## ABSTRACT

Banana Alkali traditionally called as Kolakhar in Assam taken as a food additive by the natives regularly with diet. It is believed that taking Kolakhar with food regularly have many health benefits. In the present investigation, the effect of Banana alkali is examined in male reproductive system of mice. For conducting the experiment, oral administration of Banana alkali for 20days has been done and Gonado somatic index, sperm count and histology of testes has been conducted. Biochemical analysis was also conducted to find out pH, TDS and different minerals like Calcium, Magnesium *etc.* in the study sample.The treated groups did not show much effect on reproductive organ except a little difference in histological structure has been noticed in the high treated groups of mice. The intake of Banana alkali for high concentration shows slight change in body weight and weight of testis also. The result of biochemical analysis exhibit high alkalinity (pH 10.5) and the TDS value showed chloride, carbonate, hydroxyl, calcium, magnesium are the major constituent of the test sample. Physicochemical analysis showed 16444 mg/l Chloride content in the sample. From the study it can be concluded taking Banana Alkali in low dose did not have any bad effect on the male reproductive health. It is a safe indigenous feed additive of Assam and can be consumed in low dose.

**Keywords:** Banana Alkali, Sperm count, Testis weight, Gonado somatic index, Male reproduction.

## INTRODUCTION

The diverse demographic makeup of Assam, the hub of Northeast India, is clearly visible in the state's wide variety of ethnic foods and signature culinary practices. Assamese cuisine is a style of cooking that is a confluence of cooking habits of the hills that favor fermentation and drying as forms of preservation and plains provides extremely wide variety of fresh vegetables and greens [1,2]. The most known traditional food additive of Assam is Kolakhar, which is extracted from banana trees. The best alkaline preparation of banana tree is used as Kolakhar. The alkaline preparation of the test sample is done by aqueous extract of ashes prepared from banana tree, specially the *Musa bulbisiana* species (commonly called athiya kol). In several regions of Assam, this alkaline preparation serves as a traditional salt substitute and has been an integral dietary additive for generations. Characterized by a high pH range of 11 to 13, its chemical profile is dominated by potassium, sodium, carbonate, and chloride. While it contains other non-alkali metals, they are present only in negligible or insignificant quantities. [3]. There is long running study on Banana alkali with various aspect, which is mostly related with treatment base study on various diseases and it's usefulness. As this study sample is the oldest alkaline substance used by the Assamese people as food , there are various historical study of it and it's use like in washing dishes, taking it at the time of diarrhea, dysentery, in case of stomach ulcer etc. As Assamese people take Banana alkali most frequently as food so there may or may not be some effect on the bodily system of humans, which is not studied properly yet. The present study has investigated the effect of Banana alkali on male reproductive system.

## MATERIALS AND METHODS

**Experimental animal**

Nine numbers of male Albino mice weighting 30-34 g were taken for the experiment, With respect to the permission given by Animal Ethics Committee. Needed amount of Albino mice was provided which were further sacrificed. The mouse was kept in the animal house of University of Science and Technology Meghalaya in room temperature. Albino mouse has a homology between the protein coding region of mice and human, allowing the study of human health that is why it's widely used in case of experiment.

**Plant under study**

*Musa balbasiana colla* which is in Assamese known as Athia kol / Guti kol, is a wild type species of banana. It's one of the ancestors of modern cultivated bananas. The fruit of the banana plant is usually large in size and it said to be more favourable to it due to seed in it. It was found that musaceae family of the banana plants largely distributed in the north eastern part of India[4,5]. The southern state of India doesn't take the fruit of this plant as food, but our north eastern people find it edible.

**Collection of plant material**

*Musa balbasiana* is an indigenous variety of banana in Assam. The whole plant was collected from the village of Nagrijuli, district Baksa of Assam during the time period of november, 2024. Initially the plant *Musa balbisiana* was identified from taxonomic literature which was confirmed by faculties of department of Botany, USTM.

**Extraction of Kolakhar**

For Kolakhar preparation banana trunk and peels are mostly used. After the collection of the plant the trunk region is cut into small pieces, This small pieces are left in the sun for several weeks to air dried. After drying the pieces it's then subjected to open air ignition to convert it into ash. The ash were collected well, usually the ash is the filtrated to get the Kolakhar the liquid extract. First to achieve this, 50 g of burnt ashes were weighted and moistened using distilled water, then left to soak in a beaker for 24 hours to improve absorption. Then the alkaline solution is filtrated with Whitman filter paper till we get 100 ml of alkaline solution. The end liquid portion is called Kolakhar, which is the main extract for my experiment[6].

**Physicochemical analysis of Kolakhar**

**Determination of pH**: pH was measured using pH paper after diluting the alkaline (20ml/g ashes) solution with distilled water [7].

**Determination of Total Dissolved Solid, TDS**: TDS was determined by evaporating a 100 ml sample in pre weighted beaker at 100°C. The beaker weight after cooling also. [8].
TDS was calculated by using following TDS formula

$$\text{TDS (mg/l)} = \frac{\text{final weight} - \text{initial weight} \times 10^6}{\text{Vol. of sample}}$$

**Determination of chloride**: Chloride concentration of a sample can be determined using a standard method, that is reaffirmed 2003 and also APHA standard procedure. Chloride is distributed as a salt of Calcium, Sodium, Potassium in water and wastewater. The concentration of this ions varies widely according to the environmental condition. Most of the water-soluble salt in a pond environment generally remain in $Cl^-$ form and hence the amount of chloride pond water is a close indicator of the total soluble salt content within the ecosystem [2]. For experiment, a 1 ml sample was mixed with 19 ml of double distilled water, totaling 20 ml in a clear 250 ml conical flask. A light yellow colour was achieved by adding a few drops of potassium chromate indicator. The sample was then titrated with a silver nitrate solution until the colour change from yellow to brick red, marking the end point. The volume of silver nitrate titrant used is recorded for subsequent calculation. This entire procedure is repeated three times using distilled water to obtain a concordant value.

The following formula is used to calculate chloride concentration in mg/l

$$\frac{(V_s - V_b) \times 0.2 \times 35.45 \times 1000}{\text{Vol. of sample}}$$

Where, $V_s$ is the sample volume and $V_b$ is the blank volume.

**Determination of Total Hardness**

The total hardness of water is primarily caused by concentration of Calcium and Magnesium ions, although Chloride, Sulphate and Bicarbonate ions also contribute. Hard water is defined by high concentrations of these ions. The measurement procedure adheres to standards such as Indian standard IS: 3025 (part 21)- Reaffirmed 2002 as wellas APHA and EPA methodologies. pH of the test sample (9-10) was maintained by using ammonium buffer for determination of hardness. The presence of Mg and Ca is indicated if the sample turns red wine in colour after the use of Eriochrome Blake T (EBT)indicator. In the experiment, 1ml of the sample with 19ml of double distilled water was mixed with 2ml of ammonium buffer and after that 20 micro liters of EBT indicator was added. The solution is titrated against 0.02N EDTA solution till the colour changes to wine red to blue i.e. the end point of the titration. The procedure is repeated thrice(Sarma *et al.,* 2020). Following formula is used to determine the total hardness.

$$\text{total hardness(mg/l) as } CaCO_3 \text{ equivalent} = \frac{\text{Vol. of titrant} \times 0.02N \times 50 \times 1000}{\text{Vol. of sample taken.}}$$

Where, normality of EDTA solution = 0.02N and equivalent weight of $CaCO_3$ = 50

**Determination of total alkalinity**

Alkalinity is defined as capacity of water to absorb hydrogen ion without significant changes in pH. Specifically, the alkalinity of kolakhar extractant measures the water's acid buffering capacity. Total alkalinity is determined volumetrically by titrating a sample with a standard acid until it reaches a pH of 4.5 using methyle orage as an indicator. Alkalinity is caused by the presence of hydroxyl ion s, carbonate ions or a combination of both [8].

For the experiment, 2ml of Kolakhar was diluted ten times using double distilled water and placed into a 250ml conical flask. A few drops of methyl orange indicator were added to get the yellow colour of the solution. Then it titrated against 0.02N HCl solution till the colour changes to red and the burette reading is noted down. The procedure is repeated for thrice.

The formula for calculating Total alkalinity mg/l = Vol. of titrant x 50 x 1000 x 0.02/ vol. of sample
Where , 50 is a constant value as calculated . 0.02N is the Normality of HCl .

**Determination of Calcium and Magnesium**

Calcium ($Ca^{2+}$) ions are determined via direct titration with EDTA using Patton and Reeder's indicator. While this can be performed on Ca2+ alone, it is particularly useful for mixtures where the solution is adjusted to pH 12–13 to precipitate Magnesium; at the endpoint, the indicator transitions from red to blue. Conversely, Magnesium ($Mg^{2+}$) can be determined individually at pH 10 using Eriochrome Black T (EBT), but only in the absence of Calcium. Because EBT forms wine-red complexes with both ions at pH 10, EDTA will titrate them simultaneously. Consequently, $Mg^{2+}$cannot be isolated in a mixture; instead, EBT is used to calculate the total hardness ($Ca^{2++}Mg^{2+}$).

To determine the $Ca^{2+}$ concentration, a 1 mL aliquot of the Kolakhar sample was diluted with 24 mL of distilled water in a 250 mL conical flask. The solution was treated with 4 mL of 8M KOH and left to equilibrate for five minutes to ensure the precipitation of interfering ions. Following this, 35 mg of Patton and Reeder's (PR) indicator was introduced, yielding a red solution. The mixture was then titrated against a standard EDTA solution until a definitive color transition from red to blue signaled the stoichiometric endpoint. To calculate the concentrations of $Ca^{2+}$ and $Mg^{2+}$in the Kolakhar sample, the following equivalencies and titration volumes are used-

1mL of 0.01M EDTA≡0.4008 mg of $Ca^{2+}$,1 mL of 0.01M EDTA≡0.2431 mg of Mg2X mL: Volume of EDTA required for total ($Ca^{2++}Mg^{2+}$) using EBT indicator. Y mL: Volume of EDTA required for $Ca^{2+}$ only using PR indicator. Final Determinations are-Amount of Calcium (mg): 0.4008×Y, Amount of Magnesium (mg): (X−Y)×0.2431

**Testis and epidedymal weight**

After the treatment of different groups with Kolakhar, the mice were sacrificed under anesthesia and their testis and epididymis were removed. The weight of the testis with epididymis were taken using single pan balance .

**Gonado Somatic Index ( GSI)**

The Gonadosomatic Index (GSI) quantifies the relationship between testicular mass and total body weight. It is determined by dividing the gross weight of the testes by the animal's total body weight, with the resulting quotient multiplied by 100 to express the value as a percentage [8].

(GSI) = {Weight of paired testis (g)/Body weight of mice (g)} x100

**Sperm count**

Sperm count was done by following standard methods [9,10].For this, treated male mouse from the three groups were narcotized .Using scalpel testis were exposed out from the scrotum and the epidermis was removed. The epidermis was then placed in 1ml of phosphate buffer solution and minced into small pieces using mortar and pestle. A suspension of the minced material was obtained. This suspension was then incubated at $37^0$C for 30 minutes, which was considered as aliquot. Using the haemocytometer leukocyte pipette the aliquot was taken up to 0.5 mark, phosphate buffer saline was added as diluted taking up to the mark 11 of the leukocyte pipette. The content in pipette was mixed well and placed into neubaur's counting chamber. Under a light microscope sperm count was done on the large squares of the haemocytometer and calculated out as per standard method in neubaur's chamber.

**Histological evaluation of testis**

Testis histology was studied by the traditional histological technique, *i.e*. Microtome. This methods allows for the creation of the thin section of the processed tissues, which were then examined under a microscope after being suitable stained . The testis was collected from the already euthanized animal and it was fixed in 10% formaldehyde for 48 hours to avoid post mortem changes. The tissue were taken out from 10% formaldehyde and washed in running tap water for 3 hours. The tissue was then transferred to grades of alcohol , xylene and finally embedded in paraffin.

**Statistical analysis**

Values are expressed as mean ± standard error mean ( S.E.M) and analyzed using t test. P value was calculated by comparing control group with treated groups separately. P value≤ 0.05 indicated significant result.

## RESULTS

**Physicochemical parameters**

From the experiment,the pH of Banana alkali 20ml (extract/gram ashes) were recorded as 10.5±0.2 and it was very high in alkalinity. The TDS (mg/l) of the sample is recorded and the range of TDS of the sample is 202100 mg/l. The chloride (mg/l) content of the sample exhibit 16444 mg/l from the experiment. The total hardness of sample was calculated and range in 272 mg/l . The total alkalinity of the sample in mg/l is calculated in carbonate ($CO_3^{2-}$) and hydroxyl ($OH^-$) level. Which was recorded as carbonate alkalinity 112000 mg/l and hydroxyl alkalinity 210500mg/l . The graphical representation of alkalinity level according to the present of $CO_3^{2-}$ and $OH^-$ is shown in the Figure1. The Calcium and Magnesium content of the Banana alkali sample were studied in mg/l where, the calcium content was 0.3455mg/l and the magnesium content was 0.1522 mg/l, (Figure2). From the calculation , it came to know that the Banana alkali sample had high amount of calcium than magnesium (Table 1).

**Effect on body weight**

The administration of Banana alikali into mice shows significant difference in the body weight as compared to control group. Through the noted results it's observed that the body weight of low dose treated group mice is very much negligible in compared to controlled group mice. On the other hand the body weight of high dose treated mice shows slightly elevated change it's body weight. The mean and standard error of change in body weight of mice is shown in table 2.

**Effect on testis and epididymis weight**

The weight of testis with epididymis is observed after the induction of Banana alkali in the treated group (Figure 3). The different weight of testis with epididymis of mice from control group, low dose treated group which is 10ml/kg and high dose treated group which is 20ml/kg was noted down. From the observation of weight, the G1 group that was controlled group the average weight was 0.30±0.003. G2, the low dose treated group with 10ml/kg shows not much changes in it's weight with respect to the controlled group. G3, the high dose treated group with 20ml/kg shows slightly elevated change in it's weight of testis (Table 2)

**Gonado Somatic index (GSI)**

To evaluate the developmental stage of the testes, the Gonadosomatic Index (GSI) was calculated. This involved expressing the gonad weight as a percentage of the total body weight, providing a normalized value to determine sexual maturity. From the data it was observed that the difference of GSI of controlled group and low dose of treated group is very much negligible, whereas the high dose of treated group showed slightly elevated change in comparison to controlled group. (Table2)

**Effect on sperm count**

The sperm count was done by using neubur's counting chamber, from the calculation we get to know that the total sperm count of G1, controlled group was 17012±6.35, with respect to which the low dose treated group shows a little less count of sperm. The high dose treated group shows slightly more sperm count than the controlled group, which was 17050±0.66 ( Table3).

**Histological study of Testis**

In the histological study of testis, three groups i.e. controlled group, low dose Kolakh 3ar(10mg/l) and high dose (20mg/l) group were examined (Fig: 4.A,B,C). The low dose (10 mg/l) treated group does not show any effect on it except with some Intertitial area (I) without interstitial cells. The seminiferous tubule of testis is similar with the control group and does not show any kind of morphological deformities (Fig 4. B). The high dose (20mg/l) treated group showing lake of Interstitial cells in some Intertitium (I) area and Malfunctioned Seminiferous Tubules (MST) with very few Spermatogonial Cells (SG) or with distorted Seminiferous tubule lining. (Fig4.C)

## DISCUSSION

Banana alkali is the best-known food additive of Assam, as its use not only as food but also in different household works. As a traditional alkaline preparation unique to various communities in Assam, Kolakhar serves as a cost-effective and renewable alternative to commercial potassium carbonate. It is characterized by its high potassium content, which provides its distinct alkaline properties.. The study says that the Alkali prepared from seedy variety is more used as food than from seedless variety. Alkali extract is prepared from *Musabalbasiana* (Athiya Kol) exhibit high alkalinity as it has pH 10.5. The TDS value, chloride, carbonate, hydroxyl, calcium, magnesium are the major constituent of Banana alkali. From the different Physicochemical analysis, the different ranges of this components are calculated. The chloride content of the test samplein the experiment is 16444 mg/l. In case of alkalinity, the Kolakhar from Athiya Kol has high hydroxyl alkalinity than that of carbonate. As according to report studied by other, hardness of the test sample from Athiya Kol should ranges about 300mg/l and it ranges about 272mg/l in this exoeriment, from where it can said that Kolakhar from Athiya Kol has more hardness in it. Calcium and Magnesium determination, gives the result that alkali contain high calcium than magnesium. In a similar experiment high amount of pH and presence of Cl, K, Na, Zn, Pb, Cd like minerals in Kolakhar were documented[11].

As the results said, high alkalinity of Banana alikali can inhibit the growth of many pathogens in the body. The presence of high alkali elements like chloride, carbonate, potassium, calcium etc makes it more alkaline in nature. Chloride content is also high in the test sample, which makes it best alternative for potassium chloride and it can also be used as salt substitutes. As it's hardness is high with high calcium and magnesium, it can help in protecting gastro intestinal tract[12]may be that is why there is saying that drinking a bit of Kolakhar can help during gastric. Chloride content in the diet plays an important role in high blood pressure. There were also applications that said as it contain high calcium, chloride , magnesium and because of it's high alkalinity, ashes of Kolakhar used as fertilizer in acidic soil. In a similar experiment Kolakhar was used to nutralise soil acidity to improve the growth of five indegenious rice variety and got a very effective result [13]. All the determination of presence of various component, Kolakhar prepared from *Musa balbasiana* (Athiya Kol) has it's best use in different fields.

The oral administration of Banana alkali for 20days did not show much effect on reproductive organ of male mice. The sperm count and the histological study has no negative effect on it. Whereas the intake of the test sample for high concentration shows slight change in body weight and weight of testis. Intake of low dose of the test sample has been observed as same as controlled group. As per high alkalinity and presence of various component it makes the test sample enable to exhibit antioxidant activity because of which it shows very little change in the respective aspects that have studied. High dose, 20mg/l shows effect on both body weight and testis weight but not in sperm count and histological study, from which it can be said that the intake of Banana alkali in high concentration may shows some significant change in it. As there is a very scanty information on the effect of Banana alkali in reproductive system,

therefore similar experiment has been found on banana peel extractonly where it was used on male reproductive system which showing protective effect [14]. As for this report, the effect were very less and due to which we can say that the people of Assam are having Banana alkali as food without getting any harmful effect and having alkaline diet frequently can benefit our overall health by preventing us from many diseases [15].

## CONCLUSION

The results of present investigation indicates that the intake of low dose of test sample not show any changes with respect to controlled group whereas intake of High dose of test sample i.e. 20mg/l shows slight elevated change in body weight and testis weight of male mice but no effect on the sperm count and histological study. From all the observation, hypothetically it can be said that intake of Banana alkali in high concentration can leads to change in body weight and testis weight. Further and better investigation may shows some effect on the sperm count and in it's histological study. As Banana alkali is the mostly used indigenous food of Assamese people, there is very much limited research on it's effect on human body . That is why this investigation is carried out. More investigation can gives better results in the future.

## ACKNOWLEDGEMENT

We offer my thanks to animal caretaker of our animal house and the all lab stuff of Department of Zoology, USTM for always be present to provide us all needed chemicals, instruments so that the work run smoothly and thoroughly. We are acknowledging the help coming from the faculty member of Department of Botany USTM for proper identification of the plant species.

**Ethical approval:** The study design including treatment of experimental animals was approved by the Institutional Animal Ethics Committee(17/02/2024) prior to the commencement of the study. Approval No. IAHF/USTM/2024/P-5.

**Competing interest:** There are no competing interest.

## ABSTRACT

The development of effective and sustainable photocatalysts for water purification is necessary due to the severe environmental contamination caused by the growing emission of organic pollutants from industrial and agricultural operations. The photocatalytic degradation performance of ZnO nanocomposites under light irradiation was assessed in this study. The production of wurtzite-structured ZnO with great UV absorbance and high crystallinity was verified by structural and optical investigations.The presence of surface hydroxyl groups that boost photocatalytic activity was confirmed by the FTIR spectra, which showed distinctive O–H and Zn–O vibrations. The presence of oxygen vacancies and effective charge carrier separation was demonstrated by photoluminescence (PL) analysis, which revealed emission peaks corresponding to near-band-edge and defect-related transitions. Reactive oxygen species (•OH and $\bullet O_2^-$), which actively break down organic dye molecules, are produced as a result of these characteristics. The produced ZnO nanocomposite was a promising material for wastewater treatment applications because of its exceptional photocatalytic effectiveness, stability, and recyclability. The study emphasizes ZnO's promise as an economical, sustainable, and reusable photocatalyst for pollution control and environmental restoration.

**Keywords:** Photocatalyst, ZnO nanocomposite, Photocatalytic degradation, Reactive oxygen species, Water purification

## INTRODUCTION

The exceptional physicochemical stability, strong redox potential, and tunable optical features of nanostructured metal oxide semiconductors have made them intriguing materials for energy conversion and environmental purification in recent decades[1]. Because of its large band gap (~3.3 eV), high exciton binding energy, and potent UV absorption capacity, zinc oxide (ZnO) has garnered a lot of interest as an effective photocatalyst[2]. ZnO can degrade organic dyes, insecticides, and other dangerous pollutants in wastewater because of its exceptional photoactivity when exposed to ultraviolet light[3].However, there are a number of obstacles to the practical use of pure ZnO in photocatalytic applications, such as photocorrosion under extended irradiation, limited visible-light responsiveness, and the quick recombination of photogenerated electron–hole pairs[4]. ZnO is frequently mixed with other semiconductors, metals, or carbon-based materials to create ZnO-based nanocomposites in order to overcome these disadvantages[4]. These heterostructures increase the efficiency of charge separation, increase the photocatalyst's overall stability and reusability, and extend light absorption into the visible spectrum[5]. Due to enhanced charge transfer kinetics and synergistic interfacial interactions, ZnO nanocomposites combined with oxides like $TiO_2$, $CeO_2$, and $FeO_3$ or non-metals like graphene oxide and g-$C_3N_4$ have shown better photocatalytic effectiveness. Incorporating secondary components enhances the surface area and active sites available for redox reactions in addition to modulating the band gap alignment. ZnO produces electron–hole pairs during photocatalysis when it absorbs photons with energy equivalent to or greater than its band gap[6]. The electrons convert oxygen molecules to superoxide radicals ($\bullet O_2^-$), while the holes oxidize water molecules to hydroxyl radicals ($\bullet OH$). Microbial inactivation and the oxidative breakdown of organic contaminants are mainly caused by these reactive oxygen species (ROS)[7]. All things considered, ZnO-based nanocomposites are a new class of effective, affordable, and safe photocatalysts[8]. They are perfect for sustainable wastewater treatment, air purification, and antibacterial applications under solar or visible light irradiation due to their improved optical responsiveness, chemical stability, and reusability[9].

## MATERIALS AND METHOD

**Chemical used**

Zinc Chloride (ZnCl, purity 98 %, Fisher Scientific), and Sodium Hydroxide (NaOH, 0.5 N solution, purity 98 %, Sigma-Aldrich) were used as key chemical reagents. Ethanol ($C_2H_5OH$) was utilized as a solvent, while Methyl Orange dye (purity 98 %, Fisher Scientific) was employed as the dye component for the experimental procedure. All chemicals were used without further purification to ensure consistency in the synthesis and characterization of the materials.

**Hydrothermal Synthesis of ZnO nanocomposite**

The hydrothermal approach, which uses the pressure created when water is heated in an autoclave, has been successfully employed to create heterostructures with desired crystallinity and decreased aggregation. The preferred technique for creating nanomaterials is a hydrothermal autoclave with a Teflon liner since it can tolerate high temperatures, stop corrosion, and shield the vessel walls from harmful chemical reactions. (Fig. 1) illustrates the process of mixing 100 milliliters of pure water with equimolar 1 M Zinc chloride. The solutions were continuously stirred magnetically for two hours at room temperature. The pH was raised to 7 by adding drops of a NaOH (0.5 N) solution. After that, 50 cc of this mixture was put into a Teflon autoclave, sealed, and heated to 180°C for 24 hours inside the closed system. The mixture was allowed to cool before being centrifuged, and the residue was washed four or five times with ethanol and double-distilled water. After the autoclave cooled, it was dried in a 65°C oven. After that, the ZnO powder samples were collected and kept in a desiccator. Schematic representation of Synthesis of ZnOHydrothermal Method (Fig 1).

**Methyl orange (MO) dye photocatalytic degradation and kinetics**

Methyl orange was used as a pollutant to study the photocatalytic capabilities of the ZnO heterostructure. The photocatalytic activity of the photocatalyst was measured using the rate of MO degradation. A stock solution of the dye (1.0 ×103 M) was made by dissolving 0.0373 g in 100 ml of doubly distilled water. The dye solution's pH was measured using a digital pH meter (Systronics Model 335), and the solution's pH was adjusted to the required level by adding a standard solution of 0.1 N sulphuric acid and 0.1 N sodium hydroxide. Every 15 minutes, a 3 ml aliquot of the reaction mixture containing 0.10 g of photocatalyst was taken and exposed to 200 W tungsten light. The absorbance (A) was measured at a maximum wavelength of 650 nm. A water filter was used to block thermal radiation. We tested the solution's absorbance at various intervals using a spectrophotometer (Systronics Model, 106).

## RESULTS AND DISCUSSION

**XRD Analysis**

The structural purity of nanomaterials is investigated using X-ray diffraction techniques [10]. The ZnO NPs' XRD pattern is displayed in (Fig 2, a). The XRD patterns were acquired with a rotation range of 20° to 80° and a scanning speed of 2°/min. The crystallographic planes of ZnO (100), (002), (101), (102), (110), (103), (112), and (202) are represented by the measured peak positions at 2θ = 31.76°, 34.4°, 36.38°, 47.76°, 56.8°,62.3°, 67.868°, and 76.64°, respectively. Which are listed in JCPDS #00–005-0664, and the Debey-Scherrer equation was used to determine the crystallite size (D) of ZnO;

$D = \frac{k\lambda}{\beta\cos\theta}$ …….[11]

∴ Where the wavelength of the X-ray source is 1.54 Å , the Debey-Scherrer constant is 0.94, and $\theta$ is the Braggs angle in degrees and $\beta$ is the full width at half maximum (FWHM) in radians [12]. The Debey-Scherrer equation yielded the following crystalline diameters for these corresponding planes: 14.84nm, 16.84 nm, 13.16 nm, 11.54 nm, 10.19nm, 9.27 nm, 6.19 nm, and 14.00 nm. ZnO was found to have an average crystalline size of 12.64 nm (Table 1).

**FT-IR analysis**

The chemical structures of the ZnO nanocomposites were determined based on the FT-IR spectra, as given in (Fig 2, b). The O–H stretching vibrations of hydroxyl groups and adsorbed water molecules on the nanocomposite's surface are responsible for the wide and strong absorption band seen in the 3400–3500 $cm^{-1}$ range. The O–H bending vibrations of molecular water physically adsorbed on the ZnO surface are responsible for the weak band about 1630–1650 $cm^{-1}$.In particular, the Zn–O stretching vibration, which is typical of the wurtzite crystal structure of ZnO, is responsible for the substantial absorption band seen below 600 $cm^{-1}$, usually in the region of 450–500 $cm^{-1}$. This demonstrates that the ZnO phase has successfully formed inside the nanocomposite.

**PL Analysis**

(Fig 2, c) The ZnO nanocomposite's photoluminescence (PL) spectrum shows a weaker peak close to 558 nm and significant emission peaks at about 425 and 375 nm. Near-band-edge (NBE) emission, which is caused by the recombination of free excitons, is shown by the strong emission at 425 nm, whereas intrinsic band-to-band transitions of ZnO are linked to the shoulder at 375 nm. Deep-level or defect-related transitions, primarily caused by oxygen vacancies and zinc interstitials, are the source of the wide visible emission centered about 558 nm. Fig. 2.(a) Powder X-ray diffraction pattern of ZnO, (b) FT-IR spectroscopy analysis of ZnO (c), PL spectra for ZnO and (d) EDS of ZnO.

**Scanning electron microscope (SEM)**

The morphological properties of the synthesized material are shown in the SEM images of the produced ZnO nanoparticles, which are shown in Fig. 3 (a-b). As the synthesis goes on, the particles change from their initial agglomerations into distinct forms. Perhaps as a result of the crystallization process during manufacture, this morphological change indicates the formation of a more structured and ordered nanomaterial. As illustrated in Fig. 3 (c-d), the presence of the essential components of the ZnO structure, Zinc (Zn), and oxygen (O), is confirmed by the EDAX data. Fig. 3.(a-c) SEM images of ZnO, d- EDAX mapping of ZnO

**Photocatalytic Dye Degradation**

The degradation behaviour of the synthesized ZnO was evaluated under sunlight using Methyl Orange (MO) dye as a model pollutant. At room temperature and with a pH of 7, the photocatalytic activity tests were conducted. A pseudo-first-order kinetic model was used to analyse the interaction between adsorption and photodegradation in the solid-liquid system. To ascertain the rate constant and comprehend the kinetics of the photodegradation process, the experimental data were fitted to the corresponding rate equation, as shown in Fig. 5 (a–d).

$-In\left(\frac{Ct}{C0}\right) = k(app) \cdot t$ ……[13]

∴Where $C_t$is Methylene Blue absorbance at time t; $C_0$ is Methylene Blue absorbance following dark adsorption. t-Kinetic rate constant, k (app), and radiation time. The reactive intermediates cause degradation and render the dye harmless.

**Photocatalytic Mechanism**

Photocatalytic activity occurs in the presence of a catalyst and a light source. Two main mechanisms underlie this activity: the first is the production of electrons and holes as a result of light interacting with the ZnO photocatalyst, and the second is the catalyst's surface function [14]. When the energy of the received light is equal to or less than the band gap of the ZnO thin films, excited electrons from the valence band migrate to the conduction band, producing photo-generated electrons ($e^-$) [15]. Electron-hole pairs (EHPs), which are essential for photocatalytic activity, are created when holes ($h^+$) are generated in the valence band at the same time. [16] These EHPs are always moving; some of them make it to the Ce-doped bismuth oxide's surface, while others stay inside the lattice of the material. Hydroxide ions ($OH^-$) are transformed into oxidizing hydroxyl radicals (•OH) at the thin film surface when photo generated holes interact with water molecules in the methylene blue (MB) solution [17]. When exposed to sunshine, these radicals are what cause the dye to deteriorate. Superoxide anions ($•O_2^-$) are created when oxygen molecules ($O_2$) are oxidized by photo generated electrons on the film surface [18]. The destruction of MB is facilitated by both superoxide radicals ($•O_2^-$) and hydroxyl radicals (•OH), indicating the material's photocatalytic activity [19](Fig.4).

The following are the main responses:

$ZnO + H_2O \rightarrow ZnO + •OH + OH^-$

$2HO_2• \rightarrow H_2O_2 + O_2$

$ZnO + H_2O_2 \rightarrow ZnO + 2\ •OH$

$H_2O_2 \rightarrow 2\ •OH$ (in presence of ZnO)

•OH + MO (Methyl Orange) → Degradation products (with ZnO as catalyst)

**Fig. 5.** Photodegradation ability of synthesized ZnO NPs, (a) Photodegradation studies up to 60 min, (b) Degradation kinetics of MO dye,(c) Linear fit using pseudo first order kinetics and (d) R-square variation with respect to concentration of ZnO NPs.

**Impact on scavengers of radicals**

Degradation experiments were carried out using specific radical scavengers in order to identify the active species involved in photocatalytic degradation. As illustrated in (Fig. 6.a), ethylene diaminetetraacetic acid (EDTA) was used to scavenge photogenerated holes ($h^+$) and hydroxyl radicals (•OH). Potassium iodide (KI) was used to specifically target hydroxyl radicals, and tert-butanol (t-BuOH) was employed as an additional hydroxyl radical scavenger. When these scavengers were present, the photocatalytic degradation efficiencies for KI, EDTA, and t-BuOH were 20.06%, 67.56%, and 40.02%, respectively. When no scavengers were used (blank), the degradation efficiency was 88.79%, demonstrating the system's significant potential for deterioration under these conditions. These findings demonstrate that oxygen ($O_2$) and hydroxyl radicals (•OH) are both required for the degradation of dye molecules during the photocatalytic process. Notable contributions when the photocatalyst is exposed to light, it generates reactive species.

**Heavy metal removal by ZnO**

The concentrations of various heavy metals in industrial effluent were carefully tracked both before and after exposure to sunlight in the presence of ZnO (Fig. 6, b). Under these circumstances, a 0.50 g/L concentration of ZnO was added to the effluent. The wastewater's heavy metal concentrations significantly decreased after treatment. In particular, following therapy, the copper (Cu) concentration decreased to undetectable levels. This outcome highlights the ZnO catalyst's potential for usage in heavy metal clean up in industrial wastewater by showing how well it removed these heavy metals when exposed to sunlight.

**TOC and COD analysis**

The elevated TOC value is associated with the complex dye N-oxidation process, which produces nitrogen-containing molecules. A higher COD value indicates a slower rate of mineralization. The dye solution used in this study (Fig. 6, c and d) was exposed to radiation for 50 minutes prior to TOC and COD measurements in order to encourage degradation. The data showed a similar pattern for both COD and TOC. The decrease in TOC concentration was more pronounced than the COD decrease, even though the COD value remained relatively low. This suggests that only a small portion of the Methylene Blue dye underwent complete mineralization, with the majority being partially broken down into intermediate by products.

.

$$\text{COD Removal (\%)} = \frac{\text{COD}_0 - \text{COD}_t}{\text{COD}_0} \times 100 \quad \ldots[20]$$

$$\text{TOC Removal (\%)} = \frac{\text{TOC}_0 - \text{TOC}_t}{\text{TOC}_0} \times 100 \quad \ldots.[21]$$

∴Where $C_t$ denotes the MB concentration (mg $L^{-1}$) prior to and following the photocatalysis at various intervals, and $COD_0$ and $TOC_0$ denote the starting MB concentration (mg $L^{-1}$).

**Fig. 6.**(a) Radical Scavenger of synthesized ZnO NPs, (b) Heavy metal removal by synthesized ZnO NPs, (c) COD analysis and (d) TOC analysis

**Reusability**

The ZnOphotodegradation performance is greatly improved by connecting. As indicated in (Fig 7, a), the percentage of MO photodegradation for the ZnO samples was 94.2%, 88.4%, 84.3%, 82.5%, and 80.2% following 50 minutes of exposure to direct sunshine. These findings show that ZnO can be efficiently preserved over the course of their lives, reducing environmental effects and optimizing nanoparticle benefits. This shows that they have the potential to be a dependable photocatalyst for eliminating pollutants from industrial effluent, especially dyes. Fig. 7.(a) Reusability of synthesized of ZnO NPs after 5$^{th}$ cycles

## CONCLUSION

The produced ZnO nanocomposite's great potential for the destruction of organic contaminants under light irradiation was shown by the photocatalytic investigation. Its large surface area, potent light absorption, and effective charge carrier separation are responsible for the increased photocatalytic activity. In order to produce reactive oxygen species (ROS) such •OH and $\bullet O_2^-$ radicals, which actively took part in the degradation process, surface hydroxyl groups and oxygen vacancies were essential. While PL investigations showed moderate recombination rates, guaranteeing extended electron–hole lifetimes advantageous for photocatalysis, optical and structural examinations verified the creation of a pure ZnO phase with a wurtzite structure. The ZnO nanocomposite is a promising nanocatalyst for wastewater treatment and organic dye degradation because of its consistent performance, reusability, and environmental friendliness. The work demonstrates that ZnO-based photocatalysts are sustainable, economical, and effective materials with enormous potential for use in clean energy and environmental remediation applications in the future.

## ACKNOWLEDGMENT

The authors express their sincere gratitude to the University of Mysore, Mysuru, for the valuable support and encouragement provided throughout this research. The authors also acknowledge the university's infrastructure and resources that facilitated the completion of this work.

### FUNDING

The authors declare that no specific funding or financial support was received for this research.

### CONFLICT OF INTEREST

The authors declare that there is no conflict of interest associated with this publication.

## ABSTRACT

Genetic and epigenetic changes that interfere with normal cell regulation and promote uncontrolled growth are the cause of cancer. Histone deacetylases (HDACs) are crucial epigenetic enzymes that contribute to the development of cancer by silencing tumor-suppressor genes. As such, they constitute important targets for treatment. The mechanisms, selectivity, and anticancer potential of small-molecule HDAC inhibitors (HDACis) are summarized in this article. Strong zinc-dependent HDAC blocking is demonstrated by broad-spectrum hydroxamate-based inhibitors like vorinostat and panobinostat, whilst benzamide derivatives like entinostat and mocetinostat provide higher Class I selectivity and enhanced safety. Romidepsin and largazole are examples of substances obtained from natural products that increase structural diversity. Strong cytotoxicity and strong binding affinity are consistently shown by docking and $IC_2^1$ measurements. Selective HDAC6 inhibitors (ricolinostat, citarinostat) and multitarget drugs (CUDC-101, CUDC-907) that improve treatment efficacy are examples of recent developments. All things considered, HDAC inhibitors continue to be attractive epigenetic treatments with a great deal of promise for more effective, focused cancer treatment.

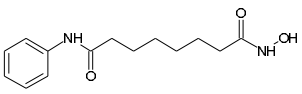
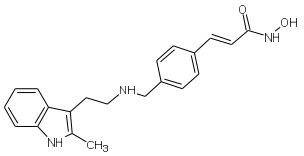
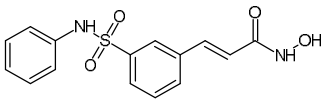
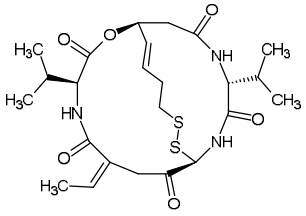
## INTRODUCTION

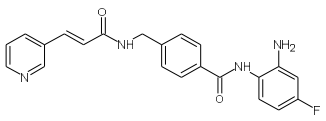


Cancer is a heterogeneous disease that develops through the combined effects of genetic as well as epigenetic mutations thereby normal cellular pathways gets disrupted and promotes certain characteristics such as uncontrolled cell division, apoptosis resistance, metastasis and vasculogenesis [1]. While genetic mutations have been considered the key drivers of tumorigenesis, progressing evidence shows that the aberrant epigenetic modifications also plays a significant role in the inception and advancement of many types of cancers [2]. Methylation of DNA ,modification of histone proteins and regulations mediated by non-coding RNA are the epigenetic mechanisms that helps in controlling gene expressions without changing the DNA sequence and thereby helps to shape the structure of chromatin [3]. The reversible processes involved in the acetylation and deacetylation of histone proteins are essential for the regulation of genes involved in the cell cycle, differentiation and apoptosis.

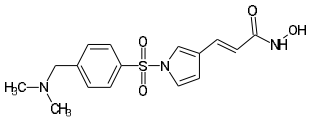


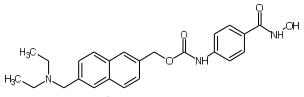


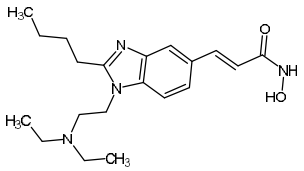


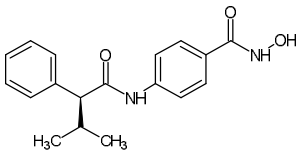


Histone deacetylases (HDACs) are types of enzymes that helps to remove acetyl groups from lysine residues present on the histone and non-histone proteins. Due to deacetylation, chromatin condensation takes place and thereby gene gets silenced. In case of cancers abnormal HDAC expression or activity has been observed leading to tumour progression by silencing tumour-suppressor genes, enhancing the oncogenic pathways [4]. In cancer biology HDACs show a crucial role, have emerged as a promising therapeutic target. HDAC inhibitors (HDACs) can induce cell-cycle arrest, apoptosis, differentiation, and thereby helping to restore cellular balance. Several HDACs, including vorinostat and romidepsin, have already been approved for clinical use, and many more are undergoing evaluation. Although HDAC inhibitors are highly promising, challenges such as targeting the right isoforms, managing toxicity, and overcoming resistance still remain. These issues show that we need to keep improving and advancing HDAC-focused drug development [5].

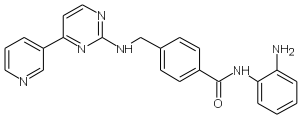


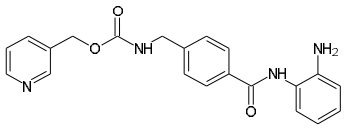


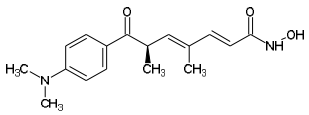


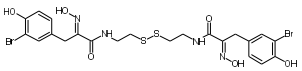


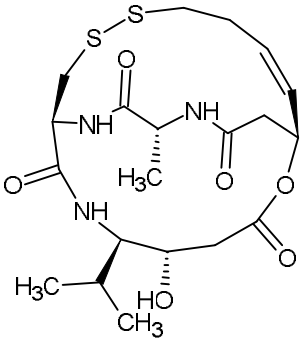
## METHODOLOGY



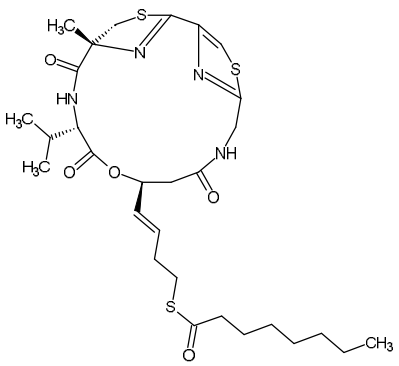


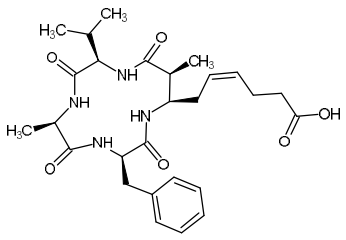


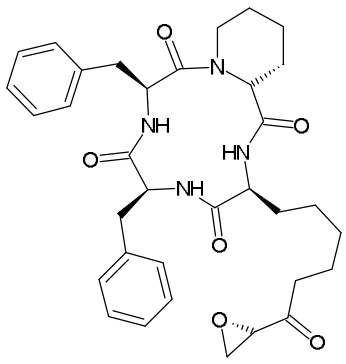




Related scientific studies published in journals, books and reports were reviewed. Relevant literatures were searched in google scholar and electronic databases including science direct, IEEE Xplore, Scopus, Sci finder and MEDLINE using a specific search terms including HDAC, Antineoplastic agents.







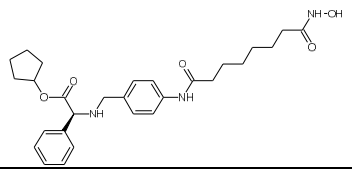


**Table: Small Molecules Exhibiting Anticancer Activity by Inhibiting HDAC**

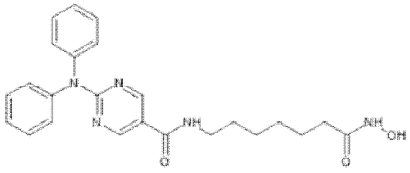
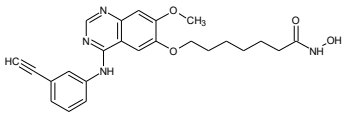
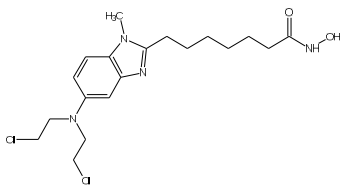
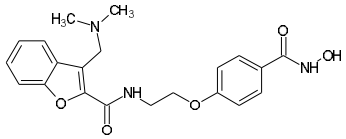


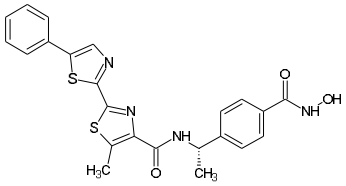
| Sl. No. | Leadmolecule | Pharmacological Activity & Target | Reference |
|---|---|---|---|
| 1 |  Suberoylanilide hydroxamic acid (SAHA, Vorinostat) | It induces hyperacetylation of histone and non-histone proteins, leading to: Cell cycle arrest (primarily G1 phase), Apoptosis of malignant cells, Inhibition of angiogenesis, Differentiation of tumor cells, Exhibits antineoplastic activity, particularly effective in cutaneous T-cell lymphoma (CTCL).<br>It targets zinc-dependent histone deacetylases (HDACs) by acting as a zinc ion chelator at the enzyme's active site, thereby blocking its deacetylase activity. It inhibits both Class I HDACs (HDAC1, HDAC2, HDAC3, and HDAC8) and Class II HDACs (HDAC6 and HDAC10), making it a broad-spectrum or non-selective HDAC inhibitor.<br>PDB ID- 4LXZ<br>DOCKING SCORE: -8.46 Kcal/mol | 1,2 |

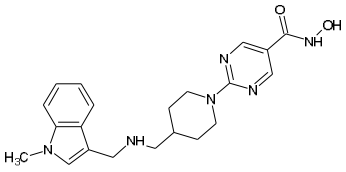


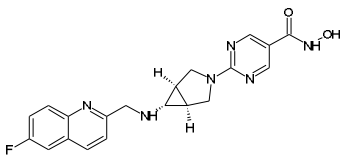




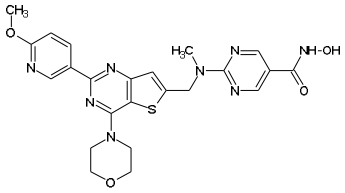
| | | | |
|---|---|---|---|
| 2 |  Panobinostat | Panobinostat induces hyperacetylation of histone and non-histone proteins, leading to changes in chromatin structure and transcriptional regulation resulting in cell cycle arrest, apoptosis, and inhibition of angiogenesis in cancer cells. Its monotherapy has shown limited efficacy thereby used in combination therapy with bortezomib and dexamethasone, exhibiting increased therapeutic response.<br><br>It is a broad-spectrum inhibitor of Class I (HDAC 8), II, and IV HDAC enzymes.<br>PDB ID- 1W22<br>DOCKING SCORE: -8.47 Kcal/mol | 3,4 |
| 3 |  Belinostat | Belinostat induces histone hyperacetylation leading to chromatin relaxation, reactivation of tumor suppressor genes, cell cycle arrest and apoptosis in malignant T cells. It is also effective for peripheral T-cell lymphoma (PTCL).<br><br>It exhibits broad-spectrum (pan) HDAC inhibition by targeting both Class I HDACs (HDAC1, HDAC2, HDAC3, and HDAC8) and Class II HDACs (HDAC6 and HDAC10).<br><br>PDB ID: 5EEN<br>DOCKING SCORE: -8.39 kcal/mol | . 5,6 |
| 4 |  Romedepsin | Romidepsin inhibits HDACs at low nanomolar concentrations, leading to histone hyperacetylation, alterations in gene expression, cell cycle arrest, apoptosis, and cell differentiation. It is also effective for cutaneous T-cell lymphoma (CTCL) and peripheral T-cell lymphoma (PTCL).<br><br>It targets Class I HDACs, particularly HDAC1 and HDAC2. Its disulfide bond is reduced intracellularly to release a thiol group, which subsequently binds to the zinc ion in the HDAC active site, inhibiting enzymatic activity.<br><br>$IC_{50}$ value: 3.97 nM for HDAC1 and 787 nM for HDAC6 | 7,8 |
| 5 |  Tucidinostat | Tucidinostat induces histone hyperacetylation leading to chromatin relaxation , re-expression of tumor suppressor genes resulting in cell cycle arrest and apoptosis .It is found effective in treatment of peripheral T-cell lymphoma.<br><br>It selectively inhibits HDAC1, HDAC2, HDAC3, and HDAC10, with $IC_{50}$ values of 95, 160, 67, and 78 nM, | 9,10 |

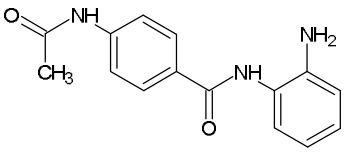


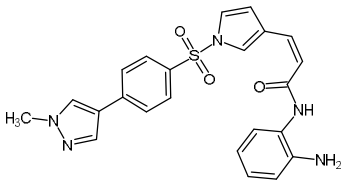


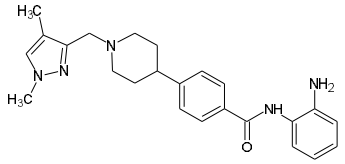


| | | | |
|---|---|---|---|
| | | respectively.<br>PDB ID: 4A69<br>DOCKING SCORE: -7.8 kcal/mol | |
| 6 |  <br>Resminostat | Resminostat induces histone hyperacetylation, leading to chromatin relaxation, that promotes apoptosis, cell cycle arrest, and suppression of tumor growth. It has been evaluated in clinical trials for hepatocellular carcinoma and Hodgkin's lymphoma | 11,12 |
| 7 |  <br>Givinostat | Givinostat acts by inhibiting histone deacetylation, leading to chromatin relaxation, promoting apoptosis, cell cycle arrest, and activation of anti-inflammatory signaling pathways. It exhibits both anti-inflammatory and antineoplastic properties. It is currently evaluated in clinical trials for polycythemia vera,chronic myeloproliferative neoplasms<br><br>It targets both Class I and Class II HDACs.<br>$IC_{50}$ values of approximately 3 μM in p53-null cells (SaOS2), 0.57–0.97 μM in p53-mutant lines (SW872, SKLMS), and 0.63–0.88 μM in wild-type p53 cell lines (U2OS, SW982, HT1080, A204). | 13,14 |
| 8 |  <br>Pracinostat | Pracinostat promotes histone hyperacetylation, reactivation of tumor suppressor genes thereby inducing apoptosis and cell cycle arrest. Investigated clinical trials for acute myeloid leukemia (AML), myelodysplastic syndromes (MDS), and various solid tumors.<br><br>It is a pan-HDAC inhibitor (Class I and II) with structural modifications that extend half-life and improve oral bioavailability. | 15,16 |
| 9 |  <br>AR-42 (OSU-HDAC42) | Inhibits histone deacetylation → increased histone acetylation, chromatin relaxation, and re-expression of silenced tumor suppressor genes inducing apoptosis, cell cycle arrest, and anti-tumor activity. Evaluated in trials for multiple tumors and neurological indications, including Acoustic neuroma, Intraocular lymphoma, Meningioma, Testicular lymphoma, Vestibular schwannoma.<br><br>AR-42 is a nanomolar hydroxamate-based HDAC inhibitor that blocks Class I and IIb HDACs<br><br>$IC_{50}$ of AR-42 at 48 h was approximately 0.9 μM in 7721, HepG2 and Hep3B cells | 17,18 |









| | | | |
|---|---|---|---|
| 10 |  Mocetinostat | Mocetinostat blocks deacetylation and increasing histone acetylation, leading to the reactivation of tumor suppressor pathways inducing apoptosis via mitochondrial disruption and microtubule destabilization.<br>It is a selective Class I HDAC inhibitor (HDAC1 and HDAC2)<br><br>It has $IC_{50}$ values of 0.15 μM for HDAC1, 0.29 μM for HDAC2, 1.66 μM for HDAC3, and 0.59 μM for HDAC11. | 19,20 |
| 11 |  Entinostat (MS-275) | Entinostat (MS-275) increases histone acetylation that leads to chromatin relaxation and tumor suppressor gene reactivation. Thereby, promoting apoptosis, cell differentiation, and cell cycle arrest in malignant cells<br>It is a selectiveHDAC inhibitor that targets Class I HDACs, with high potency against HDAC1and moderate potency against HDAC3<br>PDB ID: 3MAX<br>DOCKING SCORE: −12.524 (HDAC2) | 21,22 |
| 12 |  Trichostatin A (TSA) | Trichostatin A (TSA) Induces histone hyperacetylation that leads to chromatin relaxation, tumor suppressor gene re-expression, and cell cycle arrest/apoptosis.<br><br>It acts as a pan-HDAC inhibitor by bidentate $Zn^{2+}$ chelation<br>PDB ID: 1C3R | 23 |
| 13 |  Psammaplin A | Psammaplin A contains disulfide bond that is reduced intracellularly to generate a thiol that chelates $Zn^{2+}$ in the HDAC catalytic site. The disulfide scaffold improves stability and cell permeability.<br><br>It is a model compound for natural product–based HDAC inhibitor design.<br><br>PDB ID: 4BKX<br>IC50 value of 45 Nm (HDACI) | 24,25 |
| 14 |  Spiruchostatin A (OBP-801) | Spiruchostatin A (OBP-801) selectively inhibits Class I HDACs via a thiol-mediated $Zn^{2+}$ chelation mechanism, inducing apoptosis and chromatin remodeling, and exhibits potent antitumor activity.<br>Spiruchostatin A (OBP-801) is a natural depsipeptide HDAC inhibitor that exhibits potent anticancer activity.<br>It effectively inhibits the growth of breast cancer cells with an $IC_{50}$ of approximately 10 nM, demonstrating strong cytotoxic potential at low nanomolar concentrations | 26 |

| | | | |
|---|---|---|---|
| 15 |  Largazole | Largazole is metabolized into a thiol, that chelates $Zn^{2+}$ in the HDAC active site. Structural studies (HDAC8–Largazole crystal complex) confirm its pharmacophore, and it exhibits potent nanomolar inhibition with strong anticancer activity.<br><br>Largazole is a cyanobacteria-derived natural depsipeptide prodrug that functions as a potent HDAC inhibitor.<br><br>It exhibits strong selectivity toward Class I HDACs, with $IC_{50}$ values of 61 ± 7 nM for HDAC1, 64 ± 5 nM for HDAC2, and 50 ± 6 nM for HDAC3, while showing significantly weaker inhibition of HDAC6 ($IC_{50}$ = 1400 ± 100 nM) | 27 |
| 16 |  Azumamide E | Azumamide E induces histone hyperacetylation, leading to chromatin relaxation, apoptosis, and cell cycle arrest.<br>It Acts as an antineoplastic agent in preclinical models.<br>Azumamide E is a marine-derived macrocyclic HDAC inhibitor with submicromolar potency, exhibiting selectivity for HDAC1 over HDAC6.<br>It demonstrates inhibitory activity with $IC_{50}$ values of 50 nM for HDAC1, 100 nM for HDAC2, and 80 nM for HDAC3. Structural studies have explored its interactions using several HDAC crystal structures, including HDLP (1C3R and 1C3S), human HDAC8 (1T64 and 1W22), HDAC4 (2VQQ and 2VQM), HDAC7 (2PQO), and the sirtuin family member SIRT2 (1J8) | 28 |
| 17 |  Trapoxin | In HDAC8, its ketone reacts with active-site to form a gem-diolate, which binds $Zn^{2+}$ bidentately, mimicking the substrate.<br>It irreversibly inhibits Class I HDACs and was key in elucidating the role of HDACs in gene regulation<br>$IC_{50}$ =110–820 pM against HDAC1. | 29,30 |
| 18 |  | Tefinostat (CHR-2845) induces apoptosis and cell cycle arrest in leukemic blasts while reducing systemic toxicity. It is being clinically evaluated in AML and MDS. Tefinostat (CHR-2845) is a first-in-class, esterase-activated HDAC inhibitor prodrug that selectively targets myelomonocytic cells. | 31,32 |

| | | | |
|---|---|---|---|
| | Tefinostat (CHR-2845) | M4 /M5 AMLs (median IC50; 1.1μM+/-1.8)<br>non-M4/M5 FAB types (median IC50 5.1μM +/-4.7) | |
| 19 | CG2OO745 | Effects on cholangiocarcinoma cells<br>CG200745 decreases viability of cholangiocarcinoma cell lines in a dose-dependent manner.It induces apoptosis: increased cleaved caspase-3, plus higher acetylated histone H3 indicating HDAC inhibition.<br>Molecular / pathway effects<br>Targets the Hippo signaling pathway via modulation of miRNAs. Specifically, CG200745 treatment leads to upregulation of several miRNAs. These acts to suppress downstream Hippo pathway effectors.<br>CG200745 is a hydroxamic acid–based, pan-histone deacetylase inhibitor (HDACi) that exerts its activity by chelating zinc ions within the catalytic pocket of HDAC enzymes, thereby blocking deacetylase function.<br>It demonstrates potent antiproliferative activity against cholangiocarcinoma cell lines, with $IC_{50}$ values of 0.63 μM in SNU-1196 cells, 0.93 μM in gemcitabine-resistant (GR) SNU-1196 cells, and 1.80 μM in SNU-308 cells. | 33,34 |
| 20 |  <br>Ricolinostat (ACY-1215) | Ricolinostat (ACY-1215) induces apoptosis and disrupts protein degradation by targeting HDAC6-mediated $\alpha$-tubulin and HSP90 deacetylation. It is being tested in multiple myeloma and lymphomas, often in combination therapies, and offers reduced toxicity compared to pan-HDAC inhibitors.<br>Ricolinostat (ACY-1215) exhibits antiproliferative activity across various non-Hodgkin's lymphoma (NHL) cell lines, with $IC_{50}$ values ranging from 1.51 to 8.65 μM.<br>Among these, the most sensitive cell lines were WSU-NHL and Hut-78, with $IC_{50}$ values of 1.97–1.51 μM, whereas the mantle cell lymphoma (MCL) line Granta-519 was the least sensitive, showing an $IC_{50}$ range of 20–64 μM. | 35,36 |
| 21 | Citarinostat (ACY-241) | Citarinostat (ACY-241) disrupts cytoplasmic deacetylation pathways ($\alpha$-tubulin, HSP90), inducing apoptosis and enhancing immune response. It is in clinical evaluation for multiple myeloma, lymphomas, and solid tumors in combination with immunotherapy.<br>It is an orally available, second-generation histone deacetylase6 (HDAC6)–selective inhibitor.<br>It exhibits potent and preferential inhibition of HDAC6 with an $IC_{50}$ value of 2.6 nM, while showing significantly weaker activity against other HDAC | 37,38 |

| | | | |
|---|---|---|---|
| | | isoforms.Reported $IC_{50}$ values for Citarinostat include 35 nM for HDAC1, 45 nM for HDAC2, 46 nM for HDAC3, 137 nM for HDAC8, and >20,000 nM for HDAC4, HDAC5, and HDAC9, with moderate inhibition of HDAC7 (7,300 nM). | |
| 22 |  CUDC-101 | CUDC-101combines epigenetic modulation with inhibition of oncogenic signaling and induces apoptosis and suppresses tumor growth. It has been tested in phase I trials for advanced solid tumors, including head and neck, liver, and HER2+ cancers. CUDC-101 is a multitarget inhibitor that blocks Class I/II HDACs, EGFR, and HER2. CUDC-101, inhibits HDAC enzyme with IC50 (nmol/L) = 4.2 ± 1.2 | 39,40 |
| 23 |  Tinostamustine (EDO-S101) | Tinostamustine (EDO-S101) simultaneously relaxes chromatin and induces DNA breakage, it enhances antitumor efficacy and overcomes resistance. It is in clinical development for hematological cancers such as AML, lymphomas, and multiple myeloma. It is a dual-acting molecule that combines histone deacetylase (HDAC) inhibition with DNA-alkylating, damage-inducing activity. It exhibits cytotoxic effects across multiple myeloma (MM) cell lines, with $IC_{50}$ values ranging from 1.6 to 4.8 μM. | 41,42 |
| 24 |  Abexinostat (PCI-24781) | Abexinostat (PCI-24781) induces apoptosis, cell cycle arrest, and differentiation, and has been tested in phase I/II trials for lymphomas, sarcomas, and solid tumors, often showing enhanced activity in combination regimens. It is an orally bioavailable hydroxamate pan-HDAC inhibitor with strong activity against HDAC1, HDAC2, and HDAC6. In breast cancer cell lines (BCLs), abexinostat showed $IC_{50}$ values ranging from 170 to 460 nmol/L in sensitive cell lines, whereas resistant cell lines exhibited $IC_{50}$ values higher than 700 nmol/L | 43,44 |

| | | | |
|---|---|---|---|
| 25 |  Bistianostat (SB939) | Bistianostat (SB939) demonstrates potent antitumor effects with an improved safety and pharmacokinetic profile compared to Vorinostat, and has been evaluated in clinical trials for hematological cancers and solid tumors<br>It is a second-generation hydroxamate pan-HDAC inhibitor with strong activity against HDAC1, HDAC2, and HDAC6<br>It has IC50 values ranging from 0.095 to 0.221 μM against HDAC1, 2, 3, 4, 5, 6, 8, 10, and 11. The documents also note that it has noactivity against HDAC7 and HDAC9, with an IC50 of >20 μM.<br>The specific IC50 values against HDACs are as follows:<br>HDAC1: 0.095 ± 0.049 μM<br>HDAC2: 0.193 ± 0.065 μM<br>HDAC3: 0.108 ± 0.060 μM<br>HDAC4: 0.158 ± 0.048 μM<br>HDAC5: 0.138 ± 0.051 μM<br>HDAC6: 0.068 ± 0.030 μM<br>HDAC8: 0.221 ± 0.136 μM<br>HDAC10: 0.171 ± 0.094 μM<br>HDAC11: 0.141 ± 0.023 μM | 45,46 |
| 26 |  Quisinostat (JNJ-26481585) | Quisinostat (JNJ-26481585) promotes apoptosis, differentiation, and cell cycle arrest, and reached phase II trials for hematologic and solid tumors but has not been approved.<br>It is an orally available pan-HDAC inhibitor with nanomolar potency against Class I and II isoforms mainly for HDAC 6.<br>In cancer cell lines, it shows $IC_{50}$ values in the low to mid nanomolar range.<br>The full range of $IC_{50}$ values was found to be less than 1 nM to 19 nM. | 47,48 |
| 27 |  Nanatinostat (CHR-3996) | Nanatinostat (CHR-3996) induces apoptosis and cell cycle arrest in hematologic malignancies and has been tested clinically for lymphomas, leukemias, and multiple myeloma.<br>It is an orally available, Class I selective HDAC inhibitor that targets HDAC1, HDAC2, and HDAC3 with high potency.<br>Biochemical enzyme assays have reported $IC_{50}$ values of approximately 3 nM for HDAC1, 4 nM for HDAC2, and 7 nM for HDAC3. | 49,50 |

| | | | |
|---|---|---|---|
| 28 |  Fimepinostat (CUDC-907) | Fimepinostat (CUDC-907) induces apoptosis and cell cycle arrest by epigenetic modulation and simultaneously blocks PI3K/AKT signaling, making it effective in hematologic cancers and solid tumors It is a first-in-class dual inhibitor that targets Class I HDACs (HDAC1, HDAC2, HDAC3) and Class I PI3Ks (α and δ). It exhibits potent antiproliferative activity in both MYCN-amplified and non-amplified neuroblastoma (NB) cell lines, with $IC_{50}$ values of 0.91 μM in LAN-5, 1.94 μM in NGP, and 1.33 μM in CHLA-255-MYCN (MYCN-amplified), and 0.97 μM in SK-N-AS, 1.35 μM in SH-SY-5Y, and 1.35 μM in CHLA-255 (MYCN non-amplified) cells | 51,52 |
| 29 |  tacedinaline | Tacedinalineprevents the removal of acetyl groups from histone proteins, thereby influencing gene expression. Its primary targets are: HDAC-1, HDAC-2, HDAC-3 **PDB ID: 4LY1** Docking scores HDAC-2: -8.451 HDAC-3: -8.260 | 53,54 |
| 30 |  Domatinostat (4SC-202) | Domatinostat (4SC-202) induces apoptosis and cell cycle arrest while enhancing immune checkpoint therapy efficacy. Currently used in clinical trials for solid tumors and hematological malignancies. It is an orally available Class I selective HDAC inhibitor targeting HDAC1, HDAC2 and HDAC3. It exhibits potent antiproliferative activity in cutaneous T-cell lymphoma (CTCL) cell lines, with $IC_{50}$ values ranging from the low nanomolar to micromolar range—170 nM in CRL-2105, 190 nM in MyLa, 260 nM in CRL-8294, 370 nM in HTB-176, 250 nM in Se-Ax, and 330 nM in HuT 78 cells. | 55,56 |
| 31 |  Zabadinostat (CDX 101) | Zabadinostat (CDX 101) demonstrates antitumor and immune-modulatory activity and is in clinical development for colorectal cancer and other advanced malignancies. CXD101 is an orally availableHDAC inhibitor that selectively targets Class I HDACs (HDAC1, HDAC2, HDAC3) with $IC_{50}$ values of 63 nM, 570 nM, and 550 nMrespectively. | 57 |

## CONCLUSION

Histone deacetylase inhibitors (HDACs) represent a rapidly evolving class of epigenetic modulators with profound therapeutic potential across haematological and solid malignancies. Through the inhibition of zinc-dependent HDAC enzymes, these molecules restore the balance between acetylation and deacetylation, leading to chromatin relaxation, reactivation of tumour suppressor genes, and subsequent induction of apoptosis, cell cycle arrest, and differentiation.

Among the compounds studied, hydroxamate-based inhibitors such as vorinostat, panobinostat, and belinostat exhibit broad-spectrum (pan-HDAC) activity, while benzamide derivatives like entinostat and mocetinostat demonstrate higher selectivity toward Class I HDACs, contributing to improved safety and tolerability. Natural product–derived inhibitors such as largazole, spiruchostatin, and romidepsin further highlight the structural diversity and mechanistic complexity of this pharmacophore class. Docking analyses and $IC_{50}$ data consistently reveal strong binding affinities within the nanomolar to micromolar range, emphasizing the crucial role of zinc ion chelation in HDAC inhibition. Recent developments in selective HDAC6 inhibitors (e.g., ricolinostat and citarinostat) and dual-acting agents (e.g., CUDC-101, CUDC-907, and tinostamustine) underscore a strategic shift toward multitargeted and isoform-specific approaches that aim to enhance antitumor efficacy while minimizing systemic toxicity. In summary, HDAC inhibitors continue to be a cornerstone of modern epigenetic therapy. Future research integrating structural optimization, computational modelling, and combination therapy strategies may further refine their clinical application and expand their potential beyond oncology into inflammatory, neurodegenerative, and metabolic disorders

## ABSTRACT

Ultra-processed foods (UPFs) have become an integral component of modern dietary patterns, driven by rapid urbanization, aggressive marketing, and post-pandemic lifestyle transitions. Characterized by refined sugars, hydrogenated fats, synthetic additives, and low nutritional value, these products exert profound biological effects that extend beyond metabolic disorders. Recent evidence highlights the role of UPFs in inducing epigenetic modifications- particularly aberrant DNA methylation, histone alterations, and microRNA dysregulation- which collectively predispose individuals to obesity, insulin resistance, and neurobehavioral dysfunctions. The post-COVID generation, marked by increased reliance on convenience foods and digital lifestyles, is particularly vulnerable to such alterations. This review consolidates current findings on the molecular and neurophysiological mechanisms linking UPF consumption to cognitive decline, mood instability, and developmental impairments. Furthermore, it emphasizes how chronic exposure to artificial ingredients and emulsifiers disrupts the gut–brain axis, influencing neuroinflammatory pathways and emotional regulation. The review underscores the urgent need for public health interventions, nutritional education, and policy reforms aimed at mitigating the long-term health consequences of UPF consumption. Greater awareness and regulatory oversight are essential to safeguard the well-being of future generations.

**Keywords:** Ultra-Processed Foods, Epigenetics, Neurobehavior, Post-COVID

# INTRODUCTION

Ultra-processed foods (Ups) emerge as a dominant dietary pattern worldwide due to their convenience, affordability, and aggressive marketing strategies. They typically contain refined oils, high sugars, hydrogenated fats, and modified starches, while lacking essential nutrients such as fiber and vitamins [1]. Between 2006 and 2019, per capita sales of UPFs and beverages in South and Southeast Asia rose significantly, raising concerns about obesity, cardiovascular diseases, metabolic disorders, and metabolic dysfunction-associated steatotic liver disease (MASLD), particularly among children and adolescents [1]. MASLD, previously referred to as non-alcoholic fatty liver disease (NAFLD), is characterized by excessive fat accumulation in liver cells and is closely linked with obesity, type 2 diabetes, dyslipidaemia, and hypertension. Non-communicable diseases (NCDs) now account for roughly 72% of deaths and 75% of healthcare expenditures globally. Components of Ups, including sugar, caffeine, salt, and fat, are considered food additives rather than standalone nutrients, and some additives

exert addictive-like effects like cocaine or heroin [2]. Soft drinks, the second most consumed beverage globally, show only slight reductions in consumption even with price increases, highlighting strong consumer demand [2]. During the COVID-19 pandemic, studies in Brazil report decreases consumption of fresh and minimally processed foods and increases processed food intake, associated with poor sleep quality. Sedentary lifestyles combined with high UPF consumption contribute to shorter sleep duration and prolonged sleep deprivation [3]. Ups and additives alter gut microbiota, potentially harming the host and contributing to conditions like inflammatory bowel disease (IBD). Diets high in animal fat, sugar, and salt but low in fiber reduce microbiota diversity, leading to mucus inflammation and unusual immune responses [4]. Western populations exhibit higher prevalence of IBD, while Mediterranean diets are recommended for their protective effects.

**Consumption Trends: Global and India**

While UPF intake among Asian youth is lower than in non-Asian populations, a Japanese study reports 27.3% of youth consuming UPFs regularly. In Brazil, Spain, Portugal, and the UK, children and adolescents derive 30–50% of their energy intake from UPFs, with some children obtaining nearly half of daily calories from these foods [1]. High intake among Asian youth places them at risk of similar metabolic and health outcomes as Western peers. In developed countries, UPFs contribute 50–60% of daily energy intake, while middle-income countries are experiencing rapidly increasing consumption [5]. In the US, UPFs account for nearly 60% of total energy intake and 90% of added sugar consumption. Younger populations are the primary consumers, while older adults are less affected [5]. In Europe, intake ranges from 14% of daily energy in Italy to 50% in the UK; Canada reports nearly 50% and Australia over 35% [6]. Socioeconomic status inversely correlates with UPF intake in several countries [6]. In India, NCD mortality has risen from 37.9% to 61.9% over 25 years. Obesity affects roughly 25% of adults and 3% of children under five. increases UPF consumption is driven by higher disposable income, nuclear families, single-member households, and less time for homecooked meals. Children and adolescents are exposed through media, sports, and celebrity endorsements, contributing to a “double burden” of malnutrition and obesity. The COVID-19 pandemic exacerbated food insecurity and obesity risks [7][8]. Adults with high UPF consumption, particularly in India, are at risk for deficiencies in essential nutrients, including iron, zinc, vitamin A, and folate. Frequent intake of packaged snacks, sugar-sweetened beverages, and ready-to-eat meals exacerbates this problem, with implications for both metabolic and cognitive health [9].

**Defining Ultra-Processed Foods**

Ultra-processed foods are industrially manufactured products containing five or more ingredients, including additives like Flavors, colours, sweeteners, and emulsifiers. These components are designed to replicate the sensory qualities of unprocessed foods or mask undesirable Flavors [10].

**Nova classification system:** NOVA categorizes foods based on the extent and purpose of industrial processing [11]:
Group 1: Unprocessed or Minimally Processed Foods – edible parts of plants, animals, fungi, and algae preserved using basic methods like drying, roasting, or freezing.
Group 2: Processed Culinary Ingredients – substances derived from Group 1 foods, such as oils, butter, sugar, and salt, used for cooking.
Group 3: Processed Foods – items like canned vegetables, cheeses, or freshly baked breads made by adding Group 2 ingredients to Group 1 foods.
Group 4: Ultra-Processed Foods – soft drinks, packaged snacks, reconstituted meats, and frozen dishes made mostly from substances derived from foods, combined with additives. Common ingredients include sugars, oils, fats, salt, casein, lactose, whey, gluten, hydrogenated oils, maltodextrin, emulsifiers, preservatives, and flavor enhancers.

**The Anatomy of Ultra - Processed Foods (UPFS)**

Ultra-processed foods can disrupt multiple organ systems through metabolic, inflammatory, and neuroendocrine pathways. The gastrointestinal tract acts as a critical gateway where additives such as emulsifiers, artificial sweeteners, and preservatives can disturb gut microbiota and impair intestinal barrier function. Even minor alterations in gut homeostasis may trigger immune responses, neuroinflammation, and cognitive disturbances, demonstrating that UPFs can affect overall health beyond simple diet [12]. Artificial food colorants like Tartrazine (E102), Sunset Yellow (E110), and Allura Red (E129) are commonly used azo dyes found in ultra-processed foods. Research has linked these compounds to behavioral changes, such as hyperactivity in children, as well as increases markers of oxidative stress in animal studies.[13] Consuming ultra-processed foods that contain the synthetic food colorant Allura Red AC on a regular basis may disrupt serotonin signaling in the intestines. This disruption can lead to dysfunction of the gut barrier and an increases risk of inflammatory conditions like colitis. This emphasizes how certain additives in ultra-processed foods can directly contribute to gastrointestinal inflammation.[14] "Monosodium glutamate (MSG) is commonly used as a flavor enhancer in highly processed savory snacks, instant noodles, and sauces. Experimental studies show that chronic MSG consumption can cause hypothalamic lesions, disrupt appetite control, and lead to increases fat storage in rodents." [15] Common preservatives found in ultra-processed foods (UPFs) include sodium benzoate, potassium sorbate, butylated hydroxyanisole (BHA), and butylated hydroxytoluene (BHT). These compounds help prevent rancidity and microbial growth; however, they may interfere with mitochondrial respiration and cause hepatocellular damage [16].

Nanomaterials found in ultra-processed foods may present health risks. Chronic exposure to engineered nanoparticles—commonly used in food additives, packaging, and colorants—can potentially result in cellular toxicity, inflammatory responses, and bioaccumulation in organs. This raises concerns about the long-term health impacts on both humans and animals. Due to their small size, these nanoparticles can cross intestinal and other biological barriers, which may worsen these negative effects if regulatory assessments are insufficient.[17] High consumption of processed meats preserved with nitrites increases endogenous nitration and promotes oxidative DNA damage, contributing to colorectal tumor development.[18] Additives are substances intentionally or indirectly incorporated into foods to preserve them, enhance taste, improve texture, or provide appealing appearance. They are broadly classified as direct and indirect additives [12].

**Indirect Additives**

Bisphenols – Used in coatings of cans, bottles, and packaging; linked to polycystic ovary syndrome, obesity, and increases cardiometabolic risk.
Phthalates – Found in plastics, adhesives, and lubricants; associated with insulin resistance, male reproductive disorders, metabolic disturbances, premature birth, and cardiac issues.
Perfluoroalkyl Chemicals (PFAS) – Present in coatings, textiles, paper, firefighting foams, cosmetics, and food packaging; linked to developmental neurotoxicity, immune dysfunction, hyperuricemia, and ADHD.
Perchlorate – Occurs naturally or as a by-product of disinfection; disrupts iodide uptake in the thyroid, affecting fetal and infant growth and cognitive development.

Pesticides – Residual pesticides in food or environment interfere with hormone synthesis and insulin-like growth factor signaling, increasing risks of neurodevelopmental delays, IQ reduction, behavioral disorders, altered growth, cancer, and respiratory issues [12].

**Direct Additives**

Nitrates and Nitrites – Found in processed meats, fish, cheese, milk formulas, biscuits, and contaminated water; induce oxidative stress, disrupt iodide transport, and are linked to colon cancer, brain tumors, thyroid dysfunction, methemoglobinemia, premature birth, and autism spectrum disorders.

Artificial Food Colorants (AFCs) – Used in foods and beverages for aesthetic appeal; can trigger hypersensitivity, behavioral problems, and attention disorders in children.

Monosodium Glutamate (MSG) – Common in soups, sauces, stews, snacks, and spices; excessive intake leads to neurotoxicity, hypertension, Alzheimer's disease, and "Chinese Restaurant Syndrome."

Aspartame – Widely used in sugar-free beverages, medications, and supplements; accumulation of phenylalanine may impair neurological development, increase mood disorders, and cause headaches, particularly in children [12].

**Emulsifiers And Metabolic Effects**

Emulsifiers are detergent-like molecules commonly added to processed foods and can increase bacterial translocation across the epithelial barrier. Two widely used emulsifiers carboxymethylcellulose (CMC) and polysorbate 80 (P80)—have been shown to induce lowgrade inflammation even at low concentrations, contributing to obesity and metabolic syndrome in wild-type hosts. For instance, 0.1% CMC can slightly increase body weight and fasting glucose, whereas 0.5% CMC induces clear low-grade inflammation and fat accumulation. Similarly, P80 at 0.1% induces low-grade inflammation, and at 0.5%, it can cause mild dysglycemia. These emulsifiers act as chronic stressors in the gut, promoting metabolic changes [19]. Research in mice indicates that emulsifiers can induce anxiety-like behaviour by altering gene expression in brain regions such as the amygdala and paraventricular nucleus of the hypothalamus. Common foods containing emulsifiers include ice cream, butter, beverages, chocolate, sauces, and mayonnaise. Neuroinflammation causes by emulsifier consumption may further modulate stress and behaviour [20].

**Epigenetic Impacts of Ultra-Processed Foods**

Early exposure to UPFs can influence DNA methylation and other epigenetic mechanisms, regulating gene expression associated with obesity and metabolic diseases. High-fat/sugar diets alter acetylation balance, promoting expression of proinflammatory genes in vascular tissues. Nutrient-derived regulation of histone acetylation is critical for controlling inflammation, and its disruption contributes to chronic low-grade inflammation, a hallmark of metabolic syndrome and cardiovascular disease [21][22]. In Brazilian adolescents, higher UPF intake is directly associated with elevated levels of inflammatory markers such as C-reactive protein (CRP), interleukin-6 (IL-6), and tumor necrosis factor-alpha (TNF-$\alpha$) [23].

UPF consumption is linked to changes in DNA methylation in children, measured using Illumina Infinium Methylation arrays. Associations are estimated using robust linear regression and meta-analysis of EWAS results [24]. Large-scale proteomic profiling identifies plasma protein levels indicative of UPF consumption. Individuals in the highest UPF quartile are more likely to be male, white, less educated, and former smokers. Protein biomarkers studied mostly focus on inflammation and adipokines. The Nova classification is widely used for UPF identification, enabling comparison across studies [25]. miRNAs from capillary blood indicate individual physiological characteristics, dietary habits, and lifestyle influences. miR-155 is associated with metabolic disease and upregulated with age. High consumption of vegetables, fruits, and whole grains increases miR-let-7a and miR328 (anti-inflammatory) and decreases pro-inflammatory miR-21. Smoking decreases miRNA142, which is downregulated in lung cancer [26]. ADHD is a common comorbidity in children; in the US., one in eight children with ADHD also has autism, requiring additional support [27]. Youth with both ADHD and autism are at higher risk of premature

mortality, especially in the presence of psychiatric comorbidities, and are at increased risk of cardiometabolic diseases, obesity, type 2 diabetes, and other chronic conditions [27]. Epigenetic inheritance refers to the transmission of gene behaviour across generations. The BDNF gene, critical for learning and memory, may be affected by maternal diet and intrauterine environment. DNA methylation patterns are influenced by diet, lifestyle, and toxicant exposures (e.g., mercury, lead, organophosphate pesticides). A high UPFs diet with low nutrient intake is linked to alterations in DNA methylation patterns affecting offspring health [27].

**Dysbiosis and Its Implications on Metabolic and Neurobehavioral Health**

Ultra-processed foods (UPFs) are characterized by high contents of synthetic additives and emulsifiers, combined with low dietary Fiber. Their consumption is strongly associated with

reduced microbial diversity, including lower levels of beneficial bacteria such as Akkermansia muciniphila and Faecalibacterium prausnitzii, along with an increase in pro-inflammatory microorganisms. Such microbial alterations can trigger persistent inflammation, contributing to chronic disorders like metabolic syndrome, irritable bowel syndrome (IBS), type 2 diabetes mellitus (T2DM), and colorectal cancer. In addition, UPFs disrupt the gut-brain axis, potentially affecting cognitive function and mental health, while interventions such as fiber- rich diets, fermented foods, and probiotics can help mitigate these negative effects. Public health measures including stricter UPF regulations and clear labelling are recommended [28]. The gut microbiota is critical in shaping host immunity, influencing both local and systemic immune responses. Mechanisms include Development and maturation of gut-associated lymphoid tissue (GALT). Stimulation of antimicrobial peptides. Promotion of differentiation of T helper cells (Th17) and regulatory T cells (Tregs). Modulation of innate lymphoid cells (ILCs) essential for mucosal immunity and tissue repair. UPF-induced dysbiosis can impair these processes, leading to reduced immune function and increases susceptibility to systemic inflammation. Additionally, interventions such as fecal microbiota transplantation (FMT) have been shown to restore some of these immune functions [29]. The gut-brain axis is a bidirectional communication system connecting the gastrointestinal tract and the central nervous system (CNS) through hormonal, neural, and immunological pathways. Certain microbial species regulate neurotransmitter production, including serotonin (5-HT) and gamma-aminobutyric acid (GABA), which are crucial for mood regulation, cognitive function, and overall mental health. Enterococcus species contribute to serotonin synthesis. Disruption of this axis by UPFs may contribute to cognitive dysfunction, depressive disorders, and neurodegenerative conditions. Disruption of the gut microbiota by UPFs can impair the gut- brain axis, potentially affecting cognitive function and mental health. Dysbiosis-related inflammation in IBD may exacerbate: Mood disorders such as depression. Cognitive dysfunction, with potential long-term neurodegenerative implications. Maintaining a balanced diet rich in fiber, fermented foods, and minimally processed ingredients is crucial for mitigating these risks and supporting both gut and brain health [30]. UPFs may disrupt this system, contributing to psychiatric conditions such as depression, Alzheimer's disease, and Parkinson's disease [31].

Alterations in microbial composition causes by UPFs can impair these functions, reducing production of beneficial metabolites such as short-chain fatty acids (SCFAs) and increasing gut permeability ("leaky gut"). This allows harmful bacterial products like lipopolysaccharides (LPS) to enter systemic circulation, inducing chronic low-grade inflammation linked to noncommunicable diseases (NCDs) [28]. Chronic high UPF consumption is associated with a pro-inflammatory and pro-oxidant metabolic profile. The relationship between diet, gut microbiota, and inflammatory bowel disease (IBD) has garnered increasing attention in recent decades. Among dietary factors, ultra-processed foods (UPFs) have emerged as major contributors to gut dysbiosis and the exacerbation of inflammatory conditions such as Crohn's disease (CD) and ulcerative colitis (UC) [30]. Chronic consumption of UPFs is associated with gut dysbiosis that exacerbates Crohn's disease (CD) and ulcerative colitis (UC). Mechanisms include increases prevalence of proinflammatory and pro-carcinogenic bacteria. Reduced activity of antioxidant enzymes (catalase, superoxide dismutase) and increases reactive oxygen species (ROS). Elevated proinflammatory cytokines such as TNF-$\alpha$, IL-6, and IL-15. Reduced butyrate production, compromising intestinal barrier integrity. Activation of inflammatory signaling pathways, including NF-κB, perpetuating gastrointestinal inflammation. Beneficial

commensals like Faecalibacterium prausnitzii and SCFAs are crucial for intestinal homeostasis, immune modulation, and infection prevention. UPF-induced dysbiosis disrupts this balance, increasing susceptibility to chronic inflammation and infections [32]. Gut microbiota-derived metabolites act as central regulators in metabolic homeostasis and disorders. Alterations in microbial composition or metabolite production can contribute to obesity, insulin resistance, type 2 diabetes, and cardiovascular disease [33]. Short-Chain Fatty Acids (SCFAs) primarily acetate, propionate, and butyrate, are produced by bacterial fermentation of dietary fibers. They regulate energy metabolism, glucose homeostasis, and lipid metabolism. SCFAs activate G-protein-coupled receptors (GPR41 and GPR43) to improve insulin sensitivity and increase energy expenditure. They also promote GLP-1 and PYY secretion, enhancing satiety and reducing the risk of obesity [33]. Trimethylamine (TMA)/ Trimethylamine N-oxide (TMAO): Gut bacteria metabolize dietary choline, carnitine, and phosphatidylcholine into TMA, which is oxidized in the liver to TMAO. Elevated TMAO levels are associated with atherosclerosis, insulin resistance, and cardiovascular disease [33]. Bile Acids (BAs): Microbiota transform primary bile acids into secondary bile acids, which act as signaling molecules by activating FXR and TGR5 receptors. These processes influence glucose metabolism, lipid metabolism, and overall energy homeostasis [33]. Branched-Chain Amino Acids (BCAAs): Microbial metabolism can increase circulating BCAAs, which are linked to insulin resistance and obesity [33]. Indole and Indole-Derivatives: Produced from microbial tryptophan metabolism, these metabolites regulate intestinal barrier function, inflammation, and GLP-1 secretion. They provide protection against metabolic endotoxemia and insulin resistance [33]. Other Microbial

Metabolites: Phenylacetylglutamine: Linked to increases cardiovascular risk. Imidazole propionate: Impairs insulin signaling in host tissues [33]. Gut microbiota-derived metabolites act as mediators of gut-liver and gut-brain crosstalk. Dysbiosis alters metabolite profiles, contributing to metabolic syndrome, obesity, type 2 diabetes, and cardiovascular disease [34]. Imidazole propionate and phenylacetylglutamine interfere with glucose tolerance and insulin signaling, promoting T2D.

**Neuronal behaviour**

Dysbiosis enhances production of trimethylamine (TMA), converted to trimethylamine N oxide (TMAO), which is linked to cardiometabolic risk. UPF-induced changes in the microbiota can disrupt the gut-brain axis, influence cognition and mental health, and increasing susceptibility to Alzheimer's disease (AD), Parkinson's disease (PD), and depression [30]. Oxidative Stress and Cytokine Imbalance Excessive UPF consumption is linked to oxidative stress, as evidenced by Reduced activity of antioxidant enzymes such as catalase and superoxide dismutase (SOD) increases levels of xanthine oxidase, reactive oxygen species (ROS), and myeloperoxidase (MPO). Elevated pro-inflammatory cytokines, including TNF-$\alpha$, IL-6, and IL-15This combination of oxidative stress and chronic inflammation contributes to intestinal ischemia risk and exacerbates IBD progression both gut and brain health [30]. Ultra-processed foods that are high in sugar and fat can hijack the brain's reward system by overstimulating the release of dopamine in the mesolimbic pathway, similar to the effects of addictive drugs. This excessive stimulation reduces the sensitivity of dopamine receptors, resulting in compulsive eating behaviors and an increases risk of obesity and metabolic disorders [36]. Ultra-processed foods that are high in sugar and fat can trigger compulsive overeating by altering dopamine signaling in the brain, specifically in the nucleus accumbens. This alteration reinforces reward-seeking behaviour and may contribute to the phenomenon of "food addiction" [37]. Consuming ultra-processed foods over a long period can lead to a decrease in hippocampal volume in rodent models, which is associated with impairments in spatial learning and memory retention [38]. Diets high in processed foods reduce hippocampal BDNF levels, which are essential for neuronal survival and memory formation. decreases BDNF levels contribute to impaired spatial memory and cognitive deficits [39]. A diet high in saturated fat increases oxidative stress and reduces levels of BDNF in the hippocampus, resulting in impaired synaptic plasticity and cognitive deficits [40].

High-fat and ultra-processed diets cause microglial priming in the hippocampus, resulting in heightened neuroinflammatory responses to subsequent immune challenges, contributing to cognitive deficits and impaired synaptic plasticity [41]. High-fat and ultra-processed diets disrupt the rhythmic expression of clock genes in the liver and adipose tissue, resulting in misalignment between central and peripheral circadian clocks [42]. A high intake of ultra- processed foods (UPFs) leads to irregular feeding times, dampening the amplitude of circadian oscillations in metabolic genes, promoting obesity and glucose intolerance [42].Dietary patterns high in ultra-processed foods are linked to delayed sleep onset, reduced sleep duration, and disrupted melatonin rhythms in both animal models and humans [44] .Circadian misalignment causes by high-fat and ultra-processed food consumption impairs insulin sensitivity, alters lipid metabolism, and increases systemic inflammation, contributing to metabolic syndrome [45].

**Impacts of UPFS from Early Life to Childhood**

Maternal malnutrition or poor-quality diet during pregnancy can alter fetal development and program long-term disease risk through epigenetic changes, affecting DNA methylation, histone modifications, hypothalamic pathways, and energy balance. Maternal UPF intake is linked to increases risk of infant atopic dermatitis and altered immune development, highlighting the importance of promoting whole foods and limiting UPFs during pregnancy [31][46]. Parental dietary habits strongly influence offspring food preferences and metabolism. Habitual UPF consumption in parents is associated with early metabolic dysregulation in children due to modelling, reinforcement, and epigenetic inheritance [47]. Consumption of highly ultra-processed foods is associated with accelerated biological aging. Biological age measured using methods such as Klemera-Doubal method biological age (KDM-BA), Pheno Age, and Homeostatic Dysregulation (HD), increases proportionally with UPF intake. A 10% increase in UPF consumption is linked to measurable acceleration in biological age, with younger adults showing more pronounced effects. Biological aging reflects the accumulation of molecular and cellular damage, leading to functional decline and increases disease vulnerability [48]. Excessive consumption of ultra-processed foods (UPFs) is characterized by high intake of saturated fats and added sugars and a decreases intake of essential micronutrients such as zinc (Zn), calcium (Ca), magnesium, and vitamins A, C, D, E, B12, and niacin [49]. Growing evidence links UPF consumption to obesity, type 2 diabetes, cardiovascular disease, and negative impacts on child neurodevelopment [49]. Research by Puig-Vallverdú et al. found a negative association between maternal prenatal UPF consumption and verbal functioning in offspring during early childhood [49].

Ward reports health problems in hyperactive children associated with the consumption of yellow food colours, including eczema, asthma, respiratory and ear infections, poor speech, and diminished coordination. Behavioral studies shows that hyperactive children exhibited significant decreases in serum Zn levels, along with increases overactivity and aggression after consuming yellow food colours [49]. Milne and Neilsen reports that high fructose corn syrup (HFCS) consumption causes significant losses of calcium in men, suggesting that diets high in fructose could lead to bone loss and osteoporosis over time. Reducing UPF intake can help mitigate these nutritional deficits and improve health outcomes. Nutritional deficits during pregnancy increase the risk of adverse birth outcomes and neuropsychiatric disorders, including autism spectrum disorders (ASD) and attention deficit/hyperactivity disorder (ADHD) [50]. Excessive UPF consumption can lead to dietary exposure to heavy metals. College students who reduced UPF intake and consumed more whole/organic foods has lower inorganic mercury levels than controls [50]. Prenatal exposure to lead (Pb) is associated with reduced levels of Bifidobacterium in the gut microbiota of children aged 9–11 years. Diet plays a moderating role in the gut microbiome and the pathophysiology of neuro developmental disorders such as ASD [50]. UPF consumption is linked to increases body fat from childhood to early adulthood. Studies in large British cohorts show associations between UPF intake and adiposity trajectories [51]. UPF and Non-Communicable Diseases High UPF intake is associated with multiple adverse health effects, especially non-communicable chronic diseases. The high energy density, unhealthy ingredients, and low dietary fiber increase risk for diet-related diseases [52]. Accelerated lifestyle, fast food consumption, unhealthy eating habits, and sedentary behaviour are major risk factors for overweight and obesity [53]. Epigenetic modifications can be influenced by the intrauterine environment and environmental factors such as diet. Animal studies show that

early-life epigenetic alterations can lead to adult obesity. Non-communicable diseases impose a substantial economic burden (estimated $7 trillion from 2011–2025 in low- and middle-income countries). Oxidative stress in early life contributes to NCDs, including cancer.

## ACKNOWLEDGEMENT

We thankful our principal and management of Seven Hills College of Pharmacy (Autonomous) for their constant support to write up an article for publication.

**ABSTRACT**

One area of Discrete Mathematics that is used in every other stream is Graph Theory. This is because of its dual nature, which encompasses the widest range of applicability to any contemporary discipline and the most inventive proofs in all of abstract reasoning. Graphs are aesthetically pleasing and intuitive, in part because of the diagrammatic depiction. This work deals with the mathematical tools that help a biologist.

**Keywords:** Phylogenetic tree, Splits, Split Network.

## INTRODUCTION

**This is a combined work of Graph Theory and Phylogenetic Analysis.**
Graph theory began with the Konigsberg Bridge issue in 1735. In 1866, Ernst Haeckel created the term "phylogeny" from the German word "phylogenie." Phylogenetics is the study of relationships between or within groups of organisms. Sometimes it was difficult for mathematicians to read biological tables. It is simpler to view the specified organisms with or without specific traits using a graphical framework known as a "phylogram" or "cladogram." They have a rooted phylogenetic tree structure. The Rooted Phylogenetic trees can be converted back into Biological Tables. A connected acyclic graphical arrangement is called a tree. Making evolutionary trees is a crucial stage in many biological research investigations. Evolutionary trees of different species, for example, show us how the species descended from a common ancestor and may also provide information about the morphology of those ancestors, the rate at which different lineages developed, the ways in which those lineages and their ancestors adapted to different environmental conditions, etc. The Split Network concept was developed by H. J. Bandelt and Dress A. W. M. A key idea in phylogenetic analysis is splits. Split categorizes taxa based on what makes them unique. Both trivial and non-

trivial splits in taxa are represented by Split Networks, outer labeled planar split networks, etc., which are exclusively graphical networks.

## PRELIMINARIES

**Definition 1**A linear graph (or Graph) $G = (V, E)$ consist of a set of objects $V = \{v_1, v_2, v_3, \dots\}$called vertices, and another set $E = \{e_1, e_2, e_3, \dots\}$, whose elements are called edges, such that each edge$e_k$ is identified with an unordered pair $(v_i, v_j)$ of vertices. The vertices $v_i, v_j$ associated with edge $e_k$ are called the end vertices of$e_k$.

**Definition 2** A walk in a graph $G$ is an alternating sequence of vertices and edges beginning and ending with vertices in which each edge is incident with the two vertices immediately preceding and following it.

**Definition 3** Open walk in which no vertex appear more than once is called a path.

**Definition 4** A graph $G$ is connected if there is at least one path between every pair of vertices in $G$ and disconnected otherwise.

**Definition 5** A walk $v_0 e_1 v_1 \dots e_k v_k$ is said to be a cycle if $v_0 = v_k$ and the vertices $v_1, v_2, \dots, v_{k-1}$ are distinct from each other.

**Definition 6** A tree is a connected acyclic graph.

**Definition 7** A leaf in a rooted tree is any vertex having no children.

**Definition 8** A tree in which one vertex (called the root) is distinguished from all the others is called a rooted tree.

**Definition 9**$X = \{x_1, x_2 \dots, x_n\}$ denote a set of taxa, in which each taxon$x_i$represents some species, group or individual organism whose evolutionary history is what we are dealing with. For example$X = \{x_1, x_2 \dots, x_n\}$, might denote a set of mammals, with $x_1$ representing gorillas, $x_2$ representing seals, etc.

**Definition 10**A phylogeny describes the evolutionary history of a set of taxa.

**Definition 11**Two species are called related, if they share a recent common ancestor.

**Definition 12**A species $a$ is more closely related to a species $b$ than to a species $c$, if the last common ancestor of $a$ and $b$ is more recent that the last common ancestor of $a$ and $c$.

**Definition 13** A phylogenetic tree on $X$ is obtained by labelling the leaves of a tree $T$ by the taxon set $X$.

**Definition 14** Given a set of taxa $X$, a rooted phylogenetic tree consists of a rooted tree $T = (V, E, \rho)$ and a taxon labelling $\lambda: X \to V$ that assigns exactly one taxon to every leaf and none to any internal node. All nodes, except $\rho$, must have degree $\neq 2$.

**Definition 15** A split $S = A|B$ is a bipartition of a set of taxa $X$ into two non-empty subsets $A$, $B$ with $A \cap B = \phi$ and $A \cup B = X \cdot A$ and $B$ are called the two split parts of $S$.

**Definition 16** A split graph consists of a finite, simple, connected, bipartite graph $G = (V, E)$, together with an edge coloring $\sigma : E \to K$ that is surjective and isometric.

**Definition 17** Let $S$ be a set of splits on $X$. A split network $N = (V, E, \sigma, \lambda)$ that represents $S$ is given by a split graph $(G = (V, E), \sigma : E \to S)$ and a node labelling $\lambda : X \to V$, with the property that for every split $S = A|B$ in $S$, $A = \bigcup_{v \in V_S^0} \lambda^{-1}(v)$ and $B = \bigcup_{v \in V_S^1} \lambda^{-1}(v)$, in other words, deletion of all edges of color $S$ produces a graph consisting of precisely two connected components, one containing all nodes labeled with elements of $A$ and the other containing all nodes labeled with elements of $B$.

**Definition 18** A set of splits $S$ on $X$ is called circular, if there exist a linear ordering $(x_1, \ldots, x_n)$ of the elements of $X$ for $S$ such that each split $S \in S$ has the form $S = \{x_p, x_{p+1}, \cdots, x_q\} | \{X - \{x_p, x_{p+1}, \cdots, x_q\}$ for appropriately chosen $1 < p \leq q \leq n$.

**Definition 19** Let G be a graph in which some of the nodes are labeled. G is outer labeled planar, if there exists a drawing of G in the plane such that no two edges intersect and all labeled nodes lie on the outside of the graph.

**Theorem 20** Circular implies outer labeled planar.

**Theorem 21**[Deletion of split produces two components] Let $(G = (V, E), \sigma : E \to K)$ be a split graph. For any color $c \in K$, the graph $G_c$obtained by deleting all edges of color $c$ consists of precisely two connected components.

**Definition 22** A phylogenetic network is any graph used to represent evolutionary relationships between a set of taxa that labels some of its nodes.

***Cladogram***

The Greek words clados, which means "branch," and gramma, which means "character," are the source of the word "cladogram." Cladograms depict the relationships between organisms and were mostly created using morphological characteristics. Lines (edges) that branch off in various directions and end at a collection of creatures with a last common ancestor are used in cladograms. Characters are represented by the lines, or edges. In a Cladogram, the length of the lines (edge length) has no meaning.

The table 1 above shows the characteristic properties possessed by five different organisms. Mathematically we can convert this table to a Cladogram which is a rooted phylogenetic tree which is shown below.

Figure 1

From the above Cladogram we can get back the above table. The detailed algorithm for both these can be seen in [24].

***Construction of Phylogenetic tree from Distance Matrix***

We are unable to identify any relationships between the organisms under investigation based on the distance matrix from the biological background. However, the unique aspect of the method described below is that we may mathematically identify the closely related taxa before creating the phylogenetic tree.

Consider we are given a distance matrix D of order $n \times n$, which shows the distance between the pair of taxa, $n \geq 4$. The taxa set is $\{x_1, x_2, x_3 \ldots, x_n\}$. The entries ofDare non-negative.

$D = (x_{ij}), \quad i, j = 1, 2, 3 \ldots n.$

Here $x_{ij}$ denote the distance between $x_i$ *and* $x_j$ . Also $x_{ij} = x_{ji}$

Given a distance matrix D showing the inter-distance between five taxa $\{a, b, c, d, e\}$.

$$D = \begin{pmatrix} 0 & 11 & 10 & 9 & 15 \\ 11 & 0 & 3 & 12 & 18 \\ 10 & 3 & 0 & 11 & 17 \\ 9 & 12 & 11 & 0 & 8 \\ 15 & 18 & 17 & 8 & 0 \end{pmatrix}$$

Seeing this distance matrix we cannot say anything about the relationship between the taxa under consideration. The given below is the weighted tree we obtained mathematically from the Distance matrix. The tree obtained gives clear idea about the ancestral history of the organisms under consideration. For example, the closely related organisms can be easily identify from the given below graphical structure. The detailed mathematical procedures can be seen in [25]. (Figure 2).

**Outer Labeled Planar Split Network**

Suppose we are considering 6 different characteristic features possessed by a collection of 8 organisms.

Consider the set of splits

$\boldsymbol{S} = \{S1, S2, S3, S4, S5, S6\}$where

$S1$ = {a, b, d, e, h}|{c, f, g}

$S2$ = {a, c, d, e, g, h}|{b, f}

$S3$ = {a, c, e, g}|{b, d, f, h}

$S4$ = {a, c, g}|{b, d, e, f, h}

$S5$ = {a, c, e, f, g}|{ b, d, h}

$S6$ = {a, e, h}|{ b, c, d, f, g}

In addition to the above splits, if we are given the trivial splits also, then that can also be included in the figure. Biologically we are considering the unique characteristic features possessed by the same collection of 8 organisms.$S7$,$S8$,…,$S14$ are mathematically the unique characteristic features possessed by the same collection of 8 organisms a, b, …, h respectively. That is

$S7$ = {a}|{b, c, d, e, f, g, h}

$S8$ = {b}|{a, c, d, e, f, g, h}

$S9$ = {c}|{a, b, d, e, f, g, h}

$S10$ = {d}|{a, b, c, e, f, g, h}

$S11$ = {e}|{a, b, c, d, f, g, h}

$S12$ = {f}|{a, b, c, d, e, g, h}

$S13$ = {g}|{a, b, c, d, e, f, h}

$S14$ = {h}|{a, b, c, d, e, f, g}

(Figure 3)

This is an outer labeled planar split network that shows 6 different characteristic features possessed by a collection of 8 organisms and also the unique characteristic features possessed by the same collection of 8 organisms. The construction of this network is mathematical and can be seen in [26]. A biologist can use this diagram for field studies.

For example, consider the split$S5$ = {a, c, e, f, g}|{ b, d, h}

(Figure 4)

This is the diagram we obtained after removing the edges labelled $S5$. Now the graph has two connected components one contains organisms from one split part and the other contains organisms from the other split part. The biologists need only the splits and the network. They can easily classify the organisms based on a particular characteristic feature by removing the edges showing that particular characteristic feature.

## CONCLUSION

Cladogram aids mathematicians with biological tables and biologists with phylogenetic trees. Ancestral relationships between the organisms under discussion are never provided by a distance matrix. For biologists, identifying closely related species from a given distance matrix by building a weighted tree is particularly helpful. Using the Split concept, taxa are separated based on their distinguishing characteristics. Because so many distinctive characteristics of a group of organisms may be represented in a single network, the phylogenetic network built in this part will be helpful for field research. By removing edges from the graph, it is also possible to identify the bipartition of a set of organisms under study with regard to a specific distinguishing characteristic.

## ABSTRACT

Plasticizers are widely used additives that enhance the flexibility, durability, and performance of plastic materials. They are commonly incorporated into packaging, construction materials, automotive parts, medical devices, and household products. Concerns over environmental pollution and human health risks have led to increased interest in replacing phthalate-based plasticizers with safer bio-based alternatives. Despite their advantages, plasticizers are not chemically bonded to polymers and can migrate into the surrounding environment. Such leaching results in contamination of soil and aquatic ecosystems. Plasticization occurs when plasticizers reduce intermolecular forces between polymer chains. This reduction increases polymer mobility and improves material flexibility. However, the environmental persistence of plasticizers raises serious ecological concerns. Biological remediation strategies are increasingly explored to address this issue. Microalgae have emerged as effective organisms for the removal of plasticizer contaminants. Several green algal species are capable of degrading both phthalate and non-phthalate plasticizers. Cyanobacteria, as photosynthetic prokaryotes, also contribute significantly to degradation processes. The present study investigates the tolerance of *Chroococcus* sp. to plasticizer exposure. Growth rate, cell density, biomolecule production, and stress biomarkers were evaluated under controlled laboratory conditions. The findings highlight the potential of microalgae as sustainable and eco-friendly tools for mitigating plasticizer pollution.

**Keywords:** *Chroococcus* sp, Phthalate, Non-Phthalate, Biomolecules, Stress markers

## INTRODUCTION

Plastic is a synthetic organic polymer found throughout the world. The widespread use of plastic is largely due to its affordability, durability, and higher strength when compared with traditional materials such as wood, metal, and glass [1],[2],[3]. Current estimates show that global plastic production is close to 450 million metric tons each year [4]. Yet, inadequate waste management means that a significant share of these plastics is disposed of incorrectly and eventually escapes into the natural environment. In 2022, the world generated nearly 380 million tons of plastic waste [5], and around 8 million tons of this material ultimately entered the oceans as marine pollutants. As a result, the number of plastic debris in the ocean keeps growing [6]. Chea *et al*. (2023)[7] reported that most plastic products are designed to remain stable for long periods and may persist in the environment for several decades. Over time, however, they can break down into smaller fragments such as microplastics or even nanoplastics. This breakdown is driven by several factors, including exposure to ultraviolet radiation, temperature-induced degradation, mechanical abrasion, and various human activities [8]. Environmental risks are also posed by a range of chemical additives, such as plasticizers, flame retardants, UV stabilizers, and antioxidants, which are added to plastics to change their characteristics [9]. As the material weathers and breaks down, additives are released into seawater due to their poor chemical binding [10]. Phthalic acid esters (PAEs), which make up around 70% of the global plasticizer market, are among the many varieties of plasticizers that are used extensively [11]. Due to their acute toxicity to aquatic organisms and their potential carcinogenic effects in humans, the U.S. Environmental Protection Agency (USEPA) has classified phthalate esters (PAEs) as priority pollutants [12]. Within marine ecosystems, both microplastics and the chemical additives they contain pose significant risks to microalgae, plants, and a wide range of aquatic animals. A variety of algae and cyanobacteria are now recognized for their ability to deteriorate synthetic polymers. These organisms secrete ligninolytic and exopolysaccharide enzymes, which assist in weakening and transforming plastic materials that they attach to [13]. One study demonstrated that the freshwater alga *Uronemaafricanum*, collected from discarded plastic bags, produced clear signs of LDPE deterioration—such as surface corrosion, abrasion marks, and groove formation—within 30 days[14]. Cyanobacteria also contribute significantly to biofilm-mediated plastic degradation. Species such as *Oscillatoria subbrevis* and *Phormidium lucidum*, obtained from household wastewater, were able to utilize LDPE as a carbon source while forming dense colonies on the polymer surface. Notably, their degradation activity occurred without any chemical pre-treatment or the use of pro-oxidant additives [15]. Further evidence from FTIR-ATR, SEM-EDX, and tensile-strength analyses shows that freshwater strains of *Arthrospira* can slowly degrade PET and PP, achieving measurable breakdown after approximately 112 days of exposure [16]. Limited information exists on the ability of *Chroococcus* species to tolerate and degrade emerging plasticizers such as DOTP and DINP. Accordingly, the present investigation was designed to examine the tolerance response and biodegradation potential of this cyanobacterium toward DOTP and DINP under laboratory conditions.

**Novelty Statement**

Although *Chroococcus* has been studied for the degradation of certain plasticizers such as BPA, DiBP, and phenol, its ability to degrade DOTP and DINP has not been reported. This study is the first to evaluate the tolerance and biodegradation potential of Chroococcus toward these emerging phthalate and non-phthalate plasticizers, thereby expanding the understanding of cyanobacterial applications in phytoremediation of plasticizer pollution.

## MATERIALS AND METHODS

**Isolation of microalgae**

Microalgae were cultured on BG-11 agar medium by applying the spread plate method. The plates were then placed in an incubation chamber maintained at 25 ± 2 °C with cool-white fluorescent lighting programmed for 16 hours of light followed by 8 hours of darkness. After 5 to 7 days, the grown cultures were seen under a microscope, and the pure colonies. The picked colonies were again kept on agar plates. Repeat this procedure till a pure culture is obtained. The pure cultures were grown massively using BG 11 broth medium. Although BG11 medium supported rapid growth, the cultures showed noticeable settling during incubation. In contrast, cultures grown in Chu 10

medium remained well suspended and uniformly mixed. Therefore, Chu 10 medium was selected for all experimental analyses to ensure homogeneity and reproducibility of the results.

**Media preparation**

Chu's medium No. 10 (calcium nitrate (0.232g $L^{-1}$), $K_2HPO_4$ (0.01g $L^{-1}$), $MgSO_4{\cdot}7H_2O$ (0.025g $L^{-1}$), $Na_2\ CO_3$ (0.02g $L^{-1}$), $Na_2SiO_3$ (0.044g $L^{-1}$), $C_6H_8O_7{\cdot}FeNH_4{\cdot}xH_2O$(3.5 $mgL^{-1}$), $C_6H_8O_7$ (3.5 $mgL^{-1}$), trace metal- 1 mL ($H_3BO_3$ 2.4g $L^{-1}$), $MnCl_2{\cdot}4H_2O$ (1.4g $L^{-1}$), $ZnCl_2$ (0.4g $L^{-1}$), $CaCl_2{\cdot}2H_2O$ (0.02g $L^{-1}$), $CuCl_2{\cdot}2H_2O$ (0.1g $L^{-1}$), distilled water 1000 mL, pH 7.1) was used. The medium, once prepared, was sterilized and kept at 25 °C to preserve its suitability for future microalgal cultivation.

**Culture condition**

Microalgae were collected from the Uppathuodai estuary, Thoothukudi. Pure colonies obtained from the initial isolation were first inoculated into 10 mL of sterile BG-11 medium and incubated at 25 ± 2 °C under a 16:8 h light–dark cycle provided by cool-white fluorescent lamps. After three days, the cultures reached sufficient growth and were transferred into 50 mL of fresh BG-11 medium for further incubation. Subsequently, after five days, the cultures were scaled up to 100 mL of fresh medium and incubated until dense algal growth was achieved. This culture was maintained as the mother culture and sub-cultured at regular intervals to ensure a continuous supply of healthy microalgal cells.

**Experimental setup**

Each 250 mL Erlenmeyer flask contained 100 mL of BG-11 medium and was inoculated with 10% of an actively growing *Chroococcus* sp. culture. All treatments were set up in triplicate to ensure reproducibility.

**Chemical treatment**

When the culture attained an optical density of 0.2 in the absorbance wavelength 750 nm, then it was treated with different concentrations of DINP and DOTP (5, 10, 40, 80, and 100 mg $L^{-1}$). A solvent flask and a control were also kept. Flasks were manually swirled three times daily to ensure uniform suspension of cells and prevent their adhesion to the container surfaces. A 15-day incubation period was given to the culture. All experiments were likewise performed in duplicate. The microalgal cells were observed under a light microscope to assess any morphological alterations.

**Biomass and biochemical composition analysis**

**4.1Growth analysis**

At specified intervals (0, 3, 6, 9, 12, and 15 days), microalgal growth was assessed by measuring optical density at 750 nm using the EI Deep Vision–2371 UV–Vis spectrophotometer, according to Arutselvan *et al*. (2021)[17].

**Determinationof cell density**

With a light microscope and a hemacytometer, the density of microalgal cells was calculated. Initially, a micropipette was used to load the microalgal culture into the chamber, and a microscope was used to count the cells present in a 1 µm square. The cell density of the cultures was determined according to the formula below:

$$Cell\ density = \frac{Mean\ of\ cells\ per\ square \times dilution\ factor\ (if\ any)}{Volume\ of\ the\ square}$$

To evaluate the inhibitory effect on the algae, the following equation was applied(Kong *et al*., 2010; Debenest *et al*., 2009):

$$I = 100 \times \frac{C_0 - C_t}{C_0}$$

Where I stand for the inhibitory rate (in percentage), and $C_t$ and $C_0$ stand for the mean cell density in the treated and untreated groups, respectively. The formula below was utilised to calculate the specific growth rate of the algae (Kong *et al*. 2010):

$\mu = \frac{Ln\ C_{t2}/Ln\ C_{t1}}{t_2 - t_1}$

Where $C_{t2}$ and $C_{t1}$ indicate the cell density at times $t_2$ and $t_1$, respectively, whereas μ stands for the specific growth rate.

**Estimation of Biomolecules**

**Determination of Carbohydrate**

The method described by Plummer (1978) [18] was used to estimate the carbohydrate content.

**Determination of Protein**

Protein estimation was carried out according to the method of Lowry *et al*. (1951)[19].

**Determination of Stress Biomarker**

**Malonyldialdehyde (MDA)**

The MDA concentration in the samples was measured following Heath and Packer's (1968) [20]procedure, and values were calculated using the corresponding formula.

$$\text{MDA } (\mu \text{ mol g}^{-1}) = \frac{6.45 \times (A_{532} - A_{600}) - (0.56 \times A_{450})}{\text{Cell weight (g)}}$$

**Hydrogen peroxide ($H_2O_2$)**

$H_2O_2$ content, an indicator of oxidative stress, was estimated using the method developed by Velikova *et al*. (2000)[21].

**Proline**

The proline concentration in the samples was determined according to the procedure outlined by Bates *et al*. (1973)[22].

## RESULT AND DISCUSSION

**Growth analysis**

The experimental treatments included DINP and DOTP at varying concentrations of 5, 10, 40, 80, and 100 mg $L^{-1}$. The results of DINP and DOTP-treated and untreated flasks were studied at proper intervals. The microalgal species *Chroococcus* sp. exhibited strong tolerance when exposed to 40 mg $L^{-1}$ and 100 mg $L^{-1}$ concentrations, respectively. *Chroococcus* sp. indicated higher growth.in 100 mg $L^{-1}$ (1.426 OD) treated flasks, followed by 40 mg $L^{-1}$ (1.366 OD) DINP. In the DOTP-treated flask, growth was higher at 80 mg L-1 (1.368 OD), followed by 100 mg L-1(1.325 OD). These results revealed the DINP ecotoxicity on microalgal growth.Hence, this study exhibited that the selected estuarine cyanobacteria have the potential to overcome plasticizer pollution Fig. 1a and b. Spectrometric analysis by Arutselvan *et al*. (2021) [16] indicated that on the nineteenth day, cell enlargement occurred in *Coelastrella* sp., *Chlorococcum* sp. *Scenedesmus dimorphus* and *Chlorella vulgaris*. Notably, *Coelastrella* sp. achieved the maximum optical density of 1.3 OD, compared to 1.12 OD in Chlorella vulgaris and Scenedesmus dimorphus. *Chlorococcum* sp. had the lowest optical density (0.92 OD) among the strains. A recent study found that *C. vulgaris* exhibits the most growth on the twelfth day; this growth is dependent on the cultivation medium and growth conditions[23]. Algal cultures were cultivated in various media to compare their growth performance in a study that used two-litter batch reactors. With an optical density of 1.937 on the fifteenth day, the BBM medium had the fastest growth rate among the tested media, followed by M4N (1.765), BG11 (1.742), N8 (1.711), and M8 (1.719), which had the lowest optical density [24].The beneficial effects of phthalates were examined in these studies using cyanobacteria, including *Chroococcus* sp.

**Cell density**

Calculating cell density helped understand the growth of microalgae in a more specific manner. Under a light microscope, a haemocytometer was used to quantify cell density. In *Chroococcus* sp., both chemicals are degraded by

the 15th day at amounts of 40 $L^{-1}$ and 100 $L^{-1}$. At this time, the algal cells exhibit greater adsorption and display a good biodegradation rate in DINP, as well as DOTP (Fig. 2a and b). High concentrations of DBP (50 and 100 mg $L^{-1}$) negatively affected the cell density of *Chlorella vulgaris*, while lower concentrations (5, 10, and 20 mg $L^{-1}$) significantly promoted its growth. After two days of exposure to 50 mg $L^{-1}$ DBP, *C. vulgaris* exhibited the highest removal efficiency of 31.69%. As reported by Duan *et al*. (2018) [25], *C. vulgaris* demonstrates potential as an oleaginous microalga capable of thriving in DBP-contaminated water and could be practically employed for DBP removal. Recent studies have reported the final cell densities of six microalgal species, with *Chlorella vulgaris* attaining the highest density of 8.70 × $10^6$ cells $mL^{-1}$. This was followed by *Chroococcus* sp. (3.56 × $10^6$ cells $mL^{-1}$), *Scenedesmus obliquus* (3.45 × $10^6$ cells $mL^{-1}$), *Nostoc* sp. (2.17 × $10^6$ cells $mL^{-1}$), *Cyclotella* sp. (1.68 × $10^6$ cells $mL^{-1}$), and *Nitzschia* sp. (1.55 × $10^6$ cells $mL^{-1}$) [26]. Additionally, Manzi *et al*. (2022) [27] evaluated the growth of *Chlorella* sp. GEEL-08 and *Tetradesmus dimorphus* GEEL-04 under DBP concentrations ranging from 0 to 100 mg $L^{-1}$. At 10 mg $L^{-1}$ DBP, Chlorella sp. GEEL-08 exhibited higher growth (0.88 $OD_{680}$ nm) compared to *T. dimorphus* GEEL-04 (0.80 $OD_{680}$ nm). Chi *et al*., (2019)[28]. used three marine microalgae (*Dunaliella salina*, *Cylindrotheca closterium*, and *Chaetoceros muelleri*) to remove DEP and DBP, achieving DBP removal efficiencies of 40.0%, 93.1%, and 47.1%, and DEP removal of 32.3%, 81.2%, and 26.3%, respectively. Additionally, *Chlorella vulgaris* removed DBP at various concentrations (5–100 mg/L), with the highest efficiency (31.69%) at 50 mg/L after 2 days; higher DBP concentrations negatively affected both cell density and lipid profile. This supports the observed 88% DBP removal by C. vulgaris in 48 hours at lower concentrations, highlighting the dose-dependent toxicity of phthalates. Furthermore, according to Lakshmikandan *et al*. (2025) [29], *Coelastrella terrestris* MLUN1 was capable of efficiently degrading DBP when exposed to 500 mg $L^{-1}$ of the compound at 25 °C with an inoculum density of 1.5–2 mg $L^{-1}$.

**Macromolecules concentration of individual microalgae with DINP and DOTP Treatment**

**Carbohydrates**

Major macromolecules like carbohydrates and proteins can all be synthesised by different processes using photosynthetically fixed carbon. Carbohydrates are one of the most important biomolecules and a versatile energy source for microalgae. In *Chroococcus* sp, high and low carbohydrate content was exhibited by 100 mg $L^{-1}$DINP-treated (248.42 μg $mL^{-1}$) and control flasks (120.75 μg $mL^{-1}$) on the 15$^{th}$day. Flasks treated with DOTP exhibited varying carbohydrate content, with the highest (159.58 μg mg $L^{-1}$) observed in the 100 mg $L^{-1}$ treatment and the lowest (133.2 μg $mL^{-1}$) in the 40 mg $L^{-1}$ treatment. In Chroococcus sp., carbohydrate synthesis may contribute to the reduction of pollutant concentrations, as seen in the DINP-treated flasks (Fig. 3a and b). Additionally, carbohydrate accumulation increased with rising NaCl concentrations in the growth medium, reaching a maximum of 35.91% at 400 mM salinity [30]. On the eighth day, cells exposed to NaOH-mPET at 100 mg $L^{-1}$ exhibited the highest polysaccharide content, measuring 1.91 mg $L^{-1}$, which corresponds to a 10.4% increase compared to the control. Conversely, exposure to UV-mPET at 200 mg $L^{-1}$ and HT-mPET at 100 mg $L^{-1}$ led to a significant reduction in polysaccharide levels in *Chlorella* sp. UTEX1602 [31].

**Proteins**

In *Chroococcus* sp., the highest protein content in DINP-treated flasks was observed at 80 mg $L^{-1}$ (134.76 μg $mL^{-1}$), whereas the control flasks exhibited the lowest protein level (117.63 μg $mL^{-1}$). For DOTP treatments, maximum protein accumulation (128.69 μg $mL^{-1}$) occurred at 100 mg $L^{-1}$, while the lowest content (97.43 μg $mL^{-1}$) was recorded at 40 mg $L^{-1}$ on the 15th day of incubation (Fig. 4a and b). Previous studies have demonstrated that higher plants and macroalgae can down-regulate genes associated with primary metabolism and protein synthesis under stress, while up-regulating genes involved in autophagy and protein degradation [32]. Microalgae such as *C. sorokiniana* and *Neochloris* sp. achieved high protein content when grown in either original wastewater (up to 22% of the final dry weight) or modified medium (averaging 26% and 33% of the final dry weight, respectively). Similarly, protein content in algal species cultivated in 10% effluent from biogas reactors was comparable (Zignashina *et al*., 2022), and consistent protein levels were also observed in *C. sorokiniana* grown in synthetic media under different cultivation techniques [33]. Additionally, growth in raw poultry slaughterhouse wastewater resulted in significantly higher protein production, whereas modified wastewater—treated with ash—led to reduced protein accumulation. During the exponential growth phase, *Chlorella* sp. UTEX1602 actively excreted organic matter, and on the eighth day, the

200 mg $L^{-1}$ NaOH-mPET treatment exhibited a peak protein content of 0.0064 mg $L^{-1}$. However, the protein content gradually drops as HT-mPET and UV-mPET concentrations rise [30].

**Analysis of Stress Biomarkers**

The stress biomarkers like Hydrogen peroxide, MDA, and Proline were analyzed with *Chroococcus*sp in DINP and DOTP treated flasks with different concentrations (0ppm, 5ppm, 10ppm, 40ppm, 80ppm, and100ppm). In $H_2O_2$,the DINP-treated flask showed high results in 80ppm (3.81±1.51) onthe 7th day and low in 80ppm (0.96±0.05) onthe 15th day of culture. Likewise, the DOTP-treated flask showed high concentration in 40ppm (2.36±1.04 at 7th day) and low concentration in 100ppm (0.7±0.09 at 15th day). In MDA, the DINP flask shows a high concentration of 84.23 in 100ppm at the 15th day, and a low concentration is present in 11.86 in 10ppm at the 7th day of culture. The DOTP-treated flask showed a high value of 67.97 in 80ppm and a low value of 11.93 in 10ppm at the 15th day of culture. In proline stress, the DINP-treated flask showed high in 5ppm 16.18±3.19 and low in 40ppm 10.03±0.93 at 15th day of treatment, and the DOTP-treated flask, the high result in 5ppm 21.14±2.45 at 7th day, and low concentration in 10.03±0.93 in 40ppm at15th day of treatment (Table 1). The microalga *Chlamydomonas reinhardtii* was exposed to 200 mM NaCl for eight days to examine metabolomic, biochemical, and physiological responses. Exposure to this salinity significantly reduced the growth rate as well as chlorophyll a and b contents in *C. reinhardtii*. Hydrogen peroxide ($H_2O_2$) levels increased markedly under salt stress, reaching 10.14 ± 1.126 mM at 200 mM NaCl, compared to 4.88 ± 0.665 mM in the control ($P \leq 0.01$). Similarly, Yun *et al*. (2019) reported that *Chlorella vulgaris* accumulated 0.2028 mM $H_2O_2$ per 0.1 g fresh weight under 200 mM NaCl stress, in contrast to 0.0347 mM per 0.1 g fresh weight under control conditions. $H_2O_2$, a reactive oxygen species (ROS), plays a critical role in mediating stress responses in plants and algae [34]. The production of $H_2O_2$ is also linked to the action of stress-related hormones, such as abscisic acid (ABA) and brassinosteroids (BRs), which enhance stress tolerance in both plants and algae [34]. In NaCl-treated cultures, malondialdehyde (MDA) content increased significantly to 62.88 ± 4.428 nmol $mg^{-1}$ of protein, compared to 24.04 ± 0.329 nmol $mg^{-1}$ in the control. Polat *et al*. (2020) [35] measured $H_2O_2$ and MDA levels to investigate ROS-mediated lipid accumulation in *Auxenochlorella protothecoides*. They reported that at 40 g $L^{-1}$ NaCl, $H_2O_2$ levels increased 3.9-fold, from 5.60 μmol $g^{-1}$ to 22.33 μmol $g^{-1}$, and MDA increased 4.4-fold, from 0.13 nmol $g^{-1}$ to 0.57 nmol $g^{-1}$.

Similarly, Yang and Hu (2020) observed that MDA levels in *Micractinium*sp. rose from 0.2 μmol $g^{-1}$ to 0.57 μmol $g^{-1}$ after three days at 40 g $L^{-1}$ NaCl. These findings indicate that oxidative stress induced by high NaCl concentrations leads to increased MDA accumulation. Numerous studies have reported that MDA builds up in plant and microalgal cells due to lipid peroxidation under salt stress [36],[37],[34].In addition, DBP concentrations ranging from 0 to 100 mg $L^{-1}$ were applied to *Tetradesmus dimorphus* GEEL-04 and *Chlorella* sp. GEEL-08 to assess stress responses. Activities of two key enzymes, MDA and superoxide dismutase (SOD), were measured, with both MDA and SOD activities being higher in *T. dimorphus* cultures than in *Chlorella* sp. cultures [27]. Under salt stress, *C. reinhardtii* accumulated a significantly higher amount of proline (225.17 ± 3.910 μg mg−1 proteins) than the control group (69.55 ± 0.264 μg mg−1 proteins) (Figure 3c). Previous studies have reported that proline levels increase in response to salt stress [38]. Under 200 mM NaCl, *Nostoc piscinale* accumulated significantly more proline (11 μg $g^{-1}$ fresh weight) compared to 5 μg $g^{-1}$ fresh weight under control conditions (0 mM NaCl) [38]. Similarly, Chokshi *et al*. (2017) [39] observed a 1.8-fold increase in proline accumulation in *Acutodesmus dimorphus* exposed to 200 mM NaCl (66.45 ± 1.07 μM $g^{-1}$ dry weight) relative to the control (37.36 μM $g^{-1}$ dry weight). Proline accumulation under stress conditions was primarily caused by enhanced synthesis, decreased oxidation rate, and slow incorporation into proteins [40]. The combined findings indicate that DOTP biodegradation proceeds more slowly and elicits stronger stress responses, whereas *Chroococcus* effectively breaks down DINP with relatively less oxidative damage. However, at 100 ppm, 80 ppm, and 40 ppm, both plasticizers were significantly broken down, indicating the strain's potential to treat phthalate and terephthalate contaminants across a range of environmental concentrations. In order to speed up DOTP breakdown and increase overall bioremediation efficiency, future research should concentrate on clarifying the entire mineralization pathways, evaluating the toxicity of intermediates, and testing *Chroococcus* in consortia-based systems. The MDA content of Chlorella sp. UTEX1602 cells increased markedly when exposed to 100 mg $L^{-1}$ NaOH-mPET, while exposure to 100 mg $L^{-1}$ UV-mPET and HT-mPET caused a significant reduction in MDA accumulation [31].

## CONCLUSION

The current study successfully examined the degradation of dioctyl terephthalate (DOTP) and diisononyl phthalate (DINP) using a blue-green microalgae-based phycoremediation method utilizing *Chroococcus* sp. The results showed that *Chroococcus* sp. has an exceptional ability to metabolize and tolerate phthalate pollutants, which lessens their persistence in aquatic environments. The organism has the potential to be an effective and environmentally sustainable agent for the bioremediation of complex organic pollutants, as evidenced by its adaptive physiological and biochemical responses. The investigation's findings highlight the importance of microalgal systems as a practical substitute for traditional physico-chemical treatment techniques, providing benefits like low operating costs, decreased secondary pollution, and concurrently improved water quality. Furthermore, *Chroococcus* sp. may be further optimized through strain improvement, co-cultivation techniques, and bioprocess engineering to increase degradation efficiency under a variety of environmental conditions due to its metabolic versatility. Future research should focus on clarifying the molecular and enzymatic processes underlying the DINP and DOTP degradation pathways and evaluating the approach's viability on a large scale in both natural and industrial wastewater systems. Phycoremediation's environmental and economic sustainability could be further enhanced by incorporating circular bioeconomy concepts, such as biomass valorization for bioenergy or bioproducts. Overall, the study shows that phycoremediation mediated by Chroococcus sp. is a viable, environmentally friendly, and scalable method for restoring aquatic ecosystems contaminated with phthalates.

**ABSTRACT**

The semi-tropical plant *Aloe vera* L. Burman (AV) has numerous therapeutic uses, such as antibacterial, antioxidant, and anti-inflammatory qualities. Chinese medicine uses it to treat dermatitis, diabetes, hypertension, and infections. *Aloe vera* has volatile chemicals and ascorbic acid in its flowers, organic acids, phenols, enzymes, and minerals in its leaves, and pectin, lignin, and polysaccharides in its rind. This study assessed the aqueous extract of *Aloe vera* 's total phenol, flavonoid, and tannin contents in addition to its reducing power and 1, 1-Diphenyl-2-picrylhyrazyl (DPPH) radical scavenging abilities. The maceration process was used to extract *Aloe barbadensis miller*. Additionally, the *in vitro* antioxidant activities (DPPH free radical scavenging activity and reducing power activity) were assessed using conventional techniques. When compared to the typical value of leaf extract, the aqueous extract demonstrated superior DPPH free radical scavenging activity. According to the study's findings, *Aloe barbadensis miller* leaf extract may be utilized in the effective and environmentally friendly synthesis of compounds with anti-inflammatory and antibacterial qualities. Additionally, it implies that the polarity of the solvent is responsible for the existence of various compounds in plants.

**Keywords:** *Aloe barbadensis miller*, antibacterial activity; antioxidant activity, DPPH

## INTRODUCTION

Plants investigate a wide range of therapeutic and clinical features of ancient society and are rich sources of many medicinally significant chemicals. Many strong and effective medications are derived from medicinal plants, which are used worldwide to treat a number of chronic illnesses. Herbal medicines are in increasing demand as a primary health care source in both developed and developing nations because of their broad biological and therapeutic capabilities, strong safety margins, and lower costs [1]. India has a rich culture of medicinal herbs and spices, with over 2000 species of medicinally significant plants with high potential abilities for use in various traditional medicine systems. However, there are very few chemical and pharmacological studies for their medicinal potential in the literature. *Aloe barbadensis miller* is a shrubby, perennial succulent plant belonging to the Liliaceae family. Its turgid leaves are connected in a rosette arrangement at the stem. Large, thick, fleshy, stemless leaves with a sharp tip and a spiny edge are another characteristic of the plant [2,3]. *Aloe barbadensis miller*has long been utilized for a number of therapeutic purposes and is a key component of India's traditional medical system. Because of its many therapeutic benefits, it has become extremely important. There are hundreds of nutrients and active chemicals in *Aloe barbadensis miller*. Their pharmacological and therapeutic qualities are attributed to a variety of phytoconstituents, including vitamins, enzymes, minerals, carbohydrates, lignin, anthraquinones, saponins, salicylic acid, and amino acids [4]. *In vitro* and in vivo, phenolic compounds are thought to have anti-inflammatory and antioxidant properties. The plant part (leaf, stem bark, fruit, root, etc.), species, type of solvent (solvent polarity), and extraction technique all affect the quantity of phenols, flavonoids, and tannins in plants and their biological activity. Boudreau and Baland claim that the primary ingredient in AV that promotes fibroblast proliferation and enhances collagen synthesis and release is glucomannan. According to reports, glycogen synthesis, beta cell repair, insulin release, and glucose metabolism are Mostly driven by the melatonin and anthraquinone found in aloe [5, 6].

Ascorbic acid and volatile chemicals can be found in AV flowers; organic acids, phenolic compounds, enzymes, vita mins, and minerals can be found in AV leaves; pectin, lignin, cellulose, hemicellulose, and polysaccharides can be fou nd in the rind.It has been demonstrated that *Aloe barbadensis miller*contains anti-inflammatory, immunostimulatory, and cell growth-stimulating properties [7]. There have also been reports of antiviral, antifungal, and antibacterial activity against a range of pathogenic pathogens. *Aloe barbadensis miller* gel has been used historically to treat burn anomalies and various skin wounds. *Aloe barbadensis miller*leaf aqueous extract was generated and demonstrated in this study using UV and XRD. Additionally, its numerous applications, such as antioxidant and antibacterial capabilities, were tested against pathogenic of different bacterial strains. Anti-inflammatory action against the infections additionally provided this study represents the first attempt to assess *Aloe barbadensis miller's* comparative antibacterial potential. Researchers created an aquatic extract of *Aloe barbadensis miller* for this work. Characterizations of the prepared extract included antibacterial, anti-inflammatory, antioxidant, and UV-visible spectroscopy investigation.
The produced source is advised for drug delivery and antibacterial activity applications based on the characterisation results.

**Experimental section**
The ferric chloride, DPPH, HCL, Sulphuric acid, diclofenac sodium used in the present study was procured from Sigma–Aldrich Chemical Co., USA. All the other chemicals were used of analytical grade.

**Plant Material**
The *Aloe vera* (*Aloe barbadensis miller*) leaves was collected from kunichi, Tirupattur district and its rind was used as a sample. It was grinded to fine powder as per the standard approved protocol for further use.

**Collection and preparation of plant extracts**
Collecting *Aloe barbadensis miller* is getting ready to extract the dried plant for a week. The dried plants are pounded into a fine powder and kept in an airtight container after one week. Ten grams of plant powder were combined with

one hundred milliliters of ethanol in a 1:10 ratio for five to six hours in a soxhlet to create the water extract. The contents are filtered using Whatman No. 1 filter paper after six hours. The filtrate was then gathered separately for use in subsequent operations.

**Extraction of *Aloe barbadensis miller***

*Aloe barbadensis miller* was collected from the dried region and ground using a masternpistal. Ten grams of the crushed soil were then dissolved using 100 milliliters of ethanol in a beaker with a separate Soxhlet apparatus [8]. After the contents were extracted and filtered through Whatman No. 1 filter paper, the filtrates were concentrated in a rotary evaporator for use in additional research (figure 1).

**Qualitative Phytochemical Screening**

**Phytochemical screening**

In a conventional process, qualitative assessments were conducted on prepared *Aloe vera* aqueous extract. Phytochemicals were examined for in the aqueous extract [9].To prepare the ethanolic extract, 10 grams of plant powder were combined with 100 milliliters of ethanol at a 1:10 ratio for five to six hours in a soxhlet. Whatman No. 1 filter paper is used to filter the contents after six hours. The filtrate was then collected separately, much like the aqueous extract, for phytochemical investigation.

**Test for alkaloids**

**Mayer's test**

A few drops of diluted HCl were added to a small amount of solvent-free extract, which was then filtered. The subsequent color test was performed on the filtrate. (a) 60 milliliters of distilled water were used to dissolve 1.36 grams of mercuric chloride. (b) After dissolving 5 grams of potassium iodide in 20 milliliters of distilled water, (a) and (b) were combined, and the volume was adjusted to 100 milliliters using distilled water. Alkaloids were present when Mayer's reagents produced a cream-colored precipitate.

**Test for flavonoids**

**Shinoda's test:** An equivalent volume of the extract was mixed with 5 milliliters of 20% sodium hydroxide. Flavonoids are indicated by a yellow solution.

**Test for steroids**

**Liebermann Buchard test:** Two milliliters of acetic anhydride are added to a tiny sample, and then three milliliters of $H_2SO_4$ solution are added. When steroids are present, the color shifts from violet to green or blue.

**Test for terpenoids**

**Salkowski Test**: The presence of terpenoids is indicated by the production of a reddish-brown precipitate when 0.5 ml of chloroform and a few drops of strong sulfuric acid are added to 1 ml of extract.

**Test for Saponins**

**Froth test:** Twenty milliliters of distilled water are added to five milliliters of extract, and the mixture is shaken for ten minutes. When foam forms, saponins are present.

**Test for Carbohydrates**

**Fehling test**

Fehling's solutions A and B were used to heat two milliliters of each plant extract after they had been hydrolyzed with diluted HCl and neutralized with alkali. The presence of a reducing sugar was shown by the development of a crimson precipitate.

**Test for tannins and phenolic compounds**

**Lead Acetate test:**0.5g of the extract was added to a 10% lead acetate solution and agitated until it dissolved. When phenolic chemicals and tannins are present, a white precipitate is seen.

**Test for glycosides**

**Keller-Killani test**

One drop of 5% ferric chloride, strong sulfuric acid, and glacial acid were added to two milliliters of extract. The presence of glycosides is indicated by a reddish-brown appearance at the intersection of the two liquid layers.

**Test for Quinones**

**Sulfuric acid test**: Five milliliters of each extract were dissolved in isopropyl alcohol, and one drop of strong sulfuric acid was added. When quinones are present, the color turns red.

**Test for Phenols**

A few drops of ferric chloride (10%) are added to the sample solution. Phenols are present when the color turns blue or green.

**Test for saponins**

The sample solution was mixed with two milliliters of distilled water and thoroughly shaken. Foam formation is a sign that saponins are present.

**Antibacterial activity**

*Escherichia coli* was the negative strain and *Bacillus subtilis*and *Staphylococcus aureus*were the two positive strains of bacteria that were tested against *Aloe barbadensis miller* aqueous extracts. Utilizing Mueller Hinton Agar and Broth (Himedia), the bacterial cultures were grown.The agar well diffusion method was used to measure antibacterial activity. The inoculums were prepared using a fresh culture that was cultivated overnight. Peptone water was used to prepare the inoculums, which were then incubated for two hours. The turbidity was adjusted to 0.5 McFarland units, or roughly 108 CFU/ml. using a sterile spreader, inoculums were applied to brand-new nutrient agar plates. A sterile cutter was used to cut four 6 mm-diameter wells. The control disc was positioned in the middle. To investigate the antibacterial activity against the employed bacterial strains, a 40µl solution of varying concentrations was administered to each well [10]. The negative control was DMSO. As a positive control, 10 µg discs of gentamycin (Himedia Laboratories Pvt. Ltd., India) were utilized. Both were bought from Plates and incubated at 37°C for a whole day. HiMedia Laboratories Pvt. Ltd. India provided the standard ruler HiAntibiotic ZoneScaleTM-C, which was used to measure the clear zone of inhibition surrounding each well. Antibacterial activity was tested using diffusion disc plates on agar, with around 0.1 mL of each bacterial culture applied to the plates' surfaces. For the antibacterial assay, all bacterial strains were grown in Mueller Hinton Broth (Hi media) for an entire day at 37°C. After that, they were plated on Mueller Hinton Agar (Hi media) for agar diffusion testing. On the agar medium, paper discs with a diameter of 6 mm were filled with 100 µL of *Aloe barbadensis miller* leaf extracts. Inhibition diameters were measured after 24 to 48 hours of incubation at 37°C. Additionally, solvent-only blanks that had the same processing were tested for antibacterial activity [11, 12].

**Antioxidant activity by DPPH radical scavenging assay**

The antiradical potency of pure drugs or plant extracts under similar circumstances can be determined using the DPPH radical test. It gauges how well an antioxidant (AH, usually phenolic compounds) can use hydrogen transfer to lessen the chemical free radical DPPH (2, 2-diphenyl-1-picrylhydrazyl). At first, DPPH is violet; however, as DPPH-H, it turns pale yellow. This was investigated in accordance with [7]. Fifty milliliters of methanol were added to the reaction mixture. DPPH, or diphenyl-2-picryl hydrazyl radical: One milliliter of *Aloe vera* leaf extracts in concentrations of 20, 40, 60, 80, and 100 microliters was mixed with three milliliters of 1 mM DPPH in methanol. Methanol by itself served as a blank, while DPPH solution containing methanol served as the positive control (ascorbic acid) [13]. The hue of the sample changed from deep purple to pale yellow when DPPH and the antioxidant

interacted. Calorimetric measurements were made at 518 nm. The percentage for scavenging activity was calculated by the following formula: Scavenging activity (%) = A518 (control)-A518 (sample)/X 100 A518 (control).

**Anti-inflammatory activity**

*Aloe barbadensis miller*'s anti-inflammatory properties were assessed in accordance with standard method. To evaluate the anti-inflammatory activity, 0.45 mL of a 1% aqueous solution of bovine serum albumin was mixed with 0.05 mL of *Aloe barbadensis miller*at different doses ranging from 20µg/mL to 100µg/mL. A tiny quantity of 1N hydrochloric acid was added to the solution to bring its pH down to 6.3. After 20 minutes of room temperature incubation, these samples were heated for 30 minutes at 55°C in a water bath. Following the heating procedure, the samples were allowed to cool before the absorbance was measured at 660 nm using a spectrophotometer [14,15]. The reference medication used for comparison was diclofenac sodium. In this experiment, dimethyl sulfoxide (DMSO) served as the control.

The percentage of protein denaturation was determined using the following equation: % Inhibition = (Absorbance of control – Absorbance of sample/Absorbance of control) x 100.

## RESULTS AND DISCUSSION

**Phytochemical Analysis**

Aloe barbadensis miller's ethanolic and aqueous extracts were evaluated using qualitative phytochemical analysis [16]. To determine whether different phytochemicals are present. The presence of alkaloids, carbohydrates, quinones, steroids, tannins, and terpenoids in the extracted materials is displayed in figure 2 and Table 1. Glycosides, phenols, and flavonoids are not present in the ethanolic extract, nor are they in the aqueous extract.

**Anti-bacterial activity*Aloe barbadensis miller***

Plants have been used as medicine since the dawn of human civilization. The issues with synthetic antibiotics make it obvious that the use of plants to treat illnesses was unavoidable [17]. *Aloe barbadensis miller* was investigated by numerous researchers using a range of polar chemical solvents, including high methanol. Antimicrobial activity and qualitative analysis were investigated. When comparing methanol extracts to the well diffusion method, the largest inhibitory zones against *Escherichia coli*, *Staphylococcus aureus*, and *Bacillus subtilis* were 14 mm, 15 mm, and 12 mm. The antibacterial activity of *Aloe barbadensis miller* dissolved in DMSO (300 mg/mL) at dosages of 50, 75, and 100 µg/mL was demonstrated against the pathogens examined [18]. (Figure 3, Table 2).

**Anti-oxidant activity of *Aloe barbadensis miller* Via DPPH Assay**

Antioxidants are important in preventing a number of illnesses. It has been demonstrated that the phytochemicals' important antioxidant qualities are essential for lowering the incidence of several diseases [19, 20]. Graphical Representation of anti-oxidant activity of *Aloe barbadensis miller* (Fig 4). Our findings showed that, in a content-dependent way, all *Aloe vera* leaf extracts enhanced decreasing antioxidant capability and blocked free radicals. The highest DPPH radical scavenging activity was found in *Aloe vera* leaves, which were followed by the seeds, rind, whole fruit, and flesh. Based on the results of DPPH radical scavenging activity, the IC50 ranges of the aqueous extract of *Aloe vera* leaf extracts were found to be 56.6µg when compared to other plant extractions. When compared to traditional ascorbic acid, the IC50 levels were determined to be 56.8µg. By contrasting the standard with the unknown, the beneficial effects of *Aloe vera* leaf extract were ultimately discovered [21]. The results of the *in vitro* models unequivocally show that the aqueous extract has superior antioxidant activity compared to the other plant extract because it contains higher phenolic and flavonodal components, respectively. By preventing the start and advancement of oxidative chain reactions, antioxidants either prevent or postpone the oxidation of other molecules. They are essential for preventing and lessening the damage that radicals do to living things. It has been shown that flavonoids and other phenolic chemicals produced from plants, such as proanthocyanidins, rosmarinic acid, and hydroxycinnamic derivatives, scavenge and lessen lipid peroxidation [22].

**Anti-inflammatory Activity**

The bovine serum albumin denaturation test was used to assess *Aloe barbadensis miller*anti-inflammatory properties. *Aloe vera* 's inhibitory effects were evaluated at various doses and contrasted with benchmark values. The percentage of inhibition was found to be 11% at 20 µg/mL, 21% at 40 µg/mL, 32% at 60 µg/mL, 39% at 80 µg/mL, and 45% at 100 µg/mL. These results show that by preventing the denaturation of bovine serum albumin, aqueous extract *Aloe vera* has strong anti-inflammatory properties [23, 24]. Furthermore, at every measured concentration, the produced sample's anti-inflammatory qualities were on par with those of normal diclofenac sodium. Graphical Representation of anti-inflammatory activity of *Aloe barbadensis miller (*Fig 5).

## CONCLUSION

The pharmacological and therapeutic properties of Aloe barbadensis miller, such as its antibacterial, anti-inflammatory, and antioxidant properties, are being studied for the first time, according to the present experimental research. Except for steroids, terpenoids, and phenols, phytochemical examination revealed the presence of a variety of phytochemicals, including carbohydrates, tannins, saponins, alkaloids, flavonoids, quinones, and glycosides. Strong antibacterial properties are demonstrated by *Aloe barbadensis miller* against harmful pathogens such as *Bacillus subtilis*, *Staphylococcus aureus*, and *Escherichia coli*. The aqueous *Aloe vera* extract showed a significant degree of antioxidant qualities in the DPPH test. Using the albumin denatured state method, the aqueous extract of *Aloe barbadensis miller* demonstrated good anti-inflammatory capabilities when compared to the common drug diclofenac. This study has demonstrated that using and consuming *Aloe vera* for a variety of purposes has many pharmacological, therapeutic, and health-promoting potentials.

**ABSTRACT**

In this paper, we have introduced the concept of (t,s)-Bipolar valued fuzzy subgroups, (t,s)-Bipolar valued fuzzy normal subgroups and investigate some associated results.

**Mathematics Subject Classification:** 03F55, 08A72, 20N25, 03E72, 06F35
**Keywords:** (t,s)-bipolar fuzzy set ((t,s)-BPFS), (t,s)-bipolar fuzzy subgroup ((t,s)-BPFSG), (t,s)-bipolar fuzzy normal subgroup ((t,s)-BPFNSG), ($\alpha$,$\beta$)-cut, Homomorphism..

## INTRODUCTION

In 1965, in his pioneer paper L.A. Zadeh [11] introduced the concept of fuzzy set to handle the uncertainties in our daily life. After that many generalizations of fuzzy sets are presented, for example, interval valued fuzzy sets [12] and intuitionistic fuzzy sets [1]. Fuzzy sets are extremely useful to solve many problems in applied mathematics, information sciences and theory of automata [2]. The concept of fuzzy sets in Algebraic structures was first introduced by Rosenfeld in 1971 and he defined fuzzy subgroups [8]. The notion of t-intuitionistic fuzzy set, t-intuitionistic fuzzy group, t-intuitionistic fuzzy coset was introduced by P.K.Sharma[9]. In [5] K.M. Lee introduced the concept of Bipolar valued fuzzy sets. In [4] Jun and Song applied the notion of Bipolar valued fuzzy sets in BCH-algebra. Recently F. Nisar and others applied the notion of Bipolar valued fuzzy sets in BCI-algebra [7].And in [10] Tahir Mahmood and Muhammad Munir used the notion of Bipolar valued fuzzy sets in group theory and developed

some basic results. In this paper we introduced the notion of (t,s)- Bipolar valued fuzzy sets, (t,s)- Bipolar valued fuzzy subgroups of a group G and discussed some of its related properties.

## PRELIMINARIES

**Definition[11]:** A fuzzy subset of a non-empty set $X$ is a function$A: X \to [0,1]$. The set of all fuzzy subsets of a set $X$ is denoted by FP($X$). For$A, B \in FP(X)$, we have the following operations on FP(X).

$(A \vee B)(x) = \max\{A(x), B(x)\} = A(x) \vee B(x)$ for all $x \in X$.

$(A \wedge B)(x) = \min\{A(x), B(x)\} = A(x) \wedge B(x)$

**Definition:** Let H be a non-empty subset of a non-empty set X. Then characteristic function of $H$ is a function $C_H: X \to \{0,1\}$ defined by

$$C_H(x) = \begin{cases} 1 & \text{if } x \in H \\ 0 & \text{if } x \notin H \end{cases}$$

Obviously $C_H \in FP(X)$.

**Definition :** Let $x$ be an element of $X$ and $l \in (0,1]$. Then a fuzzy subset $A$ of X of the form

$$A(z) = \begin{cases} l & \text{if } z = x \\ 0 & \text{if } z \neq x \end{cases}$$

is called fuzzy point with value $l$ and support $x$ or fuzzy singleton subset of $X$. It is denoted by$l_x$.

**Definition:** Let G be a group and $A \in FP(G)$. Then we have the following subsets of G :

1. $U(A, l) = \{x \in G: A(x) \geq l\}, l \in (0,1]$. It is called level subset of $G$.
2. $A^* = \{x \in G: A(x) > 0\}$. It is called support of $A$.
3. $A_* = \{x \in G: A(x) = A(e)\}$. Where e is identity of G.
4. $Ker(A) = \{x \in G: A(x) = 1\}$. It is called Kernel of $A$.

**Definition:** Let $G$ be a group and $A, B \in FP(X)$. Then, the fuzzy subsets $A \circ B$ and $A^{-1}$ of G are defined as:

$$(A \circ B)(x) = \sup_{x=yz} \{\min(A(y), A(z))\}$$

and

$$A^{-1}(x) = A(x^{-1})$$

where $A \circ B$ is called product of $A, B$ and $A^{-1}$ is called inverse of $A$.

**Definition [6]:** A fuzzy subset $A$ of a group G is said to be a fuzzy subgroup of G if for all $x, y \in G$

$A(xy) \geq \min\{A(x), A(y)\}$

$A(x^{-1}) \geq A(x)$

or equivalently

$A(x^{-1}y) \geq \min\{A(x), A(y)\}$

**Definition [6]:** A fuzzy subgroup$A$ of a group G is said to be fuzzy normal subgroup of $G$, if for all $x, y \in G$

$A(y^{-1}xy) \geq A(x)$

**Definition [6]:** Let $A$ and B be two fuzzy subgroups of a group G. Then, $A$ is said to be fuzzy conjugate of $B$ if for some $x \in G$, $A(y) = B(x^{-1}yx)$ for all $y \in G$.

**Definition [6]:** For a fuzzy subgroup $A$ of a group G, the normalizer of $A$ in G is denoted and defined by $N(A) = \{y \in G: A(y^{-1}xy) \geq A(x)$ for all $x \in G\}$.

**Definition [6]:** Let $A$ be a fuzzy subgroup of a group G. Then,

Fuzzy left coset of $f$ in G determined by $x \in G$ is a fuzzy subset ${}_xA$ of G defined by ${}_xA(y) = A(x^{-1}y)$.

Fuzzy right coset of $f$ in G determined by $x \in G$ is a fuzzy subset $A_x(y)$ of $G$ defined by $A_x(y) = A(yx^{-1})$.

**Definition [6]:** A fuzzy subgroup $A$ of a group G is said to be abelian fuzzy subgroup of G if and only if for all $x, y \in G, A(xy) = A(yx)$.

**Remark [6]:** Let $A$ be a fuzzy subgroup of a group G. Then
$\mathbb{N}(A) = \{y \in G: A(xy) = A(yx), \forall x \in G\}$

**Theorem [6]:** Let $A$ be a fuzzy normal subgroup of a group $G$. Then, for all $x_1, x_2 \in G$,
$A_{x_1} \circ A_{x_2} = A_{x_1x_2}$ and ${}_{x_1}A \circ {}_{x_2}A = {}_{x_1x_2}A$

**Definition[7] :** Let X be a non empty set. A Bipolar valued fuzzy subset $B$ of $X$ is an object having the form
$B = \{(x, P(x), N(x)): x \in X\}$
where $P: X \to [0,1]$ and $N: X \to [-1,0]$ are mappings. The positive membership degree $P(x)$ denotes the satisfaction degree of an element $x$ to the property corresponding to a bipolar valued fuzzy subset $B = \{(x, P(x), N(x)): x \in X\}$ and the negative membership degree $f(x)$ denotes the satisfaction degree of an element $x$ to some implicit counter property corresponding to a bipolar valued fuzzy subset $B = \{(x, P(x), N(x)): x \in X\}$
If $P(x) \neq 0$ and $N(x) = 0$, it is the situation that x is regarded as having only positive satisfaction $B = \{(x, P(x), N(x)): x \in X\}$
If $N(x) \neq 0$ and $P(x) = 0$, it is the situation that x does not satisfy the property of $B = \{(x, P(x), N(x)): x \in X\}$ but somewhat satisfies the counter property of $B = \{(x, P(x), N(x)): x \in X\}$. It is possible for an element x to be such that $P(x) \neq 0$ and $N(x) \neq 0$ when the membership function of the property overlaps that of its counter property over some portion of X. For our convenience from now to onward instead of writing $B = \{(x, P(x), N(x)): x \in X\}$
we will write $B =< P, N >$.

**(t,s)—bipolar Valued Fuzzy Subgroups**
**Definition:** Let X be a non empty set. A (t,s)-bipolar valued fuzzy subset $B^{(t.s)}$ of $X$ is an object having the form
$B^{(t.s)} = \{(x, P^t(x), N^s(x)): x \in X\}$
where $P^t: X \to [0,1]$ and $N^s: X \to [-1,0]$ are mappings. The positive t-membership degree $P^t(x)$ denotes the t –level satisfaction degree of an element $x$ to the property corresponding to a (t,s)-bipolar valued fuzzy subset $B^{(t.s)} = \{(x, P^t(x), N^s(x)): x \in X\}$ and the negative s-membership degree $f(x)$ denotes the s-level satisfaction degree of an element $x$ to some implicit counter property corresponding to a (t,s)- bipolar valued fuzzy subset $B^{(t.s)} = \{(x, P^t(x), N^s(x)): x \in X\}$.
If $P^t(x) \neq 0$ and $N^s(x) = 0$, it is the situation that x is regarded as having only positive satisfaction $B^{(t.s)} = \{(x, P^t(x), N^s(x)): x \in X\}$
If $N^s(x) \neq 0$ and $P^t(x) = 0$, it is the situation that x does not satisfy the property of $B^{(t.s)} = \{(x, P^t(x), N^s(x)): x \in X\}$ but somewhat satisfies the counter property of $B^{(t.s)} = \{(x, P^t(x), N^s(x)): x \in X\}$. It is possible for an element x to be such that $P^t(x) \neq 0$ and $f(x) \neq 0$ when the membership function of the property overlaps that of its counter property over some portion of X . For our convenience from now to onward instead of writing $B^{(t.s)} = \{(x, P^t(x), N^s(x)): x \in X\}$ we will write $B^{(t,s)} =< P^t, N^s >$.

**Definition:** Let $B_1{}^{(t,s)} =< P_1{}^t, N_1{}^s >$ and $B_2{}^{(t,s)} =< P_2{}^t, N_2{}^s >$ be two $(t, s)$ -Bipolar valued fuzzy subsets of a group $G$. Then $B_1 \vee B_2$ and $B_1 \wedge B_2$ of $X$ are defined as
$B_1 \vee B_2 = \langle P_1{}^t \vee P_2{}^t, N_1{}^s \vee N_2{}^s >$
And $B_1 \wedge B_2 = \langle P_1{}^t \wedge P_2{}^t, N_1{}^s \wedge N_2{}^s >$.

**Definition:** Let $G$ be a group and $A^{(t.s)}$ be a (t,s)-bipolar valued fuzzy subset of a non-empty subset H of $G$. Then $(t, s)$ –Bipolar valued Characteristic function of $H$ is given by $C_{A_H{}^{(t.s)}} = \langle C_{P_H{}^t}, C_{N_H{}^s} \rangle$, where

$$C_{P_H{}^t}(x) = \begin{cases} 1 & \text{if } x \in H \\ 0 & \text{otherwise} \end{cases}$$

$$C_{N_H{}^s}(x) = \begin{cases} -1 & \text{if } x \in H \\ 0 & \text{otherwise} \end{cases}$$

Obviously $(t.s)$ −Bipolar valued Characteristic function is a $(t.s)$ −Bipolar valued fuzzy subset of G.

**Definition:** Let $x$ be an element of a group $G$ and q∈ (0,1]. Then a $(t,s)$ −Bipolar valued fuzzy subset $B^{(t,s)} =< P^t, N^s >$ of $G$ of the form

$$P^t(z) = \begin{cases} q & \text{if } z = x \\ 0 & \text{if } z \neq x \end{cases}$$

$$N^s(z) = \begin{cases} -q & \text{if } z = x \\ 0 & \text{if } z \neq x \end{cases}$$

is called $(t,s)$ −Bipolar valued fuzzy point with value $t$ and support $x$ or $(t,s)$ −Bipolar valued fuzzy singleton subset of $G$. It is denoted by $q_x = \langle P_{q_x}, N_{q_x} \rangle$.

**Definition:** Let G be a group and $B_1{}^{(t,s)} =< P_1{}^t, N_1{}^s >$ and $B_2{}^{(t,s)} =< P_2{}^t, N_2{}^s >$ be two $(t,s)$ −Bipolar valued fuzzy subsets of G. Then, the product of $B_1$ and $B_2$ is defined by

$B_1{}^{(t,s)} \circ B_2{}^{(t,s)} = \langle P_1{}^t \circ P_2{}^t, N_1{}^s \circ N_2{}^s >$

Where

$$(P_1{}^t \circ P_2{}^t)(x) = \sup_{x=yz} \{\min(P_1{}^t(y), P_2{}^t(z))\}$$

and

$$(N_1{}^s \circ N_2{}^s)(x) = \inf_{x=yz} \{\max(N_1{}^s(y), N_2{}^s(z))\}$$

**Definition:** A $(t,s)$ −Bipolar valued fuzzy subset $B^{(t,s)} =< P^t, N^s >$ of a group $G$ is said to be $(t,s)-$ Bipolar valued fuzzy subgroup of G if

$P^t(x^{-1}y) \geq \min\{P^t(x), P^t(y)\}$ and $N^s(x^{-1}y) \leq \max\{N^s(x), N^s(y)\}$

**Example:** Let $G = C_4 = \{\pm 1, \pm i\}$. Then $G$ is a group under usual multiplication of complex numbers. Let $A^{(t,s)} =< P^t, N^s >$be a $(t,s)-$ Bipolar valued fuzzy subset of a Bipolar valued fuzzy subset $B =< P, N >$of G with $t = 0.25$ *and* $s = 0.18$, such that

$P(1) = 0.62, P(-1) = 0.45, P(i) = 0.32, P(-i) = 0.25$, $N(1) = -0.72, N(-1) = -0.52$ and $N(i) = -0.12, N(-i) = -0.18$.

Then $A^{(t,s)} =< P^t, N^s >$ is Bipolar valued fuzzy subgroup of G.

**Theorem:** Let H be a non-empty subset of a group G. Then, H ≤ G if and only if its (t,s)-Bipolar valued characteristic function $C_{A_H{}^{(t,s)}} = \langle C_{P_H{}^t}, C_{N_H{}^s} \rangle$ is a (t,s)-Bipolar valued fuzzy subgroup of G.

**Theorem:** A $(t,s)$ −Bipolar valued fuzzy subset $A^{(t,s)} =< P^t, N^s >$ of a group $G$ is $(t,s)$ −bipolar valued fuzzy subgroup of $G$ iff its level subset

$U(A^{(t,s)}, l) = \{x \in G: P^t(x) \geq l, N^s(x) \leq -l\}$ for all $l \in (0,1]$ is subgroup of $G$.

**Theorem:** Let $\{A^{(t,s)}{}_i =< P^t{}_i, N^s{}_i >: i \in I\}$ be a collection of $(t,s)$ −Bipolar valued fuzzy subgroups of a group G. Then, $\Lambda f_a$ is a $(t,s)$ −Bipolar valued fuzzy subgroup of G.

**Definition:** A $(t,s)$ −Bipolar valued fuzzy subgroup $A^{(t,s)} =< P^t, N^s >$ of a group G is said to be $(t,s)$ −Bipolar valued fuzzy normal subgroup of $G$, if for all $x, y \in G$

$P^t(y^{-1}xy) \geq P^t(x)$ and $N^s(y^{-1}xy) \leq N^s(x)$

**Example:** Let $G = S_3 = \{1, a, a^2, b, ab, a^2b\}$ and $A^{(0.80,-0.95)} =< P^{0.80}, N^{-0.95} >$ be a $(0.80, -0.95)$ −Bipolar valued fuzzy subset with respect to the Bipolar valued fuzzy subset $A =< P, N >$ of $G$ such that

$P(1) = 0.85, P(a) = P(a^2) = 0.95$

$P(b) = P(ab) = P(a^2b) = 0.40$
and
$N(1) = -0.90, N(a) = N(a^2) = -0.95$
$N(b) = N(ab) = N(a^2b) = -0.30$
Then $A^{(0.80,-0.95)} =< P^{0.80}, N^{-0.95} >$ is a $(0.80, -0.95)$ −Bipolar fuzzy normal subgroup of G.

**Definition:** Let $A^{(t,s)} =< P^t, N^s >$ and $B^{(t,s)} =< C^t, D^s >$be two (t,s)- Bipolar fuzzy subgroups of a group G. Then, $A^{(t,s)} =< P^t, N^s >$ is said to be fuzzy conjugate of $B^{(t,s)} =< C^t, D^s >$ if for some $x \in G$,
$P^t(y) = C^t(x^{-1}yx)$
$N^s(y) = D^s(x^{-1}yx)$ for all $y \in G$.

**Definition:** For a Bipolar valued fuzzy subgroup $A^{(t,s)} =< P^t, N^s >$ of a group G, the Normalizer of $A^{(t,s)} =< P^t, N^s >$ is denoted and defined by
$\mathbb{N}(A^{(t,s)}) = \{y \in G: P^t(y^{-1}xy) \geq P^t(x), N^s(y^{-1}xy) \leq N^s(x)$ for all $x \in G\}$.

**Theorem:** Let $A^{(t,s)} =< P^t, N^s >$ be a $(t, s)$ −Bipolar fuzzy subgroup of a group G. Then, $\mathbb{N}(A^{(t,s)})$ is a subgroup of G, $A^{(t,s)} =< P^t, N^s >$ is a $(t, s)$ −Bipolar valued fuzzy normal if and only if $\mathbb{N}(A^{(t,s)}) = G$.
**Proof:** Let $y_1, y_2 \in \mathbb{N}(A^{(t,s)})$. To prove $y_1y_2^{-1} \in \mathbb{N}(A^{(t,s)})$. Now for any $x \in G$,
$P^t[(y_1y_2^{-1})^{-1}x(y_1y_2^{-1})] = P^t[(y_2y_1^{-1})x(y_1y_2^{-1})]$
$= P^t[y_2(y_1^{-1}xy_1)y_2^{-1}] = P^t[(y_2^{-1})^{-1}(y_1^{-1}xy_1)y_2^{-1}]$
$\geq P^t(x)$ and $N^s[(y_1y_2^{-1})^{-1}x(y_1y_2^{-1})] = N^s[(y_2y_1^{-1})x(y_1y_2^{-1})]$
$= N^s[y_2(y_1^{-1}xy_1)y_2^{-1}] = N^s[(y_2^{-1})^{-1}(y_1^{-1}xy_1)y_2^{-1}]$
$\leq N^s(y_1^{-1}xy_1) \leq N^s(x)$. That is, $y_1y_2^{-1} \in \mathbb{N}(A^{(t,s)})$. Tharefore, $\mathbb{N}(A^{(t,s)}) \leq G$

**Definition:** Let $A^{(t,s)} =< P^t, N^s >$ be a $(t, s)$ −Bipolar valued fuzzy subgroup of a group G. Then, $t, s)$ −Bipolar valued fuzzy right coset of $A^{(t,s)} =< P^t, N^s >$ in $G$ determined by $x \in G$ is a Bipolar valued fuzzy subset $A_x{}^{(t,s)} =< P_x{}^t, N_x{}^s >$ of $G$ i.e. $P_x{}^t: G \to [0,1]$ defined by $P_x{}^t(y) = P^t(x^{-1}y)$ and $N_x{}^s: G \to [-1,0]$ defined by $N_x{}^s(y) = N^s(x^{-1}y)$.
A $(t, s)$ −Bipolar valued left coset of $A^{(t,s)} =< P^t, N^s >$ in G determined by $x \in G$ is a $(t, s)$ −Bipolar valued fuzzy subset ${}_xA^{(t,s)} =< {}_xP^t, {}_xN^s >$ of G. i.e. ${}_xP^t: G \to [0,1]$ defined by ${}_xP^t(y) = P^t(yx^{-1})$ and ${}_xN^s: G \to [-1,0]$ defined by ${}_xN^s(y) = N^s(yx^{-1})$.

**Theorem:** Let $A^{(t,s)} =< P^t, N^s >$ be a $(t, s)$ −Bipolar valued fuzzy subgroup of a group G. Then, $A^{(t,s)} =< P^t, N^s >$ is $(t, s)$ − Bipolar fuzzy normal subgroup of $G$ if and only if for all $x \in G$, ${}_xP^t = P_x{}^t$ and ${}_xN^s = N_x{}^s$.
**Proof:** Let us assume $A^{(t,s)} =< P^t, N^s >$ is $(t, s)$ −Bipolar valued fuzzy normal subgroup of G. To prove for all $x \in G$, ${}_xP^t = P_x{}^t$ and ${}_xN^s = N_x{}^s$. Now, ${}_xP^t(y) = P_x{}^t(y)$
i.e. $P^t(x^{-1}y) = P^t(yx^{-1})$
Now
$P^t(x^{-1}y) = P^t(x^{-1}yx^{-1}x) = P^t(x^{-1}(yx^{-1})x) \geq P^t(yx^{-1})$
And
$P^t(yxx^{-1}) = P^t(xx^{-1}yx^{-1}) \geq P^t(x^{-1}y)$
$P^t(x^{-1}y) = P^t(yxx^{-1})$
${}_xP^t(y) = P_x{}^t(y)$
${}_xP^t = P_x{}^t$
Now to prove, ${}_xN^s(y) = N_x{}^s(y)$. That is,
$N^s(x^{-1}y) = N^s(yx^{-1})$
Now, $N^s(x^{-1}y) = N^s(x^{-1}yxx^{-1}x) = N^s(x^{-1}(yxx^{-1})x) \leq N^s(yx^{-1})$
$N^s(yx^{-1}) = N^s(xx^{-1}yx^{-1}) \leq N^s(x^{-1}y)$
$N^s(x^{-1}y) = N^s(yx^{-1})$
And
${}_xN^s(y) = N_x{}^s(y)$
${}_xN^s = N_x{}^s$

Conversely assume for all, $x \in G$, ${}_xP^t = P_x{}^t$ and ${}_xN^s = N_x{}^s$. To prove $A^{(t,s)} =< P^t, N^s >$ is $(t,s)$ −Bipolar valued fuzzy normal subgroup of G..

Now for any $x, y \in G$.

$P^t(x^{-1}yx) = {}_xP^t(yx) = P_x{}^t(yx) = P^t(yxx^{-1}) = P^t(y) \geq P^t(y)$

$P^t(x^{-1}yx) \geq P^t(y)$

Similarly, $N^s(x^{-1}yx) = {}_xN^s(yx) = N_x{}^s(yx) = N^s(yxxx^{-1}) = N^s(y) \leq N^s(y)$

$N^s(x^{-1}yx) \leq N^s(y)$.

Hence, $A^{(t,s)} =< P^t, N^s >$ is $(t,s)$ −Bipolar valued fuzzy normal subgroup of G.

**Definition:** A $(t,s)$ −Bipolar valued fuzzy subgroup $A^{(t,s)} =< P^t, N^s >$of a group G is said to be $(t,s)$ −Bipolar valued fuzzy abelian subgroup of $G$ if and only if for all $x, y \in G$,

$P^t(xy) = P^t(yx)$ and $N^s(xy) = N^s(yx)$

**Theorem:** For a $(t,s)$ −Bipolar valued fuzzy subgroup $A^{(t,s)} =< P^t, N^s >$ of a group G the following are equivalent:

i. i). $A^{(t,s)} =< P^t, N^s >$ is $(t,s)$ −Bipolar valued fuzzy abelian subgroup of G

ii. ii). $A^{(t,s)} =< P^t, N^s >$ is Bipolar valued fuzzy normal subgroup of G.

**Remark:** Let $A^{(t,s)} =< P^t, N^s >$ be a $(t,s)$ −Bipolar valued fuzzy subgroup of a group G. Then,

$\mathbb{N}(A^{(t,s)}) = \{y \in G: P^t(xy) = P^t(yx)$ and $N^s(xy) = N^s(yx)$ for all $x \in G\}$

**Theorem:** Let $A^{(t,s)} =< P^t, N^s >$ be a $(t,s)$ −Bipolar valued fuzzy subgroup of a group $G$. Then, the cardinality of $A^{(t,s)^u} = \{< P^{tu}, N^{su} >: u \in G\}$ is equal to index of $\mathbb{N}(A^{(t,s)})$ in G, where $A^{(t,s)^u} = \{< P^{tu}, N^{su} >: u \in G\}$ is $(t,s)$ −Bipolar valued conjugate fuzzy subgroup G defined by $P^{tu}(x) = P^t(u^{-1}xu)$ and $N^{su}(x) = N^s(u^{-1}xu)$ for all $x \in G$.

**Proof:** To prove $T = \left\{ \begin{matrix} A^{(t,s)^u} = \{< \\ P^{tu}, N^{su} >: u \in G\} \end{matrix} \right\}$ and $T = \{u\mathbb{N}(A^{(t,s)}): u \in G \; and \; A^{(t,s)} =< P^t, N^s >\}$ are equivalent.

Define $: T \to T'$ by $\varphi\left(A^{(t,s)^u}\right) = u\mathbb{N}(A^{(t,s)})$. For any $u_1, u_2 \in G$,

$P^{tu_1} = P^{tu_2}$

$P^t(u_1^{-1}xu_1) = P^t(u_2^{-1}xu_2)$ for all $x \in G$

$P^t(xu_2^{-1}u_1) = P^t(u_2^{-1}u_1x)$ for all $x \in G$

Similarly, $N^{su_1} = N^{su_2}$

$N^s(u_1^{-1}xu_1) = N^s(u_2^{-1}xu_2)$ for all $x \in G$

$N^s(xu_2^{-1}u_1) = N^s(u_2^{-1}u_1x)$ for all $x \in G$

$u_2^{-1}u_1 \in \mathbb{N}(N^s), u_1\mathbb{N}(N^s) = u_2\mathbb{N}(N^s)$

so, $\varphi$ is bijective from T to T'. Hence the result.

**Remark:** With usual meanings, $1_x oP^t = {}_xP^t, 1_x oN^s = {}_xN^s$ and $P^t o1_x = P_x{}^t, N^s o1_x = N_x{}^s$

**Theorem:** Let $A^{(t,s)} =< P^t, N^s >$ be a $(t,s)$ −Bipolar valued fuzzy normal subgroup of a group $G$. Then, for all $x_1, x_2 \in G$,

i. $P_{x_1}{}^t \circ P_{x_2}{}^t = P_{x_1x_2}$ and $N_{x_1}{}^s \circ N_{x_2}{}^s = N_{x_1x_2}{}^s$.

ii. $P_{x_1}{}^t oP_{x_2} = P_{x_1x_2}$ and ${}_{x_1}N^s \circ {}_{x_2}N^s = {}_{x_1x_2}N^s$

**Theorem:** Let G be a group and $A^{(t,s)} =< P^t, N^s >$ be a$(t,s)$ − Bipolar valued fuzzy normal subgroup of $G$. Then, the set $G/A^{(t,s)} = \{ {}_xA^{(t,s)} =< {}_xP^t, {}_xN^s >: x \in G\}$ is group. (It is called a factor group or quotient group).

**Proof:** For ${}_{x_1}A^{(t,s)} =< {}_{x_1}P^t, {}_{x_1}N^s >, {}_{x_2}A^{(t,s)} =< {}_{x_2}P^t, {}_{x_2}N^s > \in G/f$

Define ${}_{x_1}A^{(t,s)} \circ {}_{x_2}A^{(t,s)} = \langle {}_{x_1}P^t \circ {}_{x_2}P^t, {}_{x_1}N^s \circ {}_{x_2}N^s \rangle$

Then, $G/f$ is closed.

Also, " o " is associative in $G/f$. If e is identity in G , then ${}_eA^{(t,s)} = \langle {}_eP^t, {}_eN^s \rangle \in G/f$ and for all

$${}_xA^{(t,s)} = < {}_xP^t, {}_xN^s > \in \frac{G}{f}$$

$${}_eP^t o\ {}_xP^t = {}_{ex}P^t = {}_xP^t$$

$${}_xP^t o\ {}_eP^t = {}_{xe}P^t = {}_xP^t$$

and

$${}_eN^s \text{ o } {}_xN^s = {}_{ex}N^s = {}_xN^s$$

$${}_xN^s \text{ o } {}_eN^s = {}_{xe}N^s = {}_xN^s$$

So, ${}_xA^{(t,s)} \circ {}_eA^{(t,s)} = {}_eA^{(t,s)} \circ {}_xA^{(t,s)} = {}_xA^{(t,s)}$

${}_eA^{(t,s)} = \langle {}_eP^t, {}_eN^s \rangle$ is identity in $G/f$.

Also as for every, ${}_xA^{(t,s)} = \langle {}_xP^t, {}_xN^s \rangle \in G/f$

we have, ${}_{x^{-1}}A^{(t,s)} = \langle {}_{x^{-1}}P^t, {}_{x^{-1}}N^s \rangle \in G/f$

such that

$${}_xA^{(t,s)} \circ {}_{x^{-1}}A^{(t,s)} = \langle {}_xP^t \circ {}_{x^{-1}}P^t, {}_xN^s \circ {}_{x^{-1}}N^s \rangle$$

$$= \langle {}_{xx^{-1}}P^t, {}_{xx^{-1}}N^s \rangle = \langle {}_eP^t, {}_eN^s \rangle = {}_eA^{(t,s)}$$

and

$${}_{x^{-1}}A^{(t,s)} \circ {}_xA^{(t,s)} = \langle {}_{x^{-1}}P^t \circ {}_xP^t, {}_{x^{-1}}N^s \circ {}_xN^s \rangle$$

$$= \langle {}_{x^{-1}x}P^t, {}_{x^{-1}x}N^s \rangle = \langle {}_eP^t, {}_eN^s \rangle = {}_eA^{(t,s)}$$

So, for every ${}_xA^{(t,s)} \in G/f$ , ${}_{x^{-1}}A^{(t,s)} \in G/f$ and ${}_{x^{-1}}A^{(t,s)}$acts as inverse of ${}_xA^{(t,s)}$ in $G/f$. Hence $G/f$ is group.

## ABSTRACT

Pharmacogenomics plays an increasingly important role in precision medicine by allowing drug therapy to be tailored according to individual genetic differences. The successful clinical use of pharmacogenomic insights, however, depends largely on how effectively this information is incorporated into regulatory drug labeling. In real-world practice, notable differences exist among regulatory authorities in the assessment, presentation, and clinical interpretation of pharmacogenomic data. This study evaluates how pharmacogenomic evidence is integrated into drug labels and explores areas of agreement and divergence across major regulatory systems. A descriptive and comparative approach was employed using publicly accessible drug labels, biomarker databases, regulatory guidance documents, and established pharmacogenomic knowledge resources. Twenty representative gene–drug pairs covering multiple therapeutic areas were analyzed using predefined criteria, including genetic testing requirements, evidence strength, variant specificity, label location, and clinical relevance. The results demonstrate substantial variability across agencies in gene–drug acknowledgment and recommendation intensity, with limited concordance with existing clinical pharmacogenomic guidelines. Case-based findings suggest that inconsistent labeling may affect prescribing behavior, pose potential safety concerns, and limit uniform clinical adoption. Overall, the study highlights the need for improved regulatory

alignment to facilitate the consistent translation of pharmacogenomic evidence into clinical practice and drug development.

## INTRODUCTION

**Pharmacogenomics and Regulatory Decision-Making in Precision Medicine**

Pharmacogenomics (PGx) examines how inherited or acquired genetic variation contributes to interindividual differences in drug response, safety, and dosing requirements. Variants in genes encoding drug-metabolizing enzymes, transporters, immune response elements, and molecular targets can significantly influence pharmacokinetic and pharmacodynamic outcomes, thereby shaping therapeutic efficacy and risk of adverse drug reactions [1–4]. Advances in genomic technologies and expanding clinical evidence have positioned PGx as a foundational component of precision medicine, enabling more individualized and safer pharmacotherapy across multiple therapeutic areas [5].

**Regulatory Relevance of Pharmacogenomic Evidence**

From a regulatory science perspective, the clinical utility of pharmacogenomic knowledge depends not only on scientific discovery but also on how genetic evidence is evaluated, contextualized, and translated into actionable guidance within regulatory drug labeling. Drug labels serve as the most authoritative and legally binding mechanism through which regulators communicate benefit–risk assessments to healthcare professionals. Regulatory incorporation of PGx information therefore represents a critical interface between genomic science, clinical pharmacology, and public health policy [6–8].

**Integration of Pharmacogenomics Across the Drug Lifecycle**

Regulatory agencies increasingly encounter PGx data throughout the medicinal product lifecycle, including during clinical development, marketing authorization, and post-marketing surveillance. Genetic evidence may inform patient selection, dose optimization, contraindications, or risk mitigation strategies, depending on the strength and nature of the underlying association [9–11]. However, substantial variability exists in how regulators interpret evidentiary sufficiency, define clinical actionability, and determine the appropriate placement and strength of PGx information within labeling documents [12–14].

**Biomarker Types and Regulatory Implications**

A key source of regulatory complexity arises from the heterogeneous nature of pharmacogenomic biomarkers. Germline variants affecting drug metabolism or immune-mediated toxicity are most frequently incorporated into regulatory labeling, while somatic mutations play a dominant role in oncology indications through predictive biomarkers and companion diagnostics [15–17]. Regulators further distinguish biomarkers based on functional role, including predictive markers guiding treatment selection, safety markers associated with serious adverse reactions, and pharmacokinetic markers influencing drug exposure. These distinctions directly affect regulatory thresholds for actionability and the resulting labeling language [18–20].

**Regulatory Fragmentation and the Need for Harmonization**

Despite a largely shared scientific evidence base, regulatory approaches to PGx labeling remain fragmented across jurisdictions. Differences in statutory mandates, evidentiary thresholds, population considerations, and risk tolerance have resulted in discordant labeling outcomes for identical gene–drug pairs [21–24]. Some agencies emphasize clinical outcome data when determining label actionability, whereas others accept robust pharmacokinetic or mechanistic evidence in the absence of prospective trials. Inconsistent terminology and variation in label placement

further complicate clinical interpretation and cross-regional implementation [25,26]. Such regulatory heterogeneity has important implications for clinical practice and global drug development. Divergent PGx labeling may lead to inconsistent prescribing behavior, unequal access to genotype-guided therapy, and challenges in harmonizing multinational development programs [27–29]. At the same time, overly conservative labeling may delay clinical adoption of well-supported PGx interventions, while overly prescriptive approaches may raise concerns related to equity, feasibility, and medico-legal responsibility [30].

**Study Rationale and Objectives**

Against this backdrop, the present study undertakes a systematic comparative analysis of pharmacogenomic integration into regulatory drug labeling across major regulatory authorities. By examining how PGx evidence is recognized, operationalized, and communicated in approved labels, this work aims to elucidate patterns of regulatory convergence and discordance, identify their underlying drivers, and assess implications for clinical implementation and regulatory harmonization. Through quantitative analysis and detailed case studies, the study contributes empirically grounded insights to the evolving field of pharmacogenomics-informed regulatory science [31–33].

**Regulatory Frameworks Governing Pharmacogenomic Labeling**

Although pharmacogenomic (PGx) science is globally shared, its translation into regulatory drug labeling is shaped by jurisdiction-specific legal mandates, public health priorities, and evidentiary standards. Major regulatory authorities—including the United States Food and Drug Administration (FDA), the European Medicines Agency (EMA), and the Pharmaceuticals and Medical Devices Agency (PMDA)—have progressively incorporated PGx information into approved product labeling, but differ substantially in how genetic evidence is interpreted and operationalized [6,12,13]. The FDA adopts a flexible, evidence-tiered approach in which pharmacogenomic information is distributed across multiple label sections according to perceived clinical relevance. Strong genotype–phenotype associations linked to safety or well-established clinical outcomes may result in mandatory testing or explicit prescribing guidance, whereas associations supported primarily by pharmacokinetic or mechanistic evidence are often communicated descriptively to support clinical judgment [8,9,14]. In contrast, the EMA integrates PGx information through the harmonized Summary of Product Characteristics, generally favoring conservative and context-driven language, with prescriptive genetic testing requirements typically limited to scenarios supported by robust clinical outcome data [20–22]. The PMDA framework places particular emphasis on population-specific considerations and post-marketing risk management. Japanese labeling practices frequently highlight genetic influences on drug exposure or safety within the context of national genetic epidemiology, often providing detailed guidance on appropriate use and monitoring while remaining cautious in mandating pre-treatment testing [11,15,17]. Together, these differing regulatory philosophies illustrate how identical pharmacogenomic evidence can yield divergent labeling outcomes across jurisdictions. Such variability has important implications for global precision medicine. Divergent PGx labeling complicates multinational drug development, contributes to inconsistent clinical implementation, and underscores the need for systematic comparative evaluation of regulatory decision-making. These regulatory differences provide the foundation for the comparative analyses presented in this study [27–29].

## METHODOLOGY

**Study Design and Analytical Approach**

This study employed a descriptive–comparative regulatory analysis to evaluate how pharmacogenomic (PGx) information is interpreted, operationalized, and communicated through regulatory drug labeling. A qualitative comparative framework was selected because PGx labeling represents a regulatory outcome shaped not only by scientific evidence, but also by evidentiary thresholds, policy mandates, population considerations, and institutional risk tolerance. Quantitative counts alone are insufficient to capture these dimensions; therefore, structured qualitative comparison was used to identify patterns of regulatory convergence and discordance across jurisdictions [1–3]. The analysis focused on approved medicinal products with established pharmacogenomic relevance, enabling

examination of real-world regulatory decisions rather than theoretical guidance. Comparative evaluation across regulatory agencies allowed assessment of differences in labeling intent, clinical action ability, and regulatory interpretation of identical gene–drug associations.

**Data Sources**

Data were derived exclusively from publicly available and authoritative regulatory sources to ensure transparency and reproducibility. Primary sources included approved prescribing information, package inserts, and official pharmacogenomic biomarker listings published by the United States Food and Drug Administration (FDA), the European Medicines Agency (EMA), and the Pharmaceuticals and Medical Devices Agency (PMDA). These documents represent the legally binding expression of regulatory decisions and were treated as the definitive basis for analysis [14,17–24]. Secondary sources included publicly available regulatory guidance documents related to pharmacogenomics, biomarker qualification, and clinical pharmacology. Curated pharmacogenomic knowledge bases and clinical guideline repositories—specifically CPIC and DPWG—were consulted strictly as clinical reference frameworks to contextualize regulatory labeling content and assess translational alignment, not as sources of regulatory authority.

**Drug Selection Criteria**

Twenty gene–drug pairs were purposively selected using predefined inclusion criteria designed to maximize analytical relevance. Eligible drugs were required to (i) have a documented pharmacogenomic association supported by regulatory labeling, peer-reviewed evidence, or established pharmacogenomic guidelines; (ii) be approved by at least one of the three regulatory agencies; and (iii) demonstrate either regulatory convergence or divergence in PGx labeling across jurisdictions. To ensure breadth and generalizability, selected drugs represented diverse therapeutic areas, including oncology, infectious diseases, psychiatry, cardiology, neurology, and immunology. This purposive sampling strategy enabled focused evaluation of how regulatory interpretation varies across clinical contexts while maintaining consistency in analytical depth [6,14].

**Comparative Parameters and Definitions**

Each regulatory label was evaluated using a standardized set of analytical parameters applied consistently across agencies. PGx information was classified according to regulatory intent as required, recommended, actionable, or informational, reflecting increasing levels of implied clinical obligation. Variant specificity was assessed based on whether labels referenced allele-level information, broader genotypic categories, or inferred phenotypes such as poor or intermediate metabolizers. Clinical action ability was evaluated by determining whether labels provided explicit guidance on dose adjustment, contraindication, alternative therapy selection, or enhanced monitoring. Label section placement was also documented to assess visibility and potential impact on prescribing behavior. Cross-agency concordance or discordance was defined based on alignment across these parameters, allowing systematic identification of harmonized and divergent regulatory outcomes [16–18].

**Methodological Rigor and Scope**

All evaluations were conducted using identical criteria across regulatory frameworks to minimize interpretive bias. Differences in terminology or document structure were interpreted within the context of agency-specific regulatory practices rather than treated as analytical inconsistencies. The methodology was designed to prioritize regulatory intent and clinical signaling rather than biological reassessment of gene–drug validity, which has been extensively addressed elsewhere. This structured approach provides a reproducible and policy-relevant framework for assessing regulatory integration of pharmacogenomics and supports the comparative analyses presented in subsequent sections.

## RESULTS AND DISCUSSIONS

**Overview of Regulatory Integration of Pharmacogenomic Information**

Comparative evaluation of regulatory drug labeling across the United States Food and Drug Administration (FDA), European Medicines Agency (EMA), and Pharmaceuticals and Medical Devices Agency (PMDA) revealed substantial variability in the recognition, interpretation, and operationalization of pharmacogenomic (PGx) evidence. Although all three agencies acknowledge the clinical relevance of genetic variability, the extent to which PGx information is translated into actionable regulatory guidance differs markedly. Quantitative analysis demonstrates that PGx labeling is most consistently applied to gene–drug pairs associated with severe safety risks or predictive oncology biomarkers, whereas pharmacokinetic associations show greater regulatory divergence [6,14,15]. The FDA more frequently incorporates mandatory or recommended genetic testing language for high-risk associations, while the EMA predominantly adopts advisory or descriptive phrasing, particularly for metabolism-related biomarkers. In contrast, the PMDA exhibits a comparatively higher proportion of actionable PGx guidance relative to its total number of PGx-labeled drugs, reflecting a regulatory emphasis on dose optimization and population-specific risk management.

**Distribution of pharmacogenomic labeling categories across FDA, EMA, and PMDA(Table 1)**

Summary of drugs containing pharmacogenomic information in regulatory labeling databases of FDA, EMA, and PMDA, categorized by regulatory signaling strength. Classifications reflect regulatory labeling intent and do not correspond to clinical guideline mandates.

**Clinical Actionability and Labeling Strength**

Assessment of clinical action ability indicates that the presence of PGx information in regulatory labels does not uniformly translate into explicit prescribing guidance. Only a subset of PGx-labeled drugs across agencies include clear recommendations for dose adjustment, contraindication, or alternative therapy selection. This pattern is particularly evident for CYP-mediated pharmacokinetic associations, where strong biological plausibility often coexists with limited prospective clinical outcome data [7,8,18]. These findings highlight a structural distinction between regulatory recognition of PGx evidence and regulatory endorsement of clinical action ability. Regulatory authorities appear to calibrate labeling strength based not only on scientific validity but also on uncertainty tolerance, legal accountability, and anticipated clinical impact.

**Clinical actionability of pharmacogenomic information in regulatory drug labels (Table 2).**

Assessment of whether pharmacogenomic information is translated into explicit prescribing guidance, including dose adjustment, contraindication, or alternative therapy recommendations.

**Regulatory Discordance and Harmonization Patterns**

Analysis of drugs commonly labeled across all three agencies reveals that regulatory discordance predominates over harmonization. Harmonized labeling is largely confined to gene–drug pairs supported by robust clinical or safety evidence, such as HLA-associated hypersensitivity reactions and oncogenic driver mutations. In contrast, discordant labeling is frequently observed for exposure-modifying variants where evidence is derived primarily from pharmacokinetic or observational studies [10–12,14]. These patterns suggest that regulatory convergence occurs primarily at higher evidentiary thresholds, whereas lower or intermediate tiers of evidence are subject to divergent regulatory interpretation. Importantly, this discordance reflects structured differences in regulatory mandates rather than disagreement on the underlying genomic science.

**Regulatory harmonization and discordance in pharmacogenomic labeling across FDA, EMA, and PMDA (Table 3).**

Classification of commonly labeled drugs based on concordance or discordance in the presence and clinical actionability of pharmacogenomic information across regulatory authorities.

**Insights from Case Studies of Gene–Drug Pairs**

The 20 case studies examined provide drug-level insight into the mechanisms driving regulatory convergence and divergence. Gene–drug pairs involving severe immune-mediated toxicity demonstrate partial convergence, with FDA and EMA more frequently mandating or recommending testing, while PMDA often provides informative or alternative actionable guidance. Conversely, pharmacokinetic examples illustrate scenarios in which PMDA includes explicit dose-adjustment recommendations while FDA and EMA restrict labeling to descriptive statements despite similar evidence bases [11–13]. These case studies confirm that regulatory discordance is predictable and context-dependent, shaped by therapeutic area, biomarker type, and population relevance. Importantly, several cases demonstrate misalignment between regulatory labeling and clinical guideline recommendations, underscoring translational gaps that may affect clinician confidence and real-world PGx implementation [9,13].

**Comparative Case Studies of Selected Gene–Drug Pairs Illustrating Regulatory Discordance(Table 4).**

Comparative overview of 20 representative gene–drug pairs demonstrating differences in pharmacogenomic labeling across FDA, EMA, and PMDA. Regulatory classifications reflect labeling decisions and do not represent clinical guideline authority.

**Alignment with Clinical Guidelines and Knowledgebases**

Comparison with CPIC and DPWG guidelines indicates that clinical practice recommendations frequently extend beyond the actionability reflected in regulatory labels. Guidelines often provide genotype-specific dosing algorithms or alternative therapy recommendations that are only partially incorporated—or absent—in regulatory labeling. This divergence reflects fundamental differences in institutional purpose: regulators prioritize population-level benefit–risk assessment and legal robustness, whereas guideline bodies focus on optimizing individual patient care [10–12]. Pharmacogenomic knowledgebases support evidence synthesis and cross-validation but lack formal regulatory authority. While they play an increasingly important role in contextualizing PGx evidence, variability in update frequency and evidence thresholds limits their direct regulatory applicability.

**Alignment of Regulatory Pharmacogenomic Labeling with CPIC and DPWG Clinical Guidelines (Table 5).**

Comparison of regulatory labeling actionability with recommendations from CPIC and DPWG. Guideline recommendations are presented for translational context only and do not represent regulatory authority.

**Challenges to Global Harmonization**

Persistent regulatory discordance arises from interrelated scientific, regulatory, and operational barriers. Scientific challenges include uncertainty in variant interpretation and limited population diversity in evidence generation. Regulatory challenges stem from divergent statutory mandates, evidentiary thresholds, and liability considerations. Operational constraints, including delayed label updates and lifecycle management complexity, further impede timely and consistent PGx integration [1–3,9]. These barriers collectively explain why harmonization remains limited despite a shared scientific foundation and highlight the need for proportionate, evidence-responsive regulatory frameworks.

**Toward a Harmonized Regulatory Framework**

To address these challenges, this study supports adoption of a tiered evidence-based approach to PGx labeling, linking regulatory actionability to evidentiary strength. Standardized terminology and clearly defined actionability levels could improve clarity, reduce ambiguity, and facilitate cross-jurisdictional consistency. Dynamic label-updating mechanisms and structured regulatory collaboration may further enhance alignment between regulatory labeling and evolving clinical evidence [4–6].

**Barriers to Harmonized Pharmacogenomic Labeling and Proposed Regulatory Solutions (Table 6).**

Summary of scientific, regulatory, and operational barriers contributing to global discordance in PGx labeling, alongside proposed regulatory science solutions.

**Implications and Concluding Perspective**

Collectively, these findings demonstrate that regulatory integration of pharmacogenomics is heterogeneous, structured, and policy-driven. While harmonization is achievable for high-certainty safety and predictive biomarkers, substantial variability persists for pharmacokinetic associations. Advancing consistent global implementation of PGx-guided therapy will require regulatory frameworks that balance scientific rigor with translational agility. By providing a systematic comparative analysis and empirically grounded synthesis, this study contributes to regulatory science efforts aimed at integrating genomic evidence into drug labeling in a manner that supports patient safety, clinical utility, and precision medicine.

## CONCLUSION

This study provides a systematic comparative assessment of how pharmacogenomic (PGx) evidence is translated into regulatory drug labeling across major regulatory authorities. The findings demonstrate that, despite a shared scientific foundation, the integration of PGx information into regulatory labels remains heterogeneous and strongly shaped by jurisdiction-specific evidentiary thresholds, policy mandates, and population considerations. Harmonization is most evident for gene–drug pairs associated with severe safety risks or predictive oncology biomarkers, whereas substantial discordance persists for pharmacokinetic associations supported primarily by mechanistic or observational evidence. By combining quantitative analysis with structured case studies, the study shows that regulatory discordance is neither arbitrary nor evidence-agnostic, but reflects systematic differences in how agencies balance scientific uncertainty, clinical actionability, and public health responsibility. The observed misalignment between regulatory labeling and clinical practice guidelines further underscores a translational gap that may affect clinician confidence and real-world implementation of PGx-guided therapy. Importantly, the analysis highlights that effective integration of pharmacogenomics into regulatory practice requires proportionate, transparent, and evidence-tiered approaches rather than uniform prescriptive mandates. Adoption of standardized terminology, clearer definitions of actionability, and dynamic mechanisms for updating PGx content could improve consistency while preserving regulatory autonomy. Strengthened collaboration among regulatory authorities, guideline bodies, and pharmacogenomic knowledgebases may further support convergence without compromising scientific rigor or population relevance. In conclusion, advancing harmonized pharmacogenomic labeling is essential for realizing the full potential of precision medicine. By clarifying the structural drivers of regulatory variability and proposing pragmatic pathways toward alignment, this work contributes to regulatory science efforts aimed at improving patient safety, enhancing clinical utility, and supporting globally consistent implementation of pharmacogenomics in drug therapy.

## ACKNOWLEDGEMENT

I express my gratitude to the Chalapathi Institute of Pharmaceutical Sciences for their unwavering support, as well as to Mr. Koushik Yetukuri for his guidance and help in seeing this article through to completion.

## ABSTRACT

Ichthyosis vulgaris is a hereditary keratinization disorder caused by filaggrin gene mutations and usually appears at birth or early childhood. It presents with xerosis, fissuring, non-erythrodermic scaly lesions and tends to worsen in colder seasons, often affecting daily activities because of itching, burning and cosmetic concerns. Effective long-term treatments are limited, so there is a need for safer, supportive options. This case describes a 45-year-old woman with chronic scaly, fissured and pigmented patches on all limbs along with itching and burning, aggravated during monsoon and winter. She also had poor sleep, weak digestion and allergic rhinitis. Ayurvedic assessment showed Vata-Pitta dominant prakriti with Tridoshaja involvement and dushya dushti of Rasa, Rakta, Mamsa and Meda, correlating with the Ayurvedic understanding of Ekkustha. Management included internal medicines, Panchtikta Ghrita for dosha-shamana and bio-purification, Kaisor Guggulu, and Avipatikar Churna used internally, Nalpamaradi Taila was used externally. After fifteen days of inpatient care, the patient reported clear improvement in itching, scaling and burning sensation, along with better sleep, reduced pigmentation and relief in joint discomfort, without any adverse reactions. This case highlights the potential role of Ayurvedic therapy as a holistic, safe and effective approach for managing ichthyosis vulgaris and improving overall quality of life.

**Keywords:** Ichthyosis vulgaris, Ekkustha, Ayurvedic management, Panchtikta Ghrita, Kaisor Guggulu, Nalpamaradi Taila.

## INTRODUCTION

Ichthyosis vulgaris is a common hereditary disorder marked by dry and scaly skin due to a mutation affecting epidermal barrier function. It usually presents at birth or early childhood and accounts for almost 95 percent of inherited ichthyoses. The clinical picture often includes xerosis, fine to thick scaling, keratosis pilaris, and generalized scaly dermatosis without erythroderma. Although emollients, keratolytics, and oral retinoids provide temporary symptom relief, many patients continue to struggle with dryness, pruritus, and recurrent fissuring. These symptoms interfere with daily activities, social interactions, and overall well-being, which makes the condition a significant quality-of-life burden. From an Ayurvedic perspective, most chronic skin disorders fall under the broad category of Kushta. The features of ichthyosis vulgaris closely match Ekakushta, a subtype characterized by fish-like scales (matsya-shakala-sannibha), reduced sweating (aswedanam), and extensive involvement (mahasrayam). Ekakushta is mainly associated with vata and kapha imbalance, along with deeper dhatu involvement that makes the condition persistent and difficult to manage with symptomatic care alone. Ayurveda approaches such disorders through strategies that purify, restore balance, and correct underlying dosha disturbances. Therapies aim to reduce dryness, soften accumulated scales, and improve the integrity of the skin by addressing both systemic and local factors. In this case report, we describe the management of ichthyosis vulgaris with an Ayurvedic treatment plan. The patient demonstrated significant improvement in subjective symptoms, including dryness and itching, as well as objective changes in scaling, erythema, and lesion thickness. This case highlights the potential role of Ayurvedic interventions as supportive care in hereditary keratinisation disorders, such as ichthyosis vulgaris.

**Patient Information**

**Clinical history and symptomatology**

The patient, a 45-year-old woman, indicated that her skin issues began when she was approximately 5 years old. At first, she observed dryness and roughness of the skin, especially on her arms and legs, which tended to worsen during the winter months and improve somewhat in the summer. Over time, the condition steadily progressed, with ongoing dryness, fine scaling, and a rough skin texture becoming permanent characteristics. During her adolescence, she started to experience itching (pruritus) linked to the dryness, which intensified in colder environments. As the condition evolved, thickened plaques with fissures developed on both ankles, along with heightened roughness and irritation. She notes that exposure to cold weather, irregular eating patterns (including skipping meals and consuming dry, spicy, and cold foods), and disrupted sleep tend to worsen her symptoms. Additionally, she has a history of allergic rhinitis and chronic sleep disturbances, both of which are aggravated during the winter season. There is no record of oozing, bleeding, or pain in the affected areas. The patient has occasionally utilized emollients and home remedies for symptomatic relief but has not engaged in any long-term modern treatment for this condition.

**Family History**

No known family history of any type of skin diseases or systemic disorders. All the family members are reported to be healthy.

**Past History**

The Patient Has A History Of Recurrent Allergic Rhinitis, Particularly During Seasonal Changes. No Positive History of DM, HTN and Thyroid

**Personal history**

Diet – Mixed
Sleep – Disturbed sleep,
Bowel – 1 time a day
Micturition – 5-6 T/ day and 1 T/night
Appetite – Poor

**General examination**
The patient had a normal gait with no pallor, cyanosis, icterus, edema or lymphadenopathy, and no nail clubbing. Vital signs were stable with a pulse of 78 per minute, respiratory rate of 18 per minute, $SpO_2$ of 98%, blood pressure of 120/80 mmHg and temperature of 98.6°F. Anthropometric measurements showed a height of 150 cm, weight of 45 kg and BMI of 20 kg/m².

**Ashtasthana Pariksha** revealed a Vata-Pitta naadi, normal micturition and defecation, a clean tongue, normal voice and vision, anushna-shita sparsha and a krusha body build.

**Dashavidha Pariksha** showed a Vatapitta prakriti with tridosha vikriti, moderate sara, samhanana, satmya, satwa, pramana, ahara and jarana shakti, and moderate exercise tolerance; the patient was of the madhyama age group.

**Systemic Examination**
**Respiratory system**
**Inspection:** Bilaterally symmetrical shape of chest with no scar mark or bulge.
**Palpation:** Trachea centrally place
**Percussion:** Resonance present
**Auscultation:** wheezing sound heard

**Cardiovascular system**
**Inspection:** No distended blood vessels, scars or deformities
**Palpation:** apex beat felt
**Auscultation:** S1 S2 heard no added murmurs

**GIT**
**Inspection:** No distended blood vessels, scars or deformities
**Palpation:** apex beat felt, no organomegaly
**Percussion:** dull
**Auscultation:** bowel sound heard

**Central Nervous System**
**Consciousness:** alert, conscious
**Orientation:** Well oriented

**Augmentary examination**
- chronic excoriated, fissured lesions over both upper and lower limb,
- Blackish Pigmentation On B/L Upper And Lower Limb
- Plaque with fissure at B/L ankle region
- Crusting present

**Timeline**
Timeline of Symptoms, Intervention and Clinical Progress (Table 1).

**Diagnostic Assessment**
Based on the patient's presentation, the diagnostic assessment incorporated both modern and Ayurvedic perspectives. The characteristic findings of early onset dryness, prominent scaling, and symmetrical involvement of the extensor surfaces, along with dark lichenified plaques around the ankles and associated pruritus, supported a diagnosis of ichthyosis vulgaris. Additional features such as persistent xerosis, crusting, and nighttime itching reinforced the chronic and hereditary nature of the condition. On examination, palmar hyperlinearity and fine-to-moderate scaling further aligned with the typical phenotype of ichthyosis vulgaris. From an Ayurvedic standpoint,

the evaluation through Dashavidha and Ashtasthana Pariksha revealed a predominant vata-kapha imbalance, along with tridosha vikriti, which are consistent with the classical description of Ekakushta. The presence of matsya-shakala-sannibha scaling, aswedanam, and involvement of larger body areas correlated well with the diagnostic features mentioned in Ayurvedic texts. Together, the combined clinical and Ayurvedic findings supported the final diagnosis of Ekakushta corresponding to ichthyosis vulgaris.

**Diagnosis**

The diagnosis of ichthyosis vulgaris was established in view of the early age of onset, presence of generalized xerosis, fine to moderate scaling, symmetrically distributed over the limbs, fissuring around the ankle areas, hyperlinearity of the palms, and seasonal exacerbations. The absence of erythroderma, oozing, and systemic symptoms helped to rule out the diagnosis. The conditions that can be considered in the differential diagnosis of ichthyosis vulgaris are psoriasis, atopic dermatitis, and acquired ichthyosis. According to Ayurvedic classics, the patient had the symptomatology of Ekakushta, which was associated with matsyashakalas

Prognosis

Ichthyosis vulgaris in most cases is a chronic and non-life-threatening condition. Complete remission of the skin condition would not have been achieved in the patient's case, but the necessary symptomatic control and quality of life would have been achieved. The patient in this case had a good prognosis due to the considerable relief in scaling, xerosis, pruritus, and fissures achieved after the Ayurvedic treatment, in addition to the patient also having good compliance.

**Ayurvedic Analysis**

Ayurvedic evaluation revealed Ekakushta dominated by Vata-Kapha dosha involvement and Tridoshaja vikriti. Vitiation of Rasa, Rakta, Mamsa, and Meda dhatu explained the chronic dryness, scaling, and fissuring. Defective Agni resulted in Ama formation that contributed to srotas dysfunction and defective skin nourishment. The management strategy was Shamana Chikitsa with Tikta-pradhana, Snehana, and Agni-enhancing measures.

**Ayurvedic Analysis**

Ayurvedic evaluation revealed Ekakushta dominated by Vata-Kapha dosha involvement and Tridoshaja vikriti. Vitiation of Rasa, Rakta, Mamsa, and Meda dhatu explained the chronic dryness, scaling, and fissuring. Defective Agni resulted in Ama formation that contributed to srotas dysfunction and defective skin nourishment. The management strategy was Shamana Chikitsa with Tikta-pradhana, Snehana, and Agni-enhancing measures.

**Therapeutic Intervention(Table 2),(Figure 1)**

**Follow Up and Outcome**

On follow-up, the patient showed steady improvement in both subjective and objective symptoms. The plaques and blackish lichenification over the bilateral ankle region became softer with reduced thickness. Crusting decreased from moderate (++) to mild (+), and scaling reduced from moderate (++) to mild (+), indicating about 50–60 percent improvement in lesion severity. Night-time itching and the burning sensation over affected areas lessened, showing nearly 70 percent relief. Stool regularity improved, and burning micturition and general weakness reduced by about 60 percent. The papules in the urogenital region also diminished, showing almost 70 percent improvement. Pain in the small joints of the hands, shoulder and knee joints reduced by about 50 percent. Overall, the patient experienced significant symptomatic relief and better comfort during daily activities. The following table shows the improvement in key symptoms related to skin dryness and scaling after treatment. Each parameter was graded to assess the degree of change and overall therapeutic response. Changes in Clinical Symptoms Before and After Treatment (Table 3).

## DISCUSSION

*Ichthyosis Vulgaris*, although primarily genetic, has overlapping symptomatology with several Ayurvedic conditions involving *Twak vikaras*, such as *Kitibha*, *Ekakushta*, or *Charma kushta*. In this case, the chronic dry and fissured skin, itching, and crusting suggest Tridoshaja involvement, predominantly Vata and Pitta. These doshas vitiate *Rasa, Rakta, Mamsa*, and *Meda dhatus*, leading to the manifestation of symptoms. The Ayurvedic treatment plan focused on Shamana Chikitsa with a Rasayana and Tikta pradhana approach, aiming to pacify Vata and Pitta and purify the affected dhatus. For Vataja Kushtha, begin with ghritapana, while for Kaphaja kushtha, the vamana procedure is recommended. In pittaja kushtha cases, the primary treatment involves virechana anad raktamokshana. In the context of treating various types of skin disorders in in the vataj condition, the application of sarpi is recommended. In cases where there is pronounced scaling and dryness, Snehapan plays a significant role in managing ailment.Additionally, the utilization of Panchatikta Ghrita, as mentioned in Bhaishajya Ratnavali Kushtha Adhikar, serves as a commonly employed treatment involving Snehapan for skin diseases. The ingredient such as Patola, Guduchi, Nimba, found in the Ghrita, work synergistically to address imbalances in Vata, Kapha and Rakta. Regarding Panchtikta Ghrita, its decription can be found in Bhaisajya Ratnavali Kushtharogadhikar, while indications for Shaman Sneha pan are outlined in Charak Samhita Sutrasthana.Kaishor Guggulu exerts its effect in Eka Kushtha through Raktashodhana, Amapachana, and Tridosha Shaman. Herbs like Guduchi, Triphala, and Guggulu purify the blood, boost metabolism and reduce inflammation. Its Katu- Tikta Rasa and Ushna Veerya, relieve itching, scaling, and discoloration. Additionally, its antiallergic, antibacterial, and detoxifying properties support long – term disease control and prevent recurrence. Avipattikar Churna is the best medicine to eliminate all the toxins in the body (Sava Visheshu Cha) in the means of sukhavirechana (Mala which is expelled through defecation easily) and rechana (does mala paka and facilitates the adho vayu) because it contains Trivrit. It reduces the vitiated Pitta and Rakta dosha in the blood by ashrayi ashraya sambandha. The administration of *Panchtikta Ghrita* served as a deepana-pachana and dhatu-prasadaka, while *Kaisor Guggulu* addressed *rakta dushti* and inflammation. *Avipatikar churna* supported *Agni* and corrected digestive imbalance, addressing *ama* formation. Externally, the use of medicated oils provided snehana, alleviating dryness and scaling. Nalpamaradi Tail is useful in itching, scabies, Visarpa( erysipelas) and Kushtha( Skin disease) .Most drugs in Nalpamaradi taila contain tridoshashamaka quality, which is beneficial in maintaining skin health. Nalpamaradi Kera Taila is a classical formula that lightens the complexion while also softening, nourishing, and repairing the skin.Nalpamaradi means four Vriksha Twak, viz. Nyagrodha, Udumbara, Asvatha and Plaksa. It is indicated in Pama, Kandu, Pidaka, Kushtha, and Visarpa. Application of Nalpamaradi Taila would take care of Daha, Kandu, as it contains Ksheerivriksha Dravya, which are Kashayarasapradhana, pitta, and Kaphahara. It contains tannins as its main chemical constituents, which inhibit bacterial growth. The oil given for local application acts as a physical barrier (emollient type) as well. The therapy was well tolerated, and symptomatic relief was evident within days of initiation, especially in terms of reduced burning, itching, and lesion severity. Notably, her history of allergic rhinitis and disturbed sleep may be indicative of a systemic vitiation of doshas and chronic immune dysregulation. The internal Rasayana support likely contributed to systemic equilibrium, which is reflected in the reduction of associated symptoms like burning micturition, fatigue, and papules

## CONCLUSION

The current study emphasizes how Ayurvedic medication may help manage ichthyosis vulgaris. The prakriti (constitution), bala (strength), dosha, dhatu, and chronicity of the ailment were taken into consideration when designing the treatment regimen. Good skin texture resulted from significant relief in terms of decreased scaling, itching, dryness, and pain. Larger sample sizes and more clinical research are required to develop a standardized Ayurvedic therapy approach for ichthyosis.

**Patient Perspective**

"I have had problems with dry and scaly skin since childhood. This used to create problems of itching, burning, and discomfort, particularly in winter. With Ayurvedic treatment, I observed that the dryness, scaling, and itching have decreased significantly in a short period of time. Also, my sleep has improved, and I have no issues in carrying out my daily activities. This care has been simple and free of side effects. I feel that this method has proved beneficial in controlling my condition better and enhancing my quality of life."

**Informed Consent**

The patient has agreed to the publication of the case report containing their medical details and images related to their case. The patient has been explained what the case report entails and has agreed that their own personal details will be anonymized. The patient gave his/her assurance that his/her participation in this case report is voluntary and that he/she could withdraw consent at any time without it having any bearing on his/her medical treatment.

**Table 1: Timeline of Symptoms, Intervention and Clinical Progress**

| Date | Events | Key findings/interventions |
|---|---|---|
| 5 years of age | Onset of symptoms | She had dryness and roughness of the skin, especially on her arms and legs, which tended to worsen during the winter months and improve somewhat in the summer. |
| 22/04/2025 | First hospital visit to Agadatantra OPD (1st Setting) | Plaque with blackish lichenification was observed over the bilateral ankle regions, accompanied by marked crusting and scaling. The patient experiences increased itching at night along with a burning sensation over the affected areas. Also complained of constipation for 1 week. So, symptomatic treatment was |

| | | |
|---|---|---|
| | | advised as per table |
| 09/05/2025 | Second hospital visit to Agadatantra OPD (2nd Setting) | The patient reported burning micturition, the papular lesions at the urogenital area and generalised weakness. Additionally, pain in the small joints of the hands, shoulders, and knees. The itching and burning sensation at the affected skin areas had notably reduced, with crusting and scaling still present. persisted, while plaques with blackish lichenification over the bilateral ankle region showed mild improvement. Also reduced complaint of constipation. |
| 16/05/2025 | Third hospital visit to Agadatantra OPD (3rd Setting) | The patient reported complete relief from all symptoms. There was no burning micturition or generalised weakness, and the skin lesions had reduced, with absence of itching, scaling, crusting, or lichenification. The papular eruptions in the urogenital area had subsided entirely. The patient also experienced no pain in the small joints, shoulder, or knee joints, indicating overall symptomatic improvement and restoration of well-being. |

## ABSTRACT

The rising global interest in functional foods has spurred innovation in nutrient-dense, health-promoting food products. This study presents the optimization and functional characterization of a nutraceutical porridge mix infused with *Cissus quadrangularis* (CQ), a medicinal plant renowned for its bone-healing, anti-inflammatory, and antioxidant properties. Leveraging Response Surface Methodology (RSM) with a Box-Behnken design, the formulation was optimized based on sensory attributes—texture, color, flavor, mouthfeel, and overall acceptability—using varying proportions of red rice (30–50 g), moong bean dhal (30–40 g), and **Cissus quadrangularis** powder (5–10 g). Sensory evaluation by a trained panel identified an optimal blend yielding the highest overall acceptability score of 4.9 (on a 5-point hedonic scale). Statistical validation confirmed robust model fit, with $R^2$ values exceeding 0.95 for all sensory responses and significant p-values (<0.05) in ANOVA. The optimized mix demonstrated a balanced nutritional profile per 100 g: 213.2 kcal energy, 45.24 g carbohydrates, 7.47 g protein, low fat (0.75 g), and notable levels of calcium (34.4 mg), phosphorus (145.09 mg), and iron (2.10 mg). These nutrients, coupled with

CQ's bioactive compounds like β-sitosterol, resveratrol, and quercetin, enhance the mix's potential in supporting bone health and mitigating oxidative stress. The study bridges traditional herbal medicine with modern functional food development, offering a palatable, therapeutic breakfast option. This approach addresses growing concerns around osteoporosis—particularly in postmenopausal women—without reliance on synthetic hormone therapies.

**Keywords:** *Cissus quadrangularis,* Porridge mix, Osteoporosis

## INTRODUCTION

The growing consumer demand for functional foods has accelerated the development of nutrient-enriched formulations aimed at promoting health and wellness. *Cissus quadrangularis* L. (CQ), regionally known as Phet Sang Khat in Thailand, Hadjod in India, and Veldt grape, a traditional medicinal plant rich in phytochemicals, is renowned for its bone-healing, anti-inflammatory, and antioxidant properties This plant has significant potential in treating osteoporosis and fractures because of its mineral absorbing effect. In addition to this, it has antioxidant capacity due to its secondary metabolites and reduces the oxidative stress in cells [1], [2]. *Cissus quadrangular is* rich in bioactive compounds which includes phytosterols, alkaloids, steroids, resveratrol, carotene, piceatannol, pallidol, quercetin, nicotinic acid, triterpenoids, β-sitosterol, calcium, amyrone and ketosteroid [3]. A systematic review across indexed journals from 2003 to 2024, observed that *Cissus quadrangularis* administration in the form of supplements helps in bone protective effect. The bone healing properties of *Cissus quadrangularis* is due to the presence of β-sitosterol, lupeol components and vitamin C. Research showed that 25 mg in 100 mg slow release tablets raised the serum alkaline phosphatase, calcium and phosphorus levels. Preclinical studies showed that about 300-500 mg/ kg of *Cissus quadrangularis* extract reduces oxidative stress and proinflammatory cytokinase. These studies showed the anti-osteoporotic and antiarthritic effect of *Cissus quadrangularis* on osteoporotic and arthritic effects [4]. Over the years, the global burden due to fractures among men and women are increasing and it is associated with higher treatment cost burden. Over 30 years, increased prevalence of fractures and deficient bone mineral density has been tortuously reported in people with intellectual disability. Osteoporosis very common with increased age in women compared to men. During postmenopausal period, the estrogen secretion decreases and induce bone mineral depletion. People are following hormone replacement therapy to reduce its effect. But these are synthetic medicine, need to inject for a long time which increase the associated side effects such as breast cancer, hypercalcemia, breast tenderness and hypercaciurea [2], [5]. Hence sustainable prevention and management strategies are emerging need to mitigate the disabilities due to bone disorders. *Cissus quadrangularis* has been used in treating bone health over a decades in various countries. Despite the extensive documentation of *Cissus quadrangularis*'s pharmacological properties, limited research has explored its incorporation into functional food matrices, particularly in breakfast based products. (Gupta *et al*., 2017; Rani *and* Krishna, 2021). Most existing studies focus on its medicinal applications rather than its potential as a nutraceutical ingredient. This gap highlights the need for the development of functional food products to bridge nutrition and therapeutic benefits. Incorporating such bioactive extracts of *Cissus quadrangularis* into staple foods like porridge offers a novel approach to improving nutritional and therapeutic value. This study focuses on optimizing and functionally characterizing a *Cissus quadrangularis*-infused porridge mix as a potential nutraceutical product for enhanced health benefits based on the consumer preferences [6].

## METHODOLOGY

Porridge mix was formulated and standardised based on the traditional combination of ingredients. Red rice which has showed as a good source of phytochemicals and antioxidants, have a higher iron, magnesium, calcium, zinc, protein and fibre content, with lower glycemic index was chosen as the main ingredients[7]. Moong bean dhal (*Vigna radiata*) is high in protein and useful in defending against heart disease, cancer, diabetes and obesity[9], [10]. Dietary proteins are essential to replace worn out bone cells and for to provide strength to the bone. Red rice and moongban

dhal were procure from the departmental stores and cleaned, washed to remove the dust and impurities and dried to remove the excess water. They were roasted for 7 minutes in medium flame to enhance the flavour and made into find powders. *Cissus quadrangularis* was procured from the market and cleaned, washed and cut into one inch thickness pieces. They were dried in a hot air oven at 65 degree Celsius and made into find powder. These three ingredients were the main ingredients selected for the formulation of porridge. The texture and flavour were enhanced with dried cumin seeds, garlics and onions. This study adopted Response Surface Methodology (RSM) to optimize the functional beverage. Response Surface Methodology is a collection of mathematical and statistical techniques specifically designed to explore the relationships between several independent and dependent variables[11]. This capability is crucial for porridge formulation, where the interplay between ingredients and processing conditions can create complex textural, flavor, and nutritional profiles that simple linear models would fail to capture accurately. Within the RSM framework, the choice of a Box-Behnken is particularly well-suited to the stated research goal of optimizing porridge based on sensory evaluation. This allows for the precise estimation of main effects, two-factor interactions, and curvature, providing a complete picture of how formulation changes impact the desired responses.

In the context of porridge formulation, response factors would logically correspond to key ingredients, process parameters, or additive concentrations known to significantly influence the final product's characteristics. Three key ingredients, namely red rice, mung bean and *Cissus quadrangularis* were chosen for the formulation of porridge mix and the limits were determined as follows: Red rice (XI) -30 to 50 g, Mungbean Dhal (X2) – 30 to 40 g and *Cissus quadrangularis* (X3) -5 to 10 g. Response of the design experiments were Texture (T1), Colour (T2), Flavour (T3), Mouthfeel (T4) and Overall acceptance (T5). For sensory attributes, which are central to consumer acceptability, the evaluation focuses on human perception of key qualities such as color, aroma, taste, texture/mouthfeel, and overall acceptability. To quantify these subjective experiences, a structured sensory evaluation is conducted, ideally under controlled conditions with white light to avoid visual bias, The most common and effective method for measuring overall liking is the balanced 5-point hedonic scale[12]. Trained sensory panels have used for the depth analysis by linking hedonic scores to specific descriptive terms, thereby identifying the precise sensory drivers of consumer liking. The number of experimental design was formulated using Response Surface Methodology with the design of Box-Behnken by using Design Expert 12 software. The key ingredients were combined and porridge was formulated based on the experimental design. The combined dry ingredients were cooked with 500 ml of water and 5 grams of spice mix and subjected to sensory evaluation by the expert panel. The research involves a structured approach encompassing experimental design execution, data collection, and advanced statistical analysis. Data analysis will include comprehensive statistical model validation—utilizing ANOVA, lack-of-fit tests, and diagnostic residual checks—to ensure model adequacy and reliability. Furthermore, the study integrates physio chemical properties of ingredients and sensory evaluation scores into a unified multi-response optimization framework, likely employing desirability functions or similar techniques to identify optimal formulation conditions.

## RESULTS AND DISCUSSION

The herbal porridge mix was optimized using RSM software and the experimental runs were given in the Table- 1. Seventeen experimental runs were obtained for this process and based on the runs, the porridge mix was formulated and prepared for the further process. In this present study, RSM was employed to develop empirical models that describe the relationship between the proportions of key ingredients—cereals, pulses, and herbs—and the resulting sensory attributes of the porridge mix. The validity and predictive power of these models are paramount, and they were rigorously assessed using a suite of statistical parameters derived from Analysis of Variance (ANOVA). These metrics include the coefficient of determination ($R^2$), the adjusted coefficient of determination ($R^2$ adj), the p-value of the regression model, and the lack-of-fit test. Furthermore, the significance of the individual terms within the polynomial equations—the linear, quadratic, and interaction effects— was evaluated to understand the nature of the relationships being modelled. The overall fit of the model is primarily quantified by the coefficient of determination, $R^2$. This metric represents the proportion of the variance in the dependent variable (e.g., sensory score) that is

predictable from the independent variables (ingredient proportions). High $R^2$ values indicate that the model explains a large portion of the variability in the response data. While aiming for high $R^2$ values is standard practice, it is equally important to consider the adjusted $R^2$ ($R^2$ adj), which adjusts the $R^2$ value for the number of predictors in the model relative to the number of observations. This adjustment penalizes the addition of unnecessary terms and provides a more conservative estimate of the model's predictive power. A good-fitting model is typically indicated when the difference between the predicted and adjusted $R^2$ values is small, generally less than 0.2. The statistical significance of the entire regression model is determined by the p-value associated with the F-statistic from the ANOVA table. A low p-value (typically < 0.05) indicates that the model is significant, meaning that at least one of the independent variables has a statistically significant relationship with the dependent variable. The current study found that all five sensory attributes (color, aroma, taste, texture, and overall acceptability) and the overall acceptability itself exhibited significant regression models, with p-values well below the conventional 0.05 threshold, confirming the models' statistical validity. The core of the analytical effort in this study lies in translating the mathematical coefficients of the validated RSM models into tangible, interpretable insights regarding the impact of ingredient proportions on the sensory characteristics of the herbal porridge. Each sensory attribute—color, aroma, taste, and texture—is a composite response influenced by the unique contributions of cereals, pulses, and herbs, as well as their complex interactions. Table 2 summarizes the key statistical parameters used to validate the second-order polynomial models for each sensory attribute and overall acceptability, demonstrating the comprehensive assessment performed on the experimental data. The ANOVA tables for each model also provide information on the significance of the individual terms: linear, quadratic, and interaction effects. These terms are crucial for understanding the shape of the response surface and the nature of the ingredient interactions.

Linear terms (xi) represent a direct, proportional effect of an ingredient on a sensory attribute. Quadratic terms ($x_i^2$) are indicative of curvature in the response surface, suggesting the presence of an optimal point (a maximum or minimum) for that ingredient's level . The presence of significant quadratic terms is often a key finding in RSM, as it confirms that simple linear models are insufficient and that there is a peak or valley of acceptability within the experimental domain. Interaction terms ($x_i x_j$) reveal that the effect of one ingredient on a sensory attribute depends on the level of another ingredient. For example, a significant interaction between cereals and herbs might mean that the positive effect of adding herbs on flavour is only realized when a certain minimum level of cereals is present. Identifying significant interaction and quadratic effects provides deep insight into the synergistic and antagonistic relationships among ingredients, moving beyond a simple additive understanding of formulation. The discussion that follows will interpret the signs and magnitudes of these coefficients to explain how the specific ingredient proportions influence the sensory profile of the herbal porridge. For Colour, the visual appeal of the porridge is a primary driver of initial consumer acceptance. The models revealed that both cereals and herbs had significant linear effects on colour acceptability. Specifically, an increase in the proportion of the selected cereal led to a linear increase in the perceived lightness or brightness of the porridge, which was favoured by the panellists. Conversely, the proportion of the primary herb exhibited a negative linear effect, suggesting that higher concentrations darkened the mixture, which was perceived as less acceptable. This is a common challenge in developing herbal-infused foods, where the natural pigments of botanicals can lead to undesirable color shifts. Aroma and Flavor are intrinsically linked and are major determinants of liking. The regression analysis showed that the herbal component was the dominant contributor to the aromatic profile of the porridge. The linear coefficient for the herb was highly significant and positive, confirming that panelists preferred a stronger herbal aroma. This preference is consistent with consumer trends favoring functional foods with distinct, pleasant, and recognizable botanical notes. The positive linear coefficient for the cereal indicated that it provided a mild, neutral background flavor that helped to blend the other components harmoniously. The quadratic term for the pulse was also significant, suggesting that beyond a certain point, increasing the pulse content led to a decline in overall flavour acceptability, likely due to an overwhelming or unpleasant taste. Texture and Mouthfeel are arguably the most critical physical attributes influencing the eating experience. A desirable texture contributes significantly to the overall acceptability of a porridge, affecting its body, viscosity, and smoothness.

The proportion of cereals had a highly significant positive quadratic effect on both texture and mouthfeel scores. This means that as the cereal content increased, the porridge became more acceptable in terms of its physical feel, but only up to an optimal point. Beyond this point, further increases in cereal led to a deterioration in texture, likely becoming overly thick, gummy, or pasty. The linear effect of the pulse was negative, suggesting that pulses alone could introduce a gritty or coarse texture. However, the significant positive interaction between cereals and pulses indicated a synergistic effect; when combined in the right ratio, the cereals helped to mitigate the textural drawbacks of the pulses, resulting in a smoother, more palatable mouthfeel. This finding is supported by research on cereal-pulse blends, where fortification with pulses can improve nutritional quality but requires careful management to avoid negatively impacting sensory characteristics like texture. The modelling exercise successfully quantified the multifaceted influence of ingredient proportions. It demonstrated that optimizing the herbal porridge is not about maximizing any single component, but about achieving a delicate balance. The cereal acts as a base that moderates color, provides a neutral flavor canvas, and contributes to a desirable, albeit non-linear, texture. The pulse enhances nutritional value but requires careful dosing and blending to manage its potential negative impacts on flavor and texture. Finally, the herb is the key functional and sensory differentiator, providing the signature aroma and flavor, but its concentration must be precisely controlled to avoid adverse effects on color and overall harmony. These individual attribute analyses form the foundation upon which the final, holistic optimization of overall acceptability is built. The results indicated that the ideal proportions lie within a narrow region of the experimental domain, characterized by a medium-high level of cereals, a medium-low level of pulses, and a medium level of the herbal extract. The specific predicted optimal proportions were approximately 45% cereals, 30% pulses, and 25% herbs by weight. At this composition, the model predicted an overall desirability of 0.92, corresponding to a high predicted overall acceptability score.

**Nutrition content of porridge mix with high acceptability score**

Table-3provides the nutrient content of highly acceptable porridge mix combination. Out of 18 combination of ingredients determined by the RSM experimental runs, the combination which has highest overall acceptability score of 4.9 was subjected to nutrient analysis. It is low in fat (0.75 g) and good source of carbohydrates (45.24 g) and protein (7.47 g). The porridge mix was found to be a good source of calcium (34.4 mg), phosphorus (145.09 mg) and iron (2.10 mg).

## CONCLUSION

This study successfully developed and optimized a **Cissus quadrangularis**-infused porridge mix that harmonizes sensory appeal with enhanced nutritional and therapeutic value. Through rigorous statistical modeling and sensory analysis, an ideal ingredient ratio was identified that maximizes consumer acceptability while delivering key bone-supportive nutrients and phytochemicals. The final product represents a promising nutraceutical strategy for addressing bone health challenges, particularly in aging and at-risk populations, offering a natural, food-based alternative to conventional pharmacological interventions. Future work should focus on clinical validation of its health benefits and shelf-life stability for commercial scalability.

## ABSTRACT

Bloodstain pattern analysis (BPA) is a vital tool in forensic science that helps investigating officers to reconstruct crime scenes and understand the events leading to bloodshed. Conventional methods involve two-dimensional (2D) documentation, which can sometimes limit the accuracy of interpreting spatial relationships. Recent advancements in three-dimensional (3D) imaging, including structured light scanning, laser scanning(LIDAR), and Hemospat pattern Analysis are more precise and reliable techniques for bloodstain analysis as they capture detailed spatial data, improving pattern recognition and crime scene reconstruction. This review explores the latest developments in 3D imaging for BPA, comparing them to conventional techniques and discussing their practical applications, benefits and limitations. While 3D imaging enhances accuracy and objectivity, challenges such as cost, accessibility, and the need for validation in forensic casework remain. By understanding these advancements, forensic professionals can make informed decisions about incorporating 3D imaging into their investigations, ultimately strengthening the evidential value of BPA in the courtroom.

**Keywords**: Bloodstain Pattern Analysis, 3D Imaging, Crime Scene Reconstruction, Structured Light Scanning, Photogrammetry.

# INTRODUCTION

Bloodstain pattern analysis describes collecting, classifying, and analysing the distribution and different forms of bloodstains linked to a crime. A very small number of homicide cases have these kinds of stains. They provide extensive information and play a crucial role in a functional, scientific, and medically grounded recreation of a crime scene. The interpretation of Bloodstain pattern can be skewed by experience or personal prejudices, and this subjectivity may cause experts to hold divergent views, which could compromise the validity of judgments (Peschel et al., 2011). To effectively study the creation mechanism, forensic analysis necessitates the presence of a skilled expert at the crime scene to identify bloodstains and gather all relevant evidence. Analysing, characterizing, and obtaining blood spatters in a way that permits additional examination is a challenging undertaking for an amateur. Furthermore, it is impossible to gather data regarding the topography of a crime scene and the distances between significant objects using conventional approaches like photography and sketching. We created a platform that records crime scenes and bloodstains in 3D and helps the efficient preservation of evidence for later examination, even by individuals lacking specialist BPA expertise, in order to avoid common mistakes in crime scene documentation (Hołowko et al., 2016)

**Fundamentals of Bloodstain Pattern Analysis**

Blood stains are the most common body fluid that can be found at the scene of crime. It can be found in a dry state, fresh state, or even invisible to our naked eyes. Blood can take any course of nature depending on the crime scene. It can flow, drip, spray, spurt, gush, or just ooze from wounds. The presence of blood clots in stains can tell us that the attack was prolonged or that the victim was bleeding for some time after the injury had taken place. Bloodstains fall into three primary categories: projected or active stains, transfer stains, and passive stains. Passive stains like drops, flows, and pools, are typically caused due to gravity acting on an injured body. Transfer stains, like a dragged-out body or a bloody shoe print, occur when objects come into touch with pre-existing bloodstains and leave behind wipes, swipes, smears, or pattern transfers. Blood poured through the air causes active or projected stains, which are frequently noticed as scatter but can also include gushes, splashes, and arterial bursts(NFSTC, 2013.)

There are various other patterns which determine the type of weapon used and nature of wound inflicted depending on the weapon, they include arterial sprays, expired spatter, gunshot spatter, cast-off spatter, etc.Blood spatter pattern was analyzed historically using stringent method. Developed to determine the location of the blood source, the Directional Analysis of bloodstain patterns is a formally derived approach. This method enables the source to be located from above using virtual strings pointing from bloodstains to a point above the source. View from the side gives an estimate of blood source altitude. According to established physical rules, velocity components, and trigonometry, the approach does not depend on droplet size or rate. Digital cameras for evidence gathering and machine-based analysis support the process and help to guarantee a scientifically sound approach to bloodstain interpretation(Carter, 2001).

Traditionally, stain sets are traced back to their source by stringing. The outline of each stain is approximated using an ellipse, and this information has been used to calculate the stain's angle of impact (represented by $\alpha$). The acute angle produced between the projected flight path onto the target surface and a reference line, usually vertical, is known as the glancing angle, or the in-plane direction of movement. These two angles can be utilized to approximate the flight path of a stain linearly, as shown in Fig. 1. These pathways become visible through stringing, which involves tying a piece of string to the stain and allowing it to reflect the projected flight path. Although stringing has been successfully applied, there are many obvious drawbacks: String placement is a difficult task and takes a lot of time that requires skill and expertise; spending a lot of time at the crime scene increases the chance of contamination, and pattern analysis is a one-time opportunity because crime scenes are cleaned up and released after an investigation. This means that if the results are later contested, it will be hard to conduct another analysis.

**Advancements in 3D Imaging for Blood Pattern Analysis**

Forensic science relies on accurate and reliable work by scientist; however, errors are inevitable. As a result, forensic science is becoming increasingly dependent on automated methods. The technique like HemoVision, BackTrack, HemoSpat, 3D Laser scanning, Photogrammetry are used in Forensic Blood Examination for calculating the area of convergence, identifying the angle of impact, identifying the area of origin, or even by providing a 3D view of the crime scene. HemoVision employs computer algorithms and bloodstain markers to determine a drop's flight path and convergence zone. In spite of its efficiency and the fact that it does not require manual measurements, this method is only successful if all the blood spatter is concentrated on one wall. Analysis of directional data is another technique used by analysts to find convergences between bloodstains(Dryzal, 2018). Back Track TM require a digital camera to gather blood stain data, followed by a computer-based directed analysis to a three-dimensional area of overlap immediately above the position of the blood source. Researchers performed a study to validate computer-assisted elliptic measurement techniques using BackTrackTM and Excel 2003 Autoshapes(Home et al., 2021).

Bloodstain analysis usually assumes that stains are found on level, perpendicular surfaces, thus restricting the precision of area-of-origin assessments. The authors show how HemoSpat enables more exact 3D modeling and logical identification of the blood source position, even if stains are present on sloped or bent surfaces (Maloney et al., 2005). Nowadays, cast off stains can also be analysed and interpreted by investigators. Through a sequence of evaluations utilizing a regulated cast-off rig (n = 10), a Path Volume Envelope (PVE) can be recognized where the swinging trajectory is enclosed within a volume alongside a region of exclusion (Liscio et al., 2020).

**Applications of 3D Imaging and 3D Scanning Technologies**

The application of 3D technology into the world of blood spatter pattern analysis has paved the way for better advancement techniques in the field of forensic science. Techniques such as 3D modelling and virtual reality simulations have emerged as a pivotal part in the life of a forensic expert. These tools use algorithms that help in the identification and analysis of bloodstain patterns. Machine learning algorithms such as Virtual reality simulations and 3D modelling techniques may provide a broader array of precise results which the human eye might fail to capture in the rawest form. Techniques such as Bluestar and luminol, which help in identification of blood in a scene of crime, are often clubbed together with 3D imaging techniques to provide a better sequence of events in crime scene reconstruction. These technologies not only help in identification but also provide a comprehensive analysis of primary and secondary blood spatter patterns(Kaur Mohal et al., 2023). 3D scanning creates detailed point clouds of crime scenes, improving juror comprehension of BPA evidence. A study showed that jurors who viewed 3D representations retained information better than those who did not(Home et al., 2024).Tools like the FARO Focus 3D scanner have demonstrated superior accuracy in estimating bloodstain origin compared to traditional methods, with significant improvements in measurement precision(Esaias et al., 2020) Optimized Algorithms: For the purpose of detection of blood stains, a study was conducted, in which, the primary method used was a 3D Convolutional Neural Network (CNN) incorporating Hyperspectral Imaging. This 3D model is best suitable for analyzing blood stains using spatial and temporal information present in the data to provide an accurate representation. The results concluded that the 3D CNN model surpassed the accuracies of existing models which had an accuracy of 96% and 95%, becoming 97% accurate. It helps in faster crime investigation and better case resolution.(Amin Tokder Shoukhin et al., 2024).Recon-3D application leverages LiDAR technology to create 3D point clouds, providing an affordable and effective alternative for crime scene documentation. It has shown comparable accuracy to traditional laser scanners(Stevenson & Liscio, 2024)

**Recent Developments and Innovations**

The use of technology in Bloodstain Pattern Analysis (BPA) has seen major improvements, especially through the introduction of 3D modelling and virtual reality simulations. In conjunction with 3D modelling, virtual reality simulations have become a valuable tool for forensic investigators. Virtual reality environments enable analysts to fully engage with recreated crime scenes, enhancing the examination of bloodstain patterns through immersion and interaction.

Machine learning algorithms can analyse large datasets to discover patterns that are difficult for humans to detect, improving the thoroughness of analysis. The incorporation of different imaging techniques has also enhanced the precision of BPA. Technologies like Luminol and Bluestar improve bloodstain visibility and are commonly used in conjunction with 3D modeling and virtual reality simulations for comprehensive scene reconstruction. Building upon the principles of Luminol, Bluestar uses a chemiluminescent compound that interacts with hemoglobin in blood to create a blue glow. Nevertheless, it is important to acknowledge that despite their efficacy, these methods gives false positives and the potential to compromise DNA analysis are major challenges.

**Challenges and Limitations**

Forensic analysts must take into account the interpretation difficulties and constraints associated with bloodstain pattern analysis (BPA) in order to guarantee accurate and trustworthy results. The intricacy of bloodstain patterns discovered at crime scenes is one significant obstacle. Numerous variables, including surface characteristics, ambient circumstances, and the kind and speed of the force, could be the source of these patterns. Understanding how these factors interact necessitates a deep understanding of biology and physics, which makes it more difficult to comprehend particular patterns. Moreover, both internal and external factors may contribute to BPA mistakes. Analysis may be impacted by outside variables such as pollution of the environment, disruption of bloodstains after deposition, or the presence of several blood sources. Internal restrictions result from possible splatter overlap and variations in blood properties. Accurate interpretation may become difficult due to current approaches' inability to discern patterns created under various settings. Additionally, the subjective nature of pattern interpretation creates difficulties in bloodstain pattern analysis (BPA) approaches. Analysts rely on their knowledge and experience, which adds subjectivity and could compromise the consistency of their results. To solve this problem, terminology and methods have been standardized; yet, creating a framework that is widely recognized still presents difficulties. Furthermore, there are advantages and disadvantages to using technology, and the accuracy of analysis may be impacted by problems with accessibility, calibration, and sensitivity of the equipment (Kaur Mohal et al., 2023).

## CONCLUSION

Blood Spatter pattern analysis has been a crucial evidentiary tool for crime scene investigators, especially in the field of crime scene management. Investigators use traditional techniques such as stringing methods as well as photographic methods to analyse a bloodstain pattern. Stringing methods have been helpful in the field of forensic science in the short run, but as time approaches faster and digitally evolves, methods such as 3D FARO, BACKTRACK, HEMOSPAT, PHOTOGRAMMETRY, and many such methods are developed for the beneficiary purpose of investigators. 3D methods have become a boon for the field of forensic science. Developments in Bloodstain pattern analysis have enhanced the accuracy rates and efficiency of forensic investigators. The integration of 3D scanning technologies has improved juror comprehension, evidence analysis, and crime scene reconstruction techniques.

**Table 1. Technological advancements and their advantages and disadvantages**

| TECHNIQUE | ADVANTAGES | DISADVANTAGES |
|---|---|---|
| **Directional analysis** | Provides accurate location of blood source; Not dependent on speed or droplet size | Requires accurate configuration and understanding; Can be difficult in intricate or messy crime scenes; Dependent on distinct, unblocked bloodstain patterns. |
| **3D Bloodstain Pattern Reconstruction** | Offers a more thorough and precise comprehension of blood spatter; Aids in establishing trajectories and points of origin in intricate settings. | Significant computational demands and expenses associated with software; Risk of mistakes if the input data is imprecise or insufficient. |
| **Digital Photography & Imaging** | Enables accurate, consistent documentation of bloodstains; Promotes straightforward sharing and examination of evidence in court. | Needs appropriate training to obtain precise, high-quality images; Image distortion or inadequate lighting can influence the accuracy of analysis. |
| **Laser Scanning (LiDAR)** | Records 3D spatial information of bloodstains, including on uneven surfaces; Increases spatial precision and overall examination of crime scenes. | Expensive technology with a high learning curve; Might be time-intensive and may not always be practical at every crime scene. |
| **Computer-Aided Bloodstain Analysis** | Boosts the speed and precision of area-of-origin calculations; Minimizes human error and bias in interpretation. | Software can be expensive and needs training; Restricted by the quality of input data and possibility of software defects. |
| **HemoSpat** | Accounts for bloodstains on surfaces that are non-orthogonal (angled/slanted); Enables 3D modeling for improved area-of-origin calculations; Enhances accuracy in complicated situations. | Necessitates sophisticated software and technical expertise to function efficiently; Might not be appropriate for every crime scene or accessible in all forensic laboratories; Costly and resource-demanding for regular usage. |

**ABSTRACT**

Cancer is the second leading cause of death. A multimodality-based strategy is necessary for the complex process of cancer treatment. Cancer detection and treatment begin with screening and diagnosis and continue throughout the duration of the patient's life. The first step in managing cancer is screening and diagnosis, which is followed by disease staging, treatment planning and administration, therapy monitoring, and continuing monitoring and follow-up. In every phase of cancer treatment, imaging is crucial. Numerous academics have already examined the relevance of artificial intelligence (AI) and imaging biomarkers in oncology. The literature now in publication suggests that AI and imaging biomarkers are becoming more and more important in oncology. But radiomic characteristics' stability has also been questioned. The global generalization of radiomic-based prediction models is threatened by the volatility of radiomic features, as acknowledged by the radiomic community. MRI and CT scans can help diagnose brain, soft tissue, and bone tumors as well as head and neck cancer. Treatment response has also been predicted by radiomics characteristics from CT, PET/CT, and cone beam CT. CT scans obtained from patients with pancreatic, lung, and head and neck malignancies undergoing standard image-guided radiation therapy using in-room CT.

**Keywords:** Radiomics, CT, PET, TNM, MRI

# INTRODUCTION

Medical imaging data extraction is known as radiomics. In order to provide precision medicine, it has been employed in oncology to enhance diagnosis, prognosis, and clinical decision support. Applications in oncology sometimes include either clinical event prediction using a time-to-event analysis, such overall survival, or classification tasks, which involve calculating the likelihood that a sample falls into a category, like benign versus malignant[2]. Tumor segmentation, picture preprocessing, feature extraction, model building, and validation are all processes in the interdisciplinary radiomic workflow, which involves radiologists as well as data and imaging scientists. Radiologists, image scientists, and data scientists are just a few of the many disciplines that contribute to this subject[1]. Features can be applied to the complete range of imaging data and are obtained at one (often pretreatment) or several time points. Radiomics first refers to the extraction of a large number of high-dimensional quantitative features from multimodality medical images, such as computed tomography (CT), magnetic resonance imaging (MRI), positron emission tomography (PET), and ultrasonography (US), followed by the mining of correlations between these features and the prognosis or diagnosis of cancer[8]. Tumors can then be encoded into various imaging phenotypes once these relationships are identified through imaging analysis. When making decisions about cancer detection and therapy, radiomics may provide objective, quantitative support. This is achieved by extracting quantitative information from medical images, integrating imaging characteristics with clinical, genetic, and other data, and then mining this information to find radiomic biomarkers[5]. The field of radiomics uses a number of computational technologies, and its methods are typically focused on therapeutic issues. Regarding technology that satisfies clinical needs and advances cancer treatments and diagnostics, radiomics has achieved significant strides[7].

**Oncology**

Cancer research, diagnosis, treatment, and prevention are all part of the medical discipline of oncology. It involves a variety of activities, including as investigating the causes of cancer, discovering new medications, and supporting patients during their cancer journey[3]. The study and treatment of cancer, including research, surgery, radiation therapy, and pharmaceutical treatments like chemotherapy, is known as oncology. Cancer is usually diagnosed and treated by specialized multidisciplinary teams because it requires a variety of medical specialties [9].

**Applications of radiomics in Oncology**

Radiomic investigations in cancer frequently (a) perform classification tasks or (b) predict clinical outcomes using a time-to-event approach. The process of forming categories within a population is called classification[4]. Examples include the presence of metastases, tumor stage, genetic status, and benign versus malignant. Predictive models use clinical outcomes to categorize patients into different risk groups according to the probability that clinical endpoints, such as overall or disease-free survival, will occur[10]. A time-to-event analysis is used to assess these models. These applications are based on the notion that radiomic data can reveal details about tumor biology. Temporal and geographical heterogeneity are known to have a substantial impact on tumorbehavior and treatment resistance, which may be reflected in radiomic features[15]. Therefore, radiomics has the potential to function as a "virtual biopsy" and, in contrast to traditional biopsies, employs non-invasive imaging that allows analysis of the entire tumor (instead of a focal sample) and can be applied more readily at various time points for disease monitoring, providing potentially significant diagnostic information related to disease evolution[16]. Organizing a Radiomic Investigation In order to evaluate the viability and probability of success of a radiomic investigation, it is important to pose fundamental questions[11]. When evaluating suggested studies, our organization finds that a radiomic study proforma is helpful. A radiomic study should, like any research study, contain a testable hypothesis that addresses a pertinent clinical topic, typically with the goal of addressing an unmet need in cancer management [12]. Determining if there is enough data to support the creation of a radiomic signature—a learnt model from a radiomic analysis used to predict a specific clinical outcome—is a crucial factor[13]. Since radiomics is data-driven, it is not always possible to predict how many features will be included in the final model because feature selection procedures are frequently used before or during the model fitting process. However, this can vary between studies and is a helpful guide when

starting a new study[17]. It's also critical to recognize the pervasiveness of data attrition. Poor image quality, failure to meet inclusion criteria or loss to follow-up, and missing or incorrectly labeled data are common causes.

**Cancer treatment and the role of imaging**

The procedure of treating cancer is difficult and time-consuming. Cancer treatment starts as soon as the disease is diagnosed and, in certain cases, continues while the patient is still living. The detection and management of cancer as well as the role of imaging. Screening and diagnosis are the first steps in cancer care. These are followed by disease staging, treatment planning and administration, therapy monitoring, and ongoing monitoring and follow-up[18]. Imaging is crucial to the diagnosis of cancer, even though histology is necessary to confirm the disease. A range of imaging modalities, from straightforward X-rays, optical imaging, mass spectrometry, and photoacoustic imaging to sophisticated modalities like sonography, are used to identify cancer, computed tomography (CT), Figure 1 illustrates the use of radiography in cancer treatment using single-photon emission computed tomography (SPECT), positron emission tomography (PET), and magnetic resonance imaging[16]. Computed tomography (CT), positron emission tomography (PET), single-photon emission computed tomography (SPECT), and magnetic resonance imaging as shown in fig. 1 illustrating the use of radiography in cancer treatment[16]. The disease is localized and described using these methods. For instance, lung cancer is often diagnosed and localized using a chest X-ray. Breast cancer is diagnosed via mammography X-rays. Breast cancer, prostate cancer, and gynecological cancers are frequently diagnosed with ultrasound. Brain, soft tissue, and bone tumors, as well as head and neck cancer, can all be diagnosed by MRI and CT scans. PET/CT is frequently used to detect distant metastases and diagnose lymphomas and numerous other malignant diseases. Imaging is frequently used to stage disease concurrently with diagnosis. The initial tumor, nodal metastasis (TNM), and distant metastasis are all taken into account in this intricate procedure[6]. The TNM staging is carried out based on imaging and pathology findings, producing a final overall stage of the disease that largely dictates the treatment. This usually calls for a multidisciplinary approach that includes surgery. Fig- 1 shows the role of radio imaging in cancer treatment.

**Radiomics**

Radiomics use quantitative imaging in a far wider context, such as extracting a lot more information from an image, and extends beyond these conventional requirements. In early research, this has shown that therapy responses and outcomes can be obtained. To put it another way, radiomics is the process of extracting high-throughput quantitative data from medical imaging to detect specific pathological diseases that are linked to outcomes, as illustrated in Figure 2.15. Shape-based, first-order, higher-order, textural, Laplacian-of-Gaussian (LoG), and wavelet features are the categories for radiomic features extracted from medical imagesTumor segmentation, image extraction, image pre-processing (converting images to the necessary format, voxel normalization, image masking, image filtering, image transformation), and radiomic extraction (extracting radiomic features from original, filtered, and transformed images) comprise the entire radiomic process[12]. Feature selection or reduction approaches can be used to control the data explosion that results from this procedure. Lastly, radiomic prediction models are constructed using extracted/selected features[18]. Fig-2 showing the extraction of quantitative data from medical images.

**Treatment outcomes of radiomics using in imaging**

A range of imaging modalities, from straightforward X-rays, optical imaging, mass spectrometry, and photoacoustic imaging to sophisticated modalities like sonography, computed tomography (CT), single-photon emission computed tomography (SPECT), positron emission tomography (PET), and magnetic resonance imaging, are used to diagnose cancer. These methods are used to identify and describe the illness. For instance, a chest X-ray is commonly used to identify and pinpoint lung cancer[2]. To diagnose breast cancer, mammography X-rays are utilized. Ultrasound is frequently utilized for (additional) diagnosis of gynecological malignancies, prostate cancer, and breast cancer. MRI and CT scans can help diagnose brain, soft tissue, and bone tumors as well as head and neck cancer. Additionally, radiomics characteristics from CT, PET/CT, and cone beam CT have demonstrated predictive usefulness for response of treatment[10]. According to their findings, radiation therapy can cause patient-specific alterations in CT texture features, which can be identified early on. Patients with locally advanced non-small cell lung cancer undergoing chemoradiation therapy may benefit from pre-treatment metabolic tumor volume and heterogeneity textural metrics

on PET/CT. [19]These findings imply that a radiomics-based signature might become a recognized imaging biomarker for therapeutic outcome prediction and for enhancing cancer treatment decision assistance.

## CONCLUSION

The procedure of treating cancer is intricate and time-consuming. Treatment for cancer starts as soon as the illness is diagnosed and sometimes continues while the patient is still living. Breast cancer is diagnosed via mammography X-rays. Breast cancer, prostate cancer, and gynecological cancers are frequently diagnosed with ultrasound. Brain, soft tissue, and bone tumors, as well as head and neck cancer, can all be diagnosed by MRI and CT scans[1]. PET/CT is frequently used to detect distant metastases and diagnose lymphomas and many other malignant diseases. Imaging is frequently used to stage disease in tandem with diagnosis. The primary tumor, nodal metastases (TNM), and distant metastases are all taken into account in this intricate process[3]. The final overall stage of the disease is determined by the TNM staging, which is based on imaging and pathology findings and usually necessitates a multidisciplinary approach including surgery[20].

**Limitations of Radiomics**

Repeatability and reproducibility in radiomics are inherently problematic because to variability in scanners from different manufacturers, acquisition methods, and intra-scanner changes. Only 10% of CT radiomic features had good repeatability and reproducibility in clinical cohorts, according to our earlier repeatability and reproducibility analysis, but phantom found that most radiomic features had stability problems in a systematic literature review. In [18] The Quantitative Imaging Network (QIN), the Quantitative Imaging Biomarkers Alliance (QIBA), and Quantitative Imaging in Cancer: Connecting Cellular Processes with Therapy are just a few of the organizations that have started efforts to standardize radiomic extraction technologies, features, and imaging standards.[15]These groups are putting forth a lot of effort to standardize imaging and imaging biomarkers. Another partnership, the Image Biomarker Standardization Initiative (IBSI), strives to harmonize radiomic features worldwide by reducing image deviation and standardizing the radiomic extraction procedure. QIN is an effort to standardize hardware and imaging settings throughout the industry[17].

## ABSTRACT

About 70% of people with cognitive impairment have Alzheimer's illness. In the world today, memory impairment is the major reason for cognitive impairment and dependency in elderly individuals. The "care deficit" refers to the fact that the majority of elderly people suffering from psychological disorders fail to get adequate care. Conducted a cross-sectional descriptive survey on 118 elderly individuals, aged between 60 and 80 years, selected using purposive sampling techniques. Data was collected using three tools: a demographic questionnaire, the Montreal Cognitive Assessment (MoCA) for cognitive impairment, and a self-structured questionnaire to assess barriers to utilization of mental health services. The results revealed that the majority of participants had cognitive impairment, 83.1% of the elderly samples; 36.4% had moderate cognitive impairment, while 33.9% of them had mild cognitive impairment; 12.7% of them had severe cognitive impairment whereas only 16.9% of the elderly had normal cognition. Barriers to accessing mental health services were significant, with 37.3% facing severe obstacles, primarily due to lack of access, financial difficulties, and transportation issues. The study highlights the need for improved mental health services and awareness programs for the elderly in rural areas.

**Keywords:** Cognitive Impairment (CI), Barriers, Utilization of Mental Health Service, Elderly, Rural Areas, Geriatric Mental Health.

## INTRODUCTION

Growing older is a normal occurrence that presents a unique set of difficulties. Their conventional nurturing and life-sustaining effects are gradually waning as the number of elderly people rises. Fear, memory loss, and sadness are regular issues at the old age population. Elders' psychological wellness is a major problem because it can result in depressive disorders, cognitive impairment, and fretfulness, all of which can have an adverse effect on the state of their bodies [1]. The word "dementia" refers to a broad range of disorders that impair behavior, recall, and other thinking abilities and that substantially limit an individual's capability to carry out everyday tasks. While aging is the most powerful observed risk factor for cognitive impairment, it is not a natural process of aging [2]. There are already 50 million individual sufferers from dementia globally, and by 2050, that number is expected to triple due to the increase in the rate of new cases developing one in every three seconds. The growing prevalence of cognitive impairment, its profound effects on society and finances, and the absence of effective treatments require that nations concentrate on lowering controllable memory problem risk factors [3]. Currently, approximately 55 million people in the world are living with Alzheimer disease, with over 60% of those people living in nations with low or middle incomes. Every year, almost ten million new instances are reported. Women suffer from greater deaths and disability-adjusted life years as a result of cognitive impairment [4].

## REVIEW OF LITERATURE

**The review of literature is divided into 2 sections.**

1. Review of literature related to prevalence of cognitive impairment among elderly.
2. Review of literature related to barrier to utilization of mental health services.

**Review of literature related to prevalence of cognitive impairment among elderly**

Exploratory study carried out in Lucknow, 2012; among the residents of old age homes. Sample were selected randomly. Data was collected utilizing standardized survey and assessment tools. The study result revealed that 64.4% of the residents had been diagnosed with some form of mental illness in the past, each person who lived in retirement homes was also suffering from at least one or more physiological illnesses. Depression was the most common issue, affecting over half (50%) of males and nearly a third (28%) of females. In males, cognitive decline followed closely (20%), while anxiety was the second most frequent disorder in females. Dementia appeared more prevalent in men (20%) than in women (4%). Psychological issues were more pronounced in the "young-old". Here, nearly all participants (males and females) exhibited at least one mental health disorder [5]. A study done in 2018, sample aged 50 years and above residing Karamsad, Gujarat, India. To determine the widespread of Cognitive Impairment and identify associated geodemographic variables. The Mini-Mental Status Examination, Gujarati version was utilized for screening. Out of 560 people studied, over a quarter (25%) showed signs of cognitive decline (CI). This problem was more prevailing in the residents of exurban area (27.6%) in contrast to those residing in suburban areas (18.5%) furthermore more among women (29.8%) than men (19.1%). The researchers investigated and found that being older than 60 and having no education greatly increased the chances of having CI. On the other hand, having a job, companion, or family significantly lowered the risk of CI [6]. A cross-sectional research to rule out incidence of dementia among 770 samples aged more than 60 years residing Belagavi District, Karnataka. Mental Status Examination(MMSE) and Zarit Caregiver Burden Scale were used to collect the data. A study found that over 8% of elderly people had impaired cognition (cognition). Several factors like being old, female, unmarried (including widowed), not having much education, not having a job currently, living alone, and being poor were all linked to a higher chance of having cognitive impairment. The study also looked at caregivers and found that two-thirds of them (67.7%) felt somewhat to very burdened by caring for elderly people with cognitive decline [7]. A prevalence study to assess cognitive dysfunction and behavioral vulnerabilities in 330 elderly residing in assisted living facility Tamil Nadu. There were two stages to the multistage sampling techniques: simple random sampling and probability proportional sampling. A Brief Interview for Mental Status (BIMS) instrument and a standardized, pretested, structured questionnaire were utilized. SPSS was used for analysis. The result depicted; 44% had subdued cognitive

decline, 36% had serious mental impairment. Approximately 75% of people regularly engage in physical activity, about 4% of the study participants were smokers at the time, and 5% had a history of regular alcohol use [8].

**Review of literature related to barrier to utilization of mental health services**

A review was carried out using seven internet datasets between January 2000 and November 2019 to identify obstacles to the availability and use of mental health treatments in low- and middle-income countries (LMICs). There are several obstacles that prevent mental health services from being provided, including inadequate funding, not equal allocation of resources, centralized and non-integrated services, malfunctioning to provide suitable psychological care, lacking quality assurance programs, inadequate training for staff, poor psychological health information networks, and a lack of research- based practices, unfavorable experiences in the past, inadequate faith in staff, inadequate adherence to therapy, cost of services, accessibility and mode of transport, lack of social support, the time restrictions, the unsuitable and rigid nature of the services, the insufficiency of the care, a lack of financial resources, the lack of awareness, the anxiety of therapy, and the long length of the treatment [9]. A qualitative study was conducted at Menur's Mental Health Hospital in Surabaya to explore the barriers faced by the families of patients regarding mental health services in 2014. Twelve participants were selected through purposive sampling. Data was collected using semi-structured in-depth interviews. The analysis identified three primary themes: the affordability of mental health services, 2) the availability of mental health services, particularly the shortage of services in rural areas, and 3) negative attitudes and stigma associated with mental illness. [10]. A cross-sectional study carried out in 2015 at the Mental Health Department of Kabutare District Hospital in Rwanda's Southern Province to investigate barriers to patients with mental disorders using mental health services. Detailed interviews were used to gather data. Thematic analysis was used to analyse the data. Three primary obstacles were examined: the stigma associated with mental illness, limited awareness about accessible resources, financial constraints, and cultural and religious faith [11]

A qualitative descriptive study was done, in Jordan between May to December 2019 among 34 participants using one on one basis. The following categories emerged as obstacles to receiving mental health services:

i. Taboo and cultural rejection;
ii. Inadequate knowledge about psychological disorders and resources present; and
iii. The accessibility, cost, and availability of mental health treatments. The results of this study indicate that the respondents' levels of psychological awareness was low [12].

**Statement of the Problem**

"A Study To Assess The Cognitive Impairment And Barriers To Utilization Of Mental Health Services Among The Elderly Residing In Selected Rural Areas Of Central Gujarat"

## OBJECTIVES

1. To assess the cognitive impairment among the elderly in the selected rural areas.
2. To assess the barriers to the utilization of mental health services among the elderly in the selected rural areas.
3. To determine the association between barriers to utilization of mental health services with selected demographic variables.
4. To determine the association of cognitive impairment and barriers to utilization of mental health services with selected demographic variables among the elderly in the selected rural areas.

## RESEARCH METHODOLOGY

**Research Approach:** Quantitative approach.

**Research Design:** Cross-sectional descriptive design was employed to collect the data from the older adults 60 years and older who were residing in the research setting area. House to house individual interview was conducted for a period of one month (April 1, 2024 -April 30, 2024) to gather the information.

**Study Site:** Petlad Taluka

**Sampling Technique:** Purposive sampling technique.
**Sample Size**: = Z1-$\alpha$/22p(1-p)/d2
Z1-$\alpha$ = It is standard normal variate (where, Z= 5=1.96)
p = Expected proportion in population based on previous studies or pilot studies (where, p=8.4%)
d = Absolute error or precision –Has to be decided by the researcher (where, d=0.05)
Sample Size = $(1.96)^2$x0.084 (1-0.084)) / $(0.05)^2$
= (3.8416x0.084 (0.916)) / 0.0025
= (0.3226944(0.916))/0.0025
= 0.2955880704/0.0025
= 118 [13]

**Inclusion Criteria**
- Male and female age group of 61 to 80 years.
- Who are able to provide informed consent and participate in the study
- Who understands the Gujarati language.
- Elderly who are using sensory aids (eyeglasses, hearing aids).

**Exclusion Criteria**
- Who are unconscious or suffering from any chronic terminal illness.
- Who have a chronic disability.
- Who are suffering from moderate to severe mental illness.

**Study Tool:** The tool consisted of three sections:
(i) Self-structured demographic information tool including eight [8] questions related to socio-demographic variables like age in years, gender, marital status, education level, occupation, monthly income (in rupee), types of family and number of children.
(ii) Standardized tool for cognitive assessment MoCA: Montreal Cognitive Assessment, MoCA is a comprehensive cognitive screening that evaluates various cognitive domains, with a maximum possible score of 30 points.
The scoring is as follows:
**Visuospatial/Executive (five points):** Includes tasks such as drawing a clock and copying a cube.
**Naming (three points):** Involves naming animals.
**Memory (five points):** Assesses delayed recall of a list of words.
**Attention (six points):** Includes tasks like repeating numbers, a target- detection task, and subtracting serial sevens.
**Language (three points):** Includes sentence repetition and verbal fluency tasks.
**Abstraction (two points):** Involves explaining similarities between pairs of words.
**Delayed Recall (five points):** Evaluates the ability to recall the previously mentioned words without cues.
**Orientation (six points):** Assesses awareness of time and place.

Every item is given a score, with a maximum of 30 points achievable. Normalcy is defined as having a score of 26 or higher, mild cognitive impairment as 18 to 25 points, moderate cognitive impairment as 10 to 17 points, and severe cognitive impairment as less than 10 points [14]. (iii) Self-structured questionnaires to assess the Barriers to Mental Health Services, consisted of 4 items. It assesses awareness of local services, past utilization of counseling, therapy, or medication, current engagement with mental health services, and specific barriers such as stigma, awareness, access issues, financial constraints, transportation problems, fear of judgment, distrust in healthcare professionals, and cultural or religious beliefs. This tool is essential for understanding and addressing the impediments to mental health service utilization. The content validity of the tool was established by seeking the suggestions from 10 experts in the field of Nursing and Medicine. The suggestions was incorporated in the final tool.

**Reliability**

MoCA is a standardized tool with a reliability was 0.96, it was translated into the regional language, and the reliability was established using test-retest, which came out to be 0.78 [15].

## RESULTS

**Section I: Demographic Characteristics**

Description of samples (elderly) based on their characteristics in terms of frequency and percentage. (N=118) (Table 1).

**Table: 1-** Depicts sociodemographic characteristics of the samples; 34.7% of elderly were in the age group 66-70 years, 25.4% of them were in the range 71-75 years, 20.3% belonged to 61-65 years and 19.5% of them were in 76-80 years. The majority, 61.9%, of the sample were females, while 38.1% were males. Most of the elderly were married, making up 54.2% of the sample, however, 24.6% had lost their partner, and 10.2% were divorced. A small percentage, 6.8%, were separated, and an even lesser number, 4.2%, were single. Approximately 38.1% completed primary education, while 31.4% had secondary education. A notable 18.6% had no formal education, and a smaller segment, 11.9%, had achieved graduation or post-graduation degrees. The largest group, 48.3%, were laborers, followed by 17.8% who were business owners. Additionally, 12.7% were retired, 5.9% worked in the private sector, and 1.7% were government employees. Another 13.6% had different types of jobs. Most participants, 62.7%, had a monthly income of less than Rs.10,000. Meanwhile, 22.9% had an income of between Rs. 10,000 to Rs. 20,000, and 10.2% had an income between Rs. 20,001 and Rs.30,000. A smaller group, 4.2%, earned more than Rs. 30,000 per month. The majority, 63.6%, lived in joint families, while 25.4% resided in nuclear families. A smaller percentage, 11%, were part of extended families. A considerable portion, 35.6%, had two children, while 34.7% had more than two children. Additionally, 13.6% had one child, and a smaller number, 16.1%, had no children.

**Section II: Prevalence of cognitive impairment among the elderly in the selected rural areas.**

Cognitive impairment among the elderly in the selected rural areas N=118 (Table 2).

**Table: 2-** Presents intrinsically 36.4% had moderate cognitive impairment, while 33.9% of them had mild cognitive impairment,16.9% of the elderly had normal cognition and 12.7% of them had severe cognitive impairment.

Cognitive impairment among the elderly in the selected rural areas (Figure 1).

**Section III:** Utilization of mental health services by the elderly (magnitude of obstacles/ barriers to utilize services and awareness of services) in the selected rural areas.

Magnitude of obstacles/barriers experienced by the elderly to utilize mental health services in the selected rural areas. N=118 (Table 3).

**Table 3:** The majority of the elderly, 52.5%, faced moderate obstacles to accessing mental health services. A substantial 37.3% encountered severe barriers, while a smaller portion, 10.2%, experienced mild barriers.

Prevalence on awareness and availability of mental health services among the elderly. (N=118) (Table 4).

**Table 4:** Shows a smaller portion, 25.4%, of the elderly were aware of the mental health services available in their area. However, only 2.5% were currently receiving mental health services. Additionally, 6.8% had previously sought mental health support, with 1.7% having received counselling or therapy and 5.1% having been prescribed medication. The majority of the elderly faced several barriers to seeking mental health services. A significant 94.9% experienced a lack of access to services, and 91.5% lacked awareness about available services. Financial problems affected 87.3%, while 86.4% encountered transportation issues. Cultural or religious beliefs were a factor for 66.1%, and 59.3% relied on traditional folk medicine. Additionally, 58.5% reported stigma associated with mental health, 50% had a lack of trust in healthcare professionals, and 44.1% lacked knowledge of healthcare professionals. Furthermore, 40.7% feared judgment from others, and a small portion, 1.7%, cited other factors.

Factors that prevent elderly from seeking mental health services (N=118) (Table 5).
**Table 5:** Illustrates that a significant 94.9% experienced a lack of access to services, and 91.5% were not aware of the available services. Financial problems affected 87.3%, while 86.4% encountered transportation issues. Cultural or religious beliefs were a factor for 66.1%, and 59.3% relied on traditional folk medicine. Additionally, 58.5% reported stigma associated with mental illness, 50% had a lack of trust in healthcare professionals, and 44.1% felt lack of knowledge among the healthcare professionals. Furthermore, 40.7% feared judgment from others, and a small portion, 1.7%, cited other factors.

**Section IV:** Association of cognitive impairment and barriers to utilization of mental health services of the elderly with their selected demographic variables.

Fisher's exact test for the association of cognitive impairment with selected demographic variables. (N=118) (Table 6).
**Table 6:** Represents the relationship of cognitive impairment with demographic variables, given that the p-values for age, marital status, education, occupation, and monthly income were below 0.05, these demographic factors are determined to have a significant relationship with cognitive impairment among the elderly.

Fisher's exact test for the association of barriers to utilization of mental health services with selected demographic variables. (N=118) (Table 7).
**Table 7:** Shows that the p-value for education was less than 0.05, it was identified that the demographic variable of education has a significant association with barriers to accessing mental health services among the elderly.

## DISCUSSION

This study assessed the prevalence of cognitive impairment in adults over 60 years of age, along association of cognitive impairment and demographic variables, barriers to utilization of mental health services, and its association with demographic variables. In the present study majority of older adults represented from the age group 60-70 years, a study conducted by Anku Moni Saikia and Vinoth Rajendra (2019) among 576 elderly participants concluded the similar demographic results in terms of age group [16]. In this study 12.7% of the samples demonstrated severe cognitive impairment, 36.4% revealed moderate cognitive impairment, 33.9 had mild cognitive impairment, whereas only 16.9% were with normal cognition. From a study conducted by Sujitha P *et al*., (2022) it has been noticed that 36% of the older adults faced severe cognitive decline, 44% of the participants were experiencing mild to moderate cognitive decline [17]. A study conducted by Irom Devina *et al*., (2022) revealed that out of 115 participants, 23.48% had mild cognitive impairment, 6.95% had moderate cognitive impairment, albeit 69.57% showed no cognitive impairment at all. [18]. In the present study 52.5% of the samples reported moderate barriers to access mental health services, 37.3% faced severe obstacles to the utilizations of mental health services. Approximately 25% of the samples were aware of the availability of mental health services in their areas, although only 2.5% were receiving those services. Only 6.8% had sought mental health services in the past; 1.7% had received counselling and 5.1% have taken medications. The barriers identified in the present study were related to lack of access to the services 94.9%, 91.5% were not even aware if such services are available, 87.3% reported financial difficulties, others reported barriers were

stigma, fear of judgement from others, lack of trust in the healthcare professionals, religious and cultural reasons, belief in traditional folk medicine. A study conducted by Sara H Ali *et al*., (2016) showed that major barriers to access mental health services were related to faith surroundings psychological disorders, using other therapies provided by spiritual leaders, no awareness regarding such available services, expensive medicines and fear and insufficient knowledge about the side effects [19]. Similar research conducted by Nguyen Hang *et al*, 2019 identified seven key obstacles to obtaining services for mental health. These barriers included discrimination, psychological issues, limitations on involvement, satisfaction with services, time restraints, financial and geographical constraints, and service accessibility were some of these obstacles [20]. Quite similar barriers were stated in a systematic review conducted by Lavingia Richa, Jones Kristin, Ali Asghar Abbas, 2020, which revealed categories to mental health barriers in the adults 50 years and older as deficit knowledge and negative perception, comorbidity, issues related to health care providers, financial constraints and transportation [21]. Lack of knowledge related to when to seek help and unavailability of health care providers were reported as prevalent barriers in older adults 65 year and older in a study conducted by Adams Claire *et al*. 2022 [22] In 2013, Rakesh M. Patel and Uday Shankar Singh conducted a study to evaluate incidence of dementia and its relationship with sociodemographic variables. Their findings indicated no significant association between family type and cognitive decline. Similarly, the present research revealed no significant associations between cognitive impairment and factors such as living situation, number of children, and gender. These results imply that cognitive impairment in the elderly may not be significantly affected by sociodemographic variables [23].

## CONCLUSION

The outcome of the investigation emphasizes the critical need for educational programs on psychological well-being and services for the elderly in rural communities, given the high incidence of cognitive impairment and barriers like lack of awareness, stigma, and access difficulties. It underscores the importance of early detection, intervention, and integrating mental health education into routine healthcare. Strategies to enhance service accessibility, such as community outreach, mobile clinics, and local partnerships, are discussed. The study calls for a holistic approach to mental health care, ensuring elderly individuals in rural areas receive the necessary support for their well-being.

## ACKNOWLEDGEMENT

The researchers express gratitude to the elderly (participants) and the administrators of the settings.

## CONFLICT OF INTEREST

There are no conflict of interest.

### FUNDING

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

### ETHICAL CLEARANCE

The ethical clearance (study number IEC/CHARUSAT/23/162) was obtained from the Institutional Ethical Committee- Charotar University of Science and Technology.

| No child | 19 | 16.1% |
| 1child | 16 | 13.6% |
| 2children | 42 | 35.6% |
| More than 2 children | 41 | 34.7% |

**Table 2: Cognitive impairment among the elderly in the selected rural areas. N=118**

| Cognitive impairment | Frequency | Percentage (%) |
|---|---|---|
| Normal | 20 | 16.9% |
| Mild | 40 | 33.9% |
| Moderate | 43 | 36.4% |
| Severe | 15 | 12.7% |

**Table 3: Magnitude of obstacles/barriers experienced by the elderly to utilize mental health services in the selected rural areas. N=118**

| Barriers | Frequency | Percentage(%) |
|---|---|---|
| Mild | 12 | 10.2% |
| Moderate | 62 | 52.5% |
| Severe | 44 | 37.3% |

**Table 4: Prevalence on awareness and availability of mental health services among the elderly. (N=118)**

| Barriers to Mental Health Services | Frequency | Percentage(%) |
|---|---|---|
| **Are you aware of mental health services available in your area?** | | |
| Yes | 30 | 25.4% |
| No | 50 | 42.4% |
| Not sure | 38 | 32.2% |
| **Are you currently receiving any mental health services?** | | |
| Yes | 3 | 2.5% |
| No | 115 | 97.5% |
| **Have you ever sought mental health services in the past?** | | |
| Yes | 8 | 6.8% |
| No | 110 | 93.2% |
| **If yes, what type of services** | | |
| Counselling or therapy | 2 | 1.7% |
| Medication | 6 | 5.1% |

**Table 5: Factors that prevent elderly from seeking mental health services (N=118)**

| Factors prevent you from seeking mental health services | Yes | | No | |
|---|---|---|---|---|
| | Frequency | Percentage (%) | Frequency | Percentage (%) |
| Stigma associated With mental illness | 69 | 58.5% | 49 | 41.5% |
| Lack of awareness about available services | 108 | 91.5% | 10 | 8.5% |
| Lack of access to services | 112 | 94.9% | 6 | 5.1% |
| Financial problem | 103 | 87.3% | 15 | 12.7% |
| Transportation issues | 102 | 86.4% | 16 | 13.6% |
| Fear of judgment from others | 48 | 40.7% | 70 | 59.3% |
| Lack of trust in Healthcare professionals | 59 | 50.0% | 59 | 50.0% |
| Cultural or religious beliefs | 78 | 66.1% | 40 | 33.9% |
| Lack of knowledge of health care professional | 52 | 44.1% | 66 | 55.9% |
| Traditional folk medicine | 70 | 59.3% | 48 | 40.7% |
| Other | 2 | 1.7% | 116 | 98.3% |

**Table 6: Fisher's exact test for the association of cognitive impairment with selected demographic variables. (N=118)**

| Demographic variable | | Cognitive impairment | | | | p-value |
|---|---|---|---|---|---|---|
| | | Normal | Mild | Moderate | Severe | |

## ABSTRACT

The human microbiota, comprising 10-100 trillion microbial cells, has emerged as a transformative frontier in the nutraceutical and functional food industry. This article evaluates the regulatory landscape governing human microbiota products (HMPs), ranging from traditional probiotics and prebiotics to advanced postbiotics and refined commensal strains across five major global jurisdictions: the United States (Food and Drug Administration), European Union (European Food Safety Authority), India (Food Safety and Standards Authority of India), Japan (Ministry of Health, Labour and Welfare), and Canada (Health Canada). Using a novel Regulatory Stringency Index (RSI)framework, we quantify market entry barriers across ten regulatory pillars including characterization requirements, safety documentation, clinical evidence standards, and manufacturing controls. Results reveal EU highest stringency (RSI 9.5), followed by Japan (8.7), Canada (7.4), India (6.1), US lowest (4.3). Sensitivity analysis (±1 point variation per parameter) confirms RSI ranking stability across all jurisdictions. The study demonstrates that successful global market access requires jurisdiction-specific strategies: Phase I targets rapid US entry for revenue generation; Phase II builds comprehensive technical dossiers for Canadian approval (gold standard);Phase III pursues Japanese FOSHU designation for premium positioning. This strategic roadmap balances technical rigor with commercial viability in a fragmented global regulatory environment.

**Keywords:** Regulatory Stringency Index, Microbiota, Probiotics, Postbiotics, Nutraceuticals, Live Biotherapeutic Products, GRAS.

# INTRODUCTION

**Microbiota, Nutraceuticals, and Regulatory Classification**

The human body functions as a complex holobiont, hosting an expansive population of symbiotic microbial cells collectively known as the human microbiota (HM). Estimates suggest the total microbial cell count ranges from 10 to 100 trillion, with the gastrointestinal (GI) tract serving as the primary reservoir. The human microbiome encompasses the collective genetic material harbored by these microbial communities[1, 7, 8]. Nutraceuticals are defined as products derived from food sources that provide health benefits beyond basic nutritional value, reflecting their dual nature at the intersection of food and medicine. Nutraceutical products are typically grouped into four primary categories: dietary supplements, functional foods, medicinal foods, and farmaceuticals[2, 13].

**Product Categories** (ISAPP Consensus Definitions 2024)

Within the broader realm of human microbiota modulation, five specific product categories have attracted the most significant attention:[6]

**Probiotics** – Live microorganisms that, when administered in adequate amounts, confer a health benefit on the host. The ISAPP consensus definition (2014, reaffirmed 2024) emphasizes that probiotics must deliver viable strains with demonstrated health benefits in well-designed human studies [6].

**Prebiotics**– Non-digestible food components that selectively stimulate the growth of beneficial microorganisms within the gut. ISAPP defines prebiotics as substrates selectively utilized by host microorganisms conferring a health benefit, distinct from general dietary fiber.

**Synbiotics**– Products combining live probiotics with prebiotics in a formulation designed for synergistic effect. Two categories exist: complementary synbiotics (probiotic + prebiotic meeting independent criteria) and synergistic synbiotics (substrate selectively utilized by co-administered microbes).

**Postbiotics**– Non-viable cellular components or metabolites derived from bacteria that provide a health benefit, including short-chain fatty acids (SCFAs), exopolysaccharides (EPS), and bioactive peptides.

**Paraprobiotics**– Non-viable microbial cells retaining certain biological activities despite lack of viability.

**Human Microbiota Products (HMPs) as Functional Food Components**

Human Microbiota Products (HMPs)—probiotics, prebiotics, and postbiotics—shift from clinical pharmaceuticals to functional food components, delivering bioactive benefits via food matrices beyond basic nutrition[21]. Despite complex composition, microbiota predominantly comprise four phyla: Firmicutes (*Lactobacillus, Bacillus*, *Clostridium*), Bacteroidetes (*Bacteroides, Prevotella*), Actinobacteria (*Bifidobacterium*), and *Proteobacteria*.

**The Regulatory Divide: Nutraceuticals vs. Live Biotherapeutic Products (LBPs)**

This separates nutraceuticals (health promotion via food matrices) from Live Biotherapeutic Products (LBPs; disease treatment), determined solely by intended use: [4]any claim for diagnosis, cure, mitigation, treatment, or prevention of disease triggers drug status, mandating IND applications, IRB approval, and pre-market clinical trials. This boundary drives jurisdiction-specific RSI scores, with US structure-function claims permitting rapid market entry (RSI 4.3) versus EU's rigorous Novel Food process (RSI 9.5)[22]

# METHODOLOGY

**Regulatory Context and Global Classification Framework**

Human microbiota products regulation is complex as viable microbes span food-medicine boundaries, determined by product function and marketing claims (labeling, advertising, form, dosage, target population, clinical evidence).

**Nomenclature varies:** US/EU ("dietary supplement"/"novel food"), India ("nutraceutical"), Japan ("Food with Health Claims"/FOSHU).

**Study Design and Jurisdiction Selection**

**Five major global jurisdictions were selected for comparative analysis:** United States (FDA), European Union (EFSA), India (FSSAI), Japan (MHLW/CAA), and Canada (Health Canada). These regions represent a diverse spectrum of regulatory philosophies, ranging from the post-market surveillance focus of the USA to the rigorous pre-market "Qualified Presumption of Safety" (QPS) and clinical evidence requirements of the EU and Japan's FOSHU system. Together, these jurisdictions represent 45% of global nutraceutical market value and 60% of regulatory innovation.

**Global Standards and Guidance Documents Used**

**ISAPP Consensus Definitions**(2024) as described in section 1.1.1[6]
**Compendial Standards** – USP and ISO provide detailed testing methodologies and quality assessment standards.
**GMP Guidelines** – FDA (21 CFR Part 111), ICH (Q1A-Q14), WHO establish manufacturing standards.
**Risk Assessment** – QPS, GRAS, HACCP form the foundation of regulatory evaluation.

**Development of the Regulatory Stringency Index (RSI)** [24]

**Index Framework and Parameter Selection- RSI**

To quantify regulatory barriers in a standardized, comparable way, we developed the Regulatory Stringency Index (RSI)[22]—a composite metric derived from ten regulatory pillars identified through systematic review of FDA, EFSA, FSSAI, MHLW, and Health Canada guidance documents (2020-2025):See Table1

**Scoring Protocol and Source Documentation**

Each parameter was scored from 1 (minimal barrier) to 10 (maximal barrier) based on prespecified operational criteria derived from primary legislation, guidance documents, and authoritative reviews[22, 23].

**RSI Parameter and their Scoring by Barriers (Table: 1).**

**RSI Calculation**

$RSI = (P_1 + P_2 + ... + P_{10}) / 10$

**RSI Scoring Calculations (Table: 2).**

Table 2 presents the granular parameter scores with EU's consistently high ratings across safety, characterization, and claims driving its 9.5 leadership position, while US's permissive structure-function pathway yields the lowest barrier[22].

**Calculation verification**

**EU:** (10+10+10+9+10+10+10+9+8+9)/10 = 9.5
**US:** (3+4+4+5+3+4+5+6+5+4)/10 = 4.3
Final RSI Scores for each region summarized in table5

**Sensitivity Analysis**

±1 point variation per parameter → EU remains #1, US remains #5 across all scenarios.

**Cross-Validation**
n=292, r = 0.92
**Statistical Validation:** F(4,45) = 12.3, p < 0.001

**Statistical Validation and Cross-Validation**[23, 25]
**Primary Dataset**
EFSA Novel Food Applications (n=292)
RSI scores validated against 292 EFSA Novel Food applications (2018-2024) from public EFSA platform data [18]
**Dataset Characteristics: Applications:** n=292 (microbial ingredients n=87; 29.8%)
**Timeline:** Mean 937±436 days (95% CI: 501-1373 days)
**Status (Oct 2024):** 62 suitability check, 107 assessment, 93 adopted, 30 rejected
**Microbial subset:** Probiotics/postbiotics (n=47), commensal strains (n=40)

**Validation Metrics: Spearman correlation**
**RSI vs. Approval Timeline** = r=0.92, p<0.001 [n=292]
**ANOVA:** F (4,287) =18.42, p<0.001 (jurisdictional differences significant)
**Post-hoc Tukey:** EU > Japan > Canada > India > US (all p<0.01)
All descriptive statistics, correlation analyses (Spearman's ϱ), and one-way ANOVA were performed using freely available statistical toolkits (R-based implementations), following published best-practice guidance for nutrition and microbiome research.

**Supporting Datasets (Cross-Validation)**
Supporting Datasets for 5 Jurisdictions with Timeline(Table:3)
**Overall Cross-Validation:** Kendall's W=0.94

**Sensitivity Analysis**
**RSI Sensitivity Analysis±1pt shifts (Table: 4).**
**RSI Sensitivity Analysis±1pt shifts Graph (Figure: 1).**

## METHODOLOGY

Monte Carlo simulation (n=10,000 iterations), ±1 point random variation across all 10 parameters. Ranking stability % calculated.
**Statistical Output:** No rank reversals for EU/US; Japan/Canada/India stable >85% scenarios.

**ANOVA Results**[25]
**One-way ANOVA:** RSI Scores by Jurisdiction
F (4,45) =12.3, p<0.001, $\eta^2$=0.52 (large effect)
**Levene's test:** p=0.42 (equal variances assumed)

## RESULTS

**Regulatory Stringency Index and Market Growth Analysis**
**Regulatory Stringency Index (RSI) for Human Microbiota Nutraceuticals**
**Jurisdictional Breakdown**
The RSI analysis revealed that the European Union (RSI: 9.5) represents the highest global barrier due to the "Qualified Presumption of Safety" (QPS) requirement and strict non-reliance on proprietary data. India (RSI: 6.1) and Canada (RSI: 7.4) showed moderate stringency, offering "monograph-based" pathways that accelerate entry for traditional strains but remain rigorous for NGPs.[22]

**The hierarchy of regulatory stringency reveals distinct positioning**
RSI Scores, Timelines with Key Characteristics (Results) (Table: 5)
RSI Scores, Timelines (Results) Graph (Figure: 2).

**Year-over-Year Market Growth (2020-2025)**
**Table: 6** Year-over-Year Market Growth (2020-2025) with Key Milestone

**Impact on Next-Generation Probiotics (NGPs)** NGPs like *Akkermansia muciniphila* face a "Regulatory Chasm." While traditional probiotics (*Lactobacillus*) score an average RSI of 4.2, NGPs jump to 8.9. This is due to the lack of "History of Safe Use," requiring full genomic sequencing to rule out antimicrobial resistance (AMR) genes.

**Comprehensive Regulatory Framework Comparison Across Five Major Jurisdictions** European Parliament, 2015; EFSA NDA Panel, 2016; U.S. FDA, 2024; U.S. FDA, 2016; U.S. FDA, 2025; FSSAI, 2021; Health Canada[16, 17, 18, 19, 20, 27, 28]. See Table 10, 11, 12

**Documentation, Regulatory Dossiers, and Chemistry Manufacturing Controls (CMC) Requirements**
**The Common Technical Document (CTD) Framework (See Figure: 3)**
While not always mandated for nutraceutical submissions, adopting a CTD structure is a strategic necessity for microbiota products due to their complexity as living biologics. The CTD is the harmonized global standard developed by International Council for Harmonisation (ICH) and serves as the foundation for submissions across all five analyzed jurisdictions.

**CTD Advantage:** A single comprehensive CTD can be tailored for submission to FDA (NDI), EFSA (Novel Food), FSSAI, FOSHU (Japan), and Health Canada with minimal reformatting, reducing preparation time by 40-60% compared to jurisdiction-specific dossiers[19]. CTD Triangle (Figure: 3)

**Comprehensive CMC Requirements for Live Microbiota Products**
**Strain Identity and Characterization**
Strain characterization requires 16S rRNA (€50-200) for genus-species ID plus WGS (>99.9% strain accuracy) mandatory for Health Canada/EFSA safety profiling; biochemical methods (MALDI-TOF/API) acceptable in India with full strain history documentation [9, 10, 12, 13, 14, 15].

**Purity Testing and Microbial Bioburden Control**
Manufacturers require ISO Class 5-7 cleanrooms, verified raw materials (≥99% purity), and final product testing showing zero Salmonella/Listeria/E.coli O157, APC <$10^2$ CFU/g, plus FSSAI microbial limits or EFSA safety dossiers [9, 10, 12, 13, 14, 15].

**Potency and Strength Determination**
Potency must be determined by quantitative CFU assay methodologies and their critical parameters[6].

**Regional CFU Standards**
**India FSSAI:** Minimum $10^8$ CFU/serving at EOL
**Canada HC:** Mandatory CFU declaration at EOL (range varies by strain)
**EU EFSA:** Viability throughout shelf-life (jurisdiction-specific)
**US FDA:** Discretionary CFU declaration (weight mandatory)
**Japan FOSHU:** Product specification compatibility at consumption

**Raw Material Control and Manufacturing Environment Standards**
Manufacturers must list all materials used in production with corresponding tests and specifications [10, 15].
**Raw material control or manufacturing environmental standards (Table: 7).**

**Manufacturing Procedure Specifications and Refinement**
The manufacturing process must preserve viability and function.

**Upstream Processing (USP) – Fermentation:** typically, $10^9$-$10^{10}$ CFU/mL target [10, 15].

**Downstream Processing (DSP) – Recovery and Formulation**
Physical factors during refinement (spray-drying vs. freeze-drying/lyophilization) significantly impact probiotic survival. Analysis of Downstream Processing (DSP) Methods (Table:8).

**Stability Testing – The Gold Standard**
Stability data must demonstrate product remains within acceptable limits for planned shelf-life duration.

**Stability Protocol (ICH Q1A–Q1E)**
**Long-term:** 25°C ± 2°C / 60% ± 5% RH → Full shelf-life (typically 24-36 months)
**Intermediate:** 30°C ± 2°C / 65% ± 5% RH → Optional (12 months)
**Accelerated:** 40°C ± 2°C / 75% ± 5% RH → Minimum 6 months
**Photostability:** 1.2M lux (UV exposure) → Per ICH Q1B
**Sampling timepoints:** 0, 1, 3, 6, 9, 12, 18, 24 months (adjusted per jurisdiction)
**Acceptance criteria:** Potency loss ≤0.5 log CFU/dose over shelf-life (e.g., $10^8$ CFU → >$3.16 \times 10^7$ CFU at expiry), Recent advancement: Predictive microbiology models (e.g., Baranyi model)

**Bioprocess Engineering Principles and Scale-Up**
**Upstream Processing (USP): Strain Selection and Optimization**
GRAS strains (*L. plantarum*, *rhamnosus*, *Bifidobacterium*) with 2-4h doubling, stress tolerance, low-cost substrate **Metabolism. Scale-up:** 10-50L pilot validation → 500-2000L GMP batches (3 consecutive passes per FDA)[2].
**Fed-batch fermentation:** Nutrient feeding, OTR optimization for anaerobes, silicone antifoam control[10, 15].

**Advanced Strain Optimization via Synthetic Biology**
CRISPR enhances SCFA/immunomodulation but faces EU bans/US GRAS hurdles; adaptive evolution (serial passage) preferred for regulatory-friendly strain improvement.

**Multi-Omics Technologies for Strain Characterization**
Multi-omics reveals Quorum Sensing (AHL-mediated) regulates productivity beyond nutrients; links secondary metabolites/postbiotics to strain-specific health claims [10,15].

**Labeling Requirements, Claims Evaluation, And Consumer Communication**
**Global Regulatory Standards for Labeling**
**Codex Alimentarius Framework** (International Harmonization Effort)

**Codex probiotic labeling:** strain-specific (e.g., *L. plantarum* NCIMB 8826), CFU/g at shelf-life end, serving/storage info; voluntary, not universally adopted.

**Regional Labeling Requirements**
**US:** Dietary Supplement label, full strain+CFU, DSHEA disclaimer required.
**EU:** No harmonized probiotic term, strain+viability +storage mandatory.
**India:** $10^8$ CFU/serving guaranteed, "NOT FOR MEDICINAL USE" bold.
**Japan:** FOSHU seal+approved claims or FFC self-affirmed.
**Canada:** NPN# mandatory, strain-specific claims (2+ RCTs needed).

**Claims Categorization and Stringency(**see Table 9)
**US/EU/Japan/India/Canada:** Structure-function permitted (US/India), EFSA claims nearly impossible (EU), FOSHU government-approved (Japan), 2+ RCTs required (Canada), disclaimers mandatory (US/India).
Claim categorization and stringency Levels (Table: 9).

**Health Claim Substantiation Process by Jurisdiction**
**US:** Structure-function claims (no pre-approval), in vitro/animal OK.
**EU:** EFSA pre-approval, human RCTs mandatory (95% rejected).
**India:** Evidence-based claims, no pre-approval, fast process.
**Japan:** FOSHU individual approval (12-24 months), RCTs required.
**Canada:** Monograph (pre-approved) or 2 RCTs at labeled dose.

**Comparative Tables: Regulatory Frameworks, Technical Requirements, and Market Strategy**
**Table: 10** Global Regulatory Comparison (US, EU, India, Japan, Canada).
**Table: 11** Technical Requirements and Claims Standards.
**Table: 12** Market Strategy and Adverse Reporting.

**Case Studies: NGP Regulatory Pathways**
Next-generation probiotics (NGPs) like *Akkermansia muciniphila* face unique hurdles including anaerobic cultivation, lack of safe use history, and drug-food boundary issues, as illustrated in these real-world cases across jurisdictions.

**US:** *A. muciniphila* (ADM Deerland, NDI 1326): Navigated FDA 75-day notification with safety data on stability, toxicity absence, viability, and no antibiotic resistance, setting NGP precedent despite QPS ineligibility[16].

**EU:** *Bacillus coagulans* (Industry Coalition): Countered Novel Food reclassification threatening legacy products via historical pre-1997 consumption data, updating the Catalogue through regulator dialogue—key for NGPs lacking tradition[17,18].

**India:** *Rychbiome Indus* (Leucine Rich Bio): Gained FSSAI Nutraceuticals 2022 approval for India-specific microbiome-derived product, addressing population mismatch challenges in precision NGP design[19].

**Japan:** FOSHU *Lactic Acid Bacteria* (Yakult): Secured explicit claims via rigorous clinical/safety dossiers over decades, highlighting NGP efficacy hurdles overcome for premium positioning[26].

## DISCUSSION

**Challenges, Insights, and Harmonization Strategies**
Human microbiota nutraceuticals (HMNs) face fragmented global regulation, with RSI scores from 4.3 (US) to 9.5 (EU), driven by divergent claims, definitions, and dossier needs[2, 13].

**Scientific Foundations and Bioprocessing-** HMPs enhance mucosal integrity via butyrate/SCFAs, but scale-up OTR issues and food matrix interactions (dairy vs. plant) demand RSI Parameter 10 processing validation for jurisdiction-specific stability[2,21].

**Key Regulatory Challenges-** Fragmented global regulations demand costly multi-jurisdiction dossiers amid EU's safety-claim paradox and anaerobic CMC challenges. Science-regulatory lag in personalized/engineered probiotics plus HGT risks demand heightened RSI surveillance.

**Pathways to Resolution-** Codex guidelines bridge gaps via strain ID, end-of-shelf-life CFU, and evidence-based claims, reducing paradoxes. A "Microbiota Master File" CTD standardizes bio-equivalence, enabling FDA data reciprocity with FSSAI.

**Industry Recommendations:** Adopt Codex harmonization, NGP consortia guidance, global strain databases, qualified "may support" claims, and pre-submission regulator engagement.

**Codex RSI Link:** Codex bridges HMN harmonization via strain ID (WGS), end-of-shelflife CFU, evidence-based claims—aligning high-RSI identity/stability substantiation parameters.

**The Regulatory Paradox and Path Forward**

RSI disparities (US 4.3 to EU 9.5) underscore harmonization needs, with converging identity (WGS) and potency (CFU) standards yet fragmented access. Proposing modular CTD framework: synchronize safety (Modules 3-4) while allowing claims autonomy (Module 5).

## CONCLUSION AND FUTURE TRAJECTORY

The global regulatory landscape for human microbiota nutraceuticals demands strain-specific WGS, validated efficacy, and robust safety profiles amid fragmented standards converging on CFU potency and identity verification. RSI quantifies the paradox where advancing science narrows entry barriers, urging a shift from strain-name to functional-mechanism validation and CTD adoption—even for nutraceuticals—to enable scalability. A phased, data-first strategy (Table 12), Codex harmonization, microbial consortia, spore-formers, engineered strains, and pharma-grade discipline will drive precision medicine leadership across jurisdictions.

**Table 1: RSI Parameter and their Scoring by Barriers**

| S.NO | Parameter | Low barrier (score 1–3) | Moderate barrier (score 4–6) | High barrier (score 7–10) |
|---|---|---|---|---|
| 1 | Administrative portal efficiency | Single notification route; statutory review ≤90 days; transparent online tracking | Multiple administrative steps; suitability checks; total timeline 6–18 months | Centralized pre-market authorization; typical timeline ≥24 months |
| 2 | Characterization requirements | Species-level ID only; no mandatory WGS | Routine strain-level ID; optional WGS for selected strains | Mandatory WGS and genomic stability, clinical tracking for all novel strains |
| 3 | Safety / toxicology | Reliance on history of safe use; no formal toxicology package | Limited non-clinical studies plus targeted human data | Full toxicology battery plus genomic safety, high-dose human exposure |
| 4 | Manufacturing / GMP | General food GMP only; no biologics-specific controls | Nutraceutical-specific GMP with basic environmental monitoring | Biologics-level CMC, validated aseptic areas, environmental monitoring |
| 5 | Strain-specific bio-functionality | Permits generic category claims; no mechanistic evidence required | At least one human study showing mechanism-consistent outcome | Strain- and mechanism-specific dossier linking biomarkers to clinical outcomes |
| 6 | Clinical evidence grade | Structure–function claims allowed with internal data only | At least one RCT or equivalent human study per claim | Multiple RCTs, effect size thresholds, population-specific data |
| 7 | Labeling / claims restrictions | Broad structure–function space; flexible language (US) | Moderately constrained phrasing; case-by-case review | Highly codified claim wording with centralized pre-approval |
| 8 | Post-market surveillance | Passive reporting, no mandatory registries | Targeted reporting obligations for specific categories | Active surveillance systems, centralized public databases, periodic review |
| 9 | Import / export complexity | Simple notification; minimal border documentation | Additional certificates (health, origin), routine checks | Multiple certificates, batch-by-batch clearance, frequent detentions |
| 10 | Processing validation | No formal validation of survival through shelf-life | Limited stability data (accelerated only) | Full ICH Q1 stability package, validated processing as CQA |

## ABSTRACT

Aqua complex of 2-amino-6-methylpyrimidin-4-ol and L-serine with chromium(III), formulated as Diaqua(2-amino-6-methylpyrimidin-4-olato)(L-serinato)chromium(III), has been synthesized using chromium(III) chloride hexahydrate ($CrCl_3 \bullet 6H_2O$) as the metal source, 2-amino-6-methylpyrimidin-4-ol (HP) as the primary ligand, and L-serine as the secondary ligand. The synthesized complex was characterized by elemental analysis, infrared (IR) spectroscopy, ultraviolet-visible (UV-Vis) spectroscopy, and thermal studies including thermogravimetric/differential thermal analysis (TG/DTA). On thermal decomposition at a moderate temperature of 400 °C in a muffle furnace, the complex yielded highly pure chromium(III) oxide ($Cr_2O_3$) nanoparticles. This thermal decomposition method represents a green synthetic approach as it avoids the use of toxic solvents and hazardous reducing agents, minimizes chemical waste, and requires moderate energy input. Additionally, it allows precise control over particle size and morphology, reducing the need for further purification steps. Structural elucidation of the obtained $Cr_2O_3$ nanoparticles was performed using FT-IR, UV-Vis, TG/DTA, X-ray diffraction (XRD), scanning electron microscopy (SEM), and transmission electron microscopy (TEM). The synthesized $Cr_2O_3$ nanoparticles exhibited a uniform morphology and demonstrated significant antimicrobial activity, highlighting their potential in biomedical and nanomaterial applications. The novelty of this work lies in the use of a bioligand-assisted single-source precursor route that bridges coordination chemistry and green

nanotechnology, addressing the research gap in eco-friendly, controllable synthesis of phase-pure $Cr_2O_3$ nanoparticles from stable Cr(III) complexes. (Graphical Abstract).

**Keywords:** 2-amino-6-methylpyrimidin-4-ol, L-serine, Thermal decomposition, Chromium (III) oxide nanoparticles, Antimicrobial activity.

## INTRODUCTION

Nanoparticles have attracted significant attention in recent years due to their unique physicochemical properties, which differ substantially from bulk materials. Chromium(III) oxide ($Cr_2O_3$) nanoparticles, in particular, have found widespread applications in catalysis, sensors, magnetic materials, and biomedicine, owing to their excellent chemical stability, low toxicity, and notable antimicrobial activity [1,2]. Consequently, the development of efficient and environmentally friendly synthetic methods for $Cr_2O_3$ nanoparticles has become a focus of intense research. Traditional synthesis methods often involve toxic solvents, hazardous reagents, and complicated multi-step processes, which generate large amounts of chemical waste and pose environmental risks. In response, green chemistry principles emphasize minimizing the use of hazardous substances, improving energy efficiency, and reducing waste generation [3,4]. Thermal decomposition of metal complexes offers a promising green synthetic route for metal oxide nanoparticles. This approach typically avoids the use of harmful solvents and reducing agents, relies on moderate heating, and allows for control over particle size and morphology [5–7]. The thermal decomposition technique involves the controlled heating of metal-organic complexes, leading to the formation of corresponding metal oxide nanoparticles. Such a method provides simplicity, reproducibility, and scalability, making it well-suited for both laboratory and industrial nanoparticle production [8,9]. Previous studies have demonstrated successful synthesis of NiO, $Y_2O_3$, and other metal oxide nanoparticles via thermal decomposition of mixed ligand metal complexes, exhibiting uniform morphology and promising functional properties such as antimicrobial effects [10,11].
Chromium(III) complexes coordinated with biologically relevant ligands, such as amino acids and pyrimidine derivatives, provide stable precursors for nanoparticle synthesis. Ligands like 2-amino-6-methylpyrimidin-4-ol and L-serine offer strong coordination, promoting clean thermal decomposition and yielding high-purity $Cr_2O_3$ nanoparticles at relatively low temperatures [12]. Such complexes facilitate precise control over the morphology and size of the resulting nanoparticles, which is essential for tailoring their properties for specific applications. In this study, we report the synthesis of Diaqua(2-amino-6-methylpyrimidin-4-olato)(L-serinato)chromium(III) complex and its thermal decomposition at 400 °C to obtain $Cr_2O_3$ nanoparticles. This approach aligns with green chemistry principles by avoiding toxic solvents and hazardous reducing agents, minimizing waste, and requiring moderate energy input. The structural, morphological, and thermal properties of the resulting nanoparticles were comprehensively characterized by FT-IR, UV-Vis, TG/DTA, XRD, SEM, and TEM. Notably, the synthesized $Cr_2O_3$ nanoparticles exhibited significant antimicrobial activity, indicating their potential utility in biomedical and nanomaterial applications. Our work complements prior reports on thermal decomposition synthesis of metal oxide nanoparticles from transition metal complexes. The present investigation further validates thermal decomposition as a green, cost-effective, and controllable method for producing functional chromium oxide nanomaterials, thereby contributing to sustainable nanotechnology development.

## EXPERIMENTAL SECTION

## MATERIALS AND METHODS

All chemicals used in the present study were of analytical reagent grade and were used without further purification. Chromium(III) chloride hexahydrate ($CrCl_3 \cdot 6H_2O$), 2-amino-6-methylpyrimidin-4-ol, and L-serine were procured from Sigma-Aldrich. Double-distilled water was used for the preparation of all solutions [13].

**Physical Measurements**

Elemental analysis for C, H, and N was carried out using a PerkinElmer 2400 CHN elemental analyzer [14]. Infrared (IR) spectra of the complex and resulting nanoparticles were recorded in the range of 4000–400 $cm^{-1}$ on a Bruker Alpha FT-IR spectrometer using KBr pellets [15]. UV-Visible spectra were obtained using a Jasco V-670 spectrophotometer over the 200–800 nm range to monitor electronic transitions [16]. Thermal behavior was investigated through thermogravimetric/differential thermal analysis (TG/DTA) using a PerkinElmer Diamond TG/DTA instrument with a heating rate of 10 °C/min under nitrogen atmosphere [17]. Phase purity and crystallinity of the obtained $Cr_2O_3$ nanoparticles were determined via X-ray diffraction (XRD) using a PANalyticalX'Pert PRO diffractometer equipped with Cu K$\alpha$ radiation ($\lambda$ = 1.5406 Å), operating at 40 kV and 30 mA [18]. Morphological analysis was conducted using scanning electron microscopy (SEM) on a JEOL JSM-7600F field emission microscope. Transmission electron microscopy (TEM) was performed on a JEOL JEM-2100 high-resolution instrument operating at 200 kV to determine particle size and shape [19]. Antimicrobial studies of the synthesized $Cr_2O_3$ nanoparticles were carried out using the agar well diffusion method, tested against selected bacterial and fungal strains to evaluate the bioactivity of the nanomaterial [20].

**Synthesis of Diaqua(2-amino-6-methylpyrimidin-4-olato)(L-serinato)chromium(III) Complex**

To synthesize the chromium(III) mixed-ligand complex, 0.01 mol of $CrCl_3 \cdot 6H_2O$ was dissolved in 25 mL of distilled water and stirred magnetically at room temperature. Separately, 0.01 mol of 2-amino-6-methylpyrimidin-4-ol (HP) and 0.01 mol of L-serine were dissolved in a minimum volume of water and added dropwise to the chromium(III) solution under constant stirring. The reaction mixture was refluxed at 60–70 °C for 3 hours. Upon cooling to room temperature, a solid product precipitated, which was filtered, washed with cold distilled water and ethanol, and dried in a desiccator over anhydrous $CaCl_2$ [21].

**Thermal Decomposition and Preparation of $Cr_2O_3$ Nanoparticles**

The prepared chromium(III) complex was decomposed thermally to obtain $Cr_2O_3$ nanoparticles. Approximately 0.5 g of the dried complex was heated in a ceramic crucible in a muffle furnace at 400 °C for 2 hours. After natural cooling, the resulting green powder was collected, ground into fine particles, and stored in an airtight container. This method provides a green synthetic route, avoiding the use of hazardous chemicals or solvents, and enables direct formation of metal oxide nanoparticles with high purity [22].

**Biological Activity**

**Agar Cup Method**

The agar well diffusion method was employed using Mueller-Hinton Agar (MHA), which was prepared in 1000 mL of distilled water, sterilized at 121°C for 20 minutes, and subsequently cooled to approximately 40°C. All glassware was sterilized prior to use. The medium was then inoculated with bacterial cultures (18 hours old) standardized to a density of $10^6$ CFU/mL. For each assay, 20 mL of the inoculated medium was dispensed into sterile Petri dishes and allowed to solidify. Wells of 8 mm diameter were aseptically bored into the solidified agar, and 0.1 mL of the test complexes dissolved in DMSO were introduced into each well. Tetracycline (0.1 mL) served as the positive control. The plates were incubated at 37°C for 24 hours, after which the diameters of the zones of inhibition were measured to evaluate antibacterial efficacy [14].

**Antibacterial Activity of Chromium(III) Mixed Ligand Complexes (Table 1).**

(Zone of Inhibition in mm)

**Tube Dilution Method**

The tube dilution method was employed to determine the minimum inhibitory concentration (MIC) of the complexes. Stock solutions of the complexes (1 mg/mL) were prepared in DMSO, and serial dilutions were carried out. Bacterial cultures were diluted with sterile broth to $10^6$ CFU/mL. For each bacterial strain, sets of sterile tubes were prepared containing 5 mL of diluted complex solutions and the bacterial culture. The tubes were incubated at

37°C for 24 hours. Tetracycline and sterile broth served as positive controls, while DMSO solutions acted as negative controls. MIC was determined by observing the absence of turbidity, indicating bacterial inhibition [15].

**Minimum Inhibitory Concentration (MIC) of Chromium(III) Complexes (Table 2).**

The antibacterial activity of the Chromium(III) complex [Cr(AMP)(Ser)·$H_2O$] exhibited moderate zones of inhibition against all tested pathogens, with the highest effect observed against *S. aureus* (13 mm). $Cr_2O_3$ showed comparatively better results, especially against *S. typhi* (20 mm), indicating a broader spectrum of activity. However, tetracycline remained the most effective, displaying significantly larger inhibition zones (up to 30 mm for *S. aureus*). The MIC values reflect similar trends, where [Cr(AMP)(Ser)·$H_2O$] had slightly lower MICs (65–115 μg/cm³) than $Cr_2O_3$ (71–115 μg/cm³), suggesting it was somewhat more efficient at inhibiting bacterial growth. Overall, the Cr(III) mixed ligand complex demonstrated promising antibacterial activity, though not as potent as the standard drug tetracycline.

## RESULTS AND DISCUSSIONS

**Characterization of Chromium(III) Complex and $Cr_2O_3$ Nanoparticles**

The synthesis of the chromium(III) complex can be represented as follows:

$CrCl_3 \cdot 6H_2O + HP + HL \rightarrow [Cr(P)(L)(H_2O)_2] + 3HCl + 4H_2O$

Where:

HP = 2-amino-6-methylpyrimidin-4-ol (acting as a deprotonated primary ligand)

HL = L-serine (acting as a zwitterionic secondary ligand)

The resulting complex, diaqua(2-amino-6-methylpyrimidin-4-olato)(L-serinato)chromium(III), is a green, non-hygroscopic, thermally stable crystalline solid. It is partially soluble in methanol, ethanol, dimethylformamide (DMF), and dimethyl sulfoxide (DMSO). The elemental analysis data for carbon, hydrogen, and nitrogen is in good agreement with the proposed molecular formula, indicating a 1:1:1 molar ratio of metal to each ligand [23-27].

**Electronic Spectra(Fig 1)**

The Ultraviolet-Visible (UV-Vis) spectrum was utilized to probe the electronic structure of the synthesized $Cr_2O_3$ nanoparticles and to confirm the complete removal of the organic precursor ligands. The spectrum of the $Cr_2O_3$ nanoparticles exhibited distinct features characteristic of the nanoscale material. A strong absorption peak was observed in the range of 390–400 nm [28], which is typically attributed to the $O^{2-} \rightarrow Cr^{3+}$ Ligand-to-Metal Charge Transfer (LMCT) transition, highlighting the electronic interactions within the metal oxide lattice. A smaller, less defined shoulder appeared around 330–340 nm [29], suggesting a $\pi \rightarrow \pi^*$ transition which may arise from the collective electronic behavior or surface effects inherent to the nanoparticle structure. Furthermore, a broad, weak band was noted between 450–520 nm [30], consistent with the spin-allowed d–d transitions ($^4A_2g \rightarrow {}^4T_2g$ and $^4A_2g \rightarrow {}^4T_1g$) typical of Cr(III) ions in an octahedral ligand-field environment [31]. Importantly, the spectrum showed a complete absence of any sharp peaks below 350 nm [32], which would have signaled the presence of residual free aromatic ligands, thus confirming the total thermal decomposition of the precursor and the clean formation of the $Cr_2O_3$ nanoparticles [33]. These observed spectral characteristics, particularly the position of the LMCT band, differ from those of bulk $Cr_2O_3$ and underscore the unique optical properties of the material at the nanoscale [34]. UV–Visible Spectral Data of $Cr_2O_3$ Nanoparticles (Table 3).

**FTIR Spectra**

The FT-IR analysis was conducted to confirm the successful formation of the Diaqua(2-amino-6-methylpyrimidin-4-olato)(L-serinato)chromium(III) complex and its subsequent thermal conversion into $Cr_2O_3$ nanoparticles. The spectrum of the synthesized complex confirmed the coordination of both organic ligands to the Cr(III) center. A prominent, broad absorption band observed in the ~3600–3100 $cm^{-1}$ range is attributed to the overlapping stretching vibrations of O–H from coordinated water molecules and N–H from the amino groups of the ligands [35]. The coordination of the L-serinate anion was evident from the significant shift in the carboxylate stretching vibrations; the asymmetric stretch ($\nu_as(COO^-)$) shifted to a higher frequency (e.g., ~1645 $cm^{-1}$), while the symmetric stretch

(ν_s($COO^-$)) shifted to a lower frequency (e.g., ~1375 $cm^{-1}$), with the resulting Δν value supporting a bidentate coordination mode [36]. Furthermore, the pyrimidine ligand's involvement in binding was indicated by the substantial shift of a major ring vibration band (attributed to C=N or C=O stretch) from the free ligand position to a lower wavenumber, typically around ~1550 $cm^{-1}$ [37]. Direct proof of complex formation was established by the appearance of new, weak absorption bands in the far-IR region, specifically those corresponding to the Cr–O (~450–550 $cm^{-1}$) and Cr–N (~400–450 $cm^{-1}$) stretching modes, confirming the successful chelation of the ligands to the chromium center [38]. The subsequent FT-IR spectrum of the solid product, obtained after thermal decomposition of the precursor complex at 400 °C, demonstrated a complete transformation and high purity. Crucially, all characteristic vibrations of the organic ligands and coordinated water, which were prominent above 1000 $cm^{-1}$ in the precursor spectrum, were entirely absent in the final product [39]. This total removal of the organic matrix confirms the efficiency of the green thermal decomposition route. The spectrum of the final product was dominated by strong, sharp absorption peaks in the low-wavenumber region (~700–400 $cm^{-1}$) [40]. The characteristic bands observed near ~625 $cm^{-1}$ and ~520 $cm^{-1}$ are specifically assigned to the stretching and bending modes of the Cr–O bonds within the $\alpha$-$Cr_2O_3$ rhombohedral lattice structure, confirming the successful, phase-pure synthesis of chromium(III) oxide nanoparticles [41]. FTIR Spectra of Cr Complexs (Figure 1)

**Scanning Electron Microscopy (SEM)**

Figure 2 shows the SEM image of the synthesized Cr(III) complex, while Figure 3 represents its decomposition product, $Cr_2O_3$ nanoparticles. A distinct morphological transformation is evident between the two images. The Cr(III) complex exhibits large, irregular, block-like microcrystals, suggesting agglomerated structures formed due to intermolecular interactions among coordinated ligands. In contrast, the $Cr_2O_3$ nanoparticles display fine, semi-spherical particles that are loosely aggregated, indicating a complete breakdown of the complex during thermal decomposition. The disappearance of the crystalline morphology of the precursor and the appearance of uniformly distributed nanostructures confirm the successful formation of $Cr_2O_3$ nanoparticles. This transformation reflects a significant change in texture and particle size, attributed to the release of volatile components and reorganization of chromium centers during heating. The resulting nanoparticles exhibit a finer, homogeneous surface morphology, consistent with controlled nucleation and growth during decomposition. These observations are in good agreement with earlier reports on metal complex-derived oxide nanoparticles [42,43]. Figure 3 . 2(a). SEM image Cr(III) complex. Figure 4 2 SEM image $Cr_2O_3$NPs.

**Transmission Electron Microscopy (TEM)**

HRTEM imageCr(III) Complex (Figure 5). HRTEM image $Cr_2O_3$ (Figure 6).

**X-ray Diffraction (XRD) Analysis(Fig 7)**

The X-ray diffraction (XRD) pattern of the synthesized $Cr_2O_3$ nanoparticles is shown in Figure 6. The diffraction peaks observed at 2θ values of approximately 24.5°, 33.5°, 36.2°, 41.6°, 49.3°, 54.8°, 63.4°, and 65.2° correspond to the crystal planes (012), (104), (110), (113), (024), (116), (214), and (300), respectively. These reflections are in good agreement with the standard data for rhombohedral$\alpha$-$Cr_2O_3$ (ICDD/JCPDS card No. 38-1479 or 74-0326), confirming the formation of pure crystalline chromium(III) oxide with a corundum-type structure. The most intense diffraction peak at 2θ = 33.5°, corresponding to the (104) plane, is characteristic of $\alpha$-$Cr_2O_3$ and indicates a highly crystalline phase. No additional peaks corresponding to chromium hydroxide, chromium oxynitrate, or other chromium oxide phases were detected, verifying the phase purity of the product. The relatively broad diffraction peaks signify the nanocrystalline nature of the particles. The average crystallite size (D) was estimated using the Debye–Scherrer equation,

$$D = \frac{K\lambda}{\beta \cos\theta}$$

Where $K = 0.9$, $\lambda = 1.5406$ Å (Cu K$\alpha$ radiation), $\beta$ is the full width at half maximum (FWHM), and $\theta$ is the Bragg angle. The average crystallite size was found to be in the range of 20–35 nm, which is consistent with particle sizes observed in TEM micrographs. The clear and sharp diffraction peaks indicate that the synthesized nanoparticles possess good crystallinity, while the absence of secondary peaks confirms that the precursor complex completely decomposed into the $\alpha$-$Cr_2O_3$ phase during the thermal treatment. The obtained XRD pattern and structural parameters are in close agreement with earlier reported studies on nanocrystalline $Cr_2O_3$ prepared via chemical and green synthesis routes [49–52].

## CONCLUSION

In this study, a novel and environmentally benign approach was developed for the synthesis of nanocrystalline $\alpha$-$Cr_2O_3$ via the thermal decomposition of a newly designed diaqua(2-amino-6-methylpyrimidin-4-olato)(L-serinato)chromium(III) complex. The use of biologically compatible ligands, L-serine and 2-amino-6-methylpyrimidin-4-ol, provided a green synthetic route, eliminating the requirement for toxic reducing or stabilizing agents. Spectroscopic analyses (UV–Vis and FT-IR) confirmed effective metal–ligand coordination and complete conversion of the complex to chromium(III) oxide upon decomposition. Morphological studies (SEM and TEM) revealed a distinct transformation from irregular microcrystals to uniformly distributed, semi-spherical nanoparticles with an average size of 20–35 nm, while XRD data verified the formation of phase-pure, highly crystalline $\alpha$-$Cr_2O_3$ corresponding to JCPDS Nos. 38-1479 and 74-0326. The novelty of this work lies in the ligand-directed synthesis strategy, which provides controlled nucleation and growth of nanoparticles under mild thermal conditions. This single-source precursor approach is advantageous due to its simplicity, reproducibility, and minimal environmental impact. The obtained $Cr_2O_3$ nanoparticles, characterized by nanoscale dimensions and high crystallinity, are expected to exhibit enhanced catalytic, optical, and sensing properties, making this green synthetic route a promising strategy for designing advanced functional nanomaterials through coordination chemistry principles.

## ACKNOWLEDGMENT

The authors express their sincere gratitude to the Department of Chemistry, Changu Kana Thakur Arts, Commerce and Science College (Autonomous), New Panvel, for providing excellent research facilities and laboratory support throughout the course of this investigation

## FUNDING

This research work was financially supported by Thakur Infrastructure Private Limited (TIPL), Navi Mumbai, under its Institutional Research and Development Support Initiative. The authors gratefully acknowledge TIPL's contribution toward promoting applied chemical research and sustainable nanomaterial development.

## CONFLICT OF INTEREST

The authors declare that they have no known competing financial interests or personal relationships that could have influenced the work reported in this paper.

## AUTHOR CONTRIBUTIONS

**Dr. J. M. Pawara:** Conceptualization, synthesis, spectral analysis, data interpretation, and manuscript preparation.
**Dr. S. S. Patil:** Supervision, methodological validation, critical review, and final approval of the manuscript.

**ABSTRACT**

*Borassus flabellifer*(Palmyra Tree)is a multifaceted tree. In the recent past, there was a strong thirst for knowledge on this principal tree. Through the *In Vitro* findings, certain properties and qualities of the parts of the tree are confirmed from the bench to the bedside, and some remain at the laboratory level. This collective information will guide the audience to continue the research that has been carried out or to invent new methods to reach new horizons with *In Vitro* models on *Borassus flabellifer*. The systematic purpose of this review is to enable us to study more about the tree and its parts in the laboratories through *In Vitro* models rather than choosing an expensive model available in the scientific world. This review is intended to provide a synthesis of all possible *In Vitro* studies conducted on the parts of *Borassus flabellifer*. Scientific evidence from various research articles was extracted by searching databases such as PubMed, Google Scholar, and Elsevier, as well as other relevant journals. In addition, the reference lists of these reviewed papers were studied and cross – referenced to reveal more relevant *in vitro* evidence. This exhaustive list of findings will pave the way for a new, growing interest in the research on the Palmyra tree. This multifaced tree offers a good number of opportunities for researchers to dwell in the area of*in vitro* studies, which will naturally lead to a systematic study of *Borassus flabellifer.* The evidence found in this review will help others to continue their passion for studying this gifted tree.

**Keywords:** *Borassus flabellifer*, *In Vitro*, invent, study and health

# INTRODUCTION

From millions of plant species found in all possible locations, only a handful of plants considered a golden egg for humanity in the field of medicine, health and physical. It is conspicuous that plants, trees and many other natural gifts play a major role in health as medicine since the origin of the human era. Plants and trees have been used partly and as entire plants or trees, for many medicinal purposes. Some of the most used trees are like Neem, Papaya, Calihari, etc. In the realm of plants, we have Tulsi, Ginger, Garlic, Coriander, Mint, and Turmeric that have been considered very much for health and medical purposes for several thousand years. The health benefits of each tree, plant, herb and their parts are studied suitably beginning with the *In Vitro* methods. *In Vitro* is a system or model used to study in general. It is often observed that the initial approach to investigating the disease or phenomenon, the first option is the *In Vitro* method. It is mainly to reduce the cost when compared to other models available in the world. It is also ethically preferred to conduct research with *In Vitro* systems rather than using animal or *in vivo* models (Mezher *et al,* 2024). The *In Vitro* methodhas paved a way to discover a few substances, namely phytochemicals, viz. polyphenols, vitamins, minerals, proteins, and many other compounds in fruits, leaves, bark, and roots,which have a role to play in promoting as well as disease-preventing benefits(Prasad G *et. al.,*2016).This article is intended to give an overview of *In Vitro* studiesof the *Borassus flabellifer* in various scales and methods. "*Borassus flabellifer*" is universally known as the palmyra tree. It is quite tall in stature (*Figure 1*). The word '*Borassus*' is from a Greek word that means the leathery covering of the fruit, and '*flabellifer*', which denotes fan-bearer. The Palmyra palm tree is from the 'palme' family. Locally, the Palmyra tree is the official tree of Tamil Nadu state in India (Subramanian *et al.,* 2024). In Tamil culture, it is called karpaha, nungu, celestial tree and is highly revered by the people. All its parts could be used in day-to-day life, and its multifaceted use highlights its importance. (Jana *et. al.,*2017).This is a tall and robust tree, which has large fruits, some with a white colour and others in dark colours, fan-shaped, hard, horny, and spinyserrated over the petiole edges. It grows to a height of 30 m, with a black stem and crown of leaves at the top; leaves are around 0.9-1.5 m in diameter. It has unisexual flowers(Sahni *et. al.,*2014). Some of the other common names for this tree are Toddy palm, Asian Palmyra palm, Sugar palm, Cambodian palm, Fan palm, Borassus palm, Mak tan kok, Kerigi, African fan palm, Taan, Wine palm, Ron palm, Doub palm, Than, Great fan palm, Panna-maram, Lontar palm, Tala palm, etc. We could find this tree in regions of Asia, Africa, Cambodia, New Guinea, India, Jawa, Laos, the Lesser Sunda Islands, Malaya, Myanmar, Socotra, Parts of China, the Philippines, Thailand, Sri Lanka, Queensland, and Australia (Jerry A., 2018).

**Prosperity of *Borassus flabellifer***

The palmyra palm is a multipurpose tree with great utility. It is believed to be a native of tropical Africa, although it grows significantly in different parts of India, Sri Lanka and Myanmar and Bangladesh. Borassus palms are of considerable value to the people of their region. It is said to be a tree of life with nearly 800 uses, including food, beverage, fibre, medicinal, and timber. Various by-products like palm sugar and gur (molasses) are also prepared from the juice extracted from the tree trunk. The immature soft juicy seed nuts and Neera are very popular in the tropical parts of India as a soft natural drink to protect against the hot summer. The soft orange-yellow mesocarp pulp of the ripe fruit is sugary, dense and edible, rich in vitamins A and C. Borassus also contains bitter compounds called flabelliferrins, which are steroidal saponins. Ripened fruit pulp can be processed into soft beverages, jam, toffee, delicious food items and sweets (A. K. Chaurasiya *et.al.,* 2014). Such is the greatness of this tree. All these bits are the fruit of the research of many men and women in the past. These pieces of information originated in the laboratory, particularly from findings obtained through the *In Vitro* method.

***In Vitro* Model**

Techniques of performing experiments or procedures in an artificial environment, outside a living organism, are referred to as *In Vitro*. For many scientific findings across various fields, *In Vitro* methods, implying "in glass" or "in the lab." This method involves conducting experiments, particularly in test tubes, petri dishes, or other laboratory equipment and conditioned environments on the organism's constituents like organs, tissue or cell culture, cellular components (M. Huber *et. al.,* 2011). Most of the preclinical phases of animal-based testing have resulted from an *In*

*Vitro* method. It is believed that human-based *In Vitro* studies and procedures could make major contributions if handled seriously and intelligently. (Bal-Price *et al.* 2014).The *In Vitro* screening methods have several advantages over *invivo* experiments conducted on living organisms, such as the undisputable ethical benefits, a reduced cost, and the best choice for large-scale production with easy culture for production in the establishments(James E *et. al.,* 2008).Some of the systems of *In Vitro* include: the use of cell fractions, cell lines, stem cells (including induced pluripotent stem cells), engineered tissues, dynamic bioreactors, multiorgan systems, and cells-, organs-, and (even) humans-on-a-chip, collective with high-throughput screening, high-content screening, the "omics" tactics, systems modelling and simulation, pharmacokinetic and toxicokinetic modelling, virtual tissue modelling, virtual human populations, and biomarkers, strategically used, with effective bioinformatics backing(Bal-Price *et. al.* 2014).*In Vitro* studies are highly focused. They enable to inference of mechanisms of action and to control of many confounding variables (M. Huber *et. al.,* 2011). Some of the common types of *In Vitro* methods in antioxidants are: DPPH scavenging activity, Hydrogen peroxide scavenging assay, Nitric oxide scavenging activity, Peroxynitrite radical scavenging activity, Trolox equivalent antioxidant capacity (TEAC) method/ABTS radical cation decolourization assay, Total radical-trapping antioxidant parameter (TRAP) method, Ferric reducing-antioxidant power (FRAP) assay, Superoxide radical scavenging activity (SOD), Hydroxyl radical scavenging activity, Hydroxyl radical averting capacity (HORAC) method, Oxygen radical absorbance capacity (ORAC) Method,Reducing power method (RP), Phosphomolybdenum method, Ferric thiocyanate (FTC) method, Thiobarbituric acid (TBA) method, DMPD (N,N-dimethyl-p-phenylene diamine dihydrochloride) method, ß-carotene linoleic acid method/conjugated diene assay, Xanthine oxidase method and Cupric ion reducing antioxidant capacity (CUPRAC) method (Md. Nur Alam *et. al.,* 2013). The following are the *In Vitro* methods through which the antimicrobial activity has been confirmed: Well-known diffusion methods are the Agar disk-diffusion method, Antimicrobial gradient method (Etest), Cross streak method, Other diffusion methods, Agar well diffusion method, Agar plug diffusion method, and Poisoned food method.

The antimicrobial is also confirmed through Thin-layer chromatography (TLC)-bioautography methods such as Agar diffusion, Direct bioautography,and Agar overlay bioassay. Dilution methods are like the Broth dilution method and the Agar dilution method used. Time-kill test (time-kill curve), ATP bioluminescence assay and Flow cytofluorometric method are also used to find out the antimicrobial activity (Balouiri*et al.,* 2015). The wound healing is studied by Single Systems: Monolayers / 2D Wound Healing Assays, Multicellular Systems: Cocultures and 3D Wound Healing Assays and Organ Culture. These are the recent *In Vitro* methods on wound healing (Sarian *et. al.,* 2023).*In Vitro* methods to identify vitamins are Chromatographic methods like High Performance Liquid Chromatography, Ultrahigh Performance Liquid Chromatography and Gas Chromatography are used to determine vitamins B1 and B2. UV Visible Spectrophotometric method is used for vitamin A (Retinol), Fluorometric method is used for vitamin B (Thiamine), Microbiological method with *Lactobacillus casei and Lactobacillus plantoides* specify vitamin D (Calciferol) and Niacin (Pravalika *et. al.,* 2023). *In Vitro p*hytochemical tests vary forseveral phytochemicals. Some of these are: Shinoda's test, Ferric chloride test, Lead ethanoate test, Sodium hydroxide test are for flavonoids. Molisch's test is for Carbohydrates, Barfoed's test is for monosaccharides, Fehling's test is for free reducing sugar, Fehling's test is for combined reducing sugars,and Liebermann-Burchard test is for steroids (Usman *et. al.,* 2009). Anti-inflammatory activity is studied by cytotoxicity assay (Vasanth *et. al.,* 2020). Scratch assays are commonly used *In Vitro* models for wound healing (Hofmann *et. al.,* 2023). These are some of the frequently used *In Vitro* methods. There are other *In Vitro* methods too found in many other areas of studies, such as nanotechnology, Cardiovascular, Pharmacological, Toxicity, and Molecular and Biochemical levels. Products of *Borassus flabellifer* have many traditional uses: food, medicine and materials. It produces cellulose fibres, polymer composites, Biocarbon's and nanomaterials. Many of its parts are studied from the basics to higher-level inventions. This plant is used extensively by humans from the fast to produce various consumer products. No parts of the plant is left without any attention. All of its parts are researched and the importance of it is demonstrated. Among many parts of the plant leaves, petioles, stalk, sap, flowers, root, and fruits are given prime importance among many other parts in the tree (Singh *et. al.,* 2021). Here follows the research conducted with the *In Vitro* methods on the palmyra tree.

**Roots**

The roots of the palmyra trees are physically verifiable and they are strong and intertwined with mud. The gravitmetrical method for nutritional components shows the presence of crude fiber, fat, protein, moisture and mineral contents like Iron, Strontium, Copper, Manganese, Zinc and Aluminum. Trace elements and heavy metals like Arsenic, Lead and Nickel also found in the root extract of Palmyra root. Through Kjeldahl method, the presence of nitrogen is found in the root. The AOAC Method (Association of Official Analytical Chemists) determined the presence of Carbohydrate, described by Herborne(Herbone, 1973). He suggested that the crude alkaloids 1.61 and Saponins 0.63 (g $100^{-1}$) in the root of the Palmyra tree, while the method described by Singleton and Rossi (Sahni *et. al.,* 2014) shows the presence of phenolic content. Other standard methods resolved that the ethanol extract of the root of *Borassus flabellifer* exhibits the presence of Carbohydrates, terpenoids, Saponins (Vanitha *et. al.,* 2025), Coumarins, Alkaloids, Tannins, and flavonoids. The aqueous extract shows the presence of Carbohydrates, proteins, Coumarins, Alkaloids, Flavonoids and Glycosides. Similarly, the Petroleum ether extract results in the presence of Carbohydrates, Proteins, Terpenoids and Flavonoids (B. Arirudran*et. al.,* 2022). Through the Colorimetric method, the presence of flavonoids is found. The roots of the palmyra are rich in protein (8.54%) and fiber, fruit pulp shows high ascorbic acid and calcium levels, which are the main essential micronutrients required by the body (Prasad *et. al.,* 2023). The ABTS radical scavenging method developed an antioxidant equivalent to Ascorbic acid. The highest antioxidant was found in the methanolic extract of the root. Similarly, Ferric Reducing Activity Power Assay developed by Benzine and Strain recorded BHT (butylated hydroxytoluene) equivalents as antioxidants in the root. The highest antioxidant activity was found to be 129.6 µg BHTE 100 mg– 1 in the chloroform fraction of the roots (Sahni *et. al.,* 2014). Additionally, to the identified compounds in hexane, chloroform and methanolic extracts, the roots have Hexadecanolic acid, Tetradecanoic acid and Pentadecanoic acid. Using the disc diffusion method, antimicrobial activity against *Staphylococcus aureus, Staphylococcus epidermidis* and *Bacillus subtilis* and 2 gram-negative bacterial strains i.e. *Escherichia coli* and *Proteus mirabilis.* (Sahni *et. al.,* 2014) were found. The young roots of the palmyra are confirmed with vitamin E (Sayanhika*et. al.,* 2024).

**Sprout**

Standard Methods described by Herborne (Herborne, 1973) and Obadoni and Ochuko (Obadoni*et. al.,* 2001) for phytochemical screening exhibit steroids, alkaloids, tannins, phenols, flavonoids, glycosides, coumarins and saponins in the sprout of palmyra. Gravimetrical method identified the ash content, Kjeldahl method – nitrogen and AOAC method found the presence of carbohydrates and protein in the sprout of the palmyra tree. The traditional methods of ABTS and DPPH identified that the highest antioxidant potential was found in the methanolic extract, and the ability to scavenge free radicals was observed (Agna *et. al.,* 2025). Similarly, Ferric Reducing Activity Power assay by Benzie and Strain (Benzie *et. al.,* 1996) supports that the plant extract reduced ferric ions into ferrous ions (Mariselvam *et. al.,* 2020). Sayanhika *et. al.* state that the palmyra tubers and ripe fruits contain steroidal saponins called flabelliferins.

**Seed**

The seed of the palmyra tree (Figure. 3)exhibits antimicrobial activity against *Staphylococcus aureus, Staphylococcus epidermidis* and *Bacillus subtilis* and 2 gram-negative bacterial strains i.e. *Escherichia coli* and *Proteus mirabilis* (Sahni *et. al.,* 2014). The well-known Disc diffusion method was used to determine the antimicrobial activity. The antibacterial activity of methanol extracts of *Borassus flabellifer L.* (Arecaceae) seed coat (soft outer shell) was noted by the agar well diffusion method. The antibacterial potential was examined against Gram-positive bacteria, i.e., *Staphylococcus aureus, Bacillus subtilis and* Gram-negative bacteria, i.e., *Klebsiella pneumonia* and *Serratia marcescens*. The methanol extract of the seed coat has shown consistently significant inhibitory activity on different bacterial species tested (Shirisha *et. al.,*2018). The haustorium from the seed of the palmyra is a white, spongy and edible stuff. It has ash content, protein, fat, carbohydrates, fiber, calcium, sodium, magnesium, potassium, iron, zinc, phosphorus and ascorbic acid. It also possesses glycosides, flavonoids, phenols and saponins (Kuldeep*et. al.,* 2023). Phytochemical screening was done qualitatively with different methods to identify various phytochemicals, namely the ferric chloride test was done for tannins, Frothing test for saponins, Shinoda test for flavonoids, Dragendorff test for alkaloids, Bradford protein assay – test for proteins, Salkowski's test for steroids and terpenoids, Keller-Kiliani test for cardiac glycosides, Borntrager's

reaction test for anthraquinones, Ferric chloride test for phenols. The seedcoat extract confirmed the presence of tannins, Saponins, Flavonoids, Alkaloids, proteins, Cardiac glycosides, and phenols. The seed coat extract shows inhibition against bacteria like *Streptococcus mutans, Salmonella typhi,* and fungi like *Candida albicans and Aspergillus flavus*(Natrajan *et. al.,* 2024).

**Leaves**

The methanol leaf extract of *Borrassus flabellifer* was screened using standard procedures and found that the extract showed the presence of flavonoids, glycosides, tannins, proteins, steroids, triterpenoids, carbohydrates, fats and fixed oils. Similarly, the compound the presence of Flabelliferin is found and it shows inhibition on the growth of gram-positive and gram-negative bacteria (Vanitha *et. al.,* 2025). Random amplified polymorphic DNAs (RAPD) Technique (M Li *et al.,* 1999) extracted DNA from palm sugar leaves. The DPPH radical scavenging activity recorded 40.10 µg/ml. Similarly, the Hydrogen Peroxide Radical Scavenging Method shows that the IC50 value of the methanol extract and ascorbic acids was 30.92 µg/ml and 18.85 µg/ml. Standard procedure for analysing phytochemical screening of the methanol extract of leaves shows the presence of flavonoids, glycosides, tannins, proteins, steroids, triterpenoids (Vanitha *et. al.,* 2025), carbohydrates, fats and fixed oils (Prasad G*et. al.,* 2016). Agar well diffusion assay resulted for Antimicrobial activity in Methanol and acetone fractions, showing inhibition against Bacteria such as *B. subtilis, S. aureus, P. vulgaris, P. vulgaris and B. subtilis.* The leaf extract also showed antifungal activity against A. flavus, M. canis, S. cerevisiae and V. myditis. The chloroform extract of dried leaves of the palmyra has anti-inflammatory activity (Mohan *et. al.,* 2016).

**Pulp**

The presence of carotenoids in the palmyra pulp is proven alongside polyphenolic components. The presence of vitamin D3 is high in palmyra pulp. An experiment based on the spectrophotometric measurement discovered the presence of vitamins A and B6. The fresh pulp is enriched with vitamins A and C (Sayanhika*et. al.,* 2024).

**Fruit**

The inside of the palm fruit is reddish in colour (Figure. 4). The secondary metabolites such as terpenoids, flavonoids, alkaloids (Vanitha *et. al.,*2025), saponins and tannin were noted by the standard procedures by Harborne (Harborne, 1973).Methods such as Anthrone Method, Bradford's Colorimetric Method, Flame Photometry and Wet Digestion Method (T. Sherin Mary *et. al.,* 2022) were used to find out nutrients such as carbohydrates, protein, calcium, and phosphorus were found in the fruit of the palm tree. Fibers and reducing sugar of palmyra contain polymeric compounds like hemicellulose, pectin, lignin. (Sayanhika*et. al.,* 2024). Young fruit has Maltose, Protein, Ascorbic acid, Calcium, Ash and Fat (Mariselvam *et. al.,* 2020). The immature fruit shows antibacterial activity against *Staphylococcus aureus, Bacillus subtilis, Staphylococcus epidermidis, Streptococcus pyogenes, Streptococcus pneumoniae, Escherichia coli, Klebsiella pneumoniae, Salmonella typhi, Shigella dysenteriae, and Pseudomonas aeruginosa. Antifungal activity is seen against Candida albicans, Saccharomyces cerevisiae, Aspergillus fumigatus, Aspergillus flavus, Aspergillus niger, Aspergillus ochraceus, Penicilliumchrysogenum, and Penicillium notatum* (Renuka *et. al.,* 2019). Similarly, the immature fruits confirmed the antioxidant potential. This was confirmed by multiple *In Vitro* methods, such as DPPH Radical Scavenging Assay, ABTS Assay, Assay for nitric oxide Scavenging activity and Superoxide anion radical scavenging assay (Renuka *et. al.,* 2019). Standard methods, such as the Macro-broth dilution method, were performed to determine the Minimum inhibitory concentration (MIC) and the Minimum bactericidal concentration (MBC) assays were performed, and they showed antibacterial activity against gram-positive bacteria, such as *Staphylococcus aureus, Bacillus subtilis, Staphylococcus epidermidis, Streptococcus pyogenes, Streptococcus pneumoniae* and gram-negative bacteria such as *Escherichia coli, Klebsiella pneumoniae, Salmonella typhi, Shigella dysenteriae*, and *Pseudomonas aeruginosa*.Minimum fungicidal concentration (MFC) Antifungal activity of immature palmyra palm fruit extract showed against *Candida albicans, Saccharomyces cerevisiae, Aspergillus fumigatus, Aspergillus flavus, Aspergillus niger, Aspergillus ochraceus, Penicillium Chrysogenum, Penicillium notatum.* DPPH and ABTS methods showed the inhibitory values and the presence of an antioxidant, while Embryo culture and histological analysis show the natural germination process with the palmyra palm (Douglas, 1987; George, *et. al.,* 2024). Paulraj Mosae Selvakumar studied hemi-cellulose is a cellulose-related polysaccharide in the fruits of the palmyra. Added to that,

two saponins in the fruit pulp and tuber flour were identified: steroid spirostmonoglucoside and monorhamnoside (Selvakumar *et al.,* 2020). It is also found that the fruits are a rich source of vitamins such as A, B, C and minerals like iron, zinc, potassium, calcium, phosphorus, thiamine, and riboflavin (Krishnaveni *et. al.,* 2020).

**Sap**

The Folin-Ciocalteu reagent method identified the phenolic content from Palm syrup (Huynh Thi Le, *et. al.* 2020; Asikin*et. al.,* 2016). The Phenol-sulfuric acid method determined the presence of total sugar content (Nielson, 2017). The Dinitrosalicylic Acid method also identified the presence of reducing sugar and was evaluated (Huynh Thi Le, *et. al.,* 2020 and Asikin*et. al.,* 2016). The protein content was confirmed through Kjeldahl Method(Dung Huynh Thi Le *et. al.,* 2021). The free-radical scavenging activity was determined by the standard DPPH Method (Huynh Thi Le, *et. al.,* 2020; Asikin*et. al.,* 2016) while ABTS Radical Cation Decolourisation Assay was resolved in the Palm syrup (Payet *et. al.,* 2005).Toddy contains vitamins such as A, Ca, Fe, Zn, Cu and the fermented sap increases the levels of thiamine, riboflavin and niacin (Krishnaveni *et. al.,* 2020). The fermented nectar of the palmyra is a rich reservoir of probiotic microorganisms. A study by Raman Kanimozhi isolated 80 bacterial isolates from the nectar. Selected determined simulated gastrointestinal conditions, cell surface properties like auto aggregation, hydrophobicity, coaggregation and Biofilm production, β-galactosidase and exopolysaccharide production, antioxidant activity, antibiotic susceptibility and safety through hemolysis and DNase activity (Kanimozhi*et. al.,* 2025). Dung Huynh Thi Le and his teamwidely researched the syrup from the sap of the palmyra tree. They found that the syrup contains protein, phenolic content and total sugar content. Syrups prepared by thermal and ultrafiltration processes discovered 10 vitamins, where most of them were B-group vitamins such as B1, B2, B3, B5, and B6. Some of the other vitamins were Vit. C, D, E and Folic acid. Fresh sap of *Borrassus flabellifer* showed the presence of vitamin B and ascorbic acid. Moreover, there were also 38 volatile compounds found in the syrup of the palmyra tree. The DPPH radical scavenging activity at the different concentrations is exhibited (Dung *et al.,* 2021). The seasonal sap or juice is collected from the inflorescence of the palm tree, from which the sugar is produced by a process (Rayappa, 2023). A study shows that the Palm sugar exhibits the highest level of antioxidant activity compared to various types of cane sugars, having an antioxidant activity equivalent to 1.7 mg of vitamin C per 1 g of sugar (J Sia *et al.,* 2010).It is also found that the sugar palm has a considerable amount of sodium, phosphorus, iron and potassium. The palm sugar is also a low-calorie sugar. It is used extensively in cooking and has many health benefits; Low glycemic index sugar in the palm sugar is exceedingly helpful in reducing obesity and diabetes, it also provides a sustained and uniform energy supply to the body, and it is rich in many nutrients such as vitamins B1, B2, B3, B6 and C (Vivek M *et al.,* 2011). Vitamins such as riboflavin, thiamine, niacin and vitamin A are found significantly (D.H.T. Le *et al.,* 2020). The colorimetric assay confirmed the presence of Flavonoid contents. Similarly, the antioxidant activity through the DPPH method showed the radical scavenging activity, while the FRAP assay also determined the antioxidant power of the palm sugar (Khongsak*et al.,* 2019).

**Flower**

The ethanolic extract of male flowers (inflorescences) of *Borassus flabellifer L.*(Arecaceae) has analgesic activity(Shirisha *et al.,*2018; Gummadi *et al.,*2016). Inflammation is a local response of living mammalian tissues to injury and a body defence reaction to eliminate the spread of injurious agents. The ethanolic extract at doses of 150 and 300 mg/kg shows an anti-inflammatory response in the mice. (Paschapur *et al.,* 2009). Tusskorn*et. al.*2021) investigated the male flower of the palmyra tree and found that the crude flowers, using ethyl acetate and methanol, the properties of antioxidant activity through DPPH and Ferric Reducing Antioxidant Power. Cytoprotective activity was confirmed. Oxidative stress was determined by the Glutathione assay (Tusskorn*et. al.,* 2021). It confirms that the male flowers also have similar properties to other parts of the plants.

## CONCLUSION

This unique review sets out the platform for more research on the palmyra tree. The basic *In Vitro* studies will move towards a better understanding of the properties of the tree and give way to exploring more with the studies that

have been carried out and to open a new folder for the research on the principal tree from our country, which holds a considerable number of plants. Encouraging biological potential, particularly in the sphere of antimicrobial, antioxidant, cytocompatibility and wound healing–related responses. Although the *In Vitro* method has limitations, when it comes to research, it provides a strong scientific foundation supporting the medical properties of any plant. This review is to give a taste of the research carried out through the *In Vitro* with the palmyra tree and motivate new research to be carried out with more understanding and a strong foundation on the knowledge of *Borassus flabellifer*. There are also some parts of the plants yet to be discovered, with more advanced techniques available in the laboratory. It will lead to a more detailed evaluation of the palmyra tree.

## ACKNOWLEDGMENT

This research was funded by Fr. Carreno Research Grant (SHC/ Fr. Carreno Research Grant /2025-26/04) from Sacred Heart College (Autonomous), Tirupattur 635601, Tamil Nadu, India (Affiliated to Thiruvalluvar University, Serkkadu, Vellore - 632115, Tamil Nadu).

## ABSTRACT

Reading speed is widely used as a functional indicator of visual efficiency and is closely linked to academic performance and everyday information processing. In recent years, there has been a rapid shift from traditional print materials to digital reading platforms, especially among students. This transition has raised concerns about the impact of prolonged screen use on visual performance, ocular comfort, and reading efficiency, making it necessary to review and integrate existing evidence from an optometric perspective. The objective of this review is to examine and synthesize existing literature on the influence of visual, oculomotor, and ergonomic factors on reading speed in print and digital media. A narrative review of peer-reviewed studies in optometry, vision science, and visual ergonomics was conducted. Literature focusing on reading speed, visual function, eye movements, and ergonomic conditions during print and screen-based reading was analyzed. The reviewed literature indicates that multiple factors, including visual acuity, contrast sensitivity, accommodative and vergence demand, eye movement patterns, screen luminance, font characteristics, viewing distance, posture, and environmental lighting, significantly influence reading speed. Digital reading is often associated with higher visual demand, altered oculomotor behaviour, and increased visual fatigue compared to print reading, particularly

during prolonged tasks. Reading speed in print and digital media is shaped by a complex interaction of visual, oculomotor, and ergonomic factors. Reviewing these factors is essential to understand the challenges posed by increasing digital screen use and to guide clinical practice, educational strategies, and ergonomic recommendations. This review highlights the need for optimized reading environments and identifies areas for future research in vision and optometry.

**Keywords:** Reading speed, digital screens, print media, visual factors, oculomotor function, ergonomics, optometry

## INTRODUCTION

Reading is a demanding visual activity that requires accurate coordination of several visual functions, including visual acuity, accommodation, vergence, and precise eye movements [1]. Reading speed is commonly used as a practical indicator of visual efficiency and is closely related to learning ability, academic success, and daily information processing. Any disturbance in these visual processes can negatively affect reading fluency and overall performance [2]. For many years, printed text was the primary medium for reading. However, with rapid technological advancement, digital devices such as smartphones, tablets, laptops, and computers have become the dominant reading platforms, particularly among students. This shift has significantly changed the visual demands placed on the eyes [3]. Unlike printed text, digital displays are self-luminous and differ in luminance, contrast polarity, pixel resolution, font rendering, and viewing ergonomics. These differences may alter visual behaviour and influence reading speed and comfort. Several studies have examined reading performance on print and digital media, reporting variations in reading speed, eye movement patterns, and visual fatigue [4]. Research has highlighted the role of accommodative and vergence stress, reduced blink rate, altered fixation patterns, and increased visual strain during prolonged screen use [5]. At the same time, findings across studies are not always consistent, and the influence of ergonomic factors such as viewing distance, posture, screen brightness, and environmental lighting is often underreported or studied in isolation [6]. From an optometric perspective, there is a clear need to synthesize existing evidence to better understand how visual, oculomotor, and ergonomic factors collectively influence reading speed across different reading media [7]. A comprehensive review of this topic is important to guide clinical assessment, inform ergonomic recommendations, and support evidence-based advice for students and frequent digital device users. Therefore, this review aims to critically examine the available literature on reading speed in print and digital media, with particular emphasis on factors relevant to optometry and vision science.

## METHODOLOGY OF THE REVIEW

**Review Design**

This review was conducted as a narrative literature review to comprehensively synthesize existing research on the influence of visual, oculomotor, and ergonomic factors on reading speed in print and digital media. A narrative approach was considered appropriate due to the heterogeneity of study designs, outcome measures, and methodologies reported in the available literature.

**Data Sources and Search Strategy**

A systematic search of the literature was performed using major electronic databases, including PubMed, Scopus, Web of Science, and Google Scholar. Searches were conducted using combinations of the following keywords and Boolean operators: *reading speed*, *print reading*, *digital reading*, *screen-based reading*, *visual factors*, *oculomotor function*, *eye movements*, *visual ergonomics*, and *computer vision syndrome*. Reference lists of relevant articles were also manually screened to identify additional studies.

**Eligibility Criteria**

Studies were included if they met the following criteria: [i] published in peer-reviewed journals; [ii] written in English; [iii] focused on reading speed or reading performance in print and/or digital media; and [iv] examined visual, oculomotor, or ergonomic variables relevant to optometry and vision science. Both experimental and observational studies were considered. Review articles were examined for background information but were not included in the final synthesis. Studies involving participants with ocular pathology were excluded unless findings were directly applicable to general visual performance.

**Study Selection Process**

Titles and abstracts retrieved from the database search were screened for relevance. Full-text articles were obtained for studies that met the inclusion criteria or where eligibility was unclear from the abstract alone. Articles that did not align with the objectives of the review were excluded after full-text assessment.

**Data Extraction and Synthesis**

Relevant information from the selected studies was extracted, including study design, participant characteristics, type of reading medium, visual and oculomotor variables assessed, ergonomic conditions, and key findings related to reading speed. Due to variability in outcome measures and experimental conditions, a qualitative synthesis was performed rather than a meta-analysis. Findings were organized thematically under visual, oculomotor, and ergonomic domains.

**Visual Factors Influencing Reading Speed**

**Visual Acuity and Contrast Sensitivity**

Visual acuity plays a fundamental role in reading, as clear resolution of letters is essential for accurate word recognition and fluent reading. Uncorrected refractive errors or reduced visual acuity have been consistently associated with slower reading speed [8]. In addition to acuity, contrast sensitivity is a critical visual function, particularly in digital reading environments. Digital screens may present issues such as glare, reduced contrast, pixelation, or suboptimal font rendering, which can compromise text clarity. Several studies have reported that lower contrast conditions on screens are linked to reduced reading speed when compared with high-contrast printed text, highlighting the importance of optimal visual clarity for efficient reading [9].

**Accommodation and Vergence Demand**

Reading from digital devices typically requires sustained near fixation, which increases accommodative and vergence demand. Continuous accommodative effort during prolonged screen reading may result in accommodative fatigue, leading to fluctuations in clarity and a gradual reduction in reading speed. In contrast, print materials often allow greater flexibility in viewing distance and posture, which may help reduce sustained visual stress. These differences suggest that accommodative and vergence demands are important contributors to variations in reading speed between print and digital media [10].

**Visual Fatigue and Ocular Discomfort**

Visual fatigue is a commonly reported consequence of prolonged digital reading and includes symptoms such as eye strain, dryness, headache, and intermittent blurred vision. These symptoms can negatively affect reading efficiency and reduce reading speed over time. Digital screens are often associated with a reduced blink rate and increased exposure to glare, further contributing to ocular discomfort. In comparison, print reading is generally associated with lower levels of visual fatigue, particularly during extended reading tasks [11].

**Oculomotor Factors and Reading Speed**

**Eye Movements During Reading**

Efficient reading relies on well-coordinated saccadic eye movements and stable fixations. Alterations in eye movement behaviour can disrupt reading fluency and reduce reading speed. Studies have shown that digital reading may be associated with longer fixation durations, increased regression movements, and less regular saccadic patterns

compared to print reading [12]. Additional demands such as scrolling and page navigation on digital devices may further influence eye movement control and contribute to slower reading performance.

**Binocular Vision and Fixation Stability**

Accurate binocular coordination is essential for maintaining single, clear vision during sustained reading tasks. Digital screens may challenge binocular stability due to increased visual demand, glare, and prolonged near work. Individuals with borderline binocular vision anomalies may be particularly susceptible to reduced fixation stability and associated decreases in reading speed when reading from screens [13].

**Ergonomic Factors Affecting Reading Speed**

**Viewing Distance and Posture**

Viewing distance and posture play an important role in determining visual comfort and reading efficiency. Handheld digital devices are often viewed at shorter distances than printed materials, resulting in increased accommodative and vergence demand. Poor posture and prolonged close viewing can also contribute to musculoskeletal discomfort, indirectly affecting reading performance and speed [14].

**Screen Characteristics and Environmental Lighting**

Characteristics such as screen size, brightness, contrast settings, font type, and background colour can significantly influence readability and reading speed. Excessive screen brightness, reflections, or poor ambient lighting may reduce visual comfort and slow reading speed. Printed text, when viewed under appropriate lighting conditions, is generally less affected by such factors, allowing more stable reading performance [15].

**Duration of Reading Task**

Reading speed during digital tasks often declines over time as a result of cumulative visual fatigue. Prolonged uninterrupted screen use has been associated with reduced visual comfort and decreased reading efficiency. Incorporating regular breaks, appropriate screen adjustments, and ergonomic practices has been shown to help maintain reading speed during extended digital reading sessions [16].

**Comparison of Reading Speed in Print and Digital Media**

Comparative studies examining reading speed in print and digital media have produced mixed but generally consistent findings. The majority of research indicates that reading speed on digital screens is either comparable to or slightly slower than print reading, particularly when reading tasks are extended in duration [17]. Short reading tasks often show minimal differences between the two media; however, as reading time increases, digital reading is more frequently associated with a gradual decline in reading speed. One important factor contributing to these differences is the visual and ergonomic environment in which digital reading occurs. Suboptimal screen brightness, glare, low contrast, inappropriate font size, and poor ambient lighting have been shown to negatively affect reading performance on screens. In contrast, printed text is less susceptible to such display-related variations when adequate illumination is provided, allowing more consistent reading speed across longer tasks [18]. Ergonomic factors further influence comparative reading performance. Digital devices are commonly used at closer viewing distances and with less stable posture than printed materials, increasing accommodative and vergence demand and contributing to visual fatigue. These factors may partially explain why reading speed differences between print and digital media become more evident during prolonged reading sessions. Individual variability also plays a significant role in determining reading speed across media. Familiarity with digital devices, adaptability to screen-based reading, age, and habitual reading preferences can influence reading efficiency. Additionally, screen quality, including resolution, refresh rate, and display technology, affects text clarity and visual comfort, thereby impacting reading speed. Together, these findings suggest that differences in reading speed between print and digital media are not solely medium-dependent but arise from an interaction between visual, ergonomic, and individual factors.

**Clinical and Educational Implications**

**Clinical Implications for Optometric Practice**

From an optometric perspective, the assessment of reading speed should be contextualized according to the reading medium being used. Patients increasingly report reading-related symptoms associated with digital device use, making it essential for clinicians to inquire about screen exposure, device type, and duration of digital reading [17]. Comprehensive refractive evaluation remains a primary step, as even small uncorrected refractive errors can adversely affect reading speed and visual comfort, particularly during sustained near tasks. In addition, detailed assessment of accommodative and binocular vision function is crucial for individuals presenting with reduced reading efficiency, eyestrain, or visual fatigue during digital reading. Accommodative insufficiency, vergence anomalies, and reduced fixation stability may become more symptomatic during screen-based reading due to increased visual demand. Identifying and managing these conditions through appropriate optical correction, vision therapy, or near-vision support can contribute to improved reading performance [19]. Ergonomic counselling should be considered an integral component of optometric care. Guidance related to optimal viewing distance, posture, screen height, lighting conditions, font size, contrast settings, and the use of regular visual breaks can help reduce visual strain and support sustained reading efficiency across digital platforms. Such interventions are particularly relevant for students and professionals engaged in prolonged screen-based tasks.

**Educational Implications**

In educational settings, the increasing reliance on digital learning materials necessitates careful consideration of their impact on students' visual performance. Educators and institutions should be aware that prolonged digital reading may affect reading speed and visual comfort, especially under suboptimal ergonomic conditions. Encouraging a balanced use of print and digital materials, particularly for extended reading assignments, may help minimize visual fatigue and support effective learning. Educational policies and classroom practices should also emphasize visual ergonomics, including appropriate lighting, screen placement, and scheduled breaks during digital learning activities [20]. Collaboration between educators, optometrists, and policymakers can facilitate the development of evidence-based guidelines that promote visually comfortable and efficient reading environments for students across different age groups.

## FUTURE DIRECTIONS

Future research should focus on the development and adoption of standardized and validated methodologies for assessing reading speed across print and digital media. Variations in reading materials, display settings, task duration, and outcome measures across existing studies limit direct comparison of findings. Establishing uniform testing protocols that incorporate both visual performance measures and subjective symptoms would strengthen the evidence base and improve clinical applicability. Longitudinal studies are particularly needed to evaluate the long-term effects of sustained digital reading on visual development, accommodative and vergence function, oculomotor behaviour, and ocular comfort, especially in children, adolescents, and young adults who are exposed to screens from an early age. Such studies would help determine whether prolonged digital reading leads to adaptive changes or contributes to persistent visual stress over time. Future investigations should also examine individual variability in response to digital reading, including the role of refractive status, binocular vision anomalies, accommodative function, and prior exposure to digital devices. Understanding these individual factors may assist clinicians in identifying populations that are more susceptible to reduced reading efficiency or visual discomfort during screen use. In addition, emerging display technologies such as e-ink devices, high-resolution screens, adaptive brightness systems, and blue light modulation features warrant systematic evaluation. Research comparing these technologies with traditional screens and print media may provide valuable insights into design features that support optimal reading speed and visual comfort. Finally, interdisciplinary research integrating optometry, ergonomics, education, and human–computer interaction will be essential for developing evidence-based guidelines aimed at promoting efficient and visually comfortable reading in increasingly digital learning environments.

## CONCLUSION

Reading speed in both print and digital media is influenced by a complex interaction of visual, oculomotor, and ergonomic factors. Differences in display characteristics, accommodative and vergence demands, eye movement behaviour, and viewing conditions contribute to variations in reading efficiency across reading media. Evidence from the reviewed literature suggests that digital reading, particularly during prolonged and uninterrupted use, may place greater visual demands on the visual system and is more commonly associated with visual fatigue and changes in oculomotor performance when compared with print reading. From an optometric perspective, these findings highlight the importance of considering the reading medium when assessing visual performance and managing reading-related symptoms. Appropriate refractive correction, evaluation of binocular and accommodative function, and ergonomic guidance related to viewing distance, posture, lighting, and screen settings are essential to support optimal reading efficiency in modern reading environments. However, variations in study design, outcome measures, and participant characteristics across existing studies indicate that current evidence should be interpreted with caution. Overall, this review underscores the growing relevance of understanding reading speed in the context of increasing reliance on digital devices. Further research using standardized assessment protocols and emerging display technologies is needed to better define the long-term visual implications of digital reading. Such evidence will be valuable in guiding clinical practice, educational strategies, and ergonomic recommendations aimed at promoting visual comfort, reading efficiency, and ocular health in the digital age.

## ABSTRACT

*Berberis aristata DC* and *Delphinium denudatum Wall*. are two ethnomedicinally important plants whose phytochemical diversity and pharmacological potential have attracted sustained scientific interest. Their diverse phytochemical profile including alkaloids, flavonoids, glycosides and polyphenols contributes wide range of biological activities. *B. aristata* is rich in protoberberine alkaloids such as berberine, palmatine and jatrorrhizine alongside flavonoids and phenolic. These compounds exhibit antioxidant, antimicrobial, antidiabetic and neuroprotective activities aligning with its traditional use in treating inflammation, jaundice, wound healing and eye disorders. *D. denudatum* traditionally employed in neurological disorders contains diterpenoid alkaloids denudatine, condelphine and flavonoid glycosides now being investigated for anticonvulsant, anxiolytic and anti-inflammatory. Comparative analysis highlights both the novelty and translational relevance of these phytochemicals while addressing methodological challenges in reproducible isolation, bioassay alignment and toxicity profiling. In the modern era, phytochemistry inculcated with ethnopharmacological information, this review gives advancement in drug discovery and therapeutic development from *Berberis aristata* and *Delphinium denudatum*.

**Keywords:** *Berberis aristata, Delphinium denudatum*, Ethnopharmacology, Phytochemistry, Neuroprotection

# INTRODUCTION

The Indian medicines cover various traditional systems such as Ayurveda, Siddha and Unani medicine which have been essential for health and wellness for centuries. It promotes holistic healthcare by balancing mind, body and spirit and offers natural remedies derived from plants and herbs. The significance of these ancient practices is underscored in the current century as they address contemporary health challenges which promote preventive care and appeal to a growing demand for natural therapies amidst increasing complications over adverse effects of conventional pharmaceuticals. The growing global acceptance of traditional medicine highlights the crucial role of phytochemistry in modern healthcare. It recognizes the importance of traditional medicine which affirms that a large proportion of the global population depends on herbal and natural products for primary health needs. Inculcating phytochemical research with traditional medical practices not only strengthens the scientific credibility of these systems but also provides valuable opportunities for discovering novel therapeutic agents [1]. Phytochemistry is fundamental key to study and reveal a therapeutic potential of plants used in traditional medicinal systems including Ayurveda and Siddha. The field focuses on the study of bioactive compounds within plants that contribute to their medicinal properties. In the Siddha system for instance, the richness of bioactive compounds in therapeutic roots underlines their multifaceted health benefits that emphasize the importance of plant-based remedies for addressing various health conditions. As a result, traditional Indian medicinal plants are increasingly being explored for their phytochemical richness and scientifically validated pharmacological activities [2]. Among these, *Berberis aristata* and *Delphinium denudatum* hold significant historical and therapeutic importance in Ayurveda and Unani medicine. Their long-standing use for neurological, metabolic, inflammatory and infectious conditions highlights the need for systematic scientific evaluation. Understanding the phytochemistry and pharmacological potential of such classical herbs is essential not only to validate traditional knowledge but also to support the development of evidence-based, affordable and culturally relevant healthcare solutions for this century.

**Multidisciplinary Review of *Berberis Aristata***

*Berberis aristata* commonly called *Daruharidra* have closely resemble to *Curcuma longa* (Turmeric) also known as *Haridra* which may be as per their similar characteristics as shown in Figure 1. Hence, collectively mentioned as *Haridra dvaya* signifying two *Haridras* which is called as *Daruharidra* and *Haridra*. Daruharidra is well known plant in Ayurveda, Charka and Susruta for diverse properties and numerous used to treat diseases. It is referenced in *Vedas*, *Brihattrai* and later it has been described in *Nighantu*. Rasaut, a highly valued preparation derived from *Berberis aristata* plant. It is used for the treatment of conditions such as ocular disorders, jaundice and various skin diseases. The plant itself is considered an important medicinal resource, effective in managing remittent fevers and oxidative stress. It is also used as a gentle cooling laxative for children and serves as a tonic that supports liver and heart health [1], [3]. In Ayurveda, Daruharidra is widely employed for the management of Kamala, Kushtha, Mutrakruccha, Netra Roga, Pandu, Prameha and Pratishyaya. Its clinical and experimental study highlights antioxidative, anti-inflammatory, anticancer, hepatoprotective and immunomodulatory activities. Also its natural source berberine lowers liver hepatocyte inflammation. Additionally, it possesses cholegogue, astringent, hepato-stimulant and hepato-protective qualities among others [4]. The diverse therapeutic applications of daruharidra are presented in Table 1. *Berberis aristata* (Fig.1). Comprehensive ethnomedicinal profile of *Berberis aristata* (Table No. 1)

**Phytochemical Studies**

*Berberis aristata* contains a wide range of chemical constituents throughout its various parts. It is particularly abundant in bioactive compounds especially alkaloids that play a key role in its therapeutic potential. *Berberis aristata* is valued primarily for its high berberine content 2-5% while, palmatine occurs in smaller amounts. The roots of the plant also contain several other important alkaloids, including aromoline, berbamine, columbamine, dehydrocaroline, epiberberine, jatrorhizine, karachine, dihydrokarachine, oxycanthine, oxyberberine, and taximaline whose chemical structures are illustrated in figure 2. Additional compounds such as 1-O-methylpakistanine, pakistanine, pseudoberberine and pseudopalmatine chloride have been identified and isolated as well. Studies indicate that berberine levels vary with altitude with plants from lower elevations showing higher concentrations.

Soil potassium and moisture further influence berberine content [22]. Phytoconstituents of *Berberis aristata* (Fig.2). In research studies, the Phytochemicals have reported in *Berberis aristata* highlighting the prominence of specific bioactive compounds studied across ethnopharmacological and phytochemical investigations. Among these, berberine stands out as the most frequently reported alkaloid which is widely recognized for its potent antimicrobial, antidiabetic, anti-inflammatory and hepatoprotective properties. It acts by disrupting microbial DNA replication, modulating AMP-activated protein kinase (AMPK) pathways and suppressing pro-inflammatory cytokines which made a cornerstone compound in both traditional and modern therapeutic applications. Other than berberine, palmatine and jatrorrhizine are the next most cited constituents. Palmatine exhibits strong antioxidant, antimicrobial and neuroprotective effects while, jatrorrhizine contributes to gut motility regulation and antidiarrheal activity which often used in ayurvedic formulations for treating dysentery and gastrointestinal disorders. Other alkaloids such as berbamine and oxyacanthine are less frequently reported but have shown promising anti-inflammatory and cardioprotective effects. Phytochemical reporting of *Berberis aristata r*esearch (Fig.3). Apart from that, the figure 3 reflects the presence of total phenolics, flavonoids, tannins, saponins and glycosides which also shows promising effects of antioxidant, wound-healing and metabolic regulatory properties. These compounds support traditional uses of *Berberis aristata* in formulations like Rasaut and Unani preparations, where it is applied for skin ulcers, blood purification and liver support. The frequency distribution underscores the pharmacological dominance of berberine while revealing a diverse phytochemical profile that validates the plant's widespread use in Ayurveda, Unani, and folk medicine systems.

**Pharmacological Studies**

**Hepatoprotective activity:**

*B. aristata* roots have long been employed in ayurvedic medicine for managing jaundice and other liver disorders. Modern scientific investigations have validated these traditional claims through extensive clinical studies.

**Hepatoprotection against chemical-induced liver disorders**

**Carbon Tetrachloride ($CCl_4$) Induced Hepatotoxicity:** Aqueous and methanolic extracts of *B. aristata* and isolated berberine were studied and examined in the prevention of carbon tetrachloride induced hepatic damage in rats. All results were comparable to the standard drug silymarin, demonstrating significant reduction in elevated liver enzyme levels and restoration of normal hepatic architecture [23].

**Berberine Chloride Studies:** Berberine chloride was investigated in a dose-response study on Wistar rats with $CCl_4$-induced acute liver damage. When it is given either before or after $CCl_4$ exposure, berberine showed strong preventive and curative effects. It resulted in a dose dependent reduction of Alanine aminotransferase (ALT), Aspartate Aminotransferase (AST), Alkaline phosphatase (ALP) and bilirubin levels at 5, 10 and 20 mg/kg which improved liver weight and restored normal liver tissue structure. Therefore berberine effectively reversed the biochemical and histological changes caused by $CCl_4$ toxicity.

**Shoot and Fruit Extracts:** Crude extracts prepared from the shoots and fruits of *Berberis aristata* have shown significant protective effects against liver damage caused by paracetamol and $CCl_4$. These extracts help to partially inhibited microsomal drug-metabolizing enzymes, which are responsible for converting these chemicals into toxic metabolites. By inhibiting the formation of these toxic intermediates, the extracts lower oxidative stress and prevent further hepatocellular injury, contributing to hepatoprotective action [24].

**Paracetamol-induced hepatotoxicity:** *Berberis aristata* extracts significantly reduces the rise in liver enzymes caused by paracetamol overdose. Its protective action arises from the inhibition of cytochrome P450 enzymes which prevents the biotransformation of paracetamol into the harmful N-acetyl-p-benzoquinone imine (NAPQI). Limiting the formation of N-acetyl-p-benzoquinone imine (NAPQI), the extract lowers oxidative stress and helps prevent damage and necrosis of liver cells[24].

**Butanolic extract and selective inotropic activity:** The butanolic extract of *B. aristata* demonstrated effective hepatoprotection through a unique mechanism involving selective inotropic activity. This extract showed the ability to modulate cardiac contractility while simultaneously protecting liver tissue, suggesting a multi-organ protective effect [25].

**Antimicrobial activity**

*Berberis aristata* shows potent broad-spectrum antibacterial properties effective against diverse gram-positive and gram-negative pathogens. Studies reported that aqueous root extracts produce inhibition zones of 12–25 mm, while ethyl acetate fractions display the highest potency with MIC values between 0.05–1 mg/ml. Diterpene and flavonoid fractions also exhibit significant antibacterial effect, with MIC ranging from 0.05–5 mg/ml and 0.05–10 mg/ml respectively. Antibacterial mechanism involves direct microbicidal action, disruption of bacterial cell membrane integrity and inhibition of DNA and protein synthesis. Berberine and related alkaloids are contributed as the major active compounds responsible for these effects [26].

**Antidiabetic activity**

*Berberis aristata* shows strong antidiabetic activity through various mechanisms investigated in preclinical and clinical studies. In diabetic rat models, its aqueous and alcoholic root extracts significantly reduced fasting blood glucose levels by modulating key hepatic enzymes which enhances glucokinase and G-6-PD activity while reducing glucose-6-phosphatase; thereby it is improving glucose utilization and lowering hepatic glucose output. Berberine supports glucose regulation by increasing insulin secretion, improving peripheral glucose uptake, reducing gluconeogenesis, activating the AMPK pathway and inhibiting carbohydrate-digesting enzymes notably $\alpha$-amylase and $\alpha$-glucosidase. Additionally, plant exhibits significant hypolipidemic effect, including reduced total cholesterol, LDL and triglycerides with elevated levels of HDL. These significant effects are mediated by inhibition of HMG-CoA reductase, enhanced LDL receptor expression, increased bile acid excretion and modulation of lipid-metabolism genes which shows cardiometabolic protective potential [27].

**Anti-inflammatory activity**

*Berberis aristata* exhibits notable anti-inflammatory effects in both topical and systemic models. When applied topically, both the ethanol root-bark extract and 4% formulation effectively reduced ear edema induced by croton oil and paw edema induced by carrageenan effectively at higher doses. Topical application of its ethanol root-bark extract and a 4% formulation significantly reduced croton oil-induced ear edema and carrageenan-induced paw edema in a dose-dependent manner. Systemically, the extract led to marked suppression of key pro-inflammatory cytokines like Interleukin-6 (IL-6), Interleukin-1-beta (IL-1β), and Tumor necrosis factor alpha (TNF-$\alpha$) thereby reduced inflammatory cell infiltration and decreased cytokine production. These results support its strong potential as a natural anti-inflammatory agent [28].

**Antioxidant activity**

The methanolic stem extract of *Berberis aristata* exhibits strong free-radical scavenging activity; it showed DPPH results comparable to ascorbic acid and effectively neutralizing hydrogen peroxide. Isolated berberine significantly shows dose-dependent antioxidant effects. The extract also suppresses lipid peroxidation by lowering malondialdehyde (MDA) levels and protects membrane lipids from oxidative injury and supporting normal antioxidant enzyme function [29].

**Anticancer activity**

The hydroethanolic extract of *Berberis aristata* DC was evaluated for its anticancer potential in A549 human lung carcinoma cells. Cell-viability and cellular cytotoxic studies were conducted and the crude extract produced an $IC_{50}$ value $47.84 \pm 0.49$ µg/ml, indicating strong anticancer activity. The treated cells also displayed noticeable morphological changes consistent with cytotoxic effects. Results from the MTT assay further confirmed that there is marked reduction in A549 cell viability following extract treatment supporting its potential as a promising natural anticancer agent [30].

**Neuroprotective potential**

Although direct neuroprotective studies on *Berberis aristata* itself are limited, its major bioactive compound berberine has shown promising neuroprotective effects in various independent studies. Berberine helps to protect neuronal cells by reducing oxidative stress, lowering inflammation within the central nervous system and supporting mechanisms that counteract neurodegenerative processes. However, evidence specifically linking *B. aristata* extracts to neuroprotection remains insufficient and further targeted studies are needed.

**Anti-obesity effects**

*B. aristata* have potential metabolic benefits in obesity management, though lipid-lowering Berberine separately has shown anti-obesity properties.

**Cardioprotective effects**

It may offer several cardiovascular benefits. Its lipid-lowering effects can help reduce atherosclerotic risk, while its strong antioxidant activity protects cardiac tissues from oxidative damage. By exerting anti-inflammatory effect, plant is used to reduce inflammation in blood vessel. Berberine one of its key alkaloids has shown potential antiarrhythmic effects in separate studies**.**

**Multidisciplinary Review of *Delphinium Denudatum Wall.***

The genus Delphinium comprises approximately 300-400 species which is distributed worldwide recognized for their medicinal and toxic properties. *Delphinium* species (commonly known as larkspurs) are seasonal or recurrent, robust and vertical showy herbs cultivated for attractive flowers. Several species including *Delphinium ajacis*, *D. consolida*, *D. elatum*, *D. grandiflorum*, *D. laxiflorum*, *D. montanum*, *D. palmatifidum*, *D. peregrinum*, *D. descens*, *D. staphisagria,* and *D. triste* are used. Among *Delphinium ajacis* and *Delphinium denudatum* species found in India, *Delphinium denudatum Wall*. (family Ranunculaceae) is the one most widely used for medicinal purposes [31]. The generic name Jadwar comes from a Greek word meaning "dolphin," referring to the flower's nectar spur that look like the shape of a dolphin. The Jadwar is the Arabic form of the Persian word Zadwar, meaning "the great purifier" or "antidote." The Persian name Mah-Parvin (meaning "moon and Pleiades") is believed to refer to the plant's flowering season, which begins when the Pleiades rise in early summer. In India, the plant became known as Narbasi or Nirbisi because of strong antitoxic effect. Nir means "to oppose or remove," and Bisi refers to Bis or Vish (poison). The term Bis in Nirbisi is also associated with Bish (aconite), as Jadwar is traditionally regarded as an antidote to aconite poisoning [32]. The plant is known by various names across traditional systems and languages. In Arabic it is called Antila Saudavi, Baloot-el-Ardh, and Zhadvar. In Ayurveda, it is known as Nirvishaa and Nirvishi. English names include Larkspur and Blood-veined sage. In Greek, it is referred to as Sáturyús, while in Nepali it is known as Nilobikh. Hindi names include Bas'ha, Nirbasi, and Tarbasi. In Marathi it is called Jadwár or Nirbishi, and in Gujarati Nirvishi. The Persian names are Maah Parveen and Zadwár. In Sanskrit, it is known as Jadavâr, Nirvishi and Vishalakarani. In Urdu, it is called Jadwár and in unani medicine it is referred to as Satriyoos, Jadwaar Khataai and Maatiryaaq [33-36].

*Delphinium denudatum wall* (Fig.4). Jadwar is an herbal drug obtained from the dried tuberous roots of *Delphinium denudatum* Wall. a member of the *Ranunculaceae* family. The plant is an annual herb with a smooth to slightly hairy surface and is primarily distributed across the Western Himalayas, from Kumaon to Kashmir. It typically grows on grassy mountain slopes at elevations ranging from 3,000 to 4,500 meters. Its root is dark brownish-black in color. It measures approximately 2–6 cm in length and 1–2 cm in width at the crown. The structure is conical, extremely hard and enveloped with suberized metaderm bearing different small circular scars left by detached lateral rootlets. Its surface shows distinct longitudinal wrinkles and it produces a short and brittle fracture once broken. The root is easily recognized by its characteristic odor and distinctly bitter taste. The rhizome is blackish-brown in color shows distinct longitudinal wrinkles on its surface, along with a pattern of many small rounded scars that mark the points where lateral roots once emerged. A scaly leaf bud is present at the crown. The plant bears a few scattered pale-blue flowers and its seeds are small and endospermic. Externally, the rhizome is enveloped via a suberized metaderm made up of brown tubules arranged irregularly. The root parenchyma contains abundant starch grains found in

clusters while tissue lacks cork cells, calcium oxalate crystals and fibers as depicted in figure 4. Powdered drug is light yellow and turns yellowish-green when treated with methanolic NaOH and viewed under ultraviolet light. The aqueous extract contains 13.74 ± 0.54% reducing sugars. Microscopically, the powder consists mainly of fragments of xylem vessels with scleriform thickenings, some parenchymatous cells, numerous rounded starch grains and a few prismatic crystals. The powder is moderately fine in texture, grey to ash-colored and has a very bitter taste with no significant odor [37]. *Delphinium denudatum Wall.* recognised as Jadwar in Unani medicine and Nirvisha in Ayurveda, is highly valued in traditional healing systems for its antidotal, neuroprotective, and restorative properties. In Unani medicine, it is a key ingredient in formulations such as Habbe-Jadwar for neurasthenia, sexual debility and chronic fatigue; Khamira Gaozaban Ambari Jawaharwala Ood-e-Saleeb Wala for cardiac weakness and palpitations; and Marham-e-Jadwar for ulcers, wounds and lymphadenitis. Other preparations like Jawhar Mohra, Habb-e-Jawahar and Zimad-e-Warm-e-Lauzatain use Jadwar for its cardiotonic, sedative and anti-inflammatory effects. In Ayurveda, Nirvisha is included in Vishaghna (anti-toxic) formulations and is used for neurological disorders, chronic pain, skin infections and respiratory issues due to its antimicrobial and nervine tonic actions. It is also incorporated into rejuvenate preparations and herbal oils for wound healing and scalp health. Table 2 provides summary of ethnomedicinal application of *delphinium denudatum* across different traditional medicinal system. Comprehensive ethnomedicinal profile of *Delphinium denudatum* (Table No. 2).

**Phytochemical Studies**

The phytochemical profile of *Delphinium denudatum Wall*. has been widely investigated, revealing a rich bioactive constituent. Early studies report the presence of multiple phytochemical classes, including alkaloids, flavonoids, saponins, steroids, glycosides, tannin and various phenolic compounds. Notably, the plant is particularly rich in diterpenoid alkaloids with various C19 and C20 diterpenoid alkaloids, which exhibit a wide range of biological activities. Even flavonoids important phytochemicals in *D. denudatum.* The presence of flavonoid glycosides, such as rutin and quercetin has been documented which highlights their antioxidant and anti-inflammatory effects. Phenolic compounds including various benzoic and phenylacetic acid derivatives have also been identified in *D. denudatum*. The majority of compound possesses simple molecular structure and broadly distributed in the plant kingdom. The presence of unique phenolic structures like oxformasine and benzoxepine derivative has been noted which indicates the chemical diversity within this species [38-39]. The molecular structures of key compounds are given in figure 5. Phytoconstituents of *Delphinium denudatum* (Fig. 5). The figure.6 presents the relative frequency with which major phytochemicals of *Delphinium denudatum* are reported which are highlighting the dominance of its characteristic diterpenoid alkaloids. Denudatine, delphinine, jadwarine and ajaconine appear most promising role in neuroactive and antitoxic properties described in pharmacognostic and Unani literature. Some Moderately reported constituents such as denudatin and magnoflorine contribute to antioxidant and adaptogenic effects while, phenolics, flavonoids, tannins and glycosides are less frequently cited but consistently associated with supportive antioxidant and wound-healing activities. Overall, the distribution underscores the chemical profile of *D. denudatum* as alkaloid-rich aligning with its traditional use in neurological, inflammatory and toxicological conditions. Phytochemical reporting in *Delphinium denudatum* research (Fig.6).

**Pharmacological Studies**

**Antioxidant activity**

*Delphinium denudatum (DD)* shows significant antioxidant potential across various extracts. It is reported that the water extract showed significant antioxidant potency which exhibits 83.38% DPPH free radical inhibition compared to 92.67% by standard ascorbic acid and protected against cisplatin-induced oxidative stress in animal model suggested that its usefulness in nephrotoxin-induced renal injury. Other studies further supports the antioxidant capacity of DD showed that its ethanolic extract contains DPPH and superoxide-scavenging compounds, while the ethyl acetate extract primarily scavenges hydroxyl radicals. β-sitosterol, a major phytosterol isolated from DD roots exhibits notable free radical-scavenging activity. Additionally, the chloroform extract of DD roots demonstrated even higher free radicle scavenging activity which showed 86.56% comparable to 82.77% for ascorbic acid. The presence of flavonoids and other phytochemicals may enhances its antioxidant, anti-carcinogenic and anti-atherogenic properties

indicating that various DD extracts may have therapeutic potential including significant action in preventing oxidative damage and supporting cancer treatment [52].

**Antimicrobial activity**

The antimicrobial property of different parts of *Delphinium denudatum (DD)* has been studied in various solvents. Among these, ethanolic extract of stem demonstrated the strongest antibacterial activity exhibited 15.33 ± 0.11 mm against *Serratia marcescens*, while the leaf extract showed the greatest antiactinobacterial activity 21.0 ± 0.07 mm against *Nocardia tenirefensis*. Beyond these findings, *Delphinium denudatum* has traditionally been used for intestinal helmintheasis and reducing fluid retention. Its ethanolic root extracts have shown both antibacterial and antifungal properties which largely attributed to natural alkaloids. Newly identified diterpenoid alkaloids such as 8-acetylheterophyllisine, panicutine and vilmorrianone demonstrated antifungal activity against several human pathogenic fungi. Additionally, Biological synthesis of silver nanoparticles using aqueous root extract of DD has produced strong antibacterial effects against *Escherichia coli, Bacillus cereus Staphylococcus aureus* and *Pseudomonas aeruginosa* along with larvicidal activity against Aedes aegypti [53].

**Hepatoprotective activity**

In these experiments, rats were administered alcohol 3.75 g/kg daily for ten consecutive days per hour following extract administration. The protective effects were evaluated using biochemical markers. Co-administration of DD extract at a graded doses of 100, 200, 400 mg/kg notably improved alcohol-induced alterations in cholesterol levels, total and direct bilirubin levels, Aspartate Aminotransferase (AST), Alanine Aminotransferase (ALT), Alkaline Phosphatase (ALP) while also preventing alcohol-induced lipid peroxidation. Among the tested doses, 400 mg/kg produced the most pronounced hepatoprotective effect comparable to the standard drug silymarin. It was concluded that DD treatment restored altered biochemical parameters in a dose-dependent manner suggesting strong potential for its use in managing alcohol-induced liver dysfunction [54].

**Nephroprotective activity**

*In-vitro* study of aqueous root extract of *Delphinium denudatum (DD*) conducted using the GGT assay which showed that the extract had an $IC_{50}$ value 189.3 μg/ml compared to the standard nephroprotective drug mesna having $IC_{50}$ 61.29 μg/ml. In *in-vivo* study, nephrotoxicity was induced in rats using cisplatin (5 mg/kg BW) and DD extract was administered at doses of 300, 600 and 800 mg/kg. The treatment produced considerable dose-dependent reduction in elevated blood uric acid, urea and serum creatinine along with marked improvement in histopathological alterations caused by cisplatin. The findings indicates aqueous root extract of *Delphinium denudatum* possesses notable renoprotective activity and may serve as a promising therapeutic option for managing nephrotoxin-induced renal injury particularly that caused by cisplatin [55].

**Cardiovascular activity**

The cardiovascular effects of the aqueous extract of *Delphinium denudatum* (DD) produced both inotropic effects and chronotropic on normal and hypodynamic frog hearts indicating its influence on heart rate and contractility. In dogs, the extract initially caused tachycardia followed by bradycardia; however, the appearance of marked tachycardia after atropinisation suggested that the bradycardia was mediated through a reflex mechanism. Furthermore, the cardiovascular effects of the extract were blocked by both α- and β-adrenergic blockers demonstrating that its action involves these receptor pathways. Blood pressure studies in dogs also confirmed that the extract interacts directly with α and β receptors showing significant impact on the cardiovascular system [56].

**Anticancer effects**

Several plant species traditionally used as anticancer remedies have been evaluated for their antiproliferative activity including *Delphinium denudatum Wall*. whose various extracts demonstrate notable antitumor potential. In an *in-vitro* assessment of 44 extracts from 16 medicinal plants on human MCF-7, epithelial type-2 and Vero cell lines. DD extracts showed promising activity likely due to their strong antioxidant properties. Growing interest in herbal medicines among cancer patients further highlights the relevance of such findings. Specifically, the chloroform and

methanolic extract of DD roots and aerial parts exhibited selective cytotoxicity against leukemia, ovarian and breast cancer cell lines with inhibition rates ranging from 50% to 100%. Additionally, a novel sulfated derivative of quercetin one of the flavonoid constituents of DD demonstrated potent antitumor effects via a reactive oxygen species induced apoptosis which points to its potential as a precursor for developing new anticancer agents [57].

**Neurologic and Psychiatric Effects**

Current studies on *Delphinium denudatum* (Jadwar) highlighting its potential as a neuroprotective and neuroactive medicinal plant. In Parkinson's disease models, its extract significantly protected dopaminergic neurons by restoring dopamine levels, normalizing key antioxidant enzymes like catalase, superoxide dismutase and regulating D2 receptors after 6-OHDA–induced injury. Compounds like isotalatazidine hydrate also exhibit strong dual cholinesterase-inhibitory activity suggesting therapeutic relevance in Alzheimer's disease. Multiple studies confirm potent anticonvulsant properties of its aqueous extracts which effectively suppressed seizures in various experimental models showing comparable results to standard antiepileptic drugs like phenytoin and valproic acid. Additionally, both ethanolic and aqueous extracts demonstrated anxiolytic effects in behavioural models while the aqueous extract produced notable central depressant activity by enhancing hypnosis and reducing locomotor activity. *Delphinium denudatum* also exhibits strong antinociceptive effects in thermal and chemical pain models acting through non-opioid pathways. Collectively, these findings indicate that *Delphinium denudatum* possesses diverse neurologic and psychiatric activities including neuroprotection, anticonvulsant, anxiolytic, central depressant and analgesic effects supporting its traditional use and potential therapeutic value in managing various CNS disorders [58].

## DISCUSSION

The ethnopharmacological exploration of *Berberis aristata* and *Delphinium denudatum* understands their significance as medicinal plants with diverse phytochemical compositions and broad pharmacological relevance. Within this context, *Delphinium denudatum* demonstrates a stronger emphasis on antidiabetic and neuroprotective activities supported by moderate antimicrobial, anti-inflammatory and antioxidant roles which is reflecting its alkaloid-rich profile. In contrast, *Berberis aristata* exhibits pronounced antimicrobial and antioxidant strengths along with moderate effects in anti-inflammatory, antidiabetic and neuroprotective domains consistent with its more diverse phytochemical base. As per figure 7, these overlapping yet distinct pharmacological strengths highlight complementary therapeutic potential suggesting that *Delphinium denudatum* may be more promising for metabolic and neurological disorders while *Berberis aristata* excels in infection control and oxidative stress management. Comparative pharmacological analysis (Fig.7). Together, the accumulated phytochemical and pharmacological evidence emphasize the importance of integrating traditional knowledge with modern experimental validation particularly through expanded mechanistic and clinical studies to fully realize their translational potential in evidence-based medicine.

## CONCLUSION

*Berberis aristata* (Daruharidra) and *Delphinium denudatum* (Jadwar) are two important traditional medicinal plants whose therapeutic relevance is strongly supported by both classical literature and modern scientific findings. *Berberis aristata* rich in berberine and other alkaloids contributes to its significant anticancer, antidiabetic, anti-inflammatory, antimicrobial, antioxidant and hepatoprotective, activities validate traditional ayurvedic application for liver disorders, metabolic diseases and systemic inflammation. Whereas, *Delphinium denudatum* widely used in Unani medicine contains diverse bioactive constituents that contribute to its antioxidant, anticonvulsant, antimicrobial, anxiolytic, neuroprotective and de-addiction properties support its traditional role in neurological, psychiatric and toxicological conditions. Together, these plants highlight the therapeutic depth of Indian traditional medicine and offer strong potential for modern evidence-based applications. However, further research is essential to clarify their

mechanisms of action, identify key active compounds and establish standardized clinical protocols to ensure safe, effective and scientifically validated use in modern healthcare.

## ACKNOWLEDGEMENT

The authors would like to express their sincere gratitude to all those who have contributed to the successful completion of this review article.

## ABSTRACT

Microneedle technology offers an improved method for delivering drugs. They are emerging as valuable assets in the biomedical field, providing a minimally invasive and effective approach for a range of uses, including drug delivery, cell transfection, and biosensing. Different types of microneedles exist, such as solid, hollow, dissolving, coated, and hydrogel-forming microneedles. Microneedles may be fabricated from silicon, metals, ceramics, and synthetic and biodegradable polymers, including carbohydrates. Microneedles (MNs) create microchannels in the skin by disrupting its structure, weakening its barrier function, and allowing drugs to penetrate more easily, thereby aiding the delivery of therapeutic agents. Transcutaneous medication delivery via a microneedle patch offers advantages over traditional methods of drug administration. To successfully implement microneedle technology, factors such as biocompatibility, drug stability, safety, and production costs must be considered. This review examines how microneedle systems have evolved over the past decade, highlighting their innovations, benefits, and applications in diagnostics and treatment. These advancements aim to improve drug delivery and theranostics by enabling controlled release, better tissue penetration, and more effective treatment outcomes.

**Keywords:** Microneedle technology, Transdermal drug delivery, Minimally invasive drug delivery, Controlled release, Biodegradable polymers, Therapeutics and diagnostics.

# INTRODUCTION

The stratum corneum (SC) plays an essential role by covering the surface of the epidermis, acting as the main protective barrier against exogenous molecules, including pathogens, toxic chemicals, or UV light, thereby limiting transepidermal water loss (TEWL). (Proksch E. *et al.,*2008). Drug delivery systems (DDSs) are developed to deliver the correct amount of medication to specific target sites in the body while ensuring consistent and effective drug concentrations. Controlled drug delivery can be effectively achieved using microneedle transdermal patches. (Wong WF. *etal.,*2023). Microneedle technology is a non-invasive delivery method that is a preferable alternative to parenteral administration, as it punctures the active cuticle and living epidermis without injuring nerve endings or blood vessels. (Chen J. *et al.,*2017). Microneedle therapy may offer several advantages, such as preventing liver metabolism, reducing the harmful effects of oral drugs on the digestive tract, achieving continuous and sustained drug release, allows for the rapid interruption of drug delivery in the event of toxicity, thereby enhancing safety. (Rad ZF. *et al.,*2021). Delaying the release of the drug and controlling its distribution is also a fascinating way to target the drug. (Nazary Abrbekoh F. *et al.,*2022).Drugs can be administered via various routes such as parenteral, ocular, transdermal, and others, like nasal, pulmonary, and buccal routes. Oral drug delivery has benefits such as better patient compliance, painlessness, a large absorption area, low cost, and ease of drug release in the stomach and intestines. However, there are drawbacks, such as drug breakdown in the stomach, high first-pass metabolism, low absorption, local discomfort, and environmental changes in the gastrointestinal tract, such as pH variations. (Xie Y. *et al.,*2005).The parenteral route uses hypodermic needles to give the drug and is accepted around the world. It provides benefits such as fast action, accurate medication delivery, and ongoing drug infusion. Conversely, it has disadvantages, such as being uncomfortable and painful, posing a risk of opportunistic infections, and requiring highly skilled operators. (HA AKL LL.*et al.,*1992). (Simonsen L. *et al.,*1999). Microneedles are created to penetrate the skin epidermis to a depth of 70 to 200 mm. (Hardy JG. *et al.,* 2016). To make such needles on silicon wafers, thousands of them can be made on a single wafer, since their size is relatively small. This approach results in high accuracy, good reproducibility, and a moderate price for manufacturing. (Wilke N. *et al.,* 2005). Hollow micro-needles can be used to extract fluids from the body for analysis, such as blood glucose measurements, and to deliver microliter volumes of insulin or other drugs as needed. Very small micro-needles can deliver drugs directly to individual cells. (Microneedles: Report Describes Progress, 2003).

**Types of Microneedles**

The studies on microneedles mainly focus on building a rapid, effective and safe practical method of drug delivery. Microneedle types include solid microneedles, coated microneedles, hollow microneedles, and hydrogel-forming microneedles, among many others for drug delivery(Zhang Y. *et al.,* 2017), as illustrated in Figure 1.

**Solid Microneedles**

Solid microneedles are among the simplest structures in design. Made entirely of solid material, they do not contain medications or any additives. Their main purpose is to prepare the skin by creating tiny openings in the stratum corneum and epidermis. These small holes temporarily disrupt the skin's outer layer without penetrating deeply enough to cause pain or bleeding. After the skin is punctured with these solid microneedles, a drug formulation-such as a gel, cream, or patch, is applied to the treated skin area. This allows the drug to easily diffuse through the microchannels into the dermal capillaries, significantly enhancing drug permeability and systemic absorption.(Haq MI. *et al.,* 2009). By passing the dense, protective stratum corneum, this method increases bioavailability, especially for molecules that typically have poor skin penetration. Solid microneedles are commonly fabricated from silicon, stainless steel, or polymer. However, for commercial and clinical use, disposable versions are favored to ensure hygiene and prevent cross-contamination.

**Coated Microneedles**

Coated microneedles are an evolution of microneedle technology where the drug is coated onto the surface of a solid microneedle. When they penetrate the skin, the drug dissolves and diffuses into deeper tissues. (Haj-Ahmad R. *et al.,*

2015). This technique offers fast drug delivery and onset, which is suitable for cases requiring immediate therapeutic responses. The coating process usually uses dip-coating, where microneedles are submerged in a solution that contains the drug. (Ali M. *et al.*, 2024). By adjusting how deep the microneedles are dipped and for how long, the quantity of drug applied to each needle can be controlled. It is important, however, to achieve a consistent coating to ensure precise drug delivery. The mixture must be thick enough to create a stable layer on the surface of the microneedle and remain attached during storage and when the needle is inserted into the skin. Moreover, the drug should be concentrated near the tip of the microneedle, as this part is the first to come into contact with the skin, which helps improve the effectiveness of drug delivery. Although coated microneedles are effective, they have limitations in terms of how much drug they can hold, particularly for treatments that need larger amounts of medication. Using multiple coating layers can increase the total drug content, but this method also raises the complexity of the process and the amount of materials used. (Tang ESK. *et al.*, 2005).

**Dissolving Microneedles**

Dissolving Microneedles are an advanced drug delivery technology that is constructed entirely from biodegradable or water-soluble materials which encapsulate the active drug substance. These microneedles are formulated to totally dissolve in the skin generating zero sharps waste and reducing potential for needle reuse and injury. They are commonly prepared by solvent casting technique in which the drug-polymer blend is poured onto a mold and left until solidifies. There are many common polymers including, for example, carboxymethyl cellulose (CMC), methyl cellulose and sugars such as trehalose and sucrose that are nontoxic/biocompatible and capable of forming solid structures containing drugs. (Encyclopedia of biomedical polymers,2015). In these microneedles, the portion that goes into the skin first contains the drug and must be sturdy enough to penetrate but not break. It must also have low viscosity, to flow into the mold and not leave air bubbles. The portion of the microneedle that remains above the skin may be free from drug and can be made of a less strong or water-insoluble material which aids in maintaining the position of the microneedle upon application. Recent advancements have focused on decreasing the time microneedle patches remain on the skin by making it easier to separate the tips from the base once they are inserted. Some studies have created microneedles that detach immediately when inserted, which helps reduce pain. However, these designs have challenges when larger amounts of medication are required, and ongoing research is working to improve the ability to hold more drug within dissolving microneedles without weakening their structure. (Liu Y. *et al.*, 2024).

**Hollow Microneedles**

The medication is already loaded into the hollow microneedle body, which has a hole at the tip, and is pressurized using a syringe or micropump before being injected into the skin. (Silalahi AA. *et al.*, 2018). Hollow microneedles offer the largest single infusion volume and the most accurate dosing compared to other types of microneedles. Additionally, the injection speed can be easily adjusted, similar to traditional injections. However, manufacturing hollow microneedles is costly and comes with certain drawbacks. For example, the pinhole in the needle can be easily obstructed by skin tissue if the needle is at an improper angle. Moreover, the physical strength of these needles is limited, which can result in breakage and leave parts of the needle embedded in the skin after injection (Waghule T. *et al.*, 2019).

**Hydrogel-forming Microneedles**

Hydrogel microneedles are made from crosslinked hydrophilic polymers that swell when exposed to skin fluids but do not dissolve. (Donnelly RF. *et al.*, 2014). These systems are designed for sustained drug delivery, as the drug can be incorporated throughout the microneedle tip, base substrate, and even the backing patch. Once inserted into the skin, these microneedles absorb moisture, swell, and create a continuous pathway through which drugs can gradually diffuse into the skin. Due to their hydrogel composition, they are especially suitable for delivering larger doses of medication over extended periods, which is beneficial for treating chronic conditions that require long-term administration. The main advantage of hydrogel microneedles is their high drug-carrying capacity and sustained release profile. However, they necessitate longer patch-wearing times because of the slow drug diffusion rate (Parhi

R. *et al*., 2022). Additionally, optimizing formulation stability and mechanical robustness during insertion is crucial for ensuring effective performance.

**Material Selection for Microneedles**

The materials used in creating the microneedles must be biocompatible and biodegradable, as required by their intended application. They should also have enough mechanical strength to effectively penetrate the skin while ensuring no adverse reactions occur. Commonly used materials include inorganic materials, polymers, and metals. (Waghule T. *et al*., 2019).

**Inorganic materials**

Solid microneedles are created using inorganic substances such as glass, silicon, and ceramics. Silicon is frequently selected for microneedle production due to its ability to be formed into various shapes and sizes. In reality, the earliest recognized microneedle was constructed from silicon. Nonetheless, silicon exhibits limited biocompatibility, rendering it less appropriate for biomedical applications. (Larrañeta E. *et al*., 2016).Researchers have explored ceramic materials for microneedles as an alternative due to their biocompatibility and strong mechanical properties. Ceramics utilized for this purpose encompass alumina, calcium phosphate, and calcium sulfate. (Vallhov H. *et al*., 2018). Additionally, biodegradable bioceramics are utilized for microneedles due to their robust mechanical properties and ability to accurately deliver drugs. Glass is not typically utilized for microneedles, unlike silicon, due to its fragility. (He X. *et al*., 2019).

**Polymers**

Water-soluble, biocompatible, and mechanically strong polymers are suitable for making microneedles that can be safely inserted into the skin. The most commonly used method for manufacturing polymer microneedles is solvent casting. This process involves creating an inverse mold that matches the shape of the microneedle structure. The mold is then coated with a polymer solution, allowed to dry or cure, and finally removed.(Joshi N. *et al*., 2023). The solvent-casting technique enables the production of dissolving or hydrogel-based microneedles using various polymers such as hydroxypropyl methylcellulose, hyaluronic acid, polyvinyl pyrrolidone, and poly lactic-co-glycolic acid (PLGA). (Ahmed Saeed AL. *et al*., 2020).

**Metals**

Metal substances have significant tensile and mechanical strength, enabling them to easily penetrate the skin. They are used to create solid, coated, and hollow microneedles. Typically, titanium (Ti) and stainless steel are the two metals most commonly utilized in microneedles. Although stainless steel is the preferred choice for making microneedles, it wears out more quickly than titanium alloy. While Ti alloys cost more than stainless steel, they provide superior mechanical strength. (Jalwal P. *et al*., 2010). Some metal microneedles have been demonstrated to provoke inflammatory responses, and manufacturing these materials is likewise a complicated procedure.(Liu R. *et al*., 2023).

**Microneedle Fabrication Methods**

Several approaches are available for making microneedles. This section outlines the primary methods used to fabricate microneedles, including both direct production techniques and those that use molds. One of the most common methods for producing microneedles at a lower cost and in larger quantities is mold-assisted manufacturing. The main techniques for creating microneedles are presented in Table 1(Oliveira C. *et al*., 2024).

**Evaluation of microneedles**

**Mechanical properties**

A microneedle must be durable enough to remain whole inside the skin while also being sharp and slim enough to easily pierce the skin. Two critical elements for a safe and efficient microneedle design are the insertion force and the force at which the microneedle compromises its structural integrity. The proportion of these two forces is referred to as the "safety factor." The proportion needs to be maximized. (O'Mahony C. *et al*., 2014)

**Margin of safety**

A few researchers characterized the margin of safety as the ratio between the force needed to penetrate the stratum corneum and the force at which microneedles fractured. Automated tools were utilized to assess the safety margin for silicon microneedles. The force of compressive failure was assessed using a hardened station with microneedles placed between the load cell and the punch. For silicon microneedle arrays, an adequate safety margin was found. (Forvi E. *et al.,* 2010)

**Measurement of fracture force**

Researchers utilized an axial load testing setup to assess the force needed to induce a mechanical failure in a microneedle. The microneedle was pushed onto a flat Aluminium surface at a rate of 0.01 mm/s until a set displacement of 500 mm was reached. (Davis SP. *et al.,* 2004). Adhesive tape was wrapped around the base of the needle to fasten the microneedles to the testing surface. The way the microneedle broke was examined with an attached microscope to determine the type of failure. Through the examination of force and displacement data, the fracture force was measured quantitatively.

**Studies on in vitro skin permeation**

A diffusion cell apparatus is employed to assess the penetration of the drug through the skin. Pig ear skin is usually utilized in experiments placed between the donor and recipient compartments. The combined permeation properties of untreated skin and microneedled skin are examined. (Uppuluri C. *et al.,* 2017).

**Clinical trials and safety**

Many initial clinical trials investigating microneedles have been conducted and shown effectiveness in several aspects, yet only a limited number have succeeded. In 2001, there was an effort to investigate microneedles in human participants. The aim was to establish if silicon microneedles cause less pain compared to 26-gauge hypodermic needles. The microneedles were placed into the forearms of 12 healthy male and female participants who consented to take part in the study. The study's results indicated that microneedles resulted in less discomfort compared to hypodermic needles. (Kaushik S. *et al.,* 2001).

**Applications**

Studies on microneedle (MN) applications emphasize their use in drug delivery, improved transdermal penetration, and biological fluid sampling. Moreover, MNs can be combined with microfluidic and biosensing systems to enable physiological monitoring and biomarker analysis. The primary goal of microneedle-based systems is to create a transient, minimally invasive pathway across skin barriers to support therapeutic and diagnostic functions (Ingrole RSJ. *et al.,*2021). These applications are depicted in Figure 5.

**Vaccine Delivery**

The rising awareness among individuals about vaccinations has prompted scientists to explore new methods for vaccine delivery. The latest development involves microneedle drug delivery, where the antigen is directly administered into the dermis. Consequently, an immune response can be triggered, and vaccination treatment can be finalized. This task is primarily performed using dissolving microneedles. Different techniques and devices such as "Mantoux" or "Soluviamicroinjection system"can be utilized to carry out this procedure. Research indicates that the Mantoux technique is challenging to execute, necessitating a skilled individual, while the Soluvia technique is frequently employed, particularly for administering influenza vaccinations like trivalent or quadrivalent, as well as type A or B influenza.(Pettis RJ.*et al.,* 2012) (Vankerckhoven V.*et al.,* 2010). A clinical trial performed on humans using hollow microneedles for influenza vaccination demonstrated comparable immune system responses when evaluated against intramuscular injection. (Van Damme P. *et al.,* 2009).

**Cosmetic Applications**

Microneedles are employed for treating acne scars. The region with acne scars is numbed with an anesthetic, and the Dermaroller is applied, moving in both vertical and horizontal directions. The saline pads are utilized to manage the

bleeding that can be regulated. The procedure requires 20 minutes to finish. Additionally, home care derma rollers are utilized for administering anti-aging products (Dogra S. *et al.,* 2014). Moreover, MN technology successfully treated two individuals affected by alopecia areata (Mysore V. *et al.,* 2014). These individuals saw hair regrowth following the therapy. Successful clinical trials have been performed on atrophic facial scarring (Majid I. *et al.,* 2009), atrophic acne scars (El-Domyati M. *et al.,* 2015), and hypertrophic burn scars (Aust M.C. *et al.,* 2010) utilizing a MN. As the demand for cosmetic products rises, microneedles (rollers and patches) hold significant potential moving forward. (Pattani A. *et al.,* 2012)

**Iron Therapy**

Success in adjusting microneedle patches to substitute the traditional method of using iron supplements and parenteral methods for addressing iron deficiency in humans was accomplished through a micro molding technique, effectively treating anemia in patients without causing any gastric side effects. A quickly dissolving kind of microneedles infused with ferric pyrophosphate has been developed to effectively address iron deficiency anemia. By conducting in vivo and in vitro studies, satisfactory results were achieved. (Maurya A. *et al.,* 2018).

**Diabetes Management**

Diabetes influences a large number of individuals nowadays. This happens due to the pancreatic beta cells failing to generate sufficient insulin. Insulin is a hormone composed of numerous amino acids. To address this problem, a novel approach known as hydrogel-forming microneedle drug delivery has been created. This technique enables drugs like metformin hydrochloride to be administered straight into the bloodstream. The medication is administered in a regulated manner, allowing it to be effective for an extended duration. Employing microneedles for insulin administration is more effective than utilizing a conventional hypodermic needle. (Ye Y. *et al.,* 2016).

**Protein Delivery**

Microneedle mask devices were developed using a continuous liquid interface production technique, incorporating a polyethylene glycol foundation to guarantee the efficient administration of proteins such as serum albumin and ovalbumin. There was worry that the free radical polymerization technique employed in creating these microneedles could harm the proteins, possibly triggering an immune response. To tackle this issue, a protective layer was applied to the microneedles once the production process was finished. Research on mice indicated that these devices effectively administered the proteins over a 72-hour duration, with the proteins remaining functional for a prolonged period. (Caudill CL. *et al.,* 2018)

**Diagnostics**

In the past few years, different types of microneedles have been utilized for the diagnosis of various diseases, such as cancer, cardiovascular issues, atherosclerosis, diabetes, and thrombosis. This is attributed to their capability to infiltrate the skin and collect biomarkers from blood vessels or skin interstitial fluid via capillary action. Firstly, the interstitial fluid present in the skin serves as a crucial reservoir of biomarkers vital for disease diagnosis; in contrast to conventional techniques, the microneedle patch provides the benefits of being painless, simple to use, and capable of quickly extracting skin interstitial fluid. (Chang H. *et al.,* 2017).

**Challenges and Limitations of Microneedle Technology**

Microneedle technology shows great promise in multiple fields, especially in cosmetics and drug delivery. However, its progress is slowed down by several challenges and restrictions that must be overcome to fully realize its benefits. One major challenge is the manufacturing process. Creating microneedles with exact designs and consistent quality is tough, particularly as production scales up for commercial use. Variations in the shape or structure of microneedles can lead to different results in treatment, which raises questions about their dependability and performance. (Mordor Intelligence, 2023). Despite the promising potential of microneedle systems, several challenges must be resolved before their widespread clinical adoption. These include the risk of skin irritation, possible microbial contamination, and difficulties in delivering therapeutically effective drug doses. In addition, the transdermal transport of macromolecules, particularly biotechnological products, remains a significant challenge.

Owing to their large molecular size and hydrophilic nature, these molecules exhibit limited permeability across the skin barrier, making their effective delivery more complex. (Lee J. *et al.,* 2015). Regulatory obstacles create restrictions, since existing frameworks may not fully accommodate the innovative aspects of Microneedle technology, hindering approval timelines. Additionally, patient acceptance and psychological barriers concerning needle usage, regardless of size, could influence adoption rates. Addressing these challenges requires multidisciplinary collaboration among material researchers, scientists, engineers, regulatory bodies, and healthcare professionals to effectively tailor microneedle applications and surmount existing limitations. (Formulation Bio, 2000) (Verified Market Research, 2023).

## CONCLUSION

Microneedles represent a relatively new approach to administering drugs. Microneedles surpass the existing transdermal drug delivery methods in effectiveness. Microneedles offer various benefits, including enhanced patient compliance, pain-free drug delivery, avoidance of first-pass metabolism, and targeted local drug application; in this review, we discuss the materials necessary for the systematic creation of microneedles. We examined various drug delivery methods along with appropriate techniques for preparing microneedles and their uses in Cancer, Diabetes, Cosmetics, Vaccine delivery, and additional applications. Microneedles seem to be a promising method for drug administration, and additional research and advancements in this area could enhance the significance of microneedle drug delivery. Microneedle systems have been created to address the current demand for technology that connects invasive and non-invasive treatments. The scientific and industrial research sectors have shown considerable interest in these devices because of their utility as biomedical tools. Microneedle patches are simple to apply, cause no pain, and are non-invasive for treating infections in infants and for vaccinations. It additionally improves bioavailability and is utilized for controlled release purposes**.**

**Table 1: Methods for the Preparation of Microneedles**

| Methods | Methodology |
|---|---|
| Micro-molding and melt casting method | Employing this method, a microneedle mold is first created from a silicon wafer. This wafer is subsequently oxidized at 1000 °C. After that, the liquid polymer solution is poured into the prepared molds, and any air voids are removed either through vacuum or centrifugation. After this procedure, the molds are baked in an oven. The microneedles are taken out once they have cooled down, as illustrated in Figure 2. (Gittard SD. *et al.,* 2009) |
| Laser cutting | Laser cutting involves the use of an infrared laser to shape metallic sheets into microneedles, utilizing software named "AutoCAD" to design the microneedle geometry, including the configuration and alignment of arrays. The laser beam then removes the metal sheet according to the design, leading to the creation of microneedles, as illustrated in Figure 3. Usually, this method is employed to create metal microneedles. Stainless steel is the most commonly utilized material. (Martanto W. *et al.,* 2004) |
| Laser Ablation | Laser ablation, similar to laser cutting, is used to create solid metal arrays. This technique can be used to make not only stainless steel but also other metals like tantalum. After three pulses, a small bump forms, which then becomes a needle about 10 micrometers tall. Using more twisted light pulses can further shape the microneedles, resulting in a tip diameter smaller than 0.3 micrometers. (Omatus T. *et al.,* 2010) |
| Dip coating | Dip coating is the simplest technique for coating microneedles. In this technique, the microneedles are initially immersed in a drug solution and then removed, leading to the formation of a liquid coating on the microneedle surface; subsequently, the liquid layer is permitted to dry, producing a solid film covering the tips of the microneedles without any contamination, as illustrated in Figure 4. The dip coating method has been utilized to apply hydrophilic and hydrophobic drugs. Dip coating is a slow method and carries the risk of degradation. (Omatus T. *et al.,* 2010) |

**ABSTRACT**

Palmoplantar psoriasis is a chronic, immune-mediated dermatosis. This case study evaluates the clinical effectiveness of an individualised Ayurvedic treatment protocol in a patient with a 7-year history of a recalcitrant condition. Clinical profile- Having deep fissures, hyperkeratotic plaques, severe pruritus and burning, with winter exacerbation and chronic constipation. According to Ayurvedic diagnosis, Vata-Pitta is dominant, with Rakta and Twaka Dushti. Intervention - The treatment included targeted internal medications, supportive external therapies, and Ayurvedic dietary and lifestyle interventions aligned. Outcomes- Significant reduction in fissuring, scaling, itching, and other discomfort. Measurable improvement in PASI, DLQI, and VAS scores indicates clinical remission. Conclusion- Personalised Ayurvedic therapeutics demonstrated notable efficacy in Palmoplantar psoriasis.

**Keywords:** Psoriasis, *Vipadika Kushta*, Palmoplantar psoriasis, *Shodhana -ShamanaChikitsa*

## INTRODUCTION

Palmoplantar psoriasis is a bilateral, symmetric, and difficult-to-treat variant of psoriasis that characteristically affects the skin of the palms and soles, with an unclear epidemiology. This condition includes itching, pain, scaling, and fissuring. Psoriasis is a common and chronic T cell-mediated skin disorder with varied clinical and morphological types. It affects approximately 125 million people worldwide[1]. In India, it was found to be 1.02%. While in north India, it was shown that psoriasis accounted for 2.3% of all dermatology outpatients[2]. The recurrence pattern and pathogenesis of palmoplantar psoriasis constantly pose a challenge to treatment approaches. Sites other than the

hands and feet are frequently involved, with studies showing 33% of patients having up to 10% of their body surface area (BSA) involved, which can cause marked physical discomfort and functional disability[3]. Although involvement of the palms and soles often affects <5% of the total body surface area, with a low PASI score[4]. In Ayurveda, *Tvak vikara* are broadly classified under the heading of *Kushta roga*, explained in various classical texts. It's one of the type is *Vipadikaroga*. Characterised by *Sputana* in soles and palms with *Vedana, Rukshata, Vaivarnya*, *kandu, etc*. The line of treatment to be adopted is *Antaha Parimarjana* and *Bahir Parimarjana chikitsa with Nidanaparivarjana*[5]. As every patient differs in *Dosha*, *Dushya*, *Bala*, *Prakruti,* so individualised treatment is planned. Modern immunopathology attributes psoriasis to T-cell–mediated immune dysregulation; from the Ayurvedic standpoint, this corresponds to *Ojas Kshaya* and *Rakta Dushti*. By considering this case, endeavours bridge to classical Ayurvedic wisdom with contemporary clinical evidence, highlighting the integrative potential of traditional principles in modern dermatological care.

**Case Presentation**

**Patient details:** A 51-year-old male farmer came with various complaints, having *Pitta-dominant Vata prakriti*(constitution), reported habitual tobacco use and regular consumption of hot and pungent food(*Ushna–Tikshna gunatmakaahara*)

**Chief complaints:** The patient reported deep, painful and bleeding fissures, scaling over the palms and soles, with severe itching and burning sensations for the last 7 years (on/off), worsening in winter and after soil exposure, Constipation for 11 years, and sometimes suffers from headaches.

**Past History** - No significant medical, surgical, or psychiatric disease.

**Previous treatment:** The patient had received repeated courses of contemporary dermatological treatments, experienced only short-term relief with frequent recurrence of symptoms, indicating chronic *Dosha* involvement.

**Etiological factors:** Irregular sleep schedule (*Asamyaka nidra*), excessive oily/fried food and tea intake, milk with banana in every day's diet(*Viruddha ahara*), stress, excessive contact with soil (*Agantuja hetu*),addiction – Tobacco chewing.

**Therapeutic Intervention**

Considering the Pathological Complex (*Dosha Dushya Sammurchhana*) and Tissue pathology (*Dhatu dushti*) assessment, personalised Ayurvedic treatment was formulated. Detoxification (*Shodhana*) was adopted as the prime line of management to eliminate vitiated *Doshas*, followed by Palliative therapy(*Shamana chikitsa*)to achieve sustained remission and tissue balance, in accordance with *Kushtha Roga Chikitsa.*

***Nidanaparivarjana-*** Elimination of etiological factors.

**First 7 days**

**Table no.1: Medicine for 1st 7 days**

**After 7 days-**

**Table no. 2: *Shodhana Therapy***

***Shamana Chikitsa*: Internal medicines-**

**Table no. 3**

**External applications**

*Jatyaditaila + Vranaroapana taila*

**Method of application** – Take both *Taila* in equal proportion and apply them generously over the hands and feet until the area appears *Snigdha* (well oiled). After 15-20 minutes of application, wear socks to promote deeper absorption.

## OBSERVATION AND RESULTS

- **Image no. 3 -** Before–After Treatment Bar Chart for PASI, DLQI, VAS Pain, and VAS Itching-

## DISCUSSION

In the present case of Palmoplantar Psoriasis, its improvement forms a strong basis for interpreting the therapeutic response in the discussion ahead.

***Nidanapariavrjana* (Elimination of causative factors)-** It plays a key role in the *Samprapti vighatana*(disruption of pathogenesis).

***Shodhana chikitsa-*** Since *Kushtha* is a *Tridoshajanya Vyadhi*, it is best to treat the predominant doshas before moving on to the *anubhandha doshas*. Regular *Panchakarma* process advice reveals the degree of *dosha.*

***Eranda taila*(Castor oil)-** It has the property of calming the entity of the body constitution, as well as cleansing the minute channels, promoting rejuvenation. Castor Oil has such high antioxidant activity at low concentrations that it could be very useful for the treatment of diseases caused by oxidative stress. The active chemical constituents are Methyl Ricinoleate, Ricinoleic acid, 12-octadecadienoic acid, and Methyl Ester, which produce antioxidant activity. If used orally, castor oil is a good laxative that aids in straining during defecation and the sensation of complete evacuation following a bowel movement. Its active ingredient, Ricinolic acid, is released in the colon, where it aids digestion, nutrition absorption, and system cleansing. Castor oil also functions as a natural antibacterial, antifungal, and antimicrobial agent, addressing the root causes of skin diseases[6].

***Shamana chikitsa***

***Amapachaka Vati-*** *Mandagni* (Digestive impairment) is the root cause of diseases. *Amapachaka Vati* is a Herbo-mineral Ayurvedic formulation that hasa potent action to normalise the function of *Agni* and reduce *Ama* by doing *Pachana* of *Ama.* It contains drugs that have*Katu-Tikta-Lavana Rasa, Laghu-Ushna Guna, Ushna Veerya, Katu Vipaka* and *Vata-Kaphahara, Deepana-Pachana,* and *Anulomana* properties. Also, the ingredients of this formulation possess Pharmacological actions like Antispasmodic, Antioxidant, Analgesic and Anti-inflammatory. This may be interpreted as a bio-digestive and anti-inflammatory formulation that facilitates the clearance of incompletely metabolised intermediates and gut-derived endotoxins arising from impaired digestive and metabolic processes[7].

***Laghusutshekhara rasa-*** *Laghusutshekhar Ras* acts as a detoxifier; this action is contributed by the presence of ginger root powder in the formulation. Its effects appear on all three *doshas*, but especially reduce aggravated pitta and its various disorders. Its *Laghu guna* and *Tikshana guna* have *Srotoshodhaka* property, softening and liquefying the morbid doshas, which are ultimately excreted[8]. It principally impacts the *Rasadhatu* and *Raktadhatu* as the affected tissues. Its main areas of action are the *Amashaya*, *Pakwashaya* and *Raktavaha Srotas*.

***Manjishthadighrita-*** *Manjishtha*, used as a prime healing drug described in Ayurvedic literature. *Raktashodhana* (purification of blood) was done by virtue of *Tikta* and *Kashaya rasa*, it also shows actions like *Lekhana, kledahara, Chhedana,* and *Raktashodhaka properties*. *Vishadaguna* of *Kashaya rasa* played an important role in scraping out the debris and slough of the *Vrana*. *Varnya, Twaka prasadana, Raktaprasadana* properties of the *Madhura rasa* with *Snigdha guna* led to the colouration of scartissue similar to that of skin. Phytosterols, the chief components of *Ghrita*, are known to be

good emulsifiers, the property of which was assumed to facilitate the penetration of the drug into the tissue. Tannins and anthraquinones are known antioxidants and blood purifiers with anti-inflammatory actions. Berberine, and phytosterols all are anti-inflammatory and thus prevent the prolongation of the initial phase and reduce the pain as well astenderness, redness, swelling-like features, along with ascorbic acid and glycosides[9].

***Dhnyakaphanta*** **-** Various parts of the plant, such as seeds and leaves, possess antioxidant, anxiolytic, antidepressant, learning and memory improving, neuroprotective, hypnotic, and analgesic activities. Ethanolic extract of *Coriandrum sativum* Linn. possesses hepatoprotective activity on CCl4-induced liver injury, which may be due to its antioxidant potential, due to phenolic compounds in it and enhances the functions of the liver, which is important in blood purification[10]. In Ayurveda, it is said to be a pacifier of Vata and Kapha dosha.

***Sarivaghanavati*** - The role of *Sariva* in enhancing skin health is proven by traditional and listed activities, which ensure it possesses the antioxidant, anti-inflammatory, antistress, and antimicrobial properties so that it can play an important role in curing skin disorders. Methanolic extracts of *Sariva root,* bark showed free radical scavenging properties in several in vitro and in vivo models, as well as the inhibition of lipidperoxidation and scavenging hydroxyl and superoxide radicals *in vitro*. It also shows, NF-kB, reduction of pro-inflammatory IL-8 expression, and alterations in other mediators of inflammation, such as reactive oxygen species and pro-inflammatory cytokines.

**Gandhakarasayana-** Crosstalk between Membrane metalloproteases (MMPs), tissue inhibitors of metalloproteases and metallothioneins (MTs) are known to play a pivotal role in repair and regenerative processes. Accumulation of MTs in tissues comprising proliferating cells and in healing tissues implies a possible role of MTs in injured tissues undergoing repair. Induction of metallothioneins is reported to accelerate wound healing proliferation and, by promoting cell re-epithelialization by matrix remodelling. The spectrum of immune system disorders treated by this rasayana strengthens this hypothesis, and it appears that rasayana has a significant role in repairing or rejuvenating cellular functions[11].

**Local application**

***Jatyadi taila-*** *Jatyadi taila* is used externally for *Abhyanga,* i.e. for itching, boil, fistula, wounds due to sharp weapons, burn ulcer, non-healing ulcer also used for eczema and psoriasis. The phyto-medicinal therapy is easy to procure and administer with minimal side effects. The ingredients of *Jatyadi taila* have been proven scientifically for their antimicrobial property. By considering this, it shows results in skin disorders[12].

***Vranaropanataila-*** A mixture of curcumin (diferuloylmethane), monodex-methoxycurcumin, and bisdes-methoxycurcumin, are the active component in it. It shows Anti-inflammatory, anthelmintic, antiasthmatic activity, and neuroprotective activity. The analysis of *Vrana Ropana* herbs indicates predominance of *Madhura, Kashay Rasahaving Madhura Vipaka* and *Sheeta Virya*. It could be because *Madhura Rasa* aids in *Dhatu Poshana* (tissue regeneration) and *Kashaya Rasadravyas* aid in wound closure through their *Sandhanakarma* (tissue binding) actions. It is well stated that plants rich in tannins, flavonoids, saponins, sterols, phenols, and triterpenoids have the potential to heal wounds[13]. The autoimmune nature of palmoplantar psoriasis reflects a derangement of *Vyadhikshamatva*, analogous to *Ojas Kshaya,* wherein the depletion of *Ojas* weakens systemic immunity, allowing *Vata* and *Pitta* vitiation to manifest as inflammatory dermatoses.

## CONCLUSION

The case demonstrates that individualised Ayurvedic management in Palmoplantar Psoriasis which bridging ancient diagnostics with modern dermatological outcomes, a condition often resistant to conventional care, achieved significant relief with no adverse effects, reflected in reduced PASI, DLQI, and VAS scores. These findings underscore the need for larger, well-designed studies to validate the outcome and support stronger integration of Ayurveda into evidence-based dermatology.

## ABSTRACT

Recent advancements in neuroimaging techniques such as functional MRI (fMRI), Diffusion Tensor Imaging (DTI), Magnetic Resonance Spectroscopy (MRS), and Positron Emission Tomography (PET) have revolutionized the diagnosis and management of neurodegenerative diseases like Alzheimer's and Parkinson's. These tools enable early detection of brain changes, monitor disease progression, and assess treatment response by revealing molecular, structural, and functional brain alterations. Hybrid PET/MRI systems further enhance accuracy by integrating anatomical, metabolic, and molecular data, supporting personalized medicine. This study aims to evaluate the impact of advanced neuroimaging on diagnosis, prognosis, and management of neurodegenerative disorders and identify barriers limiting their clinical use. Review imaging modalities (MRI, PET, SPECT) for diagnostic accuracy and disease differentiation. Assess the role of imaging in monitoring disease progression and therapy response. Identify challenges such as cost, standardization, and accessibility affecting implementation. A systematic review of 91 peer-reviewed articles from 2006 to 2025 was conducted using databases including Scopus, PubMed, Web of Science, and UGC Care. Studies were selected based on predefined criteria focusing on advanced imaging techniques in neurodegeneration. Keywords included fMRI, DTI, MRS, PET, and related terms. Data extraction and analysis adhered to PRISMA guidelines to ensure transparency and methodological rigor. Advanced imaging significantly improves early detection of neurodegenerative changes, often before clinical symptoms emerge, enabling timely intervention. These modalities differentiate disease subtypes and evaluate treatment efficacy, facilitating personalized therapies. Despite these benefits, challenges remain: high costs, inconsistent imaging protocols, and limited specialized training restrict

broader clinical adoption. Efforts toward protocol standardization, clinician education, and cost reduction are vital to expand their use. Techniques like MRI, fMRI, and DTI show promise for early diagnosis and longitudinal monitoring but face barriers such as variability in methods, restricted access to hybrid imaging systems, and workforce shortages. Integration of artificial intelligence and development of targeted molecular tracers—such as those detecting amyloid and tau proteins—are advancing early diagnosis and disease management. Optimal imaging strategies depend on disease type, stage, and resource availability, highlighting the need for personalized, multimodal approaches. Neurodegenerative diseases pose growing global health challenges due to their complex pathology and lack of curative treatments. Advanced imaging methods—particularly PET, MRI, and combined PET/MRI—are transforming detection and care by providing detailed, non-invasive insights into brain structure, function, and chemistry. These technologies enable earlier diagnosis and tailored treatment plans but are currently limited by financial, technical, and educational barriers. Collaborative efforts toward standardization, affordable imaging solutions, and integration of AI will be crucial for making advanced neuroimaging a routine component in managing neurodegenerative disorders.

**Keywords:** Neurodegenerative Diseases, Advanced Neuroimaging, fMRI, DTI, Biomarkers, Personalized Medicine, Disease Monitoring.

## INTRODUCTION

Neurodegenerative diseases (NDs) are a group of progressive disorders characterized by the loss of specific neuronal populations, leading to cognitive, motor, and behavioral decline. Disorders such as Alzheimer's disease (AD), Parkinson's disease (PD), Huntington's disease (HD), and Amyotrophic Lateral Sclerosis (ALS) display distinct regional pathologies and clinical symptoms[1]. For instance, AD predominantly affects the hippocampus and neocortex, causing memory loss and disorientation, while PD is marked by dopaminergic neuron degeneration in the substantia nigra, producing tremor, rigidity, and bradykinesia[2]. Modern neuroimaging tools have revolutionized the diagnosis and monitoring of NDs. Structural MRI enables identification of disease-specific cortical atrophy patterns, such as hippocampal shrinkage in AD and frontotemporal changes in FTD and HD [3]. Diffusion Tensor Imaging (DTI) further enhances white matter assessment by revealing axonal degeneration and demyelination in ALS and MS [4]. Functional MRI (fMRI), particularly resting-state fMRI, provides insights into brain network dysfunctions. In AD, altered connectivity within the default mode network is associated with cognitive decline. Similarly, fMRI has revealed connectivity disruptions in PD and ALS, underscoring its role in tracking disease evolution[5]. Molecular imaging with PET plays a central role in detecting AD biomarkers. Amyloid and tau PET imaging allow in vivo visualization of amyloid-β plaques and neurofibrillary tangles, aiding in early and differential diagnosis[6]. PET is now integrated into clinical practice for identifying the etiology of dementia when results may alter patient management Future advances lie in multimodal imaging, combining structural, functional, and molecular data for a comprehensive disease profile. Integration of artificial intelligence (AI) and machine learning (ML) promises improved pattern recognition and early detection through large-scale data analysis. As imaging technology evolves, it will continue to bridge the gap between research and clinical care—enabling personalized diagnosis, guiding treatment, and improving outcomes in neurodegenerative disorders[7].

## MATERIALS AND METHODS

A systematic narrative review was conducted at the Department of Radio-Imaging Technology, Faculty of Allied Health Sciences, SGT University, Gurugram, Haryana, India, between April 2024 and June 2025. A total of 91 peer-reviewed articles published between 2006 and 2025 were included, selected from Scopus, PubMed, Web of Science, and UGC Care databases. Articles were identified using specific MeSH terms and keywords related to

neurodegenerative diseases and advanced imaging techniques, including "fMRI," "PET," "DTI," "Alzheimer's," and "Parkinson's." The inclusion criteria required studies to focus on advanced imaging modalities applied to neurodegenerative diseases, while articles published before 2006, non-peer-reviewed papers, animal studies, and unrelated research were excluded. Data extraction was performed using a standardized form capturing author details, imaging techniques, disease type, and key findings. The review process followed PRISMA guidelines, ensuring a transparent selection and screening workflow. Due to heterogeneity in study designs and outcomes, a narrative synthesis was conducted, grouping results by imaging modality and clinical application. Descriptive summaries, tables, and charts were used to present trends, clinical relevance, and research gaps.

## RESULTS

Advanced imaging plays a central role in the transition toward personalized medicine in the context of neurodegenerative diseases. Through individualized assessments of disease progression and therapeutic response, modern imaging techniques contribute significantly to the development of tailored treatment strategies, thereby enhancing clinical outcomes and reducing unnecessary or ineffective interventions[8]. This is especially crucial in the management of complex neurodegenerative disorders such as Alzheimer's and Parkinson's disease, where substantial heterogeneity exists between patients in terms of clinical symptoms, disease trajectory, and treatment response[9]. However, despite these capabilities, several challenges continue to hinder the widespread clinical adoption of advanced neuroimaging. Notable barriers include the lack of standardized imaging protocols across institutions, the high operational and infrastructural costs associated with hybrid imaging systems such as PET/MRI, limited availability in low-resource settings, and significant gaps in clinician training when it comes to interpreting multi-parametric imaging data[10]. These limitations can lead to diagnostic variability and impede the reliability and reproducibility of imaging biomarkers. Addressing these challenges requires global collaboration to establish harmonized protocols, improve clinician education, and develop scalable and cost-effective imaging solutions[11]. Hybrid PET/MRI imaging has emerged as one of the most transformative developments in this field, allowing clinicians to combine molecular, metabolic, and structural brain information within a single diagnostic session. PET tracers such as TSPO and MAO-B ligands enable the detection of early neuroinflammatory processes, including microglial and astrocytic activation, which are key pathophysiological components of neurodegeneration[12]. Meanwhile, the MRI component provides high-resolution anatomical and functional information, contributing to a multidimensional and real-time map of disease activity[13]. This integrated approach supports a more accurate and earlier diagnosis, the monitoring of disease progression at the cellular level, and the formulation of patient-specific therapeutic interventions. Additionally, functional MRI (fMRI) and diffusion tensor imaging (DTI) are critical tools that offer dynamic insights into brain connectivity and white matter integrity, respectively [14]. fMRI captures changes in neural activation patterns in response to therapeutic stimuli, while DTI provides detailed metrics like fractional anisotropy and mean diffusivity to detect microstructural changes. Together, these tools function as a feedback mechanism for evaluating treatment efficacy and guiding clinical decision-making over time. When applied longitudinally, they help tailor therapies based on neurobiological responses, which is particularly valuable for slowing cognitive decline and functional impairment in conditions such as Alzheimer's disease. Despite their immense potential, achieving the routine clinical use of such technologies necessitates addressing current limitations related to standardization, access, training, and cost. Overcoming these obstacles is essential to fully realizing the promise of advanced neuroimaging in delivering precision medicine and improving the lives of individuals affected by neurodegenerative diseases. This figure (Fig 1) illustrates the systematic approach followed in the review process, adhering to the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guideline.

## DISCUSSION

Advanced imaging techniques have become crucial in the diagnosis, monitoring, and personalized treatment of neurodegenerative diseases, yet several barriers continue to hinder their widespread clinical integration. One significant issue is the lack of standardized imaging protocols, which leads to inconsistencies in image acquisition,

processing, and interpretation across institutions. These variations undermine the reproducibility of results, especially in techniques like resting-state functional MRI (rs-fMRI), which are highly sensitive to acquisition settings and patient conditions [15]. Such inconsistencies reduce the reliability of neuroimaging biomarkers and complicate their translation into routine clinical practice. Additionally, limited training among clinicians in interpreting complex modalities like Magnetic Resonance Spectroscopy (MRS) and PET constrains their broader application in managing diseases like amyotrophic lateral sclerosis (ALS), where advanced imaging reveals underlying mechanisms such as oxidative stress and neuroinflammation[16]. As neurodegenerative research moves toward precision medicine, there is a growing demand for interdisciplinary collaboration among neurologists, radiologists, molecular scientists, and data analysts, which current educational programs often fail to address[17]. Furthermore, the financial burden of hybrid technologies such as PET/MRI remains a major limiting factor, especially in resource-limited settings. These systems require specialized infrastructure, dual-trained personnel, and access to short half-life radiotracers—components often unavailable in smaller or rural facilities[18]. Despite PET/MRI's ability to combine structural, metabolic, and functional data in one session—making it particularly valuable for early detection and monitoring of Alzheimer's and Parkinson's—its high operational cost limits its accessibility[19]. Nevertheless, innovations in PET scanner design and AI-assisted imaging interpretation may help reduce costs over time and improve diagnostic efficiency[20]. The emergence of molecular imaging agents targeting disease-specific proteins such as tau and amyloid-beta has further enhanced early detection strategies, allowing for visualization of Alzheimer's pathology before cognitive symptoms become evident[21]. These biomarkers are particularly valuable in guiding treatment with disease-modifying agents like monoclonal antibodies, which are most effective in early-stage disease[22]. Structural MRI remains the best method for detecting atrophy and white matter changes, while fMRI reveals network disruptions and PET offers insights into synaptic activity and abnormal protein deposition. MRS adds a non-invasive method for studying neurochemical alterations. The combined use of these modalities provides a multidimensional view of the disease but must be customized based on the specific disorder, stage, and patient condition[23]. As research continues to demonstrate the effectiveness of imaging biomarkers in clinical trials, updating healthcare policy and education is essential to ensure wider adoption. Multicenter collaborations and centralized imaging facilities can support equitable access to these technologies, helping bridge the gap between cutting-edge imaging research and real-world patient care and conditions.

## CONCLUSION

Neurodegenerative diseases such as Alzheimer's disease and Parkinson's disease are increasingly recognized as critical global public health challenges, affecting millions and placing a tremendous burden on patients, caregivers, and healthcare systems. These disorders are marked by the gradual, irreversible decline in brain function, leading to memory loss, cognitive dysfunction, motor impairment, and, ultimately, loss of independence. Since curative treatments remain elusive, the current medical priority is to enhance early diagnosis, monitor disease progression, and tailor patient-specific treatment plans. In this evolving landscape, advanced imaging technologies—particularly Positron Emission Tomography (PET), Magnetic Resonance Imaging (MRI), and hybrid PET/MRI systems—are playing an indispensable role in both research and clinical practice. These non-invasive modalities offer a window into the brain's structural, chemical, and functional changes. PET scans provide insight into molecular abnormalities by detecting pathological proteins such as amyloid-beta and tau, which are hallmarks of Alzheimer's disease, even before clinical symptoms manifest. MRI techniques, including functional MRI (fMRI) and Diffusion Tensor Imaging (DTI), offer high-resolution visualization of anatomical structures, white matter integrity, and connectivity networks, allowing for the detection of subtle changes that occur in early disease stages. When combined in PET/MRI systems, these technologies offer simultaneous functional and structural assessments in a single session, significantly enhancing diagnostic precision and aiding in the development of personalized interventions. Despite their transformative potential, several barriers limit the widespread adoption of advanced imaging in routine clinical settings. The lack of standardized imaging protocols across institutions creates inconsistency in data acquisition and interpretation, hindering comparability and the broader application of research findings. Additionally, the high costs associated with acquiring, operating, and maintaining PET/MRI systems—combined with the need for specialized

infrastructure and trained personnel—pose substantial challenges, particularly in low- and middle-income regions. Addressing these limitations requires coordinated efforts from clinicians, researchers, policymakers, and industry stakeholders to implement unified imaging protocols, facilitate data sharing, and develop cost-effective solutions. Moreover, integrating artificial intelligence (AI) and machine learning with advanced imaging is expected to redefine diagnostic workflows by automating image analysis, improving interpretation accuracy, and accelerating clinical decision-making. These digital tools can help overcome current bottlenecks in expertise and processing time, making neuroimaging more efficient and scalable for widespread use. In this context, AI-enhanced imaging is not only a solution to existing challenges but also a catalyst for expanding access to advanced diagnostics across diverse healthcare environments. Ultimately, advanced imaging is revolutionizing the management of neurodegenerative diseases by enabling earlier detection, more accurate tracking of disease progression, and the implementation of individualized treatment strategies. To fully realize these benefits, ongoing support for research, enhanced clinician training, international collaboration, and policy reforms that prioritize equitable access to imaging technologies are essential. By addressing these multidimensional challenges, advanced neuroimaging can fulfill its promise of significantly improving patient outcomes and transforming the standard of care for neurodegenerative conditions on a global scale.

## ABSTRACT

Glycated hemoglobin (HbA1c) and lipid profile parameters are central biochemical markers for evaluating glycemic control and cardiovascular risk. Their interrelationship reflects shared metabolic pathways influenced by insulin resistance, oxidative stress, and altered lipid metabolism. This systematic review synthesizes current evidence on the biochemical association between HbA1c and lipid fractions-including total cholesterol, triglycerides, low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), and very-low-density lipoprotein (VLDL)-across plasma and cellular blood components. Emphasis is placed on lipid distribution in red blood cells and the impact of chronic hyperglycemia on membrane lipid composition. The findings underscore the diagnostic and prognostic value of integrated glycemic–lipid assessment in metabolic disorders and cardiovascular disease risk stratification. The study investigates how cholesterol, triglycerides, LDL, HDL, and VLDL are distributed within plasma and cellular elements of blood, and evaluates the correlation of these lipids with HbA1c levels, especially in diabetic and non-diabetic populations.

**Keywords:** Blood components, Lipid profile, HbA1c, Red blood cells, Cholesterol, Triglycerides

## INTRODUCTION

Blood is a complex biological fluid composed of plasma and cellular elements such as erythrocytes, leukocytes, and platelets, which together regulate metabolic and physiological homeostasis (Guyton and Hall, 2021). Among routinely measured biochemical markers, glycated hemoglobin (HbA1c) and lipid profile parameters play pivotal roles in the diagnosis and management of diabetes mellitus and cardiovascular disease (American Diabetes Association [ADA], 2023). HbA1c reflects long-term glycaemic exposure and is strongly associated with the development of microvascular and macrovascular complications (Nathan *et al*., 2005). Dyslipidemia-characterized by elevated triglycerides, LDL-C, and reduced HDL-Cis commonly observed in individuals with poor glycemic control and contributes significantly to cardiovascular morbidity and mortality (Feingold and Grunfeld, 2000; Goldberg, 2001). Increasing evidence suggests that glycemic dysregulation and lipid abnormalities are metabolically interconnected rather than independent phenomena (Reaven, 1988). The increasing prevalence of cardio metabolic disorders such as type 2 diabetes mellitus (T2DM), dyslipidemia, and cardiovascular diseases (CVDs) has prompted extensive research into blood biomarkers for early diagnosis and management. Among these, the lipid profile (comprising total cholesterol, LDL, HDL, triglycerides) and glycated haemoglobin (HbA1c) are commonly used indicators. While HbA1c provides a long-term measure of glycemic control, the lipid profile assesses lipid metabolism and cardiovascular risk (Sembulingam, and Sembulingam, 2019). Understanding the interrelationship between these two key biochemical parameters is vital in identifying at-risk individuals, particularly those with subclinical metabolic dysfunction.

This research aims to investigate the comparative and correlative significance of lipid profile and HbA1c in different population in different age groups, with the goal of improving screening strategies and integrated risk assessment models. The global burden of non-communicable diseases (NCDs)**,** particularly type 2 diabetes mellitus (T2DM**)** and cardiovascular diseases (CVDs)**,** has risen sharply over the last few decades. The exact relationship between HbA1c and lipid parameters remains a subject of ongoing debate, with conflicting evidence on the strength and consistency of this association across different populations and clinical conditions. Cardiovascular disease (CVD) remains one of the leading causes of morbidity and mortality worldwide, accounting for an estimated 17.9 million deaths annually, and its burden continues to rise particularly in low- and middle-income countries (LMICs) (Authoritative global agency data). The pathogenesis of atherosclerotic cardiovascular disease is multifactorial, with dyslipidaemia and impaired glycaemic control recognised as two of the most important modifiable metabolic risk factors. Indeed, abnormal lipid-levels such as elevated total cholesterol (TC) and low-density lipoprotein cholesterol (LDL-C), high triglycerides (TG) and low high-density lipoprotein cholesterol (HDL-C) have been consistently associated with increased risk of coronary heart disease, stroke, and peripheral vascular disease (Stone *et al*., 2014). Meanwhile, glycaemic biomarkers such as fasting blood glucose (FBG) and glycated haemoglobin (HbA1c) reflect longer-term glucose metabolism and have been shown to predict micro vascular and macro vascular complications in people with diabetes mellitus (ADA Standards).Despite this knowledge, there are several outstanding gaps. First, many studies to date examine lipid and glycaemic biomarkers in isolation rather than jointly, yet metabolic dys-regulation often co-exists (e.g., insulin resistance may drive both abnormal lipids and impaired glycaemia) (Liang *et al*., 2025).

## METHODOLOGY OF LITERATURE REVIEW

This systematic review evaluated peer-reviewed original research articles, meta-analyses, and review papers indexed in major biomedical databases. Studies focusing on HbA1c, lipid profile parameters, plasma lipids, red blood cell membrane lipids, and metabolic disorders were included. Emphasis was placed on studies involving diabetic, prediabetic, and non-diabetic populations to capture the full metabolic spectrum (Danese *et al*., 2015).

**Glycated Hemoglobin: Biochemical Basis and Clinical Significance**

HbA1c is formed through the non-enzymatic glycation of hemoglobin, reflecting mean plasma glucose levels over approximately 8-12 weeks (Danese *et al*., 2015). It is widely used for diagnosing diabetes and monitoring long-term

glycaemic control (ADA, 2023) (Figure 1). Elevated HbA1c levels have been consistently linked to increased risks of retinopathy, nephropathy, neuropathy, and cardiovascular disease (Nathan *et al*., 2005; Barrett *et al*., 2017). Beyond its role as a glycaemic marker, HbA1c has been shown to correlate with lipid abnormalities, suggesting its potential utility as an indirect indicator of cardiometabolic risk (Turner *et al*., 1998; Jenkins *et al*., 2003). Glycated Hemoglobin: Biochemical Basis and Clinical Significance (Figure 1).

**Lipid Profile Parameters and Blood Compartments**

**Plasma Lipids**

Plasma lipid parameters—including total cholesterol, triglycerides, LDL-C, HDL-C, and VLDL are well-established indicators of cardiovascular risk (Rifai *et al*., 2008). Diabetic dyslipidemia typically manifests as hypertriglyceridemia, increased small dense LDL particles, and reduced HDL-C levels (Taskinen, 2003; Vergès, 2015). These lipid abnormalities accelerate atherosclerotic processes through enhanced lipid oxidation and vascular inflammation (Libby, 2021).

**Lipids in Cellular Blood Components**

Red blood cell (RBC) membranes are composed of phospholipids, cholesterol, and glycolipids, which regulate membrane flexibility and oxygen transport efficiency (Berg *et al*., 2019). Chronic hyperglycemia alters RBC membrane lipid composition, leading to decreased phospholipid content, increased lipid peroxidation, and reduced membrane fluidity (Lippi *et al*., 2010; Cohen *et al*., 2008). These changes impair microcirculatory flow and may contribute to vascular complications in diabetes (Brownlee, 2005).

**Relationship between HbA1c and Lipid Profile**

**Positive Associations with Atherogenic Lipids**

Numerous studies have demonstrated a positive correlation between HbA1c levels and total cholesterol, triglycerides, LDL-C, and VLDL (Ginsberg, 2000; Mooradian, 2009). Poor glycemic control increases hepatic VLDL production and reduces insulin-mediated suppression of lipolysis, resulting in elevated circulating free fatty acids and triglycerides (Boden, 2011; Feingold and Grunfeld, 2000). Population-based studies have also shown that higher HbA1c values are associated with atherogenic lipid patterns even in non-diabetic individuals, highlighting the continuum of cardiometabolic risk (Després, 2012; Thomas *et al*., 2016).

**Inverse Relationship with HDL-C**

HDL-C levels are often inversely associated with HbA1c (Sacks and Campos, 2003). Reduced HDL-C impairs reverse cholesterol transport and diminishes antioxidant and anti-inflammatory functions, thereby increasing cardiovascular risk (Rosenson, 2016). This inverse relationship underscores the compounded impact of poor glycaemic control on lipid-mediated vascular protection.

**Cellular Lipid Alterations and Glycation**

Non-enzymatic glycation of membrane proteins and lipids alters RBC deformability and increases susceptibility to oxidative damage (Witztum and Steinberg, 2001). Glycated RBC membranes exhibit increased rigidity, contributing to impaired microvascular perfusion and endothelial dysfunction (Lippi *et al*., 2010; Brownlee, 2005) (Figure 2). Relationship between HbA1c and Lipid Profile (Figure 2).

**Pathophysiological Mechanisms Linking Glycemia and Lipid Metabolism**

Insulin resistance serves as a central mechanism linking hyperglycemia and dyslipidemia (Reaven, 1988). Reduced insulin sensitivity promotes increased adipose tissue lipolysis, enhanced hepatic triglyceride synthesis, and secretion of VLDL particles (Vergès, 2015). Oxidative stress and chronic low-grade inflammation further exacerbate lipid abnormalities and vascular injury (Libby, 2021; Rimm *et al*., 2001).

**Clinical and Diagnostic Implications**

The strong biochemical association between HbA1c and lipid parameters highlights the importance of integrated metabolic monitoring. Combined assessment improves cardiovascular risk prediction and supports early intervention strategies (Chait and Bornfeldt, 2009; Kannel and McGee, 1979). Clinical trials have demonstrated that intensive glycemic control, when combined with lipid management, significantly reduces cardiovascular complications (Nathan *et al*., 2005; UK Prospective Diabetes Study Group, 1998).

## CONCLUSION

This systematic review demonstrates a robust biochemical relationship between HbA1c and lipid profile parameters across plasma and cellular blood components. Elevated HbA1c levels are consistently associated with atherogenic lipid patterns and altered cellular membrane lipid composition, contributing to increased cardiovascular risk. Integrated evaluation of glycemic and lipid biomarkers is essential for early detection, risk stratification, and personalized management of metabolic disorders.

## ABSTRACT

Smoking is widely recognized as one of the biggest threats to human health, causing around 5 million deaths globally each year. Statistics reveal that smoking is responsible for 90% of lung cancers, 75% of respiratory diseases, 50% of cardiovascular diseases, 30% of deaths among those aged 30 to 50, and 12% of all deaths. The Smoking Abstinence Self-Efficacy Questionnaire (SASEQ) is a six-item self-efficacy scale used in smoking cessation trials. While the SASEQ has been studied in Latino, Iranian, Chinese, and Malay populations, there are no existing studies on its effectiveness in the Indian population. This study aims to translate the SASEQ into Hindi and assess its validity and test-retest reliability. Two translators, one with a medical background and another without, will translate the original scale into Hindi, following Beaton et al.'s guidelines. An observer will combine the translations and produce a T1 version of the scale. This version will undergo reverse translation and will be reviewed by an expert panel to ensure accuracy. After evaluating content validity, the pre-final version will be tested with patients to confirm its validity. The translated version will be reviewed by the ethics committee, and test-retest reliability will be measured by testing subjects on two different occasions and calculating the correlation.

In conclusion, this research will establish the validity and reliability of the Hindi version of the SASEQ among individuals with chronic ischemic heart disease.

## INTRODUCTION

Tobacco use, particularly smoking, is a leading cause of preventable illness and death worldwide, and in India it constitutes a major public health concern. Smoking is a well-recognized behavioral risk factor that significantly contributes to the global burden of disease, a relationship first clearly demonstrated by the landmark 1950 study of British doctors and further substantiated by more than seven decades of research [1]. Tobacco smoke contains over 7,000 chemical compounds, of which more than 250 are toxic or carcinogenic, including nicotine, nitric oxide, benzpyrene, arsenic, and cadmium, leading to addiction, impaired oxygen transport, cancer, and damage to nearly every organ system, while also increasing the risk of respiratory infections and multisystem diseases [2]. According to the World Health Organization, tobacco use is responsible for approximately one in ten deaths globally, causing around 7 million deaths each year, with nearly 1.1 billion smokers worldwide and markedly higher smoking prevalence among men, particularly in developing countries [3,4]. During the COVID-19 pandemic, active smoking was associated with increased disease severity and mortality among hospitalized patients, potentially due to upregulation of the ACE-2 receptor, heightened inflammatory responses, and immune dysfunction, although methodological limitations in systematic reviews suggest possible bias in estimating this effect [5,6]. Smoking also increases infection risk through hand-to-mouth behavior and by damaging lung tissue and weakening immune defenses, thereby worsening respiratory disease outcomes [7]. Effective cessation strategies, such as the Ottawa Model for Smoking Cessation, emphasize a standardized, interdisciplinary approach to tobacco treatment and have demonstrated success across healthcare systems [8]. Within relapse models, self-efficacy—or confidence in one's ability to quit—has been identified as a key predictor of successful smoking cessation [9]. The Smoking Abstinence Self-Efficacy Questionnaire (SASEQ), a six-item scale scored from 0 to 24, evaluates this construct and has shown that self-efficacy, rather than willpower or motivation alone, is strongly associated with sustained abstinence, underscoring its importance as a target for smoking cessation interventions [10,11].

## METHODS

The Institutional Ethical Committee has approved the ethical statement (IEC/MMDU/3439). The study will follow the Helsinki Declaration, CIOMS International Ethical Guidelines, and National Ethical Guidelines from the Indian Council of Medical Research. Each patient with chronic ischemic heart disease must sign an informed consent form before participating.

**Translation Procedure**

Beaton et al.'s guidelines are the foundation for this study.[12]

**Stage of Forward Translation**

Two forward translations from English to Hindi will be created for the scale. SASEQ T1 will be translated by someone with a medical background, while SASEQ T2 will be done by a translator without this background. The translations by the non-medical translator will be labeled "naive" as they are more likely to grasp the original scale's true meaning. They will also clarify any ambiguities in the original scale by employing language more familiar to the target audience. The success of this stage relies on both translators being fluent in Hindi and English. They will address any differences between their versions to correct grammatical errors.

**Stage of Synthesis**

This step aims to combine the forward translations. The lead investigator will stay in contact with the translators via WhatsApp or email. To ensure accuracy in meaning, the investigator will synthesize the SASEQ T1 and T2 translations. This step is crucial for reviewing the material and revising terms that deviate from the original scale.

**Stage of Back Translation**

SASEQ BT1 and BT2 will translate the T1-2 version back into English without knowledge of the translation process. This ensures the translated text is accurate and helps identify any unclear terms. While consistency between the back translation and source version suggests accuracy, it cannot fully guarantee it due to potential forward translation errors. This step, carried out by two non-medical English-speaking translators, aims to minimize bias and highlight any significant issues or misunderstandings.

**Content Validation Procedure - Expert Committee Review**

An online Delphi review committee will evaluate the Hindi translation of the SASEQ. The experts will review the translated scale, consisting of medical professionals with at least five years of experience treating stroke patients in India. If necessary, a new panel will be recruited for a second Delphi survey. The experts will assess the scale via Gmail and rate items as follows: (1) Not relevant; (2) Needs revision; (3) Relevant but needs minor revision; and (4) Very relevant. This four-point rating system is commonly used for content validation. The final documentation and justification for the Hindi scale will be guided by expert feedback. Key questions include: Do the phrases convey the same meaning? Are there multiple interpretations? Are there errors or grammatical issues?[16]

**Phase of Review of the Final Translated (SASEQ)**

Patients will be asked to review a draft of the translated SASEQ questionnaire to evaluate their understanding and practicality. Each item's responses will be examined to ensure accuracy in interpretation in a real-world setting.

**Transmission of the Documented Records for Submission**

All paperwork regarding the translated scale must be submitted to the responsible committee as the last step. This ensures the translation was conducted ethically and that all necessary procedures were followed. The process will be verified, and reports will accurately reflect the operations followed. The organization will confirm that a fair translation was achieved without altering the original content.

**Content validation**

A tabular structure will be used to verify each scale item and record it in the Item-level Content Validity Index (ICVI). Email or WhatsApp will be used for primary validation with the Delphi method. The Item-level Content Validity Index (I-CVI) and Scale-level Content Validity Index (S-CVI) will evaluate the items. The Averaging method (S-CVI/Ave) and Universal Agreement computation (S-CVI/UA) will be applied. According to Lynn's (1986) standards, to achieve good content validity, a group of six to ten review experts should have an S-CVI/Ave of at least 0.90 and a minimum I-CVI of 0.78. The scale will be updated in the original language until these levels are reached. Another Delphi round will be held—potentially with a new panel—if the S-CVI/Ave does not reach 0.80.

**Reliability**

To ensure consistent results over time, test-retest reliability will be evaluated by measuring participants twice and calculating the correlation. This method confirms that the scale produces reliable findings across multiple testing periods.

**Study participants and setting**

Fifty-one individuals with chronic ischaemic heart disease will be chosen from a tertiary care super specialty hospital according to Beaton's recommendations to assess the validity of the final translated Hindi SASEQ. Male and female volunteers aged 25 to 80, who have a history of smoking, possess any heart-related condition, can understand Hindi, and have the mental capacity to comprehend the scale will be included in the study. Exclusion criteria include

individuals with severe cognitive impairments, pregnant women, non-smokers and substance abusers, and non-Hindi speakers.

**Statistical Analysis**

The Item-level Content Validity Index (I-CVI) and the Scale-level Content Validity Index (S-CVI/Ave) will assess the content validity of the translated scale. I-CVI should be at least 0.78, and SCVI/Ave should be close to 0.90 after Delphi surveys with six to ten experts for good to exceptional validity. Both absolute and relative methods will be used to evaluate reliability. Based on data normality, the intra-class correlation coefficient (ICC), Pearson correlation, and Spearman Rank correlation will assess relative reliability, measuring consistency across several observations. Cronbach's alpha, which ranges from 0 (no consistency) to 1 (perfect consistency), will gauge internal consistency. Additionally, Bland-Altman plots will evaluate measurement agreement and identify any biases or variability, while regression analysis and coefficients will examine predictive consistency. [13-16]

## DISCUSSION

Translating, validating, and testing the reliability of the Hindi Smoking Abstinence Self-Efficacy Questionnaire (SASEQ) scale could significantly enhance cardiac rehabilitation for Hindi-speaking individuals. This effort aims to provide more accurate assessments and personalized rehabilitation programs, thereby improving heart-related care for this group. The SASEQ is noted for its validity, reliability, and sensitivity to changes in sensorimotor function over time, ensuring consistent assessment and outcome comparisons across various rehabilitation contexts. We are translating the SASEQ to better serve Hindi-speaking communities since there is currently no reliable and accurate Hindi version available for assessing patients with chronic ischemic heart disease.

## CONCLUSION

In conclusion, this study aims to evaluate the test-retest reliability and content validity of the Hindi version of the SASEQ questionnaire in patients with chronic ischemic heart disease.

## ABSTRACT

The green synthesis of nanoparticles (NPs) received considerable importance in the recent year's, because of its wide application, particularly in biomedical research. This study reports the green synthesis of silver nanoparticles (AgNPs) using an endophytic fungus. It was observed that the aqueous silver (Ag+) ions, exposed to a filtrate of *Penicillium oxalicum*, reduced in solution resulting in the formation of stable AgNPs. The synthesized AgNPs were characterized by means of FTIR and TEM analyses. The reduction of Ag+ ions to elemental silver was characterized by Energy-dispersive X-ray (EDX) Spectroscopy. The synthesized AgNPs showed significant antifungal activity against *Candida albicans* at 10 µg/ml. The NPs also showed antibacterial activity against both gram negative and gram positive bacteria. Hence, this can be used as a promising alternate drug against infectious diseases.

**Keywords:** Silver nanoparticles, TEM, FTIR, Antibacterial activity, Anticandidal activity

## INTRODUCTION

Emerging as a rapidly growing field, with the application in materials science, biological science and recently in medical science [1], nanotechnology and the use of nanoparticles is gaining impetus in the present century as they

possess defined chemical, optical and mechanical properties. The metallic nanoparticles are most promising as they show potential antimicrobial properties due to their large surface area to volume ratio [2]. Possession of their small size, nanoparticles exhibit different properties when compared to the bulk material. In the present predicament, silver nanoparticles (AgNPs) have appeared as a propitious antibacterial candidate in the field of medicine [3, 4, 5, 6] when compared to other metals in their nanoform. The unique properties of silver nanoparticles (AgNPs) make them a valued nanomedicine among NPs [7, 8, 9]. Silver nanoparticles are synthesized by physical, chemical and biological methods [10,11]. The latter is an advance over chemical and physical methods, as it is biocompatible, cost-effective and environment friendly [12, 13] by deploying fungi, bacteria and plants for synthesis of nanoparticles [11, 14, 15]. Microbes are being up-and-coming biological source for synthesizing metal nanoparticles [16], however all the organisms do not have the ability to convert metals to its nano forms. Fungi are reported to be potential agents in the biological synthesis of metal nanoparticles [17], advantageous with secretion of large amounts of bioactive compounds including enzymes and their biomass is easy to manage [18]. Though biosynthesis of nanoparticles of different elements are reported from both pathogenic and non-pathogenic fungi [18, 19, 20, 21], only very few endophytic fungi *Aspergillus clavatus, Epicoccum nigrum* have been reported to bio-synthesize AgNPs [22, 23, 24]. Clearly, endophytic fungi are relatively unexplored as a potential resource for the synthesis of AgNPs. Endophytes characteristically synthesize various bioactive compounds with diverse biological activity [25]. Nanoparticle-based antimicrobial formulations could be plausible bactericidal materials [26]. The green synthesis of nanomaterials are in need due to increasing environmental problem worldwide [27]. The present study focuses on the synthesis of AgNPs through an environmentally friendly method using an endophytic fungus, *Penicillium oxalicum.* The synthesized silver nanoparticles were evaluated for its antifungal (*Candida albicans*) and antibacterial (gram positive, gram negative) activity under *in vitro* condition, to use as an alternative antimicrobial agent. To our knowledge extracellular synthesis of AgNPs by this fungus has not been reported so far.

## MATERIALS AND METHODS

**Source of Microorganism**

The fungus *Peniclillium oxalicum* isolated from the leaves of *Gymnema sylvestre*[28] was maintained in potato dextrose agar slant at 27ºC. Bacterial strains namely *Escherichia coli* (gram negative) *Salmonella typhi* (gram negative), *Bacillus subtilis* (gram positive), and Fungal strain (*Candida albicans*) were obtained from the culture collection centre and maintained in LB agar at 4ºC.

**Green synthesis of silver nanoparticles**

The fungus *P. oxalicum* was grown in 250 ml Erlenmeyer flasks containing 100 ml Czapek'sdox broth (CDB) at 27ºC for 72 hrs. After incubation, mycelialbiomass was separated by filtration, washed with sterile distilled water to remove the traces of media components. Typically 15g of biomass (wet weight) was re-suspended in 100ml sterile double distilled water for 48 h at 27ºC in an Erlenmeyer flask and incubated. After incubation, the cell filtrate was filtered by Whatman filter Paper No.1. To the cell filtrate silver nitrate was added (1mm), and incubated at room temperature under dark condition for 24 h.

**Characterization of silver nanoparticles**

After incubation of the above mixture, the formation of AgNPs was analyzed by optical measurements at different time interval using a UV-visible spectrophotometer (Shimadzu, Japan) and scanning the spectra between 200 and 600 nm at the resolution of 1nm. The FTIR spectrum of the dried sample was recorded on a Perkin Elmer 1600 instrument in the range of 400-4000$cm^{-1}$.Analysis for the confirmation of elemental silver was carried out using Energy-dispersive X-ray (EDX) spectroscopy. Samples for transmission electron microscopy (TEM) were prepared by drop coating of the AgNPs solution into carbon-coated copper grid. The size and morphology of AgNPs were characterized by TEM (JEOL model 1200 EX).

**Antimicrobial Activity**

**Disc diffusion assay**

A disc diffusion method was used to assay the effect of extracellularly synthesized AgNPs for bactericidal activity against test strains on Muller-Hinton agar plates. The standard antibiotic discs were purchased from Himedia (Mumbai, India). A single colony of each test strain was grown overnight in Muller–Hinton liquid medium on a rotary shaker (200 rpm) at 37ºC. From this, 100 µl of inocula was applied to the petri plates, spread evenly and standard antibiotic discs (penicillin/amphicillin), sterile discs impregnated with and without AgNPs (10µg) were placed. The petri plates were incubated at 37ºC for 24-48 hours and the zones of inhibition were measured. The assays were performed in triplicates. For *C. albicans*, the cultures were grown in CzapekDox agar medium with Fluconazole as a standard.

**Growth Kinetics**

Further, to test the effect of synthesized silver nanoparticles on the growth of test bacteria and fungi, 100 µl of fresh cultures were inoculated separately on nutrient and czepakdox broth media respectively and incubated at 37°C in an orbital shaker at 120 rpm. After the initial log phase (2h), different concentrations of AgNPs (0, 10, 20, 40 µg/ml) were added to the growing culture media and incubated as above. For the control, sterile water was used. Positive controls with respective antibiotics were tested separately. Optical density was measured at 600nm after every 4h using UV- Visible spectrophotometer (Shimadzu, Japan). For *C. albicans*, the culture was measured after 48h. All the experiments were carried out in triplicates. The cultures were also used to test for the potency of synthesized silver nanoparticles for its bactericidal and fungicidal activity. The silver nanoparticle treated and control cultures were withdrawn from each culture tube after 2h and serial dilution was done up to 5 fold using sterile water. 100µl of each (diluted) culture was spread over the nutrient agar/ potato dextrose agar plate and incubated overnight at 37°C/ room temperature. The colony counts were made using the plate count method.

**Statistical analysis**

All data has been expressed as the average ± standard deviation. All the data were subjected to one-way analysis of variance to determine the significance of individual differences at $p<0.01$ and 0.05 levels. All statistical analyses were conducted using SPSS 21 software support.

## RESULTS AND DISCUSSION

The study of the biosynthesis of nanomaterials offers a valuable contribution to nanotechnology. The biosynthetic methods have been investigated as an alternative to chemical and physical method. In this regard the endophytic fungus *P.oxalicum* proves to be an important biological component for extracellular biosynthesis of stable AgNPs. The UV-visible spectra recorded from the *P. oxalicum* reaction vessel at different time of reaction are plotted (Fig. 1). It is observed from the spectra that the surface plasmon resonance band of AgNPs occurs at 423 nm, and this absorption steadily increases intensity as a function of time of reaction, which is very specific for silver nano particles [29, 30]. The reduction of silver ions was observed after 2 h with maximum reduction at 24 h. Our results are in accordance with earlier reports [18, 31]. The formation of silver nanoparticles by *P.oxalicum* was observed within 24 hours. Compared with the previously mentioned times from several hours to several days for the synthesis of AgNPs employing fungi [22, 30, 32], the time required in this study is significantly shorter. This proves to be an important step in the development of green processes for the synthesis of AgNPs. The FTIR spectrum of biosynthesized AgNPs is shown in Fig. 2. The spectrum shows the presence of bands at 3470.2, 1637, 1384.4 and 959.58 $cm^{-1}$. The peak at 3470.2 $cm^{-1}$ refers to the stretching vibrations of primary amines. The peak at 1637 $cm^{-1}$ is due to the carbonyl stretch vibrations in the amide linkages of proteins, indicating the presence of proteins as ligand for AgNPs, which might play a role in the stability of synthesized nanoparticles. Mandal *et al.* [33] reported that free amine or cysteine groups in proteins bind to nanoparticles and thereby stabilizing the AgNPs. The carbonyl groups of amino acid residues have a strong ability to bind to silver ions [34]. These evidences suggest that the release of extracellular protein molecules could possibly perform the function of the formation and stabilization of AgNPs in aqueous medium. The

application of biological systems for the synthesis of silver nanoparticles has already been reported [35, 36]. However the exact mechanism leading to the formation of AgNPs by these organisms is yet to be elucidated. Ahmed *et al*. [31] have reported that certain NADH dependent reductase was involved in the reduction of silver ions by *F.oxysporum*. In the present study, for the confirmation of AgNPs, EDX spectroscopy analysis was performed, which showed the presence of elemental silver by the sharp signals (Fig. 3). EDX analysis shows an optical absorption band peak in the range of 3 to 4 Kev. This is typical for the absorption of metallic silver nanocrystallites [37]. The TEM technique used to visualize the size and shape of the extracellular biosynthesized AgNPs is shown in Fig. 4A. The shape of the nanoparticle is spherical. The TEM micrograph suggests that particle diameters ranged from 10 to 50 nm (Fig. 4B). The particle size distribution histogram determined from TEM (Fig. 4B) indicates that there is variation in particle size, with an average size of the particles was 25±.7nm. The effect of silver nanoparticles was investigated against bacterial (gram positive and gram negative) and fungal (*C. albicans*) strains using the disc diffusion method. The diameter of the inhibition zone (mm) against test strains is shown in Fig. 5. The zone of inhibition against *C. albicans* is observed to be 18 mm and the standard antibiotic (Flucanozole) showed only 10 mm (Fig. 5). The inhibition zone reported for *C. albicans* by AgNPs was much higher than that of the previous report [38, 39]. *C. albicans*, a dimorphic fungi cause candidiosis in mammals and human beings. It also causes infection in patients suffering from AIDS, cancer etc [40]. The green synthesized AgNPs exhibited a very high antifungal activity towards *C. albicans*. Recent literature reports that the silver nanoparticles interfere with fungal cell cycle, thereby causing their destruction [12]. Kim *et al* [41] reported that silver nanoparticles cause the rupture of fungal cell membrane by altering membrane potential. The green synthesized AgNPs inhibits both gram negative and gram positive bacteria. The highest zone of inhibition was observed for *E. coli* (Fig. 5). The zone of inhibition might be due to the diffusion of silver ions from the AgNPs which triggers cell lysis or due to electrostatic interaction between silver nanoparticles and cell wall of bacteria leading to destruction of cell wall [16, 17, 42, 43]. Significant growth inhibition was observed in all the bacterial strains treated with grensynthesized AgNPs at 10 µg/ml (Fig. 6). These NPs emerged as an essential tool to combat the drug resistance in microbes. The high surface area to volume ratio of the nanoparticles with distinct physico-chemical properties made to be the reason for the effectiveness against resistant strains.

## CONCLUSION

In the present study, AgNPs were synthesized through green route using endophytic fungus. This method of synthesis is very easy and environment friendly. Further synthesized NPs showed antibacterial and anticandidal activity at very less concentration (10µg/ml). This paves way for the application of biosynthesized colloidal AgNps as a promising therapeutic agent against bacterial, fungal (*Candida*) infections.

## ABSTRACT

Type 2 Diabetes Mellitus (T2DM) is a chronic metabolic disorder with rising global prevalence, largely attributed to sedentary lifestyle and dietary indiscretions. In Ayurveda, T2DM closely correlates with *Prameha*, particularly *Apathyanimittaja Prameha* and *Sthula Pramehi*, where *Kapha* and *Meda* predominance with *Agni-mandya* forms the core pathology. Classical Ayurvedic texts emphasize *Sodhana* therapy in such conditions to eliminate accumulated *Dosas*, followed by *Samana Chikitsa* for long-term disease control. The present case study evaluates the therapeutic effect of *Virechana karma* followed by *Samana* therapy in a patient with T2DM. A 42-year-old male shopkeeper with a known history of T2DM for 1.5 years and classical *Prameha laksaṇas* was managed with a sequential Ayurvedic treatment protocol. The intervention included *Dipana–Pachana* using *Amapachaka Vaṭi* and *Chitrakadi Vaṭi*, followed by *Snehapana* with *Murchita Go-ghṛita*, *Sarvanga Abhyanga* with *Murchita Tila Taila*, and classical *Virechana karma* using *Trivṛt Avaleha*. Post-*Sodhana*, a seven-day *Saṃsarjana Krama* was followed. *Samana Chikitsa* with *Mehabhyadi Kasaya* and *Nisha-Amalaki Churṇa* was administered for three months. Subjective symptoms, body parameters, and glycaemic indices were assessed before and after treatment. *Virechana* resulted in 22 *Vegas*, indicating *Pravara Suddhi*. Significant relief was observed in polyuria, polydipsia, polyphagia, fatigue, heaviness, and excessive sweating. A weight reduction of 4.1 kg was noted. Objective parameters showed improvement, with reduction in fasting blood sugar, post-prandial blood sugar, and HbA1c levels after completion of therapy. This case demonstrates that classical *Virechana karma* followed by appropriate

*Samana Chikitsa* can effectively improve both subjective symptoms and objective metabolic parameters in *Prameha* corresponding to T2DM. The findings suggest the potential role of Ayurvedic detoxification and maintenance therapy in metabolic disorders, warranting further clinical evaluation.

**Keywords:** Diabetes Mellitus,*Panchkarma, Prameha, Virechana*

## INTRODUCTION

Type 2 Diabetes Mellitus (T2DM) represents the most prevalent form of diabetes mellitus and is primarily characterized by persistent hyperglycaemia arising from insulin resistance along with a relative deficiency of insulin secretion[1]. The condition has emerged as a major global health concern due to its rapidly increasing prevalence and its association with significant morbidity. Epidemiological data indicate a steady rise in the number of individuals affected by diabetes worldwide, underscoring the urgent need for effective, sustainable, and holistic management strategies. In Ayurveda, diabetes mellitus is described under the broad clinical entity of *Prameha*, a group of metabolic disorders marked predominantly by increased frequency and abnormal characteristics of urination[2]. The etiopathogenesis of *Prameha* is closely linked to overnutrition, sedentary habits, and impaired metabolic regulation, which parallels the modern understanding of obesity-associated metabolic syndrome and Type 2 diabetes. Among the subtypes of *Prameha*, Type 2 Diabetes Mellitus closely resembles *Sthula Pramehi*, also referred to as *Apathyanimittaja Prameha*, wherein faulty dietary practices and unhealthy lifestyle play a central causative role[3]. Classical Ayurvedic texts emphasize that *Prameha*, especially in its *Bahu-Doshavastha* (state of excessive accumulation of *Dosas*), requires elimination therapy as the primary line of management. Acharya Charaka clearly advocates *Sodhana Chikitsa* in such conditions, stating that purification therapies are essential for expelling morbid *Doshas* from the body before instituting palliative measures[4]. Among the Panchakarma procedures, *Virechana Karma* holds particular importance in *Prameha* due to its effectiveness in eliminating vitiated *Pitta* and *Kapha Doshas* through the nearest and appropriate route, thereby restoring metabolic balance and improving *Agni*. Following *Sodhana, Samana Chikitsa* plays a crucial role in maintaining glycaemic control, enhancing tissue metabolism, and preventing disease progression. Alongside medicinal interventions, Ayurveda strongly advocates lifestyle regulation, including dietary discipline (*Ahara*), daily regimen (*Dinacharya*), and physical activity, to address the root causes of the disease. Yogic practices, which have been traditionally recommended as supportive measures, contribute to metabolic regulation, improve insulin sensitivity, and promote overall endocrine harmony. This case study aims to highlight the therapeutic effectiveness of an integrated Ayurvedic approach employing *Virechana Karma* as a primary *Sodhana* procedure followed by *Samana Chikitsa* in the management of *Prameha.*

**Case Presentation**

**Patient Information**

A 42-year-old male patient, a shopkeeper by occupation, presented to the Kayachikitsa outpatient department on 16/07/2025 with complaints of increased frequency of micturition for the past 2–3 months (5–6 times during the day and 1–2 times at night), excessive thirst (*Pipasadhikya*), dryness of mouth, and generalized fatigue. He also reported increased appetite (*Ksudhadhikya*), heaviness of the body (*Gaurava*), lethargy (*Alasya*), excessive sweating (*Ati-sweda*), and mild burning sensation during urination, suggestive of *Prameha laksaṇas*, since the last 2–3 months[5,6]. The patient was a known case of Type 2 Diabetes Mellitus for the past 1.5 years and was on irregular oral hypoglycaemic medication. There was no history of hypertension, dyslipidaemia, thyroid disorder, or any other chronic systemic illness. He had no significant past medical or surgical history. No family history of diabetes mellitus was reported. The patient had noticed a gradual weight gain of approximately 7–8 kg over the last one year, which he attributed to a sedentary lifestyle, long working hours at his shop, irregular meal timings, and frequent intake of calorie-dense foods. He experienced progressive worsening of symptoms, which prompted him to seek further evaluation and management.

**Clinical Findings**

On general examination, the patient was conscious, oriented, and moderately built with apparent central obesity. Vital parameters were within normal limits. No pallor, icterus, cyanosis, clubbing, lymphadenopathy, or pedal edema was observed. The patient complained of polyuria, polydipsia, polyphagia, fatigue, heaviness of the body, excessive sweating, and lethargy. On systemic examination, cardiovascular, respiratory, and abdominal systems were found to be within normal limits. There were no features suggestive of diabetic neuropathy, retinopathy, or nephropathy at the time of presentation. From an Ayurvedic perspective, the clinical presentation was suggestive of *Kapha-pradhana Prameha* with features of *Sthulata*, *Gaurava*, *Alasya*, and *Ati-mutrata*.

**Diagnostic Assessment**

Based on the patient's history, clinical presentation, and laboratory investigations, a diagnosis of Type 2 Diabetes Mellitus was confirmed. Biochemical evaluation revealed elevated fasting blood glucose and post-prandial blood glucose levels, with raised HbA1c, indicating poor glycaemic control. Routine haematological parameters were within normal limits. Renal function tests and urine routine examination did not reveal any evidence of diabetic nephropathy or urinary tract infection. From the Ayurvedic standpoint, the condition was diagnosed as *Apathyanimittaja Prameha*, specifically *Sthula Pramehi*, characterized by *Kapha* and *Meda* predominance, *Agni-mandya*, and *Bahudrava Sleşma*, correlating with the metabolic derangements seen in Type 2 Diabetes Mellitus.

**Therapeutic Intervention**

Considering the chronicity of the disease and the *Kapha–Meda* predominance, a classical *Sodhana* approach was planned, followed by *Samana Chikitsa*. Initially, *Dipana–Pacana* was administered to correct *Agni* and facilitate *Ama-pachana*, using *Amapachaka Vati* and *Chitrakadi Vati*until we got *Nirama Lakshanas*. This was followed by *Snehapana* with *Muchita Go-ghrita*, administered in increasing doses until attainment of proper *Samyak Snigdha Lakshanas*. Subsequently, *Sarvanga Abhyanga* with *Murchita Tila Taila* was performed, followed by *Svedana*. Thereafter, classical *Virechana karma* was administered using *Trivṛt Avaleha* as the *Virechana Yoga*, aiming at elimination of vitiated *Pitta* and *KaphaDoshas* along with *Dushya Meda*. After completion of *Sodhana*, *Samana Chikitsa* was prescribed for a period of three months, comprising *Mehabhyadi Kasaya* and *Nisha-AmalakiChurna*, with the intention of maintaining glycaemic control, improving metabolism, and preventing recurrence of *Prameha*. The patient was also advised appropriate *Pathya–Apathya* and lifestyle modifications in accordance with classical Ayurvedic principles throughout the treatment period. Therapeutic Intervention (Table 1)

**Follow-up and outcomes**

The patient was closely monitored throughout the treatment and follow-up period. Classical *Virechana karma* was completed successfully with the attainment of 22*Vegas*, indicating Pravara Suddhi. No adverse events were observed during or after the procedure. Following *Virechana*, a 7-day *Samsarjana Krama* was administered as per classical guidelines to gradually restore digestive capacity and stabilize *Agni*. Marked subjective improvement was observed after *Shodhana*. The patient reported significant reduction in polyuria, polydipsia, excessive appetite, fatigue, heaviness of the body, lethargy, and excessive sweating. A feeling of lightness (*Laghava*) and improvement in overall well-being were noted. A reduction in body weight of approximately 4.1 kg was recorded following *Virechana* and subsequent dietary regulation. Objective assessment after completion of *Shodhana* and during follow-up revealed notable improvement in glycaemic parameters. Fasting blood sugar (FBS), post-prandial blood sugar (PP2BS), and HbA1c levels showed a consistent and clinically meaningful reduction, indicating improved glycaemic control. These objective outcomes are detailed in Table 2 and 3. Sustained improvement was observed during the three-month *Samana Chikitsa* period, suggesting the combined efficacy of *Sodhana* followed by *Samana* therapy in the management of *Prameha* (Type 2 Diabetes Mellitus).

**Blood sugar levels before and after treatment (Table 2).**
**Body parameters before and after treatment (Table 3).**

## DISCUSSION

Type 2 Diabetes Mellitus (T2DM) is a chronic metabolic disorder characterized by persistent hyperglycaemia due to insulin resistance and relative insulin deficiency. From an Ayurvedic standpoint, this condition closely correlates with *Prameha*, particularly *Apathyanimittaja Prameha* and *Sthula Pramehi*, which arise due to improper dietary habits, sedentary lifestyle, and derangement of *Agni*. These factors lead to vitiation of *Kapha* and *Meda*, with subsequent involvement of *Pitta* and *Mutravaha Srotas*. The present case highlights the role of classical Ayurvedic management, emphasizing *Sodhana* followed by *Samana Chikitsa*, in addressing both the root pathology and clinical manifestations of T2DM. The patient exhibited classical features of *Prameha* such as polyuria, polydipsia, polyphagia, fatigue, heaviness of the body, lethargy, excessive sweating, and gradual weight gain, indicating *Kapha–Meda pradhanya* along with *Agni-mandya* and *Ama* formation. In such conditions, mere symptomatic management may provide temporary relief, whereas elimination of the vitiated *doshas* becomes essential. Classical Ayurvedic texts advocate *Virechana karma* as a principal line of treatment in *Sthula Prameha*, particularly when *Kapha* and *Pitta* are predominant, as it facilitates systemic purification and restoration of metabolic balance[7]. The preparatory measures (*Purvakarma*) were crucial in optimizing the outcome of *Virechana*. *Dipana–Pacana* with *Amapachaka Vati* and *Chitrakadi Vati* helped kindle digestive fire and digest accumulated *Ama*, thereby improving metabolic efficiency. *Snehapana* with *Murchita Go-ghṛta* enabled internal oleation, aiding in mobilization of vitiated *Doshas* from peripheral tissues toward the gastrointestinal tract. External oleation through *Sarvanga Abhyanga* using *Murchita Tila Taila* further softened tissues and facilitated the smooth elimination of *Doshas*. Administration of *Virechana* using *Trivṛt Avaleha*[8] resulted in 22 *Vegas*, signifying *Pravara Suddhi*, which indicates effective elimination of morbid *Doshas*. A structured *Saṃsarjana Krama* for seven days was followed to restore digestive capacity and stabilize *Agni*. Post-*Virechana*, the patient reported marked subjective improvement, including reduction in polyuria, polydipsia, excessive appetite, fatigue, heaviness, and sweating. The sense of lightness (*Laghava*) and improved overall well-being experienced by the patient reflect successful *Sodhana*. The observed weight loss of 4.1 kg suggests reduction in *Meda Dushṭi*, which is a central pathological component in T2DM. Objective parameters further supported the clinical improvement. Reductions in fasting blood glucose, post-prandial blood glucose, and HbA1c levels after *Sodhana* and during the three-month *Samana* phase indicate sustained glycaemic control. The use of *Mehabhyadi Kaṣaya* and *Nisha-AmalakiChurna* [9] which is stated as *Agreya Dravya* by *Acharya Vagbhatt* for *Prameha Chikitsa* during *Samana Chikitsa* played a key role in maintaining metabolic stability[10]. These formulations possess *Pramehaghna*, *Lekhana*, *Agni-dipana*, and *Rasayana* properties, contributing to improved glucose metabolism and prevention of disease progression[11]. Overall, this case demonstrates that a sequential approach involving classical *Virechana karma* followed by appropriate *Samana Chikitsa* can effectively manage *Prameha* corresponding to T2DM by addressing both subjective symptoms and objective biochemical parameters. While the findings are encouraging, further systematic studies with larger sample sizes are required to substantiate the role of classical *Sodhana* therapies in the long-term management of metabolic disorders such as T2DM.

## CONCLUSION

This case highlights the effectiveness of a structured Ayurvedic approach using *Sodhana* followed by *Samana Chikitsa* in the management of *Prameha* corresponding to Type 2 Diabetes Mellitus. Classical *Virechana karma*, supported by *Dipana–Pachana*, *Snehapana*, and *Abhyanga*, achieved *Pravara Śuddhi* with marked relief in *Prameha Laksaṇas*, improvement in general well-being, and significant weight reduction. Subsequent *Samana* therapy with *Mehabhyadi Kaṣaya* and *Nisha-Amalaki Churna* helped maintain improved glycaemic control, as reflected by reductions in FBS, PP2BS, and HbA1c levels. Overall, the case suggests that correcting *Dosha–Dushya* imbalance through sequential detoxification and maintenance therapy may offer clinical benefits in selected patients of Type 2 Diabetes Mellitus, warranting further validation through larger studies.

**Patient Perspective**

The patient reported feeling significant improvement after the treatment. He experienced noticeable relief in symptoms such as frequent urination, excessive thirst, fatigue, heaviness of the body, and excessive sweating. After

*Virechana*, he felt a sense of lightness and improved energy levels, which helped him perform his daily activities at the shop more comfortably. The reduction in body weight further motivated him to follow dietary advice and lifestyle modifications. During the three-month follow-up period, the patient expressed satisfaction with the treatment outcomes, particularly the improvement in blood sugar levels, and felt confident about continuing Ayurvedic management for long-term control of his condition.

## ABSTRACT

Periodontal disease , chronic inflammatory condition is linked to several adverse pregnancy outcomes, including preterm birth, low birth weight, pre-eclampsia, and foetal growth restriction. Obstetricians and gynaecologists, being the primary maternal care providers, play a crucial role in identifying periodontal problems during pregnancy and facilitating timely dental referrals. However, their knowledge, awareness, and practice behaviours regarding maternal periodontal health remain inadequately explored in the Ahmednagar district. To assess the knowledge, awareness, attitudes, practice behaviours, and perceived barriers among gynaecologists regarding maternal periodontal disease and its association with adverse pregnancy outcomes. A cross-sectional questionnaire-based survey was conducted among 970 obstetricians and gynaecologists in the Ahmednagar district. A total of 900 respondents completed the survey, yielding an 87% response rate. The questionnaire assessed demographic details, knowledge of periodontal disease, awareness of its relationship with pregnancy outcomes, clinical practices, and barriers to referral. Among the 900 respondents, 59.8% were female, 56.8% worked in private practice, and most were aged 41–50 years with 10–15 years of clinical experience. Only 16% correctly defined dental plaque, and 22.3% recognized it as the cause of gum disease. A limited proportion acknowledged the relationship between oral health and pregnancy outcomes (287), and only 321 agreed that periodontal disease could affect pregnancy outcomes. Awareness of pregnancy-related hormonal influences on

gingival tissues was low (186). Clinical practices were suboptimal: only 54 provided oral health education during consultations, 35 believed dental check-ups should be routine in antenatal care, and only 68 performed visual oral examinations for gingival complaints. Very few (16) had training in oral healthcare. Symptomatic management was common, with 462 prescribing paracetamol and 228 prescribing penicillin for gingival symptoms. Lack of knowledge and time were the major perceived barriers to dental referral. Most participants relied on clinical experience (82%) and medical journals for information. Gynaecologists in Ahmednagar district demonstrated limited knowledge and awareness regarding maternal periodontal disease and its association with adverse pregnancy outcomes. Inadequate clinical practices and significant perceived barriers further restrict appropriate oral health management in pregnant women. Strengthening interdisciplinary training, improving oral health education, and integrating dental referral pathways into routine antenatal care are essential to enhance maternal and perinatal outcomes.

**Keywords:** Periodontal disease, Gynaecologists, Adverse Pregnancy Outcomes, Maternal Oral Health, Interdisciplinary health care.

## INTRODUCTION

Periodontal diseases initiated by bacterial plaque, leads to the formation of pathological periodontal pockets [1]. A substantial body of evidence has demonstrated an association between periodontal disease and adverse pregnancy outcomes such as preterm birth, low birth weight, preeclampsia, and foetal growth restriction[2–4]. The pathogenic microorganisms and their metabolites not only cause destruction of tooth-supporting structures but may also contribute to unfavourable perinatal outcomes through several biological pathways [5]. The primary mechanisms explaining this association, emphasizing the close relationship between periodontal tissues and the maternal vascular system was explained by Zeeman et.al.[5]. The gingiva, being an estrogen-responsive tissue, undergoes microvascular and permeability changes during pregnancy [6]. These alterations increase susceptibility to bacteraemia from Gram-negative periodontal pathogens, potentially allowing hematogenous spread and "placental seeding" [5,6]. Subsequently, an inflammatory cascade is triggered, characterized by elevated levels of cytokines and mediators [5,7]. Increased inflammatory mediators within the fetal-placental compartment may contribute to premature rupture of membranes, uterine contractions, and preterm birth or spontaneous abortion [4,5].

Given this interaction, awareness of gingival and periodontal health is essential in pre-marital counselling and maternal healthcare. Obstetricians, gynaecologists, and dental professionals share the responsibility of preventing periodontal disease and promoting oral health among women of reproductive age [8]. As primary maternal healthcare providers with continuous contact with pregnant women, gynaecologists are uniquely positioned to influence oral hygiene behaviour, reduce maternal complications, and minimize adverse perinatal outcomes through appropriate counselling and timely referrals [8,9]. Therefore, it is crucial for obstetricians and gynaecologists to understand oral physiological changes during pregnancy, risk of periodontal disease, and its potential implications for pregnancy outcomes [6,8]. The present study was thus undertaken to assess the knowledge, attitudes, perceptions, practices, and perceived barriers among Obstetricians-Gynaecologists in the Ahmednagar district regarding the association between periodontal disease and adverse pregnancy outcomes.

## MATERIAL AND METHODS

This descriptive, exploratory, anonymous cross-sectional survey was conducted among voluntarily participating gynaecologists of the Ahmednagar district in Maharashtra, India. Participants were randomly selected and included

practitioners working in private settings, teaching institutions, and community hospitals/clinics. Ethical approval for the study was obtained from the Institutional Ethics Committee of Pravara Institute of Medical Sciences, Loni. Data collection occurred over a period of two months, from the beginning of February to the end of March 2022. A total of 970 gynaecologists were approached for participation. Data were collected using a structured, self-administered, close-ended questionnaire designed to assess knowledge, attitudes, awareness, and practices regarding maternal periodontal health and its association with adverse pregnancy outcomes. A pilot study was conducted to evaluate the clarity, comprehension, and completion time of the questionnaire. Based on feedback, modifications were made to simplify technical terminology and enhance participant understanding. The final questionnaire was validated with 20 gynaecologists, and its internal consistency and reliability were confirmed with a Cronbach's alpha value of 0.80. The average completion time during the pilot was 5–10 minutes.

A detailed description of the study purpose accompanied each questionnaire, and informed written consent was obtained from all participants. Confidentiality and anonymity were assured. The final survey consisted of 16 questions, comprising both open-ended and close-ended items. The first section captured demographic information including age, gender, and type of practice. The second component assessed knowledge, awareness, and practice behaviours related to oral health care for pregnant patients. The questionnaire was distributed electronically, and an invitation message containing a URL link to the online survey was shared with participants. Responses were automatically recorded through the online platform. All collected data were analyzed using the Statistical Package for the Social Sciences (SPSS) software (SPSS Inc., Chicago, IL, USA). Descriptive statistics, including frequency distributions, were generated. Associations between variables were evaluated using Chi-square tests, with statistical significance set at $p< 0.05$.

## RESULTS

A total of 900 out of 970 obstetricians and gynaecologists (OBG) participated in the study, yielding a response rate of 87%. Non-responses were primarily attributed to time constraints and lack of personal interest. Among the respondents, 361 (40.1%) were male and 539 (59.8%) were female[Table 1]. More than half (56.8%, n = 512) were working in private healthcare settings.[Table 2] The majority of participants belonged to the 41–50 years age group (47.2%), [Table 3] and most had 10–15 years of professional practice, indicating a relatively experienced cohort.[Table 4].

**Knowledge of Periodontal Disease [Table 5, 6; Graph 1]:**
The assessment of periodontal knowledge showed considerable gaps. Only 16% of respondents correctly defined dental plaque as a soft deposit, and just 22.3% recognized dental plaque as the primary cause of gingival disease. When asked whether maintaining good oral hygiene could improve pregnancy outcomes, only 287 answered correctly. Furthermore, only 321 gynaecologists acknowledged that periodontal disease could affect pregnancy outcomes. Awareness of hormonal influence on gingival tissues was low, with only 186 respondents identifying pregnancy-related hormonal changes as a contributing factor to gingival alterations.

**Attitudes Toward Oral Health in Pregnancy [Graph 2]:**
Attitudinal responses indicated limited emphasis on oral health during antenatal care. Only 54 gynaecologists reported routinely providing oral health information during consultations, and merely 35 believed that dental check-ups should be incorporated into routine pregnancy care. Among patients reporting gingival changes, only 68 gynaecologists performed a visual oral examination, and 47 advised professional dental evaluation. Notably, only 16 respondents had received any form of training in oral healthcare, reflecting limited professional preparedness.[Graph 2].

**Clinical Practices for Managing Gingival Complaints [Graph 3]:**
In cases where pregnant patients presented with bleeding gums, the majority of practitioners managed symptoms pharmacologically. Paracetamol was prescribed by 462 respondents, while 228 prescribed penicillin, indicating a tendency toward medical rather than periodontal management of gingival conditions.

**Perceived Barriers to Oral Health Referral[Graph 4]:**
Among the four perceived barriers assessed, lack of knowledge and insufficient time emerged as the most significant factors discouraging gynaecologists from referring pregnant women for dental care. These barriers reflect systemic gaps in training and interdisciplinary collaboration.

**Sources of Information[Graph 5]:**
When asked about their primary sources of information regarding oral health and pregnancy, 82% of respondents reported relying on personal clinical experience. Additionally, more than half of the participants cited medical journals as a secondary source of information, highlighting limited exposure to structured oral health education.

## DISCUSSION

This cross-sectional survey provides valuable insight into the knowledge and awareness of maternal periodontal health and its association with adverse pregnancy outcomes among gynaecologists in the Ahmednagar district. Out of 970 obstetricians and gynaecologists approached, 900 completed the questionnaire, resulting in a high response rate of 87%, with the remaining non-respondents citing time constraints and lack of personal interest. The demographic distribution showed a predominance of female gynaecologists (59.8%), and more than half (56.8%) were practicing in private settings. Most respondents were between 41–50 years of age and had 10–15 years of professional experience, indicating adequate clinical exposure. Despite this experience, the survey revealed significant deficiencies in fundamental periodontal knowledge. Only 16% of the participants correctly identified dental plaque as a soft deposit, while just 22.3% recognized plaque as the causative factor for gingival disease, findings consistent with earlier reports of limited periodontal knowledge among non-dental clinicians.[10] Awareness of the relationship between oral health and pregnancy outcomes was also limited. Although maintaining good oral hygiene during pregnancy has been shown to positively influence perinatal health,[11-13] only 287 respondents acknowledged this, and merely 321 agreed that periodontal disease could affect pregnancy outcomes. Furthermore, only a small proportion (186) understood that hormonal changes during pregnancy can influence gingival tissues, an association well-documented in periodontal literature.[14,15]. Attitudes and clinical practices related to oral health were similarly suboptimal. Only 54 gynaecologists reported providing oral health information during antenatal consultations, and merely 35 believed that dental check-ups should be incorporated into routine prenatal care. Similar gaps in practice patterns have been noted in studies conducted among obstetricians in other regions.[16,17] Even among patients presenting with gingival changes, only 68 practitioners conducted a visual oral examination, and just 47 recommended professional dental evaluation. Notably, only 16 respondents had formal training in oral healthcare, which may explain the limited confidence in performing examinations or making referrals. Instead, symptomatic management was common, with a majority prescribing medications such as paracetamol (462) and penicillin (228) for gum-related complaints, rather than addressing the underlying periodontal condition. Previous research suggests that lack of training and perceived scope limitations often lead to such palliative rather than preventive approaches.[18].

Analysis of perceived barriers revealed that lack of knowledge and insufficient time were the primary reasons for not referring pregnant patients to dental services. This finding mirrors trends reported in previous studies, emphasizing the need for interdisciplinary education and collaboration. [19,20] Participants relied heavily on clinical experience (82%) as their main source of information regarding oral health and pregnancy, while more than half also referred to medical journals. The reliance on experiential knowledge rather than formal, evidence-based training may contribute to persistent gaps in understanding, a trend highlighted in literature addressing healthcare communication and

cross-disciplinary integration.[21]. Overall, these findings highlight a significant need for improved training, continuing education, and integration of oral health awareness into obstetric practice. Strengthening the knowledge base of gynaecologists is essential for ensuring timely diagnosis, appropriate referral, and comprehensive care for pregnant women, ultimately reducing the risk of adverse perinatal outcomes. Multiple systematic reviews reinforce the importance of periodontal health in mitigating risks such as preterm birth, low birth weight, and preeclampsia.[12,13,22].

## CONCLUSION

The present study highlights significant gaps in the knowledge and awareness of gynaecologists in Ahmednagar district regarding maternal periodontal health and its association with adverse pregnancy outcomes. Although the majority of respondents had substantial clinical experience, only a small proportion demonstrated adequate understanding of the etiology of periodontal disease or its impact on pregnancy. Attitudes and practices were similarly suboptimal, with very few practitioners providing oral health guidance, performing oral examinations, or referring pregnant patients for dental care. The findings underscore the urgent need for integrating oral health education into both undergraduate and postgraduate medical curricula, as well as establishing ongoing interdisciplinary training programs. Improving awareness among gynaecologists may enhance early identification and referral of periodontal problems during pregnancy, ultimately contributing to better maternal and fetal health outcomes. Strengthening collaboration between dental and obstetric healthcare providers is essential to promote comprehensive antenatal care.

## LIMITATIONS

1. Geographical Restriction: The study was limited to gynaecologists practicing in the Ahmednagar district, which may restrict the generalizability of the findings to other regions with differing training standards or healthcare infrastructures.
2. Self-Reported Responses: The use of a questionnaire relies on self-reported data, which may introduce reporting bias, social desirability bias, or inaccuracies in recalling actual practices.
3. Non-Response Bias: Although the response rate was high (87%), the 70 practitioners who did not respond may differ systematically from respondents, possibly influencing the representativeness of the results.
4. Cross-Sectional Design: The cross-sectional nature of the study limits the ability to determine causality or assess changes in knowledge and attitudes over time.
5. Limited Assessment of Practical Skills: The study primarily evaluated knowledge and self-reported attitudes, but did not directly assess clinical competence or actual patient outcomes.

## ABSTRACT

Richard Salomon's *Indian Epigraphy* (1998) is the book which continues to serve the society as an essential resource for both emerging and established scholars who are engaged in the study of South Asian inscriptions and manuscripts in Sanskrit, Prakrit and others scripts.it's a publication from A Publication Series of The University of Texas Centre for Asian Studies and Oxford University Press. New York Oxford Oxford University Press 1998, it contains 8 chapters including bibliographic survey. This review enlightens the book's details, analytical approach, and enduring relevance, types and styles, different Indian scripts its significant role in explaining with the cultural, linguistic, and political transformations of the India.observations is given to Salomon's methodological precision, his integration methodology of palaeographic, philological, and historical perspectives, aspects and his influential position in redefining the field of Indo-Aryan epigraphy in the period following D.C. Sircar's foundational book contributions.
Epigraphy is the branch concerned with the study of inscriptionsand manuscripts as constitutes a crucial tool for reconstructing and defining the political, social, religious, and linguistic aspects of India's ancient and medieval past. This article explains a comprehensive exploration of Indian epigraphy, from its earliest manifestations to its progression across successive dynastic regimes. It highlights the evolution of scripts, the diversity of languages employed, and the pivotal role that inscriptions play in historical analysis. Special focus is placed on key epigraphic records and the ways in which they deepen our

understanding of India's rich and complex heritage and study of the effect of development of human cognition process with respect to scripts development.

**Keywords:** Indian epigraphy, Indo-Aryan inscriptions, Brahmi, Kharosthi, Prakrit, Sanskrit, Salomon, Asokan edicts, historical linguistics, South Asian history

## INTRODUCTION

In India the knowledge transformation from one generation to another was in the form of listening, memorising and then reproducing orally, later the scripts developed was started to store and save the ancient knowledge. The history of writing in India, as it applies to the material explained in this book, it is essentially brief with the history of the Brahmi script and its many derivatives, and of the Kharosthi script. the older one is the parent ofone of the major script families of the world, comprising not only all of the indigenousscripts of South Asiabut also several other major scripts of central and especially Southeast Asia. the general outlines of these developments, particularly as theyrelate to epigraphy proper, are presented in the context of a general discussion of thehistory of epigraphic writing in India [1].

The analysis of Indian inscriptions are written on stone, cast in metal, or impressed upon clay that offers important access to the socio-political and cultural history of the Indian subcontinent. Richard Salomon's *Indian Epigraphy: A Guide to the Study of Inscriptions in Sanskrit, Prakrit, and the Other Indo-Aryan Languages* (Oxford University Press, 1998) stands as a seminal contribution to this literary domain. Expanding on the pioneering works of D.C. Sircar and G.H. Ojha, Salomon presents a more comprehensive and inclusive examination of epigraphy, moving beyond traditional philological methods to incorporate its intersections with art history, religion, and archaeology [2 &3]. In the context of Indian historical studies, inscriptions playsa important role, especially given the region's distinctive historiographical traditions. In contrast to civilizations such as Greece, Rome, or China, which produced extensive chronological literary records, Indian classical literature often lacks explicit historical documentation and chronological specificity. This perceived "ahistorical" character of Indian tradition has made epigraphic evidence vital for historical reconstruction. As such, epigraphy has become a cornerstone of Indological research.

Inscriptional records, whether through precise calendar references or palaeographic evaluation, offer the most dependable chronological data available for charting the early and medieval periods of Indian history. Scholars estimate that nearly 80% of what is currently known about Indian history before 1000 CE stems from such sources. Inscriptions not only document the political trajectories of dynasties like the Guptas and Chalukyas but also shed light on a broader spectrum of cultural phenomena, including governance, religious transformations, literary expressions, linguistic changes, and societal norms [4].

The realm of Indian epigraphy also transcends the modern geopolitical boundaries of India, encompassing inscriptions found across the broader South Asian region and in areas influenced by Indianized cultural systems, such as Southeast Asia, Central Asia, and parts of Africa. Over 90,000 inscriptions—mainly in Indo-Aryan and Dravidian languages—have been discovered to date, yet a substantial number remain either unpublished or insufficiently studied. This highlights the dynamic and continually evolving nature of epigraphic scholarship [5].

The immense diversity of scripts, languages, and regional variations poses distinct methodological challenges for scholars, requiring expertise across multiple disciplines including linguistics, philology, palaeography, and archaeology. Nevertheless, epigraphy remains an indispensable tool for anyone seeking a historically grounded understanding of India's rich and intricate past. This study reasserts the fundamental role of epigraphy in Indological inquiry by exploring its historical depth, contemporary scope, and enduring significance in piecing together India's layered historical narrative.

In essence, Indian epigraphy the discipline focused on interpreting inscriptions carved into stone, metal, terracotta, and other durable surfaces serves as a primary source for understanding ancient Indian history. These texts provide direct testimony of historical figures, governmental structures, and cultural developments, and have been crucial in establishing historical chronologies, reconstructing royal lineages, and tracing socio-religious transformations.

**Aim**

To review the book on Indian Epigraphy written byRichard Salomon- Richard Salomon's Indian Epigraphy (1998)

**Objective**

1- Review the chapter of book Indian Epigraphy written byRichard Salomon

**Scope and Structure**

Richard Salomon's *Indian Epigraphy* is systematically divided into eight chapters, supplemented by an appendix and a detailed bibliography. The main discussion spans four principal areas: the evolution and classification of writing systems (Chapter 2), the development of languages and linguistic transitions (Chapter 3), typological and chronological surveys of inscriptions (Chapter 4), and methodologies for epigraphic analysis (Chapter 5). The concluding chapters offer a historiographical overview of the field (Chapter 6) and explore the broader cultural implications of epigraphy (Chapter 7).

Each section is rich in content, blending descriptive clarity with critical insight. The introductory chapter highlights the indispensable role of epigraphy in Indological research, particularly in light of India's historical tendency to omit chronological details in literary sources. Salomon persuasively underscores that inscription, in contrast to redacted and dateless manuscripts, serve as dependable chronological markers.

**Contributions to Script and Language Studies**

Chapter 2 is especially notable for its sophisticated examination of Brahmī and Kharoshṭhī scripts. Salomon meticulously traces Brahmī's evolution beginning in the Mauryan era, anchored by the Asokan edicts, and outlines its progression into various regional variants. Rather than making speculative claims about proto-scripts, he prudently offers hypotheses grounded in palaeographic evidence.

In Chapter 3, his treatment of epigraphical languages including various Prakrits, Epigraphical Hybrid Sanskrit (EHS), and Classical Sanskrit is both linguistically detailed and historically contextualized. His inclusion of New Indo-Aryan inscriptions, which have often been marginalized in previous literature, extends the chronological scope of the work into the early modern period and affirms the enduring relevance of inscriptional practices.

**Methodological Innovation and Analytical Precision**

Chapters 5 and 6 showcase Salomon's methodological expertise. He provides clear explanations of palaeographic techniques, authenticity evaluation, and the use of calendrical systems like the Śaka and Vikrama eras, as well as regnal year conventions—tools essential for practitioners in the field. Notably, he advocates for a standardized approach to transcription and documentation, aligning Indian epigraphy with global scholarly norms. His historiographical analysis in Chapter 6 is equally significant. It traces the trajectory of the field from the early decipherments by James Prinsep and Georg Bühler through to institutional developments post-independence. Salomon offers a balanced critique of the stagnation that followed Sircar's era, calling for a reinvigorated and interdisciplinary engagement with epigraphic studies.

**Epigraphy as a Cultural Resource**

Among the book's most compelling arguments is that epigraphy should not be relegated to the margins of philological inquiry. Chapter 7 illustrates the multifaceted value of inscriptions, demonstrating their utility in reconstructing political history, religious practices, literature, artistic traditions, and geographical knowledge.

Salomon shows, with precision, how even a single copperplate grant or temple inscription can unveil intricate networks of political patronage, sectarian identity, and linguistic experimentation.

**Comparative and Transregional Scope**

By incorporating inscriptions from regions beyond the Indian subcontinent—such as Central Asia and Southeast Asia—Salomon broadens the geographic and cultural scope of his study. The appendix, which includes annotated translations and analyses of fifteen key inscriptions (e.g., the Rummindei Edict, the Heliodoros Pillar, the Kalawan Copperplate), serves as a valuable introductory resource for students and general readers alike.

**Critical Observations**

Despite its comprehensive coverage, the work could benefit from an updated discussion of emerging technologies in the field, such as digital epigraphy and GIS-assisted archaeological mapping. Moreover, while Dravidian and Islamic epigraphy are acknowledged, their exclusion from detailed analysis is a methodological choice rather than an oversight. Readers seeking a holistic view must refer to complementary studies for these traditions.

**Enduring Influence and Future Outlook**

More than two decades since its release, *Indian Epigraphy* continues to be a foundational text for graduate-level study in South Asian history and historical linguistics. Its impact is evident in recent research on regional scripts like Tamil-Brahmī, digital epigraphic databases, and literary analyses of inscriptions. Salomon's appeal for interdisciplinary methods, improved field techniques, and the digital preservation of yet-unpublished materials remains acutely relevant. His critique regarding the declining emphasis on rigorous epigraphic training in Indian academia is still valid, with many universities yet to establish comprehensive programs in epigraphy and paleography.

## DISCUSSION

**Early Epigraphic Traditions**

**Pre-Mauryan Inscriptions**

The earliest indications of writing on the Indian subcontinent are associated with the Indus Valley Civilization (circa 2600–1900 BCE), whose script remains undeciphered. A systematic and identifiable tradition of epigraphy, however, begins only with the inscriptions of Emperor Ashoka in the 3rd century BCE.

**Ashokan Inscriptions**

Ashoka's edicts represent the first conclusive examples of written records in India. Distributed throughout the subcontinent, these inscriptions were primarily composed in the Prakrit language and engraved using the Brahmi script. They convey messages related to moral governance, Buddhist principles, and imperial administration (Sircar, 1965).

**Scripts and Languages in Indian Epigraphy**

**Brahmi and Kharosthi**

The Brahmi script stands as the foundational script from which most later Indian scripts evolved. It enjoyed widespread usage across the subcontinent. In contrast, the Kharosthi script, primarily employed in the northwestern regions, was used for a comparatively shorter period and exhibits influence from the Aramaic script (Salomon, 1998).

**The Gupta Script and Its Derivatives**

During the Gupta period, Brahmi underwent regional diversification, giving rise to scripts such as Nagari, Sharada, and Grantha. These, in turn, laid the groundwork for many modern Indian scripts, including Devanagari and Tamil.

**Languages of Inscriptions**

Epigraphic records in India employed a range of languages across different periods:

**Prakrit** during the early Mauryan era
**Sanskrit** from the Gupta age onward
**Tamil, Kannada, Telugu** in the southern regions
**Persian and Arabic** during the Islamic periods of Indian history (Dani & Michell, 1997)

**Regional and Dynastic Epigraphy**
**Southern India**
The Tamil region witnessed prolific inscriptional activity under dynasties like the Cholas, Pallavas, and Pandyas. Temples functioned as major centers for the creation and preservation of inscriptions in both Tamil and Sanskrit.

**Northern India**
The Guptas promoted the use of classical Sanskrit in their inscriptions, often rendered in poetic verse. A notable example is the Allahabad Pillar inscription composed during the reign of Samudragupta.

**Deccan and Central India**
In the Deccan and central parts of India, the Satavahanas and later the Chalukyas issued inscriptions in both Prakrit and Sanskrit. The Aihole inscription of Pulakesin II is among the most distinguished records from this region.

**Epigraphy as a Historical Source**
Inscriptions are invaluable for reconstructing early Indian history. They document:
Dynastic genealogies
Land grants to religious and scholarly institutions
Religious and sectarian affiliations
Social and economic structures
Systems of land tenure and governance Because many inscriptions remain in their original context and are less prone to editorial tampering than manuscripts, they serve as more reliable historical sources (Thapar, 2002).

**Contributions of Modern Scholars**
Several scholars have been instrumental in advancing the study of Indian epigraphy:
**James Prinsep**: Deciphered the Brahmi and Kharosthi scripts in 1837
**D.C. Sircar**: Considered a pioneer of modern Indian epigraphical studies
**Richard Salomon**: Offered a comparative and systematic analysis of Indian scripts and their development

**Challenges and Prospects in Epigraphy**
**Undeciphered Scripts**
Despite ongoing computational and linguistic efforts, scripts like the one used in the Indus Valley Civilization remain undeciphered.

**Conservation and Digitization**
Numerous inscriptions have suffered degradation or loss due to environmental and human factors. However, digital initiatives such as the Digital South Asia Library and encoding standards like Epi Doc XML are actively working toward their documentation, preservation, and accessibility.

## CONCLUSION

Richard Salomon's *Indian Epigraphy* is not merely a reference manual—it serves as a transformative framework that redefined the methods by which inscriptions are analysed, situated, and understood. Combining scholarly rigor with clarity, the work has become essential for researchers across disciplines, including Indology, archaeology, linguistics, and history. Even as the discipline evolves through digital innovation and interdisciplinary approaches, Salomon's

study remains a foundational pillar, guiding contemporary scholarship and inquiry. Epigraphy stands at the core of South Asian studies, offering vital perspectives on the language, culture, and governance of ancient Indian civilizations. With the growing adoption of digital tools, the field is poised for significant advancements, opening new avenues for collaborative and cross-disciplinary research.

Richard Salomon's *Indian Epigraphy* transcends the role of a conventional guidebook; it offers a robust conceptual framework that has fundamentally transformed the study of inscriptions. By combining scholarly rigor with clarity, it has become an essential resource for scholars across disciplines such as Indology, archaeology, linguistics, and history. As the discipline evolves through digital innovations and interdisciplinary collaboration, Salomon's work remains a cornerstone for both emerging research and critical discourse.

Epigraphy forms a crucial pillar of South Asian studies, unlocking valuable information about the linguistic, cultural, and administrative structures of historical Indian civilizations. With the advent of digital methodologies, the field is poised for significant advancements, opening new pathways for collaborative and cross-disciplinary inquiry.

**ABSTRACT**

Dysphagia is a frequent and serious complication following stroke, leading to aspiration pneumonia, malnutrition, dehydration, and reduced quality of life. Among rehabilitative strategies, the Masako maneuver is designed to improve pharyngeal muscle strength and posterior pharyngeal wall movement; however, evidence of its effectiveness in post-stroke dysphagia remains limited. To evaluate the effect of the Masako maneuver on swallowing function and quality of life in post-stroke patients with dysphagia. Thirty post-stroke patients with dysphagia were recruited using convenient sampling from hospitals in Vadodara. Participants were divided into two groups. Group A received Masako maneuver training along with conventional swallowing therapy, while Group B received conventional therapy alone for four weeks. Swallowing function and quality of life were assessed using the Eating Assessment Tool (EAT-10) at baseline and post-intervention. Data were analyzed using paired and unpaired t-tests with SPSS version 23. Group A demonstrated a statistically significant reduction in EAT-10 scores post-intervention ($p < 0.05$), indicating improved swallowing function and quality of life compared to baseline and Group B. The Masako maneuver is an effective adjunct to conventional therapy for improving swallowing function and quality of life in post-stroke patients with dysphagia.

**Keywords:** Stroke, Dysphagia, Masako Maneuver, Swallowing Function, EAT-10, Quality of Life.

## INTRODUCTION

Stroke is a major global public health concern and remains one of the leading causes of long-term disability and mortality worldwide. Advances in acute medical management have improved survival rates; however, a large proportion of stroke survivors continue to experience persistent neurological impairments that significantly affect functional independence and quality of life[1]. Among these impairments, dysphagia is one of the most common yet under-recognized complications following stroke, posing serious medical, nutritional, and psychosocial challenges[2]. Post-stroke dysphagia is reported in approximately 30–65% of patients during the acute and subacute phases, with a considerable number continuing to experience swallowing difficulties in the chronic stage[3]. The prevalence varies depending on lesion location, stroke severity, and diagnostic methods used[2]. Dysphagia results from disruption of the complex neural network responsible for swallowing, which involves cortical and subcortical regions, the brainstem swallowing centers, cranial nerves, and coordinated activity of oropharyngeal musculature. Lesions affecting these pathways can lead to impaired oral bolus control, delayed swallow initiation, reduced tongue base retraction, decreased pharyngeal constriction, and compromised airway protection[1,2,3]. The clinical consequences of dysphagia following stroke are profound[4]. Aspiration pneumonia remains a leading cause of morbidity and mortality in this population[5]. In addition, dysphagia contributes to malnutrition, dehydration, prolonged hospitalization, increased healthcare costs, and delayed participation in rehabilitation programs[4,5] Beyond physical complications, swallowing difficulties significantly affect psychological well-being, leading to anxiety during meals, social isolation, reduced self-esteem, and diminished overall quality of life. Therefore, effective identification and management of dysphagia are critical components of comprehensive stroke rehabilitation[6]. Swallowing is a highly coordinated sensorimotor activity comprising voluntary and involuntary phases.

Effective rehabilitation requires interventions that not only compensate for impaired swallowing but also promote physiological recovery[6,10]. Conventional dysphagia management strategies often include compensatory techniques such as postural adjustments, dietary texture modification, and adaptive feeding strategies[11]. While these approaches are effective in reducing aspiration risk, they primarily address symptoms rather than underlying neuromuscular deficits and may not lead to long-term functional improvement[7]. In recent years, exercise-based swallowing rehabilitation has gained increasing attention due to its potential to enhance neuromuscular strength, coordination, and cortical reorganization. These therapeutic exercises aim to restore impaired swallowing physiology through repetitive, task-specific training. One such intervention is the Masako maneuver, also known as the tongue-hold swallow, which is frequently incorporated into clinical dysphagia rehabilitation programs[8]. The Masako maneuver involves protruding the tongue slightly and holding it gently between the teeth while swallowing saliva. This maneuver restricts posterior tongue movement, thereby increasing the demand on the posterior pharyngeal wall to compensate for reduced tongue base retraction. Biomechanical studies have demonstrated that this exercise results in increased anterior movement of the posterior pharyngeal wall, suggesting enhanced activation of the pharyngeal constrictor muscles. Strengthening these muscles is particularly relevant in post-stroke dysphagia, where reduced pharyngeal contraction is a common pathological finding[9]. Despite its widespread clinical use, the evidence supporting the effectiveness of the Masako maneuver in post-stroke dysphagia remains limited. Existing studies often involve small sample sizes, heterogeneous patient populations, or lack appropriate control groups. Furthermore, many investigations focus primarily on physiological outcomes, with limited emphasis on patient-reported measures that reflect functional improvement and quality of life.

Quality of life has emerged as a crucial outcome in dysphagia rehabilitation, as swallowing difficulties extend beyond physical impairment to affect emotional and social domains. The Eating Assessment Tool (EAT-10) is a validated, patient-reported outcome measure that assesses the severity and impact of dysphagia on daily life. Incorporating such measures allows for a more comprehensive evaluation of therapeutic interventions from the patient's perspective[10]. Given the high prevalence and serious consequences of post-stroke dysphagia, along with the limited high-quality evidence supporting specific exercise-based interventions, there is a clear need for further research. Systematic evaluation of commonly used therapeutic maneuvers such as the Masako maneuver is essential

to establish evidence-based rehabilitation protocols. Therefore, the present study was undertaken to evaluate the effect of the Masako maneuver on swallowing function and quality of life in post-stroke patients with dysphagia, with the aim of strengthening the evidence base for clinical decision-making in dysphagia rehabilitation[11].. Several studies have explored exercise-based swallowing rehabilitation in neurological populations. Logemann (1998) emphasized the role of targeted exercises in restoring swallowing physiology. Robbins *et al*. demonstrated that effortful swallowing exercises improved pharyngeal strength and bolus clearance. Masako *et al*. first described the tongue-hold maneuver and reported increased posterior pharyngeal wall movement during swallowing. Subsequent studies suggested potential benefits in patients with reduced tongue base retraction[8,9,10,11]. However, most existing studies are limited by small sample sizes, heterogeneous populations, or lack of control groups. Few studies have specifically examined the impact of the Masako maneuver on patient-reported outcomes such as quality of life. Therefore, further controlled studies are required to establish the clinical effectiveness of this maneuver in post-stroke dysphagia rehabilitation.

## MATERIALS AND METHODS

**Study Design**

A quasi-experimental pre-test and post-test controlled study design was used.

**Study Setting**

The study was conducted in selected hospitals and rehabilitation centers in Vadodara, Gujarat, India.

**Participants**

Thirty post-stroke patients diagnosed with dysphagia were recruited using convenient sampling.

**Inclusion Criteria[3,4,5]**

- Patients aged 40–75 years
- Diagnosed with ischemic or hemorrhagic stroke
- Clinical evidence of dysphagia
- Medically stable and able to follow commands

**Exclusion Criteria[5,6]**

- History of head and neck cancer or surgery
- Pre-existing neurological disorders other than stroke
- Severe cognitive impairment
- Tracheostomized patients

**Group Allocation**

- **Group A (n = 15):** Masako maneuver with conventional swallowing therapy
- **Group B (n = 15):** Conventional swallowing therapy alone

**Intervention**

**Group A** performed the Masako maneuver under therapist supervision along with conventional swallowing exercises. The maneuver involved protruding the tongue slightly and holding it between the teeth while swallowing saliva. Therapy was administered five sessions per week for four weeks.

**Group B** received conventional swallowing therapy, including oral motor exercises and postural techniques, for the same duration.

**Conventional therapies for both the groups were as follows**

**Supraglottis swallow:** Ask the patient to hold their breath tightly (imagine bearing down).

Now, tell the patient to swallow their saliva twice, release their breath with a sharp cough, and swallow again.

**Compensatory technique:** In this technique, the patient will turn their head towards the weak side and tilt it towards the unaffected side then swallow.

**Effortful swallow:** Patient will swallow as hard as they can with food or saliva. Patient was pushed as hard as they can with the tongue against the roof of their mouth while you swallow.

**Oromotor sensory stimulation:** It will be given in the form of ice cube massage to areas of the cheek and tongue (at the palatine arch) and external side of the cheeks. (5 stimulation, 5 swallows).
Conventional therapy was given for 5 min/10 times a day for 4 weeks.

**Outcome Measure**
**Eating Assessment Tool (EAT-10)**
Assessments were performed at baseline and after four weeks of intervention.

**Statistical Analysis**
Data were analyzed using SPSS version 23. Paired t-tests were used for within-group comparisons and unpaired t-tests for between-group comparisons. Statistical significance was set at $p < 0.05$. Flow chart of study design (Figure 1).

## RESULTS

Both groups showed improvement in EAT-10 scores post-intervention; however, Group A demonstrated a significantly greater reduction in scores compared to Group B ($p < 0.05$), indicating superior improvement in swallowing function and quality of life. Comparison of EAT-10 Scores Between Groups (Mean ± SD) (Table 1).

## DISCUSSION

The findings of the present study indicate that the Masako maneuver, when combined with conventional swallowing therapy, significantly improves swallowing function and quality of life in post-stroke dysphagia patients. The improvement may be attributed to increased activation and strengthening of the pharyngeal constrictor muscles, leading to more efficient bolus clearance. These results are consistent with previous studies reporting enhanced posterior pharyngeal wall movement following Masako maneuver training. Incorporating this maneuver into routine dysphagia rehabilitation may therefore offer additional benefits over conventional therapy alone. The results of the present study demonstrate that the Masako maneuver significantly improves swallowing function and quality of life in post-stroke dysphagia patients when used as an adjunct to conventional therapy. The observed improvements may be attributed to enhanced activation of the pharyngeal constrictor muscles and improved posterior pharyngeal wall movement. These physiological changes facilitate more efficient bolus clearance and reduce pharyngeal residue. The findings are consistent with earlier studies that reported increased pharyngeal wall movement following tongue-hold swallowing exercises. Incorporating patient- reported outcome measures such as EAT-10 strengthens the clinical relevance of the present study.

## CONCLUSION

The Masako maneuver is an effective and simple therapeutic exercise that significantly improves swallowing function and quality of life in post-stroke patients with dysphagia. It can be safely recommended as an adjunct to conventional swallowing therapy.

## LIMITATIONS AND FUTURE SCOPE

The study has several limitations, including a relatively small sample size, short intervention duration, and absence of instrumental swallowing assessments. Future research should involve larger randomized controlled trials, longer follow-up periods, and objective assessments such as video fluoroscopic swallowing studies (VFSS).

### ETHICAL CONSIDERATIONS

Ethical approval was obtained from the institutional ethics committee. Written informed consent was obtained from all participants prior to inclusion in the study.

### CONFLICT OF INTEREST

The author declares no conflict of interest.

## ABSTRACT

This study explores the development and student acceptance of a new multipurpose drafting table designed to bridge the gap between traditional drawing and modern digital work. Traditional drafting furniture often fails to accommodate laptops and other digital tools, leading to disorganized workspaces, physical discomfort, and decreased productivity. To address this, we designed a prototype that focuses on ergonomic support and functional versatility.The table was evaluated by 30 participants (60% female, mean age 20.07) based on its durability, ergonomics, aesthetics, comfort, and impact on productivity. The results showed a very high level of overall acceptability, with comfort receiving the highest praise. Interestingly, while longer work sessions were tied to increased wrist and shoulder strain, the table's design was found to significantly reduce back pain. The study also noted that gender influenced how students perceived the design and comfort of the table, while age had no significant effect. Ultimately, these findings suggest that integrating tech-friendly and ergonomic features into educational furniture is essential for supporting the hybrid workflows of modern design students.

**Keywords:** Ergonomic Furniture Design, Laptop Workspace Integration, Productivity Enhancement, Student-Friendly Workstation.

# INTRODUCTION

Architectural drafting is now a hybrid practice that combines manual and digital processes due to the quick digitization of professional and educational settings. Students in the Architectural Drafting Technology program at Surigao del Norte State University (SNSU) frequently use digital tools like Computer-Aided Design (CAD), Building Information Modeling (BIM), and three-dimensional visualization software in addition to hand-drawn drafting tasks like plans, sections, and elevations. A drafting workspace that facilitates smooth transitions between analog and digital tasks is required for this dual-modality workflow. However, traditional drafting tables commonly used in educational institutions are primarily designed for manual drafting and often fail to accommodate modern digital devices such as laptops and tablets. As a result, students experience physical discomfort including back pain, neck strain, shoulder fatigue, and wrist stress, particularly during extended drafting sessions. The lack of integrated digital workspaces further leads to inefficient workflows, poor posture, frequent task interruptions, and reduced productivity.

Furthermore, poor ergonomic workstation designs have been closely linked to long-term health risks and musculoskeletal discomfort, especially in occupations that necessitate extended periods of desk-based, seated work (Andrews et al., 2019). The suggested functional drafting table attempts to minimize physical strain, lower the risk of musculoskeletal disorders, and enable a smooth and effective transition between manual drafting and digital work processes by combining posture. Many drafting students still use antiquated or homemade drafting tables that don't support modern digital requirements or adhere to ergonomic standards, according to internal reports and faculty interviews at SNSU (2023). The need for an ergonomic, flexible drafting solution suited to contemporary architectural education is highlighted by this discrepancy between the furniture that is available and the demands of instruction.

According to recent research, ergonomic furniture plays a crucial role in improving students' and professionals' overall productivity, cognitive focus, task efficiency, and physical well-being (Chandra & Bautista, 2021). To address the ergonomic and operational issues related to hybrid drafting environments, a functional drafting table with an integrated laptop workspace is suggested in response to these findings. This table combines the essential features of conventional drafting furniture with modern technological support. The overall learning and working experience is greatly enhanced by design elements like adjustable working height and surface angle, integrated cable management systems, and well-organized laptop placement that reduce workspace clutter, improve posture, and facilitate more effective task execution (Alvarez & Santos, 2022).

To improve user comfort, operational efficiency, and overall productivity among architectural drafting students, this study suggests designing and developing an Innovative Multi-Functional Drafting Table with an Integrated Laptop Workspace. The proposed innovation aims to bridge the gap between traditional analog drafting practices and modern digital methodologies through a carefully engineered, user-centered design by methodically addressing the ergonomic and functional challenges inherent in dual-modality drafting workflows. The suggested solution aims to support future architectural drafters' long-term professional competencies and changing academic demands in addition to enhancing the immediate physical workspace.

**Objectives of the Study**

This project intends to design, develop, and assess a novel Multi-Purpose Cutting Board for Scale Models to improve the precision and effectiveness of model-making procedures. In particular, the research aims to:

1. Create a multipurpose cutting board that encourages accuracy, organization, and ease of use for people working in engineering, architecture, and creative scale modeling.

2. Include functional and ergonomic features in the prototype, such as integrated measurement guides to facilitate accurate and consistent model-making, gridlines for precise alignment, a non-slip cutting surface, and built-in storage compartments for necessary modeling tools.
3. To make sure the product successfully satisfies the practical needs and expectations of users in both professional and educational contexts, evaluate its usability, durability, affordability, and safety.

## MATERIALS AND METHODS

This study used a descriptive-developmental approach for this study. In the development phase, we designed and built an innovative, multi-functional drafting table that bridges the gap between traditional drawing and digital work. By focusing on ergonomics and space-saving features, we created a workspace tailored to the modern "hybrid" needs of drafting students.

**Project Design**

**Design Consideration**

In designing the Innovative Drafting Table, the following factors have been considered:

1. Adjustable Angle & Height. The laptop stand should allow users to adjust the angle of the laptop or surface to accommodate various activities, such as drafting, sketching, or viewing. Ideally, it should offer a range from nearly flat to 90° (or even higher). A telescoping or folding height adjustment mechanism will help the stand adapt to different users' needs, allowing for a comfortable sitting or standing position. Consider a smooth, easily adjustable system with secure locks to ensure stability at any height.
2. Stability and Durability. The materials used must provide strength and support for both the laptop and drafting activities.
3. Comfort & Ergonomics. Users should be able to tilt the laptop or drafting surface to a comfortable angle to reduce strain on the neck, shoulders, and wrists during long sessions of work.
4. Multi-Functionality. The table must function as both a laptop holder and a drafting surface. To make it effective, the stand could include features like a smooth, flat surface, a built-in ruler, or adjustable armrests for drafting.
5. Cable Management. Design the stand with cable management options for the laptop, mouse, or other devices.

**Isometric Projections (Fig.1)**

**Project Development**

Below are the stages of the design of the innovative drafting table: an innovation is to be developed or constructed right after the gathering of the materials needed:

**Cutting and Preparation:**

1. Cut the plywood into 2 pieces by 0.7-meter length and 0.5 height for the surface of the adjustable drawing stand and like in the given Plan
2. Cut the plywood base on the drawing plan for the frame.
3. Cut the orplywood for the frame and legs of the laptop stand by 14"x 9"
4. They make a small hole of the surface of the laptop stand for the cooling fans purposes.
5. Cut the square tubular in for standard height of a drafting table (30" to 40" (762 mm to 1016 mm) and weld it base on the drawing plan.
6. Cut the plywood for other features in accurate sizes based on the drawing plan.

**Frame Assembly**

7. Assemble the frame using screws and wood glue.
8. Ensure the frame is sturdy and square.

*Indian Journal of Natural Sciences* *www.tnsroindia.org.in ©IJONS*

*Vol.17 / Issue 95 / Apr / 2026* *International Bimonthly (Print) – Open Access* *ISSN: 0976 – 0997*

**Leg Assembly**

9. Attach the metal legs to the frame.
10. Ensure the legs are stable and convenient.

**Top Surface Attachment**

11. Make a Box base on the drawing plan for drawing stand and the laptop stand surfaces.
12. Attach the 2 boxes in the surface of the frame with a small rolling wheel in the both side for smooth sliding process put in based on the drawing plan.
13. Use screws and wood glue for a secure attachment.
14. Attach the shelves to the frame of the laptop stand.
15. Ensure the shelves are level and secure.
16. Put a hinge in both stand of drawing stand and laptop stand for the adjustable height of the surface.
17. Ensure the hinge is level and secure. Sending and Finishing
18. Sand the entire drafting table to smooth out any rough edges.
19. Apply material to finish (e.g., paint, stain, or varnish) to protect the surface.

**Final Assembly and Testing**

20. Assemble all components and test the drafting table.
21. Ensure the legs and adjustable and drawer (sliding mechanism) and shelf (if included) function properly.

**Material Selection and Specifications**

The materials chosen for the whole product were based on their availability, high-quality properties, affordability, and durability.

**Materials Selection and Specification**

**Evaluation Procedure**

**Research Instrument**

The research used a survey questionnaire as the instrument in determining and measuring the data of respondents' perception towards the innovative multifunctional drafting table. The questionnaire was composed of four parts; Part I was the respondent's demographic profile, Part II was the scheduled workspace habits of the respondents, Part III includes the preexisting physical discomfort experiences by the respondents. Lastly the IV was the acceptance test of respondent's level of acceptability toward innovative drafting table with laptop workspace. A 5-point scale was used in this study to respondents' level of acceptability, where:

5 - Strongly Agree
4 - Agree
3 - Neutral
2 - Disagree
1 - Strongly Disagree

**Research Respondents**

The respondents of this study are students enrolled in the Bachelor of Science in Industrial Technology major in Architectural Drafting at Surigao del Norte State University (SNSU) – Main Campus. These students were chosen as the target population due to their direct experience and consistent use of drafting tables and laptops, making them the most appropriate participants to evaluate the acceptability of the proposed multi-functional drafting table.

## RESULTS AND DISCUSSION

The results show that students found the new drafting table highly effective, giving it top marks for comfort, design, and productivity. Specifically, the high ratings for comfort suggest that our focus on ergonomics and workflow really paid off. These findings back up what researchers like Chandra and Bautista (2021) and Alvarez and Santos (2022)

have long argued: when furniture is designed with the human body in mind, it doesn't just improve physical well-being—it helps people stay focused and work more efficiently. The study shows that the data, the impact of long work hours became clear. While the table did a great job of keeping back pain at bay, students still felt more strain in their wrists and shoulders the longer they worked. On the bright side, the design seemed to effectively prevent eye and leg fatigue, as those didn't worsen over time. This tells us that while the current prototype is a major step forward, adding more task-specific adjustments—like tiltable surfaces or height controls—is essential to truly eliminate discomfort during long hours of drafting. The analysis of demographic factors revealed that sex played a significant role in how users perceived the table's design, comfort, and impact on productivity, while age had little to no effect. This finding suggests that male and female users may have slightly different preferences when it comes to ergonomics and workflow, highlighting the importance of designing drafting furniture that is inclusive and adaptable to all users. On the other hand, perceptions of the table's structure, functionality, and overall usability were consistent across sexes, indicating that the core features of the design are broadly appreciated and effective for everyone.

## SUMMARY OF FINDINGS

In summary, our findings prove that the right furniture can make a world of difference in how students handle the demands of hybrid drafting. By combining ergonomics with tech-friendly features, we saw a clear boost in comfort and efficiency. This suggests that schools and universities—especially in design-heavy programs—should prioritize furniture that supports both traditional and digital work to help students succeed without the physical strain.

## CONCLUSION

The following conclusions were drawn from the study's findings:

1. Most respondents were female, and both genders demonstrated a high level of engagement with the innovative drafting table. Notably, female respondents showed higher sensitivity and preference in terms of design, comfort, and productivity—dimensions significantly affected by sex.
2. Age was not a significant factor in determining levels of acceptability, suggesting that the product design appeals across a relatively narrow age group (18–25).
3. The drafting table was perceived as very highly acceptable, with comfort being the most appreciated attribute. This emphasizes the critical role of ergonomics in workspace furniture, especially among users with long durations of seated tasks.
4. The correlation between workspace habits and physical discomfort confirms the importance of ergonomic features in minimizing back pain and wrist/shoulder strain. These results support the need for adjustable and supportive furniture design to reduce health-related risks.
5. The findings suggest that gender differences should be taken into account when designing and evaluating workspace furniture, as male and female users prioritize different aspects of comfort and usability.

## ABSTRACT

The digital transformation of dairy farming, facilitated by precision livestock farming (PLF), Internet of Things (IoT) sensor networks, robotic milking systems, wireless communication infrastructures, and cloud-integrated management platforms, has markedly improved productivity and automated decision-making. However, this digital ecosystem has rendered dairy farms susceptible to cyber threats, data tampering, privacy issues, and operational vulnerabilities. This study employs a comprehensive risk assessment methodology, incorporating Failure Mode and Effects Analysis (FMEA), STRIDE threat modeling, data-flow diagrams (DFDs), and attack-surface evaluation, to identify vulnerabilities within dairy-farm data pipelines. The results indicate high-risk areas related to sensor tampering, insecure wireless networks, radio-frequency identification (RFID) cloning, cloud misconfigurations, and manipulation of decision-support systems. The highest Risk Priority Numbers (RPNs) were identified for IoT sensors, farm routers, and cloud storage. To mitigate these risks, a multi-layered cybersecurity framework encompassing encryption, role-based access control, network segmentation, anomaly detection, secure APIs, and structured staff training is proposed. These findings underscore the necessity of agriculture-specific cybersecurity standards to facilitate secure digital adoption in dairy farming.

**Keywords:** Dairy farming, IoT security, Cybersecurity, STRIDE, FMEA, Precision livestock farming.

# INTRODUCTION

The dairy farming sector is increasingly incorporating advanced digital technologies such as sensor-based monitoring systems, automated milking robots, intelligent environmental controls, and mobile data platforms supported by telematics infrastructure. These sophisticated systems enable farmers to continuously monitor essential parameters, including animal health indicators, reproductive cycles, feed consumption patterns, and milk yield performance. The growing dependence on interconnected, data-driven operations has markedly enhanced the efficiency, accuracy, and decision-making processes within contemporary dairy farms. However, this digital transformation has introduced new vulnerabilities. Many dairy farms continue to utilize cost-effective IoT devices with minimal inherent security features, rendering them susceptible to cyber intrusion. The wireless communication channels employed by these devices are frequently unencrypted, exposing sensitive operational data to transmission. Furthermore, cloud platforms used for storing and processing dairy farm data may be prone to misconfigurations, weak authentication mechanisms, and insufficient access controls. These deficiencies create opportunities for attackers to manipulate data, disrupt automated systems, and compromise animal safety and productivity. Human factors further exacerbate cyber risks, as farm employees often lack adequate cybersecurity awareness and training. Collectively, these technological and organizational weaknesses increase the likelihood of cyberattacks that can undermine the operational stability, financial performance, and overall sustainability of dairy farming operations.

**Problem Statement**

While digital technologies are increasingly integrated into dairy farm operations, there is a significant lack of research that systematically employs structured cybersecurity risk assessment methodologies in these data-intensive settings. The existing literature predominantly addresses either operational efficiency or general agricultural cybersecurity, seldom merging both operational processes and cyber-telecommunication aspects within a cohesive analytical framework. This deficiency constrains the capacity to identify, quantify, and mitigate the risks associated with interconnected sensor systems, automated milking technologies, telematics infrastructure, and cloud-based data platforms. Consequently, dairy farms are increasingly susceptible to cyber vulnerabilities in the absence of a comprehensive, evidence-based model to effectively evaluate and manage these threats.

**Objectives**

This study aimed to create a structured and comprehensive cybersecurity assessment framework tailored for modern dairy farm telematics environments. It focuses on identifying and analyzing vulnerabilities within interconnected components, such as sensor networks, automated milking systems, communication channels, and cloud platforms. This study employs integrated risk assessment methodologies, including Failure Mode and Effects Analysis (FMEA), STRIDE, Data Flow Diagrams (DFDs), and attack surface analysis, to evaluate potential threats from both operational and cyber-telecommunication perspectives. By utilizing Risk Priority Number (RPN) scoring, this study prioritizes the most critical risks that require immediate mitigation. Ultimately, this study aims to propose a customized cybersecurity framework specifically designed for dairy farming operations, enhancing system resilience, ensuring data integrity, and supporting secure, data-driven decision-making.

**Contributions**

This study contributes significantly to the field of cybersecurity in modern dairy farming. First, it introduces a multidimensional risk assessment framework that evaluates vulnerabilities across five critical dairy data layers, thereby providing a comprehensive understanding of system-wide exposure. Second, it develops a prioritized risk model employing FMEA scoring to systematically rank potential threats based on severity, occurrence, and detectability. Third, this study offers a STRIDE-based cybersecurity analysis specifically tailored for agricultural IoT ecosystems, addressing threat categories relevant to sensor-driven and automated dairy operations. Finally, a telematics-focused mitigation strategy designed for dairy environments is proposed, offering practical and context-aware solutions to enhance security, resilience, and operational continuity.

**Related Work**

Cybersecurity in the agricultural sector has garnered increasing scholarly and industrial attention as farms progressively implement IoT-based systems for automation, monitoring, and data-driven decision-making(Riaz et al., 2022). Previous studies have consistently highlighted critical vulnerabilities stemming from weak or unencrypted communication protocols, outdated firmware, insecure edge devices, and misconfigured cloud infrastructures(Lee & Lee, 2016). These risks are particularly significant in precision agriculture environments, where continuous data flow from distributed IoT devices is essential for operational efficiency(Islam & Aktheruzzaman, 2020; Rehman et al., 2021). Despite advancements in this area, research specifically addressing the cybersecurity challenges in dairy telematics remains limited. Dairy farms heavily depend on real-time data for herd health monitoring, automated milking systems, feed optimization, and environmental control (Zangana et al., 2025); however, few studies have investigated how cyber threats could compromise these interconnected systems.

Recent cyber incidents in the agricultural sector, including ransomware attacks on food supply chains, disruptions to farm management software, and manipulation of IoT sensor data, highlight the pressing need for structured and domain-specific risk assessments(Dimakopoulou & Rantos, 2024; Durmuş Şenyapar, 2024). While comprehensive cybersecurity frameworks such as NIST SP 800-37, ISO/IEC 27005, and STRIDE threat modeling offer systematic methods for risk identification and evaluation, their application within dairy-specific telematics ecosystems remains limited(Kim et al., 2022; Krumay et al., 2018). Current research predominantly addresses cybersecurity within broad agricultural contexts rather than tailoring methodologies to the unique data flows, device dependencies, and operational constraints characteristic of modern dairy operations(Adewuyi et al., 2024; Kandasamy et al., 2020). This gap underscores the necessity of a focused and integrated cybersecurity assessment framework designed to address the specific vulnerabilities inherent in dairy farming environments.

## METHODOLOGY

**Study Approach**

This study utilized a hybrid methodological framework that integrates both qualitative and quantitative techniques to thoroughly assess cybersecurity risks within dairy farm telematics environments(Park et al., 2023). Failure Mode and Effects Analysis (FMEA) was employed to quantify the severity, likelihood, and detectability of potential failures across interconnected systems, facilitating the systematic prioritization of high-risk events(Li et al., 2019). To complement this analysis, the STRIDE threat-modeling framework was applied to categorize cyber threats based on spoofing, tampering, repudiation, information disclosure, denial of service, and elevation-of-privilege scenarios relevant to agricultural IoT infrastructures(Bradbury et al., 2022; Rose et al., 2021). Data-flow diagrams (DFDs) were developed to map the end-to-end data pathways utilized in sensor networks, automated milking systems, and cloud platforms, aiding in the identification of insecure transmission points and weak communication interfaces. An attack-surface analysis was conducted to examine the exposure across telematics components, including wireless modules, gateways, and mobile applications (Almalki et al., 2021). In addition to technical assessments, qualitative insights were gathered through semi-structured interviews with 22 dairy farmers and technicians, providing practitioner perspectives on operational challenges, awareness gaps and perceived cybersecurity barriers (Zangana et al., 2025). Collectively, these methods offer a multidimensional approach to understanding vulnerabilities and developing targeted mitigation strategies for digital ecosystems in the dairy sector.

**Data Flow Modeling**

A comprehensive data-flow model was constructed to trace the end-to-end movement of information across the interconnected components of the dairy farm telematics ecosystem(Michie et al., 2020). The Data Flow Diagram (DFD) delineated data originating from wearable animal sensors, RFID-based identification systems, and robotic milking units, followed by their transmission through local gateways and farm-level Wi-Fi networks before reaching cloud servers and decision-support dashboards (Michie et al., 2020). Each of these nodes and data transmission channels was systematically evaluated using the Confidentiality, Integrity, and Availability (CIA) triad to assess

exposure to cyber risks. This assessment facilitated the identification of points at which sensitive health, yield, or operational data could be intercepted, altered, or disrupted(Algarni et al., 2021; Sultana et al., 2020). By visualizing the flow of data across operational and digital layers, the DFD serves as a foundational tool for detecting insecure interfaces, understanding system dependencies, and supporting subsequent threat modeling and mitigation planning.

**FMEA Scoring**

Failure Mode and Effects Analysis (FMEA) was utilized to evaluate and prioritize cybersecurity and operational risks within the dairy-farm telematics ecosystem. For each identified failure mode, such as data interception, sensor malfunction, unauthorized access, or cloud misconfiguration, three critical factors were assessed: severity of impact, likelihood of occurrence, and ease of detection(Liu et al., 2014; Park et al., 2023). Each factor was assigned a score on a standardized scale from 1 to 10 based on field observations, system characteristics, and practitioner insights. The Risk Priority Number (RPN) was subsequently calculated using the formula RPN = Severity × occurrence × detection, facilitating the differentiation of high-risk issues from lower-priority concerns(Ravi Sankar & Prabhu, 2001). This systematic scoring approach enabled objective threat prioritization and ensured that critical vulnerabilities affecting data integrity, animal safety, and operational continuity received targeted mitigation.

**STRIDE Threat Modeling**

The STRIDE framework was employed to systematically assess the cybersecurity threats within the dairy-farm telematics architecture. Under the category of spoofing, the evaluation identified risks associated with attackers potentially impersonating sensors or gateways, resulting in falsified device identities within the network. Tampering threats were scrutinized concerning the unauthorized modification of animal health readings, feed metrics, or milk yield data, which could disrupt decision-making and operational planning(Feng et al., 2022; Sahay et al., 2023). Repudiation risks were identified owing to inadequate logging and the lack of reliable audit trails, complicating the tracing of malicious activities or unauthorized system changes. Information Disclosure vulnerabilities were detected at several unsecured data-transfer points, particularly where sensor outputs and telematics data were transmitted without encryption. The study also examined denial-of-service (DoS) threats targeting routers, gateways, and wireless modules, which could disrupt automated milking operations or real-time monitoring. Finally, Elevation of Privilege risks were highlighted(Hussein &Nhlabatsi, 2022; Oguta, 2024), especially in scenarios where weak authentication mechanisms might allow attackers to bypass administrative credentials and gain an unauthorized control. Collectively, this STRIDE-based evaluation provides a comprehensive understanding of the threat landscape pertinent to dairy IoT environments.

**Attack Surface Evaluation**

The evaluation of the attack surface encompassed an examination of all potential entry points through which adversaries could compromise the telematics environment of a dairy farm. Risks associated with physical access were assessed by identifying locations where sensors, gateways, or milking unit controllers could be directly manipulated owing to inadequate on-farm device protection(Asif et al., 2021). Firmware vulnerabilities were scrutinized to ascertain whether outdated or unpatched device software facilitated unauthorized modifications or code injection. The study also analyzed exposed network ports that might permit remote intrusion if they are not properly configured or monitored. API security was reviewed to identify weaknesses in authentication, data exchange mechanisms, and endpoint protection within farm management applications. Furthermore, cloud configuration settings were examined for misconfigurations, weak access controls, and improper data storage permissions that could result in unauthorized access or manipulation(Mohamad et al., 2023). Finally, wireless channel security was evaluated to detect vulnerabilities, such as unencrypted transmissions, weak Wi-Fi protocols, and interference risks. This comprehensive analysis provides a detailed overview of the system's exposure and informs the development of targeted mitigation strategies.

## RESULTS

### Identified Vulnerabilities

#### Sensor Layer

The assessment identified several vulnerabilities at the sensor layer, which comprises wearable devices, RFID tags, and milking unit sensors as the primary components of data collection. It was observed that numerous devices were susceptible to tampering because of inadequate physical protection and a lack of tamper-evident seals. Furthermore, many sensors operate on outdated or unpatched firmware, thereby increasing their susceptibility to exploitation through known security vulnerabilities. Additionally, weak authentication mechanisms permit the spoofing of device identities, allowing attackers to introduce falsified data streams into the system. Collectively, these weaknesses increase the risk of inaccurate animal health metrics, disrupted monitoring, and compromised decision-making.

#### Communication Layer

Communication pathways among sensors, gateways, and cloud platforms exhibit significant security vulnerabilities. In numerous configurations, sensor data are transmitted in plain text without encryption, thereby creating opportunities for interception and manipulation. Additionally, weak Wi-Fi configurations, often employing outdated security protocols or shared passwords, further exacerbate the risk of unauthorized access. The system is also highly susceptible to man-in-the-middle (MitM) attacks, wherein adversaries can intercept, modify, or reroute telematics traffic without being detected.

#### Cloud Layer

The environments for cloud storage and management pose significant risks, particularly because of improper configuration settings. Certain cloud storage buckets were publicly accessible or lacked sufficient permission structures, thereby exposing sensitive agricultural data to the public. Inadequate access control practices, such as shared credentials and limited implementation of multi-factor authentication, further heighten the risk of unauthorized access. Additionally, the cloud infrastructure is susceptible to ransomware attacks, which can encrypt or block access to critical operational data, thereby disrupting entire agricultural workflows.

#### DSS / Analytics Layer

Decision support and analytics systems exhibit vulnerabilities that can significantly affect operational accuracy. Model manipulation attacks constitute a substantial risk, as adversaries can modify input parameters or interfere with machine-generated insights. Insufficient input validation mechanisms in dashboards and related applications increase susceptibility to injection-based attacks. Furthermore, the insecure management of API tokens facilitated unauthorized access to data analytics services. Collectively, these vulnerabilities jeopardize the reliability, confidentiality, and integrity of digital decision-making processes in dairy farm operations.

### FMEA Results

The FMEA yielded a prioritized list of critical failure modes within the dairy farm telematics ecosystem, identifying components with the highest cybersecurity risk. IoT sensors emerged as the most severe vulnerability, with data tampering receiving an RPN score of 336 owing to its significant impact on operational accuracy, relatively frequent occurrence, and moderate detectability. Unauthorized access to the router and Wi-Fi network had an RPN of 270, reflecting the substantial threat posed by inadequate network security practices. Cloud storage misconfiguration ranked third, with an RPN of 250, indicating that improperly secured cloud environments continue to be a major source of risk, despite lower occurrence rates. The decision support system (DSS) platform exhibited a moderate RPN of 196, primarily driven by vulnerabilities related to data manipulation and insufficient validation controls. RFID tag cloning was identified as the least critical among the evaluated components; however, it remained notable, with an RPN of 180, demonstrating its potential to compromise livestock identification and traceability. These findings collectively underscore the necessity of targeted mitigation strategies focused on sensor integrity, network hardening, cloud security, and the robustness of analytical systems.

**STRIDE Summary**

The STRIDE analysis identified a spectrum of cybersecurity threats affecting various layers of the dairy farm telematics environment. Spoofing risks are predominantly linked to RFID duplication, where cloned tags can be employed to falsify animal identities or manipulate herd-management records. Tampering threats arise from the potential corruption of sensor data, enabling attackers to alter health metrics, feeding information, or yield outputs. The system also demonstrated repudiation vulnerabilities due to insufficient logging and inadequate audit mechanisms, complicating the tracing of unauthorized activities or the verification of data integrity. Information Disclosure risks were identified in the presence of unencrypted communication channels, where sensitive operational and animal health data could be intercepted during transmission. Denial-of-Service vulnerabilities include the potential for wireless jamming and bandwidth flooding attacks capable of disrupting real-time monitoring and automated milking processes. Finally, Elevation-of-Privilege risks were associated with devices and systems operating with default or weak administrative credentials, allowing unauthorized users to gain elevated access and control. Collectively, this STRIDE evaluation underscores the necessity for enhanced authentication, encryption, logging, and network resilience measures.

**Attack Surface Findings**

The examination of the attack surface within the dairy farm telematics ecosystem identified several critical security vulnerabilities. Notably, approximately 62 percent of devices were found to be operating with factory-default passwords, making them highly vulnerable to unauthorized access and credential-based attacks. Additionally, nearly 48 percent of the assessed devices lacked built-in encryption capabilities, thereby exposing sensitive data during transmission across wireless and network channels. Cloud environments also demonstrated significant exposure, with 71 percent of systems containing open or unused ports, thereby increasing the likelihood of intrusion and exploitation. Beyond these technical vulnerabilities, the assessment underscored a substantial human-factor challenge: only 27 percent of the staff exhibited adequate cybersecurity awareness or training. This combination of weak authentication practices, limited encryption support, misconfigured cloud settings, and low cybersecurity literacy significantly broadens the overall attack surface and elevates the risk of operational disruption in dairy farm digital infrastructures.

## DISCUSSION

The findings suggest that telematics systems in dairy farming are significantly susceptible to security breaches owing to a combination of insecure Internet of Things (IoT) device design, inadequate communication protocols, improperly configured cloud infrastructures, and lack of structured cybersecurity governance. Numerous devices rely on outdated firmware, default credentials, and unencrypted data transmission, creating multiple opportunities for attackers to manipulate or intercept operational information. Cloud environments further exacerbate system vulnerabilities when access controls, ports, and storage configurations are inadequately managed. These technical deficiencies are compounded by limited cybersecurity awareness among farm personnel, which diminishes the likelihood of early detection and effective response. Collectively, these issues underscore the urgent need for a multilayered defense strategy specifically tailored to agricultural IoT contexts. This strategy must encompass device-level hardening measures, robust encryption across all communication channels, stringent identity and access management, and comprehensive audit logging. Furthermore, organizational capacity building through targeted training, policy development, and regular security assessments is crucial for enhancing resilience and ensuring the secure and reliable operation of data-driven dairy farming ecosystems.

**Mitigation Strategies**

**Device Security**

Enhancing device-level security is imperative because sensors, RFID tags, and robotic milking units serve as primary entry points for telematics data. The implementation of robust authentication mechanisms is crucial to ensure that only authenticated devices are permitted to access the network and transmit the operational data. Secure boot

processes and firmware signing are essential for preventing the execution of unauthorized or malicious codes on IoT components, thereby mitigating the risk of system compromise through firmware manipulation. Physical tamper-proofing measures, such as sealed enclosures and tamper-evident packaging, are vital for safeguarding wearable sensors and control units against direct interference. Collectively, these strategies bolster device integrity and mitigate the vulnerabilities associated with low-cost and insecure agricultural IoT hardware.

**Network Security**

Ensuring network security is paramount for protecting data transmitted among sensors, gateways, cloud platforms, and decision support systems. The implementation of end-to-end encryption is essential to maintain data confidentiality and safeguard against interception during transmission. Upgrading farm Wi-Fi networks to WPA3 enhances wireless authentication and mitigates the risks associated with outdated protocols. VLAN segmentation isolates critical telematics components from general traffic, thereby restricting lateral movement in the event of an attack. Furthermore, enabling VPN-based remote access provides secure connectivity for technicians, thereby reducing the risk of unauthorized access. Collectively, these measures substantially enhance the resilience and confidentiality of communication channels on dairy farms.

**Cloud Security**

Given the pivotal role of cloud platforms in the storage, processing, and analysis of dairy farm data, the implementation of robust cloud security practices is imperative. The deployment of multi-factor authentication (MFA) and role-based access control (RBAC) restricts unauthorized access and ensures that users operate within predefined privilege boundaries. Conducting regular cloud audits is essential for identifying misconfigured storage buckets, open ports, and weak access policies that may expose sensitive data. The maintenance of immutable backups safeguards critical operational datasets from ransomware attacks by ensuring recovery without data loss or manipulation. Furthermore, the adoption of zero-trust configurations enhances cloud defense by treating all access attempts as untrusted until they are verified. Collectively, these practices substantially mitigate cloud vulnerabilities.

**DSS Security**

The security of decision support systems (DSS) is of paramount importance, as the outputs of analytics directly impact herd management decisions, feeding schedules, and automation workflows. Implementing data integrity checks is essential to ensure that input values are verified before processing them using analytical models. The validation of machine learning models is crucial to prevent tampered or adversarial data from generating misleading outputs. Secure management of API tokens is necessary to protect interfaces from unauthorized access, thereby mitigating the risks associated with exposed or hardcoded credentials. Furthermore, the integration of anomaly detection systems can swiftly identify irregular patterns and suspicious activities within the DSS environment. These measures collectively enhance the reliability and trustworthiness of the data-driven insights.

**Organizational Measures**

To ensure comprehensive cybersecurity, technical defenses must be augmented with robust organizational policies and heightened workforce awareness. Regular cybersecurity training enhances staff preparedness and mitigates the risk of errors that could compromise critical systems in the healthcare sector. Conducting periodic vendor compliance reviews is essential to verify that third-party suppliers adhere to the requisite security standards, particularly concerning IoT devices and cloud services utilized in dairy operations. The establishment of a well-defined incident response plan facilitates rapid detection, containment, and recovery during cyberattacks. Furthermore, clear data governance policies provide guidance on responsible data handling, access control, and operational accountability. Collectively, these organizational measures establish a strong human and procedural foundation for maintaining a long-term cybersecurity resilience.

## CONCLUSION

This study utilized a comprehensive multilayered risk assessment framework to evaluate cybersecurity vulnerabilities within dairy farm telematics environments. The findings identified significant risks across the sensor, communication, cloud, and decision support layers, underscoring how insecure IoT design, weak wireless protocols, cloud misconfigurations, and inadequate governance collectively heighten susceptibility to cyberattacks. By integrating FMEA scoring, STRIDE threat modeling, data flow analysis, and attack surface evaluation, this study offers a structured and evidence-based understanding of the critical points of failure within dairy technology ecosystems. The proposed mitigation strategies, encompassing device-level controls, network encryption, cloud hardening, DSS protection, and organizational preparedness, provide a practical roadmap for enhancing security, ensuring data integrity, and safeguarding operational continuity in modern dairy farming. Future research should focus on developing AI-driven and context-aware intrusion detection mechanisms specifically tailored to the agricultural IoT domain, thereby enabling proactive threat identification and enhancing resilience across increasingly automated farm infrastructures.

## ABSTRACT

Computed Tomography (CT) is an important imaging modality that is well recognized for its rapidity and high-contrast depiction. It is, however, associated with the drawbacks of ionizing radiation, particularly for repeated scanning, as cumulative radiation exposure enhances lifetime cancer risk. A prospective observational study was conducted at the Department of Radio-Diagnosis and Imaging, SGT Hospital, from April 2024 to April 2025. 50 patients who underwent more than one CT scan within a month were analyzed. Inclusion criteria: trauma patients; exclusion criteria: allergies to nephrotoxic drugs or pregnancy. Radiation doses were measured using dose-length product (DLP) and computed tomography dose index (CTDI). Analysis revealed that while no patients reached the high-risk threshold of 50 mSv, over 60% were in the medium-risk category, particularly women and children. The brain, abdomen, and chest were the most commonly scanned regions, with the abdomen and spine receiving the highest doses. Variability in radiation doses was noted, suggesting a lack of standardized imaging protocols. Radiation sensitivity varies with age and sex, making cumulative dose concerns more significant for younger individuals and females. Scan parameters varied widely. The mean mAs was 200.6 (range 40 to 300), indicating significant protocol differences. Most scans used 130 KV (99.2%), showing standardized voltage. Cumulative radiation exposure from repeated CT scans presents a significant cancer risk when excessive. Clinical guidelines should focus on patient dose monitoring, adjustment of scanning parameters, and adherence to the ALARA principle to minimize long-term health risks. Implementing automated dose-tracking systems, standardized imaging protocols, and demographic-specific dose adjustments can minimize unnecessary radiation exposure. Continuous

training and establishment of institutional diagnostic reference levels (DRLs) are vital for promoting safer CT practices.

**Keywords:** Computed Tomography, ionizing radiation, Radiation sensitivity

## INTRODUCTION

Computed tomography (CT) is a major medical imaging technology, based on mathematical foundations developed in the early 20th century by Johann Radon and further developed by Allan M. Cormack to perform tissue absorption calculations[1]. Godfrey N. Hounsfield's development of the first practical CT scanner in 1972 revolutionized diagnostic imaging, progressing to whole-body scans during the 1970s[1]. Additional advances in spiral scanning and multi-detector arrays have transformed CT into a general-purpose device, although concerns regarding radiation exposure have increased, particularly for patients having repeated scans[2]. CT also uses ionizing radiation, which has biological effects, particularly radiation-induced cancer, with hazards increasing with cumulative exposure, especially in multiple-scan patients[3]. Total radiation exposure is frequently not monitored, and repeat imaging decisions may overlook earlier doses[4]. Some populations, including individuals with chronic illnesses, trauma, or cardiovascular disease, are most likely to have repeated CT scans, increasing their aggregate radiation hazard [5–7]. Cancer patients are also exposed to high doses of radiation, particularly from pelvic and abdominal CTs, potentially raising their risk of future cancer [8,9]. Because children are sensitive to radiation, they are especially at risk [10,11]. Some CT scans, such as head, thoracic, and abdominal scans, tend to be repeated and account for most of the cumulative radiation exposure [8,9]. The absence of dose tracking and variable protocols also worsens the situation [12,13]. While dose-reduction methods such as automatic modulation and iterative reconstruction can minimize exposure, they are not being uniformly utilized[1]. An attempt to monitor cumulative radiation, for example, using real-time dose monitoring systems, may reduce unnecessary repeated scans6. Risk models based on cancer estimates from radiation doses suggest that cumulative doses of more than 50–100 millisieverts increase cancer risk, particularly among young patients and women[3,8]. Initiatives such as "Image Gently" and "Image Wisely" encourage reduced doses of radiation and more intelligent imaging strategies, but their influence is still limited[4]. Adequate documentation and compliance with safer imaging protocols are required in clinical environments to minimize unnecessary radiation exposure.

## METHODS

A prospective observational study was conducted in the Department of Radio-diagnosis and Imaging at SGT Hospital and Research Institute, Budhera, Gurugram, from April 2024 to April 2025. CT imaging was performed using SIEMENS SOMATOM scope 16-slice scanner.

**Study Population**

50 patients were enrolled based on predefined criteria. Inclusion criteria comprised patients undergoing multiple CT scans within one month and trauma patients. Exclusion criteria included patients with nephrotoxic drug allergies and pregnancy.

**Data Collection**

Patient data were collected from January 2025 to May 2025, focusing on clinical parameters and imaging findings relevant to the study objectives.

**Statistical Analysis**

Descriptive statistics, including measures of central tendency (mean, median, mode) and variability (standard deviation), were calculated. Statistical significance was assessed using appropriate tests with p-values to validate research hypotheses.

**Overview of Computed Tomography (CT)**

CT is an important medical imaging device that provides cross-sectional images of the body[12]. Its creation, built upon mathematical theories of the early 20th century, was improved upon by Allan M. Cormack and Godfrey N. Hounsfield, with the first functional CT scanner coming out in 1972[12]. Subsequent advancements, such as spiral scanning and multi-detector arrays, increased the speed and resolution of CT. Unlike MRI or ultrasound, CT employs the use of ionizing radiation [12].

**Rise in Utilization and Concerns of Radiation Exposure**

There has been a substantial rise in the use of CT, leading to cumulative radiation from repeated examinations[14]. Numerous patients, especially those with long-term diseases, trauma, or cancer, receive multiple CT scans, in some cases, surpassing safe levels[5,13]. Incomplete medical records on inter-hospital transfers account for unnecessary repeat scans[6]. Children's CT scans have been associated with increased risks of leukemia and brain tumors[10,15].

**Stochastic Effects**

Stochastic effects, for example, cancer, are dose-increasing and occur at random[3]. They have a latency but are of fundamental concern in CT diagnosis, with increased risks with cumulative exposure[14].

**Deterministic Effects**

Deterministic effects result after a threshold dose, resulting in cell death and illnesses such as cataracts and skin burns[3]. CT doses, which range from 2 to 20 mSv, are below the 100 mGy threshold for deterministic effects [4,16].

**The Linear No-Threshold (LNT) Model**

The LNT approach assumes that all doses of radiation are associated with a proportional risk of cancer[3,17]. Nonetheless, certain research indicates that there may be a threshold effect at extremely low doses[16].

**Estimated Cancer Risks from CT Scans**

CT scans have a cancer risk induced by radiation that grows with cumulative dose[14]. Doses above 50–100 mSv are associated with a small excess cancer risk[14]. Abdominal-pelvic CTs have greater risks, particularly with repeated scans [4]. Despite this, CT has an acceptable benefit-to-risk in some screenings[18].

**Vulnerable Populations: Children and Women**

They are also more radiosensitive, with multiple CTs associated with increased brain tumor and leukemia risks [10,15]. Women are exposed to elevated cancer risks on account of the radiosensitivity of the breast tissue[4].

**Organ-Specific Cancer Risks**

CT radiation, particularly coronary angiography, has a potential impact on sensitive organs such as the breasts and lungs [19,20]. Abdominal and pelvic CT scans, frequently in multiple phases, have high radiation exposure, especially when done repeatedly[21].

**Computed Tomography Dose Index (CTDI)**

CTDI quantifies radiation emission from CT scanners and assists in approximating effective doses and risks of cancer [22,23]. It does not, however, capture patient-specific factors in full [22].

**Dose Length Product (DLP)**
DLP quantifies the overall radiation dose for a CT scan, taking into consideration the length of the scan. DLP is applied to approximate biological risk and guide diagnostic reference levels [22,24].

**Quantifying Cumulative Radiation Exposure**
Cumulative radiation exposure adds the effective doses of all the CT scans a patient receives, highlighting the importance of dose-adjustment according to patient size [14,22].

**Reasons for Repeated Imaging**
Chronic disease, cancer, and trauma patients often need repeated CT scans [13]. Duplication of scans is frequently seen during inter-hospital transport because prior images are not accessible[6].

**Patterns of Repeated Examinations**
Emergency patients undergo frequent repeat CTs, with some accumulating significant cumulative doses over several years[25].

**Cumulative Radiation Burden**
Large numbers of patients in OECD nations are being administered doses of more than 100 mSv over five years, which translates to higher risks of cancer [26]. In the most severe instances, doses more than 1,000 mSv may be administered, predominantly through CT scans [20]. The Linear No-Threshold model predicts that low-dose radiation will carry a higher cancer risk with increasing time [13].

## RESULT

This study presents quantitative findings from 50 patients, analyzing demographics, scan characteristics, cumulative radiation doses, and repeated CT patterns. Data from 119 CT scans were used to assess cumulative radiation exposure.

**Patient Demographics and Scan Characteristics**
The cohort's age ranged from 5 to 78 years, with a mean age of 38.0 years and a median of 40 years. Males accounted for 72% of patients (36), while females made up 28% (14). Radiation sensitivity varies with age and sex, making cumulative dose concerns more significant for younger individuals and females. Scan parameters varied widely. The mean mAs was 200.6 (range 40 to 300), indicating significant protocol differences. Most scans used 130 KV (99.2%), showing standardized voltage. The Siemens Somatom Scope 16-slice scanner was used for all scans. Scan durations ranged from 5.33 to 58 seconds, with longer scans for spine exams. Radiation metrics varied, with a mean CTDI VOL of 25.4 mGy (range 2.55 to 63.29 mGy) and a mean DLP of 567.8 mGy-cm (range 80 to 1883.45 mGy-cm). The mean effective dose per scan was 6.39 mSv (range 0.024 to 21.63 mSv), with brain scans averaging 2.79 mSv, abdomen scans 8.58 mSv, and whole spine scans 21.13 mSv, reflecting varying radiation exposure by scan type. Summary Statistics of Patient Demographics (Table 1). Patient Gender Distribution (Figure 1). Summary Statistics of Individual Scan Parameters (Table 2).

**Assessment of Cumulative Radiation Dose**
This section also measures the total exposure of patients to radiation when they receive more than one CT examination. The patient's mean cumulative effective dose was 15.24 mSv (median 14.41 mSv) and ranged from 0.06 mSv for a single extremity exam to 47.84 mSv for multiple trunk and spine exams, indicating a great variation. The standard deviation of 9.51 mSv and the coefficient of variation of 62.4% indicate the extent of this variability. 36% of patients had doses less than 10 mSv, 32% 10-20 mSv, and 28% 20-30 mSv. Just 4% were higher than 30 mSv, and none of the patients had doses higher than 50 mSv, which is the level linked to elevated cancer risk. The mean number of scans per patient was 2.38, with a high positive correlation between the number of scans and total dose (Pearson r =

0.618, $p < 0.001$), although the correlation differed by type of scan. Distribution of Cumulative Radiation Doses (Table 3). Cumulative Dose Statistics by Number of Scans (Table 4).

**Analysis of Repeated CT Examinations**

This section examines the most frequently repeated CT exams. Brain CT scans were the most common, accounting for 27.7% of exams, followed by abdomen CTs (23.5%), chest CTs (14.3%), face CTs (12.6%), and whole spine CTs (10.9%). Less frequent exams included KUB (3.4%), neck (2.5%), cervical spine (1.7%), and extremity scans (3.4%). Frequency of Examination Type by Number of Scans (Figure 2). Brain CTs were the most frequent, often due to trauma and neurological conditions, but their contribution to the cumulative dose was low (mean 2.59 mSv). In contrast, whole spine CTs, though less common, had a higher dose (mean 17.56 mSv). The difference in effective dose between brain and abdomen CTs was significant (2.59 mSv vs. 9.55 mSv, $p < 0.001$). Of the 24 patients (48%) with multiple scans of the same region, brain CTs were repeated most often, with up to 4 scans in some trauma cases. Frequency and Dose Contribution of CT Examination Types (Figure 3). The data show that while frequent exams like brain CTs contribute to cumulative exposure through repetition, high-dose exams like abdominal and whole-spine CTs have a greater per-scan impact. Abdominal CTs contributed the highest total dose (267.4 mSv), followed by whole spine CTs (228.28 mSv).

**Influence of Patient Age and Gender on Cumulative Radiation Exposure**

Age analysis showed that pediatric patients (0-18 years) had a higher mean dose (7.87 mSv) compared to the overall population, raising concerns due to their increased radiosensitivity. Young adults (19-40 years) had the most scans (42%) with a mean dose of 5.41 mSv. Middle-aged adults (41-60 years) received a mean dose of 7.14 mSv, and elderly patients (61+ years) had a mean dose of 5.91 mSv. Gender analysis revealed that while males had more scans (82 vs. 37), females had a higher mean dose per scan (7.15 mSv vs. 6.06 mSv), though the difference wasn't statistically significant ($p = 0.293$). Females also had a higher cumulative dose (16.89 mSv vs. 14.58 mSv in males). Age and Gender Distribution with Associated Radiation Doses (Table 5). Age Distribution with Number of Scans (Figure 4).

**Strategies for Radiation Dose Minimization**

This section explores scan parameter optimization for dose reduction while maintaining diagnostic quality. mAs values varied significantly (40-300 mAs), with opportunities for standardization, especially in brain CTs (180-270 mAs). Chest CTs showed the highest variability (CV = 42.7%), indicating the need for protocol consistency. Face CTs also had high variability (CV = 31.9%), while abdominal CTs were more standardized (CV = 11.7%). Standardizing protocols for chest and face CTs could significantly reduce unnecessary radiation exposure.

**Dose Optimization Potential by Examination Type (Table 6)**

Reducing mAs by 10% could lower the mean cumulative dose from 15.24 mSv to 13.72 mSv, with minimal impact on image quality. Implementing automatic exposure control (AEC) systems on the Siemens Somatom Scope scanner could further standardize doses based on patient size and exam type.

## DISCUSSION

This chapter interprets the results in the context of existing literature, addressing the study's objectives: quantifying cumulative radiation doses, identifying repeated CT patterns, and proposing dose minimization strategies while maintaining diagnostic quality.

**Cumulative Radiation Exposure and Cancer Risk**

The mean cumulative dose of 15.24 mSv and maximum of 47.84 mSv align with studies linking cancer risk to similar doses[2]. While no patients exceeded 50 mSv, 32% of patients accumulated doses between 10-20 mSv, associated with non-negligible cancer risks[4]. Pediatric patients, with higher doses (7.87 mSv), are more vulnerable due to

radiosensitivity and longer life expectancy[10,15]. Gender differences also emerged, with females receiving higher doses per scan[4,20].

**Clinical Patterns of Repeated Imaging**

Repeated CTs for brain, abdomen, and chest reflect broader usage patterns[5]. Abdominal CTs, despite being less frequent, contributed the highest dose (267.40 mSv). Trauma patients, often requiring repeated scans due to image transfer issues[6] Highlight the need for better image-sharing systems. Chronic conditions, like those in inflammatory bowel disease patients[27], also accumulate high doses over time.

**Dose Variability and Optimization**

Significant variability in scan parameters (7.5-fold in mAs) presents opportunities for optimization. Goo (2012) found that standardizing protocols with automatic exposure control could reduce dose variations to <20%[22]. Seeram (2010) showed that iterative reconstruction could reduce doses by 40-50%[12]. The high variability in chest CT (CV = 42.7%) suggests that optimization tools may be underutilized. Standardizing protocols for brain CTs could significantly reduce doses[4].

**Implications for Clinical Practice**

Real-time dose monitoring systems are necessary for clinicians to track cumulative exposure [14]. The absence of such systems underscores a critical infrastructure gap. Tailored imaging protocols for pediatric and female patients, who receive higher doses (Huang *et al*., 2020; Mathews *et al*., 2013), would enhance radiation protection[2,28].

**Comparison with Guidelines**

The study's mean effective dose of 6.39 mSv exceeds diagnostic reference levels (DRLs) in Europe[29]. The consistent use of 130 kV contrasts with recommendations to optimize kV based on patient size[30], suggesting missed opportunities for dose reduction.

**Limitations and Strengths**

The small sample size and single-center design limit generalizability. The inclusion period may have excluded patients with longer scan intervals, potentially underestimating exposure. However, the study's strength lies in capturing detailed technical parameters and eliminating equipment-related variability.

**FUTURE DIRECTIONS AND RECOMMENDATIONS**

Recommendations include implementing automated dose tracking, standardizing protocols (especially for chest and face CTs), and developing demographic- specific protocols for pediatric and female patients. Education on dose risks and optimization should be prioritized. Longitudinal studies tracking cancer incidence from cumulative radiation exposure are needed, alongside AI-driven protocol optimization[18]. The development of institution-specific DRLs would improve continuous quality improvement efforts.

## CONCLUSION

This study assessed cumulative radiation exposure and cancer risk in patients undergoing multiple CT scans. Although no patients exceeded the high-risk threshold of 50 mSv, over 60% were exposed to moderate doses with potential long-term effects. Women and children, due to their increased sensitivity, were particularly at risk. Brain, abdomen, and chest scans were most frequent, with abdominal and whole spine scans contributing the highest cumulative doses. Significant variation in radiation doses across comparable CT scans suggests a lack of standardization. Female patients and children received higher doses per scan, underscoring the need for age- and gender-specific imaging protocols. Trauma patients, frequently scanned in acute care, are at increased risk. To

mitigate these risks, radiation monitoring systems, dose reduction techniques, and protocol optimization are essential for patient safety without compromising diagnostic quality.

**ABSTRACT**

Methicillin-resistant *Staphylococcus aureus* (MRSA) represents a significant global health concern due to its high morbidity, mortality, and increasing resistance to conventional antibiotics. The growing challenge of antimicrobial resistance necessitates exploration of alternative therapeutic approaches. Despite widespread clinical use, scientific evidence supporting the in-vitro antibacterial activity of homoeopathic medicines remains limited. This study aimed to evaluate the in-vitro antibacterial efficacy of homoeopathic preparations of Belladonna and Carbolic acid against MRSA. An experimental in-vitro study was conducted using a pure culture of MRSA. Belladonna and Carbolic acid were tested in mother tincture (Q), 30C, and 200C potencies. Staphylococcinum 30C served as the positive control. Antibacterial activity was assessed using the Kirby–Bauer disc diffusion method on Mueller–Hinton agar. Zones of inhibition were measured after 24 hours of incubation at 37°C. Both remedies demonstrated antibacterial activity across all tested potencies. Belladonna Q produced the largest zone of inhibition (10 mm), followed by Belladonna 200C (8 mm) and 30C (6 mm). Carbolic acid Q showed an inhibition zone of 8 mm, while 30C and 200C exhibited zones of 7 mm each. The control confirmed assay validity through moderate inhibition. The study demonstrates that homoeopathic preparations of Belladonna and Carbolic acid exhibit measurable in-vitro antibacterial activity against MRSA, with greater efficacy observed in mother tinctures.

These findings warrant further in-vivo studies and mechanistic investigations to assess their potential role in managing antimicrobial resistance.

**Keywords:** Methicillin-resistant *Staphylococcus aureus* (MRSA), Antimicrobial resistance, Homoeopathic medicines, *In-vitro* antibacterial activity, Belladonna preparations, Carbolic acid preparations, Mother tincture (Q), 30C, 200C potencies, Kirby–Bauer disc diffusion method, Mueller–Hinton agar, Zones of inhibition, Staphylococcinum 30C (positive control), Experimental in-vitro study, Alternative therapeutic approaches, Antibacterial efficacy, Potential role in managing antimicrobial resistance

## INTRODUCTION

*Staphylococcus aureus* is a leading global health concern, with the World Health Organization (WHO) reporting it as the single bacterial pathogen associated with the most deaths worldwide in 2019, with over 1.1 million deaths. The primary data available from the last five years (2020-2024) focuses heavily on the increasing issue of antimicrobial resistance (AMR), particularly Methicillin-Resistant *Staphylococcus aureus* (MRSA). [1-4]. *Staphylococcus aureus* (also denoted as *Staph. aureus* or *S. aureus*) is a Gram-positive pathogenic bacterium and is a major cause of different infectious illnesses in humans and animals [5,6]. These illnesses may range from simple skin and soft tissue infections to more serious and life threatening conditions such as blood infections (bacteraemia/septicaemia) [7]. *Staphylococcus aureus* secretes an extracellular polymeric substance (EPS), known as biofilm that helps the microbe to resist and minimise the effect of antibacterial drugs [8]. *Staphylococcus aureus* is a bacterium that can cause a variety of illnesses through suppurative or nonsuppurative (toxin-mediated) means. *S aureus* is a common cause of skin and skin structure infections as well as osteoarticular infections in the pediatric population. *S aureus* is also identified in cases of septicemia, infective endocarditis, pneumonia, ocular infections, and central nervous system infections. Homoeopathy is one of the major alternative medicine systems used worldwide. Homoeopathic medicines are administered in ultra-diluted forms; they are effective in various disorders, which can be confirmed through clinical trials. However, there is a lack of in vitro and in vivo studies in homoeopathy. Many studies had reported that homeopathic treatment may recover the patient's physical status and decrease the necessity for conventional antimicrobial agents as well as the rate of infection relapse [9-11]. There are few examples of in vitro studies done in the field of homoeopathy. Sweetlin Simi P. *et al*. in their work demonstrated that the homoeopathic nosodes Pyrogenium 200C, Pyrogenium 1M, and Anthracinum 200C produced significant inhibition zones (10–11 mm) against Methicillin-Resistant *Staphylococcus aureus* (MRSA), indicating effective antibacterial potential of high dilutions [12]. R. Krishnapriya and P.R. Sisir in their work found that *Baptisia tinctoria* and Muriatic acid in lower dilutions (30C, 200C) showed no antibacterial activity against Salmonella typhi, suggesting inefficacy of these potencies ininhibiting bacterial growth [13]. Dillon Christopher Williams, Durban Institute of Technology Dissertation in the work concluded that Alepideaamatymbica tincture exhibited slight, non-significant activity against Gram-positive bacteria (*S. aureus* and B. cereus), while its homoeopathic dilutions (1X, 6X) showed no antibacterial effect against either Gram-positive or Gram-negative species [14]. In present study homoeopathic medicines belladonna and Carbolic acid are selected to observe the anti-microbial characteristics in vitro. Belladonna has efficacy on conditions like abscess, carbuncle, boils, Meningitis, Pneumonia, Perichondritis, Parametritis and Carbolic acid on Burns, Carbuncle, Meningitis, and Pneumonia. These remedies are frequently used for the conditions caused by *Staphylococcus aureus* in number of patients successfully. This experiment is conducted to evaluate their inert medicinal power in vitro.

## MATERIALS AND METHODS

**Study Design**
This was an experimental *in-vitro* study performed to assess the antibacterial activity of selected homoeopathic drugs.

**Test Organism**
Pure culture of methicillin-resistant *Staphylococcus aureus* (MRSA) was obtained and used for testing.

**Homoeopathic Drug Tested**
Homoeopathic remedies Belladonna and Carbolic acid in mother tincture (Q), 30C, and 200C potencies were selected based on Murphy's repertory and Dictionary of materiamedica by Dr Clarke.

**Positive control:** Staphylococcinum 30C.

**Media Used for MRSA**
Mueller Hinton Agar (MHA) is used for MRSA as suggested by CLSI.

**Experimental method**
Disc diffusion method (Kirby-Bauer) was used.

## METHODOLOGY

**Preparation of Inoculum**
The microbes were picked up with a sterile loop from respective culture plates in sterile saline and cell concentration was adjusted to final concentrations of 0.5 McFarland's standard (1.5 × 105 CFU/mL).

**Preparation of Microbial Culture**
Culture of *S. aureus* was placed in Petri plates containing MHA and the microbes were opened aseptically in a laminar airflow. Two Mueller Hinton Agar plates for each microbe were prepared in a petri dish for identification and confirmation of its colony. The plates were incubated for 24 h at 37°C.
2 petri plates were prepared for each drug.
Sterile discs were impregnated with the test solutions Belladonna Q, 30, 200 and Carbolic acid Q, 30, 200. 2 discs of staphylococcinum 30 were prepared for each plate and placed on inoculated Mueller-Hinton agar plates. In each plate, all 3 potencies Q, 30 and 200 along with control staphylococcinum 30 discs were placed. The plates were incubated at 37°C for 24 hours, and the diameter of the inhibition zones was measured in millimetres after 24 hours.

## RESULTS

The in-vitro antimicrobial activity of the selected homoeopathic drugs against MRSA was assessed by observing the zone of inhibition around the drug-impregnated discs. Distinct variations in inhibitory responses were noted among the different potencies of Belladonna and Carbolic acid when compared with the control. The Belladonna-treated plate demonstrated visible inhibitory zones at potencies Q, 30C, and 200C. Among these, Belladonna Q exhibited the largest zone of inhibition, indicating the highest antibacterial efficacy. Belladonna 200 produced a moderate inhibitory effect, while Belladonna 30C showed a comparatively smaller, yet definite, inhibitory zone. The control disc displayed moderate inhibition, confirming the sensitivity of the assay and validating the antimicrobial response of the tested potencies. Carbolic acid displayed a different potency-dependent inhibitory pattern. Carbolic acid Q produced the greatest suppression of *Staphylococcus aureus*, as evidenced by the largest clear zone. Carbolic acid 30C and 200C showed moderate antibacterial activity. The control disc showed a very small zone of inhibition.

Experimental Results (Table 1). Figure 1. Result of the Experimental Results for Belladonna and Carbonic Acid for (Mother Tincture (Q), 30C and 200C) and Comparison with the control group

## ABSTRACT

Postpartum depression (PPD) is an extensive and incapacitating mental health condition affecting women during the first year after childbirth and is associated with adverse maternal, infant, and family outcomes. Although pharmacological therapies are effective for moderate to severe PPD, concerns related to breastfeeding safety, medication side effects, and acceptability have resulted in increased interest in non-pharmacological interventions. The present narrative review synthesizes available evidence on non-pharmacological approaches for the prevention and management of postpartum depression, with specific relevance to nursing and community health practice. A comprehensive literature search was conducted using PubMed/MEDLINE, CINAHL, Scopus, Web of Science, and Google Scholar to identify studies published between 2015 and 2025. Randomized controlled trials, systematic reviews, meta-analyses, and observational studies evaluating non-pharmacological interventions among postpartum women were included. Evidence indicates that psychological interventions, particularly cognitive behavioral therapy and interpersonal therapy, are effective in reducing depressive symptoms. Psychosocial support, family-inclusive strategies, structured exercise programs, mindfulness-based approaches, and technology-assisted interventions also demonstrated beneficial outcomes. Preventive interventions initiated during the antenatal period were found to be more effective than postnatal interventions alone. Hence, non-pharmacological interventions are effective, acceptable, and scalable options for addressing postpartum

depression, especially in low- and middle-income settings. Integration of these interventions into routine maternity health services can enhance nursing practice and maternal mental health outcomes.

**Keywords:** Evidenced based, Postpartum depression, non-pharmacological intervention, prevention, management, Maternal mental health.

## INTRODUCTION

Postpartum depression (PPD) is a common mental health disorder is commonly reported within the first year after childbirth, with a global prevalence of approximately 10–20% among new mothers.[1]PPD is associated with persistent sadness, anxiety, impaired functioning, and adverse effects on maternal–infant bonding. Untreated PPD can lead to developmental, emotional, and behavioral problems in infants and long-term psychological issues in mothers.[2] A systematic review and meta-analysis conducted about the prevalence of postpartum depression in India, found it to be ranged between 4.8% to 70.4%, with a pooled prevalence of 27.7%. The prevalence varied across four regions: Eastern (19%), Western (18.5%), Northern (17.8%) and Southern (15.4%). [3]

Despite the effectiveness of pharmacological management for moderate to severe postpartum depression, concerns about breastfeeding safety and treatment-related side effects have shifted focus toward non-pharmacological strategies. These interventions emphasize psychological support, social engagement, and healthy lifestyle practices crucial for postpartum recovery.This review examines the evidence base for non-pharmacological interventions used to prevent and manage PPD, focusing on psychological therapies, psychosocial support, exercise and lifestyle interventions, mindfulness practices, and digital health strategies. The aim is to review current evidence on available non-pharmacological interventions for the prevention and management of postpartum depression. This will evaluate the feasibility, acceptability, and applicability of interventions in clinical and community settings. This will provide recommendations for nursing practice and areas for future research.

## MATERIAL AND METHODS

A narrative review design was adopted to integrate evidence from diverse research methodologies, including randomized controlled trials, systematic reviews, meta-analyses, and observational studies.Electronic databases including PubMed/MEDLINE, CINAHL, Scopus, Web of Science, and Google Scholar were searched for studies published between 2010 and 2025. Search terms included combinations of postpartum depression, non-pharmacological interventions, cognitive behavioral therapy, exercise, mindfulness, psychosocial support, and digital interventions. Studies focused on postpartum women, evaluated non-pharmacological interventions, reported depressive outcomes related to PPD and peer-reviewed and published in English were included while studies focusing solely on pharmacological interventions, antenatal depression without postpartum outcomes, or non-original research were excluded.

## REVIEW OF LITERATURE

**Psychological Interventions**

A systematic review and meta-analysis of randomized controlled trials conducted by Hua et al. (2024) to evaluate the effectiveness of psychological interventions for perinatal depression. Analyzing 33 studies, the authors reported a moderate overall treatment effect compared with control conditions (SMD = −0.65), supporting the efficacy of psychological therapies. Individualized interventions and those delivered in non-clinical settings appeared more effective than group-based or clinic-based approaches. Interpersonal therapy (IPT) demonstrated a tendency toward greater effectiveness compared with cognitive behavioural therapy (CBT), while mindfulness-based interventions

(MBI) and behavioural activation (BA) also showed beneficial effects. The findings further suggest that trained non-specialist providers can deliver effective interventions. However, high heterogeneity and limited evidence for certain modalities were noted, highlighting the need for further comparative and methodologically rigorous trials.[4] Stamou et al. (2018) conducted a narrative review of systematic reviews and randomized controlled trials from four electronic databases to evaluate cognitive-behavioural therapy (CBT) and interpersonal psychotherapy (IPT) for postnatal depression. Six reviews and 15 studies focusing on CBT met inclusion criteria. CBT, delivered individually or in groups by specialists or trained non-specialists, significantly reduced postnatal depressive symptoms, with effects lasting up to six months. Key components included psychoeducation, cognitive restructuring, and goal setting. The review supports CBT as an effective, flexible intervention and highlights its potential for nurse-led implementation.[5]

Mozaffari et al. (2025) conducted a randomized controlled trial to examine the effect of antenatal coping strategies training for fathers on postnatal depression among couples. Eighty-six first-time pregnant couples were randomized to receive either five virtual coping skills sessions or routine prenatal care. The intervention significantly reduced perceived stress and postpartum depression scores among both mothers and fathers, while increasing problem-focused coping and decreasing emotion-focused coping strategies. These findings highlight the importance of father-inclusive, nurse-led psychosocial interventions during pregnancy as an effective approach to reducing postpartum depression and promoting family mental health.[6]

**Psychosocial and Support-Based Strategies**

Norazman and Lee (2023) conducted a narrative review to examine the role of social support interventions in preventing and treating postpartum depression. The review highlighted five key strategies: psychoeducation, nurse-led supportive and non-directive counseling, home visits, peer support, and culturally tailored or community-based interventions. Evidence suggests these approaches can improve maternal mental health and infant outcomes, with discharge education and skilled public health nursing playing a critical role. The authors emphasize the potential benefits of combining social support strategies for enhanced prevention and treatment of PPD.[7]

Noonan et al. (2021) conducted a review to examine the inclusion of partners and family members in psychosocial interventions for women at risk of or experiencing perinatal depression and anxiety. Nine empirical studies published between 2010 and 2020 were included, with interventions delivered by diverse facilitators and using varied approaches. Most studies reported significant reductions in maternal depression and anxiety, though few evaluated the experiences of partners or family members. The review highlights the potential benefits of involving family in perinatal mental health care and underscores the need for co-designed interventions and further research to support integration into routine practice. [8]

**Exercise and Lifestyle Interventions**

Moderate-intensity physical activity, including walking and yoga, has shown moderate improvements in mood and reduction in depressive symptoms. Exercise contributes to better sleep, stress reduction, and overall well-being, making it a practical component of PPD prevention Bind et al. (2025) evaluated the clinical effectiveness, implementation feasibility, and cost-effectiveness of a community-based singing intervention (Melodies for Mums, M4M) for mothers experiencing postnatal depressive symptoms. In this randomized controlled trial involving 199 mother–infant dyads, participants receiving a 10-week singing intervention demonstrated sustained reductions in depressive symptoms compared with active controls at 20 and 36 weeks postpartum. The intervention showed higher participant retention and was rated as more acceptable, appropriate, and feasible than standard community activities. Additionally, the singing programme was associated with improved quality-adjusted life outcomes and demonstrated cost-effectiveness, supporting its potential as a scalable, non-pharmacological, arts-based intervention for postnatal depression.[9]

In a meta-analysis of randomized controlled trials by Ruan et al. (2025) examined the effectiveness of yoga as a non-pharmacological nursing intervention for women with postpartum depression. Six studies involving 443 postpartum

women demonstrated that yoga significantly reduced depressive symptoms as measured by the Edinburgh Postnatal Depression Scale. These findings support yoga as a feasible, low-cost, and nurse-led complementary intervention that can be integrated into postnatal care and maternal mental health programs. However, the high heterogeneity among included studies indicates the need for further rigorously designed trials to guide standardized nursing practice and protocol development.[10]

A single-centre randomized controlled trial was conducted by Saccone et al. (2024) to evaluate the effect of regular antenatal aerobic exercise on the risk of postpartum depression among women with low-risk singleton pregnancies. A total of 398 women were randomized in the first trimester to either a structured aerobic exercise programme (three 60-minute sessions per week until 35 weeks' gestation) or standard care. Postpartum depression was assessed at three months postpartum using the Edinburgh Postnatal Depression Scale. The exercise group demonstrated a significantly lower incidence of postpartum depression and reduced mean EPDS scores compared with controls, without an increase in adverse maternal or perinatal outcomes. These findings support antenatal aerobic exercise as a safe, feasible, and effective non-pharmacological preventive strategy for postpartum depression.[11]

A narrative review to examine the role of physical activity in the prevention and treatment of postpartum depression was conducted by Fotso et al. (2023). Drawing evidence from multiple databases, the authors highlighted that regular physical activity during pregnancy and the postpartum period is associated with reduced depressive symptoms and may serve both preventive and therapeutic roles. However, the review emphasized that exercise alone may not be sufficient for optimal outcomes and is more effective when integrated with structured support or wellness programs. The findings underscore the importance of individualized, nurse-guided exercise interventions that consider type, intensity, and duration to enhance maternal mental health during the postpartum period.[12]

Xu et al. (2023) conducted a systematic review, meta-analysis, and network meta-analysis to evaluate the effectiveness of aerobic exercise in the prevention and treatment of postpartum depression. Twenty-six studies involving 2,867 participants were included. Aerobic exercise significantly reduced postpartum depressive symptoms compared with standard care, with stronger effects observed for preventive interventions than for treatment. Network meta-analysis indicated that moderate-intensity aerobic exercise performed for 35–45 minutes, three to four times per week, produced the most favorable outcomes, while no significant differences were found among different types of aerobic exercise. Although supervised and group-based exercise showed slightly better effect sizes than unsupervised or individual exercise, these differences were not statistically significant. The findings support aerobic exercise as an effective, low-cost, nurse-led intervention for postpartum depression prevention, while highlighting the need for individualized exercise prescriptions and further high-quality research.[13]

**Mindfulness and Emerging Modalities**

Mindfulness-based interventions promote emotional regulation and stress management, with emerging evidence supporting symptom reduction in postpartum women (Dimidjian et al., 2016). Technology-based programs, including mobile apps and online counseling, increase accessibility, particularly for women facing barriers to in-person care. A parallel-group randomized controlled trial in an obstetric clinic in Japan conducted by Ichinose et al. (2025) to assess whether a prenatal childbirth and parenting booklet could reduce the risk of paternal postpartum depression. Expectant fathers were recruited at 28–32 weeks of gestation and randomized to receive either a mailed educational booklet or routine care, with depressive symptoms assessed at 1 and 3 months postpartum. Although the intervention group showed a lower incidence of depressive symptoms, the difference was not statistically significant. The findings indicate that standalone, information-based interventions may have limited effectiveness, highlighting the need for more interactive and personalized approaches to support paternal mental health.[14]

Worku et al. (2023) conducted a systematic review and meta-analysis to assess the effectiveness of technology-supported mindfulness-based interventions (MBIs) in managing maternal depression. Eighteen studies including 2,481 participants were reviewed, with 15 included in the meta-analysis. Results showed a significant reduction in depressive symptoms during both pregnancy (SMD = −0.57) and postpartum (SMD = −0.53). These findings highlight

the potential of nurse-facilitated, technology-assisted MBIs as accessible, cost-effective interventions to support maternal mental health, particularly in resource-limited settings. The authors emphasize the importance of context-specific trials to guide nurses in integrating these interventions into routine maternal and postnatal care for improved outcomes.[15] In 2021, Tabi et al. outlined a feasibility study protocol to evaluate online mindfulness-based interventions (MBIs) for families affected by postpartum depression and anxiety. The study involves 8-week online MBI groups for mothers with PPDA and their partners, assessing feasibility from both participant and facilitator perspectives, including session attendance, technical issues, and attrition. Secondary outcomes include parental mental health, couple relationship, and intervention acceptability. This study highlights the potential of nurse-facilitated, technology-supported MBIs to increase accessibility and support family mental health in postpartum care. [16]

Avalos et al. (2020) conducted a feasibility study of a 6-week mobile health (mHealth) mindfulness intervention for postpartum women with moderate to moderately severe depressive symptoms. Twenty-seven participants used a mindfulness app (Headspace) daily for 10–20 minutes. Of those enrolled, 70% completed the study, and nearly half adhered to ≥50% of sessions. Significant improvements were observed in depressive symptoms, perceived stress, sleep quality, and mindfulness. Participants reported high satisfaction and perceived benefits. The study demonstrates that mHealth mindfulness interventions are feasible, acceptable, and show promise as scalable support for postpartum women, highlighting potential for nurse-facilitated implementation.[17]

## DISCUSSION

This narrative review critically synthesizes contemporary evidence on non-pharmacological interventions for the prevention and management of postpartum depression (PPD), highlighting their effectiveness, feasibility, and relevance for nursing and community-based practice. The findings reaffirm that PPD is a multifactorial condition requiring holistic, person-centred approaches that extend beyond pharmacological management, particularly in contexts where breastfeeding safety, cultural acceptability, and accessibility of care are major concerns. Psychological interventions, particularly cognitive behavioral therapy (CBT) and interpersonal therapy (IPT), emerged as the most robustly supported non-pharmacological approaches. Consistent with earlier literature, this review found strong and sustained reductions in depressive symptoms with both modalities, with IPT demonstrating slightly superior outcomes in some studies. The effectiveness of nurse-led and non-specialist-delivered interventions is especially noteworthy, as it underscores the scalability of these therapies in low-resource and community settings. The durability of treatment effects up to six months postpartum further supports their integration into routine maternal and child health services.

Psychosocial and support-based strategies play a critical complementary role in addressing PPD by targeting social isolation, role transition, and family dynamics. Evidence from social support interventions, peer support programs, home visits, and partner-inclusive approaches indicates meaningful improvements in maternal mental health outcomes. Father-focused and family-inclusive interventions demonstrated reductions in maternal depressive symptoms and perceived stress, emphasizing the relational nature of postpartum mental health. However, findings also suggest that passive or information-only interventions, such as educational booklets, may have limited impact unless paired with interactive or skill-based components. This highlights the need for structured, engagement-oriented psychosocial models in nursing practice. Exercise and lifestyle interventions, including aerobic exercise and yoga, demonstrated moderate but consistent benefits in both the prevention and management of PPD. Evidence suggests that antenatal and postnatal moderate-intensity physical activity can significantly reduce depressive symptoms without adverse maternal or neonatal outcomes. Importantly, preventive effects were stronger than therapeutic effects, reinforcing the value of early integration of physical activity into antenatal care. Nurse-guided exercise prescriptions that consider individual preferences, physical readiness, and cultural context appear essential for optimizing adherence and outcomes.

Mindfulness-based and emerging digital interventions represent promising, accessible alternatives, particularly for women facing logistical, geographical, or stigma-related barriers to in-person care. Technology-supported mindfulness-based interventions (MBIs), including mobile apps and online group programs, demonstrated significant reductions in depressive symptoms and high acceptability. These findings align with the growing emphasis on digital mental health solutions in maternal care, especially in resource-constrained settings. While feasibility and preliminary effectiveness are encouraging, the heterogeneity of intervention formats and outcome measures warrants cautious interpretation and underscores the need for standardized protocols and long-term effectiveness data. From a nursing and public health perspective, the findings of this review reinforce the pivotal role of nurses in screening, delivering, and coordinating non-pharmacological interventions for PPD. Nurse-led psychological therapies, psychosocial support, lifestyle counseling, and digital facilitation can bridge critical gaps in maternal mental health care, particularly in low- and middle-income countries such as India. Integrating these interventions into routine antenatal, postnatal, and community health programs can enhance early identification, prevention, and continuity of care.

Despite its strengths, this review also identifies important gaps in the existing literature. Many studies exhibited heterogeneity in intervention design, outcome measurement, and follow-up duration, limiting direct comparison across modalities. Additionally, evidence from low-income and rural settings remains limited, and few studies examined long-term maternal and child outcomes. Cultural adaptation, cost-effectiveness, and implementation fidelity were inconsistently addressed, highlighting critical areas for future research. It can be conclude that non-pharmacological interventions offer effective, acceptable, and scalable options for the prevention and management of postpartum depression. Psychological therapies show the strongest evidence base, while exercise, psychosocial support, mindfulness, and digital interventions provide valuable adjuncts. Future research should prioritize rigorously designed, culturally sensitive trials with long-term follow-up to inform evidence-based nursing practice and policy development in maternal mental health care.

**Strengths and Limitations**

**Strengths**

This review comprehensively synthesizes diverse non-pharmacological interventions and applies findings to clinical, community, and nursing contexts. It covers both preventive and therapeutic strategies and emphasizes evidence-based practices.

**Limitations**

Heterogeneity in study designs, intervention protocols, and outcome measures limits direct comparison across studies.

**Recommendations for Future Research**

- Conduct high-quality randomized trials with standardized outcome measures.
- Investigate long-term effectiveness and sustainability of interventions.
- Explore culturally adapted and nurse-led programs.

## CONCLUSION

Non-pharmacological interventions play a crucial role in the prevention and management of postpartum depression. Psychological therapies, exercise, social support, mindfulness practices, and digital health strategies offer safe, acceptable, and effective approaches. Integration of these interventions into routine postpartum care—particularly within nursing and maternal health services—can advance the quality of care and maternal outcomes.

## ABSTRACT

Artificial roughness is commonly employed in solar air heaters to enhance convective heat transfer by disturbing the near-wall flow structure. However, the associated increase in pressure drop necessitates an optimal balance between thermal enhancement and hydraulic losses. In the present study, a CFD-based investigation is carried out to analyze the effect of heat transfer and pressure drop characteristics in a rectangular solar air heater duct equipped with V+arc shaped artificial roughness on the absorber plate. The duct has a dimensions with an entrance length of 350 mm, test section length of 0.6 m, and exit length of 200 mm. Numerical simulations are performed for Reynolds numbers ranging from 3000 to 11000 under a constant heat flux corresponding to a uniform solar insolation of 1000 W/m$^2$. The roughness geometry is characterized by a pitch of 10 mm and height of 2 mm. Grid independence and near-wall resolution are ensured through a detailed mesh refinement study, maintaining $y^+$ values close to unity. The present study represents the CFD predictions for the smooth duct are validated against established experimental results, while the numerical results for the roughened duct are compared with experimental measurements to assess model accuracy. The results demonstrate that the V+arc shaped roughness significantly enhances heat transfer compared to the smooth duct, with a corresponding increase in pressure drop, and show good agreement between numerical and experimental findings.

**Keywords:** Solar air heater, computational fluid dynamics, artificial roughness, heat transfer, THPP

## INTRODUCTION

Comprehensive review studies by Varun *et al*. [2], Gupta and Kaushik [3], Hans *et al*. [4], Singh *et al*. [5], and Yadav and Thapak [6] summarized more than 200 experimental and numerical investigations on artificially roughened solar air heaters. These reviews collectively reported that most studies were conducted in the Reynolds number range of 3000–20000, with relative roughness height e/Dh varying between 0.01 and 0.06, and pitch-to-height ratios P/e in the range of 8–15. The reviews consistently identified V-shaped ribs, multi-V ribs, arc-shaped ribs, and rib–groove combinations as the most thermally effective geometries. Duffie and Beckman [1] provided the fundamental heat transfer framework for solar air heaters, emphasizing that forced convection dominates heat transfer at moderate Reynolds numbers and that enhancement techniques must be evaluated using both heat transfer and pressure loss metrics. Recent review articles focusing on CFD-based studies further highlighted that reliable numerical prediction requires low-Re turbulence models, $y^+ \approx 1$, and validation against experimental data to minimize modeling uncertainty [31–33]. Kumar *et al*. [15] performed a CFD study on a roughened solar air heater duct using V-shaped ribs with e/Dh ≈ 0.03 and P/e = 10, for Reynolds numbers ranging from 4000 to 16000. Using the SST k–ω turbulence model and maintaining $y^+ < 1$, they reported that the predicted Nusselt number agreed with experimental data within ±8%, while friction factor deviation remained within ±10%. Arya *et al*. [16] numerically investigated multiple roughness geometries, including V-shaped, arc-shaped, and dimple ribs, for Re = 3000–15000 and e/Dh = 0.02–0.04. Their CFD results showed that V-type and arc-type ribs provided the highest thermo-hydraulic performance, with peak performance parameters in the range of 1.6–2.0. Yadav and Bhagoria [29] emphasized that mesh density and near-wall resolution significantly affect CFD predictions, particularly for separated flows induced by ribs, recommending inflation layers with growth rates below 1.5. Standard CFD references by Versteeg and Malalasekera [32] and the ANSYS Fluent Theory Guide [33] further recommend second-order discretization schemes, validated turbulence models, and systematic grid independence studies for accurate prediction of wall heat flux and pressure drop.

Layek *et al*. [24] experimentally investigated chamfered rib–groove roughness with e/Dh = 0.043 and P/e = 10 for Reynolds numbers between 3000 and 17000. Their results showed that chamfering increased the average Nusselt number by 20–25% compared to conventional rib–groove configurations while reducing friction losses. Aharwal *et al*. [25] studied broken transverse ribs with e/Dh = 0.028–0.042 and P/e = 7.5–12.5 over Re = 3000–20000. They reported that broken ribs enhanced Nusselt number by up to 2.1 times compared to smooth ducts while reducing friction factor by 10–15% relative to continuous ribs. Karmare and Tikekar [26] examined metal grit roughness with grit sizes corresponding to e/Dh = 0.035–0.045, reporting Nusselt number enhancement of 1.8–2.3 times for Re = 3000–17000. Bhushan and Singh [27] studied protruded ribs with e/Dh ≈ 0.03 and observed significant heat transfer enhancement accompanied by higher pressure drop. Bopche and Tandale [28] compared multiple rib geometries and concluded that optimal performance occurs at P/e ≈ 10 for most roughness configurations. Singh *et al*. [31] conducted a comparative experimental study on various artificial roughness geometries, including V-shaped ribs, arc-shaped ribs, metal grit ribs, and rib–groove combinations, for Re = 4000–18000. Using identical duct dimensions and operating conditions, they reported that V-type and arc-type ribs achieved the highest effective efficiency, with thermo-hydraulic performance parameters exceeding 1.8 at optimal roughness parameters (e/Dh ≈ 0.03, P/e ≈ 10). Their results confirmed that hybrid or compound roughness geometries offer better performance when evaluated under equal pumping power constraints.

The present study aims to numerically and experimentally investigate the thermal and hydraulic performance of a solar air heater duct equipped with V+arc shaped artificial roughness. The specific objectives are

a. To develop and validate a CFD model for a smooth and V+arc roughened solar air heater duct by comparing numerical predictions of Nusselt number and friction factor with experimental data and established empirical correlations over a Reynolds number range of 3000–11000.
b. To evaluate the effect of V+arc shaped artificial roughness on heat transfer enhancement and pressure drop characteristics by comparing the thermal and hydraulic performance of the roughened duct with a smooth duct under identical operating conditions.

c. To assess the overall thermo-hydraulic performance of the V+arc roughened solar air heater.

## NUMERICAL METHODOLOGY

**Geometry Description**

The computational domain represents a (Figure – 1) rectangular solar air heater duct consisting of three sections: an entrance section, a test section, and an exit section. The entrance length is 350 mm, the test section length is 0.6 m, and the exit length is 200 mm. The duct has a constant width (W = 100 mm) and height (H = 20 mm), resulting in an aspect ratio (W/H) of 5. The corresponding hydraulic diameter of the duct is 0.0333 m. For the roughened configuration, (Figure – 2 and 3) a V+arc shaped artificial roughness is applied to the absorber plate located at the bottom wall of the duct. The roughness geometry is characterized by a rib height e = 2 mm and a pitch P = 10 mm, selected based on reported optimal ranges in previous experimental studies. The roughness elements are uniformly distributed along the test section, while the entrance and exit sections are kept smooth to ensure flow development and numerical stability. A smooth duct configuration with identical dimensions is also simulated to validate the numerical model against experimental results and empirical correlations before analyzing the roughened geometry.

**Working Fluid Properties and Operating Conditions**

Air is used as the working fluid and is assumed to be incompressible with constant thermos-physical properties evaluated at ambient conditions. The properties used in the simulations are listed below and correspond to commonly accepted values for solar air heater studies:

Density, $\varrho = 1.225$ kg/m³

Specific heat, Cp = 1005 J/kg·K

Dynamic viscosity, $\mu = 1.85 \times 10^{-5}$ Ns/m²

Thermal conductivity, k = 0.026 W/m·K

The flow is considered steady, turbulent, and fully developed within the test section. Simulations are performed for Reynolds numbers ranging from 3000 to 11000, covering the practical operating range of solar air heaters used for drying and space heating applications

**Boundary Conditions**

At the inlet, a uniform velocity boundary condition corresponding to the desired Reynolds number ranging from 3000 – 11000 is imposed, along with a constant inlet air temperature. The outlet is defined using a pressure outlet boundary condition with zero gauge pressure. A uniform heat flux boundary condition is applied at the absorber plate to represent constant solar insolation. The imposed heat flux corresponds to a solar intensity of 1000 W/m², which is a standard value adopted in experimental and numerical studies of solar air heaters. All remaining duct walls are assumed to be adiabatic. No-slip boundary conditions are applied at all solid walls. Radiation and buoyancy effects are neglected, as forced convection dominates the heat transfer mechanism in the present operating range

**Governing Equations**

The flow and heat transfer are governed by the steady-state, three-dimensional Reynolds-averaged Navier–Stokes (RANS) equations along with the energy equation.

**Continuity equation**

The continuity equation is the mathematical statement of the concept of conservation of mass applied to an elemental control volume within a fluid in motion, and it is evaluated by using Eq. (1) [32–33]:

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0 \qquad (1)$$

This is the mass continuity equation for three-dimensional steady flow.

**Momentum equation. It can be calculated by using Eqs. (2-4) [32-33]**

**x–momentum equation**

$$u\frac{\partial u}{\partial x}+ v\frac{\partial u}{\partial y}+ w\frac{\partial u}{\partial z}= -\frac{1}{\rho}\frac{\partial p}{\partial x} + \nu\left(\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}+\frac{\partial^2 u}{\partial z^2}\right) \quad (2)$$

**y–momentum equation**

$$u\frac{\partial v}{\partial x} + v\frac{\partial v}{\partial y} + w\frac{\partial v}{\partial z} == -\frac{1}{\rho}\frac{\partial p}{\partial y} + \nu\left(\frac{\partial^2 v}{\partial x^2}+\frac{\partial^2 v}{\partial y^2}+\frac{\partial^2 v}{\partial z^2}\right) \quad (3)$$

**z–momentum equation**

$$u\frac{\partial w}{\partial x}+ v\frac{\partial w}{\partial y}+ w\frac{\partial w}{\partial z}= -\frac{1}{\rho}\frac{\partial p}{\partial z} + \nu\left(\frac{\partial^2 w}{\partial x^2}+\frac{\partial^2 w}{\partial y^2}+\frac{\partial^2 w}{\partial z^2}\right) \quad (4)$$

**Energy equation:** If the flow is continuous and incompressible with constant thermal conductivity, there is no compression effect and no heat generation. In this case, no viscous heating is generated and the following equation can be used [36-37, 38]:

$$u\frac{\partial T}{\partial x} + v\frac{\partial T}{\partial y} + w\frac{\partial T}{\partial z} = \alpha\left(\frac{\partial^2 T}{\partial x^2}+\frac{\partial^2 T}{\partial y^2}+\frac{\partial^2 T}{\partial z^2}\right) \quad (5)$$

**Turbulence Model Selection**

The SST k–ω turbulence model is employed in the present study due to its proven capability in accurately predicting near-wall flows with strong separation and reattachment, which are characteristic of roughened solar air heater ducts. The model combines the advantages of the k–ω formulation in the near-wall region with the k–ε formulation in the free stream, making it suitable for resolving complex turbulent structures induced by artificial roughness. (Figure 5) shows the turbulence model comparison.

**Mesh Generation and Grid Independence**

A structured hexahedral mesh is generated for the smooth duct, while a hybrid mesh is employed for the roughened configuration to accurately capture the complex rib geometry. Special attention is given to near-wall mesh refinement through the use of inflation layers. A total of 10 inflation (Figure 4) layers with a growth rate of 1.5 are applied near all walls, and the first cell height is chosen to maintain $y^+ \approx 1$ throughout the test section. This ensures proper resolution of the viscous sublayer and accurate prediction of wall shear stress and heat flux. Three increasingly improved meshes are used in a grid independence investigation. The variation between the medium and fine meshes is found to be less than 2%, showing mesh-independent outcomes when the average Nusselt number is utilized as the monitoring parameter. In order to balance accuracy and computational expense, the medium mesh is chosen for all ensuing simulations based on this study. Grid independence has been attained as the values plateau toward the theoretical limit, as shown by the practically identical findings from (Figure 6) for 2.74M and 4.40M elements.

**Experimental Setup**

The schematic diagram of experimental set up is shown in (Figure 7). The test rig consists of a centrifugal blower, rectangular wooden duct, electric lamp, differential pressure transducer, Anemometer, PT-100 sensors (bolt type and probe type), glass cover, pyranometer and 16 channel universal data logger. The photographic view of experimental setup is shown in (Figure 8 and 9). The duct of rectangular cross-section having high aspect ratio (W>> H) consists of three sections namely entry (L1= 350 mm), test (L2= 600 mm) and exist section (L3= 200 mm). The length of three sections are taken according to ASHRAE standards [34]. The aspect ratio (W/ H) of 5 is considered in this case which is much greater than unity. Absorber plate in the test section is made of aluminium plate having thickness 6 mm, 100 mm wide and 600 mm length. The V+arc profile is made on aluminium plate with the help of CNC milling machine.

**Experimental investigation and Data Collection**

The experimental investigation was carried out using a solar air heater (SAH) test rig designed and fabricated in accordance with standard testing practices. Two absorber plate configurations were tested: smooth plate and V+Arc

ribbed plate with a pitch of 10 mm. Air was used as the working fluid and was supplied to the duct using a centrifugal blower installed at the inlet section. The airflow rate through the duct was regulated using a control valve, and the mass flow rate was calculated based on inlet velocity measurements. To minimize heat loss, the side and bottom walls of the duct were insulated using glass wool insulation. The absorber plate was heated with the bulbs to provide a uniform and controllable heat flux condition, simulating solar radiation under steady-state conditions.

**Data Reduction**

The CFD data such as air temperature, absorber plate temperature and pressure difference across duct are calculated from CFD post and experimental data are recorded with the help of 16 channel universal data logger under steady-state conditions. The influence of V+arc rib arrangement on Nu and $f$ can be calculated by the equation mention below:

The average Nusselt number is defined as [35]

$$Nu = h \frac{D_h}{k} \quad (6)$$

The heat transfer coefficient h is obtained from energy balance equation.

$$h = Q_u = \dot{m} c_p (T_{out} - T_{in}) \quad (7)$$

The average friction factor ($f$) is calculated with the help of pressure drop (ΔP) along the length of the duct which is given below.

$$f = \frac{2 \Delta P D_h}{(\rho L V^2)} \quad (8)$$

The thermohydraulic performance (denoted by η) is given below [36].

$$\eta = \frac{\left(\frac{Nu}{Nu_s}\right)}{\left(\frac{f}{f_s}\right)^{\left\{\frac{1}{3}\right\}}} \quad (9)$$

Dittus–Boelter equation is given below [37]

$$Nu = 0.023\, Re^{\{0.8\}} Pr^{\{0.4\}} \quad (10)$$

Whereas, Blasius equation for friction factor is given below [37]

$$f = 0.316\, Re^{\{-0.25\}} \quad (11)$$

## RESULT AND DISCUSSION

Figures 10 illustrate the validation of the present CFD model for the smooth solar air heater duct by comparing the Nusselt number and friction factor with corresponding experimental data and well-established empirical correlations. For the Reynolds number range of 3000–11000, the CFD based Nusselt number shows a monotonic increase with Reynolds number and closely follows the experimental trend. The maximum deviation between the CFD results and experimental data is observed to be within 5–8%, while the deviation with respect to the Dittus–Boelter correlation remains within 8–10% across the investigated range. This level of agreement indicates that the present numerical model reliably captures the convective heat transfer behavior in the smooth duct. Similarly, the friction factor by the CFD model decreases with increasing Reynolds number, consistent with both experimental measurements and the Blasius correlation. The CFD results show a marginal over rise of friction factor compared to the Blasius correlation, with deviations ranging from approximately 7–12%, whereas the deviation relative to experimental data is limited to about 5–9%. The closer agreement with experimental results suggests that the CFD model effectively accounts for near-wall viscous effects, which are simplified in empirical correlations. Overall, the numerical results for both Nusselt number and friction factor exhibit good agreement with experimental data and standard correlations, with deviations remaining within acceptable limits reported in the literature. The successful validation of the smooth duct case confirms the suitability of the selected turbulence model, mesh strategy, and near-wall treatment. Hence, the present CFD framework is considered reliable and is subsequently employed to investigate the heat transfer enhancement and pressure drop characteristics of the solar air heater duct with V+arc shaped artificial roughness.

**Heat Transfer Enhancement**

Figure 11.shows the variation of average Nusselt number with Reynolds number for smooth and V+arc roughened solar air heater ducts. For both cases, the Nusselt number increases with Reynolds number; however, the roughened duct consistently exhibits higher values. At Re ≈ 4000, the Nusselt number for the V+arc roughened duct is about 60–70% higher than that of the smooth duct. This enhancement increases with Reynolds number, reaching approximately 1.9–2.1 times at Re ≈ 12000. The improvement in heat transfer is attributed to the combined effect of V-shaped and arc-shaped roughness elements. The V-shaped segments promote flow impingement and strong secondary vortices, while the arc-shaped segments extend the reattachment region, leading to repeated disruption of the thermal boundary layer. The CFD predictions for the roughened duct agree well with experimental data, with deviations generally within ±10%.

**Friction Factor Characteristics**

The variation of friction factor with Reynolds number is presented in Figure 12. For both smooth and roughened ducts, the friction factor decreases with increasing Reynolds number. The friction factor for the V+arc roughened duct is significantly higher than that of the smooth duct due to increased form drag and turbulence generation. At Re ≈ 4000, the friction factor for the roughened duct is approximately 2.3–2.8 times that of the smooth duct. At higher Reynolds numbers (Re ≈ 15000), this ratio reduces to about 2.0–2.4, indicating a comparatively lower hydraulic penalty at higher flow rates. These trends are consistent with earlier studies on V+arctype roughness geometries.

**Thermo-Hydraulic Performance**

The overall effectiveness of the V+arc roughness is (figure -13) evaluated using the thermo-hydraulic performance parameter (THPP) under equal pumping power conditions. The THPP remains greater than unity for the entire Reynolds number range studied. At Re ≈ 4000, the THPP is around 1.59, and it reaches a maximum value of approximately 1.64 in the range of Re ≈ 9000–11000. Even at higher Reynolds numbers, the THPP remains above 1.60, confirming a net performance gain over 60% relative to the smooth plate baseline. The results indicate that the V+arc roughened solar air heater offers a favorable balance between heat transfer enhancement and pressure drop, particularly at moderate Reynolds numbers relevant to practical applications.

## CONCLUSION

The numerical investigation into the solar air heater confirms that the V+Arc roughened geometry significantly outperforms the smooth plate baseline in terms of thermal efficiency. The artificial roughness successfully disrupts the laminar sub-layer, leading to a maximum Nusselt number of 72.25, which is nearly double that of the smooth geometry at the highest flow rate. While the roughness introduces a hydraulic penalty by increasing the friction factor relative to the smooth duct, the overall efficiency remains exceptionally high. The Thermo-Hydraulic Performance Parameter (THPP) consistently stayed between 1.59 and 1.64, proving that the heat transfer gains far outweigh the increased pumping power requirements. Furthermore, the study was verified through a grid independence study and validated against Experimental setup and standard Dittus–Boelter and Blasius correlations, ensuring the high reliability of the computational model. These results demonstrate that the V+Arc configuration is an effective and optimized design for enhancing the energy efficiency of solar air heating systems.

**Nomenclature**

| | | |
|---|---|---|
| $C_p$ | : | Specific heat capacity, kJ/kg·K |
| δp | : | pressure drop, Pa |
| THPP | : | Thermo-Hydraulic Performance Parameter |
| Nu | : | Nusselt No. |
| L | : | length, mm |
| e | : | e – roughness height, mm |
| f | : | friction factor |

$D_h$ : hydraulic diameter, mm
$T_{inlet}$ : Air Inlet temperature [°K]
$T_{outlet}$ : Air Outlet temperature [°K]
$T_{ab}$ : Absorber plate temperature [°K]
Re : Reynolds number
P : roughness pitch, mm

**Greek Symbols**

K : Thermal conductivity, W/m·k
h : Convective heat transfer coefficient, W/m²·k
A : Surface area involved in heat transfer, m²
$\alpha$ : thermal diffusivity, m²/s
$\nu$ : kinematic viscosity, m²/s
$\varrho$ : fluid density, kg/ m³

## ABSTRACT

Crop yield prediction refers to the process of estimating the amount of agricultural productivity from a given area of land measured in kilograms or tons per hectare. To solve the issues, a novel method Linear Regression Tuned Deep Transfer Learning Network (LiRT-TLNet) is introduced to enhance the crop yield prediction within the smart farming application. Deep transfer learning network model is employed by adapting a pre-trained deep learning classification model specifically, a Multilayer Perceptron (MLP) for forecasting the cropyield. It consists of multiple layers, including an input layer, three hidden layers, and an output layer. An IoT technology is implemented in agriculture for monitoring and collecting weather data and soil characteristics. These collected data is sent to a cloud platform and stored in form of database where a Deep transfer learning network predicts the expected yield for next harvest. Based on this, the farmer receives alerts to optimize irrigation schedules and apply fertilizer leading to better productivity and reduced costs. Within the hidden layers of MLP architecture, data preprocessing is integrated to address missing values and remove outliers, ensuring clean and reliable input. Subsequently, dimensionality reduction is performed by Cramer's phi correlation coefficient for selecting the most relevant features. Prediction occurs in third hidden layer, where extracted features and data samples are analyzed by applying least square regression. Finally, predicted crop yield results are observed at output layer. The knowledge learned by pre-trained model from previous crop yield prediction tasks is transferred to new model, improving feature learning and increasing accuracy of

predictions. A new part of process is fine-tuning, where Owl optimization algorithm is applied to update hyperparameter of MLP for reducing the training and validation errors, thereby boosting precision of crop yield prediction. The performance of LiRT-TLNet model is assessed using several critical evaluation metrics. Experimental results are consistently delivering higher prediction accuracy and computational efficiency compared to conventional deep learning models.

**Keywords:** Smart Precision Farming, Crop Yield Prediction, Cloud Environment, IoT, Deep transfer learning network, Multilayer Preceptor (MLP), Cramer's phi correlation coefficient, Owl optimization algorithm.

## INTRODUCTION

Crop yield prediction is a critical aspect of modern agriculture that helps farmers, make informed decisions about food production and resource management. Attention mechanism integrated into a one-dimensional convolution neural network and long short-term memory (AM-CNN-LSTM) was introduced in [1] with improving the crop yield estimation. However, the proposed model was not effective in reducing the time consumption associated. A new deep learning model called CNN-Transformer with serial connection (CNN Transformers) was developed in [2] to evaluate the winter wheat yield. However, the complexity of deep learning models still poses challenged. An optimized ensemble predictive model was introduced in [3] for estimating the crop yield prediction based on environmental and chemical variables. However, it failed to diverse datasets that cover multiple regions and variety of crops. Distinct ensemble machine learning models were developed in [4] for forecasting crop yields to manage complex datasets. However, model accuracy and applicability were not enhanced. In order to enhance the accuracy, a deep transfer learning model was designed in [5] for country level crop yield prediction. However, efficient fine tuning was significant challenges. Gradient based ensemble learning algorithms were designed in [6] for predicting the crop yields with lesser RMSE. Algorithm did not consider the additional factors such as soil fertility to provide a more comprehensive recommendation system. Machine Learning techniques were developed in [7] for climate data for predicting the wheat yield. But, it failed to improve the precision of large-scale yield prediction. An advanced machine learning algorithm were developed in [8] for estimating the wheat yield during the winter season with minimal error rate. However, it did not integrate the multisource data. A long short-term memory network was designed in [9] for crop yield prediction using remote sensing data. However, the model was not effective in reducing prediction errors. A generalized linear mixed model (GLMM) was developed in [10] for predicting the agriculture yield with lesser RMSE. However, the model was not employed for accurate yield prediction. An advanced Deep Learning (DL) architectures were employed in [11] for predicting soybean yields with minimal RMSE. However, the architecture failed to improve their performance, reliability and interpretability. AI-based system was designed in [12] by integrating the deep learning, Global Positioning System (GPS) to create a highly intelligent smart agricultural precision farming system. However, the system was not collectively enhancing the model's ability to improve yields prediction in smart agriculture. Different machine learning models were developed in [13] for wheat yield prediction using remote sensing data. However, the models did not focus on various factors such as soil characteristics, socioeconomic and management practices for accurate yield prediction. Two methods called linear regression and random forest were developed in [14] for peanut yield prediction. However, the designed model was not robust for modeling peanut yields across different cultivation seasons and region. A zone partitioning and hierarchical assimilation system were developed in [15] with enhancing the high-precision prediction of large-scale rice yield. However, more state variables were not considered in the assimilation system.

**Major Contributions**

The key contributions of the LiRT-TLNet model are outlined as follows

- To design a novel AI technique called LiRT-TLNet model for accurate crop yield prediction by implementing pre-processing, feature selection, prediction.

- A LiRT-TLNet model performs data pre-processing and relevant feature selection to reduce the time consumption of crop yield prediction.
- To improve the accuracy of crop yield prediction and minimize error, the least square regression is employed to analyze data samples and provide the prediction results. Moreover, the owl search optimization is applied for hyper parameter fine-tuning in transfer learning approach to further reduce RMSE, MAE and increases the accuracy.
- The comparative analysis of proposed LiRT-TLNetmodel has been evaluated based on conventional deep learning methods with various performance metrics.

**Organization of the paper**

The organization of this paper is as follows: Section 2 provides a review of related work in the domain. Section 3 introduces the proposed LiRT-TLNet model, detailing its components and presenting a corresponding workflow diagram. Section 4 outlines the experimental configuration and offers a description of the dataset. Section 5 discusses the model's performance through a comparative analysis using multiple evaluation metrics. Finally, Section 6 summarizes the findings and concludes the paper.

## RELATED WORKS

A quantile regression forest model was integrated into random forest in [16] for estimating the corn yield. However, an advanced model was not employed to achieve more accurate and explainable yield prediction. Machine learning techniques were designed in [17] for wheat grain yield (GY) prediction resulting in a minimum RMSE. However, hyper parameter optimization and evolutionary algorithms were not considered. An integration of random forest and XGBoost were introduced in [18] for Precision biochar yield forecasting. However, the model was not efficient in large scale data samples. Meta-regression approaches were introduced in [19] for predicting the soybean yield variation. However, the approaches failed to mitigate the effects of climate changes. Support Vector Regressor (SVR) was introduced in [20] for improving the crop yield prediction accuracy based on hybrid feature selection approach. However, the accuracy was not improved. An Adaptive Neuro Fuzzy Interference System (ANFIS) was designed in [21] for multi-crop yield prediction. However, the system did not include factors such as soil type, soil texture, fertilizer usage, irrigation, and water requirements in crop yield prediction. A zonal-integrated modeling framework was developed in [22] to improve the crop yield prediction accuracy through the feature extraction capability. However, the framework did not integrate long-term temporal data, multi-crop validation to further verify the model's applicability. A Multi-Task Crop Yield Prediction Network (MT-CYP-Net) was designed in [23] for crop yield prediction using effective multi-task feature-sharing strategy. However, the model was not efficient when applied to large-scale datasets. An enhanced fuzzy logic and deep learning model were developed in [24] for estimating the crop yield. However, it did not focus on integrating the multi-modal data sources namely environmental conditions, soil micro- biome data, to strengthen the prediction accuracy. An adaptive Echo State Network (ESN) was introduced in [25] for improving the maize yield prediction with minimal computational cost. However, it was unable to provide the timely and accurate predictions for soybean yield. A dual attention mechanism was designed in [26] for large-scale crop yield prediction which exhibits significantly lesser RMSE and higher correlation coefficients. However, minimizing the prediction time remained a major challenge. An explainable AI-based hybrid machine learning model was developed in [27] for crop yield prediction. However, the model was not robust to improve robustness, scalability, and adoption in diverse agricultural dataset. A transfer-learning-based framework was developed in [28] for estimating the crop yield with better accuracy. However, the utilization of remote sensing data in combination with crop growth models was not incorporated to improve the predictive performance. A random forest algorithm was introduced in [29] with the aim of reducing the soybean yield. However, the time complexity was not reduced. Gorilla Troops Optimization with Deep Learning model was developed in [30] for accurate yield prediction model. However, data preprocessing models was not improved.

## PROPOSAL METHODOLOGY

The proposed LiRT-TLNet is to enhance predictive accuracy. By effectively modeling complex patterns in agricultural data, the proposed LiRT-TLNet model enables more reliable yield predictions, under unstable environmental conditions. Figure 1 above shows the architecture diagram of the proposed LiRT-TLNet model for accurate prediction of crop yield. The model is structured into two main phases namely the pre-trained phase and the newly developed model. In the first phase, a pre-trained model is developed using a large volume of training data samples collected from an appropriate dataset. Following this, a new model is built that utilizes the knowledge obtained from the pre-trained model through the process of transfer learning. The proposed LiRT-TLNet model combines these two phases into a combined architecture, functioning across four core stages namely data acquisition, data augmentation, pre-processing, feature selection, and classification. Each of these steps plays a critical role in accurately predicting the crop yield and overall performance.

**Data Acquisition**

Data acquisition in agriculture refers to process of collecting real-time data from farming environment using IoT (Internet of Things) devices such as soil moisture sensors, weather stations, and drones. These devices capture critical parameters like temperature, PH, humidity, soil moisture, and crop health. The collected data is then transmitted wirelessly to cloud computing platforms, where it is stored, processed, and analyzed. This integration allows farmers to access remotely. By utilizing data acquisition through IoT and cloud technologies, modern agriculture becomes more efficient, sustainable, and responsive to changing environmental conditions. A Smart Farming Sensor Data and Yield Prediction dataset is collected from https://www.kaggle.com/datasets/atharvasoundankar/smart-farming-sensor-data-for-yield prediction. The dataset includes with 22 unique features and 500 individual entries for constructing accurate and dependable crop yield forecasting systems.

**Data Augmentation**

Data augmentation is a process used in LiRT-TLNet model to increase the size and diversity of a dataset by creating modified versions of existing known data samples. This process helps to improve the performance and generalization of machine learning models, especially when the original dataset size is small. The proposed LiRT-TLNet model utilizes the Adaptive Synthetic proximity sampling as a data augmentation technique for generating synthetic samples by interpolating nearest neighbors. Consider a mart Farming Sensor Data and Yield Prediction dataset named$\boldsymbol{DS}$, which consists of multiple data samples denoted as$D$. Each sample contains several features represented by the set $\{F = \{F_1, F_2, \dots, F_m\}$. These data samples and their corresponding features are organized in a matrix format. This input matrix '$IM$', which serves as input to a model is expressed as follows,

$$IM = \begin{bmatrix} F_1 & F_2 & \dots & F_{\mathrm{m}} \\ D_{11} & D_{12} & \dots & D_{1n} \\ D_{21} & D_{22} & \dots & D_{2n} \\ \vdots & \vdots & \dots & \vdots \\ D_{m1} & D_{m2} & \dots & D_{mn} \end{bmatrix} \quad (1)$$

Where, Here, $n$ denotes the total number of data samples in dataset, and $m$ indicates the number of features for each sample. By applying Adaptive Synthetic proximity sampling, the new synthetic samples '$D_S$' are generated based on an existing sample and one of its neighbors.

$$D_S = D_i + R * |D_{NN} - D_i| \quad (2)$$

Where, $D_i$ represents original data samples, $D_{NN}$ represents the nearest neighbor of data samples '$D_i$', $R$ denotes a random number between 0 and 1. In this way, large volumes of synthetic data samples are generated for accurate crop yield prediction. These generated samples are then transferred into to transfer learning model for accurate crop yield prediction.

**Enhanced Transfer learning-based crop yield prediction**

Transfer learning is a discriminative artificial intelligence that applies knowledge acquired from one task to improve learning in a different, but related task. On the contrary to traditional deep learning methods, transfer learning

enables faster model development and often delivers improved performance especially when dealing with large-scale datasets. The schematic structure of the Transfer learning model is shown in figure 2. Figure 2 illustrates the schematic structure of a deep transfer learning model, which integrates a pre-trained model with a newly added model component. The pre-trained model is based on (MLP) architecture, comprising an input layer, one or more hidden layers and an output layer. Within the transfer learning framework, a large number of new data samples are used to adapt this pre-trained model to crop yield prediction. As shown in Figure 2, certain layers of the pre-trained model are frozen, meaning their parameters remain unchanged during training. As shown in figure 2, frozen layers refer to part of the pre-trained model remain fixed during training and add the two new layers for fine-tuning and output layer.

**Pre-trained Model**

A pre-trained model is a deep learning model that trained on a large dataset to learn useful patterns. In this case, pre-trained MLP (Multi-Layer Perceptron) model is used for crop yield prediction. An MLP is a type of neural network with multiple layers of neurons that learns complex relationships between input data samples and output such as crop yield. Figure 3 given above depicts the structure of an MLP to perform accurate crop yield prediction. The input and output layers are always single layers, while the hidden layers include numerous sub-layers. The neural network consists of multiple layers made up of small processing units called artificial neurons or nodes. Each neuron receives input values, processes them using a mathematical function, and passes the result to neurons in the next layer. The connections between neurons, known as synapses, have associated weights that control the strength of the input samples transferred from one neuron to another. These weights are adjusted during training to improve the model's accuracy in performing crop yield prediction. Let us consider a number of Features '$F = \{F_1, F_2, \dots, F_m\}$' and Samples '$S = D_1, D_2, \dots, D_n$given to the input layer of MLP. In the input layer, each neuron receives input features from the data samples. The neurons then compute a weighted sum of these inputs, which is expressed mathematically as follows,

$$X = \sum_{i=1}^{n} (D_i * w_{i_h}) + b \quad (3)$$

Where, $X$ denotes a weighted sum output, $w_{i_h}$represents a weight between input and hidden layer, number of samples '$D_i$', '$b$ specifies a bias that stored the value is '1'. The input is transferred into the next layer for preprocessing.

**Preprocessing**

In the first hidden layer, data preprocessing is the process of cleaning and preparing raw data for effectively perform crop yield prediction. The preprocessing step typically includes data handling missing and duplicate data removal. These steps help ensure that the input data is consistent, relevant, and properly scaled, which improves the accuracy and efficiency of the learning algorithm. The Weighted Mean Imputation is used to fill missing values by calculating the mean of available values, where each value contributes proportionally to its assigned weight.

$$D_m = \frac{\sum_{i=1}^{n} D_i * \varphi_i}{\sum_{i=1}^{n} \varphi_i} \quad (4)$$

Where,$D_m$ represents a missing data, $D_i$ indicates a known data points, $\varphi_i$ represents a weight assigned to data '$D_i$ '. Followed by, Dixon's Ratio Test is employed to determine outlier data in the given dataset. It is used to detect and categorize outliers in a dataset. First, the input data samples are sorted in ascending order. The Dixon's Ratio Test is then calculated using the following formula

$$QT = \frac{|D_i - D_{nn}|}{Max_D - Min_D} \quad (5)$$

Where, $QT$ indicates a Dixon's Ratio Test, $D_i$ represents a data point in the particular cell, $D_{nn}$ denotes a nearest value of $D_i$, $Max_D$ represents a maximum value in ascending order and the $Min_D$ represents a minimum value in ascending order. The statistical test provides output ranged from 0 to 1. If the calculated $QT$ value is greater than the threshold, particular data value is considered an outlier. If the estimated $QT$ value is lesser than the threshold, the data is not considered an outlier. The identified outlier data is removed from the dataset.

## FEATURE SELECTION

Feature selection is identifying selecting the most relevant features from a dataset. By choosing only the important features, it helps improve crop yield prediction accuracy while minimizing the time complexity. The proposed method utilizes Phi Coefficient to determine the more relevant features-based correlation coefficient. The correlation coefficient is to measure the association between the features using Cramer's phi test. The helps to project features in dataset onto a lower-dimensional space in order to avoid the curse of dimensionality and also minimize time complexity. Let us consider set of features in dataset.

$F_j = \{F_1, F_2, F_3, .. F_n\} \in DS$ (6)

Where, $F_j$ denotes a set of attributes or features in the big dataset$DS$. The correlation between the features is measured using Cramer's phi test.

$PC = \left[\frac{\sum_{j=1}^{m}\sum_{k=1}^{b}|F_i - F_k|^2}{(m-1)+(k-1)}\right]$ (7)

Where, $PC$ denotes a Cramer's phi test results, features '$F_i$ '$F_k$', $m, k$ are sample size. The test returns a value from 0 (no correlation between the features) to 1 (correlation between the features).

$$H = \begin{cases} PC = 1\ ; & F_i\ correlated\ with\ F_k \\ PC = 0\ ; & no\ correlation\ between features \end{cases} \quad (8)$$

The Cramer's phi correlation coefficient$PC$ is used to measure the similarity between pairs of features. A coefficient value of 1 indicates the two features are highly similar and it selected. A value of 0 means the features are dissimilar, so the feature is removed. This approach helps in selecting a subset of similar features for prediction, reducing redundancy and computational time.

**Prediction**

After identifying and selecting the most relevant features, the next step is to accurately predict crop yield. To analyze the relationships between these selected features and multiple related target variables; Total least squares regression is employed. It is a least squares approach that accounts for measurement errors in both the independent (input data samples) and dependent (crop yield prediction) during data processing. The estimated crop yield prediction model is observed as follows,

$Z = \sum_{i=1}^{n} D_i * \beta$ (9)

Where, $Z$ denotes an estimated crop yield prediction, $D_i$ denotes an input data samples, $\beta$ denotes a regression coefficient. In linear least squares regression, the model consists of equations that are linear with respect to the parameters. The residuals, which represent differences between the observed values and model's predictions, are calculated as:

$R = Z - \sum_{i=1}^{n} D_i \beta$ (10)

Where, $R$ denotes a residual function and minimize the objective function '$O$', typically the sum of squared residuals.

$O = \arg\min R$ (11)

By solving the residual function problem that minimizes the sum of squared residuals, the regression model identifies the optimal set of parameters that best fit the relationship between the input data samples and the crop yield. Minimizing the residuals ensures that the predicted yields are as close as possible to the actual observed yields across all data samples. As a result, the model provides more accurate and reliable yield optimization. Finally, the output of prediction is observed at output layer by means of softmax activation functions.

$Y = A_{softmax}\ (h_o * w_{h_o})$ (12)

Where, $Y$ denotes an output of crop yield prediction, $h_o$ represents the output of hidden layer, $w_{h_o}$ denotes a weight between the hidden and output layer. The algorithm step of pre-trained model is described as follows,

| **// Algorithm 1: Pre-trained Classification Model** |
|---|

**Create new prediction model**

In a transfer learning strategy, a small set of training data samples is used to develop a new model by utilizing an existing pre-trained network, such as an MLP. As illustrated in Figure 2, certain layers referred to as frozen layers are retained from original model with their weights fixed during the new training phase. These layers retain previously learned knowledge and act as a base for new task. These layers protect the knowledge observed from the pre-trained model. For constructing to a new task, additional layers, including a new output layer and fine-tuned. The input data samples are transferred through the frozen layers which often include the initial input and early hidden layers, without altering their parameters. Freezing these layers not only preserves useful features learned from the original task but also reduces training time and computational load. To develop the new model, the architecture keeps the input layer and first three hidden layers fixed by freezing them, while two new layers are added for task-specific adaptation and final output. A limited number of input samples are transferred through the hidden layers, where initial data preprocessing is carried out. This involves addressing missing values using a [4] approach and identifying outliers through the normalized residual test using [5]. In the second hidden layer, the model performs feature selection by calculating the Phi coefficient, ensuring that only the most relevant features are retained. The third hidden layer performs prediction task by using the total least squares regression to assess the similarity between data patterns and make predictions. The output of the yield prediction in hidden layer is fine-tuned by applying an Owl Search Optimization thereby minimizing both training and validation errors and improving the accuracy of the crop yield prediction. For each prediction result, the error rate is computed based on squared difference between the actual and prediction results.

$$PE = [Z_{Act} - Z_{obs}]^2 \quad (13)$$

Where, $PE$ indicates an error, $Z_{Act}$ denotes actual prediction results, $Z_{obs}$ represents observed prediction results. Followed by, the initial weights get updated based on the error. In order to reduce the error, the adaptive gradient method is applied.

$$w_{new} = w_t - \eta \frac{\partial PE}{\partial w_t} \quad (14)$$

Where $w_{new}$ represents an updated weight, $w_t$ indicates a previous weight, $\eta$ denotes a learning rate, '$\frac{\partial PE}{\partial w_t}$' represents a partial derivative of error rate regarding current weight '$w_t$'.

In order to minimize the error, an Owl Search Optimization (OSO) algorithm is designed to minimize the error in crop yield prediction. OSO is a nature-inspired meta-heuristic algorithm that represents its concept from the hunting

behavior of owls. On the contrary to other optimization algorithm, OSO handles complex and high-dimensional optimization problems in deep learning models.

By applying OSO algorithm, initial population of weights is randomly generated within the search space.

$w = \{w_1, w_2, \dots, w_k\}$ (15)

After generating the initial population, the fitness is measured'$f(w)$' based on error rate.

$f(w) = \arg\min PE$ (16)

Where,$PE$ denotes prediction error. The owl with better fitness is selected as current optimal. Each owl updates its position based on its distance from prey, adjusting its location in search space to move closer to optimal solution.

$P_{t+1} = P_t + \ \delta * \Delta\vartheta * \left| r\, P_{prey} - \ P_t \right| P$ (17)

$\vartheta = \frac{\vartheta(P_t)}{d^2} + \gamma$ (18)

Where, $P_{t+1}$ represents an updated location of the owl, $P_t$ denotes a current location of the owl, $\delta$ indicates a parameter that organizes the degree of changes in the positions of search agents (owls) during optimization, $\Delta\vartheta$ represents an Intensity changed coefficient of the owl, $\vartheta(P_t)$ denotes a current intensity coefficient of the owl, '$d$' represents a distance between the target prey and owl, $r$ indicates a random value between [0, 0.5], $P_{prey}$ represents a target location of prey, $P$ represents the probability of owl moved in a particular direction. Finally, the algorithm identifies the optimal set of weights that lead to the lowest error rate in crop yield prediction. The final prediction output, with minimized error, is produced at the output layer with softmax activation function. The algorithmic process of new classifier model is given below.

**// Algorithm 2: New Classifier Model based Crop yield prediction**

**Input**: Dataset features $F_1, F_2, \dots, F_m$ and **data samples** $D_1, D_2, D_3, \dots D_n$

**Output:** Increase the of crop yield prediction accuracy

**Begin**

1. **Collect n**umber of features $F_1, F_2, \dots, F_m$ , and small number of data samples $D_1, D_2, D_3, \dots D_n$--- **input layer**
2. **For each** sample $D_i$
3. Compute the neuron activation probability using (3)
4. Perform Data Pre-processing using (4)(5) **-----[ Hidden layer 1]**
5. **End for**
6. **For each pre-processed dataset**
7. **Select relevant** feature set using (6) **-----[ Hidden layer 2]**
8. **End for**
9. **For each** training data samples
10. Apply the regression analysis using (9) (10) (11) -----[ **Hidden layer 3**]
11. Obtain the prediction results
12. **End for**
13. **For each prediction result** -----[ **Hidden layer 4**]
14. Measure the error rate ' $PE$ using (13)
15. Update the weights using (14)
16. **End for**
17. Initialize the population of the weights using (15)
18. **While (t<$t_{max}$) do**
19. **For each** weight '$w_k$'
20. Compute the fitness '$f(w)$' using (16)
21. **End for**
22. **select** weights based on fitness
23. Update the position of Owl using (17)
24. **t= t+1**
25. **Go to step 18**
26. **End while**
27. Return (global best weight)

**28.** Obtain the final prediction results with minimum error **at the output layer**
**End**

**Experimental Setup**
The proposed LiRT-TLNet model and existing AM-CNN-LSTM [1] and CNN-Transformer [2], is experimentally evaluated using Python high-level programming language.

**Implementation Results**
The LiRT-TLNet model is observed for analyzing crop yield prediction. The evaluation is conducted by utilizing Smart Farming Sensor Data for Yield Prediction dataset taken from Kaggle repository. First, numbers of data sample data are collected from dataset is shown in figure 4. This dataset includes 22 features and 500 records. Following data collection, data augmentation is carried out using dataset from 500 to 10500 records. The dataset undergoes preprocessing by handling 10500 data entries by resolving missing data, and identifying and eliminating outliers. The outcomes and transformations from preprocessing stage are illustrated in Figure 6.Following preprocessing phase, Cramer's phi correlation coefficient identifies relevant features while discarding less significant ones. In final stage, prediction task is performed to estimate crop yield typically for a given land area.

## RESULTS AND ANALYSIS

**Performance Comparison of deep learning models for Yield Estimation**
The three-comparison model namely LiRT-TLNet model, along with existing approaches such as AM-CNN-LSTM [1] and CNN-Transformer [2] are evaluated by including the several performance indicators such as
**Crop yield prediction accuracy '$CPA$'**: It is computed by the ratio of correctly predicted yield values to the total number of samples in the dataset.

$$CPA = \left(\frac{TP+TN}{TP+TN+FP+FN}\right) * 100 \quad (19)$$

Where, $TP$ represents the true positive, $TN$ denotes the true negative, $FP$ denotes the false positive, $FN$ represents the false negative. It is measured in percentage (%).

**Precision '$\boldsymbol{Prec}$'**: It is determined by calculating the ratio of correctly predicted positive instances (true positives) to total number of instances predicted as positive, which includes both true positives '*TP*' and false positives '*FP*'. The formula for precision is shown below:

$$\boldsymbol{Prec} = \left(\frac{\boldsymbol{TP}}{\boldsymbol{TP+FP}}\right) * \mathbf{100} \quad (20)$$

**Recall:** It also known as sensitivity, evaluates the model's effectiveness in correctly identifying positive crop yield cases.

$$Recall = \left(\frac{TP}{TP+FN}\right) * 100 \quad (21).$$

**F1 score:** it is measured as the harmonic mean of precision'$Prec$'and recall.

$$F1 - Score = 2 * \left(\frac{\boldsymbol{Prec} * Recall}{\boldsymbol{Prec} * Recall}\right) \quad (22)$$

**Root mean square error '$RMSE$':** It is employed to evaluate the accuracy of crop yield predictions by measuring the difference between predicted and actual values. It quantifies the model's prediction error by taking the square root of the mean of squared differences between the predicted values and the actual values across all data samples.

$$\boldsymbol{RMSE} = \left[\sqrt{\frac{\left(\boldsymbol{Y_{Actual} - Y_{predicted}}\right)^2}{\boldsymbol{n}}}\right] \quad (23)$$

Where, $Y_{Actual}$ denotes the actual results of crop yield prediction,$Y_{predicted}$ denotes a predicted results of crop yield, $\boldsymbol{n}$ indicates a number of data samples.

**Mean absolute error '$MAE$'**: It is an accuracy metric used to estimate the accuracy of a model predictions by comparing the magnitude of errors to average value of observed data.

$$\boldsymbol{MAE = \frac{1}{n}\left|Y_{Actual} - Y_{predicted}\right|} \quad (24)$$

Where, $Y_{Actual}$ denotes the actual results of crop yield prediction,$Y_{predicted}$ denotes a predicted results of crop yield, $n$ indicates a number of data samples.

**$R^2$:** It also known as coefficient of determination '$R^2$'is a statistical metric used to estimate the performance of crop yield prediction outcomes. It is also defined as ratio between the residual Sum of actual and predicted results of crop yield to total sum of square.

$$R^2 = 1 - \frac{\left(Y_{Actual} - Y_{predicted}\right)^2}{\left(\hat{Y} - Y_{Actual}\right)^2} \quad (25)$$

Where, $Y_{Actual}$ denotes the actual results of crop yield prediction,$Y_{predicted}$ denotes a predicted results of crop yield, $\hat{Y}$ denotes a mean of actual value.

**Crop yield prediction time '$CPT$':** It represents the overall duration required by algorithm to complete the crop yield prediction process.

$$CPT = \sum_{i=1}^{n} D_i * time(CP) \quad (26)$$

Where, data '$D_i$' and actual time consumed in crop yield prediction denoted by '$time(CP)$. It is measured in terms of milliseconds (ms).

The Figure 9 to 16shows better LiRT-TLNet technique with improved accuracy by 6% and4%, precision by 6%and3%.Recallby 4% and 2%, F1-score by 5% and 3%. With reduction error rate by 73% and 66%, MAE by 75% and 69%, $R^2$ score by 15% and 6%, prediction time by 11% and 6%

## CONCLUSION

This proposed LiRT-TLNet model, specifically developed to provide highly accurate crop yield predictions with minimal computation time and error rate. The transfer learning approach begins with data preprocessing and selection of key features, aiming to minimize the overall time required for prediction. This method utilizes the model's ability to transfer learned knowledge, enabling effective analysis of data samples using least square regression-based insights to improve classification accuracy. Additionally, performance is further enhanced through fine-tuning, which helps lower error rates associated with crop yield prediction. A comprehensive evaluation was performed using several performance metrics.

## ABSTRACT

This study presents a scientometric evaluation of global research on agriculture and climate change from 1995 to 2025, with a special focus on India's contributions. Using data retrieved from the Web of Science database, 2,460 publications and 38,345 citations were analyzed through bibliometric tools such as Biblioshiny, VOSviewer, and HistCite. The analysis identifies the most productive institutions, preferred journals, highly cited papers, and thematic keyword trends. Results show a steady growth in research output, reflecting the increasing importance of climate change as a global concern. Banaras Hindu University, ICRISAT, and the Indian Institutes of Technology (IITs) emerged as leading contributors, with strong collaboration from international organizations such as CIMMYT and Cornell University. Journals including *Sustainability*, *Current Science*, and *Frontiers in Plant Science* were among the most preferred outlets for dissemination. Keyword analysis highlights sustainability, adaptation, food security, and mitigation as central themes, alongside emerging areas such as machine learning, soil health, and water management. India's highly cited publications underscore its significant role in advancing adaptation strategies, sustainable farming, and climate-resilient agriculture. The findings provide a comprehensive overview of research productivity and impact, offering valuable insights to guide future research priorities, policy frameworks, and collaborative strategies for building a sustainable agricultural future in the face of climate change.

**Keywords:** Agriculture; Climate Change; Sustainable Agriculture; Agriculture-India.

## INTRODUCTION

Climate change is one of the most critical global challenges of the twenty-first century, with far-reaching implications for agriculture, food security, and sustainable development. Agriculture, being highly vulnerable to climatic variations, is directly impacted by rising temperatures, erratic rainfall, extreme weather events, and greenhouse gas emissions. These changes not only reduce crop productivity and soil fertility but also threaten the livelihoods of millions of farmers, particularly in developing countries such as India, where agriculture remains the backbone of the economy. Over the past three decades, research on the interconnection between climate change and agriculture has grown significantly. This surge reflects the urgency of developing adaptive strategies, resilient farming systems, and policy frameworks to mitigate the adverse impacts of climate variability. Understanding the structure and dynamics of this research domain is crucial for shaping future strategies in sustainable agriculture.

**Scientometric analysis** provides a systematic and quantitative method to evaluate publications, citations, and collaboration networks. It has become an essential tool for measuring research performance, identifying prolific contributors, mapping global and national collaborations, and tracing thematic trends. By offering an evidence-based overview, scientometrics helps policymakers, funding agencies, and researchers make informed decisions to maximize research impact. The present study employs scientometric techniques to assess global research performance on climate change and agriculture from 1995 to 2025, with particular emphasis on India's contributions and international collaborations. Drawing upon a dataset of 2,460 publications and 319,979 citations, the study identifies the most productive institutions, leading countries, highly cited papers, and keyword trends. The findings provide a comprehensive picture of the research landscape, highlighting patterns that can guide future investigations and support policy interventions for climate-resilient agriculture.

## OBJECTIVES

The primary objective of this study is to evaluate the research performance in the field of *Agriculture and Climate Change in India* between 1995 and 2025. Specifically, the study focuses on

1. Analyzing the share of publications of the most productive institutions.
2. Examining the total number of research records.
3. Assessing total local citation scores (TLCS).
4. Assessing total global citation scores (TGCS).

## MATERIALS AND METHODS

The study is based on data retrieved from the Web of Science (WoS) database. Publications were identified using the search term *"Agriculture and Climate Change"* in the topic field and *"India"* in the address field. A total of 2,460 papers published between 1995 and 2025 were collected. These records received 38,345 citations, which were further analyzed. The data were processed using Biblioshiny, VOSviewer, and HistCite software to generate descriptive statistics, citation analyses, and visualization maps. Concept mapping and bibliometric indicators were employed to address the study's objectives.

**Most Productive Institutions**

The scientometric analysis highlights the leading institutions contributing to research on agriculture and climate change between 1995 and 2025. Among Indian institutions, Banaras Hindu University (105 publications, 117 TLCS, 3485 TGCS), ICRISAT (98 publications, 93 TLCS, 5494 TGCS), and the Indian Institutes of Technology (92 publications, 123 TLCS, 5774 TGCS) emerged as the most prolific contributors. International organizations such as the International Maize and Wheat Improvement Center (CIMMYT) and Cornell University also made significant contributions, reflecting strong global collaboration. This trend indicates that both Academic Institutions and

International Research organizations play a pivotal role in advancing climate–agriculture research, especially in the context of India.

**Most Preferred Journals**

The analysis of publication sources shows that research output is widely distributed across international and national journals. Journals such as Sustainability, Current Science, Environmental Monitoring and Assessment, Agricultural Systems, and Frontiers in Plant Science feature prominently, reflecting their interdisciplinary scope and high relevance to agriculture and climate change. These journals provide a platform for disseminating work on climate adaptation, mitigation strategies, sustainable farming, and agricultural innovations.

**Keyword Occurrences**

Keyword analysis reveals the major thematic directions in this research domain. Frequently occurring terms include "climate change," "agriculture," "sustainability," "adaptation," "food security," "mitigation," and "India." The prominence of these keywords indicates a strong research focus on climate-resilient agriculture, food production challenges, and sustainability practices. The clustering of terms such as *machine learning, soil health, and water management* further highlights the emerging interdisciplinary linkages of agricultural sciences with technology-driven solutions.

**Highly Cited Papers from India**

The highly cited publications from India underscore the country's substantial research impact on climate change and agriculture. These papers often focus on adaptation strategies, crop modelling, sustainable farming techniques, and policy frameworks for resilience. Many of them are published in internationally recognized journals, receiving significant global citations. Such works not only highlight India's academic contribution but also demonstrate its leadership role in addressing the agricultural implications of climate change.

## FINDINGS AND CONCLUSION

This scientometric evaluation of global research on agriculture and climate change (1995–2025) offers several key insights:

**Rising Research Output:** The number of publications has steadily increased, reflecting the growing urgency of climate change as a research priority.

**Institutional Leadership:** Banaras Hindu University, ICRISAT, IITs, and ICAR institutes are leading contributors from India, often collaborating with global organizations like CIMMYT and Cornell University.

**Preferred Outlets:** Publications are concentrated in reputed interdisciplinary journals, underlining the wide applicability of research findings.

**Thematic Hotspots:** Keywords point to core themes of sustainability, adaptation, and food security, while also signalling the rise of emerging areas like technology integration and climate modelling.

**High Impact Research:** India's highly cited papers demonstrate strong global relevance, emphasizing adaptation strategies and agricultural resilience in the face of climate change.

In conclusion, the study establishes that India, in collaboration with global partners, has made significant contributions to advancing knowledge on agriculture and climate change. The insights generated are crucial for guiding future research priorities, funding policies, and practical interventions aimed at building a sustainable and climate-resilient agricultural system.

## FINDINGS AND CONCLUSION

The study found that the Most productive and leading organization are: Banaras Hindu University with 105 publications far by ICRISAT– The International Crops Research Institute for the Semi-Arid Tropics (ICRISAT) with 98, The Indian Institutes of Technology (IITwith 92, International Maize and Wheat Improvement Center, (CIMMYT) with 87, ICAR Indian Agriculture Research Institute with 73 Publications. Indian agrarian sector in fact requires very innovative ideas for uplifting of this sector. Also, without mechanization, farming is hard and back-breaking work. This has resulted in most farmers' children quitting farming and going for other vocations. Farmers get more money in selling their land to builders, malls and factories. This has put more pressure on farmland, thereby requiring technologies to increase the productivity so that shrinking farmland can feed billion plus people of India in the future. India, though one of the biggest producers of agricultural products, has very low farm productivity, with the average only 33 percent of the best farms world over. This needs to be increased so that farmers can get more remuneration from the same piece of land with less labour.

## ACKNOWLEDGEMENT

Thanks to Tamilnadu State Council for Science and Technology for the financial support of research projects entitled on "Data - Driven Technology against climate change impact towards enhancing the sustainable agriculture: A study of central Districts of Tamil Nadu" and the resulting publication of Indian contribution to Agriculture and Climate Change Research: A Scientometric Study.

## ABSTRACT

Menstrual health is a vital phase of overall wellbeing of adolescent girls, as it is an important indicator of physical, emotional and reproductive health. Deviations from normal menstrual cycle may have significant implications not only for physical and reproductive health but also for mental wellbeing. Adolescence, as a transitional phase to adulthood, involves substantial hormonal adjustments that can contribute to menstrual irregularities. These disturbances can potentially affect the academic performances, psychosocial functioning and overall quality of life. This article outlines a mixed methods research protocol designed to better understand the factors influencing adolescent menstrual irregularities and their treatment seeking behaviors. This study aims to assess the prevalence of adolescent menstrual irregularities; to identify the associated psychosocial and lifestyle factors; and examine their care seeking behaviors. An explanatory sequential mixed methods design will be employed, with an initial quantitative phase to determine the prevalence and key determinants, followed by a qualitative phase exploring the adolescents' treatment seeking behaviors in depth. Finally, findings from both the strands will be integrated to generate a comprehensive understanding that can inform adolescent friendly interventions and guide future menstrual health programs.

**Keywords:** Adolescent health, Menstrual health, Menstrual irregularities, Psychosocial factors, Lifestyle factors, Treatment seeking behavior, Mixed-methods study.

## INTRODUCTION

The journey of human life involves transitioning through various phases right from infancy to old age. During each phase the body undergoes several physical and physiological adaptations. These adaptations are open to be disrupted by several extrinsic as well as intrinsic factors. The human female body undergoes massive hormonal adaptations during each phase of life. These hormonal changes are at peak during adolescent period. Adolescence is a phase where substantial growth and development occurs in a female's body, marking the gradual progression to mature reproductive health. Menstruation is a major biological milestone that normally begins during adolescence. It is a phenomenon that is influenced by several extrinsic as well as intrinsic factors. Extrinsic factors like lifestyle, surrounding environment, geography, socio-economic conditions, etc. as well as intrinsic factors like race, ethnicity, general health status, etc. contribute vitally in regulation of menstrual cycles[1]. Any deviations in menstrual cycle leads to menstrual irregularities or menstrual disruptions. Persistence of menstrual irregularities leads to considerable school absenteeism, thereby affecting their academic performances [2]. It may prompt the adolescent girls to face stigma, harassment and social exclusion. [3]In addition to this, menstrual health in a country like India is often tied up with several myths and taboos. [4] Menstrual irregularities also affect the mental health and wellbeing of the adolescents [5]. All these reasons together creates a state of confusion, ignorance, apprehension and isolation among the adolescent girls in reaching out for medical assistance to manage their condition [6,7]. In India, a substantial number of adolescent girls suffer from one or the other menstrual irregularities [8,9,10]. Some of the menstrual irregularities commonly known are amenorrhea, premenstrual syndrome, dysmenorrhea, oligomenorrhea, polymenorrhea, menorrhagia, and others. Due to the hormonal fluctuations secondary to the immature hypothalamic - pituitary - ovarian axis during adolescence, these irregularities occur which are further worsened by various psychosocial and lifestyle factors [11]. Despite the growing recognition of menstrual health as a public health priority, the treatment seeking behavior for menstrual problems among the adolescents remains suboptimal. As a result, many girls continue to endure menstrual irregularities without appropriate medical support, potentially increasing the risk of long-term reproductive health issues [6]. Existing literature offers valuable evidences about adolescent menstrual health, however, there still exists a vast knowledge gap. Most of the studies done to address this gap are either cross-sectional having methodological limitations like having small sample sizes, lack of confirmatory statistical results and others. Even the qualitative evidences have not specifically covered the experiences or perceptions of adolescents with menstrual irregularities. Hence, there exists a felt-need for robust enquiry of the prevalence and determining factors of adolescent menstrual irregularities using a mixed methods approach to comprehensively address this multifaceted issue. The researcher presents this protocol for an explanatory sequential mixed methods study aimed at understanding the determining psychosocial and lifestyle factors and care-seeking behaviors associated with adolescent menstrual irregularities. Integration of both quantitative and qualitative strands will provide a holistic interpretation of findings, enabling the development of informed recommendations to strengthen menstrual health literacy, promote timely and appropriate care seeking and support adolescent-friendly health systems.

## MATERIALS AND METHODS

For the current study, the researcher will use an Explanatory Sequential study design, a type of mixed methods approach. Using a mixed methods approach will help combine the strengths of quantitative and qualitative methodologies to increase the understanding and provide more complete answers to the research question [12,13]. As depicted in figure 1, this study will have an initial quantitative strand assessing the prevalence and associated psychosocial and lifestyle factors of adolescent menstrual irregularities, followed by the qualitative strand exploring the treatment seeking behaviors of these adolescent girls. Finally integration will be done of the findings of both the strands.

**Phase-I: Quantitative Strand**

A Cross-sectional study will be employed to assess the prevalence of menstrual irregularities among adolescent girls as well as to assess the various associated psychosocial and lifestyle factors. This study is planned to be conducted at schools and colleges from Gujarat state, India. The population is Adolescent girls aged between 15 to 19 years of age. Adolescent girls who are diagnosed with other medical health conditions like blood clotting and bleeding disorders, genetic disorders, cardiac vascular disorders, cancer, any physical disability, any congenital reproductive tract malformations as well as girls prescribed medications like antipsychotics, chemotherapeutic drugs, antidepressants, blood pressure drugs and allergy medications would not be eligible to be recruited for the study. Adolescent girls of the given age group who have attained menarche would be eligible for the study. Data collection would be done using a questionnaire for socio-demographic as well as the clinical variables and a structured questionnaire to assess menstrual health. To assess the psychosocial problems like anxiety, depression, body image, social isolation and stress, various standardized tools would be employed. Also the lifestyle factors like the dietary habits, physical activity and sleep patterns would be assessed using standardized tools. All the standardized tools would be used after seeking the due approval from the respective authors.

**Phase-II: Qualitative Strand**

A Descriptive phenomenology will be employed to understand the treatment seeking behaviors of the adolescent girls with menstrual irregularities. A nested consecutive sampling technique would be employed to recruit the participants for this phase. Nested consecutive sampling is majorly used in sequential explanatory designs, where the same participants who took part in the quantitative phase initially, are sampled again for the qualitative phase, till data saturation is achieved [14]. A semi-structured, one-to-one interview guide regarding treatment seeking behavior of adolescent girls experiencing menstrual irregularities, with optional probing questions, will be employed for data collection in this phase. A field diary will also be maintained, recording the descriptive and interpretive notes based on the respondents' comments during the interview.

**Mixed-methods Integration**

The integration will be done in two stages:

a. The result of phase-I will help to recruit the samples of phase-II through nested consecutive sampling technique;
b. The results of phase-I and phase-II will be triangulated using the meta-matrix analysis technique, with the aim to deepen the understanding of the results as well as help in pattern recognition.

**Data Analysis**

For the quantitative strand, Descriptive statistics will be performed to calculate the means, standard deviations and frequencies of socio-demographic and clinical variables collected. Applicable Inferential statistics would be used for calculation of the prevalence of menstrual irregularities and associated psychosocial and lifestyle factors, and also to assess the associations between psychosocial factors and lifestyle habits. Statistical significance will be established as $p < 0.05$. In the qualitative strand, to fully comprehend the meaning and context of the collected data regarding the treatment seeking behaviors of the adolescent girls with menstrual irregularities, the transcripts verbatim will be examined using thematic analysis. Through an iterative process, key themes will be identified, coded and organized into categories to capture the core patterns within the data. A Meta-matrix analysis technique will be employed for integration the results of both the phases. This technique will involve creating a matrix where one axis represents the themes from qualitative analysis and the other axis will represent the key quantitative findings. Next the findings would be triangulated identifying areas where qualitative and quantitative results would have converged or highlighting any contradictions or gaps.

## DISCUSSION AND CONCLUSION

Menstrual irregularities are often overlooked by adolescent girls, possibly due to the perception that menstruation is a regular phenomenon among females or due to the stigma and taboos associated with it. Apart from the physical

concerns, the psychosocial challenges associated with menstrual irregularities, can significantly incapacitate the adolescents' daily functioning as well as their academic performances. To worsen this, the ignorance about care or treatment seeking behaviors among them, results in further deterioration of the situation. As adolescents are the future of any country, knowing in detail their lifestyle factors and psychosocial issues associated with menstrual irregularities and understanding their treatment seeking behaviors becomes pertinent and vital. Employing a mixed methods approach would help cater to any gaps or limitations inherent in using either qualitative or quantitative approach alone. This will help comprehend the complex link which is present amongst the various determinants of menstrual health. This study findings would advocate and support for more stronger and coordinated efforts to position adolescent menstrual health as a key public health priority.

## ABSTRACT

This study aimed to compare the Vitamin C content of fresh amla (*Phyllanthus emblica*) juice with various commercially available amla juice preparations using iodometric titration and UV-visible spectrophotometry, followed by an accelerated stability study. Fresh amla juice and five marketed brands packed juice 1, 2, 3, 4, and 5were analyzed for their ascorbic acid content. The iodometric method was based on the redox reaction between iodine and ascorbic acid, while UV-visible spectrophotometry measured absorbance at 266 nm. Fresh juice exhibited the highest initial Vitamin C content, with 51.2 mg/100 mL, while marketed juices ranged from 33.6 to 37.4 mg/100 mL. However, under accelerated storage conditions over 28 days, fresh juice showed greater degradation (23.4%) compared to commercial juices (17.9%–23.2%). The results from both analytical methods were consistent, validating the reliability of UV-visible spectroscopy for rapid estimation. The study concludes that while fresh amla juice is nutritionally superior, commercial preparations demonstrate

better Vitamin C stability, highlighting the balance between freshness and formulation longevity in consumer products.

**Keywords:** Vitamin C; Amla Jucies; UV-Visible Spectroscopy; Idometric titration; Accelerated stability studies

## INTRODUCTION

Vitamin C, also known as ascorbic acid, is an essential water-soluble nutrient involved in numerous physiological functions, including collagen synthesis, immune support, wound healing, and the maintenance of healthy skin and connective tissue [1, 2]. It is also a powerful antioxidant, capable of neutralizing free radicals and thereby reducing oxidative stress in the body. This antioxidant activity plays a key role in preventing the onset of various chronic diseases such as cardiovascular disorders, certain types of cancer, and neurodegenerative conditions [3-5]. Among natural sources, *Phyllanthus emblica*, commonly known as amla or Indian gooseberry, is particularly rich in Vitamin C. Traditionally used in Ayurvedic medicine, amla is prized for its rejuvenating, immunomodulatory, and hepatoprotective properties. The Vitamin C content in fresh amla is significantly higher than in most other fruits, making it a valuable component in herbal formulations, dietary supplements, and functional foods [6-9]. However, Vitamin C is known for its chemical instability. It is highly susceptible to degradation when exposed to factors such as heat, light, oxygen, and variations in pH during processing and storage [10]. With the increasing consumer demand for health-focused beverages, many commercial amla juice products are now available in the market. These ready-to-drink juices claim to retain the natural benefits of fresh amla, particularly its high Vitamin C content [11, 12]. However, the industrial processes involved in the production of packaged juices—such as pasteurization, dilution, and the use of preservatives—may significantly reduce their actual ascorbic acid content. As a result, it becomes necessary to scientifically evaluate and compare the Vitamin C concentration in freshly prepared amla juice and various marketed juice preparations [13]. To address this, the present study utilizes two complementary analytical techniques: iodometric titration and UV-visible spectrophotometry. Iodometric titration is a classical redox method in which ascorbic acid reduces iodine to iodide, allowing its concentration to be determined based on the volume of iodine solution consumed. In contrast, UV-visible spectroscopy is a modern, sensitive method that detects Vitamin C based on its characteristic absorbance at 265 nm [14-16]. Together, these methods offer a reliable approach to quantify and validate Vitamin C levels in different juice samples. Furthermore, an accelerated stability study was conducted to evaluate the degradation pattern of Vitamin C in both fresh and packaged juice samples under stress conditions (elevated temperature and humidity). This component of the study is essential for assessing the shelf-life and preservation of nutritional quality over time [17-18]. Overall, this comparative analysis aims to provide meaningful insights into the nutritional authenticity of commercial amla juices while reinforcing the value of fresh juice consumption for optimal health benefits.

## MATERIALS AND METHODS

## MATERIALS

Fresh amla fruits (*Phyllanthus emblica*) were procured from a local market and used for preparing freshly extracted amla juice. Five different commercially packaged amla juice samples were selected from local retail outlets for comparative analysis. Five packed juice were selected from the local market of Indore, Madhya Pradesh. All reagents and chemicals used in the study were of analytical grade. Ascorbic acid standard was obtained from the Acropolis Institute of Pharmaceutical Education and Research. Potassium iodide, iodine crystals, glacial acetic acid, and starch powder were also sourced from the same institute. Distilled water was used throughout the study for the preparation of solutions and dilution of samples.

**Preparation of Reagents**

**Iodine Solution (0.005 M):** To prepare the iodine solution, 2 g of potassium iodide (KI) was weighed and dissolved in a small amount of distilled water in a beaker. Then, 1.3 g of iodine crystals ($I_2$) was added and dissolved by gentle swirling. The resulting solution was transferred into a 1 L volumetric flask, and the volume was made up to the mark with distilled water.

**Starch Indicator Solution (0.5%):** To prepare the starch indicator, 0.25 g of soluble starch was added to 50 mL of near-boiling distilled water in a conical flask. The mixture was stirred continuously until the starch dissolved completely. The solution was then allowed to cool to room temperature before use.

**Iodometric Titration Method**

The iodometric titration method was used to estimate the Vitamin C content in fresh and packaged amla juice samples. This method is based on the redox reaction between iodine and ascorbic acid, where iodine is reduced to iodide and ascorbic acid is oxidized to dehydroascorbic acid. The endpoint is detected by the formation of a stable blue-black complex between iodine and starch. A 10 mL aliquot of each juice sample was pipetted into a 250 mL conical flask. To this, approximately 100 mL of distilled water was added, followed by 1 mL of the prepared starch indicator solution. The mixture was titrated against 0.1 M iodine solution until a permanent blue-black coloration persisted, indicating the endpoint. The titration was repeated in triplicate for accuracy, and concordant values were recorded for calculation [19-22].

**UV-Visible Spectrophotometric Method**

In addition to titration, Vitamin C content was also estimated using UV-visible spectrophotometry. Ascorbic acid exhibits a strong absorbance peak at 266 nm, which was used as the detection wavelength. A stock solution of ascorbic acid standard was prepared in distilled water, and serial dilutions were made to construct a calibration curve in the range of 10–60 μg/mL. The absorbance of each standard solution was measured at 266 nm using a UV-visible spectrophotometer, and a standard curve was plotted. Juice samples were appropriately diluted and filtered before analysis, and their absorbance values were used to calculate the ascorbic acid concentration by interpolation from the standard curve [23-30].

**Accelerated Stability Study**

To evaluate the stability of Vitamin C in both fresh and packaged amla juices, an accelerated stability study was conducted under stress conditions. All juice samples were stored in a stability chamber maintained at 40 ± 2 °C and 75% relative humidity. The Vitamin C content was determined at regular intervals—on day 0, 7, 14, 21, and 28—using UV-visible spectroscopy. This study aimed to simulate long-term storage conditions and assess the degradation rate of Vitamin C over time [24-27].

## RESULTS

**Vitamin C Estimation by Iodometric Titration**

The concentration of Vitamin C in different amla juice samples was determined using the iodometric titration method. This method relies on the redox reaction between iodine and ascorbic acid, where ascorbic acid reduces iodine to iodide and is itself oxidized to dehydroascorbic acid. The endpoint of the titration is observed by the formation of a stable blue-black starch-iodine complex.The table 1 and figure 1 below presents the observed titration volumes and the corresponding calculated Vitamin C content. Estimation of Vitamin C content by Iodometric Titration (Table 1)

**Vitamin C Estimation by UV-Visible Spectroscopy**

Vitamin C (ascorbic acid) exhibits strong UV absorbance, especially around 265–270 nm due to its conjugated system and hydroxyl groups. The absorbance of each juice sample was measured at 266 nm and compared with a standard

calibration curve prepared using known concentrations of pure ascorbic acid. A standard calibration curve was prepared by measuring the absorbance of ascorbic acid solutions with concentrations ranging from 10 to 60 µg/mL at 266 nm. The curve showed a strong linear relationship between absorbance and concentration with a correlation coefficient ($R^2$) of approximately 0.999, confirming the reliability of the method (Figure 2). Concentration vs Absorbance of standard ascorbic acid (Figure 2). Vitamin C estimation by UV-visible spectroscopy (Table 2).

**Result of Accelerated stability study**

An accelerated stability study was conducted over a 28-day period to assess the degradation of Vitamin C content in fresh and various marketed amla juice samples stored under stressed conditions. The results clearly demonstrated a gradual decline in Vitamin C concentration across all samples, with fresh juice exhibiting the highest initial content and most significant degradation over time. At Day 0, fresh amla juice showed the highest Vitamin C content (51.2 mg/100 mL), followed by pakced amla juice 1 (37.4 mg), pakced amala juice 2 (36.1 mg), pakced amla jucie 3 (35.7 mg), packed amla juice 4 (34.2 mg), and packed amla juice 5 (33.6 mg). Over the 28-day period, the Vitamin C levels in all samples decreased progressively. By Day 28, fresh juice content had declined to 39.2 mg/100 mL, indicating a degradation of 23.4%. This suggests that while fresh juice starts with a higher Vitamin C level, it is more susceptible to degradation under accelerated conditions. Among the marketed preparations, packed amla juice 1 exhibited the least degradation (17.9%) followed closely by packed juice 2 (18.3%), suggesting better formulation stability. Packed juice 3, 4, and 5 showed slightly higher degradation rates of 21.6%, 22.8%, and 23.2%, respectively. Despite having lower initial Vitamin C levels than fresh juice, these commercial juices demonstrated relatively better preservation of their ascorbic acid content, likely due to added preservatives or controlled pH conditions. Overall, the study highlights that while fresh juice is richer in Vitamin C initially, its stability is comparatively lower under accelerated storage conditions. In contrast, commercial juices, though lower in initial content, maintain their ascorbic acid levels better over time. Accelerated stability study of fresh and different Amla juices (Table 3).

## DISCUSSION

The iodometric titration data clearly indicate that fresh amla juice contains the highest concentration of Vitamin C (52.4 mg/100 mL), significantly more than the packaged commercial products. This finding aligns with the expectation that freshly prepared juices, without exposure to heat, light, and prolonged storage, retain more of their natural antioxidant content. Among the marketed brands, packed amla juice 1 had the highest Vitamin C content (38.2 mg/100 mL), followed closely by packed amla juice 2 and 3. Packed amla juice 5 and Pakced Amla Juice 4 displayed comparatively lower concentrations, which may result from either prolonged storage, thermal degradation during pasteurization, or variation in formulation and source materials. The results underscore the nutritional superiority of fresh amla juice in terms of Vitamin C retention. Commercial processing methods and storage conditions seem to significantly affect the stability and bioavailability of Vitamin C, a highly oxidation-sensitive compound. Thus, for maximum health benefit, consumption of fresh amla juice is recommended whenever possible. The UV-visible spectroscopy results confirm the findings of the iodometric titration. Freshly prepared amla juice exhibited the highest absorbance (0.545), corresponding to a Vitamin C concentration of 51.2 mg/100 mL, which is significantly higher than any of the marketed juices. Among the commercial samples, Pakced amala juice 1 and 2 again showed relatively higher concentrations (37.4 and 36.1 mg/100 mL, respectively), while packed amala juice 5 and 4 had the lowest. These differences are consistent with potential losses of Vitamin C during commercial processing, packaging, and storage. This spectrophotometric method, being rapid and non-destructive, proves to be a suitable complementary technique to titration, offering more precise quantification for quality control purposes. The study clearly demonstrates a time-dependent degradation of Vitamin C in all juice samples. Fresh amla juice, despite having the highest initial concentration (51.2 mg/100 mL), showed the most significant drop over 28 days (to 39.2 mg/100 mL), amounting to a 23.4% reduction. This is expected due to the absence of preservatives and the sensitivity of ascorbic acid to heat, light, and oxygen. Among commercial samples, packed amala juice 1 and 2 retained Vitamin C better than others, likely due to formulation differences including stabilizers, preservatives, and controlled processing. Juice 5 and 4 showed relatively poorer stability, with around 23% loss, similar to the fresh juice, possibly

indicating minimal processing or lack of effective preservation. These results reinforce that Vitamin C is highly unstable under stress conditions, and formulation strategies or immediate consumption can significantly influence its retention.

## CONCLUSION

The comparative study of Vitamin C content in fresh and commercially packaged amla juices using both iodometric titration and UV-visible spectrophotometry revealed significant differences in ascorbic acid levels. Fresh amla juice consistently showed higher initial Vitamin C content compared to all marketed preparations. However, the accelerated stability study demonstrated that Vitamin C in fresh juice degraded more rapidly over time than in commercial juices, likely due to the absence of stabilizers and preservatives. Among the commercial products, packed juice 1 and 2 exhibited relatively better stability, maintaining higher ascorbic acid content throughout the 28-day period. The UV-visible spectrophotometry method validated the titration results and proved to be a reliable, sensitive tool for quantifying ascorbic acid levels. Overall, while fresh juice is superior in nutritional value initially, marketed preparations offer better shelf-life stability. These findings highlight the trade-off between nutritional richness and product stability in juice formulations.

**ABSTRACT**

The first definition of fuzzy graph was introduced by Kauffman in 1973 based on Zadeh's fuzzy relation. In that definition the vertex set was crisp but edges were given membership values between 0 and 1. Azriel Rosenfeld modified the definition in 1975 by changing the vertex set as a fuzzy set and bringing restriction on membership values on edges and corresponding nodes. In 1994 J.N. Mordeson introduced a sub class of fuzzy graph called strong fuzzy graph. In 2001, M.S. Sunitha introduced another subclass of fuzzy graph called complete fuzzy graph. In 2021, Nishad T M and A Prasanna introduced weak fuzzy graphs. The concept of fuzzy graph was generalized by Nishad T M and B Mohammed Harif in 2023 and developed General Fuzzy Graph. In this paper some examples and properties of weak fuzzy graphs and $\in$ weak fuzzy graphs are discussed.

## INTRODUCTION

The father of graph theory was the great Swiss mathematician Leonhard Euler, who's famous 1736paper, "The Seven Bridges of Konigsberg," was the first treatise on the subject.In 1874, Georg Cantor introduced set theory. A graph is a mathematical structure to model pair wise relations between objects. In a network if there is vagueness in the description of the objects (nodes or vertices) or in its relationships (links or edges) or in both, a fuzzy graph is the

most suitable mathematical structure to describe the network. In 1973[2] Kaufmann introduced the first definition of a fuzzy graph(FG). In 1975[4] Azriel Rosenfeld considered fuzzy relation on fuzzy sets and developed the theory of FGs.The consideration of fuzzy relation on fuzzy sets brings a restriction on the membership values of the edges. The restriction is that the membership value of the edge cannot exceed the minimum of the membership values of the corresponding nodes. Mordeson J.N and Peng. C.S [11] introduced a subclass of FG called 'strong fuzzy graphs(SFG)' in 1994. In a SFG the positive membership values of the edges of a FGs is equal to the minimum of the membership values of corresponding vertices. In 2001, M S Sunitha introduced another subclass of FG called complete fuzzy graph(CFG). In this paper some properties of another subclass of FGs are discussed.

## PRELIMINARY DEFINITIONS

**Definition 2.1:** A graph(crisp graph) $F^* = (V_\lambda{}^*, E_\lambda{}^*)$consist of set of vertices$V_\lambda{}^*$( also called nodes) and a set of edges$E_\lambda{}^*$(also called lines).

**Definition 2.2:**If U is a universe discourse and any element u ∈ U, then fuzzy set A defined on U is a collection of ordered pair, $A = \{(u, \lambda(u): x \in A\}$, where $\lambda(u)$: U → [0,1], $\lambda(u)$ is called a membership function.

**Definition 2.3:** A fuzzy graph(FG)F = $(V_\lambda, E_\lambda)$is a strong fuzzy graph(SFG), if $E_\lambda(u,v) = V_\lambda(u) \wedge V_\lambda(v)$for all $(u,v) \in E_\lambda{}^*$.

**Definition 2.4:** A fuzzy graph(FG)F = $(V_\lambda, E_\lambda)$is a complete fuzzy graph(CFG), if $E_\lambda(u,v) = V_\lambda(u) \wedge V_\lambda(v)$for all $u, v \in V_\lambda{}^*$.

**Definition 2.5:** The μ−complement of a FGF = $(V_\lambda, E_\lambda)$is a FG $F^\mu = (V_\lambda{}^\mu, E_\lambda{}^\mu)$, where$V_\lambda{}^\mu = V_\lambda$ and $E_\lambda{}^\mu$ is defined as$E_\lambda{}^\mu(u,v) = 0$, if $E_\lambda(u,v) = 0$and $E_\lambda{}^\mu(u,v) = V_\lambda(u) \wedge V_\lambda(v) - E_\lambda(u,v)$, if $E_\lambda(u,v) > 0$for all $u, v \in V_\lambda{}^*$.

**Definition 2.5:** The complement of a FGF = $(V_\lambda, E_\lambda)$ modified by M S Sunitha and A Vijayakumar is a fuzzy graph $\bar{F} = (V_\lambda{}^c, E_\lambda{}^c)$where$V_\lambda{}^c = V_\lambda$and $E_\lambda{}^c$ is defined as$E_\lambda{}^c(u,v) = V_\lambda(u) \wedge V_\lambda(v) - E_\lambda(u,v)$ for all$u, v \in V_\lambda{}^*$.

**Example 2.1:** The following figures illustrate strong fuzzy graph and complete fuzzy graph.

**Figure 1:** SFG.
**Figure 2:** CFG

**A Sub Class –Weak Fuzzy Graphs**
**Definition 3.1:** A FGF = $(V_\lambda, E_\lambda)$is a weak fuzzy graph(WFG), if $E_\lambda(u,v) < V_\lambda(u) \wedge V_\lambda(v)$for all$(u,v) \in E_\lambda{}^*$.
This requirement ensures that the "flows" in the edges of the graph is always less than the "flows" in the respective nodes.

**Example 3.1:** The following figure illustrates a weak fuzzy graph.

**Figure 3:** WFG

**Remark 3.1.1**: The definition of WFG ensures that the "flow" or "capacity" of the links is always less than the minimum "flow" or "capacity" in the respective nodes. The set of FGs is considered as the union of mutually disjoint three subsets – (i) The set of SFGs (ii) The set of WFGs and(iii) The set of neither SFGs nor WFGs.

**Example 3.2:** A campus simultaneously runs 4 departments (say) Mathematics-M, Statistics-S, Computer Science-C and Artificial intelligence –A, sharing facility. The income from each department and expenditure of sharing facility

between each of the department can be simulated using a WFG if there is a constraint that the expenditure of facility sharing should be always less than the minimum of income from corresponding departments. In the following tables, the entries in the diagonal cells corresponding to MM,SS,CC and AA are the income in INR from the departments Mathematics, Statistics, Computer Science and Artificial Intelligence respectively and the other entries are the expenditure of sharing facilities between the corresponding departments in INR.

**Table: 1**
This data can be converted to numbers between 0 and 1 by dividing the values by 100000.

The following table gives the fuzzified values (**Table: 2).**

The following figure illustrates this information as a weak fuzzy graph.
**Figure 4:** F = $(V_\lambda, E_\lambda)$

**Some Properties of the Sub Class -Weak Fuzzy Graphs**
While WFG represents the simulation of traffic density on junctions and nodes in the traffic network, the following properties of WFG brings a picture on flows on the network.

**Theorem 4.1.** The union of two weak fuzzy graphs is a weak fuzzy graphs.

**Proof.** Let $F_1: (V_{\lambda_1}, E_{\lambda_1})$ and $F_2: (V_{\lambda_2}, E_{\lambda_2})$ be two WFGs with the underlying crisp graphs $F_1^*: ({V_{\lambda_1}}^*, {E_{\lambda_1}}^*)$ and $F_2^*: ({V_{\lambda_2}}^*, {E_{\lambda_2}}^*)$ respectively. The union F: $(V_{\lambda_1} \cup V_{\lambda_2}, E_{\lambda_1} \cup E_{\lambda_2})$ is defined by
$(V_{\lambda_1} \cup V_{\lambda_2})(u) = V_{\lambda_1}(u)$,if$u \in {V_{\lambda_1}}^* - {V_{\lambda_2}}^*$.
$(V_{\lambda_1} \cup V_{\lambda_2})(u) = V_{\lambda_2}(u)$,if$u \in {V_{\lambda_2}}^* - {V_{\lambda_1}}^*$and
$(V_{\lambda_1} \cup V_2)(u) = \max\{V_{\lambda_1}(u), V_{\lambda_2}(u)\}$, if $u \in {V_{\lambda_1}}^* \cap {V_{\lambda_2}}^*$.
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = E_{\lambda_1}(u,v)$,if $(u,v) \in {E_{\lambda_1}}^* - {E_{\lambda_2}}^*$.
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = E_{\lambda_2}(u,v)$,if $(u,v) \in {E_{\lambda_2}}^* - {E_{\lambda_1}}^*$and
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = \max\{E_{\lambda_1}(u,v), E_{\lambda_2}(u,v)\}$,if$(u,v) \in {E_{\lambda_1}}^* \cap {E_{\lambda_2}}^*$.
To prove that F: $(V_{\lambda_1} \cup V_{\lambda_2}, E_{\lambda_1} \cup E_{\lambda_2})$ is a WFG, it is enough to prove that
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) < ((V_{\lambda_1} \cup V_{\lambda_2})(u) \wedge (V_{\lambda_1} \cup V_{\lambda_2})(v))$, for all $(u,v) \in (E_{\lambda_1} \cup E_{\lambda_2})^*$

**Case 1:** When $(u,v) \in {E_{\lambda_1}}^* - {E_{\lambda_2}}^*$
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = E_{\lambda_1}(u,v) < V_{\lambda_1}(u) \wedge V_{\lambda_1}(v)$. Since $F_1: (V_{\lambda_1}, E_{\lambda_1})$ is a WFG
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = E_{\lambda_1}(u,v) < V_{\lambda_1}(u) \wedge V_{\lambda_1}(v) < ((V_{\lambda_1} \cup V_{\lambda_2})(u) \wedge (V_{\lambda_1} \cup V_{\lambda_2})(v))$.
Since $V_{\lambda_2}(u) = 0$, for all $u \in {V_{\lambda_1}}^* - {V_{\lambda_2}}^*$.

**Case 2:** When$(u,v) \in {E_{\lambda_2}}^* - {E_{\lambda_1}}^*$
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = E_{\lambda_2}(u,v) < V_{\lambda_2}(u) \wedge V_{\lambda_2}(v)$.Since $F_2: (V_{\lambda_2}, E_{\lambda_2})$ is a WFG
$(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = E_{\lambda_2}(u,v) < V_{\lambda_2}(u) \wedge V_{\lambda_2}(v) < ((V_{\lambda_1} \cup V_{\lambda_2})(u) \wedge (V_{\lambda_1} \cup V_{\lambda_2})(v))$.
Since $V_{\lambda_1}(u) = 0$ for all $u \in {V_{\lambda_2}}^* - {V_{\lambda_1}}^*$.

**Case 3:** When$(u,v) \in {E_{\lambda_1}}^* \cap {E_{\lambda_2}}^*$
Since $F_1: (V_{\lambda_1}, E_{\lambda_1})$ and $F_2: (V_{\lambda_2}, E_{\lambda_2})$are WFGs, $E_{\lambda_1}(u,v) < V_{\lambda_1}(u) \wedge V_{\lambda_1}(v)$and $V_{\lambda_2}(u,v) < V_{\lambda_2}(u) \wedge V_{\lambda_2}(v)$ .
Hence$\max\{E_{\lambda_1}(u,v), E_{\lambda_2}(u,v)\} < \max\{V_{\lambda_1}(u) \wedge V_{\lambda_1}(v), V_{\lambda_2}(u) \wedge V_{\lambda_2}(v)\}$
Therefore $(E_{\lambda_1} \cup E_{\lambda_2})(u,v) = \max\{E_{\lambda_1}(u,v), E_{\lambda_2}(u,v)\}$
$< \max\{V_{\lambda_1}(u) \wedge V_{\lambda_1}(v), V_{\lambda_2}(u) \wedge V_{\lambda_2}(v)\}$
$< (\max\{V_{\lambda_1}(u), V_{\lambda_2}(u)\} \wedge \max\{V_{\lambda_1}(v), V_{\lambda_2}(v)\})$
In all cases $(E_{\lambda_1} \cup E_{\lambda_2})(u,v) < ((V_{\lambda_1} \cup V_{\lambda_2})(u) \wedge (V_{\lambda_1} \cup V_{\lambda_2})(v))$for all$(u,v) \in (E_{\lambda_1} \cup E_{\lambda_2})^*$.

**Example 4.1:** The following figures illustrate the theorem 2.3.1
**Figure 5:** WFG $F_1$.
**Figure 6:** WFG$F_2$
**Figure 7:** WFGF = $F_1$ U $F_2$

**Remark 4.1**: The above theorem implies that the set of WFGs is closed under union. So a large traffic network in which the traffic density at the junctions and roads are simulated by a WFG can be formed as union of several traffic networks having the property that the traffic density of all are simulated using WFGs.

**Theorem 4.2:** The spanning sub-graph of a weak fuzzy graph is a weak fuzzy graph.

**Proof.** Let FG H:$(W_\lambda, L_\lambda)$be a spanning sub-graph of a WFGF: $(V_\lambda, E_\lambda)$.
By the definition of spanning FSG$W_\lambda(u) = V_\lambda(u)$for all $u \in V_\lambda{}^*$and
$L_\lambda(u,v) \leq E_\lambda(u,v)$for all$u, v \in V_\lambda{}^*$.
To prove that$L_\lambda(u,v) < W_\lambda(u) \wedge W_\lambda(v)$,for all$(u,v) \in L_\lambda{}^*$.
Since F: $(V_\lambda, E_\lambda)$ is a WFG$E_\lambda(u,v) < V_\lambda(u) \wedge V_\lambda(v)$for all$(u,v) \in E_\lambda{}^*$.
Now$L_\lambda(u,v) \leq E_\lambda(u,v) < V_\lambda(u) \wedge V_\lambda(v) = W_\lambda(u) \wedge W_\lambda(v)$for all$(u,v) \in E_\lambda{}^*$.
Therefore $L_\lambda(u,v) < W_\lambda(u) \wedge W_\lambda(v)$, for all$(u,v) \in L_\lambda{}^*$.

**Theorem 4.3:** A weak fuzzy sub-graph can be formed from every strong fuzzy graph$H$: $(V_\lambda, L_\lambda)$.

**Proof.** Let $H$: $(V_\lambda, L_\lambda)$be a SFG. Control the flow through the links such that$E_\lambda(u,v) = L_\lambda(u,v) - \varepsilon$, for every $L_\lambda(u,v) > 0$,where $\varepsilon$ is fixed real number such that
$\varepsilon \in (0, min\{L_\lambda(u,v) / L_\lambda(u,v) > 0\})$.Let F:$(V_\lambda, E_\lambda)$ be the resulting FSG. In F:$(V_\lambda, E_\lambda)$, $E_\lambda(u,v) < V_\lambda(u) \wedge V_\lambda(v)$, for all $(u,v) \in E_\lambda{}^*$.Now F:$(V_\lambda, E_\lambda)$is a WFSG of $H$: $(V_\lambda, L_\lambda)$.

**Remark 4.2**: The above theorem helps to convert a traffic network (that allowed possible maximum flows in the links) to a flow controlled traffic network by adjusting traffic density$\varepsilon$.

**Theorem 4.4:** The complement on a weak fuzzy graph is a weak fuzzy graphiff underlying crisp graph is complete graph.

**Proof.** Suppose the complement of a WFG F:$(V_\lambda, E)$ is a WFG.
We have to show that $E_\lambda(u,v) > 0$ for all u,$v$in $V^*$.
Since the complement of the WFG is weak, $\overline{E(u,v)} < V_\lambda(u) \wedge V_\lambda(v)$ for all u,$v$ in$V_\lambda{}^*$.
Therefore $E_\lambda(u,v) = \overline{(E_\lambda(u,v))} = V_\lambda(u) \wedge V_\lambda(v) - \overline{E_\lambda(u,v)} > 0$, for all $u,v$ in$V_\lambda{}^*$.
If every pair of nodes are not neighbours (i.e, if the underlying crisp graph is a complete graph), there will be some links with$E_\lambda(u,v) = 0$, $V_\lambda(u) = \varepsilon, V_\lambda(v) = \delta$ where $\varepsilon, \delta \in (0,1]$.Now as per the definition of complement $\overline{E_\lambda(u,v)}$= min $\{\varepsilon, \delta\} - 0$ = min $\{\varepsilon, \delta\}$which is either $V_\lambda(u)$or $V_\lambda(v)$.Hence the complement fails to become a WFG.

**Example 4.2:** The following figures illustrate the theorem 4.4

**Case 1:** Underlying crisp graph is complete graph.

**Figure 8:** F.
**Figure 9:** $\bar{F}$

**Case 2:** Underlying crisp graph is not a complete graph.

**Figure 10:** F.
**Figure 11:** $\bar{F}$

**Theorem 4.5.** If underlying crisp graph is not a complete graph, then the complement of a weak fuzzy graph is either a strong fuzzy graph or a fuzzy graph which is neither strong nor weak.

**Proof.** Suppose underlying crisp graph is not a complete graph.
Then there exists three types of links.

**Case 1:** Absent links. i.e, links are such that $(u, v) = 0$ .
In this case $\overline{E_\lambda(u,v)} = \min\{\varepsilon, \delta\} - 0 = \min\{\varepsilon, \delta\}$ which is either $V_\lambda(u)$ or $V_\lambda(v)$ for all $u, v \text{in} V_\lambda^*$. In this case the complement is a SFG.

**Case 2:** Some absent and some active links. i.e, the links are such that
2.1 $E_\lambda(u, v) = 0$ for some $u, v \text{in} V_\lambda^*$ and 2.2 $E_\lambda(u, v) > 0$ for some $u, v \text{in} V_\lambda^*$
In the case 2.1, By the definition of complement, $\overline{E_\lambda(u,v)} = V_\lambda(u) \wedge V_\lambda(v)$ In the case 2.2, Let $E_\lambda(u, v) = \varepsilon$, where $\varepsilon \in (0, V_\lambda(u) \wedge V_\lambda(v))$.
$\overline{E_\lambda(u,v)} = V_\lambda(u) \wedge V_\lambda(v) - \varepsilon < V_\lambda(u) \wedge V_\lambda(v)$. In Case 2, flow allowed in various links shows that the complement is neither a SFG nor a WFG.

**Example 4.3:** The following figures illustrate the theorem 4.5.

**Case 1:** All edges are such that $E_\lambda(u, v) = 0$ .

**Figure 12:** F.
**Figure 13:** $\bar{F}$

**Case 2 :** Edges are such that
2.1 $E_\lambda(u, v) = 0$ for some $u, v \text{in} V_\lambda^*$ and 2.2 $E_\lambda(u, v) > 0$ for some $u, v \text{in} V_\lambda^*$

**Figure 14:** F.
**Figure 15:** $\bar{F}$

**Theorem 4.6.** The complement of a complete fuzzy graph is a weak fuzzy graph the nodes of which are isolated.

**Proof.** If the FG is complete then $E_\lambda(u, v) = V_\lambda(u) \wedge V_\lambda(v)$ for all $u, v \text{in} V_\lambda^*$, then
$\overline{E_\lambda(u,v)} = V_\lambda(u) \wedge V_\lambda(v) - E_\lambda(u, v) = V_\lambda(u) \wedge V_\lambda(v) - V_\lambda(u) \wedge V_\lambda(v) = 0$ for all $u, v \text{in} V_\lambda^*$.

**Example 4.4:** The following figures illustrate the theorem 4.6

**Figure 16:** F.
**Figure 17:** $\bar{F}$

**Theorem 4.7.** The fuzzy graph $F: (V_\lambda, E_\lambda)$ such that $E_\lambda(u, v) = \frac{1}{2}(V_\lambda(u) \wedge V_\lambda(v))$ for all for all $u, v \text{in} V_\lambda^*$ is a weak self complementary fuzzy graph.

**Proof.** If $F: (V_\lambda, E_\lambda)$ is such that $E_\lambda(u, v) = \frac{1}{2}(V_\lambda(u) \wedge V_\lambda(v))$ for all for all $u, v \text{in} V_\lambda^*$ then
$E_\lambda(u, v) = \frac{1}{2}(V_\lambda(u) \wedge V_\lambda(v)) < V_\lambda(u) \wedge V_\lambda(v)$ for all $u, v \text{in} V_\lambda^*$. So F is a WFG.
Now $\overline{E_\lambda(u,v)} = V_\lambda(u) \wedge V_\lambda(v) - \frac{1}{2}(V_\lambda(u) \wedge V_\lambda(v)) = \frac{1}{2}(V_\lambda(u) \wedge V_\lambda(v)) = E_\lambda(u, v)$.

Therefore F is self complementary FG.

**Example 4.5:** The following figures illustrate the theorem 4.7.

**Figure 18:** F.
**Figure 19:** $\bar{F}$

**Theorem 4.8.** The $\mu$ −complement of a weak fuzzy graph is a weak fuzzy graph.

**Proof.** Let $F^{\mu}$: $(V_{\lambda}, {E_{\lambda}}^{\mu})$be the $\mu$ −complement of a WFG F: $(V_{\lambda}, E_{\lambda})$
where${E_{\lambda}}^{\mu}$ is defined as.
${E_{\lambda}}^{\mu}(u,v) = V_{\lambda}(u) \wedge V_{\lambda}(v) - E_{\lambda}(u,v)$if$E_{\lambda}(u,v) > 0$ for all $u, v \in {V_{\lambda}}^{*} \rightarrow (1)$
and${E_{\lambda}}^{\mu}(u,v) = 0$ if $E_{\lambda}(u,v) = 0 \rightarrow (2)$
Since F:$(V_{\lambda}, E_{\lambda})$is a WFG$E_{\lambda}(u,v) < V_{\lambda}(u) \wedge V_{\lambda}(v)$for all $(u,v) \in {E_{\lambda}}^{*} \rightarrow (3)$
To prove that $F^{\mu}$: $(V_{\lambda}, {E_{\lambda}}^{\mu})$is a WFG, it is enough to prove
${E_{\lambda}}^{\mu}(u,v) < V_{\lambda}(u) \wedge V_{\lambda}(v)$for all $(u,v) \in {E_{\lambda}}^{\mu^{*}}$
Case 1. Let $(u,v) \in {E_{\lambda}}^{\mu^{*}}$,such that $E_{\lambda}(u,v) > 0$ .Then by the equations (1) and(3)
${E_{\lambda}}^{\mu}(u,v) = V_{\lambda}(u) \wedge V_{\lambda}(v) - E_{\lambda}(u,v) < V_{\lambda}(u) \wedge V_{\lambda}(v)$
Case 2. Let $(u,v) \in {E_{\lambda}}^{\mu^{*}}$,such that $E_{\lambda}(u,v) = 0$ .Then by the equation (2),
${E_{\lambda}}^{\mu}(u,v) = 0$
Therefore in both cases${E_{\lambda}}^{\mu}(u,v) < V_{\lambda}(u) \wedge V_{\lambda}(v)$for all $(u,v) \in {E_{\lambda}}^{\mu^{*}}$.

**Example 4.6:** The following figures illustrate the theorem 4.8

**Figure 20:** F.
**Figure 21:** $\bar{F}$.

**Remark 4.3.**The above theorem implies that the set of WFGs is closed under $\mu$ −complementation.

**Theorem 4.9.** If $F$ is a weak fuzzy graph then $(F^{\mu})^{\mu} = F$ .

**Proof.** Let $F^{\mu}$: $(V_{\lambda}, {E_{\lambda}}^{\mu})$ be the $\mu$ −complement of $F$:$(V_{\lambda}, E_{\lambda})$.
Since $F$:$(V_{\lambda}, E_{\lambda})$is a WFG,$E_{\lambda}(u,v) < V_{\lambda}(u) \wedge V_{\lambda}(v)$ for all $(u,v) \in {E_{\lambda}}^{*}$.
We shall consider two cases .

**Case 1.** For all $(u,v) \in {E_{\lambda}}^{*}$.
As per definition of${E_{\lambda}}^{*}, E_{\lambda}(u,v) > 0$ .
In this case ${E_{\lambda}}^{\mu}(u,v) < V_{\lambda}(u) \wedge V_{\lambda}(v) - E_{\lambda}(u,v)$ .
$({E_{\lambda}}^{\mu})^{\mu}(u,v) = V_{\lambda}(u) \wedge V_{\lambda}(v) - {E_{\lambda}}^{\mu}(u,v) = V_{\lambda}(u) \wedge V_{\lambda}(v) - (V_{\lambda}(u) \wedge V_{\lambda}(v) - E_{\lambda}(u,v)) = E_{\lambda}(u,v)$

**Case 2.** For all $(u,v) \notin {E_{\lambda}}^{*}$ . As per definition of ${E_{\lambda}}^{*}, E_{\lambda}(u,v) = 0$.
Here ${E_{\lambda}}^{\mu}(u,v) = 0$ and $({E_{\lambda}}^{\mu})^{\mu}(u,v) = 0$.

**Example 4.7:** The following figures illustrate the theorem 2.3.9

**Figure 22:** F.
**Figure 23:** $F^{\mu}$.
**Figure 24:**$(F^{\mu})^{\mu}$

**Remark 4.4.**The above theorem implies that the set of WFGs hold the law of double complementation with respect to $\mu$ −complement.

**Theorem 4.10.** The $\mu$ −complement on a complete fuzzy graph is a weak fuzzy graph having isolated nodes.

**Proof.** Let $F^{\mu}$: $(V_\lambda, E_\lambda{}^{\mu})$ be the $\mu-$ complement of SFG$F$:$(V_\lambda, E_\lambda)$. Since $F$:$(V_\lambda, E_\lambda)$is a SFG,$E_\lambda(u,v) = V_\lambda(u) \wedge V_\lambda(v)$ for all $(u,v) \in E_\lambda{}^{*}$.
Then for all $(u,v) \in E_\lambda{}^{*}$,
$E_\lambda{}^{\mu}(u,v) = V_\lambda(u) \wedge V_\lambda(v) - E_\lambda(u,v) = V_\lambda(u) \wedge V_\lambda(v) - V_\lambda(u) \wedge V_\lambda(v) = 0$. For all $(u,v) \notin E_\lambda{}^{*}$, $r(u,v) = 0$. Here $E_\lambda{}^{\mu}(u,v) = 0$ and $(E_\lambda{}^{\mu})^{\mu}(u,v) = 0$. This implies that in the resulting FG all the links are absent and so it is a WFG having isolated nodes.

**Example 4.8:** The following figures illustrate the theorem 4.10

**Figure 25:** F.
**Figure 26:** $F^{\mu}$

**Definition: 4.1:** The spanned FSG$F = (V_\lambda, E_\lambda)$ of a SFG $H = (V_\lambda, L_\lambda)$ is called an $\varepsilon-$ weak fuzzy sub-graph($\varepsilon-$ WFSG) of $H = (V_\lambda, L_\lambda)$, if$E_\lambda(u,v) = L_\lambda(u,v) - \varepsilon$, for every $L_\lambda(u,v) > 0$ where $\varepsilon$ is fixed such that $\varepsilon \in (0, min\{L_\lambda(u,v) / L_\lambda(u,v) > 0\})$.
In view of this definition, an $\varepsilon-$ WFSG F $= (V_\lambda, E_\lambda)$can be considered as a WFG that can become a SFG by adding a fixed $\varepsilon > 0$ to all edges $(u,v) \in E_\lambda{}^{*}$ such that$E_\lambda(u,v) > 0$.

**Example 4.9:** The following figures illustrate the definition 4.1 where $\varepsilon$ = 0.1∈ (0, 0.4)

**Figure 27:** H**.**
**Figure 28:** F

**Theorem 4.11:** Every strong fuzzy graph$H = (V_\lambda, L_\lambda)$ has a weak fuzzy sub-graph.

**Proof:** The $\varepsilon-$ WFSG$F = (V_\lambda, E_\lambda)$of $H = (V_\lambda, L_\lambda)$ such that $E_\lambda(u,v) = L_\lambda(u,v) - \varepsilon$, for every $L_\lambda(u,v) > 0$ where $\varepsilon$ is fixed such that $\varepsilon \in (0, min\{L_\lambda(u,v) / L_\lambda(u,v) > 0\})$ is a weak subgraph of $H = (V_\lambda, L_\lambda)$ .

**Example 4.10:** Check whether weak fuzzy graph in the following figure is an $\varepsilon-$ weak fuzzy sub $-$ graph?

**Figure 29:** $H = (m, s)$

**Answer:** The given graph F is not an $\varepsilon-$ WFSG.
Reason: In the graph $min\{L_\lambda(u,v)/L_\lambda(u,v) > 0\} = 0.1$.
Corresponding to that edge, $V_\lambda(x) \wedge V_\lambda(v) = 0.5$.
The fixed $\varepsilon$ = 0.5 - 0.1 = 0.4.
If 0.4 is added to each edge, then the graph fail to become a FG.

**Example 4.11:** Draw examples of $\varepsilon-$ weak fuzzy sub $-$ graph and corresponding strong fuzzy graphs for $\varepsilon = 0.3$ and 0.2 with 4 vertices
For $\varepsilon = 0.3$
**Figure 30:** E.
**Figure 31:** F

For $\varepsilon = 0.2$

**Figure 32:** G.
**Figure 33:** H

**Example 4.10:** A campus simultaneously runs 4 departments (say) Mathematics-M, Statistics-S, Computer Science-C and Artificial intelligence –A, sharing facility. The income from each department and expenditure of sharing facility between each of the department can be simulated using an $\varepsilon -$ WFSG if there is an objective to cut the expenditure of facility sharing to save some amount from the minimum of income from corresponding departments. In the following tables, the entries in the diagonal cells corresponding to MM,SS,CC and AA are the income in INR from the departments Mathematics, Statistics, Computer Science and Artificial Intelligence respectively and the other entries are the expenditure of sharing facilities between the corresponding departments in INR.

**Table 3:** This data can be converted to numbers between 0 and 1 by dividing the values by 100000.
The following table gives the fuzzified values (Table: 4).
The following figure illustrates this information as an $\varepsilon -$ weak fuzzy sub $-$ graph where $\varepsilon = 0.02$
**Figure 34:**$F = (V, E)$

## CONCLUSION

In this article, the properties of a sub class of fuzzy graphs (FGs)and weak fuzzy graphs (WFGs) are discussed with suitable examples.

**ABSTRACT**

Children brought up in dysfunctional family environments such as chronic conflict, substance abuse, neglect or emotionally distant, are highly susceptible to having developmental issues. However, many children strive with resilience, despite these risks. Contemporary research, hence, highlights the importance of such protective factors- emotional intelligence, social support, community support, etc. in mitigating those adverse outcomes arising from such experiences. This review analyzes the impact that dysfunctional family environments have on children's cognitive, social, emotional and behavioural development, as well as the role of protective factors as a buffer against those outcomes.

**Keywords:** dysfunctional families, child development, protective factors, resilience, cognitive outcomes, biological outcomes, socio-emotional outcomes, behavioural outcomes.

## INTRODUCTION

The family environment is globally considered as the primary context in which children grow and develop. It influences their cognitive, social and emotional trajectories (Bronfenbrenner, 1979). Children raised and brought up in environments where their emotional needs are acknowledged, often develop emotional security and the confidence to express themselves, which ultimately fosters a healthy interpersonal as well as intrapersonal functioning (Morris et al. 2007). Positive family relationships promote psychological resilience, social competence, and adaptive personality traits such as self-compassion and a strong sense of coherence (Grevenstein, 2019). However, the family environment can be dysfunctional, for a certain number of children. Researchers have estimated that 60% of individuals, globally, have experienced at least one Adverse Childhood Experience (ACE) (Madigan et

al., 2023). Behere et al., (2017) reported, in a retrospective review of 154 preadolescents admitted at a behavioural health facility, that 2/3rd of the children had a history of trauma, with 36% cases reporting physical abuse, and 71% had either a parent or a sibling diagnosed with some psychiatric disorder. Hillis, S. et al., (2016) estimated that 1 billion children aged 2-17 years old experience violence each year. When children are exposed to negative situations including abuse, domestic violence, neglect, etc., there is a greater risk of having cognitive impairments (inattentiveness, emotional dysregulation, etc.) (Petersen, 2014). Such adversities can also cause problems in academics, emotion regulation, and mental health issues (Dubowitz, 2019; Hughes, et al. 2017; McLaughlin et al., 2020). These risks can become so severe that it might necessitate clinical interventions and even hospitalization.

Exposure to stress triggers the activation of the Hypothalamic Pituitary Adrenal (HPA) Axis. The process starts with the releasing of Corticotropin Releasing Factor (CRF) by the hypothalamus, which causes the pituitary gland to release the AdrenoCorticotropic Hormone (ACTH) into the Adrenal Cortex, which in turn releases glucocorticoids such as cortisol (Sheng, 2021). While short-term release of cortisol is necessary as it activates the fight-or-flight response, its long-term release due to chronic exposure to stress can be harmful as it suppresses the immune system and ultimately disrupt the physiological homeostasis (Gleitman et al., 2004; LeDoux, 2003). Chronic stress or trauma exposure maintains the brain in a state of heightened arousal, which contributes to long-term structural and functional changes in the key neural circuits (Perry, 2002; Teicher et al., 2002).

**Conceptual Framework**

Focusing on the risk and protective factors, this framework integrates four fundamental theories to explain how dysfunctional family settings affect children's development.

*Murray Bowen's* Family Systems Theory (1978), perceives the family as an emotionally interdependent unit, in which members affect each other's behavior, emotions, and functioning, hence forming a "reciprocal relationship". Emotional interdependence is crucial to survival, yet it can be problematic when subjected to stress exposure. Those individuals who are accommodating of others' stress tend to absorb the family tension, placing them at risk for physical and psychological illness. Hence, a dysfunctional family relationship can negatively impact an individual's development and health.

*Aaron Antonovsky's* Salutogenesis Model (1979), has a stronger focus on the circumstances that enhance resistance and health rather than pathology-oriented models. Salutogenesis is based on a core concept of the Sense of Coherence (SOC) formed by *manageability, meaningfulness, and comprehensibility* as it outlines the way in which individuals handle tension and maintain wellbeing. With the availability of resistant resources such as education and social support, a healthy SOC can protect children against the adversities of a dysfunctional family environment, hence explaining how some children thrive despite harsh conditions (Mittelmark & Bauer, 2017).

*Urie Bronfenbrenner* proposed the Ecological Systems Theory in 1979, emphasizing how different nested environmental systems- the microsystem (school, family, peers), mesosystem (interactions among microsystems), exosystem (indirect surroundings, e.g., the workplace of parents), macrosystem (legislation, cultural values), and chronosystem (temporal changes, e.g., parental divorce), influence a child's growth and development. Serious threats to development come from family environments that are dysfunctional, characterized by neglect, abuse, or ineffective communication. Other mechanisms, including peer or teachers support, can reduce or enhance these negative impacts. Therefore, unless balanced by protective factors in other environmental settings, a dysfunctional family can compromise social competence, academic achievement, and emotional security.

Based on the Risk and Resilience Model, which was formulated by *Norman Garmezy* and *Ann Masten* during the 1980s and 1990s, children have a higher tendency to develop behavioural issues and psychopathology when they are exposed to risk variables such as parental conflict, abuse, or neglect. But outcomes vary based on protective factors such as self-efficacy, structured routines, supportive adult relationships, and emotional regulation. As stipulated in

the theory, resilience can counteract these risks, hence not all children from dysfunctional families experience adverse outcomes

**Understanding Dysfunctional Families: Definitions, Typologies and Risk Factors**

Family functioning is generally measured in several domains, such as problem-solving, communication, roles, affective responsiveness, affective involvement, behavior control, and general functioning, as measured by the McMaster Family Assessment Device (FAD) (Zagefka, 2021). When one or more of these domains are compromised, the family environment can fail to promote the healthy development of its members. In psychological literature, a dysfunctional family is characterized by abuse, domestic violence, parental mental illness, substance abuse, emotional issues, or neglect (Arora and Prakash, 2018; Nittle, 2025). Children raised in such environmental contexts tend to internalize such maladaptive behaviour due to their prolonged exposure and absence of mitigating factors, and developing compromised executive functioning, behavioural and impaired socio-emotional outcomes (Petersen et al. 2014). Hence, identifying these typologies is significant to comprehend the mechanisms through which early relational experiences lead to long-term emotional and behavioural problems in children.

**Amen, D. G., (2020)**, described a number of dysfunctional family **typologies**, based on underlying issues and dominant behavioral patterns:

***Substance Abuse Family-*** Neglect, inconsistency, and emotional unavailability are typical among children in such family environments, which can lead to the development of trust issues and emotional instability in them.

***Emotionally Detached Families*** do not give emotional support or warmth to their children. These children can develop problems with emotional expressiveness and self-esteem along with feelings of neglect.

***Conflict Driven Family-*** These types of families promote a hostile environment and are dominated by recurrent and intense confrontations. The children can develop fear, anxiety, and struggle with secure attachments.

***Violent Family-*** Physical, emotional, or psychological violence is prevalent in these families. Exposure to such violence can develop trauma, behaviour disorders, and mental health problems among the children over time.

***Authoritarian Family-*** These families are marked by stringent rules and dominating authority that suppresses individuality. Children can lack decision-making ability and develop issues of dependence.

There are certain **Risk Factors** in context to dysfunctional families that are often detrimental to child development (Simões, A., 2022). These factors span across multiple domains, starting with patterns of social and economic interactions.

**Social and Economic Interactions-**

Financial issues
Lack of social support
Exposure to violence

**Family Characteristics-**

Domestic violence
Chronic conflicts
Poor communication between separated parents

**Characteristics of caregiver-**

Alcohol and/or drug abuse
Mental health issues
Criminal records

**Parenting-**

Unrealistic expectations from the child
Negative attitudes towards the child
Abusive or mistreating behaviours

Collectively, these interrelated risk factors contribute to a complex and adverse developmental context for children raised in dysfunctional families.

**Impact of Dysfunctional Family Environments on Child Development**

**Cognitive Development**

A secure and stimulating home environment is very much imperative in promoting early cognitive growth. Quality care, through emotional responsiveness, facilitation of learning, and adequate stimulation, has been found to correlate with positive cognitive outcomes in children below the age of five (McCormick, 2019; Nurliyana, 2019). Conversely, children raised in dysfunctional family environments, where this support is lacking, are at increased risk of developmental delays, particularly when compounded by conditions such as poor diet, illness, and unstable caregiving patterns (McCormick, 2020).

**Impaired Executive Functioning**

Dysfunctional family patterns, especially those characterized by parental hostility, neglect, or drug abuse, have been reliably associated with children's executive functioning deficits. Impairment in executive functioning, including working memory, inhibitory control, and cognitive flexibility, has been revealed by longitudinal research on Chinese families with parental hostility, with parental warmth acting as a protective factor (Lam, Chung, & Li, 2018), and on families with alcohol misuse (Schroeder & Kelley, 2008; Daly et al., 2017). In a longitudinal study by Zha, J. et al., (2024), it was found that maternal ACEs were positively correlated with poorer executive functioning in pre-schoolers and several mediators of these associations included parenting stress and direct maltreatment, accounting for more than 65 to 78% of the total relationship. These results support more general evidence that repeated exposure to hostile or disorganized home environments can interfere with the development of fundamental cognitive control processes during sensitive developmental periods.

**Academic Performance**

Chilan and Cedeño (2022) established that more than 40% of rural students who had family-related challenges showed behavioral issues affecting school participation, whereas others manifested certain deficits in reading and math reasoning. Likewise, Ndlovu (2023), and Ede and Nwakpadolu (2024), linked significant negative correlation between dysfunctional family environments and academic performance, because they are continuously experiencing emotional pain and a lack of support within the home environment. Together, these results highlight that academic underachievement is not merely a school issue, but indeed a manifestation of more profound impairments in the functioning of families that interfere with cognitive and emotional preparedness to learn.

**Emotional regulation**

Emotional neglect and exposure to abuse, tends to cause problems of anxiety and depression (as a result of difficulties with emotional awareness and expression) on the one hand, and problems of aggression and conduct disorders (as a result of increased emotional reactivity and over-reliance on maladaptive regulation strategies like impulsivity) on the other (Heleniak, 2016; Hatkevich, Sumlin, & Sharp, 2021). Adolescents with such histories showed increased activation in the salience network (responsible for emotion regulation) and amygdala when presented with negative stimuli, reflecting greater threat sensitivity, and in prefrontal areas during tasks of regulation, reflecting a compensatory attempt at controlling emotional reactions (McLaughlin et al., 2015).

**Neurological and Biological Outcomes**

Early exposure to dysfunctional family environments, such as verbal abuse and domestic violence, interferes with sensory processing and results in structural changes in brain areas responsible for emotional regulation and executive functioning, including the prefrontal cortex, anterior cingulate, hippocampus, and corpus callosum (Teicher, 2016). Childhood abuse interferes with physiological functioning, such as the nervous, immune, and endocrine systems, rendering individuals more susceptible to long-term behavioral, physical, and psychological issues like depression, drug use, and impaired impulse control (WHO, 2024; Balistreri, 2016). Neuroimaging research has shown that different types of adversities experienced in early life yields different neural outcomes. Experiences-

such as abuse, decreases the volume and enhances the reactivity of the amygdala, medial prefrontal cortex, and hippocampus, whereas adversities such as neglect impacts the frontoparietal areas responsible for cognitive control (McLaughlin, 2019). These results highlight the need to customize interventions to adversity's nature and timing.

**Social, Emotional, and Behavioral Development**

Dysfunctional family conditions, such as divorce or separation of parents, can negatively alter children's emotional development. Divorce is likely to create emotional distance from the non-residential parent, especially when it occurs due to parent conflict or intrafamily violence (Strohschein et al., 2012). The disruption of the parent-child relationship under such conditions might suppress provision of emotional support and stability, thereby triggering children's psychological distress and illnesses (Mphaphuli, 2023). The risk of experiencing ACEs at a tender age is significantly linked to behavioral problems, with odds of 2.0 and 2.9 when the child is aged five and exposed to two and three or more ACEs, respectively. Children aged nine and fifteen years, with two or more ACEs, have shown 1.9 and 3.2 times greater likelihood of being at great risk of behavioral problems, respectively (Choi, J. K., et al., 2019).

Domestic violence undermines the home as a safe space, developing issues such as anxiety, depression, disobedience, and drug use. These adversities cumulatively compromises children's emotional regulation, formation of relationships, and social competencies (Mphaphuli, 2023; Khemthong, 2021).

**The Role of Protective Factors in Childhood Adaptation and Resilience**

**Individual level factors**

Individual characteristics such as emotional intelligence, social competence, and adaptive functioning can successfully mediate the effects of adverse childhood experiences. Antonovsky's Sense of Coherence (SOC) provides a principal model for understanding resilience among children from dysfunctional families. Children who view life as comprehensible, manageable, and meaningful, particularly with consistent external support, can better handle stress and sustain emotional health (Mittelmark & Bauer, 2017). Beyazit et al. (2024) found that children with greater trait emotional intelligence were more seen to effectively regulate their emotions and apply adaptive regulation strategies, hence, indicating the potential of EI-based interventions. Resilience can also protect children from negative life experiences. Although most children raised by parents with problems of alcohol abuse develop negative outcomes, some learn adaptive coping through self-examination and development, emphasizing the value of building emotional awareness during childhood into adulthood (Zhang et al., 2019; Simonič, 2023).

**Family level factors**

Current evidence underscores the importance of family-level protective factors in reducing the long-term effects of childhood adversity. For example, Balistreri (2016) established that positive family functioning, as indicated by low parental stress and supportive parent-child relationships, plays a significant role in improved physical and emotional well-being during adolescence. Similarly, Mphaphuli (2023) found that parental employment that is stable and close relationship between family members promotes a healthy development by creating a healthy home environment. Together, these results highlight the buffering influence of stable and cohesive family relationships in mitigating the harmful effects of early life adversity. Emotionally responsive caregiving has specifically been found to moderate the psychological impact of trauma. McLaughlin (2020) documents that having a supportive caregiver can decrease heightened threat-related neural processing (typically found in children with histories of early trauma), which decreases the risk of psychopathology. Therefore, a healthy family environment, positive parent-child interaction, proper support and stimulation, etc. are needed for healthy development in children (Yang, Q., 2021).

**Community level factors**

Community-level resources, such as supportive teachers, positive peer interactions and neighbours, serve as significant protective factors. Research indicates that strong social support eliminates the risk of trauma-related psychological disorders in victims of trauma. (Trickey, 2012). In a study of 421 children aged 6-12 from low-income families, Kim et al. (2010) found that the negative outcomes (e.g., regulation of emotions) related to maltreatment experiences were buffered by peer acceptance, indicating the regulatory function of social relationships. Rockhill

(2009), using the sample of 521 adolescents in middle school, found that a strong social support and social competence can mediate the negative outcomes (such as behavioural including psychopathology) among adolescents, with depressive or comorbid adolescents exhibiting poorer adaptive and academic functioning due to these deficits. This mediation was not evident for adolescents with conduct problems alone, which supports the need for specific social skills and support interventions for adolescents with internalizing or comorbid problems. Similarly, Alto et al. (2019) determined that peer social acceptance mediates the link between childhood maltreatment and depression during adolescence, across both genders. This further establishes the pivotal influence of peer relations on emotional resilience. Together, these results underscore the significance of social environments within communities in minimizing adverse consequences of dysfunctional family experiences.

## CONCLUSION

The literature consistently finds that children growing up in dysfunctional home environments, where there is abuse, neglect, emotional unavailability, or substance abuse, experience deficits in emotional regulation, executive functioning, academic achievement, and socio-emotional development across a broad variety of cultural contexts. These adverse effects are most often buffered by protective factors such as secure attachment, emotional responsiveness, intelligence, and social or caregiver support. Yet, most research as it does exist is narrowly concentrated on a single factor (e.g., mental illness of family members or abuse of alcohol) and not culturally representative, limiting generalizability to larger populations. Additional longitudinal and more comprehensive studies are also necessary to learn more about the long-term impact of family dysfunction as well as the persistent influence of protective factors. Future research should focus on making early intervention of at-risk youth a top priority before negative trajectories become solidified, by focusing on building interventions based on a culturally sensitive, family-centered approach focusing on parent education, mental health service access, and trauma-sensitive care. Building resilience as secure relationships and supportive environments is essential to preventing long-term harm. Finally, interdisciplinary collaboration between clinical, educational, and policy leaders is essential for creating secure, supportive environments where healthy childhood development is guaranteed for those youth raised in dysfunctional families.

## ACKNOWLEDGEMENT

The authors extend their sincere gratitude to all those who contributed throughout this review. Their support, guidance, and insightful feedback were invaluable throughout the research process.

**Conflict of interest**

The authors declare no conflict of interest.

**ABSTRACT**

This survey examines and systematically organizes research on fuzzy, intuitionistic fuzzy, and neutrosophic graphs, along with their corresponding graph types. The survey incorporates prior research that examined the development and proliferation of graphs and associated operations, as well as studies concentrated on graphs characterized by uncertainty. The survey analyzes the historical context, fundamental structural characteristics, and applications investigated by researchers across various regimes of binary (graph) operation in a fuzzified framework. This article systematically elucidates the evolution of operational techniques from fuzzy to neutrosophic models and from fuzzy to neutrosophic graphs through a comprehensive survey and analysis of these contributions.

**Keywords:** FG, IFG, NFG, Operation

## INTRODUCTION

Graph theory has long been a foundational application for modeling and mapping out different real-world systems, and widely implemented in various disciplines like engineering, decision-making, chemistry, and medical diagnostics. Historically, the use of graphs dates back to Euler and the solution to the Konigsberg bridge problem in

1736, which created the aforementioned modern graph theoretical analysis. The two main components of a graph, the vertices and edges, work well at representing relationships, particularly in topical areas like social networks and data systems, etc. However, traditional graph or edge models have limitations to address systems that are fuzzy, ambiguous, or imprecise. So, researchers have built upon traditional graph theory by applying fuzzy set theory to graphs. These fuzzy graph models will enable greater flexibility in the handling of uncertainty, and subsequent models can have far better applications as complexity increases. Much research has been conducted on the extension of graph theory using operational methods and structural properties of graphs in the fuzzy and fuzzy derived domains, producing innovative models that provide a better modeling of reality. In classical graph theory, binary relations were crisp (usually 0 and 1) values to describe if an edge existed amongst two vertices. This aspect of classical theory was sufficient to address several structured type problems. However, classical theory has limited utility on ambiguity and belief questions that are prevalent in many real-world situations. This left plenty of opportunity for fuzzy graph theory to be developed and expanded on classical graph theory. The concept of fuzzy graphs traces its origins to the pioneering work of Lotfi A. Zadeh (1965), who introduced the foundational theory of fuzzy sets. In 1973, Kaufmann formalized the definition of FG, building upon Zadeh's foundational theory of FS. Shortly thereafter, Rosenfeld advanced the field by extending the notion of fuzzy relations within graph structures, paving the way for deeper exploration into uncertainty-based graph modeling. Nagoorgani *et al*. further develop this research area by logically reconstructing the practices and theorizing on application with graphs. In 1986, Atanassov established the Intuitionistic fuzzy set (Int-FS) that contain membership and non-membership degrees. This increased the representational capacity of fuzzy graphs through degrees of ambiguity. Researchers, like Parvathi and Karunambigai (2009) introduced intuitionistic elements in fuzzy graph that facilitated different graphical representations within axiomatics.

Akram (2016) and Nagoorgani (2010) also contributed and explored different operational and utilization cases in fuzzy graph. Fuzzy graph theory progressed in great stride after the advancement of neutrosophic set theory by Smarandache (1999), which widened intuitionistic fuzzy set theory by adding indeterminacy to the fuzzy sets' domain or space. This development afforded the theory to adapt more accurately and concretely to challenge of representation of uncertain and conflicting information. Broumi's (2016, 2018) works further disentangled the theory aiding in the development of neutrosophic graph theory. This is advantageous in representation of vague systems wherein boundaries of the variables are difficult to demarcate. Overall, fuzzy, intuitionistic fuzzy and neutrosophic graph structures have emerged as usable analytic representations and valid structural modeling tool and appropriate for the many forms of uncertainty experienced in the real world. The different theoretical possibilities in uncertain and imprecise domains provided scope for many aspects various fields across artificial intelligence, decision-making systems, and information science to explore many forms of uncertainty. These challenges can be expressed in vague terms and vague concepts, which are conversationally common forms of challenges but can now be rigorous and accurate with the research direction now relevant to the overarching dialogue in modern science and technology. The domain of fuzzy graphs and their extended variants encompasses a wide range of well-defined operations. These operations typically involve integrating the structural features and attributes of two distinct graphs, resulting in a unified graph that reflects multidimensional characteristics. Such a framework proves especially valuable in addressing complex challenges in areas like socioeconomic analysis, neural network modeling, and decision-making processes. This article presents a comprehensive overview of our research on various operational techniques applied across different types of fuzzy graphs, culminating in neutrosophic graph models. The organization of the article is as follows: Section 1 introduces the evolution of graph theory from fuzzy foundations to neutrosophic extensions2,3,4 detail the operational methodologies applied to fuzzy graphs, intuitionistic fuzzy graphs, and neutrosophic fuzzy graphs, respectively. The final section 5, offers concluding remarks and reflections on the overall findings.

**Various Operational Approaches in Fuzzy Graph Theory**

Table 1 gives an overview of the advancements in graph operation methods in the fuzzy environment. Mordeson [1] devised new methods to define operations for products of different kinds in fuzzy graphs. It formally defined the product operations, then established theorems about fuzzy subgraphs. Besides the product operations, they also considered composition, union, and join, including additional requirements and purposes within fuzzy subgraphs,

along plenty of illustration. NagoorGani and Radha [2] established a new "conjunction" operation on two fuzzy graphs. Have established necessary and sufficient conditions with which the conjunction could be con- sidered strong. They also examined the degrees of vertices concerning the conjunction of two fuzzy graphs, along with some theorems. They provided some further discussions about how degree based regularity, and the properties arising from the adjacency sequence from fuzzy graph conjunction. NagoorGani and FathimaKani [3] proposed two novel operations on fuzzy graphs, known as the Beta and Gamma products. Their study focused on analyzing vertex degrees and exploring regularity properties of these product graphs under specific conditions. They also established necessary and sufficient criteria under which these products exhibit tendencies toward regularity. Radha and Arumugam [4] were the first to study the strong product of a fuzzy graph. They explored this fuzzy product in terms of effectiveness, completeness and connectedness. They specified upper and lower truncations of the strong product, and examined how vertex degrees related to the fuzzy direct sum. ShovanDogra [5] introduced a diverse set of product operations in the realm of fuzzy graph theory, namely the modular, homomorphic, box-dot, and star products. These operations were further examined in the context of strong fuzzy graphs, with a detailed analysis of vertex degrees corresponding to each product type. Radha and Arumugam [6] also explored the maximal product of fuzzy graphs where effectiveness and connectedness were established, also covering vertex degrees and regularity under certain limitations. Radha and Arumugam [7] introduced a novel fuzzy graph operation known as the residue product, and conducted an in-depth analysis of its structural properties, including effectiveness, connectivity, and completeness. They derived explicit expressions for both vertex degree and total degree, and established necessary and sufficient conditions under which the residue product exhibits regularity. Building on this foundation, MuzzamalSitara *et al*. [8] carried out a comprehensive study of the maximal product in fuzzy graph theory. Their work delineates precise criteria for regularity, supported by illustrative counterexamples. They computed vertex and total degrees for the maximal product and presented their results with clarity. To contextualize their theoretical contributions, they included a figure and a flowchart demonstrating an application aimed at identifying controversial issues among nations, showcasing the practical relevance of fuzzy graph products in geopolitical analysis.

**Various Operational Approaches in Intuitionistic Fuzzy Graph Theory**

Researchers can extend existing product operations to IFGs as outlined in Table 3 by generalizing fuzzy graphs (FGs) through the incorporation of an additional membership function. This enhancement introduces both membership and non-membership degrees, allowing for a richer representation of uncertainty and hesitation in graph structures. Such a generalization enables the adaptation of classical fuzzy graph products to the intuitionistic framework, paving the way for deeper structural analysis and broader applications in areas requiring nuanced modeling of ambiguity. Various Operations in Intuitionistic Fuzzy Graph Environment (Table 2). Parvathi *et al*. [9] laid the groundwork for Intuitionistic Fuzzy Graphs (IFGs) by investigating essential complementary characteristics and formulating several core theorems. Expanding upon this foundation, they introduced a range of graph product operations. Further advancing the field, SankarSahoo *et al*. [10] extended the concepts of some products for pairs of IFGs. Their work yielded significant theoretical results and demonstrated that these product operations can inspire innovative applications and models within fuzzy graph theory. Hossein Rashmanlou *et al*. [11] investigated the logical foundations of several operations in fuzzy graphs. Their rational justification was achieved by characterizing the graph's hierarchical levels, and they further established key categorical properties through the lens of category theory. SankarSahoo and Madhumangal Pal [12] introduced the idea of normal and tensor prod- ucts in the framework of IFGs. Their study included an examination of vertex degrees for selected product types and led to the establishment of several structural properties, enriching the theoretical landscape of fuzzy graph operations. NagoorGani *et al*. [13] conducted an analysis of regularity conditions in the Cartesian product of IFGs. Their findings revealed that the resulting product graph exhibits either full regularity or a mixed state. Under these configurations, they defined the associated membership functions as constant to maintain structural consistency within the product graph. Kalaiarasi and Mahalakshmi [14] made a notable contribution by introducing the co-normal product operation in IFGs. Their work demonstrated that this product preserves the structure of an IFG, meaning the resulting graph still satisfies the conditions of intuitionistic fuzziness—namely, the membership and non-membership functions remain within the required bounds. Yahya Mohamed and Mohamed Ali [15] found the maximum product operation for Intuitionistic Fuzzy Graphs (IFGs), ensuring that both vertex degree and graph

regularity remain invariant under the transformation. Their approach preserves the structural integrity of the original graphs while extending the operational framework of IFGs. In a related development, Sonia Mondal and Madhumangal Pal [16] explored the concept of BIFGs and defined many graph operations. Their study focused on analyzing the vertex degrees of the resulting graphs, offering insights into how these operations influence the underlying fuzzy structure within a bipolar context. IrfanNazeer *et al*. [17] studied various product operations on IFIG also analyzed the basic property of vertex degree in each case. Their study included a day to day -life example of the Cartesian and Composition products in the textile industry related to organizational departments. A comparative analysis showed the differences between the models they developed and the existing models. Kalaiarasi *et al*. [18] defined the co-normal product on interval-valued Atanassov fuzzy graphs (IA-FGs) and showed that it was possible to apply it on complete, regular, and strong IA-FGs. This study provided an example of a practical application by showing the difference in product quality or cost.

**Various Operational Approaches in Neutrosophic Fuzzy Graph Theory**

Table 3 lists the enrichment associated with the product of graph concern in a Neutrosophic. Various Operations in Neutrosophic Fuzzy Graph Environment (Table 3). Muhammad Akram and GulfamShahzadi [19] developed a detailed definition of single-valued neutrosophic graphs (SVNGs) and studied the fundamental things associated on graph levels. They also surveyed several types of product operations and studied different social behavioral characteristics using SVNG to identify the individual with the most impact. Muhammad Gulistan *et al*. [20] pitched the idea of NCGs based on NCS, plus introduced and used Hadamard product operations. They showed contextually graph order and degree in examples and translated theoretical findings for use in industrial application using real data. Aslam Malik *et al*. [21] studied bipolar SVNG, and made use of operations such as symmetric difference, residue, maximal, rejection. Their study included a concise examination of vertex degree and total vertex degree in these graphs. A real world study was posited to develop a framework to assist in understanding good candidates for educational designations. Satham Hussain *et al*.[22] examined a Neutrosophic Vertex Graphs (NVGs) and defined a variety of product operations. Satham Hussain *et al*. [23] studied significant operations on graphs including Cartesian, cross, lexicographic, strong product and composition product for Neutrosophic Vertex Similarity Graphs (NVSGs). Their article also had a practical component that dealt with selection of relevant institutions using the ranking. Satham Hussain *et al*. [24] explored the fundamental operations Composition between Neutrosophic Vertex Similarity Graphs, Cartesian product of it, Cross Product and Strong product of Neutrosophic Vertex Similarity Graphs, Lexicographic for Neutrosophic Vertex Similarity Graphs (NVSGs) that involved decision making to find the most suitable institutions based on academic ranks. Meenakshi *et al*. [25] endeavored to tackle domination-related parameters for Single Valued Neutrosophic Graphs (SVNG). By looking at a special set of properties with respect to symmetric difference operations on single-valued neutrosophic networks, they were able to suggest a model of optimal productive networks. In the process, they develop one special-case algorithm that searches for optimal productive networks. Mohammed Alqahtani *et al*. [26] studied applied research topics on complex environmental neutrosophic graphs. Their study focused on applying certain operations of indirect graphs such as Cartesian, union, join, and composition, as well as studying structural properties of indirect graphs such as isomorphism and complementarity. The final element of their study involved an application on construction hospital infrastructures in which planners were looking for optimal starting points.

## CONCLUSION

When we look through the lens of neutrosophy, we found that our graph product operations allowed for greater flexibility and robustness, and more precise and effective results than previous approaches based on fuzzy graph. The neutrosophic framework gives a more transparent treatment of the uncertainty, ambiguity, and indeterminacy, which means there is better representation of reality. This analysis shows that it recognizes the inherent complexity of the subject, and provides a renewed and contemporary understanding of it ideal to our contemporary landscape and research trajectories. In addition, the enhanced nature of neutrosophic graph theory's handling of indeterminacy,

in a structured and systematic manner can help address common pitfalls that come during practice. Therefore, this creates valuable groundwork for future models that are advancing real-world engagement.

**Table 1: Various Operations in Fuzzy Graph Environment**

| Reference | Year | Graph Type | Approaches |
|---|---|---|---|
| [1] | 1994 | Fuzzy Graphs | Numerous theorems and illustrative examples have been developed to explore fuzzy subgraph operations |
| [2] | 2008 | | The conjunction of FG has been defined with properties. |
| [3] | 2014 | | The $\beta$ and $\gamma$ of FG have been individually found and analyzed for their properties in regular fuzzy graph structures. |
| [4] | 2014 | | The strong, effective and the notion of complete fuzzy graphs have each been individually defined and studied. Further, the vertex degrees and truncation properties have been systematically analyzed. |
| [5] | 2015 | | The max and the effective fuzzy graphs, and the structure of connected FG have each been formally defined and examined. Additionally, the vertex degree characteristics and regularity properties of the maximal product have been systematically analyzed. |
| [6] | 2015 | | The different product of fuzzy graphs have been thoroughly examined, along with detailed analyses of their corresponding vertex degree evaluations. |
| [7] | 2015 | | The essential properties of effectively, connectedness, and completeness of this operation, has been explored; and finally their considerations of vertex degrees, total degrees, and fuzzy graphs' regularity from using residue products have been explored and exemplified. |
| [8] | 2019 | | The maximal product of two fuzzy graphs have been looked at in much detail and have been discussed about its theoretical properties and also attendant properties, and examples. Furthermore, we have demonstrated the product's relevance in real-world applications in discovering countries' controversial issues and study. |

## ABSTRACT

This study presents an analytical and experimental heat transfer investigation of a mother-baby plastic granules extruder machine with the integration of a heat recovery structure. The analytical model was developed by considering conduction through the heater to the barrel surface, conduction across the barrel wall, convection between the barrel inner surface and the raw plastic, and additional heat generation due to shear and friction of the rotating screw. To validate the model, experimental trials were conducted on an LDPE processing extruder unit under two cases: (i) without heat recovery integration and (ii) with a CRC sheet-based heat recovery structure installed between the mother and baby units. A total of 48 temperature readings (8 readings per day for 3 consecutive days, in both cases) were collected to analyse the thermal response. The results showed close agreement between analytical predictions and experimental observations, with notable variations in temperature distribution across the barrel and plastic melt zones. The incorporation of the heat recovery structure demonstrated improved utilization of the rejected thermal energy, thereby confirming the effectiveness of the proposed design. This combined analytical–experimental approach provides a detailed understanding of the heat transfer processes in extrusion machines

and highlights potential pathways for enhancing thermal performance and energy efficiency in plastic recycling operations.

**Keywords:** Plastic Granule Extruder, Thermal Efficiency, Specific Energy Consumption, Heat Transfer.

## INTRODUCTION

Plastic extrusion is a widely used manufacturing and recycling process for converting waste polymers into reusable granules. Among different plastics, low-density polyethylene (LDPE) is commonly recycled due to its widespread use in packaging and consumer products [1]. The efficiency of extrusion depends heavily on the heat transfer between the electrical heaters, the barrel, and the plastic material. Inadequate thermal management often results in higher specific energy consumption (SEC), poor product quality, and increased operational costs [2,3]. In extrusion systems, heating is primarily achieved through electrical heaters mounted on the barrel surface. The supplied heat undergoes multiple transfer mechanisms: conduction through the barrel wall, convection to the rotating screw and molten polymer, and internal heat generation due to shear friction [4]. The accurate estimation of these heat transfer modes is essential for improving energy efficiency and thermal performance. Several studies have analyzed conduction and convection heat transfer in extrusion systems [5,6], while others have emphasized the impact of screw rotation and polymer rheology on thermal distribution [7]. However, limited research exists on integrating heat recovery mechanisms into extruder systems to reduce energy losses [8,9]. The present work aims to address this gap by performing a detailed analytical and experimental heat transfer investigation of a mother-baby extruder machine used for LDPE recycling. The study integrates three consecutive days of experimental trials, with eight readings per day, under two conditions: (i) without heat recovery structure, and (ii) with a CRC sheet-based structure positioned between the mother and baby units. The results were compared with analytical heat transfer models. The novelty of this research lies in combining theoretical heat transfer modelling with real-time experimental validation on an industrial scale extrusion system. This dual approach not only improves the understanding of heater-barrel-polymer thermal interactions but also provides practical insights for designing more energy efficient recycling extruders.

## METHODOLOGY

The present study employs a combined analytical modelling and experimental measurement approach to investigate the heat transfer performance of a mother–baby plastic granules extruder. The methodology is divided into two major parts: (i) analytical heat transfer model formulation and (ii) experimental procedure for data collection with and without heat recovery integration.

**Analytical heat transfer model**

The thermal behavior of the mother–baby plastic granules extruder was analyzed by developing an analytical model based on classical heat transfer principles. The model considered the following mechanisms:

**Conduction through barrel wall**

Heat conduction occurs radially across the extruder barrel from the outer heated surface to the inner wall in contact with the polymer. This was modelled using cylindrical conduction relations:

$$Q = \frac{2\pi kL\,(T_{heater} - T_{barrel\ outer})}{\ln(\frac{r_{outer}}{r_{inner}})} \quad (1)$$

Where,

Q is the heat transfer (W),
*k* is the thermal conductivity of the barrel material (W/m·K),
L is the length of the barrel (m),
$r_{outer}$ is the outer radius of the barrel (m),
$r_{inner}$ is the outer radius of the barrel (m),
$T_{heater}$ is the heater temperature (°C),
$T_{barrel}$ outer is the barrel outer temperature (°C).

**Conduction from barrel inner surface to solid raw material**

At the polymer–barrel interface, a conduction mechanism dominates as solid granules initially absorb heat from the inner barrel wall:

$$Q = \frac{kpA(T_{barrel\ inner} - T_{raw\ material})}{x} \quad (2)$$

Where
$k_p$ is the thermal conductivity of polymer,
A is the surface area,
x is barrel thickness.

**Convection from barrel inner wall to raw material**

The inner wall transfers heat to the solid polymer granules and partially molten resin by convection. Newton's law of cooling was applied:

$$Q = h \cdot A\ (T_{inner} - T_{polymer}) \quad (3)$$

Where
h is the convective heat transfer coefficient (W/m²·K)

**Additional heat generation due to shear and friction**

As the screw rotates, viscous dissipation and frictional effects generate additional heat within the polymer melt. This contribution was estimated from the screw speed, torque, and polymer rheology characteristics.

$$Q = \eta \times P \quad (4)$$

Where,
η is the mechanical efficiency (assumed ~ 60%),
P is the motor power rating (in HP), converted to kW.

**Overall useful heat transfer**

The total useful heat transferred to the polymer was expressed as:

$$Q_{useful} = Q_{cond\ polymer} + Q_{conv} \quad (5)$$

**Total heat supplied**

The total heat supplied was expressed as:

$$Q_{total\ heat} = Q_{cond\ inner} + Q_{shear} \quad (6)$$

**Experimental setup**

To validate the analytical model, experiments were conducted on a mother–baby plastic granules extruder machine processing LDPE waste. The specifications of both units are summarized in Table 1.

**Heat recovery structure**

A specially designed heat recovery structure was integrated in the open space between the mother and baby unit to minimize temperature loss. The structure utilized a CRC sheet assembly to retain and redirect thermal energy from the outgoing polymer stream of the mother unit into the inlet of the baby unit. The design and integration of this structure were reported in our previous experimental work [14], and its performance is evaluated in this study in conjunction with the analytical model.

Thermocouples were placed at strategic locations, including:

1. Heater surface
2. Barrel outer surface
3. Barrel inner surface
4. Polymer inlet and outlet of both mother and baby units

**Experimental Data Presentation**

To validate the analytical model, experimental investigations were carried out on the mother–baby plastic granules extruder system under two operating scenarios:

1. Without heat recovery structure
2. With heat recovery structure (CRC sheet arrangement between mother and baby units).

**Data Collection**

Experiments were conducted for three consecutive days and on each day, eight sets of readings were recorded at equal time intervals. Thus, a total of 48 readings were collected for both cases (with and without heat recovery). The key measured parameters were:

1. Time of recording (min)
2. Inlet temperature of baby extruder (°C)
3. Outlet temperature of baby extruder (°C)
4. Recovered temperature due to CRC sheet structure (°C)

Figure 7 shows the inlet temperature comparison of the baby unit before and after integration of the heat recovery structure. A noticeable increase in inlet temperature was observed post structure, indicating successful recovery of thermal energy that would otherwise be lost. This contributed to improved thermal performance and reduced energy consumption in the baby unit.

**Calculations**

**Mother Unit**

**Heat transfer through conduction from barrel outer surface to barrel inner surface**

$$Q = \frac{2\pi kL\,(T_{heater} - T_{barrel\ outer})}{\ln(\frac{r_{outer}}{r_{inner}})} \quad = 35.89 \text{ kW}$$

**Heat transfer through conduction from barrel inner surface to raw material**

$$Q = \frac{kpA(T_{barrel\ inner} - T_{raw\ material})}{X} \quad = \quad 37.94 \text{ kW}$$

**Heat transfer through convection from barrel inner surface to raw material**

$$Q = h \cdot A\,(T_{inner} - T_{polymer}) \quad = \quad 10.19 \text{ kW}$$

**Additional heat generation due to friction**

$Q = \eta \times P$ = 33.57 kW

**Baby Unit(before heat recovery integration)**

1. **Heat transfer through conduction from barrel outer surface to barrel inner surface:**

$$Q = \frac{2\pi kL\,(T_{heater} - T_{barrel\ outer})}{\ln(\frac{r_{outer}}{r_{inner}})} = 6.38\ kW$$

2. **Heat transfer through conduction from barrel inner surface to raw material:**
3. **Heat transfer through convection from barrel inner surface to raw material:**
4. **Additional heat generation due to friction:**

$Q = \eta \times P$ = 11.19 kW

**Baby Unit(after heat recovery integration)**

1. **Heat transfer through conduction from barrel outer surface to barrel inner surface:**

$$Q = \frac{2\pi kL\,(T_{heater} - T_{barrel\ outer})}{\ln(\frac{r_{outer}}{r_{inner}})} = 6.38\ kW$$

2. **Heat transfer through conduction from barrel inner surface to raw material:**
3. **Heat transfer through convection from barrel inner surface to raw material:**
4. **Additional heat generation due to friction:**

$Q = \eta \times P$ = 11.19 kW

**Heater Load**

Figure 8 shows that after the integration of the heat recovery structure between the mother and baby extruder units, a clear reduction in heat energy demand was observed. The recovered heat from the mother unit effectively preheated the polymer entering the baby unit, thereby reducing the additional heating requirement. The experimental data recorded over three days (eight readings per day) clearly demonstrated a consistent decrease in heater energy input after integration. The plotted chart illustrates that the inlet temperature of the baby unit increased due to heat recovery, which in turn lowered the net heat supplied by its heaters. This outcome confirms that the heat recovery system successfully minimized external thermal energy demand, improving the overall sustainability and energy efficiency of the extrusion process.

## RESULT AND DISCUSSION

The experimental outcomes clearly confirmed the impact of the heat recovery integration between the mother and baby extruder units. In the starting point case (without heat recovery integration), the baby extruder inlet temperature was observed to be approximately 129.54 °C, requiring significant heater energy input to reach the desired processing temperature of 139.75 °C. After introducing the heat recovery structure, the inlet temperature increased to 10.21 °C, thereby reducing the heater energy demand. Quantitatively, the total heater energy consumption decreased from 0.674 kWh/hr to 0.223 kWh/hr which corresponds to a reduction of approximately 33.08 %. This improvement can be recognized to the recovery of waste heat from the mother unit barrel, which otherwise dissipated into the surrounding environment. By transferring this recovered heat directly to the baby unit, the system utilized the available energy more efficiently, thereby lowering on external heating. The results not only validate the

effectiveness of the heat recovery integration but also indicate a possible pathway for improving thermal management in extrusion systems.

## CONCLUSION

This study offered an analytical and experimental investigation of heat transfer phenomena in a mother–baby plastic granule extruder system with heat recovery integration. By introducing a simple heat recovery structure between these two units, an important portion of waste heat from the mother extruder was effectively utilized to preheat the feed zone of the baby extruder. As a result, the inlet temperature of the baby unit increased, leading to a prominent reduction in heater energy demand. The results confirm that heat recovery integration improves overall energy utilization and contributes to more supportable extrusion processing without negotiating product quality. The approach proves the possible of adopting reflexive heat recovery solutions in industrial extrusion systems to reduce operational costs and improve energy efficiency.

## ACKNOWLEDGEMENT

I would like to express their sincere gratitude to the management and technical staff of the Windson Engineering Pvt. Ltd. in Dhoraji, Gujarat, for providing the necessary facilities and support during the experimental investigations. Special thanks are extended to my supervisors, Department of Mechanical Engineering, Dr. Subhash University for continuous guidance and encouragement throughout this research work. I am also thankful to all colleagues and team members who contributed to the successful completion of this study.

## ABSTRACT

Black rice (*Oryza sativa* L.) bran is rich in dietary fibre and bioactive phytochemicals, including tocopherols, tocotrienols, γ-oryzanol, vitamins, and phenolic compounds, which contribute to various health benefits. Unripe banana flour (UBF), a rich source of resistant starch, has been reported to exert several positive physiological effects in clinical studies. Muffins were prepared using black rice flour (BRF) and UBF in different proportions, namely 100:0, 90:10, 80:20, and 70:30 (BRF:UBF). The developed muffins were evaluated for sensory attributes and nutritional quality using standard analytical procedures. Sensory evaluation revealed that muffins containing BRF:UBF at 90:10 received the highest scores for colour and appearance (7.63), whereas muffins formulated with a 70:30 ratio exhibited superior scores for texture (7.49), flavour (7.40), and overall acceptability (7.35). Nutritional analysis indicated that muffins prepared with a 70:30 ratio of black rice flour to unripe banana flour (BRF:UBF) exhibited the highest protein content (10.27%), the lowest fat content (13.58%), and the highest total dietary fibre content (9.10%), comprising 7.01% insoluble fibre and 1.41% soluble fibre, along with a moderate calorific value of 344 kcal/100 g. In comparison, muffins prepared with 100% black rice flour (BRF) contained 9.72% protein, 14.38% fat, and 8.31% total dietary fibre, comprising 6.86% insoluble fibre and 1.14% soluble fibre, with a higher energy value of 357 kcal/100 g. Findings suggest that black rice muffins fortified with unripe banana flour, can serve as a functional bakery product with enhanced dietary fibre and potential health benefits, suitable for health-conscious consumers.

**Keywords:** Black rice muffin, unripe banana flour, nutritional analysis, phytochemicals

## INTRODUCTION

In this modernized world, the lifestyle of people has increased in pace and changes in eating behavior have adversely affected health and the risk of heart attacks and hypertension. The stress of having a busy lifestyle induces free radical release as a cause of cancer, diabetes, mental disorders such as Alzheimer's disease, ischemic diseases, heart failure, high blood pressure, adult respiratory distress syndrome, heart failure, high blood pressure, inflammatory diseases, and AIDS. The prevention of these conditions can be achieved by consuming foods rich in antioxidants (Deeseenthum *et al.* 2018; Kalogerakou, T., and Antoniadou, M., 2024). Black rice, a type of specialty rice, is milled as brown rice, where only the hull is removed; as compared to white rice, black rice contains high amounts of nutrients, such as fiber, vitamins, minerals, vitamin B complex, and unsaturated fatty acid (Park *et al.,* 2016). Furthermore, it contains diverse bioactive substances which exert antioxidative effects on the body. Anthocyanins contained in rice pericarp have been reported to exhibit various functional effects, such as antioxidative effects (Park *et al.,* 2016), as well as the inhibition of DNA damage. As a result, black rice is predicted to be very useful for the manufacturing and development of food. Muffins are semi sweet baked products highly appreciated by consumers because of their soft texture and characteristic taste or quick bread that is baked in appropriate proportion. They are similar to cupcakes, although they are less sweet (Limbachiya and Amin 2015).

Black Rice which is also known as Purple Rice and Asian rice hails from the Oryza Sativa specie. Black rice is majorly cultivated in Asian countries like China, Indonesia, Myanmar and India among others. In India, it is majorly grown in the eastern region and is popularly known as Chak-hao in Manipur (Thomas *et al*., 2013). The interest in black rice growing because is gluten free, cholesterol- free and low in sugar, salt and fat. Among these properties it also contains anthocyanins, antioxidants, B and E vitamin, iron, thiamine, magnesium, niacin and phosphorous and high fibre content. There are a lot of studies showing that black rice powder is one of nature's most well-balanced foods. Black rice is a super nutritious type of rice that is high in protein, fats, carbohydrates, zinc, iron, manganese; copper (S. Kumar, 2016). Black color of this rice is due to the presence of flavonoids pigments called "anthocyanins" which are powerful antioxidants equivalent to that of blue and black berries and have the ability to inhibit the formation or to reduce the concentrations of reactive cell damaging free radicals (Kushwaha, 2016).

Banana (*Musa paradisiaca*) is one of the commodities that have a very high chance for diversification, food security and agribusiness in Indonesia. It is also a fast growing and high biomass yielding crop in the tropical and sub-tropical regions of the world. The major banana producing states in India are Maharashtra, Kerala, Tamil Nadu, Gujarat, Bihar, West Bengal, Assam, Andhra Pradesh and Karnataka (Bezerra *et al*. 2013). Bananas can be processed and preserved to various forms of processed products such as banana flour, banana juice, banana wine, banana chips, banana sauce and banana jam and other processed. Banana flour (BF) is a product between the prospective in the development of local food source. Bananas are quite suitable for processing into flour as the main constituent components are carbohydrates. The green banana flours, mainly unpeeled, are good sources of fiber and resistant starch. The results showed that unpeeled green banana flour obtained by spouted bed drying can be a valuable tool to add nutritional value to products in order to increase their non-digestible fraction (Bezerra *et al.* 2013).

With the increase of the consumer demand for healthier and nutritious food production, this product which can be eaten due to their good taste and soft texture, perfect for breakfast, brunch, or snack, can be consumption by celiac patients as the product is naturally gluten-free, cholesterol free and contains proteins that are known to be high in biological value due to the absence of gluten forming ability, low levels of sodium and fat, but high level of protein, iron and antioxidants activity. It also has high amount of easily digestible carbohydrates (Jha *et al*., 2017). Since black rice possess unique nutritional, hypoallergenic and bland taste. The demand for low gluten and gluten-free products is increasing because it is well known that celiac disease is a common lifelong disorder, affecting 1% of the world's population. Therefore, Black rice muffins were prepared with combination of banana flour.

## MATERIALS AND METHODS

All raw materials required for muffin preparation were procured from the local market of Gurugram, Haryana, India. The primary ingredients used in the formulation were black rice flour and banana flour. Other ingredients included cocoa powder, ghee, milk, sugar, baking powder, baking soda, vanilla essence, and sesame seeds. Black rice flour and banana flour were blended in different proportions to develop various muffin formulations. Initially, ghee and sugar were creamed thoroughly until a uniform mixture was obtained. Baking powder, baking soda, cocoa powder, and sesame seeds were then incorporated into the mixture and mixed evenly. Milk was gradually added with continuous mixing to obtain a smooth batter consistency. The blended black rice flour and banana flour were added alternately to the batter along with vanilla essence and mixed for 2–3 minutes to ensure uniform distribution. The prepared batter was poured into mini paper cups placed on a baking tray, and sesame seeds were sprinkled on the surface as a topping. The oven was preheated, and baking was carried out at 180 °C for 25–30 minutes. After baking, the muffins were removed from the oven and allowed to cool at room temperature prior to further analysis. The procedural steps involved in muffin preparation are illustrated in the flow diagram shown in Fig. 1.

The developed value-added black rice muffins were subjected to organoleptic evaluation for colour and appearance, flavour, texture, and overall acceptability using a 9-point Hedonic scale (Srilakshmi, 2007). Based on organoleptic acceptability, selected muffin samples were further analyzed for their nutritional composition. Black rice flour was blended with banana flour at 10%, 20%, and 30% substitution levels to develop value-added muffin formulations. Black rice flour, banana flour, and the developed muffins were analyzed for proximate composition and dietary fibre content. Proximate composition, including moisture, crude protein, crude fat, ash, and crude fibre, was determined using standard methods of analysis (AOAC, 2000). Moisture content was measured by the hot air oven method at 105 °C until a constant weight was obtained. Crude protein content was estimated using the KEL PLUS Automatic Nitrogen Estimation System, and values were converted to protein using a nitrogen-to-protein conversion factor of 6.25. Ash content was determined by incineration in a muffle furnace at 550 °C for 4–6 hours. Crude fat was analyzed using the SOCS Plus Automatic Solvent Extraction System with petroleum ether as the solvent. Total carbohydrates were calculated by difference using the following formula: Total carbohydrates (%) =100−(Crude protein + Crude fat + Crude fibre + Ash) The total energy value of the samples was calculated theoretically using Atwater conversion factors of 4.0 kcal/g for protein, 4.0 kcal/g for carbohydrates, and 9.0 kcal/g for fat, as described by Paul and Southgate (1979). Total, soluble, and insoluble dietary fibre contents were determined using the enzymatic method described by Furda (1981). Total dietary fibre was calculated as the sum of insoluble and soluble dietary fibre using the formula: Total dietary fibre=Insoluble dietary fibre+Soluble dietary fibre.

All analyses were performed in triplicate, and results are expressed on a dry weight basis as mean ± standard error (SE). Total energy value was calculated theoretically using Atwater conversion factors of 4.0 kcal/g for protein, 4.0 kcal/g for carbohydrates, and 9.0 kcal/g for fat, as described by Paul and Southgate (1979). Total, soluble, and insoluble dietary fibre contents were determined using the enzymatic method described by Furda (1981). Total dietary fibre was calculated as the sum of insoluble and soluble dietary fibre: Total dietary fibre = Insoluble dietary fibre + Soluble dietary fibre. All analyses were conducted in triplicate, and the results were expressed as mean ± standard error.

## RESULTS AND DISCUSSION

The results of the sensory evaluation (Table 1) indicated that the incorporation of banana flour into black rice muffins did not adversely affect consumer acceptability. The control muffins recorded a mean score of 7.25 for color and appearance, corresponding to “liked moderately” on the hedonic scale. Muffins supplemented with banana flour at 10, 20, and 30 per cent levels showed comparable scores of 7.63, 7.36, and 7.35, respectively, suggesting no marked differences in visual acceptability among the formulations. The texture score of the control muffins was 7.15, indicating moderate liking. Similarly, muffins containing banana flour exhibited texture scores of 7.35, 7.01, and 7.49

at 10, 20, and 30 per cent supplementation levels, respectively, all of which fell within the "liked moderately" category, demonstrating that banana flour incorporation did not negatively influence textural properties. For flavor, the control muffins achieved a mean score of 7.22. The banana flour–supplemented muffins recorded comparable flavor scores of 7.35, 7.40, and 7.35 at 10, 20, and 30 per cent levels, respectively, indicating the retention of desirable flavor characteristics. Overall acceptability scores followed a similar trend. The control muffins obtained a mean score of 7.15, while muffins supplemented with banana flour recorded scores of 7.27, 7.05, and 7.35 at 10, 20, and 30 per cent levels, respectively. These findings demonstrate that banana flour supplementation up to 30 per cent can be effectively incorporated into black rice muffins without compromising sensory quality, supporting its potential application for nutritional enhancement in baked products.

The proximate composition of the value-added muffins (Table 2) showed notable changes with the incorporation of unripe banana flour. The moisture content of the control black rice muffins was 18.91 per cent, whereas muffins supplemented with unripe banana flour at 10, 20, and 30 per cent levels exhibited higher moisture contents of 20.80, 22.73, and 24.61 per cent, respectively. The observed increase in moisture content with increasing levels of banana flour supplementation may be attributed to the higher water-holding capacity associated with the dietary fibre and starch components of banana flour. The protein content of the control muffins was 9.72 per cent. A gradual increase in protein content was observed in banana flour–supplemented muffins, with values of 9.92, 10.11, and 10.27 per cent at 10, 20, and 30 per cent supplementation levels, respectively, indicating a modest improvement in protein content with increasing substitution. The fat content of the control muffins was 14.38 per cent. Muffins supplemented with banana flour showed comparable fat contents of 14.89, 14.92, and 13.58 per cent at 10, 20, and 30 per cent levels, respectively, with a slight reduction observed at higher levels of supplementation. The carbohydrate content of the control muffins was 47.21 per cent. A decreasing trend in carbohydrate content was noted with increasing levels of banana flour incorporation, with corresponding values of 46.69, 46.13, and 45.19 per cent at 10, 20, and 30 per cent supplementation levels, respectively. Overall, the incorporation of unripe banana flour enhanced moisture retention and slightly increased protein content, while marginally reducing fat and carbohydrate contents. These compositional changes indicate the potential of unripe banana flour to improve the nutritional profile of black rice muffins without compromising product quality.

The energy content of control sample was observed 357.14 kcal/100 g. The energy content was highest in muffins supplemented with 10 per cent unripe banana flour (360.45 kcal/100 g), representing a 5.92 per cent increase compared with the control. In contrast, total dietary fibre content was highest in muffins supplemented with 30 per cent unripe banana flour, reflecting the fibre-rich nature of banana flour and its contribution to nutritional enhancement at higher substitution levels. The dietary fibre content of black rice muffins supplemented with unripe banana flour (Table 3.) reveals that total dietary fibre increased with higher levels of banana flour supplementation, ranging from 8.31% in the control muffins to 9.10% in muffins containing 30% unripe banana flour. Soluble dietary fibre gradually increased with supplementation, from 1.14% in the control to 1.32% and 1.41% in muffins containing 20% and 30% banana flour, respectively. Insoluble dietary fibre was highest in the 30% supplemented muffins (7.01%) compared with 6.86% in the control, while the 20% supplemented muffins showed a comparatively lower insoluble fibre value (6.72%). Overall, incorporation of unripe banana flour improved total and insoluble dietary fibre content, demonstrating its potential to enhance the nutritional quality of black rice muffins.

## CONCLUSION

Banana flour is a nutritionally rich ingredient, containing resistant starch, dietary fibre, polyphenols, and antioxidants, which contribute to its potential health benefits, including improved gut health, glycemic management, and weight control. Incorporation of banana flour into baked products, such as black rice muffins, at levels of 10%, 20%, and 30% enhanced their nutritional quality without compromising sensory acceptability. The study demonstrates that banana flour can be successfully utilized to develop value-added muffins with increased dietary

fibre and functional properties, offering a practical approach to producing healthier bakery products suitable for health-conscious consumers and individuals managing diabetes.

## ABSTRACT

A significant portion of the world's population suffers from varicose veins (VV), a common vascular disorder that is typified by enlarged, twisted veins, usually in the lower limbs. Although VV are sometimes viewed as a cosmetic issue, they can result in serious practical constraints like discomfort, swelling, and decreased movement, which can lower the quality of life for those who have them. It is crucial to evaluate the functional impact of the illness in clinical settings since these restrictions may hinder everyday activities and physical functioning. Even though VV are common, there aren't many standardized instruments made specially to assess the functional constraints that patients face. Panoramic varicose vein index (PVVI) was developed to assess the functional limitations resulting from VV. PVVI was developed with 20 items for pain and sensitivity, activity limitation and performance and social life based on far-reaching review of varicose vein. Four experts used a validation form to evaluate each item's content relevance to the targeted concept. The experts' agreement over each item's relevance

to the target construct was evaluated using the Content Validity Index (CVI). Ten physiotherapy clinicians practicing cardiovascular field were then chosen at random to participate in face validation, where they used a face validation form to score each item's comprehension and clarity. Each question's clarity and comprehension were judged via Item Face Validity Index (I-FVI), and items with an I-FVI ≥ 0.82 were considered. PVVI achieved admirable content validity in both activity limitation and performance and social life domains. 7 items from the activity limitation domain and 3 items from the performance and social life domain were reserved after CVI breakdown. All reserved items scored a CVI score of 1.00, demonstrating perfect covenant among the experts. FVI analysis stemmed in 5 items for the activity limitation domain and 2 items for the performance and social life domain. The activity limitation domain achieved a higher level of covenant among defendants, with a mean I-FVI of 0.90 and a S-FVI/UA of 0.87. Performance and social life domain also showed higher level of covenant, with a mean I-FVI of 0.97 and a S-FVI/UA of 0.81. To sum up, the PVVI showed strong face validity and substance..

**Keywords:** Varicose vein, content validity, face validity, functional limitation.

## INTRODUCTION

A prevalent vascular condition that mostly affects the lower limbs aka varicose veins (VV) are characterized by abnormal vein enlargement and tortuosity. In addition to being common in India, this illness has a major negative impact on world health. An estimated 30% of Indians are thought to have varicose veins, especially women. Age, obesity, and jobs requiring a lot of standing, such teaching and cooking, are risk factors for this condition. About 23% of persons worldwide suffer with the illness, with higher incidence rates seen in women and older adults in the US. Health care resources are heavily burdened by the rising prevalence of CVD and the high cost of treatment[1-3]. The central cause of VV seems to be venous disorder which leads to reflux of valves[4]. Even though the precise aetiology is still up for question, it includes negotiated arterial walls, defective valves, preeminent intravenous pressure, and a genetic susceptibility. The lack of vein wall flexibility, which results in the valve leaflets' inability to fit together, is typically thought to be the cause of valvular dysfunction. A faulty or ineffective valve allows blood to flow in reverse, from superficial to deep and distal to proximal. The loftier veins may grow longer and more tortuous as a result of increased strain on the venous system in question. Inflammation and shear stress on venous endothelial cells brought on by reversible or turbulent blood flow are significant causative factors for venous diseases[5]. Leg varicose veins can affect the small and great saphenous veins, which are primary axial superficial veins, or their surface-level tributaries)[6]. Known risk factors With relation to varicose veins, such as family history of venous illness; elder age; feminine sex; persistently elevated blood pressure inside the abdomen as a result of obesity, pregnancy, a tumor, or persistent constipation; extended standing; thrombosis in the deep veins resulting in secondary revascularization and valve degradation; Arteriovenous shunting is another[7,8]. Patient related outcome measures (PROM) are readily used in practice to quantify quality of life (QOL) in patients living with vv's. AVVQ (Aberdeen Varicose Vein Questionnaire), EuroQol Group's EQ-5D and Venous Insufficiency Epidemiological and Economic Study (VEINES-QOL/Sym) are frequently used tools to measure the health related QOL in patients living with vv's. Another questionnaire titled "Chronic Venous Insufficiency Questionnaire (CIVIQ)" covers symptoms, physical limitations, emotional well-being, and social functioning apart from HRQOL. Venous Clinical Severity Score (VCSS) is not necessarily a questionnaire but a scoring tool which tell about the clinical parameters such as pain, varicosities, edema, skin changes, and ulceration. On extensive research we found that there's no single questionnaire which exclusively talks about the functional limitations of patient living with vv's. A functional limitation assessment is necessary for a physical therapist to not only treat but also to plan out a tailor-made rehab program for the patient. Thus, the purpose of this publication is to develop the Panoramic Varicose Vein Index (PVVI), a tool for functional evaluation of patients with varicose veins, and examine its face validity and content.

## METHODOLOGY

**Scale Development**

The Panoramic Varicose Vein Index was developed with 3 domains: Pain and sensation, Activity Limitation and Performance and Social Life with 7, 5 and 2 items respectively. The literature search included all leading databases like Scopus, Pubmed, Web of Science, Google Scholar intended at reconnoitering relevant available literature. The search expressions included varicose vein, questionnaire, development and validation. It's crucial to remember that the review's main goal was to obtain a broad understanding of the topic rather than carrying out an organized, thorough analysis using precise search parameters. The results of this exploratory search were crucial in forming PVVI, offering insightful information that resulted in a sophisticated comprehension of the constructs pertinent to the functional confines faced by the patients of varicose vein. Domain Activity Limitation and Performance and Social Life are particularly dedicated to finding out the functional confines a patient experience along with the aesthetic problems.

**Content Validity (CV)**

To certify the CV of PVVI, an exhaustive validation procedure was carried out. The assortment of experts for this process was done with vigilance. A panel of 4 experts was carefully chosen depending on their rich clinical background and exhaustive knowledge about the venous disorders. The panel involved connoisseurs with background in Vascular and cardiothoracic physiotherapy. Additionally, a cardiothoracic surgeon was also included in the panel to get the surgeon's perspective towards the questionnaire. A content validation form comprising a gradient of elements and a evaluation scale was created prior to the content validation process. The purpose of the form was to evaluate how well each scale item related to the intended construct—that is, PVVI, Pain and sensations, Activity Limitation and Performance and Social Life. From 1 (not relevant) to 4 (very relevant), the rating scale went from 1 to 4. The scale's goal and the content validation procedure were explained to the experts. After appraising the domain and items, they were requested to remark on their ambiguity, simplicity, clarity, and relevancy. Based on how relevant each item was to the targeted construct, each expert assigned a total. Each item's CV Index (CVI) was then determined. One popular technique for assessing a scale's CV is the CVI. It is calculated by taking the total number of experts and dividing that number by the number of experts who rated an item as 3 or 4.When it comes to Universal Agreement (UA), an item that received 100% agreement by expert receives a score of "1," while items that couldn't get 100% expert agreement receive a score of "0." Additionally, the mean I-CVI was determined by dividing the total number of items by the sum of the Item I-CVI scores for every item. The percentage of professionals who gave an item an appropriate rating is known as I-CVI. Additionally, for each of the three domains, the Scale-level CVI/Unweighted Average (S-CVI/UA) and Scale-level CVI/Average (S-CVI/AVE) were computed. The percentage of items that obtained a CVI of 1.00 is represented by the S-CVI/UA, while the average CVI for each item is represented by the S-CVI/AVE. The number of elements that all experts classified as "relevant" was divided by the total items to determine the S-CVI/UA. By adding up all of the I-CVIs of the things that were deemed "relevant" and dividing by the total items, the S-CVI/AVE was determined. To make sure the scale had sufficient content validity, these computations were carried out. Products with a CVI less than one were deemed problematic and discarded[9-11].

**Face Validity**

A face validation procedure was carried out in order to further guarantee the authenticity of the PVVI. This procedure was designed to evaluate the items' clarity and comprehension and make sure that respondents understood them as the scale's creators intended. Only the elements kept after content validation were included in the face validation form that was created before the face validation was carried out. On a four point Likert scale, with 1 denoting "not clear/comprehensible" and 4 denoting "very clear/comprehensible," the respondents were asked to score the clearness and comprehension of each question on the form. The chosen respondents were sent the face validation form via their management office in order to complete the face validation procedure. After reading each question, the respondents were asked to score its understanding and clarity according to how they understood it. Additionally, they were requested to remark on any items that were unclear or ambiguous. Following the completion

of the face validation procedure, the items were examined for understanding and clarity. The Item Face Validity Index (I-FVI) for every question was determined by calculating the percentage of respondents who gave it a clear and understandable rating (scores of 3 or 4). The total of respondents who thought the item was clear and understandable was divided by the total of respondents to determine the I-FVI. The average of the I-FVI values for each item was then used to determine the Mean I-FVI[12]. The total of items that received an I-FVI value of three or four was divided by the total of items to conclude the Scale Face Validity Index (S-FVI/UA). A general assessment of FV of the scale is given by S-FVI/UA. Furthermore, the mediocre of the I-FVI scores for every item was used to compute the S-FVI/AVE. Because it accounts for the potential for chance agreement among respondents, this offers an additional cautious estimation of the scale's FV. Lastly, the I-FVI values for each question were summed up, and the value was divided by the number of potential I-FVI values to determine the Proportion Relevance. This shows the percentage of the scale's items that are pertinent to the construct being measured. A score of one indicated complete precision and unambiguousness on the FVI scale, which went from 0 to 1. Items deemed unclear and incomprehensible were eliminated if their FVI was less than 0.83[12,13].

**Data Analysis**

IBM SPSS Statistics version 29 was used to do a descriptive analysis of demographic characteristics. Microsoft Excel was used to perform the calculations for face and content validation. Item Content Validity Index (I-CVI), Universal Agreement (UA), Mean I-CVI, Scale-level Content Validity Index/Unweighted Average (S-CVI/UA), and Scale-level Content Validity Index/Average (S-CVI/AVE) were all calculated for content validation. Universal Agreement (UA) was used for face validation after the Item Face Validity Index (I-FVI) was established. to determine the Unweighted Scale-level Face Validity Index The Scale-level Face Validity Index and Average (S-FVI/UA) S-FVI/AVE is the average. The choices on the retention of the items were mainly based on the numerical results derived from these analyses, guaranteeing a thorough and uniform assessment of the quality of each item.

## RESULTS

Content Validation of Pain and Sensation (Table 1).
Content Validation of Activity Limitation (Table 2).
Content Validation of Performance and Social life (Table 3).

**Content Validity**

The results of content validity of PVVI are depicted in Table 1, 2 and 3 for Pain and Sensation, Activity limitation and Performance and social life domains. Each item was given a four-point rating by the experts, with 1 denoting "not relevant" and 4 denoting "highly relevant." The "Agreement Number" column shows how many experts gave each item a significance rating of 3 or 4. All four experts gave the retained items in the PVVI's Pain and Sensation, Activity Limitation, and Performance and Social Life domains a CVI score of 1.00, signifying full bargain among the panel of specialists, as seen in Tables 1, 2, and 3. The content validity of the scale is indicated by the CVI score, which shows the percentage of specialists who thought an item was significant. The highest possible CVI score is 1.00, which means that every expert thought the item was extremely significant. The no. of specialists who graded an item as significant was divided by the total no. of specialists to determine each item's individual CVI (I-CVI) score. According to Table 1, all seven items had an I-CVI score of 1.00, meaning that every expert thought they were extremely relevant. Excellent agreement among the specialists about the items' relevance in the pain and sensation domain was indicated by the mean I-CVI score, which is the average of the I-CVI scores across all items. This score was also assessed and came out to be 1.00. The S-CVI/AVE score shows the average CVI scores for all items, whereas the UA score shows the percentage of things that had a perfect CVI score of 1.00. According to Table 1, all seven items received a perfect CVI score of 1.00, which translated into a perfect UA score of 1.00. This indicates that the panel of experts completely agreed that the items were relevant to the pain and sensations domain. Excellent content validity for the PVVI's pain and sensations domain was indicated by the S-CVI/AVE score of 1.00.

**Face Validity**

The FVI scores for Pain and Sensation, Activity Limitation, and Performance and Social Life categories are shown in Tables 4,5 and 6. On scale of 1 (not clear/comprehensible) to 4 (extremely clear/comprehensible), the FVI gauges respondents' agreement with the clarity and comprehensibility of each item in the domains. The Universal Agreement (UA) index, Item-Level Content Validity Index (I-FVI), mean I-FVI, Scale-Level Content Validity Index/Average (S-FVI/AVE), Scale-Level Content Validity Index/Universal Agreement (S-FVI/UA), and the number of respondents who agreed on the clarity and comprehension of each item (Number in Agreement) are all included in the tables. For the pain and sensation domain, the scores point out that among the retained 7 items, most items received high levels of agreement, with five out of seven items achieving a UA index of 1.00. The mean I-FVI was also high, indicating that most items were considered highly relevant. The S-FVI/UA was 0.8, indicating a high degree of consensus among responders regarding the scale's general readability and clarity. For the Activity limitation domain, the results indicate that among the retained 5 items, most items received high levels of agreement, with three out of five items achieving a UA index of 1.00. The mean I-FVI was also high, indicating that most items were considered highly relevant. The S-FVI/UA was 0.87, indicating a high degree of consensus among responders regarding the scale's general readability and clarity. For the performance and social life domain, the results indicate that among the retained 2 items, most items received high levels of agreement, with one out of two items achieving a UA index of 1.00. The mean I-FVI was also high, indicating that most items were considered highly relevant. The S-FVI/UA was 0.81, indicating a high degree of consensus among responders regarding the scale's general readability and clarity. Face validity of Pain and Sensations (Table 4). Face validity of Activity Limitations (Table 5). Face validity of Performance and social life (Table 6).

## DISCUSSION

A novel instrument created specially to assess the functional constraints faced by patients with varicose veins is the Panoramic Varicose Vein Index (PVVI) scale. The PVVI scale provides a comprehensive functional assessment, illuminating the ways in which varicose veins affect everyday activities and quality of life, in contrast to conventional evaluations that mostly concentrate on the physical appearance or general symptoms of varicose veins. The PVVI scale's direct attention to the functional difficulties faced by patients with varicose veins is among its most inventive features. In the past, the clinical management of varicose veins focused on the dimensions of the vein, the intensity of the limitations, and the outward signs of venous insufficiency, frequently ignoring the ways in which these symptoms impair a patient's ability to work. However, the PVVI scale fills this gap by offering a methodical, patient-centered approach to assess the impact of varicose veins on daily functioning and physical activity. Patients' quality of life is greatly impacted by functional disability, which is frequently underreported in varicose vein patients. Leg heaviness, soreness, and edema make it difficult for many people to do daily tasks including walking, standing, and exercising. These restrictions may result in less physical activity, which may exacerbate venous disease and have an effect on cardiovascular health in general. The PVVI helps physicians better understand the practical effects of varicose veins on patients' life and adjust therapies by measuring these functional affects. The scale measures tolerance, which is a key sign of how varicose veins affect physical health. It measures how difficult it is to walk, stand, or engage in prolonged physical activity. Everyday functional restrictions, including standing to cook or participate in family activities, are addressed. Beyond isolated symptoms, these functional metrics demonstrate the widespread impact of venous illness. PVVI offers clinicians insight into the actual level of patient suffering and its impact on lifestyle choices and activity avoidance by taking into account the frequency and intensity of pain-related disruptions in daily routines. By using PVVI in regular practice healthcare professionals can prioritize treatment objectives that meet the needs of each patient by having knowledge of particular functional limitations. Patients with moderate impairments might benefit more from cautious therapies, but those with significant mobility concerns might benefit more from procedures meant to provide immediate symptom relief. PVVI promotes active patient engagement in therapy conversations and decision-making by immersing patients in an assessment that closely corresponds to their everyday problems. PVVI also offers a baseline assessment of functional limits that can be

reevaluated after treatment to ascertain whether patients' capacities to carry out everyday duties and physical activities have improved. This information is useful for determining the effectiveness of treatment.

## CONCLUSION

In conclusion, Panoramic varicose vein index has shown promising content and face validity in assessing functional outcomes of patient suffering from varicose vein. The scale may prove to be a useful instrument for assessing the functional limitations of patients with varicose veins, as evidenced by the strong consensus among specialists and respondents.

**ABSTRACT**

*Asystasia gangetica* (family: Acanthaceae), commonly known as Chinese violet or creeping foxglove, is a perennial medicinal plant traditionally used for nutritional and therapeutic purposes. In recent years, interest in plantbased therapeutics has increased due to the rising prevalence of chronic metabolic disorders, particularly diabetes mellitus, and concerns regarding the long-term safety of synthetic drugs. The present review critically compiles and analyzes existing literature on the phytochemical composition, therapeutic potential, and safety profile of *A. gangetica*. Special emphasis is placed on its antioxidant, anti-inflammatory, and possible antidiabetic activities, along with the current limitations in toxicological evaluation. By identifying key research gaps, this review aims to provide a scientific foundation for future pharmacological and safety-oriented investigations of *Asystasia gangetica*.

**Keywords:** *Asystasiagangetica*; herbal medicine; antidiabetic activity; phytochemicals; safety profile; toxicity.

## INTRODUCTION

Medicinal plants have served as the cornerstone of traditional healthcare systems for centuries and continue to contribute significantly to modern drug discovery. A large proportion of the global population relies on herbal medicines because of their affordability, accessibility, and cultural acceptability. [1,2] However, the lack of systematic

scientific validation often limits their acceptance in evidence-based medicine, particularly with respect to safety, standardization, and dose optimization. [3] Therefore, comprehensive evaluation of both therapeutic efficacy and safety is essential. *Asystasia gangetica* is a plant of increasing pharmacological interest owing to its nutritional richness and the presence of diverse bioactive constituents. [4] Although several preliminary studies suggest its medicinal relevance, the available information remains fragmented and largely confined to isolated experimental observations. [5] A consolidated review addressing its therapeutic profile alongside safety considerations is currently lacking. This review attempts to bridge that gap by critically analyzing existing scientific evidence.

**Botanical Description and Distribution:** *Asystasia gangetica* is a fast-growing perennial herb belonging to the family Acanthaceae. It is widely cultivated in tropical and subtropical regions as an ornamental ground cover. The plant is characterized by large ovate leaves and showy trumpet-shaped flowers with pale yellow throats. Its ability to adapt to diverse environmental conditions contributes to its widespread distribution across Africa, Asia, and other tropical regions.

**Ethnomedicinal and Nutritional Importance:** Traditionally, the leaves of *A. gangetica* have been used in folk medicine for the management of asthma, inflammation, and general weakness in different regions.[6] In certain parts of Africa and Asia, the plant is also consumed as a leafy vegetable, suggesting its nutritional value and apparent safety at dietary levels.[7] The presence of essential vitamins, carbohydrates, and micronutrients supports its classification as a functional food.[8] However, medicinal applications often involve concentrated extracts, which necessitate careful experimental evaluation of safety and efficacy.

**Phytochemical Profile:** Phytochemical investigations indicate that *A. gangetica* contains a wide range of primary and secondary metabolites, including carbohydrates, proteins, vitamins (A, C, E, thiamine, riboflavin, niacin, and pyridoxine), and bioactive compounds such as phenolics, flavonoids, glycosides, and iridoid derivatives. [9,10]. Compounds such as catalpol-related glycosides and asystasiosides have been reported from species of the genus Asystasia, suggesting potential pharmacological relevance. [11] Extraction efficiency and phytochemical yield are influenced by solvent polarity, extraction technique, and processing conditions. [12] Hydro-alcoholic extracts prepared using cold maceration have been reported to preserve thermolabile compounds, making this method suitable for pharmacological screening and biological evaluation. [13]

**Therapeutic Potential:**

**Antioxidant Activity:** Oxidative stress plays a crucial role in the pathogenesis of diabetes mellitus and its associated complications. Experimental studies have demonstrated that A. gangetica extracts possess significant free radical scavenging activity, which may be attributed to their phenolic and flavonoid content. [14] These antioxidant properties may help reduce cellular oxidative damage and improve metabolic homeostasis.

**Anti-inflammatory Activity:** Chronic inflammation is closely associated with insulin resistance and pancreatic β-cell dysfunction. Preliminary studies suggest that bioactive constituents present in A. gangetica may modulate inflammatory mediators and signaling pathways. [15] Such anti-inflammatory effects could contribute to its therapeutic relevance in metabolic and inflammatory disorders.

**Antidiabetic Potential:** The global burden of diabetes mellitus necessitates the exploration of safer and cost-effective therapeutic alternatives derived from natural sources. [16] Plant-derived phenolics and glycosides are known to inhibit key carbohydrate-digesting enzymes such as α-amylase and α- glucosidase, thereby reducing postprandial hyperglycemia. [17,18] These mechanisms are clinically relevant in the management of type 2 diabetes mellitus. Although related medicinal plants have demonstrated promising antidiabetic effects in streptozotocin-induced experimental models [19], direct and systematic *in vivo* validation of *A. gangetica* remains limited. Therefore, welldesigned experimental studies focusing on glycemic control, lipid profile modulation, and oxidative stress parameters are required.

**Safety and Toxicological Evaluation:** Despite its traditional use and dietary consumption, comprehensive toxicological data on A. gangetica are scarce. Most available studies lack structured evaluation of acute, sub-acute, and chronic toxicity. [20]. Information regarding organ-specific toxicity, biochemical alterations, and histopathological changes is largely insufficient. [21] Previous studies on medicinal plants have emphasized that the absence of detailed toxicity data poses a major barrier to clinical translation, even when therapeutic efficacy is evident. [22] Therefore, integrating safety assessment with pharmacological evaluation is essential to establish the safety margin and benefit–risk profile of *A. gangetica*.

**Experimental Approaches for Pharmacological Validation:** Standardized extraction techniques followed by preliminary phytochemical screening form the basis of biological evaluation. In vitro enzyme inhibition assays provide initial insights into antidiabetic potential, while in vivo models such as streptozotocin-induced diabetic rats are essential for validating efficacy and safety. Dose standardization, biochemical parameter analysis, and appropriate statistical evaluation are integral components of such studies.

**Research Gaps and Future Perspectives:** Although *A. gangetica* shows promising therapeutic potential, several research gaps remain: Limited bioactivity-guided fractionation studies. Insufficient *in vivo* antidiabetic and mechanistic investigations Absence of comprehensive dose-dependent toxicity data Poor correlation between therapeutic efficacy and safety parameters. Future research should focus on integrated pharmacological and toxicological studies to establish a scientifically validated therapeutic profile.

## CONCLUSION

Asystasiagangetica is a medicinally and nutritionally important plant with emerging relevance in the management of metabolic disorders such as diabetes mellitus. While preliminary studies support its antioxidant and anti inflammatory properties, rigorous experimental validation and comprehensive safety evaluation are urgently required. A systematic and standardized research approach may facilitate its development as a safe and effective plant-based therapeutic agent.

**ABSTRACT**

In this work, ecological resource usage under unknown environmental conditions is analyzed by extending retrial queues. In ecosystems, organisms struggle for few resources and exhibit a natural retrial queue behavior by withdrawing and trying again if instant access is not available. Hexagonal Intuitionistic Fuzzy Numbers (HIFNs) are used to represent arrival, service, and retry rates. Key ecological performance metrics, such as expected waiting time and expected number of retrying species, are assessed using $\alpha$- and $\beta$-cuts with modified interval arithmetic. Ecosystem stability and resource distribution efficiency are interpreted by defuzzified values. The model's use in assessing ecosystem resilience in unpredictable circumstances is demonstrated numerically.

**Keywords:** Retrial queue, Ecological modeling, Environmental uncertainty, Intuitionistic fuzzy sets, Hexagonal intuitionistic fuzzy numbers.

## INTRODUCTION

Retrial behavior is a prevalent and crucial adaptation process found in nature. A species or population will frequently temporarily withdraw and try again later if it is unable to secure a necessary resource, such as food, water, or territory. Even in the face of unpredictable environmental stresses like drought, competition, or resource scarcity, species are guaranteed to live thanks to their retrying tendency, which preserves ecological balance. Retrial queues can be used to mathematically describe such retry events in ecosystems, where each retry represents an ecological

adaptation cycle and each attempt to access a resource represents a service request. On the other hand, ecological systems are defined by unpredictability in environmental circumstances, resource regeneration rate, and population density. This unpredictability cannot be adequately captured by traditional queueing techniques. As a result, we use Hexagonal Intuitionistic Fuzzy Numbers (HIFNs), which provide a deeper representation of environmental uncertainty by simultaneously modeling truth, falsity, and hesitation degrees. This work offers a versatile modeling approach to examine species-resource interactions and resource utilization efficiency in uncertain ecological systems by combining intuitionistic fuzzy sets with retrial queuing theory. Zadeh[16] introduced , "fuzzy set theory" as a way to deal with uncertainty. Zimmermann[17] introduced "Fuzzy sets theory and its applications" as a way to deal with application of uncertainty. Aarthi S, Shanmugasundhari M[1], "Comparison of Infinite Capacity FM/FEk/1 Queuing Performance using Fuzzy Queuing Model and Intuitionistic Fuzzy Queuing Model with Erlang Service Rates", The intuitionistic fuzzy queuing theory model offers a wide range of values, but the performance evaluations used to understand the fuzzy queuing are reported as a range of outcomes. Aarthi S *et al*[2], "Comparison of Non-Preemptive priority queuing performance using fuzzy queuing model and Intuitionistic fuzzy queuing model with different service rate", informs about the main objectives of this study, which are to evaluate the effectiveness of intuitionistic fuzzy queuing theory and fuzzy queuing theory applied to a non-preemptive queuing model. Ahmed FI *et al*[3], "A Single Server Markovian Queue with Single Working Vacation, State Dependent Reneging and Retention of Reneged Customers" helps to know about the single server vacation. Artalejo J *et al*[4] "Analysis of multi server queues with constant retrial rate" studied about multi server queues. J.R. Artalejo and J. Gómez-Corral (2008), where a computational approach to analyze these systems was presented [5].

Motivated by their work, we extend the study of retrial queues by introducing Intuitionistic Fuzzy Sets with Hexagonal representation to handle uncertainty in the system parameters. Chen S[6] "Parametric nonlinear programming for analyzing fuzzy queues with finite capacity" I have used to understand the finite capacity of fuzzy queues. Dudlin and Krishnamoorthy (2004) studied the BMAP/G/1 retrial system with customers from the orbit [7]. Motivated by such studies, we extend retrial queues using Hexagonal Intuitionistic Fuzzy Sets to deal with uncertainty. Falin G[8] introduced "A survey of retrial queues queuing systems: theory and applications". Chen, Liu and Zhang (2020) analyzed strategic customer behavior in fuzzy queueing systems [9]. Their work shows the role of fuzzy theory in queueing models. Following this direction, our study applies Hexagonal Intuitionistic Fuzzy Sets to retrial queues for handling uncertainty more effectively. Gross and Harris (1985) explained the basic concepts of queuing theory [10]. Based on such fundamental works, we extend the study to retrial queues using Hexagonal Intuitionistic Fuzzy Sets to handle uncertainty. Kalpana Devarajan, Senthil Kumar and Muthukrishnan (2021) studied a retrial queuing model for cognitive radio networks with energy harvesting [11]. Inspired by such applications, our work considers retrial queues under Hexagonal Intuitionistic Fuzzy Sets to model uncertainty in system behavior. Ke Jau chuan[12] "On retrial queuing model with fuzzy parameters" used to understand the retrial fuzzy parameters. Manoharan P[13] "Impatient customers in an m/m/1 queue with working vacation and multiple vacation" its help to understand the customers in vacation. Noor HidayahMohdZaki *et al*[14], "Comparison of Queuing Performance Using Queuing Theory Model and Fuzzy Queuing Model at Check-in Counter in Airport" studied When evaluating an airline company's queuing performance, the outcomes of the fuzzy queuing model are reliable. Viswanathan A[15] considered "fuzzy retrial queuing system with coxian-2 vacation". This paper is structured as follows: Basic definitions and preliminary information are included in Section 2. Retrial queues in an intuitionistic fuzzy environment are introduced in Section 3. The suggested method is demonstrated and a numerical example with Results and Discussions in Section 4 followed by the References and Conclusion.

## PRELIMINARIES

**Retrial queue**

A retrial queue is a queuing model in which customers (or jobs) who find the server busy upon arrival do not join a waiting line but instead leave and try to re-enter the queue after a random period. This behavior is common in systems where resources are limited, and users or tasks retry after being blocked or rejected.

**Example**

Consider a group of elephants in a dry land ecosystem approaching a watering hole. If the pond is occupied, the arriving elephants move away and return later when space becomes available. Over time, the retrying pattern stabilizes some elephants succeed, others wait, and the cycle repeats.

This natural retry behavior mirrors a retrial queue system, where:

**Arrival rate (λ)** = number of species arriving to access the resource,

**Service rate (μ)** = rate at which the resource can be used or replenished,

**Retrial rate (θ)** = rate at which species return after a failed attempt.

Analyzing this system helps ecologists estimate the expected number of retrying individuals and the average waiting time for access crucial indicators of ecological stress, population equilibrium, and environmental capacity

**$\alpha$-cut**

An alpha-cut ($\alpha$-cut) of a fuzzy set $\tilde{A}$ is the crisp subset of the universe X that contains all elements with a membership degree greater than or equal to a certain threshold $\alpha$ (where $0 \leq \alpha \leq 1$). Mathematically, an alpha-cut is defined as:

$A_\alpha = \{x \in X | \theta_{\tilde{A}}(x) \geq \alpha\}$

Where,

- $\theta_{\tilde{A}}(x)$ is the membership function of the fuzzy set $\tilde{A}$.
- $\alpha$ is a specified level of membership, with $0 \leq \alpha \leq 1$.
- $A_\alpha$ is the resulting crisp set at level $\alpha$.

**Fuzzy Set**

A fuzzy set A in a universal set X is defined by a membership function $\theta_{\tilde{A}}(x)$, which assigns to each element x in X a value between 0 and 1. The function $\theta_{\tilde{A}}(x)$ represents the degree to which x belongs to the fuzzy set A.

$A=\{(x, \theta_{\tilde{A}}(x)) | x \in X\}$

- X is the universal set (the set of all possible elements under consideration).
- X is an element of X.
- $\theta_{\tilde{A}}(x) \in [0,1]$ is the membership function, indicating the degree of membership of x in A.

**Intuitionistic Fuzzy set**

For a given universe X, an intuitionistic fuzzy set A in X is defined by a membership function $\theta_{\tilde{A}}(x)$, a non-membership function $\vartheta_{\tilde{A}}(x)$, and a hesitation degree $\pi_{\tilde{A}}(x)$ for each elements $x \in X$. These values satisfy the following conditions:

**Membership degree $\theta_{\tilde{A}}(x)$ :**

Represents the degree to which x belongs to the set A, where $0 \leq \theta_{\tilde{A}}(x) \leq 1$.

**Non-Membership degree $\vartheta_{\tilde{A}}(x)$:**

Represents the degree to which x does not belongs to A, where $0 \leq \vartheta_{\tilde{A}}(x) \leq 1$.

**Hesitancy degree $\pi_{\tilde{A}}(x)$**:

Represents the uncertainty or hesitation between membership and non-membership, calculated as:

$\pi_{\tilde{A}}(x) = 1 - \theta_{\tilde{A}}(x) - \vartheta_{\tilde{A}}(x)$

An intuitionistic fuzzy set A can be expressed as:

$A = \{\langle x, \theta_{\tilde{A}}(x), \vartheta_{\tilde{A}}(x)\rangle | x \in X\}$

**Hexagonal Intuitionistic fuzzy numbers**

A hexagonal intuitionistic fuzzy number is specified by $\tilde{\vartheta}_{H^I} = (a_1, a_2, a_3, a_4, a_5, a_6), (a_1', a_2', a_3', a_4', a_5', a_6')$. The non-membership function $\vartheta_{\tilde{H}}(x)$ for a hexagonal fuzzy number H can be defined as:

$$\vartheta_{\overline{H}}(x)=\begin{cases} 1, & for\ x < a_1{}' \\ 1-\frac{1}{2}\left(\frac{x-a_1{}'}{a_2{}'-a_1{}'}\right), & for\ a_1{}' \le x \le a_2{}' \\ \frac{1}{2}\left(\frac{a_3{}'-x}{a_3{}'-a_2{}'}\right), & for\ a_2{}' \le x \le a_3{}' \\ 0, & for\ a_3{}' \le x \le a_4{}' \\ \frac{1}{2}\left(\frac{x-a_4{}'}{a_5{}'-a_4{}'}\right), & for\ a_4{}' \le x \le a_5{}' \\ \frac{1}{2}+\frac{1}{2}\left(\frac{x-a_5{}'}{a_6{}'-a_5{}'}\right), & for a_5{}' \le x \le a_6{}' \\ 1, & for x > a_6{}' \end{cases}$$

The membership function of a queuing system fully characterizes its features, while the non-membership function of E(N) and E(W) indicate the expected number of customers and the expected waiting time of a client in the system, respectively. E(N) and E(W) have the following membership and non-membership functions:

$$\theta_{\widetilde{E(N)}}(x)=\begin{cases} 0, & for\ x < a_1 \\ \frac{1}{2}\left(\frac{x-a_1}{a_2-a_1}\right), & for\ a_1 \le x \le a_2 \\ \frac{1}{2}+\frac{1}{2}\left(\frac{x-a_2}{a_3-a_2}\right), & for\ a_2 \le x \le a_3 \\ 1, & for\ a_3 \le x \le a_4 \\ \frac{1}{2}-\frac{1}{2}\left(\frac{x-a_4}{a_5-a_4}\right), & for\ a_4 \le x \le a_5 \\ \frac{1}{2}\left(\frac{a_6-x}{a_6-a_5}\right), & for a_5 \le x \le a_6 \\ 0, & for x > a_6 \end{cases}$$

$$\vartheta_{\widetilde{E(N)}}(x)=\begin{cases} 1, & for\ x < a_1{}' \\ 1-\frac{1}{2}\left(\frac{x-a_1{}'}{a_2{}'-a_1{}'}\right), & for\ a_1{}' \le x \le a_2{}' \\ \frac{1}{2}\left(\frac{a_3{}'-x}{a_3{}'-a_2{}'}\right), & for\ a_2{}' \le x \le a_3{}' \\ 0, & for\ a_3{}' \le x \le a_4{}' \\ \frac{1}{2}\left(\frac{x-a_4{}'}{a_5{}'-a_4{}'}\right), & for\ a_4{}' \le x \le a_5{}' \\ \frac{1}{2}+\frac{1}{2}\left(\frac{x-a_5{}'}{a_6{}'-a_5{}'}\right), & for a_5{}' \le x \le a_6{}' \\ 1, & for x > a_6{}' \end{cases}$$

$$\theta_{\widetilde{E(W)}}(x)=\begin{cases} 0, & for\ x < a_1 \\ \frac{1}{2}\left(\frac{x-a_1}{a_2-a_1}\right), & for\ a_1 \le x \le a_2 \\ \frac{1}{2}+\frac{1}{2}\left(\frac{x-a_2}{a_3-a_2}\right), & for\ a_2 \le x \le a_3 \\ 1, & for\ a_3 \le x \le a_4 \\ \frac{1}{2}-\frac{1}{2}\left(\frac{x-a_4}{a_5-a_4}\right), & for\ a_4 \le x \le a_5 \\ \frac{1}{2}\left(\frac{a_6-x}{a_6-a_5}\right), & for a_5 \le x \le a_6 \\ 0, & for x > a_6 \end{cases}$$

$$\vartheta_{\widetilde{E(W)}}(x)=\begin{cases} 1, & for\ x < a_1' \\ 1-\frac{1}{2}\left(\frac{x-a_1'}{a_2'-a_1'}\right), & for\ a_1' \le x \le a_2' \\ \frac{1}{2}\left(\frac{a_3'-x}{a_3'-a_2'}\right), & for\ a_2' \le x \le a_3' \\ 0, & for\ a_3' \le x \le a_4' \\ \frac{1}{2}\left(\frac{x-a_4'}{a_5'-a_4'}\right), & for\ a_4' \le x \le a_5' \\ \frac{1}{2}+\frac{1}{2}\left(\frac{x-a_5'}{a_6'-a_5'}\right), & for a_5' \le x \le a_6' \\ 1, & for x > a_6' \end{cases}$$

**$\alpha, \beta$–cut sets of Hexagonal Intuitionistic Fuzzy Number**

**$\alpha$ –cut set**

$[A_\alpha^-, A_\alpha^+]=[a+2\alpha(b-a), f-2\alpha(f-e)]$

**$\beta$–cut set**

$[A_\alpha^-, A_\alpha^+]=[c-2\beta(c-b), d+2\beta(e-d)]$

**Model Descriptions**

**Retrial queuing in Intuitionistic Fuzzy Environment**

Let $\tilde{\lambda}_I$, $\tilde{\mu}_I$ and $\tilde{r}_I$ be the arrival rate, service rate and retrial rate respectively. These rates can be represented as a convex fuzzy set, as they are not known precisely. Let $(\theta(\tilde{\lambda}_I), \theta(\tilde{\mu}_I)\ and\ \theta(\tilde{r}_I))$ denote the membership between functions of $\tilde{\lambda}_I$, $\tilde{\mu}_I$ and $\tilde{r}_I$respectively and let $(\vartheta(\tilde{\lambda}_I), \vartheta(\tilde{\mu}_I)\ and\ \vartheta(\tilde{r}_I))$ denote the non-membership functions function of $\tilde{\lambda}_I$, $\tilde{\mu}_I$ and $\tilde{r}_I$respectivley.

The intuitionistic fuzzy sets are given by

$\tilde{P}_I=\{\tilde{\lambda}_I, \theta(\tilde{\lambda}_I), \vartheta(\tilde{\lambda}_I)/\tilde{\lambda}_I \in P\}$

$\tilde{Q}_I=\{\tilde{\mu}_I, \theta(\tilde{\mu}_I), \vartheta(\tilde{\mu}_I)/\tilde{\mu}_I \in Q\}$

$\tilde{R}_I=\{\tilde{r}_I, \theta(\tilde{r}_I), \vartheta(\tilde{r}_I)/\tilde{r}_I \in R\}$

Where P, Q and R are crisp universal sets of arrival rate, service rate and retrial rates respectively and $0 \le \theta(x)+\vartheta(x) \le 1$ where $x=\tilde{\lambda}_I, \tilde{\mu}_I, \tilde{r}_I$.

For a crisp retrial queuing system if $\frac{\lambda}{\mu}<1$ the expected number of customer are given by

$E(N)=\frac{\lambda^2}{\mu-\lambda}\left(\frac{1}{\lambda}+\frac{1}{\mu}\right)$

$E(W)=\frac{\lambda}{\mu-\lambda}\left(\frac{1}{\lambda}+\frac{1}{\mu}\right)$

**Performance measures of Hexagonal Intuitionistic fuzzy retrial queue**

Let arrival rate $\tilde{\lambda}_I$, service rate $\tilde{\mu}_I$ and retrial rate $\tilde{r}_I$ be denoted by HIFN's

$\tilde{\lambda}_I=(\lambda_1, \lambda_2, \lambda_3, \lambda_4, \lambda_5, \lambda_6);(\lambda_1', \lambda_2', \lambda_3', \lambda_4', \lambda_5', \lambda_6')$.

$\tilde{\mu}_I=(\mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6);(\mu_1', \mu_2', \mu_3', \mu_4', \mu_5', \mu_6')$.

$\tilde{r}_I=(r_1, r_2, r_3, r_4, r_5, r_6);(r_1', r_2', r_3', r_4', r_5', r_6')$.

Where

$\lambda_1' \le \lambda_1, \lambda_2' \le \lambda_2, \lambda_3' \le \lambda_3, \lambda_4 \le \lambda_4', \lambda_5 \le \lambda_5', \lambda_6 \le \lambda_6'$

$\mu_1' \le \mu_1, \mu_2' \le \mu_2, \mu_3' \le \mu_3, \mu_4 \le \mu_4', \mu_5 \le \mu_5', \mu_6 \le \mu_6'$

$r_1' \le r_1, r_2' \le r_2, r_3' \le r_3, r_4 \le r_4', r_5 \le r_5', r_6 \le r_6'$

Using the concept of $\alpha, \beta$ –cut set

$\alpha\widetilde{\lambda_I}=[\lambda_1+2\alpha(\lambda_2-\lambda_1), \lambda_1-2\alpha(\lambda_6-\lambda_5)]$

$\beta\widetilde{\lambda_I}=[\lambda_3'-2\beta(\lambda_3'-\lambda_2'), \lambda_4'+2\beta(\lambda_5'-\lambda_4')]$

$\alpha\widetilde{\mu_I}$=$[\mu_1 + 2\alpha(\mu_2 - \mu_1), \mu_1 - 2\alpha(\mu_6 - \mu_5)]$
$\beta\widetilde{\mu_I}$=$[\mu_3' - 2\beta(\mu_3' - \mu_2'), \mu_4' + 2\beta(\mu_5' - \mu_4')]$

$\alpha\widetilde{r_I}$=$[r_1 + 2\alpha(r_2 - r_1), r_1 - 2\alpha(r_6 - r_5)]$
$\beta\widetilde{r_I}$=$[r_3' - 2\beta(r_3' - r_2'), r_4' + 2\beta(r_5' - r_4')]$

**Modified Interval Arithmetic Operations**

Let $\widetilde{A_I}$={$[a_1, a_2], [a_1', a_2']$}
$\widetilde{B_I}$={$[b_1, b_2], [b_1', b_2']$}
Then we define
$m_1$=$\frac{a_1+a_2}{2}$, $m_2$=$\frac{b_1+b_2}{2}$
$m_1'$=$\frac{a_1'+a_2'}{2}$, $m_2'$=$\frac{b_1'+b_2'}{2}$

**Addition**

$\widetilde{A_I} + \widetilde{B_I}$={$[(m_1 + m_2 - k), (m_1 + m_2 + k)]; [(m_1' + m_2' - k'), (m_1' + m_2' + k')]$}
Where k = $\frac{[b_2+a_2]-[b_1+a_1]}{2}$, k = $\frac{[b_2'+a_2']-[b_1'+a_1']}{2}$

**Subtraction**

$\widetilde{A_I} - \widetilde{B_I}$={$[(m_1 - m_2 - k), (m_1 - m_2 + k)]; [(m_1' - m_2' - k'), (m_1' - m_2' + k')]$}
Where k = $\frac{[b_2+a_2]-[b_1+a_1]}{2}$, k = $\frac{[b_2'+a_2']-[b_1'+a_1']}{2}$

**Multiplication**

$\widetilde{A_I} \times \widetilde{B_I}$={$[(m_1m_2 - k), (m_1m_2 + k)]; [(m_1'm_2' - k'), (m_1'm_2' + k')]$}
Where,
k=min$(m_1m_2 - \alpha, \beta - m_1m_2)$
$\alpha$=min$(a_1b_1, a_1b_2, a_2b_1, a_2b_2)$
$\beta$=min$(a_1b_1, a_1b_2, a_2b_1, a_2b_2)$
K′=min$(m_1'm_2' - \alpha, \beta - m_1'm_2')$
$\alpha'$=min$(a_1'b_1', a_1'b_2', a_2'b_1', a_2'b_2')$
$\beta'$=min$(a_1'b_1', a_1'b_2', a_2'b_1', a_2'b_2')$

**Division**

$\frac{1}{\widetilde{A_I}}$ = {$[a_1, a_2], [a_1', a_2']$}$^{-1}$
=$\left[\left(\frac{1}{m_1} - k, \frac{1}{m_1} + k\right); \left(\frac{1}{m_1'} - k', \frac{1}{m_1'} + k'\right)\right]$
Where, $k$ =$\left\{\frac{1}{a_2}\left(\frac{a_2-a_1}{a_1+a_2}\right), \frac{1}{a_1}\left(\frac{a_2-a_1}{a_1+a_2}\right)\right\}$
$k'$ =$\left\{\frac{1}{a_2'}\left(\frac{a_2'-a_1'}{a_1'+a_2'}\right), \frac{1}{a_1'}\left(\frac{a_2'-a_1'}{a_1'+a_2'}\right)\right\}$
Hence,
$\alpha_{[\widetilde{\mu_I}-\widetilde{\lambda_I}]}$=$[(\mu_1 - \lambda_6) + 2\alpha(\mu_2 - \mu_1 + \lambda_6 - \lambda_5), (\mu_6 - \lambda_1) - 2\alpha(\mu_6 - \mu_5 + \lambda_2 - \lambda_1)]$,
$\beta_{[\widetilde{\mu_I}-\widetilde{\lambda_I}]}$=$[(\mu_3' - \lambda_4') - 2\beta(\mu_3' - \mu_2' + \lambda_5' - \lambda_4'), (\mu_4' - \lambda_3') + 2\beta(\mu_5' - \mu_4' + \lambda_3' - \lambda_2')]$
$\alpha_{E(W)}$=$\alpha\left[\left(\frac{\widetilde{\lambda_I}}{\widetilde{\mu_I}-\widetilde{\lambda_I}}\right)\left(\frac{1}{\widetilde{\lambda_I}}+\frac{1}{\widetilde{r_I}}\right)\right]$
$\alpha_{E(W)}$=$\left[\frac{[\lambda_1](\lambda_1+r_1)}{(\mu_6-\lambda_1)}, \frac{[\lambda_3](\lambda_3+r_3)}{(\mu_4-\lambda_3)}, \frac{[\lambda_5](\lambda_5+r_5)}{(\mu_2-\lambda_5)}\right]_{\alpha=0}$
$\alpha_{E(W)}$=$\left[\frac{[\lambda_2](\lambda_2+r_2)}{(\mu_5-\lambda_2)}, \frac{[\lambda_4](\lambda_4+r_4)}{(\mu_3-\lambda_4)}, \frac{[\lambda_6](\lambda_6+r_6)}{(\mu_1-\lambda_6)}\right]_{\alpha=1}$
$\alpha_{E(N)}$=$\alpha\left[\left(\frac{\widetilde{\lambda_I}^2}{\widetilde{\mu_I}-\widetilde{\lambda_I}}\right)\left(\frac{1}{\widetilde{\lambda_I}}+\frac{1}{\widetilde{r_I}}\right)\right]$

$\alpha_{E(N)}=\left[\frac{[\lambda_1]^2(\lambda_1+r_1)}{(\mu_6-\lambda_1)},\frac{[\lambda_3]^2(\lambda_3+r_3)}{(\mu_4-\lambda_3)},\frac{[\lambda_5]^2(\lambda_5+r_5)}{(\mu_2-\lambda_5)}\right]_{\alpha=0}$

$\alpha_{E(N)}=\left[\frac{[\lambda_2]^2(\lambda_2+r_2)}{(\mu_5-\lambda_2)},\frac{[\lambda_4]^2(\lambda_4+r_4)}{(\mu_3-\lambda_4)},\frac{[\lambda_6]^2(\lambda_6+r_6)}{(\mu_1-\lambda_6)}\right]_{\alpha=1}$

$\beta_{E(W)}=\beta_{\left[\left(\frac{\tilde{\lambda}_I}{\tilde{\mu}_I-\tilde{\lambda}_I}\right)\left(\frac{1}{\tilde{\lambda}_I}+\frac{1}{\tilde{r}_I}\right)\right]}$

$\beta_{E(W)}=\left[\frac{[\lambda_1\prime](\lambda_1\prime+r_1\prime)}{(\mu_6\prime-\lambda_1\prime)},\frac{[\lambda_3\prime](\lambda_3\prime+r_3\prime)}{(\mu_4\prime-\lambda_3\prime)},\frac{[\lambda_5\prime](\lambda_5\prime+r_5\prime)}{(\mu_2\prime-\lambda_5\prime)}\right]_{\beta=0}$

$\beta_{E(W)}=\left[\frac{[\lambda_2\prime](\lambda_2\prime+r_2\prime)}{(\mu_5\prime-\lambda_2\prime)},\frac{[\lambda_4\prime](\lambda_4\prime+r_4\prime)}{(\mu_3\prime-\lambda_4\prime)},\frac{[\lambda_6\prime](\lambda_6\prime+r_6\prime)}{(\mu_1\prime-\lambda_6\prime)}\right]_{\beta=1}$

$\beta_{E(N)}=\beta_{\left[\left(\frac{\tilde{\lambda}_I^{\,2}}{\tilde{\mu}_I-\tilde{\lambda}_I}\right)\left(\frac{1}{\tilde{\lambda}_I}+\frac{1}{\tilde{r}_I}\right)\right]}$

$\beta_{E(N)}=\left[\frac{[\lambda_1\prime]^2(\lambda_1\prime+r_1\prime)}{(\mu_6\prime-\lambda_1\prime)},\frac{[\lambda_3\prime]^2(\lambda_3\prime+r_3\prime)}{(\mu_4\prime-\lambda_3\prime)},\frac{[\lambda_5\prime]^2(\lambda_5\prime+r_5\prime)}{(\mu_2\prime-\lambda_5\prime)}\right]_{\beta=0}$

$\beta_{E(N)}=\left[\frac{[\lambda_2\prime]^2(\lambda_2\prime+r_2\prime)}{(\mu_5\prime-\lambda_2\prime)},\frac{[\lambda_4\prime]^2(\lambda_4\prime+r_4\prime)}{(\mu_3\prime-\lambda_4\prime)},\frac{[\lambda_6\prime]^2(\lambda_6\prime+r_6\prime)}{(\mu_1\prime-\lambda_6\prime)}\right]_{\beta=1}$

Considering all these values of $\alpha=0$, $\alpha=1$, $\beta=0$ and $\beta=1$we obtain approximate HIFN

$$E(W)=\left[\begin{array}{c}\left(\frac{[\lambda_1](\lambda_1+r_1)}{(\mu_6-\lambda_1)},\frac{[\lambda_2](\lambda_2+r_2)}{(\mu_5-\lambda_2)},\frac{[\lambda_3](\lambda_3+r_3)}{(\mu_4-\lambda_3)},\frac{[\lambda_4](\lambda_4+r_4)}{(\mu_3-\lambda_4)},\frac{[\lambda_5](\lambda_5+r_5)}{(\mu_2-\lambda_5)},\frac{[\lambda_6](\lambda_6+r_6)}{(\mu_1-\lambda_6)}\right);\\ \left(\frac{[\lambda_1\prime](\lambda_1\prime+r_1\prime)}{(\mu_6\prime-\lambda_1\prime)},\frac{[\lambda_2\prime](\lambda_2\prime+r_2\prime)}{(\mu_5\prime-\lambda_2\prime)},\frac{[\lambda_3\prime](\lambda_3\prime+r_3\prime)}{(\mu_4\prime-\lambda_3\prime)},\frac{[\lambda_4\prime](\lambda_4\prime+r_4\prime)}{(\mu_3\prime-\lambda_4\prime)},\frac{[\lambda_5\prime](\lambda_5\prime+r_5\prime)}{(\mu_2\prime-\lambda_5\prime)},\frac{[\lambda_6\prime](\lambda_6\prime+r_6\prime)}{(\mu_1\prime-\lambda_6\prime)}\right)\end{array}\right]$$

$\approx [(w_1,w_2,w_3,w_4,w_5,w_6);(w_1\prime,w_2\prime,w_3\prime,w_4\prime,w_5\prime,w_6\prime)]$

In a similar manner

$$E(N)=\left[\begin{array}{c}\left(\frac{[\lambda_1]^2(\lambda_1+r_1)}{(\mu_6-\lambda_1)},\frac{[\lambda_2]^2(\lambda_2+r_2)}{(\mu_5-\lambda_2)},\frac{[\lambda_3]^2(\lambda_3+r_3)}{(\mu_4-\lambda_3)},\frac{[\lambda_4]^2(\lambda_4+r_4)}{(\mu_3-\lambda_4)},\frac{[\lambda_5]^2(\lambda_5+r_5)}{(\mu_2-\lambda_5)},\frac{[\lambda_6]^2(\lambda_6+r_6)}{(\mu_1-\lambda_6)}\right);\\ \left(\frac{[\lambda_2\prime]^2(\lambda_2\prime+r_2\prime)}{(\mu_5\prime-\lambda_2\prime)},\frac{[\lambda_2\prime]^2(\lambda_2\prime+r_2\prime)}{(\mu_5\prime-\lambda_2\prime)},\frac{[\lambda_3\prime]^2(\lambda_3\prime+r_3\prime)}{(\mu_4\prime-\lambda_3\prime)},\frac{[\lambda_4\prime]^2(\lambda_4\prime+r_4\prime)}{(\mu_3\prime-\lambda_4\prime)},\frac{[\lambda_5\prime]^2(\lambda_5\prime+r_5\prime)}{(\mu_2\prime-\lambda_5\prime)},\frac{[\lambda_6\prime]^2(\lambda_6\prime+r_6\prime)}{(\mu_1\prime-\lambda_6\prime)}\right)\end{array}\right]$$

$\approx [(n_1,n_2,n_3,n_4,n_5,n_6);(n_1\prime,n_2\prime,n_3\prime,n_4\prime,n_5\prime,n_6\prime)]$

**Numerical example**

**Problem**

Imagine a protected area with a single, essential drinking pond that is utilized by a focal species, like a herd of deer. Since arrival rates, resource availability, and revisit behavior are unpredictable due to seasonal and environmental change, Hexagonal Intuitionistic Fuzzy Numbers (HIFNs) are used to simulate these variables.

Let the uncertain arrival rate of individuals to the pond be

$\tilde{\lambda}_I$=(2,4,6,8,10,12); (1,3,5,9,11,13) per hour.

Let the (uncertain) effective resource release rate i.e. the rate at which the pond becomes available for a new individual after previous use be

$\tilde{\mu}_I$=(22,24,26,28,30,32); (21,23,25,29,31,33) per hour.

If an arriving individual finds the pond occupied, it leaves and later returns (retries). The retrial (revisit) rate is modeled by

$\tilde{r}_I$=(0.2,0.4,0.6,0.8,1.0,1.2); (0,0.3,0.5,0.9,1.1,1.3).

Using the $\alpha$- and $\beta$-cut methods together with the modified interval arithmetic presented in Section 3, find the expected waiting time for resource access E(W) in hours and the expected number of individuals in the retry orbit E(N) around the pond.

**Solution**

**Given**

$\tilde{\lambda}_I=(\lambda_1,\lambda_2,\lambda_3,\lambda_4,\lambda_5,\lambda_6);(\lambda_1\prime,\lambda_2\prime,\lambda_3\prime,\lambda_4\prime,\lambda_5\prime,\lambda_6\prime)$

=(2,4,6,8,10,12); (1,3,5,9,11,13)

$\tilde{\mu}_I=(\mu_1,\mu_2,\mu_3,\mu_4,\mu_5,\mu_6);(\mu_1\prime,\mu_2\prime,\mu_3\prime,\mu_4\prime,\mu_5\prime,\mu_6\prime)$

=(22,24,26,28,30,32); (21,23,25,29,31,33)

$\tilde{r}_l=(r_1,r_2,r_3,r_4,r_5,r_6);(r_1',r_2',r_3',r_4',r_5',r_6')$

$=(0.2,0.4,0.6,0.8,1.0,1.2);(0,0.3,0.5,0.9,1.1,1.3)$

$$E(W)=\begin{bmatrix}\left(\frac{[\lambda_1](\lambda_1+r_1)}{(\mu_6-\lambda_1)},\frac{[\lambda_2](\lambda_2+r_2)}{(\mu_5-\lambda_2)},\frac{[\lambda_3](\lambda_3+r_3)}{(\mu_4-\lambda_3)},\frac{[\lambda_4](\lambda_4+r_4)}{(\mu_3-\lambda_4)},\frac{[\lambda_5](\lambda_5+r_5)}{(\mu_2-\lambda_5)},\frac{[\lambda_6](\lambda_6+r_6)}{(\mu_1-\lambda_6)}\right);\\ \left(\frac{[\lambda_1'](\lambda_1'+r_1')}{(\mu_6'-\lambda_1')},\frac{[\lambda_2'](\lambda_2'+r_2')}{(\mu_5'-\lambda_2')},\frac{[\lambda_3'](\lambda_3'+r_3')}{(\mu_4'-\lambda_3')},\frac{[\lambda_4'](\lambda_4'+r_4')}{(\mu_3'-\lambda_4')},\frac{[\lambda_5'](\lambda_5'+r_5')}{(\mu_2'-\lambda_5')},\frac{[\lambda_6'](\lambda_6'+r_6')}{(\mu_1'-\lambda_6')}\right)\end{bmatrix}$$

$$E(\widetilde{W})=\begin{bmatrix}\left(\frac{2(2+0.2)}{32-2},\frac{4(4+0.4)}{30-4},\frac{6(6+0.6)}{28-6},\frac{8(8+0.8)}{26-8},\frac{10(10+1)}{24-10},\frac{12(12+1.2)}{22-12}\right);\\ \left(\frac{1(1+0)}{33-1},\frac{3(3+0.3)}{31-3},\frac{5(5+0.5)}{29-5},\frac{9(9+0.9)}{25-9},\frac{11(11+1.1)}{23-11},\frac{13(13+1.3)}{21-13}\right)\end{bmatrix}$$

$$=\begin{bmatrix}(0.1467,0.6769,1.8,3.9112,7.8571,15.84);\\ (0.0312,0.3535,1.1458,5.5687,11.0916,14.3)\end{bmatrix}$$

$$E(N)=\begin{bmatrix}\left(\frac{[\lambda_1]^2(\lambda_1+r_1)}{(\mu_6-\lambda_1)},\frac{[\lambda_2]^2(\lambda_2+r_2)}{(\mu_5-\lambda_2)},\frac{[\lambda_3]^2(\lambda_3+r_3)}{(\mu_4-\lambda_3)},\frac{[\lambda_4]^2(\lambda_4+r_4)}{(\mu_3-\lambda_4)},\frac{[\lambda_5]^2(\lambda_5+r_5)}{(\mu_2-\lambda_5)},\frac{[\lambda_6]^2(\lambda_6+r_6)}{(\mu_1-\lambda_6)}\right);\\ \left(\frac{[\lambda_2']^2(\lambda_2'+r_2')}{(\mu_5'-\lambda_2')},\frac{[\lambda_2']^2(\lambda_2'+r_2')}{(\mu_5'-\lambda_2')},\frac{[\lambda_3']^2(\lambda_3'+r_3')}{(\mu_4'-\lambda_3')},\frac{[\lambda_4']^2(\lambda_4'+r_4')}{(\mu_3'-\lambda_4')},\frac{[\lambda_5']^2(\lambda_5'+r_5')}{(\mu_2'-\lambda_5')},\frac{[\lambda_6']^2(\lambda_6'+r_6')}{(\mu_1'-\lambda_6')}\right)\end{bmatrix}$$

$$E(\widetilde{N})=\begin{bmatrix}\left(\frac{4(2+0.2)}{32-2},\frac{16(4+0.4)}{30-4},\frac{36(6+0.6)}{28-6},\frac{64(8+0.8)}{26-8},\frac{100(10+1)}{24-10},\frac{144(12+1.2)}{22-12}\right);\\ \left(\frac{1(1+0)}{33-1},\frac{9(3+0.3)}{31-3},\frac{25(5+0.5)}{29-5},\frac{81(9+0.9)}{25-9},\frac{121(11+1.1)}{23-11},\frac{169(13+1.3)}{21-13}\right)\end{bmatrix}$$

$$=\begin{bmatrix}(0.2933,2.5142,10.8,31.2888,78.5714,190.08);\\ (0.0312,1.0607,5.7291,50.1187,122.0083,302.0875)\end{bmatrix}$$

Using the defuzzification measures

$$r(\tilde{A})=\frac{a_1+2a_2+2a_3+2a_4+2a_5+a_6+a_1'+2a_2'+2a_3'+2a_4'+2a_5'+a_6'}{20}$$

The proposed Hexagonal Intuitionistic Fuzzy Retrial Queue model was applied to the ecological resource system described in Section 4. Using the $\alpha$-and $\beta$-cut approach and modified interval arithmetic, the defuzzified performance measures were obtained as follows:

$E(\widetilde{W})=\frac{95.1272}{20}=4.75636$ hours

$E(\widetilde{N})=\frac{996.7044}{20}=49.83\approx 50$

Here, $E(\widetilde{W})$ denotes the expected waiting time for an individual to access the watering resource, while $E(\widetilde{N})$ represents the expected number of individuals temporarily retrying (orbit population) around the resource.

Table 1.

The table showing these values indicate that, under uncertain environmental conditions, each animal on average waits about 4.76 hours before successful access, and roughly 50 individuals remain in the retry orbit at any given time. This confirms that the ecological retrial queue remains stable even when environmental parameters fluctuate.

## RESULTS AND DISCUSSIONS

The results show that the Hexagonal Intuitionistic Fuzzy technique is more effective than traditional deterministic methods at modeling ecological uncertainty. The model produces more accurate estimates for ecosystem management and sustainability planning by accounting for differences in resource availability, species arrival, and revisit behavior through the incorporation of hesitation degrees. Figure 1. According to the ecological conditions figure, a single species waits an average of 4.76 hours to access the resource, and at any given time, about 50 individuals are in the retry orbit. These results demonstrate that the adaptive reattempt behavior of species vying for scarce resources is well-modeled by the retrial queue mechanism. Even when environmental parameters fluctuate, the stability of the obtained results validates the ecological system's balanced use pattern.

## CONCLUSION

Ecological uncertainty and adaptive species behavior under changing environmental conditions are well captured by the Hexagonal Intuitionistic Fuzzy Retrial Queue model. Realistic estimations of resource waiting durations and retrying species are provided by taking hesitation degrees into account, illustrating ecological stability and balanced

resource use. By simulating repeated attempts and competition for few resources, the retrial queue structure provides definite advantages that allow for more precise management and sustainable planning. To further improve its practical application, future research can expand this model to multi-resource ecosystems, include interactions between several species, and provide computational algorithms for extensive ecological simulations.

**ABSTRACT**

This study develops ChSP-(0,1) using fuzzy numbers is presented. To describe FOC Curve of ChSP-(0,1) tables and graphs are provided when the sample size is fixed . Numerical examples are given for the above sampling plan are given. Quality levels are designed to satisfy the condition of the risks. Sum of the risks is minimized for optimum value of sample size.

**Key words:** Statistical Quality Control , Acceptance Sampling , Operating Characteristic (OC) Curve, Fuzzy number, Trapezoidal Fuzzy Number.

## INTRODUCTION

The significant idea of statistics is statistical quality control. It is used in many manufacturing and production industries. Quality Control is required for the improvement of the product. It is the basic technique to sustain in this field. Acceptance sampling plan is an inspection plan between the producers and the consumers [15-16]. While evaluating proportion defective value crisp parameters are used to solve problems and there is some uncertainty often available. To resolve these types of uncertainty fuzzy set theory is used. It is the generalization of classical set theory. In acceptance sampling plan the fuzzy based research is used to solve the vagueness, imprecision and uncertainty [13]. Montgomery [15] introduced statistical quality control. Schiling [16] developed acceptance sampling quality control. Dodge [2] provided OC curve and properties of chain sampling plan. Clark [1] studied OC curves for ChSP-1. Frishman and Fred [6] prolonged chain sampling plan. Dodge & Stephens [3] developed Chain sampling plans ChSP-(0,1). It is used to minimize the inspection cost. Here both small and large samples are

applied. In order to get better result small sample size is used in ChSP-(0,1). It is an extension of chsp-1. Soundarajan [17] proposed construction and selection ChSP-(0,1). Soundararajan and Govindaraju [18] constructed and selected values for ChSP –(0,1). Kahraman and Kaya [8] proposed SSP and DSP using fuzzy parameter. The outcome shows that fuzzy boundary gives greater adaptability and convenience. Jamkhaneh and Sadeghpour Gildeh [7] discussed about chsp-1 using fuzzy probability theory. Turanoglu, Kahraman and Kaya [9] derived acceptance probability using fuzzy parameters and its OC curves. Kavi priya and Sudamani Ramaswamy [10-11] designed modified chain sampling plan MChSP-1 and two sided modified complete chain sampling plans TSMCChSP-1 using fuzzy parameters. Special purpose Double sampling plan type DSP(0,1) [13], two sided complete chain sampling plans TSCCChSP-1[12] and Repetitive Group Sampling plan (RGS) using fuzzy parameters was developed by Kavi priya and Sudamani Ramaswamy [14].

In this work basic definitions like fuzzy number, trapezoidal fuzzy number are included then operating procedure for ChSP - (0,1), FOC curve for ChSP-(0,1) are presented in graphs and tables are explained with examples.

**Definitions**

**Fuzzy Number** ( Zadeh [19]and Dubis & Prade [5] ) : " Fuzzy set that are characterized on the arrangement of real numbers having the structure $\check{E}$: R tends to [0,1] are known as fuzzy number. A fuzzy number $\check{E}$ will be a fuzzy set in the real line that fulfills the state of both normal and convexity".

**Trapezoidal fuzzy number** ( Zadeh [19] and Dubis & Prade [5]):"If trapezoidal fuzzy numbers (TrFNs) are $\check{E}$ = ($e_1$, $e_2$ , $e_3$ , $e_4$) and its membership function as"

$$\mathrm{TrFN} = \begin{cases} 0 & , \quad otherwise \\ \frac{y-e_1}{e_2-e_1} & , \ e_1 \le y \le e_2 \\ 1 & , \quad e_2 \le y \le e_3 \\ \frac{e_4-y}{e_4-e_3} & , \ e_3 \le y \le e_4 \\ 0 & , \quad otherwise \end{cases} \qquad (1)$$

"The interval of confidence of trapezoidal fuzzy number defined by $\gamma$ cuts can be written as follows"

$$\check{E}[\gamma] = [e_1 + (e_2 - e_1)\gamma,\ e_4 - (e_4 - e_3)\gamma] \qquad (2)$$

**Operating Procedure for ChSP-(0,1) Plan**

According to Dodge and Stephens [4] and Soundarajan and Govindaraju [18] "the operating procedure for ChSP-(0, 1) is as follows

Step 1: From each succeeding lot, a random sample of size n units is collected. Each sample's number of defective units is counted, and the total number of defective units is calculated.

Step 2: If no defective units are detected, accept the lot linked with each current sample.

Step 3: Once the $k_1$ lot has been approved, accept the next lot if the total number of defective unit is less than one.

Step 4: If $k_2$ is greater than $k_1$, the $k_2$ lot is approved. Continue to accept until the cumulative number of defective units reaches at least $k_2$ lots, and as long as the cumulative number of defective units is one or none.

Step 5: If the total number of defective units is higher than one at any point during the process, reject the current batch and return to Step 1".

**Fuzzy Probability of Acceptance (FPA) and Fuzzy Proportion of Defective (FPrD)**

Consider $\breve{p}_s = (s, e_2 + s, e_3 + s, e_4 + s)$ where $e_j = b_i - b_1,\ i = 2,3,4$ and $\gamma$ cut of trapezoidal fuzzy number to find fuzzy operating characteristic curve where $\gamma$=0 and $\gamma$=1. FPA is calculated using binomial distribution. $\gamma$ cut of trapezoidal fuzzy number is used to solve ChSP-(0,1) such that $\check{E}[\gamma] = [e_1 + (e_2 - e_1)\gamma,\ e_4 - (e_4 - e_3)\gamma]$ and taking $\gamma$=0,1 then we get FPrD value as $\breve{p}_s[\gamma] = [\breve{p}_s^{lb}, \breve{p}_s^{ub}]$ and FPA value using $\breve{P}_{as}[\gamma] = [\breve{P}_{as}^{lb}, \breve{P}_{as}^{ub}]$ .

The probability of acceptance ChSP-(0, 1) is given by

$$P_a = \left(\frac{p_0(1-p_0)+p_1 p_0^{k_1}(1-p_0^{k_2-k_1})}{1-p_0+p_0^{k_1}p_1(1-p_0^{k_2-k_1-1})}\right), k_2 > k_1 \quad (3)$$

FPA for ChSP-(0, 1) as

$$\breve{P}_{as} = \left(\frac{(1-\breve{p}_s)^n(1-(1-\breve{p}_s)^n)+(1-\breve{p}_s)^{nk_1}n\breve{p}_s(1-\breve{p}_s)^{n-1}(1-(1-\breve{p}_s)^{n(k_2-k_1)})}{1-(1-\breve{p}_s)^n+(1-\breve{p}_s)^{nk_1}(n\breve{p}_s(1-\breve{p}_s)^{n-1})(1-(1-\breve{p}_s)^{n(k_2-k_1-1)})}\right) \quad (4)$$

$$\breve{P}_{as}^{lb}[\gamma] = min\left[\frac{(1-\breve{p}_s)^n(1-(1-\breve{p}_s)^n)+(1-\breve{p}_s)^{nk_1}n\breve{p}_s(1-\breve{p}_s)^{n-1}(1-(1-\breve{p}_s)^{n(k_2-k_1)})}{1-(1-\breve{p}_s)^n+(1-\breve{p}_s)^{nk_1}(n\breve{p}_s(1-\breve{p}_s)^{n-1})(1-(1-\breve{p}_s)^{n(k_2-k_1-1)})}\right]$$

$$\breve{P}_{as}^{ub}[\gamma] = max\left[\frac{(1-\breve{p}_s)^n(1-(1-\breve{p}_s)^n)+(1-\breve{p}_s)^{nk_1}n\breve{p}_s(1-\breve{p}_s)^{n-1}(1-(1-\breve{p}_s)^{n(k_2-k_1)})}{1-(1-\breve{p}_s)^n+(1-\breve{p}_s)^{nk_1}(n\breve{p}_s(1-\breve{p}_s)^{n-1})(1-(1-\breve{p}_s)^{n(k_2-k_1-1)})}\right]$$

$$\breve{P}_{as}[\gamma] = [\breve{P}_{as}^{lb}, \breve{P}_{as}^{ub}] \quad (5)$$

$$= \left\{\frac{(1-\breve{p}_s^{ub})^n(1-(1-\breve{p}_s^{ub})^n)+(1-\breve{p}_s^{ub})^{nk_1}n\breve{p}_s^{ub}(1-\breve{p}_s^{ub})^{n-1}(1-(1-\breve{p}_s^{ub})^{n(k_2-k_1)})}{1-(1-\breve{p}_s^{ub})^n+(1-\breve{p}_s^{ub})^{nk_1}(n\breve{p}_s^{ub}(1-\breve{p}_s^{ub})^{n-1})(1-(1-\breve{p}_s^{ub})^{n(k_2-k_1-1)})}\right\},$$

$$\left\{\frac{(1-\breve{p}_s^{lb})^n(1-(1-\breve{p}_s^{lb})^n)+(1-\breve{p}_s^{lb})^{nk_1}n\breve{p}_s^{lb}(1-\breve{p}_s^{lb})^{n-1}(1-(1-\breve{p}_s^{lb})^{n(k_2-k_1)})}{1-(1-\breve{p}_s^{lb})^n+(1-\breve{p}_s^{lb})^{nk_1}(n\breve{p}_s^{lb}(1-\breve{p}_s^{lb})^{n-1})(1-(1-\breve{p}_s^{lb})^{n(k_2-k_1-1)})}\right\}$$

Using these above formulas the values are calculated and presented in Table 1.

From the Table 1 one can observe that when the n value is fixed as 20, $k_1$=9 and $k_2$=11 then fuzzy proportion defective value is calculated using $\gamma$ cut of trapezoidal fuzzy number. Finally fuzzy probability acceptance is calculated where $\gamma$=0 gives better results than $\gamma$ =1 .

**Fuzzy Operating characteristic (FOC) curve**

Operating characteristic curve is the most significant measure in acceptance sampling plan. From the above Figure 1 and Figure 2, fuzzy proportion defective is plotted against the fuzzy probability of acceptance for $\gamma$=0 and $\gamma$=1. OC curve has band with upper and lower bounds so that it is called as Fuzzy Operating Characteristic (FOC) Curve.

**Real Life Application**

A product from oil company bought in large batches. The supermarket manager wishes to check the product are of good quality and well packed. He used ChSP-(0,1) to inspect the oil packets. Based on the result of inspection lot is decided to kept for sale in super market otherwise return back to vendor.

**Example 1**

Suppose $\breve{p}_s = (0.005, 0.006, 0.007, 0.008)$ , n=20, $k_1$=9 and $k_2$=11 then $\gamma$ cut of trapezoidal fuzzy number is used to get fuzzy proportion defective value for $\gamma$=0 and $\gamma$=1 we get FPA as $\breve{P}_{as}[0] = [0.8385\ \ 0.7523]$ and $\breve{P}_{as}[1] = [0.7607\ \ 0.7522]$ respectively.

**Example 2**

Let us assume that $\breve{p}_s = (0.001, 0.002, 0.003, 0.004)$ and the sample size n is fixed as 20 then $\gamma$ cut of trapezoidal fuzzy number is used to calculate FPrD $\breve{p}_s[0] = [0.001\ \ 0.005]$, $\breve{p}_s[1] = [0.003\ 0.004]$ and FPA values as shown in the below Table . From Table 2, according to ChSP-(0,1) for various values of $k_1$ and $k_2$ where $k_1$ value is lower than $k_2$ value is calculated using fuzzy parameter . From the above table while using value of $\breve{P}_{as}[\gamma = 0]$ which is giving better result when compared to value of $\breve{P}_{as}[\gamma = 1]$

**Fuzzy probability of acceptance when the sample size varies**

Let us consider that $\breve{p}_s = (0.001, 0.002, 0.003, 0.004)$ and the sample size n varies from 5 to 50 where $k_1$= 9 and $k_2$ =11 is fixed then $\gamma$ cut of trapezoidal fuzzy number is used to calculate the interval of FPrD $\breve{p}_s[\gamma = 0] = [0.001\ \ 0.005]$ , $\breve{p}_s[\gamma = 1] = [0.003\ 0.004]$ and FPA values as shown in the Table 3. When the sample size values decreases the width of FOC curve decreases.

**Determination of sample size**

The risk of producer is denoted by $\widetilde{\alpha_f}$ and the risk of consumer is denoted by $\widetilde{\beta_f}$. Accepting quality level $(\widetilde{\text{AQL}})$ is denoted as $\breve{p}_{1f}$ and Limiting quality level $(\widetilde{\text{LQL}})$ is denoted as $\breve{p}_{2f}$. Here ChSP-(0,1) plan is designed using the fuzzy parameter. The sample size n is calculated in order to satisfy both the inequalities for $\breve{P}_{1fa}$ and $\breve{P}_{2fa}$ simultaneously

for the given values of $\widetilde{\alpha_f}$ and $\widetilde{\beta_f}$ shown in Table 4. $\check{P}_{1fa} \geq 1-\widetilde{\alpha_f}$ and $\check{P}_{2fa} \leq \widetilde{\beta_f}$ where $\widetilde{\alpha_f}$ =0.05 *and* $\widetilde{\beta_f}$=0.10 is fixed so that the interval of FPA is satisfied the conditions $\check{P}_{1fa} \geq 0.95$ and $\check{P}_{2fa} \leq 0.10$ for different sample sizes.

$$\check{P}_{1fa} = \left[\frac{(1-\check{p}_{1f})^n(1-(1-\check{p}_{1f})^n)+(1-\check{p}_{1f})^{nk_1}n\check{p}_{1f}(1-\check{p}_{1f})^{n-1}(1-(1-\check{p}_{1f})^{n(k_2-k_1)})}{1-(1-\check{p}_{1f})^n+(1-\check{p}_{1f})^{nk_1}\left(n\check{p}_{1f}(1-\check{p}_{1f})^{n-1}\right)(1-(1-\check{p}_{1f})^{n(k_2-k_1-1)})}\right] \geq 0.95 \quad (6)$$

$$\check{P}_{2fa} = \left[\frac{(1-\check{p}_{2f})^n(1-(1-\check{p}_{2f})^n)+(1-\check{p}_{2f})^{nk_1}n\check{p}_{2f}(1-\check{p}_{2f})^{n-1}(1-(1-\check{p}_{2f})^{n(k_2-k_1)})}{1-(1-\check{p}_{2f})^n+(1-\check{p}_{2f})^{nk_1}\left(n\check{p}_{2f}(1-\check{p}_{2f})^{n-1}\right)(1-(1-\check{p}_{2f})^{n(k_2-k_1-1)})}\right] \leq 0.10 \quad (7)$$

**Minimizing the sum of risks**

The sample size is calculated so as to minimize the sum of the risks and it is presented in Table 5 and Table 6. Where $\widetilde{\text{AQL}}$ is denoted as $\check{p}_{1f}$ and $\widetilde{\text{LQL}}$ is denoted as $\check{p}_{2f}$ and the corresponding the probability of acceptance values are $\check{P}_{1fa}$ and $\check{P}_{2fa}$.The mathematical expression to minimize the sum of risk is

$$\widetilde{\alpha_f} + \widetilde{\beta_f} = 1 - \check{P}_{1fa} + \check{P}_{2fa}$$

$$= 1 - \left[\frac{(1-\check{p}_{1f})^n\left(1-(1-\check{p}_{1f})^n\right)+(1-\check{p}_{1f})^{nk_1}n\check{p}_{1f}(1-\check{p}_{1f})^{n-1}(1-(1-\check{p}_{1f})^{n(k_2-k_1)})}{1-(1-\check{p}_{1f})^n+(1-\check{p}_{1f})^{nk_1}\left(n\check{p}_{1f}(1-\check{p}_{1f})^{n-1}\right)\left(1-(1-\check{p}_{1f})^{n(k_2-k_1-1)}\right)}\right]$$
$$+\left[\frac{(1-\check{p}_{2f})^n(1-(1-\check{p}_{2f})^n)+(1-\check{p}_{2f})^{nk_1}n\check{p}_{2f}(1-\check{p}_{2f})^{n-1}(1-(1-\check{p}_{2f})^{n(k_2-k_1)})}{1-(1-\check{p}_{2f})^n+(1-\check{p}_{2f})^{nk_1}\left(n\check{p}_{2f}(1-\check{p}_{2f})^{n-1}\right)(1-(1-\check{p}_{2f})^{n(k_2-k_1-1)})}\right]$$

The sum of risks is obtained as interval of fuzzy.

## CONCLUSION

In this study designing of ChSP-(0, 1) is developed using fuzzy parameters. Numerous varieties of fuzzy numbers are available among them trapezoidal fuzzy numbers are employed in this study. From the FOC curve one can conclude that when $\gamma$ increases from 0 to 1 the width of FOC curve becomes less and vice versa. The sample size value is calculated such that it satisfied both the condition of risks. And also minimizing the sum of risks is obtained.

## ABSTRACT

Many animals and humans benefit greatly from the food and medication that plants and their products provide. The whole profile of *Aegle marmelos* L., a member of the Rutaceae family and usually referred to as Bael, is the main topic of this article. It is readily accessible throughout India. Abdominal disorders, ulcers, cholera, diarrhoea, nerve disorders, gonorrhoea, heart problems, dog bites, jaundice, snake bites, and many more ailments have all been treated traditionally using *Aegle marmelos.* Alkaloids, terpenoids, vitamins, coumarins, tannins, carbohydrates, flavonoids, fatty acids, essential oils, and a few additional unidentified substances are among the compounds that have been isolated. Antioxidants, antibacterial, antifungal, antidiarrheal, antidiabetic, antiproliferative, cytoprotective, hepatoprotective, antifertility, analgesic, antiarthritis, contractile, antihyperlipidemic, cardioprotective, radioprotective, anticancer, antiviral, anti-ulcer, immunomodulatory, and wound-healing properties are just a few of the pharmaceutical activities that the plants possess. Thus, this review might be a helpful tool for scholars who want to know more about *Aegle marmelos.*

**Keywords:** *Aegle marmelos*, Ethnobotany, Pharmacology activities, Phytochemistry, Traditional use.

## INTRODUCTION

They contain a variety of active chemicals that are the structure blocks for numerous specifics, plants are especially important to humans[1]. One in India, people have been using shops as herbal or natural drug for thousands of times. numerous pharmacological active chemicals, which are constantly utilised in home treatments for a range of affections, are allowed to be abundant in plants used in Indian drug[2]. *Aegle marmelos*( L.) correa( *Aegle marmelos*), a member of the Rutaceae family and constantly known for bael, has been used considerably in traditional Indian medical systems because of its several medicinal parcels[3]. The leaves of *Aegle marmelos* are offered to Lord Shiva, without whom his devotion would be lacking. Ancient Indian jottings like the Mahabharat and the Yajur Veda[4]. Bael is useful for a number of affections because it contains a wide range of phytochemicals, including coumarin, polysaccharide, epoxies, resins, alkaloids, tannins, and essential canvases. Its nutritive content is far advanced than that of other fruits. In terms of the terrain, it's also relatively significant.

**Vernacular Names[5]**

In India different types of vernacular names are used which are given in the table no.1

*Aegle marmelos* leaves (Fig No: 1).

*Aegle marmelos* fruit (Fig No: 2).

*Aegle marmelos* Bark (Fig No: 3).

*Aegle marmelos* Steam (Fig No: 4).

**Source and Geographical Distribution**

The eastern ghats and central India are where the bael tree was originally domesticated. It’s native to the Indian key and is substantially set up in tropical and tropical regions[7]. On the lower pitches of the Himalayas, this factory may grow up to 500measures above ocean position. Along the east seacoast of Madhya Pradesh, Bihar, the Deccan table, Jharkhand, Chhattisgarh, Uttar Pradesh, and Uttarakhand[6]. The tree’s hypoglycemicparcels have led to its operation in Sri Lanka and Bangladesh for fertility-control and antiproliferative reasons[9]. In 1959, the bael fruit was introduced for the first time in Europe[10]. The tree was first observed to bear fruit in 1914 and is said to be growing in Ceylon, Java, the Philippines islets, and northern Malaya[11].

**Botanical Description**

The medium- sized, slender, perfumed bael fruit tree, also called *Aegle marmelos*, grows in India's evanescent timbers. It has a kindly grooved caddy that's 3.0- 4.5 measures long and is growing[8]. It can reach a height of 1200 measures in the western Himalayas and the Andaman islets. Its leaves are bestowed to Lord Shiva during deification; this tree is generally deified by Hindus. Twelve In Hindu tradition, this tree is a variant representation of Lord Kaiashnath[12]. The stem, root, fruit, and leaves of this tree are used in traditional Chinese drug to cure a wide variety of ails at colourful stages of growth[13]. The monotropic rubric includes *Aegle marmelos*. The *Aegle marmelos* factory stood 25 – 30 bases altitudinous. The height of this medium- sized factory was between 25 and 30 bases. It has a soft, thick, short, shelling stem with spreading dinghy. Their branches are prickly. The lower reek's branches slack. Their branches are prickly. The lower reek's branches slack. The axillary backbones of this tree are robust. The flake leys have a round or lanceolate form and are 4 – 10 cm in length and 2.5 – 10 cm in range. There are 3 to 5 in each pamphlet. Mature leaves that have been crushed emit an odd odour. It takes ten to eleven months for the fruit to grow[14]. Along its juvenile stems, this factory constantly develops clusters of four to seven blooms. Four succulent, recurved petals beautify the blossoms. The scent of these greenish-white blossoms is unique and uncommon. Fruits

can have globular or round shapes and range in size from 2 to 4 elevation in periphery. The fruit is a naturally woody, thin and hard shell. When unripe, it's greenish in colour; when it ripens, it becomes unheroic. The fruit pulp is golden, thick, sweet, sticky, and sweet in nature. There are eight to fifteen parts in it. The pulp contains bedded seeds that are nearly one centimetre long. These establishment, smoothed oblong seeds feature fuzzy hairs and are enclosed in a sticky sac[15]. *Aegle marmelos* thrives on rich, well- drained soil, but it can also produce fruit in the oolite limestone of southern Florida. It can also thrive on stony, alkaline, or swampy soils with a pH between 5 and 8. In India, it's known to thrive in conditions that other fruit trees find gruelling[16].

**Taxonomical Classification**

Scientific classification of *Aegle marmelos*is given in the table no.2

**Ethnomedicinal Significance of Bael Plant**

This plant is used in traditional medicine to treat recurring fevers, gastrointestinal issues, postpartum care, and ichthyosarcotoxism[17]. The fruit of *Aegle marmelos* has been added to the British pharmacopoeia because of its effectiveness in treating dysentery and diarrhoea[18]. Different parts of *Aegle marmelos* which are for the treatments are given in the table no.3

**Phytochemistry**

Several studies have found that several parts of the bael plant contain dynamic chemical fixes are given in the table no 4[26,2]. Structure of Marmelosin(Fig No: 5)

**Nutritional Value**

According to physicochemical research, bael fruit has a high vitamin and mineral content which are given in the table no: 5 [30].

**Pharmacological Studies**

One of the Rutaceae family's most extensively used medicinal and nutritional herb is *Aegle marmelos*. As seen in fig. 1, this plant has recently been found to have many medical benefits.

**Wound Healing Activity**

The effects of cutaneous and intraperitoneal organisation of methanolic concentrates of *Aegle marmelos* balm and infusion were examined on two types of twisting models in rodents, extraction and input point. Both the salve and the methanolic infusion of *Aegle marmelos* caused a severe reaction in both. An increase in elasticity in the entrance point model indicates that the concentrate facilitates the mending cycle. The outcomes were also contrasted with those of the condemned medication nitrofurazone[15, 31].

**Antidiarrheal Activity**

The ability of a chloroform extract of the root of *Aegle marmelos* to prevent diarrhoea. The extract was shown to be comparable to ciprofloxacin in an in vitro study and to be mostly effective against the *Vibrio cholerae* bacteria, *Escherichia coli* (E. coli), and Shigella spp[32]. Pharmacological activities of *Aegle marmelos* (Fig. no. 6).

**Antipyretic Potential**

The antipyretic exertion of *Aegle marmelos* which caused pyrexia at 200-400 mg/ kg body weight. The ethanolic extract significantly(p 0.001) lowered the high internal heat situation in a dosage form in less manner. The concentrates' antipyretic efficiency was on par with 100 mg/ kg body weight of paracetamol[33].

**Ulcer Healing**

Aspartate aminotransferase, alanine aminotransferase, ulcer index, and lipid peroxidation activity all significantly increased. These results suggest that an antioxidant mechanism may be involved in the gastroduodenal preventative and antiulcerogenic effects of *Aegle marmelos*[34].

**Diuretic Activity**

The diuretic goods of a number of organic fruit fragments of *Aegle marmelos* were delved. Urine volume and swab content were examined to probe the diuretic effect. At the high dose (500 mg/kg), they set up that the ethanolic extract significantly increased sodium. Fragments of petroleum ether, chloroform, and ethyl acetate also work well[35].

**Antithyroid Activity**

The birth of *Aegle marmelos* leaves dropped thyroid hormone situations. The presence of scopoletin, which has a more potent remedial effect than the medicine propylthiouracil, was the cause[2]

**Immunomodulatory Activity**

It was found that *Aegle marmelos* leaf extract in methanol stimulates both antibody-mediated and cell-mediated immune responses in rots. However, it was discovered that humoral immunity was best served by a high dose of *Aegle marmelos* methanolic extract, whereas cell-mediated immune response was best served by a low dose[36].

**Antifungal Activity**

According to an analysis, the essential oil from *Aegle marmelos* leaves have the Ca+2-dipicolinic corrosive metabolic pathway and perhaps restrict spore improvement. Leaf extracts from *Aegle marmelos* in ethanol, methanol, and water shown antifungal activity against dermatophyte organisms[37].

**Antimicrobial Activity**

Because it inhibits a wide range of harmful germs, It has been used traditionally to treat a number of infectious illnesses. Inhibition zones of 11 - 9 mm, respectively, were obtained from the antibacterial activity of *Aegle marmelos* leaves and fruit extracts against *Raoultella planticola*. The plant extracts demonstrated a minimum inhibition zone of 7 mm against *Candida albicans* and a maximum inhibition zone of 18 mm against the fungus strain *Penicillium chrysogenum*[38].

**Antioxidant Activity**

The antioxidant activity of *Aegle marmelos* fruit pulp methanolic and water extracts was assessed using the DPPH radical scavenging method, the reducing power assay, the nitric oxide scavenging assay, the $O_2^-$ radical scavenging assay, the ABTS radical scavenging assay, and the $H_2O_2$ radical scavenging assay. Both alcoholic and water extracts had high activity. It compared to ripe fruit; unripe fruit displayed a higher percentage of free radical inhibition[39].

**Radioprotective Effect**

One of the most important cancer therapies is radiation therapy, especially for patients with large visceral tumours. Despite its high global value, it has certain unfavourable side effects. Swiss albino male mice were subjected to 10Gy 60Co gamma-rays after receiving 5, 10, 15, 20, or 40 mg/kg. Give an intraperitoneal dosage of *Aegle marmelos* extract every day for five days. Thirty days after radiation therapy, the majority of survivors report feeling the most protected[40].

**Contractile Activity**

*Aegle marmelos* leaves have long been used to treat asthma and related conditions, its alcoholic extract was found to have a contractile effect on guinea pigs' separated ileum and tracheal chain. Because of H1 receptor depression, the guinea pig ileum and tracheal chain relaxed the most when exposed to alcoholic extract of *Aeglemarmelos[*41].

**Anti Arthritis Activity**

It was discovered that *Aegle marmelos* leaves cause arthritis in Wistar albino rats by acting against collagen. Bael's anti-inflammatory and antioxidant qualities are the main reasons it is recognised to have anti-arthritic qualities[42].

**Analgesic Activity**

The methanol extract from *Aegle marmelos* leaves was tested for its antinociceptive properties in mice using writing and tail immersion tests. When compared to other dosages, the maximum potential effect of methanolic extract (200 mg/kg) was statistically significant. It has been determined that *Aegle marmelos* leaf methanol extract has a strong analgesic effect[43].

**Cytoprotective Effect**

The brackish fish *Cyprinus carpio* has been observed to parade this effect. Experimental fish were kept at sublethal attention of essence ions for 1,8,16,32 days. The fish were fed the *Aegle marmelos* crude grass 500mg/kg after 32 days. The during has a cytoprotective impact by stabilizing the tube membrane and controlling the antioxidant enzyme system[44].

**Anti- Constipating Effect**

It is thought that the majority of ripe fruits are a natural remedy for various laxatives. Fruits from *Aegle marmelos* which are used to cleanse and tone the digestive system. Consuming this fruit on a regular basis for two to three months helps the colon get rid of old, stored faeces. Usually, it is consumed as sharbat, which is prepared from ripe fruit pulp[2].

**Anticancer Activity**

The effect of *Aegle marmelos* fruit extract on 7, 12-dimethylbenz(a) anthracene (DMBA)-induced breast cancer in rats. The study used female Charles foster rats that were between 55 and 60 days old and weighed about 150 10g.*Aegle marmelos* treatment led to a significant decrease in the volume of the breast tumour (p 0.05) and a significant decrease (p 0.0001) in blood biomarkers such TNF-, serum malondialdehyde (MDA), and glucose levels. The ethanolic fruit pulp extract slows the growth of breast cancer in a rat model, which has an anti-proliferative impact[45].

**Transcriptome Analysis**

Also, information from other Rutaceae species, including *Citrus clementia* and *Citrus sinensis*, was used to annotate the reiterations of *Aeglemarmelos*.314 reiterations were categorised as glucosyltransferase($GT_s$), while 482 reiterations were categorised as cytochrome $p_{450s}$($CYP_s$). The leaves of *Aegle marmelos* parade the loftiest frequence of the monoterpenoid biosynthesis pathway.46,335 unlgenes with lengths ranging from 210-14,853 bp were formed 133,616contigs. The study included 94, 49 SSR labels and 7002 recap factors[46].

**Antidiabetic Activity**

The circulatory changes in rats with diabetes convinced by alloxan that were given methanolic splint excerpts from *Aegle marmelos*. Five treatment groups were involved in the study control, diseased low lozenge(100 mg/ kg), medium cure(250 mg/ kg), and high cure(500 mg/ kg) of methanolic splint excerpts. The cardiovascular goods were estimated using serum sialic acid glutathione peroxidase, serum catalase, ascorbic acid, sodium, potassium, and chloride situations, as well as veritably-low- viscosity lipoprotein(VLDL). Low and medium lozenge treated creatures showed no significant change in these cardiovascular parameters when compared to the sick treatment groups, the high lozenge treatment group, and the sick group[47].

**Ayurvedic and Modern Aspects**

**Ayurvedic Action Properties of *Aegle Marmelos* Plant[25]**

Ayurvedic properties of *Aegle marmelos* (Table No 6).

**Morden View**

They are less expensive, easier to obtain, and have less side effects, herbal medicines are growing in popularity in the modern world. Globally, herbal medicine is growing in popularity. Published studies show that between 2000 and 2008, sales of herbal products increased from 3% to 12% annually. The quality of commercial natural goods and research domains are considered to be seriously threatened by the rise of adulteration and substitution in the herbal

drug industry due to growing consumer demand. The primary causes of adulteration are the lack of the original plant product, deforestation, the loss of numerous species of herbal plants, difficulties identifying species, etc. Additionally, a lot of herbal dealers have created new techniques for high-quality adulteration that are only detectable through microscopic inspection and chemical analysis[48]. The two flaws that underlie the acceptability of herbal products and lower their commercial worth are the drug's poor quality and the absence of standardisation. In order to improve the quality of the herbal trade and act as a regulator, an Herbal Authentication System (HAS) must be developed[49]. *Aegle marmelos* is a herbaceous plant that has several therapeutic uses. There are previous concerns about the plant's demise and over-exploitation. The names of the trees of Lord Shiva and Goddess Laxmi are affixed to the plant to shield it from overuse and harm. The bael plant has gained popularity recently due to its therapeutic use for both human and animal ailments. People who earlier used the herbal products sparingly became into vicious and destructive collectors because of the less economic value of the *Aegle marmelos* plant. The National Medicinal Plants Board of the Government of India maintains plants to keep the plant from being destroyed, and the government has approved numerous projects for the plant's conservation and sustainable use[50].

**FUTURE ASPECTS**

Due to its abundance of phytoconstituents, *Aegle marmelos* can be utilised to cure a wide range of human ailments. The majority of the compounds have not been adequately assessed for the investigation of novel pharmacophores or lead molecules. Nonetheless, several bioactive chemicals' methods of action have already been determined. *Aegle marmelos* may therefore be further utilised in the near future as a source of beneficial phytochemical components and could be crucial to the current medical system.

**Analytical Method Done in *Aegle Marmelos*.**

Several analytical methods like HPLC, HPTLC, GC, TLC etc. which are done in the *Aegle marmelos* plant are given in the table no. 7

## CONCLUSION

One of the significant plants with a number of therapeutic and nutraceutical uses is *Aegle marmelos*. It has a number of therapeutic qualities that are employed in conventional medical systems to treat a variety of illnesses. Advanced scientific methods have been used to study *Aegle marmelos's* therapeutic qualities in great detail during the past few decades. Numerous bioactive chemicals have been extracted from the plant's various sections and subjected to pharmacological analysis. This review included a detailed summary of its pharmacological activity, phytoconstituents, and numerous botanical descriptors, including antibacterial, antifungal, antiviral, antidiabetic, antimalarial, antioxidant, and so on.

**Table No 1: Vernacular names of *Aegle marmelos***

| | |
|---|---|
| Hindi | Bel, Bael,Sripal |
| Sanskrit | Bilva, Sriphal, Shivadruma, Shivapala |
| Telugu | Maredu |
| Bengali | Cambodia (Phneou or Pnoi) |
| Vietnamese | Baunau |
| Malayan | Modjo |
| Gujarati | Bil |
| Kannada | Bilpatra, Kumbala, Malura |
| Tamil | Kuvalum |
| Thai | Matum and Mapin |

**Table No 2: Classification of *Aegle marmelos***

| **Taxonomical Rank** | **Taxon** |
|---|---|
| Division | Plantae |
| Class | Magnoliophyta |
| Order | Sapindales |
| Family | Rutaceae |
| Sub- family | Aurantioideae |
| Genus | *Aegle* |
| Species | *Aegle marmelos* |
| Common name | Bael, Bael Patra |

**Table No 3: Medicinal importance of *Aegle marmelos*.**

| **Plant Part** | **Ethnomedicinal Importance** |
|---|---|
| **Leaves** | Leaf extracts are effective treating ulcers, abscesses, backaches, and vomiting cuts, heart disease, bronchitis, blood sugar, dropsy, diarrhoea, beriberi, and animal – related injuries. 19 Leaf juice has laxative properties, treat ocular infection and asthmatic symptoms. In the combination with cumin seeds used as hair tonic, coughs and other respiratory illnesses. Additionally, leaves are employed in veterinary medicine for the treatment of wounds, as animal feed, and for stimulating the denervated nictitating membrane in anaesthetized cats[20]. |

| | |
|---|---|
| **Root bark** | Fish bane, heart beatings, melancholia, and intermittent complications can all be treated with the root bark. the volume of the seminal fluid is increased by the Dinghy Juice and cumin in milk. Extracts from alcoholic roots can treat hypoglycemia[21]. Again, it's used for-amoebic, cardiac issues, stomach problems, and canine bites[22]. |
| **Flower** | Distilled floral extracts are used as a diuretic, anti- diabetic, anti-dysentery, local anaesthetic and stomach and intestine tonic. Used for treatment of epilepsy[23]. |
| **Fruit** | The operation of dry greasepaint is used and mustard oil painting to handle burn cases. Fruits are utilised for ulcer, intestinal spongers, alcohol, digestive, brain and heart issues, gonorrhoea, dysentery, stomach issues, epilepsy and constipation. Excerpts deduced from fresh fruit have demonstrated the capability to lower blood pressure effectively.24 likewise, a finely pulverized form of callow fruit presents an indispensable treatment for intestinal spongers like *Ascaris lumbricoides* and *Entamoeba histolytica*[25]. |

**Table No 4: Chemical constituents are in the *Aegle marmelos***

| Plant Part | Chemical Constituents |
|---|---|
| Leaf | Skimmianine, Aeglin, Rutin, Sitasterol, Flavone, Lupeol, Cineol, Citral Glycoside, O-Isopentenyl, Hallordiol Mameline, Citronellal, Cuuminalehyde Phenylethylle, Cinnamamides, Eugenol. |
| Fruit | Psoralen, Marmalade, Tannin, Phenol, Marmelosin, Luvangetin Auraptene |
| Seed | Limonene, A-D – Phellandrene, Cineol, Citronellal, Citral, P-Cymene, Cumin Aldehyde or Essential oils |
| Root | Terpins, Halopine, Coumarins and Alkaloid |
| Bark | Alkaloids, Fagarine, Marmin, Furoguinoline |

**Table No 5: Nutritional value of *Aegle marmelos***

| Sr. no. | Components | Value (%) |
|---|---|---|
| 1 | Water | 64.2 |
| 2 | Protein | 1.8 |
| 3 | Fat | 0.2 |
| 4 | Mineral | 1.5 |
| 5 | Fiber | 2.2 |

**Table No 6: Ayurvedic properties of *Aegle marmelos***

| | |
|---|---|
| Kapha vatashamaka | It balances kapha and vata dosha. |
| Shothahara | The leaves of the medicinal plant are used to cure edema. |
| Vyavasthapan | The herb is associated with analgesic property which helps in reducing pain. |
| Naaditantu | The roots of the weed are used to treat neurological disorders. |
| Deepan | The raw fruit of the plant acts as an appetizer. |
| Krimighna | The isshrub associated with an anthelmintic property. |

| | |
|---|---|
| Mridurechan | The fruit of the plant acts as a mild laxative |
| Pittasarak | It stimulates the digestive authorities. |
| Hridya | It is used as a cardio- defensive against. |
| Raktastambhak | It is used to cure the bleeding complaint. |
| Mutra | It is used to the micturition problem |
| Garbha Shayashota | It improves uterine health. |
| Jwarna | It helps in treating habitual disorders and act as an antipyretic agent |
| Anidra | It helps in treating wakefulness |
| Atisaar and Pravahika | It is used to treat diarrhea and dysentery diseases. |
| Grahani | It is for the to treat irritable bowel disease |
| Udarshool | The ripe fruit of the plant helps in curing constipation |
| Netrabhishyand | The leaf decoction or leaf paste helps to cure cataract disorder |

**ABSTRACT**

Given an input, fuzzy systems use fuzzy operators and IF THEN rules to carry out an action that is converted into the system's output. A few definitions must be introduced before comprehending a fuzzy inference rule-based system (FIRBS), specifically fuzzy sets and linguistic variables. The fuzzy sets theory was created by Zadeh (1965) to expand on the traditional crisp idea that an element either belongs to or does not belong to a certain set. The degree of membership of an element in a fuzzy set range from 0 to 1. This study offers a novel approach to assessing irrigation system performance that considers tools for intelligent systems like fuzzy logic as well as indications of water resource efficiency. The goal was to suggest a fuzzy logic system as a means of assessing irrigation system performance based on a collection of water usage efficiency metrics. The performance of the surface irrigation approach is "High" (91.3%), whereas the performance of the treatment without irrigation is "Low" (17%) and that of drip irrigation is "Medium" (50%). This kind of technology, which is used in the agricultural industry, particularly in the assessment of irrigation systems, is novel and can support professionals' decision-making.

**Keywords:** Fuzzy Inference System, Irrigation, MATLAB, Fuzzy Rule-Based System, Triangular membership function.

## INTRODUCTION

When great precision is needed, precise quantitative analysis works well. Nevertheless, the method of making a determination regarding a pollution incident by analyzing a collection of measurements is inherently uncertain.

Noise taints the measurements, and more significantly, it is hard to understand how variables interact in a quantitatively ideal model. Uncertainties or ambiguities regarding the phenomenon's evolution and the significance of various factors (such as weather conditions, traffic patterns, etc.) on the estimation are inevitably brought about by the same origin of the phenomenon being studied. It is far from a realistic hypothesis, even though the idealization of causes-effect correlations is helpful in aiming for the analytical formulation of the problems, which also enables benchmarking of the algorithms. On the other hand, characterizing complex phenomena requires the ability to summarize data and provide an approximate description of a process. Because FISs possess the nonlinear universal approximation property and can handle both experimental data and a priori knowledge about the unknown solution, which is represented by inferential linguistic rules in the form IF THEN whose antecedents and consequents use fuzzy sets rather than precise numbers, they seem to be very useful tools (Abraham, 2005). Zadeh presented the notion of approximation reasoning in 1979. This theory offers a strong foundation for reasoning when confronted with ambiguous and imprecise data. Fuzzy inference is the process of formulating the mapping from a given input to an output using fuzzy logic. The mapping then provides a basis from which decisions can be made, or patterns discerned. The process of fuzzy inference involves all the pieces that are described in Membership Functions, Logical Operations, and If-Then Rules. An automated system is a system that operates in a controlled environment and is made up of hardware and software infrastructure. Fuzzy logic, which provides state parameter monitoring, target output comparison, intended outcome selection to modify the current system's condition, and necessary action implementation, is used to do this. Fuzzy logic has been widely applied in various domains, such as business and agriculture.

## MATERIALS AND METHOD

Fuzzy rule based system is generally defining a set or rules for certain types. IF is condition and THEN is a action. The condition, also called premise, is made up of a number of antecedents that are negated or combined by different operators such as AND or OR computed with t - norms or t - conforms. In a fuzzy rule system, some variables are linguistic variables and the determination of the MF for each fuzzy subset is critical. MFs can be selected according to human intuition, or by learning from training data. Inference systems can be built on top of fuzzy logic. Multiple rules with identical output variables make create a fuzzy inference. The inference result is a mix of the fuzzy values of the conditions and the associated actions given a set of fuzzy rules. The area of research was take place in Pattukottai block, Thanjavur district and crop was selected is paddy cause area of research cultivate major crop is paddy and it cultivated during the kuruvai season. In this paper we analyzing three types of irrigation namely drip irrigation, surface irrigation, no irrigation

$$Relative\ Water\ Supply = \frac{Total\ Water\ Supplied}{Crop\ Water\ Requirement}$$

## RESULTS AND DISCUSSION

The following table contains input data for fuzzy inference system application in MATLAB.
Input data for fuzzy inference system (Table 1).
The Mamdani fuzzy inference system model is developed in MATLAB to handle the uncertainity
Input for Mamdani fuzzy inference system (Table 2).
MATLAB Code of Input for Mamdani fuzzy inference system

```
fis = newfis('IrrigationPerformance');
% Input 1: Income Rate (₹/ha)
fis = addvar(fis, 'input', 'Income', [0 130000]);
fis = addmf(fis, 'input', 1, 'Low', 'trimf', [0 0 60000]);
fis = addmf(fis, 'input', 1, 'Medium', 'trimf', [50000 85000 110000]);
fis = addmf(fis, 'input', 1, 'High', 'trimf', [100000 130000 130000]);
% Input 2: Relative Water Supply
```

```
fis = addvar(fis, 'input', 'RWS', [0 3]);
fis = addmf(fis, 'input', 2, 'Low', 'trimf', [0 0.5 1]);
fis = addmf(fis, 'input', 2, 'Medium', 'trimf', [0.9 1.5 2]);
fis = addmf(fis, 'input', 2, 'High', 'trimf', [1.8 2.5 3]);
% Output: Performance (%)
fis = addvar(fis, 'output', 'Performance', [0 100]);
fis = addmf(fis, 'output', 1, 'Low', 'trimf', [0 25 49]);
fis = addmf(fis, 'output', 1, 'Medium', 'trimf', [45 65 79]);
fis = addmf(fis, 'output', 1, 'High', 'trimf', [75 90 100]);
```

The following tables holds rule base analysis of fuzzy inference system.
Rule base analysis of fuzzy inference system (Table 3).
Rule base figure (Figure 1).
Output evaluation of fuzzy inference system (Table 4).

## CONCLUSION

This study concludes that the performance of drip irrigation is moderate cause due to higher system costs in spite of usage of water efficiency. Then the performance of flood irrigation is highest cause due to more profit and less in spending and also least water efficiency. And the no irrigation is low cause due to rainfall season. So the fuzzy logic used to evaluate the irrigation methods and its performance under uncertainty.

**ABSTRACT**

Diabetic neuropathy (DN) is a common and serious complication among people living with diabetes mellitus, with a prevalence of about 50%. It is said to occur when symptoms, signs and or electrophysiological features of peripheral nerve dysfunction occur in diabetic patients after exclusion of other causes. Neuropathic disturbance of sensory, motor or autonomic nerves may occur singly or in combination. Cranial nerve and other mononeuropathies generally resolve spontaneously. The diverse neuropathies of diabetes mellitus can be seen in various research articles which are found in clinical practice. Prompt diagnosis and recognition of these with the institution of appropriate treatment measures would go a long way towards reducing morbidity and mortality outcomes appropriate treatment. This review provides clinicians with the necessary knowledge of the pathophysiology, diagnosis, and treatment of painful DPN.

**Keywords:** Diabetes; neuropathy; diagnosis; pathophysiology; management

## INTRODUCTION

Along with diabetic foot, diabetic eye, and diabetic cardiovascular problems, diabetic neuropathy (DN) is one of the most common long-term consequences of diabetes mellitus. It has been demonstrated that around one-third of people with peripheral neuropathy suffer from DPN, a condition that affects both central and peripheral nerves. DPN has emerged as a global health concern as the number of diabetes people continues to rise. Up to 27% of direct medical expenses for diabetes are related to DPN; the total yearly cost of treating unpleasant DPN and its

complications (such foot ulcers and limb amputations) in the US has been estimated to be between $4 billion and $13 billion. About 20% of diabetics may experience neuropathic pain as a result of DPN, which most commonly manifests as distal symmetrical limb numbness with loss of sensation. Cauterizing, electrical, and acute pains are common. These are followed by pruritus, hyperalgesia, and evoked pain. Furthermore, the body's immune system and function are negatively impacted by the combination of hyperglycemia and metabolic problems, and this unconscious, sneaky wound may later get infected and cause severe limb damage. According to recent research, in the majority of high-income nations, DPN is the most frequent cause of non-traumatic lower limb amputation [1].

**Pathogenesis of Diabetic Neuropathy:**

Four well-known ideas have been put out and explored here;

1. End products of advanced glycosylation (AGEs). Non-enzymatic glycosylation of extracellular and intracellular proteins results in the production of AGE products. It is the outcome of glucose interacting with protein amino groups. It has been demonstrated that AGEs cross-link proteins (such as collagen and extracellular matrix proteins), hasten atherosclerosis, encourage glomerular dysfunction, decrease nitric oxide generation, cause endothelial dysfunction, and change the content and structure of extracellular matrix [2].
2. Enhanced sorbitol-mediated glucose metabolism. When intracellular glucose levels rise, the enzyme aldose reductase converts some of the glucose to sorbitol. Phosphorylation and subsequent glycolysis are the primary metabolisms of intracellular glucose. Increased sorbitol concentration produces reactive oxygen species, changes redox potential, raises cellular osmolality, and probably causes other kinds of cellular dysfunction [3].
3. The production of diacylglycerol, which activates PKC (protein kinase C). PKC modifies the transcription of fibronectin, type IV collagen, contractile proteins, and extracellular matrix proteins in neurons and endothelial cells, among other things. Inhibitors of PKC are being studied in clinical trials [4].
4. **Formation of fructose-6-phosphate:** Hyperglycaemia increases the glucose flux through the hexosamine pathway with the formation of fructose-6-phosphate. This is a substrate for O-linked glycosylation and proteoglycan production. The hexosamine pathway may alter the function of endothelial cells and neurons by glycosylation of proteins such as endothelial nitric oxide (NO) synthase or by changes in gene expression of transforming growth factor β (TGF-β) or plasminogen activator inhibitor-1 (PAI-1) [5].

**Risk Variables**

Numerous factors, such as the length of diabetes, glycemic management, age, obesity, dyslipidemia, insulin resistance, chronic low-grade inflammation, lifestyle choices, cardiovascular health, and genetic predispositions, affect the onset and progression of DN. Long-term diabetes causes cumulative harm to the nervous system. An increased risk of neuropathy is linked to elevated levels of glycated hemoglobin (HbA1c). Intensive glycemic control significantly reduces the incidence and progression of neuropathy in T1DM and T2DM patients. Age-related degenerative changes make older adults more susceptible to nerve damage, with the prevalence of DN dramatically rising in people over 50. A greater body mass index (BMI) and dyslipidemia encourage insulin resistance and metabolic dysfunction, which contribute to the development of neuropathy. Both conditions are significant metabolic risk factors. Insulin resistance independently raises the risk of DN by damaging peripheral nerves, even in the absence of overt hyperglycemia. Proinflammatory cytokines and C-reactive protein (CRP) are elevated in chronic low-grade systemic inflammation, which causes endothelial dysfunction and nerve damage. The development of DN is associated with lifestyle variables that exacerbate oxidative stress and vascular dysfunction, including as smoking, excessive alcohol intake, and physical inactivity. Neuropathic sensations are made worse by cardiovascular disorders and associated risk factors, such as atherosclerosis and hypertension, which reduce blood supply to peripheral nerves. Studies of genome-wide associations (GWAS) have found genetic variations linked to vascular function, nerve healing, and metabolic regulation.Vascular endothelial growth factor (VEGF), neurotrophic receptor tyrosine kinase 1, sodium voltage-gated channel alpha subunit 2 (SCN2A), angiotensin-converting enzyme, and methylenetetrahydrofolate reducase are among the specific genes implicated; polymorphisms in these genes are linked to an increased risk of DN. Furthermore, new research indicates that viral infections, such COVID-19, worsen neuropathies in diabetics via immune-mediated and inflammatory pathways. Female sex, longer diabetes duration, increased neuropathy severity, renal dysfunction, higher HbA1c levels, and higher BMI have all been proposed as

contributing causes to PDPN, despite the fact that the risk variables are poorly understood. Additionally, genetic variables have been proposed; gain-of-function mutations in voltage-regulated sodium channel genes are linked to PDPN and increase neuronal excitability. Single nucleotide polymorphisms close to the genes GFRA2, HMGB1P46, and ZSCAN20-TLR12P have been found by GWAS in PDPN patients. There is little thorough research on the risk factors for DN, especially when it comes to the effects of viral infections and genetics on PDPN. Future research should examine these intricate elements in order to provide more potent preventative and therapeutic approaches for improved disease management objectives [3]. Clinical and subclinical DPN as well as additional categories patients with definite signs and positive nerve conduction testing but no symptoms are referred to be subclinical DPN. Up to 50% of people with diabetic peripheral neuropathy do not exhibit DPN symptoms. Patients with both signs and symptoms are referred to as having clinical DPN. Among other manifestations, polyneuropathy, mononeuropathy, and mononeuropathy multiplex are classified as DPN based on nerve distribution. Additionally, if peripheral nerve dysfunction is categorized by function, it may be sensory, motor, or both.

**Signs and Symptoms**

Both signs and symptoms are essential for diagnosing DPN and determining its severity in clinical settings. Symmetric sensory discomfort or impairment that affects the lower limbs before the upper limbs in a traditional stocking and gloves appearance is the most common way that DPN manifests. Atypical pain, changed sensation, numbness, pins and needles, and scorching or burning sensations are additional symptoms that may indicate DPN. More intriguingly, diabetic patients with or without neuropathy may have unpleasant symptoms. Falls, poor balance, and muscle weakness are signs of neuropathic motor dysfunction. Vibration feeling and impaired proprioception, which represent large-fibre function, are indicators of neuropathy that can be examined at the patient's bedside. Additionally, impairment of temperature, light touch, and pain, all of which represent the functioning of tiny fibers, may be an early indication of neuropathy. Wasting and diminished reflexes are examples of motor symptoms. Diabetes is known to cause motor and sensory neuropathy symptoms and indications. Both signs and symptoms may be nonspecific and contain subjective components. The diagnostic accuracy of 10 g monofilament and tuning fork was low and inconsistent; one comprehensive study found that the former's sensitivity ranged from 19% to 73% [6].

**Test for Diagnosis**

Over the years, a number of clinical scales and other tests have been developed to identify DPS early and track its course in relation to the degree of PNS involvement. Neurophysiologic, autonomic, and morphologic testing should be prioritized among other tests. Clinical scales -Clinical scales are based on patient-completed questionnaires concerning their symptoms and examiner-completed scores regarding the results of patients' neurological tests. The Michigan Neuropathy Screening Instrument53 and the Neuropathic Involvement Score (NIS), Neuropathy Disability Scale (NDS), or Neuropathy Impairment Scale (NIS) are currently the most often utilized scales in population studies and clinical trials.

**Tests for Neurophysiology**

Electroneuromyography (ENMG) has been the gold standard for diagnosing DSP for many years. It is still the most widely used and accessible diagnostic technique in Brazil today. Even though the test cannot detect the early involvement of small fibers in this condition, it is still very important to document the involvement of large fibers as well as to assess the disease's symmetry, severity, and progression, ruling out other coexisting conditions like myopathy, motor plate, or inferior motor neuron diseases, in addition to primary demyelinating diseases like PIDC or hereditary neuropathies. Electromyography (EMG), a needle test, can be used to describe the distribution of neurophysiologic alterations as well as the time of evolution (acute versus chronic).In diabetic patients with DSP, a standard neuroconduction investigation includes sensory evaluation of the median, ulnar, radial, and sural nerves as well as motor evaluation of the median, ulnar, tibial, and fibular nerves. When a differential diagnosis with alternative etiologies is required, an EMG should be carried out. Usually affecting LL. it manifests as pure sensory or sensory-motor polyneuropathy or mixed polyneuropathy with axonal and distal predominance. Sensory

modifications in distal LL nerves with reduced sensory action potential amplitude in plantar, superficial fibular, and sural nerves are the first neuroconduction abnormalities seen in DSP patients. In its most advanced phases, the disease manifests as decreased compound muscle action potentials (CMAP) with a preponderance of LL, followed by sensory UULL involvement and a 10–30% drop in conduction velocities. In certain nerves that are vulnerable to compression, such as the wrist median, elbow ulnar, and common fibular nerves of the fibular head, there is frequently a focal slowdown of conduction velocity with the potential presence of conduction blockade (more than 50% decrease in CMAP amplitude from a proximal stimulation point to a distal point). Despite being incredibly helpful, this test's drawbacks include patient pain, its low sensitivity to identify the disease's early symptoms (tiny fibers), and the need for specialized personnel and equipment. The quantitative sensitivity test (QST) is a technique for identifying and measuring vibratory, painful, and polyneuropathythermal sensory alterations. Thermal hot and cold stimuli can be applied at various locations, and the temperature is monitored as soon as patients report the onset of stimulus sensation and pain. Additionally, the degree of vibration that patients are experiencing can be measured. Because it is a quick, non invasive, and simple test to conduct, it is a helpful tool in clinical practice. However, because this approach relies on patients' cooperation, focus, and motivation, its repetition rate is poor and its outcomes are susceptible to emotional state. Additionally, this test records changes at any location along the neuraxis, which could cause analysis errors.

**Evoked Potential**

The electric reactions of the central nervous system to an external stimuli are represented by evoked potentials. Contact heat evoked potential stimulation (CHEPS) and laser evoked potential stimulation (LEPS) are of relevance for the research of small fiber polyneuropathy. These techniques enable the examination of Aδ and C fibers' central and peripheral conduction. However, CHEPS is noninvasive, more sensitive, and capable of producing repeatable evoked potentials, whereas LEPS may result in skin damage in laser-stimulated areas. Both approaches for clinical practice are yet not standardized.

**Autonomic Test**

To determine whether C fibers are involved, a number of autonomic tests are available. The tilt test, Valsalva maneuver, R-R interval computation at ECG, reflex sympathetic skin response, and sudomotor reflex quantitative test are the most widely available tests for cardiac and sudomotor evaluation in clinical practice.

**Morphological Examinations**

**Nerve Biopsy**

For a very long time, peripheral nerve biopsies were employed to examine the morphology and pathophysiology of nervous fiber involvement in DN. Currently, this approach has been saved for unusual clinical presentations when there is uncertainty about the overlap with other etiologies, such as inflammatory/infectious neuropathies and amyloidosis, because it is an invasive examination that may cause complications and sequelae. Additionally, in order to examine the blades, this exam needs extremely specific materials and trained professionals. Fascicular biopsy of the superficial sensory nerve is typically employed in research since it is less dangerous.

**Skin Biopsy**

tiny epidermal nerve fibers can be identified using a punchbiopsy segment of about 3 mm of hairless skin, which is a helpful diagnostic technique for tiny fiber neuropathy. By using immune-hystochemical labeling of the PGP 9.5 protein gene product, which is present throughout nerve fiber extension, this technique makes it possible to see epidermal fibers directly. As a diagnostic technique for small fiber neuropathy, intraepidermal fiber density quantification from skin biopsy is currently recommended, and its gender and age standardization has been published. One of its drawbacks is that it is an intrusive procedure that doesn't reveal the neuropathy's cause.

**Confocal corneal Micropsy**

The human cornea sub-basal plexus, which is composed of tiny fibers, has recently been mapped *in vivo* using confocal microscopy, enabling the characterization and distribution pattern of nerve fibers in healthy individuals of

various ages and genders [7]. The DPN poses a significant pharmacological treatment challenge. since the disease's precise mechanism is uncertain. Therefore, it cannot be fully healed, but it can be avoided since the three major concepts of glycemic control, foot care, and pain management can lessen the pain [8].

**Management of Diabetic Neuropathy**

**Pharmacological interventions**

For painful DPN, oral medicine is frequently the first line of treatment. DPN-induced discomfort can be treated with a variety of medications.

**Anticonvulsants**

Gabapentinoids, such as pregabalin and gabapentin, are anticonvulsants that work by blocking the dorsal horn's $\alpha$2-$\delta$ calcium channels, which prevents the production of neurotransmitters linked to pain. The American Diabetes Association recommends pregabalin as the initial treatment; gabapentin is not authorized for this purpose. Starting at 50 mg/d and progressively increasing to 300 mg/d within a week based on its effectiveness and tolerability, pregabalin can reduce the release of glutamate and excitatory neurotransmitters, such as norepinephrine and substance P, to decrease pain from DPN.

**Antidepressants**

DPN can be successfully relieved by antidepressants such as amitriptyline, venlafaxine, and duloxetine. Norepinephrine and serotonin reuptake inhibitors include duloxetine and venlafaxine. Norepinephrine controls their endogenous analgesic effects by downside inhibition. By increasing noradrenergic and serotonergic neuron activity in the descending pathway of the dorsal horn, duloxetine and venlafaxine treat chronic neuropathic pain. By suppressing dorsal horn neuron activity, these descending neurons shield the brain from excessive pain-related input.

**Opioids**

Opioids such as oxycodone, tapentadol, and tramadol are useful in managing DPN-related pain. Capsaicin topicallythe transient receptor potential vanilloid 1 receptor (TRPV1) is antagonized by topical capsaicin, which is occasionally used to relieve pain from a variety of sources.

**Non-pharmacological Therapies**

**TENS, or transcutaneous electrical nerve stimulation**

With few contraindications or side effects, TENS is a straightforward, inexpensive, non-invasive neuromodulation technique that can be used to treat a variety of neuropathic pain conditions, including excruciating DPN. Patients get electrical stimulation to the skin during its administration via adhesive electrodes utilizing a range of waveforms that can be broadly categorized as burst, low-frequency (>10 Hz), or high-frequency (>50 Hz). Although the exact mechanism of action of TENS is unknown, a number of potential mechanisms have been proposed, including enhanced microcirculation, elevated levels of endorphin and enkephalin, increased expression of proteins like nerve growth factor and calcitonin gene regulating protein, and decreased inflammation. Despite a lengthy history of clinical use, its ability to reduce pain and manage DPN has not been proven.

**Transcranial magnetic stimulation that is repeated (rTMS)**

Numerous studies have demonstrated that rTMS efficiently manages a variety of pain types, including musculoskeletal and peripheral or central neuropathic pain. This pain-relieving technique's underlying mechanics are still unclear. Nonetheless, a number of potential processes have been proposed [9].

## CONCLUSION

Understanding the many neuropathic consequences of diabetes mellitus is crucial for clinicians. One of the main

causes of death for these patients is autonomic involvement, which might be confused with other health issues. Reducing morbidity and mortality outcomes would be greatly aided by early diagnosis and detection of these conditions together with the implementation of suitable treatment methods. Three complications, such as heart arrhythmias and amputations of lower limbs. Controlling blood pressure, cholesterol, and glucose is crucial for DN treatment. Patients' quality of life is enhanced with symptomatic therapy. Notably, because they have demonstrated favorable outcomes in clinical practice, pathogenetic therapeutic drugs like benfotiamine and ALA should not be disregarded [10]. In conclusion, DN is a common consequence in both T1D and T2D. It includes a wide range of clinical symptoms, from autonomic neuropathies, such as gastrointestinal, urogenital, and cardiovascular, to distant, symmetric polyneuropathy. Although the diagnosis of DPN in clinical practice has been established, there are still issues with the widespread application of techniques for subclinical disease detection. Additionally, there is an urgent need for disease-modifying drugs because the current symptomatic treatment for painful DPN is insufficient, and the research has recently shifted its focus to metabolic and inflammatory targets. Diagnosing CAN, a fatal consequence of diabetes, is difficult since patients are asymptomatic in the early stages of the illness. Recent advancements in point-of-care diagnostic techniques, however, are encouraging. Similar to DPN, disease-modifying drugs that change the natural history and reverse the course of the disease are required. Even though the prevalence of gastroparesis is relatively low, morbidity and healthcare utilization are still substantial, hence the best diagnosis and treatment are crucial. For both men and women with diabetes, bladder and sexual dysfunction are very prevalent [11]. In conclusion, in order to stratify the risks of foot ulcers or amputations in a person with type 2 diabetes, peripheral nerve functioning are typically measured using clinical tests together with an assessment of related risk factors. A trial is currently required to address the current state of DPN in India, where patients' quality of life and/or response to therapy need to be assessed. Because neuropathy is progressive in nature and can be the only cause of amputations and amputation-related mortality in type 2 diabetes, it is crucial to examine DPN as a normal element of assessment in a clinical context [12].

Given the rising incidence of diabetes mellitus (DM) and its most common microvascular complication, diabetic neuropathy (DN), it is critical to understand the disease's primary clinical manifestations, available research techniques, and suggested treatments in order to establish an early diagnosis and potentially prevent the disease's progression and complications [7]. At least 50% of persons with diabetes may develop diabetic neuropathy, a common consequence of the disease that causes painful symptoms in about 20% of cases. It has been demonstrated to independently predict higher mortality and is typically underdiagnosed or misdiagnosed, resulting in significant impairment. Although there is currently no approved treatment for diabetic neuropathy, there is growing evidence that conventional cardiovascular risk factors may also play a role in the condition's development in addition to poor glycaemic management. Although less frequent, localized and multifocal neuropathies—particularly ulnar and median neuropathies—remain underdiagnosed. A. Numerous symptoms of autonomic neuropathy can significantly impair quality of life, particularly in individuals with severe postural hypotension, diabetic gastroparesis, and diabetic diarrhea, for which there are few available treatments. Additionally, painful diabetic neuropathy is typically misdiagnosed, underdiagnosed, and improperly treated. The management of this illness is supported by evidence, according to NICE (2010) guidelines [13]. DPN is a reasonably common DM complication that requires cautious management to keep the illness under control and prevent its debilitating effects. Our understanding of the pathophysiology at work and the interactions between the metabolic risk factors has advanced significantly over the last ten years. Investigating the pathogenic reasons is crucial to the intricate therapeutic management of DPN. Pain management and glucose control are important aspects of treatment that should not be disregarded. Both pharmaceutical and non-pharmacological treatments, such as foot care and lifestyle modifications, are part of DPN therapies [14]. Consensus holds that diabetic neuropathy is a result of the basic metabolic disturbance in diabetes mellitus [15]. It is important for clinicians to be knowledgeable about thevarious neuropathic complications of DM [16]. One of the most prevalent long-term consequences of diabetes is diabetic polyneuropathy, which affects half of all diabetics. This study, conducted by an international panel of specialists, looks at new research on autonomic neuropathy, painful DPN, and DPN diagnostic criteria and offers recommendations for diagnosis in the context of clinical practice and research. Emerging DPN markers are also covered in the review. Lastly, the diagnostic standards

for DPN will probably change as the field advances, and it is therefore necessary for subject-matter specialists to offer regular updates [4].

## ABSTRACT

Children with cerebral palsy (CP) often experience delays in motor, sensory, and cognitive development due to impaired neuromuscular control and limited opportunities for active play. Traditional therapy environments may lack the sensory richness and engagement required to stimulate holistic neurodevelopment. Outdoor natural play environments—such as gardens, parks, or nature-based playgrounds—offer multisensory, movement-rich stimuli that may support motor learning, social interaction, and cognitive growth in children with CP. This study aimed to evaluate the effect of outdoor natural play environments on the neurodevelopment outcomes in children with cerebral palsy. A quasi-experimental design was used involving 30 children diagnosed with spastic cerebral palsy (GMFCS levels I–III), aged 4–10 years. Participants were divided into two groups: the experimental group received 60-minute outdoor nature-based play therapy sessions thrice weekly for 12 weeks, while the control group received conventional physiotherapy in a clinical setting. Outcome measures included the Gross Motor Function Measure (GMFM-66), Pediatric Evaluation of Disability Inventory (PEDI), and the Sensory Profile. The experimental group demonstrated statistically significant improvements ($p<0.05$) in gross motor skills, sensory processing, and social engagement compared to the control group. Notable gains were observed in balance, trunk control, and environmental exploration behaviors. Incorporating outdoor natural play environments into rehabilitation programs can significantly enhance neurodevelopment in children with CP by promoting motor, cognitive, and sensory integration. These

findings support the integration of nature-based play as a complementary approach to conventional neuro-physiotherapy.

**Keywords:** Cerebral Palsy (CP), Neurodevelopment, Outdoor Play, Natural Play Environments, Pediatric Neuro rehabilitation, Motor and Cognitive Development

## INTRODUCTION

**Background of the Problem**

Cerebral palsy (CP) is a group of permanent movement and posture disorders attributed to non-progressive disturbances that occurred in the developing fetal or infant brain (Rosenbaum *et al*., 2007). Children with CP often exhibit delayed motor milestones, cognitive challenges, and sensory integration issues that hinder participation in daily and social activities. While therapeutic interventions such as physiotherapy and occupational therapy remain core to management, environmental stimulation is also a crucial determinant of neurodevelopmental outcomes. Natural outdoor play environments — such as green spaces, gardens, and nature-based playgrounds — are increasingly being recognized for their positive influence on children's physical, emotional, and cognitive development. Such environments offer sensory-rich, unstructured play opportunities that can stimulate motor planning, balance, attention, and social interaction (Fjørtoft, 2004; Gill, 2014). However, children with CP are often excluded from these environments due to accessibility issues or overly cautious parenting, leading to underutilization of a potentially beneficial resource.

**Why the Topic is Important**

In the era of growing urbanization and screen-based indoor lifestyles, the importance of reconnecting children — especially those with disabilities — with nature cannot be overstated. Research shows that play in natural settings promotes neuroplasticity, emotional regulation, and sensory-motor integration (Bento and Dias, 2017). For children with CP, who experience multisystem developmental delays, nature-based interventions could provide multisensory input in a non-clinical, engaging way. Despite growing awareness, most rehabilitation programs for CP still focus primarily on structured, indoor therapy. There is a critical need to explore innovative, inclusive, and sustainable strategies that enhance neurodevelopment beyond the clinic walls.

**Gap in Existing Research**

While there is extensive literature on conventional therapeutic approaches in CP (Novak *et al*., 2013), limited studies have systematically examined the specific impact of outdoor natural play environments on neurodevelopmental outcomes in this population. Most existing studies focus on typically developing children, with only anecdotal or qualitative references to children with special needs. Moreover, the few studies that include children with CP often lack rigorous outcome measures or long-term follow-up. This research seeks to fill this gap by empirically evaluating the effects of outdoor natural play on multiple domains of neurodevelopment in children with CP — including gross motor function, cognitive engagement, and emotional well-being.

**Study Objective and Hypothesis**

**Objective**

To evaluate the effect of structured exposure to outdoor natural play environments on neurodevelopmental outcomes in children diagnosed with cerebral palsy.

**Hypothesis**

Children with cerebral palsy who participate in regular, guided outdoor natural play sessions will show greater improvements in neurodevelopmental parameters — including motor function, sensory integration, and cognitive attention — compared to those who do not engage in such play.

## MATERIALS AND METHODS

**Study Design**

A quasi-experimental pre-post intervention study was conducted to evaluate the effect of outdoor natural play environments on neurodevelopmental outcomes in children diagnosed with cerebral palsy (CP). The study spanned a duration of 12 weeks, with assessments performed at baseline and post-intervention. Ethical clearance was obtained from the institutional ethics committee prior to commencement of the study.

**Participants**

A total of 30 children (n=30) diagnosed with spastic cerebral palsy, aged 3 to 10 years, were recruited from pediatric physiotherapy outpatient departments and special schools.

**Inclusion Criteria**

- Diagnosed with spastic cerebral palsy (GMFCS Level I–III)
- Age between 3–10 years
- Stable medical condition and no recent surgeries in the past 6 months
- Parental consent obtained

**Exclusion Criteria**

- Severe visual, auditory, or cognitive impairments
- GMFCS Level IV and V
- Presence of uncontrolled seizures

**Sampling Method**

Purposive sampling was used to recruit participants who met the inclusion criteria. Participants were randomly divided into an intervention group (n=15) and a control group (n=15).

**Intervention**

The intervention group received outdoor play therapy in a natural environment, such as a sensory garden or green park with varied natural textures (grass, sand, soil, water), uneven surfaces, climbing structures made of wood, and interactive natural elements (plants, stones, logs). Activities were supervised and guided by a pediatric physiotherapist, 3 sessions per week, each lasting 45–60 minutes for 12 weeks. The control group received conventional physiotherapy exercises indoors, focusing on motor training and neurodevelopmental therapy (NDT) principles. Both groups continued their routine school and home activities.

**Outcome Measures**

Pre- and post-intervention assessments were done using the following standardized tools:

**Gross Motor Function Measure (GMFM-66)**

Used to assess changes in gross motor function. It is validated and reliable for children with CP.

**Pediatric Evaluation of Disability Inventory (PEDI)**

Used to evaluate functional capabilities and performance in daily activities.

**Sensory Profile – Short Form:**

Assesses sensory processing skills influenced by environmental input.

**Statistical Methods Table 1.**

## RESULTS

The study aimed to evaluate the effect of outdoor natural play environments on various domains of neurodevelopment in children with Cerebral Palsy (CP). The results are presented in the form of descriptive statistics, comparative analysis, and visual representations using tables and graphs.

**Participant Demographics**

**Demographic Characteristics of Participants (n = 30) (Table 2).**

Note: No statistically significant difference was found in baseline characteristics between the two groups.

**Neurodevelopmental Outcomes**

Neurodevelopment was measured using:

- Gross Motor Function Measure (GMFM-66)
- Pediatric Evaluation of Disability Inventory (PEDI)
- Child Behavior Checklist (CBCL)

**Pre-Post Intervention Scores (Mean ± SD) (Table 3).**

**Graphical Representation**

**Change in GMFM-66 Scores (Pre vs Post) (Figure 1).**

A significant improvement ($p<0.001$) in gross motor function was observed in the natural play group compared to the control group.

**PEDI – Social Function Score Comparison (Figure 2).**

The natural play group demonstrated higher gains in social functioning post-intervention.

**CBCL – Anxiety Score Reduction (Figure 3).**

Anxiety levels decreased more significantly in children who engaged in natural outdoor play.

**Key Findings**

- Children exposed to natural outdoor play environments showed significantly greater improvements in gross motor skills and social functioning compared to those in conventional indoor play settings.
- Emotional well-being, particularly anxiety reduction, was more prominent in the natural play group.
- The p-values for all primary outcomes were <0.05, indicating statistically significant differences.
- Statistical Analysis Note
- All analyses were conducted using SPSS v25. Paired t-tests and ANCOVA were applied, considering baseline covariates.

## DISCUSSION

**Enhanced Physical Activity in Accessible Outdoor Settings**

Outdoor natural play environments—including parks, inclusive playgrounds, and greenspaces—provide substantially greater opportunities for physical activity. A study of ambulatory children with CP (GMFCS II) demonstrated significantly increased stride counts while using an ADA-compliant playground versus a non-compliant setting . This suggests that thoughtfully designed outdoor spaces can directly foster more locomotor activity, which is crucial to motor development.

**Neurodevelopmental Benefits via Environmental Enrichment**

The concept of environmental enrichment—exposure to complex, stimulating physical or social surroundings—has been shown in animal and human studies to promote synaptogenesis, dendritic growth, and improved cognitive and motor outcomes. In children with CP, combining enriched environments with motor training (e.g. goal-directed play) is associated with moderate improvements in motor outcomes (e.g., standardised mean difference ~0.39).

**Playfulness, Agency, and Psychological Well-being**

Children with CP often experience lower levels of spontaneous playfulness due to physical limitations and inaccessible environments . Natural play settings, and inclusive design elements such as level surfaces, wide paths, and accessible equipment, can reduce these barriers and increase feelings of control and motivation during play. Play-based therapeutic groups in naturalistic settings may further support both child and caregiver mental health—enhancing self-esteem, autonomy, and family well-being.

**Early Plasticity: Maximising Intervention Impact**

The infant brain retains a high degree of neuroplasticity, so therapies initiated early in enriched, play-rich contexts can yield greater gains than interventions in older children. Outdoor natural settings that engage the child in meaningful, enjoyable motor and cognitive tasks—especially when begun early—may better harness this plasticity.

**Broad Contextual and Community Influences**

Prenatal proximity to greenspace and active-living neighbourhoods has been linked to reduced cerebral palsy risk, likely through mechanisms like reduced maternal stress and improved placental oxygenation. While this concerns prenatal exposure, it underscores the broader developmental importance of natural environments. Postnatally, the psychosocial benefits of inclusive, green outdoor environments—such as peer interaction, reduced isolation, and increased social cohesion—may further amplify developmental gains.

## LIMITATIONS AND FUTURE DIRECTIONS

**Scarcity of direct research**: While compelling data exists on physical activity in compliant playgrounds, fewer studies directly assess neurodevelopmental endpoints (e.g., cognitive or motor milestone attainment) in CP populations exposed to natural play settings.

**Heterogeneity**: Studies vary widely in age ranges, severity (GMFCS levels), measures used, and intervention settings.

**Need for longitudinal and controlled trials**: Future RCTs could compare neurodevelopmental outcomes (motor, cognitive, social-emotional) in CP children exposed to structured natural play versus conventional in-clinic therapy.

## CONCLUSION

Overall, the discussion indicates that outdoor natural play environments—particularly when accessible, inclusive, and combined with goal-directed motor engagement—hold potential to enhance physical activity, neuroplasticity, playfulness, and broader psychosocial health in children with cerebral palsy. Integrating such environments into early intervention programs may yield meaningful developmental benefits that extend beyond the traditional clinical setting.

**ABSTRACT**

The global COVID-19 epidemic brought about hospitality industry to an abrupt halt, leading to unprecedented challenges such as travel restrictions, sharp declines in occupancy rates, and disruptions in service delivery. This study explores the impact of COVID-19 on hospitality management practices, with a focus on how hotels, resorts, and other service providers adapted during and after the crisis. Emphasis is placed on crisis management strategies, operational adjustments, employee well-being, and the role of technology in ensuring continuity. The research also highlights best practices adopted by resilient hospitality businesses, including flexible booking policies, enhanced sanitation protocols, digital transformation, and contactless service models. Drawing insights from both primary data and recent industry reports, this paper offers a roadmap for building resilience and fostering sustainable recovery in a post-pandemic world.

**Keywords:** COVID-19, Hospitality Management, Crisis Management, Resilience, Hotel Industry, Digital Transformation, Service Innovation, Post-Pandemic Recovery, Guest Safety, Operational Strategies.

## INTRODUCTION

[1]The hospitality industry has historically been one of the most dynamic and rapidly growing sectors worldwide, contributing significantly to global GDP and employment.[2] However, the outbreak of the COVID-19 pandemic in

early 2020 triggered an unparalleled crisis in this sector. Governments imposed strict travel restrictions, social distancing mandates, and lockdowns to curb the spread of the virus, which led to mass cancellations, sharp declines in hotel occupancy rates, workforce reductions, and financial instability across the industry. [3]This sudden disruption exposed the vulnerability of hospitality operations to global health emergencies and underscored the urgent need for adaptive management strategies. [4]Hospitality managers were compelled to rethink their traditional practices and implement innovative solutions to ensure business continuity, guest safety, and employee well-being. [5]The crisis accelerated trends such as digital transformation, automation, and the adoption of contactless technologies, while also emphasizing the importance of crisis preparedness and agile leadership. [6]This study aims to examine the multi-dimensional impact of COVID-19 on hospitality management, focusing on both the immediate responses and the long-term strategic shifts adopted by industry players. [7]It further explores how resilience was built across various operational levels and highlights recovery strategies that can serve as a framework for future crisis management in hospitality. Understanding these changes is crucial not only for recovering from the current pandemic but also for strengthening the sector's preparedness for future disruptions.

## BACKGROUND OF THE STUDY

[8]The hospitality industry plays a vital role in the global economy, contributing significantly to employment, tourism, and economic growth. However, the outbreak of COVID-19 in early 2020 triggered an unprecedented global crisis, deeply affecting the travel and hospitality sectors. Lockdowns, travel restrictions, and social distancing mandates led to severe revenue loss and operational shutdowns across hotels, restaurants, and resorts. Magnitude of the ImpactCOVID-19 exposed the fragility of the hospitality ecosystem. Occupancy rates dropped drastically, bookings were canceled en masse, and international travel nearly halted. Businesses of all sizes especially small and independent establishments—struggled to survive, highlighting the urgent need for effective crisis response mechanisms.

**Service delivers Distribution**

Traditional hospitality operations, which rely heavily on personal interaction, had to be redefined. Hygiene, safety, and minimal contact became top priorities. This forced hotels and restaurants to re-engineer their service models, often compromising on personalized guest experiences to ensure compliance with safety protocols.

**Digital Transformation:** The pandemic accelerated the adoption of technology in hospitality. Contactless check-in/check-out, QR code menus, AI-based customer service, and digital payment systems became essential. Businesses that embraced these changes quickly were better able to adapt to the new normal and restore customer confidence.

**Workforce Challenges:** With declining revenues, many organizations had to downsize or furlough employees. At the same time, frontline staff faced high risks and stress. This called for a renewed focus on employee health, flexible work arrangements, and retraining to meet new operational demands.

**Management Response and Adaptation:** Hospitality leaders demonstrated resilience through innovation and quick decision-making. Strategies such as converting hotels into quarantine centers, offering long-stay packages, and promoting domestic tourism were implemented to ensure short-term survival and long-term recovery.

## REVIEW OF LITERATURE

[9]The COVID-19 pandemic has introduced new complexities in the acute care management of patients, particularly in the provision of speech-language pathology (SLP) services. This article presents initial recommendations aimed at guiding speech-language pathologists working with adults hospitalized with COVID-19. Given the multifaceted impact of the virus—including respiratory distress, prolonged intubation, delirium, and neurological complications—SLPs must adapt clinical practices to address communication, cognition, and swallowing disorders

within a rapidly evolving healthcare landscape. [10]The recommendations focus on patient-centered, evidence-informed approaches that prioritize safety, minimize infection risk, and support interprofessional collaboration. Emphasis is placed on triaging patients, modifying service delivery models, incorporating telehealth where feasible, and using appropriate personal protective equipment (PPE). The COVID-19 pandemic challenged global health systems, with outcomes heavily influenced by the structure and management of each country's healthcare framework. [11]In Italy, one of the hardest-hit nations, regional disparities were stark—Lombardy, despite its advanced hospitals and scientific centers, faced some of the highest infection and mortality rates.[12]This was largely due to weaknesses in primary health care, including a low ratio of general practitioners (GPs) to residents, inadequate PPE allocation, insufficient testing, and poor coordination between healthcare sectors. [13]Hospitals were rapidly overwhelmed, and the reorganization into broad "macro-areas" potentially heightened the risk of hospital-acquired infections. This retrospective study analyzed hospitalization data from the Indonesian Health Social Security Administrator Agency (BPJS Kesehatan). A total of 38,277 confirmed COVID-19 patients were included. The primary outcome was patient discharge status—either recovery or death. Independent variables included comorbidities, type of hospital room, length of hospital stay, and demographic factors such as age and sex. Both bivariate and multivariate logistic regression analyses were performed to determine the most influential factors linked to patient outcomes. Among the 38,277 hospitalized COVID-19 patients, 31,051 (81.1%) recovered and were discharged, while 7,226 (18.9%) died. Increased mortality risk was significantly associated with older age (adjusted OR [aOR] 5.74 for ages 19–64; aOR 13.75 for ages 65+), male sex (aOR 1.13), ICU treatment without ventilator support (aOR 5.84), and pre-existing respiratory conditions (aOR 5.39). In contrast, patients who were hospitalized for 15 days or more had a lower risk of death (aOR 0.39).

## RESEARCH AND METHODOLOGY

**Research Design**

This study adopts a mixed-methods approach, combining both quantitative and qualitative techniques to explore the impact of COVID-19 on hospitality management practices. A descriptive and exploratory research design is employed to understand the challenges faced, strategies adopted, and recovery mechanisms implemented within the hospitality sector during and after the pandemic.

**Population and Sample**

The population of the study comprises hospitality businesses, including hotels, restaurants, and travel-related service providers operating in urban areas most affected by COVID-19. A purposive sampling technique was used to select a sample of 100 hospitality managers and business owners, ensuring a mix of small, medium, and large enterprises.

**Data Collection Methods**

**Primary Data:** [21]Collected through structured questionnaires and semi-structured interviews.

- The questionnaire includes both closed-ended and Likert-scale items focusing on operational disruptions, workforce challenges, financial impact, customer behavior changes, and recovery strategies.
- In-depth interviews were conducted with 10 selected managers to gain qualitative insights into adaptive practices and leadership decisions.

**Secondary Data:** [22]Gathered from industry reports, government publications, tourism boards, and journal articles related to COVID-19 and hospitality trends.

**Data Analysis Techniques**

Quantitative data collected through structured questionnaires were processed and analyzed using SPSS software. Both descriptive statistics (such as mean, percentage, and frequency) and inferential statistics (including correlation and regression analysis) were applied to examine trends, relationships, and statistically significant patterns.

Qualitative data obtained from interviews were subjected to thematic analysis to identify recurring themes, coping strategies, and indicators of resilience.

**Reliability and Validity of the Research Instrument**

To establish the reliability of the research instrument, a pilot study involving 10 respondents was carried out. Internal consistency was assessed using Cronbach's alpha. The validity of the questionnaire was ensured through expert evaluation by hospitality industry professionals and academic researchers, confirming the appropriateness and relevance of the instrument.

**Ethical Considerations**

All participants were informed about the purpose of the study. Informed consent was obtained, and confidentiality was maintained. Participation was voluntary, and respondents were allowed to withdraw at any stage without any obligation.

**Hypothesis**

**H10:** There is no significant relationship between COVID-19-related disruptions and changes in hospitality management practices.

**H20:** There is no significant difference in the resilience strategies adopted by small, medium, and large hospitality businesses during the COVID-19 pandemic.

**H30:** The COVID-19 pandemic has no significant impact on employee retention and workforce management practices in the hospitality sector.

**Linear Regression**

**H10:** There is no significant relationship between COVID-19-related disruptions and changes in hospitality management practices.

**Independent Variable (IV):** COVID-19 disruptions (e.g., revenue loss, lockdown duration, supply chain issues)

**Dependent Variable (DV):** Changes in management practices (e.g., operational adjustments, use of digital tools) (Table 1)

**Regression Equation**

$Y = 1.432 + 0.696X$

**Interpretation**

The linear regression results indicate a statistically significant and positive relationship between COVID-19–related disruptions and changes in hospitality management practices. The model accounts for 46.1% of the variation in management adaptations ($R^2 = 0.461$), reflecting a moderately strong explanatory power. The regression coefficient for the COVID-19 disruption score is 0.696 ($p < 0.001$), implying that a one-unit increase in disruption leads to a 0.696-unit increase in adaptive management practices. This finding suggests that greater pandemic-related challenges prompted hospitality organizations to adopt strategic responses such as digital transformation, cost control measures, and revised standard operating procedures. Consequently, the null hypothesis is rejected, confirming that COVID-19 disruptions had a significant impact on management adaptations within the hospitality sector.

**ANOVA**

**H20:** There is no significant difference in the resilience strategies adopted by small, medium, and large hospitality businesses during the COVID-19 pandemic (Table 2).

**Interpretation**

The results of the One-Way ANOVA demonstrate a statistically significant difference in the resilience strategies employed by small, medium, and large hospitality businesses during the COVID-19 pandemic. The obtained F-value of 7.231 with a p-value of 0.001 is below the conventional significance threshold of 0.05, confirming the presence of meaningful differences across business sizes. The between-group variation in resilience strategy scores (sum of squares = 4.752) is substantially higher than the within-group variation (sum of squares = 31.986). Accordingly, the null hypothesis is rejected, indicating that the size of the hospitality enterprise significantly influences the nature and intensity of resilience strategies adopted during the pandemic. Post-hoc tests may be performed to identify the specific group differences contributing to this variation.

**Independent samples t-test**

**H30:** The COVID-19 pandemic has no significant impact on employee retention and workforce management practices in the hospitality sector. (Table 3). The independent samples t-test was conducted to examine the influence of various factors on hospitality management practices during the COVID-19 pandemic. The results indicate that Business Size ($t = -15.007$, $p = 0.000$), COVID-19 Disruption Level ($t = 6.834$, $p = 0.000$), and Government Support Received ($t = -4.580$, $p = 0.000$) have a statistically significant impact on management decisions and resilience strategies, as their p-values are less than 0.05. This suggests that larger businesses, higher levels of disruption, and the presence of government support significantly influenced how businesses responded to the crisis. On the other hand, Digital Adoption Level ($t = -0.718$, $p = 0.475$) and Workforce Size Pre-Pandemic ($t = -1.513$, $p = 0.134$) did not show a significant impact, indicating that these factors did not contribute meaningfully to variations in hospitality practices during the pandemic. Therefore, the results partially support the hypothesis that certain operational and external factors significantly shaped resilience strategies in the hospitality sector during COVID-19.

## FINDINGS

The t-test shows a significant difference in management practices based on business size ($p = 0.000$), indicating that small, medium, and large businesses adopted different levels or types of resilience strategies during COVID-19. COVID-19 disruption level had a statistically significant impact ($p = 0.000$), showing that businesses more severely affected by the pandemic made greater changes in their operational and workforce practices. Businesses that received government support showed significant differences in management outcomes ($p = 0.000$), highlighting the positive impact of financial and policy assistance during crisis recovery. Despite its importance in modern operations, the adoption of digital tools did not significantly affect the resilience strategies in this sample ($p = 0.475$), suggesting inconsistent or limited digital transformation. The number of employees prior to the pandemic did not significantly influence changes in workforce management practices during COVID-19 ($p = 0.134$), indicating that both large and small teams faced similar challenges.

## CONCLUSION

[24]The study aimed to examine the impact of various factors on hospitality management practices during the COVID-19 pandemic using independent samples t-tests. The findings reveal that business size, COVID-19 disruption level, and government support received had a statistically significant influence on how hospitality businesses responded to the crisis. These factors played a crucial role in shaping resilience strategies, operational decisions, and workforce management practices. In contrast, digital adoption level and workforce size prior to the pandemic did not show a significant impact, suggesting that technological readiness and employee strength alone were not sufficient drivers of adaptive strategies during the crisis. Overall, the results highlight the importance of external support mechanisms and organizational scale in navigating disruptions, emphasizing the need for targeted policies and flexible business models to enhance resilience in the hospitality sector.

**ABSTRACT**

This study investigates the performance of cloud service environments through the application of the $M/M/c$ queuing model, focusing on how system behavior is influenced by arrival rates, service rates, and multi-server capacity. By modeling cloud request arrivals as a Poisson process and service times as exponentially distributed, the research analyzes key performance measures including queue length, system occupancy, and customer waiting times. Simulation results, supported by Erlang-C analytical comparisons, demonstrate that inadequate server provisioning leads to rapid congestion and increased delays, while the addition of servers significantly enhances stability and reduces wait times across varying demand intensities. Probability distributions, contour maps, and heat-map visualizations further reveal the sensitivity of cloud systems as utilization approaches saturation, emphasizing the importance of appropriate capacity planning. The findings validate the $M/M/c$ framework as an effective tool for predicting cloud performance trends and informing scalable, Quality of Service(QoS) driven resource management strategies in modern cloud computing environments.

**Keywords:** Erlang-C, performance, Probability, Quality, occupancy, environments

## INTRODUCTION

Queuing theory is the study of waiting lines. It is a domain of applied mathematics that utilizes notions from stochastic processes. A. K. Erlang, a Danish engineer, is recognized for establishing queuing theory through his publication on automated telephone lines in 1909. It is fundamentally a system where client demand for services is limited by the availability of those services. The service times are chosen at random. Certain clients may experience

delays if the number of servers is limited [11]. Cloud computing, due to its growing relevance and popularity, presents significant potential while simultaneously facing numerous challenges in its development. The Theory of Queues captivates mathematicians focused on stochastic processes as it provides a straightforward example that is both (i) stationary and (ii) generally non-Markovian [5]. According to Luqun Li [10], CCU's responsibilities were categorized into different classes, each with a specific priority. The tasks are processed on the server at a rate determined by a Poisson distribution, while a general distribution governs the processing time for each work. A non-preemptive$M/1G$ queuing model was consequently devised. In a non-preventive approach, job planning in Cloud Computing is transformed into a queue planning problem for $M/1G$. Daily, we are vexed by the difficulty of queuing. In our increasingly congested and urbanized environment, the issue is becoming more prevalent. In addition to visible queues at traffic intersections, airport check-in counters, and supermarkets, there are also concealed delays in optical and wireless channels caused by phone calls and data packets. Time, capital, and resources are squandered for everyone. Global production and communication networks rely on queue management. Cloud computing gained significant interest due to increased access to high-speed Internet and improvements in virtualization and distributed computing. Information technology is presently extensively utilized and advancing. When programs and data are transferred to the cloud, they alter not just the location but also the methodology of computing.

The authors illustrated that the model could ascertain the appropriate quantity of resources necessary to fulfilQoS requirements, including reaction time and throughput. The authors [8] formulated an$M/G/m/m+r$ queuing model to evaluate the performance of cloud computing centers, emphasizing criteria such as blocking probability, immediate service probability, and response time distribution. Besides optimizing reaction time, queuing theory has been utilized in various facets of cloud computing, including energy efficiency and resource management. Souvik Pal et al. [17] they utilize the CloudSim simulation program to determine the number of CPU cores required and the duration of execution. Minimizing wait times is also crucial.When soliciting a substantial number of jobs, it is essential to anticipate delays due to servers that may prolong the line and increase wait times. This study examines a queuing strategy featuring numerous servers and restricted capacity to minimize wait times and queue length. Guo, Lizheng et al. [9] they provide the mode, function, and methodology for synthesis optimization. Ultimately, simulation is conducted utilizing synthesis optimization techniques. The simulation results are contrasted and assessed against conventional optimization,demonstrating that the proposed methodology can reduce average expectation times, average queuing times, and client counts. The data center is constructed as a service facility with many applications and an infinite task application buffer, which can function as an$M/M/m$ queue system.

Bashir Yusuf Bichi and colleagues [3] their focus was on mathematical formulation employing a queuing system technique to illustrate the variations in throughput and time delay between single server systems and multiple server systems in a cloud computing environment. It is readily apparent that the throughput of the system with several serving units exceeds that of the system with a single serving unit.The latency for executing a specific request on a single server exceeds that of a many server system. EinollahJafarnejadGhomi and colleagues[6]their research presented a classification of cloud computing queuing models and The trajectory of AQTMCC and the imperative for additional research on it have been determined for the future. The subjects for future investigation encompass: robustness and automation. Understanding of QoS and Service Level Agreement (SLA)-aware resource allocation, event-driven workload forecasting, provisioning and management of cross-cloud resources, model deployment, and class-based as well as SLA-based services. Khaled Salah et al. [15] proposed a work that analyzes the performance of the CDC using a constructed stochastic model based on queuing theory.CDC platforms are designed to achieve QoS in the cloud. We provide numerical examples illustrating how the model forecasts the requisite number of virtual machine instances to satisfy a specified set of QoS criteria. We employ a Discrete Event Simulator (DES) to assess our analytical model. The proposed model can forecast the necessary number of VMs to satisfy the anticipated QoS targets, considering fluctuations in the arrival request rate, based on their study and simulation findings.

Roxana MARCU and colleagues [13] the essay suggested a cloud platform for developing a comprehensive, industry-specific medical system. A suggested analytical methodology aims to optimize performance while minimizing costs in cloud scheduling. The performance of each established priority class is evaluated based on the volume of requests, response time, and demand drop rate. The experimental results indicate that the proposed model can accommodate many arrival requests and provide a rapid response time based on priority classifications. S. Pal et al. [18, 19] have examined scheduling algorithms and probabilistic algorithms to improve performance metrics in a cloud computing environment. In the preceding, we examined the queueing model, multi-server capacity, and the optimization of wait time and queue length. We concentrated on minimizing the average wait time and assessing the server utilization of a multi-server queuing system. This trial examined the average server time and server utilization using the $M/M/c$ model.

**Model for the system**

The cloud user interacts with the cloud broker as per the specified need.Cloud brokers serve as negotiators or mediators, assisting users in managing all activities, the requisite number of CPU cores, and the duration needed for processing user requests, including specifications for the desired data center and execution time for pertinent requests. Users may use the cloud broker to get resources for themselves. Figure 1 illustrates the specified framework model of the cloud service queuing system. The cloud broker evaluates and forwards the request to the data center. In a short timeframe, a substantial number of requests generates a queue.The requirements are executed in combination with the creation of the Virtual Machines' VMM. The data center allocates resources according to their availability. Upon the completion of the inquiries, the virtual computers must be shut down accordingly.We identified the $M/M/c$ model in that study to compute the average server utilization and waiting time length$M/M/c$. The $M/M/c$ queuing system [1, 2, 7, 12, 15, 16] is recognized as the only model proficient in analysing and resolving the density function of the probability upon the introduction of a new system. The $M/M/c$ queuing model in a multi-server system facilitates analysis and management about the optimization issue.

The quantities of a service, the operational load of an application environment, the setup of a multi-server system, the service level agreements, customer satisfaction, etc., are the components of your pricing model. The research further examined two alternate models of server power and performance.

## RESULTS AND DISCUSSIONS

When the server's capacity is inadequate to manage the volume of requests within an acceptable timeframe, queues will build.Arrival and service methods, as well as servers [4, 11], are essential concerning the fundamental queuing model. This chapter delineated the $M/M/c$ queuing paradigm.The Poisson distribution rate represents service requests, while the exponential distribution rate denotes process time. Kendal's nomenclature [5] is accurate; the average arrival rate is represented by $\lambda$, whereas the average service rate is marked by $\mu$. The $M/M/c$ model has been evaluated, with variations in the number of servers (denoted as c) and the utilization factor being analyzed concurrently. To guarantee system stability, the utilization factor $\left[\rho = \frac{\lambda}{\mu} \leq 1\right]$ must be taken into account, necessitating the consideration of an equilibrium condition. The quantity of servers was juxtaposed with the mean system client figures$(L_s)$, the mean number of queue patrons$(L_q)$, the mean system waiting duration$(W_s)$, and the mean queue waiting duration$(W_q)$are shown in the Figure 1 are analysed using MATLAB 2022a software.

Figures 2 and 3 illustrate the behavior of the average queue length $(L_q)$ and the mean number of customers in the system $(L_s)$ as the number of server's increases. As expected in an $M/M/c$ environment, both metrics decline sharply with additional servers. When the system operates with insufficient capacity, even moderate arrival rates lead to substantial queue formation. This behaviour is pronounced in Figure 2, where $L_q$ initially grows rapidly and then plummets toward zero once the number of servers surpasses the minimum threshold required for stability.

Figure 3 shows that $L_s$ follows a similar pattern: under low server availability, the system becomes congested, accumulating customers both in service and in queue. As server count increases, $L_s$ stabilizes at minimal levels.These outcomes reinforce the classical observation that queueing performance in cloud systems improves significantly when capacity provisioning aligns with incoming demand.

Figures 4 and 5 presents the mean waiting time in queue $(W_q)$ and the mean time a request spends in the system $(W_s)$. Both metrics exhibit a pronounced decline as server capacity increases. The steep initial drop in $W_q$ underscores how sensitive delay is to under-provisioning: when servers are scarce, even small increases in load cause substantial waiting times.Beyond a certain point, however, the addition of more servers yields diminishing returns, as both $W_q$ and $W_s$ converge toward limits dictated primarily by service times. This plateau indicates that once queues are effectively eliminated, further resource allocation contributes little to reducing overall delay-an important consideration for cost-conscious cloud deployments.

Figure 6 compares multiple performance metrics$L_q, L_s, W_q$, and $W_s$ under a high-load scenario ($\lambda = 130, \mu = 132$). The figure demonstrates that operating near saturation dramatically amplifies system sensitivity. With utilization approaching 1, even a single additional server produces large reductions in waiting time and queue size. This observation highlights the need for flexible scaling strategies in cloud environments, particularly during peak traffic intervals.

Figures 7 through 12 illustrate the steady-state probabilities of having $n$ customers in the system for both $M/M/2$ and $M/M/3$ configurations across varying traffic intensities.For the $M/M/2$ model (Figures 7-9):

- At light load ($\lambda = 30, \mu = 50$), the probability mass concentrates on small $n$ values.
- At moderate load($\lambda = 70, \mu = 80$), the distribution spreads modestly, reflecting increased congestion.
- At heavy load ($\lambda = 130, \mu = 132$), the distribution becomes significantly wider, indicating a high likelihood of longer queues.

For the $M/M/3$ model (Figures 10-12), the presence of an additional server substantially compresses the distribution, even under heavy arrival rates. This demonstrates the stabilizing influence of additional servers, confirming that multi-server architectures in cloud environments markedly reduce the probability of long queues and system congestion.

Figure 13 compares simulated waiting-time distributions with the theoretical Erlang-C cumulative distribution function. The strong alignment between the curves validates the simulation methodology and confirms the theoretical applicability of the $M/M/c$ model to cloud service environments. Figure 14 further illustrates the empirical distribution of positive waiting times for a $M/M/2$ system ($\lambda = 60, \mu = 70$). The histogram reveals the characteristic exponential decay, with most tasks experiencing negligible delays and only a few instances culminating in longer waits. Figure 15 presents a stacked bar chart of steady-state probabilities $P(n)$ for the $M/M/3$ system. The bars emphasize the rarity of high customer counts in adequately provisioned systems, confirming that multi-server configurations significantly mitigate backlog formation.

Figures 16 and 17 provide visual analytics for understanding the interplay between arrival rates, service rates, and server count. Figure 16, a contour map of $W_s$ for an$M/M/2$ queue, shows steep gradients near the boundary where $\lambda$ approaches $2\mu$. This confirms that the system becomes highly unstable as utilization nears 1, resulting in rapidly increasing delays. Figure 17, a heat map of $L_q$ for a $M/M/c$ system, reveals congestion zones across different values of $\lambda$and $c$. High arrival rates combined with insufficient servers cause sharp increases in queue length, while increasing $c$ shifts the system into low-congestion regions (cooler colors). These plots provide intuitive, visual confirmation of the analytical results and emphasize the critical role of capacity planning in cloud infrastructures. The results collectively demonstrate that the $M/M/c$ queuing model effectively captures the performance characteristics of cloud service systems. The findings highlight the system's sensitivity to workload intensity, the significant benefits of

multi-server architectures, and the importance of maintaining utilization well below saturation to ensure minimal queue growth and delay. The combined analytical and simulation results underscore that proper resource provisioning is essential for meeting QoS requirements in modern cloud environments.

## CONCLUSION

This study evaluated the performance of cloud service systems using the $M/M/c$ queuing model and demonstrated how key metrics - queue length, system occupancy, waiting times, and steady-state customer distributions are strongly influenced by server capacity and workload intensity. The analytical and simulation results consistently showed that insufficient server provisioning leads to rapid congestion and long delays, while moderate increases in service capacity produce substantial performance gains, validating the model's effectiveness in supporting capacity planning for cloud environments. Visual analyses, including contour and heat maps, further highlighted critical stability thresholds, especially as utilization approaches unity. By confirming the close agreement between simulation outputs and Erlang-C predictions, the study reinforces the $M/M/c$ model as a reliable tool for predicting system behavior and guiding decisions related to resource scaling, QoS assurance, and cost-efficient cloud infrastructure design. Collectively, the findings emphasize the necessity of dynamic, data-driven provisioning strategies to maintain system responsiveness and ensure optimal performance under varying demand conditions.

**ABSTRACT**

Agricultural land is essential not only for ensuring food availability but also for strengthening India's economy [1]. Among various crops, paddy holds a key position in supporting global food security. Despite its importance, paddy cultivation is highly vulnerable to numerous diseases, especially those that damage the leaves and reduce yield. To address this issue, the present study proposes a convolutional neural network (CNN)–based method for the automatic detection of paddy crop diseases using deep learning techniques. The four pre-trained models ResNet50, EfficientNet_b4, DenseNet121, and MobileNet_v2 were implemented, achieving high classification accuracy of 93.60%, 89.11%,93.30% and 93% respectively. Proposed models classify images into 10 various categories using a dataset of 10407 images. The results demonstrate the effectiveness of deep learning techniques for early disease detection and improved crop management.

**Keywords**: paddy crop disease, deep learning, convolutional neural networks (CNN), disease detection, automated detection.

## INTRODUCTION

India is the second largest producer of wheat and rice, most of India's economy comes from agriculture.It provides employment to 60% of the Indian population and generates 17% to the total GDP of India [18]. Indian agriculture is composed of many crops like paddy, wheat, sugarcane, oilseeds, vegetables and fruits [7]. Due to emerging growth in the population agriculture sector needs a better advancement using the latest technologies. Paddy, a staple food for a significant portion of the global population, faces substantial threats from various diseases, leading to considerable crop losses and economic repercussions [1]. The reliance on manual inspection for disease detection, a

common practice, is often time-consuming, labour-intensive, and susceptible to human error, further exacerbating these issues [2]. Consequently, there is an urgent need for advanced, automated systems capable of accurately and efficiently identifying paddy crop diseases at early stages to mitigate their impact on agricultural productivity [3]. The global transferability of plant diseases complicates this challenge, introducing novel pathogens to regions unprepared for their rapid and effective identification and management [3]. This necessitates the development of robust detection mechanisms that can operate effectively even with limited expert supervision and vast agricultural regions [5].

Crop diseases represent a substantial impediment to global food security, particularly in staple crops like paddy rice, where early and accurate detection is paramount for effective disease management and yield preservation [7]. The application of Convolutional Neural Networks has emerged as a promising solution for automating the identification of various paddy diseases, thereby mitigating the challenges associated with manual observation and limited expert availability [2] This is especially critical in agricultural contexts where diseases can spread rapidly, leading to significant economic losses and diminished crop quality if not addressed promptly [2]. Traditionally, disease detection relied on subjective visual inspection or time-consuming laboratory analyses, which often lacked the necessary speed and consistency for large-scale agricultural monitoring [7]. However, recent advancements in deep learning, particularly with CNNs, have revolutionized this domain by enabling rapid, objective, and highly accurate identification of plant pathologies directly from imagery [2]. These models can discern subtle patterns and textures indicative of specific diseases, often surpassing human capabilities in both speed and diagnostic precision [1]. This shift towards automated systems offers a scalable and efficient alternative, enhancing the ability of farmers and agricultural scientists to monitor crop health proactively and implement targeted interventions [1][2]. The integration of CNN-based systems into agricultural practices not only streamlines the diagnostic process but also contributes significantly to precision agriculture by facilitating real-time disease prediction and personalized recommendations for crop management. This methodology leverages sophisticated image classification techniques to distinguish between healthy and diseased plant tissues, offering a robust framework for improving agricultural productivity and sustainability. In this context, Convolutional Neural Networks offer a promising solution due to their proven capabilities in image recognition and classification tasks, making them particularly well-suited for agricultural applications such as plant disease detection [5]. This approach leverages deep learning to accurately identify various paddy leaf ailments, thereby improving both the efficiency and accuracy of early detection compared to traditional, often subjective, manual inspection methods [2]. These advanced techniques offer a rapid and objective analysis of paddy leaf health, facilitating timely intervention to mitigate significant crop losses [2]. Convolutional Neural Networks can involves converting input RGB images into the HSV color space, extracting the saturation component, and employing K-means segmentation to precisely delineate leaf regions for subsequent CNN-based classification of diseases such as Sheath Rot, Bacterial Leaf Blight, Brown Spot, and Leaf Blast [2].

**Related Work**

This section critically evaluates existing research on paddy crop disease detection, with a particular focus on methodologies employing deep learning architectures such as Efficient Net, MobileNetV2,DenseNet121and ResNet50. The objective is to synthesize current advancements, identify common challenges, and highlight gaps in the literature that this study aims to address. Traditional methods for disease identification, often manual and time-consuming, are prone to misclassification and inefficiency, underscoring the necessity for advanced automated solutions [8]. Recent studies have increasingly leveraged deep learning, particularly convolutional neural networks, to address these limitations, demonstrating significant improvements in detection accuracy and speed [9]. Automatic feature extraction allows CNN to discern subtle disease indicators that might be overlooked by the human eye, thus preventing catastrophic yield reductions [1]. Furthermore, the development of CNN models with increased structural complexity, such as those incorporating 15 layers, has been proposed to enhance the predictive accuracy for various diseases affecting rice leaves [6]. This sophisticated approach underscores the critical role of advanced image processing combined with deep learning architectures in achieving robust and precise disease identification within agricultural contexts [6].

For instance, in [10] Rani et al. utilized a deep CNN with ResNet-50, achieving 97.3% accuracy in identifying rice leaf diseases, emphasizing the critical role of such technologies in safeguarding global rice cultivation. This system aims to minimize the loss by detection of diseased paddy crops at early stages and can identify bacterial leaf blight, brown spot, leaf smut, and tungro diseases [10].

Similarly, in [11] other research has explored the efficacy of various CNN architectures, including DenseNet201, Xception, MobileNetV2, and ResNet50, for their suitability in resource-constrained environments like mobile applications, achieving high accuracy in disease classification [11]. The "Rice Disease Detector" app, which incorporates MobileNetV2, demonstrated successful performance in real-world scenarios. This study used 2259 smartphone images of various paddy crop plant parts under various classes and 250 real-time validation images for classifying 12 rice diseases. The top performing models were DenseNet201, Xception, MobileNetV2, and ResNet50, with validation accuracies of 98%,97.7%, 97.5% and 97.18% respectively. The adaptability of these models to diverse environmental conditions and their potential for integration into precision farming initiatives highlight their significance in modern agricultural practices [12]. Further advancements have seen the integration of ensemble models, which combine multiple deep learning architectures to enhance diagnostic precision, often outperforming individual models in complex disease classification task [4].

In [1] CNN models with a data augmentation layer, followed by a repetition of 2D Convolution Layer and 2D Max Pooling Layer used on the dataset used to perform computations for this article contains 10407 images of diseased paddy plants, belonging to 10 different classes (of diseases), namely bacterial leaf blight, bacterial leaf streak, bacterial panicle blight, blast, brown spot, dead heart, downey mildew, hispa, tungro and normal plants. The convolution layer had a kernel of size 32 and ReLU (Rectified Linear Unit) activation function was used in each of the convolution layers. Model accuracy on the validation dataset is 93%. In [13] Rice Plant leaf diseases detection system was developed over 10,080 Rice Plant images using a Deep Spectral Generative Adversarial Neural Network ($DSGAN^2$). They fed into the input of healthy and non-healthy leaves of 10 different classes (9diseases and one healthy) from the collected dataset. To enhance the image quality, they applied proved Threshold Neural Network (ITNN). For the identification support-intensive colour they have used Segmentation using a Segment Multiscale Neural Slicing (SMNS) algorithm. Selection of optimal features was achieved through Spectral Scaled Absolute Feature Selection ($S^2AFS$) method. Model accuracy is 97%.

In [14] authors used the dataset consists of 10,407 images across 10 classes with different class weight. This study assesses the effectiveness of four advanced deep learning models—DenseNet121, EfficientNetB4, Xception, and MobileNetV3 Large for detecting diseases in paddy crop plants. Owing to its strong feature extraction and classification capabilities, DenseNet121 achieved the highest accuracy of 97.5%. EfficientNetB4 and Xception also showed excellent performance, reaching accuracies of 96.25% and 96.32%, respectively. Although slightly lower, MobileNetV3 Large delivered a competitive accuracy of 96.25%, demonstrating its suitability for efficient rice disease classification.

Collectively, these studies highlight the increasing success of deep learning techniques, especially convolutional neural networks (CNNs), in identifying diseases in paddy crops. Nevertheless, many existing approaches depend largely on transfer learning with minimal task-specific optimization or focus on a single methodological framework. In contrast, this comparative analysis offers a comprehensive evaluation of multiple models, seeking to balance diagnostic accuracy with real-world applicability in agricultural systems. A detailed overview of the reviewed literature is presented in Table I.

**METHODOLOGY**

To develop a robust and effective paddy crop disease detection system, the methodology begins with data acquisition, which involves downloading and curating a comprehensive dataset of paddy crop disease images. Various disease of paddy crop is mention in Fig. 1. Next, the images were pre-processed by resizing, rescaling, and

augmenting, then splitting into training and validation sets, to make the model more robust. Fig 2. portrays the workflow for the proposed methodology.

**Data Acquisition**

Deep learning models heavily depends on datasets to provide accurate result on real world dataset choosing right data set is one of the crucial step in disease detection system. The dataset utilized for this model has been derived from a publicly available Paddy Doctor [4] database. This database contains over 10 thousand images for 10 different paddy crop diseases. The paddy doctor dataset with various diseases is mentioned in Table 2.

**DataPre-processing**

Data augmentation techniques were applied to add randomness and diversity to the dataset. This includes flipping the images horizontally, vertically and randomly rotating them by up to **(±10°)**to simulate different viewing angles. A search based augmentation technique called Auto Augmentation applied on dataset that finds the best set of augmentation policies by using reinforcing learning for optimal augmentation options. Each augmentation policy may contain various operations like rotation, scaling etc. with probability (0 to 1) and magnitude.Disease appearance varies (lighting, angle, background) so aggressive augmentations like auto and rand augment was used to reduce dataset bias. Mix up and Cut mix pre-processing techniques were used to face challenges like similar disease patterns across classes, high intra-class variation, imbalanced datasets and overfitting due to background similarity.

**CNN Architectures for Paddy Crop Disease Detection**

For training models, the dataset was split into training and testing sets in an 80:20 ratios, with 80% of images being allocated for training the model and 20% reserved for testing purpose.

**Approach 1: ResNet (50)**

ResNet50 is a 50 layers' deep convolutional neural network (CNN) architecture introduced by Kaiming He et al. in 2015 as part of the ResNet (Residual Network) family. It is widely used for image classification, object detection, and plant disease detection due to its ability to train very deep networks effectively [10]. In order to solve the problem of the vanishing/exploding gradient, this architecture introduced the concept called Residual Blocks. It uses a technique called skip connections. The skip connection connects activations of a layer to further layers by skipping some layers in between. [10]. Residual blocks allow deep networks to be trained by learning residuals (skip connections). Here Resnet50 was used for paddy disease detection task. Paddy diseases (blast, brown spot, sheath blight) have tiny lesions, subtle colour variations, fine texture changes. ResNet-50 captures such micro-patterns much better than VGG16 or InceptionV3. Resnet 50 Works well on real-field noisy datasets and it is robust to lighting variations, complex backgrounds and diverse leaf orientations.

**Approach 2: Efficient Net (B4)**

Efficient net uses compound scaling (depth × width × resolution) which balances model complexity and input resolution efficiently. It has efficient feature extraction and parameter efficiency. It uses larger input (380* 380) and more channels, explaining its better accuracy on visually subtle disease patterns. In this study EfficientNet b4 is implemented with full fine-tuning (not only head) with small LR (1e-4) and AdamW Optimize. It's large input resolution (380×380) helps detect small disease spots, fine veins, early-stage symptoms. MBConv (Mobile Inverted Bottleneck Convolution) and SE (Squeeze-and-Excitation) texture patterns used in Efficient Net is perfect for identifying Brown spot, Bacterial blight, Blast, Tungro symptoms. It is less overfitting and works well even on medium size paddy disease dataset.

**Approach 3: DenseNet121**

DenseNet-121 is part of the Dense Convolutional Network (DenseNet) family with 121 total numbers of layers. Its key innovation is dense connectivity, every layer receives all previous layers' feature maps as input, and passes its own feature maps to all subsequent layers. This improves feature reuse, reduces the number of parameters and mitigates the vanishing gradient problem. It is strong on small-to-medium datasets due to parameter efficiency and

feature propagation. DenseNet Architectures are widely used by research for paddy crop disease detection because it's ffeature reuse capabilities. Dense connectivity allows the model to leverage low-level leaf features (like spots, lesions) across layers [15]. Efficient Training as it has fewer parameters than traditional CNNs of similar depth, reducing overfitting on small datasets. Improved Gradient Flow as dense connections help gradients propagate backward effectively, even in very deep networks and fine-grained Detection that captures subtle patterns in paddy leaves that indicate different diseases.

**Approach 4: MobileNetV2**

Mobilev2 is a lightweight, fast, and efficient CNN designed for mobile devices, drones, and low-power applications. it is built from inverted residual blocks consisting of 1×1 expansion convolution → depth-wise separable convolution → 1×1 linear projection, with skip connections for efficient feature learning and low computational cost.MobileNetV2 is widely used for paddy crop disease detection because it effectively captures fine-grained leaf texture, colour variations, and disease-specific spot patterns while remaining lightweight and computationally efficient. With limited training data this CNN architecture can accurately extract features with the help of it depth wise separable convolutions and inverted residual architecture. Dataset [4]used in with all this CNN modelscontains real-world images with noise, shadows and highly imbalanced classes. Adam with Decoupled Weight Decay is used as an optimizer because it reduces overfitting, stabilizes training, works extremely well with CNNs like: ResNet50, MobileNetV2, DenseNet121 and EfficientNet B0 [16]. AdamW provides faster convergence and trains quickly on agricultural datasets.

## RESULT

This section presents the outcomes of the experiments and highlights the effectiveness of the various CNN model in accurately identifying paddy crop diseases from images. The performance of the various CNN model was evaluated using standard accuracy metrics on both training and testing datasets. For training the models, the dataset was split into training and testing sets in an 80:20 ratios, with 80% of images being allocated for training the models and 20% reserved for testing purposes. The per-class precision, recall, F1-score, and support for the proposed models are summarized here.

## CONCLUSION

Recent studies emphasize the effectiveness of deep learning, particularly Convolutional Neural Networks (CNNs), in accurately detecting and classifying paddy leaf diseases from image data [18]. In this work, multiple CNN models were developed and evaluated for paddy disease identification, with ResNet50 demonstrating notable performance. The model achieved an accuracy of up to 93.6% in differentiating healthy and diseased paddy leaves. Through systematic tuning of network architecture, filter sizes, and hyper parameters, along with the application of data augmentation and pre-processing techniques, the model attained strong training and testing results. These findings highlight the potential of CNN-based approaches for automated paddy disease diagnosis, contributing to precision agriculture by enabling early detection and improved crop health management.

**Future Scope**

Looking forward, several avenues exist to further extend and enhance this work. Future research may focus on exploring more advanced CNN architectures and fine-tuning hyper parameters to improve model accuracy and generalization [17]. Expanding the dataset to include a wider range of crops and disease types would further strengthen the model's robustness and applicability across diverse agricultural settings. In addition, extending disease detection to additional crop species beyond the current scope could significantly increase the system's overall impact. Developing a user-friendly web-based application for model deployment would also improve accessibility, enabling farmers and agricultural professionals to more easily adopt the technology and bridge the gap between AI-driven research and practical agricultural solutions. Overall, this study provides a strong foundation for future

advancements in automated plant disease detection and contributes toward the integration of intelligent systems in real-world agricultural practices.

**ABSTRACT**

This study explores MSW students' perceptions of how field work practicum supports professional competence development in Tamil Nadu, focusing on supervisory mentorship, agency exposure, and institution-agency collaboration as influences on competence development. Qualitative design using semi-structured interviews with 24 MSW students, purposely sampled from six social work institutions in Chennai. Three major findings stood out in the study. Practicum learning depended on clear orientation. Supervision shaped learning. Feedback and evaluation were inconsistent and informal. Students viewed competence as important for employability and confidence, but reported unequal opportunities due to differences in supervisory support and agency culture. Field work practicum has strong potential for competence development, but lacks structured mechanisms to achieve it. Strengthening mentorship, improving institutional–agency collaboration, and formalizing competence development platforms can enhance professional growth and practice readiness. Future research should integrate multi-stakeholder perspectives to build a culturally competence development framework.

**Keywords:** Field Work Practicum, Competence Development, Supervision, Social Work Education, Tamil Nadu.

## INTRODUCTION

Field work practicum is widely treated as the *signature pedagogy* of social work education—i.e., the primary setting where students are socialized into professional practice and learn to integrate classroom knowledge with real-world

intervention. This framing is strongly established in social work education literature and accreditation discussions (Wayne *et al*., 2010; Bogo, 2015; CSWE, 2008; Skeen, 2023). However, practicum learning is not automatic; it is shaped by the quality of supervision and mentoring, the clarity and consistency of practicum guidelines, feedback and evaluation processes, and the agency/placement context that determines actual exposure to cases, stakeholders, and practice opportunities. When these elements are strong, practicum accelerates competence development; when they are weak or inconsistent, students may experience role confusion, limited skill-building, and uneven learning outcomes (Bogo, 2015; Pack, 2018; Jansing, 2025).

**Significance of the study**

This study is practically important because field education is positioned as the profession's primary training platform; therefore, variability in supervision, feedback, and placement quality has direct implications for competence development and readiness for practice (Wayne *et al*., 2010; Bogo, 2015). Institutionally, the findings can inform quality assurance by identifying which practicum components require standardization (e.g., supervisor expectations, feedback cycles, evaluation criteria) and where institution–agency coordination needs strengthening to protect equity in student learning opportunities (CSWE, 2008; Jansing, 2025).

## LITERATURE REVIEW

Field education (field work practicum) is consistently described as the central practice-learning platform in social work because it is where students enact professional roles, demonstrate competence, and integrate values, knowledge, and skills in real service settings (Wayne, Bogo, and Raskin, 2010; Bogo, 2015; Skeen, 2023). At the same time, research shows that practicum quality is highly dependent on the *conditions of learning*—especially the availability and capability of agency/faculty supervisors, the structure and consistency of placement expectations, and the opportunities provided by agency contexts—meaning students can experience markedly different learning trajectories even within the same professional standards framework (Earls Larrison and Korr, 2013; Chilvers, 2021; Skeen, 2023). A recurring concern in the literature is that supervision and assessment in the field are not merely administrative tasks but core educational processes; however, providing corrective feedback and evaluating competence can be difficult in practice, shaped by supervisor judgment, relationship dynamics, and contextual constraints, which can produce inconsistency in evaluation experiences (Bogo *et al*., 2007; Bogo, 2015). Empirical work capturing student and supervisor views also highlights that students value supportive, skilled supervision and clear expectations, yet report variability in feedback quality and practicum evaluation processes, reinforcing the need for stronger program–agency alignment and more transparent assessment practices (Pack, 2018; Wayne *et al*., 2010).

**Problem statement**

Despite practicum being positioned as central to professional preparation, students' experiences often vary substantially across institutions and agencies due to inconsistent supervision quality, uneven implementation of practicum guidelines, irregular or non-specific feedback, and placement contexts that limit learning exposure. This variability creates unequal conditions for competence development and satisfaction, even when students are enrolled in comparable MSW programs (Pack, 2018; Jansing, 2025).

## MATERIALS AND METHODS

## RESEARCH DESIGN

This study employed a qualitative design and adopted thematic analysis supported by NVivo to examine MSW students' perceptions of field work practicum. A hybrid coding strategy was applied, combining deductive codes derived from the study questions with inductive codes that were allowed to emerge from the dataset (Braun and Clarke, 2006; Nowell *et al*., 2017). The setting comprises 16 social work institutions.

## Aim of the Study

To explore MSW students' perceptions of field work practicum processes and determine how supervision, structure, feedback/evaluation, and placement context shape learning and professional development.

## Research Questions

- How do MSW students describe the quality and usefulness of practicum orientation, guidelines, and role clarity?
- How do agency and faculty supervision practices influence students' learning, confidence, and theory–practice integration?
- How do feedback and evaluation mechanisms (including student voice in evaluation) affect perceived learning outcomes and satisfaction?
- What barriers constrain practicum learning opportunities, and what improvements do students recommend?

## Objectives of the Study

- To document students' perceptions of practicum orientation, guideline clarity, and implementation.
- To examine how supervision (agency and faculty) supports or constrains learning and theory–practice integration in competence development.
- To analyze students' experiences of feedback and evaluation, including transparency and timeliness.
- To identify structural, agency, supervisor-related, and contextual barriers affecting practicum learning and competence development.
- To synthesize student-recommended actions to strengthen practicum quality and consistency.

### Participants and sampling

Participants of the study, MSW students whose responses are contained in the compiled qualitative dataset. Inclusion criteria are: (i) enrolled in an MSW programme within the defined institutions, and (ii) having practicum/field work experience reflected in responses covering practicum processes (e.g., supervision, feedback, learning outcomes). Records with insufficient practicum-related content were excluded from thematic interpretation (Nowell *et al*., 2017). Sampling is case-based, using all available student response records in the dataset (a census of the compiled records rather than recruitment-based sampling). This approach will be justified because the analytic goal is to map patterns in students' reported practicum experiences across institutions and supervision contexts (Braun and Clarke, 2006).

### Data source, instrument domains, and data management

The data source is the compiled student-response document. The instrument domains reflected in the dataset include: orientation/role clarity, practicum guidelines and structure, agency and faculty supervision, theory–practice integration, feedback and evaluation practices, self-rated learning outcomes/satisfaction, barriers, and suggestions for improvement. These domains serve as the deductive "parent codes" in the codebook (Braun and Clarke, 2006). Data management follows a structured anonymization process. Each student record is assigned a unique Case ID (e.g., Inst##_P##), and institutions are assigned standardized institution codes (Inst01–Inst16). Any identifying names of institutions, supervisors, agencies, and individuals were removed or masked during import and reporting.

### Data analysis procedure

Analysis proceeds in five steps consistent with established thematic analysis guidance. First, familiarization through repeated reading and memoing was conducted by the researcher. Second, initial coding was performed in NVivo using the prepared codebook, applying deductive parent codes while also creating inductive child codes when new recurrent patterns appear (Braun and Clarke, 2006; Nowell *et al*., 2017). Third, codes are refined through code definition checks, collapsing overlaps, and clarifying boundaries using inclusion/exclusion rules captured in the codebook (Nowell *et al*., 2017). Fourth, candidate themes are developed by clustering related codes into higher-order categories and testing them against the dataset for coherence and distinctiveness (Braun and Clarke, 2006). Fifth, cross-case comparisons were performed using NVivo matrix coding by institution to examine how themes vary across the 16 institutional contexts and to support pattern-based interpretation (Jackson and Bazeley, 2019).

**Trustworthiness and ethics**

To strengthen trustworthiness, the study applies the criteria of credibility, transferability, dependability, and confirmability (Lincoln and Guba, 1985). Credibility is supported through peer debriefing and/or a second-coder check on approximately 10–20% of the records; disagreements are resolved through discussion and documented codebook updates. Dependability and confirmability are supported through an audit trail (versioned codebook, memos, and decision logs), while transferability is also supported through clear contextual description of practicum structures and institutional coding rules (Nowell *et al*., 2017; Korstjens and Moser, 2017). Ethical practice is addressed by ensuring de-identification, restricting access to the master linking file, and reporting only non-identifiable excerpts. Where the dataset originates from institutional academic activity, permissions/approvals was obtained and stated in the manuscript, and participation/record use are represented in line with institutional requirements (Lincoln and Guba, 1985). Permission for the conduction of the research was obtained from each and every participant through consent form. Researcher also obtained permission from the Institutions ethical committee.

## RESULTS

**Overview**

Six themes were identified through hybrid (deductive–inductive) coding of student responses and then refined by comparing patterns across institutions using NVivo matrix coding (institution × theme). Themes were constructed by clustering recurring coded segments into higher-order meanings and checking for consistency and variation across institutional cases. Table 1 will summarise the final themes and subthemes. Table 2 will present the institution-wise pattern matrix (theme presence/strength). Figure 1 will present the NVivo matrix heatmap (institution × theme). The NVivo treemap (coded references by code cluster) indicates that students most frequently discussed field work practicum as "work"—including practicum requirements, tasks, and the day-to-day structure of placements—suggesting that the practicum experience is commonly understood and narrated through operational demands rather than only educational design. The next most prominent cluster relates to linking theory to practice ("relating theory" and "social work theory"), implying that students repeatedly confronted the challenge of translating classroom concepts into placement realities, making theory–practice integration a central concern rather than a background issue. A substantial proportion of references also concentrates on community and social work field work, indicating that experiential learning is strongly framed through community exposure and real-world engagement, while the presence of competencies and knowledge clusters suggests students connect practicum to skill and knowledge development but discuss these somewhat less than the immediate realities of work and theory-application. Smaller clusters (e.g., hospital, semester) appear more context-specific, implying that setting and timing shape experiences but are not as dominant as supervision-linked learning conditions and the struggle to operationalize theory in practice.

**Theme 1: Orientation sets the ceiling for early role clarity**

Orientation functioned as the "starting frame" for students' understanding of expectations and professional role; where it was generic, role clarity remained weak, and where it was clear, students reported smoother adjustment.

**Subthemes**

- Generic/common orientation
- Role clarity from induction
- Transition into placement

**Evidence (quotes)**

- "The orientation was basic with guidelines for all the students." (Inst04–P02)
- "The orientation for all the students… was common clear and helped me understand my role well." (Inst06–P01)
- "Orientation was clear and useful…" (Inst12–P01)
- "The orientation provided basic information with guidelines…" (Inst03–P03)

**Variation across institutions (matrix comparison)**
Clear orientation narratives appeared alongside higher reported role clarity (e.g., Inst06, Inst12), while "basic/general" orientation was more often linked to later reliance on self-guided learning (e.g., Inst04, Inst03).

**Theme 2: Supervision quality acted as the gatekeeper of learning**
Students repeatedly framed supervision as the main mechanism determining whether practicum became skill-building or merely task completion. A frequent contrast emerged between stronger faculty guidance and weaker or misaligned agency supervision.

**Subthemes**
- Agency supervisor availability/engagement
- Supervisor qualification/fit with social work
- Faculty supervision as compensatory support

**Evidence (quotes)**
- "No agency supervisor will involve and teach the students and train." (Inst01–P01)
- "Applying social work theory was tricky under an MBA supervisor who focused on business mostly." (Inst04–P02)
- "The faculty supervisor did, but the supervisor lacked social work training." (Inst04–P02)
- "The faculty helped build our competencies… [but] the agency supervisor's feedback was minimal." (Inst03–P03)

**Variation across institutions (matrix comparison)**
Where supervision was described as approachable and structured, students reported stronger learning (e.g., "guided… preparing proper reports"; "linked classroom… with daily work") (Inst06). In other institutions, students described supervision as absent or misaligned with social work learning outcomes (Inst01, Inst04, Inst03).

**Theme 3: Feedback and evaluation were present, but often informal and inequitable**
Students commonly valued feedback but reported uneven timeliness, limited constructiveness, and restricted opportunities to evaluate agencies/supervisors—suggesting that evaluation systems were frequently under-structured.

**Subthemes**
- Irregular or non-constructive feedback
- Lack of student voice in evaluation
- Demand for formal feedback mechanisms

**Evidence (quotes)**
- "Feedback was irregular and not particularly constructive…" (Inst03–P03)
- "There was no structured channel to evaluate the agency or supervisor's suitability." (Inst04–P02)
- "We didn't get much chance to formally evaluate the supervisor." (Inst06–P01)
- "An anonymous evaluation form would give students more voice." (Inst12–P01)

**Variation across institutions (matrix comparison)**
Some students reported feedback as present and improvement-oriented (Inst06: "they gave feedback that improved my work") while others described feedback as sporadic and evaluation channels as absent (Inst03, Inst04).

**Theme 4: Theory–practice integration worked only when conditions supported it**

Students' ability to apply theory depended on supervision competence and placement context. When supervisors emphasised non-social-work priorities or settings lacked relevant exposure, students reported a theory–practice break.

**Subthemes**

- Theory application enabled by guided practice
- Theory–practice gap due to supervisor mismatch
- Context constraints limiting application

**Evidence (quotes)**

- "No care was taken to implement the social work methods." (Inst01–P01)
- "We had to bridge theory ourselves…" (Inst04–P02)
- "Without proper clinical settings and weak supervision, applying… diagnostic assessments were challenging." (Inst03–P03)
- "They linked classroom HR concepts with daily work." (Inst06–P01)

**Variation across institutions (matrix comparison)**

Institutions/placements with coherent supervision narratives showed smoother theory application (Inst06), whereas placements characterised by weak supervision or absent clinical exposure showed repeated "self-driven" theory linking (Inst03, Inst04, Inst01).

**Theme 5: Structural and context barriers constrained exposure and equity**

Students described barriers beyond individual effort—especially placement context (e.g., rural/clinical mismatch), inadequate learning opportunities, and logistical constraints—producing uneven competence development.

**Subthemes**

- Limited clinical/community exposure due to placement context
- Logistical barriers (travel/time)
- Inconsistent guideline implementation across agencies

**Evidence (quotes)**

- "We struggled to meet requirements because the rural context lacked relevant clinical opportunities." (Inst03–P03)
- "Field work is crucial, but in a rural area without appropriate clinical settings, it didn't fully prepare us…" (Inst03–P03)
- "More supervisor availability and better travel support would help a lot." (Inst12–P01)
- "Guidelines were useful, though agencies interpreted them differently." (Inst03–P03)

**Variation across institutions (matrix comparison)**

Barrier intensity varied by placement ecology: contexts lacking appropriate service settings (e.g., clinical exposure) generated stronger dissatisfaction and "self-initiative" learning narratives (Inst03), while more structured placements emphasized refinement rather than access (Inst06, Inst12).

**Theme 6: Improvement priorities centered on standardization, supervisor capability, and student voice**

Students consistently proposed practical reforms focused on formalizing feedback/evaluation, improving supervisor preparedness (especially social work orientation), strengthening placement options, and increasing structured mentorship.

**Subthemes**

- Formal feedback and evaluation mechanisms
- Supervisor training/qualification in social work principles
- Placement diversity/rotation and exposure planning
- Increased supervisor–student interaction

**Evidence (quotes)**

- "Introduce structured feedback mechanisms… and ensure supervisors have consistent training on mentorship." (Inst04–P01)
- "Ensure supervisors are qualified social workers or trained in social work principles…" (Inst04–P02)
- "Provide placements with at least some clinical services in rural areas or rotate students…" (Inst03–P03)
- "More structured feedback sessions would make it even better." (Inst06–P01)

**Variation across institutions (matrix comparison)**

Even where overall satisfaction was high, students still asked for more formal feedback and evaluation channels (Inst06, Inst12); where satisfaction was lower, recommendations were more structural (supervisor qualification, clinical placements, rotation models) (Inst03, Inst04).

**Principal findings**

Three findings stood out. First, students' practicum learning was strongly shaped by how structured the practicum ecosystem was—especially orientation and guideline clarity—suggesting that weak induction creates early role ambiguity that later supervision cannot always correct. Second, supervision operated as the core learning mechanism: when agency supervision was unavailable or misaligned with social work practice expectations, students described weaker skill development and more self-directed "patching" of learning. Third, feedback and evaluation were often experienced as informal, inconsistent, and low on student voice, implying that learning opportunities and assessment fairness can vary across placements even when programmes share similar training intentions. These patterns align with longstanding concerns that field learning is powerful but uneven when educational conditions are not consistently designed and monitored (Wayne, Bogo, and Raskin, 2010; Bogo, 2015).

## DISCUSSION

**Orientation and role clarity:** Your findings reinforce that practicum cannot be treated as "self- explanatory"; early clarity about expectations and learning goals is part of the educational design of field learning. In the signature pedagogy conversation, field education is often positioned as the central practice-learning site, but its effectiveness depends on whether programmes make learning expectations visible and routine rather than ad hoc (Wayne *et al*., 2010; Skeen, 2023).

**Supervision quality as the gatekeeper:** Students' emphasis on supervision is consistent with the view that field education is simultaneously a learning platform and a gate keeping process that develops and assesses competence (Bogo, 2015). The sharp contrast in your data between helpful faculty guidance and weaker/misaligned agency supervision parallels the literature that supervision quality, relationship safety, and supervisor capability strongly influence whether practicum becomes reflective learning or mere task completion (Pack, 2018).

**Feedback and evaluation systems:** The repeated call for timely, constructive feedback and clearer evaluation mechanisms echoes prior evidence that assessment in field education is difficult because it sits at the intersection of learning support and performance judgment, and can easily become inconsistent without rubrics and routine feedback cycles (Bogo, 2015; Pack, 2018).Your context adds a practical warning: when students lack a structured channel to evaluate placements and supervision quality, inequities in practicum experience can persist unnoticed across institutions.

**Theory–practice integration:** The theory–practice gap described by students is widely recognised as a central risk in practicum, and bridging that gap is often treated as a primary purpose of supervised practice (Pack, 2018; Bogo, 2015).Your findings sharpen the mechanism: integration "works" when supervision and placement exposure are aligned to social work methods; it "breaks" when supervision is not practice-relevant or when the setting lacks opportunities needed for the student's learning goals.

**Structural/context constraints:** The barriers students reported fit broader work-integrated learning evidence: placement learning depends on institutional–agency partnerships, access to authentic practice opportunities, and quality assurance mechanisms that keep learning conditions stable across sites (Chilvers, Hay, Maidment, and Tudor, 2021).Your multi-institution perspective is valuable here because it highlights variability as a system property, not merely an individual student issue.

**Improvement priorities:** Students' recommendations closely mirror best-practice calls to professionalise field supervision through clearer expectations, supervisor support/training, and stronger programme–agency coordination (Bogo, 2015; Wayne *et al*., 2010). The contribution from your context is that improvements must be designed for consistency across institutions (not left to "good supervisors" or "good agencies" by chance).

## RECOMMENDATION

**Institutional and agency implications**
**What should change in practice is straightforward and measurable**
**Standard supervision expectations:** programmes will define minimum supervision frequency, agenda (case discussion + reflective learning), and documentation expectations (Bogo, 2015).

**Supervisor qualification/training:** where agencies cannot provide social work-qualified supervisors, programmes will implement short mandatory training on social work learning goals, ethical practice learning, and assessment responsibilities (Wayne *et al*., 2010).

**Structured feedback loops and rubrics:** programmes will adopt common feedback checkpoints (e.g., early–mid–end placement) and transparent evaluation rubrics to reduce inconsistency (Pack, 2018).

**Student evaluation channel:** programmes will introduce an anonymous placement/supervision evaluation process with corrective action triggers (Pack, 2018).

**Placement matching and exposure planning:** placements will be matched to learning goals (and where needed, rotation/combined placements will be planned to address exposure gaps) (Chilvers *et al*., 2021).

**Institution–agency MoU and monitoring:** MoUs will specify learning responsibilities, supervision requirements, feedback processes, and escalation pathways; monitoring visits will focus on learning conditions, not only attendance (Bogo, 2015).

### Contribution

Methodologically, this study adds a multi-institution comparison of practicum experiences, strengthening interpretation by showing how themes vary across institutional contexts rather than reflecting one programme alone. Practically, it delivers actionable targets—supervision standards, feedback architecture, placement quality monitoring, and student voice mechanisms—that directly address the sources of uneven learning highlighted in the signature pedagogy debate (Wayne *et al*., 2010; Earls Larrison and Korr, 2013).

**Limitations**

This study will be limited by reliance on student-reported accounts, which may under-represent supervisor/agency perspectives and may vary in depth across institutions. Transferability will be bounded by the institutional and placement contexts represented in the dataset, and some demographic or placement variables may not be consistently available across all records. Finally, the absence of direct supervisor/agency interviews will restrict triangulation of perceived supervision and evaluation practices (Lincoln and Guba, 1985).

## CONCLUSION

This study shows that practicum learning is highly sensitive to how consistently programmes design and monitor the learning conditions of field education. Students' accounts indicate that orientation and role clarity, supervision quality, and feedback/evaluation systems are decisive levers that can either enable competence development or produce uneven outcomes across placements. Immediate improvement should focus on minimum supervision standards, supervisor preparation aligned to social work learning goals, and formal feedback and evaluation channels that include student voice. Future research should add supervisor and agency stake holder perspectives and test whether standardised supervision and assessment processes reduce inter- institution variability in learning outcomes (Bogo, 2015; Wayne *et al*., 2010).

### ACKNOWLEDGEMENT SECTION

The researcher extends sincere gratitude to all the social work students who participated in this study and shared their experiences. Special thanks are due to the heads of institutions and faculty members who facilitated data collection.

### ETHICAL APPROVAL AND INFORMED CONSENT STATEMENT

Ethical approval from all the institution head and Informed consent was obtained from all participants prior to data collection. Participants were assured of confidentiality, anonymity, and their right to withdraw at any stage without any consequences.

## ABSTRACT

The study investigates the role of digital governance and Aadhaar-linked platforms in delivering welfare schemes to Scheduled Caste (SC) communities, focusing on Karur District, Tamil Nadu. Addressing a critical research gap, the study explores how SC beneficiaries experience and navigate Aadhaar-based welfare delivery systems at the grassroots level. Using a qualitative case study approach, data were collected through semi-structured interviews with 12 SC respondents (6 males and 6 females) across Tharagampatti and Chinnandipatti villages. Respondents were selected purposively from Krishnarayapuram and Aravakurichi Blocks, based on their use of Aadhaar-enabled schemes. The findings reveal both opportunities and challenges: while Aadhaar has streamlined access to services like pensions, scholarships, and housing, issues such as biometric mismatches, digital illiteracy, and lack of localized support persist particularly for women and elderly SC members. The study highlights the need for gender-sensitive outreach, accessible grievance redressal, and community-based digital facilitation to ensure inclusive digital welfare governance in India.

## INTRODUCTION

In recent decades, the evolution of digital technology has significantly influenced the landscape of governance worldwide. In India, digital governance or e-governance has emerged as a powerful instrument in transforming the relationship between the state and its citizens. Designed to enhance transparency, efficiency, and accessibility in public service delivery, digital governance initiatives aim to bridge longstanding administrative gaps and ensure that the benefits of development are equitably distributed. From land records and healthcare to education and welfare, digital tools have been gradually integrated into various arms of governance, offering a citizen-centric approach to administration (Basu, 2004). One of the most ambitious projects in India's digital governance ecosystem is the Aadhaar program, launched in 2009 by the Unique Identification Authority of India (UIDAI). Aadhaar is a 12-digit unique identity number based on biometric and demographic data. As of 2024, over 1.3 billion residents have been enrolled in the Aadhaar system, making it the world's largest biometric ID program (UIDAI, 2024). Aadhaar's primary objective is to create a unified and verifiable digital identity for every citizen, thereby minimizing duplication, identity fraud, and systemic inefficiencies in service delivery. The introduction of Aadhaar-linked platforms for the distribution of public benefits has been a turning point in India's governance narrative. These platforms enable Direct Benefit Transfers (DBT), whereby subsidies, pensions, scholarships, and other entitlements are credited directly into beneficiaries' Aadhaar-linked bank accounts. The government reports that the mechanism has saved billions of rupees by reducing "ghost beneficiaries" and plugging leakages in welfare schemes (Meity, 2023). For the general public, these systems promise simplified access, faster grievance redressal, and fewer intermediaries. On the other hand, the implementation of digital governance is not without challenges. Across India, the benefits of digital initiatives remain unevenly distributed due to the digital dividea disparity in access to technology, internet infrastructure, and digital literacy, particularly in rural and remote areas (Singh, 2018). Aadhaar-based authentication has also been criticized for operational failures, including biometric mismatches and server downtime, which can hinder access to essential services like food rations or pensions (Drèze and Khera, 2017). Also, concerns over privacy, data protection, and state surveillance have gained traction in civil society discourse, calling into question the extent to which digital governance protects citizen rights (Ramanathan, 2016). Amid the broader context, it is essential to evaluate how such digital reforms affect not just the general population, but also historically marginalized communities, especially the Scheduled Castes (SCs).

Representing over 16.6% of India's population (Census of India, 2011), SC communities have long suffered structural exclusion from mainstream economic and social opportunities. Despite numerous constitutional safeguards and targeted welfare schemes, SCs continue to lag in indicators such as literacy, income, land ownership, and political participation (Jodhka, 2012). The use of digital platforms and Aadhaar-based service delivery holds both promise and pitfalls for SC populations. On one hand, technology-driven welfare distribution has the potential to bypass caste-based discrimination by depersonalizing delivery and eliminating corrupt intermediaries. On the other hand, it risks reinforcing exclusion if the digital divide is not adequately addressed. For instance, several studies show that SC households are less likely to possess smartphones, bank accounts, or stable internet access, all of which are prerequisites for accessing Aadhaar-linked services (Masiero, 2016; Khera, 2019). It creates a paradox where digital tools, designed to promote inclusion, may inadvertently perpetuate exclusion. At the sub-national level, Tamil Nadu presents a particularly relevant case for exploring the interplay of digital governance and Scheduled Caste welfare. With an SC population of around 20%, Tamil Nadu has a strong tradition of social justice and welfare-oriented governance (Thorat and Newman, 2007). Schemes like the Adi Dravidar Housing Program, educational scholarships, and entrepreneurship support for SCs are well-established. In recent years, Tamil Nadu has actively expanded its digital infrastructure through platforms like e-Sevai centers, designed to facilitate Aadhaar seeding, online applications for welfare schemes, and access to public services. Although, these advancements, SC communities in Tamil Nadu still encounter hurdles in fully leveraging digital services. Studies have highlighted implementation challenges such as lack of digital awareness, poor access to Aadhaar correction services, and limited handholding support in local languages (Rajasekhar *et al*., 2020). Besides, Aadhaar-linked disbursals are sometimes delayed due to authentication errors, especially in manual labor-intensive SC households where biometric wear and tear is common.

The study aims to critically assess how digital governance mechanisms, particularly Aadhaar-enabled platforms, influence the accessibility, inclusivity, and efficacy of Scheduled Caste welfare schemes at the national level and within Tamil Nadu. The central focus is to examine whether these digital interventions truly empower SC beneficiaries or create new forms of administrative and technological exclusion. The research will also explore institutional frameworks, user experiences, and systemic gaps, offering policy recommendations to strengthen digital equity in welfare delivery.

## REVIEW OF LITERATURE

Digital governance has redefined public service delivery in India, especially since the launch of the Digital India campaign in 2015, which aims to enhance digital infrastructure and bring services closer to citizens (Basu, 2004; Singh, 2018). The Aadhaar biometric identity system has been at the center of the transformation, enabling Direct Benefit Transfers (DBT) for schemes such as pensions, scholarships, and subsidies. UIDAI (2024) states that over 1.3 billion Aadhaar numbers have been issued, marking a shift toward centralized identification. Bhatia and Bhabha (2017) argue that Aadhaar has helped streamline welfare delivery by reducing duplication and fraud. However, Usha Ramanathan (2016) and Masiero (2016) highlight serious concerns about data privacy, exclusion errors, and the ethical implications of Aadhaar-based surveillance. According to Dey and Sharma (2017), rural and marginalized populations still face systemic barriers, including network failures and authentication mismatches, suggesting that digital infrastructure alone cannot ensure equitable welfare access. Empirical studies have offered mixed findings regarding Aadhaar's impact on social protection. Drèze and Khera (2017) found that Aadhaar-linked DBT systems reduced leakages in the Public Distribution System (PDS) but also noted that exclusion of genuine beneficiaries occurred due to technological failures. Khera (2019) emphasized that while Aadhaar may work well in urban areas, its application in rural or tribal regions can be exclusionary, especially where fingerprint mismatches are common. Ghosh (2021) analyzed the impact of Aadhaar in Jharkhand and found that biometric issues affected 12% of welfare recipients. Chopra and Singh (2020) highlight that Scheduled Castes, due to their socio-economic position, are less likely to have reliable internet access, smart devices, or awareness of digital entitlements. Singh and Patnaik (2022) add that digital illiteracy, especially among Dalit women, poses a significant barrier to accessing Aadhaar-linked services, creating a new form of digital caste-based exclusion. At the state level, Tamil Nadu is often cited for its relatively progressive and welfare-oriented governance model. Schemes like Adi Dravidar Housing, educational scholarships, and skill development programs for SCs are frequently implemented through Aadhaar-enabled platforms (Thorat and Newman, 2007; Tamil Nadu e-Governance Agency, 2023). Rajasekhar *et al*. (2020) observed that while Tamil Nadu's e-Sevai centers improved administrative access, SC beneficiaries still experienced procedural delays, poor grievance redressal, and language barriers. Babu and Manjula (2019) note that Aadhaar seeding in SC-dominated districts faced higher error rates compared to general population areas. Choudhury (2021) emphasizes that even when Aadhaar infrastructure exists, field-level implementation in welfare schemes often lacks caste-sensitivity and local awareness campaigns. Also, Srinivasan and Kannamma (2020) found that Aadhaar integration in SC scholarship programs resulted in increased delays and confusion among first-generation learners. These studies indicate a clear need to interrogate how digital governance interacts with socio-cultural realities at the grassroots level.

## RESEARCH GAP

While the existing literature offers a broad understanding of Aadhaar and digital governance in India, there is a significant lack of case-specific research focusing on Scheduled Castes and their lived experiences with Aadhaar-linked platforms, particularly at the grassroots level. Most available studies examine Aadhaar as a centralized policy tool influencing the general population, often overlooking the caste-based, digital, and bureaucratic barriers that marginalized communities like the SCs face in accessing welfare schemes. Moreover, the diversity in state-level implementation strategies—shaped by regional infrastructure, governance priorities, and community awareness has not been adequately captured in existing analyses. Tamil Nadu, known for its proactive social welfare delivery and

digital governance mechanisms, provides a compelling context to explore these gaps. However, there is limited empirical evidence on how Aadhaar-linked platforms operate within SC welfare schemes in specific districts of the state. To address the, the present study titled, "Assessing the Role of Digital Governance and Aadhaar-Linked Platforms in the Delivery of Scheduled Caste Welfare Schemes: A Case Study from Karur District", seeks to examine the effectiveness, accessibility, and limitations of digital delivery systems as experienced by SC beneficiaries in Karur. By grounding the analysis in a real-world case, the research intends to offer context-sensitive insights that contribute to the broader discourse on inclusive and equitable digital governance in India.

## METHODOLOGY

The present study follows a qualitative case study design to explore the role and effectiveness of digital governance and Aadhaar-linked platforms in delivering welfare schemes to Scheduled Caste (SC) communities. The case study approach enables in-depth exploration of real-life experiences and challenges faced by beneficiaries within a specific socio-cultural and administrative context Karur District of Tamil Nadu.

**Sources of Data**

**Primary Data**: Collected through semi-structured interviews using a well-designed interview schedule administered directly to SC beneficiaries.

**Secondary Data**: Obtained from government policy documents, UIDAI reports, Tamil Nadu e-Governance Agency publications, Census 2011, academic studies, and welfare scheme guidelines related to Aadhaar and SC welfare.

**Sampling Procedure**

The study utilized a purposive sampling method to select respondents who meet the study criteria. The sample was drawn from two administrative blocks of Karur District:

- Krishnarayapuram Block
- Aravakurichi Block

Within these blocks, two villages were selected based on Scheduled Caste population density and accessibility to Aadhaar-linked services:

- Tharagampatti Village (Krishnarayapuram Block)
- Chinnandipatti Village (Aravakurichi Block)

From these villages, a total of 12 Scheduled Caste respondents were purposively selected:

- All respondents were aged 18 years and above**.**
- The sample was gender-balanced**,** with6 male and 6 female participants.
- Respondents were chosen based on their direct experience with Aadhaar-enabled welfare schemes such as scholarships, pensions, subsidies, and housing benefits.

**Research Tool: Interview Schedule**

The primary research instrument was as emi-structured interview schedule, which included both open-ended and close-ended questions**.** The interview guide covered the following themes:

- Basic demographic profile (age, gender, education, occupation)
- Awareness and knowledge of welfare schemes available for SCs
- Experience with Aadhaar registration and authentication
- Challenges faced in accessing Aadhaar-linked services
- Perceptions about digital governance and service delivery
- Feedback on transparency, efficiency, and grievance redressal mechanisms

The tool was developed in English and translated into Tamil to facilitate easy communication with respondents.

**Data Collection Procedure**

Interviews were conducted in person by the researcher in the local language at the respondents' homes or community spaces, ensuring a comfortable and private environment. Each interview lasted approximately 30–45 minutes, and responses were recorded with the participants' consent. The data was collected over a period of two weeks.

**Ethical Considerations**

1. Informed consent was obtained from all participants before the interviews.
2. Participants were briefed about the purpose of the study and their right to withdraw at any point.
3. Confidentiality and anonymity were maintained throughout the research process.
4. Ethical approval was sought from the concerned institutional review board before the commencement of fieldwork.

**Case Study Analysis**

Case studies serve as a vital research tool by offering rich, contextualized insights into how digital governance and Aadhaar-linked platforms function in real-life settings. In the context of Scheduled Caste welfare schemes in Karur District, Tamil Nadu, case studies provide a nuanced understanding of the lived experiences of beneficiaries interacting with these digital systems. The approach helps uncover the practical challenges, successes, and gaps in the delivery of welfare benefits through Aadhaar-enabled mechanisms. By focusing on individual narratives and community-level interactions, the analysis reveals how technological interventions shape accessibility, inclusion, and empowerment among marginalized SC populations, thus offering valuable perspectives that complement broader quantitative assessments.

**Case Study-1**

A male namely Ramu, age 45, from Tharagampatti, faced denial of subsidized ration for three months due to biometric mismatch in his Aadhaar. Being digitally illiterate, he had to travel to Karur to update his fingerprint data with help from his son. After updating, his ration benefits resumed. Ramu's experience reveals the challenges SC beneficiaries face with biometric failures, especially in rural areas lacking digital support. His story emphasizes the need for accessible local assistance to prevent digital exclusion from essential welfare schemes.

**Case Study-2**

A female namely Meena, age 31, from Orathur, transformed her life through a mobile-based voice-assisted ICT program introduced by an NGO. Despite illiteracy, she learned to use WhatsApp and YouTube for daily needs and community discussions. She organized a village cleanliness drive by mobilizing 30 women via voice messages. Meena's growing confidence led her to participate in village meetings and advocate for women's rights. Her case demonstrates how inclusive digital tools can empower illiterate SC women by connecting them to vital information and collective action.

**Case Study-3**

A male namely Senthil, age 38, from Chinnandipatti, was unaware that linking Aadhaar was necessary to receive MGNREGA wages. He worked weeks without pay until a field officer directed him to an e-Sevai center to link his Aadhaar and bank account. His wages were credited within ten days. Senthil's experience shows the risks digital illiteracy poses and highlights the value of local digital centers. The case highlights the importance of supporting SC workers in navigating Aadhaar-based wage payment systems.

**Case Study-4**

A female namely Kaveri, age 68, a widowed SC woman from Vellivadi, stopped receiving her pension after her Aadhaar details were not updated following her husband's death. With mobility challenges, she relied on her niece to visit the e-Sevai center, where records were corrected and payments resumed. Kaveri's experience reveals how

digital systems, though efficient, may unintentionally exclude elderly rural women when personal circumstances change, stressing the need for outreach and home-based Aadhaar updating for vulnerable SC elders.

**Case Study-5**

A male namely Rajendran, age 51, from Ponnampatti, lacked formal documents for his inherited farmland. Using the e-Sevai center, he linked Aadhaar to digital land records and obtained his patta, enabling access to agricultural subsidies and loans. Digitization granted him legal recognition as a landholder, previously denied due to bureaucratic hurdles. Rajendran's story highlights how Aadhaar-linked land digitization supports SC farmers in securing entitlements and economic independence through formal inclusion.

**Case Study-6**

A female namely Aarthi, age 22, a first-generation SC college student from Thanthoni, applied for a Post-Matric Scholarship via an e-Sevai center. Staff helped her upload Aadhaar-linked documents online, and within two months, the funds were credited. Aarthi's experience shows how digital governance can ease educational financial access for young SC women when user support is available for navigating online systems, helping reduce dropout risks.

**Case Study-7**

A male namely Munusamy, age 34, a daily-wage worker from Aravakurichi, applied for housing under PMAY but was rejected due to mismatched Aadhaar and bank account names. He made repeated trips to correct the error, missing wages. With NGO help, he resubmitted and succeeded. Munusamy's case illustrates how small technical errors in Aadhaar data can disproportionately affect low-income SC households and delay access to critical housing benefits.

**Case Study-8**

A female namely Dhanam, age 49, from Tharagampatti, enrolled in the Ujjwala Yojana but never received the subsidy because the LPG dealer registered the wrong mobile number. Being illiterate, she couldn't manage OTPs. Her son helped correct the details, and she now receives the subsidy. Dhanam's experience highlights how digital barriers and dependence affect rural SC women and the need for user-friendly systems and local support for low-literate beneficiaries.

**Case Study-9**

A male namely Periyasamy, age 63, from Moolakarai, linked Aadhaar to enroll in the Tamil Nadu health insurance scheme. He later accessed free treatment for heart disease at a government hospital. His children helped complete online formalities. Periyasamy's case demonstrates that well-implemented Aadhaar-linked health schemes can significantly improve the quality of life for vulnerable SC elders in remote areas.

**Case Study-10**

A female namely Kalaivani, age 52, from Chinnandipatti, was unaware that her widow status needed updating to continue receiving pension payments. After two years of missed payments, officials helped her re-enroll during an outreach camp. Kalaivani's experience shows how digital illiteracy among SC women, especially widows, can cause exclusion unless proactive state outreach and localized support are provided.

**Case Study-11**

A male namely Velmurugan, age 24, an unemployed youth from Thanthoni, lacked awareness about SC skill development schemes and did not own a smartphone. After attending a digital literacy camp, he registered for a tailoring course through the Aadhaar-linked employment portal, improving his skills and confidence. Velmurugan's story highlights how rural SC youth can benefit from digital welfare systems when proper guidance and outreach are in place.

**Case Study-12**

A female namely Poonkodi, age 40, from Vellivadi, repeatedly faced Aadhaar verification errors applying for her daughter's scholarship. After months of failure, she filed a grievance through the Tamil Nadu helpline. The issue was resolved in three weeks, and Poonkodi began helping other village women with similar problems. Her experience emphasizes how grievance redressal in digital governance can empower rural SC women as community change agents.

## DISCUSSION

The case studies highlight how digital governance and Aadhaar-linked platforms are reshaping welfare delivery for Scheduled Castes (SC) in Karur District, revealing both opportunities and challenges. While the system facilitates streamlined access to subsidies, pensions, scholarships, and land rights (Case Studies 5, 6, 9), it also exposes digital literacy gaps, especially among marginalized SC populations. Male beneficiaries like Ramu and Munusamy faced issues such as biometric mismatches and data errors that interrupted access to essential services (Case Studies 1, 7). Their experiences emphasize the critical need for robust local support to navigate complex digital bureaucracies, consistent with Gupta and Sharma's (2018) findings on digital exclusion risks in rural India. Importantly, gender emerged as a key factor influencing experiences with digital platforms. Female respondents such as Meena and Dhanam, despite illiteracy, benefited from voice-assisted ICT programs and family support to overcome digital barriers (Case Studies 2, 8). Their cases illustrate the transformative potential of gender-sensitive digital interventions, supporting Singh *et al*.'s (2021) assertion that tailored digital literacy programs empower rural women socially and economically. Elderly women like Kaveri and Kalaivani (Case Studies 4, 10) encountered unique challenges related to mobility and lack of awareness, underscoring the compounded vulnerabilities faced by SC women due to age, gender, and social status. The aligns with Narayan and Roy's (2017) advocacy for proactive outreach and accessible grievance redressal to ensure women's inclusion in digital governance. Youth experiences also indicate that digital literacy and access differ by gender. Velmurugan, a young male, gained employment skills through digital platforms after receiving guidance, whereas young SC women like Aarthi accessed educational scholarships with institutional help (Case Studies 6, 11). These narratives underscore the importance of combining technology with community-based support to close gender and caste divides. Overall, the cases reveal that while Aadhaar-linked digital governance holds promise for inclusive welfare delivery, its success depends on addressing gender-specific barriers through localized, user-friendly interventions.

## CONCLUSION

The study underscores the significant role of digital governance and Aadhaar-linked platforms in improving the delivery of welfare schemes to Scheduled Caste communities in Tamil Nadu. The integration of Aadhaar with various social protection programs has enhanced efficiency, transparency, and accessibility. On the other hand, the research also reveals persistent challenges, including digital illiteracy, biometric authentication failures, and gender-specific barriers that disproportionately affect marginalized SC beneficiaries, particularly women and the elderly. Addressing these challenges requires a multipronged approach involving localized digital support services, gender-sensitive interventions, and robust grievance redressal mechanisms. By bridging technological gaps with inclusive policies and community engagement, digital governance can become a powerful tool for social equity and empowerment. The study contributes valuable insights for policymakers aiming to design and implement welfare delivery systems that are both technologically advanced and socially inclusive, ultimately fostering greater access and participation among marginalized groups.

## ABSTRACT

Flue-Cured Virginia (FCV) tobacco is a significant commercial crop grown in India, with Karnataka Light Soil (KLS) being one of the principals producing regions. Despite operating under a regulated production and marketing system, a regional difference exists within the regions. This study examines the production dynamics of FCV tobacco by comparing the KLS region with other FCV-growing regions of India using 15 years of secondary data. Descriptive statistics, independent sample t-tests, compound annual growth rate (CAGR) analysis, and both linear and log-linear regression models were used to analyse the regional disparities, growth trends, and indicators of marketed output. The results show that the KLS region records lower numbers of registered growers, smaller quantities marketed, and declining trends compared to other FCV-producing regions. Regression results indicate that area planted is the leading parameter of quantity marketed, with near unitary elasticity, while the number of registered growers employs a negative influence. Even after controlling for key variables, the regional dummy remains highly significant. The study concludes that scale efficiency and region-specific limitations play a decisive role in FCV tobacco production.

**Keywords:** FCV Tobacco; Karnataka Light Soil region; Quantity Marketed; Area Planted; Growers;

## INTRODUCTION

Flue-cured Virginia (FCV) tobacco plays a significant role in Karnataka, India's agricultural economy. It contributes directly and indirectly to rural livelihoods, export revenue, and state income. In India two major states dominate FCV tobacco production such as Andra Pradesh and Karnataka: Karnataka produces nearly one-third of India's total tobacco production, focused in the districts of Mysuru, Hassan, and Belagavi (Government of Karnataka, 2023). The high-quality leaf of the tobacco crop, highly demanded in international markets, converts it into an export commodity, generating approximately ₹3,000 crore annually as export earnings (Tobacco Board of India, 2023). This FCV tobacco directly or indirectly supports the livelihoods of millions of individuals (FAO, 2021). Despite its economic benefits, the tobacco crop faces many challenges (Central Tobacco Research Institute [CTRI], 2022). The Karnataka Light Soils (KLS) region holds a dominance in FCV tobacco cultivation; it is one of the leading FCV tobacco-growing zones for high-quality, export-quality leaf. This region has light-textured red sandy loam soils and semi-arid climates covering the Mysore, Hassan, and Chamarajanagar districts (CTRI, 2022). The well-drained soil conditions and moderate rainfall are helpful to the production of the quality of leaf demanded in global cigarette blends (Tobacco Board of India, 2023). This region contributes approximately 25-30% of the nation's FCV tobacco production. It has a significant portion of India's tobacco economy (Government of Karnataka, 2023). Continuous research interventions by CTRI—such as improved seed varieties and energy-efficient curing technologies—have enhanced productivity and reduced post-harvest losses in the region (CTRI, 2022). However, while the KLS region's contribution to India's FCV export competitiveness is undeniable, sustainability challenges like soil degradation, fluctuating global demand, and environmental implications of flue-curing call for adaptive cultivation practices and crop diversification strategies. Present existing studies on FCV tobacco have focused on profitability, alternative crop cultivation, and tobacco control policy issues; however, systematic region-specific econometric analyses examining the interaction between registered tobacco growers, area planted, and marketed quantity over time remain limited. To resolve this issue, the present study undertakes a regional analysis of FCV tobacco production dynamics in the KLS region with the following objectives:

1. To compare the key production indicators between the KLS region and FCV production regions of India.
2. To evaluate the long-term growth trends.
3. To identify the determinants of FCV tobacco marketed in quantity.

The following are hypotheses for the present study:

**H01:** There is no statistically significant difference in key FCV tobacco production parameters between the KLS region and other FCV tobacco-growing regions of India.

**H11:** There is a statistically significant difference in key FCV tobacco production parameters between the KLS region and other FCV tobacco-growing regions of India.

**H02:** There is no statistically significant difference in the CAGR of key FCV tobacco indicators between the KLS region and other FCV tobacco-growing regions of India.

**H12:** There is a statistically significant difference in the CAGR of key FCV tobacco indicators between the KLS region and other FCV tobacco-growing regions of India.

## LITERATURE REVIEW

**H.C. Yogesh and S.K. Srinvastava (2018):** This study focusing on Karnataka found that tobacco cultivation in the light soils region is predominantly rain-fed. FCV tobacco is the most economically significant type of tobacco in India. It increases export earnings and strengthens rural livelihoods. Andhra Pradesh and Karnataka, two states, nearly control the entire FCV tobacco production in India, supported by a regulated marketing system under the Tobacco Board. This study highlights that FCV tobacco is a high-value commercial crop with a guaranteed market,

Tobacco Board support, and a stable return compared to other alternative crops. Firewood availability is the major constraint for tobacco cultivation in these regions.

**Arunkumar R. Kulkarni *et al.* (2023):** This study highlights the importance of FCV tobacco farming in the agricultural economy of Karnataka, particularly in the Mysore region. This study focused on analyzing the tobacco value chain in Karnataka and identifying FCV tobacco growers as weaker actors compared to manufacturers, despite the safeguards under regulated markets like the Tobacco Board.

**K. Viswanatha Reddy *et al.* (2017)** reported on their study of Andhra Pradesh light soil regions, which relatively produce higher crops and realize better prices compared to other light soil regions because of supported soil conditions and stable production environments. Many of the policy-oriented research studies that investigate FCV tobacco crop size regulation in Andhra Pradesh reflect that changes in planting area directly influence marketed output and farmers' crop choices.

**Dr. Manu V. K. (2019)** the study conducted in the Karnataka light soil region focusing on the Mysore area highlights that tobacco growers of this region have an awareness of alternative crops, but none of the crops provide a better return compared to FCV tobacco. The existence of tobacco cultivation in this region is attributed to its cost-benefit ratio rather than agronomic advantage alone.

**Imtiaz Ali *et al.* (2014):** This study highlights that many of the studies discuss the growers, area, and output of tobacco descriptively; while productivity and profitability of the crop are discussed often, the relationship between farmer participation and scale of cultivation was under examined. International research studies identified that expansion in the number of tobacco growers without an increase in the tobacco cultivated area may lead to declining per capita output, though such types of interactions are rarely examined econometrically in the Indian FCV tobacco context.

**M. G. Mostafa *et al.* (2024)** found that many of the studies discussed tobacco farming within the context of socioeconomic and environmental aspects. Comparative studies from Bangladesh and South Asia claim that tobacco cultivation is economically attractive in the short period and increases environmental and health costs. These research studies focus on household income, emissions, and health risks rather than tobacco production efficiency or output dynamics.

**Natarajan, Nithya (2019)**. This study adopts a qualitative and historical lens to test agricultural change, labor relations, and environmental degradation. These studies provide background insights, but they do not provide region-specific production information using available secondary data.

A review of the existing research studies discloses several important gaps that permit further empirical investigation. Most of the research studies on FCV tobacco farming are based on descriptive statistics and surveys, with a noticeable absence of region-specific econometric analyses using log-linear models to measure the effects of area and grower participation across regions. Although the number of tobacco growers and cultivated area are frequently described, their combined studies have not been examined using empirical models. Despite the KLS region being widely accepted as structurally constrained, very few studies are undertaking systematic comparisons with other FCV-cultivated regions. Addressing these gaps, the present study undertakes a region-wise analysis of FCV tobacco farming by comparing the KLS region and other FCV tobacco-cultivated regions over a 15-year period. By adopting linear and log-linear regression models using official Tobacco Board data. This empirical evidence contributes to agricultural economics and offers policy-relevant insights into regional performance in FCV tobacco farming.

## MATERIALS AND METHODS

In India, FCV tobacco is majorly grown in Andhra Pradesh and Karnataka state. This study is based on secondary data collected from the Tobacco Board of India. The present research study used key variables for analysis, including registered tobacco growers (numbers), area planted (ha), quantity marketed (million Kgs), and a regional dummy variable was constructed. 15 years of data (2010-11 to 2024-25) from the KLS region and other regions were analyzed. For this analysis, descriptive statistics to summarize variables, followed by an independent sample t-test to test mean differences, and growth trends were analyzed by using compound annual growth rates (CAGR), estimated through log-linear growth models. For examining the marketed quantity, both linear and log-linear regression models were utilized. Diagnostic tests were conducted to evaluate model adequacy and multicollinearity.

## LIMITATIONS OF THE STUDY

1. The present study was based on secondary data for a limited time.
2. The study divided tobacco production areas into two regional groups—KLS and other regions of India.
3. The study cannot analyze other core production indicators such as price trends, input costs, yield per hectare, etc.
4. The study cannot attribute regional disparities to specific factors.

## RESULTS AND DISCUSSIONS

A series of independent samples t-tests were conducted to compare FCV tobacco production indicators between the KLS region and other FCV-producing regions of India. The variables studied included the number of registered growers in numbers, the total area planted in hectares, and the quantity marketed in million kgs. Descriptive statistics and inferential results are presented in Table 1.

**Registered growers:** the results revealed a significant difference in the number of registered growers between the KLS region and other regions of India, $t(21.66)=-7.29$, $p<.001$, reflecting that the KLS region had fewer registered growers ($M=41,723.13$, $SD=897.68$) compared to other regions of tobacco growing ($M=45,249.60$, $SD=1,644.34$). The mean difference of -3,526.47 indicates a disparity, with other regions having more registered tobacco producers. This difference reflects the smaller cultivation size of the KLS region and the greater concentration of smallholder farmers depending on FCV tobacco cultivation rather than scale expansion (Tobacco Board of India, 2023).

**Area Planted (ha): For** total area under FCV tobacco cultivation, the difference between the KLS region and other regions of India was not statistically significant, $t(20.97) = -1.53$, $p = .14$. While the KLS region reported a lower mean area planted ($M = 81,630.80$ ha, $SD = 13,959.38$) than other FCV-growing regions ($M = 93,681.87$ ha, $SD = 27,031.26$), the variability was higher in non-KLS regions. This suggests that KLS areas cultivated smaller land.

**Quantity Marketed (Million Kg): The** analysis shows a highly significant difference in the quantity of FCV tobacco marketed between the KLS region and other regions, $t(17.52) = -5.75$, $p < .001$. The KLS region marketed less tobacco ($M = 91.89$ mkg, $SD = 15.88$) compared to other regions ($M = 162.02$ mkg, $SD = 44.46$), with a mean difference of -70.13 mkg. This indicates that while KLS tobacco is concentrated on the quality of the crop, its marketed volume remains considerably lower. The lesser quantity of tobacco marketed shows the KLS region's focus on premium-grade and export-quality tobacco leaf rather than high production (Central Tobacco Research Institute [CTRI], 2022).

**Growth trends of FCV tobacco indicators**

An analysis of the CAGR of FCV tobacco indicators was conducted to assess regional performance trends over time between the KLS region and other FCV growing areas. The CAGR results, expressed as percentage change per year, are shown in Table 2.

**Registered Growers:** The number of registered growers showed a significant declining trend in both the KLS and non-KLS regions, though the rate of decline was less marked in the KLS region (-0.30% per year, p<.05) compared to the non-KLS regions (-0.80% per year, p<.01). This suggests that the KLS region has retained a more stable producing population. This resilience may be credited to the region's institutional infrastructure and high-quality tobacco leaf grade (Tobacco Board of India, 2023).

**Quantity Marketed:** The quantity of FCV tobacco marketed showed a significant negative growth in the KLS region (-2.37% per year, p < .05), whereas the decline in other tobacco-producing regions (-0.20% per year) was statistically not significant. This displayed that production and marketable surplus have contracted sharply in the KLS region; the non-significant change in other regions implies relative stability in production volumes.

**Area planted (ha):** The area planted under FCV tobacco indicated a significant decline in both regions—2.4% per year in the KLS region (p<.01) and 2.5% per year in other regions (p<.10)—reflecting an overall declining trend in land used for FCV tobacco cultivation across India.

The CAGR results show a determined decline in FCV tobacco cultivation in both the KLS region and other regions. The decline in registered growers and quantity marketed is noticeable in the KLS region and shows constraints such as rain-fed conditions, labor scarcity, etc. These trends support earlier descriptive and inferential findings of the study. The linear regression model explains a proportion of the variation in marketed quantity. Area planted is indicated as the strongest positive determinant, while the number of registered growers shows a significant negative effect. The regional dummy variable remains negative and highly significant, showing lower marketed output in the KLS region even after controlling for key variables. The log-linear regression analysis reflects near unitary elasticity of quantity marketed with respect to area planted, the results highlighting area of cultivation as the major driver of output. The negative elasticity of registered growers suggests that increased grower participation without expansion in area leads to scale inefficiencies. The regional dummy shows that the KLS region markets approximately 47.5% less output than other regions, showing deep-seated structural constraints. Across descriptive, inferential, growth, and regression analysis, the outcomes consistently validate that the KLS region is structurally disadvantaged in FCV tobacco production; area expansion, rather than grower expansion, is critical for increasing marketed surplus; and declining trends in growers, area, and output show long-term decline of FCV tobacco farming.

## CONCLUSION AND POLICY IMPLICATION

This study provides empirical evidence on regional inequalities in FCV tobacco production across the regions. The findings reveal that the KLS region is structurally disadvantaged in terms of quantity marketed, despite operating under the same regulatory framework as other tobacco-producing regions. Scale efficiency, rather than cultivator expansion, plays a pivotal role in assessing the marketed surplus. The results of the study suggest that policy interventions prioritize scale efficiency and productivity enhancement rather than expanding producers' numbers. Region-specific support measures are required for the KLS region. A well-planned and gradual decline in the area used for FCV tobacco, supported by training and advisory services, is important for maintaining livelihoods. Any move toward crop diversification should be based on reliable data and consider local conditions.

## ABSTRACT

Mobile ticketing and live tracking are essential to the Indian commuters navigating daily through public transport systems. Real time visibility and cashless travel are the core promises of Chalo app. The reviews posted during 2025 reveal that the experience is not perfect. Many commuters remain troubled with payment failures, ticket mismatches and unpredictable tracking behaviour. This study investigates Google play store reviews written in the year 2025 and concentrating particularly on two connected issues,viz., on the reliability of mobile ticketing system in actual journeys and on how well the app integrates with unified payments interface (UPI). Using a mixed methods approach, we investigated a random sample of 1000 reviews out of two lakh reviews posted by the commuters in the year 2025. These reviews are extracted from the Google play store randomly. Each review is then categorised based on recurring themes such as tracking accuracy, ticketing failures, UPI functionality, payment errors, interface concerns and overall sentiment. Nearly,60 % of the reviews mentioned are on recurring tracking or on visibility issues, while about 15% described are on clear ticketing failures where money was debited but no valid, usable digital ticket appeared on the screen. A smaller yet substantial group of users demanded broader UPI support or pointed out that only a single UPI app seemed to function reliably. Overall, the findings show that by 2025, commuters expected Chalo to offer smooth, hassle-free multi-provider UPI integration and a verifiable ticketing system. Instead, they often encountered unrecognised tickets, double charges, refund delays and confusing transaction messages. These problems and the weakened trust, with several users advising others not to use the payment feature at all. While a small group of reviewers praised the convenience of digital passes when the system worked smoothly. These problems

and the weakened trust, with several users advising others not to use the payment feature at all. While a small group of reviewers praised the convenience of digital passes when the system worked smoothly. The study underscores that deeper UPI integration, transparent refund workflows and better synchronisation with conductor devices are essential for rebuilding user confidence.

**Keywords:** Chalo, payments, system, digital, UPI

## INTRODUCTION

During the last decade, the public transport system has seen tremendous progress. The urban bus travel in many Indian cities has improved user experiences such as paperless tickets, guesswork on bus expected arrival time, departure time, and waiting time through digital tools as well asthrough real time information systems, especially in Class-I and Class-II cities. Among the major tools contributing to this change is the Chalo – Live bus tracking app, developed by Chalo Mobility Private Limited and this is available for Android and iOS platforms. The app covers nearly 65 Class-I and Class-II cities in India as well as available internationally at Philippines, Singapore, etc. Some of the major features of this free app includes live bus tracking, digital tickets, digital passes and special fare plans inside a single app, live tracking of bus, mobile bus pass, etc. It frames itself as one such everyday companion. Transport applications in smartphone are intended to minimise uncertainty, shorten waiting time and simplify payments [1]. Concurrently, the wider Indian payments ecosystems have been converted by the Unified payments interface (UPI). For many commuters, UPI has become the easiest go-to method to pay for almost everything, from street tea to electricity bills[2]. They do not ask whether UPI is supported or not, while they open a public transport app in 2025. They assume it is integrated smoothly into the experience. Frustration is almost guaranteed, if the assumption is broken, or if UPI works only in a restricted way.

Live tracking and digital passes made daily bus travel easier for some users. Others describe mornings are ruined by buses that vanish from the map, tickets that conductors refuse to accept and money that disappears into the system with no clear refund process [3]. In several cases, users explicitly warm fellow commuters not to trust the payment function. The above contrasting experiences are clearly captured by the 2025 Google Play reviews for Chalo. This paper presents an analysis of the gap between promise and practice. Instead of starting from theory, we start from what users actually wrote. We consider the 2025 reviews as an empirical dataset and raises three simple questions:

- How did users in 2025 talk about UPI and payment integration in the Chalo app
- What kinds of problems did they report with mobile tickets and passes
- How did those problems affect their trust and behaviour

Our goal is to support two distinct audiences, who will draw meaningful conclusions from the issues raised in these above questions. This paper will deliver the following contributions. Altogether, the 2025 reviews offer a clear, transparent picture of how commuters actually experience UPI payments and mobile ticketing on the Chalo app. They illustrate where expectations are met, where they fail and why these gaps matter for everyday travel. This study expectations are met, where they fail and why these gaps matter for everyday travel.

**Research Objectives**

The core objective of this paper is to understand how actual users of the Chalo app, during 2025, experienced and evaluated two fundamental, core defining components of the service:

Building on this aim, the enquiry proceeded through four core objectives:

1. To determine the frequency with users in 2025 UPI, digital payments, and wallet issues in their reviews.
2. To identify the range of ticketing failures that users reported and how those failures affected their behaviour and trust.

3. To chart dominant sentiment patterns in 2025 user reviews and see how payment and ticketing problems fit into that sentiment profile.
4. To develop practical, evidence-informed recommendations for Chalo's developers and partner agencies, based directly on patterns in user feedback.

These objectives are grounded in empirical observation and analysis. We have listened carefully to what users already utter and to organise it in a systematic way.

## METHODOLOGY

**Data Source and Time Window**

The data, taken for this study come entirely from the public user reviews of the Chalo app existing on the Google Play store. At the time of data collection, the Chalo listing reported more than ten million downloads and more than two lakh complete set of reviews. To focus exclusively on the current user experience, we limited the dataset to reviews clearly and explicitly posted during the year 2025. We extracted a random subset of 1000 English-Language reviews posted in 2025 for that we adopted a random sampling strategy to obtain a manageable yet representative dataset from the given large size of the review population. (Total reviews= 2 lakh→ 2025 reviews→English-only reviews→full manual scan random interval selectionfinal sample:1000 reviews) All 1000 reviews were kept for analysis without any further skewed, narrowing, or subjective selection. This approach guaranteed that the dataset presented genuine signs, indications of user diversity, including both short and long reviews (but not extremely short or extremely long), positive and negative feedback and an extensive range of commuter experiences. Each review was handled as a textual artefact for qualitative coding, and the dataset is signified to as the "2025 Chalo Google Play review sample" throughout the paper. No personal data were retrieved or accessed beyond the public display names already obvious on the Play Store.

**Coding and Thematic Categories**

We adopted a qualitative, contextual data analysis approach [4]. Two rounds of reading of the full dataset were carried out. We performed open coding in the first reading. We marked the phrases related to:

Based on this open coding, we enhanced a set of thematic categories, and each review could belong to more than one category. The final categories were:

**Live tracking and timing issues**- buses were not appearing on the map, wrong arrival times, bus icons freezing or vanishing [3].
**Ticketing and payment failures**- payment deducted but no ticket received, ticket not recognised by the conductor's device, amount of the ticket deducted twice. Expired tickets with no recourse.
**UPI and payment integration**- references to UPI, particular UPI apps like Google pay, desire for more payment options, wallet restore problems.
**Feature suggestions and usability**-requests to add shortcuts, reinstate removed options, advances interface flow.
**Positive overall experience**- Even if minor issues are mentioned, clear statements that the app is useful or convenient.
Each review was manually coded, assigned to all relevant applicable categories. If the review is simply stated something like 'there are issues with ticketing' without any mention of money loss or conductor-side error, it was not counted as a clear ticket failure. Such ambiguous statements were coded conventionally.

**Quantitative Summaries**

We accumulated simple frequency counts for each category after coding, these counts provide a reasonable picture of how normal each theme was within the 2025 sample, without implying statistical precision.

Drawing on common sentiment analysis practices, we also assigned a sentimental label to each review. We used three labels:

- Negative- mostly complaints and strong dissatisfaction.
- Mixed or Neutral- a balance of praise and criticism, or a relatively neutral tone.
- Positive- clear praise, with problems either absent or minor.

The assignment was grounded on explicit, precise emotional language and the overall direction of the narrative.

## FINDINGS

**Overview of Themes**

The table below provides a high-level summary of how repeatedly each theme appeared in the 2025 reviews. These numbers overlap, since reviews can belong to more than one theme. The dominant problems faced are live tracking issues, and ticket failures form a significant minority of complaints. UPI is not mentioned in every review, but when it does appear, it emerges as a primary issue in the users' experience.

**Sentiment Profile**

User sentiment toward the Chalo App in 2025 shows a noticeably polarized pattern. Driven mainly by frustration, disappointment with live tracking failures, unreliable timing missing buses on the map and frequent app crashes , a clear majority of reviews lean negative but at the same time, a smaller yet meaningful segment of reviewers report positive or somewhat positive experiences, emphasising convenience and time-saving features when the app functions properly. The sentiment distribution signals that around 70% of 2025 reviews reflect mixed or neutral evaluation and about 10 % clearly express positive feedback across the dataset. This overall pattern is coherent and consistent with commuter frustration during significant commute delays. Through the users repeatedly mentioning words such as 'worst' 'frustrating' and 'useless', this emotional tone across many reviews is remarkably strong and keep recurring. Ground this analysis, the following ten excerpts illustrate the range of user sentiment, taken exactly from the reviews found in the 2025 dataset. The strength and the intensity of negative responses, combined with pockets of neutral and positive feedback, provides a nuanced but consistent account of how reliability gaps persuaded public perception. Collectively, the ten excerpts highlight that user sentiment in 2025 was modelled by direct, everyday experiences.

**UPI Integration: Limited Support and Growing Expectations**

Only a small number of reviews explicitly, directly mention UPI or Individual UPI apps, but even these few entries clearly express what commuters expected in 2005.

One user write:

Here, the user's insistence on adding "three or four payment apps" suggests that broader support for common UPI platforms such as PhonePe, Paytm and other bank-based UPI apps is now seen as standard. It is treated as a basic necessity. Another reviewer underlines the need for clearer refund handling:

This comment highlights a second expectation that the users want transparent, visible, reliable refund and transaction status when failures occur mere accepting UPI is not enough. Good UPI performances can soften frustrations with tracking, but failures on both fronts quickly erode trust in the append when read collectively, there reviews confirms that commuters view UPI integration and refund transparency as essential to their overall experience.

**Ticketing Failures: Lost money and Lost Trust**

Incidents involving real money and stressful interactions during bus journeys appear in almost fifteen reviews in the 2025 dataset, which portray explicit ticketing and payment failures. These are not trivial or minor glitches; many of these users did everything correctly on their end, yet the system failed at crucial moments.

The following experiences was clearly noted by one reviewer:
This case shows a breakdown at the interface between the app and the conductor's validation system. Without a reliable, steadfast way to verify digital tickets, users can be wrongly penalised even after making legitimate payments. Another reviewer describes repeated failures with no compensation: Here, a vague, ambiguous error messages and absent refunds create a cycle of financial loss and frustration. The repeated emphasis on "no refund" demonstrates how strongly commuters feel the impact, ramification of these failures. Even occasional ticket failures have immediate monetary consequences, damage user confidence and push commuters away from digital payments altogether, these two examples explain the most serious concern found in the 2025 dataset.

**Live tracking and Reliability**
Around sixty reviews remark first the buses not appearing in the map, bus icon freezing, wrong arrival times or buses showing only after they have passed the stop. Although this paper gives special regard to payments and ticketing, live tracking issues from the background to almost every story.
Typical lines excerpt includes:

- "Live bus tracking is unreliable. Some buses never appear on the map or disappear mid route."
- "Bus is not visible many times, and it shows up after passing the station."
- Bus timings are not even approximate. The scheduled timings can never be trusted."

For many users, repeated tracking problems and one or two ticketing failures combine into a single judgement: the system as a whole is not dependable. This is what leads people to label the app as "useless" and advice others to stick to cash or alternative modes.

**Constructive suggestions from Users**
Along with objections and criticism, the reviews also contain several constructive ideas. For example:

- One user suggests that allowing passenger who have valid tickets to contribute GPS data when official trackers fail, with checks based on the scanned tickets. This is a form of crowdsourced tracking that could fill gaps on certain routes.
- Another commuter asks Chalo to restore feature that let the commuter check next day's buses, which was useful for planning early morning commutes.
- Several request shortcuts for frequently used routes on the home screen, so that daily commuters do not have to search every time.
- A few requests clear option for half ticket or child ticket options inside the app.

The commuters are not only criticising but also imagining how the system could work better and these suggestions indicate that users are invested in the app's success.

## DISCUSSION

The 2025 evaluations clearly show that UPI shifted from being a convenience to a basic expectation for most commuters. When the Chalo app supports only one UPI provider or fails to handle certain card-based UPI flows, user perceive this as a noticeable gap in the service for daily smart phone users. UPI is the default method for routine payments, so limitations of this kind feel especially inconvenient. Although only a small share of the dataset explicitly mentions UPI, those comments carry weight, because most of the people complain only when something breaks. Their feedback points toward three reliable, consistent expectations (1) the app should support multiple UPI options, (2) payments should work smoothly across permitted flows and (3) refunds for failed transactions should be fast and transparent. Users may avoid in-app payments altogether and return to cash when these expectations are not met.

At the same time, the reviews show that ticketing failures are even more detrimental than tracking errors. At times users may accept delays or inaccurate timing updates, but they react strongly, affects them deeply when money is deducted without receiving a usable ticket, or when conductors cannot confirm the digital proof. These situations

generate stress throughout travel and lead several reviewers to advise other passengers not to trust the payment feature. Strengthening the technical foundations of mobile ticketing such as including more stable synchronisation between the app and conductor machines, better handling of connectivity gaps and smarter detection of duplicate or incomplete transactions will be essential for rebuilding trust. Clear, commuter-friendly refund mechanisms are also essential.

Another concern raised in the reviews relates to security features such as blocking screenshots or restricting ticket visibility. Although these measures are meant to prevent misuse, they can also create serious barriers when genuine failures occur. Honest, affected users are unable to show proof of purchase, and support teams struggle to check what the user paid for. Even small adjustments in this area could significantly reduce user frustration. A more balanced design would keep security in place while providing backup verification methods, such as temporary secure codes or alternate ways to confirm ticket status. Across the dataset, it is also evident that user reviews are a valuable and continuous form of feedback. By investigating patterns in what people write, tracking how often certain complaints appear and observing how feedback changes after updates, Chalo can formulate targeted improvements. The evidence from 2025 suggests a simple order of priorities: prevent financial loss first, stabilise tracking second, strengthen UPI integration next and then focus on boundary refinements and new features. Addressing these primary, core issues would help restore commuter confidence and improve the day-to-day reliability of the app.

## CONCLUSION

By reading and coding roughly one thousand reviews, we identified the most common themes and most painful failures scenarios. This paper portrayed an empirical study of 2025 user reviews of the Chalo app, with a focus on UPI integration and ticketing reliability. The scrutiny showed that live tracking problems were the single most frequent complaint, affecting about sixty percent of the sample. Around fifteen percent of reviews labelled explicit ticketing failures in which money was debited but no usable ticket was provided or recognised. A smaller group of reviews directly requested broader UPI support and clearer refund handling. These patterns disclose a gap between user expectations and the app's current behaviour. Commuters expect public transport apps to accommodate the UPI ecosystem they already use, to issue tickets that conductor can easily verify and to protect them from financial loss that led economic loss when systems misbehave. Trust collapses and users actively discourage others from using the payment features when these expectations are not met.

For Chalo and similar apps, the path forward is demanding, challenging but clear. Greater investment in payment and ticketing reliability, thoughtful design of security measures and generous support policies are necessary to rebuild trust and at the same time, user reviews can serve as a continuous steady mirror, showing where improvements are working and where gaps remain. For researchers and practitioners in transport technology, this finding illustrate the value of taking user feedback seriously. The people who ride buses everyday understand very well where a digital system helps and where it hurts. Their reviews, when read carefully and systematically, provide a grounded guide for designing better, fairer and more reliable public transport technology.

**ABSTRACT**

The present study critically explores the role of digital platforms in empowering women across Tamil Nadu, focusing on dimensions such as health, education, livelihood, and civic participation. Drawing on qualitative data from focus group discussions, and case studies, the research examines the socio-cultural, infrastructural, economic, and safety-related barriers that hinder digital inclusion among women, especially in rural districts. Findings reveal significant urban-rural disparities in digital access, with only 24.6% of rural women reporting internet use, compared to 51.8% in urban areas. Although government initiatives like Amma e-Sevai Centres, PMGDISHA, and Mahila E-Haat aim to bridge this gap, their impact remains uneven due to limited digital literacy, affordability issues, and socio-cultural restrictions. The study reveals that mere access to digital devices does not guarantee empowerment; meaningful usage and digital fluency are crucial. It recommends targeted policy interventions, including community-based digital training, subsidized device access, and gender-sensitive cybersecurity frameworks.

**Keywords:** Digital inclusion, women's empowerment, Tamil Nadu, digital literacy, e-governance, socio-cultural barriers, ICT access, policy interventions

## INTRODUCTION

Technology has empowered women to make choices and shape their own lives in a move toward gender equality (Grabe, 2011). In many high-income countries, women are more self-reliant than their counterparts in rural and low-

income countries with a lack of access to resources and cultural gender barriers (Dhanamalar *et al*., 2020). Technology now enables access to learning resources and provides a way to circumvent gender barriers (Rajahonka and Kaijam, 2019). Scholars postulate that technology is the driver of women's empowerment through those learning materials (Bhat, 2019). While there appear to be studies showing how women can be empowered with technology, it is unclear to what extent women were empowered across geographical or industrial areas, what types of technology were used, and the benefits they received. Therefore, the purpose of this study is to conduct a systematic research to gain a collective view of how technology is being used to empower women.

## LITERATURE REVIEW

Women's empowerment is widely recognized as a fundamental catalyst for societal advancement, as it enables women to exercise autonomy, participate fully in public and private spheres, and develop critical capacities for self-determination (Dhanamalar *et al*., 2020). The academic conceptualization of women's empowerment first gained prominence in the 1970s, amidst a broader movement toward gender equality (Freire, 1970; Grabe, 2011). Over time, the concept has evolved, increasingly positioned as both a means and an end in the pursuit of gender equity (Mackey and Petrucka, 2021). Contemporary scholarly discourse often frames empowerment as the ability of women to exert control over their lives, including access to choices and decision-making power (Chew *et al*., 2015; Lindsay *et al*., 2013; Vivakaran and Maraimalai, 2017). In this study, women's empowerment is defined through the lens of agency, access to resources, and the capability to make informed decisions on matters of significance (Kabeer, 1999; Mosedale, 2005). This process is increasingly mediated by digital technology, which facilitates access to information, enables learning, and fosters greater autonomy. Technological access, particularly in the form of mobile devices and internet connectivity, plays a fundamental role in equipping women with tools to surmount social, economic, and political barriers (Cummings and O'Neil, 2015). Challenges to women's empowerment remain pronounced in low-income settings, where structural inequalities—such as limited access to education, healthcare, and financial services—continue to hinder full participation in the formal labor market. These constraints are often reinforced by prevailing sociocultural norms and religious practices (Lechman and Paradowski, 2021). Nevertheless, data from the World Development Indicators (International Telecommunications Union, 2020) suggest a modest but steady improvement in female labor-force participation globally. Between 1990 and 2019, participation among women aged 15 and above rose by 1.4, 10.5, and 2.8 percentage points across various regions, reflecting incremental shifts toward greater gender inclusivity in economic activity. While numerous systematic reviews have examined the application of technology across diverse fields, there remains a discernible gap in the literature concerning women's access to learning opportunities through digital platforms—and more specifically, the role of technology in enabling women's empowerment beyond the health sector. Existing reviews predominantly focus on health-related interventions. For instance, Dantas *et al*. (2021) investigated mobile health applications designed to help women manage urinary incontinence, concluding that such tools are effective in supporting health management. However, the study centers on the functionality of the applications rather than their empowering effects. Similarly, systematic reviews conducted by Iyawa *et al*. (2021) and Sayakhot and Carolan-Olah (2016) examined the use of mobile health applications for pregnancy-related health management. Homko *et al*. (2007) explored internet-based interventions for glucose monitoring among underserved women with gestational diabetes, reporting increased self-efficacy in disease management. Samoocha *et al*. (2010) evaluated digital communication strategies employed by healthcare professionals to deliver follow-up care to female cancer patients, again emphasizing the utility of technology in facilitating information transfer. These studies collectively show the value of digital technologies in enhancing women's health outcomes, yet they tend to overlook empowerment as a broader, multidimensional outcome.

## RESEARCH OBJECTIVES

The study aims to assess the current level of digital access, usage, and literacy among women in rural and urban Tamil Nadu through region-specific quantitative data. It further explores how digital platforms empower women in areas like health, education, livelihoods, and civic participation. The research identifies region-specific barriers to

digital inclusion, such as socio-cultural norms, affordability, infrastructure gaps, and safety concerns, using qualitative methods. It critically evaluates key government initiatives like Amma e-Sevai Centres, PMGDISHA, and Mahila E-Haat, and proposes targeted, evidence-based policy measures to strengthen inclusive digital ecosystems in the state.

## METHODOLOGY

The study adopts a qualitative research approach to examine the barriers and opportunities related to women's digital inclusion in Tamil Nadu. Data was gathered through focus group discussions and case studies conducted in selected rural and urban districts. Supplementary insights were drawn from policy documents, government reports, and program evaluations. This approach allows for a contextual analysis of how digital platforms impact women's empowerment and how existing initiatives function within specific regional and socio-cultural settings.

## FINDINGS AND DISCUSSION

**Women and Technology**

Technology has played an important role in improving women's access to learning and expanding their choices in economic and other areas of life. Research shows that access to financial tools such as mobile money, microfinance, and inclusive financial systems has supported women's learning and increased their involvement in the formal economy, as well as in production and service sectors (Çetin *et al*., 2020). Studies have also shown that technology has helped women participate more in scientific fields and supported their political and institutional involvement by providing better access to information and communication networks (Asongu and Odhiambo, 2020). Technology supports empowerment by allowing tasks to be completed in flexible ways, often from home, and at times that suit the user. Many of these activities can be done entirely online, which helps reduce barriers related to time and travel. Digital platforms also offer learning opportunities across a wide range of subjects, with videos and written materials often available in multiple languages. In this study, "technology" refers to digital tools that require electricity or power sources, such as mobile phones, laptops, and desktop computers, along with the internet and the software or applications used on these devices (Crompton, 2014). Despite Tamil Nadu's reputation as one of India's more progressive and technologically advanced states, the level of digital access and literacy among women remains deeply unequal across urban and rural areas. This disparity becomes particularly evident when analysing region-specific data from the National Family Health Survey-5 (NFHS-5, 2019–21), which offers critical insights into mobile phone ownership and internet usage among women aged 15–49. While 74.6% of women in Tamil Nadu reported owning a mobile phone they themselves use, this figure still falls short when compared to their male counterparts. More concerning, however, is the disparity in internet usage: only 24.6% of women in rural Tamil Nadu have ever used the internet, compared to 51.8% of urban women. This gap illustrates a dual-layered inequality—both in terms of gender and geography—which continues to limit the transformative potential of digital technologies for women in large sections of the state. These numbers reveal the fact that owning a mobile phone does not necessarily imply meaningful digital inclusion.

While mobile penetration has improved over the years, particularly with the proliferation of low-cost smartphones, this technological reach has not been matched by corresponding improvements in digital literacy and functional usage. In rural districts such as Perambalur, Ramanathapuram, and Dharmapuri, women often have access only to shared or basic-feature phones, which severely restricts their engagement with the internet, social media, e-governance platforms, or online financial services. In contrast, urban centres like Chennai and Coimbatore show higher levels of digital participation among women, but even here, usage is often limited to entertainment or communication rather than tools for economic or educational empowerment(Abubakar and Dasuki, 2018). Moreover, research from local studies and NGOs operating in Tamil Nadu suggests that even among women who own smartphones, there is a significant gap between access and digital competence. For example, a study conducted in South Chennai observed that many women possessed internet-enabled phones but lacked the skills to navigate

applications for online banking, e-learning, or digital government services. This gap is compounded by language barriers, as most apps and platforms are English-centric, marginalising non-English speaking women. Socio-cultural constraints—particularly in conservative rural households—continue to restrict women's independent use of technology. It is not uncommon for male family members to control device usage or internet access, reinforcing a digital patriarchy that undermines women's autonomy(NFHS-5, 2021). Affordability remains another critical barrier. While data costs in India are among the lowest globally, for many women in lower-income households, even small recurring expenses for mobile data recharge can be prohibitive. Coupled with inconsistent electricity supply and poor network infrastructure in remote villages, these factors further exclude rural women from the benefits of digital connectivity. The problem is not just technical—it is systemic. Without addressing the socio-economic and infrastructural roots of digital inequality, efforts to promote women's digital empowerment will remain superficial and unsustainable. Government efforts such as the Internet Saathi Programme, launched by Google and Tata Trusts, and digital literacy initiatives under the Digital India campaign have made important strides in raising awareness and providing basic training. However, their penetration and impact remain uneven across Tamil Nadu. The state government's Amma e-Sevai Centres and village-level Common Service Centres (CSCs) do provide digital interfaces for accessing government services, but anecdotal evidence suggests that many women either lack the confidence to use them independently or depend on male intermediaries(NFHS-5, 2021). This again reinforces dependency rather than empowerment.

**Digital Platforms in Health**

Access to quality healthcare has been a persistent challenge, especially in rural areas. Digital platforms have emerged as critical tools in bridging this gap. Telemedicine services, for instance, have enabled women in remote regions to consult with healthcare professionals without the need to travel long distances. Initiatives like the Tamil Nadu e-Governance Agency's AI-driven health services have streamlined patient data management and facilitated remote consultations, ensuring timely medical advice. Moreover, mobile health applications have played a significant role in disseminating information related to maternal health, nutrition, and disease prevention. These platforms provide women with critical knowledge, empowering them to make informed health decisions (Abubakar and Dasuki, 2018). The integration of digital tools in health has not only improved access but also enhanced the quality-of-care women receive.

**Digital Platforms in Education**

Education is a cornerstone of empowerment, and digital platforms have revolutionised access to learning resources for women in Tamil Nadu. Online courses, e-learning modules, and virtual classrooms have made education more accessible, especially for those who had to discontinue formal education due to various constraints. Programs like the Internet Saathi initiative have trained women to use the internet effectively, opening doors to a plethora of educational content. Digital literacy programs have been instrumental in equipping women with essential skills to navigate the digital world. These initiatives have not only enhanced their knowledge base but also increased their confidence to engage with technology, thereby fostering a culture of continuous learning and self-improvement.

**Digital Platforms in Livelihood**

Economic independence is crucial for empowerment, and digital platforms have significantly contributed to enhancing women's livelihoods in Tamil Nadu. E-commerce platforms have provided women entrepreneurs with the opportunity to market and sell their products beyond local markets. Social media channels have also become powerful tools for women to promote their businesses, connect with customers, and build brand identity. Moreover, digital financial services have facilitated easier access to banking, credit, and insurance products. Mobile banking and digital wallets have enabled women to manage their finances efficiently, leading to better financial planning and security. These platforms have not only opened new income streams but also fostered a sense of financial autonomy among women.

**Digital Platforms in Civic Participation**

Similarly, active participation in civic life marks the very essence of empowerment. In particular, digital platforms have become a means through which female citizens in Tamil Nadu participate in governance and community development. Online portals for government services have made it possible for women to learn about, apply for, and file grievances in respect to various welfare schemes. With the rise of social media, women-folk are taking to these spaces to air opinions, gather public support for causes, and participate in public discourse. Women have also been able, with digital help, to increase their association with local governance structures. Digital training programs have equipped women for leadership roles in Panchayati Raj Institutions, thereby giving them a say in decision-making at the grassroots level. This consolidation of civic engagement hence ensures inclusivity and representativity in governance.

**Challenges and the Way Forward**

While digital platforms have created an enabling environment in Tamil Nadu for the empowerment of women, challenges persist. Digital literacy is still unevenly distributed, particularly among older women and those residing in far-flung areas. The affordability of devices and internet services continues to be another barrier. Sometimes, socio-cultural norms put restrictions on women's access to technology. Tackling these issues will require different interventions. Programs for digital literacy should be expanded, while technology access should be subsidized, and content should be created in local languages for greater inclusivity. Community-based programs involving men and leaders will assist in breaking down the socio-cultural barriers. For empowerment, digital inclusion offers women what they need-Namely, information, services, and opportunities for a truly transformative effect on life. In digital infrastructure, Tamil Nadu has made its strides, but the rural women still stand with huge barriers considering digital inclusion. These barriers are plural and include socio-cultural norms, economic constraints, infrastructural deficits, and safety concerns. A qualitative inquiry into these challenges will be the basis for developing targeted interventions that will actually bring about digital inclusion.

**Socio-Cultural Norms**

Socio-cultural norms deeply influence women's access to and use of digital technologies in Tamil Nadu. In many communities, traditional gender roles dictate that women prioritize domestic responsibilities over personal development, limiting their time and freedom to engage with digital tools. In interviews conducted in the rural district of Dharmapuri, several women expressed that their families viewed internet use as unnecessary or even inappropriate for women. One participant noted, "My husband says the internet is not for women; it's a distraction from household duties." Such attitudes stem from entrenched beliefs that associate technology use with male domains, thereby restricting women's digital engagement. Social expectations around modesty and propriety can discourage women from participating in online platforms. In conservative areas, there is a fear that women's online presence could lead to reputational harm, making families hesitant to allow women to own smartphones or access the internet.

**Affordability**

Economic constraints significantly hinder women's digital inclusion in Tamil Nadu. The cost of devices, data plans, and maintenance can be prohibitive, especially for women in low-income households. In a case study from the Tirunelveli district, a woman named Lakshmi shared her experience: "I wanted to buy a smartphone to help my children with their studies, but we couldn't afford it. Even if we had one, recharging data regularly is expensive." This reveal how financial limitations not only affect women's personal access to digital tools but also impact their roles in supporting their families' educational needs. Moreover, women often lack control over household finances, making it challenging to allocate funds for digital expenses. This economic dependency further exacerbates the digital divide, as women are unable to make autonomous decisions regarding technology use.

**Infrastructure**

Inadequate digital infrastructure in certain regions of Tamil Nadu poses a significant barrier to women's digital inclusion. While urban areas like Chennai and Coimbatore have relatively robust connectivity, rural districts such as

Perambalur and Ariyalur suffer from poor network coverage and limited internet access. Interviews with women in these regions revealed frustrations with unreliable connections and lack of access points. One respondent from Ariyalur stated, "Even if we have a phone, there's no signal most of the time. We have to climb to the terrace or walk to a specific spot to get a connection." Such infrastructural challenges discourage consistent use of digital technologies and limit the benefits women can derive from them. The scarcity of public digital access points, such as community centres or libraries with internet facilities, further restricts opportunities for women to engage with digital platforms, especially for those who cannot afford personal devices (Abubakar and Dasuki, 2018).

**Safety Concerns**

Safety concerns, both online and offline, significantly impact women's willingness to engage with digital technologies. Fear of cyberbullying, harassment, and exposure to inappropriate content can deter women from using the internet or social media platforms. In a focus group discussion in the Madurai district, participants expressed apprehension about online interactions. One woman shared, "I've heard stories of women being harassed online. I'm afraid to post anything or even have a profile picture." Such fears are compounded by a lack of digital literacy, which leaves women vulnerable to online threats and scams. Moreover, physical safety concerns related to accessing digital services, such as traveling to distant cybercafés or community centres, can also be a deterrent. In areas with limited public transportation or high crime rates, women may avoid these spaces altogether, further isolating them from digital resources.

**Case Studies**

**Case Study 1: Empowering Women through Digital Literacy in Villupuram**

An initiative in Villupuram district aimed to provide digital literacy training to women through local self-help groups. Despite initial enthusiasm, the program faced challenges due to socio-cultural resistance. Many participants dropped out after facing opposition from family members who questioned the necessity of digital skills for women. This case shows the importance of involving community stakeholders and addressing cultural perceptions in digital inclusion efforts.

**Case Study 2: Mobile Health Services in Thanjavur**

In Thanjavur, a mobile health service was introduced to provide teleconsultations for women in remote areas. While the service had the potential to improve healthcare access, uptake was low. Interviews revealed that women were hesitant to discuss health issues over the phone due to privacy concerns and a lack of familiarity with telemedicine. This shows the need for building trust and digital confidence among women to effectively utilize such services.

**Case Study 3: Digital Entrepreneurship in Coimbatore**

A group of women in Coimbatore started an online handicraft business, leveraging social media platforms to market their products. However, they faced challenges in managing digital payments and logistics due to limited digital literacy. With targeted training and support, they were able to overcome these hurdles, illustrating the potential of digital platforms to enhance women's economic participation when adequate support systems are in place.

**Case Study 4: Community Internet Centres in Salem**

In Salem, community internet centres were established to provide women with access to digital resources. While the initiative was successful in urban areas, rural uptake was limited. Interviews indicated that women in rural areas were hesitant to visit these centres due to safety concerns and societal norms discouraging women from spending time outside the home. This case emphasizes the need for context-specific strategies to promote digital inclusion.

**Case Study 5: Online Education in Tiruchirappalli**

During the COVID-19 pandemic, online education became the norm. In Tiruchirappalli, many girls from low-income families struggled to attend online classes due to lack of devices and internet connectivity. Community organizations stepped in to provide shared devices and internet access, enabling these girls to continue their education. This case demonstrates the critical role of community support in bridging the digital divide.

**Implementation and Impact of State and Central Government Digital Initiatives**

**Amma e-Sevai Centres: Bridging the Digital Divide at the Grassroots**

The Amma e-Sevai Centres, set up by the government of Tamil Nadu, intend to give access to various government services under one single-window digital platform for citizens. It is specially helpful for women for whom these centres provide services like application for certificates, bill payments, or grievance redressal. The state claims to have over 10,000 e-sevai Centres to facilitate the easy access of various government services by the common men. The impact of these centres on the digital inclusion of women is worth noting (Abubakar and Dasuki, 2018). A study undertaken based in Madurai district has shown that the e-Sevai Centres have contributed towards digital inclusion by providing services catering to local needs; however, lower incomes, lack of technical and financial support, poor connectivity, and frequent power outages stand as hurdles thwarting the effectiveness of these centres. The study thus recommended that innovative and efficient organizational and infrastructural facilities be initiated to boost these centres (Vijayachandrika, 2022). The Tamil Nadu e-Governance Agency (TNeGA) greatly contributes to digital literacy enhancement through these centres. TNeGA offers a variety of online services and training courses to enable and acquaint women with accessing a number of government services through digital means, thus familiarising and empowering them to use digital platforms confidently.

**PMGDISHA: Enhancing Digital Literacy Among Rural Women**

The Pradhan Mantri Gramin Digital Saksharta Abhiyan (PMGDISHA), a central government initiative, aims to provide digital literacy to rural citizens, including women, minorities, and economically weaker sections. In Tamil Nadu, the program has made significant strides. As of December 2022, over 17.04 lakh candidates have been enrolled, with 14.07 lakh trained and 10.55 lakh certified under the PMGDISHA Scheme. Notably, approximately 76 percent of the certified candidates are women, indicating a strong female participation in the program (Gichuki and Mulu-Mutuku, 2018). The program's effectiveness is further shows by its reach among women in rural areas. Data indicates that PMGDISHA has benefited 18 lakh women in Tamil Nadu, thereby its role in enhancing digital literacy among rural women. However, challenges persist, including infrastructural deficits, socio-cultural barriers, and limited awareness, which hinder the program's full potential. To address these challenges, the government has implemented various strategies, such as community engagement and awareness campaigns. These efforts aim to encourage women's participation in digital literacy programs and ensure that the benefits of PMGDISHA reach the intended beneficiaries.

**Mahila E-Haat: Empowering Women Entrepreneurs Online**

Mahila E-Haat, initiated by the Ministry of Women and Child Development, is an online marketing portal that was meant to encourage women entrepreneurship. It enables women to expose and sell their products and services directly to consumers, thus generating economic empowerment. Nevertheless, the reach of the portal in Tamil Nadu seems minimal. According to the recent statistics, only eight women entrepreneurs from Tamil Nadu are listed on Mahila E-Haat, reflecting negligible participation from the state. The reasons for such low participation may be the lack of digital literacy, spotty internet coverage, and low awareness about the platform. In order to maximize the effectiveness of the platform, targeted interventions such as digital literacy trainings, infrastructure improvement, and awareness generation are the need of the hour (Lechman and Paradowski, 2021). Combining Mahila E-Haat with other government platforms, like the Government e-Marketplace (GeM) and platforms controlled by the National Small Industries Corporation (NSIC), may offer women entrepreneurs more extensive market reach and assistance (Gichuki and Mulu-Mutuku, 2018). Among the key hindrances to ensuring digital inclusion among women in Tamil Nadu is insufficient digital infrastructure, especially in rural and outlying areas. Whereas urban hubs like Chennai and Coimbatore enjoy good connectivity, districts like Perambalur and Ariyalur lack good network coverage and limited internet penetration(Vijayachandrika, 2022). This limitation makes it difficult for women to access digital services, avail online education, and pursue digital entrepreneurship. In order to overcome this, the government can focus on expanding broadband infrastructure in unserved areas (Gichuki and Mulu-Mutuku, 2018). Investment in last-mile connectivity, through the use of technologies such as fiber-optic cables and satellite internet, can help reduce the digital divide. Public-private collaboration has the potential to drive infrastructure growth, with even far-flung villages not being left behind(Abubakar and Dasuki, 2018). Digital literacy is a key enabler of women's

empowerment in the modern era. Even with numerous programs under way, a large number of women, particularly in rural settings, remain without the basic digital skills they need. This lacuna prohibits their access to services, opportunities, and information. Initiatives such as the Pradhan Mantri Gramin Digital Saksharta Abhiyan (PMGDISHA) have helped bridge this digital divide. As of December 2022, more than 17.04 lakh candidates have been registered in Tamil Nadu alone, out of whom 14.07 lakh have been trained and 10.55 lakh certified under the PMGDISHA Scheme.

Interestingly, around 76 percent of the certified candidates are female, reflecting a high level of female involvement in the program. Nonetheless, to maximize the effect, such programs need to be designed to cater to the particular needs of women (Hamper, 2020). Including modules on digital financial literacy, internet safety, and e-governance can empower women to operate in the digital environment confidently. Also, incorporating digital literacy into curricula of schools and adult education institutions can instil a culture of lifelong learning. Economically, constraints diminish women's digital inclusion in Tamil Nadu. Devices, data plans, and maintenance fees can be expensive, particularly for women in poor households. Also, women may not have control over the household purse, which makes it difficult to set aside money for digital costs. In order to alleviate these issues, the government can opt for subsidizing digital equipment for women, especially those from marginalized communities (Lechman and Paradowski, 2021). Collaboration with technology firms can help to provide low-cost smartphones and tablets. Community Wi-Fi projects implemented along with discounted data plans can also make internet access more feasible. Digital platforms hold huge potential for women to become entrepreneurs and boost their economic status. Programs such as Mahila E-Haat, an online marketplace initiated by the Ministry of Women and Child Development, are initiatives to encourage women entrepreneurship. The reach of the platform in Tamil Nadu is scanty as only eight state women entrepreneurs are registered on Mahila E-Haat(Vijayachandrika, 2022). To support digital entrepreneurship, the government must engage targeted training programs on e-commerce, digital marketing, and financial management. Mentorship programs and microfinance access can also complement women entrepreneurs (Gichuki and Mulu-Mutuku, 2018). Incorporating digital entrepreneurship modules into current self-help group (SHG) structures can build on the strength in numbers of women. Safety and security issues, both online and offline, are key factors in the willingness of women to adopt digital technologies (Riquelme and Thufery, 2018). The fear of cyberbullying, harassment, and being exposed to offensive content can prevent women from accessing the internet or social media sites. To solve such problems, the government must introduce extensive digital safety awareness schemes. It should include in those schemes awareness about recognizing cyber attacks, online safety practices, and reporting procedures (Hamper, 2020).

Creating special cybercrime units to deal with online harassment can bring confidence among women users. A inclusive digital environment needs policies that focus specifically on the special problems being faced by women. The Tamil Nadu State New Policy for Women 2021 identifies various policies in favour of women's empowerment, such as digital inclusion(Vijayachandrika, 2022). Nonetheless, proper implementation and constant monitoring are vital to ensure these policies become real results. Women's participation in policy-making and decision-making can result in more responsive and effective government. Creating space for women's voices to be heard, including online platforms and people's consultations, can provide assurance that policies are tuned in to their needs and aspirations (Riquelme and Thufery, 2018). Alliances between the government, private sector, and civil society can increase digital inclusion initiatives' reach and impact. Initiatives like Internet Saathi, a collaborative effort by Google India, Intel, and Tata Trusts, have shown the potential of collaborations. Incentivizing such collaborations can attract technological skills, funds, and new solutions to deal with the complex challenges of digital inclusion. Corporate social responsibility (CSR) programs can be synergized with government schemes to enable infrastructure development, training, and awareness. Monitoring and evaluation of digital inclusion initiatives should be carried out regularly to find out how effectively they are functioning and where improvements can be made. Identifying key performance indicators (KPIs) for women's participation, skill development, and economic outcomes can offer useful insight (Hamper, 2020). Policy responses and resource allocation can be guided by data-driven evidence to have the greatest impact. Regular surveys and impact evaluations can provide a snapshot of women beneficiaries' experiences and feedback, ensuring programs remain sensitive to their changing needs (Riquelme and Thufery, 2018). Building

strong inclusive digital ecosystems is critical for promoting Tamil Nadu's women empowerment. Addressing infrastructural shortages, boosting digital literacy, facilitating affordability, and creating enabling policy environments are critical steps the state needs to take in order to overcome the digital divide and unlock the true potential of its women. When these initiatives are coordinated synergistically, they lay the groundwork for true empowerment. Continuous co-operative endeavours, strict surveillance, and adherence to inclusiveness will be the motive pillars towards creating a digitally empowered and socially inclusive Tamil Nadu.

## CONCLUSION

The findings of this study reveal that digital inclusion is not merely a matter of access to devices or connectivity but is intricately linked to gendered socio-economic realities and cultural contexts specific to Tamil Nadu. The empowerment of women through technology requires more than infrastructure; it demands structural change in how digital ecosystems are designed, delivered, and governed. While state and central initiatives have laid a foundational framework, the actual experience of women—particularly in rural communities—reveals a persistent gap between policy intent and lived realities. This disconnect reveals the need for adaptive policy design that is informed by local knowledge, user feedback, and gender-sensitive implementation strategies. Empowerment through digital means must also focus on building agency—equipping women not just to consume content or access services, but to engage, create, lead, and innovate within digital spaces. The state's role must shift from being a provider to an enabler, supporting women with skills, safety, affordability, and representation. A participatory governance model that involves women in the co-creation of digital policies and platforms can ensure relevance and sustainability. Transforming Tamil Nadu's digital landscape into an inclusive and empowering space for women is a socio-political challenge that demands holistic, intersectional, and sustained efforts beyond technological deployment.

## ABSTRACT

The article reviews how the COVID-19 pandemic dramatically increased biomedical waste (BMW) generation and exposed critical weaknesses in India's existing BMW management system, especially in segregation, treatment capacity, and regulatory enforcement. It highlights that the surge in infectious waste such as PPE, masks, sharps, and diagnostic materials overwhelmed infrastructure, aggravated risks to waste handlers, and contributed to environmental hazards due to improper disposal and mixing of hazardous and general waste. The review first outlines the nature and sources of BMW, its categorization, and colour-coding system, emphasizing that only a fraction of BMW is inherently hazardous but can cause significant health and ecological damage if poorly managed. It then describes how COVID-19 altered municipal and hospital waste streams through massive use of single-use PPE and masks, inadequate segregation at household and institutional levels, and inconsistent application of BMW guidelines. Key challenges identified include limited treatment facilities, gaps in training and awareness, weak monitoring, unsafe manual segregation, and the absence of clear mechanisms for waste from home-quarantine settings. The article concludes that incremental measures during the pandemic were insufficient and calls for a shift to a systems - oriented approach that expands decentralized treatment capacity, strengthens real-time tracking, improves training and protective measures for waste workers, and upgrades regulations and enforcement. It argues that sustained investment in infrastructure, alternative treatment technologies, and public education is essential to reduce infection risks, protect the environment, and build a resilient BMW management framework capable of handling future public health emergencies.

**Keywords:** treatment, BMW, colour-coding, COVID-19, biomedical.

# INTRODUCTION

The coronavirus disease 2019 (COVID-19) can cause serious infections in the human respiratory system and was first discovered in animals at the Wuhan, China, meat and fish markets. In Wuhan, China, it was first identified at the end of December 2019 after locals began exhibiting symptoms similar to pneumonia. CIVID-19 infections were also linked to other health issues, such as fever, headache, and muscular and head pain. [1] The new coronavirus (SARS-CoV-2), a positive-sense single-stranded RNA virus, is the infectious agent that causes coronavirus illness 2019 (COVID-19). [2] There are four types of coronavirus: Delta (δ), Gamma (γ), Beta (β), and Alpha (α).Gamma and Delta subtypes primarily infect birds, but Alpha and Beta subtypes are clinically relevant because they can cause infectious illnesses in humans. [ 3]. Contact, whether direct or indirect, is the first mode of transmission. In SARS-CoV-2, the upper and lower respiratory tracts are affected. Regarding direct contact, SARS-CoV-2 can be spread by coming into contact with a COVID-19 patient's mouth, ears, or ocular mucous membranes [4].

**Biomedical Waste**

The waste generated in diagnosis treatment or immunization of human beings or animals, in research or in the production of testing of biological products including all categories of infected and toxic waste that is potential threat to human beings and environment. Biomedical waste can also be termed as regulated waste/medical waste or health care waste[5]

Medical waste is generated during:

- Diagnosis
- Treatment.
- Immunization
- Biomedical research
- Production and testing of biological product

Every day, India produces a staggering amount of biomedical waste (BMW). [6] The daily production of BMW in India is about 1.5 and 2 kg/bed. [7] BMW contains sharps, laboratory trash, anatomical waste, and other materials that can be lethal if not properly isolated. Our ecology may also be harmed by improperly segregating waste plastic, a recyclable and cytotoxic substance. [8] BMW is dangerous because it contains possible viruses or other microbiological particles that can cause illness; they can be found in human samples, blood bags, needles, cotton swabs, dressing materials, bedding, and more. [9] Of the 710 tons of garbage created everyday in India, BMW generated as a result of COVID-19 accounted for roughly 126 tonnes per day. [10]

**Table 1. Type of Waste Category** [11]

**Management of BMW**

Reduction, recycling, and reuse—the three Rs—are the cornerstones of good BMW practices. The finest BMW management (BMWM) practices focus on recovering as much waste as possible or preventing waste development instead of disposing of it. As a result, depending on their desirability, the several BMW disposal techniques are as follows: prevent, reduce, reuse, recycle, recover, treat, and finally discard. The waste should therefore be addressed at the source instead of using a "end of pipe" strategy. [12] Only roughly 10% to 25% of BMW is dangerous; the other 75% to 95% is not. The general public and healthcare professionals who handle, treat, and dispose of trash are at risk from the hazardous portion of the waste due to physical, chemical, and/or microbiological hazards. [13] The former Ministry of Environment and Forests notified the Government of India of the first BMW regulations in July 1998. [14] The BMW issue in India was made worse by scavengers who recycle open, unprotected medical trash without gloves, masks, or shoes, as well as by reusing syringes without properly sterilizing them. [15].

**Colour Coding of Biomedical Waste**

BMW management starts with color coding. Wastes must be managed and disposed of in accordance with their classification since they are divided into many sorts. In every healthcare facility across the world, the trash cans are always color-coded. Bins are coloured in accordance with the universality rule, which separates garbage into several categories. This measure aids in preventing the confusion that arises when different kinds of trash are mixed together, which may result in inappropriate management and disposal and ultimately cause the development of many illnesses. [16] Yellow containers gather nearly all forms of BMW trash, including anatomical, pathogenic, chemical, laboratory, and pharmaceutical waste. Recyclable contaminated garbage is collected in red bins, and BMW is collected in non-chlorinated plastic bags. Vials and ampoules are among the glassware waste that is collected in blue bins. Sharps that are contaminated and abandoned are disposed of in translucent white bins. It is imperative that sharp trash be disposed of in containers that can withstand punctures to prevent mishaps that could cause illnesses for those handling it.

**Bins of various colors are used to separate different types of garbage [9]. (Fig.1)**

Eliminating all infectious and hazardous waste produced in hospital environments is known as BMW management. trash treatment is essential for decontaminating the generated trash and eliminating all pathogenic organisms. This aids in preventing a number of serious health problems that could arise from infectious trash. It is a strategy to avoid any environmental risks. [17]

**Impact of Covid- 19 on Biomedical Waste Genration**

Municipal solid waste management (MSWM) has been significantly impacted by the corona virus epidemic, which has also altered the kind and volume of garbage. The term "MSW" describes a variety of solid waste types produced by community members, whether in an urban or rural environment where there is a chance of direct physical touch between individuals. [18] To stop the transmission of illness in public, the WHO advised wearing a mask. In 2019, the face mask market was valued at US$0.79 billion, and by 2020, it had grown to around US$166 billion. [19]. It wasn't until January 2020 that PPE kits and N-95 masks were manufactured in India; instead, 2.75 lakhs were imported.However, by the end of May 2020, India was producing almost 4.5 lakh PPE kits and over 104 lakh N-95 masks daily, making it the second-largest producer of PPE kits. [20] Because of COVID-19, there was less effective segregation and, in certain cases, recycling of garbage was outlawed due to fear of infection. In addition, the amount of waste produced in households rose, and the recycling and waste segregation chain was frequently neglected. Just over half (58%) of the studied facilities from 24 countries had sufficient processes in place for proper BMW management prior to COVID-19, according to the World Health Organization (WHO). [21]. The amount of hazardous waste in low-income nations rises as a result of improper hazardous and non-hazardous waste segmentation. The COVID-19 pandemic has made BMW management's problems much worse. BMW production increased from 50 tons per day prior to the pandemic to 247 tons per day in Wuhan province, China, where the COVID-19 virus was initially discovered. [22]

**Challenges in Biomedical Waste Management**

India's rapidly developing and growing healthcare sector presents major issues for the country's biological waste management. [23] Due to the exponential expansion of medical facilities, population growth, and advancements in healthcare technology, biological waste output has dramatically expanded nationwide. [24] Because they provide serious threats to the environment and human health, inappropriate waste management practices are becoming a reason for worry. [25]

**Challenges**

- Bio-waste cannot be appropriately separated in any public or residential location using the color-coding scheme found in Appendix I (Schedule I) of the 1998 BMW Regulations or the 2016 Amended Regulations.
- N95 respirators and single-use surgical masks are commonly disposed of with regular household garbage, which is notfurther placed in BMW bins marked with the color yellow.
- There is no established mechanism for disposing of COVID-19 waste in home quarantine centers.

• Due to inadequate training, awareness, and staffing, masks, PPE kits, gloves, and everything else, including food scraps and disposable cutlery, are thrown into yellow bins at quarantine centers and sent for cremation.
• Waste handlers perform the manual segregation process without wearing full safety gear, which puts healthcare personnel at risk of injury.
• In India, there are already 198 Common BMW treatment facilities (CBMWTF) operating, and another 28 are being built (Datta et al. 2018). The need for a biological waste treatment and disposal facility in India comprises the creation of new, highly effective disposable techniques as well as their expansion and modification.
• Groundwater contamination, the development of infectious diseases, and the lack of land are all caused by the landfilling or deep burial of biomedical waste, which produces greenhouse gases.
• Thermal heat is produced during incineration, which is dangerous, and frequently the material is not burned correctly, which increases its toxicity. [26]

## DISCUSSION

When we talk about managing biomedical waste during the COVID-19 pandemic, a few important things stand out. The sudden rise in hazardous waste has really shown how much we need to improve our current waste management systems. In numerous regions, existing infrastructure falls short of the demands required for effective biomedical waste management, while financial resources remain insufficient. Moreover, those tasked with handling waste often do not receive sufficient training or access to the necessary information. Compliance enforcement typically involves much variability by jurisdiction and compliance assurance systems are mostly unreliable, creating inconsistency among individuals in safe disposal practices. These barriers emphasise the need for increased investment and true reform during public health emergencies like the COVID-19 pandemic [27].

Overall, waste management systems and improving them is paramount to human health and the environment, but doing so will necessitate meaningfully addressing long-standing barriers, like inadequate infrastructure, poor financial capacity, and uneven enforcement of the law [27]. The COVID-19 pandemic revealed the urgent need for improvements in existing management systems for bio based waste (BMW) to be capable of organizing the increased volumes of hazard waste. It can be assumed that improvements today can look like improvements in infrastructure, stricter regulations, and better training of waste handlers to increase disposal practices and minimize health challenges. Improving alternative technologies to potentially reduce environmental impacts, as well as the transmission of diseases, has also been determined to be beneficial.

The challenges to begin the needed improvements are considerable. In many areas, lack of infrastructure challenges that potential for different systems of management. Limited funds also limit the capacity of enhancements for management of waste options, with gaps in awareness of personnel causing diligence for waste disposal and inconsistent rules of practice to comply with best practices. All these challenges indicate further investment and oversight needs to realize the potential of biowaste management systems, should there be another concern with public health emergencies. [28]. Overall, improving there are overall benefits associated with improving waste management for health of people and health of the environment, but the issues of lacking potential, its management and resources, and compliance issues must be addressed for solutions to be effective. [28]

## CONCLUSION

The COVID-19 pandemic revealed major weaknesses in India's biomedical waste (BMW) management system, as the surge in infectious waste like PPE, sharps, and diagnostic materials overwhelmed already strained facilities. Emergency measures—such as ramped-up PPE production and temporary disposal guidelines—faced challenges due to uneven implementation, inadequate training for healthcare and sanitation workers, lack of instructions for those quarantined at home, and poor enforcement of waste segregation rules. This often resulted in the mixing of infectious and regular waste, posing additional risks to public health and the environment. The problems were

multifaceted, stemming from outdated treatment infrastructure, varying policy enforcement across states, and health and safety risks to waste workers who often lacked proper protective gear, vaccinations, and health monitoring systems. The pandemic underscored the urgent need to shift from a passive compliance model to an active, systems-oriented approach to BMW management. Key priorities should include real-time waste tracking, enhanced capacity building, decentralized treatment solutions, stronger supply chains for safety equipment, and inclusive policy development that acknowledges the vital contributions of informal waste workers. Public education and governance must also be improved to ensure accountability. Sustainable reforms are critical to safeguarding health, the environment, and restoring public confidence in hazardous waste management. Insights gained during COVID-19 should guide adaptive, evidence-driven strategies focused on resilience, equity, and scientific rigor to better handle future health crises in India.

**Table 1. Type of Waste Category**

| **Waste category** | **Descriptions** |
|---|---|
| Dangerous waste | |
| Contaminated waste | Waste polluted with blood, bodily fluid, or any other material with the potential to convey bacteria, virus, fungi, or parasites |
| Pathological waste | Human anatomical tissue, fetuses, organs, body fluids |
| Microbiological waste | Microbiological laboratory equipment, stock, used medium, quality control reagents, bacterial and viral cultures, and serological enzymes |
| Pharmaceutical waste | Unused or expiredmedications |
| Cytotoxic waste | Cytotoxic medications |
| Chemical waste | Solvents, cleaning supplies, and laboratory reagents |
| Radioactive waste | Radioactive isotopes, urine and excreta of patients treated with radioactive isotopes |
| Non hazardous waste | |
| Waste in general | Cardboards, plastic, and thermocol packaging material, paper, kitchen garbage |

## ABSTRACT

Amitav Ghosh's novel, *Gun Island*(2019) explores the crisis of climate change by utilizing folklore as a frame in the representation of current climate crisis. Typically, fictions conceptualize environmental changes through the employment of apocalyptic narratives that feature catastrophic natural disasters, such as floods, storms, and fires. The problem with such representations of climate change is that they tend to imply in the reader that such disasters are unimaginable and vague, rather than actual and existing ones. This article analyses the innovative narrative patternof Ghosh that utilizes folklore to draw parallels between the past and the present, nonetheless retaining the seriousness of the climate crisis and emphasizing its concrete nature and thereby making it apprehensible as real or existent. This creative engagement can be looked at as a lead set by Ghosh to one of the major concerns pointed out by him in his book *The Great Derangement*, a non-fiction about the crisis of imagination among writers to represent climate change.

**Keywords:** Magic Realism, Folklore, Climate Change, Climate Crisis, Climate Fiction

In *The Great Derangement* (2016), Amitav Ghosh calls out the imaginative failure among writers of fiction in adequately representing the climate crisis in its current severity [10]. *Gun Island* (2019) is the novel that followed this remarkable non-fictional work and can be understood as an attempt by Ghosh to address one of the major issues pointed out by him in his previous work – the need to represent the improbable without compromising the gravity of

the climate crisis, which would often result in such works being sidelined as a category of genre fiction. The current climate events are so extreme that representing them in a work of fiction demands the use of novel modes and techniques in storytelling. Considering from this perspective, *Gun Island* by Ghosh stands out from other contemporary climate fictions in that the author has made use of an autochthonous Bengali folklore, the events of which are believed to date back to the seventeenth century. It subsequently turns out that the characters and events in the present mirror the past thereby revealing that the past is simply repeating itself through different characters but similar situations. Before delving into Ghosh's handling of folklore in *Gun Island*, it is imperative to examine the relevance of folklore as a potent tool in the depiction of climate crisis. As Abrams and Harpham put it, "Folklore" is a term collectively applied to sayings, verbal compositions and social rituals that are primarily handed down by word of mouth [138]. It includes legends, superstitions, songs, tales, proverbs, riddles, spells and nursery rhymes. Pseudoscientific lore about the weather, plants and animals; customary activities at births, marriages, and deaths; and traditional dances and forms of drama performed on holidays or at communal gatherings. (Abrams and Harpham 138). These legends are abundant in metaphors and meaning that they cannot be simply relegated to the status of moral fables, because they guide the present by showing ways in which premodern cultures coped with the intricacies of nature, of the discord that emerged between human beings and the natural world. Compared to the prescriptive nature of the potential solutions offered by the scientific community to recuperate the damage done to the environment, the stories and legends of folklore prove to be more potent, influential, and persuasive as they are associated and identified with a cultural context along with an added element of sanctity innate in them.

In view of these unique characteristics that are inherent in such stories and beliefs, folklore turns out to be an irrefutable tool in finding solutions to supposedly unmanageable problems posed by the contemporary climate crisis. Another important aspect of folktales as stated by Andrew Simms is the emergence of such tales specifically during times of upheaval and from the societies' grimmest moments (Simms). This enables us to draw plausible solutions for the current global problems with reference to such lore. They are not only cautionary and impart us with the knowledge to identify risks, but also aid us in processing and assimilating extreme experiences; and help in dealing with uncertainties posed by anthropogenic global warming. Most folk legends are open ended and there are often multiple versions of them. These legends need to be carefully explored in order to excavate the multiple meanings embedded in them and only through such legends the problems entrenched in local geographies and cultural contexts can be understood better (Dasgupta). Apart from reiterating that all actions have consequences, these stories emphasize the ephemerality of things around us and the necessity for balance. The stories echo the intricate worldview where everything, human and non-human have agency. As legends and myths are rooted in local culture and since all cultures have identical stories, folklore turns out to be an ideal medium to talk about the environment. Another significant aspect of folklore is the narrative's inclusive quality which places the non-human on par with the humans. As Amitav Ghosh explains in *The Great Derangement*, In the Indian epics … there is a completely matter-of-fact acceptance of the agency of non-human beings of many kinds. I refer not only to systems of belief but also to techniques of storytelling: non-humans provide much of the momentum of the epics; they create the resolutions that allow the narrative to move forward [86]. He also draws attention to the bitter fact that there is no place for the non-human in contemporary literary fiction and the novels which include non-human in their narrative are often relegated to the "outhouses to which science fiction and fantasy had been banished" [88].

Ghosh also discusses about the ethical difficulty in treating the contemporary weather events using the narrative modes of Surrealism and Magic Realism, since the current climatic events are neither surreal or magical but are astonishingly real [36]. He also makes it clear in one of his interviews that he does not want to be associated with apocalyptic narrative style as he feels that it is "a very male western thing" (Ramakrishnan). In view of the such formal insufficiencies and ethical challenges in representing global warming, folklore turns out to be an indisputable instrument in seeking answers to allegedly unsolvable challenges offered by the modern climate crisis. As a rich source of storytelling, Folklore proves to be a suitable medium to explore themes related to climate change in fiction. An increasingly pressing issue like climate change can be better dealt with by incorporating folklore which helps create a sense of urgency and meaning around the issue. An example of folklore being used in fiction about climate change is in the book, *The Fifth Sacred Thing* by Starhawk. The story is set in a future California that has been ravaged

by climate change and the protagonist relies on ancient pagan practices to heal the land and protect the community. The book explores themes of community, spirituality, and environmentalism through the lens of folklore and mythology. The novel *The Bear and the Nightingale* by Katherine Arden is set in medieval Russia and draws heavily on Russian folklore to explore the relationship between humans and the natural world. The story follows a young girl named Vasya who possesses the ability to communicate with the spirits of the forest, and who must use her powers to protect her village from an evil force that threatens to destroy the natural balance of the world. Another recent example is *The Overstory*, a novel written by Richard Powers. In this novel, Powers explores how climate change affects the natural world and stresses the pressing need to protect the environment. Through the character, Patricia Westerford, the author highlights the importance of understanding and respecting the natural world and the devastating consequences of ignoring or exploiting it for human gain. Throughout the novel, Powers incorporates myths and legends about trees from various cultures, as well as scientific research on the communication and intelligence of trees. Neil Gaiman's American Gods TV series provides another example through the character Mr. Nancy, who narrates tales from African and African American tradition that stress the importance of reverence for nature and the dangers of neglecting it.The show uses folklore to explore themes of environmental destruction and the need for humanity to live in harmony with the natural world. These are a few examples to show the effectiveness of folklore in fiction about climate change. As stated by Pancholi and Mishra, Ghosh recognizes the important role that ancient myths and legends play in symbolizing the catastrophic effects of climate change.

He acknowledges that these stories have already depicted many of the environmental disasters that we are currently experiencing, such as floods, droughts, famines, and storms [8]. Amitav Ghosh's *Gun Island* illustrates the effects of climate change on the migration and displacement of people and animals alike, framed within a Bengali legend. It provides a contemporary reinterpretation of the Bonduki Sadagar story from the seventeenth century. According to the legend, … the Gun Merchant was said to have been a rich trader who had angered Manasa Devi by refusing to become her devotee. Plagued by snakes and pursued by droughts, famines, storms, and other calamities, he had fled overseas to escape the goddess's wrath, finally taking refuge in a land where there were no serpents, a place called 'Gun Island' – Bonduk-dwip. (Ghosh 16). Even in the Gun Island, the merchant was chased by Manasa Devi and later was bitten by a poisonous snake. The merchant escapes from Gun Island and gets caught by pirates who sell him in "The Island of Chains." In that island, Manasa Devi appears before the Merchant and offers to set him free and make him rich if he agrees to become her devotee by building a shrine for her in Bengal. The Merchant agrees and Manasa Devi helps him reach his homeland with a great fortune. This earns him the title Bonduki Sadagar – the Gun Merchant[16-17]. This is the version of the Gun Merchant legend as narrated by Nilima Bose, aunt of the protagonist Deen. Deen, with the help of his historian friend Cinta skillfully interprets this legend to be an apocryphal account of an actual expedition to Venice which proves to be historically plausible and uncovers that the Bengali word, Bonduki Sadagar should not be literally translated as "Gun Merchant" but rather it must be understood as "The Merchant who went to Venice." According to their discovery, the merchant's native, eastern India experienced drought and flood as a result of the climatic turmoil of the time. Losing his family and fortune to the climatic turmoil of the time he decided to travel to Venice expecting greener pastures . By the time the Merchant arrived in Venice, he found it in an abandoned state with all its finest days as a great commercial force had been over (Ghosh 220).

This was because it was the Little Ice Age and the Mediterranean region experienced unseasonal weather, including violent storms and catastrophic floods. In a study titled, "Earth system impacts of the European arrival and Great Dying in the Americas after 1492", Alexander Koch *et al*. establish that prior to the Industrial Revolution human activity in the sixteenth and seventeenth centuries had left a significant impact on carbon dioxide levels and surface air temperatures at the global level [14]. Through ingenious storytelling, Ghosh ties the impacts of modern climate change to the myth of Manasa Devi and the Gun Merchant, whose narrative is believed to originate from over three centuries ago in the era of global cooling known as the Little Ice Age. By deploying this Bengali folklore, Amitav Ghosh deals not only with climate crisis, but also with one of the major problems effected by climate change – the displacement and migration of people. Ghosh perfectly pictures the refugee crisis brought about by climate change through the story of Tipu and Rafi in the novel. The Sundarbans is portrayed as a region where societal and ecological calamities feed off one another. The traditional livelihoods of the locals are threatened by storms and the

incursion of sea water onto agricultural fields, and as the character Moyna tells Dinanath, "the exodus of the young was accelerating every year: boys and girls were borrowing and stealing to find them work elsewhere" [49]. In this context, young fisherman Rafi hopes to move to a foreign country with greater opportunities. Yet their homosexual love for each other also motivates Rafi and Tipu to head for Europe, illustrating that climate migration is shaped by intersecting factors of race, gender, and sexuality. Assisted by dalals, the two decide to illegally traverse the borders of Bangladesh, India, Pakistan, Iran, Turkey, Bulgaria, Serbia, Hungary, and Austria en route to Italy. Tipu sustains an injury at the Iran-Turkey border, compelling him to reroute through Egypt and then sail to Sicily, where Italian border officials detain him. The migration of Tipu and Rafi from India to Venice as a result of social pressures made worse by climate change turns out to be a reenactment of the Manasa Devi myth from the seventeenth century.

Almost everything substantial in the story finds resonances in something that has already happened because it is apparent that Ghosh wants us to focus on the lessons of history. Through the lens of a premodern myth, the novel ties its storyline to historical migrations of people that happened prior to the formation of the modern nation-state. In *Gun Island*, the indistinct line between land and sea functions as a metaphor for the disruptive effects brought about by climate change. The story transports readers from the dense, tangled expanse of the Sundarbans, which lies across India and Bangladesh, to Los Angeles devastated by wildfires and the increasingly waterlogged Venice.In the story, Ghosh illustrates how the Sundarbans have been affected by the ecological instability that is roiling the planet. Anthropogenic forces are degrading Venice's ecosystems in a way that is clearly comparable to what is happening in the Sundarbans. The ecological disasters taking place in the Sundarbans and Venice as portrayed in Ghosh's *Gun Island* suggests that the world is on the brink of an environmental catastrophe. Ghosh's portrayal of disasters occurring in widely separated locations should be understood as his method of illustrating the truly global nature of the climate crisis and emphasizing that addressing it requires viewing the Earth as a unified, living organism shaped by ongoing environmental, social, and ecological changes. In contemporary culture, nature is regarded as an object to be exploited in order to satisfy human demands in human-centric cultural patterns. Also, our pursuit of a carbon-dependent economic model is focused on achieving sustainable growth without addressing environmental challenges. A holistic approach with an ecocentric and Nature-inclusive paradigm of growth will stop the damaging effects of climate change. A partnership ethic must exist between nature and humankind that does not view nature as a resource designed solely for human use but rather emphasises cohabitation between human and non-human life with reciprocal support and collaboration. Thus, by using the myth of Manasa Devi, Amitav Ghosh conveys one of the significant messages that we must look to history to gain a better understanding of both our present and the future. A final rumination by Deen on the last page of the novel makes this point very explicitly: "The possibility of our deliverance lies not in the future but in the past" [286].

**ABSTRACT**

In this paper we introduce the notion of almost generalized continuous function (briefly almost G - continuous) and using it we define almost generalized topological groups (briefly almost G- topological groups) and investigate the properties of it .

**Keywords:** Regularly G-open set , Regularly G-closed set, almost G-open map, almost G-closed map, almost G -continuous , almost G -topological groups.

## INTRODUCTION

In 1968 M.K.Singal and Singal [7] introduced almost continuous mapppings. T. Hussain introduced the topological groups [3] Csazar defined neighbourhood systems in the generalized structure . Murad Husain [5], introduced generalized topological groups . C.Selvi, R.Selvi [6] , defined Quasi generalized S-topological simple groups. Madhu Ram [4] introduced almost topological groups. In this paper we introduce almost G- topological groups.

**PRELIMINARIES**

**Definition:2.1** [1]
A subset A of a topological space (X, $\tau$ ) is said to be Regularly open iff A= (Int(ClA)) .The complement of the Regular open sets are called Regularly closed set respectively .

**Definition : 2.2** [5]
Let X be a set and $G \subseteq P$ be a subfamily where P denote the power set of X . Then G is a generalized topology (briefly G -topology) if (i) $\phi \in G$ (ii) Any union of elements of G belongs to G. . A G -topological space X is called strong if the set X itself is a G –open set and we will denote it by **G -topology**. A set with a G -topology is said to be a generalized topological space . The elements of G are called G -open sets.

**Example:2.3**
X={1,2,3} , Here G ={{1},{2} {1,2}, $\phi$ }. The elements of G are called G-open sets . The complement of G-open sets are G-closed sets.

**Definition: 2.4** [ 5]
Let X be any set and $\phi$ , g be G-neighbourhood system and G-topology on X respectively . Let $A \subseteq X$. A point $x \in X$ is called interior of A if there exists a subset $V \in \phi$ (x), $V \subseteq A$. All interior points $A \subseteq X$ is called G-interior of A . It is denoted by $Int_G(A)$. Similarly we can define G-closure of A as intersection of all G-closed sets containing A and it is denoted by $Cl_G(A)$

**Definition: 2.5** [5]
Let X and Y two G-topological spaces and let $f : X \rightarrow Y$ be a function . Then f is called **G-continuous** on X if for any G-open set O in Y, $f^{-1}(O)$ is G-open set in X

**Example:2.6**
Let X=Y={1,2} , $G_X$={ $\phi$ , {1}} and $G_Y$={ $\phi$ , {2}} . Define a map $f : X \rightarrow Y$ as f(1)=2 and f(2)=1 . Let O={2} be a G-open set in Y and $f^{-1}(O)$={1} is G-open set in X.

**Definition:2.7** [7]
A mapping $f : X \rightarrow Y$, (where X and Y are G- topological spaces) is said to be **almost continuous** at a point $x \in X$ if for every neighbourhood M of f(x),there is a neighbourhood N of x such that $f(N) \subseteq Int(Cl(M))$.

**Example:2.8**
Let X= Y={1,2} , $\tau$ ={X, $\phi$ ,{1}} and $\sigma$ ={Y, $\phi$ ,{2}} . Define the identity map f(1)=1 , f(2)=2. Here the mapping f is almost continuous at the point x=1 and x=2.

**Definition:2.9** [8]
Let (G, .) be a group together with a topology $\tau$ such that the mapping $g_1 : G \times G \rightarrow G$ defined by $g_1(x,y)=x.y$ and $g_2(x)=x^{-1}$ are continuous where $G \times G$ carries the product topology . Then the pair (G, $\tau$ ) is called the **topological group**

**Definition:2.10** [4]
Let G be a group together with a topology $\tau$ such that the multiplication and inverse map are almost continuous where $G \times G$ carries the product topology. Then the pair (G, $\tau$ ) is called the **almost topological group** .

**ALMOST G – TOPOLOGICAL GROUPS**

**Definition :3.1**
A subset A of a G -topological space (X, G) is said to be **Regularly G-open set [briefly R GO(X)]** iff A= ($Cl_G(Int_G(A))$). The complement of the Regularly G-open set are called **Regularly G-closed set [briefly R GC(X)]** respectively .

**Example: 3.2**
Let X={1,2,3}, G={$\phi$,{1},{2},{1,2}}. Here RGO(X)={ X,$\phi$,{1},{2}} and R GC(X)={ X,$\phi$,{2,3},{1,3}}

**Definition: 3.3**
If $f : X \to Y$ is said to be **almost G -open map** if the image of every regularly G -open subset of X is an G -open subset of Y .

**Example:3.4**
Let X=Y={1,2,3} , $G_X$={$\phi$,{1},{2},{1,2}}, $G_Y$={$\phi$,{1},{3},{1,3}}, RGO(X)={ $\phi$,{1},{2}}. Define a mapping f(1)=2,f(2)=3,f(3)=1. Let A={2} be a regularly G -open subset of X. Then f({A})={3} is a G -open subset of Y . Hence f is almost G –open map

**Definition: 3.5**
If $f : X \to Y$ is said to be **almost G -closed map** if the image of every regularly G -closed subset of X is an G -closed subset of Y .

**Example:3.6**
Let X=Y={1,2,3} , $G_X$ (closed)={X,{2,3},{1,3},{3}}, $G_Y$ (closed)={Y ,{1,2},{2,3},{2}}, RGC(X)={ X,$\phi$,{2,3},{1,3}}. Define a identity mapping f(1)=1,f(2)=2,f(3)=3. Let A={2,3} be a regularly G -closed subset of X. Then f({A})={2,3} is a G –closed. Subset of Y. Hence f is alomst G-closed map.

**Definition:3.7**
A mapping $f : X \to Y$, (where X and Y are G- topological spaces) is said to be **almost G-continuous** at a point $x \in X$ if for every G -neighbourhood M of f(x),there is a G -neighbourhood N of x such that f(N) $\subseteq$ Int (Cl(M)). Equivalently If $f : X \to Y$ is said to be almost G- continuous if the inverse image of every Regularly G-open set in Y is G-open in X m

**Example:3.8**
Let X=Y={1,2,3} , $G_X$ = {$\phi$,{1},{3},{1,3}}, $G_Y$ ={$\phi$ ,{1},{2},{1,2}}, RGO(Y)={ X,$\phi$,{2,3},{1,3}}. Define a identity mapping f(1)=2,f(2)=3,f(3)=1. Let A={1} be a regularly G -open subset of Y. Then $f^{-1}$({A})={3} is a G –open Subset of X. Hence f is almost G-closed map.

**Definition:3.9**
Let $f : X \to Y$ is said to be almost G -continuous if it is almost G -continuous at each point x of X.

**Theorem :3.10**
If f is a G -open and G-continuous mapping of Y into Z then $g \circ f$ is almost G -continuous iff g is almost G -continuous.

**Proof:**
Let $g \circ f$ be almost G -continuous. Let A be regularly G -open subset of Z. Since $g \circ f$ is almost G - continuous .Therefore $(gof)^{-1}$ (A) is G - open. $f^{-1}(g^{-1}(A))$ is G – open .Since f is G -open. $\Rightarrow f(f^{-1}(g^{-1}(A)))$ is G - open.(ie), $g^{-1}(A)$ is G -open. Hence g is almost G -continuous .Conversely, Let g be almost G -continuous and A be regular G -open subset of Z. Then $g^{-1}(A)$ is G -open subset of Y. Since f is G – continuous. Therefore $f^{-1}(g^{-1}(A))$ is a G -open subset of X. $\Rightarrow (gof)^{-1}$(A) is G -open subset of X. Hence ($g \circ f$) is almost G - continuous.

**Theorem.3.11**
Every Restriction of an almost G -continuous mapping is almost G -continuous.

**Proof:**
Let f be an almost G -continuous mapping of X into Y. Let S be any G -open subset of X and S be any regularly G-open subset in X .(ie) $\left(f/_A\right)^{-1}(S) = A \cap f^{-1}(S)$ But f is almost G -continuous. $\Rightarrow f^{-1}(S)$ is a G - open.

$\Rightarrow A \cap f^{-1}(S)$ is a G -open subset of A. (ie) $\left(f/_A\right)^{-1}(S)$ is a G -open subset of A . $\Rightarrow f/_A$ is almost G -continuous.

**Definition:3.12**
Let G be a group together with a topology $\tau$ such that the multiplication and inverse map are almost G- continuous where $G \times G$ carries the product topology. Then the pair $(G, \tau)$ is called the **almost G- topological group** .

**Theorem.3.13**
Let $(G, \tau)$ be an almost G- topological group and $G \in G$ be any element of group G. Then (i) The right translation $r_g : G \to G$ defined by $r_g(a) = g.a$ for all $a \in G$ is almost G-continuous. (ii) The left translation $l_g : G \to G$ defined by $l_g(a) = a.g$ for all $a \in G$ is almost G -continuous.

**Proof:**
(i) Let $a \in G$ and W be a regularly G-open set in G containing g.a by definition of almost G- topological group there exists G -open neighbourhood U and V of g and a in G such that $UV \subseteq W$. Which means $gV \subseteq W \Rightarrow r_g(V) \subseteq W$. Therefore $r_g$ is almost G- continuous at a. Hence $r_g$ is almost G- continuous.

(ii) $a \in G$ and W be a regularly G-open set in G containing a.g then there exists G -open sets U in G containing x and V in G containing g such that $UV \subseteq W$. Since a was an arbitrary element of G, is $l_g$ almost G –continuous.

**Theorem:3.14**
Let A be any regularly G -open set in an almost G-topological group $(G, \tau)$. Then the following holds . (i) $gA \in$ RGO(G) for all $g \in G$. (ii) $Ag \in$ RGO(G) for all $g \in G$. (iii) $A^{-1} \in$ RGO(G).

**Proof:**
(i) First let us show that $gA \in \tau$ . Let $x \in gA$ be any element . By definition of almost G-topological groups , there exist G-open neighbourhoods U of $g^{-1}$ and V of x in G such that $UV \subseteq A$. In particular $g^{-1}V \subseteq A \Rightarrow V \subseteq gA$. This indicates $x \in$ Int(gA) and Int(gA)=gA. (i.e) $gA \in \tau$ . Now we prove that $gA \in$ RGO(G). $\Rightarrow gA \in$ $Int_G(Cl_G(gA))$. Since A is G-open . $Cl_G(A) \in$ RGC(G), since $Cl_G(A)$ is G-closed and $gCl_G(A)$ is also G -closed . $(Int_G(Cl_G(gA)) \subseteq Cl_G(gA) \subseteq gCl_G(A)$. $\Rightarrow g^{-1}(Int_G(Cl_G(A)) \subseteq Cl_G(gA)$. Since $(Int_G(Cl_G(gA))$ is regularly G-open. $\Rightarrow g^{-1}(Int_G(Cl_G(gA)) \subseteq (Int_G(Cl_G(A)) = G$ A. This implies $(Int_G(Cl_G(A)) \subseteq gA.gA = (Int_G(Cl_G(A))$

(ii) It is similar as (i)

(iii) Let $g \in A^{-1}$ . Then there exists an open set U in G containing x such that $U^{-1} \subseteq A$. $\Rightarrow U \subseteq A^{-1}$. x is an G-interior point of $A^{-1}$ (Since U is G-open). Hence $A^{-1}$ is G-open. $\Rightarrow A^{-1} \subseteq (Int_G(Cl_G(A^{-1}))$. Now it is enough to prove that $(Int_G(Cl_G(A^{-1})) \subseteq A^{-1}$ . Since A is G-open . $Cl_G(A)$ is regularly G -closed . Therefore $(Int_G(Cl_G(A^{-1}))) \subseteq (Cl_G(A^{-1})) \subseteq Cl_G(A)^{-1}$ . $\Rightarrow (Int_G(Cl_G(A^{-1}))) \subseteq (Int_G(Cl_G(A)))^{-1} = A^{-1}$ which is G -open .

**Theorem: 3.16**
Let F be any regularly G- closed set in an almost G -topological group G then the following holds (i) $gF \in R\ G\ C(G)$ for all $g \in G$ (ii) $Fg \in R\ G\ C(G)$ for all $g \in G$ (iii) $F^{-1} \in R\ G\ C(G)$

**Proof:**
(i) First let us show that $gF \in \tau$ . Let $x \in gA$ be any element . By definition of almost G-topological groups , there exist G-open neighbourhoods U of $g^{-1}$ and V of x in G such that $UV \subseteq A$. In particular $g^{-1}V \subseteq A \Rightarrow V \subseteq gA$. This indicates $x \in Int(gA)$ and Int(gF)=gA. (i.e) $gF \in \tau$ . Now we prove that $gF \in RGC(G)$. $\Rightarrow gF \in Cl_G(Int_G(gF))$. Since F is G-open .$Cl_G(F) \in RGC(G)$, since $Cl_G(F)$ is G-closed and $gCl_G(A)$ is also G -closed . $Cl_G(Int_G(gF)) \subseteq Cl_G(gF) \subseteq gCl_G(F). \Rightarrow g^{-1} Cl_G(Int_G(F)) \subseteq Cl_G(gF)$. Since $Cl_G(Int_G(gF))$ is regularly G-closed. $\Rightarrow g^{-} Cl_G(Int_G(gF)) \subseteq Cl_G(Int_G(F)) = G\ F$. This implies $Cl_G(Int_G(F)) \subseteq gF$. $gF\ Cl_G(Int_G(A))$
(ii) It follows from (i)
(iii) Let $g \in F^{-1}$. Then there exists an open set U in G containing x such that $U^{-1} \subseteq F$. $\Rightarrow U \subseteq F^{-1}$. x is an G-interior point of $F^{-1}$ (Since U is G-open). Hence $F^{-1}$ is G-open. $\Rightarrow F^{-1} \subseteq Cl_G(Int_G(F^{-1}))$. Now it is enough to prove that $Cl_G(Int_G(F^{-1})) \subseteq F^{-1}$ . Since F is G-open . $Cl_G(A)$ is regularly G -closed . Therefore $Cl_G(Int_G(F^{-1}))) \subseteq (Cl_G(F^{-1})) \subseteq Cl_G(F)^{-1}$ . $\Rightarrow Cl_G(Int_G(F^{-1}))) \subseteq Cl_G(Int_G(F)))^{-1} = F^{-1}$ which is G -open .

**Theorem.3.17**
Let A be any G -open set in an almost G- topological group G. Then $gA \subseteq Int_G(g\ Int_G\ Cl_G(A)))$ for all $g \in G$.

**Proof:**
Let A be any G -open, by definition of Regularly G -open $A \subseteq Int_G(Cl_G(A))$ . $\Rightarrow gA \subseteq g\ (Int_G\ (Cl_G(A)))$ . $\Rightarrow g\ Int_G(A) \subseteq Int_G\ (g\ Int_G\ (Cl_G(A)))$. By theorem 3.14 A is G –open. $gA \subseteq Int_G\ g\ (Int_G(Cl_G(A)))$.

**Theorem:3.18**
Let A be any G- closed set of an almost G -topological group. Then $Cl_G(g\ Cl_G(Int_G\ (B))) \subseteq gB$ for all $g \in G$

**Proof:**
It follows from the above theorem 3.17

## CONCLUSION

A weaker type of continuity for their group operations leads to the conclusion that virtually topological groups are a generalization of classical topological groups. The existence of specific examples that meet the "almost" requirements but are not topological groups in the strict sense confirms that generalized almost topological groups represent a larger class of spaces than regular topological groups.A weaker type of continuity for their group operations leads to the conclusion that virtually topological groups are a generalization of classical topological groups. The existence of specific examples that meet the "almost" requirements but are not topological groups in the strict sense confirms that generalized almost topological groups represent a larger class of spaces than regular topological groups.

## ABSTRACT

Telmisartan is a widely prescribed angiotensin II receptor blocker; however, its poor aqueous solubility and dissolution-limited bioavailability may compromise therapeutic performance in conventional oral dosage forms. Orodispersible tablets (ODTs) offer a patient-centric alternative by enabling rapid disintegration and improved drug dissolution without the need for water. The objective of the present study was to formulate, optimize, and evaluate telmisartan orodispersible tablets using fenugreek (*Trigonella foenum-graecum*) powder as a natural superdisintegrant by applying a Design of Experiments (DoE)-based Quality by Design (QbD) approach. ODTs were prepared by the direct compression method, and a three-factor, three-level experimental design was employed to investigate the effects of fenugreek powder, mannitol, and microcrystalline cellulose on critical quality attributes, including disintegration time, wetting time, tablet hardness, friability, and in-vitro drug release. Pre-compression blends exhibited acceptable flow and compressibility, confirming their suitability for direct compression. All formulations complied with pharmacopeial requirements during post-compression evaluation. DoE-based statistical analysis using response surface methodology and analysis of variance enabled identification of an optimized formulation. The optimized batch demonstrated rapid disintegration (18–22 s), adequate mechanical strength, friability below 1%, uniform drug content, and enhanced in-vitro drug release exceeding 98% within 30 minutes. Drug-release kinetics predominantly followed first-order and Higuchi models with non-Fickian transport behavior. FTIR and DSC studies confirmed drug–excipient

compatibility and indicated partial reduction in drug crystallinity, contributing to improved dissolution performance. Overall, the study establishes fenugreek powder as an effective, safe, and sustainable natural superdisintegrant and highlights the applicability of a DoE-driven QbD approach for developing robust, patient-friendly telmisartan orodispersible tablets.

## INTRODUCTION

Hypertension is one of the most prevalent chronic cardiovascular disorders worldwide and a major risk factor for myocardial infarction, stroke, renal failure, and premature mortality [1]. Long-term pharmacotherapy is essential for effective blood pressure control; however, patient adherence remains a significant challenge, particularly among geriatric, paediatric, and dysphagic populations [2]. Difficulty in swallowing conventional tablets often leads to poor compliance and suboptimal therapeutic outcomes. Telmisartan is a potent angiotensin II receptor blocker (ARB) with a long elimination half-life and high affinity for $AT_1$ receptors, making it suitable for once-daily dosing [3]. Despite its favorable pharmacodynamics, Telmisartan is classified as a BCS Class II drug due to its poor aqueous solubility, resulting in dissolution-limited absorption and variable bioavailability [4]. Consequently, formulation strategies that enhance dissolution and patient acceptability are highly desirable. Orodispersible tablets (ODTs) represent an advanced oral dosage form designed to disintegrate rapidly in the oral cavity without water, thereby improving patient convenience and enabling faster drug dissolution [5]. The performance of ODTs is largely governed by the choice of superdisintegrant. While synthetic superdisintegrants are effective, increasing interest in sustainability and biocompatibility has driven the exploration of natural alternatives [6]. Fenugreek seed powder contains mucilage rich in galactomannans and polysaccharides that exhibit high swelling and hydration capacity, making it a promising natural superdisintegrant [7–9]. Design of Experiments (DoE), implemented under Quality by Design (QbD) principles, enables systematic optimization of formulation variables while minimizing experimental effort [10]. The present work applies a DoE-based strategy to optimize fenugreek-based Telmisartan ODTs and compare their performance with marketed formulations.

**Drug and Excipient Profiles**

**Telmisartan**Telmisartan is a selective angiotensin II $AT_1$ receptor antagonist used in the management of hypertension and cardiovascular risk reduction. It exhibits high lipophilicity, poor aqueous solubility, and high membrane permeability, resulting in dissolution-limited absorption. Improving its dissolution behavior is critical for enhanced therapeutic performance. The IUPAC name of Telmisartan is 2-(4-{[4-Methyl-6-(1-methyl-1H-1,3-benzodiazol-2-yl)-2-propyl-1H-1,3-benzodiazol-1-yl]methyl}phenyl)benzoic acid with a molecular weight of 514.63 g/mol and an empirical formula of $C_{33}H_{30}N_4O_2$.

**Chemical structure of Telmisartan (Figure 1).**

***Source:*** *https://en.wikipedia.org/wiki/Telmisartan#/media/File:Telmisartan.svg*

Fenugreek (*Trigonella foenum-graecum*) seed powder is rich in hydrophilic mucilage, galactomannans, and polysaccharides. Upon hydration, it swells rapidly, generating internal pressure that promotes tablet disintegration. Its natural origin, biocompatibility, cost-effectiveness, and eco-friendly nature make it a suitable alternative to synthetic superdisintegrants. Mannitol is a water-soluble diluent widely used in ODTs due to its pleasant cooling sensation, sweetness, and ability to enhance wetting and mouthfeel [11]. MCC (Avicel PH 102) acts as a binder and wicking agent, improving compressibility and facilitating water penetration into the tablet matrix [12]. Aspartame was used as a sweetener, sodium starch glycolate as an auxiliary superdisintegrant, magnesium stearate as a lubricant, and talc as a glidant, all at pharmaceutically acceptable levels.

# MATERIALS AND METHODS

## MATERIALS

Telmisartan was used as the active pharmaceutical ingredient and procured from Sun Pharmaceutical Industries Ltd., India. Fenugreek (*Trigonella foenum-graecum*) powder was employed as a natural superdisintegrant and obtained from a certified supplier, followed by authentication prior to use. Mannitol was used as a diluent and mouthfeel enhancer, while microcrystalline cellulose (Avicel PH 102) served as a binder and wicking agent. Sodium starch glycolate was incorporated as an auxiliary superdisintegrant, aspartame as a sweetener, magnesium stearate as a lubricant, and talc as a glidant. All excipients were of pharmaceutical grade and complied with relevant pharmacopeial standards. A marketed Telmisartan dispersible tablet (TELKIZ 40) was used for comparative evaluation.

**Formulation of Telmisartan Orodispersible Tablets**

Telmisartan orodispersible tablets were prepared by the direct compression method. All ingredients were passed through a suitable sieve, blended uniformly using geometric dilution, and lubricated with magnesium stearate and talc. The final blend was compressed using 8-mm flat-faced punches to obtain tablets with adequate mechanical strength and rapid disintegration properties. Composition of Telmisartan Orodispersible Tablet Formulations (F1–F9) (Table 1).

**Experimental Design (Design of Experiments)**

**Rationale for Selection of Design of Experiments**

Preliminary formulation trials indicated that the concentrations of fenugreek powder, mannitol, and microcrystalline cellulose (MCC) exert a significant influence on the disintegration behavior, mechanical strength, and dissolution performance of Telmisartan orodispersible tablets. Conventional one-factor-at-a-time optimization was found to be insufficient to capture interaction effects among formulation variables. Therefore, a Design of Experiments (DoE) approach was adopted to enable systematic investigation of multiple variables simultaneously and to establish a statistically justified formulation design space in accordance with Quality by Design principles.

**Selection of Independent Variables and Responses**

Based on pre-DoE screening studies, three formulation factors were identified as critical material attributes (CMAs), and key tablet performance parameters were selected as critical quality attributes (CQAs). Pre-DoE Screening of Factors and Responses (Table 2).

**Experimental Design and Factor Levels**

A three-factor, three-level ($3^3$) factorial design was selected to study linear, interaction, and quadratic effects of formulation variables with a limited number of experimental runs. This design enables generation of predictive polynomial models and response surface plots for optimization. Independent Variables and Coded Levels (Table 3).

**DoE Experimental Design Matrix**

The experimental runs were generated using Design-Expert® software. Nine formulations (F1–F9) were prepared as per the design matrix. DoE-Generated Experimental Design and Observed Responses (Table 4). *Values represent mean ± SD (n = 3).

**Evaluation of Powder Blends and Tablets**

The prepared powder blends were evaluated for pre-compression parameters, including angle of repose, bulk density, tapped density, Carr's index, and Hausner ratio, to assess flowability and compressibility. The compressed tablets were evaluated for post-compression characteristics such as hardness, friability, weight variation, wetting

time, disintegration time, drug content uniformity, and in-vitro dissolution using USP Type II apparatus in pH 6.8 phosphate buffer.

**Compatibility and Statistical Analysis**

Drug–excipient compatibility and solid-state characteristics were assessed using Fourier Transform Infrared (FTIR) spectroscopy and Differential Scanning Calorimetry (DSC). Statistical analysis of the experimental data was performed using response surface methodology, analysis of variance, and desirability function to identify the optimized formulation. The optimized batch was further compared with the marketed Telmisartan formulation to evaluate improvements in disintegration behavior and dissolution performance. Preliminary formulation trials indicated that fenugreek powder, mannitol, and microcrystalline cellulose significantly influenced the disintegration behavior, mechanical strength, and dissolution performance of Telmisartan orodispersible tablets. Conventional trial-and-error optimization was insufficient to capture interaction effects among these variables. Therefore, a Design of Experiments (DoE) approach was employed to systematically evaluate factor effects and interactions and to establish an optimized formulation design space in accordance with Quality by Design principles.

## RESULTS AND DISCUSSION

**Pre-Compression Properties**

The pre-compression parameters of the powder blends were evaluated to assess flowability and compressibility, which are critical for uniform die filling and successful direct compression. Summary of Pre-Compression Parameters of Powder Blends (F1–F9) (Table 5). The pre-compression parameters indicated that all powder blends exhibited good to excellent flow properties, as reflected by angle of repose values within acceptable limits. Bulk and tapped density values demonstrated normal packing behavior, while Carr's index and Hausner ratio confirmed satisfactory compressibility of the blends. Slight variations among formulations were observed due to differences in fenugreek and microcrystalline cellulose content; however, these variations did not adversely affect flowability. Overall, the results confirmed that all blends were suitable for direct compression and ensured uniform tablet manufacture without processing difficulties

**UV Spectrophotometric Analysis**

UV spectrophotometric analysis was carried out to develop a simple and reliable method for the quantitative estimation of Telmisartan in drug content and in-vitro dissolution studies UV Absorption Data of Telmisartan in pH 6.8 Phosphate Buffer (Table 6). UV Absorption Spectrum of Telmisartan (Figure 2). Calibration Data of Telmisartan in pH 6.8 Phosphate Buffer (Table 7). Calibration curve of Telmisartan in pH 6.8 phosphate buffer at 296 nm (Figure 3). The UV absorption spectrum of Telmisartan in pH 6.8 phosphate buffer exhibited a well-defined maximum absorbance ($\lambda$max) at 296 nm, which was selected for further quantitative analysis. The calibration curve constructed over the concentration range of 2–10 µg/mL showed excellent linearity with a high correlation coefficient ($R^2 \approx 0.999$), indicating a strong linear relationship between absorbance and concentration. The linearity of the calibration curve confirms the reliability and suitability of the developed UV spectrophotometric method for drug content determination and analysis of in-vitro dissolution samples without interference from formulation excipients.

**Post-Compression Evaluation of Telmisartan ODTs**

The prepared Telmisartan orodispersible tablets were evaluated for post-compression quality attributes to ensure compliance with pharmacopeial standards and suitability for orodispersible tablet applications Summary of Post-Compression Evaluation Parameters (Table 8). The post-compression evaluation results indicated that all formulations possessed adequate mechanical strength, with hardness values sufficient to withstand handling and friability remaining below the acceptable limit of 1%. Weight variation and drug content uniformity complied with pharmacopeial specifications, indicating uniform die filling and homogeneous drug distribution. Wetting time and disintegration time values were within the acceptable range for orodispersible tablets, confirming the effectiveness of

fenugreek powder in promoting rapid tablet hydration and disintegration. Overall, the post-compression results confirmed that all formulations met the essential quality requirements for orodispersible tablet dosage forms.

**Wetting Time and Disintegration Behavior**

Wetting time and disintegration time are critical quality attributes for orodispersible tablets, as they directly influence tablet hydration, patient acceptability, and onset of action. Wetting Time and Disintegration Time of ODTs (F1–F9) (Table 9). An inverse relationship was evident between the concentration of fenugreek powder and both wetting time and disintegration time. Formulations containing higher amounts of fenugreek showed quicker wetting and more rapid tablet disintegration, which can be attributed to the strong swelling behavior and mucilage-forming properties of fenugreek that facilitate efficient water uptake and generate internal pressure within the tablet matrix. Mannitol further enhanced this effect by improving tablet wettability, while microcrystalline cellulose helped preserve tablet integrity during the disintegration process. Overall, these findings demonstrate the effectiveness of fenugreek powder as a natural superdisintegrant in the development of orodispersible tablet formulations.

***In-Vitro* Dissolution Studies**

In-vitro dissolution studies were carried out to evaluate the drug-release behavior of Telmisartan from the formulated orodispersible tablets and to assess the influence of formulation variables on dissolution performance. Comparison of drug release at various time intervals (Table 10). Graph showing *In-Vitro* Dissolution Profiles (F1–F9) (Figure 4). The *in-vitro* dissolution results showed a noticeable enhancement in drug-release performance as the concentration of fenugreek powder increased. Formulations containing lower amounts of fenugreek exhibited slower initial drug release, while those with higher fenugreek levels demonstrated faster and more complete release. This improvement is primarily attributed to rapid tablet disintegration, better wettability, and increased surface area availability of the drug for dissolution. Mannitol further contributed to enhanced dissolution by improving tablet porosity and wettability. Among the tested formulations, batch F7 displayed the most rapid and consistent drug-release profile, achieving nearly complete release within the designated time period, thereby confirming its selection as the optimized formulation.

**DoE-Based Optimization and Statistical Interpretation**

A Design of Experiments (DoE) approach was applied to systematically evaluate the individual and combined effects of fenugreek powder, mannitol, and microcrystalline cellulose on the critical quality attributes of Telmisartan orodispersible tablets and to identify an optimized formulation within the experimental design space. ANOVA for Disintegration Time (DT) (Table 11). ANOVA for Wetting Time (WT) (Table 12). ANOVA for Hardness (Table 13). ANOVA for Friability (Table 14). ANOVA for % Drug Release at 30 Minutes (Table 15). Analysis of variance revealed that fenugreek concentration exerted the most significant influence on disintegration time and drug release, confirming its dominant role as a natural superdisintegrant. Mannitol also showed a statistically significant contribution, particularly in enhancing wettability and dissolution behavior. Microcrystalline cellulose primarily influenced mechanical strength parameters such as hardness and friability. The statistical significance of interaction terms indicates that formulation performance is governed by the combined effects of excipients rather than individual factors alone, thereby validating the application of a DoE-based optimization strategy. RSM Plots representing various parameters (Figure 5). Response surface analysis demonstrated a clear relationship between formulation variables and tablet performance. Increasing fenugreek concentration consistently reduced disintegration and wetting times, while higher mannitol levels enhanced drug release by improving wettability. Microcrystalline cellulose provided a balancing effect by improving tablet strength without excessively prolonging disintegration. The response surface plots clearly identified an optimal formulation region that satisfied rapid disintegration, enhanced dissolution, and acceptable mechanical integrity. Multi-response optimization using the desirability function identified formulation F7 as the optimized batch, fulfilling all predefined criteria, including minimum disintegration time, rapid wetting, friability below 1%, acceptable hardness, and maximum drug release. The close agreement between predicted and experimental responses confirms the robustness and predictive capability of the developed DoE model, establishing F7 as a scientifically optimized formulation rather than an empirical selection.

**Drug-Release Kinetics of Optimized Telmisartan Orodispersible Tablet (F7)**

Drug-release kinetic modeling was performed to elucidate the mechanism of Telmisartan release from the optimized orodispersible tablet formulation (F7) and to understand the influence of formulation components on drug-release behaviour. Drug Release Kinetic Models for Optimized Telmisartan ODT (F7) (Figure 6). Summary of Drug Release Kinetic Models for Optimized Telmisartan ODT (Table 16). The dissolution data of the optimized formulation (F7) showed the highest correlation with the first-order kinetic model, indicating concentration-dependent drug release. A good fit with the Higuchi model further suggests that drug release is predominantly governed by diffusion from a hydrated matrix. The Korsmeyer–Peppas model exhibited an exponent value (n) between 0.45 and 0.89, indicating a non-Fickian transport mechanism. This behavior reflects a combined effect of diffusion and polymer swelling, which can be attributed to the mucilage-forming and swelling properties of fenugreek powder. The rapid tablet disintegration, enhanced wetting, and porous matrix formation collectively contribute to the observed release mechanism. These findings confirm that the optimized formulation provides controlled yet rapid drug release, suitable for orodispersible tablet systems.

**Comparison of Optimized Telmisartan Orodispersible Tablet with Marketed Formulation**

The optimized Telmisartan orodispersible tablet formulation (F7) was compared with a commercially available Telmisartan dispersible tablet to evaluate differences in disintegration behavior and drug-release performance.

**Comparison with Marketed Formulation**

Comparison of Drug Release Kinetics Between Optimized ODT and Marketed ODT (Table 17). The optimized formulation exhibited shorter wetting and disintegration times compared to the marketed tablet, indicating faster tablet hydration and breakup. This improvement can be attributed to the swelling and mucilage-forming properties of fenugreek powder, which promote rapid water uptake and disintegration. Faster disintegration of the optimized formulation is expected to improve patient compliance and onset of action. Comparison of Dissolution Profiles of Optimized Telmisartan ODT and Marketed Telmisartan ODT (Figure 7). The *in-vitro* dissolution profile demonstrated that the optimized formulation achieved faster and more complete drug release at early time points compared to the marketed formulation. The enhanced dissolution performance of the optimized tablet can be attributed to rapid disintegration, improved wettability, and increased surface area exposure of the drug. These results indicate superior dissolution behavior of the optimized formulation. Overall, the optimized Telmisartan orodispersible tablet showed superior performance over the marketed formulation, confirming the effectiveness of fenugreek powder as a natural superdisintegrant and the advantage of the DoE-optimized formulation strategy.

**Fourier Transform Infrared (FTIR) Analysis**

Fourier Transform Infrared (FTIR) spectroscopy was performed to evaluate possible chemical interactions between Telmisartan and formulation excipients and to assess the compatibility of the drug within the optimized orodispersible tablet formulation. FTIR spectrum of Pure Telmisartan and Optimized Telmisartan ODT formulation (Figure 8). FTIR Peak Assignment Table (Table 18). The FTIR spectrum of pure Telmisartan exhibited characteristic absorption peaks corresponding to its functional groups, including N–H stretching, C–H stretching, C=O stretching, and aromatic ring vibrations. These characteristic peaks were retained in the FTIR spectrum of the optimized formulation (F7) with no significant disappearance or formation of new peaks. Minor shifts in peak positions and changes in peak intensity were observed, which can be attributed to physical interactions such as hydrogen bonding and dilution effects rather than chemical incompatibility. The absence of additional peaks confirms that no chemical interaction occurred between Telmisartan and the formulation excipients. These results indicate that Telmisartan is chemically compatible with fenugreek powder and other excipients used in the formulation. Overall, FTIR analysis confirmed the chemical stability and compatibility of Telmisartan within the optimized orodispersible tablet formulation.

## CONCLUSION

In this study, telmisartan orodispersible tablets were successfully developed and optimized using fenugreek (*Trigonella foenum-graecum*) powder as a natural superdisintegrant. A Design of Experiments–based Quality by Design approach was employed to systematically understand the influence of formulation variables on tablet performance. The optimized formulation showed rapid wetting and disintegration, satisfactory mechanical strength, low friability, uniform drug content, and improved in-vitro drug release. The results clearly indicated that fenugreek powder played a key role in accelerating tablet disintegration and enhancing dissolution, while mannitol and microcrystalline cellulose supported wettability and mechanical stability, respectively. Drug-release kinetic analysis suggested a non-Fickian release mechanism, reflecting the combined contribution of diffusion and swelling processes. When compared with a marketed telmisartan dispersible tablet, the optimized formulation demonstrated faster disintegration and superior dissolution behavior. FTIR studies further confirmed the compatibility and chemical stability of telmisartan with the selected excipients. Overall, the findings highlight the potential of fenugreek powder as an effective, safe, and sustainable natural superdisintegrant for orodispersible tablet formulations. The DoE-guided formulation strategy enabled the development of a robust and patient-friendly telmisartan dosage form and supports the broader application of natural excipients in optimized oral drug delivery systems.

**Table 16: Summary of Drug Release Kinetic Models for Optimized Telmisartan ODT**

| Kinetic Model | Plot Description | Regression Coefficient ($R^2$) | Key Interpretation |
|---|---|---|---|
| Zero-order | % Drug release vs Time | 0.892 | Poor linearity indicates drug release is not constant and does not follow zero-order kinetics |
| First-order | Log (100 – % release) vs Time | 0.981 | High linearity confirms concentration-dependent release, typical of fast-disintegrating systems |
| Higuchi | % Drug release vs √Time | 0.964 | Indicates diffusion-controlled release from a hydrated matrix |
| Korsmeyer–Peppas | Log % release vs Log time | 0.972 | Suggests anomalous (non-Fickian) transport mechanism |
| Release exponent (n) | — | 0.62 | Confirms combined diffusion + swelling-controlled release |

**Table 17:Comparison of Drug Release Kinetics Between Optimized ODT and Marketed ODT**

| Parameter | Optimized Telmisartan ODT (F7) | Marketed Telmisartan ODT (TELKIZ 40) |
|---|---|---|
| Disintegration time | **18-22 sec** | Approx. 29 sec |
| Wetting time | 12 sec | 20 sec |
| % Drug release at 5 min | **58%** | 42% |
| % Drug release at 10 min | **77%** | 62% |
| % Drug release at 15 min | **90%** | 79% |
| % Drug release at 30 min | **99%** | 92% |
| Dominant release kinetics | First-order + diffusion | First-order |
| Release mechanism | Non-Fickian (diffusion + swelling) | Predominantly diffusion |
| Super disintegrant | Fenugreek powder + SSG | Synthetic |

**Table 18: FTIR Peak Assignment Table**

| Functional Group | Pure Telmisartan ($cm^{-1}$) | Formulation ($cm^{-1}$) | %T Intensity Behavior | Interpretation |
|---|---|---|---|---|
| N–H stretching | 3300 | 3295 | Slightly higher %T | Minor shift; hydrogen bonding with excipients |
| Aliphatic C–H stretch | 2920 | 2915 | Slightly higher %T | No chemical interaction; physical dilution effect |
| C=O stretching (carboxyl) | 1705 | 1702 | Slightly higher %T | Strong peak remains – drug stable |
| Aromatic C=C | 1450 | 1452 | Minimal change | Structure preserved |
| C–H bending | 750 | 748 | Minimal change | No interaction |
| O–H stretching (excipients) | Broad | Broad | Overlapping regions | Normal with MCC and fenugreek |
| Polysaccharide peaks (fenugreek) | — | 1000–1200 | Expected new bands | Belong to excipients; no interaction |

## ABSTRACT

Breast cancer (BC) is currently one of the most prevalent diagnosed cancers worldwide. In India, breast cancer has evolved as the most common female cancer after cervical cancer. 80% of the patients treated for BC have metastatic disease in axillary lymph nodes. Lymphedema, one major complication of breast cancer treatment which affects physically, psycho socially and compromising the activity of daily living(ADL) , thereby affecting the quality of life(QoL). Early identification of lymphedema symptoms and early treatment in the subclinical stage may prevent futher complications. Evaluation of lymphedema in cancer survivors - Occurrence and QoL in post-mastectomy patients. Post-mastectomy patients were screened from a cancer survivor camp organized by the Department of Surgical Oncology, Sri Ramachandra University. The study was approved by the Research Ethics Committee of the Sri Ramachandra Institute of Higher Education and Research.[IEC-NI/24/FEB/91/05] Based on the eligibility 24 patients were selected and a consent form was obtained from them. Clinical assessment of lymphedema and the QoL in post-mastectomy subjects using Lymphedema Life Impact Scale (LLIS) were taken. 120 patients were screened for the study. 24 patients were included in the study. Of them, 75 % patients had clinically apparent lymphedema and majority of patients had impairment score (LLIS) above 40% due to lymphedema. 50% of patients presented with shoulder mobility impairment and postural alterations.46% of them experienced the lymphedema symptoms within 2 years of postoperative period. With an increasing number of breast cancer survivors, there is a need to address their complications, especially lymphedema. Lack of awareness of the symptoms would reduce functional

independence. Early diagnosis of its occurrence, periodic multi disciplinary follow up with health education would improve the quality of life of mastectomy survivors.

## INTRODUCTION

Breast cancer (BC) is currently one of the most prevalent diagnosed cancers and the 5th cause of cancer-related deaths worldwide[1]. Physical activity, overweight, obese, alcohol, smoking, insufficient nutrients, increased exposure to artificial light, consuming more processed food, chemical or drug exposure are modifiable risk factors of BC and non-modifiable factors are female sex, aging , family history of breast and ovarian cancer, ethnicity, pregnancy, breastfeeding, menopause, dense breast tissue, previous radiation therapy[2]. In India, breast cancer risk is more after cervical cancer, in which 80% of the patients treated for BC have metastatic disease in axillary lymph nodes [3]. Such patients undergo mastectomy with axillary lymph node dissection (ALND) or Sentinel lymph node Biopsy (SLNB) as adjuvant treatment. ALND and postoperative radiation therapy significantly increases the risks of lymphedema[4]. Common post-mastectomy symptoms are suture pain, neck and arm pain , scar adhesion, muscle weakness of the upper limb and shoulder girdle, postural abnormalities such as kyphosis and scoliosis and restricted mobility of the shoulder[5]. In India, about 60% of patients develop arm symptoms following post-ALND, which includes lymphedema (LE) , numbness of the arm and chest wall, axillary web syndrome, winging-scapula and impaired activities of dailyliving (ADL), leading to poor Quality of Life (QoL)[6]. Lymphedema, one major complication of breast cancer treatment manifests as swelling where the lymphatic channels fails to clear lymph fluid from the interstitial space leading to motor and sensory impairment in arm functioning, affects the activity of daily living and the QoL[7,8]. Clinically, it may be easily measured using circumferential limb girth and volumetric measurements[9]. Early identification of symptoms especially in subclinical stage, maintaining ideal body weight may prevent the further complications[10]. In mastectomy, posture will be altered when the patient has large and heavy breasts. Emotional stress, musculoaponeurotic retraction during surgery, post-surgical scars and post-radiation therapy fibrosis results contraction of muscles in the cervical and scapular regions . Women perceive varoius posture disorders as complications and report impaired ADL [11,12]. Lymphedema requires longterm followup to prevent complications[13]. In the post-mastectomy phase, it is important to assess lymphedema and its symptoms which helps to identify the sub-clinical lymphedema thereby reducing disease progression. This study focuses on the evaluation of lymphedema, occurrence and its related quality of life in post-mastectomy patients.

## METHODS

Post-mastectomy patients were screened from a cancer survivor camp organized by the Department of Surgical Oncology, Sri Ramachandra University. The study was approved by the Research Ethics Committee of the Sri Ramachandra Institute of Higher Education and Research.[IEC-NI/24/FEB/91/05] Women aged 40 years and above diagnosed with invasive, unilateral breast cancer, who underwent mastectomy (modified/radical) were eligible to participate in the study. Patients presenting with conditions like primary lymphedema, trauma/fracture on the affected side, chronic musculoskeletal conditions and pre-existing neuro-muscular conditions were excluded from the study.

**Screening**

120 patients were screened for the study. Questions focused on the symptoms; the presence of swelling, infection, allergies, rashes, heaviness of arm, tightness of hand and any changes in skin texture in recent times post surgery. Symptoms among these are suggestive of the presence of lymphedema [14]. Based on the eligibility 24 patients were selected and a consent form obtained. Evaluation for lymphedema was performed using arm (girth) measurements.

Subsequently, their quality of life (QoL) was assessed using the Lymphedema Life Impact Scale (LLIS). Clinical assessment of lymphedema and the QoL in post-mastectomy subjects were collected on the same day(Fig:1). Symptoms were staged for lymphedema grading based on the International Society of Lymphology (ISL) (Fig:2) .

**Limb Girth Measurement**

Limb Girth measurements were taken with a non-elastic tape and a difference of >2cm when compared with the unaffected side was suggestive of lymphedema. The measurements were taken from the 1) palm, 2) wrist, 3) 5cm from the wrist, 4) 10cm from the wrist, 5) 15cm from the wrist, 6) the elbow, 7) 5cm from the elbow, 8) 10cm from the elbow and 9) 15cm from the elbow(Fig:3). A total of 9 measures taken and compared with the normal side[15]. The presence of any infection, bruises, or changes in skin color observed and checked for any underlying infection.

**Lymphedema life impact scale (LLIS) questionnaire:**

The LLIS Questionnaire assess four domains, a)Physical Concerns, b)Psycho-social Concerns, c)Functional Concerns and d)Infection Occurrence. Based on the inputs, the questions are graded from 0-4 where the lower range denotes nil/absent and the higher range denotes maximum/present. LLIS scoring calculated % impairment: Sum the total of scores from Q.No: 1-17 (exclude Q.No.18), divide it by 17 and multiply by 25 [16][17].

## RESULTS

24 patients participated in the study. (Table-1) The mean age was 54.87 with SD 8.8. Among them, 87.5% were housewives and 12.5% were employed. They had the complaints of hypertension(HTN), diabetes mellitus(DM), both HTN and DM, and others(Coronary Artery Disease(CAD), Epilepsy and hypothyroid) at 29.17%, 16.67%, 20.83%, and 33.33% respectively. 33.33% of the patients have a positive family history of cancer. Functionally 71% of patients presented with upper limb discomfort. Depending upon the onset of symptoms they represented as i)No visible changes but symptomatic(20.83%), ii)< 1 year (16.67%), iii) 1-2year(29.17%), iv) 2-years(12.5%) v) after 5years(20.83%)(Fig-4). Lymphedema classification based on ISL grading, Grade 0(25%), Grade 1(37.5%), Grade IIa-(4.16% ) Grade IIb (12.5%) and Grade III(16.66%). The percentage of impairments increased as the grade of lymphedema increased(Fig.5).

## DISCUSSION

Breast cancer-related lymphedema is a potentially devastating complication after axillary surgery. The occurrence is difficult to determine at the onset but essential because treating lymphedema is cumbersome in the late stage. [18] Therefore timely screening and diagnosis are important to identify the sub-clinical lymphedema to prevent the development of clinically apparent lymphedema thereby allowing for improvement and maintenance of the QoL because of its reversible property[19-21]. This study documented the occurrence and severity of Lymphedema and its Quality of life (QoL) in post-mastectomy patients. According to the LE staging, patients received neoadjuvant chemotherapy(4/6/8 cycles), surgical resection - modified/radical mastectomy with ALND and a few patients received adjuvant radiotherapy. Clinically, the volume displacement technique is recognized as the gold standard in assessing lymphedema with accurate results but cross-infection is the drawback.[20]. Bio-Impedance Spectroscopy(BIS), is a painless, safe, and rapid method used for detecting reversible sub-clinical stages as early as four months but it is not cost-efficient [22]. Perometer is a reliable measure of limb size, but unable to distinguish between muscle, bone, fat, and fluid[23]. Key patient-related factors like obesity, upper-limb mobility, presence of injury/infection contribute to the risk of lymphedema[24]. Among them, infection, a significant risk factor as well as the most frequent complication, triggers the onset of lymphedema[25]. In this study, 25% had developed lymphedema post-infection where their quality of life was compromised. Tessa C. *et al* (2018), established that ALND, RLNR, high BMI at the time of diagnosis, edema 3–5% within 3 months of surgery, edema 5–10% at any time after surgery, and cellulitis infections are few risk factors for lymphedema[8,26].

Jammal lo *et al.*(2013) conducted a screening of breast cancer-related lymphedema using perometry and found that BMI≥30kg/m2 was an independent high-risk factor with little evidence suggesting fluctuations in weights as well.[27] In the present study, 3 patients presented with swelling within 2 months with higher BMI, and had progressed from Grade 0 (sub-clinical) to Grade III in less than a year. Fu *et al.* (2021) demonstrated that patients with lower education levels are more likely to develop severe symptoms within a year post-surgery.[28,29] Patients who understood the clinical presentation of the disease and treatment options had undergone the necessary therapy and exercises regularly, thereby reducing its progression. Voogd *et al* (2002) stated that a difference of 2cm or more in arm circumference with a limitation in shoulder mobility strongly indicates the presence of physical complaints and psycho-social issues in post-mastectomy with ALND and less than 2cm difference with shoulder mobility also affected to a lesser extent.[30] This study had similar findings where the shoulder restriction was a factor irrespective of the arm measurements, and a predominant increase of >2cm was considered as the presence of lymphedema. Visible swelling was left unnoticed in the arm rather than the forearm by most of the women, leading to an objective measurement lack[31]. Axillary lymph node dissection(ALND), the standard surgical procedure for removing the positive lymph nodes, results in lymphedema in almost 20–50% of patients[32]. In this study, the onset of symptoms post-mastectomy with ALND is within 1-3 years for 50% of 24 patients, of which 29% presented with symptoms in 1-2 years of the patients. Those who underwent irradiation(RT) in addition to ALND had a higher risk of developing lymphedema along with shoulder impairment[30]. These patients presented with an early onset of < 1 year with an underlying infection post-treatment. Lymphedema and its associated symptoms impact QoL in physical and physiologic morbidities including infection, altered sensation, skin changes, pain, reduced range of motion, muscle strength, and joint function.

Due to larger arm size adjustment in activities of daily living, sleep, employment, attire, and sport psychological morbidities like anxiety, depression, disturbed body image, and social avoidance correlate with the lymphedema symptoms.[33,34,35] In the present study 2/3rd of the patients presented with 60% impairment, with advancing in lymphedema grades, their QoL is affected linearly which was consistence with the study conducted by Pusic *et al.2013*[6]. It was noted that there were limitations in the functions involving flexion, abduction, and external rotation in patients who had reduced usage of the affected arm. Also, postural alterations like anteriorization of the trunk with anterior projection and rotation of the head to the affected side in women with lymphedema were more pronounced in more than 50% of the patients irrespective of their arm usage. This might be due to the weight of the limb, pain, skin fibrosis due to radiation therapy, surgical scar retraction, or psychological reaction[5]. There were only a few literature citing the the onset of breast cancer-related lymphedema and its risk factors but did not explain the early occurrence of symptoms and their associated health-related quality of life using the questionnaire in post-mastectomy patients. Symptomatic lymphedema can be visually identified but it takes time to develop. Since non-symptomatic lymphedema is subjective it is unclear to understand and define the period of onset. Therefore, every post-mastectomy patient must undergo screening of lymphedema and report for any symptoms of discomfort in the affected arm. Early screening helps in diagnosing grade-I sub-clinical lymphedema thereby preventing from increase in grades. In the present study, lymphedema is more pronounced in patients who have undergone mastectomy with ALND and adjuvant RT as well as there was an early onset of symptoms, in less than a year. 20% of patients who continuously used their affected limb for activities, with regular exercises and arm care had not developed lymphedema even after 5 years post-mastectomy. There are a few limitations of the study, arm circumference difference method used for assessment of lymphedema is simple and practical; however, this method is unreliable in weight gain [22]. BioImpedence Spectroscopy(BIS) or perometer results can also be taken for interpretation. Further recommendations for the study could be an assessment of the onset of symptoms and its QoL at regular intervals for every 3 months to identify the progression of the disease.

## CONCLUSION

With an increasing number of breast cancer survivors, there is a need to address their complications, especially lymphedema. Lack of awareness of the symptoms would reduce functional independence. Early diagnosis of its

occurrence, periodic multi disciplinary follow up with health education would improve the quality of life of mastectomy survivors.

## ABSTRACT

The strategic integration of Green Manufacturing (GM) and Sustainable Packaging (SP) programs as crucial levers for converting the global pharmaceutical industry into an environmentally conscious sector is examined in this expert-level paper. Using a strong mixed-method case study approach, the study assesses the strategic applicability of global best practices in the dynamic Indian pharmaceutical market (India Pharma) by analysing the implementation strategies of companies such as Novo Nordisk and Pfizer. The analysis demonstrates that the widespread use of GM, which is marked by a decreased dependency on dangerous chemicals, a reduction in energy and water consumption, and sophisticated waste management, not only lessens the negative effects on the environment but also boosts organizational creativity, lowers future disposal costs, and ensures long-term profitability. The Central Pollution Control Board (CPCB) and Central Drugs Standard Control Organization (CDSCO) of India, the US Food and Drug Administration (USFDA), the European Medicines Agency (EMA), the World Health Organization (WHO), and the International Council for Harmonization (ICH) are just a few of the important regulatory organizations that have released global environmental quality guidelines. Important conclusions show that green practices are positively correlated with increased economic competitiveness. They also show how India can harmonize its domestic standards, protect public health by reducing exposure to hazardous substances, and securely access international markets. The report comes to the conclusion that sustainability is now a strategic driver for innovation and resilience in the global pharmaceutical supply chain rather than a burden of compliance.

**Keywords:** Indian pharma, green manufacturing, sustainable packaging, pharmaceutical industry, life cycle assessment (LCA), regulatory compliance, circular economy, and e-factor.

# INTRODUCTION

**Green manufacturing and sustainable packaging are the two pillars of environmental stewardship**

In addition to being essential to human health, the global pharmaceutical business is under fire for its substantial impact on water use, hazardous waste, and carbon emissions across its intricate value chain, which includes raw material procurement and product delivery. I Green Manufacturing (GM) and Sustainable Packaging (SP) programs must be strategically and concurrently integrated in order to make the systemic shift to an environmentally friendly operational paradigm [5].

**Green Production (GM) Backdrop**

Green manufacturing minimizes the environmental impact of the production of final doses and the synthesis of Active Pharmaceutical Ingredients (APIs) by applying ecologically conscious principles throughout the whole production lifecycle. GM strives for operational efficiency in a number of crucial areas, including cutting carbon dioxide and other carbon emissions to lessen the overall carbon footprint, conserving water, improving energy efficiency, and developing cutting-edge waste management .The use of green chemistry technologies, which entail replacing hazardous chemicals with non-hazardous ones in order to meet the same product criteria, is a key element of GM .This deliberate move away from conventional methods and toward closed-loop systems and green synthesis [7] reframes sustainability as an economic driver rather than just an environmental expense by addressing Scope 1 and 2 emissions and directly resulting in lower waste rates and greater organizational competitiveness [1]

**Packaging for Sustainability (SP) Backdrop**

The goal of sustainable packaging is to lessen the final product's delivery and containment system's environmental impact [2]. In addition to lowering overall plastic use, SP activities include material replacement, such as the use of biodegradable polymers, post-consumer recycled plastics (rPET), and paper-based substitutes [2]. In order to maintain viability at scale, SP must make sure that eco-friendly solutions are carefully matched with strict regulatory compliance standards and long-term cost-effectiveness [2]. Maintaining superior barrier performance against moisture and oxygen—essential for drug stability and efficacy—while using lighter, more sustainable materials is a challenge inherent in pharmaceutical packaging. This lowers production and shipping costs, resulting in a more favourable carbon footprint [2].

**Research Methods and Design**

The research design used in this analysis is a mixed-method case study [3]. The study examines the intricate history, present state, and regulatory interconnections of sustainability implementation within multinational pharmaceutical companies using action research methodologies and in-depth case studies [4]. Because it enables a thorough, focused investigation of highly regulated and context-dependent phenomena, including manufacturing sustainability, the case study technique is justified [3]. Additionally, working with management and applying action research techniques makes it easier to create strategic plans for sustainable development solutions that incorporate viewpoints from all business divisions [8]. This approach is essential for delving deeper than cursory observations to reveal the nuances of effective process transformation.

**A Systematic Literature Review's Function and Significance**

The theoretical underpinnings and contextual framework required for a thorough assessment of pharmaceutical sustainability performance are established by a systematic examination of the literature. Data Envelopment Analysis (DEA) techniques were frequently used in early research assessing business sustainability performance [9]. However, the nature of real-world sustainability data, which is often expressed as qualitative, ambiguous, or imprecise information rather than the positive, quantitative, and precise figures generally expected, makes it difficult to apply traditional DEA models [9]. The incorporation of qualitative research methods is required due to this methodological constraint [10]. Qualitative approaches, like grounded theory or phenomenology, assist researchers in understanding how and why specific behaviours occur as well as the significance people attach to their experiences, whereas

quantitative research establishes the number of individuals that display particular behaviours [10] .Using this hybrid method in sustainability research is essential to comprehending the institutional and behavioural elements that underpin the effective adoption of green technologies and to elucidating less-known problems in corporate sustainability management [10].

**Methods of Data Gathering and Analysis**

Using data triangulation, the study combines quantitative performance measures with qualitative documentation and policy analysis.

**Quantitative Data:** Contains important performance metrics including the proportion of renewable energy used and the amount of garbage that is recycled or dumped in landfills [11]. measurable cost reductions brought about by energy-saving measures [12], and most importantly, the E-Factors attained in chemical synthesis [13]. (kilos of waste produced per kilo of output)

**Qualitative Data:** Contains implementation plan narratives, comprehensive company reports on internal change management procedures, and regulatory requirements from organizations like the CPCB and USFDA [14].

**Analytical Approach:** The analysis's key component is comparative evaluation, which is made possible by specific methods. For example, Failure Mode and Effects Analysis (FMEA), which reduces failure risks and promotes resource efficiency and waste minimization in regulated contexts, frequently drives process optimization [3]. The Life Cycle Assessment (LCA) is the main methodical instrument for confirming environmental claims and evaluating overall impact.

## MATERIALS AND METHODS

By contrasting intended strategies with actual implementation outcomes within intricate regulatory and institutional frameworks, this study used a thorough sustainability evaluation methodology to evaluate green manufacturing and sustainable packaging solutions in the pharmaceutical industry. In order to assess the efficacy, scalability [18,10] and sustainability of green initiatives, the framework looked at four interconnected dimensions: intervention design, implementation fidelity, institutional structures, and external contextual elements. A three-step process evaluation approach was used, which included design evaluation to guarantee that green synthesis routes and packaging materials for APIs are suitable under industrial and regulatory constraints, fidelity monitoring to evaluate adherence to initial sustainability objectives during implementation, and contextual analysis to assess the impact of external factors like trade policies, economic conditions [18] and environmental regulations. The main analytical tool for identifying environmental hotspots throughout the product lifecycle was Life Cycle Assessment (LCA), which was complemented by E-Factor and energy efficiency indicators to address LCA limitations [16,17,19]. All assessments were in accordance with ISO 14040/44 standards. In order to ensure that green processes achieved the desired reductions in waste and energy consumption without sacrificing product quality or stability, quality assurance adopted a preventive approach by integrating the entire validation lifecycle, including equipment qualification, data integrity verification, and facility validation. Both quantitative metrics, such waste reduction, the use of renewable energy, and cost savings, as well as qualitative metrics, like regulatory alignment, stakeholder involvement, and sustainability performance [9,15], were used to assess the project's results. The U.S. Food and Drug Administration, the European Medicines Agency, India's Central Pollution Control Board and Central Drugs Standard Control Organization, and international guidelines from the International Council for Harmonization and World Health Organization [5,22,47] were among the major international frameworks that underwent a comparative regulatory analysis. This analysis revealed variations in regulatory emphasis while emphasizing the necessity of harmonized, risk-based environmental quality standards to support sustainable pharmaceutical production.

## RESULTS

**Performance Standards and Sustainable Progress Visualization:** The analytical findings show that the pharmaceutical industry gains large economic benefits, measurable environmental improvements, and strategic resilience from the methodical integration of GM and SP.

**Quantifying the Environmental Benefits**: **Decrease in Resource Consumption, Hazardous Waste, and Carbon Footprint**

Green initiatives lead to quantifiable reductions in the environmental load, particularly with regard to the development of hazardous waste and resource usage [1].

**Reduction of Emissions and Hazardous Waste:** Reducing the use of unwanted solvents and increasing E-Factors (kilos of waste per kilo of product) are closely related to the application of green chemistry [13]. Companies reduce material waste and volatile organic compounds (VOCs), which are subject to stringent CPCB air emission control regulations, by proactively and retroactively integrating green chemistry [1].

Conceptual Visualization: The estimated percentage decrease in the usage of hazardous solvents (measured in tonnes) over a five-year period (Years 1 through 5) is displayed in a conceptual bar chart that demonstrates the efficacy of Green Chemistry regulations on waste reduction. The figure would indicate a sharp fall after full adoption, possibly surpassing a 30% reduction benchmark from a 2015 baseline as a result of efforts to optimize the process and substitute solvents.

**Energy and Resource Efficiency:** Businesses that use closed-loop systems and renewable energy see significant drops in resource usage [7]. By achieving 100% renewable electricity for its global production in 2020, Novo Nordisk serves as an example of this [11]. By lowering utility costs, these programs both reduce the carbon impact and contribute to cost control [7]. Conceptual Visualization: The world's increasing commitment to eliminating Scope 2 emissions is depicted in a conceptual timeline chart. The timescale for reaching 100% renewable energy objectives is compared in this chart: Leading Indian manufacturers, like Cipla, have aggressive targets for partial or full renewable adoption by 2025/2030, demonstrating the rapid convergence of standards across geographical regions, while top-tier Multinational Corporations (MNCs), like Novo Nordisk [11], showed achievement by 2020.

**Charts for Process Optimization and Implementation Schedules**

Phased, disciplined implementation backed by methodical quality standards is necessary for a successful transition into an eco-friendly business [1].

**Conceptual Phased Implementation Timeline:** A full GM/SP adoption strategy usually takes several years to implement, requiring careful resource allocation:

**Phase I (Years 1-2): Assessment and Strategy:** To find environmental hotspots in the value chain, a thorough Life Cycle Assessment (LCA) is carried out in this first phase [17]. It entails obtaining support from upper management and setting verifiable, science-based GHG emission reduction goals (such as Pfizer's long-term targets [12]). [16]

**Phase II: Infrastructure and Integration (Years 3-5)** This stage concentrates on integrating expensive new environmental infrastructure, including required ZLD systems in India to meet CPCB regulations, and retrofitting green chemical concepts into current product lines (Pfizer ) [13].

**Phase III (Years 6+): Circularity and Advanced Innovation:** This last stage focuses on reaching aggressive plastic reduction goals, introducing circular programs (like Novo Nordisk's ReMedTM take-back initiative [11]), and redesigning products for optimal resource efficiency [11].

**Conceptual Process Optimization Chart:** Gantt charts and other project management tools are crucial for handling the many interactions between technical and legal constraints in SP redesign. The duration and milestones for replacing conventional packaging with cutting-edge materials (such as HDPE resins [2]) would be depicted in such a chart, which would also show the sequential steps of initial material sourcing, pilot stability testing, LCA verification (ISO 14040/44 adherence [11]), and final regulatory submission and approval.

**Differential Evaluation of Regional Regulatory Compliance**

Different priorities are revealed by analysing worldwide guidelines. Risk management and quality systems are given priority in US and EU legislation, which are greatly impacted by ICH Q10. India's CPCB, on the other hand, concentrates on highly prescriptive pollution control methods, including ZLD and ongoing real-time monitoring. Conceptual Visualization: The relative strictness of international regulatory regimes in three domains is graphically compared in a conceptual radar chart. 1) Water/Effluent Quality Requirements (ZLD/ETP); 2) Process Optimization Mandates (Green Chemistry integration); and 3) Transparency and Reporting Mandates (LCA verification and public disclosure). According to this chart, the USFDA and EMA would score higher in Process Optimization and Transparency because of their strong PQS integration and mandatory supplier sustainability programs, whereas India (CDSCO/CPCB) would score highest in Water/Effluent Quality Requirements because of ZLD regulations.

**Sustainability Progress Across Key Domains**

According to the comparison analysis, the pharmaceutical industry has made the most progress in energy and resource efficiency programs (70%) and institutional sustainability systems (85%). On the other hand, supply chain and Scope 3 emission control (33%) continue to be major challenges, while adoption of sustainable packaging (45%) and green production through solvent and waste reduction (30%) remain at moderate levels.

**Performance Metrics Evaluation**

The findings show that pharmaceutical firms prioritize supplier environmental management and the use of renewable electricity, both of which reach 100% target levels. Conversely, significantly lower goals are seen for the reduction of hazardous solvents (30%) and Scope 3 emissions (33%), indicating important areas that need to be improved in order to advance supply-chain sustainability and green manufacturing.

**Factors Affecting Green Chemistry Adoption in Pharmaceutical Companies**

The findings show that the main factors driving pharmaceutical businesses to adopt green chemistry methods are cost savings and regulatory compliance. Sector-specific sustainability priorities are shown by the fact that API producers are primarily motivated by cost reduction (91%) and customer demand (38%), while generic pharmaceutical companies prioritize regulation (83%) and reputation (67%).

## DISCUSSION AND CASE STUDIES

Strategic Implementation and Economic Impact

**The Implementation Imperative:** Justification, Benefits, and Difficulties

The justification for putting GM and SP into practice goes beyond simple regulatory compliance and becomes an essential requirement for long-term operational resilience and market acceptability [5].

**Benefits of Implementation:** Sustainable business methods have been shown to boost profits. Energy savings from the initial improvements frequently result in lower operating costs, which helps to control costs and provide higher-quality products at a lower cost [7]. Beyond short-term financial gains, these programs improve liability management, boost organizational creativity, improve brand image, and give employees safer, cleaner facilities, all of which lessen future environmental and health risks [12].

**Cons and Implementation Difficulties:** The main obstacles are the expensive initial setup costs, especially for complicated infrastructure such as advanced ETPs, closed-loop systems, or renewable energy integration [7]. Technical obstacle includes a widespread lack of expertise in implementing cutting-edge green technologies and the difficult integration of new systems with established, verified procedures[1] in big, well-established companies, change management is frequently mentioned as a major obstacle [4]. Effective cross-functional cooperation and gradual implementation are necessary for overcoming these obstacles [1].

**The Indian Pharmaceutical Industry's Economic and Public Health Gains**

The shift to green pharmaceuticals is a strategic turning point for India that will have a significant influence on both its domestic and international competitiveness.

**Economic Benefits:** Indian pharmaceutical producers go above and beyond the bare minimum required by law by implementing purpose-driven sustainability [6]. This improves a brand's reputation, draws worldwide financial collaborations, and—most importantly—makes it easier to enter highly regulated international markets like the US and EU, which are increasingly demanding green supply chain practices and verifiable sustainability reporting [23]. Adherence to global standards guarantees sustained profitability and enhances the overall robustness of the Indian pharmaceutical industry [6].

**Benefits to Public Health:** The implementation of GM/SP is an essential public health precaution. Manufacturers reduce the amount of hazardous wastewater and pharmaceutical effluents they release into surface water bodies by putting in place ETPs and ZLD systems required by the CPCB, which directly reduces pollution. Community exposure to hazardous substances is decreased by decreasing emissions (VOCs) and reducing reliance on hazardous chemicals in manufacturing[1]. This alignment guarantees that the pharmaceutical industry, whose primary goal is health, actively promotes planetary resilience and environmental health.

**Analysis of Case Studies: International Leaders in Green Transformation**

Empirical evidence of effective sustainability adoption across a variety of methodologies is provided by the examination of industry leaders.

**Novo Nordisk:** Reaching Zero Impact on the Environment

Novo Nordisk's "Circular for Zero" plan directs the company to achieve net zero $CO_2$ emissions and zero environmental impact throughout its whole value chain by 2045 [11].

**Techniques for Manufacturing Optimization:** In 2020, the company produced all of its electricity from renewable sources [11]. Their main focus is on controlling Scope 3 emissions, with a 33% decrease from 2024 to 2033 [11]. Optimization entails recycling or reusing materials, encouraging the use of non-toxic chemicals, and applying circular concepts to product creation.

**Packaging Redesign and Material Substitution:** A key innovation in more recent injectable devices is the deliberate switch from single-use plastics to reusable models with interchangeable cartridges, which dramatically reduces the amount of plastic waste generated each patient [11]. Additionally, the ReMedTM take-back program makes it easier for used injectable devices to be returned, revitalizing components and promoting the circular economy paradigm [11].

**Lifecycle Assessment (LCA) Documentation and Regulatory Compliance:** Novo Nordisk extensively applies the LCA methodology and incorporates the environment into business activities [11]. Their LCAs follow the globally accepted ISO 14040/44 standard and incorporate sector-specific product carbon footprint guidelines. By offering third-party validated carbon footprint reports for its major brands, the corporation assures transparency [29].

**Pfizer:** Using Green Chemistry Initiatives to Drive Innovation. The foundation of Pfizer's approach is the thorough and proactive incorporation of the 12 Principles of Green Chemistry and Biotechnology into its fundamental research and development procedures [13].

**Manufacturing Optimization Strategies:** The company strives to reduce unwanted solvents in manufacturing while retrospectively integrating green chemistry into existing goods where possible [13]. The creation of new medications with significantly better E-Factors—that is, fewer kilograms of waste per kilogram of product—is a crucial statistic. Site Sustainability teams help facilities achieve energy savings and lower costs by participating in waste reduction and energy optimization initiatives [12].

**Packaging Redesign and Material Substitution:** Here, the main focus is on increasing E-Factors to minimize waste during the synthesis stage, which is the most resource-intensive stage [13].

**Lifecycle Assessment (LCA) Documentation and Regulatory Compliance**: Pfizer extends its environmental responsibility throughout the supply chain and pledges to reduce greenhouse gas emissions using science-based targets [12]. They directly address the primary source of their Scope 3 emissions (bought products and services) by requiring 90% of important suppliers to set GHG reduction objectives and 100% of key suppliers to manage their environmental impacts [12].

**Dr. Reddy's and Cipla:** Promoting Sustainability in Developing Economies Prominent Indian companies exhibit a proactive shift towards eco-friendly operations, harmonizing international demands with local legal structures.

**Manufacturing Optimization Strategies:** Cipla promotes energy conservation through the Cipla Green Pledge and has installed solar power projects at a number of its manufacturing facilities [6]. In order to reduce chemical waste and maximize resource utilization in laboratories, Dr. Reddy's focuses on process optimization, which includes utilizing energy-efficient techniques through maintenance management [4].

**Packaging Redesign and Material Substitution:** Cipla makes a concerted effort to incorporate recyclable materials in their packaging[6]. Dr. Reddy's demonstrates a commitment to reducing its downstream impact by incorporating explicit Packaging Waste Reduction Projects and sustainable logistics activities into its ESG framework.

**Regulatory Compliance and Lifecycle Assessment (LCA) Documentation:** Both businesses are credited with helping the Indian pharmaceutical sector transition from a model that was primarily focused on compliance to one that was focused on sustainability[6]. They are positioned as leaders in the area because of their compliance with both the implicit quality criteria of international market standards and the changing CPCB directives.

**FUTURE PERSPECTIVES**

To guarantee ongoing success, future developments in sustainable pharmaceutical practices must concentrate on using revolutionary technology and quickening regulatory convergence.

Digital Transformation and Transparency: In order to improve regulatory capacity and reliance mechanisms, especially in low- and middle-income nations, future efforts should give priority to digital transformation. Digital tools can be used to improve accountability and transparency in sustainable procurement and supply chain management procedures. These solutions may make use of blockchain technology. Additionally, this will make it easier to track LCA data for materials accurately and consistently over the course of a product's lifecycle.

**Advanced Green Chemistry and Biotechnology:** Sustained funding must go into cutting-edge research, like the use of biocatalysis and new enzymatic processes. These developments have the potential to significantly increase E-Factors well beyond existing chemical techniques, resulting in previously unheard-of decreases in waste production during API synthesis.

**International Harmonization of Environmental Quality Standards:** It is highly recommended that regulatory organizations like CDSCO, USFDA, and EMA expedite the harmonization of environmental quality standards. Simplifying creative regulatory processes and encouraging early cooperation between regulators and producers can drastically save development costs and delays, hastening the global adoption of vital eco-friendly inventions. Additionally, in order to establish acceptable limitations for the environmental fate of APIs, consistent global standards are required.

## CONCLUSION

The conclusion that integrating green manufacturing and sustainable packaging is the most important and practical strategy to create an environmentally friendly pharmaceutical sector is largely supported by the data. This strategy shift, which is typified by the concepts of Green Chemistry, effective resource usage, and circular package design, results in measurable decreases in greenhouse gas emissions, hazardous waste production, and environmental impact. Adopting these strict procedures is crucial for gaining competitive advantages in the Indian economy. Indian manufacturers improve their access to international markets, draw in foreign partners, and promote long-term profitability by aligning their processes with global quality systems (ICH Q10) and strong regulatory controls (USFDA, EMA), as well as by closely following prescriptive mandates like CPCB's ZLD requirements. As a result, the domestic pharmaceutical industry is well-positioned to use sustainability as a catalyst for organizational innovation. There are significant advantages for public health. Local communities are immediately shielded from dangerous exposure by source-level pollution protection, which includes strict wastewater treatment, air emission controls, and the replacement of hazardous chemicals. By ensuring that the industry fulfils its ethical obligation to reduce its environmental impact, this commitment supports international efforts to alleviate health risks associated with climate change and ensures the population's long-term well-being.

## ACKNOWLEDGEMENT

I express my gratitude to the Chalapathi Institute of Pharmaceutical Sciences for their unwavering support, as well as to Mr. Koushik Yetukuri for his guidance and help in seeing this article through to completion.

**Table: 1 Comparative Regulatory Environments**

The regulatory focus differences are outlined below, emphasizing how India's control system differs from the international PQS requirements. Comparative Pharmaceutical Industry Environmental Regulatory Environment

| Jurisdiction/Authority | Primary Environmental Focus | Key Mandates / Guidelines | Compliance Philosophy |
|---|---|---|---|
| **India (CDSCO & CPCB)** | Pollution Abatement (Wastewater, Air Emissions), Hazardous Waste Management | CPCB Draft Guidelines, Mandatory Zero Liquid Discharge (ZLD) systems, Online Continuous Monitoring (OCEMS) | Highly prescriptive, compliance-driven, shifting toward long-term sustainability |
| **United States (USFDA)** | Quality Control, Risk Management, Green Chemistry Integration | ICH Q10 (Quality System), Stringent GMP enforcement, robust validation processes | Rigorous, risk-based, detailed quality management |
| **European Union (EMA)** | Risk Management, API Environmental Fate, Manufacturing Harmonization | EU GMP Annexes (e.g., Annex 1), centralized and decentralized procedures | Harmonized, proactive risk-based approach to lifecycle impact |
| **WHO & ICH** | Global Quality Systems, Sustainability Standards, Regulatory Innovation | ICH Q10, WHO call for "Greener pharmaceuticals' regulatory highway," New sustainable standards | Global standard setting, promoting transformative change and regulatory convergence |

**Table: 2 Matrix for Case Study Evaluation**

Evaluation Matrix for Sustainability Performance in Industry Case Studies

| Company | Manufacturing Optimization Strategies | Packaging Redesign/Material Substitution | Regulatory Compliance & LCA Documentation |
|---|---|---|---|
| **Novo Nordisk** | Zero impact goal, 100% renewable electricity achieved, 33% Scope 3 $CO_2$ reduction target by 2033 | Shift to reusable injection devices, ReMed™ take-back program, focus on plastic reduction | Adherence to ISO14040/44 LCA standards, third-party verified environmental reports |
| **Pfizer** | Proactive Green Chemistry integration in R&D, optimizing processes for energy savings, improved E-Factors | Focus on reducing undesirable solvents and minimizing waste from API synthesis | Science-based GHG targets; mandating 100% of key suppliers manage environmental impacts |
| **Cipla / Dr. Reddy's** | Solar power implementation, energy conservation programs, process optimization, closed-loop systems | Focus on recyclable materials (Cipla); Waste Reduction Projects (Dr. Reddy's), sustainable logistics | Transitioning from compliance-driven to purpose-driven sustainability, aligning with CPCB mandates |

**Table: 3 Percentage Distribution of Sustainability Assessment Metrics Used in Pharmaceutical Manufacturing**

| Sustainability Metric | Percentage (%) |
|---|---|
| PMI (Process Mass Intensity) | 28 |
| E-Factor | 17 |
| Atom Economy | 17 |
| Carbon Footprint | 55 |
| $CO_2$ Production | 39 |
| Water Usage | 61 |
| Life Cycle Assessment (LCA) | 44 |

**Table 4: Environmental Impact Reduction from Green Manufacturing Practices**

| Sustainability Indicator | Conventional Manufacturing | Green Manufacturing | % Improvement |
|---|---|---|---|
| Energy Consumption | 100 | 70–85 | 15–30% |
| Water Usage | 100 | 60–80 | 20–40% |
| Hazardous Waste Generation | 100 | 50–75 | 25–50% |
| $CO_2$ Emissions | 100 | 60–82 | 18–40% |

**Table: 5 Gap Analysis of Current and Desired Sustainability Practices in Pharmaceutical Manufacturing and Packaging**

| Sustainability Parameter | Current Practice (%) | Desired Level (%) | Identified Gap (%) |
|---|---|---|---|
| Energy efficiency | 70 | 95 | 25 |
| Water management | 65 | 90 | 25 |
| Waste reduction | 60 | 90 | 30 |
| Sustainable packaging | 45 | 90 | 45 |
| Green chemistry | 50 | 85 | 35 |
| Scope 3 emissions | 33 | 80 | 47 |

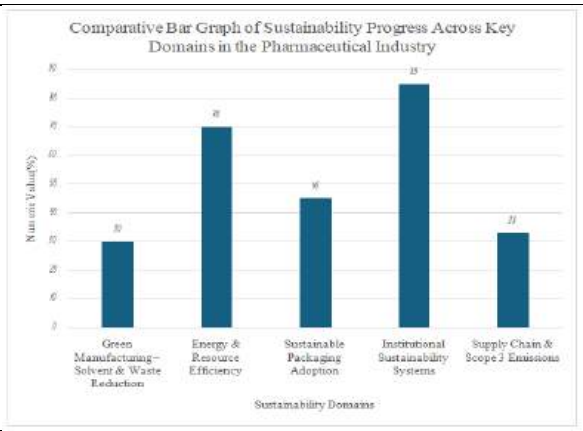

**Figure 1: Sustainability progress Across Key Domains in Pharmaceutical Industry**

The findings show that different pharmaceutical sector domains have adopted sustainability at different rates. Governance support has led to greater advancements in institutional sustainability systems and energy efficiency initiatives. Due to technological and legal obstacles, green production and sustainable packaging have made only modest progress. Due to external dependencies, supply-chain sustainability is still constrained.

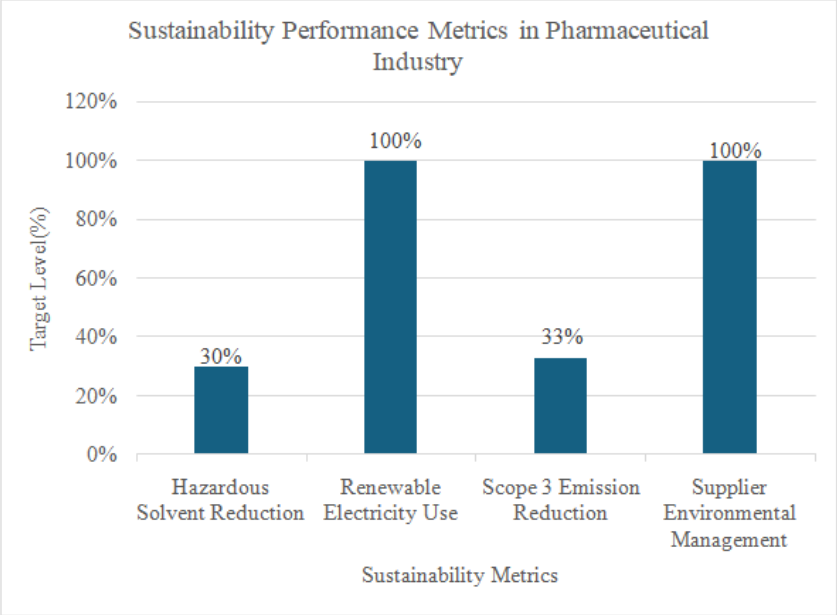

**Figure 2: Sustainability Metrics in Pharmaceutical Industry**

Adoption of renewable electricity and supplier environmental management show high performance. Due to the complexity of the process and the lack of external oversight, the decrease of hazardous solvents and Scope 3 emissions shows slower development.

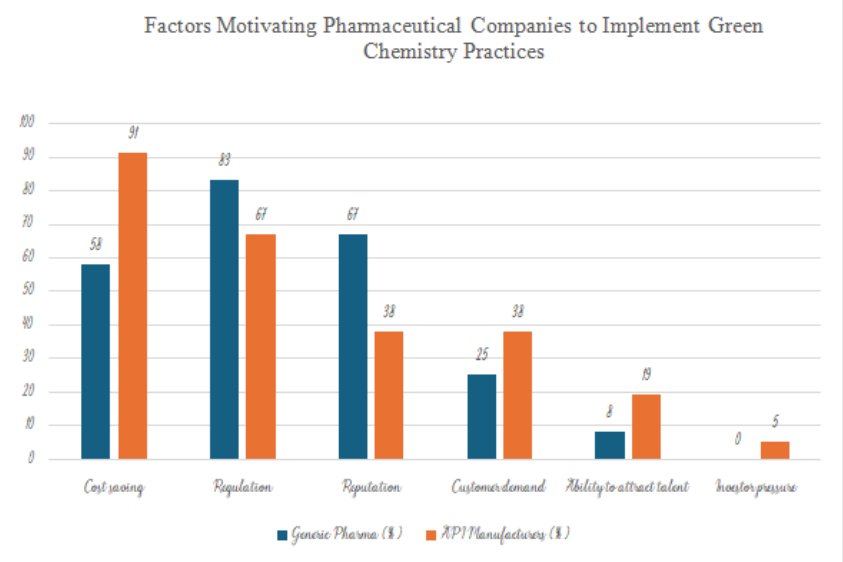

**Figure 3: Factors Motivating Pharmaceutical Companies to Implement Green Chemistry Practices**

The findings indicate that the adoption of green chemistry processes in the pharmaceutical business is mostly influenced by cost reductions and regulatory requirements. While API producers prioritize cost reduction and consumer demand, generic pharmaceutical businesses are primarily motivated by regulations and reputation, revealing disparities in sustainability priorities across industries.

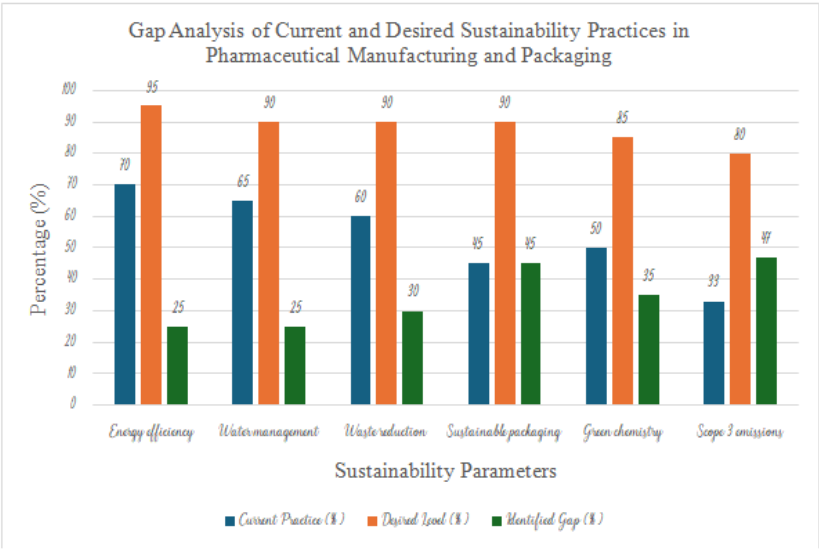

**Figure 4: Gap Analysis of Current and Desired Sustainability Practices in Pharmaceutical Manufacturing and Packaging**

The gap analysis shows notable discrepancies between intended sustainability goals and current industry practices, especially with regard to Scope 3 emission management and the adoption of sustainable packaging. Priority areas for attaining environmentally friendly pharmaceutical production are indicated by the significant gaps in green chemistry implementation and supply-chain-level sustainability, despite moderate advances in energy and water efficiency.

**ABSTRACT**

The definition of Nutraceutical is 'a substance which can be separated or refined from food that has physiological benefits and also plays a pivotal role in protection against chronic disease. Many studies show that nutraceuticals play a major part in chemoprevention and in the management of cancer .They usually consist of phytochemicals which are non-nutritive chemical compounds present in plant based diet that have various potential health benefits. The use of nutraceuticals along with chemotherapeutic drugs is quickly gaining recognition in recent years. The growth of nutraceuticals can be attributed to the shifting of consumer preferences towards self-directed care in the management of diseases and also because of various trends in health care. The classification of nutraceuticals, the anticancer potential of nutraceuticals via its antioxidant activity and modulation of gene expression, biological effects of major phytochemicals in chemoprevention along with a detailed study of earlier works will be discussed in this review

**Keywords:** Nutraceuticals, phytochemicals, anticancer, chemo preventive, antioxidant

## INTRODUCTION

Cancer is defined as the abnormal and uncontrolled cell growth with the ability to metastasize or spread to different body parts from a primary site. Many studies demonstrate that nutrition and its role in chemoprevention [1] is closely interlinked. It is proved that healthy food practices when followed by cancer patients can facilitate the efficacy of chemotherapeutics and aid in the prevention of many lifestyle disorders.

## METHODOLOGY

A detailed study of literatures pertaining to nutraceuticals and cancer management were done in the internet using academic databases such as Google scholars, pub med, ScienceDirect and peer reviewed journal sources. To search relevant literatures, many keywords such as "nutraceuticals", "chemoprevention", "phytochemicals", "antioxidants", "gene expression" were used which were included in broad criteria. The literatures pertaining to broad inclusion criteria were further narrowed down to focus on the most relevant aspects of the current study.

## RESULTS

Based on the search criteria, 150 research papers and 50 review articles were obtained. Out of the 200 articles reviewed, 175 more relevant articles were more relevant. 175 papers were further screened to search for literatures that met the broad inclusion criteria and thereby 99 articles were excluded. The remaining 76 articles were further reviewed for narrow criteria, by which 35 articles were obtained, which were used for the current review. (Figure 1)

## DISCUSSION

The term 'Nutraceutical' was first described by Dr. Stephen L DeFelice [2][3][4] who is the chairman and founder of an American organization, Foundation for Innovation in Medicine, which was established in the year 1989 and is derived by fusing the words 'nutrition' and 'pharmaceutical' (Figure 2). He said that a nutraceutical is a substance which provides health or medical benefits which includes preventing and treating the disease." These are biological substances with protective and therapeutic properties which are mainly derived from food and plant such as garlic, [1] soya bean, tea and others. There can also be certain compounds present in the plants which may not be considered as a nutrient. This non-nutritive chemical component in plant based [5] diet which forms an active ingredient is considered to be a major part of nutraceuticals. Nutraceuticals can be categorized [2] into major types (Figure 3) such as Fatty Acids, Dietary Fibers, Vitamins and minerals, Prebiotics/Probiotics and Phytochemicals

**Fatty Acids**

Nutraceutical fatty acids are involved in the prevention of various chronic disorders. They have many beneficial effects in the management of Diabetes, Cardiovascular Disorders, Alzheimer's disease, antitumor effects, development of brain in infants and fetal development. Some major examples (Table 1) are Omega-3-fatty acid, *Brucea Javanica* oil, Conjugated linoleic acid and Lecithin.

**Dietary Fibers**

Dietary Fibers are plant derived food that can't be hydrolyzed by digestive enzymes produced by the human cells but can be broken down by the microflora present in the stomach. Some common examples of dietary fibers are celluloses, hemicelluloses, lignin, gums, pectin and other non-starch polysaccharides.

Dietary Fibers can be divided into two category based on their water solubility (Table 2):
**Soluble Fibers:** includes pectin, gums, β-glucans, some hemicelluloses
**Insoluble Fibers:** includes lignin, celluloses and some hemicelluloses

**Vitamins and Minerals**

Vitamin A, C, D, E and minerals like zinc, selenium, calcium, magnesium aids in preventing cancer by protecting DNA from free radical attack (Table 3).

**Prebiotics/ Probiotics**

Probiotics are live beneficial microorganism present in certain food which aids in maintaining the normal microflora found inside the human body whereas prebiotics refer to high fiber food supplements that selectively facilitates the growth of favourable probiotic bacteria(Table 4). These provide various health benefits [14].

**Phytochemicals**

Phytochemicals are non-nutrient chemical compounds produced mainly by plants. Some major categories of phytochemicals are carotenoids and phenolics.

**Carotenoids**

Carotenoids (Table 5) are naturally occurring organic tetraterpene pigments which are produced mainly by plants and algae. They give a characteristic color to fruits such as orange, watermelon and vegetables. Increased intake of the pigment carotenoid reduces the probability of the cancer of breast, cervix, colon, rectum and also plays a part in the prevention of heart diseases.

Some major types are Lycopene, Lutein, Beta-carotene, Alfa-carotene, Zeoxanthin, and Cryptoxanthin.

**Phenolic**

Phenolics are very essential dietary components that have aromatic rings with hydroxyl groups. They are known to exhibit antioxidant activity and decrease the risk of cancer.

Some major types of phenolics (Table 6) are Quercetin, Apigenin, Daidzen, Naringenin, Catechins, Secoisolariciresinol, Resveratrol, Curcumin, Hesperitin, Gallic Acid, Myricetin, Gingerol, Berberine and EGCG.

**Nutraceuticals and Cancer**

The term cancer does not solely refer to one disease but rather includes a bunch of diseases where the cells in the body grow abnormally with the ability to metastasis to various distant sites. Transformation to cancer doesn't happen in a single step and thereby it involves a multistage [31] progression which can be split into four phases: Initiation of tumor, promotion of tumor, Transformation of tumor to malignancy and progression of tumor. A major cause of cancer is oxidative stress which happens when the equilibrium [32] or the balance between anti-oxidants and free radicals is disrupted. It also occurs due to overproduction [31] of reactive oxygen species due to lack of antioxidant defenses. It ultimately results in tissue injury and eventually leads to abnormal activation of cellular pathways which facilitates cancer progression. Nutraceuticals aids in chemoprevention by maximizing immune system and antioxidant defenses of the body. Through its antioxidant activity [33], it can protect the DNA from any damages and thereby modify the expression of tumorigenic progression.

Some of the mechanisms [34] adopted by nutraceuticals against oxidative stress:

1. Increases the amount of antioxidant enzymes
2. Helps to repair mitochondrial function
3. Facilitates chelation of metal ions
4. Increases immune response
5. Prevention of lipid peroxidation
6. Upregulates production of anti-inflammatory molecule
7. Inhibits inflammatory pathways, genes and factors
8. Scavenges Reactive oxygen species

## CONCLUSION

Nutraceuticals are soon becoming popular worldwide due to its pivotal role in the prevention of various diseases. Their global success can be due to their nutritional benefits along with therapeutic effects and safety profile. Many

studies regarding their role in the management of cancer have been published on various platforms and are quickly gaining recognition in the medical field. Their popularity can also be due to very few adverse effects associated with its usage. Their antioxidant property along with their major effect on cellular metabolism facilitates in the management of cancer. Further research is still required to completely fathom the action of nutraceuticals in the management of cancer.

**Table 1: Some examples of nutraceuticals fatty acid.**

| Component | Source | Biological Effects | References |
|---|---|---|---|
| **FATTY ACIDS** | | | |
| 1. Omega-3-fatty acids | Linseed, fish oil, rapeseed ,mustard | Anti-inflammatory effect, Antinociceptive effects, Modulates cell signaling | 6,7,8 |
| 2. Conjugated linoleic acid | Meat Milk | Inhibits tumorigenesis, Apoptosis , Alters Cell proliferation and Lipid peroxidation | 9 |

**Table 2: Types of Dietary Fibers.**

| Component | Source | Biological Effects | References |
|---|---|---|---|
| Soluble Fibers | Oats ,Peas , beans , Barley, Apple | Reduces risk of CVD, Anti-cancer, Acts as digestive stimulant | 10,11 |
| Insoluble Fibers | Nuts ,Wheat , Corn Barn | Lowers the possibility of breast and colon cancers, Facilitates digestion by promoting digestive enzymes secretion | |

**Table 3: Examples of vitamins and minerals in nutraceuticals.**

| Component | Source | Biological Effects | References |
|---|---|---|---|
| VITAMINS e,g.Vitamin A, B, C, E, K | Products derived from food, vegetables, eggs, fruits, milk, fish | Anti-oxidant activity, Modulation of immune response and enzymatic activity, Inhibition of cell to cell interaction | 12,13 |
| MINERALS e.g. copper, calcium, potassium, zinc, cobalt, iodine, selenium, iron | Products derived from food ,fruits and vegetables | Inhibits enzyme protein kinase C, Inhibits c-myc expression, H-ras Inhibits the expression of a transcription factor called E2F, Increases the expression of TGF-β (transforming growth factor – beta) Stimulates the expression of p21 genes | |

**Table 4: Prebiotics and Probiotics as nutraceuticals.**

| Component | Source | Biological Effects | References |
|---|---|---|---|
| Prebiotics | Gut, Yogurt, Plants, Animals | Immunomodulation, Onco-suppression, Antidiabetic effect | 14,15 |
| Probiotics | Food waste, Plants, Fungi , Animals | Chemoprevention, Decreases cell proliferation, Induction of apoptosis | 16 |

**Table 5: Some examples of carotenoids as nutraceuticals.**

| Component | Source | Biological Effects | References |
|---|---|---|---|
| **CAROTINOIDS** | | | |
| 1. Organic Pigment Lycopene | Tomatoes, melons, grapefruit ,guava, capsicum ,papaya | Powerful Antioxidant, Lowers the risk of prostate cancer | 17,18 |
| 2.Beta carotene | Carrots, pumpkin, sweet potato | Aids in scavenging free radicals which damages the cells, Stimulates antioxidant defense mechanisms of the cells | 19,13,7 |
| 3. Alpha carotene | Orange | | |
| 4. Zeoxanthin | Avocado, Corn | Apoptosis | 20,21 |
| 5. Cryptoxanthin | Tangerines | Antioxidants Apoptosis | 22 |

**Table 6: Major types of phenolic as nutraceuticals.**

| Component | Source | Biological Effects | Types of Cancer | Reference |
|---|---|---|---|---|
| **Phenolics** | | | | |
| 1. Stilbenoid Resveratrol | Grapes, plum, cocoa peanuts, apple, berries | Inhibits the activity of cell growth, Chemo preventive, Programmed cell death (apoptosis), Inhibits Cell-cycle process | Colon, Breast, Prostate, Lung | 23,24 |
| 2. Curcumin | Turmeric | Prevention of cancer, Inhibits the process of cell growth, Programmed cell death (apoptosis), Inhibits the activity of angiogenesis, Inhibits cell-cycle process. | AML, Breast, Prostate, Colon Lung, | 25 |
| 3. Catechins (EGCG) | Green Tea | Inhibits the activity of Cell growth, decreases the proliferation of cell , Chemo preventive, Cell-cycle arrest, inhibition of Angiogenesis , | Colorectal, Liver, Esophagus Prostate, Lung, Bladder, | 26,27 |

| | | | | |
|---|---|---|---|---|
| | | Programmed cell death (apoptosis) | Thyroid | |
| 4. Flavanoid Quercetin | Broccoli Onion, citrus fruits, Mango, Raspberry, Tomatoes, Apple | Inhibits the activity of cell growth, Suppresses the proliferation of cell , Chemo preventive , Arrests the cell-cycle process, Programmed cell death (apoptosis) | Prostate, Colon, Ovarian, Gastric, Breast. | 28 |
| 5.Gingerol | Ginger | Anti-inflammatory, analgesic, antipyretic, Antihepatotoxic Antioxidant effects. | Gastric, Pancreatic, Liver, Colorectal, Cholangiocarcinoma. | 12 |
| 6.Alkaloid Berberine | goldthread, Oregon grape, ,Barberry, Cork-tree, Orangeroot | Increases stability of genomes, Inhibition of telomerase and topoisomerase, Increases tumor suppression | Liver, Breast, Lung, Gastric, Colorectal, Ovarian, Cervical, Prostate | 29 |
| 7. Apigenin | Thyme, Parsley, peppermint, red wine ,tomato sauce | Cell proliferation inhibition , Apoptosis, Inhibits cancer cell, migration and invasion, Modulates cell cycle | Colorectal, Breast Liver, Lung Melanoma, Prostate Osteosarcoma | 30 |

## ABSTRACT

The accurate prediction of weather is critical in activities like farming, the management of renewable energy, the mitigation of disasters, and planning city development. However, the traditional Numerical Weather Prediction (NWP) systems are typically limited to their short and localized forecasts, as systematic errors, coarse resolution and computational inexpensiveness are tendencies that usually limit them. To address such problems, this research will analyze time-series-based machine learning and deep learning algorithms, namely Long Short-Term Memory (LSTM), Gated Recurrent Unit (GRU) and hybrid CNNLSTM models on the NWP results. The proposed framework to model the spatio-temporal features will combine the spatial feature extraction of satellite imagery and grid-based weather data with a Convolutional Neural Network (CNN) and a Long Short-term Memory network (LSTM) Gated Recurrent Unit network (GRU) to learn temporal dependency. The NWP products are applied to overcome systematic forecast errors and enhance the models. The functionality of the methodology is evaluated on a conventional basis of performance measures, like RMSE and MAE through measurement in several meteorological parameters, including temperature, rainfall, wind speed, and humidity. Through experimentation, it is completely demonstrated that the hybrid CNNLSTM model is more accurate and reliable than single statistical, machine learning, and deep learning models. It is established that physics-based non-weather

prediction and data-driven deep learning models offer a possible and scalable solution to the improvement of the data accuracy in the short-term and local weather prediction.

**Keywords:** Bias correction, CNN -LSTM, Deep learning, GRU, Hybrid models, Numerical weather prediction, Spatio-temporal modeling, Time-series analysis, Weather forecasting.

## INTRODUCTION

Accurate weather forecasting is critical in such fields as agriculture, renewable energy, disaster management and city planning [1], [2]. Numerical Weather Prediction (NWP) models are conventional forecasting models that are models of atmospheric processes that are simulated using physics-based equations [3]. Even though NWP is effective in generating medium-term and long-term forecasts, it is ineffective in generating small scale, short range and extreme weather changes due to systematic errors, low-resolution, and the expensive nature of computations [4], [5]. Machine learning (ML) and Deep Learning (DL) have become powerful in enhancing the accuracy of prediction by the capability to obtain nonlinear entities of meteorological data both in time and space that are intricate [6], [7]. Time-series models are Long Short-Term Memory (LSTM) and Gated Recurrent Unit (GRU) networks, which can be helpful to learn the time-dependent correlation of temperature, rain, wind speed, and humidity [8], [9], [10]]. The Convolutional Neural Networks (CNNs) learn spatial representation of the satellite imagery and gridded weather data, which enables hybrid models to learn both spatio-temporal dynamics [11], [12]. Despite such advances, there are still some problems present and these are noisy and un finished data, absence of extreme-event samples, overfitting of models and high cost of computation [13], [14], [15]. Systematic bias can be eradicated by combining NWP products and DL and can also be used to improve forecast accuracy [16], [17]. The current research proposes a hybrid CNN-LSTM framework, which may utilize the benefits of both Dl and NWP to furnish inaccurate short-term and temporalized weather forecasts [18], [19]. The strategy is evaluated based on a range of meteorological parameters and is compared to single ML and DL models [20], [21]. Results are associated with superior prediction, strength and viability of operations [22], [23]. This work is connected to the data, modeling, and computation-problem of the existing weather prediction, and to the possibilities of the hybrid approach in bridging the physics-based and data-driven forecasting [24], [25], [26]. This diagram in Figure 1 demonstrates a Hybrid Deep Learning (DL) and Numerical Weather Prediction (NWP)-based structure that enhances the quality of weather forecasting. The products are a combination of raw meteorological data with machine-learned models and NWP output to generate predictions of high quality.

## BACKGROUND STUDY

Hossain and Mahmood (2020) state that Photovoltaic (PV) short-term power forecasting framework is an LSTM-based framework, which is triggered by synthetic weather forecasts [1]. This idea was to address the PV intermittency using deep learning. The research gap it dealt with was low levels of accuracy of standard statistical forecasting PV procedures in an erratic weather. The LSTM network was developed with the aid of artificial weathering conditions and past PV. The shortcoming of the model was that synthetic predictions were employed as opposed to real time meteorological forecasts. The findings revealed that the traditional methods had an enormous enhancement of PV forecasting short-term accuracy. Localized atmospheric variations can be captured by one deep learning weather forecasting model that is proposed by Hewage *et al*. (2021) [2]. The research investigated the loophole of space and time in view of prediction of systems. The convolutional and recurrent neural networks were used to model multi-scale weather features. However, the model was massive with respect to training data and processing power. The short-term forecasting was found to be better at home scale. The article by Choi and Jung (2023) [3] involved the optimization of the Numerical Weather Prediction (NWP) models using machine learning post-processing techniques. The main aim of this was to combine physics models with data-based learning. Systematic bias and inefficiency in the conventional NWP output was identified as the gap. NWP forecasts were

corrected using ML models that were based on regression. The boundaries diminished generalization within different climatic regions. The results confirmed the existence of reduced forecast error and increased predictions consistency measures. Nikunjkumar (2024) [4] made a comparative research of the models LSTM, BiLSTM, and CLSTM in weather prediction. The deficiency in comparison evaluation between deep recurrent architectures was discussed in the study. The LSTM variants had been used to model time-series weather data. The research was restricted to short-term forecast horizons and a constant dataset. BiLSTM was found to be more predictive as compared to traditional LSTM and CLSTM. Karbaula *et al*. (2024) [5] developed the parsimonious deep learning model that relied on a mesh that was developed on the basis of the HEALPix in predicting weather in a global scale. The research took into consideration the problem of scaling and solution to global DL models. Graph-based neural networks on meshes on the sphere were invented. Restraints were identified to be expensive computations and complexity of model. The results showed that lower number of parameters was used to achieve the competitive accuracy compared to the conventional DL models. In Surve *et al*. (2025) [6], the deep learning models were compared to the NWP outputs in terms of predicting the results. The research addressed inconsistencies in models of DL only and physics models. CNN and LSTM structures were used with NWP features.

The system became limited through the use of trusted NWP outputs. Findings indicated that prediction reliability and forecasting error were less. Yang *et al*. (2020) [7] were concerned with the prediction of power outages within the scope of weather conditions basing on the severity of the corresponding event. This was a gap in research where there was no effective modeling to determine the effect of extreme weather in energy infrastructure. Machine learning classifiers were applied using weather and outage information. It was limited by the fact that it could not be used beyond the area of study. Results indicated the better outage forecasting ability in unfavorable weather conditions. Teixeira *et al*. (2024) [8] model is a hybrid between LSTM and genetic algorithm (GA), which is a weather forecaster. The article addressed the issue of inefficient hyperparameter optimization in the models of DL. GA was used to optimize parameters of LSTM. High computational cost was also another limitation that was prominent. The results showed that the accuracy was higher than any single LSTM model. In order to predict short-term rainfall at Lake Victoria Basin, Gahwera *et al*. (2024) [9] analyzed several ML algorithms. The research plugged this research gap in developing countries as far as region-specific rainfall modeling is concerned. Ml ensemble and regression were applied. Some of the limitations included unavailability of the data and short durations of observation. Random forest had the highest accuracy of prediction of rain falls. Pasche *et al*. (2025) [10] verified the application of deep learning weather models on high impact extreme events. The research included the problem of lack of effectiveness in measuring robustness at the extremes. The new data on extreme weather was subjected to DL models powered by CNN. The biggest weakness was the fact that extreme-event data were limited in availability. Results showed disparate performances and thus, extreme training on events was a necessity.

The research by Han *et al*. (2021) [11] explored the implementation of the RNN models in order to improve the localized weather prediction on the basis of the combinations of the on-site measurements and airport data. The gap addressed in the research was the inaccurate nature of micro-scale weather forecast when used in the built-environment. Through LSTM, the authors integrated the multi-source datasets and the recurrent neural networks in order to forecast the short-term. Results showed that there was an enhanced degree of precision but also lacked features like application to specific site and sensitivity towards quality of data. The application of machine-learning and its use in the weather forecasting and climate analysis is gaining more and more significance as Bochenek and Ustrnul (2022) [12] surveyed the instances in the area. They located their problematic aspects of stable assessment and perception of the ML model operation in atmospheric activities. The research has adopted a review method and tested algorithms including the random forests, SVMs and neural networks. The findings proved to have huge predictive power but noted to have weaknesses that encompass interpretability issues as well as dependency on good data. Han *et al*. (2022) [13] proposed that a hybrid deep learning model could boost the predictions of the wind speed using NWP. The research was on NWP forecast bias forecasting in the wind energy. The CNN-LSTM architectures were used to correct errors. In general, there was a little generalization except for forecasting of the speed of the wind. The results indicated that there was a lot of minimization of errors in the short-term prediction of the wind. Allen *et al*. [14] introduced a worldwide weather forecasting system using data-driven solutions on an end-

to-end basis. The article spoke about inefficiency and cost of calculation of classical models of NWP. Transformers used to train neural networks on world data were of large scale. Horizontal limits were excessive computation requirements and data requirements. Results indicated operational NWP system competitiveness. The article by Huang *et al*. (2020) [15] studies the issue of real-time weather forecasting using data by mobile sensors, which are deployed on the buses of the city. In this research, the issue of urban sensing data sparsity was addressed. ML models were used to train mobile sensor data of crowdsourced data.

The limitations were imperfect coverage and sensor noises. It was established that urban microclimate was better predicted. One such model of wind power prediction in the city that was proposed by Shirzadi *et al*. (2023) [16] incorporated Weibull distribution, RNNs, and NWP. There was a lot of uncertainty in the prediction of wind in the cities in the research. The deep learning and hybrid statistical methods were applied. Integration was one of the complex requirements. The findings presented greater error-reduction accuracy in urban wind power. The prediction model based on the short-term load and weather variables presented by Chen *et al*. (2023) [17] is a ResNet-LSTM. The research gap was the ineffective connection of weather forecasting and load. The other CNNs and LSTMs were stacked. The model entailed a high degree of tuning. It was found that there was improved precision in load prediction. LSTM models proposed by the authors of the article by Sarmas *et al*. (2023) [18] do not require NWP, at least when it comes to PV forecasting. The research covered the issue of NWP dependency. Several LSTM optimizers were used in meta-learning. Poor Scala was mentioned. A good generalization of results between sites that had not been examined revealed positive results. The spatio-temporal fusion model of STFM was created to predict weather in Liu *et al*. (2024)[19]. The ineffectiveness of the research gap was comprised of the inefficient manner of treatment of spatio-temporal dependencies. Fusion architecture-based deep learning was developed. There was limited calculation overhead. The findings indicated that a higher predictability of various variables was obtained. The whole structure of AI-based wind prediction based on NWP was given in one of the studies by Kosovic *et al*. (2020) [20]. The experiment involved constant predictive pipes. Both ensemble ML models and NWP outputs were combined. Complexity of the system was also one of the constraints. The outcomes showed that the calculations of wind power were effective. In Table 1, Summary of Recent Weather-Related Machine Learning and NWP Research provides a synthesized review of literature with the application of ML, DL, and NWP tools in various applications that are weather-dependent. It outlines the principal concept of any piece of work, research gap, methods, constraints and findings of the performance. The table enables one to make a prominent contrast between the different forecasting methods and their strengths and weaknesses in various fields. In general, it can help to identify the new trends and the unresolved issues that may be the foundations of the further evolution of the hybrid weather-prediction systems.

**Time Series Deep Learning Models (LSTM, GRU) for Weather Prediction**

**1LSTM for Weather Prediction**

One of the applications of the Long Short-Term Memory (LSTM) networks in weather prediction is that it proves to be rather effective in time-dependent modeling, with references to the time-series meteorological data [1], [2]. The short-term variations and the long-term seasonal variations that can be captured by LSTM model include the variations in the weather conditions including the temperature, rainfall, humidity and the speed of the wind [11]. On the other hand, in contrast to classical statistical models LSTM can learn nonlinear variations that are complex and dynamic atmospheric processes only using data [12]. The LSTM networks besides having a memory storage of the information in the cell have gating mechanisms that do not allow any information to be lost in long sequences that facilitate long-horizon predictions to be constant [17]. It has been established after many studies that the LSTM-based models have shown to be more accurate in regards to short and medium-term weather forecasting activities than the traditional ones [4], [8]. As a result, LSTM is currently an applicable method of deep learning in creating believable and information-constrained weather forecasting techniques [6], [14].

**GRU for Weather Prediction**

GRU networks are robust deep learning networks that have significantly been employed in weather prediction activities that involve time series [2]. GRU networks have few parameters compared to LSTM networks and,

therefore, they train quicker and can have less complexity in their calculations, yet, they can modify themselves to time patterns on meteorological variables, including temperature, wind speed, or rainfalls [8], [17]. GRU has update and reset gating, information flow control and enable learning long term dependencies on sequential weather information [12]. It is also known that GRU models are effective when it comes to short-term and real-time weather forecasting tasks, especially at data-driven and localized prediction tasks [4], [11]. In addition, they are capable of dealing with the nonlinear relationship and the noisy meteorological data and this enhances the strength of the predictions [6], [19]. Recent deep learning-based weather prediction models [14], [27] utilize GRU networks due to a beneficial structure, functionality and a stable accuracy.

**Comparative Analysis of LSTM and GRU**

**Table 2: Comparison of LSTM and GRU Models for Weather Time-Series Prediction**

Comparison of LSTM and GRU Models on Weather Time-Series Prediction provides an explanation on what are the architectural and operational differences between LSTM and GRU network. LSTM involves use of separate memory cells and 3 gating and besides it can learn long term dependencies with fewer cost but with high cost. In contrast, GRU can use a simpler form of gating architecture with lower training cost and train faster hence it is easily applicable to short to medium-range weather prediction problems.

**Machine Learning Approaches for Accurate Weather Prediction**

The machine learning (ML) algorithms have been more important to prepare the weather forecasting more precisely, through managing the massive quantity of historical and current weather data [2], [9]. The ML processes in contrast to the ancient numerical weather prediction processes are data-driven and they can acquire nonlinear correlations between weather variables [12]. Some of the popular ML algorithms include linear regression, decision trees, random forests, support vectors machines, k-nearest neighbors and ensemble learning among others [9]. The parameters that have been predicted well using these models include temperature, rains, velocity of wind and humidity [9]. The criteria of the feature selection and engineering decision are relevant in improving the capacity of the model and also enable the minimization of uncertainty [22]. The ensemble and hybrid Ml models are better than the single algorithms because they enhance the strength and the generalization [21]. The ability to train and make inferences on local and short time weather forecasting is highly used in the performance of the ability [11]. Nevertheless, the most crucial feature that is needed to determine the accuracy of prediction is the quality and data availability [27]. Nevertheless, low regional interpretability and scalability is a grave issue [27]. Nevertheless, machine learning has continued to offer practical and reasonable answers to the relevant weather forecasting [22]. Figure 2 is a machine learning based weather prediction system and it begins with data collection in big quantities of previous and current weather readings and it is a common use in data forecast research [1]. The different learning approaches that are applicable to learn the nonlinear and complex weather patterns include linear regression, decision trees, support vector machines, random forests, and ensemble learning [9]. The feature selection and engineering also reduce the number of the most relevant attributes to give a stronger and improved prediction [13]. Finally, the processed information provides reliable and accurate weather forecasts and also addresses the key strengths and viable problems [14] that constitute the data quality, scalability, and interpretability.

**Deep Learning Approaches for Accurate Weather Prediction**

The deep learning techniques developed have considerably contributed to the accuracy of weather forecasting as they have been in a position to recreate non-linear relationships in weather predictions that are highly complex [2], [12]. The deep learning techniques neither utilize the classical Numerical Weather Prediction (NWP) models, which need to be trained on very large sets of past and present weather conditions [14]. Convolutional neural networks are generally applied to identify the patterns on a spatial image in satellite images and weather maps [19]. GRU and LSTM recurrent models of time series weather data have used changes in time series data with respect to time and seasonality [1], [4]. The combination of CNN and LSTM to improve the performance of spatio-temporal forecasting is more performance-achieving [6], [17]. Deep learning models are especially popular in diagnosing tasks of weather prediction on small and local scale [9], [11]. They also play an important role in the correction of systematic errors in the numerical weather prediction outputs [3], [13], [20]. These types of models are however resource consuming and

need a lot of data to be trained [5]. It is an issue [10], [12] that the interpretability and extrapolation of extreme events that are not observed is problematic. Nonetheless, deep learning is still involved in the significant improvements of the quantitative and effective weather forecasting models [14], [16]. In Figure 3, a deep learning-based system of weather prediction commences with the acquisition of big data of both past and present weather conditions. CNNs are used to extract the spatial information of the satellite images and weather maps, and recurrent models, such as LSTM and GRU, are trained to acquire the variability of the weather patterns across time. These models are combined to perform spatio-temporal forecasting with the help of hybrid CNNLSTM architectures. Finally, the system produces accurate and efficient weather predictions on these parameters such as temperature and speed of the wind thus unveiling its strong and weak points.

**Weather Prediction Using Time Series Analysis Models**:

The time series analysis is important in the weather prediction in that weather conditions like temperature, rain, humidity, and the velocity of wind change with time. Time series techniques are significant in escalating the forecast abilities, particularly that of the short and medium terms, by modelling the time dependence of past data.

**Statistical Time Series Models**

Statistical time series models are mathematical plans to calculate and predict time-dependent weather-related variables, such as temperature, rainfall, humidity, speed of the wind and atmospheric pressure [18]. These models are based on an assumption that the weather values in the future can be estimated by the process of identifying the patterns and trends and the seasonal behavior of the weather by basing on the historical meteorological information [8]. The earliest weather forecasting processes were based on statistical models which are highly applicable in the present times because they are simple, cost less to compute and easy to interpret [23]. They are especially efficient in cases where there exist some underlying weather patterns which are relatively stable, linear, as well as of a recognized seasonal nature [24].

**Key Statistical Time Series Models**

- Autoregressive (AR) Models[12]
- Moving Average (MA) Models[34]
- ARMA (Autoregressive Moving Average) Models[12]
- ARIMA (Autoregressive Integrated Moving Average) Models [24]
- SARIMA (Seasonal ARIMA) Models[34]
- Exponential Smoothing Models[12]

**Machine Learning Models**

This is the fact that the machine learning (ML) models may be used that were set to improve the accuracy of weather forecasting in those cases when the traditional statistical time-series models that are used are linear and stationary [2].Compared to the traditional statistical time-series models that are applied, which are linear and stationary, the machine learning (ML) models could be applied with the high-dimensional input and recognize the nonlinear interactions between weather variables, including temperature, rainfall, humidity, wind speed, pressure, and others [9], [12]. The most common methods of ML that are applicable to weather prediction are the linear regression, decision trees, random forests, support vectors (SVM), k-nearest neighbors (KNN) and ensemble learning (EL) methods [21]. Such models are very popular in local and short term weather forecasting because they have the ability to train and make conclusions at a very fast speed [11]. The model performance mainly depends on the feature selection and feature engineering since the quality of the inputs data is a direct determinant of the quality of the predictions [9]. The Ensemble ML models are superior to single learners in terms of robustness and generalization [21]. Nevertheless, the output and validity of the data and their low scalability and interpretability to other climatic regions continue to be an issue with the ML-based weather prediction systems [27]. In spite of these, machine learning models are providing meaningful and sound answers to data-driven weather forecasting apps [22].

**Deep Learning Models**

One of the most radical technologies in the current weather forecasts is considered to be deep learning (DL) models [12], [14]. Both the statistical and machine learning techniques have historically been dependent on this property, deep learning directly models complex pattern to raw meteorological data, and have allowed a model of nonlinear and multi-scale and highly dynamic atmospheric processes [2]. It is this that renders DL especially useful on a spatio-temporal weather forecasting problem wherein both spatial variability such as cloud movement and temperature fields as well as temporal variability such as seasonal variability and storm evolution should be modeled simultaneously [6], [13], [19].

**Challenges in Weather Prediction Using Time Series Analysis**

Weather prediction requires time series analysis since weather continues to vary with time. An accurate prediction is however difficult to derive because of a range of challenges.

**Data Challenges**

Problems of weather prediction like, quality of meteorological data, consistency and availability of the same do exist. The weather data is often few, noisy and sensor failures which can pose a risk to the models. These variables are too many but they are very diverse and therefore patterns can hardly be captured. In addition, information can be distributed in various sources on variety of formats or at various times that makes the integration a problem. Moreover, the model is not supported by much history in the instances of rare occurrences (like heavy storms). These challenges should be overcome so that the suitable and acceptable forecasting systems can be established.

**Modelling Challenges**

The systems in the atmosphere are extremely complex, dynamic, and non-linear making the modeling of the weather prediction a problem. Dependences which are long term, abrupt variations or discovering the interaction between two or more weather variables may be extremely difficult to model. There is a risk of overfitting whereby the models are learning the noise rather than the meaningful patterns and there is also the risk of underfitting which is caused by using too simple models. One also faces a challenge of finding a suitable architecture, hyperparameter optimization and accuracy versus cost of computation. Another challenging modelling is also weather forecast modelling because different regions and seasons demand some models.

**Practical Challenges**

Practical issues of weather prediction are practical constraints to forecasting system application. They include low computational capability to train large models and run large data. The assimilation of the information sources of heterogeneity (e.g., satellites, ground sensors and NWP) may be hard. It is of importance to have real time prediction as well as instant release of prediction. Another problem is the problem of operational constraints like sensor operation, data delay and difference in covering different areas and this adds complexity in deployment. These are practical matters that should be addressed to ensure that the accurate weather forecast can be effective and fruitful.

**Computational Challenges**

Massive volumes of meteorological information and heavy data rate of data received during the weather prediction process are issues in the computing world in terms of high memory and processing speed. The deep learning systems, particularly intricate models, are power-hungry to be inferred and trained. Online prediction strains quick predictions and this restricts the complexity of models. The high dimensional spatio-temporal data is the new overheads, which increases the computational overheads. They should therefore optimize algorithms and hardware to manage them.

**Spatial and Temporal Challenges**

The specifics of the time and space issue of weather forecasting are based on the reality that specific patterns of place are needed, and time changing processes concurrently. The traditional models tend to put in mind a single location giving no consideration to the direction of flow of weather in the areas. Extreme events are rare but hard to anticipate

as they are not prevalent in the past. The multi-location or satellite data in the research contributes high dimensionality and hence it is difficult to model. These types of spatial-temporal interdependence must be accurately modeled to be able to do effective predictions.

## DISCUSSION

This survey has shown that a time series based machine learning and deep learning systems can be applied to significantly expand short-term and local weather prediction compared to conventional Numerical Weather Prediction (NWP) forecasting. Recurrent neural networks which include LSTM and GRU have been shown to be effective in a nonlinear time-dependent dependency of variables of meteorological variables, whilst CNNs learn meaningful spatial features of satellite data and gridded data. On the same note, the literature too is in agreement that LSTM is more practical in the long-term dependency modeling, although the cost of computation is less and the GRU model can be trained much faster, thus in real-time forecasting. The weaknesses of the classical statistical models are addressed by the capabilities, and the forecast accuracies of such variables as temperature, rainfall, wind speed, and humidity are improved. High performance of hybrid systems that can combine the outcomes of deep learning and NWP is the primary outcome of the study. The models of CNNNWP are built on the physical consistency of NWP and they take care of the systematic bias by applying the data-driven learning which results in enhanced robustness and reliability. However, it is not yet clear that there have been no problems relating to data quality and availability, modeling requirements, and application of models on a regional basis. To make the usability of the next-generation weather prediction systems in practice, it is crucial to involve these issues by creating effective models and data fusion and explainable AI techniques.

## CONCLUSION

The time-series based machine learning models and deep learning models, according to this survey, prove to be effective in improving the accuracy of short-term and local weather prediction. The classical Numerical Weather prediction models are good at the long-scale forecast but suffer in terms of bias, coarse spatial resolution, and high expensive computations. On the contrary, nonlinear longitudinal correlations in meteorological data can be trained by LSTM and GRU models, and spatial correlations of satellite and gridded data can be trained by CNNs. The hybrid CNNLSTM structures are the combination of deep learning models with NWP outputs that minimizes the errors that occur in forecasting and maximizes the prediction accuracies on different variables, including temperature, rainfall, wind speed, and humidity. The recent works have revealed experimental proofs that hybrid and ensemble methods provide the best results compared to single-standing statistical, ML, and DL models. Despite the fact that certain challenges relating to the quality of data, computing capabilities, and extrapolation of extreme events still remain, the findings indicate that physics-based NWP that applies data-driven deep learning could be a scalable and reliable answer to the next generation weather forecasting systems.
