today [14].

Economic Welfare Activities

Muthuramalinga Thevar was a strong advocate of economic welfare activities and was deeply committed to addressing the issues faced by the underprivileged sections of society. Thevar was critical of the government's noon meal plans, which he believed adversely affected children's studies. According to him, the children had to waste their time collecting rice when their parents begged, hampered their education and overall development. He blamed the government's poor planning and weak economic policies for such issues and called for urgent action to rectify the situation. Thevar emphasised the importance of addressing people's grievances and ensuring that the government's economic policies were people-centric. He believed that the government should work towards creating a conducive environment for businesses to thrive and generate employment opportunities. He also stressed the need for investment in infrastructure, healthcare, and education to improve the people's standard of living. Muthuramalinga Thevar was a visionary leader who worked tirelessly to improve society. His ideas and principles continue to inspire generations to work towards uplifting the underprivileged and marginalised sections of society [15].

Thevar’s Focus on Indian Market Growth

With his economic insight, Muthuramalinga Thevar thoroughly analysed the Madras Government's budget for 1949-1950. He criticised it as favourable to the rich and detrimental to the poor. He emphasised the need for careful consideration in taxation, ensuring a balanced payment by the people. The government, serving the people's interests, should prioritise essential expenses in the budget and maintain a surplus to benefit everyone. When leaders suggested diversifying grain consumption beyond rice, Muthuramalinga Thevar opposed such ideas, advocating for resolving food issues by promoting all possible solutions. He believed providing necessary agricultural tools and livestock could significantly improve farmers' status. His practical and implementable solutions showcased him as a legitimate economist [16]. Muthuramalinga Thevar was a visionary leader who fought for his people's rights and keenly understood economic policies. He believed in creating a tax-free budget for economic prosperity in a developed society. His philosophy was that taxes should not burden the middle and lower classes and that caution should be exercised in avoiding the tax practices of industrialised nations in a poor country like India. Thevar's economic policies were characterised by his emphasis on specific details in the budget regarding unemployment issues and strategies for overcoming them. He believed the government should have a clear plan to address the unemployment problem and create opportunities for people to earn a livelihood [17].

Thevar's focus on economic policies was rooted in his deep concern for the welfare of his community. He recognised that economic development is essential for the overall progress of society. His vision was to create a culture where everyone had equal opportunities, and economic growth was not limited to a select few. Muthuramalinga Thevar's

economic policies were not just about taxes and budgets but creating a society where everyone could prosper. His ideas about economic development continue to inspire us today, and his legacy lives on as a beacon of hope for generations to come [18]. Thevar advocated for coordination between words and deeds, emphasising the government's avoiding unnecessary expenses on police and law enforcement. He believed that with proper planning, India could become one of the world's most advanced nations. Job opportunities should be created to reduce unemployment, and the government's income should be enhanced by tapping into the resources of the wealthy for overall state development [19]. Muthuramalinga Thevar's economic views focused on achieving social and economic equality. He criticised the Congress party's changing objectives, contributing to economic disparities. He urged the government to learn from capitalist and socialist countries to gauge economic progress accurately. He supported industrialisation and nationalisation, emphasising state-owned enterprises' funding for social welfare programs [20].

CONCLUSION

Muthuramalinga Thevar was a prominent Indian economist who deeply understood the economic challenges post-independence India faced. He was born on October 30, 1908, in the Madurai district of Tamil Nadu. Thevar's economic perspectives were grounded in practical observations and aimed at addressing the societal issues that arose due to economic inequality. Thevar emphasised social welfare, equitable distribution of wealth, and pragmatic economic policies to change India's economic landscape. He believed that social welfare and economic development go hand in hand, so social and economic policies should be integrated. Thevar advocated for measures to reduce poverty and improve living standards for people experiencing poverty. One of Thevar's key contributions was his advocacy for land reforms. He believed land should be distributed equitably among farmers to reduce societal inequality. Thevar's ideas on land reforms were a precursor to the green revolution in India, which transformed Indian agriculture and helped the country achieve food self-sufficiency. The Government recognised his contributions to the economic development of India, and he was awarded the Padma Bhushan, India's third-highest civilian award, in 1962. Muthuramalinga Thevar was an Indian freedom fighter and politician who fought against British colonialism and defended the rights of the oppressed and marginalised communities in India. His ideas and perspectives on economic and social issues remain relevant today, particularly in developing countries where economic inequality and social welfare are still pressing issues.

Thevar's emphasis on social welfare, equitable distribution of wealth, and pragmatic economic policies can provide a valuable framework for policymakers to address economic challenges and create a more just and fair society. His vision of a culture that prioritises the welfare of its citizens and ensures that everyone has equal access to basic needs such as food, shelter, and healthcare is even more critical today, as many developing countries are struggling to provide these necessities to their citizens. Furthermore, Thevar's advocacy for a decentralised economic system that promotes local self-sufficiency and encourages the growth of small-scale industries can also be used as a model for developing countries. Developing countries can reduce their dependence on imports by promoting local entrepreneurship, empowering small-scale sectors, and creating more job opportunities for citizens. Muthuramalinga Thevar's ideas and perspectives remain relevant today and can provide valuable insights for policymakers in developing countries to address economic challenges and create a more just and fair society.

ABSTRACT

Equity mutual funds have emerged as a prominent investment avenue for long-term wealth creation, offering diversification and professional fund management. This study evaluates the effectiveness of two widely adopted investment strategies Systematic Investment Plan (SIP) and lump-sum investmentin achieving long-term financial growth. The research conducts a comparative analysis based on historical performance data of selected equity mutual funds over a significant time horizon, considering key metrics such as returns, risk, volatility, and consistency. The study examines how market timing, investment discipline, and cost averaging influence the performance of SIP, while also assessing the potential advantages of lump-sum investments during favorable market conditions. Statistical tools and performance indicators, including compound annual growth rate (CAGR), standard deviation, and risk-adjusted return measures, are employed to provide a comprehensive evaluation. The findings highlight that SIP offers relatively stable returns with reduced risk exposure due to rupee cost averaging, making it suitable for risk-averse investors. In contrast, lump-sum investments tend to generate higher returns in bullish market phases but are more susceptible to market volatility.

Keywords: Equity Mutual Funds, Systematic Investment Plan (SIP), Lump-Sum Investment, Long-Term Wealth Creation.

INTRODUCTION

In recent years, equity mutual funds have gained significant prominence as an effective investment avenue for long-term wealth creation. With increasing financial awareness and the growing participation of retail investors, mutual funds have emerged as a preferred choice due to their ability to offer diversification, professional management, and accessibility [1]. Among the various investment approaches available in equity mutual funds, Systematic Investment Plan (SIP) and lump-sum investment are the two most widely adopted strategies, each offering distinct advantages and associated risks.A Systematic Investment Plan (SIP) allows investors to invest a fixed amount at regular intervals, thereby promoting disciplined investing and mitigating the impact of market volatility through rupee cost averaging. This approach is particularly beneficial for investors who prefer gradual exposure to equity markets and seek to reduce the risks associated with market timing. On the other hand, lump-sum investment involves deploying a significant amount of capital at a single point in time, which can potentially yield higher returns when markets are favorable but also exposes investors to greater risk during market downturns.The effectiveness of these two strategies has been widely debated among financial analysts and investors, especially in the context of long-term wealth creation[2]. While SIP is often considered a safer and more consistent approach, lump-sum investments may outperform in bullish market conditions due to early capital deployment. Therefore, understanding the comparative performance of these strategies is crucial for investors aiming to optimize returns while managing risk.This study aims to evaluate and compare the effectiveness of SIP and lump-sum investment strategies in equity mutual funds over a long-term investment horizon[3]. By analyzing historical data and key performance indicators such as returns, volatility, and risk-adjusted measures, the research seeks to provide empirical insights into the suitability of each approach under varying market conditions. The findings of this study are expected to assist investors, financial planners, and researchers in making informed investment decisions and developing effective portfolio strategies.[4]

OBJECTIVES

- To analyze the performance of equity mutual funds in the context of long-term wealth creation.
- To compare the effectiveness of Systematic Investment Plan (SIP) and lump-sum investment strategies[5].
- To evaluate the returns generated by SIP and lump-sum investments using key financial metrics such as Compound Annual Growth Rate (CAGR).[6]
- To assess the risk associated with both investment strategies using measures like volatility and standard deviation.[7]

LITERATURE REVIEW

- The comparison between Systematic Investment Plan (SIP) and lump-sum investment strategies has been widely discussed in financial literature, particularly in the context of long-term wealth creation through equity mutual funds. Several studies have examined the performance, risk, and behavioral aspects associated with these investment approaches[10].
- Sharpe (1966) introduced the concept of risk-adjusted return through the Sharpe Ratio, which has become a fundamental tool in evaluating mutual fund performance. This measure is widely used to assess whether higher returns from lump-sum investments adequately compensate for the additional risk compared to SIP strategies[13].
- Treynor (1965) emphasized the importance of systematic risk in portfolio evaluation. His work highlighted that investment strategies should[8] be assessed not only on returns but also on their exposure to market risk, which is particularly relevant when comparing SIP and lump-sum approaches in volatile equity markets.
- Jensen (1968) developed Jensen's Alpha to measure the abnormal returns of investment portfolios. This concept has been applied in mutual fund studies to evaluate whether active investment strategies [9]outperform the market, providing a basis for comparing the efficiency of SIP and lump-sum investments.

- According to Ramasamy and Yeung (2003), mutual fund performance is influenced by fund management skills, market timing, and economic conditions. Their study suggested that disciplined investment strategies like SIP can help investors mitigate timing risks in uncertain markets[11].
- A study by Gupta and Jithendranathan (2012) found that SIP investments tend to provide more stable returns over time due to the averaging effect, especially in volatile markets. However, lump-sum investments were observed to generate higher returns when markets showed a consistent upward trend[14].
- Kaur and Kaur (2015) analyzed investor behavior and concluded that SIP is more suitable for risk-averse investors, as it reduces the psychological stress associated with market fluctuations. In contrast,[13] lump-sum investments require a higher risk appetite and better market timing ability.
- Mishra (2018) highlighted that SIP encourages financial discipline and is particularly beneficial for salaried individuals, while lump-sum investment is more appropriate for investors with surplus funds and a strong understanding of market conditions[15].

RESEARCH GAP

- Although numerous studies have examined the performance of equity mutual funds and the effectiveness of Systematic Investment Plan (SIP) and lump-sum investment strategies, several gaps still exist in the existing literature. Most prior research has focused either on general mutual fund performance [16]evaluation or on theoretical comparisons of investment approaches, with limited emphasis on empirical, data-driven comparisons over extended investment horizons.
- Additionally, many studies have analyzed SIP and lump-sum strategies independently, rather than providing a comprehensive comparative analysis under identical market conditions and time periods. There is also a lack of consistent evaluation using multiple performance indicators such as return, risk, volatility, and risk-adjusted measures within a unified framework[17].
- Furthermore, existing literature often overlooks the impact of varying market cyclessuch as bullish, bearish, and volatile phases-on the relative performance of these two strategies. Investor-specific factors[18], including risk tolerance, investment discipline, and behavioral biases, have also not been adequately integrated into comparative studies.
- Another significant gap is the limited focus on recent market data and evolving investment trends, particularly in emerging economies where mutual fund participation is rapidly increasing. As a result, there is a need for an updated and comprehensive study that evaluates SIP and lump-sum strategies using real-time or recent historical data[19].
- Therefore, this study aims to bridge these gaps by providing a detailed comparative analysis of SIP and lump-sum investment strategies in equity mutual funds, incorporating multiple performance metrics, market conditions, and practical investment perspectives to offer more reliable and applicable[20] insights for long-term wealth creation.

METHODOLOGY

Research Design

The study is based on a descriptive and analytical research approach. It focuses on comparing the performance of SIP and lump-sum investments using historical data and financial performance indicators [21].

Data Collection

The secondary data collected from reliable and authentic financial sources. Historical Net Asset Value (NAV) data of selected equity mutual funds were obtained from official platforms such as AMFI reports, fund house websites, and financial portals. The data covers a long-term period of 5 to 10 years to ensure a comprehensive evaluation of investment performance. Monthly NAV values were used to simulate Systematic Investment Plan (SIP) investments, while the initial NAV at the beginning of the period was considered for lump-sum investment analysis. The collected

data includes fund performance details, market trends, and return indicators, which are essential for comparing the effectiveness of SIP and lump-sum strategies. Care has been taken to ensure the accuracy, consistency, and reliability of the data used in the study[8]. Table 1 presents the sample dataset used for analyzing the performance of Systematic Investment Plan (SIP) and lump-sum investment strategies in equity mutual funds. The table includes monthly Net Asset Value (NAV) data along with corresponding investment details.

Sample Selection

The sample for this study consists of selected equity mutual fund schemes chosen based on specific and well-defined criteria to ensure reliability and consistency in analysis. The funds were selected from diversified equity categories, including large-cap, mid-cap, and multi-cap funds, to provide a comprehensive representation of the equity market. Only those mutual funds with a consistent performance track record and availability of historical NAV data for a minimum period of 5 to 10 years were considered. Additionally,[9] funds with higher assets under management (AUM) and strong market presence were preferred to ensure stability and credibility. The selection process also ensured that the chosen funds are actively managed and widely invested by retail investors. By applying these criteria, a representative sample was formed to facilitate an accurate comparative analysis of SIP and lump-sum investment strategies under similar market conditions.

The study considers three well-established equity mutual funds representing different categories to ensure a comprehensive and balanced analysis. The first fund, Parag Parikh Flexi Cap Fund, is a flexi-cap fund that invests across companies of varying market capitalizations, including large-cap, mid-cap, and small-cap stocks. This diversified investment approach helps in reducing risk while providing stable long-term growth, making it suitable for investors seeking consistent returns. The second fund, SBI Bluechip Fund, is a large-cap fund that primarily focuses on well-established and financially strong companies with high market capitalization. Due to its investment in stable and reputed firms, it offers relatively lower risk and steady returns, making it ideal for conservative investors. The third fund, Axis Midcap Fund,[9] invests mainly in mid-cap companies that have high growth potential but are associated with higher volatility and risk. This fund is suitable for investors with a higher risk appetite who are willing to accept fluctuations in returns for the possibility of greater long-term gains. The inclusion of these three funds ensures diversification across different market segments and strengthens the comparative analysis of SIP and lump-sum investment strategies.

Table 2 presents the historical monthly Net Asset Value (NAV) data of the selected mutual fundsParag Parikh Flexi Cap Fund, SBI Bluechip Fund, and Axis Midcap Fundfor the study period. The NAV values indicate the price at which units of each fund are bought or sold, forming the basis for investment calculations. These monthly figures are used to simulate Systematic Investment Plan (SIP) contributions and to evaluate lump-sum investment performance. The variation in NAV across months reflects market fluctuations and fund performance. This dataset enables a comparative analysis of returns and risk associated with both investment strategies.[11]

The study uses historical NAV data of selected mutual funds such as Parag Parikh Flexi Cap Fund, SBI Bluechip Fund, and Axis Midcap Fund. Monthly NAV values were collected and used for SIP simulation, while lump-sum investments were calculated based on initial NAV values. Table 2 presents the sample NAV data used for analysis.
Table 3 presents the comparative results of SIP and lump-sum investment strategies based on the selected mutual funds. The analysis shows that lump-sum investment generates higher returns in most cases, particularly in rising market conditions. However, SIP provides more stable and consistent returns with lower risk exposure.

Investment Strategies Considered

- **SIP (Systematic Investment Plan):** Fixed amount invested at regular intervals (monthly basis assumed).
- **Lump-Sum Investment:** One-time investment made at the beginning of the investment period.

Data Analysis Procedure

- Historical NAV data of selected mutual funds is collected.
- SIP returns are calculated by simulating periodic investments.
- Lump-sum returns are calculated based on a one-time initial investment.
- Comparative analysis is performed using the above financial metrics.
- Results are interpreted to identify which strategy performs better under different market conditions.

Hypotheses

To evaluate the effectiveness of SIP and lump-sum investment strategies, the following hypotheses are formulated:

Null Hypothesis (H_0):

There is no significant difference in the returns and risk associated with Systematic Investment Plan (SIP) and lump-sum investment strategies in equity mutual funds for long-term wealth creation.

Alternative Hypothesis (H_1):

There is a significant difference in the returns and risk associated with Systematic Investment Plan (SIP) and lump-sum investment strategies in equity mutual funds for long-term wealth creation.

RESULT AND DISCUSSION

RESULT

The comparative analysis of Systematic Investment Plan (SIP) and lump-sum investment strategies in selected equity mutual funds reveals notable differences in terms of returns, risk, and consistency over the long-term investment horizon. The results indicate that lump-sum investment generally produces higher total returns and Compound Annual Growth Rate (CAGR) when the investment is made during favorable market conditions, particularly at the beginning of a bullish phase. This is due to the immediate full capital exposure to market growth, allowing the investment to benefit from compounding over time[7]. In contrast, the SIP strategy demonstrates more stable and consistent performance across different market conditions. Due to the principle of rupee cost averaging, SIP investments acquire more units when prices are low and fewer units when prices are high, thereby reducing the average cost per unit. This results in comparatively lower volatility and reduced risk exposure.The analysis of risk indicators, such as standard deviation, shows that SIP investments experience lower fluctuations in returns compared to lump-sum investments. Furthermore, risk-adjusted performance measures, such as the Sharpe Ratio, suggest that SIP provides more balanced returns relative to the level of risk undertaken, especially in volatile or uncertain market environments[5].

DISCUSSION

The findings of this study highlight the fundamental trade-off between return maximization and risk management in equity mutual fund investment strategies. Lump-sum investment is highly dependent on market timing, making it suitable for investors with strong market knowledge and a higher risk tolerance. If the investment is made at a market peak, it may lead to significant short-term losses and delayed recovery. [3]On the other hand, SIP offers a disciplined and systematic approach to investing, which minimizes the impact of market volatility and reduces the psychological burden of timing the market. This makes SIP particularly suitable for salaried individuals and retail investors who prefer gradual investment and lower risk exposure. The study also emphasizes the importance of investment horizon. Over a long-term period, the differences between SIP and lump-sum returns tend to narrow, especially when markets experience multiple cycles of ups and downs. However, SIP continues to provide an advantage in terms of consistency and risk mitigation. These results are consistent with existing financial theories

and empirical studies, which suggest that while lump-sum investment can generate higher returns in rising markets, SIP is more effective in managing risk and ensuring steady wealth accumulation[20].

CONCLUSION

This study evaluated the effectiveness of Systematic Investment Plan (SIP) and lump-sum investment strategies in equity mutual funds for long-term wealth creation. Based on the comparative analysis of returns, risk, and consistency, it is evident that both investment approaches have their own advantages and limitations, depending on market conditions and investor behaviour. The findings reveal that lump-sum investment has the potential to generate higher returns when investments are made during favorable market conditions, particularly in the early stages of market growth. However, it is also associated with higher risk due to market volatility and the challenge of accurate market timing. In contrast, the SIP approach provides more stable and consistent returns by leveraging rupee cost averaging, thereby reducing the impact of market fluctuations and minimizing investment risk. Furthermore, SIP promotes disciplined investing and is well-suited for investors with regular income and lower risk tolerance, while lump-sum investment is more appropriate for investors with surplus funds and a higher capacity to withstand market fluctuations. Over a long-term horizon, SIP demonstrates greater reliability and risk-adjusted performance, making it a preferred strategy for gradual wealth accumulation. In conclusion, the choice between SIP and lump-sum investment strategies should be guided by individual financial goals, risk appetite, and market outlook. A balanced approach that combines both strategies may further enhance portfolio performance and optimize long-term wealth creation. This study provides valuable insights to investors and financial planners, enabling them to make informed and strategic investment decisions in equity mutual funds.

ABSTRACT

Planetary health emphasizes the interconnections between human well-being, social infrastructure, and environmental sustainability, particularly through everyday access to water, sanitation, energy, and healthcare services. In climate-vulnerable, middle-income settings like India, deficits in these basic needs expose households to waterborne diseases, household air pollution, and ecosystem degradation, hindering SDG 6 progress and amplifying global health risks. This study adopts a planetary health perspective to investigate how household educational attainment is associated with integrated access to social infrastructure services such as access to water, sanitation, energy, and healthcare among 27,929 households in Tamil Nadu, a high-performing southern Indian state, using National Family Health Survey (NFHS-5, 2019 to 2021) microdata. For an international readership, WASH refers to water, sanitation, and hygiene services. A novel Basic Needs Index integrates these domains, revealing that each additional year of schooling elevates the index by 0.415 units (SE=0.016, t=25.47, $p<0.01$), with educated households (67% of sample) showing two to three fold higher uptake of piped water (57.8% vs. 29.6%), hygienic sanitation (54.9% vs. 19.9%), clean fuels (57.1% vs. 22.2%), and access to formal health care. These results position education as a scalable planetary health intervention, reducing environmentally mediated risks and informing policy integration of literacy with infrastructure campaigns for equitable resilience.

Keywords: education, social infrastructure, NFHS-5, Tamil Nadu, basic needs index, WASH

INTRODUCTION

Infrastructure contributes both physically and socially to economic development, with social infrastructure, defined here as household access to essential services like water, sanitation (WASH), energy, and healthcare, serving as a foundation for human capabilities and environmental health. Planetary health provides an integrative lens for this nexus, highlighting how education and social conditions mediate exposure to climate-sensitive risks such as

waterborne pathogens, air pollution from biomass fuels, and treatment gaps in vulnerable ecosystems. Empirical evidence shows that investments in education, sanitation, and health enhance productivity and social inclusion, transcending traditional GDP metrics to encompass quality-of-life dimensions like clean water and connectivity [12,23]. Grounded in human capital theory and behavioral economics, education builds skills, reshapes preferences, and reduces biases like present bias in sanitation or status quo bias in fuel choices, In India, NFHS data reveal persistent WASH gaps despite schemes like Swachh Bharat and Jal Jeevan Mission (a national piped-water initiative), positioning education as a lever for sustainable adoption. Tamil Nadu, with advanced welfare like mid-day meals and high literacy, exemplifies these dynamics while retaining rural-urban disparities. [1,12,10]

Despite national progress, few studies isolate education's marginal role in a multidimensional bundle of services or interpret it through planetary health, where household choices aggregate into population-level environmental impacts. By constructing a Basic Needs Index from Tamil Nadu NFHS-5 data and estimating education's association, this study contributes granular evidence on human capital pathways, synthesizing WASH literature with planetary health to clarify policy levers for SDG 6 and resilience in comparable contexts. [8]. Social infrastructure was found to contribute indirectly to the economic development of a country. For example, education may not be having a direct role in a country's Gross Domestic Product (GDP). However, education provides people with skills and knowledge that can help them obtain better jobs, which can positively impact a country's economy [5].

The state of Tamil Nadu has experienced notable social growth and development because of various government interventions, which are evident in various welfare programs such as the Mid-Day Meal Scheme, housing initiatives, and the recently implemented Breakfast scheme. The midday meal scheme guarantees that school students are provided with nourishing meals, thus enhancing their well-being and academic achievements. Likewise, the housing program namely the Pradhan Mantri Awas Yojana (PMAY) [14] and Chief Ministers Housing Program (KalaignarinKanavu Illam) [20] caters to the housing requirements of disadvantaged groups, offering them stable housing and enhancing their standard of living. The recently implemented Breakfast Plan serves as a valuable addition to these initiatives, as it guarantees that youngsters commence their day with a nutritious breakfast, thereby augmenting their holistic welfare and scholastic achievements. These welfare schemes and programs serve the purpose of reducing poverty and promoting inclusivity by granting marginalized people access to vital resources and opportunities, hence improving social well-being and fostering economic growth. These local dynamics in Tamil Nadu exemplify broader planetary health imperatives, where anthropogenic pressures on water cycles, sanitation, and biomass energy use amplify zoonotic risks, antimicrobial resistance, and climate-induced scarcities worldwide [1, 16]. Globally, 2.2 billion people lack safely managed drinking water, fueling disease burdens that transcend borders via migration and trade, as evidenced in recent analyses of NFHS trends paralleling sub-Saharan disparities. This study situates Tamil Nadu's education-infrastructure nexus within this framework, illuminating pathways for sustainability transitions in comparable middle-income contexts.

LITERATURE REVIEW

Conceptual perspectives on development and social infrastructure

Amartya Sen explained his paper on “Development as Freedom”, -the concept of development as freedom, wherein real freedom expands when people enjoy economic well-being, social opportunities, and political rights. These freedoms are not viewed as the primary end of development but as the principal means of attaining development. Understanding development requires recognition of multiple interconnected and interdependent dimensions. Efforts to quantify human development while assessing social infrastructure have led to the computation of the Human Development Index (HDI), which considers economic, health, and education paradigms to assess human development without depending on aggregates such as per capita income alone [9]. The paper entitled- “Social Infrastructure and Women’s Undernutrition” states that better access to social infrastructure improves overall health and well-being., it is observed that better access to social infrastructure like drinking water and toilet facilities brings about a positive result on undernutrition and women’s health in general. This study considered data from NFHS-3

for the analysis [6,8].Taken together, these contributions underscore how social infrastructure operates as a multidimensional determinant of human capabilities and health, providing a conceptual basis for examining education's role in basic services provision in India. These theoretical foundations establish the analytical framework for subsequent empirical investigations into education's specific influence on multidimensional social infrastructure outcomes within diverse regional contexts [6,9,17].

Building on these conceptual frameworks that emphasize multidimensional human development, empirical studies have quantified the persistent gaps in WASH access across India. The article on "Progress and determinants of household access to improved drinking water in India using a Water Access Index: Insights from the National Family Health Survey towards achieving SDG 6.1" analyses long-term trends and determinants of household access to improved drinking water in India using five rounds of NFHS data (1992–2021) and a composite Water Access Index (WAI) constructed via principal component analysis from four indicators: improved source, on-premises supply, access within 5 minutes, and household water treatment. National coverage of improved sources is now high (95.9 percent), yet substantial spatial and socioeconomic inequalities persist, particularly for on-premises access, timely access, and water treatment. District-level WAI mapping shows nearly half of districts as "front runners," while 31 percent), remain "aspirants," concentrated in parts of eastern, central, and southern India, including West Bengal, Bihar, Odisha, Jharkhand, Madhya Pradesh, Chhattisgarh, Telangana, Andhra Pradesh, Tamil Nadu, and several northeastern states. Multivariable regressions indicate that higher education, pucca housing, non-poor status, urban residence, and location in northeastern or western regions significantly increase odds of better water access, whereas rural households and those with BPL cards are systematically disadvantaged. The study concludes that despite progress towards SDG 6.1, India requires targeted, region-specific, multisectoral interventions and strengthened local governance to expand on-premises supply, water treatment infrastructure, and equitable access for vulnerable populations [4].

Education, behavior change, sanitation and planetary health

While these empirical analyses highlight education's role in WASH access, integrating such findings with planetary health perspectives reveals broader environmental and behavioral dimensions. Kalaiyarasan, A (2014) In his paper, "Comparison on the Economic progress between the states of Gujarat and Tamil Nadu". Both states have achieved greater economic growth than the national average. Both states are highly urbanized and industrialized among the developed states in the country. However, regarding social developmental outcomes such as the rate of poverty reduction, health, reducing illiteracy among the workforce, infant mortality rate, under five mortality rates, and education, Tamil Nadu has performed better. The paper has also used empirical evidence to state that deprived castes gained education at a faster rate in Tamil Nadu than in Gujarat during the period of the study from to 1993-94 to 2011-12 [7]. Tamil Nadu's superior social outcomes relative to comparably industrialized states therefore constitute a compelling case study for unpacking the education-infrastructure relationship at the household level

In another instance, a cluster-randomized controlled trial in 66 villages of rural Puri district, Odisha, evaluated whether a low-cost, theory-driven behavior change package could improve latrine use and safe disposal of child feces among latrine-owning households that had already benefited from India's rapid expansion of toilet coverage under Swachh Bharat Mission. The intervention, capped at about US$20 per household, combined community-level activities (folk theatre, colored-powder transect walks, community meetings, wall paintings, public recognition) with mothers' meetings, household visits, and basic latrine repairs, all structured using behavior-centered design, COM-B, and RANAS frameworks to address motivational, normative, and practical barriers to use. Using a difference in differences analysis on 14,181 individuals, the authors found a modest increase of 6.4 percentage points in reported latrine use among those aged 5 years and above, corroborated by small but consistent improvements in enumerators' observations of latrines appearing in use. Effects on child sanitation were larger: JMP-defined safe disposal of feces among under 5s rose by 15.2 percentage points, driven by substantial gains in caregiver disposal practices and increased latrine use particularly among boys. The authors conclude that such low-intensity programming can shift behaviors, especially around child feces, but is unlikely on its own to reduce fecal-pathogen exposure enough to yield measurable health benefits, highlighting the need to pair behavior change with broader environmental

improvements [4].While these findings highlight the potential of behaviorally informed, low-cost interventions to enhance WASH practices, they also suggest that sustained progress may require complementary structural enablers such as education and broader social infrastructure. This comparative evidence positions Tamil Nadu as a particularly salient case for exploring how social investments, especially in education, translate into improved access to essential infrastructure and health-related outcomes.

The article on **"**Planetary health and WASH: causes and consequences" contends that, although climate impacts are significant, population growth, urbanization, and economic development may exert even greater pressure on WASH systems in low-income settings, and that strengthening service resilience through a planetary health lens can simultaneously reduce emissions and enhance societal capacity to absorb shocks. It argues that WASH is both a driver and victim of planetary change: sanitation systems generate greenhouse gases, particularly methane and nitrous oxide, and contribute nutrients that can trigger eutrophication, while infrastructure construction and operation rely heavily on fossil energy and carbon-intensive materials. Conversely, climate change and broader environmental degradation reshape water availability, quality, and extremes like altered precipitation, groundwater recharge, floods, droughts, storms, and sea-level rise, thereby undermining water supply and sanitation performance, especially in vulnerable coastal and rapidly urbanizing contexts [19]. Situating WASH within a planetary health perspective therefore draws attention to the ways in which household- and community-level infrastructure choices, often shaped by education and social conditions, aggregate into far-reaching environmental and health consequences. This planetary health lens thereby illuminates pathways through which education-mediated household decisions regarding infrastructure can mitigate cumulative environmental and health risks.

These planetary health insights into WASH pressures extend to specific climate vulnerabilities, where disasters exacerbate infrastructure deficits and underscore education's resilience-building potential. Climate change which includes increase in the emission of greenhouse gases, increase in surface temperature and extreme weather events, poses a threat to agricultural productivity, wildlife, and the availability of safe drinking water. This situation heightens the likelihood of malnutrition and diseases transmitted through food and water. Droughts, floods, and shifts in seasonal weather patterns complicate the ability of communities to consistently produce and obtain enough nutritious food and clean water. This problem disproportionately affects poorer populations who are already facing challenges with hunger and inadequate sanitation. The insecurity of food and water caused by climate change can harm physical health and have an impact on mental well-being [15].

Cyclone Amphan severely disrupted already fragile WASH systems in two coastal villages of Satkhira, Bangladesh, intensifying pre-existing inequalities in service access and health risks. Using household surveys, key informant interviews, and direct observation, the authors document that three-quarters of respondents reported destruction of all WASH2 facilities, while 80 percent received no post-disaster WASH2 support from government or NGOs. Households were forced to depend on a mix of unsafe and inconvenient water sources, including contaminated ponds, shallow tube wells, and poorly maintained pond sand filters, with only a minority accessing relatively safer options such as rainwater harvesting, NGO-supplied water, or reverse osmosis plants. Despite some use of filtration and purification tablets, many respondents perceived persistent problems of odor, taste, and color in drinking water, reflecting the combined effects of saline intrusion, inadequate treatment, and long-term storage. Sanitation conditions deteriorated sharply, with widespread damage to pit latrines prompting extensive open defecation, particularly undermining privacy, dignity, and safety for women, children, and older persons. These compromised WASH conditions contributed to notable outbreaks of diarrhea, skin disease, dysentery, and other ailments, underscoring how underfunded infrastructure amplifies disaster-related health burdens. The authors argue for risk-informed, sustainably financed WASH systems, integrating disaster preparedness, community-based health and hygiene education, and stronger governmental and humanitarian engagement to ensure minimum service levels during and after extreme events [17]. Such disaster case studies further demonstrate the vulnerability of WASH systems to shocks, highlighting education's potential role in building household resilience to infrastructure disruptions.

Complementing these vulnerability analyses, targeted educational interventions demonstrate how knowledge-driven behavior change can operationalize planetary health principles at scale. Planetary health education assumes that transforming human behavior is central to sustaining Earth systems and protecting population health. The learning objectives emphasize that students must understand how every day and institutional practices drive biogeochemical disruption, biodiversity loss, and climate change, and how these disturbances translate into concrete health risks across diseases, injuries, and psychosocial outcomes. Knowledge is framed not as abstract awareness but as a basis for risk assessment, enabling learners to analyze how social, economic, and political structures shape vulnerability, resilience, and differential exposure to environmental hazards. By integrating ethics, environmental justice, and literacy, the framework positions informed behavior, at individual, community, corporate, and governmental levels, as both a determinant of planetary crises and a lever for mitigation, adaptation, conservation, and restoration. In this way, the article constructs behavioral change, grounded in critical understanding, as indispensable to planetary health practice [10]. Educational interventions framed in this manner thus position schooling as both a determinant and accelerator of planetary health transitions at multiple scales

The article on "Evidenced transformations: Using data to demonstrate improvement in school-based access to water, sanitation and hygiene in Uttar Pradesh, India," examines an extensive school transformation initiative in Uttar Pradesh that sought to systematically improve water, sanitation and hygiene facilities in government elementary schools through data driven planning, strong institutional leadership and ICT enabled monitoring mechanisms. Grounded in rights based and national policy commitments to WASH in education, the Operation Vidyalaya Kayakalp campaign integrated earlier national programs and award schemes into a unified, statewide approach that combined comprehensive baseline and midline assessments, standardized technical norms and a star based ranking system to classify schools and identify learning laboratories. Using mobile applications, online dashboards and interactive voice response systems, the program tracked 19 key infrastructural indicators, guided resource allocation and fostered accountability among district and block officials. Results between 2020 and 2021 show statistically significant gains in critical services such as running water supply, functional toilets with water and group handwashing units, alongside substantial public financing leveraged from multiple departmental sources. The authors highlight enabling political and bureaucratic support, capacity building of diverse stakeholders and interdepartmental convergence as central to these improvements, while also acknowledging COVID related disruptions, technological constraints and financing uncertainties at local government level. They argue that the Uttar Pradesh experience offers transferable lessons for scaled WASH interventions in schools and for forthcoming campaigns targeting preschool centers [3].

This emphasis on knowledge-driven behavioral change reinforces the proposition that educational attainment can function as a key lever for advancing both local WASH outcomes and global planetary health goals. The Uttar Pradesh experience illustrates the scalability of index-based WASH monitoring when integrated with educational administration, suggesting analogous potential for household-level applications in states like Tamil Nadu.

Empirical evidence on Social Infrastructure and WASH in India

Biswas et al. (2025) analyze long-run trends and inequalities in household access to improved drinking water in India using five rounds of the National Family Health Survey (NFHS-1 to NFHS-5, 1992–2021) and develop a multidimensional Water Access Index (WAI) to assess progress toward SDG 6.1 at the district level. Drawing on more than 1.5 million households across 36 states and union territories, the authors combine descriptive statistics, geospatial mapping and multivariable logistic regression to examine four core dimensions of water access: reliance on improved sources, on-premises availability, collection within 5 minutes and the presence of household water treatment. These indicators are synthesized using Principal Component Analysis into a normalized 0–100 WAI, classified following NITI Aayog's achiever–front runner–performer–aspirant framework, thereby translating a complex set of infrastructural and behavioral attributes into a policy-usable metric. The findings highlight substantial aggregate progress, with 94.9 percent of NFHS-5 households using improved sources and 30 states/UTs exceeding 90 percent coverage, and 98 percent of districts already in the achiever or front runner categories for improved sources; yet spatial and social disparities remain marked, especially in parts of the Northeast (Manipur, Meghalaya, Assam)

and eastern and central states such as Jharkhand, Odisha and Chhattisgarh. When water is redefined more stringently, as on-premises, rapidly accessible and treated, the picture becomes less reassuring: only six districts have universal on-premises supply, 18 percent of districts remain aspirants for on-premises access, 5 percent of districts have under half their households accessing water within 5 minutes and a striking 52 percent of districts are aspirants for water treatment, with particularly low treatment coverage in Bihar, Uttar Pradesh, West Bengal and Andhra Pradesh. The regression analysis underscores a familiar but policy-relevant gradient: higher education, pucca housing, non-poor status and urban residence significantly increase the odds of access across all four outcomes, while rural location and residence in central and eastern regions depress them; women-headed households show slightly higher odds of improved access, suggesting gendered roles in water management but also potential agency in seeking safer sources. The discussion situates India's trajectory within the global WASH literature, juxtaposing national programs such as the Jal Jeevan Mission and National Rural Drinking Water Program with experiences from South Africa's free basic water policy, Latin American community-led models and Scandinavian high-capacity systems, and argues that India's own progress is constrained by infrastructural deficits, regional unevenness and the lack of granular, real-time monitoring in smaller towns and rural areas. The authors call for region-specific investments in piped networks, community purification technologies, behavior change communication, and capacity building of local governments, complemented by public–private partnerships and geospatial tools for targeting low-performing districts, and emphasize that external technical and financial support, together with stronger UN–national alignment, will be critical for low- and middle-income countries to close the remaining gaps by 2030. Methodological limitations include the cross-sectional design of NFHS, potential self-report bias and the absence of post-2011 census data, but the study's contribution lies in providing an explicitly spatial and index-based lens on water inequality, offering an operational framework for tracking SDG 6.1 and for prioritizing districts where households still spend too long fetching water, rely on untreated sources or remain structurally excluded from the benefits of India's recent surge in water infrastructure spending [2,3,21]. These insights into WASH inequalities in India motivate closer state-specific analyses that can unpack how socio-economic factors, including education, condition of access to water, sanitation, energy and hygiene.

Corroborating this, a 2025 NFHS analysis constructs a multidimensional Water Access Index revealing 221 aspirant districts (31 percent), with education emerging as the strongest predictor (AOR up to 2.81).Using unit-level data from 63,732 rural households from the 76th round of India's National Sample Survey (2018), the authors first estimate logit models to identify determinants of individual and bundled WASH practices, then apply Blinder–Oaxaca decomposition to quantify adoption gaps by gender of household head and caste/tribe status, and finally use a heteroskedasticity-based instrumental variable approach (Lewbel method) to estimate health impacts. Wealth and education of the household head strongly and positively predict both single and bundled WASH adoption, while households headed by women and those belonging to scheduled castes and tribes consistently exhibit lower probabilities of adopting multiple practices even after accounting for observable characteristics. Decomposition results indicate that gaps are largely driven by endowment differences but also by differential returns to these characteristics. Impact estimates show that single WASH practices have limited and mostly insignificant effects on WASH-related morbidities, whereas bundles of practices significantly reduce problems such as skin, stomach, vector-borne, and other WASH-related illnesses. The authors conclude that policy should prioritize integrated WASH packages targeted towards poorer, less educated, female-headed, and scheduled caste/tribe households to reduce the rural disease burden and advance SDG-related health goals [15].

Research Gap

Taken together, this body of evidence on education, WASH, and planetary health reveals key patterns but also critical analytical gaps in isolating education's marginal effects. While NFHS analyses have advanced understanding of WASH inequalities and composite indices at national and district scales, few studies systematically isolate education's marginal contribution to an integrated bundle of social infrastructure components, treating it instead as one among multiple covariates. The present analysis addresses this lacuna by developing a novel Basic Needs Index from Tamil Nadu NFHS-5 microdata and estimating education's association therein, thereby contributing granular evidence on human capital pathways in a high-performing yet heterogeneous state.

Objectives

To explore the influence of education on certain basic needs in terms of social infrastructure in the study area of the state of Tamil Nadu.

To determine the impact of educational status on household asset ownership by constructing the Wealth Index for Tamil Nadu.

Hypotheses

There is no significant association between household educational level and their preferred drinking water source

There is no significant association between household educational level and sanitation facility used

METHODOLOGY

This study utilizes unit-level microdata from the National Family Health Survey-5 (NFHS-5, 2019–2021), a nationally representative cross-sectional survey conducted by the Ministry of Health and Family Welfare, Government of India, in collaboration with the International Institute for Population Sciences (IIPS) and ICF. NFHS-5 employs a stratified two-stage cluster sampling design, covering 636,699 households across India, with response rates exceeding 95% for household questionnaires. The analytic sample comprises 27,929 households from Tamil Nadu (4.38% of the India sample across 17 states surveyed), including 16,123 rural (57.7%) and 11,806 urban (42.3%) households, filtered for complete data on education, water, sanitation, cooking fuel, and healthcare variables.

Tamil Nadu was selected as the study area due to its high literacy (80.3% adult rate, above national 73.0%) and advanced welfare infrastructure, yet persistent rural-urban disparities in WASH services. The key exposure variable, household educational attainment, is measured as the highest years of schooling completed by any adult member (head or spouse), recoded into categories (no education=0, primary=1, secondary=2, higher=3) for regression. Outcomes include binary/ordinal indicators for improved drinking water (piped/borehole vs. unprotected), hygienic sanitation (flush/improved pit latrine vs. open/other), clean cooking fuel (LPG/electricity vs. biomass), and formal healthcare (public/private facility vs. self/home). Descriptive statistics and robustness checks (e.g., wealth quintiles as controls) were performed in SPSS; significance at $p<0.05$ (two-tailed).

Tools of Analysis

Basic Needs Index

A novel Basic Needs Index (BNI; range 0–9) was constructed through scoring to integrate four ordinal domains:

Drinking water (max 4): piped into dwelling (4), public handpump/tube well (3), bottled/purchased (2), unprotected well/tank/river (1).

Hygienic sanitation (max 1): improved facility with flush/pit (1), else (0; includes shared/open).

Clean fuel (max 2): LPG/electricity/biogas (2), no cooking (1), dung/wood/coal/charcoal (0).

Healthcare source (max 2): private facility (2), public facility (1), self/home/other (0).

Weights reflect WHO/UNICEF JMP ladders and planetary health priorities (e.g., biomass emissions). Index = sum of domain scores; higher values indicate integrated access. Cronbach's $\alpha=0.72$ confirms internal reliability; correlation with NFHS wealth index ($r=0.68$, $p<0.001$) validates construct validity.

Linear Regression

Linear Regression is applied to find out the influence of educational attainment on chosen basic needs of the households represented by Basic Needs Index of the surveyed households. The present study aims to identify the influence of education on the basic needs of the social infrastructure in Tamil Nadu.

The model used in the analysis is

$Y = \beta_0 + \beta_1 X_1$

Where:
Y = dependent variable (basic needs score).

The explanatory variable Xis educational attainment (years of schooling) of the surveyed households in the NFHS-5 survey for Tamil Nadu.

Table 2, reports bivariate OLS regression estimates demonstrating educational attainment exerts a statistically significant positive influence on the composite Basic Needs Index (β=0.415, SE=0.016, t=25.47, p<0.001). The coefficient magnitude indicates each additional year of schooling associates with a 0.415-unit index increase, representing approximately 10% of the index range (possible scores 0-9). This magnitude aligns with human capital returns documented across developing country contexts while confirming education functions as an important determinant of infrastructure adoption [1,15]. Thus, the higher the level of education, the better the provision of basic needs, resulting in a better standard of living for the surveyed households.

Association Tests
Chi-Square Test was conducted to determine whether the association between education and the selected variables are statistically significant and the results were interpreted.

Chi-Square (χ^2) Test
The chi-square (χ^2) test assesses whether two categorical variables are independent. In this study, χ^2 tests examine associations between:
Household educational level and preferred drinking water source
Household educational level and sanitation facility used

Hypotheses:
H_1: There is no significant association between household educational level and preferred drinking water source.
H_2: There is no significant association between household educational level and sanitation facility used.

The chi-square statistic is calculated as:
$\chi^2 = \Sigma (O - E)^2 / E$
Where:
O = observed frequency
E = expected frequency
Expected frequency for each cell:
$E = (RT \times CT) / N$
Where:
RT = row total containing the cell
CT = column total containing the cell
N = total observations

The calculated χ^2 is compared to the critical value from χ^2 tables at (r-1)(c-1) degrees of freedom (df) at the 5% significance level (α = 0.05). Reject H_0 (independence) if calculated χ^2 > table value (or $p < 0.05$). Results confirm significant associations for education with drinking water sources ($\chi^2 = 419.260$, df = 3, $p < 0.001$), sanitation facilities, and cooking fuel. Both H_1 and H_2 are rejected, supporting significant dependence between education and social infrastructure choices.

Cramér's V-augmented χ^2 tests independence between education (binary: educated ≥primary vs. uneducated) and each domain, with df=(r-1)(c-1); effect size $V=\sqrt{(\chi^2/(n \cdot \min(r,c)-1))}$.

Analysis and Interpretation

Selected variables from NFHS -5 were recoded using SPSS for the sake of the analysis as follows. The NFHS-5 Sample for India was 2,81,429 households from 17 states, out of which the standardized dataset was Filtered for Tamil Nadu state for the sake of this study. The state's total sample size was 27929 households which is 4.38 per cent of the Indian sample size.

Wealth Index of the Rural-Urban Households

As per the sample households studied in the NFHS-5, the wealth index is computed using asset ownership based on households' ownership of items such as televisions and access to social infrastructure facilities, namely electricity, housing, sanitation, drinking water sources, and healthcare availed. The information on the wealth index is sourced from the NFHS-5 Household Questionnaire, which includes data on various household assets, such as television and car, dwelling characteristics such as flooring material, drinking water source, toilet facilities, and other characteristics related to wealth status. These data are used to assign a standardized score to each household depending on whether they own certain assets. The scores are then summed, and individuals are ranked according to the total score of the household in which they reside. The sample was then divided into population quintiles, with the same number of individuals in each group. The population was divided into five equally sized groups of poorest, poor, medium, richer, and richest based on the index given for rural and urban households (Table - 2). A single asset index is developed based on data from the entire country sample and is used in all tabulations presented. Separate asset indices were not prepared for rural and urban population groups based on rural and urban data, respectively.

Wealth quintiles are expressed in terms of quintiles of individuals in the population, rather than quintiles of individuals at risk for any health or population indicator. This approach produces information directly relevant to the principal question of interest, such as health status or access to services for the poor in the population as a whole and facilitates comparisons across indicators for the same quintile. Individual variables such as source of drinking water, sanitation facility, healthcare availed, and cooking fuel were disaggregated and studied further in this analysis.

It is evident from Table - 4 that, out of the total surveyed households, 7.5 percentage are poorest, 19.1 are poor, 28.1 percent households are in the middle category of asset ownership while richer 26.7 and richest 18.7 categories of households dominate in urban areas, of which 35.3 percentage are urban households. To interpret the outcome of the above table, a significant majority of households in Tamil Nadu are rich (45.4 percent), whereas the poor constitute only 26.6 percent of households. Tamil Nadu's wealth distribution reflects sustained welfare investments including in-kind asset transfers (televisions, appliances) alongside social infrastructure access characteristic of Dravidian welfare regimes. Urban concentration among richest quintile (35.3 percent) corresponds with superior infrastructure endowments, while rural poorest households (10.6 percent) constitute priority intervention targets [10,11]. Educated households dominate piped access (30.1 percent vs. 12. 5 percent uneducated), suggesting education enables bargaining for better infrastructure or shifts norms toward hygiene (χ^2=419.26, $p<0.001$). From the above analysis, it is inferred that there is a need for more government intervention in rural areas to improve their standard of living by providing the required basic needs which ensure strong social infrastructure availability in rural areas.

Educational Status in Tamil Nadu

According to the National Family Health Survey, educational attainment is defined as no education, incomplete primary, complete primary, incomplete secondary, complete secondary, and higher levels of attainment. For analysis, the researcher classified the educational status of households into two categories by grouping together those who had completed primary, secondary, and higher levels of education as educated households, and those who had no education, incomplete primary education, and incomplete secondary education as uneducated households.
The details of the households' educational status are given in the following table.

From Table 5 and Figure 1, it is clear that more than two-thirds of households in Tamil Nadu are educated. This may be due to the various schemes and programs implemented by both the Centre and State governments. Table 6

documents systematic education gradients across infrastructure domains, with Cramér's V coefficients (>0.25) indicating large effect sizes per Cohen's conventions. The sanitation association proves strongest (V=0.52), suggesting education exerts particularly pronounced influence on hygienic facility adoption. It demonstrates a strong and systematic education gradient across all four basic-needs domains: water, sanitation, clean fuel, and healthcare. Educated households are roughly twice as likely as uneducated households to use piped or otherwise improved drinking water sources, and the very large chi-square statistic for water (χ^2=419.26, df=3, $p<0.001$) indicates that this pattern is unlikely to arise by chance. The association is even more pronounced for hygienic sanitation, where educated households are nearly three times as likely to use improved toilets, and the corresponding chi-square value ($\chi^2 \approx 1350.43$, df=1, $p<0.001$) signals a very strong dependence between education and sanitation choices. Similar, though slightly less extreme, gaps appear for clean cooking fuels and formal healthcare, with education consistently shifting households away from high-risk, environmentally burdensome options such as biomass fuels and informal, often unregulated care.

Taken together with the regression coefficient on the Basic Needs Index (β=0.415, $p<0.01$), these patterns confirm that each additional year of schooling is not merely correlated with one specific service but is associated with a broad, multidimensional upgrading of social infrastructure. In other words, education in Tamil Nadu appears to operate as a catalyst that enables households to secure safer water, adopt hygienic sanitation, transition to cleaner energy, and engage more systematically with formal health systems. This multidimensional shift resonates with global WASH and planetary health literature, which shows that educational attainment is one of the most consistent predictors of access to safely managed services and reduced exposure to environmental health risks. The Tamil Nadu evidence thus contributes to international debates by illustrating, with granular NFHS-5 data, how investments in human capital can translate into concrete behavioral changes that advance SDG 6, reduce household-level emissions and pollution, and strengthen resilience at the interface of social and ecological systems.

DISCUSSION, FINDINGS AND RECOMMENDATIONS

The strong education gradients in the Basic Needs Index confirm that schooling drives multidimensional upgrades in social infrastructure, aligning with human capital theory and extending planetary health scholarship by linking household behaviors to environmental risk reduction. Each additional year of education associates with safer water, hygienic sanitation, clean fuels, and formal care, implying reduced enteric diseases, black carbon emissions (contributing to regional climate forcing), and climate-exacerbated vulnerabilities, effects amplified in Tamil Nadu's flood-prone coastal zones. This integrated pattern surpasses isolated WASH analyses, demonstrating education's cross-domain leverage even in a high-coverage state [8,13].

Policy implications emphasize complementing supply-side programs (e.g., Jal Jeevan Mission) with education: school-based planetary health curricula and targeted literacy for rural poorest quintiles (10.6% of households) could accelerate safe disposal (χ^2=1350.43, $p<0.001$) and clean-fuel transitions (V=0.45), closing gaps identified in national indices. International parallels, from Odisha trials to Bangladesh cyclones, reinforce that behavioral enablers like education sustain gains amid shocks [5,12,14]. Education and the availability of drinking water, sanitation facilities, cooking fuel, and healthcare are strongly correlated, as demonstrated by regression and chi-square tests conducted on the NFHS-5 household data for Tamil Nadu. These analyses indicate that educational attainment is significantly linked to the availability of drinking water, sanitation facilities, clean cooking fuel, and access to healthcare, all of which are crucial for the well-being of households in Tamil Nadu. Education is associated with a 20-50 percent higher uptake of WASH services, aligning with information barriers in behavioral models, as educated households are more likely to overcome the status quo in fuel and sanitation. Tamil Nadu surpasses the national average in India (e.g., 87 percent piped water access compared to the national average of 70 percent), attributable to various schemes; however, the rural poorest still lag. To ensure long-term sustainable practices, efforts are needed to improve access to and awareness of safe drinking water sources, sanitation practices, and health care services. Targeted educational initiatives aimed at empowering marginalized communities should be implemented. In addition, households should

be educated on sustainable options and their benefits to encourage the adoption of sustainable practices. The government should monitor and upgrade the social infrastructure, including education, healthcare, and sanitation facilities, to ensure equitable access to basic needs and a socially inclusive society. In theory, findings demonstrate planetary health by measuring the impact of education on behavioral pathways, such as overcoming the tendency to stick with the status quo. Additionally, comparisons between states, like Tamil Nadu and Gujarat, highlight the amplifying effects of welfare regimes. Limitations include cross-sectional NFHS design and self-reports; future work with panel data or IVs could strengthen causality. Overall, Tamil Nadu illustrates scalable human capital investments for planetary health transitions.

Methodological Considerations

The bivariate regression identifies association rather than causal effects, with potential omitted variable bias from unobserved wealth, caste, or geographic parameters. Future studies incorporating NFHS wealth index quintiles, district fixed effects, and instrumental variable strategies would strengthen causal identification. A cross-sectional design does not allow for the analysis of changing treatment effects or the persistence of infrastructure over time [12,15].

CONCLUSION

This study demonstrates education's pivotal role in elevating household access to a bundled Basic Needs Index, interpreted through planetary health as a reducer of human-environmental risks in Tamil Nadu. The β=0.415 coefficient and large-effect χ^2 associations (e.g., sanitation V=0.52) reveal systematic shifts toward sustainable services, positioning schooling as a high-leverage complement to infrastructure amid persistent rural-urban divides. Findings advance theory by synthesizing human capital, behavioral, and planetary health literatures into an empirical framework for middle-income contexts, while policy recommendations urge integrating literacy campaigns with SDG 6 initiatives like Swachh Bharat to target poorest households and build resilience. Tamil Nadu's welfare model (mid-day meals, breakfast schemes) offers a blueprint, underscoring collaborative governance for equitable planetary health. Further research could extend to causal designs or cross-state panels, but the evidence affirms education as a foundational investment for social infrastructure and global sustainability goals [3,11].

ABSTRACT

AMR represents global health challenge, necessitating novel therapeutic agents with unique mechanisms of action. In this study, phytochemicals derived from *Withania somnifera* were computationally evaluated as potential inhibitors of topoisomerase IV and bacterial DNA gyrase, two vital enzymes for transcription and DNA replication. A curated dataset of 149 drug-like phytochemicals was subjected to docking, ADME, toxicity prediction, MD simulations. Several withanolide derivatives showed better docking scores than standard antibiotics (ciprofloxacin, novobiocin), with PubMed IDs 32919219 and 35159267 emerging as lead candidates. Molecular dynamics simulations verified the structural stability of protein–ligand complexes, while ADME and toxicity assessments verified desirable pharmacokinetic characteristics and acceptable safety margins. These findings highlight potential *Withania somnifera* phytochemicals as promising scaffolds for antibacterial drug development and warrant further experimental validation.

Keywords: Antimicrobial resistance, *Withania somnifera*, DNA gyrase, Topoisomerase IV, Molecular docking

INTRODUCTION

AMR emerged as global health threat, posing a serious challenge to the effective treatment of bacterial infections. WHO identified AMR as major public health concern, predicting a significant rise in infection-related mortality if novel antimicrobial agents are not developed urgently [1-3]. The widespread overuse of antibiotics in clinical practice, agriculture, animal husbandry has evolution of multidrug-resistant bacterial strains, thereby diminishing

the therapeutic efficacy of existing antibiotics [4,5]. Bacterial DNA gyrase, topoisomerase IV, plays a vital role in DNA replication, transcription, recombination, chromosome segregation by introducing DNA is supercoated with negative. Enzyme is composed two GyrA, two GyrB subunits and is indispensable for bacterial survival [6,7]. Importantly, DNA gyrase is not present in mammalian cells, making it a desirable and selective target for drug discovery [8]. Several clinically used antibiotics, including fluoroquinolones and aminocoumarins, exert their antibacterial activity by inhibiting DNA gyrase; however, the emergence of resistance due to target mutations and efflux mechanisms has significantly reduced their clinical utility [9-11]. Approximately two-thirds of currently used antibiotics are derived from or inspired by natural sources[12]. Medicinal plants, in particular, offer structurally diverse bioactive compounds with multitarget activity and comparatively lower toxicity. As a result, plant-derived phytochemicals have gained increasing attention as potential alternatives or complements to synthetic antimicrobial agents [13,14]. *Withania somnifera* (Ashwagandha), medicinal plant belonging to Solanaceae, traditional Ayurvedic medicine. Traditionally prescribed for management of infections, inflammation, stress-related disorders, and immune dysfunctions [15,16]. Pharmacological studies have demonstrated that *Withania somnifera* exhibits a wide range of biological functions, such as immunomodulatory, antibacterial, antioxidant, and anti-inflammatory, anticancer, and neuroprotective effects[17]. Phytochemical investigations revealed presence of numerous constituents. Among these, withanolides reported to possess antibacterial activity against both Gram-positive and Gram-negative bacteria [18,19]. According to studies, these substances might prevent bacteria from synthesizing their cell walls, enzyme activity, and DNA replication processes; however, the precise molecular mechanisms and specific bacterial targets involved remain largely unexplored [20,21]. Recent advancements in computational biology and cheminformatics have revolutionized drug discovery by enabling rapid and cost-effective screening of bioactive compounds. Docking is widely used for binding affinity, interaction patterns among ligands and target proteins, while *in silico* ADME prediction provides valuable insights into pharmacokinetic properties and drug-likeness [22]. Furthermore, molecular dynamics (MD) simulations allow the evaluation of conformational stability, flexibility, Protein-ligand complexes' dynamic dynamics in physiological settings, offering a more realistic representation of molecular interactions [23].

MATERIALS AND METHODS

Protein Preparations

For this research project, two primary proteins were selected on: DNA Gyrase and Topoisomerase IV. The 3D structures were obtained from the Protein Data Bank[24] using PDB IDs: 5MMN for DNA Gyrase and 3KFG for Topoisomerase IV. Following a thorough assessment of their resolution and structural quality factors, these particular structures were chosen. Since lower resolution values indicate more precise atomic position determination, which results in more accurate docking studies, both structures demonstrated resolutions better than 2.5Å. This provides good structural reliability. The majority of residues were found to be in favoured regions, indicating the outstanding stereochemical quality of the protein backbone conformations, according to an analysis of the Ramachandran plots of these structures from the PROCHECK website depicted in Figure 1. UCSF Chimaera was used to prepare the protein structures[25]. Multiple chains were initially present for proteins 5MMN and 3KFG; however, only chain A was kept because it contained all of the catalytic site information, making the study simpler and ensuring uniformity. By showing the entire backbone, the structural integrity was evaluated and any missing backbone information was found. Dock Prep, a Structure Editing tool in UCSF Chimaera, was used to optimize these gaps. Further, Hydrogen atoms were added, charges were assigned, water molecules and non-interacting ions were eliminated, and missing side chains were rebuilt as part of the preparation procedure. Each structure was then subjected to energy minimization to maximize conformations and remove any high-energy interactions that might have an impact on docking outcomes. Optimized structures were saved as PDB format. Subsequently, AutoDock Tools1.5.7 was employed for the grid box generation of each protein. The grid box dimensions and coordinates (x, y, z) were carefully recorded for the docking studies, ensuring complete coverage of the active sites. Finally, the co-crystallized ligands removed, proteins were converted in PDBQT format, making them ready to perform molecular docking studies.

Dataset Preparations

A comprehensive phytochemical dataset of *Withania somnifera* was prepared through an extensive literature survey and database mining. More than 223 phytochemical constituents reported from parts of Ashwagandha, including roots, leaves, stems, and berries. Constituents belong to withanolides, withaferins, alkaloids, flavonoids, steroidal lactones, and glycosides [26-27]. For the present study, phytochemical information was systematically collected from PubMed-indexed research articles, review papers, and experimentally validated phytochemical reports. PubMed was selected as the primary literature source for reliability, reproducibility, scientific authenticity of compounds. From the reported pool of over 223 constituents, compounds were screened and selected based on availability of structural information, reported biological or antimicrobial relevance, and suitability for computational analysis. Redundant entries, poorly characterized compounds, and those lacking defined chemical structures were excluded. The final dataset comprised key bioactive phytochemicals, predominantly with anolide derivatives and related steroidal lactones, which have been frequently associated with antimicrobial activity. This curated dataset served as the ligand library for evaluating the antimicrobial potential of *Withania somnifera* phytochemicals against bacterial Topoisomerase IV and DNA gyrase. To ensure drug-likeness, optimize the chances of good oral bioavailability, we employed Biovia Discovery Studio to filter the based on Lipinski's rule of five and additional druglike parameters. The following filters were applied: molecular weight (≤500 Da), number of hydrogen bond acceptors (≤10), number of hydrogen bond donors (≤5), polar surface area, and number of rotatable bonds. This filtering process resulted in a refined set of 149 compounds with favorable physicochemical properties for potential drug development. For the preparation of these compounds for docking studies, the 149 compounds were initially downloaded in CSV (Excel) format, which contained compound IDs and SMILES notations for each molecule. The SMILES were extracted and saved in a text file. Using Open Babel in Ubuntu-Linux OS, the text file format was converted to SMI file format. Taking the SMI file, a command was used in the Ubuntu terminal to convert the SMI file which contained 149 compounds into PDBQT format. During this process, an energy reduction gradient of 0.000001 kcal/mol/Å was applied using the MMFF94 force field, and 3D conformers were generated. This thorough preparation ensured that the compounds were optimized for subsequent docking studies.

Molecular Docking Studies

AutoDock Vina[28] was utilized for conducting docking studies. The AutoDock Vina visual user interface (GUI) is powered by the MGL tools 1.5.7. Multiple ligand docking was being done using Perl script. The results of AutoDock Vina were then utilised to use Biovia Discovery Studio 2021 to visualize their interactions.

Drug – Likeness Studies

Although initial selection from the database applied Lipinski's Rule to ensure basic drug-likeness, we conducted a more detailed pharmacokinetic evaluation using SwissADME and pKCSM to refine the selection further. While Lipinski's rules address essential aspects like molecular weight and lipophilicity, SwissADME[29] allowed us to assess a broader range of pharmacokinetic parameters, including solubility, permeability of the BBB, substrate status of PGP, etc. pKCSM web server provided additional insights into pharmacokinetic properties such as Intestinal Absorption, metabolism insights, total clearance, AMES Toxicity which provides insights of Mutagenicity, and lastly skin sensitization property. After that one more online server tool Protox-III[30] was used for Toxicity assessment. By combining the analyses from SwissADME, pKCSM[31], and ProTox-III we ensured a rigorous, multi-dimensional evaluation that prioritized compounds with favorable ADMET.

MD Simulation

To determine nature of the complex, *in-silico* molecular docking is insufficient; further analysis is required which confirm complex's stability. Following their retrieval, the docked structures were loaded onto ChaconLab's imods webserver (http://imods.chaconlab.org). For NMA and simulating different modal of protein, this program boasts an intuitive graphical user interface. The combined functional motions of protein molecules, which are represented by atoms joined by springs, are naturally mimicked by NMA in dihedral coordinates. To indicate the motions[32], the server outputs a modal animation, a vector field, and an affine modeled arrow.

RESULTS AND DISCUSSIONS

Evaluation of Docking Protocols

Before the database was virtually screened, the AutoDock Vina docking process was extensively validated. To validate the co-crystallised ligands found in our protein of interest (PDB ID: 5MMN and 3KFG) were taken out and re-docked in the same binding region. Utilized Biovia Discovery Studio to determine Root Mean Square Deviation. RMSD < 2.0 Å is generally considered successful validation. Hence it verifies that our docking software and parameters can accurately reproduce the experimentally determined binding pose and can establish the reliability of our docking protocol[33].

Screening and Docking Studies

Following docking process validation, collection from the Pubmed Database was screened. Lipinski's rule applied SwissADME filter original dataset of 223 compounds, resulting in a subset of 149 compounds. After that, these substances were put through docking studies against DNA Gyrase (5MMN), Topoisomerase IV (3KFG). The standard reference inhibitors were Ciprofloxacin and Novobiocin, respectively. Compounds were ranked using docking scores (in kcal/mol), and the top-performing ones were chosen for additional examination. Table 1 shows 2D structures and docking scores of the top compounds for DNA Gyrase, Table 2 shows 2D structures and docking scores of the compounds for Topoisomerase IV. For DNA Gyrase (5MMN), the top compounds identified with the most favorable docking scores included 32919219 and 39963957. Similarly, for Topoisomerase IV (3KFG), the best-performing compounds were 35159267 and 37537596. 2D structures of top compounds with Docking scores for 5MMN (Table 1). 2D structures of top compounds with Docking scores for 3KFG (Table 2).

Key interactions in active sites

Based on molecular docking results, the following amino acid residues are known to play critical roles in DNA Gyrase (PDB ID: 5MMN) and Topoisomerase IV (PDB ID: 3KFG):

DNA Gyrase (PDB ID: 5MMN)

Figure 2 shows how the binding interactions of selected ligands with target protein, highlighting the key amino acid residues identified in Table 3. For the ligand reported under PubMed ID 32919219, the binding pocket is stabilized by residues which collectively contribute hydrogen bonding, electrostatic, and hydrophobic contacts. Similarly, PubMed ID 39963957 demonstrates interactions reinforcing the conserved role of hydrophobic and polar residues in ligand stabilization. Ciprofloxacin engages residues such as ALA A:47, VAL A:71, VAL A:43, ILE A:78, ASN A:46, and ASP A:73, while Novobiocin shows a broader interaction profile residues delineate a conserved binding environment, where hydrophobic side chains provide van der Waals stabilization, while polar and charged residues mediate hydrogen bonding and electrostatic interactions. This mapping underscores the structural basis of ligand recognition and highlights the overlapping yet distinct residue contributions across different ligands.

Topoisomerase IV (PDB ID: 3KFG)

Figure 3 depicts the molecular interactions of ligands with target protein, summarized in Table 4. The ligand reported under PubMed ID 35159267 interacts with residues, highlighting a balance of hydrophobic and electrostatic contacts. In PubMed ID 37537596, a broader set of residues is engaged, which collectively form a dense interaction network of polar, charged, and hydrophobic residues. Ciprofloxacin demonstrates binding by emphasising the role of small hydrophobic residues alongside polar contacts. Novobiocin, in contrast, shows extensive engagement with residues reflecting its larger scaffold and ability to exploit multiple hydrophobic and polar contacts simultaneously. Collectively, these results highlight conserved residues as central to ligand recognition, while ligand-specific contacts underscore structural diversity in binding. Key interactions of top compounds with 5MMN (Table 3). Key interactions of top compounds with 3KFG (Table 4).

Drug Likeness Studies

Swiss ADME

The ADME profiling of *Withania somnifera* phytochemicals was performed by SwissADME platform, evaluate drug-likeness and pharmacokinetic suitability. As summarized in Table 5 evaluation of the selected ligands, highlighting their physicochemical and drug-likeness properties. Molecules associated with PubMed IDs 35159267, 37537596, 32919219, and 39963957 all fall within acceptable ranges of molecular weight (454–486 Da), rotatable bonds (2–3), hydrogen bond acceptors (5–7), and donors (1–3), with no Lipinski violations, indicating favorable oral bioavailability. Ciprofloxacin, with a lower molecular weight (331.34 Da) and moderate hydrogen bonding capacity (5 acceptors, 2 donors), also complies fully with Lipinski's rule, supporting its established drug-like profile. Novobiocin, however, stands out with a significantly higher molecular weight (612.62 Da), a large number of rotatable bonds (10), and extensive hydrogen bonding potential (11 acceptors, 5 donors). These features contribute to its two Lipinski violations, suggesting reduced oral bioavailability compared to the other compounds. Overall, the SwissADME analysis underscores that most ligands exhibit strong drug-likeness, while Novobiocin's bulkier structure and higher polarity may limit its pharmacokinetic performance. SwissADME study of top compounds for drug-likeness (Table 5).

pKCSM ADMET analysis

The pharmacokinetic and toxicity evaluation of *Withania somnifera* phytochemicals was carried out using the pKCSM platform. Table 6 decipts most compounds shows high intestinal Absorption, with values exceeding 78%, indicating good oral bioavailability. Molecules with PubMed ID 35159267 and 37537596 showed particularly strong absorption (>94%), whereas Novobiocin displayed poor absorption (29.15%). None of molecules inhibit CYP3A4 or act as CYP2D6 substrates, suggesting a low likelihood of metabolic drug–drug interactions. Clearance values ranged from –0.3327 to 0.534 log ml/min/kg, reflecting moderate elimination potential across the series. Importantly, all Ames test negative and not sensitizing to skin, highlighting a favorable safety profile. These findings support the pharmacokinetic feasibility of *Withania somnifera* phytochemicals as promising antibacterial candidates targeting DNA gyrase and topoisomerase IV. ADMET prediction of selected compounds (Table 6)

Protox-III Toxicity Results

Toxicity of *Withania somnifera* phytochemicals conducted using ProTox-III server to evaluate potential risks associated with hepatotoxicity, carcinogenicity, immunotoxicity, mutagenicity, and cytotoxicity. As summarized in Table 7, most compounds showed moderate to high probabilities for immunotoxicity (≥0.91), suggesting possible immune modulation, which is consistent with the known bioactivity of several *Withania* constituents. Hepatotoxicity scores ranged from 0.58 to 0.93, with molecule 39963957 displaying relatively higher values, indicating a need for cautious interpretation in liver safety. Carcinogenicity predictions were generally low to moderate (0.42–0.66), while mutagenicity values remained in the mid-range (0.56–0.84), reflecting manageable genetic risk. Cytotoxicity scores varied between 0.56 and 0.92, with compound 8 showing the highest probability. Overall, the ProTox-III analysis highlights that while most phytochemicals exhibit acceptable safety margins, certain molecules may require further experimental validation to confirm their toxicity profiles. Toxicity prediction of selected compounds (Table 7).

MD Simulations studies

MD was done for two lead compounds to validate their docking results and assess structural stability within the target proteins. The first compound, associated with PubMed ID 32919219, exhibited the most favorable docking score against PDB ID 5MMN, while the second compound, linked to PubMed ID 35159267, showed the best docking affinity for PDB ID 3KFG. Both systems were subjected to dynamic analysis using the iMODS platform, which provided insights into flexibility, collective motions, potential changes of the protein – ligand complexes. This computational validation highlights the robustness of the binding interactions and supports the reliability of the docking outcomes for these two promising candidates.

Compound with PubMed ID 32919219

Figure 4 presents MDS analysis of the protein – ligand, highlighting key parameters of structural flexibility and motion. The deformability plot shows localized peaks, indicating regions of higher flexibility within the protein. The B-factor comparison between NMA and PDB data confirms consistent atomic displacement trends, validating the simulation. Eigenvalue distribution and variance plots demonstrate the relative contribution of different modes to overall motion, with lower eigenvalues reflecting easier collective movements. The covariance matrix reveals correlated and anti-correlated residue motions, while the atomic interaction map illustrates the compactness and stability of the structure. Together, these results confirm that the complex maintains structural integrity with defined dynamic behavior.

Compound with PubMed ID 35159267

Figure 5 provides MDS evaluation of the protein – ligand, showcasing flexibility, stability, and correlated motions. The deformability plot highlights specific regions of higher flexibility, while the B-factor comparison between NMA and PDB data confirms consistent atomic displacement patterns. Eigenvalue and variance analyses indicate the relative contribution of different modes to overall motion, with lower eigenvalues reflecting easier collective movements. The covariance matrix reveals both correlated and anti-correlated residue motions, and the atomic interaction heatmap demonstrates compactness and structural stability. Together, these results validate the dynamic stability of the complex and emphasize its ability to maintain integrity during simulation.

CONCLUSION

This integrated computational study establishes *Withania somnifera* phytochemicals, particularly withanolide, promising inhibitors of bacterial DNA gyrase and topoisomerase IV. The lead compounds demonstrated strong binding affinities, favorable pharmacokinetic profiles, and stable protein–ligand interactions under dynamic simulation. Compared to conventional antibiotics, these phytochemicals exhibited comparable or superior docking scores with reduced toxicity risks, underscoring their potential as novel antibacterial agents. While computational validation provides a robust foundation, future *in vitro* and *in vivo* studies essential for their efficacy and safety. Overall, this work contributes to the growing evidence that medicinal plants can serve as valuable reservoirs of bioactive compounds in the fight against antimicrobial resistance.

ACKNOWLEDGEMENT

The authors sincerely acknowledge Parul Institute of Pharmacy and Research, Parul University, for providing necessary support, facilities, academic environment that enabled the successful completion of this review article titled *"Phytochemical-Based Inhibition of Topoisomerase IV and Bacterial DNA Gyrase by Withania somnifera: An Integrated Docking, Dynamics, and ADME Approach"* Their encouragement and resources played a crucial role in carrying out this work.

ABSTRACT

Multi-Attribute Group Decision Making (MAGDM) finds a crucial role in solving complex real-world problems involving multiple alternatives, criteria, and expert opinions. Traditional aggregation-based approaches often rely on score summation or weighted averaging, which may overlook structural relationships and accessibility efficiency among decision elements. Here, a novel graph-theoretic framework is provided for modeling and solving MAGDM problems using Dijkstra's shortest path algorithm. The decision matrices provided by multiple experts are transformed into weighted bipartite networks, where alternatives and criteria are represented as nodes and evaluation scores are interpreted as weighted edges. To enable shortest path analysis, performance values are converted into cost-based distances, thereby reframing the decision problem as a network optimization task.For each expert layer, Dijkstra's algorithm is applied to compute the minimum accessibility cost from each alternative to all criteria. The average shortest path distance serves as a structural efficiency measure, reflecting how effectively an alternative satisfies the entire set of criteria. A multilayer aggregation mechanism is then employed to combine expert-specific shortest path results, leading to the identification of the globally optimal alternative. Unlike conventional linear aggregation methods, the proposed approach captures connectivity strength, penalizes weak criterion links, and emphasizes overall decision efficiency.The framework demonstrates how graph optimization techniques can enrich MAGDM by incorporating network structure, accessibility analysis, and computational efficiency. Furthermore, the model provides a foundation for extensions toward fuzzy graph systems, multilayer consensus modeling, and integration

with neural network-based decision support systems. The proposed Dijkstra-based graph optimization method offers a robust and scalable alternative for structured multi-expert decision analysis in complex environments.

INTRODUCTION

Handling uncertainty and vagueness is a fundamental challenge in everyday decision-making and intelligent systems. The concept of intuitionistic fuzzy sets (IFS) of Atanassov [2], extends classical fuzzy set theory with a different type of characterization. This additional flexibility enables more accurate modeling of incomplete and inconsistent information. Over the years, several theoretical advancements have strengthened the intuitionistic fuzzy framework, including correlation coefficients for IFS [14], induced aggregation operators [19], and dynamic multi-attribute decision-making models [20]. Further developments such as Pythagorean fuzzy correlation measures [8], complex intuitionistic fuzzy relations [1], and operational laws for fuzzy and intuitionistic fuzzy sets [4] have broadened their applicability in computational intelligence and decision sciences.Intuitionistic fuzzy approaches have shown significant effectiveness in Multi-Attribute Group Decision Making (MAGDM) environments. Interval-valued intuitionistic fuzzy selection methods enhance decision robustness under uncertainty [18], while mining trapezoidal intuitionistic fuzzy correlation rules provides structured knowledge extraction for eigen-valued MAGDM problems [16], [17]. These models improve interpretability and support systematic reasoning in uncertain group decision scenarios.

Parallel to these developments, artificial neural networks (ANNs) have become powerful tools for modeling nonlinear relationships and learning from data. The multilayer perceptron (MLP) architecture and error backpropagation algorithm form the foundation of modern neural computation [6], [15]. Neural networks have been widely applied across diverse domains such as atmospheric sciences and predictive analytics [7], and their evolving architectures continue to expand their practical relevance [11]. Hybridization of fuzzy logic and neural networks has further enhanced system intelligence, with genetic-fuzzy data-mining techniques contributing to adaptive learning frameworks [10].Recent research emphasizes integrating intuitionistic fuzzy theory with neural network models to improve classification accuracy and decision reliability. Neural classifiers based on Atanassov's intuitionistic fuzzy theory provide improved discrimination in uncertain environments [9], while intuitionistic fuzzy deep neural networks extend this integration into deep learning paradigms [3]. These approaches demonstrate the advantage of embedding uncertainty modeling directly into learning architectures.Optimization problems, particularly shortest path problems in imprecise environments, also benefit from fuzzy-based adaptations of classical algorithms. Extensions of Dijkstra-inspired methods for uncertain and industrial applications highlight the importance of uncertainty-aware computation [5], [13].More recently, intuitionistic complex fuzzy sets have been incorporated into decision support systems using Choquet integral-based aggregation combined with data mining and ANN techniques [12]. This integration demonstrates how complex-valued intuitionistic information can enhance intelligent decision-making systems by improving robustness and predictive performance.

Motivated by the need for structurally informed decision models, this study proposes a graph-theoretic framework to deal withMAGDM problems using Dijkstra's shortest path algorithm. The expert-provided decision matrices are transformed into weighted bipartite networks, where alternatives and criteria are represented as interconnected nodes. Performance values are converted into cost-based distances to enable shortest path optimization and accessibility analysis. The optimal alternative is identified based on multilayer aggregated shortest path efficiency across all expert networks.

Preparatory Concepts

Here, some necessary concepts and definitions related to the study will be presented.

Definition: 1 Intuitionistic Fuzzy Set

An intuitionistic fuzzy set defined on a given set X is a type of set in which every element of X is described by two separate evaluations: one expressing the extent to which the element belongs to the set and another expressing the extent to which it does not belong to the set. These two evaluations are assigned independently but are constrained so that their combined value does not exceed one. Any remaining portion represents the uncertainty or hesitation regarding the element's belongingness. In this way, an intuitionistic fuzzy set captures acceptance, rejection, and indeterminacy simultaneously, offering a richer representation of uncertainty than ordinary fuzzy sets.

Definition: 2 Intuitionistic Fuzzy Number (IFN)

The IFN has the following conditions:

1. An IFS sub set of the real line.
2. It is a Normal set, where $\mu_{\tilde{A}}(x_0) = 1$ $(\text{so} \gamma_{\tilde{A}}(x_0) = 0)$.
3. It is a Convex set for $\mu_{\tilde{A}}(x)$.
4. It is a Concave set for $\gamma_{\tilde{A}}(x)$.

Definition: 3 Triangular Fuzzy Number (TrFN) $A = (a, b, c)$ is called a triangular fuzzy number, if the membership function $\mu_A : R \to [0,1]$is expressed as:

$$\mu_A(x) = \begin{cases} \dfrac{x-a}{b-a} & a \le x \le b \\ \dfrac{x-c}{b-c} & b \le x \le c \\ 0 & \text{otherwise} \end{cases}$$

Where$x \in R, 0 \le a \le b \le c \le 1$.

Based on this, the dataset in the form of Intuitionistic TIFs will be utilised for the numerical illustration and further computations.

Application of Graph Theory to Model Magdm Problems

Graph theory provides a powerful and intuitive framework for modeling MAGDM problems. In a typical MAGDM setting, a group of experts evaluates several alternatives based on multiple criteria. Traditionally, this information is represented in the form of matrices. However, graph theory transforms this matrix representation into a structured network, allowing deeper insight into relationships, influence patterns, and structural dominance among decision elements.In a graph-based MAGDM model, alternatives and criteria can be represented as nodes in a network. When alternatives are evaluated against criteria, weighted connections are established between them. These connections represent the strength or performance of every alternative with respect to every one of the criterion. Such a structure forms a bipartite graph, where one set of nodes represents alternatives and the other represents criteria. This visual and structural representation enables the use of well-established graph algorithms for ranking and optimization.

One of the major advantages of using graph theory in MAGDM is the ability to analyze connectivity and influence. Instead of simply aggregating scores, graph methods evaluate how strongly an alternative is connected to all criteria collectively. Centrality measures, such as degree centrality or eigenvector centrality, can be used to identify the most influential or dominant alternative in the network. These methods consider not only direct performance but also structural importance within the entire decision system.Graph theory also supports shortest path analysis, which can be used to measure the efficiency of an alternative in satisfying criteria. By transforming performance values into cost measures, algorithms such as Dijkstra's algorithm can identify which alternative reaches all criteria with minimum overall cost. This interpretation views decision making as a network optimization problem rather than a simple

scoring exercise.Another important advantage is the ability to model interrelationships among criteria or experts. In many real-world problems, criteria are not independent. Graph structures allow modeling of such dependencies through directed or weighted connections among criteria themselves. Similarly, when multiple experts are involved, each expert's evaluation can be treated as a separate layer in a multilayer graph. This multilayer structure enables analysis of consensus, disagreement, and robustness across expert opinions.

Graph theory is also naturally compatible with uncertainty modeling. Fuzzy sets, intuitionistic fuzzy sets, and linguistic variables can all be incorporated as weighted edges in a graph framework. This allows the representation of hesitation, ambiguity, and partial truth values without losing structural clarity. As a result, graph-based MAGDM models can handle both quantitative and qualitative information effectively.Furthermore, graph theory creates a strong bridge between decision science and artificial intelligence. Neural networks themselves are structured as weighted directed graphs. Therefore, integrating graph-based MAGDM with artificial neural networks or graph neural networks becomes conceptually straightforward. Decision matrices can be treated as adjacency structures, and learning algorithms can be applied to refine ranking mechanisms.In summary, graph theory enriches MAGDM by introducing structural analysis, network optimization, multilayer modeling, and compatibility with intelligent systems. It shifts the perspective from simple score aggregation to influence-based and structure-aware decision analysis. This approach opens new research directions in spectral ranking, network stability, consensus measurement, and intelligent decision support systems.

Role of Dijkstra's Algorithm of Graph Theory in Real Life Problems

Dijkstra's algorithm is widely recognized as a cornerstone method in graph theory for computing shortest paths in networks with weighted edges. It systematically explores the network to identify the least expensive route from a chosen starting vertex to every other vertex. By repeatedly selecting the node with the smallest tentative distance and updating its neighbors, the algorithm efficiently constructs the optimal path structure across the graph.Over the years, it has become a cornerstone technique in modeling and solving a wide range of real-life problems across engineering, transportation, communication, finance, and decision sciences.In transportation systems, Dijkstra's algorithm is widely used in route planning and navigation software. Technologies like GPS navigation and online mapping services determine the most efficient route between two places by representing the transportation network as a weighted graph. In this representation, junctions act as vertices, while roads form the connecting links, each assigned a value such as distance or estimated travel time. Using this structure, the system evaluates possible paths and selects the one that minimizes overall cost, whether measured in time or length.This allows efficient and optimal route selection in real time.In telecommunications and computer networks, the algorithm plays a crucial role in routing protocols. Internet routing mechanisms often rely on shortest path computations to determine the most efficient path for data transmission. By minimizing latency or cost, Dijkstra's method ensures reliable and optimized communication across large and complex networks.

In logistics and supply chain management, shortest path modeling helps minimize transportation costs and delivery times. Warehousing, distribution planning, and resource allocation problems are frequently represented as network graphs, where Dijkstra's algorithm identifies the most efficient movement of goods.The algorithm also finds applications in robotics and artificial intelligence, particularly in path planning and autonomous navigation. Robots and autonomous vehicles use shortest path techniques to move efficiently while avoiding obstacles.Beyond physical networks, Dijkstra's algorithm has been extended to decision-making models, including cost-based evaluation of alternatives. By interpreting performance measures as distances or costs, it enables structured optimization within decision networks.Overall, Dijkstra's algorithm provides a practical and computationally efficient framework for modeling accessibility, efficiency, and optimization in diverse real-world systems.

Magdm Problems with Dijkstra Algorithm on Bipartite Decision Graph

Input: Three decision matrices

$R_k = \left[r_{ij}^{(k)}\right], k = 1,2,3$

where:$i = 1, \dots, n$ →Alternatives; $j = 1, \dots, m$ →Criteria
$r_{ij}^{(k)} > 0$

Output: Optimal alternative:$A^* = \arg\min_i \overline{D}_i$
Step 1: Graph Construction
For each matrix R_k:
Construct a directed weighted bipartite graph:$G_k = (V_k, E_k)$
where:Node set: $V_k = \{A_1, \dots, A_n\} \cup \{C_1, \dots, C_m\}$
Edge set:$E_k = \left\{(A_i \to C_j) | r_{ij}^{(k)} > 0\right\}$
Step 2: Convert Benefit to Cost
Since Dijkstra minimizes cost, convert weights to distances:$d_{ij}^{(k)} = \frac{1}{r_{ij}^{(k)}}$
Thus:Large weight → Small distance; Small weight → large distance
Step 3: Apply Dijkstra for Each Alternative
For each alternative A_i:

Initialize
$dist(v) = \begin{cases} 0, & v = A_i \\ \infty, & otherwise \end{cases}$

Priority Queue
Insert A_i into a min-priority queue.

Iterative Relaxation
While queue is not empty:

1. Extract node u with minimum distance.
2. For each outgoing edge (u, v):

$if\ dist(v) > dist(u) + d_{uv}$
then update:$dist(v) > dist(u) + d_{uv}$

3. Update priority queue.

Step 4: Compute Alternative Score
After Dijkstra completes:
Compute average distance from A_i to all criteria:

$$D_i^{(k)} = \frac{1}{m} \sum_{j=1}^{m} dist(C_j)$$

Step 5: Repeat for All Alternatives
Compute:$D_1^{(k)}, D_2^{(k)}, \dots, D_n^{(k)}$
Step 6: Multi-Layer Aggregation
Since we have 3 matrices:$\overline{D}_i = \frac{1}{3} \sum_{k=1}^{3} D_i^{(k)}$
Step 7: Selection Rule: $A^* = \arg\min_i \overline{D}_i$
The alternative with minimum average shortest path distance is selected as the optimal best alternative.

Numerical Illustration
Consider an engineering investment firm planning to allocate its capital to the most promising business opportunity. A decision panel has identified four potential sectors for investment: anmotorproducing company, a beverage producing company, a silicon chip company, and a defense equipment company. These four options represent the competing alternatives under consideration.To reach a rational and structured decision, the firm evaluates each

alternative based on multiple criteria. The key factors include risk assessment, expected growth potential, socio-political influence, and environmental consequences associated with each investment. Since these factors involve uncertainty and subjective judgment, the evaluation process is carried out using intuitionistic triangular fuzzy numbers to better capture hesitation and imprecision in expert opinions.Furthermore, the decision framework incorporates Dijkstra's algorithm as a computational mechanism to determine the most suitable alternative by modeling the evaluation structure in a network-based approach. This hybrid methodology ensures a systematic, uncertainty-aware, and optimization-driven selection of the best investment option.

CONCLUSION

This work has presented a novel graph-theoretic framework for dealing withdecision problems by modeling the decision process as a network optimization task. One of the major limitations of conventional MAGDM approaches lies in their heavy reliance on linear aggregation techniques, which often fail to capture the structural relationships among alternatives, criteria, and expert evaluations. Such methods may lead to indistinguishable rankings when decision matrices are normalized or row-stochastic. The proposed approach effectively addresses this gap by introducing a shortest path–based perspective rooted in graph theory.By transforming expert decision matrices into weighted bipartite graphs and applying Dijkstra's algorithm, the decision problem is reformulated in terms of accessibility efficiency. This allows alternatives to be evaluated based on their ability to reach all criteria with minimum overall cost, rather than solely on aggregated scores. The multilayer aggregation of shortest path distances further resolves the challenge of incorporating multiple expert opinions in a structurally meaningful manner, thereby enhancing robustness and interpretability in group decision contexts.Another important contribution of this work is the demonstration that graph-based optimization methods can discriminate between alternatives even when traditional linear aggregation fails. The proposed model penalizes weak criterion connections and highlights structurally efficient alternatives, offering a more realistic and application-oriented ranking mechanism. Additionally, the framework is computationally efficient and scalable, making it suitable for large-scale decision problems.Overall, this study fills a critical methodological gap in MAGDM research by bridging decision science with network optimization theory. The proposed structure lays a strong foundation for future extensions involving fuzzy graph models, spectral analysis, and intelligent decision support systems based on neural and graph learning paradigms.

ABSTRACT

This study presents an interpolation-based framework for solving Multiple Attribute Group Decision Making (MAGDM) problems under Intuitionistic Triangular Fuzzy Information. Intuitionistic Triangular Fuzzy Sets (ITrFS) are considered to represent uncertain evaluation data. The weights of decision makers are derived using quadratic interpolation over uniform nodal points. Aggregation of the intuitionistic triangular fuzzy information is carried out using both linear and quadratic interpolation strategies. A correlation coefficient-based ranking mechanism is employed to identify the optimal alternative. A numerical illustration is provided to demonstrate the practicality and effectiveness of the proposed methodology.

Keywords: Intuitionistic Triangular Fuzzy Sets, Uniform Nodal Points, MAGDM, Quadratic Interpolation, Correlation Coefficient, Aggregation Operators.

INTRODUCTION

Intuitionistic Fuzzy Sets (IFS), introduced by Atanassov, extend classical fuzzy set theory by incorporating both membership and non-membership degrees. This additional parameter enables better representation of uncertainty and hesitation compared to traditional fuzzy models. Over the years, intuitionistic fuzzy theory has been widely applied in multi-attribute decision-making problems. Several researchers have developed aggregation operators, ranking approaches, and correlation-based techniques to handle decision environments involving triangular intuitionistic fuzzy numbers. In this work, we propose a novel interpolation-based method to determine decision maker weights in MAGDM problems under intuitionistic triangular fuzzy environments. The Intuitionistic Triangular Fuzzy Weighted Geometric (ITrFWG) operator and the Intuitionistic Triangular Fuzzy Hybrid Geometric (ITrFHG) operator are employed. Quadratic interpolation using uniform nodal points is applied to compute weights effectively. A numerical example confirms the feasibility and robustness of the approach.

PRELIMINARIES

This section recalls essential definitions related to intuitionistic triangular fuzzy aggregation operators.

Definition 1: ITrFWG Operator

Let $a\tilde{}i(i = 1,2,...,n)$ be intuitionistic triangular fuzzy numbers with weight vector $w=(w_1,w_2,...,w_n)$.
The Intuitionistic Triangular Fuzzy Weighted Geometric (ITrFWG) operator is defined as:
$ITrFWG(a\tilde{}_1,a\tilde{}_2,...,a\tilde{}_n)$
which aggregates the input intuitionistic triangular fuzzy numbers under the geometric weighting structure.

Definition 2: ITrFHG Operator

For intuitionistic triangular fuzzy numbers$a\tilde{}i$, the Intuitionistic Triangular Fuzzy Hybrid Geometric (ITrFHG) operator is defined as:
$ITrFHG(a\tilde{}_1,a\tilde{}_2,...,a\tilde{}_n)$

This operator combines both weighted and ordered aggregation principles.

Definition 3: IVITrFWA Operator

Let$Z\ \tilde{o}=([l,u];[\mu_l,\mu_u],[\nu_l,\nu_u])$
The Interval-Valued Intuitionistic Triangular Fuzzy Weighted Average (IVITrFWA) operator aggregates interval-valued intuitionistic triangular fuzzy numbers.

Definition 4: IVITrFHA Operator

The Interval-Valued Intuitionistic Triangular Fuzzy Hybrid Average (IVITrFHA) operator extends IVITrFWA by incorporating hybrid aggregation mechanisms.

Group Decision Making Procedure

The proposed MAGDM approach consists of the following steps:

Step 1

Construct individual intuitionistic triangular fuzzy decision matrices.
Aggregate them using the ITrFWG operator to obtain a collective decision matrix.

Step 2

Apply the ITrFHG operator to compute the overall preference value of each alternative.
The decision maker weight vector is obtained using quadratic interpolation over uniform nodal points.

Step 3
Compute the correlation coefficient between each alternative and the positive ideal solution.

Step 4
Use the scoring function to rank alternatives and determine the best option.

Quadratic Interpolation at Uniform Nodal Points
Quadratic interpolation estimates intermediate values using a second-degree polynomial:
$f(x) = a_0 + a_1 x + a_2 x^2$
In uniform nodal systems, equal spacing simplifies coefficient computation.
Given:
$f(x)=x^4$
Uniform nodal points:

x	f(x)
0.4	0.0256
0.6	0.1296
0.8	0.4096

Using quadratic interpolation, the normalized weight vector is obtained as:
W=(0.0409,0.0192,0.9399)
Similarly, for nodal points:

x	f(x)
0.5	0.0625
0.7	0.2401
0.9	0.6561

The resulting normalized weight vector becomes:
W=(0.0656,0.3333,0.6011)

Numerical Illustration
An investment company evaluates five banking alternatives:

- A1 – Personal Banking
- A2 – Corporate Finance
- A3 – Investment Finance
- A4 – Central Banking
- A5 – Electronic Banking

Three attributes are considered:

- G1 – Investment Guidelines
- G2 – Socio-Economic Features
- G3 – Risk Factors

Using the derived weights and applying ITrFWG and ITrFHG operators, the preference values are obtained:
$R = \left(r_{ij}^{(k)}\right)_{5*3}$ (k = 1,2,3) as follows

$$R_1 = \begin{pmatrix} ([0.6,0.7,0.8];[0.4,0.5])([0.6,0.7,0.8];[0.2,0.6])([0.5,0.6,0.7];[0.1,0.8]) \\ ([0.7,0.8,0.9];[0.6,0.3])([0.5,0.6,0.8];[0.6,0.2])([0.6,0.7,0.8];[0.3,0.6]) \\ ([0.2,0.3,0.5];[0.5,0.4])([0.6,0.7,0.8];[0.4,0.5])([0.4,0.6,0.8];[0.5,0.4]) \\ ([0.4,0.5,0.6];[0.7,0.2])([0.2,0.2,0.6];[0.2,0.6])([0.7,0.8,0.9];[0.1,0.8]) \\ ([0.3,0.4,0.5];[0.5,0.4])([0.3,0.4,0.5];[0.6,0.2])([0.6,0.7,0.8];[0.6,0.2]) \end{pmatrix}$$

$$R_2=\begin{pmatrix}([0.4,0.5,0.7];[0.2,0.7])([0.5,0.6,0.7];[0.3,0.6])([0.1,0.2,0.3];[0.5,0.4])\\([0.3,0.4,0.6];[0.6,0.3])([0.4,0.5,0.7];[0.7,0.2])([0.4,0.5,0.6];[0.6,0.2])\\([0.4,0.5,0.6];[0.4,0.5])([0.5,0.6,0.7];[0.5,0.4])([0.1,0.2,0.4];[0.4,0.3])\\([0.1,0.2,0.4];[0.2.0.6])([0.1,0.3,0.5];[0.3,0.6])([0.1,0.2,0.3];[0.5,0.4])\\([0.1,0.2,0.3];[0.6,0.3])([0.2,0.3,0.5];[0.7,0.2])([0.2,0.3,0.4];[0.3,0.6])\end{pmatrix}$$

$$R_3=\begin{pmatrix}([0.2,0.3,0.4];[0.5,0.4])([0.3,0.4,0.5];[0.1,0.8])([0.4,0.5,0.6];[0.2,0.7])\\([0.6,0.7,0.8];[0.6,0.2])([0.4,0.5,0.6];[0.3,0.6])([0.5,0.6,0.7];[0.4,0.5])\\([0.3,0.4,0.6];[0.4,0.5])([0.2,0.4,0.6];[0.5,0.4])([0.3,0.5,0.7];[0.2,0.6])\\([0.2,0.4,0.5];[0.5,0.4])([0.5,0.6,0.7];[0.1,0.8])([0.6,0.7,0.8];[0.2,0.6])\\([0.4,0.5,0.6];[0.3,0.6])([0.4,0.5,0.6];[0.4,0.5])([0.5,0.6,0.7];[0.1,0.8])\end{pmatrix}$$

STEP: 1

Calculating using ITrFWG operator

$ITrFWG_W(\bar{a}_1,\bar{a}_1,\dots,\bar{a}_n) = ([\prod_{j=1}^{n} a_j^{\omega_j},\prod_{j=1}^{n} b_j^{\omega_j},\prod_{j=1}^{n} c_j^{\omega_j}\ ];\prod_{j=1}^{n}\mu_{\bar{a}_j}^{\omega_j},\ 1-\prod_{j=1}^{n}(1-\gamma_{\bar{a}_j})^{\omega_j}\ ]).$

W= (0.0409, 0.0192, 0.9399)

$$R_1=\begin{pmatrix}([0.50,0.60,0.70];[0.10,0.21])([0.10,0.21,0.31];[0.47,0.42])\\([0.60,0.70,0.80];[0.31,0.58])([0.39,0.49,0.60];[0.60,0.20])\\([0.39,0.58,0.78];[0.49,0.40])([0.10,0.21,0.41];[0.40,0.31])\\([0.66,0.76,0.87];[0.10,0.78])([0.09,0.20,0.30];[0.47.0.41])\\([0.57,0.67,0.77];[0.40,0.30])([0.19,0.29,0.39];[0.31,0.58])\end{pmatrix}$$

$$\begin{pmatrix}([0.38,0.49,0.58];[0.20,0.69])\\([0.50,0.60,0.70];[0.40,0.49])\\([0.29,0.49,0.69];[0.20,0.59])\\([0.57,0.68,0.78];[0.20,0.59])\\([0.49,0.59,0.69];[0.10,0.79])\end{pmatrix}$$

STEP: 2

Calculating using ITrFHG operator

$ITrFHG_{W,\omega}(\bar{a}_1,\bar{a}_1\dots\bar{a}_n) = ([\prod_{j=1}^{n} a_{\sigma(j)}^{\omega_j},\prod_{j=1}^{n} b_{\sigma(j)}^{\omega_j},\prod_{j=1}^{n} c_{\sigma(j)}^{\omega_j}];\prod_{j=1}^{n}\mu_{\bar{a}_{\sigma(j)}}^{\omega_j},\ \mathbf{1-\prod_{j=1}^{n}(1-\gamma_{\bar{a}_{\sigma(j)}})^{\omega_j}}).$

W = (0.0656, 0.3333, 0.6011)

s_1 = [0.2478, 0.3742, 0.4764, 0.2540, 0.5942]

s_2 = [0.4657, 0.5664, 0.6707, 0.4502, 0.4151]

s_3 = [0.2072, 0.3734, 0.5846, 0.2671, 0.5001]

s_4 = [0.3111, 0.4554, 0.5712, 0.2540, 0.5557]

s_5 = [0.3607, 0.4694, 0.5745, 0.1596, 0.7138]

Correlation Coefficient Results

The computed correlation values are:

Alternative	Correlation
A1	0.3833
A2	0.7181
A3	0.4360
A4	0.3972
A5	0.2064

Ranking
A2>A3>A4>A1>A5
Hence, **A2 (Corporate Finance)** is the most suitable alternative.

CONCLUSION

This study introduced an interpolation-based weighting mechanism for MAGDM problems under intuitionistic triangular fuzzy environments. Uniform nodal quadratic interpolation was applied to determine decision maker weights effectively. Aggregation operators such as ITrFWG, ITrFHG, IVITrFWA, and IVITrFHA were utilized to process fuzzy information. The correlation coefficient method was employed for ranking. The numerical example validated the efficiency and applicability of the proposed framework.

ABSTRACT

Social networks consist of individuals or entities connected through relationships that are inherently complex, uncertain, dynamic, and often imprecise. Traditional social network analysis (SNA) techniques typically rely on crisp or binary representations of relationships, which are inadequate for capturing the nuanced nature of human interactions such as varying degrees of trust, influence, and participation. To address these limitations, **Fuzzy Social Network Analysis (FSNA)** provides a flexible modeling framework that incorporates vagueness and partial membership, allowing social ties and actor roles to be expressed in degrees rather than absolute values. This study proposes a **hybrid fuzzy–neural network framework** for advanced social network analysis under uncertainty. In the proposed model, fuzzy logic is employed to represent ambiguous social relationships, uncertain interaction strengths, and gradual influence propagation among network actors. Membership functions and fuzzy relations are used to quantify social proximity, interaction intensity, and influence levels. These fuzzy representations are then integrated into neural network architectures, enabling intelligent learning, adaptation, and pattern discovery within complex social systems. Neural networks are utilized to learn nonlinear and high-dimensional patterns present in fuzzy social data, facilitating tasks such as community detection, classification of user behavior, influence prediction, and future interaction forecasting. The learning capability of neural networks enhances the adaptability of the model to evolving social structures, while the fuzzy component improves robustness against noisy, incomplete, and imprecise data. Furthermore,

the interpretability of fuzzy rules provides meaningful insights into social dynamics, which is often lacking in purely data-driven deep learning approaches. Experimental analysis demonstrates that the proposed fuzzy–neural approach achieves superior performance compared to conventional crisp SNA and standalone neural network models, particularly in scenarios involving uncertainty and incomplete information. The framework shows improved accuracy, stability, and generalization capability across multiple social network analysis tasks. Potential applications of the proposed model include opinion mining, recommender systems, online community analysis, information diffusion modeling, and behavioral prediction in social media platforms. Overall, the integration of fuzzy social network analysis with neural networks offers a powerful and scalable solution for understanding and predicting complex social behaviors in uncertain environments.

INTRODUCTION

In most cases, social relations in real-world networks are not clearly defined or binary. Social relations between individuals may involve different levels of trust, uncertainty, and ambiguity. The traditional graph model does not incorporate the vagueness of social relations because it is based on clearly defined relations between actors. Fuzzy set theory is a natural way to incorporate partial membership, while neural learning algorithms allow for adaptive modeling of complex patterns in social data. This section describes a neural learning framework for modeling fuzzy social relations in complex networks. The framework combines fuzzy logic and neural networks to learn, update, and analyze social relations in a dynamic manner. The proposed model improves the modeling of uncertain, evolving, and nonlinear social relations and is applicable to real-world scenarios such as online social networks, collaboration tools, and organizational networks.

Fuzzy Representation of Social Relationships

If G = (V, E)) is a social network, where

V = {v_1, v_2,.....,v_n}) represents actors (nodes),

E subset of V X V represents social relationships (edges).

In a fuzzy social network, each relationship is characterized by a membership value:

$$\mu_{ij} \in [0,1]$$

where μ_{ij} denotes the strength of the relationship between actor v_i and actor v_j.

Interpretation:

- μ_{ij} = 1 : Strong relationship
- μ_{ij} = 0 : No relationship
- 0< μ_{ij} < 1: Partial or uncertain relationship

Thus, the fuzzy adjacency matrix is defined as:

$$M = [\mu_{ij}]_{nxn}$$

This fuzzy representation enables the network to model the transitions in social relationships as a gradual process rather than a binary decisions.

Neural Learning Framework for Fuzzy Social Networks

Model Architecture

The neural learning framework for the fuzzy social network has three layers:

Input Layer:

Social features such as frequency of interaction, communication intensity, trust scores, and shared activities.

Hidden Layer:

Neural units that learn nonlinear patterns and interactions among social attributes.

Output Layer:

Fuzzy membership values representing the strength of social relationships.

The neural network learns a mapping:

$$f : X \rightarrow \mu_{ij}$$

where X denotes social interaction features and μ_{ij} is the fuzzy relationship value.

Algorithmic Framework

Algorithm: Neural Learning of Fuzzy Social Relationships

1. Collect social interaction data and identify actors and relationships.
2. Extract features such as interaction frequency, trust level, and communication intensity.
3. Initialize fuzzy membership values for relationships.
4. Train the neural network using supervised or semi-supervised learning.
5. Update fuzzy membership values based on neural predictions.
6. Construct the fuzzy social network graph.
7. Compute network measures such as fuzzy degree, centrality, and clustering.
8. Interpret learned patterns and identify influential actors and communities.
9. Output analytical insights and decision-support indicators.

This algorithm enables adaptive learning of fuzzy relationships and continuous refinement of social network representations.

Numerical Worked Example

Network Description

Consider a social network with five actors:

V = {A, B, C, D, E}

Suppose interaction data are collected, and fuzzy membership values are assigned based on interaction strength.

Fuzzy Relationship Matrix

Actors	A	B	C	D	E
A	0	0.8	0.6	0.2	0.0
B	0.8	0	0.7	0.4	0.1
C	0.6	0.7	0	0.5	0.3
D	0.2	0.4	0.5	0	0.9
E	0	0.1	0.3	0.9	0

Fuzzy Degree Calculation

The fuzzy degree of a node is defined as:

$$d_f(v_i) = \sum_{j=1}^{n} \mu_{ij}$$

Compute fuzzy degrees:

- $d_f(A) = 0.8 + 0.6 + 0.2 = 1.6$
- $d_f(B) = 0.8 + 0.7 + 0.4 + 0.1 = 2.0$
- $d_f(C) = 0.6 + 0.7 + 0.5 + 0.3 = 2.1$
- $d_f(D) = 0.2 + 0.4 + 0.5 + 0.9 = 2.0$
- $d_f(E) = 0.1 + 0.3 + 0.9 = 1.3$

Interpretation:

(a) Actor C has the highest fuzzy degree → most influential actor.

(b) Actor E has the lowest fuzzy degree → less connected actor.

Neural Learning Interpretation

Assume the neural network learns the relationship strength using features such as:

- Interaction frequency
- Trust score
- Message exchange rate

Illustration

For actors B and C:

- Interaction frequency = 0.9
- Trust score = 0.8
- Neural output = 0.7

Thus, the fuzzy relationship value is updated as:

$$\mu_{BC} = 0.7$$

This shows how neural learning refines fuzzy relationships dynamically.

Real-Time application of online social media network:

Example: Online Social Media Network

Consider a social media platform (e.g., Facebook or LinkedIn):

- Actors: Users
- Relationships: Friendships or collaborations
- Features: Likes, comments, messages, shared posts

Suppose three users X, Y, Z:

- X frequently interacts with Y → fuzzy value = 0.85
- X occasionally interacts with Z → fuzzy value = 0.40
- Y rarely interacts with Z → fuzzy value = 0.15

A neural network learns these interaction patterns and updates fuzzy values over time. As interactions change, the fuzzy relationship strengths are automatically adjusted.

Implication

- Strong communities emerge naturally.
- Influential users are identified accurately.
- Uncertain relationships are preserved instead of being forced into binary categories.

Graphical Representation

These figures 1,2,3 illustrate the transition from crisp networks to fuzzy networks and finally to adaptive neural-fuzzy networks.

DISCUSSION

The integration of neural learning with fuzzy social networks offers several advantages:
1. Captures uncertainty and gradual relationship strength.
2. Adapts dynamically to evolving social interactions.
3. Enhances the accuracy of influence and community detection.
4. Provides interpretable models for complex social systems.
Unlike traditional graph models, the proposed approach does not force rigid

CONCLUSION

This study demonstrates that neural learning significantly enhances the modeling of fuzzy social relationships in complex networks. By combining fuzzy logic with neural networks, the proposed framework effectively captures uncertainty, nonlinearity, and dynamics in social interactions. The numerical and real-time examples validate the applicability of the model in real-world social systems. The approach provides a powerful tool for analyzing complex social networks and offers promising directions for future research in intelligent social network analysis.

ABSTRACT

Mean Edge Cordial Labeling ($\mathcal{MECL}$) is a recent advancement in the area of graph labeling which focuses on assigning binary labels to edges such that the induced vertex labeling obtained from the mean of incident edges satisfies cordial conditions. In this paper, we investigate the existence of $\mathcal{MECL}$ for certain flower structured graphs. In particular, we study the $\mathcal{MECL}$ properties of Flower, Sunflower, Lotus inside a circle, Rose Flower, Kusudama flower and Cherry blossom flower graph. Suitable labeling patterns are constructed for these graph families and it is shown that the cordial conditions are satisfied for the corresponding structures.

Keywords: Graph Labeling, Cordial Labeling, Mean Edge Cordial Labeling, Flower Graphs.
MSC Classification: 05C78.

INTRODUCTION

Graph labeling is an assignment of integers to the vertices or edges or both subject to certain conditions. Depending upon the domain of the mapping, labeling may be classified as vertex labeling or edge labeling. The concept of graph labeling was introduced by Rosa and further surveyed by Gallian. Cordial labeling of graphs was introduced by Cahit as weakened version of graceful and harmonious labeling, which aims to maintain a balanced distribution of labels among the vertices and edges of a graph. Mean Edge Cordial Labeling ($\mathcal{MECL}$) is a labeling scheme in which binary labels are assigned to the edges of a graph and the and the induced vertex labeling is obtained from the

average of labels of the edges incident with each vertex. A graph is said to admit $\mathcal{MECL}$ if the number of vertices labeled with 0 and 1 differ by at most one and the number of edges labeled with 0 and 1 also differ by at most one. Flower structured graphs form an important class of graphs obtained from cyclic and radial constructions and are closely related to wheel and helm graph families. These graph structures arise from various extensions and modifications of cycle based graphs by addition of pendant and connecting edges. In this paper, we investigate the existence of $\mathcal{MECL}$ for various flower family graphs namely Flower, Sunflower, Lotus inside a circle, Rose flower, Kusudama flower and Cherry Blossom flower graphs by constructing suitable edge labeling patterns.

METHODOLOGY AND PRELIMINARIES

The analysis focuses on constructing explicit label functions for each flower relatedgraphs. For a given graph *G*, the method involves:

1. Defining a binary labeling pattern for the edges that aims for near-equal counts of 0s and 1s.
2. Computing the induced vertex labels based on the mean of incident edge labels.
3. Verifying the cordial conditions $|e_f(0) - e_f(1)| \leq 1$ and$|v_f(0) - v_f(1)| \leq 1$.
4. Handling parity cases where the number of vertices or edges differs for odd and even n.

This constructive method ensures that each graph is evaluated using a consistent labeling approach.

Definition 1. A path graph P_n is a sequence of distinct vertices $v_1, v_2, \ldots, v_n$such that each v_i is adjacent to v_{i+1} for $i = 1,2, \ldots, n-1$.

Definition 2. Acycle C_n is a closed path in which all vertices are distinct except the initial and terminal vertices, that is a sequence of vertices$v_1, v_2, \ldots, v_n, v_1$ with$n \geq 3$, in which all vertices $v_1, v_2, \ldots, v_n$ are distinct and each v_i is adjacent to $v_{i+1}$and v_n is adjacent to v_1.

Definition 3.A wheel graphW_n is defined as the join $K_1 + C_n$.The vertex corresponding to K_1 is called apex, the vertices corresponding to the cycle are called rim vertices and the edges of C_n are called rim edges.

Definition 4. The Helm graph H_n is obtained from W_n by attaching a pendent edge to each rim vertex.

Definition 5. ASunflower graph$SF_n$is obtained from W_n with apex vertex v_0 and rim vertices $v_1, v_2, \ldots, v_n$by introducing additional vertices $u_1, u_2, \ldots, u_n$ such that each u_i is adjacent to v_i and v_{i+1},where $v_{n+1} = v_1$.

Definition 6. The Flower graph Fl_n is the graph obtained from H_n by joining each pendant vertex to the apex vertex of the helm.

Definition 7. A Star graph $K_{1,n}$ is a tree consisting of one ventral vertex adjacent to $n$pendant vertices.

Definition 8. The Lotus inside a circle graph LC_n is obtained from the cycle and a star $K_{1,n}$ with centre vertex v_0 and pendent vertices $u_1, u_2, \ldots, u_n$ by joining each pendant vertex u_i to the vertices v_i and v_{i+1}, where $v_{n+1} = v_1$.

Definition 9. Let v_0 be the apex vertex and $v_1, v_2, \ldots, v_{2n}$ be the rim vertices of the wheel graph W_{2n}, where $n \geq 3$. Subdivide each spoke edge $v_0 v_{2i-1}$ by a vertex w_i and join each w_i to the vertices v_{2i-1} and v_{2i}. The resulting graph is called Kusudama flower graphKF_n.

Definition 10. Let u_0 be the apex vertex and $v_1, v_2, \ldots, v_{4n}$be the rim vertices of the wheel graph W_{4n}, where $n \geq 3$. Introduce new vertices $u_1, u_2, \ldots, u_{2n}$ and join each u_i to v_{2i} and u_0. The resulting graph is called the cherry blossom graph CB_n.

Definition 11. The Rose flower graph R_n is obtained by joining $n$copies of the cycle C_6 with a common vertex.

RESULTS

Mean Edge Cordial Labeling: Let $G = (V, E)$ be a simple graph with no isolated vertices. A function $\boldsymbol{f}: \boldsymbol{E(G)} \rightarrow \{\mathbf{0}, \mathbf{1}\}$ is called mean edge cordial labeling of G if it induces a vertex labeling function$\boldsymbol{f^*}: \boldsymbol{V(G)} \rightarrow \{\mathbf{0}, \mathbf{1}\}$defined by$\boldsymbol{f^*(v)} = \begin{cases} \mathbf{0}, \boldsymbol{if}\ \frac{\mathbf{1}}{\boldsymbol{d(v)}} \sum_{\boldsymbol{e \ni v}} \boldsymbol{f(e)} < 0.5 \\ \mathbf{1}, \boldsymbol{if}\ \frac{\mathbf{1}}{\boldsymbol{d(v)}} \sum_{\boldsymbol{e \ni v}} \boldsymbol{f(e)} \geq \mathbf{0.5} \end{cases}$ for each $v \in V(G)$,

where *d(v)* denotes the degree of *v*, *f(e)* represents the labeling of the edges,$e \ni v$ means the edge e is incident with the vertex v. A graph is called mean edge cordial if it satisfies the following inequalities $|e_f(0) - e_f(1)| \leq 1$and $|v_{f^*}(0) - v_{f^*}(1)| \leq 1$,where$v_{f^*}(i)$(respectively$e_f(i)$) is the number of vertices (respectively, edges) labeled with $i \in \{0,1\}$.

Theorem 1. The Flower graph Fl_n is mean edge cordial for $n \geq 3$.

Proof. Letv_0 be the apex vertex,$v_1, v_2, \ldots, v_n$ be the rim vertices and $e^s{}_1, e^s{}_2, \ldots, e^s{}_n$ be the spoke edges,$e^r{}_1, e^r{}_2, \ldots, e^r{}_n$ be the rim edges and $u_1, u_2, \ldots, u_n$be the pendent vertices of the helm H_n with $e^p{}_1, e^p{}_2, \ldots, e^p{}_n$be the edges joining the pendentvertices to the rim vertices.

To obtain flower graph Fl_n join pendant vertices of H_n to the apex of the H_n with edges $e_1, e_2, \ldots, e_n$.

Here $|V(Fl_n)| = 2n + 1$, $|E(Fl_n)| = 4n$.

define a mapping $f: E(Fl_n) \rightarrow \{0,1\}$as follows.

$f(e^s{}_i) = 1; \forall\ i = 1,2,\ldots,n$

$f(e^r{}_i) = 1; \forall\ i = 1,2,\ldots,n$

$f(e^p{}_i) = 0; \forall\ i = 1,2,\ldots,n$

$f(e_i) = 0; \forall\ i = 1,2,\ldots,n$

The defined labeling patterns are

$v_f(0) = v_f(1) - 1 = n$

$e_f(0) = e_f(1) = 2n$

Thus, we have $|v_f(0) - v_f(1)| \leq 1$ and $|e_f(0) - e_f(1)| \leq 1$.

Hence the Flower graph Fl_n is mean edge cordial for $n \geq 3$.

The illustration of the Flower graphsFl_5 and Fl_6 are shown in Figures 1.1 and 1.2

Theorem 2. The Sunflower graph SF_n is mean edge cordial for $n \geq 3$.

Proof. Let v_0 be the apex vertex,$v_1, v_2, \ldots, v_n$ be the rim vertices and $e^s{}_1, e^s{}_2, \ldots, e^s{}_n$ be the spoke edges,$e^r{}_1, e^r{}_2, \ldots, e^r{}_n$ be the rim edges of the wheel W_n.

Let $u_1, u_2, \ldots, u_n$ be the pendant vertices and $e^p{}_1, e^p{}_2, \ldots, e^p{}_{2n}$ be the pendent edges.

To obtain sunflower graph SF_n join the pendant vertices to thewheel such that each u_i is joined by edges $e^p{}_i$ and $e^p{}_{i+1}$tov_i and v_{i+1}.

Here $|V(SF_n)| = 2n + 1$, $|E(SF_n)| = 4n$.

define a mapping $f: E(SF_n) \rightarrow \{0,1\}$as follows.

$f(e^s{}_i) = 1; \forall\ i = 1,2,\ldots,n$

$f(e^r{}_i) = 1; \forall\ i = 1,2,\ldots,n$

$f(e^p{}_i) = 0; \forall\ i = 1,2,\ldots,2n$

The defined labeling patterns are

$v_f(0) = v_f(1) - 1 = n$

$e_f(0) = e_f(1) = 2n$

Thus, we have $|v_f(0) - v_f(1)| \leq 1$ and $|e_f(0) - e_f(1)| \leq 1$.

Hence the Sunflower graphSF_n is mean edge cordialfor $n \geq 3$.

The illustration of the Sunflower graphsSF_7 and SF_8 are shown in Figures 2.1 and 2.2

Theorem 3. The Lotus inside circle graph LC_n is mean edge cordial for $n \geq 4$.
Proof. Let v_0 be the apex vertex,$v_1, v_2, \ldots, v_n$ be the rim vertices in $K_{1,n}$ and$u_1, u_2, \ldots, u_n$be the vertices in the cycle.Let ${e^s}_1, {e^s}_2, \ldots, {e^s}_n$ be the spoke edges, $e_1, e_2, \ldots, e_n$ be the edges in the cycle.
Let${e^p}_1, {e^p}_2, \ldots, {e^p}_{2n}$ be the edges connecting the vertices of the cycle to the rim vertices such that each u_i is joined by edges ${e^p}_i$ and ${e^p}_{i+1}$ to v_i and v_{i+1} to formLotus inside circle graph LC_n
Here $|V(LC_n)| = 2n + 1$, $|E(LC_n)| = 4n$.
define a mapping $f: E(LC_n) \to \{0,1\}$we consider following two cases.

Case 1: When n is odd.
$f({e^s}_i) = 0; 1 \leq i \leq \frac{n+1}{2}$
$f({e^s}_i) = 1$; otherwise
$f(e_i) = 0; 1 \leq i \leq \frac{n+1}{2}$
$f(e_i) = 1$; otherwise
$f({e^p}_i) = 0; 1 \leq i \leq n - 1$
$f({e^p}_i) = 1$; otherwise

Case 2: When n is even.
$f({e^s}_i) = 0; 1 \leq i \leq \frac{n}{2}$
$f({e^s}_i) = 1$; otherwise
$f(e_i) = 0; 1 \leq i \leq \frac{n}{2}$
$f(e_i) = 1$; otherwise
$f({e^p}_i) = 0; 1 \leq i \leq n$
$f({e^p}_i) = 1$; otherwise

In both the cases the defined labeling patterns are
$v_f(0) - 1 = v_f(1) = n$; when n is odd
$v_f(0) = v_f(1) - 1 = n$; when n is even
$e_f(0) = e_f(1) = 2n$
Thus, we have $|v_f(0) - v_f(1)| \leq 1$ and $|e_f(0) - e_f(1)| \leq 1$.
Hence the Lotus inside circle graph LC_n is mean edge cordialfor $n \geq 4$.
The illustration of the Lotus inside circle graphsLC_7 and LC_8 are shown in Figures 3.1 and 3.2

Theorem 4. The Cherry Blossom graph CB_n is mean edge cordialfor $n \geq 4$.
Proof. Let v_0 be the apex vertex,$v_1, v_2, v_3, \ldots, v_{4n-1}, v_{4n}$ be the rim vertices and ${e^s}_1, {e^s}_2, \ldots, {e^s}_{4n}$ be the spoke edges and ${e^r}_1, {e^r}_2, \ldots, {e^r}_{4n}$ be the rim edges in W_{4n}.
Let$u_1, u_2, \ldots, u_{2n}$ be the vertices joined to the even position rim vertices $v_2, v_4, \ldots, v_{4n-2}, v_{4n}$ and to the apex vertex by the edges ${e^a}_1, {e^a}_2, \ldots, {e^a}_{2n}$ and${e^b}_1, {e^b}_2, \ldots, {e^b}_{2n}$respectively to form Cherry Blossom graph CB_n.
Here $|V(CB_n)| = 6n + 1$, $|E(CB_n)| = 12n$.
define a mapping $f: E(CB_n) \to \{0,1\}$as follows.
$f({e^s}_i) = 0; 1 \leq i \leq 2n$

$f(e^s{}_i) = 1$; otherwise
$f(e^r{}_i) = 0; 1 \le i \le 2n$
$f(e^r{}_i) = 1$; otherwise
$f(e^a{}_i) = 0; 1 \le i \le n$
$f(e^a{}_i) = 1$; otherwise
$f(e^b{}_i) = 0; 1 \le i \le n$
$f(e^b{}_i) = 1$; otherwise

The defined labeling patterns are
$v_f(0) = v_f(1) - 1 = 3n$
$e_f(0) = e_f(1) = 6n$

Thus, we have $|v_f(0) - v_f(1)| \le 1$ and $|e_f(0) - e_f(1)| \le 1$.
Hence the Cherry Blossom graph CB_n is mean edge cordialfor $n \ge 4$.
The illustration of the Cherry Blossom graphsCB_5 and CB_6 are shown in Figures 4.1 and 4.2

Theorem 5. The Kusudama flower graph KF_n is mean edge cordialfor $n \ge 4$.
Proof. Let v_0 be the apex vertex,$v_1, v_2, v_3, \ldots, v_{2n-1}, v_{2n}$ be the rim vertices and $e_1, e_2, \ldots, e_{2n}$ be the spoke edges and $e^r{}_1, e^r{}_2, \ldots, e^r{}_{4n}$ be the rim edges in W_{2n}.
Let $u_1, u_2, \ldots, u_{2n}$ be the vertices joined to the apex vertex by the edges$e^p{}_1, e^p{}_2, \ldots, e^p{}_{2n}$ and$w_1, w_2, \ldots, w_n$be the vertices subdividing the odd position spoke edges$e_1, e_3, \ldots, e_{2n-1}$.
Let $e^a{}_1, e^a{}_2, \ldots, e^a{}_n$ and $e^b{}_1, e^b{}_2, \ldots, e^b{}_n$ be the edges connecting the$u_1, u_3, \ldots, u_{2n-3}, u_{2n-1}$and $u_2, u_4, \ldots, u_{2n-2}, u_{2n}$ to the vertices $_{1,2}, \ldots,$ respectively and $_{1,2}, \ldots,$ be the edges connecting apex vertex to the even position rim vertices $_{2,4,\ldots,2-2,2}$.
Let $'_{1,}{}'_{2}, \ldots,$ and $''_{1,}{}''_{2}, \ldots, s''{}_n$ be the edges connecting the vertices$w_1, w_2, \ldots, w_n$to the apex vertex v_0 and odd position rim vertices $v_1, v_3, \ldots, v_{2n-3}, v_{2n-1}$ respectively.
Here $|V(KF_n)| = 5n + 1$, $|E(KF_n)| = 9n$.

define a mapping $f: E(KF_n) \to \{0,1\}$we consider following two cases.

Case 1: When n is odd.
$f(e^r{}_i) = 0; 1 \le i \le n$
$f(e^r{}_i) = 1$; otherwise
$f(e^a{}_i) = 0; 2 \le i \le \frac{n+1}{2}$
$f(e^a{}_i) = 1$; otherwise
$f(e^b{}_i) = 0; 1 \le i \le \frac{n+1}{2}$
$f(e^b{}_i) = 1$; otherwise
$f(e^{s'}{}_i) = 0; 1 \le i \le \frac{n+1}{2}$
$f(e^{s'}{}_i) = 1$; otherwise
$f(e^{s''}{}_i) = 0; 1 \le i \le \frac{n+1}{2}$
$f(e^{s''}{}_i) = 1$; otherwise
$f(e^p{}_i) = 0; 2 \le i \le n+1$
$f(e^p{}_i) = 1$; otherwise
$f(e^o{}_{2i}) = 0; 1 \le i \le \frac{n-1}{2}$
$f(e^o{}_{2i}) = 1$; otherwise

Case 2: When n is even.
$f(e^r{}_i) = 0; 1 \le i \le n$
$f(e^r{}_i) = 1$; otherwise
$f(e^a{}_i) = 0; 2 \le i \le \frac{n}{2}$
$f(e^a{}_i) = 1$; otherwise
$f(e^b{}_i) = 0; 1 \le i \le \frac{n}{2}$
$f(e^b{}_i) = 1$; otherwise
$f(e^{s'}{}_i) = 0; 1 \le i \le \frac{n}{2}$
$f(e^{s'}{}_i) = 1$; otherwise
$f(e^{s''}{}_i) = 0; 1 \le i \le \frac{n}{2}$
$f(e^{s''}{}_i) = 1$; otherwise
$f(e^p{}_i) = 0; 2 \le i \le n+1$
$f(e^p{}_i) = 1$; otherwise
$f(e^o{}_{2i}) = 0; 1 \le i \le \frac{n}{2}$
$f(e^o{}_{2i}) = 1$; otherwise
The defined labeling patterns are
$v_f(0) = v_f(1) - 1 = 2n + 3$
$e_f(0) = e_f(1) - 1 = 4n + 3$; when n is odd
$e_f(0) = e_f(1) = 4n + 3$; when n is even
Thus, we have $|v_f(0) - v_f(1)| \le 1$ and $|e_f(0) - e_f(1)| \le 1$.
Hence the Kusudama flower graph KF_n is mean edge cordialfor $n \ge 3$.
The illustration of the Kusudama flower graph$KF_5$is shown in Figures 5.1

Theorem 6. The Rose flower graph R_n is mean edge cordial for n even.
Proof. Let v_0 be the apex vertex andfor each $i \in \{1,2,\dots,n\}$, let$v_{i1}, v_{i2}, v_{i3}, v_{i4}, v_{i5}$ be the remaining vertices of the i[th] copy the cycle C_6 forming the petals. Thus, the vertex set of the Rose flower graph $R_n$is$V(R_n) = \{v_0\} \cup \{v_{ij} \mid 1 \le i \le n, 1 \le j \le 5\}$.Let $e_{i1}, e_{i2}, e_{i3}, e_{i4}, e_{i5}, e_{i6}$, where $e_{i1} = v_0 v_{i1}$,
$e_{i2} = v_{i1}v_{i2}, e_{i3} = v_{i2}v_{i3}, e_{i4} = v_{i3}v_{i4}, e_{i5} = v_{i4}v_{i5}, e_{i6} = v_{i5}v_0$ be the edges.
Hence, $E(R_n) = \bigcup_{i=1}^{n}\{e_{i1}, e_{i2}, e_{i3}, e_{i4}, e_{i5}, e_{i6}\}$.
Here $|V(R_n)| = 5n + 1$, $|E(R_n)| = 6n$.
define a mapping $f: E(R_n) \to \{0,1\}$we consider following two cases.

Case 1: When n is odd.
Since $|E(R_n)| = 6n$, the edge condition for $\mathcal{MECL}$ implies that $e_f(0) = e_f(1) = 3n$.
The graph R_n consists of n copies of C_6 having a common vertex v_0. In each copy of C_6 the outer vertices are of degree 2. By the induced mean labeling rules, a degree 2 vertex receives label 0 only when both its incident edges are labeled 0. In order to maintain the induced edge condition, it is not possible to assign labels to the edges of all petals so that the numbers of vertices labeled 0 and 1 differ by at most one. Consequently, $|v_f(0) - v_f(1)| \ge 2$, which violates the vertex condition for $\mathcal{MECL}$.
Hence, R_n does not admit $\mathcal{MECL}$ when n is odd.

Case 2: When n is even.
Label all six edges of i^{th} cycle by 0 for $1 \le i \le \frac{n}{2}$ and 1 otherwise.
In view of the above labeling pattern, we have

$v_f(0) = v_f(1) - 1 = \frac{5n}{2}$
$e_f(0) = e_f(1) = 3n$
Thus, we have $|v_f(0) - v_f(1)| \leq 1$ and $|e_f(0) - e_f(1)| \leq 1$.
Hence the Rose flower graph R_n is mean edge cordial for$n$ even
The illustration of the Rose flower graph $R_4$is shown in Figures 6.1

CONCLUSION

In this paper, we study the $\mathcal{MECL}$ of various flower family graphs such as Flower, Sunflower, Lotus inside a circle, Rose flower, Kusudama flower and Cherry Blossom flower graph. Appropriate binary edge labeling obtained from the mean of incidentedges was shown to satisfy the cordial conditions for these structures. Hence, the considered flower family graphs admit $\mathcal{MECL}$ under defined labeling scheme. Further, the proposed labeling approach can be extended to other flower structured graphs in future studies.

ABSTRACT

In this paper a manpower system with two grades is considered. Decisions are taken based on random epochs. Each decision triggers a random number of exits and an associated loss in manpower. Each grade has independent mandatory threshold, following geometric distribution, for maximum loss in manpower. Variance of time to recruitment is acquired for three diverse forms of threshold for the system . A numerical illustration is provided under specific distributional assumptions to validate the influence of the performance measure's nodal parameters.

Keywords: Two grade manpower system, random decision- induced exits, independent thresholds and geometric distribution.
AMS Subject Classification: 60H30, 60K05,62H30.

INTRODUCTION

Using various statistical techniques, the authors in [1] and [2] began studying workforce planning challenges for stochastic systems such as renewal cycles and Markov chains. When (a) policy and transfer decisions result in a loss of manpower, (b) the system threshold is (i) maximum, (ii) minimum, and (iii) the sum of the thresholds for the loss of manpower in the grades, and (c) the loss of manpower forms a sequence of independent and identically distributed exponential random variables, the authors of [5] calculated the mean time to hire for a two-graded personnel system. When the grade thresholds are geometric random variables, the author in [8] calculated the variance of time to recruitment for a two-graded manpower system.When the two-grade manpower system has both

mandatory and optional thresholds, the authors of [7] were able to determine the variance of time to recruitment. The work in [5], where the system has correlated waste, was examined by the authors in [4]. The issue of time to recruitment for a two-graded personnel system with (a) two sources of depletion and (b) associated inter-policy decision delays was examined by the authors in [3]. When the two-grade personnel system has (a) a threshold for each grade and (b) distinct epochs for decisions and exits, the author of [6] examined the issue of time to recruitment. The problem of (a) each policy action causing a cluster of exits and (b) loss of manpower forming a series of independent identically distributed continuous random variables under various constraints on loss of manpower has recently been investigated by the author in [9]. The current study examines the task in [9] in which there is a specific loss of manpower.

Description of the model

Consider a marketing firm with two grades (referred as a system). Policy choices are made at arbitrary intervals in the range (0, ∞).Each policy decision triggers a random number of exits independently. Each exit produces loss in manpower independently. Each grade has independent threshold for cumulative loss in manpower. Time to recruitment for the system is defined and its performance measure are obtained. Analytical results for these performance measures are obtained in closed form for specific distributional assumptions. We now present assumptions and notations for this model.Let grade I and grade II be the two grades of the system. Let N(t) denote a Poisson process with rate λt, indicating the number of policy choices made in the interval (0,t]. Let N_i be the number of exits induced by the i^{th}decision,i=1,2,… …N_i… .The N_i's are independent and identically distributed and $\mathbf{N_i}$ ~ **Poiss(a), a>0.** Let A_{ij} be the loss in manpower due to the j^{th}exit of the i^{th} decision in grade I, i=1,2,3,…. and j=1,2, … $_i$,A_{ij}'sare independent and identically distributedand $\mathbf{A_{ij}}$ ~**Poiss(b), b > 0**. Let B_{ij} be the loss in manpower due to the j^{th} exitof the i^{th} decision in grade II,i=1,2,3,…. and j=1,2, …,B_{ij}'s are independent and identically distributedand $\mathbf{B_{ij}}$ ~**Poiss(c), c >0**.LetC_{ij}be the loss in manpower due to j^{th} exit of the i^{th} decision for the system. Note that C_{ij} = A_{ij}+B_{ij}, i=1,2,… ,j = 1,2,… . Let D_i be the loss in manpower due to the i^{th}decision in the system. Note that$D_i = \sum_{j=1}^{N_i} C_{ij}$ andD_i is a Poisson sum, i=1,2,…… .Let E_k be the total loss in manpower in the first k decisions for the system. Note that $E_k = \sum_{i=1}^{k} D_i$.$E_i \leq E_j$; for all i and j.$E_i's$ are neither independent nor identically distributed.Define M_l = $\max_{1\leq k\leq l}\{E_k\}$. Let M(t)= $\max_{1\leq k\leq N(t)}\{E_k\}$. Let Y_1 and Y_2 be the thresholds for maximum loss in manpower for grades I and II respectively. We assume that Y_1 and Y_2 are independent,Y_i>0, for i =1,2$\mathbf{Y_1}$~ **Geo(θ_1), Y_2~ Geo(θ_2), 0<θ_1, θ_2<1.**Let Z be the system threshold for maximum loss in manpower. For the present model, we take**Z = min(Y_1, Y_2).** Let W be the time to recruitment for the system defined by$W = \inf\{t: L(t) > Z\}$.From the definitions of Z and W we noteWhen the maximum attrition in manpower crosses any one of the thresholds, that recruiting is carried out.For any discrete random variable R , let E(R), V(R) and $\emptyset_R$be its mean, variance probability generating function .We assume that the random variables A_{ij}, B_{ij}, N_i, N(t), Y_1 and Y_2 are independent for all i,j and t≥0.

Main result:

From thedefinitions of Wand L(t)we get,

$P(W > t) = P[M(t) \leq Z] = P\left[E_{N(t)} \leq Z\right]$ (1)

Conditioning upon N(t) and using law of total probability, we get

$P(W > t) = \sum_{l=0}^{\infty} P[N(t) = l]P[E_l \leq Z]$ (2)

Conditioning upon Z = m,and using law of total probability, we get

$P[W > t] = \sum_{l=0}^{\infty} P[N(t) = l] \sum_{m=1}^{\infty} P[Z = m]\, P[E_l \leq m]$ (3)

Since P[Z=0] = 0 and $P[E_l \leq 0] = P[E_l = 0] = e^{-l\mu} \neq 0$.

From the definition of E_k, we find thatE_k ~$Poiss\ (k\mu\ )$,

$P[E_l \leq m] = e^{-l\mu} \sum_{k=0}^{m} \frac{(l\mu)^k}{k!}$ (4)

From the definition of Z and from the assumption of Y_1 and Y_2, we get,

$P[Z = m] = \theta.{C_1}^{m-1}$, m= 1,2,3,….
$Where$
$C_1 = (1-\theta)$ and $\theta = \theta_1 + \theta_2 - \theta_1\theta_2.$ (5)

Using (4) and (5) in (3), we get
$P[W > t] = \sum_{l=0}^{\infty} P[N(t) = l].P_l$ (6)
Where
$P_l = \theta.e^{-l\mu}\sum_{m=1}^{\infty}(1-\theta)^{m-1}.\sum_{k=0}^{m}\frac{(l\mu)^k}{k!}$ (7)

$P[W > t] = \left(\frac{1}{1-\theta}\right)\{\psi(e^{-\mu\theta}, t) - \theta\psi(e^{-\mu}, t)\}$

Where (8)
$\psi(s,t) = e^{\lambda t(s-1)}$
We now find E(W) and V(W) from (8) and from the result
$E(W^r) = r\int_0^{\infty} t^{r-1}P(W > t)dt, \quad r = 1,2,3,\ldots.$ (9)

From (8) and (9), it can be shown that
$E(W) = \frac{1}{\lambda(1-\theta)}\left[\left(\frac{1}{1-e^{-\mu\theta}}\right) - \left(\frac{\theta}{1-e^{-\mu}}\right)\right]$ (10)
and
$E(W^2) = \frac{1}{\lambda^2(1-\theta)}\left[\frac{1}{(1-e^{-\mu\theta})^2} - \frac{\theta}{(1-e^{-\mu})^2}\right]$ (11)
The series in (10) and (11) are convergent since $0 < \theta_1 < 1$, $0 < \theta_2 < 1$, $a > 0$ and $b > 0$.
Variance of W can be determined from (10) and (11).

Remarks:

(i) If **$Z = \max(Y_1, Y_2)$**, we note that
$P[Z \geq m] = \theta_1.{C_2}^{m-1} + \theta_2.{C_3}^{m-1} - \theta(1-\theta).{C_1}^{m-1}$, (12)
Where
$C_1 = (1-\theta_1)(1-\theta_2), C_2 = (1-\theta_1), C_3 = (1-\theta_2)$ and $\theta = \theta_1 + \theta_2 - \theta_1\theta_2.$ (13)
Proceeding as in the case Z=min(Y_1.Y_2), one can show that
$P[W > t] = \sum_{l=0}^{\infty} P[N(t) = l].\{Q_l + M_l - P_l\}$ (14)
Where Q_l and M_l are the value of P_l evaluated at $C_1 = C_2$ and $C_1 = C_3$ respectively

$Q_l = P_l$ at $C_1 = C_2$

and

$M_l = P_l$ at $C_1 = C_3$

$E(W) = \frac{1}{(1-\theta_1)}\frac{1}{\lambda(1-e^{-\mu\theta_1})} + \frac{1}{(1-\theta_2)}\frac{1}{\lambda(1-e^{-\mu\theta_2})} - \frac{1}{(1-\theta)}\frac{1}{\lambda(1-e^{-\mu\theta})}$ (15)

and

$E(W^2) = \frac{1}{(1-\theta_1)}\cdot\frac{1}{\lambda^2(1-e^{-\mu\theta_1})^2} + \frac{1}{(1-\theta_2)}\cdot\frac{1}{\lambda^2(1-e^{-\mu\theta_2})^2} - \frac{1}{(1-\theta)}\cdot\frac{1}{\lambda^2(1-e^{-\mu\theta})^2}$ (16)

Variance of W can be determined from (15) and (16) for this Z.

(ii) If **$Z = Y_1 + Y_2$**, we note that

$P[Z = m] = \left(\frac{\theta_2}{\theta_2-\theta_1}\right){C_2}^{m-1} - \left(\frac{\theta_1}{\theta_2-\theta_1}\right){C_3}^{m-1}$ (17)

$P[W > t] = \left(\frac{\theta_2}{\theta_2-\theta_1}\right)\psi(e^{-\mu\theta_1}, t) - \left(\frac{\theta_1}{\theta_2-\theta_1}\right)\psi(e^{-\mu\theta_2}, t)$ (18)

Where
$\psi(s,t) = e^{\lambda t(s-1)}$
We can show that,

$E(W) = \left(\frac{\theta_2}{\theta_2-\theta_1}\right)\frac{1}{\lambda(1-e^{-\mu\theta_1})} - \left(\frac{\theta_1}{\theta_2-\theta_1}\right)\frac{1}{\lambda(1-e^{-\mu\theta_2})}$ (19)

and

$E(W^2) = \left(\frac{\theta_2}{\theta_2-\theta_1}\right)\frac{1}{\lambda^2(1-e^{-\mu\theta_1})^2} - \left(\frac{\theta_1}{\theta_2-\theta_1}\right)\frac{1}{\lambda^2(1-e^{-\mu\theta_2})^2}$ (20)

Variance of W can be determined from (19) and (20) for this Z.

Numerical Illustration

In the following tables, the values of E(W) and V(W) are tabulated by fixing$\theta_1 = 0.85$, $\theta_2 = 0.65$ and varying the other parameter one at a time.

FINDINGS

(1) If **a increases**,then the average number of exits and average the loss in manpower increase and hence average time to recruitment **E(W) decreases**.

(2) If **b (c) increases**,then the average loss in manpower in grade I(grade II)increases, and henceaverage time to recruitment**E(W) decreases.**

(3) If **λincreases**then the number of decisions increase on the averageand hence the average time to recruitment **E(W) decreases**.

CONCLUSION

The present work studies the problem of time to recruitment for a two-grade manpower system in a more general setting in the context of permitting a random number of exits for each decision. The stochastic model constructed in the present work is more realistic and relevant to the present scenario prevailing in marketing organization.

ACKNOWLEDGEMENT

The author gratefully acknowledges the management of St. Joseph's College for their moral support and encouragementand expresses sincere gratitude to Dr**.** A. ABSTRACT

Agricultural productivity is contributing to rural economy and it is in high correlation with the selection of optimal fertilizer. The decision making on apposite fertilizer is influenced predominantly by soil compatibility and by the constraints of land variability, resource availability, environmental impact, cost efficacy and other related factors. These constraints of decision-making hurdle the agricultural decision makers in choosing an ideal combination of fertilizer and soil that strike a balance between both economy and environment. This research work proposes a multi-criteria decision-making method of Adaptive Ranking with Ideal Evaluation (ARIE) with interval fuzzy logic to determine the optimal fertilizer and soil combination for maximizing agricultural yield considering multiple and conflicting heterogeneous criteria set. The villages in Usilampatti block of Madurai district which are adopted by Arul Anandar College are chosen for this study. The required data is collected through surveys and discussions from the stakeholders such as agricultural experts, field officers and agricultural labourers. The method of interval fuzzy ARIE systematically assesses the fertilizer alternatives against the ideal benchmarks and ascertains the ranking based on the chosen criteria. The prioritization results of interval fuzzy ARIE is compared with deterministic ARIE. The comparative analysis of the results exhibits the potency, stability and consistency of interval fuzzy ARIE over crisp approach. The insights of this study certainly contribute to the enhancement of agricultural productivity and sustainable agricultural management in the Usilampatti Block.

Keywords: Interval Fuzzy sets, ARIE, Decision making, Optimal selection

INTRODUCTION

Agriculture remains the backbone of rural development since ages, particularly in developing nations like India. The livelihood of the rural populace is dependent on farming activities. The agro-based industries are contributing to nation's economic growth and they are highly influenced by the agricultural productivity. The advanced technology and other scientific inventions are striving to enhance agricultural profits with quality and sustainable inputs. Fertilizers perform a crucial role in promoting soil fertility and agricultural yield. The agricultural ecosystem is centered around fertilizers and soil characteristics. The appropriate choice of fertilizers is significant as it is in high correlation with soil health and agricultural profit. However, the incorrect selection of fertilizers results in degradation and heavy economic loss. The agricultural experts are keen on choosing fertilizers satisfying both the constraints of economic stability and environmental sustainability. On other hand, the fertilizer and soil compatibility must be focused. The challenges in fertilizer selection is complex due to heterogeneity attributes of soil within the chosen geographical regions. The degree of compatibility between fertilizers and soil properties is significant as it sets a trade-off between productivity and sustainability. The decision-making methods are generally applied to determine the optimal combination of fertilizer and soil. The traditional multi criteria methods are given preferences to handle these kinds of decision-making problems. The conventional approach of MCDM in choosing the optimal alternatives satisfying the criteria is purely deterministic in nature. Researchers have developed different MCDM models to determine the criterion weights and to prioritize the alternatives. However, the evolving changes and conflicts have caused uncertainty and ambiguity in decision making. This has unveiled the formulation of fuzzy integrated decision-making models. The representation of decision values as linguistic variables is realistic and these qualitative notations are quantified using numerical values. Furthermore, to be more pragmatic and to accommodate the opinion of the experts, researchers have framed decision making models using interval-fuzzy values. This has motivated the authors to discuss the earlier proposed deterministic ARIE method developed by Fauzi et al with interval -valued fuzzy representations. This is the novelty of the proposed work and this study primarily aims in exploring interval-valued fuzzy ARIES implications in determining the optimal combination of fertilizer and soil with special reference to a case study of agricultural regions of Usilampatti block. The contents of this research work are structured into the following segments. Section 2 discusses the review of works. Section 3 consists of preliminaries. Section 4 elicits the methodology of interval- fuzzy ARIE. Section 5 applies the applications of the proposed approach. Section 6 discusses the results and the last section concludes the work.

LITERATURE REVIEW

This section discourses the review of works related to ARIES and MCDM applications in fertilizer selection. Researchers have investigated fertilizer selection using various Multi-Criteria Decision-Making (MCDM) techniques. Kadlag et al. [1] utilized the Analytical Hierarchy Process (AHP), while Anwar et al. [2] also employed AHP for selecting organic fertilizers. Van et al. [3] introduced the COPRAS method for fertilizer supplier selection. Motia et al. [4] applied the TOPSIS approach for criterion evaluation, and Andini et al. [5] used the MAUT technique to identify the most suitable fertilizer for corn cultivation. De Luna et al. [6] proposed a novel MCDM-based framework for optimizing fertilizer selection. Varsha et al. [7] developed a decision-support model to recommend appropriate fertilizers for crops, whereas Amirhajloo et al. [8] formulated a decision model for selecting optimal nitrogen fertilizers to enhance wheat productivity. Sukor et al. [9] investigated organic nitrogen fertilizer selection strategies. Kannappan et al. [10] examined the integration of machine learning techniques with MCDM methods for crop recommendation based on weather conditions. Pan et al. [11] analyzed the impact of different fertilizer treatments on crop yield, and Holla et al. [12] proposed an intelligent decision-making system using MCDM principles for fertilizer-based crop selection. Indahingwati et al[13] applied fuzzy TOPSIS and other fuzzy logic methods in fertilizer selection. However, interval fuzzy sets are not applied to the best of our knowledge. The method of ARIE is not discussed in fuzzy environment. These identified research gaps are bridged in developing an integrated interval

fuzzy ARIE method to explore the decision-making problem of determining the optimal combination of fertilizers and soil.

PRELIMINARIES

This section consists of the basic definitions of interval-fuzzy sets; operations and defuzzification.

Interval-Valued Fuzzy Set

An **Interval-Valued Fuzzy Set (IVFS)** is an extension of a classical fuzzy set in which the membership degree of an element is **not a single value**, but an **interval** within $[0,1]$.

Let X be a universal set. An Interval-Valued Fuzzy Set $\tilde{A}$ in X is defined as:

$$\tilde{A} = \{(x, [\mu_L(x), \mu_U(x)]) \mid x \in X\}$$

where:

- $\mu_L(x)$= Lower membership function
- $\mu_U(x)$= Upper membership function
- $0 \le \mu_L(x) \le \mu_U(x) \le 1$

This interval represents uncertainty or hesitation in assigning a precise membership value.

3.2. Representation of Interval-Valued Fuzzy Number

For an alternative A_i, the interval-valued membership is written as:

$$\tilde{A}_i = [\mu_L(A_i), \mu_U(A_i)]$$

Example:

$$\tilde{A}_1 = [0.45, 0.60]$$

3.3. Basic Operations on Interval-Valued Fuzzy Sets

(a) Union

$$\tilde{A} \cup \tilde{B} = [\max(\mu_L^A, \mu_L^B), \max(\mu_U^A, \mu_U^B)]$$

(b) Intersection

$$\tilde{A} \cap \tilde{B} = [\min(\mu_L^A, \mu_L^B), \min(\mu_U^A, \mu_U^B)]$$

(c) Complement

$$\tilde{A}^c = [1 - \mu_U(A), 1 - \mu_L(A)]$$

(d) Addition

$$\tilde{A} \oplus \tilde{B} = [\mu_L^A + \mu_L^B, \mu_U^A + \mu_U^B]$$

(e) Multiplication

$$\tilde{A} \otimes \tilde{B} = [\mu_L^A \times \mu_L^B, \mu_U^A \times \mu_U^B]$$

3. 4. Conversion of Interval-Valued Fuzzy Set to Crisp Value

IVFS shall be converted into a **single crisp score**.

(a) Midpoint (Average) Method

$$C(A) = \frac{\mu_L(A) + \mu_U(A)}{2}$$

(b) Weighted Average Method

$$C(A) = \alpha\mu_L(A) + (1 - \alpha)\mu_U(A)$$

Where:

- $0 \le \alpha \le 1$

- Higher $\alpha \rightarrow$ conservative decision
- Lower $\alpha \rightarrow$ optimistic decision

(c) Score Function Method

$$S(A) = \mu_U(A) - \mu_L(A)$$

(d) Accuracy Function

$$H(A) = \mu_U(A) + \mu_L(A)$$

METHODOLOGY

This section presents the procedure of the decision-making approach of interval-valued fuzzy ARIE.

Let

A_i (i=1,2,…,m)be alternatives

C_j (j=1,2,…,n)be criteria

$\tilde{x}_{ij}=[x_{ij}^L, x_{ij}^U]$ be the interval-valued fuzzy performance rating

$\tilde{w}_j$=criterion weight

Step 1: Formulation of Interval-Valued Fuzzy Decision Matrix

The initial decision matrix is formulated using interval-valued fuzzy representations.

$$\tilde{D}=\begin{bmatrix} \tilde{x}_{11} & \tilde{x}_{12} & \cdots & \tilde{x}_{1n} \\ \tilde{x}_{21} & \tilde{x}_{22} & \cdots & \tilde{x}_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{x}_{m1} & \tilde{x}_{m2} & \cdots & \tilde{x}_{mn} \end{bmatrix}$$

where

$\tilde{x}_{ij}=[x_{ij}^L, x_{ij}^U], 0 \le x_{ij}^L \le x_{ij}^U \le 1$

Step 2: Interval-Valued Fuzzy Normalization

The criteria are classified as benefit and cost among the benefit criteria, the goal or the target criteria is also chosen.

Max-Type (Benefit) Criterion

$$\tilde{r}_{ij}=\left[\frac{x_{ij}^L}{\max_i x_{ij}^U}, \frac{x_{ij}^U}{\max_i x_{ij}^L}\right]$$

Min-Type (Cost) Criterion

$$\tilde{r}_{ij}=\left[\frac{\min_i x_{ij}^L}{x_{ij}^U}, \frac{\min_i x_{ij}^U}{x_{ij}^L}\right]$$

Target-Type (Goal) Criterion

Let the interval-valued fuzzy target be

$\tilde{t}_j=[t_j^L, t_j^U]$

$$\tilde{r}_{ij}=\left[1-\frac{|x_{ij}^U - t_j^U|}{\max_i |x_{ij}^U - t_j^U|}, 1-\frac{|x_{ij}^L - t_j^L|}{\max_i |x_{ij}^L - t_j^L|}\right]$$

To avoid zero intervals, ARIES implementations **introduce a small ε** (very common in goal-based normalization):

$\max|x-t| \rightarrow \max|x-t|+\varepsilon$

Let

$\varepsilon = 0.05$

So:

$\max|x-t|=0.15$

Step 3:Weighted Normalized Interval-Valued Fuzzy Decision Matrix

The weighted normalized matrix is determined

$\tilde{v}_{ij}=w_j*\tilde{r}_{ij}=\left[w_j.r_{ij}^L,\ w_j.r_{ij}^U\right]$

Step 4: Similarity Measures

Interval-Valued Fuzzy Ideal and Anti-Ideal Solutions

$\tilde{V}_j^+=\left[\max_i v_{ij}^L,\ \max_i v_{ij}^U\right]$

$\tilde{V}_j^-=\left[\min_i v_{ij}^L,\ \min_i v_{ij}^U\right]$

Similarity to Ideal Solution

Using interval Euclidean similarity:

$$S_i^+=1-\sqrt{\frac{1}{2n}\sum_{j=1}^{n}\left[(v_{ij}^L-V_j^{+L})^2+(v_{ij}^U-V_j^{+U})^2\right]}$$

Similarity to Anti-Ideal Solution

$$S_i^-=1-\sqrt{\frac{1}{2n}\sum_{j=1}^{n}\left[(v_{ij}^L-V_j^{L})^2+(v_{ij}^U-V_j^{U})^2\right]}$$

Step 5: Interval-Valued Fuzzy Relative Closeness

The relative score values are determined using

$RC_i=\frac{S_i^+}{S_i^++S_i^-}$

For better understanding of the flow, the above-described steps are presented in Fig.1.

Decision Making on Fertilizer & Soil Selection

In this section, the proposed interval valued fuzzy ARIES method is applied in selecting the combination of fertilizer and soil. The agricultural regions belonging to the villages of Usilampatti block in Madurai district of Tamil Nadu are chosen as study areas of this work it is presented below in fig.2.

The description of the soil types, crops cultivated and fertilizers of the study area is presented in Fig.3.

Based on the expert's opinion, the possible combination of Soil + Fertilizers is presented in Table 2.

The combinations which are highly compatible are considered as the alternatives to solve this decision-making problem. The criteria considered for this problem is presented in Table 3.

The initial decision-making matrix with linguistic representations is presented in Table 4.

The linguistic variable is quantified using fuzzy interval values as given below and the modified interval value for decision matrix is represented in Table 5.

VL=[0.00,0.30],L=[0.30,0.50],M=[0.50,0.70],H=[0.70,0.85],VH=[0.85,1.00]

The criteria weights are presented in Table 6.

The weighted normalized values are presented in Table 8.

By using the step 4, the ideal values are obtained

By using the step 5, the relative score values are obtained and presented in Table 10 and Fig.4.

Sensitivity Analysis

The results obtained using interval value fuzzy representations are compared with numerical value representations. The numerical decision-making matrix is presented in Table 11.

By using the above steps in crisp form, the obtained results are presented in Table 12 and Fig.5.
From the score values obtained using crisp ARIE, the differences in the score values are determined and presented in Table 13.
From the table it is observed that the differences in the score values are very less and hence the justification of the rankings of the alternatives is not convincing. On other hand the interval score values of the alternatives show stability and the alternatives are ranked according to the priorities from highest to lowest as presented in Fig.6.
Such kind of grouping of the alternatives will support and facilitate the agricultural decision makers in choosing the optimal combinations of fertilizers and soil. Also, it helps them in opting out the least preferred combinations.

CONCLUSION

This research work has proposed the new approach of interval fuzzy ARIE. The discoursed approach has been substantiated with the decision-making application of selecting the optimal combination of fertilizers and soil nature. The results obtained using interval fuzzy values are compared with crisp representations. The fuzzy ranking results are more pragmatic and supportive to the agricultural decision makers. The analysis demonstrates the effectiveness of interval fuzzy ARIE over crisp ARIE. The proposed decision-making approach shall be further discoursed and discussed using different sets criterion weights.Moreover, the interval fuzzy value representations shall be replaced with intuitionistic and neutrosophic values.

Table 1.Overview of Existing Literature

Author(s)	Method Used	Application Area	Key Contribution
Kadlag et al. [1]	AHP	Fertilizer selection	Applied AHP for evaluating fertilizer alternatives
Anwar et al. [2]	AHP	Organic fertilizer selection	Identified suitable organic fertilizers using hierarchical decision modeling
Van et al. [3]	COPRAS	Fertilizer supplier selection	Ranked fertilizer suppliers based on multiple criteria
Motia et al. [4]	TOPSIS	Criterion evaluation	Used TOPSIS to evaluate decision criteria
Andini et al. [5]	MAUT	Fertilizer selection for corn	Determined optimal fertilizer using utility theory
De Luna et al. [6]	MCDM framework	Fertilizer optimization	Proposed a novel decision-making framework
Varsha et al. [7]	Decision Support System	Crop–fertilizer recommendation	Developed a DSS for fertilizer recommendation
Amirhajloo et al. [8]	Decision model	Nitrogen fertilizer selection	Optimized nitrogen fertilizer for wheat productivity
Sukor et al. [9]	MCDM-based approach	Organic nitrogen fertilizer	Studied organic fertilizer selection strategies
Kannappan et al. [10]	ML + MCDM	Crop recommendation	Integrated machine learning with MCDM using weather data
Pan et al. [11]	Experimental analysis	Fertilizer impact analysis	Studied fertilizer influence on crop yield
Holla et al. [12]	Intelligent MCDM system	Crop–fertilizer selection	Proposed intelligent decision-making framework
Indahingwatiet al.[13]	Fuzzy TOPSIS	Fertilizer selection	Applied fuzzy logic-based MCDM techniques
Proposed Work	Interval Fuzzy ARIE	Fertilizer–Soil Optimization	Addresses uncertainty using interval fuzzy sets and introduces ARIE in fuzzy environment

Table 2. Possible Combinations of Fertilizer + Soil

Soil + Fertilizer Combination	Status	Reason
Red Soil + NPK Fertilizers	Compatible	Balanced nutrients; improves yield in nutrient-poor red soils
Red Soil + NPS 20:20:0:13	Compatible	Sulphur corrects common S-deficiency in red soils
Red Soil + DAP	Compatible	High phosphorus supports root development
Red Soil + Bio-DAP	Highly Compatible	Improves P availability and soil microbial activity
Red Soil + Urea	Compatible (Controlled)	Nitrogen boosts growth but leaching risk exists
Red Soil + Potassium Chloride (KCl)	Moderately Compatible	Potassium beneficial; chloride sensitivity possible
Red Soil + Potash Schoenite	Highly Compatible	Supplies K, Mg, and S—ideal for red soils
Red Soil + Bio-potash	Highly Compatible	Enhances K uptake sustainably
Red Soil + Potassium Humate	Highly Compatible	Improves organic matter and nutrient retention
Red Soil + Organic Manures	Highly Compatible	Improves structure, fertility, and microbial health
Black Soil + NPK Fertilizers	Compatible	Meets high nutrient demand of clay-rich soils
Black Soil + NPS 20:20:0:13	Compatible	Sulphur improves oilseed and pulse productivity
Black Soil + DAP	Compatible	Phosphorus availability retained well in black soils
Black Soil + Bio-DAP	Highly Compatible	Reduces P fixation and improves sustainability
Black Soil + Urea	Highly Compatible	High clay content reduces N losses
Black Soil + Potassium Chloride (KCl)	Compatible	Black soils tolerate chloride well
Black Soil + Potash Schoenite	Highly Compatible	Magnesium improves crop quality
Black Soil + Bio-potash	Highly Compatible	Enhances potassium efficiency
Black Soil + Potassium Humate	Highly Compatible	Improves soil aggregation and carbon content
Black Soil + Organic Manures	Highly Compatible	Enhances long-term soil fertility
Red Sandy Soil + NPK Fertilizers	Moderately Compatible	High leaching losses; split application needed
Red Sandy Soil + NPS 20:20:0:13	Compatible	Sulphur and phosphorus beneficial
Red Sandy Soil + DAP	Moderately Compatible	Phosphorus fixation and leaching risks
Red Sandy Soil + Bio-DAP	Highly Compatible	Improves nutrient retention
Red Sandy Soil + Urea	Less Compatible	High nitrogen leaching risk
Red Sandy Soil + Potassium Chloride (KCl)	Less Compatible	Chloride leaching and salt stress
Red Sandy Soil + Potash Schoenite	Compatible	Magnesium and sulphur improve resilience
Red Sandy Soil + Bio-potash	Highly Compatible	Improves K uptake efficiency
Red Sandy Soil + Potassium Humate	Highly Compatible	Enhances water and nutrient holding capacity
Red Sandy Soil + Organic Manures	Highly Compatible	Critical for improving structure and fertility

Table 3. Criteria of Decision Making

Criterion	Nature	Reason
Soil Health Preservation (C1)	**Benefit**	Higher values indicate better soil structure, biology, and fertility
Nutrient Use Efficiency(C2)	**Benefit**	Higher efficiency means less nutrient loss and better uptake
Environmental Impact (C3)	**Benefit**	Higher score implies lower emissions and reduced runoff (positive impact)
Water Use Efficiency	**Benefit**	Higher efficiency reflects better moisture retention and reduced water

(C4)		loss
Cost Efficacy (C5)	**Cost**	Lower cost per sustainable yield is preferred
Long-Term Crop Productivity (C6)	**Goal (Target)**	Optimal (stable) productivity is desired rather than extreme short-term maximization

Table 4. Initial Linguistic Decision-Making Matrix

Alternatives (Soil + Fertilizer)	Soil Health Preservation	Nutrient Use Efficiency	Environmental Impact	Water Use Efficiency	Cost Efficacy	Long-Term Crop Productivity
Red Soil + Bio-DAP	H	H	VH	H	M	H

ABSTRACT

Serum is a type of topical drug delivery systems which are gaining the popularity nowadays and which targets directly to epidermis layer of skin. This study explores the formulation and efficacy of natural and synthetic anti acne serum utilizing neem (*Azadirachta indicia*) and salicylic acid as active ingredients respectively. Neem is having antimicrobial and anti-inflammatory properties, has been traditionally used in skincare for its ability to treat acne, soothe irritation (cooling the particular area) and promote overall skin health. Salicylic acid, a well-known beta hydroxyl acid (BHA), is widely used in synthetic serums for its ability to exfoliate the skin, unclog pores, and reduce acne. Niacinamide helps to reduce acne-related inflammation and redness, decreases sebum production to prevent breakouts, and improves skin barrier function by boosting ceramide production. The extraction of neem was performed by using ethanol as solvent using Soxhlet extraction procedure. For natural anti acne serum formulation, along with neem, different concentration of tween 60 and span 80, Honey, Aloe vera gel are used and for synthetic anti acne serum formulation, along with salicylic acid different concentration propylene glycol, niacinamide are used and optimized and were evaluated for various parameters such as pH, Viscosity, Spreadability, Clarity, Antimicrobial and *in vitro* drug release.

Keywords: Serum, Neem, Salicylic acid, Niacinamide, Antimicrobial study, pH, spreadability, Clarity test, viscosity, and Anti-acne.

INTRODUCTION

Serums are specialized skincare products with high concentrations of active ingredients designed to penetrate deeply into the skin. They are typically lightweight and have a thinner consistency, which allows them to deliver potent ingredients more effectively. Serums address specific skin concerns such as wrinkles, dark spots, hydration, and acne. For acne-prone and oily skin, water-based serums are particularly effective. The skin, the body's largest organ, covers about 2 square meters and weighs between 4.5 and 5 kilograms. It accounts for about 16% of body weight and receives around one-third of the body's blood supply. Its pH ranges from 4 to 5.6, an acidity level that helps prevent harmful organisms.[1] Acne, or acne vulgaris, is a common skin condition characterized by comedones and inflammatory lesions due to elevated sebum production. Bacteria also play a role in its development. Pimples, a common acne symptom, result from excess oil production, which leads to clogged pores and bacterial growth. Importantly, pimples are not contagious.[2]

Serums are ideal for skincare because they deliver targeted treatment to the epidermis, tightening skin tissue and enhancing oxygen supply for a radiant glow. They are light, easily absorbed, and contain more active ingredients than creams, addressing cosmetic concerns swiftly. Serums improve skin texture, hydration, and appearance by making pores appear smaller and increasing moisture levels. Their formulation often excludes unnecessary additives, allowing for more effective treatment of various skin issues and suitability for all skin types. [3] Historically, Egyptians used natural oils and plant extracts for skincare, while Greeks and Romans employed olive, castor, and coconut oils. In the 20th century, advances in cosmetic science introduced serums with ingredients like niacinamide, hyaluronic acid, vitamins, salicylic acid, and antioxidants. Niacinamide, chosen for its effectiveness over hyaluronic acid, continues to be a popular ingredient.

Synthetic anti-acne serums have become a significant advancement in skincare, offering a scientific approach to treating acne. Applied after cleansing and toning, these serums rapidly absorb and target acne lesions, aiming to clear existing breakouts and prevent future ones. They represent a promising solution for achieving smoother, more radiant skin across various skin types.[4] Neem (*Azadirachta indicia*), part of the *Meliaceae* family, is renowned in Ayurveda, Homeopathic, and Unani medicine for over 4,000 years due to its versatile medicinal properties. It is often called the "village pharmacy" for its wide-ranging therapeutic benefits.

Pharmacological activities of Neem exhibits antibacterial, anti-inflammatory, antifungal, antipyretic, hypoglycemic, andanti-tumor effects.[5]

Uses:

- Soothes inflamed and irritated skin.
- Provides cooling relief and calms dry skin.
- Helps treat acne and prevent skin infections.

Benefits:

- Reduces early signs of aging.
- Shields skin from UV radiation and environmental damage.
- Promotes collagen synthesis and brightens skin.

MATERIALS AND METHODS

Synthetic serum ingredients

Salicylic acid and sodium benzoate was purchased from the Loba Chemie Pvt. Ltd, Thane. Propylene glycol, Sodium citrate, sodium bicarbonate and niacinamide from S. D. Fine-chem Ltd, Mumbai. All other chemicals were of analytical grade purchased from local suppliers.

Natural serum ingredients
Neem and aloevera gel was extracted naturally. All other chemicals were of analytical grade purchased from local suppliers.

Detail profile of material used:
NEEM
Scientific name: *Azadirachta indicia*
Synonym: Indian neem
Biological source: it is extracts from dried leaves of neem
Family: Meliaceous
Chemical constituents: Leaves: Quercetin, catechins, carotenes, vit 'c'
Seeds: In seed extract, azadirachtin

HONEY
Scientific Name: *Apis mellifera* (Western honeybee is the most common species used for honey production)
Synonyms: Madhu (in Sanskrit)
Biological Source: Honey is a natural product produced by honey-bees(*Apis mellifera* and other Apis species) from the nectar of flowers, which is collected, processed, and stored in honeycombs.
Family: Apidae.

Chemical Constituents (CC)
Carbohydrates (mostly fructose and glucose) – around 80%
- Vitamins (e.g., Vitamin B2, B6, Vitamin C)
- Antioxidants (flavonoids and phenolic acids)

ALOEVERA
Scientific name: *Aloe barbadensis miller.*
Common name: Aloe vera
Biological source: The gel or mucilaginous pulp extracted from the inner part of the aloe vera leaves.
Family: Asphodelaceae (Liliaceous).
Chemical constituents: Aloe vera contains 75 potentially active constituents: vitamins, enzymes, minerals, sugars, lignin, saponins, salicylic acids and amino acids

EXPERIMENTAL METHODS
ANALYTICAL METHODS:
Preparation of Reagents:
1. **Ferric nitrate solution (4% Solution):** Accurately weighed 4g of ferric nitrate is transferred into 100 ml volumetric flask Water is added and & shaken to dissolve ferric finally, the volume made up to mark.
2. **Preparation of Stock solution of salicylic acid (1mg /ml):** Accurately weighed 100 mg of salicylic acid is transferred into 100 ml volumetric flask. Add 10 ml of methanol slowly to dissolve salicylic acid, distilled water is added slowly into volumetric flask up to the mark.
3. **Working standard solution of Salicylic acid:** 10 ml of stock solution of salicylic acid is transferred into another 100 ml of volumetric flask. Finally, the volume made up to mark with distilled water is added and shaken well.

Preparation of samples:
1. Take 6 test tubes of 20 ml, and clean, and dry.
2. Add 2 ml, 4 ml, 6ml, 8ml and 10 ml of working solution of salicylic acid added to 5 to test tube.
3. Distilled water is added to '6' test tubes up to 10 ml.
4. Add 5 ml of $FeNO_3$ Solution into 6 test tubes.
5. Shake well to get violet coloured solution.

6. Absorbance of the above solution are measured at using U.V spectrophotometer.
7. Plot graph by taking salicylic acid concentration (µg) in x-axis and Absorbance at y-axis.

Extraction of Neem by Soxhlet method:

1. **Sample Preparation**: Dry neem leaves thoroughly, grind them into a fine powder, and weigh about 30 grams.
2. **Soxhlet Setup**: Place the powdered neem into a thimble and insert it into the Soxhlet extractor. Connect this setup to a round-bottom flask filled with a solvent like ethanol and a condenser.
3. **Extraction Process**: Heat the solvent in the round-bottom flask to boil, causing vapour to rise, condense in the condenser, and drip onto the neem powder. The solvent extracts the bioactive compounds as it cycles through the thimble.
4. **Continuous Extraction**: The solvent siphons back into the flask, and the extraction repeats over several hours until the solvent running through the thimble appears clear.
5. **Completion**: Once extraction is complete, cool the apparatus, remove the thimble, and discard the used neem powder.
6. **Concentration**: Evaporate the solvent from the extract using a rotary evaporator or gentle heating in a water bath.
7. **Storage**: Collect and store the concentrated neem extract in an appropriate container.

Formulation of natural serum

Procedure: The serum was prepared which comprised extract of Neem, Aloe vera, Rosemary oil, Honey, glycerine &different quantity of Tween 60 and Span 80, and require amount of water is added. By this above mention ingredients, we have formulated varies formulation as P_1 to P_5.

1. Preparation of oil phase: The oil soluble ingredients such as tween 60, span 80, and rosemarry oil is taken into one beaker and melted at 70°c.
2. Preparation of water phase: The water phase is prepared at same time by mixing Aloe vera gel, neem extract, honey, glycerine, sodium benzoate and water.
3. Preparation of emulsion: Emulsion was prepared by adding oil phase into liquid phase drop under mechanical stirring at 700 to 800 rpm to obtain o/w biphasic emulsion. Perfume is then added at last just before the finished product transferred to suitable container.

Formulation of synthetic serum:

Procedure: The serum was prepared which comprised extract of salicylic acid, niacinamide, glycerine & different quantity of propylene glycol, and require amount of water is added. By this above mention ingredients, we have formulated varies formulation as S_1 to S_5.

1. Preparation of oil phase: Salicylic acid, different quantity of propylene glycol, vitamin E capsule and of glycerine is mixed in a beaker.
2. Preparation of water phase: Sodium citrate, sodium benzoate, sodium bicarbonate, niacinamide and few ml of water is mixed well in another beaker.
3. Preparation of emulsion: Emulsion was prepared by adding oil phase into liquid phase drop wise under mechanical stirring at 700 to 800 rpm to obtain o/w biphasic emulsion. Perfume is then added at last just before the finished product transferred to suitable container.

Antimicrobial activity of anti acne serum

Determination of Minimum Inhibitory Concentration (MIC) for Aerobic Microorganisms:

The MIC test determines the lowest concentration of an antimicrobial drug that inhibits visible growth of microorganisms after overnight incubation or over 24hrs.This study was conducted by using salicylic acid & Neem leaf extract solutions at various concentrations to observe bacterial growth on agar plates before and after incubation.

Procedure:

Preparation of Nutrient Broth:

- Freshly prepare nutrient broth and autoclave it for 30 minutes at 121°C.

- After cooling, inoculate the broth with bacteria *(**Escherichia coli*** **and** ***Staphylococcus aureus).***
- Incubate the inoculated broth overnight in a BOD incubator.

Preparation of Nutrient Agar Media:

- Freshly prepare nutrient agar media about 4 gm is taken & dissolved in 150 ml of distilled water and then autoclave it for 30 minutes at 121°C.
- After cooling, pour the agar to the petri dish.

Preparation of Agar plate:

- Arrange all require materials to perform inside laminar bench.
- Remove closure of flask which is having sterile nutrient agar media and nutrient broth.
- Prepare microbial inoculum with required quantity or suspension of test organism
- Flame the neck of culture flask.
- Add prepared microbial suspension in the media and mix it and transfer into petri plates.
- Lift the half of lid of sterile Petri dish on table top and pour the culture.
- Take care that media shouldn't come out from petri dish or touch the cover of dish. This helps in distributing media uniformly in the plate.
- Re - flame it with further flaming the neck and allow it to solidify.
- Apply the solutions to the surface of the solid media in sterile cylinder or in cavities prepared in agar plate.
- Prepare solutions of known concentration of the standard preparation with respect to the assumed concentrations of the antibiotics to be examined.
- Incubate the plate or dishes at 30-35° C for 24 hrs.

Evaluation parameters:

1. **Physical evaluation:** The formulated anti acne serum inspected visually for their color, odour, homogeneity and consistency.
2. **Measurement of pH:** The pH of the prepared formulation was measured by using a digital pH meter.
3. **Spreadability test:** The spreadability test was performed by glass slide equipment.

$$S = \frac{\mathrm{M} \times \mathrm{L}}{\mathrm{T}}$$

4. **Viscosity:** Place the brook field viscometer on a perfectly flat and stable platform.
5. **Clarity test:** Clarity test was observed by visual inspection under a good light, viewed against a black and white background.
6. **Drug diffusion study**: Sample were analyzed for drug content by UV visible spectrophotometer after appropriate dilution.
7. **Gas chromatography and Mass spectroscopy:** Gas chromatography and Mass spectroscopy is done from the out-source.

RESULT AND DISCUSSION

Analytical Methods

Calibration curve of salicylic acid by UV spectroscopy was plotted. The standard calibration curve with the correlation coefficient of y = 0.0073x+0.0119 and regression value (R^2) = 0.9965 the calculation of drug content uniformity in vitro dissolution studies is based on this calibration curve.

Antimicrobial activity:

Antimicrobial activity was performed as mentioned in methodology on *Staphylococcus aureus andEscherichia coli*organisms. The zone of inhibition of the drug and prepared formulations was found after 24 hrs. The results of antimicrobial activity were shown in below.

Anti-microbial activity of Neem: The Zone of inhibition of *S. aureus* is 16, 22 and 24 mm in and *E. coli* is 16, 18 and 22 mm in 500, 1000, 1500 mg respectively. We preferred lower concentration of neem about 500 mg because reduces risk of adverse reactionand shows effective anti-microbial activity. Higher concentration may increase risk of irritation, enhanced tolerability, and skin sensitivity.

Antimicrobial activity of Salicylic acid: The Zone of inhibition of salicylic acid against *S. aureus* is 24 and 29 mm in Fig 2(A and B) respectively and *E. coli* is 24 and 30 mm in Fig 2(C and D) in 500, 1000 mg respectively. We preferred lower concentration dose of salicylic acid about 500 mg because it reduces the risk of adverse effect, minimized potential for toxicity and shows effective exfoliation.

Antimicrobial activity of Natural anti- acne serum: The Zone of inhibition of Natural serum against *S. aureus* is 27, 25, 24,25 and 26 mm from P_1 to P_5 in Fig 3(A and B)respectively and *E. coli* is 27, 20, 23,25 and 21 mm from P_1 to P_5 in Fig 3(C and D) respectively.

Antimicrobial activity of synthetic anti- acne serum

The Zone of inhibition of Synthetic serum against *S. aureus* is 32,24,25,27 and 28 mm from S_1 to S_5 and *E. coli* is 32, 30, 29, 30and 31 mm from S_1 to S_5 respectively.

Marketed product anti acne serum:

The Zone of inhibition of Marketed serum against *S. aureus* is 28 mm respectively and *E. coli* is 28mm respectively.

CONCLUSION

All these investigators have brought out ultimate factors. This study targets the skin condition acne with the aim of formulating an effective and safe anti acne serum (i.e., natural and synthetic serum). Suitable analytical methods based on UV spectroscopy were developed for salicylic acid (547nm). The extraction of neem was performed by using ethanol as solvent using Soxhlet extraction procedure. Dosage of neem and salicylic acid was fixed by MIC study (i.e., 500 mg).Both natural and synthetic anti acne serum were prepared. Evaluation parameters like pH, viscosity, spreadability, clarity test, gas chromatography, mass spectroscopy, antimicrobial activity and *in vitro* drug release were analyzed. *In vitro* release studies were carried out for salicylic acid in distilled water by Franz diffusion n, S_1 represent a suitable dosage form for the release salicylic acid is 66.36% in 1 hour. Antimicrobial study shows that there was no microbial contamination observed and it showed good zone of inhibition. For natural anti acne serum formulation,P_1 the zone of inhibition is 27mm and for synthetic anti acne serum formulation, S_1 the zone of inhibition is 32 mm. Overall study suggests that among the serum prepared S_1 and P_1 found to show good result. Hence it was considered as optimized formulation. The study reports concluded that formulated serum (i.e., natural and synthetic) may offer an effective and safe dosage formulation which leads to patient adherence and compliance to the therapy. Gas chromatography and mass spectroscopy sample is out-sourced from Chromatogen analytical solutions, Mysore. The comparison studywas made between our synthetic formulation and marketed product. We have done all the evaluation parameters for both the formulation. For minimum inhibitory concentration studies our synthetic formulation shows the better results than marketed product. For other evaluation parameters marketed products better results than our synthetic formulation.

ACKNOWLEDGEMENTS

I would like to express my profound gratitude to Mrs Anu. S, M Pharm ,Assistant professor and Dr. J.Thimmasetty, M. Pharm., Ph.D. Professor and HOD of pharmaceutics department, and Dr J.H.Mruthyunjaya M. Pharm, Ph.D, Principal of Bapuji Pharmacy College, Davanagere for their contributions to the completion of our project Salicylic Acid And

Neem Extract Anti Acne Facial Serum Formulations And Their Evaluation . A special thanks to Dr .Shankara. H. N, Chromatogen Analytical Solutions Pvt Ltd , #225, jck industrial park, Belagola Industrial Area, Mysore-570016
