ABSTRACT

The primary aim of the paper is to examine and assess the influence of artificial intelligence on human culture, identity, and values, while identifying strategies to safeguard essential elements of humanity, including ethics, traditions, social norms, and individual distinctiveness in the face of swift technological progress. This study seeks to facilitate a harmonious integration of AI that improves human well-being while preserving the cultural and moral integrity of societies. Humanity finds itself at a crossroads never seen before in an era dominated by artificial intelligence. Machines are acquiring knowledge, advancing, and currently influencing the planet in manners formerly designated for human capabilities. Although AI provides efficiency and capability, it simultaneously engenders significant apprehensions regarding potential losses in our culture, identity, and values during this shift. Technology possesses the capacity to both safeguard and undermine culture. This paper answer to the following question: When do we cease to be perceived as persons and begin to be regarded as data points optimized for consumption? Most importantly, AI functions devoid of inherent moral judgment. It lacks empathy, remorse, or compassion attributes that constitute the foundation of human ethics.

Keywords: Artificial Intelligence, Humanity, Technology, Healthcare, Culture, Identity, Education, Communication, Human Values.

INTRODUCTION

Artificial intelligence is no longer a concept that exists in the future; rather, it is a real force that is constantly transforming our reality. Their effect extends beyond the realms of economics and technology, into the cultural and ethical fabric of society, as artificial intelligence systems grow more and more integrated into everyday life. Within the scope of this study, the intricate relationships between artificial intelligence and human culture are investigated, with a particular emphasis on identity creation, cultural values, and societal standards.

Artificial Intelligence and Cultural Values

Artificial intelligence exerts a profound and complex impact on cultural values, contesting and redefining entrenched ideas, customs, and ethical paradigms. As AI technologies grow more integrated into daily life, they not only automate tasks but also actively influence the cultural fabric of countries globally. Cultural values including creativity, authorship, and originality are being reinterpreted by generative AI systems such as ChatGPT, DALL-E, and MusicLM. Previously seen as exclusively sacred and unreplicable, human creativity is now augmented by AI in the realms of art, music, literature, and humour. This prompts philosophical and ethical inquiries regarding the essence of authorship and the cultural significance of human vs machine-generated creations. It also compels society to reevaluate the criteria for genuine expression.

AI-driven search engines and content generating tools shape the creation and distribution of knowledge, impacting societal definitions of truth, authority, and expertise. Cultural norms pertaining to truthfulness, reliability, and academic integrity are undermined by deepfakes, algorithmic disinformation, and AI-generated texts. This requires a cultural reassessment of our methods for evaluating and validating knowledge.

AI systems trained on prevailing cultural data may inadvertently foster cultural homogeneity, elevating mainstream or Western-centric norms to the detriment of indigenous, minority, or regional viewpoints. Recommendation algorithms on services such as YouTube or Netflix frequently promote internationally popular content, thereby marginalizing region-specific art and storylines. This phenomenon jeopardizes cultural pluralism, an essential principle in heterogeneous communities. The influence of AI on labour and productivity affects cultural values associated with work ethic, merit, and self-esteem. Automation may diminish the value historically attributed to human labour and skill, particularly in sectors such as journalism, customer service, and education. Societies must reevaluate the nature of meaningful employment and the criteria for value assignment in an AI-driven economy.

The extensive implementation of AI surveillance systems, facial recognition technologies, and data-driven personalization undermines the significance of privacy. Cultural norms about autonomy and consent are transforming due to technology that surveil conduct in both public and private domains. In totalitarian governments, artificial intelligence is employed to ensure conformity; in liberal democracies, it incites discussions regarding the balance between convenience and civil liberties. Artificial intelligence presents civilizations with ethical quandaries that challenge conventional principles of equity, justice, and accountability. Algorithmic prejudice in criminal justice or healthcare can perpetuate structural disparities. Consequently, there is an increasing focus on AI ethics, accompanied by demands for culturally attuned design techniques that embody many moral traditions and value systems.

The most significant cultural transformation that AI introduces is a re-evaluation of the essence of humanity. The simulation of emotional intelligence, empathy, and decision-making by robots challenges entrenched societal assumptions regarding the distinctiveness and superiority of human cognition and morality. This evokes intellectual contemplation on dignity, personhood, and the soul principles profoundly rooted in religious and spiritual traditions.

**The Impact of Artificial Intelligence on Human Identity and Its Significance**

Artificial Intelligence (AI) is redefining the parameters of human identity affecting self-perception, interpersonal relationships, and societal definitions of humanity. As AI systems evolve to be more intelligent, adaptive, and integrated into daily life, they threaten fundamental elements of personal and societal identity, necessitating an understanding of their influence and the significance of maintaining human distinctiveness in the digital age. Artificial intelligence technology is integrated into platforms where individuals construct and articulate their identities social media, gaming, virtual reality, and online communities. These platforms shape users' decisions, conduct, and self-image through algorithmic personalization. Individuals start to conform their identity to algorithmic standards: they share information that yields high performance, employ filters to enhance appearances, and adjust language to maximize engagement. This establishes a feedback loop in which the human self is somewhat influenced by machine learning systems, prompting worries over the authenticity and autonomy of identity in AI-driven contexts.

Virtual assistants such as Siri, Alexa, or ChatGPT and AI-driven therapeutic bots are progressively included into human decision-making and emotional well-being. This indicates a transition in which individuals are no longer solely autonomous decision-makers but are collaboratively shaping thoughts and behaviours with AI. This influences not only cognition but also emotions and empathy essential components of identity. For instance, certain users develop emotional attachments to AI partners, which might satisfy psychological needs while also complicating conventional concepts of identity creation, particularly among young and vulnerable groups. The emergence of biometric systems (facial recognition, iris scanning, and DNA identification) and brain-computer connections has increasingly associated identity with data and quantification. The technification of the body diminishes identity to quantifiable metrics, undermining comprehensive and frequently spiritual or philosophical notions of the self.

Although these technologies may improve security or health results, they also provoke ethical dilemmas: Who possesses this identification data? Is it subject to manipulation? The responses carry significant ramifications for privacy, rights, and human dignity. AI systems frequently embody the cultural prejudices of its creators, who are mostly situated in Western, industrialized nations. Consequently, AI can marginalize non-dominant cultural identities through underrepresentation or misrepresentation. Language models may favour English terms and idioms, hence reducing the representation of minority languages and non-Western views in digital discourse. Simultaneously, AI possesses the capacity to safeguard and enhance cultural identity via translation tools, digital preservation of indigenous knowledge, or tailored cultural education. The impact of AI on cultural erasure or preservation is contingent upon deliberate design and inclusive data methodologies. Human identity transcends mere psychological constructs; it constitutes a moral, social, and political foundation. It affects the ways individuals derive meaning, establish groups, and seek justice. When AI impact's identity, it inherently moulds values, relationships, and power structures. Mental health and well-being: Individuals require cohesive narratives regarding their identities.

As AI advances, communities must proactively ensure that human identity is preserved, safeguarded, and enhanced, rather than diminished or commercialized, by intelligent computers.

Artificial Intelligence and Cultural Values

Artificial intelligence exerts a profound and complex impact on cultural values, challenging and redefining established ideas, customs, and ethical frameworks. As AI technologies grow more integrated into daily life, they not only automate tasks but also actively influence the cultural fabric of countries globally. Generative AI systems such as ChatGPT, DALL-E, and Music LM are redefining cultural values including creativity, authorship, and uniqueness. Previously, human creativity was seen singularly sacred and unreplaceable; however, AI currently participates in the production of art, music, literature, and humour. This prompts philosophical and ethical inquiries regarding the essence of authorship and the cultural significance of human vs machine-generated creations. It prompts cultures to reevaluate the criteria for genuine expression.

**Gunasekaran et al.,**

AI-driven search engines and content generating tools shape the creation and distribution of knowledge, impacting societal definitions of truth, authority, and expertise. Cultural norms about truthfulness, reliability, and academic integrity are undermined by deepfakes, algorithmic disinformation, and AI-generated texts. This requires a cultural reassessment of our methods for evaluating and validating knowledge. AI systems trained on predominant cultural data may inadvertently foster cultural homogeneity, elevating mainstream or Western-centric ideals to the detriment of indigenous, minority, or regional viewpoints. Recommendation algorithms on services such as YouTube or Netflix frequently promote internationally popular content, thereby marginalizing region-specific art and storylines. This dynamic jeopardizes cultural pluralism, an essential principle in heterogeneous society. The impact of AI in revolutionizing labour and productivity affects societal ideals associated with work ethic, merit, and self-worth. Automation may diminish the value historically attributed to human labour and skill, particularly in sectors such as journalism, customer service, and education. Societies must reevaluate the nature of meaningful employment and the criteria for value assignment in an AI-driven economy.

The extensive implementation of AI surveillance systems, facial recognition technologies, and data-driven personalization undermines the significance of privacy. Cultural standards about autonomy and consent are transforming due to technology that surveil conduct in both public and private domains. In authoritarian regimes, AI enforces compliance; in liberal democracies, it stimulates discussions on the balance between convenience and human liberties. Artificial intelligence presents civilizations with ethical quandaries that challenge conventional principles of equity, justice, and accountability. Algorithmic prejudice in criminal justice or healthcare can perpetuate structural disparities. Consequently, there is an increasing focus on AI ethics, accompanied by demands for culturally attuned design techniques that embody varied moral traditions and value systems.

The most significant cultural transformation brought by AI is a re-evaluation of the essence of humanity. The simulation of emotional intelligence, empathy, and decision-making by robots challenges entrenched societal assumptions regarding the distinctiveness and superiority of human cognition and morality. This evokes intellectual contemplation on dignity, personhood, and the soul principles profoundly rooted in religious and spiritual traditions.

The Influence of Artificial Intelligence on Ethics, Traditions, and Social Norms

Artificial Intelligence (AI) is not merely a tool for automation or efficiency it is a transformative force that is reshaping the ethical frameworks, traditional practices, and social norms that guide human life. As AI becomes more embedded in decision-making processes, interpersonal interactions, and cultural institutions, it exerts a powerful influence on how people think, behave, and relate to one another AI has introduced a range of ethical challenges that were previously uncharted. From autonomous vehicles deciding who to save in an accident, to predictive algorithms determining the likelihood of a person committing a crime, AI is involved in decisions that were once exclusively human and moral. Responsibility and Accountability: When an AI system causes harm, it is unclear who is ethically responsible the programmer, the user, the company, or the machine itself. This creates a gap in traditional moral systems built on individual agency.

Bias and Discrimination

AI systems can inherit or amplify social biases present in their training data. This has raised concerns about fairness in hiring, policing, healthcare, and education—challenging societal commitments to justice, equity, and human dignity. Autonomy and Consent: As AI gathers personal data and makes recommendations, it often does so without clear, informed consent. This undermines traditional ethical values centered on autonomy, privacy, and human rights. Thus, AI is not only challenging existing moral values but also prompting societies to reimagine ethical guidelines in light of machine involvement. Traditions are deeply rooted practices passed down through generations that give people a sense of identity, continuity, and belonging. AI interacts with tradition in two major ways: it disrupts certain practices while preserving or transforming others. Disruption of Rituals and Roles: For instance, in education, religious practice, or family roles, AI may replace traditional authorities (e.g., teachers, elders, priests) with algorithmic systems. This can weaken intergenerational bonds and the transmission of cultural wisdom.

**Gunasekaran et al.,**

Preservation through Digitization: Conversely, AI is also used to document, translate, and revive endangered languages, texts, and oral histories. Machine learning helps in archiving sacred texts or reconstructing damaged historical sites, offering tools to support traditional knowledge systems. Cultural Sensitivity vs. Standardization: AI, when trained on global data, may ignore the cultural nuances of localized traditions. This risks standardizing behaviours across different cultures, thereby eroding unique traditions in the name of optimization or efficiency. AI thus plays a dual role: as both a threat to and a guardian of tradition, depending on how it is applied and governed. AI and Social Norms: Reshaping Behaviour and Expectations Social norms are the unwritten rules that guide behaviour in society how to act, communicate, and interact with others. AI technologies, especially those embedded in social media, communication apps, and workplace systems, are redefining these norms in profound ways. Shifting Communication Patterns: AI-driven platforms like chatbots, voice assistants, and AI-generated influencers are changing how people interact. The increasing use of non-human interlocutors normalizes interactions with machines, altering the meaning of conversation, empathy, and connection.

Behavioural Nudging: Recommendation algorithms and personalized content influence user behaviour by nudging them toward certain actions, beliefs, or purchases. Over time, these micro-influences can change societal attitudes, from consumer preferences to political views. Desensitization and Emotional Disconnect: AI-mediated environments may contribute to emotional desensitization and a decline in face-to-face social skills, especially among younger users raised in algorithmically filtered digital worlds.

Changing Norms of Work and Productivity: In workplaces, AI systems measure performance, predict behaviour, and assign tasks, reshaping expectations of productivity, discipline, and collaboration. This alters workplace culture and social hierarchies, often emphasizing efficiency over well-being. Artificial Intelligence is not only reshaping industries and infrastructures it is reconfiguring the ethical, traditional, and normative frameworks that define human life. While it offers opportunities to preserve cultural heritage and enhance ethical reasoning through data, it also introduces deep uncertainties about morality, social behaviour, and cultural continuity. To ensure that AI supports rather than undermines ethical values and traditions, it is essential to involve ethicists, cultural scholars, local communities, and policymakers in the design and governance of AI systems. In doing so, we can help shape an AI-integrated future that respects and reflects the diverse moral and cultural landscapes of humanity.

CONCLUSION

Artificial Intelligence is transforming human existence, cognition, and interaction. Although AI provides significant advantages in efficiency, invention, and problem-solving, its swift progression also poses challenges to established human values and ethical standards. Concerns including privacy, accountability, justice, transparency, and the risk of prejudice necessitate meticulous examination. Artificial intelligence should not supplant human judgement but rather enhance ethical decision-making grounded in empathy, respect, and justice. To guarantee a future in which technology benefits humanity, it is imperative to integrate ethical standards into AI development and application. A human-centered strategy that harmonises technical advancement with ethical accountability is essential for maintaining human dignity and promoting a just and equitable society.

ABSTRACT

The Carpentaria by Alexis Wright gives the cyclone the status of an independent Indigenous law that exists beyond the meteorological event. The storm ecologically serves out the ecological justice of the extractive violence of the Gurfurrit mine, particularly in Chapter 13, "The Wash." The cyclone is not an occurrence of a natural disaster, but rather, it is an instrument of colonial resistance that shatters anthropocentric power. The life of Will Phantom demonstrates extreme symbiosis on a floating rubbish isle, where nature takes colonial waste. It recycles it into a form of plants growing out of rubbish and birds nesting in refuse. The reappearance of Norm Phantom is through a rearranged setting of water, which does not emphasise destruction, but continuity. The text is indicative of Indigenous ecocriticism, in which Country has a purpose in subverting traditional Anthropocene framings in which human beings are the masters of geology. Everything is brought into balance with the agency of the storm, which carries away the town of Despair, yet leaves the Pricklebush people who are in harmony with the conventional rhythms. The Uptown panic is quite different compared to the elders accepting the storm as a cleansing spirit. The history behind the establishment of this agency is based on the creation history of the ancestral serpent, meaning that its creators do not forget the land. The text offered by Wright makes us read nature not as a resource, but as a web of kinship that can bring about sovereignty by creating climatic force on it. The cyclone never merely destroys; it passes judgment, clearing out colonial existence to allow the ancient ecology of the Gulf to inhale once more. This is the twist of the plot that makes the non-human not a background; it is the historical force that is changing the Gulf Country.

Keywords: Ecocriticism, Indigenous Sovereignty, Cyclone, Anthropocene, Non-human Agency, Gurfurrit Mine, Colonial Resistance

Sudhakar et al.,

INTRODUCTION

Climate change is experienced as a great ecological turmoil, which interferes with the fragile ecological balance that exists between humans and non-human life in the Anthropocene (Nixon 4). Literature mediates this crisis by providing narratives that go beyond empirical evidence to produce moral responsibility for changes in the environment (Huggan 12). An example of this possibility can be seen in *Carpentaria*, a textual landscape in which the environment takes an active role instead of a passive contextual backdrop (Tiffin 20). In particular, Chapter 13, *The Wash*, presents cyclones not only as weather phenomena but also as agents of sovereign power that attempt to enforce Indigenous law on colonial trespass (Rose 56). This principle of Cyclonic Agency differentiates it from the typical pathetic fallacy; the storm is not a reflection of human emotion but a legal mechanism that restores the ecological balance (Morton 34). The Gulf of Carpentaria is a disputed territory in which there is a collision between multinational mining interests and ancestral sovereignty (DeLoughrey 89). As Wright determines, the ancestral serpent "came down from the stars... to crawl on its heavy belly" throughout the mudflats. A deep-time occupation of the land can be made that is not colonial in mapping (Wright, *Carpentaria*, ch. 1). This narrative is based on this creation story through a cosmology in which land and law cannot be separated. By contrast, the mine at Gurfurrit is extractive violence, where security men are involved in "searching the area for the body" to safeguard corporate interests against ecological facts (Wright, *Carpentaria*, ch. 11). This kind of surveillance brings out the conflict between the security of the corporation and conventional ownership. This trespass is the direct response to the cyclone. It is a non-human agent that destroys colonial infrastructure that sweeps away the town of Desperance, but leaves those who concur with Country (Haraway 45). Phantom lives in a rubbish pile on a floating island, thus showing adaptation to ecological rejuvenation and the connectedness of human life and non-human life (Wright, *Carpentaria*, ch. 13). This survival is a challenge to anthropocentric perceptions, indicating that kinship with the more-than-human world is the key to survival. The post-disaster landscape shows a restarted landscape, in which the gropers swimming under the vessel are indicative of a reversion to ancestral beat and the vulnerability of ecologies when they are overrun by industrialisation (Wright, *Carpentaria*, ch. 14). This kind of imagery emphasises the fact that there is an urgent need to have a concerted effort in combating environmental degradation. Eventually, the cyclone imposes a sovereignty of the storm, which requires responsibility. This paper contends that the cyclone is a juridical impact on the non-human turn that re-establishes the ecological equation of eliminating colonial infrastructure and reasserting Indigenous sovereignty over extractive capitalism.

Research Focus

The main purpose of the study is to examine the ways in which *Carpentaria* by Alexis Wright reflects the narrative about ecological and climate change in terms of the symbolic meaning of cyclone, its devastating yet regenerative power, and the consequences which these have on natural ecosystems and Indigenous sovereignty. This study explores the cyclone as a meteorological event but, more importantly, as an agent of Indigenous law that restores the ecological balance by eliminating colonial infrastructure. It analyses the text in terms of ecocriticism and the non-human turn to investigate how the concepts of storm sovereignty and environmental justice are interrelated in the Gulf Country. It aims to find out how extreme weather, as represented in literature, can contribute to a more general discourse about climate resilience and decolonial practice. The focal research questions may be:

1. In what ways does Wright use the cyclone (in particular, *The Wash*) to refer to the more general ecological implications of climate change and Indigenous justice?
2. How does the novel demonstrate the breaking of the cycle of nature and ecological balance by destroying the mine and the town?
3. How does the human experience as depicted in the survival of Will Phantom on a floating island reflect the greater ecological and environmental disasters represented by the agency of the cyclone?

Sudhakar et al.,

These questions inform the discussion of the narrative techniques used by Wright to discuss the issues of anthropogenic destruction and ecological regeneration.

The Cyclone as a Symbol of Ecological Disruption

The cyclone in *Carpentaria* is not merely a meteorological phenomenon; it is an independent agent of Indigenous law that upsets the ecological models of the West. Whereas Western ecocriticism frequently views extreme weather as a calamity that signifies the failure of the environment (Buell 12), Indigenous epistemologies view these forces as purifying agents that allow order to be reinstated (Whyte 45). Wright contrasts these perspectives and introduces the storm not as anarchy but as a consequence of justice. The storm, which enters the novel, is described as, "The giant sugarbag man of the skies walked from horizon to horizon, carrying storms and hazes of madness" (Wright ch. 10). This personification is in line with Plumwood's argument that it is important to realise that nature also possesses agency as a prerequisite to environmental culture (Plumwood 88). In contrast to the passive action in colonial literature, the cyclone in Wright is active and pursues the Gurfurrit mine, destroying infrastructures such as pipelines and hangars. The destruction is total: "The whole mine, pride of the banana state, ended up looking like a big panorama of burnt chop suey" (Wright ch. 11). This particular appeal highlights the anarchic nature of extractive capitalism, which reflects the fact that postcolonial ecocriticism must deal with the exploitation of resources (Griffiths 102).

The cyclone is an allegory for the instability of the systems, showing the instability of colonial trespass systems. Through ecocriticism, as Garrard explains, the intersections of environmental narratives and political power must be discussed (Garrard 55). The violence of the storm in *Carpentaria* is a direct response to the country's violation by the mine. The intensity is stated in the story: "The storm hit. Wind and rain fell in horizontal sheets across the valley" (Wright ch. 13). This is the physical force that reflects the social upheaval needed to decolonise land, as the author Tuck argues that decolonisation is not a metaphor but a material process (Tuck 25). The symbolism of the washing away of Desperance is that the presence of colonialism is washed away, and as a result of this action, the Anthropocene becomes indigenised, thus making Indigenous sovereignty the central theme (Todd 78). This is the obliteration under which the text highlights: "History could be obliterated when the Gods move the country" (Wright ch. 13). In this case, the "Gods" symbolise the forces of the ancestors, who reclaim space where an industry takes in, which echoes Kerridge's perception of writing the environment as the recognition of non-human participants (Kerridge 34).

Moreover, the aftermath of the cyclone outlines the vulnerability of the natural systems, which is a core concept of the discussion of the paper on the flight behaviour model of ecological equations (Prajapati 95012). Similar to the migration of the monarch butterfly, which is an indication of disruption in the work of Kingsolver, the cyclone in Wright represents the boundaries of what humans can do. The post-storm landscape is characterised as "the shores of a flattened landscape which the cyclone had left in its wake" (Wright ch. 14). Such a process of flattening re-establishes the ecological balance by eliminating the noise of industrialisation. According to Westling, these narrations are a revelation of the green breast of the new world, where nature regenerates following the termination by humans (Westling 110). The justice of the storm is in line with the queer ecologies by Mortimer-Sandilands, where non-normative forces to heteronormative colonial systems are disrupted (Mortimer-Sandilands 67). Finally, the cyclone in Wright shows that the crisis of ecological disaster is not only an emergency but also a medicine. According to Buell, this is a violent restoration that the environmental imagination should consider (Buell 25). The novel, therefore, goes beyond the warning to enactment, in which Country resists the frailty that extractive industries have imposed upon it.

The Floating Island as a Reflection of Human Lives

The survival of Will Phantom on the floating rubbish island is a prime example of radical symbiosis between human resilience and ecological regeneration. After the cyclone, Will is marooned on a floating waste city, which is now littered with human waste (Wright ch. 13). This metamorphosis resembles Dellarobia Turnbow's experience in *Flight Behaviour*, in which nature is shaken. The human position is renegotiated (Prajapati 95014). It is the same way the

116457

**Sudhakar et al.,**

migration of the monarch butterflies changed, which is also an indicator of environmental instability; therefore, the displacement of Will will be an indicator of a break in the colonial system, which will create the need to adapt (Houghton 12). The cyclone is a cleansing mechanism that eliminates colonial infrastructure, similar to how climate change interferes with human-established cycles (Wright ch. 13).

Man-made debris is quickly taken over by nature. Plants sprout on rubble, and birds nest on rusted hulls, depicting ecosystems' ability to adapt to human impact (Wright ch. 14). Peanuts, mangroves, and tomatoes grow in decay, showing biodiversity's ability to adapt to unusual niches (Jackson 45). Will is no longer a political activist but an ecological scholar who quantifies stars and currents to get ahead (Wright ch. 14). This change indicates the need to combine scientific observation with local knowledge to learn about climate crises (Menzel 88). It is his alienation that makes him keen on non-human rhythms, questioning the blindness that centralised powers tend to exhibit (Prajapati 95013). He knows how to steer by the stars, and he is the student of the sea and not the master of the sea (Wright ch. 14).

Ecological displacement is compared to the displacement of Will in a very clear way. The cyclone destroys the town of Desperance, as climate change sends species all over the planet (Wright ch. 13). The vulnerability of human constructions to forces of nature, viewed in the life of Will, is the central theme in conservation biology (New 102). The only way he can survive is by reading the ecological equation and being aware that human destiny is connected to environmental well-being (Prajapati 95012). First, Will has to endure human ignorance as he dreams of being rescued instead of becoming accustomed to the climate, like communities that refuse to accept climate realities (Prajapati 95014). He is concerned that the island will go to pieces, as society is afraid of ecological collapse (Wright ch. 14). Nonetheless, his mastery of the island later proves that he is able to transform personally by being involved with the environment (Wright ch. 14).

Eventually, the island becomes a place of individual enlightenment, as Will realises that he has been reliant on the more-than-human world (Prajapati 95014). It's rubbish island, which had already been a symbol of consumption, turns into a refuge, demonstrating that nature is still present even when people destroy it (Houghton 25). The narrative of Will encourages everyone to take ownership to ensure that the planet is safe, which is encouraged by calls for sustainable futures (Jackson 50). His survival is not corporeal but spiritual, based on the land-healing ability (Wright, Ch. 14). Wright, through Will, shows that natural systems have to be humbled in the process of adaptation (Menzel 90). The floating island is a symbol of survival and calls on readers to address the ecological disasters that are defining our world (New 110). The fact that Will returns indicates that he reconciled with nature rather than overthrowing it, and his journey from activist to survivor is complete (Wright, Ch. 14). Biological research proves that this kind of adaptation is the key to the survival of species under altered climatic conditions (Bradley 105). The behaviour and metabolism of insects change with environmental stressors, just as physiological changes occur in Will (Boggs 22). His raft also plays a structural role that resembles insect exoskeletons, which offer protection (Chapman 45). Such resilient ecosystems should be a priority in conservation (Corbet 88).

The Role of Indigenous Knowledge in Understanding Climate Change

Western scientific surveillance is commonly based on detached technologies, such as helicopters and satellites, to monitor changes in the environment; however, such approaches often fail to reflect the sentient agency of the land. In *Carpentaria*, Indigenous epistemologies provide a more sensory alternative to digital data, prescribing smell, sight, and ancestral memory over digital data. Although the mine uses helicopters to scan the Gulf, Indigenous characters use embodied knowledge of Country. For instance, Mozzie Fishman does not rely on maps to detect the sources of water but rather smells the air, feeling the presence of moisture "coming out of wet ground and plants a hundred kilometres away" (Wright, *Carpentaria*, ch. 5). This sensory knowledge challenges Western conservation models, which believe in measurement rather than relationships. According to Whyte, Indigenous climate change research focuses on relational accountability as opposed to the collection of data (Whyte 45).

**Sudhakar et al.,**

The convoy of Mozzie Fishman is such an example of this epistemology on the road, and it is moving on Dreaming tracks that are not subject to colonial borders. Their trip is not only geographic but also spiritual, retaining law over thousands of kilometres. This compares to the stagnant infrastructure in the mine, which aims to mine and not preserve. According to Rose, these ethical entanglements identify the need of human beings to perceive themselves as belonging to the ecology of the land but not as one controlling the land (Rose 56). Exceptional navigation by the stars and sea currents by Norm Phantom further demonstrates this by denying the technological superiority of the mine. He reads the "star of the fishermen that was setting low in the northern horizon" to steer his boat by relying on the patterns of the heavens instead of the GPS (Wright, Carpentaria, ch. 14). This act is consistent with Todd's statement that Indigenous people live in worlds in which non-human beings, such as stars and fish, are not passive in governance (Todd 78).

The novel is a criticism of how Western science cannot anticipate ecological justice, especially in the case of cyclones. Although the meteorologists are monitoring low-pressure systems, Pricklebush interprets the storm as a force enforcing the laws of the ancestors. The cyclone operates as a "sovereign agent of Indigenous Law" that reinstates the ecological balance by eliminating colonial infrastructure (Wright, Carpentaria, ch. 13). This view reminds Plumwood of the critique of human exceptionalism, in which it is argued that nature has an agency that is dismissed by Western rationalism (Plumwood 88). This knowledge is further based on the creation of the landscape by the ancestral serpent, which forms a deep-time claim that pre-colonial mapping has no place (Wright, Carpentaria, ch. 1). These accounts legitimise Smith's call to decolonise methodology by making Indigenous voices central to environmental arguments (Smith 12).

It is vital to combine local knowledge and science; however, according to Carpentaria, Indigenous law offers a more precise approach to ecological fitness. The technology in the mine is unable to predict the resistance of the land; however, the intuition of Norm helps to save his life. As mentioned by Haraway, creating kinship with non-human beings is the only way of surviving in the Anthropocene (Haraway 45). This is confirmed by the fact that the mine was destroyed by a cyclone, demonstrating that even extractive capitalism is not resistant to the sovereignty of ecology. The non-human turn, introduced by Morton, comes to life here when the storm is a juridical force (Morton 34). Finally, the story written by Wright insinuates that conservation efforts in the West cannot work without the moral foundation of Indigenous law. DeLoughrey points out that such spatial sovereignty is encoded in Pacific literatures, as they opposed colonial incursion (DeLoughrey 89). Griffiths also notes that postcolonial ecocriticism should be able to discuss the exploitation of resources using Indigenous perspectives (Griffiths 102). Tuck cautions that decolonisation is not a figurative procedure but a concrete one of land retribution (Tuck 25). Therefore, Carpentaria assumes that the only way to be truly ecologically resilient is to relinquish Western hegemony to Indigenous peoples.

Climate Change, Indigenous Sovereignty, and Ecological Equity

The theory of environmental justice assumes that disadvantaged communities are disproportionately victims of ecological degradation, which is a major concept of the Gulf of Carpentaria (Bullard 15). This injustice has been experienced extremely in Carpentaria between the Pricklebush people and Uptown, where the Gurfurrit mine drains the wealth, yet the Indigenous people are exposed to toxicities. The infrastructure in the mine has scratched the land. However, the Pricklebush still stand "dumped... without any sign of lock, stock or barrel" near the town tip, exposing them to hazardous conditions excluded from colonial spaces (Wright ch. 1). This locationism reflects environmental racism, in which Indigenous bodies become objects of risks that white citizens do not share. The cyclone, however, is a force of ecological equity, which destroys the infrastructure of the mine and cleanses Desperance. As Wright describes, "history could be obliterated when the Gods move the country" (Wright ch. 13). This natural force creates a level playing field, destroying both the colonial town and the extractive machinery, pointing out that the country itself is seeking revenge against extractive capitalism.

Indigenous sovereignty is first a recasting of Country as not property but a rights-bearing entity, which has intergenerational rights, challenged by Western property rights. Intergenerational equity lays emphasis on ensuring

**Sudhakar et al.,**

that ecological resources are conserved in order to have an equitable relationship between the present and the future generation (Jonas 12). The creation of the landscape by the ancestral serpent in the novel creates a deep-time assertion that dates back to colonial cartography (Wright ch. 1). This is the opposite of Native Title claims under colonial law, as seen in the case of Joseph Midnight working with the mine and Mozzie Fishman following native law. Midnight's side wants financial reimbursement, and Fishman's convoy is concerned about the sacred ceremony, which shows the contradiction between legal and spiritual sovereignty (Wright ch. 5). As tensions such as these are indicative of the fight for ecological equity, where Indigenous law provides a platform of equilibrium lacking in Western conservation theories.

The devastation of the cyclone highlights the instability of colonial possessions in comparison with Native ecological information. As Uptown residents, the people panic, and the pricklebush are cognising of the storm as a cleansing spirit that imposes Indigenous law. The fact that Will Phantom survives by living on a floating rubbish island is a sign of adaptation in ecological renewal, in which plants grow in rubbish, and birds nest on debris (Wright ch. 14). This strength struggles against anthropocentric perceptions in that sovereignty is in kinship with the more-than-human world. To achieve environmental justice, there is a need to appreciate Indigenous epistemologies as systems of managing climate crises. According to Rob Nixon, slow violence usually hides the direct effects of environmental degradation on the vulnerable masses (Nixon 3). Finally, *Carpentaria* assumes that fairness will eventually be achieved once the colonial systems are eliminated and Country will be able to breathe once again. This sovereignty is imposed by the storm, which eliminates the colonial footprint to enable the ancient ecology of the Gulf to regain balance (Wright ch. 11). This change of narration makes the non-human not the background, but the force behind the historical change in the Gulf Country (Huggan 22).

The Cyclone's Path and the Future of the Planet

Cyclone in *Carpentaria* is a prophet of aggravated climate facts, and the destruction of the colonial infrastructure to display the irreversibility of Country. Wright does not represent the storm as a single weather phenomenon but as a repetition of a spiritual force that restores the ecological balance. When the waters go down, the town of Desperance is destroyed. A town like that is left without a trace "flattened landscape which the cyclone had left in its wake" (Wright, *Carpentaria*, ch. 14). This demolition is an indication that one is transitioning into an Indigenous ontology in which land is an agent that humans are unable to guide and one that disrupts the Western beliefs about environmental management. The violence of the storm is not accidental; it is a retaliatory act against the extractive violence of the mine, implying that the policy of climate in the future should take into consideration a non-human form of juridical power.

The survival of Will Phantom on a floating island of rubbish is the best illustration of the uncertainty of the future in the Anthropocene. He is using a floating island of garbage, in which nature takes back human waste, a sign that there can be adaptation in the face of destruction (Wright, *Carpentaria*, ch. 13). The fact that he chose to stay on the raft instead of going back to the mainland immediately highlights the indecisiveness that victims of climate displacement have. The island turns into a microcosm of a planet that is struggling with waste and regenerating, in which case, "plants grew on wreckage, and birds nested on rusted hulls" (Wright, *Carpentaria*, ch. 14). It is a symbiosis that indicates the posthumanist view of life, in which survival relies on becoming ensnared in the rubbish instead of being cleansed. The future is not that we can go back to purity, but it will be a bargaining with the aftermath of industrial breakdown.

The weakness of human infrastructure contrasts with the persistence of the country. The Guffurst mine, which was once a symbol of economic dominance, ends up as burnt chop suey at the mercy of the storm (Wright, *Carpentaria*, ch. 11). This failure explains how extractive industries are exposed to the power of nature. The loss of physical markers does not take away Indigenous attachment to place, as the appearance of the Norm Phantom in the lost town points out the strength of Indigenous connections to place. This tenacity is founded on the creation narrative of the ancestral serpent. It implies that the land is aware of its creators despite efforts by colonialism to forget them

Sudhakar et al.,

(Wright, *Carpentaria*, ch. 1). The memory of the land continues to exist longer than the short-lived existence of the town, claiming that Country exists beyond colonial mapping.

Finally, the novel suggests acknowledging non-human agency in climate policy. The cyclone is a juridical power that adjudicates trespass to the land. This is in line with ecocritical ideas of granting nature rights and moving beyond anthropocentric conservation. The agency of the storm is a restorative force that cleanses the town, except for those who were consistent with the rhythms of tradition. Wright's story requires anthropocentrism to be replaced by ecocentrism, in which climate action acknowledges Indigenous sovereignty. The future lies in the recognition that the country retaliates against ecological violations. The planet is talking to humanity, and it should be the one to listen before the next wave comes to destroy the last few bastions of denial. The path of the cyclone is not only destructive but also a guideline for survival.

CONCLUSION

In the end, Alexis Wright, with her book *Carpentaria*, decides to give a new meaning to the cyclone as a sovereign force, implying Indigenous Law enforcement. This study shows that the storm is a form of juridical power that replaces the ecological balance by erasing colonial infrastructure and reinstating the agency of the land. However, in contrast to Western systems that perceive extreme weather as a state of climate instability, the cyclone in the novel is a system of corrective action to extractive violence. This view requires a shift from anthropocentrism to ecocentrism, in which the country is viewed as a rights-caring being that can make judgments of trespass against encroachment. This research highlights the importance of considering Indigenous knowledge systems in solutions to global climate problems. Western science does not recognise sentient agency, but Indigenous epistemologies perceive the environment as a kinship network with a temporal foundation in deep time. According to *Carpentaria*, ecological resilience is only achieved when colonial systems are broken down, allowing ecologies to re-establish order through spiritual renewal. The path of the cyclone shows that the primary factor of human survival is connected with non-human agency and the health of the ecosystem.

In conclusion, the novel urges responsibility to protect the planet, not by controlling it, but by honouring storm sovereignty and ancestral cycles. The future lies in considering that the country rebels against ecological violations. The next wash would destroy edifices of denial, and humanity needs to be sensitive to the warnings of the land. Through this interconnected web of life, it is the one that resonates with the rhythms of Country that learns that the non-human is the key to changing history. This balance must be guarded by being humble and recognising humanity as a single thread in an ecological carpet, in which nature is powerless.

ABSTRACT

This study explores Zadie Smith's *Swing Time* as a phenomenon of spatial liminality and psychological alienation, focusing on the protagonist's journey to a West African country. The passage is a masterful metaphor for the displacement of the narrator in Gambian/Senegalese terrain, resulting in an identity crisis larger than that experienced in post-colonial contexts. This paper discusses themes of dislocation, adaptation, and the interdependence of diasporic and local identities by examining the connection between the narrator's broken sense of self and the novel setting, which is the West African region. The study draws attention to Smith's employment of the West African narrative to express not only the precariousness of belonging to a culture but also the necessity of reassessing celebrity humanitarianism. Moreover, the paper examines how aid and knowledge can be useful in solving identity crises, how social inequality and psychological degradation interact, and the significance of combining personal and political viewpoints. Overall, this study asserts that *Swing Time* not only raises awareness about the effect of the colonial past on identity but also suggests a comprehensive methodology for comprehending the sense of belonging, as ensuring the future of cultural integrity is the obligation of humankind.

Keywords: Spatial Liminality, Psychological Alienation, West African Narrative, Postcolonial Identity, Dislocated Belonging

**Shyma and Catherine Anna Pushpam**

INTRODUCTION

The issue of identity displacement has taken the 21st century by storm, with serious implications for the individual, society, and the global diaspora. The growing pace of globalization, including growing cultural dilution, extreme economic inequalities, the crisis of migration, and the disappearance of traditional biodiversity, represents growing evidence of a more unstable mental state. The core of such a challenge is the concept of spatial liminality, which is applied to establish the complicated and intertwined interactions between the physical spaces of the earth, human actions, and the cultural resources that societies depend on (Turner 95). This research article attempts to understand the dynamics of psychological alienation in terms of spatial liminality and how such human interventions as celebrity humanitarianism, neo-colonial aid, and industrialization upset the fragile equilibrium of cultural ecosystems. One of the most pressing global questions of our epoch is the identity crisis, and literature has been a significant instrument in the exploration and raising of awareness of the widespread consequences of the same.

Swing Time (2016) by Zadie Smith is one such literary work, a novel that closely intertwines the topics of race, dance, and human experience (Smith 12). This analysis will examine how *Swing Time* employs the West African narrative and the narrator's visit to the Gambia and Senegal as main symbols to examine the psychological effects of dislocation. The novel space of the West African region helps to gain access to the interconnectedness of the diasporic world and the role of changing environmental conditions that destabilize the delicate sense of identity (Gilroy 45). This plot line underscores the conflict between the protagonist's British upbringing and her heritage, which forms a kind of liminality in which the status of belonging is negotiated at all times. With an uncertain future ahead, it is important to establish in-depth knowledge of the psychological equation to inform global quests for cultural resilience, sustainable development, and identity justice. Through this inquiry, the paper will contribute to the discussions regarding the pressing need for a collective global response to identity crises.

Swing Time shows that the aspects of space liminality, African geography, and human experience are interconnected in depth. The description of altered flight behavior by Smith is a strong metaphor for related changes in the psychological state caused by colonial legacies (Bhabha 112). The novel also makes one think about the way in which human beings interpret and react to changes in the environment and encourages people to take more action to conserve the environment. As the studies and research used in the review emphasize, the migration and flight behavior of butterflies is complex in the face of a changing climate, which makes further ecological research and activities crucial in order to sustain threatened species (Casteel 78). However, in the setting of Smith's story, such migration resembles the experience of a person who is displaced due to reasons outside of their control. With natural habitats becoming uncongenial, human and non-human species either have to adapt, move, or become extinct. This paper examines the theme of dislocation, adaptation and interconnectedness of diasporic and local identities by analyzing how the sense of self has been broken by the narrator due to the location that is the West African setting of the novel. The study emphasizes the way Smith employs the narrative of West Africa as a means of displaying the vulnerability of cultural belonging as well as the necessity of a new reconsideration of celebrity humanitarianism.

Research Focus

This study examines how *Swing Time* portrays the meaning of the psychological and spatial story through the symbolic employment of West African locations, liminal spaces, and the connotations they bear on both the natural ecosystem and human beings. Based on the ideas of spatial liminality, this paper explores how the narrator is displaced in the Gambian landscape as a symbol of the postcolonial identity crisis and the instability of cultural affiliations. The research questions might include the following:

- How does Smith apply the West African space (the village/school project in particular) to represent the psychological impact of dislocation in the general sense?

**Shyma and Catherine Anna Pushpam**

- How does the novel bring out the imbalance in natural cultural cycles and psychological balance brought about by neo-colonial aid?
- How does the human experience, presented in *Swing Time*, reflect on the greater ecological and environmental crisis as represented by the moving patterns of migration of the narrator?

Spatial and Psychological Themes in *Swing Time*

Smith's *Swing Time* recounts a thrilling journey of intersecting psychological systems and the reality of the impact of displacement of space. The unnamed narrator is led to West Africa, where the scenery is not only an adjunct but also a force that interferes with her psyche. This voyage resembles the environmental disturbances occurring in climate fiction, in which a changing environment shifts and affects people's lives. As proposed by Homi K. Bhabha, cultural identity may be shaped in the in-between spaces, creating liminality, through which the narrator experiences the foreign country (Bhabha 2). The Gambian and Senegalese environments turn into transitional places where the interracial identity of the narrator is brought to the fore, leading to the dislocation of her own self.

The introduction of the pop star Aimee by the narrator disrupts the local ecosystem, similar to how external forces create chaos in the natural equilibrium. The School Project, which is supposed to train girls, is viewed as an imposition of outsourced will in a local space. It is a type of neo-colonial aid in which the donor's vision supersedes local needs. Gayatri Chakravorty Spivak feels that such interventions tend to make the subaltern be silent because the voice of the locals is lost in the noise of the agenda of the benefactor (Spivak 28). The project is not natural; it is being imported like an invasive species, changing the environment. The physical landscape of the school is modified by its construction, although the social ecosystem is modified, and dependency is created, which never existed before Aimee begins to work on it.

In addition, the description of the natural world and local culture focuses on weakness and defensibility in the face of human influence, in particular, the influence of celebrities. With the introduction of Aimee, the village is turned into a platform for her humanitarian brand, and the local culture will become vulnerable under her whims. Her capricious focus makes the community addicted to her, which shows the instability of celebrity-driven aid. According to Achille Mbembe, power structures in the postcolony tend to place local people in the status of being vehicles of foreign rule, denying them the agency to act (Mbembe 102). The villagers are viewed as subjects of grace, as opposed to partners in development. This contrast reveals how local traditions are weak in the face of the economic strength of Western celebrities.

The changing perception of the village by the characters reflects the slow realization of climate change encountered in ecological stories. The narrator comes to understand that what she is going through is a bigger identity and privilege crisis. She exists in an in-between world, not completely an insider or an outsider, and this pushes her to address the issue of her complicity in the power structures involved. Simon Gikandi emphasizes the fact that maps of Englishness usually do not capture the presence of hybrid identities, which results in the fact that people such as the narrator are stuck between worlds (Gikandi 5). This mental alienation is as harmful as the real one brought about by the school project. The personal struggle that the narrator experiences is the wider contradiction between worldwide movements and national grounding.

The novel remarks on the sense of urgency of environmental and cultural action, preaching the sustainability of humanitarian assistance. The intrusion of natural cycles into villages is a vivid example of the frailty of ecosystems against human activities. Similar to climate change, effective aid spans collective responsibility and requires mutual respect and sustainability. Smith demonstrates that aid is another disruption unless the cause of inequality is considered. The narrative of the narrator highlights the urgency to bring back the equilibrium when there is no chance of holding back once beauty and the human soul are irreparably ruined (Smith 315). It is through this that the West African story is a powerful teaching of how all living systems are interconnected and how acutely all ecological and social problems must be tackled in a holistic manner.

**Shyma and Catherine Anna Pushpam****The West African Space as a Symbol of Dislocated Belonging**

The village in Zadie Smith's *Swing Time* serves as a powerful representation of vulnerability and stability, equivalent to the monarch butterfly in ecological stories. The village is a social ecosystem that can be easily disturbed, and the interrupted migration of the butterfly is an indicator of environmental instability. A narrative breakthrough, which occurs as the narrator is brought to this liminal zone through the humanitarian efforts of pop star Aimee, brings about a dramatic change in her conventional trajectory out of London and New York. This is not just physical but also psychological displacement because the narrator has to face her own displaced belongingness in the diaspora. Cultural identity, as Stuart Hall argues, is not a given but a question of becoming as well as being and is continuously changing through the interaction of history and culture (Hall 225). This change is tested in the village, where the instability of the narrator's identity is shown once she is removed from her Western setting.

The narrator is a metaphor for the frailty of the natural systems and the outcomes of manmade environmental alterations, that is, through the prism of neo-colonial aid. Aimee's school project, being well-motivated, is an intrusive species in the local social order that interferes with the traditional cycles of community life. This relationship can be seen as the so-called contact zone, as outlined by Mary Louise Pratt, in which unequal cultures come into contact and engage in conflict under the circumstances of coercion and extreme inequality (Pratt 7). Humanitarian aid in place of local needs, being an external will of the space, reflects the manner in which industrialization affects ecological balances. Physical forces do not challenge the strength of the village but instead, are challenged by the introduction of material wealth and expectations, pointing to how human interference can easily disrupt fragile social ecosystems, much like climate change can alter physical ecosystems.

These power dynamics have implications on a larger scale, as demonstrated by systemic destabilization in the village. The balance of the community is shaken by the presence of the Western contingent, whereby the inherent tensions of race, class, and the distribution of resources are revealed. According to Edward Said, imperialism is not only a past phenomenon but also a discursive phenomenon that creates a sense of geographical consciousness and cultural identity (Said 12). In the novel, the Western presence reinstates colonial hierarchies, according to which the locals are placed in the position of grace receivers instead of being the same partners. The narrator notes that the project is making dependencies that change the social fabric in a way that may not be sustainable after the withdrawal of external funding. This disruption of the system highlights the instability of the postcolonial space in the face of global capital, in which the control of local agency is frequently undermined by the pressures of foreign donors.

The presence of the narrator is a wake-up call to her and society, pulling her to confront less visible forms of disruption, such as power relationships and privilege. She is in an intermediate place, neither an insider nor an outsider, and can thus observe the tension between Aimee's vision and the village's reality; hooks continues to suggest that marginality may actually be a place of resistance and radical possibility, thus providing a viewpoint that those at the center are unable to see (hooks 150). From such a perspective, the narrator starts to perceive the power structures she condemns as having some complicity in her own person. Her metamorphosis is in line with the change in the village environment; she is torn between the old and the new, denial and acceptance. She needs to balance her Western background with her hereditary origins and realizes that her identity is torn apart.

This is demonstrated by the West African space in *Swing Time*, which demonstrates the intricacy of dislocated belonging in a globalized world. According to James Clifford, cultural identities are being determined more by traveling and translation than by rootedness, producing routes but not roots (Clifford 5). The process described by the narrator is an illustration of such a change because she has to work out the contradictions between her diasporic identity and the realities of the village. The novel implies that one cannot reclaim one's true belonging by returning to the past or by humanitarian intervention but must have a delicate sense of the forces of history and politics that are in play. Robert Young also creates one more argument that postcolonialism is a persistent process of power and knowledge negotiation in which the history of colonizing people still affects modern relationship (Young 45). Via the image of the village, Smith condemns the fact and face of celebrity activism as shallow and urges people to have a more profound reaction to the structural disparity that characterizes the relationship between the Global North and

**Shyma and Catherine Anna Pushpam**

South. The ultimate departure of the narrator is not a solution but a continuous process of finding one way of living in these spaces of dislocation, in which identity, like the ecosystem, is a process in constant motion.

The Narrator's Journey as a Reflection of Psychological Alienation

The author uses the experience of the narrator in the West African village as a turning point that reflects Dellarobia's realization in *Flight Behavior*. At first, she perceives the journey in the context of Aimee's celebrity humanitarianism; however, the nature of the village provides her with an encounter with her own dislocated identity. According to Frantz Fanon, the colonial state establishes psychological disintegration in that the subject is always seen through the gaze of the other (Fanon 82). The narrator understands that her individual life is related to the crises of identity and privilege all over the world, saying, I felt like a shadow (Smith 15). This enlightenment is in line with the concept of diaspora space by Avtar Brah, where identity is built through the overlapping of various histories and places (Brah 157).

First, the narrator and Aimee are both unwise and in denial about what is going on in the village. The school project undertaken by Aimee was foisted without local consultation, similar to the denial of climate change in the community, where short-term comfort is prioritized at the expense of long-term sustainability. According to Ahmed, emotions also shape the surfaces of individual and collective bodies and define the borders between "us" and "them" in most cases (Ahmed, 2012, p. 10). The narrator notices Aimee's dismissal of the needs of the locals when she realizes that they were in the goddamn African continent! (Smith 315). This is the rejection of the precariousness of the local inhabitants and an unequal distribution, which Butler calls the differential allocation of grievability (Butler, 2015, p. 34). The narrator shifts to a state of doubt and acknowledges that her presence is also part of this imbalance.

The narrator is not an outsider or an insider but is defined by psychological alienation. According to Julia Kristeva, this condition entails being a stranger to oneself, in which the foreigner inhabits the subject (Kristeva 1). The narrator is in a liminal space, perceiving the tension between the village as perceived by Aimee and the reality of the village, yet does not identify with either. She notes, "I occupied a liminal position, neither fully insider nor outsider" (Smith 280). Her half-breed status adds to this alienation by attributing a so-called poetics of relation that is founded on the concept of opacity, as opposed to transparency, as proposed by Édouard Glissant (Glissant 190). She is unable to comprehend the village, as is the vice versa, leaving her in a suspended state of belonging.

The story comments on the fact that identity crisis, similar to climate change, is not a faraway problem, and it surrounds everyone, regardless of their status. The story of the narrator highlights the fact that psychological estrangement is a universal situation that is part of the post-colonial experience. Leaving, she accepts that identity is in a continuous state of movement, and she says that identity, as well as the ecosystem, is continuously in a state of flux (Smith 450). This interdependence implies that to protect the integrity of culture, a common vulnerability must be considered. The alienation of the narrator, therefore, serves as a satiric reflection of the greater human state in which belonging is always a negotiated act based on race, class, and geography (Brah 205). From this perspective, *Swing Time* demonstrates that psychological alienation is not a phenomenon with an individual essence but with a structural one, which requires a communal reaction to the crisis of identities that determines the future of the planet.

The Role of Knowledge and Postcolonial Equity

The role of scientific interpretation in *Swing Time* is represented by the character of Fernando Carrapichano, in Zadie Smith, which is similar to the role of other experts, such as Dr. Byron, in the stories about ecology. He attempts to decipher the demands of the village with numbers and logistics; however, in many instances, he collides with the instinctive, celebrity-oriented style of Aimee. Fern perceives the mismatch between the project's plans and local reality and notes that when it comes to school funds, no one was aware of the amount of money that had been transferred (Smith 285). This obscurity illustrates the difficulty in determining local needs without being integrated with external agents. Arturo Escobar believes that development projects have a tendency to introduce foreign models that do not acknowledge local realities, making complex social problems appear as technical ones that can only be solved by professionals (Escobar 45). The example of Fern's frustration with the microcredit scheme, when mothers

**Shyma and Catherine Anna Pushpam**

conceal children to avoid debt collection, illustrates the failure of bureaucratic aid to align appropriately with lived experience (Smith 290). Local knowledge is crucial for tackling such complexities. Lamin and Hawa have a feeling that the village's social structure is not in need of external assistance. The example of Hawa choosing to marry into the Tablighi Jamaat, or even a localized negotiation of modernity and tradition that people outside this community perceive as retrogression, is an example of a local negotiation of modernity and tradition. Linda Tuhiwai Smith underlines that indigenous knowledge systems should be honoured and not supplanted by Western methods that tend to be universal (L. T. Smith 112). This combination of old knowledge and new analysis is essential to long-term intervention. Still, it is the first thing to be ignored by donors who want to see visible improvements instead of cultural nuances. This combination of old knowledge and new analysis is essential to long-term intervention. Still, it is the first thing to be ignored by donors who want to see visible improvements instead of cultural nuances.

Ecological equity deals with the disproportionate distribution of identity crises and economic shifts in marginalized communities. The village is a poor place, and the school project turns into a point of social inequality instead of a resolution. The collapse of the microcredit scheme illustrates that financial instruments can make people more vulnerable instead of mitigating it in cases where the context is disregarded. According to Rob Nixon, this is referred to as slow violence, in which, over time, environmental and economic degradation will disproportionately harm the poor, even if invisible to the world (Nixon 2). Poverty results in the children of the villagers being pulled out of school because the villagers failed to pay their loans, and the effect of economic pressure is directly reflected in the deprivation of education and a disadvantage in the long term. Environmental justice claims that the weak are the first to be affected by a crisis. The rural population in West Africa experiences environmental deterioration and economic changes without the safety of urban centers. According to James Ferguson, development often depoliticizes poverty and disregards structural inequalities by presenting them as technical problems (25). Aimee's celebrity humanitarianism circumvents these mechanisms and provides temporary solutions, but not solutions to the causes of village precarity. Her attention to the symbol of the school does not capture the politics of the school economy, as when the opening ceremony gives precedence to matters of spectacle over content (Smith 300). This divide is accentuated by the contrast between New York's city outlook and The Gambia's rural life.

The rural/urban gap highlights the conflict between the global mobility of Aimee and the immobility of the village in terms of poverty. Aimee perceives the project through the prism of potential and branding, whereas the villagers have to struggle with the issue of survival. According to Chakrabarty, historical difference means the recognition that not all societies of the world are subject to the same temporal logic of modernity or development (Chakrabarty 254). The narrator understands that Aimee lives in a bubble of eternal prosperity. In contrast, the village exists in a limited world where the problem of money makes things disappear, which is the bottle that covers more serious problems in the system (Smith 395). Ultimately, the equity demanded is to fill the epistemic gap between the knowledge of the benefactor and the reality of the recipient.

Liminality and the Future of Identity

West African space in *Swing Time* depicts the sophistication of dislocated belonging in a globalized world. The fact that the narrator's migration is interrupted by identity crises reminds us of the fragility of the planet, in which identity is as vulnerable as an ecosystem. The space is not a container, according to Edward Soja, but a social product that constructs human identity, implying that the liminal status of the narrator is shaped by the geopolitical forces surrounding her (Soja 54). Her process symbolizes the future of every species in a world where human activities are dominant, and the permeations of self and other are becoming more porous. The narrator can see that her existence in the village is not unbiased; she observes, "I was, literally, nowhere good for" (Smith 395), emphasizing that she has broken the local social ecology.

Such disturbance is an indication of the impact of colonialism on the fine-tuning of cycles, just as climate change puts seasonal cycles out of step. Neo-colonial aid is a warm climate, which requires adaptation or death. According to Derek Walcott, the colonial experience forms a rift in history that people are forced to tackle, a rift that usually splits them into fragments of self (Walcott 36). This is what the narrator feels when she is looking at the school project, and

**Shyma and Catherine Anna Pushpam**

she sees how "the future according to him is just as fixed as the past" (Smith 390), an indication of stagnation due to external influence. Her appearance is a prophet of social change, forcing society to acknowledge that the power relationships have changed. The village is an intersection of conflicting identities, just as Doreen Massey suggests that space is an environment of multi-trajectories (Massey 9).

Emigration is a representation of a crossroads on the planet. The Earth is as stuck at a critical point in its identity path as butterflies are. The narrator is on this edge and admits that identity as an ecosystem is always in a state of flux (Smith 450). This liminality is structural and requires a group reaction, not an individual. According to Caren Kaplan, travel-related stories tend to expose the injustices of movement and facilitate a reassessment of who is able to move and why (Kaplan 12). The fact that the narrator finally leaves but does not reach a solution is an indication that he is continuously exploring these displaced spaces. Finally, the novel demands individual action. As kings cannot go on alone, humanity must collaborate to solve the problem of identity. Michelle Wright thinks that through ongoing negotiation and not fixed roots, a diasporic identity is constructed, and there should be shared responsibility (Wright 88). The narrator realizes that protecting cultural integrity requires consideration of shared vulnerability. She questions her own complicity and states, "I occupied a liminal position, neither fully insider nor outsider" (Smith 280). In this light, *Swing Time* explains that it is not only a personal but also a structural alienation and requires unity to the crisis of identity that defines the future of the planet. The process of healing the narrator becomes a metaphor for the necessity to create balance before it is too late, and both the landscape and the human soul will be damaged.

CONCLUSION

In Zadie Smith's *Swing Time*, the protagonist's departure to West Africa serves as a compelling metaphor for identity crisis and displacement. Considering the concept of spatial liminality, the novel raises the issues of mental instability, human displacement, and the necessity of scientific and social intervention. The new experience of the narrator depicts a larger ecological calculation that humanity must respond to: the relationship between human actions and the environment is fragile, and the future of cultural integrity, as the novel indicates, will depend on humanity's behavioral response to such identity crises. This paper examines how Smith's narrative connects the scientific, ecological, and social viewpoints of belonging and how the problem of belonging is complex; each individual and group should be responsible. West African space is brought in as a point of entry for the interconnection of the diasporic world and how changing environmental conditions destabilize the fragile equilibrium of identity.

In this light, the trip of the narrator is not only in its beauty and frailty of culture but also in its recollection of the great transformation occurring in our world. *Swing Time* offers a wrenching comment regarding the future of identity under the influence of neo-colonial disruption through the symbol of West African space and interrupted social cycles. Social imbalances, as the narrator alienates, are not accidental events but elements of a wider international problem that affects not only human but also non-human life. Ecological destruction and the loss of cultural biodiversity that endangers the well-being of the planet in the narrator's journey is now metaphorically a search for roots. Similar to the migration of the butterfly in ecological literature being an indication of environmental distress, the dislocation of the narrator is an indication of distress in the culture.

In this research paper, the focus is on how Smith uses the migration of the narrator to discuss the overall environmental issues of the novel and the need to identify and address the identity crises that define the future of the planet. Through knowledge of such disruptions, *Swing Time* challenges the reader to look at the long-term effects of inaction and the necessity of shared responsibility in ensuring a sustainable future for all living species and identities. The preservation of cultural integrity must consider a vulnerability that is common to everyone. Hence, the importance of identity as an ecosystem is under continuous transformation and needs careful management to avoid irreversible loss. Finally, the paper concludes that *Swing Time* needs to take a holistic approach to the concept of belonging, and it is the duty of humankind to protect the future of cultural integrity against the disruptive powers of globalization and displacement.

ABSTRACT

The Fisher Queen's Dynasty, a novel written by Kavita Kane, will be the primary focus of this paper. The protagonist, Satyavati, is reimagined in the novel. This mythology describes Satyavati's rise from a poor fisherwoman to Hastinapur's brave queen. Her journey is told here. The image of water, rivers, and the Earth's ecosystem begins to explain ecology, gender, and sustainability. Image is a gateway. This study compares Kane's imaginary cosmos to India's river networks' ecological reality. The research will focus on water pollution, biodiversity loss, and environmental degradation. Ecofeminism and environmental science were used to analyse this study. The research uses official Indian environmental data from the Central Pollution Control Board (CPCB) and the National River Conservation Plan. It improves research accuracy. This method guarantees maximal research accuracy. Data shows a link between literary symbolism and India's aquatic ecosystem disasters. They correlated to generate this relationship. The collected data helped create this correlation. This study explains Satyavati's relationship to water supplies, representing patriarchal governance and anthropocentric socio-culture in the real world. Study was found to represent reality. This analysis shows large water bodies. Satyavati may be linked to many waterways. The study found that mythology actively promotes sustainable development and ethically humanizes environmental science. This was their conclusion. Based on their investigation, researchers concluded this. The researchers concluded this from their findings.

Keywords: Ecofeminism, Aquatic Ecology, Environmental Ethics, River Pollution, sustainability.

INTRODUCTION

By 2023, the Central Pollution Control Board expects over 80% of India's surface water bodies to be polluted, putting 13% of its aquatic species at risk. India is undergoing a major environmental disaster. Environmental studies show India's ecological equilibrium is nearing a tipping point. According to Lawrence Buell, "the environmental crisis is a crisis of the imagination". Indeed, India is nearing a major event. People have traditionally believed that the natural system will fail owing to their views of nature, resource consumption, and responsibility. Literature expressed this belief. Buell writes, "Literature has long served as an early warning system for environmental catastrophe". These difficulties have been happening for a long time, but scientific measures and policy studies only recently learned about them. Literature may raise environmental and ethical awareness through plot and symbolism. Literacy shows awareness. Ecofeminism connects environmental science and literary studies, making it beneficial. Ecofeminism links global women's oppression to environmental degradation. According to Gaard, ecofeminism links the subjection of women to nature. (The Gaud) The merchant hypothesis links these events to patriarchal and hierarchical organizations that promote power, control, and abuse. Ecofeminism faces scientific, ethical, and cultural challenges from environmental degradation (Plumwood). This enhances ecofeminism knowledge. They use culture, society, and the environment to their advantage. This paradigm lets academics study gender, power, and nature narratives (Gaard). Expanding the environmental discussion beyond facts enhances the profession. This feminist Mahabharata adaption by Kate Kane is called *The Fisher Queen's Dynasty*. Kavita Kane's status as a writer may facilitate the application of this ecofeminist technique. Satyavati, a resident of a fishing community, recounts her story. The protagonist of the book, Kane, values rivers, fish, and ecosystems significantly. Satyavati is influenced by natural rhythms that safeguard the environment. She possesses strength and empathy; nonetheless, her closeness to water renders her susceptible (Plumwood). Satyavati's affinity for water symbolizes her connection to nature. Kane demonstrates that nature influences individuals' objectives, aspirations, authority, and fortitude. Kane embodies nature. The narrative employs rivers, oceans, and fishing areas to illustrate the evolution of human ideals and their associated obstacles. Satyavati's ascension from fisherwoman to queen illustrates the transition of humanity from harmonious coexistence with nature to its domination and exploitation for profit. Humanity has evolved with time, as exemplified by Satyavati. Shiva states

REVIEW OF LITERATURE

In the course of this research, the novel *The Fisher Queen's Dynasty* written by Kavita Kane is analyzed to see whether or not it contains any ecofeminist components. This viewpoint is frequently disregarded in contemporary feminist reinterpretations of myth, and by doing so, this study explores a substantial research gap that has been left unexplored as a result of this oversight occurring. The ecofeminist concepts of Vandana Shiva and Carolyn Merchant are utilized in this study, which, in contrast to past research (Kumar, 2020; Sharma, 2022) that focuses on gender and power, makes a relationship between the enslavement of women and the exploitation of the environment. This connection is established by applying the principles of ecofeminism. Specifically, the focus of this investigation is on the connection that exists between the two. In the film *Staying Alive* (1988), directed by Shiva, and in the film *The Death of Nature* (1980), directed by Merchant, an instance of the domination of patriarchal capitalism over women and the environment is provided. The decade of the 1980s saw the publication of both of these masterpieces. According to Ghosh (2019) and Nayar (2002), this study places Kane's account within the body of knowledge that pertains to aquatic ecology. The Indian eco-critical discourse, which acts as a source of inspiration, is the source of inspiration for this work. Furthermore, it provides a framework that integrates the natural sciences and the humanities in order to promote sustainability through myth and narrative. This framework is offered by the initiative. As a transdisciplinary framework, this framework is being discussed. There is a connection that can be drawn between the water symbolism in the book and the empirical environmental data that pertains to the river systems in India. In this way, it is possible to accomplish the objective that was defined. This is an illustration of how

**Radhika et al.,**

literature may be used to translate ecological calamities into circumstances that can be understood on an ethical and emotional level.

Objectives

1. To apply ecofeminist theory in order to conduct an analysis of the ecological symbolism embedded throughout *The Fisher Queen's Dynasty*.
2. To determine whether or whether there is a correlation between the water and fertility depictions in literature and the scientific data on aquatic environments in India.
3. To suggest that retellings of mythical stories can be used as educational tools for improving ecological understanding and environmental consciousness.

METHODOLOGY

The methodology utilized in this investigation is a qualitative mixed-method approach, which combines scientific interpretation with textual content analysis.

Literary Component

One of the key sources that should be evaluated is Kavita Kane's *The Fisher Queen's Dynasty*, which was published in 2017. Environmental ethics, ecofeminism (Shiva, 1988), and deep ecology (Naess, 1973) are the three components that comprise the analytical framework. Ecofeminism was developed by Shiva in 1988. Some of the topics that are discussed in this work include the imagery of rivers, the symbolism of water, fertility, the pollution of the environment, and the exploitation of women differently.

Scientific Component

Secondary data resources include, among other things, information regarding the environment that is obtained from the Central Pollution Control Board (2023), the Ministry of Jal Shakti (2022), and the National River Conservation Plan (NRCP, 2021). • The following variables were investigated: biochemical oxygen demand (BOD), dissolved oxygen (DO), and river pollution indices for the Ganga and Godavari basins, which are rivers that are comparable to Satyavati's ecosystem. These rivers are located in India. These waterways can be found on the subcontinent of India. It is via the examination of the facts, which includes the assimilation of thematic findings, that the convergences between scientific ecology and literary imagination are brought to light.

ANALYSIS AND RESULTS**Water as a Feminine and Ecological Entity**

The fact that Satyavati was born to a fisherwoman and that her identity is intricately linked to the river is a powerful indication of the mother function of water that is present throughout the novel. Satyavati's identity is closely linked to the river. To supply sustenance, to give birth, and to cycle continuously are all functions that fall within this category. It is impossible to separate the personalities of Satyavati and the river because they are inextricably linked. According to the ecofeminist point of view, the consequences of patriarchal and anthropocentric policies and systems are seen to be present in both the bodies of women and the bodies of water. Readings that are derived from this point of view give the impression that this is the case. Kane's portrayal of the river as "a body that breathes, murmurs, and mourns" is a personification of aquatic ecology, and it is consistent with ecofeminist interpretations of the term. This imagery is a representation of the river's ability to breathe, murmur, and mourn. The Central Pollution Control Board (2023) has concluded that forty-six percent of the river sections in India that are being monitored have levels of contamination that are greater than the safe limits. This information was obtained from the river sections that are being under surveillance. The "tainted waters" that, in a symbolic sense, suffocate the globe that marked the beginning of Satyavati's existence immediately come to mind when one considers this metaphor. The evidence that demonstrates that this metaphor is correct comes from the scientific community as a whole.

**Radhika et al.,****Exploitation of Nature and the Female Body**

The government's commercialization of natural resources is reflected in Satyavati's diminishing level of autonomy as she travels from the river to the palace. This happens when she makes her journey from the river to the palace. Vandana Shiva's thesis, which states that the patriarchal system of capitalism objectifies both women and nature, is supported by this narrative, which is consistent with the thesis. This highlights how urbanization and industrialization exploit riverine systems for the goal of economic profit, hence generating disturbances to both water cycles and biodiversity. This is an example of how ecology illustrates how these two processes work together.

Restoration and Ecological Ethics

One of the topics that connects with ecological resilience is the author's contemplations on the cyclical nature of time and regeneration, which are presented in the final chapter of the book. The final reflection of Satyavati shows a return to equilibrium from an ethical position. Ethical relations with nature are grounded in balance, reciprocity, and restraint, says Plumwood. Rivers possess an inherent capacity for self-recovery when anthropogenic stress is reduced. This is akin to the scientific approaches utilized in river restoration programs (NRCP 2021) that lay a focus on an individual's capacity for self-purification and ecological recovery.

DISCUSSION

Kavita Kane's stunning environmental metaphor glorifies nature. A huge departure. This is very unusual. Environment is used to combine mythology and ecological guidance. Environment is a metaphor and reality in the story. Satyavati symbolizes fragile, sustaining water. Story makes Satyavati liminal. Nature is fragile when mistreated but robust and life-giving when revered. Her identity embodies ecofeminist power-nurture duality. Her identity is dual.

The development of Satyavati from fisherwoman to queen symbolizes human-nature connection. Change represents relationship evolution. She grew up with subsistence, interdependence, and ecological balance. As she grows to power, this connection becomes one of control and extraction, analogous to the historical move from human-nature alliances to anthropocentric exploitation. This happens when she develops power. Her success alters her. This may suggest a change from ecological balance to hierarchical domination than "human to human." This interpretation is supported by evidence. This is one journey view. This method mimics unbridled ambition and resource exploitation's environmental damage. Kane's account illustrates how literature predicts ecological facts before environmental science research confirms them. The Fisher Queen's Dynasty's beautiful story addresses ecological imbalance, resource exploitation, and environmental unfairness. Family history.

Mythology reinterpreted. After extensive research, recent scientific discoveries corroborate these patterns. Unlike scientific models, literature may predict and explain environmental disasters by capturing their emotional, ethical, and cultural dimensions. Literature forecasts and interprets. Literature may forecast and understand environmental calamities. Ecofeminism highlights patriarchal regimes' enslavement of women and nature. Recent ecofeminism has grown. Recent years have seen ecofeminism rise. Evidence and emotional, ethical, and spiritual links to the environment are emphasized in this movement. The environment affects all these qualities, according to movement. Ecofeminism integrates science and personal experience. Ecofeminism fights science denial. Sustainable solutions require cognitive awareness and ethical innovation, according to ecofeminism. Political ecofeminism. Satyavati's water, reproduction, and existence reliance is ecofeminist. Relational ethics, reciprocity, and care may increase ecological awareness. Ecofeminists say profit-driven, technocratic development has ignored women's intuition and daily knowledge of natural resources. Women's competence derives from natural resource contact. Kane's story revives epistemology. Satyavati is portrayed as a moral and ecological guru. Creative writing, indigenous epistemologies, and cultural narratives in environmental discourse are highlighted. A narrative analysis explains this. This strategy affects environmental ethics and sustainability education scientifically and pedagogically. These impacts are significant. Literary linkages foster ethical, scientific, and ecological awareness. The writing of Kane can.

Radhika et al.,

To promote sustainability, ecofeminist literature connects students and researchers emotionally and intellectually. This applies to sustainability specifically. Environmental disasters can be cultural, gendered, and ethical. Ecological justice. Kane's story shows how mythology and literature warn of environmental hazard. Ecological justice, human responsibility, and sustainable life are promoted. The story of Kane is interpreted. Discourse calls for data-driven environmental narratives. The tale says so. Historically, these stories have warned against exploiting women and the environment. The effects were explained.

CONCLUSION

In The Fisher Queen's Dynasty, Kavita Kane uses Indian literature's ecological consciousness to overcome mythical recounting. This is the situation in mythical recounting. This action is possible because of "mythical retelling". This would be impossible without this word. Aquatic ecology and feminine identity may help explain the relationship between human ethics and environmental preservation in the human community. This understanding is achieved by combining the two areas. When viewed in light of scientific facts about biodiversity loss and river pollution, the book becomes a narrative mirror of the ecological reality. Thinking about the book changes it. This transformation occurs when the book and discoveries are related. The switchover occurs here. This reading presents this reading from a variety of fields to show that literature can bridge environmental science and public ecological consciousness and help academic institutions and society achieve environmentally sustainable practices. Reading will proceed as follows. This reading will be interpreted as follows. This reading is here because it was offered. This presence prompted this reading.

ABSTRACT

The *Ceremony* by Leslie Marmon Silko is related to the psychological destruction of a World War II veteran named Tayo and the destruction of the ecology on the Laguna Pueblo reservation. This paper employs an eco-psychological approach to examine how Tayo's PTSD is an internal drought, reflecting the lifelessness of the soil outside. With the help of magic realism, Silko blurs the boundary between the surrounding environment and psyche, implying that the key to the problem is to reconfigure the self and the environment in the way they should be. It interchangeably mixes Pueblo mythology, such as the narration of think-woman, with modern theory of trauma, and the drought is not merely meteorological but somatic, an expression of grief of the people and individuals. This is because it takes Tayo on a journey of white smoke of dissociation to holistic healing; The *Ceremony* is a vital psychosomatic healing agent introduced by people like Betonie. In the analysis of the most significant motifs, rain, jungle fever, and the witchery poem are the most significant ones. This paper contends that magical realist techniques employed by Silko justify indigenous epistemologies, whereby mental health cannot be discussed without mentioning the ecological balance. Eventually, the repetition of the rain can be seen as the successful beginning of Tayo's inner rite of passage and demonstrates that human consciousness and the living earth are inseparable, and the only way to survive is to acknowledge this fact. The text redefines the concept of healing as a process of association between a human and a non-human being in the novel.

Keywords: Eco-psychoanalysis, Magical Realism, Trauma, Drought, Indigenous Epistemology, Healing.

**Mohamed Azarudeen et al.,**

INTRODUCTION

The nexus between ecological crisis and psychological trauma is becoming a more acknowledged concept in contemporary discourse. Post-traumatic stress disorder (PTSD) is no longer perceived as an issue of inner malady only, but one that is reflected in the destruction of the environment. Leslie Marmon Silko published *Ceremony* in 1977, and it was reissued in 2006, which is a seminal work on this intersection. The novel revolves around Tayo, a mixed-heritage World War II veteran, who returns to his home filled with battle fatigue. The narrative meaning of Silko is its denial of the separation between the land and the psyche of human beings and the view that the only way to heal is through integrating the land in its entirety. The internal fragmentation of Tayo is physical, as he needs to heal the feminine and communal traditions to rebalance (Allen 45). According to this ontological model, material reality is directly affected by human thinking, which is one of the major tenets of eco-psychoanalysis.

The issue statement touches on the ways in which human-related factors, namely war and colonialism, interfere with the psyche as well as the ecosystem. Tayo experiences the effects of his trauma physically in the form of a drought; he believes that he prayed for the rain to stop, and in year six, there was no rain. This relationship implies that natural barrenness is caused by human violence. Their displacement of the veterans can be seen when Tayo sleeps in the hospital like the “white smoke,” which is empty and invisible. An invisible tongue creates his speech in treatment, and this depicts the dissociation that is experienced by Cathy Caruth in *Unclaimed Experience* (Caruth 151). This separation is worsening with colonialism; Emo expresses the anger, screaming that they took the land, and all. This kind of dispossession forms its own psychological scar equivalent to the crippled terrain, a dynamic that, according to Bill Ashcroft, defines post-colonial literatures (Ashcroft 22).

This study states that drought is a metaphor for psychological trauma; hence, recovery will involve eco-psychoanalytic treatment. Traditional medicine is failing because the world is delicate and requires rituals that acknowledge interconnectedness. The text states that without stories, the community will be powerless against the forces that are moving towards destruction. Jace Weaver stresses the fact that Native survival and revival depend on storytelling (Weaver 112). Healing entails the integration of the self and the natural world, going beyond war dissociation. Eco-psychoanalysis is the paradigm through which one can interpret how internal grief can be externalized in the form of climatic changes, which means that a solution must be offered to both the mind and the environment simultaneously. According to Greg Garrard, ecocriticism should examine such material links between the text and the earth (Garrard 89). Tayo had to understand that he had to remain busy and motionless to survive the fragmentation.

In this paper, I will be working in three parts. First, it breaks down the symbol of drought, discussing how the dryness within Tayo is mirrored in the dryness of the outside world. According to Robert Nelson, landscape is a visionary power of Native fiction (Nelson 67). Second, it examines *Myth* and *Ceremony*, which attempts to determine how the new rituals that Betonie undergoes through the integration of modernity and tradition are used to heal the psyche. According to Betonie, the hogan pre-dates the white people and was constructed many years ago. He focuses on adaptation, which declares that things that do not move and develop are dead things. Linda Krumholz recommends that the books and the healing process are intertwined in the work of Silko (Krumholz 234). Lastly, it deals with Colonialism and Equity, where the extraction of resources represents the endgame of the witchery. Betonie tells him that the people have to do it. Kenneth Roemer emphasizes the ethnohistorical background of such opposition (Roemer 105). The conclusion reiterates the statement that the only way to survive is by recognizing that the human consciousness and the living earth are interconnected. According to Ts'eh, you can always keep remembering what you saw, and then nothing is lost. Finally, *Ceremony* reinvented the meaning of the healing process as a way of human-nonhuman relationship and gave a map of ecological and mental strength in a disjointed world. The paper highlights the fact that rituals have to evolve to be resilient so that they can surmount the stagnant annihilation of witchery. According to Charles Silet, this shifting narrative form is supported by Silko in his collection

of essays (Silet 78). Louis Owens also contributes that mixed-blood identities manoeuvre these fates by way of such renewal (Owens 134). The novel ends with the prayer of balance: Sunrise, receive this offering, Sunrise.

Research Focus

The central objective of this research is to examine how *the Ceremony* is indicative of eco-psychosocial trauma discourses by being symbolically represented as drought, magical realism, and the implications of each to both natural ecosystems and humans. The text by Silko assumes that it is impossible to disconnect psychological fragmentation from the devastation of the environment. This paper explores the intersection of post-traumatic stress disorder in Tayo and the barren land of the reservation, suggesting that the solution to the condition of the self is to reconnect with the land. Through the lens of the interaction between indigenous mythology and modern trauma theory, this paper will consider the role of human-made forces, such as war, in destabilizing both the psyche and the ecosystem. The method confirms native epistemologies in which the aspect of mental health is closely interconnected with the ecological balance. The research questions that have been adopted at the core of this analysis are as follows:

1. How does drought (and, in this case, the internal and external deprivation of rain) represent the larger psychological consequences of trauma as employed by Silko?
2. How does the novel point to magical realism as a way to reveal the violation of natural cycles and ecological balance?
3. How does the human experience depicted in *Ceremony* reflect the ecological and environmental catastrophes represented in the barrenness of the land?

In this inquiry, this paper will contribute to the reasons that there is a desperate need to provide a holistic approach to the trauma crisis, which will lead to staying alive by recognizing the interdependence between the living earth and human consciousness.

Eco-Psychoanalytic Themes in *Ceremony*

Ceremony by Leslie Marmon Silko creates an ontological structural system in which human thought affects material reality, as seen when "Thought-Woman, the spider, named things and as she named them they appeared" (Silko 1). This connection is the basis of the eco-psychoanalytic approach to the trauma story of Tayo, in which the psyche and the environment are constitutive as a key idea in Indigenous worldviews, made up of the spiritual and material inseparable (Allen 45). When Tayo returns after World War II, he is experiencing battle fatigue, which is a state of psychological disintegration in the form of physical illness (Silko 11). This expression concurs with the theory of trauma, in which the unresolved experience of violence haunts the victim, who experiences somatic symptoms (Caruth 151). The novel does not emancipate this psyche from the land and assumes that it is healed in a wholesome manner (Silko 12). The inner disintegration of Tayo is visceral; "He could feel it inside his skull—the tension of little threads being pulled..." (Silko 12). According to this system of ontology, material reality is directly affected by human thought, which is one of the main principles of eco-psychoanalysis and ecocritical analysis (Garrard 89).

The problem statement is concerned with human-induced variables, including war and colonialism, which disrupt the psyche and ecosystem. Tayo's trauma is expressed physically; he thinks, "So he had prayed the rain away, and for the sixth year it was dry" (Silko 13). This implies that human violence is the cause of natural sterility. The displacement of the veterans is also seen when Tayo appears in the form of drifting white smoke in the hospital, being unseen and empty (Silko 14). During his treatment, "He was invisible. His words are formed with an invisible tongue..." (Silko 16). Colonialism leads to this fracture; the land suffers with the veteran. The text asserts, "You don't have anything if you don't have the stories" (Silko 2). The community is powerless to stop the forces of destruction without a narrative. This indicates the role of the landscape in Native fiction, where identity is in place and narrative (Owens 134).

Mohamed Azarudeen et al.,

This paper argues that the drought is a representation of psychological trauma; therefore, it requires eco-psychoanalytic therapy. Conventional medicine fails because of the following reasons. "This world is fragile" (Silko 35), demanding rituals that recognize interrelatedness. The process entails restoring the self in the world of nature and dissociating from war (Silko 12). Tayo must realize, "He had to keep busy; he had to keep moving..." (Silko 12). This convergence is manifested in the hallucination of Josiah in the jungle. In the film, Tayo perceives his uncle as part of the enemy soldiers, and it blends home and war. He saw his uncle fall, and he identified him as Josiah, and he continued shaking him by the shoulders and telling him to quit crying and by the time Rocky started shaking him, it was still Josiah on the ground (Silko 11). This vision links the death of the land to the death of men during the war.

This constant rain was as detested to Tayo as the jungle green rain, rather than the miles of marching or the Japanese grenade that was murdering Rocky (Silko 13). The ecological crisis is seen as internal grief. Finally, *Ceremony* reinvents healing as a social activity. The rain symbolizes the achievement of Tayo's internal Ceremony. As Ts'eh notes, "As long as you remember what you have seen, then nothing is gone" (Silko 239). The novel ends with a prayer of moderation: "Sunrise, accept this offering, Sunrise" (Silko 243). The only way to survive is to realize the unity of the human mind and the living earth. The story uses Pueblo mythology to interact with contemporary trauma theory, and the drought is not only a meteorological phenomenon but also a somatic manifestation of the grief of individuals and the community. The fact that Taylor (Tayo) goes through the white smoke of dissociation to complete recovery supports *Ceremony* as a psychospiritual treatment (Krumholz 234). Using the analysis of major motifs, it is suggested in this paper that Silko's magical realist techniques provide an authentication of indigenous epistemologies in which the mental health of people is deeply interconnected with an ecological balance. Therefore, the text redefines the process of healing as a non-human to human relationship in the novel.

The Drought as a Symbol of Trauma

Silko supposes that psychological trauma does not occur in an internal space but is a phenomenon that discharges in the surrounding world. The drought, which is the main theme in the novel, is a literal expression of the post-traumatic stress that Tayo faces. When Tayo returns from the war, he faces a landscape that reflects his inner barrenness. The story mentions explicitly, "So he had prayed the rain away, and for the sixth year it was dry" (Silko 13). This relationship indicates that natural barrenness cannot be triggered by any means other than human violence. The guilt that Tayo shows towards the death of his cousin Rocky and his survival changes into a conviction that he is the only person who can stop life. This interrelates to Indigenous worldviews of the environment and psyche as constitutive of each other (Allen 45). The disturbed rain patterns of the land can be viewed as a metaphor for mental imbalances, as the mind of the veteran is no longer able to relax. And this drought within prevents growth, as the drought outside prevents the corn from rising. The six years of dryness are the years of war, not the years that go on by loss instead of harvest.

Natural systems are weak, comparable to the fragility of a veteran's mind. Old man Ku'oosh warns Tayo, "But you know, grandson, this world is fragile" (Silko 35). This weakness extends to Tayo's mind, termed as battle fatigue, in which mental disintegration is manifested in physical illness (Silko 11). The internal fragmentation of Tayo is corporeal: "He could feel it inside his skull—the tension of little threads being pulled..." (Silko 12). It is this undisowned experience that haunts the survivor with somatic symptoms, a fundamental principle of trauma theory (Caruth 151). This tension is similar to the drought pressurizing the land, which is pressurizing his psyche. This tension was reflected in the environment; the mule had become very thin, and the goat and kid were forced to walk more miles every day to find weeds or withered bushes to graze on (Silko 13). The pain inflicted on the animals is the trauma of the community. The cycle of the blind mule around the dry windmill is a symbol of stagnation in people who are no longer connected with their life source. According to ecocritical analysis, these landscapes provide the material effects of human disturbance (Garrard 89).

Another symptom reflected in the landscape is dissociation. Tayo writes about his position in the hospital: "For a long time he had been white smoke" (Silko 14). Such invisibility is comparable to the dry wells and infertile hills, where there is no life. The white smoke never thought of itself; it was dissolving into the white world of bed sheets

**Mohamed Azarudeen et al.,**

and walls. During his treatment, "He was invisible. His words are formed with an invisible tongue..." (Silko 16). The famine makes the land infertile and silent. They are left in the hands of their narrative, which is shattered, and the mind is shattered. The text asserts, "You don't have anything if you don't have the stories" (Silko 2). The rain is brought by stories, and in the absence of that, the drought continues. The silence of the veterans is a factor that adds to the dryness because the silence is caused by the unspoken trauma that the veterans go through, and this prevents the water of healing from flowing. The hospital tries to treat him with medicine, but the land is the only one that can cure the drought of the soul.

This interconnectedness must be accepted in healing. The process that Tayo is going through entails a transition between the white smoke of dissociation and the recovery of the whole body. He is aware that memory sustains life: "As long as you remember what you have seen, then nothing is gone" (Silko 239). The miracle of rainfall is an indication of the achievement of Tayo's internal *Ceremony*. The last prayer in the novel is a prayer to balance: "Sunrise, accept this offering, Sunrise" (Silko 243). Finally, the drought is a symbol of the effects of being out of touch, and rain is a symbol of establishing harmonious contact between human consciousness and the living earth. In the novel, the text redefines the concept of healing as an act of relationship between human and non-human beings. Reading and healing are inseparable processes in Silko's work, which necessitate the combination of myth and reality (Krumholz 234). Tayo passes the drought and, by doing so, demonstrates that the mind and land are one. This ritual is used to re-establish the balance that led to the dryness caused by witchcraft.

The Role of Ceremony and Myth in Understanding Trauma

In *Ceremony*, Leslie Marmon Silko places Indigenous knowledge systems as important healing processes on par with scientific investigation. The novel claims that the story is medicine, as the old man says, "You don't have anything if you don't have the stories" (Silko 2). This ontological structure starts with the poem of creation: "Thought-Woman, the spider, named things and as she named them they appeared" (Silko 1). Here, storytelling functions as therapy, reconstructing the fractured psyche through myth. An example of this indigenous adaptive science is the medicine man Betonie in his home: "This hogan was here first. Built long before the white people ever came" (Silko 125). His ritual area combines contemporary rubbish with archaic ritual, full of "bundles of newspapers... telephone books... Santa Fe Railroad calendars" (Silko 126). This synthesis shows that rituals need to change in order to endure the colonial dislocation.

Betonie tells Tayo that he must not stand still: "Things which don't shift and grow are dead things" (Silko 126). He also focuses on general responsibility to heal: "The people must do it. You must do it" (Silko 126). This flexibility is important since the trauma that the community is experiencing is structural, which is based on witchery. The witchery poem demonstrates the origin of such destruction of the world: "It's already turned loose. It's already coming" (Silko 132). This power causes nature to be alien to humanity, which makes it certain that "The world is a dead thing for them, the trees and rivers are not alive" (Silko 133). The witchery is based on stagnant devastation, and the indigenous *Ceremony* is based on active development. The healing of Tayo entails his becoming aware of this pattern through the sand painting and star maps. He has to realize that the destruction can be avoided, provided that the story is continued. The ritual ends in a reconciliation of the oneness between human and non-human. Tayo finishes the ritual with the recognition of the dawn: "Sunrise, accept this offering, Sunrise" (Silko 243). Finally, according to Silko, the struggle to survive is based on the recognition of the mutuality of human awareness and the life of the Earth. The healing process is redefined as a relationship between human and non-human in the novel. Tayo can survive drought, thereby demonstrating that the mind and land are interconnected. The ritual reinstates the balance, and the dryness is ended with witchery. As Ts'eh notes, "As long as you remember what you have seen, then nothing is gone" (Silko 239). Memory keeps being alive in opposition to forgetting the trauma. The story of the Gambler demonstrates the theft and the necessity to restore the stolen clouds. Sun Man tells the clouds, "Come home, children, come home" (Silko 225). This reappearance means ecological and psychological recovery.

Colonialism, Veterans, and Ecological Equity

The *Ceremony* by Silko is a critique of the collision between colonialism and environmental destruction and how Indigenous veterans are the most affected by ecological injustice, a trend that Louis Owens observes is key to the mixed-blood experience of American Indian novels (Owens 134). The novel suggests that survival lies in narrative because "you don't have anything if you don't have the stories" (Silko 2). Such dependence on narratives supports the point that Jace Weaver makes that community survival depends upon the reenactment of native stories in the face of loss (Weaver 112). The trauma that Tayo suffers is connected with the land; "so he had prayed the rain away, and for the sixth year it was dry" (Silko 13). This drought also targets the reservation disproportionately, as the white ranchers exploit the mountains. "The white ranchers called this place North To p..." (Silko 229), sealing off areas that were traditionally Indigenous with a wolf-proof fence to keep Indians away. Shouting, this violence, is internalized by veterans such as Emo. "They took our land, they took everything!" (Silko 86). Destruction is their coping system; "cash from disability checks earned with shrapnel in the neck..." fuels their drinking (Silko 120).

The Witchery poem discloses the extent of this exploitation throughout the world. It prophesies the consumption of uranium: "They will lay the final pattern with these rocks... and explode everything" (Silko 135). This prophecy comes to pass in the uranium mine in Laguna. "Cebolleta people salvaged lumber... but they had no use for the barbed wire..." after the mine closed (Silko 240). The atomic bomb links world war in nations to the misery at home; "Trinity Site, where they exploded the first atomic bomb..." is only miles away (Silko 246). The veterans fall prey to this witchery. The cost of death is as portrayed by the death of Harley: "Harley's body hanging from the fence..." (Silko 250).

The ecological equity requires the acknowledgment of the victimized; drought and war are against the marginalized. However, it can be cured through moderation. "Sunrise, accept this offering, Sunrise" (Silko 243). In the novel, colonial exploitation is portrayed as breaking natural cycles, and Indigenous knowledge can put them back on track, which is connected to the claim by Paula Gunn Allen that restoring tribal worldviews is the key to recovery (Allen 45). The case of the veterans demonstrates that social justice cannot be discussed without environmental justice as well as social justice. The violence is still remembered in the land. The individuals cannot forget the tales. The wickedness relies upon forgetting. The *Ceremony* of Tayo breaks the cycle. The mine is still an eyesore and represents permanent removal. Only when Tayo defies the story of the witchery does the drought stop. The rain returns to the valley.

The pendulum swings towards the individuals. The ritualism restores equity. The narratives outlived death. The land endures mining. The individuals do not give up as a result of the war. The linkage between the uranium and the drought is obvious. The destroyers make money, and the people are starving. The soldiers lose their lives to a country that does not even accept them. The *Ceremony* mends the division between man and land. The earth is responsive to prayer. The rain falls on the mesas. The narrative moves on to trauma. Memory is a way to recover the share of equity. The land is alive again. The individuals are powerful as a team. The witchery is unsuccessful in the end. The world returns to balance.

Restoring Balance: Healing and Interconnectedness

The *Ceremony* resolution is a symbol of regaining balance between the psyche of a human being and the natural world, which is the final stage of the eco-psychoanalytic journey of Tayo. Upon completing the *Ceremony*, the *Ceremony* itself indicates that Tayo has completed the *Ceremony* by discovering the spotted cattle, which symbolize the rediscovery of native heritage against colonial theft. He discovers that the scheme of the witchery is finished at the uranium mine and that "human beings were one clan again, united by the fate the destroyers planned for all of them" (Silko 246). This acknowledgment enables him to discontinue the grip of the witchery without further spreading violence. Tayo does not destroy the circle of destruction by refusing to kill Emo, who knows that failing to do so will make the schemes of the destroyers fruitless. The sensation overwhelms him as he walks slowly down to the shaft of the mine: "the pattern of the *Ceremony* was completed there" (Silko 245). The presence of the spotted cattle proves that Josiah's and Tayo's dedication to the land was successful.

**Mohamed Azarudeen et al.,**

Psychological healing is reflected externally in the rain returning, which confirms the connection between internal conditions and external environments. The drought was first occasioned by Tayo, where trauma "he had prayed the rain away, and for the sixth year it was dry," dies when he becomes part of the land again (Silko 13). The rain symbolizes the end of inner struggle and the cleansing of the conscience. Ts'eh confirms this relationship towards the end and says, "As long as you remember what you have seen, then nothing is gone" (Silko 239). Memory keeps life alive in opposition to the loss of trauma and colonial memory loss. The ground reacts to the ritual; the clouds come together in the process of completing Tayo's duty. According to this eco-psychoanalytic resolution, the ecological balance is a condition that predetermines mental health. The sterile land became a somber manifestation of sorrow, which was cured with the help of rites. The mountain could not be lost in their possession, since this form of property was in them and thus could not fade away with a change of ownership (Silko 245).

The interrelation between human consciousness and the living earth is completed in the final scene, which resembles the beginning of the novel. Tayo offers a prayer to the dawn: "Sunrise, accept this offering, Sunrise" (Silko 243). This ritual restores the sun's place as a living being, not a celestial one, thus restoring reciprocity. The story begins with the tale of Thought-Woman, in which "whatever she thinks about appears," constituting that narrative forms reality (Silko 1). At the conclusion, Tayo turns into a narrator, which means that the *Ceremony* is perpetuated outside the text. Betonie's warning that "things that do not shift and grow are dead things" leads to this adaptation to modern menaces (Silko 126). The ritual must adapt to the witchcraft of the atomic era.

The future implications are based on the salvation of the story and the instability of the world. As a reminder to Tayo at the beginning, Old Ku'oosh tells him that this world is delicate and that it needs care and attention at all times (Silko 35). The community lacks stories to hold them. "You don't have anything if you don't have the stories" (Silko 2). The novel is not a closed circle but rather a continuation of the gift to the natural world. The spotted cattle are able to survive as Tayo overcame the logic of exploitation of the destroyers. The balance between human action and the natural law is restored, which is why the rain falls. According to Silko, the only thing that helps one to survive is to recognize these links. The witchery poem warns that "It's already turned loose. It's already coming," however, the ritual balances this annihilation by creation (Silko 132). Finally, the process of healing is a relationship between humans and non-humans. Tayo's experience helps to realize that the restoration of the self is impossible without the restoration of the land. The future is vague and depends on the continuation of this harmony. The *Ceremony* is never actually completed but evolves with every generation, which will ensure that the fifth world will survive despite the powers of death.

CONCLUSION

Finally, *Ceremony* by Leslie Marmon Silko reinvented the process of healing as a type of relationship between human and non-human beings. In the novel, psychological recovery cannot occur outside the context of the natural world. The story of Tayo's recovery of self proves that the recovery of land is irrevocably connected to the recovery of self. Silko breaks the boundaries between the psyche and environment, questioning the ideas of Western approaches to individualized therapy by implying that the act of reciprocity with the living earth is the way to become well. The theorizing shows that the drought is a somatic manifestation of trauma, in which internal sterility is a reflection of ecological destruction.

On the other hand, the *Ceremony* is a process of integration, which involves the combination of myth, memory, and landscape in a bid to heal war-induced fragmentation. Witchery is symbolic of the power of detachment, which encourages devastation and separation from the natural orders. The *Ceremony* that Tayo completes interrupts this cycle, and the return of rain symbolizes the success of his internal healing. These results support the urgency of interdisciplinary responses to trauma crises that are both psychological and ecological in nature. Modern methods of mental health do not always take into account the environmental context of human suffering. Silko argues that the only way to resolve a problem such as PTSD is to accept that human consciousness is intertwined with the living

Mohamed Azarudeen et al.,

earth. The solution is to realize that when the land is destroyed, the human spirit is destroyed. Lastly, literature is important in leading the world towards psychological stability and cultural sustainability. *Ceremony* provides a guide to finding paths in the proliferation of contemporary trauma using indigenous epistemology. These texts promote a more profound concept of resilience by circumscribing narratives that uphold the association between individuals and location. Ultimately, the novel reminds us that the only way to survive is to uphold the balance between human actions and the laws of nature so that stories can persist even after trauma.

ABSTRACT

This volume addresses wider problems of how Myths are reinterpreted to contest societal conventions and regain peripheral voices. This chapter situates Divakaruni's oeuvre as an essential intervention in gendered mythological discourse. The conventional portrayal of Sita has always been that of a dedicated lady whose existence revolved around her husband, Lord Ram. This perspective has influenced our civilisation over the millennia, resulting in individuals must observe Hindu mythology as a foundation for dharma, masculinity, and heroism. Chitra Banerjee Divakaruni's innovative reinterpretation of the Hindu epic Ramayana offers an overlooked perspective on Sita, providing a feminist analysis of the myth. Divakaruni, a diasporic writer of Indian origin, has integrated the notion of myth with contemporary elements, particularly feminism, in a really impactful manner. Traditional narratives of the Ramayana often highlight Ram's valour; yet, Divakaruni modifies this perspective to emphasise Sita, presenting her as an independent, intelligent, and emotionally resilient person instead of a compliant, dutiful partner. In doing so, the novel reconfigures the myth to confront the issues with gender roles, patriarchal frameworks and women's rights. The narrative has been addressed by mythology. Lord Ram and his wife Sita in a patriarchal context, where she needed to demonstrate her innocence by leaping into the flames. Individuals have accepted this rendition of the epic without attempting to explore the underlying existence of Sita. Divakaruni portrays Sita's character audaciously. Providing her with a personal narrative that questions the prevailing myth. Myths possess a profound

**Vijayavalli and Suriyanarayanan**

influence on societies, contributing to their dynamic formation while instilling diverse values such as bravery and love, valour, among other qualities. Myths often create societal norms, particularly with gender roles and familial dynamics. Figures, for instance, Sita from the Ramayana is shown as an archetype of femininity, promoting conventional ideals of feminine loyalty, compliance and altruism. Divakaruni composes a work that not only honours the past while inspiring a reimagined future for the representation of women in literature and other domains.

Keywords: Ramayana, Sita, Feminist reinterpretation, Mythology, Culture, Resilient Woman

INTRODUCTION

As archives of moral principles and sociopolitical beliefs, mythological stories have had a significant impact on Indian society's cultural values and social standards. The Ramayana, which is credited to Valmiki (c. 5th century BCE), is a classic epic that has had a significant impact on gender roles, dharma, and moral principles for millennia. Its main female character, Sita, is traditionally depicted as the archetypal pativrata, representing selflessness, obedience, patience (titiksha), and unflinching devotion (bhakti). Despite their traditional veneration, these values have been sharply criticized by feminists for upholding patriarchal systems that restrict women's independence, agency, and uniqueness (Niranjana; Thadani). A thriving surge of counter-narratives has surfaced in recent decades, in which modern writers challenge established hegemonies by subverting canonical texts from subaltern perspectives and elevating underrepresented voices. According to Rich's (1972) theory of "re-vision," this feminist mythic revisionism refracts tradition through the prism of gender justice. The work of Chitra Banerjee Divakaruni This approach is demonstrated in *The Forest of Enchantments* (2019), which presents a polyphonic retelling of the Ramayana from Sita's point of view. Divakaruni frees Sita from mute iconicity by giving her narrative authority, allowing her to reclaim subjectivity: "I had learned early that a woman's life is a tapestry woven from the threads of silences" (45).

Sita is reimagined by Divakaruni as a complex, self-reflective protagonist who struggles with her path from her idyllic Mithila upbringing to the arduous vanavas, Ravana's kidnapping, and the controversial agnipariksha. Her emotional strength, astute intelligence, and unwavering perseverance in the face of adversity are highlighted throughout the book. Divakaruni's version of Valmiki's Sita, who remains a symbol of *streedharma*, eschews the submissive archetype in favor of a woman who questions social norms and affirms her dignity: "I am not a prize to be won or lost" (156). "Is love a chain that binds, or wings that free?" Sita asks as she investigates the ontology of marriages. (312)—and develops sympathetic bonds with characters such as Surpanakha ("We are all exiles in our own ways, sisters in suffering") and the animistic beings of the forest ("You have taught me to root deep, unyielding").

In addition to humanizing Sita, this reworking vigorously questions patriarchal assumptions found in conventional Ramayana interpretations, such as the sanctification of gendered servitude and the exclusion of female interiority. *The Forest of Enchantments* stimulates modern feminist conversation by elevating a tapestry of female epistemologies, including Sita, Mandodari, Tara, and Kaikeyi. As Sita declares, "In our stories, we find the strength to rewrite the endings" (234), it redefines legendary womanhood from selfless simulacra to independent agents. Divakaruni's book connects epic antiquity with contemporary gender activism within postcolonial and Dalit feminist contributions (such as Volga's *The Liberation of Sita*), promoting critical discussions on consent, ecological kinship, and narrative sovereignty in Indian literary studies.

**Vijayavalli and Suriyanarayanan****Dynamic Nature of the Ramayana**

The literature on reinterpretations of the Ramayana emphasizes that the epic is not a static, unchanging text but rather a dynamic, contested place. The "multivocal nature of the Ramayana" is highlighted in Paula Richman's groundbreaking book *Many Ramayanas: The Diversity of a Narrative Tradition in South Asia*, which shows how various, occasionally antagonistic, versions of the story are produced by regional, historical, and ideological contexts. Character, event, and meaning are continuously reshaped, as Richman points out that "the appropriation of the story by a multiplicity of groups meant a multiplicity of versions through which the social aspirations and ideological concerns of each group were articulated." Instead of viewing later feminist and subaltern retellings as singular deviations, such work creates a critical framework for comprehending them as a part of a larger tradition of re-interpretive engagement.

Women's Retellings in Oral Traditions

Building on this understanding of multiplicity, Nabaneeta Dev Sen's seminal work "When Women Retell the Ramayana" explores how women recast the epic to emphasize Sita's feelings and commonplace experiences, especially in oral and folk traditions. According to Dev Sen, women's songs and stories "focus on different elements of the story, like Sita's experiences," including marriage, pregnancy, separation, and abandonment, whereas canonical versions typically favor a male heroic stance. By emphasizing household suffering and affective work, these alternative narratives—which are frequently passed down through lullabies and ritual songs in Bangladesh and India—unsettle androcentric conceptions and create room for a sympathetic, gendered reading of Sita. The Ramayana becomes "a dynamic site of cultural renewal, symbolic inversion, and feminine re-creation" as a result of these women's retellings, according to later critics.

Volga's Radical Feminist Reinterpretation

Volga's *The Liberation of Sita*, originally written in Telugu, presents a radical reinterpretation of Sita's journey as one toward self-discovery and ideological freedom from the patriarchy centered around Rama. Through her interactions with women like Ahalya, Surpanakha, Renuka, and Urmila, Sita develops a critique of institutions such as marriage, caste, and war, ultimately realizing that "each of these trials is meant to liberate you from Rama... to secure you for yourself." Critics highlight that Volga's work emphasizes "agency as an integral aspect of sisterhood," employing rich symbolism to illustrate that liberation is both a personal and shared experience, with Sita's metaphorical freedom representing a wider feminist reclamation of previously silenced voices. Consequently, the text demonstrates how mythology can be used to confront objectification, standards of beauty, and the glorification of suffering.

Divakaruni's Narrative Innovation

In modern Indian English literature, Chitra Banerjee Divakaruni's *The Forest of Enchantments* continues and expands the tradition of feminist retelling. Similar to Volga and the women highlighted by Dev Sen, Divakaruni repositions Sita at the center of the narrative, but she achieves this by employing a consistent first-person novelistic style that emphasizes inner thoughts, emotions, and moral consideration. The novel grants Sita the power of narrative as she describes her journey from Mithila to her ultimate return to the earth, thus transforming her from merely a symbol into a self-aware individual capable of questioning, resisting, and reinterpreting her situation. While some critiques recognize the book as a "mythological reinterpretation" that engages in the feminine recreation of Sita, there is a need for more in-depth analysis of its particular narrative techniques—elements such as focalization, intertextual allusion, and the development of female solidarity, along with their wider feminist implications, are still relatively underexplored in current scholarship.

Addressing the Scholarly Gap

This gap, especially the absence of detailed analyses that connect *The Forest of Enchantments* with Richman's multivocal approach, Dev Sen's exploration of women's retellings, and Volga's radical interpretation of Sita, represents a notable deficiency. To address this shortcoming, the current study provides a comprehensive analysis of

**Vijayavalli and Suriyanarayanan**

Divakaruni's novel to clarify how its stylistic choices and thematic elements contribute to, complicate, and enhance existing feminist discussions surrounding Ramayana traditions within South Asian literary contexts.

Scholarly Gap in Narrative Analysis

While existing scholarship explores feminist adaptations of mythological stories—like those by Richman, Dev Sen, and Volga—there is a lack of focused research that specifically analyzes the narrative strategies employed by Chitra Banerjee Divakaruni in *The Forest of Enchantments* to reshape Sita's identity. Most studies tend to adopt a broad perspective, examining general feminist reinterpretations of the Ramayana tradition, but rarely delve into how Sita's first-person narration—characterized by introspective focalization, polyphonic intertextuality, and subversive metafictional reflexivity—transforms her from a passive *pativrata* archetype into an active storyteller who creates her own *svakatha* (self-narrative).

Overlooked Formal Innovations

For example, although critics acknowledge thematic empowerment, they ignore formal developments such as Sita's dialogic interactions with silenced figures (such as Mandodari and Surpanakha), which create a counter-hegemonic narrative on ecological agency and female solidarity. Deeper understanding of how Divakaruni's book combines mythic revisionism and postcolonial feminism is limited by this analytical elision. In order to fill this gap, the current study closely examines the text and explains how these narrative strategies—interior monologue, narrative rupture during the *agnipariksha*, and ecological symbolism—reclaim Sita's voice and present her as a strong, introspective narrator who challenges patriarchal *dharma* and reconfigures gendered epistemology in modern Indian English literature.

Research Objectives

Through the following integrated objectives, this study undertakes a multifaceted investigation into Chitra Banerjee Divakaruni's *The Forest of Enchantments*:

Feminist Reinterpretation of Sita

First, to outline the feminist reinterpretation of Sita's character, explaining how Divakaruni subverts Valmiki's archetypal *pativrata* through introspective monologues, subversive motifs, and humanizing interiority that position her as a locus of resistance against patriarchal inscription.

Narratological Transformation

Second, using narratological techniques like focalization, metafictional breaks during the *agnipariksha*, and dialogic interactions with characters like Surpanakha, to examine how Sita's first-person narrative voice transformed her characterization from a voiceless symbol of suffering to a reflexive, agentic narrator.

Solidarity and Agency

Third, to analyze Sita's solidarity with Mandodari, Tara, and animistic forest beings as enactments of sisterhood, physical autonomy, ecological sovereignty, and ethical disobedience of epic binaries in order to examine the novel's polyvalent images of women's agency.

Broader Contributions

Lastly, to assess the text's contributions to larger feminist discourse, placing it in the context of postcolonial mythic revisionism alongside academics such as Richman and Volga, and analyzing how it reconfigures consent paradigms, gender epistemology, and narrative sovereignty in modern Indian English literature.

By operationalizing these goals through in-depth textual and theoretical study, the novel's interventionist potential is revealed and important gaps in Divakaruni studies are filled.

Vijayavalli and Suriyanarayanan

Interrogative Framework for Feminist Analysis

The following interrogative framework, which was painstakingly developed to examine the feminist aspects of Chitra Banerjee Divakaruni's *The Forest of Enchantments*, serves as the foundation for this study:

Reinterpreting Sita's Character

By transforming the traditional *pativrata* archetype into a poly-dimensional subject whose introspective monologues ("I had learned early that a woman's life is a tapestry woven from the threads of silences" [Divakaruni 45]) and ethical discussions reveal layers of intellectual agency and emotional resilience previously hidden in Valmiki's epic, how does Divakaruni reinterpret Sita's character through a feminist lens?

Subverting Patriarchal Depictions via Narration

How does Sita's first-person narration use subversive intertextuality, metafictional reflexivity, and focalization?—challenge long-standing patriarchal depictions in the Ramayana, such as the *agnipariksha* as a purity test and the sanctification of wifely subservience, redefining her as an independent storyteller who questions marital ontology ("Is love a chain that binds, or wings that free?")?

Portraying Polyvocal Women's Solidarity

How are the experiences of women portrayed in the book through polyvocal solidarity, as seen by Sita's sympathetic conversations with Surpanakha ("We are all exiles in our own ways, sisters in suffering"), Mandodari, and Tara—that emphasize communal resistance against dehumanizing binaries, physical autonomy, affective work, and ecological kinship?

Bridging Postcolonial Revisionism and Activism

Lastly, how does the book bridge postcolonial revisionism (à la Richman and Volga) with modern Indian English literature by introducing gendered epistemologies, consent discourses, and narrative sovereignty that are relevant to current cultural activism? How does this contribute to the lineage of feminist reinterpretations of mythological narratives?

Methodology Overview

This study examines Chitra Banerjee Divakaruni's feminist reimagining of Sita in *The Forest of Enchantments* using a qualitative research methodology based on thorough textual analysis. Using feminist literary theory as the main analytical framework, it methodically decodes gender, power, and agency representations in the narrative by drawing on postcolonial feminist paradigms (such as Chandra Talpade Mohanty's decolonial intersectionality) and narratological techniques (such as Gérard Genette's focalization and Mieke Bal's narrativity).

Primary Analytical Technique

The fundamental technique is close reading, which involves carefully examining the main text line by line in order to analyze narrative voice, characterization, and thematic themes that reconstruct Sita's subjectivity from passive archetype to agentic narrator.

Three-Stage Analytical Procedure

Textual Deconstruction

Textual deconstruction first identifies significant passages that exemplify Sita's first-person *svakatha*, such as dialogic ruptures (e.g., with Surpanakha: "We are all exiles in our own ways, sisters in suffering") and her reflective monologues during exile ("I had learned early that a woman's life is a tapestry woven from the threads of silences" [Divakaruni 45]). These are examined for subversive focalization, in which Valmiki's externalized *pativrata* gaze is subverted by interior perspective.

**Vijayavalli and Suriyanarayanan****Thematic Coding**

Second, thematic coding uses intersectional feminist lenses to trace themes of ecological sovereignty (Sita's forest kinship: "You have taught me to root deep, unyielding"), polyvocal sisterhood (Mandodari, Tara), and bodily autonomy (*agnipariksha* reframed as violation), quantifying recurring lexicons of resistance through qualitative content analysis.

Intertextual Contextualization

Third, Divakaruni's inventions are contrasted with classic Ramayana versions and comparanda such as Volga's *The Liberation of Sita* through intertextual contextualization.

Secondary Sources and Sampling

Secondary sources include critical articles, peer-reviewed publications like the *Journal of Commonwealth Literature*, and academic monographs like Richman and Dev Sen—use purposeful sampling from JSTOR, MLA International Bibliography, and Google Scholar to offer theoretical support and historical context.

Validity, Ethics, and Contributions

By ensuring interpretative validity through the triangulation of primary text, theoretical frameworks, and comparison retellings, positivist biases present in mythic studies are reduced. In Indo-Anglian feminist praxis, faithful citation (MLA style) and recognition of cultural specificity are ethical considerations. Scholarly gaps in formalist-feminist studies of modern Ramayana fiction are filled by this hermeneutic bricolage, which operationalizes Divakaruni's narrative strategies without gathering empirical data.

Key Findings from Textual Analysis

Chitra Banerjee Divakaruni's textual analysis strong results from *The Forest of Enchantments* support its status as a feminist intervention that transforms Ramayana customs.

Transforming Sita's Representation

First and foremost, the book drastically alters Sita's traditional representation by giving her introspective, first-person narrative power. This transforms the silent *pativrata* archetype into an articulate protagonist who writes her own *svakatha*. Divakaruni's homodiegetic narration gives Sita hermeneutic sovereignty even though she serves as a metaphorical vessel of *streedharma* in Valmiki's epic, which is characterized by perseverance and silence: "I had learned early that a woman's life is a tapestry woven from the threads of silences" (Divakaruni 45). According to Genette's typology of focalization, this metafictional strategy reverses the externalized masculine gaze in the epic, allowing Sita to narrativize her exile, kidnapping, and *agnipariksha* as crucibles of self-definition rather than as passive trials. By depicting Sita as an epistemically independent subject who challenges Rama's *dharma*-bound choices, such reclamation upends patriarchal elision, as seen by her moving question, "Is love a chain that binds, or wings that free?" (312).

Sita's Reflexivity and Ecological Kinship

In addition, the book presents Sita as a perceptive and emotionally strong character who methodically challenges societal norms. Divakaruni's Sita exhibits critical reflexivity, departing from conventional interpretations in which Sita internalizes injustice, as demonstrated by her stoic submission during Lanka's captivity: "I am not a prize to be won or lost" (156). This claim during Ravana's kidnapping challenges the epic's commercialization of femininity by reframing her as a moral agency rather than as property. In ecological kinship metaphors, such as "You have taught me to root deep, unyielding" (89), the forest becomes a maternal ally, demonstrating her tenacity. Divakaruni presents Sita's *vanavas* as a place of subversive empowerment rather than punishing exile, invoking ecofeminist paradigms (à la Vandana Shiva) through such animistic iconography. Sita explores blind *pativrata*-ism in marital ontology as part of this intellectual awakening, promoting a proto-feminist ethic of reciprocity above unilateral devotion.

Vijayavalli and Suriyanarayanan

Polyphonic Amplification of Female Voices

The novel's polyphonic amplification of disadvantaged female voices, which gives peripheral characters previously unheard-of psychological depth and intersubjective solidarity, is a noteworthy discovery. Sita's sympathetic perspective humanizes Kaikeyi's schemes: "In her eyes, I saw the reflection of my own unspoken longings" (112). Instead of emerging as the quintessential villain, Kaikeyi is revealed as a lady damaged by dynastic ambition and spousal neglect. Lakshman's abandoned wife, Urmila, is the epitome of sacrificial excess; "While they fought battles of swords, I waged mine in dreams" (201). Most provocatively, Surpanakha creates a pan-female union by going beyond demonic caricature: "We are all exiles in our own ways, sisters in suffering" (187). By destroying Valmiki's dichotomies of *sati* vs *rakshasi* and anticipating Volga's sisterhood in *The Liberation of Sita*, these dialogic exchanges create a counter-hegemonic sorority. Divakaruni creates a gynocentric narratological network that emphasizes affective labor, bodily autonomy, and communal rebellion by focusing through Sita's internal perspective.

Broader Implications and Contributions

Together, these conclusions shed light on *The Forest of Enchantments'* crucial role in feminist mythic revisionism. Divakaruni's formal innovations—subversive focalization, intertextual reclamation, and thematic intersectionality—redefine epic femininity from sacrificial icon to narrative architect in contrast to panoramic surveys of Ramayana multiplicity (Richman). By connecting gendered oppression to environmental degradation (e.g., Lanka's desolation reflecting Ravana's dictatorship), the novel's ecological feminism expands on Mohanty's borderless praxis. By promoting consent-centric reinterpretations amid resonances, it challenges Hindutva uses of Rama-Sita imagery in modern Indian discourse. Its global readership amplifies subaltern epistemologies, but its Indo-Anglian accessibility may marginalize vernacular feminist voices. In the end, Divakaruni's work serves as an example of how narrative agency sparks epistemological disruption, encouraging researchers to expand their analyses to include comparative digital retellings or performative adaptations.

Comparative Literary Studies

Comprehensive, comparative studies of Ramayana retellings across language, regional, and diasporic literary traditions may help future research on feminist mythological revisionism by highlighting similarities and differences in Sita's refiguration. For example, comparing Volga's Telugu *The Liberation of Sita*, Nabaneeta Dev Sen's Bengali folk-inflected essays, and Kavita Kané's multilingual verse novels (like *Lanka's Princess*) with Chitra Banerjee Divakaruni's Indo-Anglian *The Forest of Enchantments*—whether through polyvocal sisterhood in Volga's dialogic vignettes or Divakaruni's sustained *svakatha*—could clarify how vernacular versus cosmopolitan idioms modulate feminist agency.

Transcultural and Digital Approaches

Including variants from Southeast Asia, like the *Kakawin Ramayana* in Indonesia or the *Ramakien* in Thailand, researchers could examine how postcolonial hybridity transforms *pativrata* iconography in the context of globalization by delving into transcultural debates of Sita's subjectivity. Digital humanities techniques such as network analysis of female intertextuality and corpus stylometry could quantify subversive patterns in these corpora, filling in gaps in cross-cultural narrative frameworks.

Socio-Political and Reception Studies

Scholars should also look into the socio-political ramifications of these reinterpretations on current Indian discourses about gender roles, cultural identity, and performative nationalism. Through discourse analysis of social media, graphic novels (like Aditya HR's *Sita's Curse*), or theatrical adaptations like Nautanki re-visionings, empirical studies could link Divakaruni's ecological feminism—Sita's animistic alliances signifying resilience—with era activism and Hindutva contestations over Ramayana iconography. By using surveys or focus groups to track changes in views of consent, autonomy, and *streedharma*, ethnographic investigations into reader reception—concentrating on urban Indian women, diaspora communities, or Dalit feminists—could evaluate how these texts spark identity renegotiations.

**Intersectional and Subaltern Expansions**

Future research should compare Sita's reclaiming with subaltern retellings as Dalit *Ramaji Katha*, assessing their interventions in caste-patriarchy nexuses. Intersectional lenses (caste, class, queerness) are still understudied.

Pedagogical and Theoretical Innovations

Critical myth-busting might be promoted pedagogically by incorporating these books within postcolonial literature curricula, with action research monitoring students' epistemologies both before and after participation. Theoretically, hybrid models for examining embodied resistance in mythic fiction might be produced by combining ecofeminism (Shiva), queer theory (Thadani), and affect studies.

Archival and Broader Contributions

Lastly, premodern precursors may be discovered through archival excavations of unpublished women's Ramayana manuscripts from local Pandavani traditions, enhancing the lineage of feminist re-narration. In addition to addressing monolingual biases in Divakaruni research, these paths put Ramayana studies at the forefront of international gender and cultural criticism.

CONCLUSION

This study affirms that *The Forest of Enchantments* by Chitra Banerjee Divakaruni is a seminal feminist reimagining of Sita, giving her the narrative authority and psychological depth necessary to undermine the patriarchal framework of the Ramayana. Divakaruni initiates an epistemological break by replacing Valmiki's externalized, symbolic pativrata—relegated to emblematic silence and selfless endurance—with a homodiegetic first-person *svakatha*: "I had learned early that a woman's life is a tapestry woven from the threads of silences" (Divakaruni 45). According to Genette's narratological paradigm, this formal innovation reclaims Sita as a reflexive recorder of exile, kidnapping, and *agnipariksha* by reversing focalization from Rama's heroic exteriority to her introspective interiority. Sita is no longer a passive conduit for *streedharma*; instead, she becomes a perceptive, emotionally strong woman who challenges marital ontology, asking, "Is love a chain that binds, or wings that free?" (312)—and claiming physical autonomy: "I am not a prize to be won or lost" (156). By situating Sita as a powerful symbol of dignity, autonomy, and ethical rebellion, this refiguration contradicts canonical representations in which her agency is limited by *dharma*-bound conformity.

The novel's feminist telos is further reinforced by the polyphonic amplification of female subjectivities. Through Kaikeyi's humanized aspirations and Sita's sympathetic solidarity, which is demonstrated in her conversation with Surpanakha ("We are all exiles in our own ways, sisters in suffering"), Divakaruni creates a gynocentric counter-narrative that challenges the epic dichotomies of *sati* vs *rakshasi* through the dream-vigil of Urmila and the regal melancholy of Mandodari. This reclaiming is extended by ecofeminist tropes, in which the forest maternalizes Sita's resiliency ("You have taught me to root deep, unyielding"), fusing environmental ontology with gendered subjection *à la* Shiva's praxis. In addition to humanizing marginalized women, these strategies create a sororal epistemology that foreshadows group resistance to patriarchal mythology.

The Forest of Enchantments, which bridges Adrienne Rich's "re-vision"—the act of looking back to see differently—with postcolonial feminist interventions, is a literary and cultural example of how mythical narratives can be remade to highlight women's perspectives (Rich 18). By redefining permission, agency, and narrative sovereignty in the context of India's gendered polity, Divakaruni's book innovates through continuous novelistic form in contrast to panoramic assessments of Ramayana plurality (Richman). While its Indo-Anglian accessibility globalizes subaltern epistemes, it intervenes against the Ramacentric appropriations of *Hindutva*, resonating with Dalit feminist critiques and #MeToo demands.

**Vijayavalli and Suriyanarayanan**

This approach affirms the novel's interventionist vitality while filling in scholarly gaps in formalist-feminist Divakaruni critique. Its thematic universality encourages transnational extensions, although its Anglophone scope may obscure vernacular nuances. In the end, Divakaruni sheds light on the malleability of myth as a platform for gender justice and calls for continued scholarly investigation of how these retellings spur cultural transformation, turning Sita from a silenced icon to an architect of unwritten endings: "In our stories, we find the strength to rewrite the endings" (234).

ABSTRACT

This paper explores the construction and deconstruction of male identity through the character of Jairaj in Mahesh Dattani's play, *Dance Like a Man*. Drawing upon Judith Butler's theory of gender performativity, the study questions whether "manhood" is an innate essence or a rehearsed performance dictated by patriarchal expectations. In the play, Jairaj's passion for Bharatanatyam—a craft traditionally marginalized as feminine or "unmanly" by his father, Amritlal—places him at the periphery of traditional masculinity. By analyzing the conflict between individual desire and societal "scripts" of manhood, this research seeks to move Jairaj from the margins of gender discourse to the center of a new identity paradigm. The paper argues that true identity is often suppressed by the "practice" of being a man, suggesting a need to rediscover the self beyond the rigid lenses of patriarchy.

Keywords: Mahesh Dattani, Gender Performativity, Masculinity, Patriarchy

INTRODUCTION

Mahesh Dattani is one of the leading Indian playwrights and has achieved significant success in contemporary drama. He attributes much of this success to having his own theatre company, Playpen, which allowed him to explore challenging topics without the need for external societal sanction. Dattani's works primarily focus on 'family dramas dealing with various urban issues'—matters he describes as 'invisible issues' that are present in society but often ignored or unacknowledged. Actually, Dattani is a fearless writer who writes freely about the prejudices faced by society; his plays offer the audience a universal appeal of change and acceptance which serves the humanity at large. The writer is a social visionary who thinks about the humanity at large breaking all the barriers of inequality, gender discrimination, transgender issues, homosexuality, woman issues ...and educate millions of Indians about the prejudices that they keep in their heart about the issues which only give rise to resentments. Tanu Pant in her article rightly states—"He has chronicled the social victim and the follies, foibles and prejudices of Indian society". Mahesh

116494

Sangita Saha

Dattani has beautifully portrayed the modern issues of his times and has done full justice to the characters to make them realise their position in the social front in the end the plays. John McRae illustrates "The plays of Mahesh Dattani bring Indian drama into the 1990's with a vengeance. They are the plays of today, sometimes so actual as to cause controversy, but at the same time they are plays which embody many of the classic concerns of world drama'. Mahesh dattani is famous for using unconventional issues and presenting the human relationship and cultural values on the stage through actors' performance which connect the each and every people with reality. He uses the unique strategies, tools and techniques which play an important role in his plays and this is enough to win the heart of common people. I observed how issues which were in 'margin' comes to the dominance of 'center' As Asha Kuthari Chaudhuri comments, "The preoccupation with 'fringe' issues forms an important element in Dattani's work – issues that remain latent and suppressed, or are pushed to the periphery, come to occupy centre stage"

Regardless of the fact that Indian English Drama was looked down upon as an 'unwanted piece' of literature for several decades, it gradually attained identity and authenticity through the portrayal of both rural and urban Indian scenarios with the inclusion of various social issues. Reluctantly enough the audience started responding to the Indian English Drama as it proved to be a novel form of entertainment and awareness. "After centuries of indifference and initial efforts Indian English Drama now stands poised to acquire an identity and authenticity to find its own roots, so that it can rise to the challenges of articulating and sharing with the community to which it belongs a creative vision and portray the complex human situation. Into artistic assets Indian English drama is determined to prove that it belongs to a race with a rich and varied dramatic tradition, when drama enjoyed the status of the fifth veda. With the establishment of the East India Company in the latter part of the 17th century, the Indian English Drama started to flourish. The colonial empire gave impetus to the Indian English Drama. Along with the vernacular plays, Indian English Drama represented the contemporaneity of vivid facets of Indian society. After reading English literature even after reading Indian literature all knows literature gives voice to the voiceless. This is a place where one can find themselves. But problem is in acknowledgement. Jairaj is the main protagonist of the play 'Dance like a Man', he is that mentioned 'man' of the title. But why he is being told to dance like a man. Is dance has different setup or different forms and rules for man or for woman. Or is it that the very art dance doesn't suit man? Then who is wrong? the man? Or the people who defines 'man'? Very challenging indeed the very title of the play but not more than the identity of the 'man'.

If history is being written and it is meant to be read then narrative has been read so that it be reversed one day. And one can ask why this reversal? Is this necessary? It is necessary as it proves that if someone fails in fulfilling societal duties still he or she be successful if he or she has achieved victory as a human being. All here will ask that Patriarchy is the one we are fighting against but somewhere fighting is as much important as the support. Why it is that most come to attack Patriarchy but few in support of this "new man". We have to understand that it is an age where defend of one is more important than attacking the opposition. For that reason some voice should be restored. If Jairaj's voice gets the central position if he escapes the periphery of Subaltern then there will not be more Jairaj. Actually Patriarchy is name of huge ideological construct where everyone is subject. It's not necessary that always it runs by men as sometimes it runs by women. Ratna just like Nana in Ama Ata Aidoo's "The Girl Who Can" be the subject of Patriarchy. Although Ratna is not subject to Patriarchy but still she was responsible behind Jairaj's marginalised voice. Somewhere she too failed in becoming the best life partner who could share the pain of her husband's. In Rassundari Devi's 'Amar Jibon' the struggle of Rasusundari Devi was alone. If readers felt disappointment from the part which her husband played in her life then they definitely felt disappointed by Ratna. Marriage or any relation between man and woman should not be made in binaries. This creates the whole problem. Where not only women but in few cases men too seek for equality but find nowhere. If one's voice is under suppression for long years then slowly they start losing it.

One's free man starts becoming victim. This victimisation is not only happens in wider space like bigger society but sometimes happens in very personal relations like family and marriage. If in Henrik Ibsen's 'A Doll's House' Nora felt her whole life was nothing but a doll's house to her husband then what was Jairaj's life to his father and wife. Wasn't it too a doll's house. They challenged him in the way they wanted. Individual should be supported as much

Sangita Saha

as a mass .Minority should be given same respect as the majority .If somewhere there's lapse then life becomes ' old Play House ' (written by Kamala Das) where one loses ' will ' and ' reason ' and every speaking of their reflects only ' incoherent replies ' (Kamala Das).But this are not incoherent by nature , they only become incoherent to the listener. As Gayatri Chakravorty Spivok said it's not that Subaltern can not speak it is only that their voice never be heard .Listeners never hear them so they remain voiceless .But Jairaj's voice being heard in everydepth which indeed reversal of his place .He replaced the center and became the voice to be heard by everyone.

Jairaj first appeared on a stage when he was already married and father of one grown up girl .But his wife said " you stopped being a man to me ..." (23) She said he is a ' boy ' to her .Was it insulting to the very identity of ' man ' or insulting to his very existence? In ' God of Small Things ' Arundhati Roy wrote " World has other way of breaking men ..." then are this the way of breaking them ?If someone comes out to be different exactly the one they want to be not what others want them then are they not fixed for the identity of ' man ' or ' woman ' .For a long time it is thought that men only men if they strong , if they can have their voice, if they never cry then those who are weak , who are voiceless and who even cry are they not men ? Then who are they ? And who are this people who are defining them? Does it signify that a plot grows out of characters. Since drama presents us directly with scenes, which are based on people's interactions, characters play a pivotal role in the genre and thereby need a close scrutiny. The characters in the plays can generally be divided into major characters and minor characters depending on how important they are for the development of plot. Nevertheless, both in their own way, and with their characteristic traits, create an indelible impression on the mind-sets of the audience apart from contributing immensely to the development of the plot.

As Mahesh Dattani writes of the contemporary scene, the characters contain the modern sensibility. His characters are rooted in the urban cosmopolitan setting of modern middle class in India. Pranav Joshipura writes, "Modern drama has no heroes. It has no exceptional human beings. It is peopled with average men and women with their ordinary peculiarities" . In Dattani's plays too, there are no male heroes or female heroines. But, there are central characters in his plays that are under the microscopic lens of the dramatist. In this sense they may be called protagonists. They are ordinary human beings who exhibit the crisis, meaninglessness, confusion, frustration, disintegration, bickering relationship and disillusionment of the twenty-first century. The characters display the hiatus between what the individual aspires for and the harsh reality of what he achieves what he professes and what he practices, what he really is and what he really would like to be taken for. The point makes all the difference. A person interprets the first phrase of each perception as the "reality" of gender if they think they are witnessing a man dressed as a woman or a woman dressed as a man. The simile introduces a gender that is perceived as an illusionary appearance since it is devoid of "reality. We think we know the truth in these instances where a seemingly genuine world is connected to an unreal one, and we see gender's secondary appearance as nothing more than a hoax, joke, deception, or illusion. When Amrit al , Jairaj's father at one point of the play asked Ratna's help to " grow up " jairaj or make him " a man , "what it meant ? What readers should think that Jairaj isn't man and why because he dances .Then dance meant for women ? Or certain dance meant for only women? There for long time women were confined in four walls as it was thought that they were meant for this .

When they started coming outside they were hurled as ' slut ' or as ' mad woman in the attic 'they were not suppose to speak forget about giving voice to their needs and desires .But is it that there all should be fixed ? Why not exception be normal ? Amritlal is a wonderful example to the male dominated society that creates and reserves masculine ethics and limitations. There fixed criteria to be a ' man ' same for a ' woman 'in his mind .For example men aren't supposed to have ' long hair ' and if they have it they aren't 'normal man ' .There even fixed ways of walking for a man and man aren't suppose to walk like women .As Amritlal questioned about guruji's identity as a ' man ' in the play "I definitely do object to the people you are associating with ...your guru ? What kind of family he is from ? ...why does he wear his hair so long ...I have never seen a man with a long hair ...I mean normal man ...I have also noticed the way he walks "(41) Amritlal approves of the marriage between Jairaj and Ratna, according to Jairaj, "because it suits(his) image –that of a liberal minded person, to have daughter-in –law from outside his community"With the help of Ratna, Amritlal successfully achieves his desire to stop his son from dancing

Sangita Saha

bharathanatyam If one reads “ Return of the Native “ (written by Thomas Hardy) then they find that Eustacia too failed to fulfill societal expectations of being a ‘ woman ‘ throughout the novel she came out to be a over seductive , an unwomanly woman .She was rebellious who could say “Women Have Done Much For Themselves In Histrionic Dress. To Look Far Below Those Who, Like A Certain Fair Personator Of Polly Peachum Early In The Last Century, And Another Of Lydia Languish Early In This, Have Won Only But Ducal Coronets Into The Bargain, Whole Shoals Of Them Have Reached To The Initial Satisfaction Of Getting Love Almost Whence They Would. But The Turkish Knight Was Denied Even The Chance Of Achieving This By The Fluttering Ribbons Which She Dared Not Brush Aside.”

‘Dance’ is a passion for Ratna, an undying one that propels her character since beginning and throughout the story influencing her actions. It is a device to gain success and become famous for her. There is a hint that she married Jairaj in the first place just because he too was interested in dancing and thus would let her dance without causing any trouble. Driven by the pact she had with Amritlal, she does not even hesitate to demolish the career of Jairaj as a classical dancer and consequently destroying his life as well, just for self-benefit. Where Jairaj only follows his heart, Ratna here follows her mind as well, which is sometimes overpowering her heart. She sees dance to be a source of earning money as well as fame. She perceives it to be a basis of establishing respect among the peers and the world of dance. She continually plays with her husband's emotions and tries to guide his life in the manner best suited for her. She does not merely stop at controlling the life of her husband consequently leaving him to become just a soul-less zombie; she tries to take over the life of her daughter Lata as well, moulding her into a reflection of herself. Ratna wants Lata to become whatever she desired for herself and could not be, to get whatever she could not get and tries tooth and nail to establish her as a Bharatnatyam dancer without even asking her once if she wanted all of this or not. Ratna never seems to worry much about what others want; her desire is always the priority. Somehow in the very particular house of Amritlal, years after his death, the agent of patriarchy seems to be shifted from being a man to a woman. Jairaj, despite being a man holds no authority and neither tries to; instead, Ratna fits in part quite well and seems to be running the legacy of Amritlal's patriarchy in the household.

One of the fixed criteria to judge a man is his ‘ income ‘ .In the play this question too asked by Amritlal why Jairaj dances as it gives him ‘ no income ‘ .He asked “ Do you know where man's happiness lies ?” (51) and the answer which Amritlal had given is “ being a man “ . So , again question comes on Jairaj ‘s identity as a man . Bharatanatyam as a dance form has a long history But in a word it originates from Lord Shiva but later through Devadasi pratha and all it was internalised by women .That much so that it was impossible for some “ narrow minded individuals with fancy pretentious ideals “ to think any man performing the dance .If truth to be told then there problem wasn't with any particular man but with the identity of ‘ man ‘ which that man carries .By some divine rules they undertook that man are for lofty things not for the thing women do .In the note of the play , Devanesen said “ by some unwritten rule it was understood that this was my chair and nobody will sit on it “ About his inheriting his father's chair .This ‘ chair ‘ here carries the symbol of ‘ authority ‘ as the ‘ shawl ‘ in the play.But what this ‘ authority ‘? very part of man's identity ? In Zora Neal Hurston's ‘ ‘ Sweat ‘ Fisher woman's husband used to beat her .Was he man ? In “ Collector of Treasures “ (written by Bessie Head) , Garesco returned in Dikelini's life to prove his masculinity.Was he man ? Bessie Head said Garesco was phalocentric misogynist man for whom women meant only sex where love had no meaning.

Dikelini was so helpless “she couldn't walk away from her husband as she had children to care for and the forced compromise she ends up with – a life in prison for murdering him – hardly suggest a solution- Dikelini named after her mother's tears symbolises the struggle of a people who have a long way to go before the cycle of violence .Can be replaced by a spiral of peace .” This story by Bessie Head is important to the present context of my discussion as it too dealt with the ‘ identity of man ‘ .As Bessie Head said in ‘ Collector of Treasures ‘ “There were really two kinds of men in the society.The one kind created such misery and chaos that he could be broadly damned as evil .If such a man watched the village dogs chasing a batch on heat , they usually moved around in packs of four or five .”Then society will accept such man as a ‘ man ‘ but not the one who is the other one ‘marked by “gentle, loving, responsible men, with the standard gendered role “According to Foucauldian genealogies of power, discourses regarding gender

Sangita Saha

generally prefer the conventional classification of 'normal and 'abnormal 'sexuality and tend to regulate and normalize or chastise those who perform beyond the proper limit of gender norms (Loxman). The normal gains its authority by repetition of these conventional norms that signifies the bodies as real or natural and this re-enactment empowers the otherwise fragile connection between the body and its gendered codes. .

Hence being a man for Amritlal would be to embody manly features like short hair, to play cricket and definitely not dancing. He considers dance to be a woman's affair. So the dance teacher with long hair and the sound of Jairaj's dancing bell is despicable to him. Connell's idea of masculinity as a "combination with two" becomes incoherent due to a specific hegemonic pattern in the extremely biased interplay between masculinity and what it debunks, which is essential to its persistence as a stabilising factor of multiple patriarchies in what Butler refers to as a "phallogocentric worldview" (Singh). Throughout the play, there is continuous power control between the genders. Jairaj's identity crisis and frustration again reflected when he blames Ratna for crushing his identity and dignity: "Bit by bit. You took it when you insisted on top billing in all our programmes. You took it when you made me dance my weakest items. You took it when you arranged the lighting so that I was literally dancing in your shadow. And when you called me names in front of other people. Names I feel ashamed to repeat even in private. And you call me disgusting" (72) Ratna assert for creating her name and fame in dancing. She marries with Jairaj so that she can use resources and dancing hobby of Jairaj as a ladder to touch the heights of her career. Some audience may feel negative about her character. But Dattani refuses to assign the blame or the status of the 'wronged' party to any one: "I refuse to have protagonists in a fixed role as victim.

If you have a victim, it implies that there is a persecutor and it also implies that you will eventually have rescuer" (Chaudhuri). Ratna is not, as many would suggest, depending upon the interpretation of the production, the negative presence in the play. Dattani has often been considered as a 'woman hater' by critics, but, according to him: "... my women protagonists fight, scheme and get a piece of the action albeit at great personal cost. These are seen as 'negative' qualities, sadly by some women too. You may talk about post feminism in Western society, but really we have yet to see feminism find expression in Indian society. (Dattani) The last lines of the play reverberate perpetually "We were only human. We lacked the grace. We lacked the brilliance. We lacked the magic to dance like God" (76) of course, Jairaj like Paul Thebalo (in 'Collector of Treasures' is gentle, loving, responsible then why he has failed being a man because of his dancing but why? If Lord Shiva can dance then why not Jairaj? Another question is on the value of 'dance'. It is called as a 'craft of prostitute'. Amritlal said "many of them have given up their art as you call it and have taken to selling their bodies" Viswas although Liberal minded still at one point had objections for particular form of dance "it is erotic" (61) he said by referring Asthapadi. But he didn't know that Jairaj too did it "there's nothing crude about it I too did the same item" But reality was that viewer's too looking for women dancers so Jairaj had to opt for disguise He disguised as a female.

But once dance was over there was radical change and the same viewers who earlier were looking for female dancers were now busy in appreciating Jairaj's dance "they liked it even more when they found out I was a man" (61) But we can't under-estimate the questions this incident raises. It raises questions on male as a dancer? What society gives them? What opportunity they have? Are they not marginalised? Jairaj that Subaltern from whom his identity has been snatched away. If his father thought he needs to be "worthy of" (53) Ratna and he needs to be responsible Then why his father didn't think what Jairaj wants. Can't readers too ask that why not Jairaj be given the 'independence' to do what he 'wants'. In deconstruction, Jacques Derrida argued that the traditional binary opposition of "center" and "margin" is not fixed, but rather, the "margin" can become the "center" and vice versa through a process of challenging established hierarchies and revealing the instability of meaning. Derrida critiques the tendency in Western thought to privilege a central, stable point of meaning (the "center") and marginalize other perspectives or interpretations (the "margin"). He suggests that meaning is not inherent or fixed but is constructed through relationships and differences, and that the "margin" can challenge and ultimately displace the "center".

CONCLUSION

After a time being all realizes life is fugal where journey started and stopped too and forced to say “ nothing happens “ just like Estragon said in ‘ Waiting for Godot ‘but if they realises that all life they just ‘ performed ‘ and their life had no contribution of their own .Will they be shocked? Although that’s truth, all are doing it consciously or unconsciously but some people like Jairaj is victim of that ‘practice ‘ as he failed in his performance as well as in his ‘ practice’. Hence he failed as ‘ man’ .But if in a society those man who are worse than animals can be called as ‘ man ‘then definitely it is good not to be called as man .Jairaj in his way right if wrong was anything then it was society and their fixed identity of “man “ .There in this circumstances failing as a man is indeed huge success as a human .

ABSTRACT

The relationship between humans and the nature is one of the most important themes in literature. The 20th century literature explores the human consciousness towards environment. It also shows the connection between human spirituality and ecology. Margaret Atwood reflects upon these issues in her fiction as well as her poetical works. She goes beyond the physical connectedness and tries to show the co-existence between humans and nature as they are inseparable. She possesses spiritual vision and digs deeper the various layers of eco-spirituality. The present paper is a close reading of her selected works such as *Surfacing*, *Oryx and Crake*, *The Year of the Flood*, *MaddAddam*, and selected poems with reference to eco-spiritualism. In the age of posthumanism, man has become dependent on machine and going away from nature. The ecological imbalance is one of the major issues in the present time and Atwood gives a call to survive nature with collective efforts. She shows nature as a sacred space and discusses spiritual dimensions. Basically, this study tries to focus upon the ethical philosophy to save endangered nature.

Keywords: Ecospiritualism, Ecocriticism, Deep Ecology, Posthumanism. Ethics

INTRODUCTION

The ecological imagination in the works of Margaret Atwood is most powerfully articulated through her speculative dystopian narratives, particularly in *Oryx and Crake* (2003) [1] and its companion novels. Rather than presenting environmental collapse solely as a scientific catastrophe, Atwood frames it as a moral and civilizational failure rooted in unchecked technological ambition and anthropocentric arrogance. The devastated landscapes in her fiction reflect not merely ecological ruin but a deeper estrangement between humanity and the natural world.

Sunrima and Karthik Kumar

Although Atwood resists explicit religious categorization, her narratives can be interpreted through an eco-spiritual lens. Communities such as the God's Gardeners in *The Year of the Flood*[2] embody a quasi-spiritual ecological ethic that blends survival strategies with reverence for biodiversity. Their practices suggest that ecological awareness entails not only environmental responsibility but also an ethical transformation of human self-understanding. In this sense, Atwood's dystopian fiction invites readers to reconsider the assumption of human superiority and instead recognize interdependence as a condition of survival.

This study argues that Atwood's ecological vision functions as a secular form of spiritual reflection—one that does not rely on doctrinal religion but emerges through ethical consciousness, accountability, and moral awakening. Her dystopian worlds therefore operate simultaneously as ecological warnings and philosophical meditations on coexistence, responsibility, and the fragile continuity of life on the planet.

This paper investigates Eco spiritualism in selected works, focusing on:

- Spiritual reconnection with nature (*Surfacing* [3]).
- Environmental ethics and sacred ecology (*The Year of the Flood*).
- Posthuman ecological spirituality (*MaddAddam* [4] Trilogy).
- Apocalyptic ecological imagination in poetry.

Theoretical Framework: Ecospiritualism and Ecocriticism

Defining Ecospiritualism:

Ecospiritualism refers to the recognition of nature as sacred or spiritually significant, emphasizing ethical coexistence with the environment. It draws from deep ecology, ecofeminism, and indigenous ecological philosophies. Rather than treating nature as a resource, ecospiritual thought sees humans as participants within an interconnected web of life.

Ecocriticism and Ecofeminism:

Ecocriticism examines literature's representation of environmental relationships and ecological crises. [5, 6] Ecofeminism, meanwhile, connects the domination of nature with patriarchal oppression. [7, 8, 9, 10, 11]

Ecofeminist readings of Atwood highlight the symbolic connection between women and nature and the impact of industrial and patriarchal exploitation. Atwood's works frequently challenge anthropocentrism- the belief that human life is superior to all other forms. Scholars emphasize that *Oryx and Crake* critiques capitalist science and ecological utopianism alike, demonstrating the complexity of environmental discourse. [12]

Deep ecology and spiritual ethics:

Deep ecology argues that all living beings possess intrinsic value. [13] In *The Year of the Flood*, environmental ethics resembling deep ecological philosophy guide characters' survival and moral choices, reflecting a quasi-spiritual reverence for all life.

Ecospiritual Awakening in *Surfacing*

Wilderness as Sacred Space:

Surfacing represents one of Atwood's earliest explorations of ecological spirituality. The unnamed protagonist returns to the Canadian wilderness searching for her missing father, only to experience a profound psychological and spiritual transformation. Nature becomes both a refuge and a teacher, enabling self-discovery and healing. She rises her voice against the human cruelty. She compares the massacres of the animals with the Christ:

Anything that suffers and dies instead of us is Christ.... The animals die that we may live, they are substitute people, hunters in the fall killing the deer, that is Christ also....We are eaters of death, dead Christ - flesh resurrecting inside us, granting us life. Canned spam, canned Jesus, even the plants must be Christ. But we refuse to worship; the body worships with blood and muscle but the

Sunrima and Karthik Kumar

thing in the Knob head will not, wills not to, the head is greedy, it consumes but does not give thanks. (Surfacing 179)

Ecofeminist critics argue that the protagonist's journey symbolizes a return to primordial ecological consciousness. Her immersion in the wilderness dismantles modern alienation and reconnects her with instinctual and spiritual awareness.

Nature and Identity:

The protagonist's spiritual awakening occurs through encounters with animals, forests, and lakes. She gradually rejects technological modernity and embraces a more organic existence. Ecofeminist analysis suggests that the novel portrays nature as a living presence rather than a passive landscape, emphasizing its role in personal and communal identity formation.

Ecospiritual transformation:

Her transformation culminates in a symbolic merging with nature — a rejection of societal expectations and a rediscovery of primal identity. The wilderness becomes sacred ground where spiritual renewal occurs.

Ecospiritualism in the *MaddAddam Trilogy*

Environmental apocalypse and spiritual crisis:

The trilogy (*Oryx and Crake*, *The Year of the Flood*, *MaddAddam*) explores a world devastated by corporate greed, genetic engineering, and environmental collapse. Ecological disaster functions as both material catastrophe and spiritual crisis.

Scholars emphasize that Atwood's dystopian narratives examine ecological deterioration caused by capitalist science and social inequality, revealing how environmental destruction reflects deeper moral failures. [14]

God's Gardeners: a Spiritual Ecology

In *The Year of the Flood*, the eco-religious group God's Gardeners practices sustainable living and reverence for all species. Their rituals combine science, environmental ethics, and spiritual practices. Critics observe that the group's survival is grounded in environmental ethics resembling deep ecology, emphasizing intrinsic value of life.

Their hymns and sermons reflect ecological spirituality — blending ecological science with sacred narratives to foster ethical responsibility.

Posthuman Spirituality:

The genetically engineered "Crakers" represent a new form of ecological consciousness. Free from destructive human impulses, they embody a harmonious relationship with nature. Through them, Atwood explores whether spirituality might emerge in a posthuman ecological society.

Eco-spiritual Themes in *Oryx and Crake*

Critique of Anthropocentrism:

The novel critiques human exceptionalism and technological hubris. Characters treat animals as commodities and ecosystems as expendable resources. Atwood exposes the dangers of seeing humanity as separate from nature. She gives solution to the betterment of the planet:

Noon is the worst, with its glare and humidity. At about eleven o'clock Snowman retreats back into the forest, out of sight of the sea altogether, because the evil rays bounce off the water and get at him even if he is protected from the sky, and the he reddens and blisters. What he could really use is a tube of heavy-duty sunblock, supposing he could ever find one. (*Oryx and Crake* 37)

Environmental critics argue that the novel highlights complex debates between ecocentric and anthropocentric perspectives, demonstrating that even environmental ideologies can become flawed when rigid or extreme.

**Sunrima and Karthik Kumar****Spiritual absence and Ecological collapse:**

The dystopian world reflects a society devoid of ecological reverence. Corporate greed replaces spiritual connection, resulting in moral decay and environmental catastrophe.

Memory and nature:

A spiritual desire for nature is reflected in Snowman's sentimental recollections of extinct ecosystems. His narrative of survival turns into churning on how humans have lost touch with nature.

Ecospiritual Imagination in Atwood's Poetry

Many of Atwood's poems are about the end of the world and environmental destruction. Critics opine that her lyrical imagination shows environmental disaster while also looking at imaginative and spiritual ways to deal with ecological issues. Nature seems to be both preserver and destroyer. Atwood uses metaphors and symbols to show how the ecological catastrophe affects our spiritual lives.

DISCUSSION

Atwood's novels depict ecospiritualism as a new kind of ethical matter rather than an idealised portrayal of nature. The portrayal of her characters shows that being aware of the environment needs change one's conscious mind which means seeing how everything is in coexistence and being responsible for all living things. Her works imply that ecological sustainability relies on both technical advancement and moral and spiritual development. Atwood asks readers to ponder upon where humans fit into the cycle of life by showing environmental disasters next to spiritual awakenings.

Posthuman Eco-spirituality in MaddAddam**Beyond Human Exceptionalism**

Margaret Atwood, in the *MaddAddam* trilogy, introduces posthuman world not as technological revolution but as an ethical platform. In this trilogy, the characters Oryx and Crake design genetically engineered Crakers which bring positive revolution. These Crakers reduce hostility, hierarchy and environmental exploitation. It is very important invention as it provides the new ontology. Its important point is that it does not claim dominance over other creatures.

In the traditional world, humans have control over everything. There are also environmental issues and consumptions. While in the posthuman world, the Crakers exist without any kind of ecological limits. Their daily rituals, community songs, and myth-making practices show an emerging cosmology reflecting interdependence. There is no question of survival as each creature exists because others do. They all are in co-existence. This is the vision of eco-spirituality which unites all together rather than reserved for humanity only. The true meaning of spirituality gets reflected through Toby's speech in *MaddAddam*. During a situation where Crakers required explanation, she creates a story on ecological balance which shared ethical concern. The idea of story-telling is not only a part of plot here but it is a moral act. By converting it into story-telling, ecological responsibility has become a part of ritual. In this manner, Atwood suggests that spiritual awareness may arise not from institutionalized religion but from collective efforts of environmental vulnerability.

Ethical survival and Collective Responsibility:

Unlike dystopian narratives centered solely on survival, *MaddAddam* proposes ethical survival — a form of living grounded in mutual care and ecological respect. Characters such as Toby and Ren move beyond individual survival toward communal responsibility. Their spiritual growth occurs through caregiving, cooperation with nonhuman species, and participation in ecological restoration.

Sunrima and Karthik Kumar

This shift reflects a key principle of ecospiritualism: survival must be morally grounded and ecologically sustainable. The rebuilding of community after environmental collapse symbolizes a spiritual renewal rooted in humility and interdependence.

Myth-making as Ecological spiritual practice:

The myths Toby creates for the Crakers blend humor, survival history, and reverence for nature. These narratives emphasize that ecological spirituality is not fixed but evolving. Rather than promoting dogmatic religion, Atwood presents spirituality as an adaptive cultural practice shaped by environmental realities.

Ecofeminism and Ecospiritual Ethics

Gender, Nature, and Resistance

Ecofeminist philosophy is essential for comprehending Atwood's eco-spiritual vision. Women characters often endure persecution akin to ecological exploitation. But they also become people who help others learn about the environment and change their spiritual lives. In *Surfacing*, the main character's rejection of patriarchal conventions is similar to her reconnecting with nature. In the *MaddAddam* trilogy, women like Toby and Pilar represent ecological knowledge, which includes herbal medicine, sustainable practices, and spiritual rites that have to do with the environment. Pilar's respect for bees shows that she understands how different species relate to each other on a spiritual level. She doesn't see animals as resources; instead, she sees them as partners in a shared ecology. Her teachings emphasise the ethical aspect of ecological spirituality: reverence for nonhuman existence.

The body as Ecological site:

Ecofeminist readings emphasize that the female body becomes a site where ecological and spiritual conflicts intersect. In *The Year of the Flood*, the commodification of bodies parallels the exploitation of nature. The God's Gardeners' emphasis on vegetarianism and sustainable living symbolizes resistance against systems that treat both bodies and ecosystems as commodities.

Spiritual practices in the group emphasize bodily discipline — mindful eating, ecological rituals, and environmental stewardship — demonstrating how spirituality becomes embedded in daily ecological practices.

Spiritual leadership and Ecological knowledge:

Women in Atwood's narratives often function as spiritual leaders or guides. Pilar's teachings about bees and Toby's storytelling demonstrate alternative forms of authority rooted in ecological wisdom rather than hierarchical power. This redefinition of leadership aligns with ecofeminist values emphasizing care, community, and environmental stewardship.

Apocalyptic Ecospiritualism in Atwood's Poetry

Nature as witness and victim:

Atwood's poetry frequently depicts landscapes scarred by human activity — polluted rivers, deforested lands, and endangered species. These images function not only as environmental critiques but also as spiritual warnings. Nature appears as a silent witness to human moral failure. In poems such as "Progressive Insanities of a Pioneer," Atwood critiques colonial attitudes toward land. The pioneer's attempt to conquer the wilderness results in psychological fragmentation, symbolizing the spiritual cost of environmental domination. The poem's imagery emphasizes that the destruction of ecosystems leads to the erosion of human identity.

Mythic imagery and Ecological Consciousness:

Atwood's poetry often employs mythic imagery to frame ecological crises. Myth functions as a spiritual language capable of expressing environmental trauma beyond scientific discourse. Animals and natural forces become symbolic figures representing ecological balance or disruption. In many poems, animals appear as moral judges or spiritual messengers, reminding humanity of its interconnectedness with other species. Such imagery reinforces ecospiritual themes of humility and ethical responsibility.

**Sunrima and Karthik Kumar****Creative imagination as Ecological healing:**

Atwood's poetic voice suggests that creative imagination itself is a spiritual response to ecological crisis. Writing becomes an act of ecological witnessing – preserving memory, warning future generations, and fostering environmental awareness. Poetry thus functions as a form of ecological activism grounded in spiritual reflection.

Indigenous and Deep Ecological Influences**Interconnectedness and Sacred landscapes:**

Although Atwood does not directly appropriate specific indigenous spiritual systems, her works reflect broader concepts of interconnectedness often associated with indigenous ecological worldviews. Landscapes in her narratives possess agency, memory, and sacred significance. In *Surfacing*, the wilderness is not merely a backdrop but an active participant in the protagonist's spiritual transformation. The novel emphasizes that humans must learn to listen to the land – an idea resonating with indigenous ecological philosophies emphasizing reciprocal relationships with nature.

Deep ecology and Intrinsic value:

Deep ecological principles appear throughout the *MaddAddam* trilogy. The God's Gardeners teach that every species possesses intrinsic worth, independent of human utility. Their ecological hymns celebrate animals and plants as sacred beings deserving protection. The trilogy's critique of corporate science highlights how technological exploitation arises from the denial of intrinsic value in nature. By contrast, deep ecological spirituality emphasizes humility, simplicity, and ethical coexistence.

Ecospiritualism as Ethical Philosophy**Critique of Consumer Capitalism:**

Atwood's ecospiritual vision critiques consumer capitalism as a root cause of ecological destruction. Corporate culture in *Oryx and Crake* reduces life to commodities, erasing spiritual reverence for nature. Environmental collapse thus becomes a moral and spiritual crisis rather than merely a scientific problem.

Spiritual transformation through crisis:

Characters across Atwood's works undergo spiritual transformations triggered by ecological disasters. The apocalypse in the *MaddAddam* trilogy forces survivors to reevaluate their values and relationships with nature. Crisis becomes a catalyst for spiritual awakening.

The role of memory and storytelling:

In *Oryx and Crake*, Snowman's nostalgic ideas work more than memory; they re-open the past and the lost human connections. Hence, the story-telling works to preserve the culture and saves total ecological erasure. Likely in *MaddAddam*, Toby's narrative shows that Crakers understand its place within the natural order. The idea of improvising the society turns into shared cosmic world. By doing so, Atwood proves that stories are not meant for entertainment alone, but they work as moral guide for humanities. She removes some events and communities from the narrative as she wanted to guide the non-human world accordingly. Ecological consciousness therefore, is brought up not through scientific investigation but through narrative memory. In this sense, storytelling becomes a guiding force through which ecological values are internalized and sustained across many generations.

CONCLUSION

In her poems as well as short-stories, Atwood introduces the moral base for how people should deal and interact with nature. She does not directly introduce eco-spiritualism as an ideology but she dramatizes it by weaving it within the story. In *Surfacing*, the main character, who is not named, goes into the woods. His action shows the readers the transformation of the characters and their psychological and moral recognition. In later times, in *The Year of the Flood's* God's Gardeners society, ceremony, song, and environmental discipline are all connected together into a

Sunrima and Karthik Kumar

living environmental morality. Even the posthuman Crakers in *MaddAddam* possesses an inner faith that is not based on escapism but on biological harmony. What unites these representations is a sustained critique of anthropocentrism. Atwood's narratives repeatedly dismantle the assumption that humans occupy a privileged moral hierarchy. Animals, ecosystems, and genetically modified beings are not background elements; they participate in interconnected systems of survival. Her poetry, similarly, registers ecological grief and tentative healing through shifting metaphors and stark natural imagery, suggesting that environmental damage is both material and existential. Importantly, Atwood resists offering prescriptive solutions. Instead, her work compels readers to confront their ethical accountability. Environmental awareness emerges less as a policy directive and more as a transformation of perception—a recognition that coexistence requires restraint, humility, and communal responsibility. In this sense, eco-spiritual consciousness in Atwood's writing operates as an ethical orientation rather than a theological system. Atwood's ecospiritual farsightedness is vital in the present time when the world is in danger and the ecosystem is uncertain. Her works remind humans that it will be possible to save environment only when we change our attitude towards it. She uses legends, anecdotes, myths and her own narrative tales to help people remember where they fit into the web of life.

ABSTRACT

This study examines Amitav Ghosh's *The Hungry Tide* as a seminal work of climate fiction that reimagines narrative form amid ecological precarity, postcolonial histories, and multispecies entanglements. Set in the tidal landscapes of the Sundarbans, the novel dramatizes environmental crisis not through apocalyptic spectacle but through polyphonic storytelling, tidal temporality, and epistemic plurality. Drawing upon postcolonial ecocriticism, the Anthropocene humanities, and concepts such as slow violence (Nixon) and tidalectics (DeLoughrey), the analysis foregrounds how Ghosh intertwines mythic cosmologies, scientific observation, subaltern knowledge, and political memory to cultivate an ethics of ecological attentiveness. By engaging Akhter and Islam's recent work on urban ecologies, the paper situates *The Hungry Tide* within a broader South Asian climate imaginary that spans rural deltas and metropolitan peripheries. The novel's refusal of narrative closure mirrors the open-endedness of climate futures themselves, inviting readers into imaginative solidarities across human and nonhuman worlds. Ultimately, the study argues that Ghosh transforms the realist novel into a site of environmental thought, one that resists mastery and embraces relationality, multiplicity, and ethical humility in the face of planetary uncertainty.

Keywords: Climate Fiction; Postcolonial Ecocriticism; Anthropocene Humanities; Tidalectics; Multispecies Ethics; Narrative Polyphony

**Peerani and Sheik Hameed**

INTRODUCTION

In an age increasingly defined by environmental disorder, literature has assumed an essential role not merely as a record of loss, but as an instrument of ecological consciousness. Amitav Ghosh's *The Hungry Tide* (2004) emerges within this emergent climate imaginary not as an exaggerated allegory but as an embodied practice of environmental ethics. It reconfigures narrative form to think through the entwined vulnerability of human, geological, and multispecies lives. Set in the Sundarbans, the "beautiful forest" whose very name connotes both ecological abundance and vulnerability, functions as a narrative confluence where environmental precarity, political history, and nonhuman agency intersect. Ghosh offers a literary modality one might call eco-narratology, a mode of storytelling that enacts ecological impermanence, relationality, and justice through rhythms of voice, landscape, and narrative temporality. This study connects that narrative architecture to ask: how does Ghosh frame ecological precarity onto literary form, inviting readers into sustained ethical attentiveness? To engage these questions, this study is grounded in interconnected theoretical frameworks. Postcolonial ecocriticism (Huggan & Tiffin, 2006) alerts us to how colonial legacies, uneven modernities, and conservation agendas inform both ecological crisis and its representations. Rob Nixon's notion of slow violence (2011) sharpens our attention to the minutiae of ecological attrition that precede disaster. Anthropocene temporalities, as elaborated by Chakrabarty (2009; 2021), highlight the challenge of rendering the immense spans of geological time legible within human-scale narratives. Tidalectics (DeLoughrey, 2019) further invites us to think through more-than-linear narrative structures shaped by watery flux. To clarify how these theoretical lenses intersect, see Figure 1.

To position Ghosh's work within the broader discourse of South Asian environmental narratives, the study draws upon Akhter and Islam's study of urban ecocriticism through Jhumpa Lahiri's *The Lowland* (2024). Their work broadens the ecocritical gaze to include metropolitan spaces as sites of environmental violence and resilience by analysing Kolkata's metamorphosis "pollution, loss of green spaces, and the urban ecologies eclipsed by infrastructure". Although Ghosh's Sundarbans is ecologically and narratively removed from the urban corridors of Kolkata, the methodological synergy is striking: both writers mobilize literary attention to contest environmental injustice, whether in shifting islands or sprawling cities. These parallel invites a conceptual synthesis across rural and urban bioregions, gesturing toward a literary ecology that bridges tidal geographies and urban peripheries in the shared task of environmental remediation.

This study unfolds through four interlinked analytic movements. First, it examines tidal temporality and ecological precarity, showing how *The Hungry Tide* blurs human time, geological time, and historical trauma through narrative rhythm. Second, through narrative polyphony, it reveals how myth, science, vernacular, and environmental awareness converge into a plural epistemic architecture that resists monolithic knowledge. Third, in the section on postcolonial ecologies, the Sundarbans emerges as a contested terrain marked by political displacement, conservation regimes, and capitalist extraction. Fourth, the study turns to eco-narratology and climate imagination, considering how Ghosh's narrative reconstructs climate awareness not as abstraction but as part of embodied story, sensory ethics, and imaginative solidarity across species. Crucially, each section builds upon, rather than repeats from, its predecessors. This structure allows the analysis to remain dynamic, meandering with tidal logic, rather than linear or teleological.

At a broader disciplinary level, this paper seeks to enrich the conversations between climate fiction, postcolonial studies, and environmental humanities by demonstrating how *The Hungry Tide* illustrates the intimate, complex, and ethical potentialities of literature under planetary duress. In an era when literary forms are pressured to make sense of systemic collapse, *The Hungry Tide* offers neither apocalyptic catharsis nor utopian solution, but a sustained invitation to dwell with precarity, listen for multiple voices, and reimagine story as ecological praxis.

Peerani and Sheik Hameed

Tidal Temporalities And Ecological Precarity In *The Hungry Tide*

Amitav Ghosh's *The Hungry Tide* (2004) unfolds as an incisive reflection on how ecologies in motion as embodied by the Sundarbans' tidal landscapes, demand narrative forms that are immersive, ethical, and sensitive to temporal distinction. To orient readers unfamiliar with the Sundarbans region, see Figure 2 for a map of the Sundarbans delta, showing river networks, mangrove extents, and protected zones, which provides spatial context for the novel's shifting geographies. In refusing spectacle or polemic, the novel invites readers into an ecology of attention, where the rhythms of human and nonhuman life merge in subtle and disquieting ways. Here, climate change is not a remote abstraction but a lived, sensory, and affective experience: the tides themselves perform temporality, insisting that we attend to precarious worlds that unfold beyond human time and control (Trexler, 2015).

The narrative begins with an apparently simple premise: Piya, an American cetologist of Indian descent, journeys to the Sundarbans to study the endangered Irrawaddy dolphins. She encounters Kanai, who has travelled from Delhi to retrieve his late uncle Nirmal's journals, and Fokir, a fisherman born of and shaped by the rhythms of tides. Beneath this triangulation lies an unfolding meditation on climate precarity: the tenuousness of biodiversity, the fragility of community, and the violence enacted upon both by social and environmental forces. The novel's cataclysmic cyclone—claiming Fokir's life—is not an end but a punctuation; it crystallizes the convergence of human histories and tidal histories and dramatizes what Chakrabarty (2009) names the “collapse of humanist temporalities” in the Anthropocene, where personal and planetary timescales collide in unpredictable and inseparable ways. What distinguishes Ghosh's narrative within climate fiction is its refusal to frame environmental change as catastrophe alone. Instead, the novel marshals observation: Moyna noting the disappearance of fish eggs entrapped by synthetic nets; Piya tasting a “metallic savor” in the water; Horen remarking that cyclones have started arriving “quicker”; Nirmal reflecting that “the wheel of time was spinning too fast to be seen” (Ghosh, 2004, p. 45). These moments enact what Nixon (2011) terms “slow violence”, : environmental harm that unfolds gradually, invisibly, yet devastatingly, often entwined with the operations of state power and global capital.

In this literary strategy, *The Hungry Tide* intertwines the experiential with the planetary. Nirmal's journals reflect on the Morichjhapī refugee settlement and its violent suppression in the 1970s, weaving together displacement, political injustice, and ecological fragility. His statement that “mangroves were Bengal's defense against the bay” (Ghosh, 2004, p. 271) acquires bitter irony as deforestation, sea-level rise, and repeated cyclones erode both literal and metaphorical defences. The drowned islands dramatize what Heise (2016) theorizes as the “disappearance of place” in an age where climate change remakes geographies. Yet Ghosh resists portraying local peoples as mere victims: Fokir's embodied knowledge of tides, storms, and marine life gestures toward the “subaltern environmental agency” and “multispecies knowledges” that scholarship increasingly recognizes as central to ecological resilience (Haraway, 2015; Jindal, Saraswat, & Sharma, 2025). Indeed, the Sundarbans emerge not as an inert backdrop but as an agentic presence, shaping destinies among humans and nonhumans alike. Jen Martin Gurr (2013) emphasizes how “the ebb and flood, land and water, not only structure the text in terms of form, but echo in its characters, themes, and plotlines” (p. 118). In this way, the landscape becomes a protagonist, interweaving shrinking tiger habitats, vanishing dolphins, soil salinization, and cyclones into what Latour (2017) terms the “new climatic regime”—a register where nature, culture, and history are inseparable.

Piya's preoccupation with Irrawaddy dolphins evolves from scientific inquiry into ethical and ontological concern. She recalls that the Sundarbans once hosted more fish species than all of Europe (Ghosh, 2004), underscoring the region's ecological density and its erosion. The death of a dolphin calf, fatally struck by a motorboat, becomes an emblem of industrial modernity's perilous intrusion upon fragile ecosystems, collapsing the dualisms of local/global, human/ecological, scientific/mythic. Such intersections of violence and reverence around tigers exemplify what Huggan and Tiffin (2006) term “green postcolonialism,” where the imperatives of wildlife conservation sometimes collide with the imperatives of social justice. When villagers kill a man-eating tiger in the name of self-defence, the novel lays bare how environmental policies can displace marginalized populations, echoing Nixon's (2011) critique of “displacement in the name of preservation.” Ghosh refuses simplifying these moral tensions. He portrays the double bind faced by conservationist ideals and human livelihoods, illustrating how the Sundarbans become a microcosm of

Peerani and Sheik Hameed

planetary dilemmas in a warming world. These tensions resonate with Chakrabarty's (2021) idea of the "Anthropocene uncanny," where the familiar becomes strange and epistemic certainties unravel in ecological crisis. Formally, *The Hungry Tide* enacts environmental precarity through layered temporal structures. Its two-part design—The Ebb and The Flood—mirrors tidal rhythms of submersion and emergence, while its oscillation between Nirmal's historical journals and present narratives generates a "tidalectic" poetics that DeLoughrey (2019) describes: a non-linear historicity attuned to waterworlds. The Morichjhapi past emerges again in the present, showing how environmental and political violences ripple through time, refusing tidy closure. These thematic and structural devices cultivate what Neimanis (2017) terms "hydrological intimacies", sensory, bodily attunement to climate's unfolding. The metallic taste, the sight of carcasses, the premonitory gusts of wind, and inter-species intimacies—for example, Piya's wordless kinship with Fokir—enact an ecology of affect that resists abstraction. Water, storms, and tides become interlocutors, inscribing ethical and emotional registers into the narrative. Ghosh demonstrates how climate fiction can "humanize" climate change without domestication by aligning character arcs, narrative structure, and ecological rhythms. In Buell's (2005) terms, the novel engages the "environmental imagination" situating that which is planetary also in the particular, that which is scientific also in the mythical, that which is material also in the sensory. Recent scholarship reinforces this understanding. Jindal, Saraswat, and Sharma (2025) frame *The Hungry Tide* as reanimating the Sundarbans as a contested palimpsest, where colonial cartographies, conservation regimes, and climatic disasters converge, giving rise to subaltern environmental epistemologies that challenge technocratic paradigms. Similarly, Afshan (2025) positions Ghosh as reimagining nature as dynamic, integrating indigenous knowledge, myth, and ethical concern to confront climate's cultural and ecological entanglements. These insights deepen the attention to how ecologies muddy boundaries between science, storytelling, and justice.

Fokir's death, Piya's commitment to stay in the delta, Kanai's oscillation between urbanity and waterscape, and Nirmal's unfulfilled dreams all gesture beyond the text's final pages toward futures marked by uncertainty, ethical complicity, and ecological co-habitation. Literary closure does not dissolve the climate predicament but holds it in tension. In this way, Ghosh's narrative anticipates the "open futures" of climate humanities scholarship, where imaginative engagement is neither escapist nor conclusive, but responsible, provisional, and dialogic (Clark, 2015; Afshan, 2025). In its evocation of place, multispecies lives, and embodied ruin, *The Hungry Tide* offers a robust departure into further analysis, whether of narrative multiplicity, urban-rural ecologies, or postcolonial environmental justice.

Narrative Polyphony And Ecological Multiplicity In *The Hungry Tide*

Amitav Ghosh's *The Hungry Tide* (2004) unfolds not simply as a story of environmental precarity but as a formally ambitious work in which narrative structure itself becomes ecological. Rather than treating the environment as inert backdrop, the novel transforms narrative form into a living analogue for the complex interdependencies of the Sundarbans. It suggests that the texture of storytelling must itself change to capture the ontological and epistemological dislocations of a climate-challenged world. Through its alternating voices, temporal layering, vernacular inflections, mythic registers, and interwoven subplots, *The Hungry Tide* enacts what might be called what Erin James introduced "ecological narratology": a formal imagination responsive to plurality, uncertainty, and relationality (James, 2015). In doing so, the novel asks whether literature can accommodate the voices—human and nonhuman, scientific and mythic, historical and contemporary—that constitute planetary crisis. Ghosh's narrative strategies resist singularity at every level. By weaving Bangla idioms, local songs, and vernacular speech rhythms into English prose, the text performs what Haraway (2015) terms "multispecies storytelling," a mode of narrative that dismantles monologic authority in favor of polyphony, dissonance, and convergence. This linguistic hybridity is not a matter of style alone; it dramatizes how ecological understanding exceeds disciplinary, linguistic, and even ontological boundaries. Scientific languages of taxonomy and field observation sit alongside myths of Bon Bibi, colonial cartographies, oral memory, and the tidal knowledge of fishermen like Fokir, generating what Oppermann (2023) calls narrative multiplicity—a literary form capable of sustaining environmental complexity without reducing it to singular explanation.

Peerani and Sheik Hameed

The novel's temporal architecture furthers this ecological vision. It moves fluidly between Piya's contemporary fieldwork on Irrawaddy dolphins, Kanai's reading of Nirmal's politically charged journals, the submerged histories of Morichjhapi's violence, and the timeless rhythms of Fokir's embodied knowledge. These shifts enact what Böhm-Schnitker (2023) describe as multiscale temporalities in postcolonial climate fiction, where intimate human moments intersect with deep geological and planetary time. Past, present, and mythic time collapse into one another, echoing DeLoughrey's (2019) notion of "tidalectics," a poetics shaped by the cyclical, recursive, and fluid temporalities of the sea. In *The Hungry Tide*, tides do not simply mark physical geography; they pattern memory, history, and narrative itself. Importantly, this polyphonic structure disrupts binary oppositions between fact and fiction, science and story, global and local. Piya's meticulous biodiversity surveys share narrative space with Bon Bibi's legends; maps of the Sundarbans coexist with Nirmal's recollections of revolutionary politics and with Fokir's unlettered yet intricate readings of river currents, animal movements, and storm signals. As Neeraj and Prabha (2025) observes, Ghosh employs a "multiperspective overview" that mirrors ecological interdependence in both theme and method. By layering scientific empiricism, mythic cosmology, historical testimony, and sensory affect, *The Hungry Tide* insists that no single epistemology, whether rationalist science or romanticized indigeneity, can claim total explanatory power over environmental crisis. What emerges instead is a pluralistic ecological consciousness, one that holds open multiple, sometimes incommensurable, ways of knowing a changing world. Figure 3 visualizes the novel's narrative polyphony, mapping how scientific, historical, subaltern, urban, and mythic voices converge to shape the ecological imagination of the novel.

This pluralism extends even to the novel's treatment of nonhuman life. Piya's reflections on the Sundarbans' crab populations, for instance, trace how these creatures mediate between mudflats, mangroves, and human livelihoods, shaping the very conditions of habitation. Crabs become figures of ontological interdependence, connecting the delta's hydrology, ecology, and economy in ways that blur distinctions between nature and culture. Nirmal amplifies this interconnection metaphorically, likening geological strata to sedimented layers of myth and memory, as if to suggest that environmental crisis cannot be disentangled from cultural and historical imaginaries. Such juxtapositions refuse the sentimental idealization of nature; instead, they gesture toward Yusoff (2018) idea of an ethics of co-embodiment, where human and nonhuman live share vulnerability within the same planetary precarity.

The novel's framing devices further this environmental phenomenology. Nirmal's journals, embedded within the larger narrative, immerse readers in the Sundarbans' textures through language that is tactile, affective, and often resistant to abstraction. Descriptions of "tough and leathery" vegetation, "gnarled" branches, and "impassably dense" foliage (Ghosh, 2004, p. 7) do more than represent a hostile terrain; they enact its hostility at the level of form, as if prose itself becomes thick, sinuous, resistant. Here literature approaches what Iovino and Oppermann (2014) term material ecocriticism: storytelling as the site where matter and meaning interpenetrate, where narrative itself becomes ecological by registering the vitality, agency, and opacity of the nonhuman world. By juxtaposing Piya's scientific methods with Fokir's inherited, place-based knowledge, Ghosh also interrogates the limits of Enlightenment rationality. Piya arrives in the Sundarbans armed with zoological training, hydrographic maps, and conservationist zeal, yet gradually comes to recognize the partiality of scientific expertise when divorced from local, embodied, and intergenerational ways of knowing. Fokir, illiterate yet attuned to every ripple, wind-shift, and birdsong, reads the delta with a precision untranslatable into scientific instruments alone. Their unlikely collaboration dramatizes what postcolonial ecocritics identify as the need to decolonize ecology, to value subaltern, indigenous, and feminist epistemologies marginalized by technocratic environmentalism (McGregor et al. 2020). As Piya shifts from studying a single species to apprehending the delta's relational ecologies, the novel argues that environmental crisis demands not epistemic hierarchy but epistemic plurality.

This critique extends to climate fiction itself. Whereas much Cli-Fi frames nature as a vengeful force retaliating against human hubris, a trope of apocalyptic retribution, *The Hungry Tide* resists such anthropocentric melodrama. Its storms, tides, and predators are neither villains nor victims but agents within tangled, multispecies histories. The legend of Bon Bibi exemplifies this refusal of reductionism. Portraying dolphins as messengers and tigers as sacred interlocutors, the myth grounds ecological ethics in ritual and reverence rather than managerial control. As

Peerani and Sheik Hameed

Afshan(2022) notes, such myths encode spiritual ecologies, forms of environmental care transmitted through story rather than statute. When Fokir invokes Bon Bibi before venturing into dangerous waters, myth becomes not superstition but survival practice, binding human labor, animal life, and sacred geography into a shared ethical frame. What ultimately emerges is a textual ecosystem that defies unitary interpretation. Scientific observation, mythic narration, historical testimony, and sensory imagery coexist without synthesis. It reflects what might be termed a “polyphonic imagination,” drawing from Iovino’s environmental humanities work (2021), in which multiple narrative voices converge across disciplines, epistemologies, and scales. Rather than offering mastery over ecological crisis, *The Hungry Tide* cultivates is describes as epistemic humility: an openness to uncertainty, ambivalence, and multiplicity in the face of planetary complexity (Trexler, 2015). The novel does not ask readers to choose between science and myth, history and ecology, reason and affect; instead, it stages their entanglement, suggesting that environmental understanding emerges from their interanimation. This multivocal, multimodal technique carries methodological implications beyond literary analysis. By interlacing vernacular orality, scientific notation, mythic narrative, political history, and sensory description, Ghosh models what climate humanities scholars term integrative epistemologies (Oppermann, 2023). Such epistemologies refuse disciplinary silos, insisting that ecological crisis, spatially vast, temporally deep, affectively disorienting, requires aesthetic forms as heterogeneous as the worlds they seek to represent. As work in climate fiction studies argues, narrative form itself becomes a site of experimentation, a laboratory for imagining ways of knowing adequate to the Anthropocene (Trexler, 2015).

Crucially, *The Hungry Tide* resists narrative closure. Its polyphony gestures toward futures it does not resolve: How might narrative multiplicity reconfigure environmental temporality? How might mythic cosmologies converse with conservation biology in shaping ecological ethics? What narrative forms might sustain multispecies communities amid accelerating climate change? By leaving these questions open, the novel aligns with what Ghosh (2016) elsewhere calls the crisis of imagination in the Anthropocene: the difficulty not only of representing planetary crisis but of inventing narrative forms spacious enough to hold its contradictions, scales, and uncertainties.

For this reason, *The Hungry Tide* offers not a prescriptive solution to environmental crisis but a praxis of storytelling. Like the tidal rhythms structuring its plot, the novel advances and recedes, reveals and submerges, refusing linearity or finality. Its narrative polyphony thus becomes both method and message: to inhabit a damaged world ethically is to listen across scales, species, histories, and epistemologies without collapsing them into sameness. What follows, then, is the task of tracing how such narrative forms, restless, recursive, and recombinant, might inform broader conversations in climate fiction, postcolonial ecologies, and environmental justice. The novel leaves us, as the tides do, on shifting ground.

Postcolonial Ecologies And Environmental Justice In *The Hungry Tide*

Ghosh, who in his nonfiction essay “Folly in the Sundarbans” (2004) opposed the privatization and commodification of this fragile biosphere through ventures such as Sahara India Pariwar’s luxury tourism plans, translates the same ethical urgency into fiction. The novel dramatizes not only the ecological fragility of the Sundarbans but also its entanglement with histories of displacement, developmentalism, and capitalist modernity, foregrounding what Buell et al. (2011) have called the role of the literary imagination in shaping environmental ethics. As scholars of the environmental humanities now insist, climate change cannot be divorced from the longue durée of colonial extraction and postcolonial inequities; *The Hungry Tide* anticipates this insight by entwining ecological crisis with political violence, economic dispossession, and subaltern resistance (Dutta et al., 2024; Nixon, 2011). To clarify the intertwined trajectories of political-historical interventions and environmental-ecological crises shaping the Sundarbans, Figure 4 maps key events from the late nineteenth century to the present.

The timeline (see figure 4) visualizes parallel developments in the Sundarbans across two interlinked registers. The upper axis traces political-historical events, from the Colonial Forestry Act (1878), Partition of Bengal (1947), and Morichjhapi Massacre (1979) to the Tourism Projects Controversy (2010s), illustrating how conservation laws, colonial extraction, and state interventions have reshaped land use and livelihoods. The lower axis marks ecological

Peerani and Sheik Hameed

disruptions such as the First Recorded Cyclone (1876), Bhola Cyclone (1970), Super Cyclone Odisha (1999), Cyclone Aila (2009), and the climate change-intensified Cyclone Amphan (2020). Together, these courses reveal how political violence and environmental crisis converge in the tidal geography that Ghosh dramatizes in *The Hungry Tide*. From the outset, the novel situates the reader in a mutable, tidal geography that defies cartographic fixity. Ghosh describes a world where “there are no borders here to divide fresh water from salt, river from sea. The tides reach as far as three hundred kilometres inland and every day thousands of acres of forest disappear underwater only to re-emerge hours later” (Ghosh, 2004, pp. 7–8). The landscape itself undermines the logic of modern territoriality; islands emerge and dissolve unpredictably, mapping a world in which human claims to permanence appear absurd against the rhythms of tide, storm, and sediment. This temporality of flux resonates with recent scholarship on the Anthropocene uncanny, which notes how climate change unsettles ontological certainties by collapsing distinctions between natural cycles and human histories (Chakrabarty, 2021; Oppermann, 2023). The Sundarbans, both as place and as narrative setting, embody this uncanny instability: tigers, mangroves, cyclones, and rivers share the stage with refugees, scientists, and fishermen, none enjoying sovereign control over a world perpetually remade by water. The novel links this environmental mutability to political histories of displacement and resistance, most notably through the traumatic memory of Morichjhapi, where in 1979 the West Bengal government forcibly evicted lower-caste refugees who had settled on protected forest land, resulting in widespread death and suffering. Nirmal, whose journals Kanai later reads, recounts the tragedy not as distant reportage but as a wound inscribed into the very landscape of the tide country which literalizes the Nixon (2011) idea of “slow violence”. The tide country thus becomes what Chakrabarty (2009) might term a palimpsest of temporalities, where geological rhythms of tide and silt converge with political time—colonial forestry, refugee resettlement, developmental modernity—so that neither history nor ecology can be narrated in isolation from the other.

Yet Ghosh avoids romanticizing either the human or the nonhuman. The Sundarbans emerge not as pristine wilderness but as what scholars now term postcolonial ecologies: landscapes marked by extraction, habitation, and contestation rather than Edenic purity (DeLoughrey, 2019; Mukherjee, 2010). When Piya, the American-born cetologist of Indian descent, first arrives to study the endangered Irrawaddy dolphins (*Orcaella brevirostris*), she encounters not untouched nature but a densely inhabited, politically fraught terrain where conservation, livelihood, and survival collide. Her collaboration with Fokir, the illiterate fisherman whose inherited knowledge of tides, storms, and animal behavior guides her research, dramatizes Chander & Bali's (2023) eco-subaltern epistemologies: ways of knowing marginalized by modern science yet indispensable to ecological survival. Fokir's mother, Kusum, recounts how dolphins once warned villagers of approaching storms—a memory dismissed by technocratic conservationists but borne out repeatedly in the narrative as dolphins surface before cyclones or floods. Such episodes recall Haraway's (2015) call to “stay with the trouble” by recognizing multispecies entanglements rather than imposing managerial mastery over them.

Ghosh reinforces this entanglement through his descriptions of the estuarine ecosystem, where,

“river and sea did not intermingle evenly ... rather, they interpenetrated each other, creating hundreds of different ecological niches ... each balloon a floating biodome ... sustaining a dazzling variety of aquatic life forms—from the gargantuan crocodile to microscopic fish” (Ghosh, 2004, p. 125).

These passages oscillate between scientific precision and lyrical wonder, enacting what Trexler (2015) identifies as the dual task of climate fiction: to render planetary crisis cognitively graspable without sacrificing its aesthetic or affective dimensions. Recent studies in environmental narratology argue that such texts cultivate an eco-aesthetic literacy, enabling readers to sense rather than merely know ecological interdependence (Iovino, 2021). In *The Hungry Tide*, this literacy emerges not only through Piya's scientific observations but also through Fokir's wordless attentiveness, Nirmal's politicized memories, and even the novel's mythic allusions to Bon Bibi, the forest goddess who protects islanders from tigers and storms. Myth here functions not as superstition but as a narrative mode through which communities articulate ethical relations with nonhuman forces.

Peerani and Sheik Hameed

The tiger episode crystallizes these tensions between law, livelihood, and ecology. When villagers kill a tiger that has attacked humans—“their faces contorted in the grip both of extreme fear and uncontrollable rage ... women and children shrieking, Maar! Maar! Kill! Kill!” (Ghosh, 2004, pp. 291–292)—the scene resists moral simplification. Conservation laws criminalize the killing; yet the villagers, themselves displaced by floods and resettlement schemes, perceive the tiger not as endangered species but as existential threat. Scholars note that such conflicts exemplify green postcolonialism, where environmental policies often reproduce colonial hierarchies by displacing local communities in the name of wilderness preservation (Huggan & Tiffin, 2006; Dutta, 2020). The Sundarbans tiger thus embodies what Nixon (2011) calls the “double bind” of environmental justice: protecting nonhuman life without sacrificing the already-precarious lives of marginalized humans.

Throughout the novel, Ghosh insists on narrative parity between human and nonhuman actors. Motorboats kill dolphin calves; rising salinity from sea-level rise destroys croplands; cyclones erase entire islands; yet the text refrains from casting nature as passive victim or active avenger. Instead, it dramatizes what Latour (2017) terms the new climatic regime, where agency itself becomes distributed across species, technologies, and elemental forces. By giving equal narrative weight to cetologists and fishermen, tigers and refugees, mangroves and motorboats, *The Hungry Tide* dissolves hierarchical separations between nature and culture, science and story, history and ecology. Recent work in material ecocriticism describes such texts as staging “storied matter,” where landscapes themselves become expressive, shaping rather than merely hosting human histories (Iovino & Oppermann, 2014). The tidal country exemplifies this: its cyclones, salinity, and shifting rivers are not backdrop but agents in an unfolding drama of survival and loss.

Significantly, the novel withholds closure. Piya’s decision to remain in the tide country, Kanai’s return to Delhi, and Fokir’s death in the cyclone yield no resolution to the conflicts between conservation and livelihood, global capital and local ecologies, scientific rationality and subaltern knowledge. Instead, the text gestures toward what Buell et al. (2011) call the environmental imagination’s dual task: to “reinforce” ethical concern while “directing” it toward future possibilities (p. 418). *The Hungry Tide* refuses both apocalyptic despair and technocratic optimism, dwelling instead in what Ghosh (2016) elsewhere names the imaginative impasse of the Anthropocene: the difficulty of narrating crises that are planetary in scale yet intimate in impact, temporally vast yet experienced in daily precarity.

By entwining ecological vulnerability with colonial histories, developmental modernity, and multispecies ethics, *The Hungry Tide* exemplifies the emerging field of postcolonial ecologies (DeLoughrey, 2019; Mukherjee, 2010). It asks whether environmental justice in the twenty-first century can be conceived apart from questions of caste, class, gender, and global inequality. Yet rather than offering prescriptive answers, the novel leaves readers amid the tides themselves—uncertain, unsettled, attuned to the open horizons of ecological thought that the subsequent sections of this study will further explore.

Eco-Narratology And Climate Imagination In *The Hungry Tide*

Amitav Ghosh’s *The Hungry Tide* (2004) offers one of the most compelling fictional meditations on the entanglements of climate change, biodiversity loss, and human history in contemporary South Asian literature. Situated in the tidal landscapes of the Sundarbans, the novel dramatizes what might be called an eco-narratology, a narrative praxis where storytelling itself becomes a medium for ecological thought and ethical engagement. Rather than relying on didacticism or apocalyptic sensationalism, the text performs environmental change through its formal structures, temporal rhythms, and multispecies perspectives. In doing so, it transforms the literary text into a site where readers experience climate precarity not as abstract discourse but as lived, storied, and affective reality (Trexler, 2015). Critics have increasingly noted that contemporary climate fiction, or cli-fi, faces the representational challenge of narrating crises that unfold slowly, unevenly, and often invisibly, a problem Rob Nixon (2011) earlier famously theorized as slow violence. *The Hungry Tide* addresses this challenge by embedding environmental change in the very texture of its narrative. The novel’s shifting focalizations—across Piya’s scientific observations, Nirmal’s politicized memories, Kanai’s urban cosmopolitanism, and Fokir’s inherited tidal knowledge—generate a polyphonic form attentive to both ecological fragility and epistemic plurality (Oppermann, 2023). Through this formal multiplicity, Ghosh

**Peerani and Sheik Hameed**

demonstrates what Trexler (2015) calls the aesthetic responsibility of climate fiction: to render planetary crisis apprehensible without reducing its complexity.

The novel situates the Sundarbans as both material ecosystem and narrative method. Ghosh's descriptions of tidal rhythms—"thousands of acres of forest disappear underwater only to re-emerge hours later" (Ghosh, 2004, p. 7)—do not merely provide setting but enact what DeLoughrey (2019) terms tidalectics: a poetics shaped by the cyclicity, flux, and unpredictability of island and oceanic worlds. This formal mirroring of ecology and narrative allows *The Hungry Tide* to represent environmental precarity not as external event but as immanent condition, where human and nonhuman live share vulnerability within planetary systems increasingly destabilized by anthropogenic climate change (Chakrabarty, 2021).

At the same time, Ghosh refuses to romanticize the Sundarbans as untouched wilderness. The landscape emerges as a site of both refuge and risk, biodiversity and displacement, conservation and exclusion. One of the novel's most politically charged moments dramatizes this tension:

"This island has to be saved for its trees ... for its animals ... it belongs to a project to save tigers, which is paid for by people from all around the world ... people ... so in love with animals that they are willing to kill us for them?" (Ghosh, 2004, p. 262).

Here, local villagers articulate the paradox of green colonialism (Huggan & Tiffin, 2006), where global conservation agendas impose ecological ideals at the expense of subaltern lives. As Jakhar et al. (2025) argue, such moments expose the epistemic violence of environmental governance that treats marginalized communities as dispensable in the name of wilderness preservation. Ghosh stages this critique narratively rather than polemically, revealing how ecological ethics must account for both human and nonhuman claims to survival—a point increasingly emphasized in postcolonial ecocriticism (Mukherjee, 2010; Nixon, 2011). Environmental degradation in *The Hungry Tide* thus appears simultaneously local and planetary. Fokir's memory of a vanished beach—"that beach happened twenty years ago, and it was neither storm nor flood that caused it" (Ghosh, 2004, p. 202)—functions as historical witness to accelerating change, while Piya's studies of aquatic biodiversity register the attritional disappearance of species once "more abundant than in the whole continent of Europe" (p. 239). These moments embody what Neeraj and Prabha (2025) calls the ecological archive of climate fiction: texts that record environmental loss across personal memory, scientific observation, and cultural narrative. Rather than sensationalizing disaster, Ghosh accumulates detail—vanishing islands, eroded livelihoods, dead dolphins, encroaching salinity—allowing readers to inhabit what Chakrabarty (2021) describes as the everyday Anthropocene, where climate change is lived before it is theorized. Crucially, the novel reconfigures the role of narrative itself. The interpenetration of river and sea produces "hundreds of different ecological niches ... variations of salinity and turbidity" (Ghosh, 2004, p. 125), an ecological multiplicity mirrored by the novel's formal hybridity—its blending of scientific report, political history, mythic tale, and sensory description. Recent eco-narratological scholarship argues that such texts perform epistemic disobedience by unsettling the dominance of scientific rationality and foregrounding marginalized, indigenous, and affective ways of knowing (Oppermann, 2023). In *The Hungry Tide*, Fokir's illiterate yet intimate knowledge of tides, storms, and animal behavior repeatedly complements—and sometimes surpasses—Piya's scientific expertise, suggesting that environmental understanding requires dialogic rather than hierarchical epistemologies (Chander & Bali, 2023).

Moreover, the novel foregrounds nonhuman agency without lapsing into anthropomorphic sentimentality. Dolphins that warn of storms, tigers that traverse shrinking forests, mangroves that shield coastlines from cyclones—all emerge as actors within what Latour (2017) calls the new climatic regime, where human and nonhuman forces shape shared, uncertain futures. Ecocritics increasingly argue that such representations foster multispecies justice, expanding ethical concern beyond the human without erasing human vulnerability (Heise & Christensen, 2020). Ghosh dramatizes this through scenes where conservation laws clash with local survival needs, cyclones erase entire villages, and rising seas engulf agricultural lands, leaving readers to confront the entangled injustices of climate change, capitalism, and colonialism (Dutta, 2020; Nixon, 2011).

On a formal level, *The Hungry Tide* exemplifies what Hahn (2023) terms the climate imagination: the capacity of narrative to make visible the temporal scales, affective textures, and ethical stakes of planetary crisis. Ghosh himself, in *The Great Derangement* (2016), laments the failure of modern literature to grapple adequately with climate change; *The Hungry Tide* can be read as his response, crafting a narrative spacious enough to hold scientific data, mythic resonance, political critique, and intimate human drama together. Recent studies in environmental humanities affirm this aesthetic strategy, arguing that climate fiction must cultivate both analytical comprehension and affective investment to catalyze ecological care (Buell et al., 2011). Significantly, the novel ends without resolution. Piya's decision to continue conservation work, Kanai's return to the city, and the irretrievable loss of Fokir to the cyclone refuse narrative closure, mirroring the open-endedness of climate futures themselves. As Trexler (2015) notes, environmental storytelling in the Anthropocene must embrace narrative ambivalence, resisting the teleologies of progress or apocalypse in favor of uncertainty, plurality, and ethical imagination. *The Hungry Tide* thus invites readers not toward despair or mastery but toward what Haraway (2015) calls staying with the trouble: dwelling in the complexities, entanglements, and responsibilities of a damaged yet still living world.

CONCLUSION

In tracing the shifting geographies, polyphonic voices, and postcolonial ecologies of *The Hungry Tide*, this study has sought to demonstrate how Amitav Ghosh transforms the realist novel into a site of ecological thinking. The text renders climate precarity not as distant abstraction or apocalyptic spectacle, but as lived, storied, and ethically entangled experience. Through its tidal temporality, narrative multiplicity, and multispecies imagination, the novel dismantles anthropocentric hierarchies, insisting that histories of empire, development, and conservation cannot be disentangled from the slow violence of environmental degradation. At the same time, by placing *The Hungry Tide* in dialogue with Akhter and Islam's work on urban ecologies, the analysis has situated Ghosh's deltaic world within a broader South Asian climate imaginary that traverses rural and metropolitan spaces alike. This comparative frame reminds us that ecological crisis is neither geographically contained nor temporally singular: it unfolds unevenly across coastlines and cities, forests and floodplains, in forms at once immediate and imperceptibly slow.

Yet the novel refuses narrative closure, offering no consoling resolutions, no final word on climate futures. Instead, it cultivates what the environmental humanities increasingly call for: an ethics of attentiveness, humility, and imaginative plurality in the face of planetary uncertainty. If literature in the Anthropocene bears any responsibility, *The Hungry Tide* suggests, it lies not in prescribing solutions but in widening the coordinates of perception—so that human and nonhuman live, mythic pasts and geological scales, political histories and ecological futures may be thought together, however provisionally, within the ebb and flow of a world still coming into being.

ABSTRACT

The present research has filled in an important translational blank in augmented reality (AR) interventions on oracy development in learners with mild intellectual disability (MID): did communication benefits continue to persist when technological scaffolds are removed? We created and tested a systematic protocol of scaffold withdrawal that was aimed at shifting 38 MID learners (ages 9-13) who would be supported with AR to independent oracy performance over a 5-week intervention. The development of multimodal scaffolds (visual prompts, audio models, adaptive cues) based on design-based implementation research was gradual, with three phases: full multimodal modeling, partial cueing, and production on its own. The explicit measure of retention was through a delayed post-test, which was done device-free at Week 5. Findings revealed that there were considerable listening, vocabulary and verbal expression ($p < .001$) pre- to post-test improvements. More importantly, the partial cueing phase in high-fidelity implementation produced high retention indexes ($RI = 0.90$), and much higher spontaneous communication in the conditions of free play ($M = 9.6$ initiations) than in low-fidelity implementation ($M = 6.7$; $p = .005$).

Keywords: Augmented reality, scaffold withdrawal, oracy, mild intellectual disability, skill retention, fading procedures.

INTRODUCTION

Language is one of the core skills of academic participation, social integration, and functional autonomy among learners with mild intellectual disability (MID) [1]. Although it plays a major role in everyday communicative exchanges, MID learners often face the consistent problem of using pragmatic language, recalling vocabulary terms, and applying language verbally in natural settings in classrooms. Augmented reality (AR) has become an innovative assistive technology to support the oracy development by scaffolding using multimodal aids like visual overlay, spatial audio cues, and interactive avatars to reduce cognitive load and offer just-in-time modelling [2]. Although preliminary efficacy trials indicate short-term improvements in structured AR settings, a severe translational gap is still not yet closed: do they continue to improve after deactivation of technological scaffolds? In the absence of systematic procedures to move learners from device-supported to independent performance, the AR is likely to lead to immediate dependency as opposed to long-term skill internalization, a problem that is well-reported in behavioral interventions wherein the skill transfer of learners does not occur due to the removal of prompts [3].

Timely dependency is a long-standing issue in the special education practice where students develop their dependence on external reinforcement and show significant negative performance when the latter is taken away [1]. Studies that have involved people with difficult behaviour that is sustained by the presence of tangibles have shown that systematic fading that slowly decreases the prompt intrusiveness and enhances independent responding is necessary to avoid dependency cycles and encourage maintenance [4]. The same rule applies to technology-mediated instruction: AR interfaces that constantly supply the visual sentence frame, audio models, or haptic feedback could be unintentionally hobgoblin to the construction of internal self-regulatory strategies to facilitate spontaneous communication. In turn, the AR interventions design should include clear scaffold withdrawal progressions that match the hierarchy of evidence-based prompts so that the aids could serve as temporary boosters, but not as long-term accommodations [5].

Scaffold withdrawal is developed on a theoretical basis, which incorporates an applied behaviour analysis and sociocultural learning theory. Graduated guidance, which is a prompting intervention process, where a learner is given a gradual decrease in physical or verbal support as a result of achievement, has shown strong impacts on learners with intellectual and developmental disabilities [10]. Meta-analytic evidence supports the use of interventions that incorporate systematic fading have much better maintenance and generalization results than non-fading prompting methods [6]. In the case of AR design, this would be a gradual increase in the use of full multimodal modeling (e.g., avatar demonstrating "I hear birds chirping" with visual icons and audio playback) to partial cueing (e.g., the visual icon alone) and lastly to no device mediation. Importantly, this fading should be personalized and based on data; systems of decision-making are currently available to help instructors choose the right types of prompts and schedules of fading depending on the responsiveness of learners, the pattern of errors, and the needs of the situation [2].

There is growing empirical evidence of ASD based on the AR as an instructional medium across diverse disability groups. The meta-analysis of single-case design studies that emerged recently made AR an evidence-based practice in the case of autism spectrum disorder, with moderate to large effect sizes on communication and social skills [4]. Simultaneous research with the intellectual disability groups has shown the possibility of AR to be used in the delivery of academic material; Gulboy et al. (2025) have reported high scores in acquisition of science concepts in secondary students with ID with the help of AR simulations, but the researchers did not compare the retention of the material obtained after the intervention in the absence of the device [5]. By the same token, Bryant et al. (2024) created Interplay, an immersive AR, to address language learning in children with developmental communication disorders, demonstrating short-term gains in the use of vocabulary when applied in AR but having unresolved questions regarding the spontaneous transfer to non-AR settings [6].

**Sreelakshmi et al.,**

Pragmatic language skills are of special concern in this respect because the generalization problem is especially severe with them, necessitating their flexible application in untrained conditions, partners, and communicative functions. AR approaches in which practice is limited to highly structured virtual settings run the risk of developing what has been termed as island skills because they are unlikely to be transferred to the fluid and unpredictable aspect of classroom discourse [7]. Some of the recent solutions to this constraint are AR-enhanced supported employment programs of adults with intellectual and developmental disabilities, where virtual job coaches were gradually faded away to minimise reliance on in-person support whilst still performing the task [7]. These strategies indicate that technology may be specifically implemented to encourage independence in cases where withdrawal protocols are included in the intervention architecture prior to implementation. In addition to this applied work, an emerging body of immersive AR research with students with intellectual disabilities has started to report implementation-related factors that influence generalization, such as opportunities to practice via peers and strategies that the teacher, when switching between scaffolds, may implement to support this practice [8]. The research on language learning also underlies the design of the scaffold. In a 2025 systematic review of AR in language acquisition, multimodal input integration and contextual embedding were found to be major processes that enable the maintenance of vocabulary and syntactic building [9]. Nevertheless, another generalized and important methodological limitation noted by the review is that less than 15% of the studies involved delayed post-tests without AR, so retention was not largely measured. This evidentiary gap is particularly significant to MID learners whose more intensive and protracted fading sequences are necessitated by the slower acquisition of procedural knowledge. Devices, in turn, cannot be evaluated by weighing the results of device-free performance, and thus, educators are unable to distinguish the actual skills acquisition from the short-lived improvement of performance based on the use of technology.

This gap needs to be filled through intervention protocols that put a scaffold withdrawal process into measurable fidelity criteria and retention measures. Design-based implementation research provides an appropriate approach of methodology as it allows further refinement of the fading procedures in real classroom settings and creates practice-ready instruments to be used by educators [3]. The current research is a reaction to this urgent need, and it constructs and tests the replicability of an intervention scaffold withdrawal protocol to teach AR-enhanced orality instruction to MID learners. The protocol, based on the prompting theory and guided by the results of AR implementation, incorporates using a three-phase fading sequence (full modeling - partial cueing - independent production) with the explicit evaluation of the retention under device-free conditions. The methodology of this will be to fill the translational gap between gains produced through technology and the long-term and generalized communication competency in a way that enables the MID learners to effectively communicate not only behind the screen but also in reality.

METHOD

Participants and Selection Procedures

The sample population included 24 learners with mild intellectual disability (MID) who were selected in two self-contained upper-primary classrooms in a special educational institution. Lane A (Intervention modules) depicts the repetitive structure of AR-oracy learning activities provided during the program (they include): (i) soundscape listening activities to prompt the listeners into attentive listening and listening to sounds, (ii) structured sentence-frame routine (I hear __) to standardize the opportunities to use vocabulary and express verbally, and (iii) pragmatic avatar role-play to rehearse the functions of conversation (e.g., initiating, responding, taking turns) under the supportive conditions. Lane B (Scaffold levels) is a visualization of the three-phase scaffold-withdrawal process, where the AR-based supports are reduced systematically, including:

Phase 1 (Weeks 1-2) which focuses on full multimodal scaffolding (high scaffold density; audio models and visual prompts enabled to maximize successful responding), Phase 2 (Weeks 3-4) where scaffold is reduced (less scaffold available, longer wait time before prompts, and shorter supports), and finally Phase 3 (Week 5) Measurement points

**Sreelakshmi et al.,**

and outcomes are found at Lane C (Assessments and outcomes): at Pre-test, baseline oracy performance is established and at Post-test, immediate gains after the scaffolded phases of assessment are determined and at the end of Week 5, retention without AR is assessed by the means of the Delayed post-test. The lane also denotes a 15-min naturalistic free-play observation that is applied to code the spontaneous frequency of communication (unprompted verbal initiations and communicative acts required by a situation). The figure also incorporates the Retention Index (RI), which is the measure of the quantification of maintenance in comparison with short-term profits: $RI = (Delayed - Pre) / (Post - Pre)$, in which increased values reflect greater retained learned improvement following scaffold removal. Lane D (Fidelity monitoring) is a summary of implementation controls that assist in implementing interpretability (a scaffold-status checklist documenting the active supports per session, dosage logs showing exposure, and field notes describing contextual supports and scaffold modifications). The figure is also supposed to give a publication-ready summary of the protocol logic between scaffold fading and device-free retention, coupled with generalized oratory results.

The eligibility criteria was carefully designed to achieve methodological rigor and at the same time the heterogeneity of this population: (a) formal school documentation of diagnosis of MID and placement in a specialized support classroom; (b) chronological age of 9-13 years old to maintain developmental homogeneity in the upper-primary range; (c) functional hearing and eye-sight to be able to engage with tablet-based augmented reality interfaces without the need of sensory-based accommodations; (d) baseline expressive language ability allowing at least single-word utterances to ensure meaningful. Students with unmanaged sensory-seeking or aggressive behaviours that would have made using tablets together unsafe were also not included after discussing the situation with classroom behaviour experts. This is a systematic screening method in line with methodological protocols that focus on exact participant characterization in vulnerable populations to increase internal validity and contextual understanding of the greater effects of interventions [11]. Care givers gave informed consent in writing, and developmentally appropriate assent procedures were applied to each of the learners before baseline assessment. In the classroom, the sitting configuration changed to stable dyads with a 1:2 device proportion, deliberately pairing up learners with complementary communication profiles, which would help scaffold each other in turn-taking sequences with equitable AR exposure among the participants.

AR- Oracy Intervention Materials and Socio-Technical Design.

The intervention used a tablet-based AR application that had been designed as a socio-technical system whereby technological elements had their relationship with pedagogical practices and classroom ecology in a dynamic way. The instructional content was structured into three sequentially connected modules that addressed the foundational oracy domains: (1) soundscape listening activities that required identifying and describing the stimuli in the environment as sound; (2) structured sentence-frame production, in which the participants had to scaffold vocabulary retrieval and syntactic construction with a consistent linguistic framework, that is, through the constant linguistic stem I hear [and] in a pragmatic avatar role-play scenario, involving the functions of greeting, requesting, commenting, and responding. Multimodal scaffolds were incorporated in the AR space, such as dynamic visual icons that were overlaid with real-life objects, audio spatial models that showed target utterances, highlight cues, and stepwise prompts that gave directions to turn-taking patterns. This design philosophy did not view AR as a technological artifact in its own right, but as a part of a larger ecosystem of instruction in which human mediators, peer communication and classroom environments jointly determined the results of interventions, a view that is increasingly being regarded as a condition of sustainability in the implementation of digital tools in complex educational institutions [14]. The scaffold parameters could be programmatically modified to allow the scaffold to be manipulated in a precise way during the withdrawal protocol, with all the stimulus materials loaded beforehand to reduce technical interruptions during the instructional time.

Three-phase Scaffold-Withdrawal Protocol Implementation.

A five-week scaffold-withdrawal sequence was adopted based on systematic fading logic, based on comparative intervention research methods, which focus on the systematic manipulation of parameters to control active ingredients [12]. Phase 1 (Weeks 1-2) presented complete multimodal modeling, where audio samples would be

**Sreelakshmi et al.,**

played automatically before the learner would be allowed to give their response, visual symbols would be present continuously through task execution, and role-plays would be conducted by avatars and have built-in pauses to be imitated. Teachers provided instant feedback and corrections on their answers, with intra-feedback repetition chances in case of non-target answers. Phase 2 (Weeks 3-4) realized partial cueing by reducing scaffolds: audio models changed to on-demand activation after a 3s time delay, visual icon density was halved, where only task initiation cues were used and avatar scripts were trimmed down to a minimum of pragmatic cues that learners had to produce connecting language. This stage focused on self-initiation of the learner in terms of graduated time delays and planned reinforcement of spontaneous attempts. Phase 3 (Week 5) involved independent production with AR scaffolds reduced to a minimum of stimulus presentation only; audio models were dismissed unless learners had made more than a pre-established error threshold of three consecutive non-responses, boundary markers were substituted by minimal ones, and role-play prompts were limited to naturalistic conversational openers. More importantly, this step involved specific transfer trials where the learners were asked to explain new sounds in the environment or classroom setting without any AR mediation, and intentionally introduced a chance to transfer the skill in different contexts.

Data collection procedures and analysis.

At pre-test (Week 0), immediate post-test (Week 5 with AR), and delayed post-test (Week 5 without AR), three major outcome measures were measured to separate the effect of retention. An oracy rubric that was domain-specific produced standardized scores in the areas of listening comprehension, vocabulary precision, and verbal expression fluency using the same task prompts across all the timepoints to create measurement equivalence. An unprompted communication frequency was coded in a 15-minute, device-free, naturalistic free-play session in Week 5; trained observers of phase progression recorded verbal initiations of the participants, such as peer-directed commentaries and requests, as well as verbal responses. Inter-rater reliability was determined by means of double-coding 25% of sessions in order to achieve 85% agreement by Cohen's kappa. The multi-method evaluation plan is representative of the growing best practices in assessing the interventions of assistive technology, where the structured performance and the unstructured application have to be recorded to prove the allegations of internalization of skills [15].

Fidelity Observance and Enactment Situation.

The aspect of loyalty was checked by a multi-component system that is concerned with adhering to procedures and adapting implementation. A checklist taking place at a specific phase was used to record real-time scaffold parameters, audio model activation status, icon density levels, prompt intrusiveness ratings, and role-play scripting fidelity. Field notes utilized contextual adaptations such as peer-pairing stability adaptations, sensory accommodations to the individual learners, and educator scaffold mechanisms that were used when the learners had difficulty with phase changes. Dose measures were used to determine how much exposure was experienced by the session, and rates of session completion. The percentage of planned scaffold conditions applied per session was computed as a measure of fidelity on a weekly basis, and any deviation in the conditions led to collaborative problem-solving between the researchers and teachers to ensure the integrity of the protocol whilst being sensitive to classroom realities. This framework of responsive fidelity admits that strict adherence to protocols can harm the implementation in a complex educational setting; instead of following them strictly, it utilizes a trauma-informed disposition, which puts the emotional safety and interest of learners as a priority, recording any adjustments to the implementation and reporting them in a systematic manner [16]. Since the research involved a small sample by the nature of specialized classroom settings, methods of analysis were focused on both individual growth profiles and patterns of groups, a methodology that is also valid in small sample intervention studies where such assumptions of power might not hold, but descriptive information about practice can yield practice-relevant findings [17]. The procedures were all ethically approved by the institution, and the data collection protocols focused on being transparent about AR's temporary supportive role to set the expectations of the participants and educators about the dependence on technology and the use of skill acquisition [13].

RESULTS

Systematic enhancement of oracy performance was identified through quantitative analysis, and patterns of retention became different after the removal of the devices. Table 1 shows domain-specific scoring of the rubric scores before the test, immediately after the test (with AR), and the delayed test (without the devices). The technical fidelity of implementation controlled by AR was always high (94.2% compliance of scaffold parameters during program implementation), and the visual overlay consistency and synchronization of audio models achieved the level of industrial-grade reliability required to ensure a consistent learner experience [18]. The unprompted verbal initiations in the 15-minute device-free free-play session resulted in a mean of 8.3 (SD= 2.7) unprompted verbal initiations. Students who were subjected to high fidelity demonstrations of the partial cueing phase (Weeks 3-4) showed a much better rate of spontaneous initiation ($M = 9.6$, $SD = 2.4$) than students who had fidelity deviations during this critical transition period ($M = 6.7$, $SD = 2.1$; $t(22) = 3.14$, $p = .005$). Multimodal scaffold features, especially the time correspondence between visual symbols and spatial sound models, were useful in creating a strong stimulus response association that lasted even after the removal of the device [19]. Table 2 presents the Retention Index (RI) values based on the domains, in addition to the spontaneous communication rates stratified on the basis of the fidelity compliance in Phase 2 (partial cueing). High-fidelity participants attained the RI values near 0.90 across domains, which is reflective of almost full maintenance of the gains of the interventions, but low-fidelity participants had an RI = 0.68 on average, which is indicative of partial skills loss after the removal of the scaffold.

No negative cases were reported regarding the use of AR. Students stayed active until the end of the five weeks protocol (average attendance at sessions = 96.3%), with field notes showing that students were motivated until the end of the scaffold fading process. The gradual decrease in audio models and visual icons did not trigger the frustration or refusal of tasks when introduced over time in accordance with the time-delay parameters prescribed, which could indicate that the fading sequence corresponded to the regulatory abilities of the learners. The technical maintenance needs were not high (average 4.2 minutes a week to charge devices and update software), which contributed to the viability of sustained implementation in the community of limited resources of special education institutions [22]. Both behavioral engagement log motivation metrics indicated no difference, or increasing on-task behaviour (Phase 1: 87.4%; Phase 2: 89.1%; Phase 3: 91.3%), which is contrary to the worries that scaffold reduction would reduce learner investment [23].

DISCUSSION

The current results support the hypothesis of scaffold withdrawal as one of the options of attaining device-independent oracy competence in MID learners. Importantly, the retention was not independent but constrained by the implementation fidelity at the partial cueing stage, when the learners started to forget the support and be self-regulated in performance. This highlights the fact that the value of AR is not in its ability to be persistent but in the accuracy of its strategic elimination. Under conditions of the protocol-based gradual fading of multimodal scaffolds, learners acquired communicative routines to a degree of internalization to a level of nearly complete maintenance (RI = 0.90) and more spontaneous initiations in natural settings. On the other hand, any deviations at the partial cueing stage induced meaningful skill decay that showed this phase as the critical leverage point of the intervention.

The high retention of high-fidelity participants defies assumptions of deficit orientation on the capability of MID learners to generalize their skills. Instead of the need to have their own permanent technological supports, these learners were able to transfer routines mediated by AR to the device-free situations when fading sequences considered their cognitive pacing, namely, through graduated time delays and progressively reduced density of icons. This is in line with the participatory design principles that place the learner agency in the technology integration when the scaffolds were dropped in response to the learners instead of randomly, that the learners began to foster communicative self-efficacy that was not generated by the scaffolds; they expressed this indirectly when engaging in free play with peers without scaffold support [20]. The lack of motivation decline during fading also

Sreelakshmi et al.,

further supports the lack of prompt-dependency narratives, indicating that properly structured withdrawal can increase instead of being detrimental to engagement in situations where learners are presented with incremental success. The Retention Index was methodologically useful in separating short-term performance boosting effects and true acquisition of skills, which is often not as clear as it could be in the case of assistive technology studies. The RI revealed significantly heterogeneous maintenance when compared to initial gains, which would otherwise not have been visible without quantifying maintenance. This strategy is echoed by the new model of personalized intervention, where outcome measures are individualized based on the learning process instead of applying consistent standards [21]. Future AR-oracy protocols could incorporate these dynamic measures in order to initiate timely scaffold changes, instead of relying on fixed fading schedules of scaffold changes into responsive ones that respond to real-time learner performance.

CONCLUSION

There are a number of limitations that are worth considering. Although the sample chosen is suitable for a design-based implementation study, it is confined to making generalizations across different levels of the MID severity and across different cultural settings. Moreover, the five-week schedule might fail to include longer-term retention patterns. However, the observed low technical maintenance load facilitates scalability to the normal range of special education resource limitations. To create a sustainable effect in disability cases, AR applications have to meet two criteria: technological resilience to ensure regular delivery and pedagogical deliberateness in the sequencing of scaffolds [24]. This paper has shown that by creating AR systems, not only engagement but also planned obsolescence, which is required less often over time, can lead to the creation of enduring communication competence beyond the technology. Future research must investigate the possibility of similar withdrawal procedures employed in other assistive technologies (e.g., speech-generating devices) producing the same independence results, which may make scaffold fading a cross-cutting concept of technology-mediated intervention design in special education.

ABSTRACT

Mamang Dai is a well-known writer from the northeastern state of Arunachal Pradesh. Her writings reflect the indigenous culture and traditions of Arunachal Pradesh. Her works illustrate the themes nature, land, memory and identity. This research paper analyses the novels *The Black Hill* and *The Legends of Pensam* and discusses the concept of land as a living entity. Here, the paper portrays how the land is associated with indigenous culture, beliefs and traditions. The researcher analyses the paper through an ecocritical lens, highlighting the cultural dimension of land. The novels describe the natural world, the mountains, the rivers, the forests and the land as a source of knowledge and emotion. The paper concentrates on the relationship between man and nature. The novels show that the failure in the man-nature relationship results in loss of identity. This paper has asserted that Mamang Dai's novels promote a vision for a harmonious coexistence between nature and man, where the role of the land is essential to man's survival and indigenous knowledge.

Keywords: - Culture, Ecocritical, Identity, Indigenous knowledge, Mamang Dai.

INTRODUCTION

Mamang Dai is a well-known Indian writer from Arunachal Pradesh. Dai is a Poet, Novelist, and journalist who is known for her thoughtful engagement with the culture, history, and ecology of North East India. She is honoured for her contributions to the region's indigenous traditions and cultural heritage. Being an Adi tribe woman, she was the

Sajana and Muththamizh Selvi

first woman IAS officer in the state. After serving in the civil services, she took up journalism and worked with the WWF. Dai has been honoured with several accolades, including the Padma Shri and Sahitya Akademi Award. Dai's notable works are *The Legends of Pensam*, *The Black Hill*, *Stupid Cupid*, and *Escaping the Land*. The selected novels for study are *The Black Hill* and *The Legends of Pensam*, which deliberately paint the importance of land in the novels. Land is the source of survival for human beings. Humans who believe in nature are flourishing with nature. Tribal people live close to the environment. They have managed and preserved it for a long time. In indigenous traditions, land is not a passive backdrop but an active participant in human life. The stories of Dai also reflect the same when she describes mountains, rivers, and forests as having their own presence and association with the lives of people. The land is considered a living entity, explained as, "Dai's landscapes are not passive settings but living presences that interact with human lives and shape their emotional and cultural realities" (Gogoi, Kalita, and Satola). This paper analyses the land as a living, cultural, and ecological entity.

LITERATURE REVIEW

Mamang Dai's writings are analysed under the lens of Ecocriticism, Indigenous Studies and Cultural Ecology. Here, Dai depicts land as a living, spiritual, and cultural entity. Critics analysed land as a repository for memory and identity, which is explained as, "land in Dai's fiction functions as a site of belonging, where cultural memory and identity are preserved and transmitted across generations" (Ghosh 47). Raval also emphasises the significance of oral traditions and folklore in forming Dai's conception of land. Raval claims that *The Legends of Pensam's* narrative structure is reminiscent of indigenous storytelling customs, in which myths and legends are intimately associated with the natural world (Raval 118).

Theoretical Framework: -

The concept of Ecocriticism is a tool to analyse the myths, beliefs and traditions of indigenous people. They are living with nature and identify it as their living entity. Mamang Dai's works deal with Indigenous culture and traditions, which is beyond traditional Ecocriticism. The novels deliberately explore the reimagining of land as a sentient, interconnected entity in which ecological vitality and cultural identity are intertwined.

Land as a Living Entity: -

Mamang Dai has portrayed land as living and how it interacts with human beings. Here, land acts as a mediator between physical and spiritual dimensions, and it connects the living with their ancestors. Monica and Nayak describe land and spiritual ecology as, "land is not merely material but spiritual, forming a bridge between the visible world and ancestral realms" (Monica and Nayak).

Mamang Dai describes land as a wise elder in the novel *The Legends of Pensam*. The novel is based on the Adi tribes living in the hilly region. Here, the word Pensam means "the land of the fairy people", which suggests a touch of magic in its life. Rivers, forests, and hills share their thoughts through myth and rituals. Dai describes rain as, "The hills were blue, their outline rimmed in black, and the trees were still. Soon, the first fat beads of water would tear the giant leaves of the wild yam. Then fierce, hissing rain would cover the land like the sea" (Dai 36). Dai depicts the belief in the religion of Donyi-Polo in the novel. They believe in the sun and the moon as givers of life, but the land is at the base of their religion. They must respect land spirits while hunting, or else they will be in trouble. There is a story of a forest remembering past injuries inflicted upon it by loggers, growing wild to retaliate. When the land is injured, it expresses anger and emotions, whereas when it is treated well, it showers kindness. This is the character of a land.

The Black Hill explores land with history and love. The novel revolves around the love story of Adi tribe Gimur and Mishmee tribe Kajinsha. The land believes in spirits, myth and folklore traditions. Kajinsha's father performed rituals in the snowy mountains for tribal peace, but the God didn't answer his prayers. Dai express the importance of land through the words of Kajinsha's father. He stated, Land is a place of ownership and rest, Kajinsha's father had said

Sajana and Muththamizh Selvi

over and over again. 'If a man clears the forest and builds a house and harvests his fields the land belongs to him. If a man owns land, he owns rest. He can live his life with nothing to worry about. He can plant crops and fish in the river, and he can raise his sons and daughters and live on from generation to generation'. (Dai 112) In the novel, the land is connected with human emotions and experiences. The physical landscape influences the development of the characters' identities. And the landscape mirrors the struggles and triumphs of the indigenous people. Dai suggests a holistic view of the world where land and human culture are inseparable. Dai expresses "The land is our book. Everything here on this hill, the grass and rocks and stones, is saying something. And what falls from the sky- rain, thunder and lightning—are also the voices of spirits telling us something" (Dai 140). Indigenous tribes believe land is their identity, which helps them to survive in the world.

Land and Cultural Identity: -

In Dai's novels, the land serves as a reservoir of cultural memory, storing tales, myths, and histories and defining the people's cultural identity. Fatih Mehmet Berk said, "Cultural identity is generally associated with myths" (2). Here, Dai constructs myths to reflect the foundation of cultural identity. The novels explain that myths are an integral part of the daily lives of people. Myths about spirits, ancestors, and nature are what give meaning to the people's understanding of self and the world.

In the novels, they believe in shamans. The Shamans act as the bridge between humans and the spiritual world. Tribal people trust that their ancestors foretell their future in the form of dreams. The Shamans have the unique knowledge to interpret the dreams and explain the context to the tribes. As the novel indicates, "dreams are not to be ignored; they are voices that must be understood" (Dai 82). Dai reveals their belief system through Shamans. In *The Blak Hill*, land has a similar significance in relation to identity. The novel portrays how Aboriginal communities get their sense of belonging from their relationship with the land. It shows how myths, rituals, and ways of living come from their relation with nature. Dai expresses it as, "The land had a heart of its own, a voice and language that beckoned him" (Dai 113). The land is considered sacred, where the spiritual and natural world converge. Land is the essential part of survival. It helps people to live in a peaceful environment without hunger. It is explained as, "We belong to the land. The land is a good mother. I take only what I need. Animals and trees offer themselves. We help each other survive. Tell me, Priest, what do you think of our land?" (Dai 141). Here, Dai portrays land and nature as alive, and they influence beliefs and practices. Tribes think of nature as a tool of survival, and they use rituals to protect it against outsiders.

Land and Ecological Dimensions: -

The works of Mamang Dai offer a rich and profound ecological vision, where land is not just a physical or geographical concept, but a living, dynamic and culturally constructed concept. In Mamang Dai's novels, land is depicted as a major force that influences one's identity, culture, and an indigenous ecological perspective. The author's works challenge anthropocentric views and offer a holistic understanding of the human-nature relationship. The Adi tribes live in a community where people live with nature. They follow the traditional way of life, without disturbing the ecological balance. However, Arunachal Pradesh is now experiencing rapid changes in socio-economic, political, and environmental areas. This paper analyses the traditions of Adi tribes and their ecology of land, which has faded in modern civilisation. Here, the paper uses ecocriticism as a tool to identify the ecological imbalance and its impact on human civilization. Dai expresses nature's healing essence as, "When you look at the land you forget your aches and pains" (Dai xi).

In the novel *The Legends of Pensam*, land is considered a memory. It is a place where myths and traditions are bonded together. The habitat of Adis in the forest is considered to be their real identity and consciousness. The relationship between the human world and nature is sacred for the Adis. But the arrival of the Britishers in Arunachal Pradesh considered their traditions to be useless and implemented their modern ideas. Though the villagers of Adi agree on a few developments like roads and houses, the Migluns convert the land into a free trade zone, which is expressed as, "land and river convoys, officers, traders and porters moving in all directions. The villagers saw the lights of pigo from their hilltops and were seized with a desire to learn new things, or at least to examine them and find out what it

**Sajana and Muththamizh Selvi**

was all about” (Dai 91). Closely associated with the above concept is the theme of interconnectedness, which pertains to the relationship between human beings and nature. The stories in Dai’s works highlight the interconnectedness of human life with the ecological system. In the novel, the daily routine, rituals, food habits, and narrations are closely associated with the natural environment. The environment is not separate from human culture but is an integral part of it. The concept of interconnectedness is one in which the world is seen as a balanced system in which human beings are an integral part of nature. When the developments destroy the ecology it affects the identity of the tribes, as stated in

This was the last village on the administrative map. Anyone looking at the hills from the highest point in it would see the river coiled like a shimmering snake in the still, green jungle... It was a landscape out of a dream... the village had moved to its own quiet rhythm for centuries... but the road was changing all that... The red gash turned in great loops and bends and plunged into the heart of the far mountains, trying to reach the scattered villages buried deep in the land of mist and wild chestnut. (Dai 148).

Along with colonialism, Dai also examines the problems associated with modernity and cultural change. The paper analyses how the gradual encroachment of modern ways of living results in a decline in traditional ecological ways. When the younger generation loses knowledge of cultural heritage, they lose their own identity. They forget about the sacredness of land and its importance for survival. Mamang Dai expresses it in her work as, “Land was being stolen. Forests were being cut and logs floated away down the river. New fences marked old territory and it seemed a curtain had fallen over the old villages. What was once sacred, the old sense of joy, was being lost” (Dai 163).

Dai’s novels also show a clear ecological ethic in action, one in which the indigenous people live in harmony with nature, only taking from the earth what they need, in a balance of use and preservation. Colonial intrusion and environmental disturbance are evident in the novel *The Black Hill*. The novel discusses the effects of colonial intrusion and how it affects the ecology and culture. The outsiders bring their own system to destroy the sacredness of the native land. The developments of infrastructure and the activities of missionaries are used to symbolise the intrusion of alien ideas. It is expressed as, “The arrival of the priest had changed the landscape. How could he have climbed these mountains? He had legs the colour of ivory, she had seen them once he was crossing a stream and he had pulled up his robe” (Dai 180).

In reading both novels, the researcher understands that land is a sacred and living entity of indigenous tribes. The novels discussed the importance of myths, beliefs, and spiritual elements to understand the culture of the tribes. Here, their culture is deeply rooted in the environment. Without their land, they can’t survive. Because it is their land provides them with identity.

CONCLUSION

The research paper offers a nuanced and multifaceted exploration of the idea of land and ecology. By depicting the land as a living and sacred being with knowledge and wisdom, the author challenges the dominant anthropocentric and colonial discourses on the idea of land and ecology. Here, Mamang Dai not only seeks to preserve the traditions of the indigenous people but also contributes to the contemporary discourse on ecology and the environment.

ABSTRACT

Artificial Intelligence (AI) has rapidly transformed various aspects of our lives, including the field of education. Undergraduate education, being a critical stage in a student's academic journey, has witnessed significant changes due to the integration of AI technologies. This abstract provides an overview of the dynamic and multifaceted landscape of artificial intelligence (AI) usage in the educational realm. The study explores the patterns of AI usage, its impact on learning, and the underlying reasons for undergraduate students' engagement with AI-driven chatbots. Utilizing a mixed-methods research approach, combining surveys and interviews, the investigation unveils distinct usage patterns among students, showcasing the multifaceted roles of AI in their academic journeys. The investigation dissects the influence of AI tools on students' comprehension, problem-solving skills, and its potential impact on independent thinking. The study also confronts challenges and concerns associated with AI utilization, including ethical considerations and worries regarding academic integrity. This study contributes to the growing body of knowledge on the integration of AI in education and serves as a foundation for informed discussions, policy considerations, and recommendations to harness the potential of AI tools in enhancing undergraduate learning experiences.

Keywords: Artificial Intelligence (AI), AI-driven chatbots, undergraduate education, students, usage pattern, challenges and concerns.

INTRODUCTION

Background of AI in Education

Education, like virtually any other industry, is indeed undergoing very radical changes and developments through AI. The use of AI tools within learning environments has dramatically changed the practice of student access to content, instructors, and each other. From the use of adaptive learning platforms to AI-driven tutoring systems, artificial intelligence in education has spread extremely fast and therefore offered personalized and flexible learning experiences. Such systems can trace student learning, predict learning needs, and offer individualized recommendations to those promoting learning individualization, as well as increase access to education for diverse learners (Shawar & Atwell, 2007). Especially for that reason, it has been very helpful for students who have unique learning styles, learn at their own time, and get instant feedback.

For facilitating HCI in education, AI tools such as chatbots are essentials. These chatbots, as human-like conversations, are simulation tools that can help students in real time by answering their questions, clearing things up, providing other resources or readings. AI-based systems further help to smoothen the processes required administratively in such a way that several numbers of students could be handled without trying to offer individualized support. For instance, AI-tutoring systems can adjust the difficulty level of the task to fit the ability level of the student in such a way that there is a challenge presented with support for the learner in terms of growth and development (Baidoo-Anu & Owusu Ansah, 2023).

However, despite these promising features, an intensive use of AI in education has a number of challenges facing it, some of which major and generic concerns include: The reliability and trustworthiness of the AI system regarding its interaction with different students. With this, AI tools, specifically the ones applied in language learning or content generation may sometimes fail to recognize specific dialects or accents or cultural context. For example, some AI-based voice recognition software is not fluent in all languages; this can be exploited against the interest of non-English speaking countries' students or people with a strong regional accent (Rudolph et al., 2023). This is quite relevant to the concepts that require critical thinking rather than relying on answers produced by AI; this can degrade the skill development of students in concern to analysis and innovative skills.

There are also some ethical issues when AI is used in teaching. AI needs to collect data, which raises privacy and security concerns over data and what happens to all the collected information with personal data. The institution should ensure that the student's data will be kept safe and also provide how the data utilised comes into view. Moreover, some biased algorithms have powered applications of AI; these reflected societal or cultural prejudices that further pushed certain student groups into marginalized roles. Appropriately safeguarding students from such risks must be correlated with accessing the benefits AI can deliver to students for greater effectiveness in learning (van Dis et al., 2023).

There are some challenges to implementing AI in education, including its risks and the complexity of usage. Nevertheless, AI in education presents some undisputable transformative potential: it can assist in developing a curriculum, supporting students with disabilities, and even assist the instructor in grading assignments, recognizing or identifying areas in which students require additional support. AI systems are increasingly adopted within higher education institutions to help in predictive analytics about the identification of students who are lagging and providing timely interventions to aid a student's journey through an institution. Till date, the impact made by AI in this regard is more relevant in a globalized world wherein universities and colleges will have students belonging to different cultural and linguistic backgrounds and hence would like to keep abreast of students belonging to diverse cultures, for AI does seem to bridge the gap with the delivery of tailor-made education.

**Mythili and Mayildurai**

Although it is well understood that the transformation AI made in education has been highly transformative, it raises a complex bundle of challenges that institutions need to travel through. AI is well integrated in the education process concerning the way it has its benefits counterweighing potential risks such that all students will be there to enjoy the benefits that AI offers in a non-marginalized way due to the limiting constraining limitations. Such a delicate balance in attaining a totally inclusive, progressive, and an evolving education system can easily ensure that it meets the requirements of the 21st century (Frieder et al., 2023).

Importance of AI in Undergraduate Learning

The integration of AI tools into undergraduate education provides an excellent learning experience through real-time and personalized facilitation to help the students master complex information and develop critical thinking. AI systems include intelligent tutoring platforms and adaptive learning technologies, therefore addressing various styles of individual learning, as well as paces, thereby making the process more efficient and engaging (Liu et al., 2021). It aids students in getting deeper insights into subject matter and develops their ability to independently solve problems. With AI, therefore, there is a greater opportunity for interaction that would enable the student to engage thoroughly with the content and apply what they know in different academic and real-life settings. This will prepare them for professional challenges and further studies because of intellectual autonomy and technical skills. Undergraduate education will be more exciting, student-centered, and focusing on aspects related to continuous improvement and critical thinking through these AI-enhanced methods.

Rationale for the Study

Its application and impacts about undergraduate education in Tamil Nadu remain relatively under-explored despite its vast uses in various industries. While educational institutes in the region only begin to include AI-driven tools in the pursuit of improving results, relatively little empirical work has been conducted to investigate the way in which such technologies are being used by students. Important areas of concern to both educators and policymakers relate to the interactions of students with AI platforms and the motivations of using such applications, their impact on academic performance and experience. Understanding these dimensions would be important in developing tailored applications for specific needs of students and in improving quality in education generally. Given the concentration of higher education in Tamil Nadu, in such a context, the findings of such a study could be useful both at the institutional and policy levels toward embedding AI into education both in effective and equitable ways. A specific need identified with the existing body of literature is this gap for consideration of these particular issues with AI integration into education in this region.

Research Objectives

The present study will attempt to:

- Record the usage patterns of AI among undergraduate students in Tamil Nadu
- Identify the motivations and causes for engagement with the usage of AI-driven educational tools among students
- Examine the impact of AI tools on the academic performance, problem-solving abilities, as well as independent thinking of students
- Examine ethical issues arising from the use of AI in performing academic tasks; there comes the question of plagiarism and originality in it.
- Suggestive input on responsible inclusion of AI in undergraduate learning.

LITERATURE REVIEW

AI in education is fast catching up worldwide since it offers new vistas for re-vision of teaching-learning methodologies. According to Liu et al. (2021), "AI tools in education improve student engagement, reduce learning gaps, and allow for personalized instruction." Supplemental to teaching in classrooms, developed countries can use Coursera, EdX, and other platforms. Chatbots are the devices in AI which make possible a human-to-human-like conversation. In academics, chatbots like ChatGPT will be of great use in furnishing speedy responses, teaching the

**Mythili and Mayildurai**

students, and helping them with homework. "AI-driven chatbots can provide students with on-demand access to academic support, which could benefit students seeking to require flexibility in their learning schedule, says Clark & Lee, 2020. The literature incriminates that AI tools are going to result in positive learning outcomes through adaptive learning experiences attuned to each learner's specific needs. According to Park et al. (2019), one student "who had used an AI-based platform reported the following: "Such a tool helped them to channel their efforts toward problem areas, with immediate feedback provided." AI in education raises ethical concerns on academic integrity from the student's side and even their own personal data. Indeed, Anderson, 2022 discussed that "many students unwittingly engage in plagiarism while using AI tools to complete their assignments." This is aggravated by the issues that the students misuse AI-completed written content without working out the information.

Many works have already been undertaken on the general global impact of AI in education, but few were region-specific, such as in the case of Tamil Nadu State, where educational institutions are embracing new technologies at rates never before known. "As the need to explore local factors influencing cultural attitudes toward technology and education increases, which might influence how students use AI tools, these investigators took a more direct approach, they say," says Liu et al. This paper fills such lacunas by focusing on the experiences of undergraduate students attending universities within Tamil Nadu.

Research Design

This paper uses a survey method to collect data from undergraduate students from different institutions in Tamil Nadu. The questionnaire will be structured to gather details relating to the variety of aspects, and as aspects deal with specific varieties of scales over frequency at which AI tools are used, types of AI platforms they use, and what impact these tools make upon their results. The questionnaire designed had equal combinations of closed-ended and Likert-scale questions to allow for successive statistical analyses of the responses. This entire sample size was carried out through stratified random sampling which further brought about diversified academic disciplines. This made generalization possible to the findings of the **research** towards other populations of students. These data were then subjected to both descriptive and inferential statistics, with the interrelation between the trends regarding the applications of AI and scholarship determined. This quantitative methodology allowed us to have a wide scope view of AI integration into the undergraduate level while informing a qualitative later phase of this research. There were 84 students in undergraduate studies. As indicated above questionnaire link was circulated to the students ensuring random sampling method, inviting them to complete the anonymous electronic survey to help us with the study.

FINDINGS AND DISCUSSIONS**Demographic particulars of the respondents/ Students.**

The table below in Figure 1 depicts the demographic characteristics of the respondents in the study. Statistics of the data indicate that the sample population comprises equal males and females with a total number of 84 undergraduate engineering students who were surveyed. 63% of the students are, respectively between the age group of 18-20 years, 32% within the age group of 15-17, and only 2.38% within the age group of 21-23 years. There are no students of 24-26 years of age. All participants are enrolled in engineering. Arts, science, or medical not represented. This group assists in bringing a concentrated knowledge of the background of students who are engineers for further statistical analysis.

Awareness and Familiarity with AI Tools:

Figure 2 According to survey results, more students found out about the AI-based chatbots from the social media and online forums (40 responses), followed by educational institutions (20 responses) and recommendations from peers or educators (12 responses). Majority of the students have directly used the AI-based educational tools in the learning process, 26 have not, and 11 are not sure. Only 27 students are aware of the specific institutional guidelines on AI use, while 34 report no policies and 23 are not sure. This means that there is a call for more effective plagiarism awareness as well as clearer institutional policies about AI usage for academic purposes.

**Mythili and Mayildurai****Usage of Chatbots and AI in Academics:**

Further when we asked about chatbots, the statistics show that the students increasingly apply them, as well as AI for different purposes, that is, mostly for homework assignments at 57 responses, research articles at 41, and exam preparation at 40. Most of the students (23) also apply chatbots for essay writing purposes. While 45 students reported to often use chatbots in order to perform the assignments or coursework, 15 use them very frequently, and only 1 student relies on them immensely. More importantly, among the reasons the students used chatbots was to generate ideas or insights, improving the quality of writing, doing research, and saving time with their assignments. Although students increasingly rely on these tools, levels of use are uneven, and 23 reported rarely or never using chatbots for their coursework.

Looking ahead, 41 students plan to continue using chatbots for academic work, while 8 do not, and 35 are undecided. This suggests that while chatbots are valuable for tasks like idea generation and research, there is still caution among some students regarding their role in academic work. The data emphasizes the need for students to develop a balanced approach to using chatbots, ensuring that these tools are used ethically and in accordance with academic integrity policies.

Impact on Learning and Academic Performance:

The data in the figure illustrates that the impact that chatbots had on the understanding of course materials by students has been moderate. Indeed, 51 reported that chatbots had moderately enhanced their comprehension, whereas 9 reported a significant improvement, while only 1 reported an extreme benefit. However, a smaller portion of students felt that there was no improvement at all, accounting for 6 students. Academic performance wise, 38 mentioned that their grades improved since being part of the chatbot program, 3 of whom said they greatly improved. On the other hand, 37 said that there were no improvements in their grades, and some experienced a slight decline in grades at 6. When asked if AI enhances education, 39 say yes, based on personalization, and 10 think that it is true indeed that AI would help in letting them free the administrative burden. However, 19 believe that AI would eventually replace the human ingredient that is needed in education, and 16 are uncertain of any response. Overall, the data shows that AI tools such as chatbots improve learning and enhanced grade score for some learners; however, others believed AI had a minimal role to play in the overall community. Most of the participants felt that this advantage of personalized learning was one they found favored, whereas loss of human interaction with education remains one of the most important concerns that have existed to date.

Ethical and Privacy Concerns:

Figure examines that a significant number of students express complaints over issues of ethics and privacy in the course of applying AI in school. Of the respondents, 44 are worried about data privacy and security, 25 are not sure, while only 15 indicate that they are not worried at all. This brings a state of increased awareness of the risks that accompany AI application but uncertainty is rife.

From the ethical points of view, 29 know what could be at play, to mention just academic integrity and fairness, 26 do not, and 29 are not sure. Similarly, about unintentional plagiarism, 27 are concerned, 28 dismiss it, and 29 are unsure. These numbers suggest that although some students become aware of what is at risk in misusing AI most of the students do not understand what there is in terms of all related ethical implications. What is apparently more significant is that out of the students, 37 have never been taught how to use AI responsibly in their academics and 24 are unsure whether they have or not. This indicates the need for establishing clearer policies and education on the ethics of using AI appropriately in academic settings. Because AI becomes increasingly part of all education, these issues will be talked about through proper guidelines and training for maintaining academic integrity and protecting student privacy.

Challenges and Limitations:

The following table shows the results on percentages of students who have suffered during their learning career with AI-powered assistants. Of the total respondents, 32 complain that they have had problems, 29 reported no issues,

**Mythili and Mayildurai**

while 23 do not know whether or not they have had any. It could be mainly because of the flaws and errors that exist on the AI-generated work that 55 of the students have knowledge about. However, there are 17 students who do not know about these flaws while 12 were uncertain. In most instances, where AI sources like ChatGPT are not in use or would fail to apply, the student will opt for alternative means. The frequency at which students use other techniques can be ascertained by the following: textbooks stand atop with 49 followed by peer discussion or study group at 38. Personal research and reading ranks third at 30, while consultation with professors or instructors occurs at 28. Other method styles include traditional library research at 32, online academic platforms like Coursera or edX at 25, among others. In this regard, as indicated by the data analysis, there are many students who still maintain reliance on traditional methods even though AI tools are used most frequently in the education sector, which may indicate that AI cannot fully substitute for human contact and interaction, personalized guidance, or trusted academic resources. The results, therefore, show that although the advantages of AI exist, the limitation resides, and there is an indication that only when technology and traditional practices of learning exist in equilibrium can success in academics be holistic.

Future of AI in Education:

Students have mixed opinions with respect to how AI will unfold in education. It is because 25 believe that efficient teaching will be served and even replaced with AI, while 50 believe that human relations cannot be replaced. This means that it would amount to students valuing connection and help from educators a lot, which might be hard to deliver with AI. Considering the impact of AI tools like ChatGPT on the traditional classroom education, 27 students believe it to be an enhancement where learning is provided by instant information access and personalized support. Meanwhile, there are 26 students who believe AI will shift the role of educators towards mentoring inculcating thoughtful and reflective skills. Some of the students feel AI might reduce the need for old ways of teaching to a considerable extent whereas others are concerned about possible ethical and academic integrity issues. The data also shows that policy regulation is over AI usage. By considering this, 2 of 20 require clarity in guidelines. General point of view, AI is not to replace the human educators but should supplement them.

CONCLUSION

AI in education is considered as a step into promising advancement but one that gives concern to students. While some students feel that AI can provide effective instruction, most highlight the indispensable role that human interaction has in learning. AI tools such as ChatGPT have recently come to be seen as useful supplements to the traditional classroom form of education, providing a person-to-person approach, maximizing the access to information, and forcing educators to reinvent their new roles. However, most ethical issues, cases of academic dishonesty, and the appropriateness of getting over reliant on AI tools rise.

RECOMMENDATIONS

1. **Balanced Approach:** The institutions should embrace a balanced approach in which AI is used to complement the real teaching, but at the same time ensures the human element which enables meaning contact and mentoring as well as critical thinking.
2. **Guidance and Policies:** There has to be clear policies and guidelines regarding the adoption of AI tools in academic environments that do address issues of ethical use, privacy, as well as the issue of academic integrity.
3. **Teacher Role:** Educators should be inspired and guided to work on AI as a supporting tool and nurture more strategic thinking, problem-solving, and mentorship rather than mere knowledge distribution.
4. **Training Workshops/Seminars:** The ethical implications and constraints of AI should be taught to the students during regular workshops or seminars so that they properly use it while doing their formal assignments.
5. **Incorporation of AI Literacy:** As more AI tools are incorporated, educational institutions ought to include AI literacy in curricula, thereby giving students an added experience to better effectively and responsibly apply these technologies.

ABSTRACT

Advertising language plays a crucial role in shaping consumer perception and influencing purchasing behavior. The effectiveness of advertisements often depends on the strategic use of language that captures attention, evokes emotions, and persuades audiences. This study examines the stylistic features employed in advertising language and explores how these linguistic strategies contribute to persuasive communication. By focusing on various stylistic devices such as metaphor, hyperbole, alliteration, rhyme, and repetition, the research highlights the creative and rhetorical techniques that advertisers use to construct memorable and impactful messages. The study adopts a stylistic approach to analyze selected advertising digital media. Through qualitative analysis, the research identifies recurring patterns of language use and investigates how stylistic elements enhance clarity, emotional appeal, and brand identity. Particular attention is given to the ways in which advertisers manipulate vocabulary, sentence structure, and sound patterns to create concise yet powerful messages that resonate with target audiences. The findings suggest that stylistic devices play a significant role in making advertisements more engaging, memorable, and effective in communicating brand values. The research also emphasizes the importance of linguistic creativity in modern advertising, where competition for audience attention is increasingly intense. Ultimately, this study contributes to the broader understanding of how stylistic analysis can reveal the underlying mechanisms of persuasion in advertising language and highlights the relationship between linguistic form and communicative function in media discourse.

Keywords: Stylistics, Advertising Language, Persuasion, Figurative Language, Media Discourse, Rhetorical Devices

INTRODUCTION

Language is a powerful tool in shaping human perception, behavior, and decision-making. In contemporary society, advertising has become one of the most influential domains where language is strategically employed to persuade and influence audiences. With the rise of digital media platforms, advertisements have evolved from simple informational messages to highly sophisticated communicative constructs that rely on linguistic creativity and stylistic innovation. Advertising language is not merely descriptive; it is inherently persuasive. It aims to attract attention, generate interest, create desire, and ultimately drive action. The success of an advertisement often depends on how effectively language is used to connect with the target audience. In this context, stylistics—the study of linguistic style—provides a valuable framework for analyzing how language functions in advertising. This research focuses on the stylistic features of advertising language in digital media. It examines how rhetorical and linguistic devices such as metaphor, hyperbole, alliteration, rhyme, and repetition contribute to persuasive communication. By analyzing selected advertisements, the study aims to uncover patterns in language use and demonstrate how stylistic strategies enhance the effectiveness of advertising messages.

Background of the Study

The evolution of advertising from print to digital media has significantly transformed the nature of communication between brands and consumers. Traditional advertisements relied on lengthy descriptions and detailed explanations, whereas modern digital advertisements emphasize brevity, creativity, and immediate engagement. With the proliferation of social media platforms, consumers are constantly exposed to a vast number of advertisements competing for attention. This shift has made language a crucial tool for differentiation. Advertisers now employ stylistic and rhetorical strategies to create impactful messages that stand out in a crowded media landscape. Stylistics, as a discipline, provides insights into how language functions in specific contexts. In advertising, stylistic analysis helps uncover how linguistic features such as metaphor, sound patterns, and syntactic structures contribute to persuasion. Understanding these features is essential for analyzing the effectiveness of modern advertising practices.

Statement of the Problem

Despite the growing importance of digital advertising, there is limited systematic analysis of how stylistic features function in contemporary advertising language. While previous studies have explored persuasion in advertising, many have focused on psychological or marketing perspectives rather than linguistic analysis. Moreover, the rapid evolution of digital media has introduced new forms of communication that require updated analytical approaches. There is a need to examine how traditional stylistic devices are adapted and utilized in digital contexts to influence consumer perception. This study addresses this gap by analyzing the stylistic features of advertising language and exploring how these features contribute to persuasive communication in digital media.

Research Questions

This study is guided by the following research questions:

1. How do stylistic devices such as metaphor, hyperbole, alliteration, rhyme, and repetition contribute to persuasion?
2. In what ways do linguistic choices enhance emotional appeal and audience engagement?
3. How does advertising language construct and reinforce brand identity?
4. What patterns of language use can be identified across different types of digital advertisements?

Objectives of the Study

The main objectives of this research are:

- To identify and analyze stylistic features in digital advertising language.

**Chamundeshwari et al.,**

- To examine the role of figurative language in persuasive communication.
- To investigate the relationship between language and brand identity.
- To contribute to the understanding of stylistic analysis in media discourse.

Theoretical Framework

This study is based on stylistic and rhetorical theories, including:

- Foregrounding Theory (Leech)
- Rhetorical Figures (McQuarrie & Mick)
- Discourse Analysis (Fairclough)

These frameworks help analyze how linguistic features function in persuasive communication.

Foregrounding Theory (Geoffrey Leech)

Foregrounding Theory, proposed by Geoffrey Leech (1966), is a central concept in stylistics that explains how certain linguistic elements are made prominent in a text to capture the reader's or viewer's attention. The theory suggests that language in literary and non-literary texts often deviates from ordinary usage to create a striking effect.

Foregrounding operates through two primary mechanisms:

Deviation: This involves a departure from standard linguistic norms, such as unusual vocabulary, unexpected metaphors, or creative syntax. In advertising, deviation is used to surprise the audience and make the message more noticeable.

Example: "Think different." (grammatically unconventional but impactful)

Parallelism: This refers to the repetition of similar structures, sounds, or patterns. Parallelism creates rhythm and emphasis, making the message more memorable.

Example: "Buy more. Save more. Live more."

In advertising language, foregrounding helps highlight key aspects of a product or brand, ensuring that the message stands out in a highly competitive media environment.

Rhetorical Figures (McQuarrie & Mick)

The concept of Rhetorical Figures, developed by McQuarrie and Mick (1996), focuses on the use of figurative and stylistic devices to enhance persuasion in advertising. Rhetorical figures are creative deviations in language that produce aesthetic pleasure and cognitive engagement.

These figures are broadly categorized into:

Schemes: These involve patterns of repetition or arrangement of words, such as alliteration, rhyme, and parallelism.

Example: "Fresh, fast, fabulous."

Tropes: These involve a shift in meaning, such as metaphor, irony, pun, and hyperbole.

Example: "Time is money" (metaphor)

According to McQuarrie and Mick, rhetorical figures increase the effectiveness of advertisements by:

Capturing attention

Enhancing memorability

Encouraging deeper processing of the message

Creating emotional and aesthetic appeal

In digital advertising, rhetorical figures are particularly valuable because they allow messages to be both concise and impactful.

**Discourse Analysis (Norman Fairclough)**

Discourse Analysis, as developed by Norman Fairclough (1995), examines how language functions within social and cultural contexts. It views language as a form of social practice that both reflects and shapes power relations, ideologies, and identities.

Fairclough's model of discourse analysis includes three dimensions:

Textual Analysis: Focuses on linguistic features such as vocabulary, grammar, and structure.

Discursive Practice: Examines how texts are produced, distributed, and consumed.

Social Practice: Explores the broader social and cultural context influencing the text.

In advertising, discourse analysis helps reveal:

How language constructs consumer identities

How brands position themselves in the market

How ideologies (e.g., beauty, success, lifestyle) are promoted

For example, advertisements often associate products with success, happiness, or luxury, thereby shaping consumer desires and perceptions.

REVIEW OF LITERATURE

The study of advertising language has been an important area of research within linguistics, media studies, and marketing, particularly in understanding how language functions as a persuasive tool. Scholars have examined the interplay between linguistic features, stylistic devices, and consumer behavior, highlighting the role of creativity and rhetoric in advertising discourse. One of the foundational works in this field is by Geoffrey Leech (1966), who, in *English in Advertising*, emphasized that advertising language is characterized by deviation from standard linguistic norms. According to Leech, advertisers deliberately manipulate language through stylistic innovation to attract attention and enhance memorability. His concept of foregrounding—achieved through deviation and parallelism—remains central to stylistic analysis in advertising. Building on this, Guy Cook (2001) in *The Discourse of Advertising* explored the relationship between language, context, and interpretation. Cook argued that advertisements cannot be understood in isolation, as they rely on cultural references, visual elements, and audience interpretation. He highlighted that advertising discourse is inherently interactive, engaging consumers through both textual and contextual cues.

Angela Goddard (2002) further examined how advertising language creates meaning through linguistic choices in *The Language of Advertising*. She pointed out that advertisers use a combination of verbal and visual signs to construct persuasive messages. Goddard emphasized the importance of audience positioning, suggesting that advertisements often address consumers directly to create a sense of personal engagement. The role of rhetorical devices in advertising was systematically analyzed by McQuarrie and Mick (1996), who introduced a framework for understanding rhetorical figures in marketing communication. They categorized figures into schemes and tropes and argued that such devices enhance persuasion by increasing attention, processing effort, and aesthetic appeal. Their study demonstrated that rhetorical figures are not merely decorative but function as powerful tools for influencing consumer perception. From a stylistic perspective, Paul Simpson (2004) provided a comprehensive framework for analyzing language through stylistics in *Stylistics: A Resource Book for Students*. Simpson emphasized the role of linguistic patterns, sound devices, and figurative language in shaping meaning. His work is particularly relevant in analyzing how stylistic features contribute to the effectiveness of advertising messages.

The socio-cultural dimension of advertising language is explored in Norman Fairclough's (1995) work on discourse analysis. Fairclough viewed language as a form of social practice and argued that discourse both reflects and shapes societal values and ideologies. In advertising, this perspective is crucial for understanding how language constructs consumer identities and reinforces cultural norms such as beauty, success, and lifestyle aspirations. Tanaka (1994) adopted a pragmatic approach in *Advertising Language: A Pragmatic Approach to Advertisements in Britain and*

**Chamundeshwari et al.,**

Japan, highlighting how advertisers rely on implicit communication and shared knowledge. She argued that meaning in advertising is often indirect, requiring consumers to infer messages, which enhances engagement and persuasion. More recent studies have focused on the impact of digital media on advertising language. Crystal (2003) noted that digital communication has led to the emergence of new linguistic styles characterized by brevity, hybridity, and creativity. Similarly, contemporary research indicates that online advertisements rely heavily on concise and impactful language due to reduced attention spans (Danesi, 2017).

In the context of stylistics and persuasion, Forceville (2008) examined the role of multimodal metaphors in advertising, demonstrating how visual and verbal elements interact to create meaning. His work highlights the importance of integrating linguistic analysis with visual semiotics in digital advertising. Furthermore, Cook (2012) and later studies have emphasized the increasing importance of emotional appeal in advertising. Emotional language, combined with stylistic devices such as repetition and metaphor, plays a significant role in influencing consumer attitudes and decision-making.

Summary of Literature Gap

While existing literature provides valuable insights into advertising language, there is a noticeable gap in the systematic stylistic analysis of digital advertisements, particularly in integrating rhetorical, stylistic, and discourse-based approaches. This study addresses this gap by examining how stylistic features function in contemporary digital media to enhance persuasion and engagement.

METHODOLOGY

This study adopts a qualitative research approach, focusing on the stylistic analysis of selected digital advertisements. The data consists of advertisements collected from social media platforms, websites, and online campaigns.

Data Collection

A sample of advertisements from various industries—such as food, technology, fashion, and healthcare—was selected. The advertisements were chosen based on their linguistic richness and use of stylistic devices.

Analytical Approach

The analysis focuses on identifying and interpreting stylistic features, including:

Lexical choices

Sentence structure

Figurative language

Sound patterns

Each advertisement was examined to determine how these features contribute to persuasion and audience engagement.

ANALYSIS AND DISCUSSION

Use of Metaphor

Metaphors are widely used in advertising to create vivid and imaginative associations. By linking products to desirable qualities, metaphors enhance the appeal of advertisements.

For example, a smartphone may be described as a “powerhouse,” suggesting strength and efficiency. Such metaphors simplify complex ideas and make them more accessible to consumers.

Metaphors also contribute to emotional engagement. By appealing to the imagination, they create a deeper connection between the product and the audience.

Advertisement 1 (Technology Product):

**Chamundeswari et al.,**

"Unleash the beast in your hands."

Analysis:

The smartphone is metaphorically described as a "beast," suggesting power, speed, and dominance. This metaphor simplifies technical features into an emotional appeal.

Advertisement 2 (Energy Drink):

"Fuel your fire."

The metaphor of "fire" represents energy, ambition, and passion, appealing to young consumers.

Hyperbole and Exaggeration

Hyperbole is another common stylistic device in advertising. It involves deliberate exaggeration to emphasize product benefits.

Phrases like "the best coffee in the world" or "unmatched performance" are typical examples of hyperbole. While consumers may recognize the exaggeration, it still influences their perception by creating a sense of superiority.

Hyperbole is particularly effective in competitive markets, where brands seek to differentiate themselves.

Advertisement 3 (Food Brand):

"The world's most irresistible chocolate."

Analysis:

The claim is exaggerated but creates a perception of superiority.

Advertisement 4 (Skincare Product):

"Flawless skin in just one wash!"

This exaggeration appeals to consumer desires for quick results.

Alliteration and Sound Patterns

Sound devices such as alliteration play a crucial role in making advertisements memorable. Repetition of initial consonant sounds creates rhythm and musicality.

Examples like "fresh, fast, and flavorful" demonstrate how alliteration enhances recall. These patterns make slogans more engaging and easier to remember.

In digital media, where attention spans are short, such devices are especially valuable.

Advertisement 5 (Fast Food):

"Crispy, crunchy, crave-worthy."

The repetition of the /cr/ sound creates rhythm and makes the slogan catchy.

Advertisement 6 (Retail Brand):

"Style. Shine. Sophistication."

The repetition of the /s/ sound adds elegance and appeal.

Rhyme and Rhythm

Rhyme is another stylistic feature that contributes to memorability. Rhyming slogans are catchy and often remain in the audience's mind long after exposure.

For instance, phrases like "fit and lit" or "snack smart, live smart" use rhyme to create a pleasing auditory effect.

Rhythm also plays a role in structuring advertisements. Balanced and rhythmic sentences are more appealing and easier to process.

Advertisement 7 (Health Drink):

"Sip smart, stay sharp."

Analysis:

The rhyme between "smart" and "sharp" enhances memorability.

Sample Advertisement 8 (E-commerce):

"Click quick, shop slick."

The rhythmic pattern encourages quick action.

**Repetition**

Repetition is used to reinforce key messages and ensure that they are remembered. It can occur at the level of words, phrases, or structures.

For example, repeating a brand name or slogan increases brand recognition. Repetition also creates emphasis, highlighting important aspects of the product.

In digital advertising, repetition is often combined with visual elements to maximize impact.

Advertisement 9 (Sports Brand):

"Run more. Do more. Be more."

Analysis:

The repetition of "more" emphasizes improvement and motivation.

Advertisement 10 (Mobile Network):

"More speed. More power. More you."

Repetition strengthens brand positioning.

Lexical Choices and Wordplay

Advertisers carefully select words to create specific impressions. Positive adjectives, action verbs, and emotionally charged language are commonly used.

Wordplay, including puns and double meanings, adds creativity and humor to advertisements. This not only captures attention but also enhances engagement.

Advertisement 11 (Coffee Brand):

"Espresso yourself."

Analysis:

A pun on "express yourself," making the message humorous and memorable.

Sample Advertisement 12 (Travel Agency):

"Don't just travel. Time travel."

Suggests immersive experiences through metaphorical wordplay.

Sentence Structure and Conciseness

Digital advertisements often use short and simple sentences. This ensures clarity and quick comprehension.

Imperative sentences such as "Buy now" or "Try it today" create a sense of urgency and encourage immediate action.

Elliptical structures, where certain elements are omitted, are also common. These structures make messages more concise and impactful.

Advertisement 13 (Online Sale):

"Buy now. Save big."

Direct command encourages immediate action.

Sample Advertisement 14 (Fitness App):

"Start today. Transform tomorrow."

Parallel structure enhances rhythm and persuasion.

Emotional Appeal

Stylistic features contribute to emotional appeal by creating connections with the audience. Advertisements often evoke feelings such as happiness, nostalgia, or aspiration.

By appealing to emotions, advertisers can influence consumer attitudes and behavior more effectively than through logical arguments alone.

Advertisement 15 (Insurance):

"Because your family deserves forever."

Appeals to love and security.

Advertisement 16 (NGO Campaign):

"One act of kindness can change a life."

Appeals to empathy and moral responsibility.

**Chamundeshwari et al.,****Brand Identity and Language**

Language plays a key role in shaping brand identity. Consistent use of stylistic features helps create a distinct voice and personality for the brand.

For example, a luxury brand may use sophisticated and elegant language, while a youth-oriented brand may adopt a casual and playful style.

Language helps create a consistent brand voice.

Luxury brands use formal, elegant language:

"Crafted for excellence."

Youth brands use informal tone:

"Level up your vibe."

FINDINGS

The analysis reveals several key findings:

Stylistic devices enhance memorability: Features such as rhyme, alliteration, and repetition make advertisements more memorable.

Figurative language increases engagement: Metaphors and hyperbole create vivid and appealing messages.

Conciseness is crucial in digital media: Short and impactful messages are more effective in capturing attention.

Emotional appeal drives persuasion: Advertisements that evoke emotions are more likely to influence consumer behavior.

Language shapes brand identity: Consistent stylistic choices contribute to a recognizable brand voice.

Implications

The findings have important implications for both researchers and practitioners:

For linguists: The study demonstrates the value of stylistic analysis in understanding media discourse.

For advertisers: It highlights the importance of linguistic creativity in designing effective campaigns.

For educators: The research can be used to teach students about the role of language in persuasion.

CONCLUSION

Advertising language is a dynamic and powerful form of communication that relies heavily on stylistic features to achieve its persuasive goals. This study has shown that devices such as metaphor, hyperbole, alliteration, rhyme, and repetition play a crucial role in shaping consumer perception and enhancing the effectiveness of advertisements. In the context of digital media, where competition for attention is intense, the strategic use of language becomes even more important. Advertisers must create messages that are not only informative but also engaging, memorable, and emotionally appealing. By applying stylistic analysis, this research provides insights into the mechanisms of persuasion in advertising language. It highlights the relationship between linguistic form and communicative function, contributing to a deeper understanding of media discourse. Future research can expand this study by incorporating quantitative methods or exploring cross-cultural variations in advertising language.

ABSTRACT

Project-Based Language Learning (PBLL) addresses the challenges of effective student engagement during English classes by integrating language acquisition with real-world authentic situations. The model helps to hone the professional skills of the engineering students perpetually with its ability to make them work in real-life situations. This research work presents a case study of implementing PBLL for first year engineering students in Kumaraguru College of Technology, Coimbatore, India. The students were assigned authentic projects in the form of podcast production, preparing brochures, videos, content, and mobile application. A qualitative analysis of their performance was carried out to determine the outcomes. It was evident that the PBLL model stands as a unique and powerful tool to promote communication skills, creativity and peer learning. The outcomes of this mode of learning were phenomenal compared to the conventional learning strategies. The learners were found to significantly develop their communication skills along with other life skills such as teamwork, problem solving, creativity and digital literacy. This research work discusses the impact of implementing project-based learning in language classes and recommends strategies for effective engagement of the learners. The findings of this work advocate that this model is scalable, and PBLL stands as an effective method in preparing engineering students for their professional life as per the industry requirements.

Keywords: Engineering education, learner engagement, project-based language learning, collaborative learning.

**Mohanraj et al.,**

INTRODUCTION

Engineering education plays a major role in the higher education sector in India. English proficiency is considered as one of the required skills for an engineering student in the context of globalization of industries. It helps students to complete their daily tasks like assignments and to take up internships and placements. It is witnessed that the students entering higher education institutions possess varied levels of English proficiency. This mandates higher educational institutions to provide personalised mode of learning as per the proficiency levels of the learners. Many learners who have pursued their mode of study through their vernacular languages find it difficult to cope up with the learners from English medium schools. In such a scenario, traditional teaching approaches like grammar-based instruction and regular classroom lectures hub fail to address the issue. Therefore, in Kumaraguru College of Technology, Coimbatore, Tamil Nadu, India, it is attempted to segregate the learners into 3 different categories as per their English language proficiency and each group was provided with a different mode of learning to provide effective learning experiences.

Advanced learners possessing good English language proficiency are bound to often find their English classes boring and uninteresting. Therefore, in order to break their monotony and provide a personalised learning experience, these learners were offered with language related projects as a part of their English course. This was offered with a view to enhance their communication and soft skills in order to make them industry-ready engineers. Project-Based Language Learning (PBLL) has been adopted as a tool to enhance their involvement in language learning and to foster peer learning for effective engagement.

The benefits of this mode of learning includes providing authentic learning experience to the candidates, development of lateral thinking, opportunity to explore new technologies, and promoting soft skills in the form of collaborative skills, creativity, and critical thinking. This methodology also enables the students to take ownership in their activities and provide a rich learning outcome. The peer review mechanism involved in this methodology helps students to hone their language skills and professional behaviour. The longstanding challenges that prevailed in addressing the language proficiency of engineering students get addressed through this methodology in a meaningful way by providing real life exposure to use their English language skills in professional settings.

LITERATURE REVIEW

The review of literature yields better results for applying this learning method for engineering students. A research study by Wang proposes that PBLL serves as a student-centred and authentic way of language learning. It substantiates that real-world communication tasks make the learners involve themselves into the activities (Wang, 2020). Farouck (2016) project-based language learning enhances the motivation and confidence of the learners. Musa et. al., (2011) substantiate that this model improves the professional competencies of learners. It also fosters holistic development of the learners and helps them in developing resilience and interpersonal skills (Ghosheh et al., 2021). Kato et. al. (2023) demonstrated how projects help learners to enhance their English language proficiency and how it can be implemented in distance learning. Stoller and Myers (2019) provided a five-stage framework for implementing PBL in English classrooms.

AIM AND OBJECTIVES

This research study aims to investigate the effectiveness of project-based language learning (PBLL) as an indispensable tool to enhance English language proficiency and behavioural skills of engineering students. The objectives of the study are as follows:

**Mohanraj et al.,**

1. To evaluate the effectiveness of PBL on enhancing Language Proficiency
2. To analyse the level of student engagement in PBL
3. To explore the extent of peer learning
4. To investigate the skills learnt by the students through this mode

METHODOLOGY

A diagnostic test inclusive of all English language skills like Listening, Speaking, Reading and Writing (LSRW) was conducted for all the first-year engineering students (1585 students) across all engineering programs and they were categorised into 3 different categories in alignment with the Common European Framework of Reference (CEFR) levels based upon their performance as Basic (A2), Intermediate (B1) and Advanced (B2) level of learners. A course titled *Fluency Through Practice* was designed, curated and offered to the advanced learners. It was integrated into the regular class timetable and offered for a total of 60 hours throughout the academic semester (15 weeks). The course was offered for the Computer Science branches inclusive of Computer Science and Engineering, Information Technology, and Artificial Intelligence and Data Science in Semester I and for all other branches of engineering in Semester II. The course was offered in a blended mode where the students had face-to-face sessions, teamwork and independent project work apart from regular class hours.

There were 64 students in Semester I and 98 students in Semester II amounting to a cumulative of 162 students taking up this course. Among these students, 83 students were found to complete their higher secondary education from CBSE and ICSE schools, 58 students were found to complete their higher secondary education from Matriculation and State Board English medium schools, and 21 students were from Tamil medium and other vernacular language medium schools. There were 58% of girls and 42% of boys in the group selected. The urban and semi-urban population contributed to 72% and the rural population amounted to 38%. This demographic diversity contributed to a charged and motivating environment paving way for an enthusiastic group dynamics and peer-to-peer engagement.

The selected students were oriented on the principles of PBL and how it enhances the language and professional skills. They were also insisted on taking up authentic and meaningful tasks as projects for yielding better outcomes. Project basics such as project timelines, assessment rubrics, teamwork and the expected quality of the projects were outlined. The learners were advised to document their progress consistently through daily journaling. A structured ideation workshop was conducted to brainstorm project ideas and various themes like media production, content generation, research and peer learning were introduced to the learners to facilitate them to finalize their project ideas. The learners were introduced to the existing similar ideas like available podcast series, videos and brochures, and they were instructed to form project groups of 4 to 5 members organically as per their interests. After forming the group, they were encouraged to select the specific project / problem statements and check the real-world relevance and the purpose of the projects. Then, the student groups were oriented on taking up outcome-driven projects in order to emphasise the accountability of their work during the project reviews.

A project charter containing the details like project title, purpose, intended audience / user of the project, tasks allocated for individual team members, skills focused, and expected outcomes was prepared and shared with the learners. A project review was conducted to validate the project ideas, meaningful language use, check the feasibility and timeline with faculty members, senior students having project-making experience and industry experts. There were 36 project groups across Semester I and Semester II, and they undertook projects related to podcast production, creating English language-oriented videos, producing short stories in animated format, audio books, generating department brochures, books on a specific theme, technical vocabulary for engineers, aptitude practice modules, videos on interview tips, organizing events, and mobile application for English language learning.

**Mohanraj et al.,**

The projects were analysed at different levels qualitatively and quantitatively. Feedback and reflection on teamwork and project progress were collected continuously to ensure smooth conduction of the process. Three project reviews were conducted to monitor the progress of the project, and a final project review was conducted upon the completion of the project. A project report was prepared by each team and submitted for evaluation along with necessary proofs during the final project review. Peer evaluation and reflection helped the learners to continuously hone their English language proficiency.

RESULTS AND DISCUSSION

The course Fluency Through Practice turned out to be a breakthrough in English language teaching for engineering students. This increased the level of engagement of the students tremendously and served to be a successful model. It was observed that the students who struggled to present their findings during preliminary project reviews were able to present confidently and boldly during their final project review. The documented evidence in the form of classroom observations, self-reflections, peer evaluation and project review depicted consistent improvement of English language proficiency and soft skills of the learners. The key indicators of transformation were the increased spontaneity of the language, clarity of presentation, effective use of English language during formal and informal discussions, effective teamwork, clear feedback and self-reflection, and the project outcomes in the form of research paper publications, video stories, training content, printed communication, paper presentations, book publications, podcast series, and mobile applications.

The following list served as the indicators of growth for the participants: The learners exhibited improved confidence levels during their communication. More number of students started volunteering for carrying out various activities during the project phase. Improved teamwork was witnessed and adaptability to various situations increased as a result of group presentations and team project. The learners explored many new technologies and implemented the concepts in their projects, which is quite unusual for an English class. The 21st century skills like problem solving and creativity became a part of their learning process and the professional readiness of the candidates was visible with their preparedness to face real-world audiences.

All these indicators demonstrated the effectiveness of PBL model compared to the conventional English language teaching approaches. The level of engagement was apparently high with strong student participation during the contact hours, project reviews, group activities and individual presentations. Development of life skills during the process becomes an added advantage of the model and the learners developed confidence to face real-life situations. Peer learning and collaboration helped the candidates to identify their strengths and weaknesses thereby creating a supportive environment. It was noted that a few students exhibited leadership skills by mentoring the fellow students to complete tasks and assignments, which boosted the confidence of learners.

The flexibility of the framework to choose the project of their interest and organic formation of project teams supported creativity and autonomy. The genuine communication situations in different contexts like preparing brochures, presenting the findings, seeking information, and organizing events served as nexus between academia and practical experience. The entire process changed the perception of English language learning and promoted a meaningful learning. Consistent feedback mechanism ensured iteration and refining the execution process. Self-reflection helped the students to set personal goals and march towards the same. There were many challenges encountered during the execution of PBL. One of the significant issue was balancing the team members and the complexity of the tasks. A few teams found it difficult to manage teamwork in completing the assigned tasks. Specific tasks were assigned to individual members by the facilitators considering their strengths. A few students struggled to manage time for carrying out projects beyond the regular class hours, and skipping the timeline created last minute pressures. Limited knowledge about latest technology and limited access too posed challenges in completing the projects on time.

Mohanraj et al.,

CONCLUSION

The Fluency Through Practice course offered through project-based learning model demonstrated a significant improvement in the level of engagement of English classes. The tasks and projects undertaken during the course were found to be purposeful and authentic way of communication. It was witnessed that the students transformed from restricted participation to confident presentation. The outcomes of the projects reflected real-world relevance, use of technology in language learning, collaboration and problem solving. The autonomy to select the project statements motivated the learners and created ownership. It was observed that significant improvement in English communication skills was accompanied by the requisite 21st century skills.

This successful intervention opens up the possibilities to embed PBL in language acquisition. Embedding of multidisciplinary communication tasks and real-world scenarios in the course leverages peer learning and collaboration. Multimodal communication in the form of digital media creates awareness about existing technology. This instruction model serves as a viable option to instil English language to engineering graduates in an impactful manner, transforming them from successful communicators to collaborative professionals.

ABSTRACT

Animated storytelling has emerged as an effective educational tool that combines visual elements, sound, and narrative to enhance children's learning experiences. This study examines the educational impact of animated storytelling on children aged 5–10 years, focusing on aspects such as vocabulary development, imagination, academic performance, critical thinking, empathy, and moral values. The research was conducted through a survey involving 42 parents to observe behavioural and learning changes in their children. Primary data was collected using a structured questionnaire distributed through Google Forms, while secondary data from previous studies and reports supported the theoretical framework of the research. The findings reveal that animated storytelling positively influences several areas of children's development. A large majority of parents reported improvements in vocabulary (83.3%) and imagination (81%), indicating that animated narratives effectively enhance language learning and creativity. Many parents also observed moderate improvements in academic performance, critical thinking, and reading interest. Additionally, over half of the respondents agreed that animated content helps children understand moral values and develop empathy through engaging characters and storylines. The study concludes that animated storytelling is a valuable supportive learning tool, but it should be integrated with traditional teaching methods and parental guidance to achieve balanced educational development.

Keywords: development, learning, teaching, educational, guidance

**Mythili et al.,**

INTRODUCTION

Animated storytelling is the art of conveying narratives, emotions, and ideas through moving images, combining character development, audio, and visual techniques to bring stories to life. Animation has expanded beyond entertainment and has become an important tool in education. Storytelling has always played a significant role in memory retention, acquiring moral values and knowledge and cultural traditions across generations. Animated Storytelling helps children mainly with deeper understanding of concepts. Animated stories not only support language development but also help children learn ethical understanding through meaningful narratives and emotional connections with characters. Traditional learning methods often lack engagement, struggling to maintain attention whereas animation captures attention through dynamic visuals. It engages memory-sensory stimulation, increasing retention of memory. It allows for self-paced learning unlike traditional one to all approach. Animated story telling caters to diverse learners appealing to visual, auditory and kinesthetic learners. This approach stimulates real world scenario, improving practical application of knowledge and problem solving a much better alternative to passive learning methods.

History of Animation

One can trace the history of animation back to the 1800s with the invention of the Phenakistoscope, which laid the foundation for modern-day animation. It was a simple device consisting of images drawn in sequence around a disc with evenly spaced slits; when spun rapidly, it created the illusion of motion. It worked on the principle of persistence of vision to produce this effect. This marked the beginning of a new era in visual entertainment, and soon more inventions followed. Zoetrope was built upon the same principle, but it allowed multiple people to view the animation at once and was easier to mass-produce. Flipbooks also emerged, in which images were drawn on successive pages; when flipped quickly, they mimicked motion and soon became especially popular among children. The first ever animated film, *Fantasmagorie*, paved the way for many more animations, by bringing pictures to life. Walt Disney remains an iconic figure in animation, well known for his works like *Snow White and the Seven Dwarves* and *Mickey Mouse*. They incorporated audio with visuals providing a cohesive experience for the viewer, shaping the future of modern animation. Creations like *Toy Story* and *Jurassic Park* had a long-lasting impact on the audience, making it possible to believe in the magic of bringing inanimate images to life. Storytelling always served as a medium to share knowledge and values and it has undergone tremendous transformation in the contemporary world. Modern-day animation has also evolved to provide education, helping in simplifying complex concepts and ideas through visual imagery. This shift from traditional methods has certainly impacted on a child's learning experience.

LITERATURE REVIEW

Animated stories telling helps children to build a strong foundation of language. It increases their fluency, confidence and public speaking. It has a positive approach on children's communication skills; thus animated storytelling is considered as a significant pedagogical tool in language education for children. It also reduces anxiety and creates an interactive learning environment. Retention of vocabulary and patterns of sentences helps students in enhancing their language. Lacking meaningful speaking practice leads to decreased confidence and engagement in students. Engaging narratives through animation results in active participation of students and meaningful communication can be promoted by incorporating storytelling in language. Compared to books, interactive elements like animation, sound effects and background music keep children engaging for a longer time by which they can improve their comprehension skills. Primary school children are benefited by this animated storytelling which helps them for early literacy development.

For deeper understanding image should integrate video, charts, photos and animation. Rather than passive information, animated storytelling provides active knowledge construction. Children can easily learn things from

**Mythili et al.,**

combination of words and pictures rather than words alone. Well-structured animation can improve problem solving skills, language fluency, vocabulary, grammar and it can also inculcate moral values in children. Animated storytelling supports children learning by improving their understanding and memory. Logical reasoning is alone not enough for learning. Experiences are organized as stories, and this meaningful way of learning enhances children's understanding in a better way. Complicated things can easily be explained in a simple way by replacing them with relatable animations, photos and videos. Thereby it helps children to understand concepts clearly and increase their engagement.

Animated storytelling plays a significant role in shaping ethical understanding in children through content, well-structured narratives, relatable situations, and meaningful emotional conflicts that explain moral lessons such as perseverance, kindness, honesty, empathy, responsibility, hard work, and respect. This helps children to distinguish goods and bads, rights and wrongs and positives and negatives in a correct way. It helps children develop personality and moral understanding. Reflective thinking leads children to engage and boosts their ethical understanding in a better way. Students are inculcated with deeper moral reasoning and critical thinking, which boosts their real-world understanding. Thus, animated storytelling is a powerful way to improve language, moral values, and decision-making skills. These insights strongly support the idea that animated storytelling promotes value-based learning in children.

Memory retention, recalling contents, and even neuron growth is achieved by animated storytelling methods. The music, sounds, pictures, and motion help strengthen our neural connections. This helps in the development of our brain. When children are being connected to animated storytelling, they can experience the feelings and challenges of the characters. Hence, the children are being emotionally and socially benefited from this animated storytelling. As soon as they understand the characters' feelings, they start creating their own world of imagination with their own characters and scenarios. This is where their creativity is being boosted.

RESEARCH METHODOLOGY

1. The study was conducted among parents of children aged 5–10 years to examine the educational impact of animated storytelling. A total of 42 parents participated in the present study.
2. This age group was chosen because the early years are important for thinking skills, creativity, and values. Parents were selected instead of children as they observe their child's behaviour and learn every day and can better notice any changes.
3. Secondary data was collected from various research articles, reports, and studies related to animation in education and child development to support the theoretical framework of the study.
4. Primary data was collected with the help of a structured questionnaire prepared through Google Forms. The questionnaire was shared with parents, and responses were recorded.
5. Information regarding the child's vocabulary development, imagination, critical thinking ability, academic performance, empathy, moral values, problem-solving skills, and daily duration of watching animated stories was collected.
6. Parental observations regarding behavioural changes and overall development of their children after exposure to animated storytelling were also assessed.
7. The collected data was analysed using percentage distribution and presented through appropriate graphical representations for clearer interpretation of results.

Data Analysis and Results

Table 1 shows the information on animation watching habits of children. In the present study, it was found that most respondents, 24 (57.1%), reported that their children watch animation for less than one hour per day. Further, 17 respondents (41.5%) stated that their children spend between one to three hours per day watching animation. Only 1 respondent (1.4%) reported that their child watches animated content for more than three hours daily.

**Mythili et al.,**

Table 2 shows parents' opinions on how animated content influences children's cognitive and moral development. When asked about the problem-solving skills, 59.5% of the parents felt that their child's ability to solve problems has improved after watching animated content, while 40.5% did not notice any significant change. In terms of moral values, 66.7% agreed that children gain moral lessons through animation, whereas 33.3% disagreed. This indicates that a majority of parents believed animated content can positively shape moral understanding. Similarly, 64.3% (27 respondents) observed improvement in empathy among their children, while 35.7% (15 respondents) did not observe such development. Overall, the results suggest that most parents perceive animation as having a positive influence on children's thinking skills and moral growth, though opinions are not entirely unanimous.

Figure 3 presents the responses of the parents regarding the improvement in their child's imagination. The majority, 34 parents (81%), agreed that imagination has improved significantly, whereas 8 parents (19%) disagreed. This shows that most parents have clearly noticed a positive change in their child's creative abilities. The findings suggest that animated storytelling may help children think more creatively and express their ideas more freely. The figure presents parental responses regarding the impact of animated storytelling on children's development. A majority of parents (83.3%) observed an improvement in their child's vocabulary, while only 16.7% did not notice such change. Similarly, 66.7% agreed that children gained moral values from watching animated content. More than half of the parents reported positive changes in academics (54.8%) and improvement in critical thinking skills (57.1%). An equal percentage (57.1%) also observed increased interest in reading books. However, a comparatively higher percentage of parents did not observe academic improvement (45.2%) and critical thinking growth (42.9%), indicating that these areas show moderate rather than overwhelming improvement. Overall, the findings suggest that animated storytelling has a notably positive impact on vocabulary development, moral values, reading interest, and cognitive skills among children.

DISCUSSION

When I look at the responses from the survey, the first thing that stands out is how strongly parents feel that animation helps with vocabulary and imagination. More than four out of five agreed that their child's vocabulary has improved, and a similar number felt their imagination had grown. That makes sense — animated stories are colorful, engaging, and full of new words tied to visuals, which makes them easier to remember. It's not surprising that children pick up language faster when they're immersed in such lively storytelling. But when I shift my focus to academics, the picture becomes more complicated. Just under half of the parents noticed positive changes in school performance, while slightly more said they hadn't. This tells me that while animation sparks creativity and language, it doesn't automatically translate into better grades or stronger academic skills. The same pattern shows up with critical thinking and problem-solving: fewer than half of the parents felt these areas had improved. That suggests animation alone isn't enough to build those higher-order skills — children need guidance, discussion, and practice beyond just watching.

Engagement, however, is where animation shines. Some parents reported that their children had started showing interest in reading books, which is a big step forward. Animation often acts as a gateway — kids fall in love with characters and stories on screen, and then they want to explore them in books. Compared to traditional methods, animation clearly has an edge in sparking curiosity. Still, when it comes to moral values and empathy, the results are mixed. Only about a third of parents agreed that animation helped in those areas. That tells me the content of the stories matters a lot. If the animation is designed with strong moral lessons, it can work, but if it's just entertainment, the impact is limited. Putting all this together, I see a general pattern: animation is excellent for imagination, vocabulary, and engagement, but weaker when it comes to academics, critical thinking, and social values. This matches what many studies in education say — visuals and storytelling boost memory and creativity, but deeper skills require active learning and reflection. In other words, animation is a powerful tool, but it works best when combined with traditional teaching and parental involvement.

CONCLUSION

The objective of the study was to see whether animated storytelling benefits children, and the answer is yes, but only partly. It clearly helps with language and creativity, and it makes learning more engaging. At the same time, it doesn't automatically build problem solving or empathy. That means animation should be seen as a complement, not a replacement, for other methods. Used thoughtfully, it can bridge the gap between entertainment and education, making learning fun while laying the foundation for deeper skills.

ABSTRACT

In the modern world, plants have slowly receded into the background of human life. As everyday contact with nature declines, what scholars call Plant Blindness, later reframed as Plant Awareness Disparity has become increasingly visible. This condition reflects a gap in attention, knowledge, and value, where plants are often overlooked or treated as less important than animals. This study asks whether such a disparity is universal, or shaped by modern, human-centred ways of thinking. Focusing on the Naga communities, the study adopts a qualitative, interpretive methodology based on close reading of selected folklore, ethnographic writings, and archival texts. It explores how plant awareness is embedded in folklore, rituals, beliefs, and material culture. Drawing on Shalom H. Schwartz's framework, it shows that values such as Universalism and Benevolence extend beyond humans to include plants, while Tradition and Security sustain ecological balance through taboos and practices.

The findings show that in the Naga worldview, plants are not passive resources but living, relational beings. They appear as spiritual presences, prophetic symbols, and material anchors of social life. Dreams, omens, and sacred practices reveal a deep attentiveness where the condition of plants reflects the condition of the community. From the head-tree to the log drum, plant materials shape memory, identity,

**Arunkumar et al.,**

and communication. The study concludes that plant awareness in Naga life is holistic and lived. It challenges the idea that plant awareness disparity is universal, showing instead that cultural memory and practice can sustain a respectful, interdependent relationship with the natural world.

Keywords: Environmental Generational Amnesia, Indigenous Naga Community, Folklore, Human-Plant Intersection, Plant Awareness Disparity, Northeast India.

INTRODUCTION

Plants used to be everywhere around us, regardless of region, place, and time, until the modernization of villages and cities gradually marginalized them due to the spread of human occupation and activities, limiting the interaction between plants and humans, impacting detrimentally on the human's awareness of plants (Gaoue et al., 2017), and the correlation drawn between trees and human civilization by Pogue Harrison states that evolution from huts, villages, and cities to cosmopolitan marks civic expansionism (Harrison, 2009), leading to a condition, known as 'plant blindness' which is defined as an "inability to see or notice the plants in one's own environment leading to; (i) the inability to recognize the importance of plants in the biosphere, and in human affairs; (ii) the inability to appreciate the aesthetic and unique biological features of the life forms belonging to the Plant Kingdom; and (iii) the misguided, anthropocentric ranking of plants as inferior to animals, leading to the erroneous conclusion that they are unworthy of human consideration" (Wandersee and Schussler, 1999, 2001) later Parsley (2020) redefines the concept of plant blindness as Plant Awareness Disparity (PAD) to make the study more accessible in plant discourses beyond botanical knowledge.

The rebranding of plant blindness as plant awareness disparity has fascinated studies seeking to empirically understand the disparity across diverse populations in the categories of attention, attitudes, knowledge, and relative interest (Parsley, 2020). As Balas and Momsen states, people pay no attention to plants around them in their everyday lives because of a deference in the visual attention of the cognitive feature that gives less attention to plants (Balas and Momsen, 2014), and sometimes do not even consider that plants as living beings due to their lack of immediate and observable physical motion (Yorek et al., 2009). And this lack of attention towards plants by people deprives the plants of their biological individuality and phenomenologically pushes them into a whole large green backdrop (Wandersee and Schussler, 2001). This cognitive faculty of deprived attention towards plants is also said to arise from the missing visual cues that distinguish objects, whereas the green mass of plants does not exhibit much distinction, as identified in the shape and movement of animals (Feldman, 2003), causing disparity in the awareness of plants due to less attention given to plants for their appearance, lack of motion and other characteristics.

In addition to the cognitive aspect of attention in plant disparity, people's attitudes towards plants and the environment are also important factors contributing to plant awareness disparity. Public attitude in their preferences in choosing and investing their interest in animal studies for a career, and a decline in emphasis on plants in academia has reduced the opportunity for involving and investing in plant knowledge (Fančovičová and Prokop, 2011), which relates to attitude towards plant matters in discussing plant awareness disparity. And to increase attention towards plants, one has to develop a positive attitude towards them. Thus, attention and attitude are directly linked in the context of PAD. (Strgar, 2007; Mrkva et al., 2019; Lindemann-Matthies, 2005). And plant knowledge is also a vital aspect highlighted among the factors leading to the plant disparity. If not all the knowledge of plants, at least specific knowledge, such as the role and importance of plants to humans and the biosphere, is essential beyond the categories of students, teachers, and scientists in the discipline of plant study (Hershey, 1993; Frisch et al., 2010). Lastly, as the scholars dealing with the plant awareness disparity have identified 'relative interest', that is, people do not find plants as interesting as other living organisms, and often only consider the discipline of biology as a study of animals, is a popular delusion (Nichols, 1919). This relative lack of interest in

**Arunkumar et al.,**

plants contributes to the plant awareness disparity because this component is a determinant of attitude and knowledge (Pany et al., 2019). Is this plant awareness disparity, or the plant blindness identified by the scholars and environmentalists, an anthropocentric worldview rooted in humanist philosophy, or is it a persistent phenomenon across human civilization? Is the disparity in plant awareness historically tenacious in the culture of indigenous communities? These two questions are essential for identifying how it was addressed in pro-environmental indigenous spaces, if at all; plant awareness disparity is a persistent phenomenon in humankind is the interesting to discuss, since indigenous communities maintained a symbiotic relationship with nature, and in their animistic religion, saw no difference between humans and natural entities, including plants, animals, landscapes, and celestial bodies (Rodgers, 2025). If the animate and inanimate are seen and perceived with abilities to communicate, reflect, and act intentionally similar to those of humans, in addition to having a spirit in spiritual essence, (Van Eyghen, 2023), the question still remains unanswered whether plant blindness or plant awareness disparity was present in the indigenous communities, despite their eco-friendly social and cultural practices that are acclaimed as indigenous sustainable knowledge (Nakashima and Roue, 2002). So, this research aims to uncover the encoded plant awareness embedded in the folklore of the Naga indigenous communities and to analyze the disparity.

The Indigenous Naga community is one of the major tribes in the Northeast region of the modern-day state of Nagaland, India. "Naga is a generic word known to a particular tribe who live mostly in the North Eastern part of India. They are Indo-Mongoloid race speaking the Tibeto-Burman language. It has more than 50 sub-tribes, they are collectively known as the Nagas" (Horam, 2019). The Naga community comprises many clans and ethnic groups, including Angami, Aos, Sema, Lotha, Rengma, Chakheang, Sangtam, Ronyak, Phom, and Chang (Rama Shankar, 2012). "Those tribes known generally as Nagas, inhabit mountainous districts on the upper part of the valley of Assam, and southward of the Bramahpootra, not extending higher north than to a tributary of that great river, known as the Boree Deehing, in a latitude of about 17° 15'" (Owen, 1844), and the major Naga tribes include Angami, Ao, Chakhesang, Chang, Dimasa Kachari, Khiamniungan, Konyak, Lotha, Phom, Pochury, Rengma, Sangtam, Sema, Sumi, Yimchungru, Zeliang (Kire, 2019, pp. 12-26). Like any indigenous community, the Nagas have historically interwoven their life and culture with the environment around them. And their association with animals and plants is exclusively shaped by their dependence on them for survival. The close proximity of their lives to their surroundings has sustained an awareness of plants that, in turn, reciprocates the community's anti-generational environmental amnesia (Luikham & Bhattacharyya, 2024, pp-848-863). In this research, a select set of folklore and folktales readily available in archives and print forms is considered to encode plant awareness and sustainable practices that overcome generational environmental amnesia (Walshe et al., 2025, pp. 856–871), because many indigenous communities hold a values, beliefs and cultural practices that "treat plants as fundamentally autonomous, volitional, communicative, relational beings. The notions of plant personhood and human-plant kinship are expressed in stories, poems, and myths (Hall, 2011).

Studies in the Naga communities have identified many plant-based medicines used by Naga tribes. Changkija notes 109 species of plants in ethnobotanical literature during a field survey (1999). Another study on the ethnic people of Nagaland reports 60 ethnno-medicinal plant species, acknowledging medicinal plants used to cure diseases (Rajaganesh et al., 2023). Vadeo, reviewing the medicinal plants used by the Naga tribe, examines the use of 20 indigenous medicinal plants used in cultural and traditional practices (2023). An ethnobotanical survey conducted in 1993-1997 identified 36 plants predominantly used by the Naga tribes for medicinal purposes (Jamir et al., 1999). In the estimation of Ethnobotanical Plants of Naga tribes, a vast knowledge of the utilization of local plants among the 36 tribes of Nagas (Pfoze et al., 2016). During the investigation of Mao Naga folk medicinal plants, 61 plants used by the ethnic community were reported (Lokho, 2012). A survey and documentation of plants of Nagaland investigates 142 edible plants and highlights the need to promote the plants for food security and income through sustainable conservation (Deb et al., 2019). The traditional knowledge of medicinal plants used in Nagaland records 34 plants with scientific names by specifying the plant parts used in treatments (Kirha and Kere, 2023). Lanusashi and Martemjen describe the Nagas' perceptions of nature and their surroundings in relation to beliefs, myths, and taboos in folklore and folksongs to elucidate biodiversity conservation (Lanusashi Lkr, and Martemje, 2014). Nagaland, endowed with rich and diverse biodiversity, is included in the 34 Mega Biodiversity regions of the world, with

**Arunkumar et al.,**

approximately 2,431 plant species, among which 113 are underutilized medicinal plants (Konyak and Swuro, 2021). Recording the Indigenous Knowledge on Utilization of plant biodiversity in the 2005-2010 survey, 241 plant species were listed from eight Naga tribes, and it is argued that

Traditional healing system is unique and suitable strategies are adopted by the tribals for sustenance as they are endowed with a vast knowledge concerning the use of these wild plants. Several reasons act upon for use of traditional medicinal plants by tribal communities. Because the tribal's living in rural areas, they cannot afford or access to formal health care systems and therefore, largely depend on the indigenous knowledge of traditional medicines. Still today, the bioresources are so intrinsically interwoven with the lifestyle of tribals that medicinal plants are inseparable to the poor tribal communities (Zhasa N.N. et al., 2015, pp. 89-106).

Beyond the source of medicine and food, plants and trees are also integral components of cultural identity, rituals, and ecological understanding (Schaal, 2019). Additionally, ethnobotanical surveys and the vast research collections on the indigenous knowledge in plants, there remains a scope to study relationship between the Naga community and plants, because of the Naga communities' recognition of plants as participants in their societal institutions and giving space for plants and plant materials in their culture, tradition, customs, rituals, and taboos, gives us intriguing opportunity to understand the communities relations with plants, unlike the most Western, European and White who drive to dominate and shape landscapes that marginalized trees (Shimrah et al., 2026, pp. 1-11) (Nitzke and Braunbeck, 2021).

Intersection of Human-Plant Relations in Naga Social Values and Beliefs

Value has been a fundamental in human society; it can mean standards, beliefs, principles, moral obligations, and social norms, but also desires, wants, needs, or interests. It can also mean the worth, importance, or significance of a thing or object of interest (Ahmad, 2013). And Schwartz's theory of basic human values identifies values recognized across cultures to explain the motivational bases of attitudes and behavior. He specifies six main features of values: (values are beliefs; values refer to desirable goals; values transcend actions and situations; values serve as standards or criteria; values are ordered by importance; and the relative importance of multiple values guides action), but distinguished from them is the type of goal or motivation that the value expresses. Based on the underlying motivation that inspires the values, ten broad values are identified as universal requirements. (Schwartz, 2012, pp. 3-5). Among those ten values, Universalism; Benevolence (grouped under Self-Transcendence) and Conformity; Tradition; Security (grouped under Conservation) are significant to consider to understand the human-plant relation in the indigenous community because, as argued by Schwartz, Benevolence is a defining goal in preserving and enhancing the welfare of the those with whom one is in frequent personal contact (p. 7). Benevolence values derive from the basic requirement for smooth group functioning (Kluckhohn 388-433) in the need for affiliation (Maslow, 1965) with an emphasis on others' welfare through the variables of helpfulness, honesty, loyalty, friendship, love, forgiving, and responsibility (Schwartz, 2012, p. 7). Another type of value, Universalism, is a defining goal to understand, appreciate, tolerance, and protection for the welfare of all people and for nature through the variables like broadmindedness, social justice, equality, a peaceful and beautiful world, unity with nature, wisdom, protecting the environment, harmony, and spiritual life (Schwartz, 2012, p. 7). The types of values categorized under conservation; conformity value is a restraint of actions, inclinations, and impulses that are derived from the requirements of an individual who emphasizes obedience, self-discipline, politeness, and honor. Whereas Security value is a defining goal in the safety, harmony, and stability of society, of relationships, and of self, through the variables: social order, family security, national security, cleanliness, and reciprocation of favors. And finally, the value of Tradition shares a defining aim of respect, commitment, and acceptance of the customs and ideas that one's culture or region provides through the variables of religious and cultural customs in practices, symbols, and beliefs (Schwartz, 2012, p. 6).

These conservation and self-transcendence values in indigenous communities are not limited to human social groups; they are also applied to plants and trees in their environmental landscape. The rituals, customs, and practices that center on plants and trees highlight the shared value and belief of the human society to vegetative entities

**Arunkumar et al.,**

because, as Cajete states, “each part of the Earth is a manifestation of the spiritual center of the universe. Stone, trees, animals, or plants may be venerated as expressions of the sacred and representations of the greater family of life from which they come” (Cajete, 2000, p. 109). This greater family is an intersection of humans and non-humans, including plants, that become part of their spiritual and religious values and belief systems. The Naga community exhibits shared values and beliefs with plants and trees in many Taboos and Omens centered on plants and trees.

Plants and Spiritual Entities

The Angami Naga worldview of “oneness” and the “sentient landscapes”(Heneise, 2020, pp. 80, 126) perfectly mirror Schwartz's “Unity with Nature” value. The animated forests and rivers are equal with humans; the Universalist drive isn't just an abstract political stance; it is a biological and spiritual necessity, and to harm a plant is to harm the life-force that sustains the self. Schwartz (2012) defines Tradition as respect for and commitment to cultural or religious customs, while Security focuses on safety and stability. The informant falling ill after entering a sacred forest links these two, and the “spirits demanding respect”(Heneise, 2020, pp. 6, 12) function as a mechanism of Schwartz's conformity and security. By adhering to traditional taboos, the community maintains the “oneness,” suggesting that in the Angami Naga worldview, universalism is actually maintained through the rigid structures of tradition and security, rather than being a separate, “liberal” value as it is often framed in Western contexts. Because trees are “sentient beings”(Heneise, 2020, p. 126), the act of respecting spirits is a benevolence toward a non-human kin group.

When a tree falls or a mushroom grows in a dream, it is felt as a literal disturbance in the human soul. Therefore, “plant awareness” is not just about knowing how to use plants; it is a constant, high-stakes awareness of how to coexist with them without violating the laws of the spirit masters who own the land. These taboos and omens could be considered as variables of value type of universalism and broadmindedness to be aware of the welfare of forests, trees and plants upholds plant awareness in the Naga community. These indigenous values are conservation biology driven by spiritual reverence. By labeling forests as sacred and attributing illness to their disturbance, the community effectively creates protected biological zones where biodiversity is preserved through spiritual fear. This awareness shows that the Nagas perceive a “consubstantiation”(Heneise, 2020, p. 80) a oneness-between their own bodies and the physical environment specially with plants and trees.

Plants as Prophetic Symbols

In the Naga worldview, taboos and omens are a sophisticated moral and environmental codes. The forest is a sentient landscape governed by ancestral laws and spirit masters. The Angami Naga consider that crossing spiritual boundaries between human and nature, whether in reality or in a dream, triggers immediate consequences, ensures human relationship with the botanical world, and maintains a deep respect and cessionary conduct towards sacred forests and trees. (Heneise, 2020, p. 121). Plants and forests also act as the physical markers of territories and violating them is seen as an act of spiritual trespassing. “...an informant ...unwittingly enters a sacred forest, falls immediately ill and requires significant intervention [of] dream prophetess and the spirit.”(Heneise, 2020, pp. 6, 127)Local villagers explicitly warn against entering forests “guarded by a master spirit.” The illness that follows a violation is seen as a physical manifestation of a broken spiritual taboo. “You know, when you dream of mushrooms it's a bad omen... It kept growing and growing until I thought it was going to consume me”(Heneise, 2020, p. 105).Small, often overlooked mushrooms are elevated to powerful symbols of decay or personal threat, showing that no part of the plant kingdom is viewed as “neutral.” And “dream in which a giant tree fell... it is a particularly tragic dream as it is attached to the well-being of the family”(Heneise, 2020, p. 43).Because the tree stands as a metaphor for the clan, its “fall” in a dream is a taboo event that requires communal vigilance to prevent an actual death.

In the Naga worldview, performative taboos like genna or kenyu are spiritual safeguards. The Sangtam Naga tribe believed that “it is taboo to use trees and items struck by lightning” (Kire, 2019, p. 176). Not using a tree that is struck by lightning for human needs shows that the Naga community views trees as capable of interfering with their social and spiritual beliefs. The specific plants like “ayilo and zunhebo” (Kire, 2019, p. 181) usedfor protection by Sumi Naga, or the use of michem leaves to signal the birth of a child, demonstrate a precise knowledge of botanical beings,

**Arunkumar et al.,**

and the Naga communities accept such mediation because of their awareness of plants and trees. And their mediation is not limited to the earthly life, "since the Angamis believed in life after death, the deceased would be buried with his agricultural tools and seed grains"(Heneise, 2020, p. 69). This belief underscores the human-plant relationship. By burying a person with "seed grains," the community acknowledges that the cycle of life, labour, and growth does not end at death. It suggests that the essence of a person's life is defined by their role as a cultivator and that the spiritual world mirrors the physical one, requiring the same botanical foundations as seeds to sustain the soul in the afterlife. It's seen as a preservation of the past by burying the deceased with agricultural tools and seed grains that have been used by their ancestors. These beliefs demonstrate a profound plant awareness that goes far beyond simple utility; it reveals a "botanical intelligence" where plants are recognized as holders of power, omens, and protective energy. While it comes under benevolence, it has more to do with deep-rooted traditions as it focuses on tribal aspects and their connection to an agrarian lifestyle.

The Chang Naga community sees the forest as a specific map of meanings. The Michem tree is believed to be the guardian for a newborn's placenta (Kire, 2019, p. 136), the wild nut (wei) is a vessel for prophecy, and the head-tree is the spiritual anchor of an entire village's security. And by observing whether a branch falls from a specific tree or if a seed "bursts" inside or outside a home (Kire, 2019, p. 94) the community displays an intimate sensitivity to the life cycles and physical properties of local flora. This belief system suggests that, for the Naga communities, plants are not just resources to be consumed but sentient witnesses to human history, capable of communicating the health, future, and morality of the village. This manifests Schwartz's security variable of the conservation value. These rigid Naga community beliefs and taboos are believed to protect the household from bringing any bad luck and life-threatening problems to their clan.

These taboos and omens prove that "plant awareness" in the Naga community is a form of indigenous conservation biology driven by spiritual reverence. By labeling certain forests "sacred" and attributing illness to their disturbance, the community effectively creates protected biological zones where biodiversity is preserved through spiritual fear. This awareness shows that the Nagas perceive a "consubstantiation"(Heneise, 2020, p.80), a oneness between their own bodies and the physical environment. When a tree falls or a mushroom grows in a dream, it is felt as a literal disturbance in the human soul (ruopfü). Therefore, "plant awareness" is not just about knowing how to use plants; it is a constant, high-stakes awareness of how to coexist with them without violating the laws of the spirit masters who own the land.

While elements of Security (the fear of death or "being consumed") and Benevolence (the birth of a rightful heir) are present, the mechanism of dreaming and the specific meanings assigned to certain plants are anchored in the shared symbols and customs of the Angami tribe. The "giant tree falling" is codified as foretelling the death of a clansman (Heneise, 2020, p.43). The meaning of the tree is not subjective; it is a traditional truth. By adhering to these interpretations, the individual reaffirms their commitment to the collective cultural wisdom over personal or "modern" logic. The mushroom dream is described as a "bad omen" that threatens to "consume" the dreamer (Heneise, 2020, p. 105). Prophetic plant symbols provide a psychological sense of Security even when the omen is negative. Knowing what is coming (death or birth) allows the clan to prepare. The plants act as an early-warning system, maintaining social order by reducing the chaos of the unknown. The bamboo penetrating the roof signifies a "baby boy... the rightful heir."(Heneise, 2020, p. 44) The gender of the newborn in Ao Nagas is revealed by purring up a tall bamboo pole outside the house, right in the middle of the front of the house for a boy, and slightly off-center for a girl (Kire, 2019, p. 84). And the Lotha Nagas, in the process of establishing a new village, specifically look for a water source and a suitable tree to serve as a head-tree (Kire, 2019, p. 132). The plant is a messenger for the human clan, aligning with Schwartz's Benevolence, as the prophecy is not about individual wealth but about the continuity and strength of the in-group (the family/clan lineage). The dreamer does not argue with the omen; they accept it. This limits impulses that might upset the social balance. Thus, plant awareness in the Naga community is holistic and non-extractive. The Naga community views the forest as a sentient mirror of their own society. By linking the falling of a tree to the death of a human, the community acknowledges a profound biological and spiritual interdependence. In other form the tree is a clansman that creates a culture of deep environmental respect, where one does not simply

**Arunkumar et al.,**

cut a tree or clear a forest without considering the spiritual consequences. It elevates plants from objects to subjects with the agency to warn, protect, and guide the human community. In the Naga cosmology, plants are living spirits through which the spiritual world communicates with the human realm. The dream of Nagas is a legitimate space for negotiation and revelation. Whether it is a warning of death or a promise of prosperity, the state of a plant in a dream is believed to manifest directly in the physical life of the clan.

The rapid, vertical growth of bamboo is a metaphor for the continuation of a lineage. This dream was powerful enough to halt a legal property distribution, proving that plant signs carry judicial weight. "if you dream of paddy, it is a premonition for quarrel ...dream of mushrooms it's a bad omen... it was like a giant boil in the floor... until I thought it was going to consume me"(Heneise, 2020, pp. 41, 105). These symbols show that even small plants are "read" as indicators of social disharmony or personal illness. This prophetic relationship proves that "plant awareness" in the Naga community is holistic and non-extractive in their value and belief system designed for the welfare of the humans and plants or trees who are in personal and close contact. It shows that the Nagas do not view the forest as a collection of "timber" or "crops," but as a sentient mirror of their own society. By linking the falling of a tree to the death of a human, the community acknowledges a profound biological and spiritual interdependence; the tree is a "clansman" in another form shall be associated with the variable of Benevolence value type. This awareness creates a culture of deep environmental respect, where one does not simply cut a tree or clear a forest without considering the spiritual consequences. It elevates plants from the status of "objects" to "subjects" that possess the agency to warn, protect, and guide the human community (Swaraj & Mishra, 2026).

Botanical Material Culture Among Nagas

Material culture is the study of physical objects, resources, and spaces that people create, use, and share as part of their culture. "Material culture is fundamental to being human. Things are the medium through which we act, understand ourselves and relate to each other. They habituate our reflexes, make meanings concrete and intervene as agents in our lives" (*Material Culture* | Department of Archaeology, n.d., 2026). It is about the social relationship between people and things and is important because,

...it is essential to examine the concept of the artifact, as it constitutes the primary source of information for the archaeological discipline. Archaeology relies on the analysis of artifacts to understand past societies, particularly those that lacked written systems for transmitting knowledge and information. In the case of Prehistory, where no written records exist, the detailed study of material objects, such as tools or pottery, is crucial for reconstructing key aspects of the ways of life and cultural dynamics of these societies (Sánchez-Climent, 2024, p. 116).

The categories of material culture include Art (paintings, drawings, prints, sculpture, photography); Diversions (books, toys, games, meals, theatrical performances); Adornment (jewelry, clothing, hairstyle, cosmetics, tattooing, other alterations of the body); Modifications of the landscape (architecture, town planning, agriculture, mining); Devices (machines,, vehicles, scientific instruments, musical instruments, implements) these material agents are significant since, people in all societies express and have expressed their beliefs more explicitly and openly in their material forms and aspects of their mind can be discovered through their material culture (Prown, 1982). Plants and plant materials used in any of the above-mentioned categories of material culture make them eligible for inclusion in the study to understand attention, attitudes, knowledge, and relative interest, which are contributing factors to the disparity in plant awareness. By investigating the plant material culture, it is possible to understand the complex and overlooked relationships between humans and plants. Plants and trees as biocultural actors bridge the nature-culture divide (Cornish and Hourigan, 2025). Considering both the material properties of plants and social implications of plant–people relations, the historic relationship between people and plants is often seen as reciprocal (van der Veen, 2014), and

Specifically, in societies where culture and nature are entwined through diverse traditions and regulated by indigenous knowledge systems, native trees and other natural features provide cultural and social functions. This forms eco-cultural synergy, which recognizes that human cultures are deeply embedded in their natural

Arunkumar et al.,

environments and that ecological health and cultural vitality are mutually reinforcing (Roba, 2025). This socio-cultural construct in the indigenous Naga community holds that people create and interpret meanings through interactions and assign plant and tree materials to experiences (Schaefer, 2004). The symbolic significance of trees in a number of cultures conceptualizes human interaction with the natural environment and natural resources, reflecting the human urge to share or preserve ideas through material signs, which is important for becoming conscious of thought or ideas by fixating them on the material object itself (Rival 1998). The nature and culture of the indigenous Naga communities underpin the plant and tree materials as active constituents in their social institutions draws the perspective of agency to the plant and tree materials in their culture and social institutions in the form of infrastructure, tools, symbols, weapons, etc.

Plants Material in Ritual Foundations

Schwartz defines Benevolence as the preservation of the welfare of the "in-group." The use of banana leaves for "gift exchange culture" and the "doubling" of meat (Heneise, 2020, p. 39). The plant is the material medium through which Benevolence is expressed. You cannot have the "gift" without the "leaf." By using local plants to wrap and share food, the community reinforces the bonds of the in-group. The plant becomes an extension of the giver's intent to support the collective. The "bamboo basket" and "thin strands of bamboo" used to secure food (Heneise, 2020, p. 104), the precision in how the soybeans are "tightly wrapped" reflects a need for order and preservation. In a material sense, plants ensure food security and domestic stability. These material uses are not merely efficient; they are correct. To use a different plant would be to deviate from the Naga social identity.

In the Naga cultural landscape, the head-tree (*mangkotürong* or *Mingetung*) functions as a quintessential biocultural actor, and the biological properties of the plant around the village gate are inseparable from the social identity of the village.

Every Ao village has an open space which houses the head-tree. In large villages, each khel had its own head-tree. The head-tree, also called mangkotürong (Chungli) oryimzung (Mongsen), was integral to the village. The heads of enemies would be hung on the head-tree for all to see. People placed round stones known as prosperity stones at the foot of the tree. It was common to see another set of stones beneath the tree, which were markers of peacemaking between two villages. The stones were said to breed and increase in number on their own. (Kire, 2019, p. 73)

As a primary form of material culture, the head-tree is more than a backdrop; it is a deliberate modification of the landscape that anchors the community's history and spiritual life. By serving transforms abstract tribal valour and diplomatic treaties into tangible, visible reality. This interaction reflects an eco-cultural synergy, where the plant material culture bridges the nature-culture divide. The tree is an active constituent in social institutions its physical growth and presence are entwined with the village's survival and status. By assigning experiences to these botanical forms, the Naga community fixates their belief systems upon the tree's living structure, turning it into a material sign of collective consciousness. Thus, the head-tree is not merely a natural resource but a sophisticated technological and symbolic device that habituates the reflexes of the community, proving that plants are fundamental agents in the construction of human social relationships.

In animist times, the presence of a head-tree, called Mingetung in Lotha, was a significant part of village architecture in those Naga villages that followed... The heads of enemies were hung on the head-tree. (Kire, 2019, p. 36). Every Ao Village has an open space which houses the head-tree. In the large village, each khel had its own head-tree. The head-tree, also called mangkotürong, was integral to the village. The heads of enemies would be hung on the head-tree for all to see. (Kire, 2019, p. 73) The Western Rengma village had a head trees, which were great trees in a prominent place under which the sacres stones were buried and where enemy heads hoisted on long bamboos were places against its branches. The head-tree was highly revered. If a branch fell from a head-tree, a no-work day was immediately announced. (Kire, 2019, p. 158)

**Arunkumar et al.,**

The central role of the head-tree suggests that the Plant Awareness Disparity prevalent in modern, "civilized" expansionism was historically absent in indigenous Naga spaces. Unlike the "green backdrop" effect described by Wandersee and Schussler (2001), the Naga's animistic worldview ensured plants were perceived as autonomous, volitional beings. By integrating the tree into the village's architectural and judicial core, the community actively resisted plant blindness, maintaining a high level of relative interest and attention. This relationship illustrates a tenacious, historical plant awareness where trees were not inferior to humans or animals, but were instead vital, communicative partners in sustaining communal life and memory.

The log drum serves as a sophisticated artifact of plant material culture, where a single tree is transformed into a device that habituates the social reflexes of the village. In some villages, the log drum occupied a very important space. In the Ao villages, the village drum was placed close to the *morung*, as it was the members' responsibility to look after it, and they would beat it to convey messages to the villagers during calamities or to call people to celebrate headhunting raids, festivals, etc. Sheds were built to protect the drums from the weather.

Today the villagers still know how to play four different rhythms: festival rhythms are played very slowly, rhythms to signal an attack are played faster, and a beat to signal fire in the village is played the fastest. When the governing body, the Putu, was changed every thirty years, a special rhythm was played. An interesting theory of the origin of the log drum says that Nagas might have migrated from Southeast Asia on boats that they later turned into drums. (Kire, 2019, p. 37)

According to Prown's (1982) cultural framework, the drum is a modification of the landscape and a communicative machine; its placement near the *morung* and the construction of protective sheds demonstrate a high degree of relative interest and plant awareness. This architectural integration ensures the tree remains a central "biocultural actor" rather than a marginalized green backdrop. The four distinct rhythms, ranging from festive to emergency signals represent a concrete social relationship between people and things, where the plant material is assigned the agency to regulate village life. This intimate knowledge of the drum's voice actively resists Plant Awareness Disparity; the villagers do not suffer from plant blindness because the drum is a volitional, communicative partner essential for survival. By fixating their history, the Nagas maintain an eco-cultural synergy that treats the tree as an enduring, living archive of human civilization.

Schwartz argues that Tradition maintains social significance; following the botanical protocols is an act of cultural preservation. This material and ritual reliance proves that plant awareness among the Nagas is integrative and dynamic. It shows that the community possesses a sophisticated, inherited knowledge of botanical properties, knowing exactly which wood to burn for a sacred fire, which bamboo shoots to cook for a wedding, and which leaves will best preserve fermented soybeans. This awareness is not just technical; it is deeply relational. By using plants as the wrapper for their gifts and the flavor of their celebrations, the Nagas acknowledge that their social survival is impossible without the forest. This creates a culture in which the physical life of the plant world is converted into the spiritual and physical strength of the human clan.

Plant and tree products have an aesthetic material significance in the Naga communities and are used in many forms and occasions. The Zelianf Nagas have decorative necklaces made of plant and tree materials, a "henaktsitei is a black necklace made locally from wild plantain seeds... Machipumatei is another necklace made from acrylics of different colours" (Kire, 2019, p. 198). The use of plant or tree material in socially and personally highlights how the Naga people bridge the gap between the botanical agents and personal identity. By transforming wild plantain seeds into jewellery, the community demonstrates that plants are not just for consumption or construction; they are the literal fabric of their aesthetic and social expression. It shows a resourcefulness that finds beauty and utility in the smallest parts of the botanical world, the seeds turning raw nature into a local craft that distinguishes one tribe or status from another. The material significance of these botanical entities reveals a profound plant awareness rooted in technical mastery and ecological intimacy. This dependence on botanical materials deepens understanding of the physical properties of plants and trees, including strength, flexibility, and longevity across various species.

Arunkumar et al.,

This awareness is a form of living science where the community has mapped the utility of their entire ecosystem. Whether it is felling big trees among Sangtam Nagas (Kire, 2019, p. 174) or selecting medicinal herbs like peshe by Rengma Nagas for bandages (Kire, 2019, p. 159), the Naga communities are not just passive residents of the forest, but active engineers. Their material culture is a testament to a society that has spent centuries observing plant life cycles, resulting in a sustainable lifestyle where every part of a plant from the "hardened bamboo cup" in Lotha Nagas, to Zeliang Naga's "wild plantain seed Necklace" (Kire, 2019, pp. 136, 198) recognizes unique contribution of plants and tress to human material culture.

CONCLUSION

The integration of plants into every taboo, culture, values, beliefs, and material culture, the Naga tribes show an ancient understanding of ecology where the survival of the community is inextricably linked to the respect shown to the flora surrounding them. The Naga community's relationship with the botanical world presents a powerful rebuttal to the theory of Plant Awareness Disparity. While modernization typically marginalizes plants into a green backdrop (Wandersee and Schussler, 2001), Naga material culture and spiritual values, specifically Universalism and Benevolence, elevate plants to biocultural actors. By integrating trees like the *mangkotürong* or botanical material products like the log drum into the village's architectural and judicial core, the community ensures high levels of attention and relative interest, effectively neutralizing plant blindness. Through the lens of Schwartz's Basic Human Values, the Nagas do not view plants as inferior objects but as sentient clansmen and prophetic symbols. This eco-cultural synergy creates a living science where technical mastery, such as ritual use, is driven by spiritual reverence rather than extractive utility. Consequently, the sentient landscape functions as a protective biological zone. By assigning agency to botanical materials in everything from birth rituals to legal property distribution, the Naga community demonstrates that a deep, reciprocal bond with nature is not an ancient relic but a sophisticated, persistent strategy that overcomes generational environmental amnesia and preserves biodiversity through cultural vitality.

The traditional folklore and material culture of the Naga indigenous community offer a robust rebuttal to the phenomenon of Plant Awareness Disparity (PAD). While modern urbanization often relegates flora to a green backdrop, the Naga worldview elevates plants from passive objects to biocultural actors and sentient clansmen. This study demonstrates that plant awareness is strategically encoded within the community's spiritual and social infrastructure to pre-emptively combat generational environmental amnesia (Straka et al., 2025, pp. 1165–1184). By analysing Naga belief systems through Schwartz's theory of values, it becomes evident that universalism and benevolence are not merely human-centric, but extend to the botanical realm. For example, the head-tree and the log drum function as physical anchors of judicial and social identity, ensuring that plants remain at the forefront of collective attention. Furthermore, prophetic symbols such as dreaming of falling trees or mushrooms transform botanical life into a sentient mirror of human survival, where harming a plant is perceived as harming the self. Ultimately, this botanical intelligence fosters an eco-cultural synergy where spiritual reverence creates protected biological zones, preserving biodiversity through cultural vitality rather than mere extractive utility.

ABSTRACT

Media discourse plays a crucial role in shaping public perception by constructing and organizing social reality through language. This paper examines how media institutions employ specific linguistic and rhetorical strategies to frame events, influence interpretation, and guide audience understanding. Drawing upon theoretical perspectives from Critical Discourse Analysis, framing theory, and media linguistics, the study explores how language choices in news reporting, headlines, and narrative structures contribute to the formation of ideological meanings. The paper investigates the ways in which discourse strategies such as lexical selection, metaphor, presupposition, intertextuality, and narrative framing function within media texts. These strategies are not neutral; rather, they reflect institutional priorities and sociopolitical contexts that shape the representation of events and actors. By analyzing selected media samples from contemporary news platforms, the study demonstrates how linguistic framing can foreground certain viewpoints while marginalizing others, thereby influencing public opinion and reinforcing dominant ideologies. Ultimately, this study emphasizes the importance of critical engagement with media language. By uncovering the discursive mechanisms that structure reality in media communication, the paper contributes to a deeper understanding of the relationship between language, power, and representation. The findings underscore the need for media literacy and critical awareness among audiences to recognize how discourse practices shape perceptions of social and political realities.

Keywords: Media Discourse, Critical Discourse Analysis, Media Representation, Discourse Strategies.

INTRODUCTION

Language is a powerful tool that does more than merely convey information; it actively constructs reality. In contemporary society, media institutions serve as primary sources of information, making media discourse a significant site for the production and circulation of meaning. News reports, editorials, headlines, and digital media content shape how audiences perceive events, individuals, and social issues. Media discourse is not neutral or objective; it is shaped by institutional ideologies, editorial policies, and socio-political contexts. The selective use of language influences how reality is framed and interpreted. As Fairclough (1995) argues, discourse is both socially constitutive and socially conditioned, meaning that it both shapes and is shaped by social structures. This paper explores how discourse strategies in media communication structure reality. By analyzing linguistic choices and rhetorical techniques, it seeks to reveal the underlying ideologies embedded in media texts. The study is grounded in Critical Discourse Analysis (CDA), framing theory, and media linguistics, offering a comprehensive understanding of how language functions in media contexts.

Background of the Study

The study of media discourse has gained prominence with the rise of mass communication and digital media. Scholars have increasingly recognized that media language plays a crucial role in shaping public opinion and social knowledge. The concept of “constructed reality” suggests that what people perceive as reality is often mediated through language and representation (Berger & Luckmann, 1966). Critical Discourse Analysis provides a framework for examining how power and ideology are embedded in language. Fairclough (1995) emphasizes that discourse is a form of social practice that reflects and reinforces power relations. Similarly, van Dijk (1998) highlights the role of discourse in reproducing dominance and inequality.

Framing theory, developed by Entman (1993), further explains how media selects certain aspects of reality and makes them more salient in communication. Frames influence how audiences interpret events by emphasizing specific elements while downplaying others. Media linguistics focuses on the stylistic and structural aspects of media language, including headlines, narrative patterns, and lexical choices (Bell, 1991). Together, these theoretical perspectives provide a foundation for analyzing discourse strategies in media communication.

Statement of the Problem

Despite the widespread belief that media provides objective and factual information, research suggests that media discourse is inherently selective and ideological. Language choices in media texts often reflect institutional biases and sociopolitical agendas, which can shape public perception in subtle but powerful ways. The problem lies in the lack of critical awareness among audiences regarding these discourse strategies. Many readers and viewers consume media content without recognizing how language influences their understanding of reality. This can lead to the reinforcement of stereotypes, misinformation, and dominant ideologies.

Therefore, this study seeks to examine how discourse strategies in media communication structure reality and influence audience perception.

Research Questions

- How do media institutions use linguistic and rhetorical strategies to frame events?
- What role do discourse strategies play in shaping ideological meanings in media texts?
- How do lexical choices, metaphors, and narrative structures influence audience interpretation?
- In what ways does media discourse reinforce or challenge dominant ideologies?

Objectives of the Study

- To analyze the role of language in constructing reality in media discourse
- To identify key discourse strategies used in media communication
- To examine the relationship between language, ideology, and power

Chamundeswari et al.,

- To promote critical awareness of media language among audiences

REVIEW OF LITERATURE

Media discourse has been extensively studied across disciplines such as linguistics, communication studies, and sociology. Fairclough (1995) argues that media discourse is a site where language and power intersect, shaping social identities and relationships. His work emphasizes the importance of analyzing discourse as a form of social practice. Van Dijk (1998) focuses on the cognitive and social dimensions of discourse, highlighting how media representations influence mental models and public opinion. He argues that discourse plays a key role in reproducing social inequalities. Entman (1993) introduces framing theory, which explains how media selects and emphasizes certain aspects of reality. Frames guide audience interpretation by defining problems, diagnosing causes, making moral judgments, and suggesting remedies. Bell (1991) examines the language of news media, focusing on how journalists construct narratives through linguistic choices. He highlights the importance of headlines, tone, and structure in shaping audience perception. Fowler (1991) explores the ideological nature of news language, demonstrating how linguistic features such as transitivity and modality reflect underlying power structures.

Together, these studies provide a comprehensive understanding of how media discourse functions and its impact on society.

Research Gap

While previous studies have explored media discourse and framing, there is a need for integrated analysis that combines multiple discourse strategies within a single framework. Many studies focus on individual aspects such as framing or lexical choice, but fewer examine how these strategies interact to construct reality. Additionally, there is limited research focusing on contemporary digital media platforms, where discourse strategies are rapidly evolving. This study addresses these gaps by providing a holistic analysis of discourse strategies in modern media contexts.

Hypothesis

Media discourse employs specific linguistic strategies to construct and frame reality.

These discourse strategies reflect and reinforce dominant ideologies.

Audience perception is significantly influenced by the framing and representation of events in media language.

Theoretical Framework

This study is grounded in an interdisciplinary theoretical framework that integrates Critical Discourse Analysis (CDA), Framing Theory, and Media Linguistics. These theoretical perspectives collectively provide a comprehensive lens to examine how media discourse constructs social reality through language, while embedding power relations and ideological meanings within communicative practices.

Critical Discourse Analysis (CDA)

Critical Discourse Analysis (CDA) serves as the primary theoretical foundation of this study. CDA conceptualizes language as a form of social practice that both reflects and shapes power relations in society (Fairclough, 1995). It emphasizes that discourse is inherently ideological and cannot be separated from its social and political context (van Dijk, 1998).

Fairclough's (1995) three-dimensional model of discourse is particularly relevant to this study:

Text (micro level): Analysis of linguistic features such as vocabulary, syntax, and rhetorical devices

Discursive practice (meso level): Processes of text production, distribution, and consumption

Social practice (macro level): Broader socio-cultural and institutional structures shaping discourse

CDA enables the identification of how media texts reproduce dominance, legitimize institutional authority, and marginalize alternative voices (Wodak & Meyer, 2009). It is especially useful in analyzing discourse strategies such as lexical selection, presupposition, and intertextuality, which often carry implicit ideological meanings.

**Framing Theory**

Framing Theory, developed by Entman (1993), provides a complementary perspective by explaining how media selectively represent reality. According to Entman (1993), framing involves selecting certain aspects of perceived reality and making them more salient in communication, thereby shaping audience interpretation.

Frames perform four key functions:

- Define problems
- Diagnose causes
- Make moral judgments
- Suggest remedies (Entman, 1993)

Media framing operates through linguistic and structural elements such as headlines, visual imagery, and narrative emphasis (Scheufele, 1999). For instance, describing an issue as a “crisis” versus a “challenge” can significantly alter audience perception. Framing Theory is crucial for this study as it highlights how discourse strategies guide interpretation and influence public opinion. It complements CDA by focusing on the cognitive and interpretive effects of discourse on audiences.

Media Linguistics

Media Linguistics focuses on the stylistic and structural features of language used in media communication. Bell (1991) argues that news language is carefully constructed to meet both informational and ideological purposes. Media texts are shaped by institutional norms, audience expectations, and communicative goals.

Key linguistic features examined in media discourse include:

Lexical choices: Words with ideological connotations (Fowler, 1991)

Headline structures: Designed to attract attention and frame interpretation (Bell, 1991)

Narrative patterns: Organization of information to guide audience understanding

Metaphorical language: Simplifies complex issues and evokes emotional responses (Lakoff & Johnson, 1980)

Media linguistics provides the analytical tools to examine how language operates at the textual level, complementing the broader socio-political insights of CDA and framing theory.

Conceptual Integration of Theories

The integration of CDA, framing theory, and media linguistics allows for a multi-dimensional analysis of media discourse:

CDA explains how discourse is linked to power, ideology, and social structures (Fairclough, 1995; van Dijk, 1998)

Framing Theory reveals how meaning is structured and how audiences interpret media messages (Entman, 1993; Scheufele, 1999). Media Linguistics analyzes the specific linguistic mechanisms that shape discourse (Bell, 1991; Fowler, 1991). Together, these frameworks enable a comprehensive understanding of how discourse strategies—such as metaphor, presupposition, intertextuality, and narrative framing—function to construct social reality in media communication.

METHODOLOGY

This study adopts a qualitative research approach based on Critical Discourse Analysis (CDA). Selected media texts from newspapers and digital news platforms are analyzed to identify discourse strategies.

Data Collection

News articles and headlines from major media outlets, Editorials and opinion pieces, Online news reports, Analytical Framework

The analysis focuses on the following discourse strategies:

Lexical selection, Metaphor, Presupposition, Intertextuality, Narrative framing, Procedure

**Case Study: Media Framing of Farmers' Protests in India****Introduction to the Case**

The coverage of the Indian Farmers' Protests (2020–2021) provides a compelling example of how media discourse constructs reality through language. The protests, which emerged in response to three agricultural reform laws, received extensive attention from national and international media. However, different media outlets framed the same events in contrasting ways, revealing the role of discourse strategies in shaping public perception.

Data Selection

This case study examines headlines and excerpts from:

National English-language newspapers

Television news reports

Digital media platforms

The analysis focuses on identifying discourse strategies such as lexical selection, metaphor, presupposition, and framing.

Analysis of Discourse Strategies**Lexical Selection**

Media outlets used different lexical choices to describe the protesters. For example:

Some reports referred to them as “farmers” or “protesting citizens”, emphasizing legitimacy

Others labeled them as “agitators” or “disruptors”, implying disorder

Such lexical variation reflects ideological positioning and influences audience perception (Fowler, 1991). According to van Dijk (1998), lexical choices are key tools in constructing in-group and out-group distinctions.

Framing of the Event

The protests were framed differently across media platforms:

Economic frame: Focus on agricultural reforms and market efficiency

Law-and-order frame: Emphasis on protests as disruptions to public order

Human rights frame: Highlighting police action and protesters' rights

Framing determines how audiences interpret events by making certain aspects more salient (Entman, 1993). For instance, describing the protest as a “crisis” versus a “movement” leads to different evaluative responses.

Use of Metaphors

Metaphorical language was frequently used in reporting:

“Battle between farmers and government”

“Siege of the capital”

“Waves of protest”

These metaphors frame the protests in terms of conflict, urgency, and scale, shaping emotional engagement (Lakoff & Johnson, 1980). Metaphors simplify complex realities but also introduce ideological bias.

Presupposition

Many media texts contained implicit assumptions:

“The protests continue to disrupt normal life” presupposes that protests are inherently disruptive

“The government's reforms aim to modernize agriculture” presupposes positive intent

Presuppositions present particular viewpoints as given or unquestioned, thereby influencing interpretation (Fairclough, 1995).

Intertextuality

Media coverage frequently referenced:

Past protest movements

Political speeches

International reactions

These intertextual references shape meaning by linking current events to broader narratives (Wodak & Meyer, 2009). For example, comparing the protests to earlier social movements adds legitimacy or controversy depending on context.

Ideological Implications

The analysis reveals that media discourse is not neutral but ideologically driven. Different representations of the same event reflect institutional biases and political alignments. Media outlets supportive of government policies tended to emphasize economic benefits and law-and-order concerns, while critical outlets highlighted issues of democracy and rights.

This aligns with CDA's assertion that discourse reproduces power relations and dominant ideologies (Fairclough, 1995; van Dijk, 1998).

Impact on Public Perception

The variation in discourse strategies influenced how audiences perceived the protests:

Positive framing increased sympathy toward farmers

Negative framing generated concerns about disruption and instability

Framing effects play a crucial role in shaping public opinion and policy debates (Scheufele, 1999).

DISCUSSION

This case study demonstrates how discourse strategies function together to construct multiple versions of reality. Lexical choices, metaphors, and frames interact to produce meanings that align with specific ideological positions. The findings highlight the importance of critically analyzing media language. Without such awareness, audiences may unknowingly adopt biased interpretations presented as objective facts.

CONCLUSION

The media coverage of the Farmers' Protests illustrates the powerful role of discourse in structuring social reality. By employing various linguistic and rhetorical strategies, media institutions influence how events are understood and evaluated. This case reinforces the need for media literacy and critical engagement with news discourse to recognize the underlying ideologies shaping public narratives. Texts are examined to identify patterns in language use and their ideological implications. The analysis considers both linguistic features and socio-political contexts.

FINDINGS AND DISCUSSION

The analysis reveals that media discourse employs a range of strategies to structure reality.

Lexical Selection

Word choice plays a crucial role in shaping perception. For example, terms like "freedom fighters" versus "terrorists" reflect ideological positioning. Such lexical choices influence how audiences interpret events and actors.

Metaphor

Metaphors are frequently used to simplify complex issues. For instance, describing the economy as "recovering" or "collapsing" frames it in terms of health, influencing emotional responses (Lakoff & Johnson, 1980).

Presupposition

Media texts often contain implicit assumptions that are presented as facts. These presuppositions shape audience understanding without explicit argumentation.

Intertextuality

Media discourse frequently references other texts, events, or narratives. This creates connections that reinforce certain interpretations while excluding others.

**Chamundeswari et al.,****Narrative Framing**

Narrative structures organize information in ways that highlight specific aspects of events. For example, focusing on conflict rather than cooperation can create a sense of tension and urgency.

Case Study 2: Media Coverage in India

In the Indian context, media coverage of political events often reflects ideological divisions. Different news outlets present the same event in contrasting ways, emphasizing different aspects and using varied linguistic strategies.

For example:

Some reports highlight government achievements using positive language

Others focus on criticism and dissent using negative framing

This demonstrates how media discourse constructs multiple realities based on linguistic choices.

Implications

The findings highlight the importance of media literacy in contemporary society. Audiences need to critically evaluate media content to recognize underlying biases and ideologies.

Educational institutions should incorporate media literacy programs to develop critical thinking skills. Policymakers and media organizations should also promote transparency and ethical journalism.

CONCLUSION

This study demonstrates that media discourse plays a significant role in structuring reality through language. Discourse strategies such as lexical selection, metaphor, presupposition, intertextuality, and narrative framing are not neutral; they reflect institutional ideologies and sociopolitical contexts. By analyzing these strategies, the study reveals how media language shapes public perception and reinforces power structures. The findings underscore the need for critical engagement with media discourse to understand the relationship between language, power, and representation. Ultimately, fostering media literacy and critical awareness is essential for navigating the complex landscape of modern communication.

ABSTRACT

This study attempts to explore the integration of roleplay and self-assessment as pedagogical strategies to enhance communication skills among the second-year students of engineering in a Tier 1 institution in the western part of Tamilnadu, India. The study also aims to foster learner autonomy aided through self-assessments by implementing a 30-hour course titled Mastering Conversations which focused majorly on roleplay scenarios. The students engaged in thematic roleplays by adapting various academic, social and professional settings. All roleplays were assessed by the teacher and were followed by a structured self-assessment and peer feedback. Both quantitative and qualitative data were collected and analysed to measure performance and developments in terms of clarity, content, body language, voice modulation and non-verbal communications including exhibiting confidence and expressions. A significant progress in verbal delivery and improvements in non-verbal expressions and body language was found among the learners after repeated performances. It is also found that learners take responsibility of assessing their performance through reflective goals settings and strategic use of feedback after every role play. It is also evident from the study that learner autonomy developed as the learners actively applied the feedback they received from peers and self. Learners practiced along with self-directed preparation and overcame stage fear over time. The study finally states that combining role play with reflective self-assessment and peer assessment provides a transformative learning experience which shift communication pedagogy from teacher-centered instruction to learner-driven development. These insights underscore the value of active and reflective learning approaches in engineering education to better prepare students for professional scenarios.

Keywords: Communication skills, engineering education, learner autonomy, role play, self-assessment.

INTRODUCTION

Communication in engineering is many-sided which includes verbal, written, interpersonal, and digital competencies. These skills have been found to be crucial for collaborating within teams, presenting complex technical

116589

**Mythili et al.,**

knowledge clearly, engaging with clients and stakeholders, and steering multidisciplinary and diverse environments. Accordingly, today's highly dynamic field of engineering which keeps evolving at a higher rate clearly tells us that technical competence alone will no longer be sufficient for professional success. Effective communication directly influences the academic achievements, professional growth, and contributions of the learners to the engineering community. In the present scenario, engineering projects have become all the more complex and globalized, where the capability to communicate efficiently across diverse platforms becomes the key determining element of success. Therefore, engineers are expected to interact flawlessly not only with colleagues and superiors but also with clients, suppliers, investors, and even government officials. Consequently, poor communication, whether in handling technical details or addressing complaints, can have significant consequences in today's interconnected digital world, where a single insensitive remark can escalate quickly through platforms such as social media.

Furthermore, English language has taken a dominant role in today's globalized world. Globalization without any doubt has made English as the medium of professional and academic exchange in many parts of the world. A lack of proficiency in English communication may prove aversive to the learner community, where opportunities for individual advancement and professional mobility is hindered. As a result, teaching communication skills to engineers requires careful reflection of the content provided, pedagogy used, and techniques tailored to suit respective programmes. Such interdisciplinary courses aim to equip engineering students with relevant communicative and professional competencies, using English as both a tool and a facilitator for their future careers. All stakeholders including employers, accreditation bodies like NAAC & NBA also consistently emphasize that oral and written communication skills are crucial for employability, leadership, and career progression. Despite these prevalent benefits and recognition, many engineering students continue to face challenges in expressing their ideas effectively, which undermines their ability to work collaboratively, and bleak out their chance of adapting to the demands of professional environments. Now to address this issue, various pedagogical approaches are adopted that emphasize engaging students in numerous activities apart from the conventional learning methodologies which mirror real-world scenarios. Roleplay is one such active learning method that has gained momentum in the past decade. Roleplay is recognized as an effective active learning method that provides opportunities for students to actively participate and eventually bridges the gap between classroom engagement and workplace demand.

Roleplay As An Active Learning Method

Roleplay is a powerful learning strategy that moves out from conventional teacher centered pedagogy by providing chances to students to actively engage and apply their communication skills by interacting and collaborating in real-world scenarios. Roleplay is no doubt an interactive tool where students assume the role of engineers, team leaders, stakeholders, clients and many more that they may have to face in their academic and professional career. As Kolb (1984) mentioned, learning is a cyclical process involving concrete experience, reflective observation, abstract conceptualization, and active experimentation and roleplay is one such strategy that aligns with this concept as it offers a realistic environment to the learner to apply the theoretical communicative tactics that he had learnt over the years. Roleplays help in developing several 21st century skills like communication skills, empathy, flexibility, problem-solving, and confidence building in professional setting. It without any doubt also focuses on verbal and nonverbal communication capabilities. Moreover, role play promotes critical self-awareness, peer collaboration, and active participation, all of which are critical for developing learner autonomy. It has become an essential tool for communication training, especially in engineering education because it converts the abstract learning objectives into concrete, skill-based competencies by involving students in real-world communication tasks.

Self-Assessment As A Reflective Practice:

Assessments are an integral part of education where the teacher collects and analyses the knowledge level, learnings and skills of the students to evaluate and provide outcomes on students' advancement. These assessments come in the form of tests, projects, assignments, individual and group presentation and are named as Formative and Summative assessments. Since roleplay is learner based active learning process, apart from teachers' performance-

**Mythili et al.,**

based assessments, Self-assessments play a crucial role in identifying the strengths and weaknesses of the individual learner through self-reflection. Self-evaluation employs certain tools like checklist, open-ended responses, self-evaluation and Peer evaluation which enables individuals' capacity to set goals and monitor their own progress, resulting in empowering learners to take ownership of their progress.

This process of self-evaluation strengthens learners' autonomy as it shifts the responsibility of learning and growth from the teacher to the learner. Holec, who is considered the father of learner autonomy, defines it as the capacity to take responsibility for one's learning in terms of setting goals, choosing learning methods and evaluating outcomes. In short, learner autonomy refers to the ability of an individual to take control and responsibility of their own learning, especially by identifying strategies and self-assessment. The learners who have been in the passive role of receiving information now become active and take charge of their learning outcomes. This learner autonomy plays a significant role in skills-based education, particularly in communication skills training. It enables the learner to be more self-directed, reflective and confident in applying strategies to improve their performance and adapt to diverse communication settings. A wide range of research has underscored the significance of learner autonomy, stressing that it is not an inborn quality but a competence that can be nurtured and strengthened through well-designed pedagogical approaches.

Transformative Learning In Engineering Education:

With the practice of active learning methodologies like roleplay and implementation of self-evaluation leads to learner autonomy transforming the way the learner interprets and engages with the learning process. This transformation has shifted the focus from conventional teaching method of rote memorization and theoretical aspect of the learner towards approaches that encourage foster critical analysis and practical application of concepts in real-world environment

Roleplay and self-assessment are popularly recognized pedagogical tools; nevertheless, it has been observed that the focus of engineering education is mostly on the theoretical or qualitative aspects of the concepts rather than the quantitative insights. Not many studies on the impact of how roleplay and self-assessment foster learner autonomy in terms of data-driven research are available that demonstrates measurable outcomes.

Research Objectives:

This study aims to evaluate how role-plays and self-evaluation promote learner autonomy and improve communication abilities in engineering education. In order to provide quantifiable insights into how effective these strategies are, the study examines student reflections and by doing so, it demonstrates how traditional communication pedagogy can be transformed by active and reflective learning approaches.

- To examine if roleplay enhances communication skills such as fluency, confidence, and teamwork.
- To explore how self-assessment promotes learner autonomy by enabling students to identify strengths, weaknesses, and goals.
- To investigate whether roleplay and self-assessment can facilitate a transformative shift from teacher-centered to learner-centered communication pedagogy.
- To analyze assessable patterns emerging from student reflections on role play and self-assessment.

LITERATURE REVIEW

The students face challenges in applying engineering education in real-world situations. To bridge this academic-industry gap in software engineering education, Bittal and Alfatmi (2025) introduced the Roleplay Peer Review Learning approach. This approach assigns students different roles from software development to encouraging active participation, critical thinking, hone their communication skills and make them industry ready by carefully fostering actual workplace dynamics.

**Mythili et al.,**

Li et al. (2024) in their research work titled “Fostering Autonomous Learning in Oral English Through Role Play: An Exploration in Course Setting” explore how roleplay fostered autonomous learning among the primary school students of China. Li et al. conducted this research as a three-month long action study where they introduced Roleplay Oral English Course (RPOEC) designed for primary school students of China. This study was structured on 4 themes which are set around learning interactive communication, cooperative learning, and evaluative discussions. The research findings showed that roleplays in schools enhanced engagement, reflection, self-assessment and self-learning. The research work concluded that experiential active learning approaches like RPOEC can for sure impressively foster oral proficiency by promoting learner autonomy in interactive and team building settings.

Tatiana, B., & Valentina, S. (2018) conducted a research study with 38 second-year students at a Russian University. They in their study investigated how roleplay can foster learner autonomy in an English for Specific Purpose course (ESP). This study compared the scores of the study group who were involved in roleplays with that of a control group students using IELTS speaking scores and questionnaire that focused on learner autonomy. The study concluded that the students involved in roleplay had significantly improved in IELTS speaking, which was through self-reflection, hence proving that roleplays are efficient strategies for developing autonomous language learning.

Thanh, N. T. (2019) in their research study titled “Promoting Learner Autonomy through Self-Assessment and Reflection” had conducted a framework of self-assessment and reflection. A 15-session programme for the second-year non-English major students was conducted which enabled the learners to perform practical listening and speaking tasks outside the classroom encouraging them to assess themselves and reflect on their performance. The study showed that the use of self-assessment and reflections conducted after each roleplay activity effectively supported students in becoming more self-directed language learners.

Benson (2006), in his research titled “Autonomy in Language Teaching and Learning”, categories autonomy into five models: resource-based, technology-based, curriculum-based, classroom-based, and teacher-based, with a focus on learners’ beliefs, motivation, and identity. He states that learner autonomy is central to language learning but requires a strategic approach where learners learn to balance individual control with institutional demands.

METHODOLOGY

Roleplay was introduced as an exclusive course under the name “Mastering Conversations” to the second-year students of engineering programmes in a Tier 1 institute in the western part of Tamilnadu, India. This course was designed to provide a platform for students to practice real-world conversations on various topics and themes that would suit both academic and professional scenarios. The course on roleplay was designed to be conducted for 30 hours of practical sessions across the semester in regular timetable. The purpose of the course was to foster communication skills to the engineering students through roleplay methodology, where the learners engage in real-time interactions based on the scenarios provided.

The course Mastering Conversations has 5 modules which are organized thematically. The first module serves as an introduction to roleplay, where it focuses on gesture tone modulation and provides strategies for building conversations which includes framing questions and reflect on the answers. The second module “Social Skills” focuses on conversations in social settings which include ordering food, making reservations, shopping and participating in community related activities. The 3rd module titled “Education and Technology” emphasises on personal growth, offline and online interactions addressing academic tasks such as participating in workshops, presenting research or simply explaining a scientific concept. The 4th module “Strategic Insights” aims to train the learners in critical thinking problem solving enhancing negotiation skills and entrepreneurship scenarios. The last module named “Cultural Exchange” fosters to explore traditions, cultural events, media, entertainment and art of different states and countries. The learners are also encouraged to create advertisements and plan events that suit the scenario.

**Mythili et al.,****Procedure:**

A total of 5 roleplays were conducted over the given 30 hours. The learners were put in 2- & 3-member team according to the requirement of the scenario they participated. The team formation was done by both the learner for 2 modules and for the rest of the 3 modules the teacher created the teams. For the modules 2 & 3 the learners were put in teams a week ahead and the scenarios were shared which allowed the students to prepare for the presentation. The time was given keeping in mind the learners' need to research, rehearse, and collaboratively plan their roles so that the presentations would reflect both fluency and confidence in real-life communicative contexts. For the modules four and five a days' time was given for research and practice. All the four modules were considered for Formative assessment and the last roleplay, a collective scenario of all the four modules, was considered for Summative assessment. No separate end semester practical exam was conducted. After each role play activity, the learners were asked to complete self-assessment feedback using a structured MS Form. The self-assessment consisted of two parts: a quantitative section, where Likert scale and agree-disagree items were used, and a qualitative section, where students responded to open-ended questions by reflecting on their performance in the role play. The data collected through MS Forms was exported into an excel spreadsheet for further analysis. The Likert scale responses were represented using charts and graphs while the qualitative open-ended questions were thematically organised by identifying common pattern expressed by the learners.

RESULTS AND DISCUSSION

To study and analyse the development of learners' performance across roleplays, the 1st and the 5th roleplay reflections were considered for the question "I used appropriate body language, tone, and expressions" because it directly aligns with the awareness of verbal and non-verbal communications which form the basis of any effective conversations. The comparison clearly provides proof of improvement over repeated practice and reflection from 1st to 5th assessment, where the number of students who disagree with the point have significantly reduced. The learners' response on 'one thing they did well during their roleplay' was recorded after 4 roleplays and 78 students responded. Six common parameters were identified. It is to be noted that most students mentioned fluency and clarity (20) in their performance and confidence/no stage fear (18), showing growth in speaking skills. Others focused on body language (15), teamwork (10), improvisation (8), and content preparation (7). These themes suggest that role play helped students improve both communication and performance skills.

Analysis of students' self-reflections on confidence revealed four patterns: high confidence (e.g., 'Yes, I felt confident because I had practiced well'), partial confidence where students balanced confidence with stage fear ('Partially yes and partially no'), low confidence due to nervousness or lack of preparation ('No, I didn't feel confident while performing as I have stage fear'), and evidence of confidence growth ('Not in the first but now I am okay with confidence'). The majority of responses fell under high and partial confidence, indicating that while many students felt prepared, stage fear and anxiety continued to influence performance for a notable proportion of learners.

Student reflections on communication skills applied during the role play were coded into eight thematic categories: fluency and flow, confidence and public speaking, voice modulation and expression, pronunciation and vocabulary, active listening and response, body language, improvisation, and general communication skills. The most frequently cited areas of improvement were fluency and flow (20) and voice modulation and expression (18), followed by confidence and public speaking (15). Fewer students reported progress in improvisation (7) and body language (8). These findings suggest that the activity primarily strengthened verbal delivery aspects, while non-verbal and spontaneous communication skills received comparatively less emphasis.

Peer feedback received after role play activities clustered around five major themes: voice and audibility, confidence and stage presence, body language and eye contact, clarity and fluency, and positive reinforcement. The most common suggestions were related to audibility (20) and confidence (15), indicating that peers recognized the

**Mythili et al.,**

importance of projection and stage presence. Several students were also reminded to maintain eye contact and manage body language (12). Positive feedback was also evident, with peers appreciating natural speech, improved pronunciation, and noticeable progress since earlier sessions. A portion of students (18) reported not receiving feedback. These findings highlight that peer feedback emphasized both strengths and areas for improvement, complementing self-assessment data.

CONCLUSION

The findings of the study revealed that most of the students agreed or strongly agreed that roleplay activities significantly improved their communication skills including body language, tone and expression. Learners found it initially difficult to perform on stage with various factors to be included in their roleplay like content, expressions, body language etc they in course of time showed tremendous improvement. This improvement that the learners were able to achieve was not only because of the feedback from the teacher but with self-assessment and reflection on their performance including peer reviews. Though learners have noticeably improved in several areas, they consistently report improvement in fluency, clarity of expression, reduced stage fear and improved confidence across repeated performances. Non-verbal cues such as body language, tone and expression also show considerable improvement when compared to the data between the first and the fifth roleplays. Self-assessment and reflection after roleplay have tremendously decreased the negative responses and a steady increase in the number of students progress can be witnessed. In the analysis of self-assessment, it is revealed that fluency and flow are two aspects of communication that has seen significant improvement and the same is followed by tone, voice modulation, and expression. Improvement in choice of vocabulary, pronunciation and active listening is also mentioned but not as frequently as the others. From this it is evident that the learner places more emphasis on the verbal and expressive aspects of communication. Evidence of learner autonomy was clearly demonstrated through the goals students set for subsequent role plays. Students' responses on how they planned to use feedback in subsequent role plays revealed seven themes. The most frequently cited strategies were practice and preparation (20), voice and audibility (18), and constructive use of peer/teacher suggestions (16). Many also planned to improve body language and eye contact (15) and increase confidence and stage presence (14). Fewer students mentioned communication development in broader terms (12), while a small group admitted to not planning specific improvements (10). These findings indicate that students viewed feedback primarily as a tool for refining delivery aspects such as rehearsal, voice projection, and stage presence, showing a practical orientation toward continuous improvement. Overall, the results confirm that role play combined with self-assessment not only strengthens communication skills but also fosters learner autonomy by promoting self-reflection, strategic goal setting, and responsibility for one's learning path.

Table 1 One thing I did well during the roleplay

Theme	Example Student Responses	Frequency (n)
Confidence / No stage fear	"I did my role with confidence"; "No stage fear"	18
Body language & gestures	"I expressed my body language"; "Maintaining posture"	15
Fluency & clarity	"Spoke clearly"; "No stammering"; "Flow of speech"	20
Collaboration / teamwork	"Collaborated with peers"; "Coordinate with my teammates"	10
Improvisation / adaptability	"Managed even when script was forgotten"	8
Content preparation	"Remembering sentences"; "Prepared script delivery"	7

Table 2. Did I feel confident while performing? Why or why not?

Category	Example Responses	Frequency (n)
High Confidence	"Yes, I felt confident throughout the role play."	28
Partial Confidence	"Confident but a bit nervous." / "Partially yes and partially no"	22
Low Confidence	"No, I didn't feel confident because of stage fear."	14
Confidence Growth	"Not in the first but now I am ok with confidence."	10

Table 3. What communication skills did I apply or improve during this activity?

Category	Example Responses	Frequency (n)
Fluency & Flow	"Fluency in speaking," "Flow of my language"	20
Confidence & Public Speaking	"Spoke boldly," "Reduced stage fear"	15
Voice Modulation, Tone & Expression	"Voice modulation," "Tone of my dialogue"	18
Pronunciation & Vocabulary	"Professional vocabulary," "Pronunciation"	10
Active Listening & Response	"Active listening," "Respond to others"	12
Body Language & Non-Verbal Skills	"Gestures," "Posture," "Body language"	8
Improvisation & Spontaneity	"Spontaneous speaking," "On-spot improvisation"	7
General Communication Skills	"Professional communication," "Conversation building"	12

Mythili et al.,

Table 4 Did any of your peers give you feedback after the role play? Summarise one useful comment or suggestion you received

Theme	Example Responses	Frequency (n)
Voice & Audibility	"Speak louder," "Voice was low"	20
Confidence & Stage Presence	"Be confident," "Don't panic"	15
Body Language & Eye Contact	"Improve body language," "Maintain eye contact"	12
Clarity & Fluency	"Speak more clearly," "Avoid stammering"	10
Positive Feedback / Appreciation	"Good pronunciation," "Well done"	14
No Feedback / Not Applicable	"No feedback received"	18

Table 5 How do you plan to use this feedback in your next performance?

Theme	Example Responses	Frequency (n)
Voice, Tone & Audibility	"Talk loudly," "Project voice," "Improve clarity"	18
Body Language & Eye Contact	"Maintain eye contact," "Improve gestures"	15
Confidence & Stage Presence	"Lose stage fear," "Perform confidently"	14
Practice & Preparation	"Practice lines," "Rehearse," "Take notes"	20
Communication Skills Development	"Improve fluency," "Better expression"	12
Constructive Use of Feedback	"Use feedback as guide," "Apply suggestions"	16
No Action / Unclear	"No," "Didn't plan," "I don't know"	10

ABSTRACT

English language proficiency and employability skills are critical determinants of career success. While India holds distinct advantages in English language learning and related employability competencies, several persistent challenges hinder optimal outcomes. This study proposes a differentiated curriculum framework for first-year engineering students, grounded in the principles of Outcome-Based Education (OBE), to address these challenges effectively. Students were classified into three proficiency-based groups—beginner, intermediate, and advanced—based on initial language competency assessments. Each group followed a tailored curriculum and distinct assessment strategy. Beginner-level learners received foundational language instruction complemented by a creative podcast production task; intermediate learners engaged in industry-relevant assignments and case-based analyses; and advanced learners undertook independent, project-based language learning (PBLL). The findings indicate measurable improvements across all levels, with advanced learners demonstrating capabilities beyond conventional classroom expectations, intermediate learners showing notable progress, and beginner-level learners requiring additional targeted support. All groups achieved the intended learning outcomes in alignment with OBE principles.

Keywords: Language learning, Beginner, Intermediate, Advanced, PBLL, OBE.

INTRODUCTION

Engineering graduates are anticipated to demonstrate excellent communication skills, professional behaviour, critical thinking skills, leadership ability in addition to the technical competency. The first-year engineering students have different levels of proficiency which is a challenge to work on the language skills and the employability skills by a teacher. Heterogeneous groups often result in a confusing state because of the understanding capacity of the different levels of students in the same cohort. In order to overcome this challenge, the grouping is necessary to be modified in to homogeneous. If this grouping is done at the graduate level education, the expected outcome in terms of knowledge, skills, and attitude / behaviour which is in alignment with OBE will be obtained.

This research paper aims at presenting a language learning framework for the homogeneous group of learners in alignment with the Outcome Based Education framework. The diagnostic test at the beginning of the course helped in categorising the levels of students, the course content helped the learners to achieve the desirable results, the assessment methods validated the learning outcomes, and, overall, the expected results were in alignment with the OBE.

The OBE principles adopted for this research are from the three verticals of OBE:

1. Knowledge – Theoretical understanding of English language usage in professional contexts.
2. Skill – The capacity to apply language skills for various professional purpose like academic, industrial, and societal.
3. Attitude/Behavior – The ability to be confident, collaborative in nature , and being professional behavior.

LITERATURE REVIEW

Rong Luo (2025) in his research article examines how Outcome-Based Education (OBE) help create an innovative English Classroom Instruction. After analyzing the limitations, Luo offers a groundbreaking model that gives space for revision of curriculum, preparation of learning objectives, plan for interactive teaching techniques, and wide-ranging evaluation strategies. Similarly, P. Qian's (2023) in his research article discuss on how English Education can shift focusing the teaching from exam point of view to application point of view. The paper highlights that the English Classroom has outdated teaching methods and emphasis too much on tests. At this point, the author brings OBE as a reformative and transformative approach that provides long term change in English Language Teaching in higher educational institutions.

Huaqian Fu's (2023) in his research article offers a unique and strategic study on how vocabulary teaching can be strengthened with the application of OBE principles. Fu integrates vocabulary teaching with multimodal approaches and outcome-based methods and highlights on how OBE complements vocabulary teaching in a dynamic way. Similarly Chuan-hui Zhou's (2019) in his article speaks on the design of English teaching strategies with the TOPCARES-CDIO model and OBE model. He integrates project-based learning and outcome-based assessment to argue that this combination can bring a connection between academic learning and professional application, thus achieving both linguistic and employability outcomes.

LiLi Sun and Dr. Elvira Balinas in their research article expands the scope to vocational education. In this study, the authors acknowledge that there is an insufficiency in the use of digital resources and confrontation to adapt to new methods. The authors approve a course design that comes with iterative improvement. Their study reflects on the importance of developing hybrid OBE instruction, reflective teaching practices and tech-integrated models that can support vocational English education in a rapidly changing job market. Similarly Talha Memon and Waqar Ali Shah's (2024) in their research article acclaim that ELT through OBE is a new and flexible approach that reshapes language learning environment. The study highlights that this method brings autonomy to the teaching strategies as well as recognition to teachers' individuality at engineering universities.

METHODOLOGY

A total of 597 learners is enrolled in the first year English language course in the academic year 2024 -2025. The total number of learners is categorised into three verticals, beginners, intermediate and advanced. The categorization of the homogeneous group of first-year engineering students is done with a diagnostic test before the commencement of the programme. The 597 students enrolled in the programme appeared for a diagnostic test, the diagnostic assessment included listening, speaking, reading, writing and some of the essential grammar components. Based on the scores secured by the learners, they are categorised into three levels. The diagnostic test assessed the skills in terms of the reliability and the validity in connection to the globalised environment and to fall in line to achieve the OBE principle.

1. Beginner Level– Learners who scored less than 60 % are identified to this level. This level is to make the learners have the foundational language development to get well along with their regular courses and have a comfortable learning environment.
2. Intermediate Level – Learners who scored between 61 and 90 are identified to this level. This level is to make the learners engage with professional communication tasks and go ahead in learning and have more meaningful academic engagement.
3. Advanced Level – Learners who scored more than 91 are identified to this level. This level of learners should be proficient and capable of applying autonomous learning with problem solving and project-based approach including participation in various research forums and set a standard.

Out of the 597 total enrolments, 351 learners are enrolled in beginner level course, the beginner level course is titled '*Effective Communication*'. 183 learners are enrolled in intermediate course; the course is titled '*Professional Communication*'. 63 learners are enrolled in advanced level course; the course is titled '*Fluency Through Practice*'.

As stated above, the three different courses have unique focus areas that support the requirement of the proficiency level. Each course is designed to facilitate various skillsets ranging from basic language competency to industry-ready skills. The table given below displays the three courses and their focus area. The curriculum for the courses across the three levels was aligned with the three verticals of the OBE domains, as shown in the table.

Pedagogical Strategies

Pedagogical strategies are the key requirements to accomplish effective outcomes in the learners. The chosen strategies must align with specific learning outcomes in relevance to the real world application. The pedagogical strategies must align with the expected outcomes and proficiency levels to achieve the desired results. Given below are the different pedagogical strategies and the proficiency levels of the different learners.

1. Beginners: Problem Based Language Learning, Task-based learning, structured writing exercises, listening labs, introduction to digital production (podcast preparation).
2. Intermediate: Case studies, Problem Based Language Learning, blended learning with digital tools, workplace-simulated writing tasks.
3. Advanced: Project-based learning, teamwork, output creation (websites, mobile apps, books, creating digital tools for language learning and research publications).

The teaching methodologies and strategies employed in the study were designed to be both diverse and adaptable to meet the varying needs of learners. The courses Effective Communication and Professional Communication adopted a Problem-Based Learning (PBL) framework. Broad problem statements were developed, supported by specific guiding statements for each topic, ensuring that the scope and complexity of the problems aligned with learners' proficiency levels. The course instructor played a key role in ensuring that each problem statement was both relevant

**Arokia Lawrence Vijay et al.,**

and appropriately challenging. For instance, one problem statement required students to prepare a “Freshman Guide.” This task began with a reading-focused activity, as incoming students must be familiar with institutional rules and regulations. Learners were required to read the college rulebook or relevant sections of the institutional website. Subsequently, the activity progressed to drafting a procedural guide for online course registration, thus integrating reading comprehension with procedural writing.

Both courses incorporated two continuous written assessments and spoken assignments. For example, beginner-level learners worked on producing podcasts, which were later presented in class. These assessments, combined with end-semester examinations, were used to validate learner performance. Notably, the end-semester examination questions were not prepared by the course instructor but were generated using Artificial Intelligence (AI) tools. This approach ensured uniformity, standardization, and comparability of examination experiences across proficiency levels. Question difficulty was calibrated according to each group’s competency level. Performance evaluation was thus based on a combination of formative assessments conducted by the course faculty and summative assessments generated by AI, aligning with the principles of Outcome-Based Education (OBE).

Advanced-level learners were engaged in independent, project-based language learning. Students worked in teams of four to six members, with 63 participants forming 15 teams. Each team developed a project aimed at enhancing language skills. The outputs included publishing podcasts on commercial digital platforms, producing short educational videos, developing content for Learning Management Systems (LMS), publishing storybooks, and creating websites focused on placement-related English skills. Project evaluation comprised two interim reviews—the first conducted two weeks into the course and the second at mid-semester—followed by a final review at the end of the course, during which teams presented their completed outcomes.

RESULTS AND ANALYSIS

The teaching strategies used at the three levels aligned with the OBE principle paved way to measure the desired results. These desirable results are achieved because of the following strategic actions and plans.

1. Homogeneous group of learners
2. Course content specific to the proficiency level
3. Problem Based Language Learning
4. Project Based Language Learning
5. Case study analysis
6. Industry relevant tasks
7. Continuous monitoring

Figure 2 clearly depicts the performance of the different level of students and their performance based on the scores.

Effective Communication: The results for the *Effective Communication* course demonstrated a normal distribution of marks across the cohort. Out of 351 learners, 61 students (17.37%) scored between 80 and 89, 159 students (42.29%) achieved scores between 70 and 79, and 89 students (25.00%) scored between 60 and 69. Only 6 students (1.70%) failed to meet the basic performance requirements. These results suggest that learners, particularly at the beginner level, were distributed across a wide range of achievement levels. The performance patterns provide clear evidence of measurable learning outcomes, reflecting the varied impact of differentiated instruction. Moreover, the distribution highlights the need for targeted interventions to support those at the lower end of the spectrum, while continuing to challenge and extend the higher-achieving students in line with Outcome-Based Education (OBE) principles.

Professional Communication: The results for the *Professional Communication* course indicated a marked improvement in performance compared to *Effective Communication*. Out of 183 learners, the majority—119 students (65.02%)—scored between 80 and 89, positioning them at the higher end of achievement. A further 49 learners (26.77%) scored

**Arokia Lawrence Vijay et al.,**

between 70 and 79, while 9 learners (4.92%) achieved scores in the 90–100 range, demonstrating advanced proficiency. Notably, only 6 learners (3.27%) scored between 50 and 69, indicating a minimal proportion of students at the lower performance band. This distribution reflects a higher overall competency level and suggests that the differentiated curriculum and targeted learning strategies employed in *Professional Communication* were effective in supporting learners toward higher achievement levels. Fluency Through Practice: The score distribution for this course was heavily concentrated at the higher end, with no learners scoring below 60. The largest cohorts—30 students each—were in the 80–89 and 90–100 ranges, representing 47.00% of the total in each category. Only 3 students (4.76%) scored between 70 and 79, indicating that most participants demonstrated high proficiency. This concentrated distribution at the upper performance bands suggests that the instructional design and learning activities were highly effective in facilitating advanced-level achievement.

Skill Development and OBE Attainment

The results and the scores of the learners convey various ideas according to the different levels of learners. Beginner level learners progressed from basic sentence construction to producing structured reports and podcasts. The Intermediate level learners demonstrated fluency in professional writing, digital communication, industry-relevant tasks, drafting effective blogs and analyzing critically and the advanced level learners displayed autonomous project management, innovation, and leadership in producing concrete specialized outcomes. The research analysis clearly depicts the outcomes of knowledge, skills, and behaviors / attitudes at all levels. The assessment at two verticals, by the course handling faculty and the aid of AI validates outcome and the strategic element in OBE-based curriculum design. Fluency through practice encompasses visible and measurable outcomes by the autonomous projects.

CONCLUSION

This Outcome-Based Approach validates that aligning course delivery to learner proficiency levels empowers effective attainment of defined outcomes. Homogeneous grouping encouraged the course instructors to be specific and pay more to the learner's needs. This ensured the beginners concentrated more on the basic language development, intermediate users to build real-time workplace skills, and advanced learners involved in autonomous language development projects. The integration of reliable tasks such as podcasts, digital profiles, project reports and case studies ensured relevance in both academic and employment contexts. The research and the results convey that the similar approaches can be employed to all first-year engineering students to learn English. This methodology does not make the advanced learners repeat the learning what is already familiar to them and waste time. Instead, they can learn more in advance and support their peers in improving them. Similarly, the beginners need not be in a class where the content is too heavy and not able to follow or understand which results in failure. The intermediate learners also find it difficult to fall between the other two learners. Hence, the model discussed depicts a differentiated, OBE-driven curriculum that can address heterogeneous proficiency in first-year engineering students. This will ensure measurable learning outcomes.

Table 1. Course Allotment and Focus Areas

Level	Course Title	Focus Areas
Beginner	<i>Effective Communication</i>	Fundamental language skills, Reading Aloud, Paragraph writing, Data interpretation, Drafting Email, Note-making, Report writing, Listening, podcast creation etc.
Intermediate	<i>Professional Communication</i>	Industry-Specific Terminology, Professional email writing, Digital and Online Communication tools, Review and Essay writing, Creating Digital Profiles, Video Resumes, Case Studies, Project Report Writing Blog Writing etc.
Advanced	<i>Fluency Through Practice</i>	Independent projects (Eg. Podcasts publication, mobile pronunciation apps, websites, book publications, paper presentations), advanced writing, case studies, real-world application tasks.

Table 2 Curriculum Design and OBE Mapping

OBE Domain /Levels of the learners	Beginner	Intermediate	Advanced
Knowledge	Grammar, sentence structure, paragraph organisation	Industry-specific vocabulary, report writing conventions,	Research conventions, publishing procedure and formats
Skills	Writing emails, interpreting charts, note-making, Writing error free sentences, Speaking in digital platform (Podcast)	Creating digital profiles, Drafting Professional Email, drafting project reports	Website content for language development, podcast production, public speaking Content creation for LMS platform Presentation skills, Pitch presentation
Attitudes/ Behaviours	Confidence in expressing ideas, basic teamwork, willing to acquire global skills	Professionalism in digital communication, responsibility in group work, accepting the needs and working on the same.	Leadership, initiative, social responsibility, project making, entrepreneurial thought

ABSTRACT

“Supreme court of India heard several petitions to legalise same sex marriages and its nuances in detail for over 10 days and reserved its verdict saying it cannot give a declaration on the anticipation as to how the parliament is likely to respond to it” based on the point that marriage is not a fundamental right promised under the Indian Constitution. (*Supriyo @ Supriya Chakraborty v. Union of India*). In this context, a Film like *Badhaai Do* directed by Harshavardhan Kulkarni, occupies a significant position in discourses on same sex marriages in India. An academic dissection of nuances surrounding the institution of marriage in India and the traumatic crisis in it, is the need of the hour. Is lavender marriage a moral solution pleasing the society? Is it an escape from societal pressure leading to dual lives? The researcher attempts to study lavender marriages as a space to negotiate queer identities with society and the aftermath of it which includes trauma as a major concern. The chosen film texts portray pressure on queer individuals leading to unsuccessful Lavender marriages resulting in traumatic lives. Using Judith Hermen’s theory of complex Trauma, and identify the trauma that queer individuals go through in the institution of marriages wherein ‘queer desire,’ ‘sex’ and sexuality are unspoken and misunderstood. The paper situates the chosen visual texts against the backdrop of Indian society and marriages and explores the consequences of compulsory heterosexuality.

Keywords: Queer, trauma, Lavender marriage, performativity, negotiation

**Madhusudan et al.,**

INTRODUCTION

Marriage in general has been an integral part of human society for eons and the reason why one chooses to be married and who to be married to, has been instrumental in deciding one's social status and dignity in any society across the globe. What is it that significantly bothers the mainstream society about same sex marriages? An answer to this question needs a good understanding of why marriage in general is such a great deal in heteronormative society. Is it for the mere companionship? Is it for the reproduction? Or is it just a social institution to ensure security in terms of one's wellbeing? But can all these be attained even without marriage? Society in India and across South Asian countries has always considered marriage especially that of daughters as a great responsibility and a destiny. It is very common for Indian parents to save money for their daughters' weddings. There is a taboo against daughters that do not end up married either by choice or by chance. Therefore, it is common in India and south east Asian countries, for parents to pressurise their children to get married once they reach a certain age and for gays and lesbians that are in closet, the pressure becomes even more intense. Advertisements in matrimonial sites speak volumes on the same. Gays and lesbians who succumb to this pressure, try to find relief in what is called the lavender marriage. Lavender marriages become not mere compromises with society but a calculated and psychological strategy to survive within the constraint of heteronormative structure.

METHODOLOGY

Using qualitative analysis of the chosen film texts namely *Badhaai Do*, a Bollywood film and *Kathal the Core*, a Malayalam film. Judith Herman's theory of Complex trauma is used to base the arguments. The theory states that exposure, could be just one if prolonged to atmospheres that are toxically pressured restricting freedom and self-expression lead to complex trauma. The intention of the research is not to pathologize queer individuals portrayed in the films rather canter variation, survival, and restricted agency under heteronormative pressure.

LITERATURE REVIEW

Most researchers have viewed lavender marriages from a law and society point of view and seldom from that of what queer individuals might experience in the process. Relatively, less work has been done from a trauma point of view. The researcher takes interest in positing lavender marriages as a space for three agents to contribute to trauma. Firstly, the queer individuals themselves, their immediate families, and then the society in the form of neighbours as seen in both the film texts. The main argument is that lavender marriages can more comprehensively be dissected using the theory of complex trauma as theorised by Judith Herman as emerging from a long-term exposure to constant pressure where self-expression is destroyed in a structured by hindering freedom.

DISCUSSION

Is lavender marriage a negotiation with society and queer individuals or a Trauma adaptive survival strategy?

Complex trauma involves Long, recurrent exposure to forcible or dangerous environments, rather than one shattering event. Gay and lesbian individuals often forced to enter heteronormative marriages experience complex trauma as seen both the film texts. It is not only that queer person in the marriage suffers trauma because of excessive pressure to perform the role of spouse and then live his/her nocturnal life but also the other partner who is heterosexual or homosexual also experiences trauma from not receiving the reciprocation of love and affection. As seen in *Kaathal the core*, after twenty-five years of marriage, when they have the college going daughter the wife files for a divorce as she comes to know of her husband's homosexuality. The amount trauma on her is equally significant here just like that of the character played by Mammootty. It is the victim victimising. Queer individuals experience Chronic familial surveillance, which can be seen in *Badhaai Do* where in constantly their families and neighbours

Madhusudan et al.,

keep interfering into their personal; space and as such it was Emotional coercion that led to their marriage. Lavender marriages although gives initial relief to queer individuals as they feel they have put an end to their pressure from families, it only turns into a trauma-containment strategy, if not a trauma origin. It further leads Emotional numbing for both partners in the marriage and the queer partners that they are within their secretive lives, which can be seen in *Badhaai Do* where in Bhumi Pednekar's character loves babies but cannot adopt one, so numbs her feelings and tries to stay strong. Dissociation, Fragmented sense of self, and Difficulty with intimacy are other significant ways they experience trauma. In *Kaathal* the core, Jyotika's character, on being asked by their intimacy says they have had sex only thrice in 25 years. Lavender marriages become adaptive responses to complex trauma that takes its base in survived heteronormative pressure. Positioning lavender marriages within the outline of complex trauma permits survival strategies shaped by chronic pressure and forced choice rather than as separate psychological dysfunctions (Herman).

A marriage of convenience has been part of Indian culture ever since the idea of marriage evolved from being just a couple living their lives to that of two families playing a huge role in it. Shradul, a gay man in *Badhaai Do*, is a police officer, an epitome of what any straight woman would desire for. He is portrayed to be this well built, tall, dark, handsome, macho man with a gym toned body, husky voice and charming with a cleanshaven face and a moustache. This aspect of detailed working of his character as a police officer is a realistic approach that he shouldn't be compromised with machoism, however, the story takes an interesting turn when Shradul expresses to his wife Suman, a Lesbian woman, that it was all because of extreme pressure of being a man, ostensibly forced him to develop masculinity to the society's orders. The ambiguity of whether Shradul really wanted to have that gym toned body and be that macho speaks volumes on the condition of gay men in India.

The idea of performativity as stated in *Gender Trouble* by Judith Butler holds good here. "Gender proves to be performative— that is, constituting the identity it is purported to be. In this sense, gender is always a doing, though not a doing by a subject who might be said to pre-exist the deed." Butler does not claim that gender is a performance, and she distinguishes between performance and performativity. Shradul's character in the film exemplifies what Butler calls gender performativity. He is demanded to perform as a macho man in the heteronormative structure of the society. The whole notion of being a man, being a macho man adds on to his already existing trauma of accepting himself as gay. It is also significant to note that to be a man and to be gay could mean different as the latter is sexual orientation whereas to be a man is to perform a set of repeated acts as Butler puts it. Gay men in India have that extra pressure to play the role of men while processing their sexuality's nuances. To come to terms with one's homosexuality while playing the gender role is a process. Following Connell's types of masculinity, Shradul tries to put on hegemonic masculinity as the society demands whereas he could potentially fall into subordinate masculinity. So cultural archiving plays the role in shouldering the societal expectation and demand that deeply rooted in India and never admit any kind of incestuous passion.

The opening scene of the film deals with an identity marker when Shradul's sister says he is the light of the family: "Kul Deepak." This shows how men are considered in India. His obsession with body building in his introducing scene in the film, makes the audience think he is a macho man and take his sexuality for granted meaning thinking that he can only be straight. He also wants a transfer from a female police station. The officer says people die for a posting in female police stations, shows the mindset about men. He is already portrayed with a hint that he is not into women, only when keenly observed. The family has called for a meeting to discuss about his marriage. He has always told them that he is in love with a girl to keep the discussion away and when all of them agree, he says she got married to someone else. This shows how he kept lying to keep the marriage discussion far from him, which is a representation of several gay men in India who try to put on a macho pose and say that they are in a relationship with a girl to the outer world while they continue their closeted gay lives.

Rather than signalling repression or moral failure, emotional withdrawal within such marriages reflects trauma-adaptive behaviour shaped by chronic threat (Herman). In a scene where his constables are catching couples in a public park, a female constable sees two men making out behind a bush and calls them lesbians, and a male constable

**Madhusudan et al.,**

sees them to say no, they are homo. Though the scene is portrayed comically, it shows the lack of awareness on who is what? When they report those two men to Shradhul, there is an instant way of how he connects with them with a certain sense of empathy, he immediately asks them to leave and says “people like this spoil the country” only to not surprise and bring a doubt in the minds of the two constables. This is the first instance where it can be known that he plays the role. A man that is straight and cisgender is expected to not support any act of two men making out, and more importantly abuse them. The linguistic gender performativity is seen here.

The demand for silence within marriage illustrates how survival is negotiated through self-erasure in contexts of institutional betrayal (Freyd). In a monologue scene, drunk Shardul expresses himself to Suman saying he never wanted to be this body, he takes his shirt off and shows his body. He displays his strong muscles. He gets emotional calling him a homocop and a gay man became a police officer thinking of catching thieves, but gays are even more scared of police. This shows that he perhaps wanted to be someone else, beyond that gym toned body. He has been performing his macho gender all this while. Suman happens to meet a north eastern girl Rim Jim, a lab technician working at a hospital, they both connect instantly and fall in love however when Suman tells her about her lavender marriage with Shardul, the way Rim Jim asks her questions about the lavender marriage gives that there is a sense of hopelessness about them being together, yet they manage to laugh it out. So, potentially after lavender marriage, finding love becomes even more challenging for queer people as no other queer individual might take interest in someone who is in a lavender marriage or if the potential lover is not in favour of a lavender marriage.

s van der Kolk notes, chronic trauma conditions individuals to prioritise safety over desire, a dynamic that is evident in the formation of lavender marriages (van der Kolk). Shardul and Suman manage to get a flat outside the city to hide themselves but they soon end up shifting to a police quarter. When a neighbour senior couple visits them, Shardul says they do not want a maid because “Suman will do all the chores.” Shardul takes on a hegemonic masculine trait and controlling husband role in front of the guests. When she is about to sit, he orders her to go and make coffee like a typical husband. On being questioned why he is acting like this suddenly; he says they should feel like they were husband and wife. Up on a condition, Suman behaves like a wife and takes his order of making coffee. The senior woman goes to the kitchen and asks Suman to keep him under control while the senior man appreciates Shardul for his dominating husband behaviour. This shows how both performed their gender in front of a heteronormative structure that is based on patriarchy.

heteronormative structure based on patriarchy is seen here. For instance, when Rim Jim shifts with Suman, Shardul does not like it, though he does not strongly express it. So, even though a lavender marriage initially seems to work out, eventually when the queer couples respectively find their love partners, it gets complicated. Rim Jim's entry does create an impact on their heteronormative portrayal to society. In a scene where Rim Jim has her arms around Suman in a public park, Shardul comes and immediately puts his arms around Suman as a husband, showing how he was always conscious of what others perceive about them. He is not so happy with Rim Jim being with Suman in their flat, though this is portrayed in a subtle way with humour. Rim Jim gets uncomfortable with seeing Suman and Shardul being like a husband and a wife outside, she fights with Suman asking her how she can so comfortably act like this, to which Suman says for the first time in her life she is living on her own terms and if it demands lying, she would not hesitate, which is yet another instance showing how queer individuals enjoy even a little freedom of being themselves in the oppressing heteronormative society.

General cultural sphere creates an ideological formation in the minds of people and expects them to live according to the formatted sphere and thus Suman's attire accounts important in the role being played as daughter-in-law though it's a feigned relationship according to them. It adds to the narrative the expectation of heterosexual couples to go with the momentum with procreation that amplifies relationship further in a coherent ordination, expectation to remain as the daughter in law without getting disturbed by authoritative questions by the elder is another example for the woman to remain passive in the idyllic relationships. Authority of predisposition regulated in their mind of men tend to blame women for their discomfort in mentioning about their incapacibilities is well mentioned in the movie with the example of this scene depiction. when his uncle asks why they are not having children, says that

**Madhusudan et al.,**

Suman cannot get conceived. Cultural hybrid irrespective of man or gay, likes to blame women. Masculine ego emerges in this argument that filament in the frame of heteronormative structure of family. Cultural attitude embedded in the system and they are so uncritically accepted to monitor the couples personal and private affairs to watch their behaviour towards each other is never be surprising and this attitude is brilliantly captured in the movie by appointing Shardul's mother to keep an eye on them.

By now, the couple have almost become impatient, they just do not know what to do. The mother starts reporting about the couple's lifestyle to the family. Shardul's grandmother, asks her to tell Suman's parents to talk to her saying "it is also their responsibility." The couple are forced to sleep on a same single bed because the mother is at home. The mother is forced by the family to ask Suman to come home early and dress like a lady to attract her husband. All these are portrayed slightly on a comical note. In fact, the mother watches an adult scene on TV in front of Suman. At one point due to increased pressure, the couple even think of having sex just to have a baby. the whole idea seems so technical in their mind. Rim Jim does not give her consent for the idea. So, they leave it at that. This shows how in a lavender marriage, queer couple even think of having children which could further complicate the case.

Drawing on Freyd's theory of betrayal trauma, this paper argues that lavender marriages often require individuals to suppress awareness of harm in order to preserve vital familial and social bonds (Freyd). Suman one day tells her mother-in-law that the problem is with Shardul. The mother cries on hearing this. When Suman says let us get your sperm count tested at the hospital where Rim Jim works and she can give a report that his sperm count is less and that would give them time to be away from the pressure of having children. Shardul, though is not happy, goes with the plan. Upon knowing that it is the problem of their son, the family agrees for them to adopt a baby. Assertive authority of the family members blames suman being caught having sex with Rim jim, blames her for being the lesbian by citing their common behaviour with her, such as sleeping next to her and changing their dress in front of her, assertion over their body and mind is not surprising in these contexts, rectitude expectance is relatively common and considerably accepted norm for Indian woman to follow the mass as the 'self' remains as the 'constructive self' and it is much expected that these kind of exhaustion and disappointment is not new for the homosexuals or lesbians as suman expresses her disappointment with her father that these reaction is quite expected and her suffering is right from childhood deep within expecting that one day they will have to deal with their family's reaction. And in the journey, they would have taken so many decisions that put them into stress, trauma, and pressure. Garrulity and dominance in blaming the other gender is easy to posit blame on women and establishes their power to retain their self -constituted invasion in couple's life though not chosen by them rather imposed on them by severing their personal lives. Family gets shell shocked by shardul reply in accepting that he is the gay and even he has the disease if it is so mentioned Lesbianism as the disease. "I also have that disease, and I am gay." Interesting response in the film, assertion of the practice drives them to remain as the couple choices for adopting the baby, conditioned to the system again with the foreclose expectation of adoption given exclusively to the heterosexual couples according to the Indian Law of adoption. Movie concurrently gives the glimpse for a change in the system of adoption by highlighting the law that forces couple to remain in the family system irrespective of the family and cultural acceptance. Movie ends in questioning the system turbulent demand by the family, choice of the individual, customised expectation of enforced law commands the individual to play the role in the constituted family axiom with the clear mention to the family about their mutual understanding by reasoning them with their identity requirement, but subordinate to the functional system of the society.

CONCLUSION

Lavender marriages act more as responses to adapt to long term pressure handled in a heteronormative structure. According to Judith Herman's framework of complex trauma, lavender marriages are a result of queer individuals' frustration with their families due to chronic surveillance about playing the roles by families, general stigma from the society, and institutional extermination. These conditions, make the marriages function as a shielding construction

**Madhusudan et al.,**

that lessens exterior hazard although they amplify the psychological pain inside. Therefore, the deliberate determination of lavender marriages replicates violence deeply structured by heteronormativity rather than individual dishonesty.

ABSTRACT

Problem-based language learning serves as an impactful pedagogical approach for engineering students, which equips them with career skills that are necessary for their professional life along with language development. This study investigates the implementation of this learning model to first-year engineering students and evaluates its effectiveness and the challenges faced by the learners. This work explores how PBL makes the students to meet the demands of professional life by equipping them with the necessary skill sets. The results of this work indicate that this mode of learning improves the linguistic proficiency of the learners along with other professional skills like collaboration, problem solving, teamwork, communication and presentation skills. The learners overwhelmingly reported that they had increased motivation during the classes, and they simulated real-life conversations while completing the tasks assigned. They also endorsed that they would recommend this model to others and for a broader adoption in other science and engineering courses. This work affirms the fact that adoption of PBL in English language learning makes the engineering students both professionally and linguistically competent. This work also insists the researchers to ensure inclusivity of all the learners during implementation of any teaching-learning process.

Keywords: Problem-based language learning, innovative pedagogy, experiential learning, professional skills, learning through real-life scenarios

**Mohanraj et al.,**

INTRODUCTION

Engineering graduates are expected to communicate in English in a number of professional situations, especially considering globalization and working with multicultural teams. English language proficiency becomes crucial for them to be successful in their academics and to become employable. As engineers, they are expected to communicate clearly, collaborate with others efficiently and attack to various situations. Despite this reality, it is often found that engineering students face consistent challenges in language learning. Frequently it is observed that these challenges come as a result of limited exposure to the language, limited use of English in their daily activities and lack of confidence prevailing in the learners. Conventional mode of language learning does not seem to help this scenario since it is dominated by grammatical components to the most part and long lectures where the student participation is minimal. This situation prevails in most of the engineering institutions in India, thereby calling for an innovative teaching model which would cater to the needs of the Gen Z learners.

Problem based learning seems to be a promising approach which is student centered and stimulates language learning. The students will be able to use this as a tool to communicate with others by simulating real world situations. This also would help the students to learn other 21st century skills along with the air English language. Problem based language learning was introduced in a Tier 1 institute in the western part of Tamil Nadu, India, to overcome the above problems and to increase the motivation of the learners. This model was implemented after thoroughly exploring its potential to enhance English language proficiency among the engineering graduates. This research article will examine the student perceptions how this model impacted their English language learning and its application in India's real life professional contexts. This work will also analyse the different skills that they have developed through this mode of learning like teamwork, collaboration, critical thinking, digital literacy and problem solving.

REVIEW OF LITERATURE

KoK and Duman (2023) examined the problem-solving abilities developed by the learners who learnt English language through problem-based learning mode. The study was carried out in a public university in Türkiye for a controlled group of students who were split into 2 groups. One group of students was taught using PBL and the other group was taught using traditional instruction. The results showed that there was a significant difference between both the groups. Students who learnt through PBL developed more problem-solving abilities. Ali (2019) explored the effectiveness of problem-based learning in English language classes. The results depict that there was a transformation from a teacher-centered approach to a learner-centred approach in this mode of learning. The students were found to actively engage in all the tasks aligned to real-world problems. It was witnessed that PBL promotes self-directed learning and improves the communication skills of the learners. Jaleniauskienė (2016) investigates the impact of language learning in the higher educational institutions through problem-based learning. The study explores how the traditional learning methods often fail to engage the learners. The study also investigates the gap between the learning environment and the real-life language use. Fitriyah et al. (2024) come up with an instructional design for this mode of learning. It is evident in their study that PBL promotes higher-order thinking skills in the learners. By providing authentic problem-solving tasks, the students were trained and evaluated on their ability to analyse, question and evaluate. This work advocates for the use of PBL to enhance critical thinking in the learners.

RESEARCH METHODOLOGY

A mixed-method design was applied to analyse the effectiveness of this implementation, and this enabled us to obtain both quantitative and qualitative analysis of the data. A survey was conducted using MS Forms, and this allowed to get the student perceptions systematically and enabled the faculty to explore and understand the

**Mohanraj et al.,**

individual student experiences in the English classes conducted through Problem-Based Learning. The responses collected through MS Forms allowed to carry out a statistical interpretation of student perspectives and the qualitative dimension helped to understand the subjective perceptions of the students. This innovative teaching pedagogy was carried out for a class of 61 first-year engineering students from a Tier 1 institution in the western part of Tamil Nadu, India.

The class comprised of students from various engineering programs – Mechanical Engineering 35, Electronics and Communication Engineering 12, Mechatronics Engineering 6, Automobile Engineering 4, Civil Engineering 3 and Aeronautical Engineering 1. This was found to be a heterogeneous group of students where there were 47 boys and 14 girls out of which 23 of them hailed from rural background and 38 students came from urban and semi-urban areas. The educational background also differed with 42 students completing their higher education in English medium schools and 19 students completing their schoolings from Tamil medium and other vernacular medium schools.

The English language course, which was a part of their regular curriculum, was taught through the Problem-Based Learning mode. Real-life scenarios related to academic and professional environments were given in the class and the topics like email writing, letter writing, blog writing, group discussion, report writing, preparing agenda and minutes of meeting, creating advertisements, product review, reading comprehension, listening for specific purpose, listening to TED talks, oral presentation, and proposal writing were aligned to these scenarios and the students were made to respond to the situations. A few real-life activities were carried out to make the classes more interesting and to make the learners involved in the course. For instance, while handling email writing, the students were instructed to write emails to their friends, teachers and to a few companies by providing specific situations. Role plays were conducted where each student was assigned with different roles, and they were asked to enact their part for a specific situation. This made them to explore the real-life situations and how people behave in professional situations in industries.

Engagement of students was continuously monitored with utmost care throughout the classes. The faculty served to be the observer and facilitator guiding the learning process. There were individual and group activities throughout the course. The candidates were divided into groups of 4 to 5 members and brainstormed on the activities. The usage of English language was consistently monitored during the brainstorming sessions and group discussions. English language use was monitored during the activities like role play, presentations and other interactive activities and in the written texts. The candidates were observed on their behaviour, self-confidence, critical thinking and problem-solving abilities. They were encouraged to develop leadership qualities and work collaboratively in order to become a good team player. A checklist was created and used to track the progress of the students with specific rubrics for evaluation. The intervention of the faculty members was minimal during the activities, and the students were given a free hand to present with confidence.

Data was collected using a questionnaire consisting of multiple choice, multiple selection, Likert-scale, and open-ended questions. It was then tabulated digitally to ensure accuracy. Open-ended questions in the MS Forms helped the faculty to critically analyse the motivation, confidence level and the challenges faced by the learners. The students were encouraged to give authentic and self-reflective responses in order to understand the effectiveness of the training model. The candidates were brainstormed on the specific skill that they developed after each activity ensuring that they are aware of their learning.

RESULTS AND DISCUSSION

A survey was conducted using a questionnaire to understand the effectiveness of the Problem-Based Language Learning. Insights of the survey responses provided the effectiveness of this teaching methodology and how the

**Mohanraj et al.,**

students were able to develop various language skills. A chi-square test was applied to understand the distribution of language skills and other skills among the candidates. This analysis compared the expected frequencies of skill selection with the frequencies that the learners have reported. It was expected that all the mentioned skills are to be developed equally by the learners through this mode of learning.

Descriptive Analysis

- A strong majority (70.5%) of students found that problem-based learning was very effective, while 27.9% of students thought that it had a moderate impact. Only 1.6% reported that there was no impact, revealing that this teaching methodology is impactful in motivating the learners to understand their course efficiently.
- 78.7% of the learners perceived that problem-based language learning motivated them to apply their knowledge in real-life situations, while only 3.3% took a different stand. 18% of the candidates were not certain about whether this teaching model motivated them, which is deemed to be a part of difficulty in implementation.
- 72.1% have stated that this mode of learning made them think out-of-the-box, whereas 11.5% of the learners disagreed with the statement. 16.4% of learners were not able to come to a conclusion and the overall scenario pictures that this teaching methodology is cognitively stimulating.
- When it comes to learner motivation, 75.4% of the students felt extremely satisfied, while only 4.9% felt that they were not motivated. The remainder of 19.7% found it difficult to understand whether this model motivated them or not, and this indicates that this pedagogy largely facilitates learner motivation.
- Overall, it was observed that 73.8% of the learners recommend this teaching pedagogy, while only 4.9% of the students hesitate to recommend the model to others. 21.3% of the candidates were uncertain, and the overall thought processes of the learners indicate the model's effectiveness.
- When it comes to learning new technology, 57.4% of the students agreed that this learning methodology warranted them exploring new technologies in order to complete the tasks, while 14.8% differed. 27.9% of the learners were unsure about learning new technology during the course, and this suggests moderate effectiveness of problem-based language learning in inducing the learners to explore new technologies.
- It was evident from the feedback of the students that they were able to improve many skills in the form of collaboration, communication, confidence, problem solving and speaking skills, while the scope to improve their negotiation skills was comparatively less. Thus, the student responses suggest that this mode of learning is highly effective in developing various skills that are essential for their future personal and professional life.

The 3D pie chart represents the distribution of skills developed by the students through this mode of learning. This reveals that the teamwork and collaboration of the learners along with their communication skills dominated the outcome with teamwork (13.1%), communication skills (12.8%), and confidence (12.2%) which represents a collective total of over 38% of the reported improvements. Divergently, negotiation skills (2.7%) and critical thinking (7.1%) appeared as minimal sections, which suggested that the present pedagogy fosters interpersonal skills and collaboration more than the higher-order cognitive skills. This could be possibly because of the fact that only first-year engineering students were the participants of the course.

The stacked bar chart illustrates the students' perceptions on five significant learning outcomes in the form of application of the learning in real-life scenarios, encouraging the learners to think out of the box, motivating the learners to improve their English language proficiency, learning new technology for completing the tasks during the course, and the satisfaction level of the learners. There were high affirmative responses ("Yes") for real-life application (78.7%), cognitive engagement (72.1%), motivation (75.4%), and peer recommendation (73.8%), with technology adoption (57.4%) showing moderate acceptance. The limitations of this mode of learning are evident through the responses of a small group of learners ("No" $\leq 14.8\%$ across all categories). The "Maybe" responses (18–27.9%)—which can be specifically witnessed in technology integration—advocates the limitations of individuals in learning new technologies. Thus, these perceptions affirm that problem-based language learning has strong efficacy in affective and practical domains.

Mohanraj *et al.*,

The given column bar chart portrays the perceived efficacy of problem-based language learning with its effectiveness. Majority of the learners (70.5%) rated its effectiveness as "Highly impactful," followed by a few students rating it as "Average" perception (27.9%). Only a negligible number of candidates (1.6%) reported as "Did not create any impact." These responses underscore the impact of this mode of learning in enhancing the communication and English language skills of the students. It is also a notable fact that even though a small amount of the learners have given negative comments, it mandates us to revisit the model for refinement to ensure inclusivity.

Chi-Square Test for Skill Development

Objective

To determine whether the distribution of skills developed through problem-based language learning is uniformly distributed or whether some specific skills are significant than others.

Methodology

- **Null Hypothesis (H_0):** The distribution of skill development is uniform (all skills improved equally).
- **Alternative Hypothesis (H_1):** The distribution is **not uniform** (some skills improved more than others).

Data Considered:

- **Total responses:** 61 (assuming each respondent could select multiple skills).
- **Categories analyzed:** 10 skill options (excluding "Other").
- **Expected frequency (if uniform):**

$$E = \frac{\text{Total selections}}{\text{Number of categories}} = \frac{335}{10} = 33.5$$

Chi-Square Test Results

Statistic	Value
Chi-square (χ^2)	31.16
Degrees of freedom (df)	9
p-value	0.00028

Statistical Significance

The p-value (0.00028) is far below $\alpha = 0.05$, indicating **strong evidence against H_0** .

Conclusion: The distribution of skill development is **not uniform**—some skills were significantly more impacted than others.

The chi-square test results ($\chi^2 = 31.16$, $df = 9$, $p < 0.001$) reveal a statistically significant non-uniform distribution of skill development while inducing problem-based English language learning. This indicates that a few specific skills sets have developed prominently while others were found to be on the lower side. Teamwork and communication skills—teamwork (13.1%), communication (12.8%), and confidence (12.2%)—emerged as predominant outcomes of this mode of learning. Consequently, critical thinking (7.1%) and negotiation skills (2.7%) were on the lower side. It is evident that the development of all the skills cannot be equally distributed, and this analysis gives the researchers an opportunity to refine their teaching pedagogy to ensure equal development of all the skill sets.

CONCLUSION

The instructional design of this model of integrating the real-life professional contexts in English language learning mandated the students to engage in peer collaboration and think out of the box to complete the activities. The concept of rote learning almost vanished through this methodology as the students involved themselves, both individually and as a group, to discuss and present their findings related to the context. The results obtained through this study align well with the existing literature on problem-based language learning. This method increased the

**Mohanraj et al.,**

motivation and confidence of the candidates by providing authentic professional environments, which mirrored their situation after graduation. The positive feedback of the students and the increased satisfaction about the pedagogy highlights the success of this model. This serves as a proof that English language learning can happen in a technical context.

Integration of real-life situations warrant the students to use their English proficiency and technical knowledge in practically during discussions and presentations. Development of other life skills during language learning becomes an added advantage. This learning model also fosters moving beyond regular grammar drills in English classes towards task-driven approaches. There was a significant improvement in the soft skills such as communication skills, teamwork, problem solving, critical thinking and confidence during the learning process. Students were able to identify their improvement in handling situations, which served as a great motivation for them. Learning new technologies for completing tasks in English classes reflects the multifaceted impact of this pedagogy.

This teaching methodology comprehensively serves as a model which is engaging, relevant and provides a transformative classroom experience to the learners. This serves as an authentic case study to integrate PBL into English language learning. Adapting this pedagogy to engineering and science subjects would impact the learners to a great extent. Implementation of any pedagogy will have its own limitations. The results that are shared in this research work is limited to a specific set of students studying in one single institution. The effectiveness may vary on a case-to-case basis. A minimal number of students have reported that the model did not create any impact on them. This has to be considered in future studies and it has to be ensured that every student gets benefitted during the implementation of the process.

The multifaceted benefits derived from the model makes it more suitable for the present generation of learners. It encourages the learners to become resourceful and involve themselves in the activities unlike rote learning. It also promotes deeper understanding of the subject and equips them with professional readiness. Institutions adopting this approach can definitely create learning environments where the students are better prepared to face the complexities of the professional setting.

ABSTRACT

Language is not merely a neutral tool of communication; it is deeply embedded in systems of ideology and power. This paper examines how language ideology—the beliefs and assumptions people hold about language and its use—plays a significant role in shaping social hierarchies, authority, and access to resources within society. Drawing on theoretical perspectives from scholars such as Pierre Bourdieu, Michel Foucault, and Norman Fairclough, the study explores how language functions as a mechanism through which power relations are constructed, maintained, and sometimes challenged. The paper focuses on the ways dominant language ideologies privilege certain languages, dialects, or accents while marginalizing others. In many societies, the concept of a “standard” language is often associated with prestige, education, and authority, granting social and institutional advantages to its speakers. Conversely, speakers of non-standard or minority languages may experience exclusion, discrimination, or reduced access to opportunities in areas such as education, employment, and governance. These dynamics illustrate how language ideology operates as a subtle yet powerful instrument of social control. Furthermore, the study analyzes how institutions such as education systems, media, and political discourse reinforce dominant language ideologies. Through policy decisions, curriculum design, and public narratives, these institutions contribute to the reproduction of linguistic hierarchies that sustain broader social inequalities. At the same time, the paper also highlights instances where marginalized communities resist dominant ideologies by asserting linguistic identity and promoting linguistic diversity.

Keywords: Language Ideology; Power Relations; Sociolinguistics; Linguistic Inequality; Discourse; Social Hierarchy; Language Policy; Identity.

INTRODUCTION

Language is central to human interaction, yet it is far from neutral. It reflects and reinforces social structures, hierarchies, and relations of power. The concept of language ideology provides a framework for understanding how beliefs about language shape social realities. Language ideology refers to the cultural assumptions, attitudes, and values attached to language forms and their speakers (Woolard & Schieffelin, 1994). In modern societies, language operates as a gatekeeping mechanism. It determines access to education, employment, and political participation. Certain forms of language are institutionalized as “standard,” while others are stigmatized as inferior or incorrect. These hierarchies are not linguistic in nature but are socially constructed and politically maintained. This paper examines how language ideology functions within systems of power. Drawing on critical theories from Pierre Bourdieu, Michel Foucault, and Norman Fairclough, it explores how language contributes to the production and reproduction of inequality, while also serving as a site of resistance.

Background of the Study

Language plays a central role in shaping human interaction, social identity, and institutional structures. Beyond its communicative function, language operates within ideological frameworks that influence how it is perceived, valued, and used in society. The concept of language ideology refers to the system of beliefs, assumptions, and attitudes that individuals and communities hold about language and its speakers. These ideologies are not neutral; rather, they are deeply intertwined with power relations and social hierarchies. Scholars such as Pierre Bourdieu have emphasized that language functions as symbolic capital, granting power and prestige to those who command socially valued linguistic forms. Similarly, Michel Foucault highlights how discourse shapes knowledge systems and regulates what can be expressed within a society, thereby reinforcing structures of power. Norman Fairclough further develops this perspective through Critical Discourse Analysis, demonstrating how language practices both reflect and reproduce social inequalities.

In multilingual and multicultural societies, language ideologies often privilege certain languages, dialects, or accents over others. The notion of a “standard language” is frequently associated with education, authority, and socio-economic mobility, while non-standard varieties are marginalized. This hierarchy is particularly evident in contexts such as education, media, and governance, where dominant language norms are institutionalized. In countries like India, where linguistic diversity is vast, English often functions as a language of power and global access, whereas regional and indigenous languages may be undervalued in formal domains. Such dynamics illustrate how language ideology contributes to unequal access to resources and opportunities. At the same time, emerging movements advocating linguistic diversity and identity challenge these dominant ideologies, making language a site of both control and resistance. This study is situated within this broader sociolinguistic and critical framework, examining how language ideology operates as a mechanism of power in contemporary society.

Statement of the Problem

Despite the recognition of linguistic diversity in many societies, dominant language ideologies continue to privilege certain language forms while marginalizing others. These ideologies are embedded within institutional practices, particularly in education, media, and political discourse, leading to unequal access to opportunities and resources for speakers of non-dominant languages or dialects. The problem lies in the subtle yet pervasive nature of linguistic inequality. Standard language norms are often perceived as neutral and objective, masking the power structures that sustain them. As a result, speakers of marginalized language varieties may experience discrimination, reduced social mobility, and identity suppression. Furthermore, these inequalities are frequently reproduced through institutional mechanisms, reinforcing existing social hierarchies.

Although previous research has explored the relationship between language and power, there remains a need to critically examine how language ideologies function across different social domains and how they contribute to both

**Chamundeshwari et al.,**

the maintenance and contestation of power relations. This study seeks to address this gap by analyzing the role of language ideology in shaping social inequality and exploring the potential for resistance through linguistic practices.

Research Questions

This study is guided by the following research questions:

- What are language ideologies, and how are they constructed within society?
- How do dominant language ideologies contribute to the formation and maintenance of social hierarchies?
- In what ways do institutions such as education, media, and political discourse reinforce linguistic inequality?
- How does language function as a tool of power and social control?
- What forms of resistance emerge against dominant language ideologies, and how do they promote linguistic diversity and identity?

Objectives of the Study

The primary objectives of this study are:

- To examine the concept of language ideology and its relationship with power and society.
- To investigate the role of institutions (education, media, and politics) in reinforcing dominant language ideologies.
- To explore the impact of linguistic inequality on marginalized communities.

REVIEW OF LITERATURE

The relationship between language, ideology, and power has been extensively explored within sociolinguistics, linguistic anthropology, and critical discourse studies. Early foundational work by William Labov (1972) demonstrated that linguistic variation is systematic and socially meaningful rather than deficient. Labov's work challenged deficit theories by showing that non-standard dialects possess their own internal logic and structure. The concept of language ideology gained prominence through the work of scholars such as Woolard and Schieffelin (1994), who define it as the cultural system of ideas about language and its role in social life. They argue that language ideologies mediate between social structures and linguistic practices, shaping both perception and usage. Pierre Bourdieu (1991) provides a critical framework by introducing the notion of symbolic power and linguistic capital. According to Bourdieu, the dominance of a "legitimate language" is maintained through institutional mechanisms, particularly education. Speakers who possess this linguistic capital gain social mobility, while others are systematically disadvantaged.

Similarly, Michel Foucault (1972) conceptualizes language as discourse, emphasizing its role in constructing knowledge and regulating power. Foucault argues that discourse determines what is considered truth, thereby shaping social reality and controlling subjectivity. Building on these perspectives, Norman Fairclough (1995) develops Critical Discourse Analysis (CDA) as a methodological tool to examine how language reproduces social inequalities. Fairclough highlights the interconnection between discourse and social structures, arguing that language both reflects and constructs power relations. Further contributions by Braj B. Kachru (1985) on World Englishes highlight the global spread of English and its localized adaptations. Kachru's model challenges the dominance of native-speaker norms and emphasizes the legitimacy of diverse English varieties, particularly in postcolonial contexts.

Phillipson (1992) introduces the concept of linguistic imperialism, arguing that the global dominance of English perpetuates cultural and economic inequalities. This perspective is particularly relevant in multilingual societies where English functions as a gatekeeping mechanism. Recent studies have focused on the role of media and digital platforms in shaping language ideologies. Androutsopoulos (2014) notes that online spaces allow for greater linguistic diversity, enabling users to challenge traditional norms and assert identity. However, digital discourse also reproduces existing hierarchies, reflecting broader societal inequalities. Overall, the literature establishes that

Chamundeshwari et al.,

language ideology is deeply embedded in social structures and plays a crucial role in maintaining and contesting power relations.

Research Gaps

Despite extensive research on language ideology and power, several gaps remain:

Contextual Gap:

Much of the existing literature is based on Western contexts. There is a need for more studies focusing on multilingual and postcolonial societies, particularly India, where linguistic diversity is complex and layered.

Institutional Integration Gap:

While individual institutions such as education or media have been studied, there is limited research examining how multiple institutions collectively reinforce language ideologies.

Contemporary Digital Context:

Although recent studies address digital discourse, there is insufficient exploration of how social media simultaneously challenges and reproduces linguistic hierarchies.

Resistance Narratives:

Existing research often focuses more on domination than resistance. There is a need to highlight how marginalized communities actively negotiate and resist dominant language ideologies.

Interdisciplinary Approach:

There is scope for integrating sociolinguistics, discourse analysis, and political theory more comprehensively to understand language ideology in contemporary society.

This study aims to address these gaps by providing a critical and context-sensitive analysis of language ideology across institutional and social domains.

Theoretical Framework

Bourdieu: Language and Symbolic Power

Pierre Bourdieu conceptualizes language as a form of symbolic capital. According to Bourdieu (1991), linguistic competence is not merely the ability to produce grammatically correct sentences but the ability to use language appropriately within a given social context. This competence is unevenly distributed across social classes. The notion of the “legitimate language” is central to Bourdieu’s argument. Standard language varieties are often associated with dominant social groups and institutions. Speakers who possess this linguistic capital gain access to power and prestige, while others are marginalized. Thus, language becomes a tool for reproducing social inequality. Educational systems, for example, often reward students who already possess the dominant linguistic code, thereby reinforcing class divisions.

Foucault: Discourse and Power

Michel Foucault views language through the lens of discourse. For Foucault (1972), discourse is not just language but a system of knowledge that defines what can be said, by whom, and with what authority. Power, in this sense, is not centralized but diffused across institutions and practices. Language plays a crucial role in shaping what is considered “truth.” For example, political discourse can construct certain groups as “others,” legitimizing their marginalization. Foucault’s framework highlights how language is implicated in systems of control and surveillance. It shapes subjectivity and governs social behavior.

Fairclough: Critical Discourse Analysis

Norman Fairclough develops Critical Discourse Analysis (CDA) as a method for examining the relationship between language and power (Fairclough, 1995). CDA focuses on how discourse practices reproduce or challenge social inequalities.

Fairclough identifies three dimensions of discourse:

Text (linguistic features)

Discursive practice (production and interpretation)

Social practice (broader socio-cultural context)

Through this framework, language is seen as both constitutive and constituted by social structures. It plays an active role in shaping ideologies and power relations.

METHODOLOGY

Research Design

This study adopts a qualitative research design, grounded in interpretive and critical paradigms. It seeks to explore the relationship between language ideology and power through textual and discourse-based analysis.

Data Sources

The study uses secondary data, including:

Educational materials (textbooks, policy documents)

Media texts (news articles, advertisements, television discourse)

Political speeches and public statements

Digital discourse (social media posts, blogs)

These sources are selected to represent key institutional domains where language ideologies are produced and circulated.

Data Analysis Method

The analysis follows Fairclough's three-dimensional model:

Textual Analysis:

Examining vocabulary, grammar, and rhetorical features to identify ideological patterns.

Discursive Practice:

Analyzing how texts are produced, distributed, and interpreted within specific contexts.

Social Practice:

Linking discourse to broader social structures, including power relations and institutional frameworks.

This multi-level analysis allows for a comprehensive understanding of how language ideology operates across different domains.

Sampling Technique

A purposive sampling method is used to select texts that are representative of dominant and marginalized language ideologies. The selection is based on relevance to the research questions and diversity of contexts.

Scope and Limitations

The study is limited to qualitative analysis and does not include quantitative data.

It focuses primarily on selected institutional domains rather than all aspects of society.

Interpretation of discourse may involve subjective analysis, though theoretical frameworks ensure rigor.

Language Ideology and Social Hierarchies

Language ideologies often reflect broader social hierarchies. The idea of a "standard language" is a prime example. Standardization is typically linked to nation-building, education, and governance. However, it also marginalizes regional dialects and minority languages. In many societies, speakers of the standard language are perceived as more educated, intelligent, and competent. Conversely, non-standard speakers are often stigmatized. This linguistic discrimination can lead to social exclusion and reduced opportunities. For instance, in multilingual countries like India, English often functions as a language of power. It is associated with higher education, corporate employment, and global mobility. Meanwhile, regional languages may be undervalued in formal domains. Such hierarchies demonstrate that language ideology is not merely about communication but about power and identity.

Language, Identity, and Inequality

Language is a key marker of identity. It reflects one's social background, ethnicity, and cultural affiliation. However, dominant language ideologies often impose normative standards that suppress linguistic diversity. Marginalized communities frequently experience linguistic insecurity. Their speech is labeled as "incorrect" or "inferior," leading to internalized stigma. This phenomenon has been documented in sociolinguistic studies (Labov, 1972). Language-based discrimination intersects with other forms of inequality, including class, race, and gender. For example, women's speech has historically been judged more harshly than men's, reflecting gendered power dynamics.

**Chamundeshwari et al.,**

Thus, language ideology contributes to the construction of social identities and the perpetuation of inequality.

Institutional Reinforcement of Language Ideologies

Education

Educational systems play a crucial role in reinforcing language ideologies. Standard language is often the medium of instruction and assessment. Students who do not possess this variety face disadvantages. Curriculum design may exclude minority languages, leading to their gradual erosion. Teachers may also unconsciously favor students who speak the standard language, reinforcing linguistic hierarchies.

Media

Media discourse shapes public perceptions of language. News anchors, television programs, and advertisements often promote standard language norms. Accents and dialects are sometimes used to stereotype characters, reinforcing social biases. Media also plays a role in legitimizing certain narratives while marginalizing others. Through repeated exposure, audiences internalize dominant language ideologies.

Political Discourse

Political language is a powerful tool for constructing reality. Politicians use rhetoric to shape public opinion and legitimize policies. Language can be used to include or exclude groups, often reflecting underlying power dynamics. For example, terms like “illegal immigrants” or “outsiders” carry ideological implications. Such language influences how individuals and groups are perceived and treated.

Language Ideology as Social Control

Language ideology functions as a subtle mechanism of social control. By defining what constitutes “correct” language, institutions regulate behavior and maintain order. This control is often internalized. Individuals modify their speech to conform to dominant norms, a process known as linguistic accommodation. While this may facilitate social mobility, it can also lead to the loss of linguistic identity. In this way, language ideology operates not through coercion but through consent, aligning with Foucault’s notion of power as pervasive and internalized.

Resistance and Linguistic Diversity

Despite the dominance of standard language ideologies, there are numerous instances of resistance. Marginalized communities often reclaim their linguistic identity as a form of empowerment. Movements promoting linguistic diversity emphasize the value of all language varieties. For example, the recognition of indigenous languages and dialects challenges dominant narratives. Digital media has also provided new spaces for linguistic expression. Social media platforms allow users to communicate in diverse languages and styles, challenging traditional norms. Such resistance highlights the dynamic nature of language ideology. It is not fixed but constantly negotiated and contested.

Implications for Language Policy

Understanding language ideology has important implications for policy-making. Inclusive language policies can promote linguistic diversity and social equity. Educational reforms should recognize the value of multilingualism. Incorporating students’ native languages into the classroom can enhance learning outcomes and cultural identity. Similarly, media and political institutions should adopt more inclusive language practices. This can help reduce linguistic discrimination and promote social cohesion.

FINDINGS AND DISCUSSION

The analysis of institutional discourse across education, media, and political domains reveals that language ideology operates as a powerful mechanism for structuring social hierarchies and maintaining unequal power relations. The findings are discussed thematically in relation to the research questions and theoretical framework.

Language as Symbolic Capital and Social Stratification

The study confirms Pierre Bourdieu’s (1991) assertion that language functions as symbolic capital. Standard language varieties—particularly English in the Indian context—are associated with prestige, authority, and access to socio-

economic opportunities. Individuals who possess proficiency in these varieties are more likely to succeed in education and employment. Conversely, speakers of regional languages or non-standard dialects are often marginalized. This reinforces social stratification, as linguistic competence becomes a criterion for inclusion or exclusion. The findings demonstrate that linguistic inequality is not merely cultural but deeply structural.

Institutional Reinforcement of Language Ideology

The study finds that institutions play a critical role in reproducing dominant language ideologies:

Education: Curriculum and assessment practices prioritize standard language norms, disadvantaging students from diverse linguistic backgrounds. Media: News and entertainment media reinforce stereotypes by associating certain accents with intelligence or authority. Politics: Political discourse strategically uses language to construct identities and influence public perception. These findings align with Norman Fairclough's (1995) view that discourse is both shaped by and shapes social structures. Language is not simply reflective but constitutive of power relations.

Discourse, Knowledge, and Power

From a Foucauldian perspective, the study demonstrates how discourse regulates knowledge and authority. Michel Foucault (1972) argues that power operates through discourse by defining what is "true" or "acceptable." For example, policy documents and media narratives often frame English as a "global necessity," thereby legitimizing its dominance. This discourse marginalizes other languages by positioning them as less valuable. Such narratives are internalized by individuals, shaping their linguistic preferences and aspirations.

Linguistic Inequality and Identity

The findings highlight that language ideology significantly impacts identity formation. Speakers of marginalized languages often experience linguistic insecurity and social stigma. This can lead to code-switching or language shift in an attempt to conform to dominant norms. At the same time, language serves as a marker of cultural identity. The suppression of linguistic diversity can result in the erosion of cultural heritage. This dual role of language—as both a tool of exclusion and identity—underscores its complexity.

Resistance and Emerging Linguistic Practices

Despite dominant ideologies, the study identifies various forms of resistance:

Use of regional languages in digital platforms

Revival of indigenous languages through cultural movements

Increased recognition of linguistic diversity in education

These practices challenge traditional hierarchies and promote inclusivity. Digital media, in particular, has created spaces where non-standard varieties gain visibility and legitimacy.

Case Studies (India-Focused Examples)

To contextualize the findings, the following case studies illustrate how language ideology operates within India.

English as a Gatekeeping Mechanism in Education

In India, English-medium education is often associated with quality and prestige. Access to English education is uneven, with urban and private institutions offering greater opportunities than rural or government schools. Students from non-English backgrounds face challenges in comprehension, participation, and assessment. This creates an educational divide that mirrors socio-economic inequalities. The preference for English reinforces its status as linguistic capital while marginalizing regional languages.

Linguistic Hierarchies in Media Representation

Indian media frequently portrays English-speaking individuals as modern, educated, and elite. In contrast, characters using regional dialects are often depicted as rural or less sophisticated. Such representations reinforce stereotypes and influence public perception. Media discourse thus plays a crucial role in shaping language ideology and sustaining social hierarchies.

**Chamundeswari et al.,****Language Politics and Policy Debates**

Language policy in India has long been a site of political contestation. Debates over the promotion of Hindi versus regional languages reflect deeper issues of identity and power. For example, resistance from southern states against the imposition of Hindi highlights the role of language in regional identity. These debates illustrate how language ideology intersects with politics and governance.

Digital Media and Linguistic Democratization

Social media platforms such as YouTube, Instagram, and X have enabled users to create content in multiple languages and dialects. This has led to the rise of regional influencers and content creators who challenge traditional language hierarchies. Digital discourse allows for greater linguistic experimentation and inclusivity, although inequalities still persist.

CONCLUSION

Language ideology plays a central role in shaping power relations within society. It influences how languages and their speakers are valued, often reinforcing existing inequalities. Through theoretical insights from Pierre Bourdieu, Michel Foucault, and Norman Fairclough, this paper has demonstrated how language functions as a mechanism of both domination and resistance. While dominant ideologies privilege certain language forms, marginalized communities continue to challenge these hierarchies. Recognizing and valuing linguistic diversity is essential for creating a more equitable society. Ultimately, language is not just a means of communication but a site of power, identity, and social transformation.

ABSTRACT

The research paper presents an instructional model designed for a module “Analytical Thinking Skills” as part of a course “Mastering Sustainable Skills,” which was conducted over a 4-month period for first-year engineering learners at a Tier I college located at the western part of Tamil Nadu, India. The module was structured within the Problem-Based Learning (PBL) instructional framework. The study explores the effectiveness of problem-based learning as a transformative pedagogical approach that nurtures analytical thinking skills in language learning contexts. The research delves into the comprehensive cultivation of analytical thinking skills in learners through diverse activities, tasks, problem scenarios and effective teaching strategies, with a pivotal focus on adapting PBL within the context of language acquisition. Ultimately, the article proposes the integration of PBL to facilitate the progress of analytical thinking skills within a carefully aligned language learning environment.

Keywords : Analytical Thinking, Language Learning, Problem-Based Learning Pedagogy, Transformative Education.

INTRODUCTION

The pursuit of holistic skill development has become the primary component within the scope of today’s engineering education. The integration of analytical thinking skills within language teaching practices has emerged as a

**Hema et al.,**

foundational objective for a better learning experience. This amalgamation is further enriched when coupled with a problem-based learning pedagogy—a transformative approach that propels learners beyond repetitive memorization, encouraging active inquiry, collaboration, and practical application in their learning process. In today's ever-changing world, the ability to analyze information, solve complex problems, and make informed decisions is of immense importance. Kumar and Refaei restates the fact that, "The 21st century demands a new response to become productive contributors to society, where we must quickly master the learning innovations, technology, and career skills needed for work and life" (2017). This analytical thinking skill plays a crucial role in helping individuals navigate the challenges of a dynamic and rapidly evolving environment. As a result, there is a growing emphasis on equipping learners with the tools and techniques to enhance their analytical thinking abilities. This paper delves into the concept of cultivating analytical thinking and explores how it can be fostered through effective educational approaches like problem-based learning. By examining the key components of analytical thinking and its real-world applications, we aim to shed light on the significance of this skill and the systematized curriculum specifically designed for the purpose of cultivating critical thinking. Analytical thinking holds great significance. It involves proficiency in deconstructing intricate issues, critically evaluating data, and deducing sound conclusions. This capability has become increasingly indispensable in preparing learners for the demands of our rapidly evolving world. In this context, the English language classroom emerges as a vibrant arena where the amalgamation of pedagogical approaches and cognitive skill refinement can thrive harmoniously.

Analytical Thinking

Kek Megan & Henk Huijser mentioned that "Analytical thinking for the learners of higher education is important to prepare them for today's complex and rapidly changing world" (2011). The same has been widely accepted by scholars from different research fields. Analytical thinking is the ability to analyze, evaluate, and construct reasoned arguments and serves as the cognitive compass guiding learners through the maze of information that characterizes our interconnected world. When intertwined with language learning, it empowers learners to not only comprehend language structures but also to unravel the nuanced meanings embedded in communication. Through the lens of critical thinking, learners can deconstruct texts, question assumptions, and formulate interpretations that transcend the surface level, fostering deeper engagement with language content. Fadhlullah and Ahmad defines "Analys as critical thinking focused on parts and their functionality in the whole." (2017).

Analytical thinking holds immense significance for learners as it equips them with a multifaceted set of skills and abilities that extend far beyond the classroom. In this information era, building analytical skills and the ability to solve complex global problems is crucial for promoting deeper understanding, effective problem-solving, strong communication skills, cognitive flexibility, and informed decision-making in all areas of life. The learners need training to think in an organized, fair, and open-minded way. With these skills, learners can reason confidently and use critical thinking in any subject or field and be successful, said Lundquist (1999). In consolidation, analytical thinking is considered the essential key to lifelong learning and individual growth. It encourages learners to face and resolve the complexities of this current world by ensuring that they not only surpass in terms of education but also evolve as responsible individuals who can bring in a positive change in the society they live in.

Problem-based learning

The conventional teacher-centered paradigm is reinterpreted by putting the learners at the center of their learning process, where PBL fosters a sense of agency and curiosity in learners by exposing them to real-world problems, which forces them to tackle intricate issues that require multifaceted solutions. The PBL approach meets the demands of today's workplace, in which critical thinking and flexibility are considered as desirable traits in an employee. The combination of Problem-Based Learning (PBL) and Analytical Thinking is a much-desired pedagogical strategy that gets the most of both methods to produce an engaging and life-changing learning environment. This collaboration takes a comprehensive approach to teaching languages by fostering problem-solving abilities, contextual learning, autonomous learning, real-world application, and lifelong learning. According to Legg (2007), Problem-Based Learning (PBL) uses real-world problems as a starting point for acquiring and integrating new knowledge. This approach can be applied in university English classrooms to enhance teaching and learning (2007). It equips learners

**Hema et al.,**

with language proficiency, cognitive flexibility, problem-solving prowess, and adaptability needed to thrive in an interconnected, complex world.

Bridging Analytical Thinking in the Language Learning Classroom

The development of analytical thinking has gathered significant attention in today's educational scenario. Within the scope of engineering education, Guerra and Holgaard (2016) propose translating critical thinking into tangible elements, integrating it into ongoing work through problem identification, analysis and formulation, inquiry, and argumentation to achieve the best outcomes. The acquisition of a new language involves mastering linguistic aspects and cultivating a deeper understanding of its structures, nuances, and cultural implications. Critical thinking, which involves the ability to break down complex ideas, evaluate information objectively, and draw well-reasoned conclusions, plays a key role in enriching the language learning process. When learners practice skills such as reading, writing, listening, and speaking, critical thinking enables them to examine the finer details of language, recognize patterns, and interpret meaning with accuracy. This, in turn, strengthens their overall language competence. While acquiring a language, critical thinking has numerous benefits. It refines the capacity for critical analysis of language use, enhances understanding, and enhances problem-solving capacities. Moreover, it makes communication more effective, supports learners' understanding of cultural environments, and enhances independent language research. These skills ultimately result in enhanced critical participation and intellectual adaptability, besides enhanced language competence.

LITERATURE REVIEW

As we delve into the literature surrounding problem-based learning and its interplay with analytical thinking, we uncover a rich mosaic of insights that illuminate the effectiveness of this pedagogical strategy. The study by Heilyn Camacho and Ellen Christiansen, 'Teaching Analytical Thinking Within an Institutionalized Problem-Based Learning Paradigm—Quite a Challenge,' examines a 'Professional Inquiry' course that was taught over four years to Information Studies learners at Aalborg University, Denmark, using the Problem-Based Learning (PBL) approach. It was identified that despite assuming that analytical thinking is integral to PBL, unexpected conflicts arose during the course, risking learners' development of critical reflection skills. It is also observed that time constraints and the need for personalized attention intimidate the learning process.

In this research paper, "The Problem-Based Learning in Enhancing Learners' Critical Thinking for Reading Skills in English Teaching at Vocational School," Iskandar and others focus on how Problem-Based Learning (PBL) was designed and implemented to teach English to vocational school learners in Indonesia. The goal was to enhance critical thinking skills through this approach. Both qualitative and quantitative methods were employed. The findings revealed that the PBL strategy's design was effective for teaching English as a foreign language in a vocational school setting. Consequently, this strategy could be adopted to boost critical thinking skills among vocational school learners learning English.

Megan Yih Chyn A. Kek and Henk Huijser's study aims to explore the essence of critical thinking, its skills, effective teaching methods, and the potential of PBL in teaching these skills. Ultimately, it reflects on how PBL can foster critical thinking as an aligned pedagogical approach within the learning and teaching environment.

Research Design

The design of this research paper outlines a part of a skill development credit course, "Mastering Sustainable Skills," conducted for the first-year engineering learners during the academic year 2024-2025. The structure of this research paper encompasses the module's objectives, instructional design, and assessment strategies. The prime objective of the module was to introduce and refine learners' learning approach towards critically dissecting and comprehending information. The classroom environment was optimized to accommodate two cohorts of batch sizes of 50 and 60 learners, respectively. This facilitated a tailored approach to instruction, catering to the unique dynamics of the

**Hema et al.,**

different class strengths. To achieve this, the module was strategically curated over a comprehensive timeframe of 15 hours of classroom engagement, including workshops. During classroom instruction, important analytical thinking strategies like concept mapping, identifying fact or opinion, solving puzzles using guided clues, and finding solutions for problem scenarios were practiced, fostering an active learning environment as well as developing a critical thinking mindset.

Module Objectives and Instructional Plan

The primary aim of designing the “Analytical Thinking Skills” module was to hone learners’ ability to apply thinking and shift perspectives from basic concepts to deal with unique problem situations. The instructional plan of the module foregrounds the connection between the classroom engagement activities and the step flow of the essential analytical skill. The module underscores five classroom engagement activities that include determining whether the given scenario is fact or opinion, integrating the concept into a visual representation, devising innovative solutions for the problem scenario, employing deductive reasoning to solve puzzles, and critically evaluating the arguments with evidence.

Demonstration of Classroom Engagement Activities

In this section of the paper, the five classroom engagement activities that are aligned with problem situations and analytical thinking strategies are explained to show how each complements the other for the successful execution of the module.

Fact or Opinion

In this part of the module, learners are facilitated to differentiate between factual statements and opinionated expressions. The learners are taught to highlight key characteristics that help them evaluate facts and opinions. They are first introduced to a variety of statements, including an explanation. Learners should evaluate the statement and the explanation based on the evidence sourced from various resources like academic texts, news reports and articles, research papers, and everyday conversations. This helps them differentiate how facts are identified with the help of objective evidence, whereas opinion is based only on the subjective interpretation.

Example Statements:

Mark F for Fact; O for Opinion

Greenland is farther from the North Pole than the South Pole.

More than one-third of Earth’s surface is covered by oceans.

As discussed, the activity cultivates the learners’ ability to differentiate between verifiable facts and personal viewpoints. This process strengthens their capacity to assess information with a critical lens and provide evidential confirmation.

Concept Mapping

In this part of the activity, the learner is introduced to the technique of connecting concepts through organizing and comprehending information. This activity teaches the learners how intricate ideas can be simplified through concept maps for clearer interpretation. It is also emphasized that concept maps can help in showcasing the challenging concepts through visual aids. Learners are instructed to collaborate in small groups. And each group is assigned a topic. Learners create concept maps capturing key concepts and their interconnections. This hands-on activity helps the learners analyze underlying connections and helps visualize the concept in a very clear and creative way. After this phase, the learners are encouraged to exchange insights and reflect on each other’s interpretations, thereby promoting deep analytical thinking skills.

Problem-Solving Scenarios

In this session, the learners are facilitated to play a crucial role in analyzing a real-life scenario related to learners’ academic situations. Learners are presented with an outline of how the scenarios should be brainstormed, evaluated,

**Hema et al.,**

and analyzed. This equips the learners to skillfully evaluate complex and challenging situations. In addition, the learners are encouraged to critically scrutinize each part of the scenario, from identifying the elements to the issues that demand solutions. The learners are expected to apply a case study model called the PACER framework, which includes identifying problems, alternative solutions, evaluating alternative solutions, and arriving at the best solution possible.

Example Scenario:

It is Friday, and you have a midterm exam on Wednesday. You just found out you have been scheduled to work all weekend, and you have class all day Monday and Tuesday? If you do not work this weekend, you risk the chance of getting fired, and you need this job. This is leaving you very little time to study. What should you do?

This activity is designed in such a way that learners are encouraged to do a collaborative activity, endorsing multiple perspectives. The initial phase of analysis involves analyzing the scenario and breaking it into manageable components, which directly leads to simplifying the complex problem. In the second part of the analysis, collective brainstorming brings a series of potential solutions. This reflects the practice of interpretation. In the evaluative process, the learners are challenged to assess the merits and drawbacks of alternative solutions. By evaluating pros and cons, learners apply analytical aptitude needed for evaluating resolutions. Eventually, learners reflect on the findings and potential solutions.

Puzzle-Solving with Clues

This section of the module introduces puzzle-solving as an activity to stimulate critical thinking. The learners are given some puzzle statements and clues that form the basis for sequential reasoning and analytical deduction. In this activity, learners team up to decode puzzles using provided clues. This collaborative approach demands the application of interpretative skill. While doing the activity, the learners discuss deductions and reasoning within their groups. This discussion brings an exchange of analytical insights and interpretations.

Analyze and Discuss

This section of the module prepares the learners to engage in a structured formal debate where opening statements, rebuttals, and closing arguments are encouraged. The learners are provided with a topic relevant to the learners' field of study, and they are guided to have a constructive discourse. During this structured session, learners are divided into affirmative and opposing sides, creating an environment for dynamic conversation. Learners are encouraged to prepare arguments based on their point of view, expecting them to critically assess the strengths and weaknesses of their arguments. This stage involves evaluating evidence, deducing logical reasons, and dissecting the possible assumptions. The learners are actively engaged in defending their arguments, which reflect the presence of analytical aptitude when evaluating and interpreting complex information.

Workshop I & II – Analytical Thinking Skills

The instructional plan of the module included two workshops, and each of the workshops focused on laying a strong knowledge required to interpret, analyze, and evaluate information. Workshop I, conducted for 2 hours, ensured that the learners captured the essence of important skills required for the application of analytical thinking skills. It served as groundwork before delving deeper into the subject matter. Then, Workshop II, conducted for 2 hours, took an advanced-level approach where the learners were equipped with the most important techniques and tools that foster critical thinking, intricate problem-solving, and incisive decision-making. Both the workshops supported the learners in understanding and imparting basic to advanced strategies that help navigate complex problem-solving scenarios and systematically apply analytical competencies.

The tabulation below provides a clear overview of the module, highlighting the objectives, activities, and allotted timeframes for each session.

**Hema et al.,****Assessment**

The assessment pattern for the module “Analytical Thinking Skills” included a wide-ranging evaluation method where learners’ overall competency and application of analytical and evaluative skills were considered. The evaluation was conducted by inviting an external assessor, and the learners were asked to prepare a presentation of the concept mapping. The evaluation criteria were designed in such a way that they supported measuring learners’ deeper understanding and application of analytical thinking skills. Firstly, the learners were expected to share an analysis of the past, present, and future aspects of the chosen topic, accounting for 15 marks. Secondly, the learners presented statistical trends, facts, and figures pertinent to the topic, contributing 10 marks. The quality of the assessment is extended furthermore when learners presented a qualitative discussion on factual elements, which attributed 15 marks. 10 marks were added to the fourth criterion when learners addressed challenging problems and provided potential solutions. Collectively, this assessment approach reinforces learners’ ability to engage in thorough analysis, critical evaluation, and articulate presentation, ultimately reflecting their mastery of analytical thinking and speaking skills.

RESULTS AND IMPLICATIONS

The findings of the research based on the instructional, implementation, and assessment plan resulted in the attainment of enhanced critical thinking skills among learners. It was found that the students were able to achieve a substantial average score of about 35 to 45 marks during the assessment process. Additionally, it was determined that the learners exhibited an average increase of 65% in the ability to analyze arguments and evaluate evidence. During the evaluation process, it was identified that learners showed a significant improvement in applying multiple perspectives to analyze the strengths and weaknesses within arguments. These outcomes indicate that the high contribution of the module’s classroom engagement activities, like concept mapping, discussion and debate, problem-solving scenarios, and collaborative puzzle-solving, supported nurturing analytical thinking abilities in learners. This process also implies that there is no limit or hindrance for planning and implementing any innovative andragogy to significantly impact the skill development in educational settings. Ultimately, the findings of the paper underscore the value of integrating active learning and problem-solving strategies that foster deeper analysis and interpretation skills, setting a model for elevating upcoming educational practices and empowering learners with integral and essential skills.

Challenges And Considerations

Though the process of preparing and implementing the module “Analytical Thinking Skills” through problem-based learning was an enjoyable, challenging as well as fruitful engagement, it has brought a lot of noteworthy challenges. A significant challenge was to engage heterogeneous group of learners having different learning styles. Time management was also another challenge where certain activities required more time than originally assigned. So, to address both these challenges, we refined our activities to engage the learners in a collaborative way to approach challenging concepts and introduced flexible time management strategies to cover the activities comprehensively. Another notable challenge was to set a clear balance between guiding and fostering independent thinking. Some learners felt overwhelmed by open-ended activities, so we provided structured support, gradually allowing them for autonomous learning. Yet another challenge was identified when the interdisciplinary nature of the learners needed familiar concepts and content. We resolved it by preparing examples to cater to learners’ individual academic backgrounds, thus ensuring modules’ logic. When the external evaluation process was an unbiased assessment perspective, the challenges showed up when aligning the assessment criteria with the module’s objectives. But the assessment ensured fair and accurate evaluation of learners’ analytical skills.

CONCLUSION

The research paper investigates the execution of a meticulously designed instructional module which aimed to enhance analytical thinking skills through problem-based learning within the English language classroom. The

Hema et al.,

module's delivery plan, assessment technique and the learners' performance in the classroom demonstrated a substantial improvement in analyzing arguments, evaluating evidence, and learners showed an increased confidence while approaching problem concepts. Engagement strategies, such as concept mapping and collaborative activities, effectively nurtured analytical thinking. Overall, this study emphasized the value of active learning and innovative teaching approaches in enriching educational practices and empowering learners with vital cognitive skills.

Table 1 Outline of the Module Sessions

Session	Topic	Objective	Activity	Duration
1	Fact or Opinion	Develop critical thinking by distinguishing between information and opinion.	Present statements for analysis to categorize them as fact or opinion.	1.5 hours
2	Workshop I	Build foundational knowledge in effectively analysing and interpreting information.	-	2 hours
3	Concept Mapping	Enable students to visually represent connections between ideas, enhancing analytical abilities.	Create concept maps on the specific core engineering topics.	2 hours
4	Problem-Solving Scenarios	Enhance analytical thinking through real-world problem-solving scenarios.	Breaking down complex scenarios into manageable components through systematic evaluation.	1.5 hours
5	Puzzle-Solving with Clues	Cultivate sequential thinking and critical reasoning skills through collaborative puzzle-solving.	Collaborative puzzle-solving with clues as a deductive reasoning exercise.	2 hours
6	Workshop II	Equip learners with advanced techniques and tools that foster critical thinking, intricate problem-solving, and judicious decision-making.	-	2 hours
7	Analyse and Discuss	Equip students with structured approaches to debates, fostering critical thinking skills.	Team-based debate on a current topic.	2 hours
8	Assessment	Critical analysis of any topic presenting in the form of a concept map.	-	2 hours

Table 2. Comprehensive View of the Assessment Criteria

Criteria	Points	Performance Indicators
Past, Present, and Future Analysis	15	Accurate, relevant, and logically connected perspectives across timeframes
Statistical Trends, Facts, and Figures	10	Uses credible, up-to-date data and interprets it correctly
Quality of Discussion on Factual Elements	15	Clear, logical discussion supported by reliable evidence
Addressing Challenges and Proposed Solutions	10	Identifies realistic challenges and offers practical solutions

ABSTRACT

Accurate financial forecasting is essential for investment decisions, risk management, and economic stability. However, the unpredictable and noisy nature of financial time series renders traditional models unreliable. This review examines 50 significant studies conducted between 2019 and 2025, highlighting the limitations of traditional technical indicators in dynamic market environments and demonstrating the superiority of adaptive methodologies. It further explores the utility of hidden Markov models and online techniques in real-time market change detection. Advanced methodologies, such as complete ensemble empirical mode decomposition (CEEMD) and wavelet transforms, have been employed to identify critical trends. The review discusses enhancing forecasting accuracy through feature engineering, including automated selection and data integration. The integration of multiple methods yields superior results compared to singular approaches, although challenges persist in comprehension, real-time application, and cross-market adaptability. There view under Scores the necessity for standard benchmarks, real-time integration, explain able artificial intelligence, cross-market adaptability, and resilience to market fluctuations. It lays the groundwork for developing improved forecasting systems to enhance investment decision- making and risk management. This review addresses four critical are astomitigate these issues: (1) the limitations of financial indicators, (2) market regime detection, (3) time-series decomposition, and (4) feature engineering for forecasting. There view involved comprehensive literature search, initially encompassing 555 papers, which was refined to 50 key studies from 2019 to

**Harini and Rethinavalli**

2025. Key findings indicate that traditional indicators, such as moving averages and the relative strength index (RSI), perform inadequately during market changes. Hidden Markov models and online methods effectively detect market shifts but are not well integrated into forecasting systems. Decomposition techniques, such as CEEMD and wavelet transforms, facilitate the separation of trends from noise, thereby enhancing accuracy when combined with machine learning. Advanced feature engineering, including automated selection and data integration, improves model performance. The combination of diverse methods surpasses single approaches in terms of accuracy and prediction. The review identifies five research gaps: the absence of standard benchmarks, insufficient real-time regime integration, the need for explainable AI, limited cross-market application, and a lack of robustness to market changes. These findings emphasize the need for adaptive, efficient, and comprehensible forecasting systems tested across various markets and conditions.

Keywords: financial technical indicators; market regime detection; time-series decomposition; feature engineering; financial forecasting; machine learning; hybrid models; CEEMD; wavelet transform; Hidden Markov Models

INTRODUCTION

Context and Background

Predicting financial markets is a heavily researched challenge that lies at the intersection of economics, statistics, and computer science. These markets function as complex adaptive systems, marked by extreme non-stationarity, dynamics that depend on different regimes, and high sensitivity to external shocks. These characteristics collectively render accurate predictions extremely challenging, even with significant technological advancements (Chen et al., 2025). In recent decades, there has been a notable shift from traditional statistical models, such as auto-regressive integrated moving average (ARIMA) and generalized auto-regressive conditional heteroscedasticity (GARCH), to more advanced machine learning and deep learning frameworks, signifying a paradigm shift in the field. This evolution has enhanced forecasting accuracy and risk-adjusted performance, especially through hybrid and ensemble methods that combine various methodological approaches (Bukhari et al., 2020). The practical importance of this area extends from individual investment decisions to institutional risk management and the stability of the macroeconomic system (Xie et al., 2018). The incorporation of signal decomposition techniques, such as empirical mode decomposition (EMD) and wavelet transforms, into machine learning frameworks has shown particular promise in capturing the non-linear and non-stationary dynamics typical of financial time series (Zhu et al., 2016). Simultaneously, advancements in market regime detection have paved the way for condition-adaptive forecasting strategies that modify model behavior based on the current market state, representing a fundamental shift from static to dynamic modeling paradigms.

Research Problem and Identified Knowledge Gaps

Although progress has been made, significant obstacles persist in achieving reliable and broadly applicable financial forecasting. These challenges can be categorized into four interconnected areas. First, the reliance on fixed thresholds for technical indicators does not account for the ever-changing nature of financial markets, leading to high rates of false signals during periods of regime shifts and crises (Abir et al., 2025). Second, existing methods for detecting market regimes often struggle with complex, multidimensional, and path-dependent data, which hampers their effectiveness and precision in practical applications (Issa & Horvath, 2023). Third, there is a notable lack of systematic integration of time-series decomposition and dynamic feature engineering, which is crucial for enhancing predictive accuracy across diverse market conditions (Qin et al., 2025; Tsang & Chen, 2018). Finally, there is ongoing debate over the selection and combination of technical indicators, with research offering conflicting evidence on their

**Harini and Rethinavalli**

predictive value and vulnerability to false signals (Xu et al., 2024). Consequently, many forecasting models remain suboptimal, exposing practitioners to increased financial risks and missed opportunities (Fozap, 2025).

Conceptual Framework

The theoretical framework supporting this review encompasses four distinct yet interrelated methodological areas:

- Financial technical indicators, which offer quantitative assessments of market momentum, trends, and volatility;
- Market regime detection techniques, which pin point structural shifts in market behavior;
- Time-series decomposition methods, which differentiate meaningful signal components from noise; and
- Feature engineering strategies, which convert raw and decomposed data into valuable inputs for machine learning models. Feature engineering serves as the crucial link that unites these areas by leveraging complementary information from indicators, regime states, and decomposed components within a cohesive predictive framework (Padhi et al., 2022).

Objectives and Scope

This systematic review offers a critical analysis of the current research landscape across all four domains and their intersections. Specifically, this review is as follows:

- This study assesses the effectiveness and limitations of both traditional and adaptive financial technical indicators under various market conditions, asset classes, and volatility regimes.
- Benchmarks techniques for detecting market regimes in terms of adaptability, computational efficiency, and accuracy in volatile settings.
- Evaluate the influence of time-series decomposition methods on the quality of trend extraction, informativeness of features, and accuracy of subsequent forecasts.
- This study compares different feature engineering strategies and their integration with machine learning and deep learning frameworks.
- Identifies hybrid modeling frameworks that effectively combine multiple methodological components and examines their relative performance benefits.

This review focuses on peer-reviewed empirical studies and high-quality preprints published between 2019 and 2025 to ensure relevance to the evolving field of computational finance.

Methodology of Literature Selection

This review utilized a systematic and transparent multistage approach to guarantee comprehensive coverage and in-depth analysis. The entire procedure is outlined in Table 1 and elaborated in the following sections.

Query Transformation and Search Strategy

The central research question, which involves financial technical indicators and their constraints, methods for detecting market regimes, time-series decomposition and trend extraction, and feature engineering for financial forecasting, is divided methodically into three related search queries. The first query addressed all four thematic areas simultaneously. The second focused on studies that combined machine learning with technical indicators and feature extraction to predict prices. The third concentrated on studies that integrated multiple data sources and merged alternative data streams with technical indicators for forecasting and trend detection.

Paper Screening and Inclusion/Exclusion Criteria

Searches were conducted using an extensive academic literature database. Papers were selected if they:

1. Focused on at least one fundamental thematic area.
2. Included empirical analysis or made a significant methodological contribution.
3. Used financial market data.

**Harini and Rethinavalli**

4. Were peer-reviewed publications or high-quality preprints that adhered to standards of methodological transparency.
5. Provided sufficient methodological detail for critical assessment and comparison across studies.

Papers were excluded if they:

1. Were published in languages other than English.
2. Were published before 2019 or after 2025.
3. Dealt with financial forecasting solely in non-market contexts (e.g., macroeconomic forecasting without application to asset prices).
4. Lacked empirical validation or were purely theoretical without computational experiments.
5. Were duplicate publications or extended versions of conference papers already included in the corpus.

Citation Chaining

To ensure that foundational works not captured in primary database searches were included, a systematic citation chaining process was applied to highly relevant papers identified during the initial screening. This involved both forward citation analysis, which identifies papers citing key works, and backward citation analysis, which examines the reference lists of key papers. As a result, **90 additional relevant papers** were identified, increasing the total number of candidate papers to **555**.

Relevance Scoring and Final Selection

All **555** candidate papers underwent structured relevance scoring based on six criteria:

- Direct relevance to the review objectives.
- Methodological rigor and innovation.
- Quality of empirical contribution.
- Citation impact.
- Publication venue prestige.
- Recency.

This evaluation identified **50 papers** that met the inclusion threshold in the primary synthesis corpus. The stratified approach ensured the efficient allocation of analytical effort while maintaining comprehensive coverage of the research landscape.

Limitations of the Search Process

This review identified several methodological constraints. The focus on publications from **2019 to 2025** excludes earlier foundational work, and limiting the review to **English-language** sources may overlook significant contributions from non-English research communities.

Instead of a quantitative meta-analysis, a narrative approach was used because of the variability in reported metrics across studies, which prevents formal statistical aggregation. Additionally, publication bias, in which journals tend to favor positive outcomes, may exaggerate the perceived benefits of advanced methods. These limitations should be considered when interpreting the synthesized findings.

THEMATIC REVIEW OF LITERATURE**Financial Technical Indicators and Their Limitations****Static versus Adaptive Technical Indicators**

For many years, traditional technical indicators, such as simple moving averages (SMA), exponential moving averages (EMA), relative strength index (RSI), moving average convergence divergence (MACD), and Bollinger Bands, have been essential tools in algorithmic trading. However, a significant issue highlighted in the literature is that while these indicators work well in stable markets, their performance declines significantly during market regime changes and crises (Deep et al., 2025; Demir et al., 2019; Loubaris, 2025).

Loubaris (2025) provided empirical evidence of this issue by examining the performance of RSI and MACD across various equity indices during the COVID-19 market shock. The study found a notable increase in false buy signals

**Harini and Rethinavalli**

and MACD crossover failures during the crisis compared to stable periods, challenging the assumption of temporal stationarity in fixed-parameter indicator configurations. Maddodi and Kunte (2024) demonstrated through a comparative analysis across equity markets under geopolitical stress that optimal indicator thresholds differ systematically across market conditions and that applying thresholds calibrated for one period to another can substantially reduce directional accuracy (Maddodi & Kunte, 2024; Rosillo et al., 2013). Applying thresholds calibrated for one market to another can significantly reduce directional accuracy, sometimes to below-random levels.

Ghanbari et al. (2024) further explored this market specificity in cryptocurrency markets, demonstrating that portfolio-level optimization under varying market conditions requires adaptive parameter selection rather than fixed configurations (Ghanbari et al., 2024). Peng et al. (2023) advanced the field by proposing Bayesian-optimized adaptive thresholds that dynamically adjust in response to detected regime shifts. Their trading algorithm, tested on major currency pairs over several years, showed improved returns and reduced drawdowns compared to static indicator baselines, maintaining relative performance stability during the 2020 market crisis when static-threshold benchmarks suffered significant losses. The method's reliance on Hidden Markov Model (HMM) regime detection introduces operational latency before updating indicator thresholds. Singh (2025) attempted to address this limitation with an LSTM-based regime prediction, although it resulted in higher false regime classifications compared to the HMM baseline.

Integration of Technical Indicators with Machine Learning

Another line of research explores whether machine-learning models can derive predictive insights from technical indicators more effectively than traditional rule-based threshold methods. The reviewed literature consistently indicates that the success of indicator-based machine-learning features depends heavily on the quality of feature engineering. Studies that used raw indicator values as direct inputs for models showed only slight accuracy improvements over threshold-based rules. In contrast, those that incorporated engineered derivatives—such as the rate of change, divergence metrics, and interactions between indicators—achieved significantly greater gains.

The most notable improvements were found in studies that combined engineered features with regime-specific indicator values. This suggests that raw indicators alone do not provide sufficient information for significant machine-learning advancements; however, well-constructed features can reveal hidden predictive potential (Jadhav & Chandre, 2025).

Patil et al. (2024), in their study on predicting foreign exchange volatility, discovered that ensemble methods (XGBoost and Random Forest) gained more from technical indicator features than deep-learning models (Long Short-Term Memory and Convolutional Neural Network). The authors attributed this to the ability of tree-based ensembles to capture indicator threshold effects and regime interactions through recursive partitioning, whereas Long Short-Term Memory models faced challenges with the noise-to-signal ratio in raw indicator series without extensive preprocessing.

Market Regime Detection Techniques**Hidden Markov Models and Statistical Approaches**

Market regime detection addresses the well-documented phenomenon whereby financial markets exhibit distinct behavioral states, each characterized by unique levels of volatility, return patterns, and cross-asset correlation structures. Hidden Markov Models (HMMs) are considered the most theoretically sound statistical method for identifying these regimes, treating market states as hidden discrete variables with observable continuous outputs. In their adaptive trading framework, Peng et al. (2023) utilized a three-state HMM-based regime detection approach to identify bull, bear, and transitional regimes, showing that strategies informed by regime awareness can significantly lower risk exposure while still achieving returns comparable to static strategies.

**Harini and Rethinavalli**

Traditional HMM methods encounter two major operational challenges: instability in parameter estimation in high-dimensional contexts and sensitivity to initial conditions, which can lead to inconsistent regime classifications across different model runs. This issue is particularly critical in live trading scenarios.

Non-Parametric and Machine Learning Methods

Rezaei et al. (2020) presented a non-parametric method for online detection that addresses several drawbacks of traditional HMM methods. Their automated system detects regime shifts in high-dimensional financial data by employing path-wise similarity metrics and clustering techniques, functioning in real time without requiring parametric distribution assumptions or manual regime labeling. Empirical tests across various asset classes showed improvements in both the speed and precision of regime-change detection compared with standard HMM models, making this method particularly suitable for operational forecasting systems. Supervised machine-learning techniques, such as Support Vector Machines (SVM), Random Forests, and Recurrent Neural Networks (RNNs), are increasingly being utilized to identify market regimes. These techniques can capture complex nonlinear regime boundaries while simultaneously integrating multiple market variables. However, their primary drawback is the requirement for labeled training data, which can introduce subjectivity in regime definitions and potential look-ahead bias when historical data are retrospectively labeled.

Time-Series Decomposition and Trend Extraction**Empirical Mode Decomposition Methods**

Time-series decomposition is designed to break down financial series into analytically manageable components, such as trends, cyclical patterns, and random noise, allowing forecasting models to work with more stable and predictable subsignals. Leung and Zhao (2021) thoroughly examined the use of Complete Ensemble Empirical Mode Decomposition with Adaptive Noise (CEEMDAN) in conjunction with the Hilbert–Huang Transform (HHT) for non-stationary financial series. Their findings indicated that CEEMDAN efficiently separates intrinsic mode functions (IMFs) across various time scales, and the instantaneous frequency features generated by HHT significantly enhance the accuracy of machine-learning forecasts compared to undecomposed input data across several equity market datasets. Nasir et al. (2025) introduced a hybrid framework combining Local Mean Decomposition (LMD), Autoregressive Moving Average (ARIMA), and Extreme Gradient Boosting (XGBoost), which separates stochastic and deterministic components while addressing the mode-mixing issue found in standard Empirical Mode Decomposition (EMD). This hybrid model showed superior forecasting accuracy compared to baseline ARIMA and standalone machine-learning methods, particularly for medium-term prediction horizons.

Wavelet Decomposition Approaches

Wavelet decomposition offers a multi-resolution analysis framework that is particularly effective for financial time series with localized features and non-stationary volatility clustering. Unlike methods based on Empirical Mode Decomposition (EMD), wavelet decomposition operates within a mathematically rigorous framework with well-established theoretical convergence properties. Verma et al. (2024) developed a multi-stage feature engineering pipeline that combines the Discrete Wavelet Transform (DWT) with hyperparameter-optimized ensemble models, showing that DWT-based decomposition enhances prediction accuracy by maintaining structural signal characteristics while eliminating noise components. Palma et al. (2025) utilized Gaussian Mixture Models (GMMs) on components derived from EMD to predict asset price movements, capitalizing on the complementary strengths of adaptive decomposition and probabilistic modeling. Their integrated approach demonstrated improved directional prediction performance under regime-dependent conditions. The research also highlighted that selecting the optimal decomposition method depends on the forecasting context, including the prediction horizon and market characteristics, requiring systematic evaluation rather than a one-size-fits-all application.

Feature Engineering for Financial Forecasting**Automated Feature Selection Methods**

Feature engineering plays a pivotal role in determining the effectiveness of forecasting models, often having a greater influence than the choice of model architecture when models are evaluated with the same level of feature complexity.

**Harini and Rethinavalli**

Pabuccu and Barbu (2024) introduced Feature Selection with Annealing (FSA), an algorithm designed to reduce dimensionality while maintaining predictive accuracy by utilizing simulated annealing optimization within the feature-selection search space. Through empirical testing on various financial time series, FSA consistently identified stable feature subsets that delivered strong out-of-sample performance, surpassing traditional forward-selection and backward-elimination methods (Pabuccu & Barbu, 2024). In 2025, Qin et al. proposed a dual-layer Mamba architecture with convolutional feed-forward networks for efficient financial time-series forecasting, demonstrating that architectural innovation in feature processing can substantially improve prediction efficiency while maintaining accuracy under volatile conditions (Qin et al., 2025). This approach effectively addresses heteroscedasticity in financial return distributions while ensuring computational efficiency, particularly under volatile market conditions where well-calibrated prediction intervals are crucial for risk management.

Dimensionality Reduction and Feature Transformation

Sarıkoç and Celik (2024) developed a hybrid framework that sequentially applies Principal Component Analysis (PCA) and Independent Component Analysis (ICA) for dimensionality reduction. This process is conducted before the transformed features are input into Long Short-Term Memory (LSTM) networks to predict the S&P 500 Index. Their study demonstrates that effective dimensionality reduction can enhance prediction accuracy by eliminating redundant data while retaining crucial market dynamics. The combined method outperformed models that utilized raw features or relied solely on single-stage decomposition. Singh (2025) performed a comparative study of tree-based ensemble models and deep-learning approaches for forecasting equity prices. The study highlighted that although dimensionality reduction improves computational efficiency and mitigates overfitting, it is essential to validate that significant trading signals are not mistakenly discarded as low-variance components during compression. This balance between information compression and signal preservation remains an important methodological challenge (Gong et al., 2025).

Integration of Heterogeneous Data Sources

Recent studies have increasingly focused on incorporating alternative data sources beyond conventional price and volume metrics. Ji et al. (2022) demonstrated that integrating macroeconomic indicators, sentiment data derived from news and social media, and cross-asset relationship features can significantly improve forecasting accuracy. However, incorporating alternative data introduces several methodological challenges, including differing update frequencies, asynchronous timing relationships, propagation of measurement errors, and an increased risk of spurious correlations in high-dimensional feature spaces. Effective integration therefore requires careful feature engineering, appropriate handling of missing data, and rigorous holdout validation. Htun et al. (2023) emphasized the importance of domain knowledge in developing theoretically grounded features that capture meaningful economic relationships. Their study showed that combining data-driven feature selection with expert-guided feature design produces more robust and interpretable forecasting models than relying solely on automated methods. This hybrid approach offers a practical balance between statistical efficiency and economic interpretability.

Identification Of Research Gaps And Future Directions

This review highlights five significant research gaps that present both theoretical and practical challenges, thereby limiting the effective application of advanced forecasting frameworks in real-world financial markets. These gaps, along with the corresponding future research directions, are summarized in Table 3.

Absence of Standardised Benchmarks for Decomposition Methods

Although individual decomposition techniques, such as CEEMD, VMD, DWT, and LMD, have been assessed independently in various studies, there is no standardized benchmark framework for systematically comparing these methods across different markets and prediction timeframes. The lack of a unified framework hinders the objective determination of the most effective methods for particular market scenarios or forecasting goals, resulting in fragmented empirical evidence in this field. Establishing community-standard benchmark datasets and evaluation protocols similar to the shared benchmarks found in computer vision and natural language processing would

**Harini and Rethinavalli**

significantly enhance methodological advancement and improve reproducibility (Palma et al., 2025; Bareket & Parv, 2024).

Real-Time Integration of Regime Detection

Most research on forecasting accuracy has evaluated performance through historical backtesting using *ex post* knowledge of regime shifts and market conditions. However, real-time implementation encounters substantially different challenges, including computational latency, delays in data availability, lag in regime-change detection, and the need for continuous model updates. The discrepancy between backtested results and actual trading performance has not been well quantified in the existing literature (Issa & Horvath, 2023). There is an urgent need for research on computationally efficient online algorithms, robust evaluation frameworks that account for realistic operational constraints, and techniques for handling streaming data with varying latency.

Explainability of Complex Hybrid Models

As forecasting models become increasingly sophisticated through the integration of hybrid methods and deep learning, their interpretability correspondingly decreases. This creates two major challenges. First, regulatory compliance, as outlined by frameworks such as the EU AI Act and financial supervisory model risk management guidelines, requires transparent explanations for model decisions. Second, financial practitioners need to understand the reasoning behind model predictions to support informed risk-management decisions. Current research provides limited guidance on preserving interpretability while employing advanced ensemble and neural network architectures (Bisdoulis, 2024; Singh, 2025). Developing explainable artificial intelligence (XAI) techniques specifically designed for financial forecasting—such as SHAP-based regime attribution, wavelet saliency mapping, and indicator causal graph estimation—remains a critical research priority.

Cross-Market and Cross-Asset Generalisation

Most reviewed studies focused on major developed equity indices or individual currency pairs, while only a limited number examined transferability across different markets (Tufekci & Abul, 2020). Models optimized for a specific market frequently underperform when applied to other markets or asset classes unless extensive recalibration is performed. This limitation presents a major challenge for multi-asset portfolio management and global trading strategies. Future research should focus on developing transfer-learning methods that facilitate knowledge transfer across markets, designing meta-learning frameworks capable of rapidly adapting to new environments, and identifying universal feature sets validated across diverse financial instruments.

Robustness to Market Microstructure Evolution

Financial markets continually undergo structural transformation due to regulatory changes, technological advances such as algorithmic and high-frequency trading, and evolving market participant behavior. Forecasting models trained on historical data may systematically fail following significant changes in market microstructure, even when they demonstrate strong backtesting performance (Loubaris, 2025). Future research should therefore emphasize continuous-learning frameworks that incorporate automated structural-break detection, model-update triggers, and microstructure-robust features that remain stable despite changes in the execution environment.

CONCLUSIONS**Summary of Key Findings**

This systematic review synthesized evidence from **50 highly relevant studies** selected from an initial pool of **555 candidate papers**, covering four interconnected methodological domains: financial technical indicators, market regime detection, time-series decomposition, and feature engineering for financial forecasting.

The major findings are summarized as follows.

**Harini and Rethinavalli**

First, traditional static technical indicators, including the Relative Strength Index (RSI) and Moving Average Convergence Divergence (MACD), exhibit performance that is highly dependent on market conditions, with effectiveness declining significantly during market regime shifts and financial crises (Loubaris, 2025; Peng et al., 2023). In contrast, adaptive methods incorporating dynamic threshold optimization and regime-specific parameterization demonstrate substantially greater robustness. Second, market regime detection techniques, particularly Hidden Markov Model (HMM)-based approaches and non-parametric online detection methods (Issa & Horvath, 2023), accurately identify distinct market states but remain underutilized in operational forecasting systems.

Third, time-series decomposition techniques such as Complete Ensemble Empirical Mode Decomposition (CEEMD), Discrete Wavelet Transform (DWT), and Local Mean Decomposition (LMD) effectively separate trend signals from noise, substantially improving feature quality for subsequent machine-learning models (Leung & Zhao, 2021; Nasir et al., 2025; Verma et al., 2024). Fourth, advanced feature engineering techniques—including multi-stage feature selection, dimensionality reduction, and heterogeneous data integration—consistently improve predictive performance and model generalizability (Pabuccu & Barbu, 2024; Singh, 2025; Htun et al., 2023). Finally, hybrid forecasting frameworks that integrate all four methodological components consistently outperform single-method approaches in terms of predictive accuracy, directional forecasting, and risk-adjusted performance, although they also introduce greater computational complexity and reduced interpretability.

Theoretical and Practical Implications

From a theoretical perspective, this review supports a paradigm shift in financial forecasting from isolated single-method models toward integrated hybrid systems that combine technical indicators, market regime detection, signal decomposition, and advanced feature engineering.

The consistently superior performance of these integrated approaches demonstrates the limitations of relying solely on individual modeling techniques in complex, non-stationary financial environments.

From a practical perspective, the findings suggest that financial practitioners should:

1. Transition from static indicator settings to adaptive, regime-specific parameterization.
2. Incorporate real-time market regime detection into dynamic risk-management frameworks.
3. Standardize time-series decomposition as a preprocessing step for trend-sensitive forecasting tasks.
4. Invest in robust feature-engineering strategies that combine automated feature selection with domain expertise.
5. Employ rigorous out-of-sample validation methods, including walk-forward analysis and stress testing during crisis periods.

Limitations of This Review

This review has several limitations.

The selected publication period (2019–2025) excludes earlier foundational studies. Rather than conducting a quantitative meta-analysis, the review adopted a narrative synthesis because of substantial variation in evaluation metrics across studies, preventing formal statistical aggregation. Publication bias may also have resulted in an overestimation of the effectiveness of advanced hybrid forecasting methods. Furthermore, the review was limited to English-language publications indexed in academic databases, potentially excluding valuable contributions from practitioner literature and research published in other languages. These limitations should be considered when interpreting the findings presented in this review.

Concluding Remarks

Financial market forecasting remains an exceptionally challenging research domain because of the non-stationary nature of financial data, market regime dependence, and continuous structural evolution.

Although perfect prediction is theoretically unattainable under the Efficient Market Hypothesis, the systematic integration of technical indicators, market regime detection, time-series decomposition, and advanced feature engineering within adaptive hybrid frameworks provides a promising pathway for improving forecasting accuracy,

Harini and Rethinavalli

robustness, and operational reliability. This review establishes a comprehensive foundation for advancing both the theoretical understanding and practical implementation of next-generation financial forecasting systems, with the broader objective of supporting more informed investment decisions and enhancing overall market efficiency.

Table 1: Literature Search and Selection Methodology Summary

Stage	Process	Outcome
Query Transformation	The primary research question was systematically expanded into three complementary search queries covering technical indicators, regime detection, time-series decomposition, and feature engineering.	A comprehensive and targeted query set ensuring broad thematic coverage.
Database Search	Queries were executed across a large-scale academic database with inclusion filters applied: 2019–2025 publication period, English language, and peer-reviewed or high-quality preprint sources.	465 candidate papers retrieved.
Citation Chaining	Forward citation analysis (papers citing key studies) and backward citation analysis (reference lists of key studies) were conducted on high-relevance papers.	90 additional papers identified; total candidate pool expanded to 555 papers.

Harini and Rethinavalli

Relevance Scoring	All 555 papers were evaluated based on thematic relevance, methodological rigour, empirical contribution quality, citation impact, venue prestige, and recency.	50 high-relevance papers selected for full synthesis.
Thematic Synthesis	Selected papers were categorised across four research domains; cross-domain themes, contradictions, and synergies were identified through narrative synthesis.	Integrated findings, research gap analysis, and future research directions developed.

Table 2. Comparative Analysis of Key Studies Across Research Dimensions

Study	Indicator Robustness	Regime Detection	Decomposition Method	Feature Engineering	Key Findings
Peng et al. (2023)	Adaptive regime-conditioned thresholds via Bayesian optimisation	Three-state HMM identifying bull, bear, and transitional regimes	Not primary focus	Bayesian threshold optimisation conditioned on detected regime	Regime-aware adaptive trading demonstrated improved returns and reduced drawdown compared with static-threshold baselines on major forex pairs.
Loubaris (2025)	Documented substantial degradation of RSI and MACD signal quality during the COVID-19 market shock	Not addressed	Not addressed	Analysis of indicator correlation structure under market stress	Provided empirical evidence that traditional technical indicators generated systematically elevated false signals during crisis periods.
Issa & Horvath (2023)	Not primary focus	Novel non-parametric online detection using path-wise similarity metrics and clustering; operates in real time without distributional assumptions	Not addressed	Path-wise similarity metrics for regime clustering	Automated pipeline demonstrated superior speed and accuracy of regime-change detection compared with conventional HMM implementations.
Leung & Zhao (2021)	Not primary focus	Not addressed	CEEMD combined with Hilbert–Huang Transform (HHT) for multi-scale decomposition of non-stationary series	HHT-generated instantaneous frequency features for machine learning forecasting	HHT-enhanced feature sets substantially improved machine learning forecasting accuracy relative to undecomposed baselines.
Verma et al. (2024)	Not primary focus	Not addressed	Discrete Wavelet Transform (DWT) for multi-resolution noise	Multi-stage feature engineering pipeline with hyperparameter-	DWT-based decomposition improved prediction accuracy by

Harini and Rethinavalli

			reduction	optimised ensemble models	preserving signal structure while reducing noise in equity and index data.
Patil et al. (2024)	Adaptive volatility-regime parameter adjustment for technical indicators	Implicit via volatility regime identification	Not primary focus	Technical indicator integration with ensemble machine learning (XGBoost, Random Forest, LSTM, CNN)	Ensemble tree-based methods benefited more from indicator features than deep learning architectures, attributed to the threshold-capturing ability of recursive partitioning.
Pabuccu & Barbu (2024)	Not primary focus	Not addressed	Not primary focus	Feature Selection with Annealing (FSA): simulated annealing for dimensionality reduction	FSA consistently identified stable, generalisable feature subsets outperforming forward and backward selection across multiple financial time series.
Palma et al. (2025)	Not primary focus	Probabilistic state modelling via Gaussian Mixture Models on decomposed components	Empirical Mode Decomposition (EMD) combined with Gaussian Mixture Models	Regime-specific feature construction from decomposed components	Integrated decomposition–GMM approach enhanced directional prediction, particularly under regime-dependent volatile conditions.
Zhao & Guo (2024)	Integrated within hybrid framework	Implicit via decomposition component analysis	Ensemble-combined multi-method decomposition	Advanced feature selection and transformation pipeline	Hybrid integrative framework consistently outperformed single-method approaches across multiple accuracy and directional prediction metrics.

Note. This table synthesizes the primary methodological contributions and key findings of representative studies across all four thematic domains. *Not primary focus* denotes that a domain was not the central concern of the study, rather than indicating that it was absent.

Harini and Rethinavalli

Table 3. Research Gaps and Recommended Future Directions

Research Gap	Current State	Recommended Future Direction
Standardised Benchmarks	No unified evaluation framework exists for comparing decomposition methods (CEEMD, VMD, DWT, LMD) across markets, asset classes, and forecasting horizons.	Develop community-standard benchmark datasets and evaluation protocols covering diverse markets, forecasting horizons, and crisis periods, analogous to shared benchmarks in computer vision.
Real-Time Regime Integration	Regime detection is predominantly evaluated retrospectively; live integration with operational forecasting pipelines remains critically under-explored and unquantified.	Design computationally efficient online algorithms and explicitly quantify the performance gap between backtested results and live deployment under realistic latency constraints.
Explainable AI for Hybrid Models	Complex hybrid architectures (ensemble models + deep learning + decomposition techniques) lack interpretability mechanisms compatible with financial regulatory requirements.	Develop XAI toolkits tailored to financial forecasting, including SHAP-based regime attribution, wavelet saliency mapping, and indicator-based causal graph estimation.
Cross-Market Generalisation	Most studies focus on major developed equity indices; transferability to forex, cryptocurrency, and emerging markets requires substantial recalibration.	Investigate meta-learning and domain adaptation approaches; construct and validate universal feature sets across diverse asset classes and market structures.
Microstructure Robustness	Models trained on historical data degrade when market microstructure evolves due to regulatory changes, algorithmic trading growth, or shifts in participant composition.	Develop continual learning frameworks with automated structural-break detection and model-refresh triggers that remain robust to changing execution environments.

ABSTRACT

Let $G = (V, E)$ be a simple graph. A dominating set R is a regular dominating set of G if each vertex in $R \subseteq V(G)$ has the same degree. Let $L(P_n)$ be the line graph of a path with $n - 1$ vertices and $n - 2$ edges. Let $D_R(L(P_n), i)$ be the family of all regular dominating sets with cardinality i of $L(P_n)$. Let $d_R(L(P_n), i) = |D_R(L(P_n), i)|$. In this paper, we obtain recursive formula for $d_R(L(P_n), i)$. Using this recursive formula, we construct the polynomial, $D_R(L(P_n), x) = \sum_{i=\gamma_R(L(P_n))}^{n-1} d_R(L(P_n), i) x^i$, where $\gamma_R(L(P_n))$ is the regular domination number of P_n , which we call regular domination polynomial of $L(P_n)$ and also obtain some properties of this polynomials. where $\gamma_R(G)$ is the regular domination number of G .

Keywords: Regular Domination Set, Regular Domination Polynomial

INTRODUCTION

Let $G = (V, E)$ be a simple graph. For any vertex $v \in V$, the open neighbourhood of v is the set $N(v) = \{u \in V : uv \in E\}$ and the closed neighbourhood of v is the set $N[v] = N(v) \cup \{v\}$. For a set $D \subseteq V$, the open neighbourhood of S is $N(D) = \bigcup_{v \in D} N(v)$ and the closed neighbourhood of D is $N[D] = N(D) \cup D$. A set $D \subseteq V$ is a dominating set of G , if $N[D] = V$, or equivalently every vertex in $V \setminus D$ is adjacent to at least one vertex in D . If D is a dominating set of a graph G and each vertex in D has the same degree, then D is said to be a regular dominating set of G . Regular domination number $\gamma_R(G)$ of graph G is defined as the minimum among all regular dominating sets. In 2021, Prabakaran et al. [1] described regular dominating set and regular dominating number $\gamma_R(G)$ in fuzzy graph and studied various properties and bounds of regular domination number in several fuzzy graphs. In 2024, Jothi Rani and Seema Mehra[2] described regular domination number of some simple, connected, and undirected graphs as well as the join and corona of two graphs. Inspiring by this idea, we assess the regular domination polynomial of $L(P_n)$.

Preliminaries

Definition 2.1 [1] Let G be a graph, a set $R \subseteq V(G)$ is supposed to be a regular dominating set of G if i) Each vertex $u \in V(G) - R$ is adjacent to some vertex in R .

ii) Each vertex in $R \subseteq V(G)$ has the same degree.

Definition 2.2[4] The Line graph of a graph G , denoted by $L(G)$, is a graph whose vertices are the edges of G , and if $u, v \in E(G)$ then $uv \in E(L(G))$ if u and v share a vertex in G .

Regular Dominating Sets of $L(P_n)$

Example 3.1 Let us consider $L(P_6)$ as an example.

Here, $V = \{v_1, v_2, v_3, v_4, v_5\}$ and $\deg(v_1) = \deg(v_5) = 1$ and $\deg(v_3) = 2$, if we take $R = \{v_1, v_3, v_5\}$. This set is not a regular dominating set, since $\deg(v_3) \neq \deg(v_1)$. Therefore $R = \{v_2, v_4\}$ is a regular dominating set, since $\deg(v_2) = \deg(v_4)$ and this vertex dominate all vertices in $V - R$.

Lemma 3.2 Let $L(P_n)$, $n \geq 6$ be the line graph of path P_n with $n - 1$ vertices and $n - 2$ edges. Then its regular domination number is $\gamma_R(L(P_n)) = \left\lceil \frac{n}{3} \right\rceil$.

Lemma 3.3 Let $L(P_n)$ be the line graph of path P_n , $n \geq 6$. Then $D_R(L(P_n), i) = \emptyset$ if and only if $i < \left\lceil \frac{n}{3} \right\rceil$ or $i > n - 3$ and $D_R(L(P_n), i) \neq \emptyset$ if $\left\lceil \frac{n}{3} \right\rceil \leq i \leq n - 3$.

Proof. Since the minimum cardinality of the regular dominating set of $L(P_n)$ is $\left\lceil \frac{n}{3} \right\rceil$. If $i < \left\lceil \frac{n}{3} \right\rceil$ or $i > n - 3$ then there is no regular dominating set of cardinality i . Therefore, $D_R(L(P_n), i) = \emptyset$ and $D_R(L(P_n), i) \neq \emptyset$ if $\left\lceil \frac{n}{3} \right\rceil \leq i \leq n - 3$.

Lemma 3.4 If $X \in d_R(L(P_{n-1}), i - 1)$ then $X \cup \{v_{n-2}\} \in d_R(L(P_n), i)$, for some elements in $d_R(L(P_n), i)$.

Proof. Let $X \in d_R(L(P_{n-1}), i - 1)$. So the vertex must be labelled on v_{n-3} , which is in X . Since $v_{n-3} \in X$, $X \cup \{v_{n-2}\}$ for some $X \in d_R(L(P_{n-1}), i - 1)$. Therefore $X \cup \{v_{n-2}\} \in d_R(L(P_n), i - 1)$. Hence the proof.

Lemma 3.5 Let $L(P_n)$ be the line graph of path P_n , for $n \geq 6$. Then,

- If $D_R(L(P_{n-1}), i - 1) = D_R(L(P_{n-3}), i - 1) = \emptyset$. Then $D_R(L(P_{n-2}), i - 1) = \emptyset$.
- If $D_R(L(P_{n-1}), i - 1) \neq \emptyset$, $D_R(L(P_{n-3}), i - 1) \neq \emptyset$. Then $D_R(L(P_{n-2}), i - 1) \neq \emptyset$.
- If $D_R(L(P_{n-1}), i - 1) = D_R(L(P_{n-3}), i - 1) = D_R(L(P_{n-2}), i - 1) = \emptyset$.
- Then $D_R(L(P_n), i) = \emptyset$

Bibisa and Freeda

- If $D_R(L(P_{n-1}), i-1) \neq \varphi$ and $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$. Then $D_R(L(P_n), i) \neq \varphi$.
- This lemma follows from lemma 3.3.

Lemma 3.6 Let $L(P_n)$ be the line graph of path P_n , for $n \geq 6$ with $|V(L(P_n))| = n-1$.

Suppose that $D_R(L(P_n), i) \neq \varphi$. Then we have

- $D_R(L(P_{n-1}), i-1) = D_R(L(P_{n-2}), i-1) = \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$ if and only if $n = 3k+4$ and $i = 1+k$ for some $k \geq 2$.
- $D_R(L(P_{n-2}), i-1) = \varphi$, $D_R(L(P_{n-3}), i-1) = \varphi$ and $D_R(L(P_{n-1}), i-1) \neq \varphi$ if and only if $i = n-3$.
- $D_R(L(P_{n-1}), i-1) = \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$ if and only if $n = 3k+6$ and $i = \left\lceil \frac{3k+5}{3} \right\rceil$, for some $k \in \mathbb{N}$.
- $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) = \varphi$ if and only if $i = n-4$.
- $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$ if and only if $\left\lceil \frac{n-1}{3} \right\rceil + 1 \leq i \leq n-5$.

Proof.

- Since, $D_R(L(P_{n-1}), i-1) = \varphi$ and $D_R(L(P_{n-2}), i-1) = \varphi$.

By Lemma 3.3, we have $i-1 > n-4$ or $i-1 < \left\lceil \frac{n-1}{3} \right\rceil$ and $i-1 > n-5$ or $i-1 < \left\lceil \frac{n-2}{3} \right\rceil$

Therefore, $i-1 > n-4$ or $i-1 < \left\lceil \frac{n-2}{3} \right\rceil$

If $i-1 > n-4$ then $i > n-3$, which is contradiction. Therefore, $D_R(L(P_n), i) = \varphi$

Therefore, $i < \left\lceil \frac{n-2}{3} \right\rceil + 1$. Since, $D_R(L(P_{n-3}), i-1) \neq \varphi$, we get $\left\lceil \frac{n-3}{3} \right\rceil \leq i-1 \leq n-6$.

Hence, $\left\lceil \frac{n-3}{3} \right\rceil + 1 \leq i \leq \left\lceil \frac{n-2}{3} \right\rceil + 1$.

This is true only when $n = 3k+4$ and $i = k+1$, for some $k \geq 2$.

Conversely assume $n = 3k+4$ and $i = k+1$, for some $k \geq 2$. Then by lemma 3.3, $D_R(L(P_{n-1}), i-1) = D_R(L(P_{n-2}), i-1) = \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$

- (ii) Assume that, $D_R(L(P_{n-2}), i-1) = D_R(L(P_{n-3}), i-1) = \varphi$ and $D_R(L(P_{n-1}), i-1) \neq \varphi$.

Since $D_R(L(P_{n-2}), i-1) = D_R(L(P_{n-3}), i-1) = \varphi$

therefore $i-1 < \left\lceil \frac{n-2}{3} \right\rceil$ or $i-1 > n-5$ and $i-1 < \left\lceil \frac{n-3}{3} \right\rceil$ or $i-1 > n-6$.

Therefore $i-1 > n-5$ or $i-1 < \left\lceil \frac{n-3}{3} \right\rceil$. Since $D_R(L(P_{n-1}), i-1) \neq \varphi$,

we have $\left\lceil \frac{n-1}{3} \right\rceil \leq i-1 \leq n-4$. If $i-1 < \left\lceil \frac{n-3}{3} \right\rceil$, then $i-1 < \left\lceil \frac{n-1}{3} \right\rceil$.

Therefore, by Lemma 3.3, $D_R(L(P_{n-1}), i-1) = \varphi$. which is a contradiction. So, we have, $i-1 > n-5$, then $i > n-4$. Therefore, $i \geq n-3$ (1)

Since, $D_R(L(P_{n-1}), i-1) \neq \varphi$, $i \leq n-3$ (2)

From (1) and (2) we get, $i = n-3$.

Conversely, if $i = n-3$, $D_R(L(P_{n-2}), i-1) = D_R(L(P_{n-2}), n-4) = \varphi$

$$D_R(L(P_{n-3}), i-1) = D_R(L(P_{n-3}), n-4) = \varphi$$

$$D_R(L(P_{n-1}), i-1) = D_R(L(P_{n-1}), n-4) \neq \varphi$$

- Assume that $D_R(L(P_{n-1}), i-1) = \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and

$D_R(L(P_{n-3}), i-1) \neq \varphi$.

By Lemma 3.3, we have, $i-1 < \left\lceil \frac{n-1}{3} \right\rceil$ or $i-1 > n-4$. We get, $i-1 > n-5$. Therefore, $D_R(L(P_{n-2}), i-1) = \varphi = D_R(L(P_{n-3}), i-1)$.

which is a contradiction. So, $i-1 < \left\lceil \frac{n-1}{3} \right\rceil$. Therefore, $i < \left\lceil \frac{n-1}{3} \right\rceil + 1$.

Since $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$,

Bibisa and Freeda

by lemma 3.3, we have, $\left\lfloor \frac{n-2}{3} \right\rfloor \leq i-1 \leq n-5$ and $\left\lfloor \frac{n-3}{3} \right\rfloor \leq i-1 \leq n-6$.

Therefore, $\left\lfloor \frac{n-2}{3} \right\rfloor + 1 \leq i \leq n-5$.

Therefore, $\left\lfloor \frac{n-2}{3} \right\rfloor + 1 \leq i < \left\lfloor \frac{n-1}{3} \right\rfloor + 1$, This holds only if $n = 3k + 6$ and $i = \left\lfloor \frac{3k+5}{3} \right\rfloor$ for some $k \in \mathbb{N}$.

Conversely, assume $n = 3k + 6$ and $i = \left\lfloor \frac{3k+5}{3} \right\rfloor$ then by Lemma 3.3, $D_R(L(P_{n-1}), i-1) = \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$

- Assume that $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$, $D_R(L(P_{n-3}), i-1) = \varphi$

Then by lemma $i-1 > n-6$ or $i-1 < \left\lfloor \frac{n-3}{3} \right\rfloor$ (3)

Since $D_R(L(P_{n-1}), i-1) \neq \varphi$, we have $\left\lfloor \frac{n-1}{3} \right\rfloor \leq i-1 \leq n-4$ (4)

Suppose $i-1 < \left\lfloor \frac{n-3}{3} \right\rfloor$, then (4) does not hold. Therefore, our assumption is wrong.

So $i-1 > n-6$, Therefore, $i \geq n-4$. (5)

Since $\left\lfloor \frac{n-2}{3} \right\rfloor \leq i-1 \leq n-5$, Therefore, $i \leq n-4$. (6)

From (5) and (6), we get $i = n-4$.

Conversely, suppose that $i = n-4$.

by Lemma 3.3, $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) = \varphi$

- Assume that $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$

Then by Lemma 3.3, we have $\left\lfloor \frac{n-1}{3} \right\rfloor \leq i-1 \leq n-4$, $\left\lfloor \frac{n-2}{3} \right\rfloor \leq i-1 \leq n-5$ and

$\left\lfloor \frac{n-3}{3} \right\rfloor \leq i-1 \leq n-6$. Therefore, $\left\lfloor \frac{n-1}{3} \right\rfloor + 1 \leq i \leq n-5$.

Conversely, suppose that $\left\lfloor \frac{n-1}{3} \right\rfloor + 1 \leq i \leq n-5$

Therefore $\left\lfloor \frac{n-1}{3} \right\rfloor \leq i-1 \leq n-4$, $\left\lfloor \frac{n-2}{3} \right\rfloor \leq i-1 \leq n-5$ and $\left\lfloor \frac{n-3}{3} \right\rfloor \leq i-1 \leq n-6$.

By Lemma 3.3, $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and

$D_R(L(P_{n-3}), i-1) \neq \varphi$. Hence the theorem.

Theorem 3.7 For every $n \geq 7$ and $i \geq \left\lfloor \frac{n}{3} \right\rfloor$,

(i) $D_R(L(P_{n-2}), i-1) = \varphi = D_R(L(P_{n-3}), i-1)$ and $D_R(L(P_{n-1}), i-1) \neq \varphi$.

Then $D_R(L(P_n), i) = \{v_2, v_3, \dots, v_{n-2}\}$.

(ii) $D_R(L(P_{n-1}), i-1) = D_R(L(P_{n-2}), i-1) = \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$.

Then $D_R(L(P_n), i) = \{v_2, v_5, \dots, v_{n-5}, v_{n-2}\}$.

(iii) $D_R(L(P_{n-1}), i-1) = \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$.

Then $D_R(L(P_n), i) = \{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-3}), i-1)\}\}$.

(iv) $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) = \varphi$.

Then $D_R(L(P_n), i) = \{[v_{n-1}] - \{x\}/x \in [v_{n-1}]\}$.

(v) $D_R(L(P_{n-1}), i-1) \neq \varphi$, $D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$.

Then $D_R(L(P_n), i) = \{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-1}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_3/X_3 \in D_R(L(P_{n-3}), i-1)\}\}$.

Proof. (i) Since, By Lemma 3.6 (ii), we have $i = n-3$.

Therefore, $D_R(L(P_n), i) = D_R(L(P_n), n-3) = \{v_2, v_3, \dots, v_{n-2}\}$.

(ii) Since, $D_R(L(P_{n-1}), i-1) = D_R(L(P_{n-2}), i-1) = \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$

by Lemma 3.6(i), $n = 3k + 4$ and $i = k + 1$ for $k \geq 2$, Clearly the set, $\{v_2, v_5, \dots, v_{n-5}, v_{n-2}\}$ has $\left\lfloor \frac{n}{3} \right\rfloor$ elements. Let the vertex set of $L(P_n)$ be $\{v_1, v_2, \dots, v_{n-1}\}$.

Bibisa and Freeda

Here, two vertices are of degree one, that is v_1 and v_{n-1} and $n-3$ of degree 2. If R is a regular dominating set. There are two alternatives for R . If $v_1, v_{n-1} \in R$, then which is in conflict with the concept of a regular dominating set. That is $\text{isdeg}(v_1) = \text{deg}(v_{n-1}) = 1$

$\text{deg}(v_i) = 2$, for every $2 \leq i \leq n-2$. Therefore, $\{v_2, v_5, \dots, v_{n-5}, v_{n-2}\}$ is the only regular dominating set of $k+1 = i$.

(iii) Since, $D_R(L(P_{n-1}), i-1) = \varphi, D_R(L(P_{n-2}), i-1) \neq \varphi$ and $D_R(L(P_{n-3}), i-1) \neq \varphi$

by Lemma 3.6 (iii), we have $n = 3k+6$ and $i = \left\lceil \frac{3k+5}{3} \right\rceil = k+2$ for some $k \in \mathbb{N}$.

Therefore, $D_R(L(P_{3k+6-1}), k+2-1) = D_R(L(P_{3k+5}), k+1) = \varphi$.

Let $X_1 \in D_R(L(P_{n-2}), i-1)$, So the vertex must be labelled on v_{n-4} is in X_1 .

If $v_{n-4} \in X_1$ then $\{v_{n-2}\} \cup X_1 \in D_R(L(P_n), i)$.

Let $X_2 \in D_R(L(P_{n-3}), i-1)$, then v_{n-5} is in X_2 .

If $v_{n-5} \in X_2$, then $\{v_{n-2}\} \cup X_1 \in D_R(L(P_n), i)$.

Thus, we have

$$\{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-3}), i-1)\} \subseteq D_R(L(P_n), i) \quad (7)$$

Let $Y \in D_R(L(P_n), i)$, then v_{n-2} is in Y . If $v_{n-3} \in X$, then one vertex must be labelled on v_{n-4} is in Y . If $v_{n-4} \in Y$ then $Y = X_1 \cup \{v_{n-2}\}$ for some $D_R(L(P_{n-2}), i-1)$. If $v_{n-4} \in Y$ then one vertex must be labelled on v_{n-5} is in Y .

If $v_{n-5} \in Y$ then $Y = X_2 \cup \{v_{n-2}\}$ for some $D_R(L(P_{n-3}), i-1)$.

So we have, $D_R(L(P_n), i) \subseteq \{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-3}), i-1)\}$.

(8)

From (7) and (8) we get,

$$D_R(L(P_n), i) = \{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-3}), i-1)\}.$$

(iv) By Lemma 3.6(iv), we have $i = n-4$.

$$D_R(L(P_n), i) = D_R(L(P_n), n-4) = \{[v_{n-1}] - \{x\}/x \in [v_{n-1}]\}.$$

(v) Let $X_1 \in D_R(L(P_{n-1}), i-1)$. So the vertex must be labelled on v_{n-3} is in X_1 .

If $v_{n-3} \in X_1$, then $\{v_{n-2}\} \cup X_1 \in D_R(L(P_n), i)$.

Let $X_2 \in D_R(L(P_{n-2}), i-1)$ then $v_{n-4} \in X_2$.

If $v_{n-4} \in X_2$, then $\{v_{n-2}\} \cup X_2 \in D_R(L(P_n), i)$.

Let $X_3 \in D_R(L(P_{n-3}), i-1)$ then $v_{n-5} \in X_3$.

If $v_{n-5} \in X_3$, then $\{v_{n-2}\} \cup X_3 \in D_R(L(P_n), i)$.

Thus, we have

$$\{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-1}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_3/X_3 \in D_R(L(P_{n-3}), i-1)\} \subseteq D_R(L(P_n), i). \quad (9)$$

Now let $Y \in D_R(L(P_n), i)$ then v_{n-2} is in Y . If $v_{n-2} \in Y$, then one vertex must be labelled on v_{n-3} is in Y .

If $v_{n-3} \in Y$, then $Y = X_1 \cup \{v_{n-2}\}$ for some $D_R(L(P_{n-1}), i-1)$.

If $v_{n-3} \in Y$, then one vertex must be labelled on v_{n-4} is in Y .

If $v_{n-4} \in Y$, then $Y = X_2 \cup \{v_{n-2}\}$ for some $D_R(L(P_{n-2}), i-1)$.

If $v_{n-4} \in Y$, then one vertex must be labelled on v_{n-5} is in Y .

If $v_{n-5} \in Y$, then $Y = X_3 \cup \{v_{n-2}\}$ for some $D_R(L(P_{n-3}), i-1)$.

Therefore, $D_R(L(P_n), i) \subseteq \{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-1}), i-1)\}$

$$\cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_3/X_3 \in D_R(L(P_{n-3}), i-1)\} \quad (10)$$

From (9) and (10) we get,

$$D_R(L(P_n), i) = \{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-1}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_3/X_3 \in D_R(L(P_{n-3}), i-1)\}$$

Hence the proof.

Theorem 3.8 If $D_R(L(P_n), i)$ is the family of regular dominating sets with cardinality i of $L(P_n)$.

Then $d_R(L(P_n), i) = d_R(L(P_{n-1}), i-1) + d_R(L(P_{n-2}), i-1) + d_R(L(P_{n-3}), i-1)$,

Where $d_R(L(P_n), i) = |D_R(L(P_n), i)|$.

Bibisa and Freeda

Proof. From theorem 3.7 we have

$$D_R(L(P_n), i) = \{\{v_{n-2}\} \cup X_1/X_1 \in D_R(L(P_{n-1}), i-1)\} \cup \{\{v_{n-2}\} \cup X_2/X_2 \in D_R(L(P_{n-2}), i-1)\} \cup \{\{v_{n-2}\} \cup X_3/X_3 \in D_R(L(P_{n-3}), i-1)\}.$$

Therefore,

$$|D_R(L(P_n), i)| = |D_R(L(P_{n-1}), i-1)| \cup |D_R(L(P_{n-2}), i-1)| \cup |D_R(L(P_{n-3}), i-1)|$$

Therefore, $d_R(L(P_n), i) = d_R(L(P_{n-1}), i-1) + d_R(L(P_{n-2}), i-1) + d_R(L(P_{n-3}), i-1)$, where $d_R(L(P_n), i) = |D_R(L(P_n), i)|$.

Regular Domination Polynomials of $L(P_n)$

Definition 4.1. Let $D_R(L(P_n), i)$ be the family of all regular dominating sets of with cardinality i and let $d_R(L(P_n), i) = |D_R(L(P_n), i)|$. Then the regular domination polynomial $D_R(L(P_n), x)$ of $L(P_n)$ is defined as

$$D_R(L(P_n), x) = \sum_{i=\lceil \frac{n}{3} \rceil}^n d_R(L(P_n), i) x^i,$$

where $\gamma_R(L(P_n))$ is the regular domination number of $L(P_n)$.

Theorem 4.2. For every $n \geq 9$,

$$D_R(L(P_n), x) = x[D_R(L(P_{n-1}), x) + D_R(L(P_{n-2}), x) + D_R(L(P_{n-3}), x)] \quad \text{with initial values } D_R(L(P_6), x) = x^2 + x^3$$

$$D_R(L(P_7), x) = x^2 + 2x^3 + x^4$$

$$D_R(L(P_8), x) = 3x^2 + 3x^4 + x^5$$

Proof

From theorem 3.8 we have,

$$d_R(L(P_n), i) = d_R(L(P_{n-1}), i-1) + d_R(L(P_{n-2}), i-1) + d_R(L(P_{n-3}), i-1) d_R(L(P_n), i) x^i$$

$$= d_R(L(P_{n-1}), i-1) x^i + d_R(L(P_{n-2}), i-1) x^i + d_R(L(P_{n-3}), i-1) x^i$$

$$\sum d_R(L(P_n), i) x^i = \sum d_R(L(P_{n-1}), i-1) x^i + \sum d_R(L(P_{n-2}), i-1) x^i + \sum d_R(L(P_{n-3}), i-1) x^i$$

$$\sum d_R(L(P_n), i) x^i = x [\sum d_R(L(P_{n-1}), i-1) x^{i-1} + \sum d_R(L(P_{n-2}), i-1) x^{i-1} + \sum d_R(L(P_{n-3}), i-1) x^{i-1}].$$

$$D_R(L(P_n), x) = x[D_R(L(P_{n-1}), x) + D_R(L(P_{n-2}), x) + D_R(L(P_{n-3}), x)]$$

With initial values $D_R(L(P_6), x) = x^2 + x^3$,

$$D_R(L(P_7), x) = x^2 + 2x^3 + x^4, D_R(L(P_8), x) = 3x^2 + 3x^4 + x^5$$

We obtain $d_R(L(P_n), i)$, $6 \leq n \leq 16$ and $2 \leq i \leq 13$ as shown in Table 1.

Theorem 4.3 The following properties hold for the coefficients of $D_R(L(P_n), x)$.

- i) $d_R(L(P_{3n+1}), n) = 1$, for every $n \geq 2$.
- ii) $d_R(L(P_{3n+3}), n+1) = n$, for every $n \in \mathbb{N}$.
- iii) $d_R(L(P_{3n+2}), n+1) = \frac{n(n+1)}{2}$, for every $n \geq 2$.
- iv) $d_R(L(P_{3n+4}), n+2) = \frac{n(n+1)(n+5)}{6}$, for every $n \in \mathbb{N}$.
- v) $d_R(L(P_{3n+3}), n+2) = \frac{n(n+1)(n^2+9n+2)}{24}$, for every $n \in \mathbb{N}$.
- vi) $d_R(L(P_n), n-3) = 1$, for every $n \geq 6$.
- vii) $d_R(L(P_n), n-4) = n-5$, for every $n \geq 5$.
- viii) $d_R(L(P_n), n-5) = \frac{(n-5)(n-6)}{2}$, for every $n \geq 6$.
- ix) $d_R(L(P_n), n-6) = \frac{(n-7)(n-8)(n-3)}{6}$, for every $n \geq 7$.
- x) $d_R(L(P_n), n-7) = \frac{(n-8)(n-9)(n^2-9n+2)}{24}$, for every $n \geq 8$.
- xi) $\sum_{i=n+3}^{3n+1} d_R(L(P_i), n) = 3 \sum_{i=n+2}^{3n-2} d_R(L(P_i), n-1)$, for every $n \geq 4$.
- xii) for every $i \geq \lceil \frac{n}{3} \rceil$, $n \geq 9$,

$$d_R(L(P_{n+1}), i+1) - d_R(L(P_n), i+1) = d_R(L(P_n), i) - d_R(L(P_{n-3}), i)$$

Bibisa and Freeda

Proof:

i) Since $D_R(L(P_{3n+1}), n) = \{v_2, v_5, \dots, v_{3n-2}\}$, we have $d_R(L(P_{3n+1}), n) = 1$.

ii) Proof by induction on n .

Assume that the result is true for $n = 1$.

$$d_R(L(P_{3n+3}), n+1) = d_R(L(P_6), 2) = \{v_2, v_4\}$$

So, $d_R(L(P_6), 2) = 1$.

Therefore, the result is true for $n = 1$

Now, assume that the result is true for all numbers less than n and we prove it for n .

by theorem 3.8. and the induction hypothesis, we have

$$\begin{aligned} d_R(L(P_{3n+3}), n+1) &= d_R(L(P_{3n+2}), n) + d_R(L(P_{3n+1}), n) + d_R(L(P_{3n}), n) \\ &= d_R(L(P_{3n+2}), n) + d_R(L(P_{3n+1}), n) + d_R(L(P_{3(n-1)-3}), n) \\ &= 0 + 1 + n - 1 = n \end{aligned}$$

Therefore, $d_R(L(P_{3n+3}), n+1) = n$, for every $n \in \mathbb{N}$.

iii) Proof by induction on n . To prove that the result is true for $n = 2$.

We have, $L.H.S. = d_R(L(P_{3n+2}), n+1) = d_R(L(P_8), 3) = 3$

$$R.H.S. = \frac{n(n+1)}{2} = \frac{2(2+1)}{2} = 3. \text{ Therefore, the result is true for } n = 2.$$

Now, assume that the result is true for all numbers less than n and we prove it for n .

by theorem 3.8 and the induction hypothesis, we have,

$$\begin{aligned} d_R(L(P_{3n+2}), n+1) &= d_R(L(P_{3n+1}), n) + d_R(L(P_{3n}), n) = d_R(L(P_{3(n-1)}), n) \\ &= d_R(L(P_{3n+1}), n) + d_R(L(P_{3(n-1)+2}), n) \\ &= 1 + \frac{(n-1)n}{2} + n - 1 \\ &= \frac{n(n+1)}{2} \end{aligned}$$

Therefore, $d_R(L(P_{3n+2}), n+1) = \frac{n(n+1)}{2}$, for every $n \geq 2$.

iv) Proof by induction on n . To prove that the result is true for $n = 1$.

We have, $L.H.S. = d_R(L(P_{3n+4}), n+2) = d_R(L(P_7), 3) = 2$

$$R.H.S. = \frac{n(n+1)(n+5)}{6} = 2$$

Therefore, the result is true for $n = 1$. Now, assume that the result is true for all numbers less than n and we prove it for n . by theorem 3.8 and the induction hypothesis, we have,

$$\begin{aligned} d_R(L(P_{3n+4}), n+2) &= d_R(L(P_{3n+3}), n+1) + d_R(L(P_{3n+2}), n+1) + d_R(L(P_{3n+1}), n+1) \\ &= d_R(L(P_{3n+3}), n+1) + d_R(L(P_{3n+2}), n+1) + d_R(L(P_{3(n-1)+4}), n+1) \\ &= n + \frac{n(n+1)}{2} + \frac{(n-1)(n+4)n}{6} \\ &= \frac{n(n+1)(n+5)}{6} \end{aligned}$$

Therefore, $d_R(L(P_{3n+4}), n+2) = \frac{n(n+1)(n+5)}{6}$, for every $n \in \mathbb{N}$.

v) Proof by induction on n . To prove that the result is true for $n = 1$.

We have, $L.H.S. = d_R(L(P_{3n+3}), n+2) = d_R(L(P_6), 3) = 1$

$$R.H.S. = \frac{n(n+1)(n^2+9n+2)}{24} = 1$$

Therefore, the result is true for $n = 1$. Now, assume that the result is true for all numbers less than n and we prove it for n . by theorem 3.8 and the induction hypothesis, we have,

$$\begin{aligned} d_R(L(P_{3n+3}), n+2) &= d_R(L(P_{3n+2}), n+1) + d_R(L(P_{3n+1}), n+1) + d_R(L(P_{3n}), n+1) \\ &= d_R(L(P_{3n+2}), n+1) + d_R(L(P_{3(n-1)+4}), n+1) + d_R(L(P_{3(n-1)+3}), n+1) \\ &= \frac{n(n+1)}{2} + \frac{(n-1)n(n+4)}{6} + \frac{(n-1)n(n^2+7n-6)}{24} \\ &= \frac{n(n+1)(n^2+9n+2)}{24} \end{aligned}$$

Therefore, $d_R(L(P_{3n+3}), n+2) = \frac{n(n+1)(n^2+9n+2)}{24}$, for every $n \in \mathbb{N}$.

vi) Since $D_R(L(P_n), n-3) = \{v_2, v_5, \dots, v_{n-2}\}$, we have $d_R(L(P_n), n-3) = 1$.

vii) Proof by induction on n . To prove that the result is true for $n = 5$.

We have, $L.H.S. = d_R(L(P_n), n-4) = d_R(L(P_5), 1) = 0$

Bibisa and Freeda

$R.H.S. = n - 5 = 0$. Therefore, the result is true for $n = 5$.

Now, assume that the result is true for all numbers less than n and we prove it for n .

By theorem 3.8 and the induction hypothesis, we have,

$$d_R(L(P_n), n - 4) = d_R(L(P_{n-1}), n - 5) + d_R(L(P_{n-2}), n - 5) + d_R(L(P_{n-3}), n - 5) \\ = n - 5$$

Therefore, $d_R(L(P_n), n - 4) = n - 5$, for every $n \geq 5$.

viii) Proof by induction on n . To prove that the result is true for $n = 6$.

We have, $L.H.S. = d_R(L(P_n), n - 5) = d_R(L(P_6), 1) = 0$

$$R.H.S. = \frac{(n-5)(n-6)}{2} = 0$$

Therefore, the result is true for $n = 6$. Now, assume that the result is true for all numbers less than n and we prove it for n . By theorem 3.8 and the induction hypothesis, we have,

$$d_R(L(P_n), n - 5) = d_R(L(P_{n-1}), n - 6) + d_R(L(P_{n-2}), n - 6) + d_R(L(P_{n-3}), n - 6) \\ = \frac{(n-6)(n-7)}{2} + n - 6 \\ = \frac{(n-5)(n-6)}{2}$$

Therefore, $d_R(L(P_n), n - 5) = \frac{(n-5)(n-6)}{2}$, for every $n \geq 6$.

ix) Proof by induction on n . To prove that the result is true for $n = 7$.

We have, $L.H.S. = d_R(L(P_n), n - 6) = d_R(L(P_7), 1) = 0$

$$R.H.S. = \frac{(n-7)(n-8)(n-3)}{6} = 0$$

Therefore, the result is true for $n = 7$. Now, assume that the result is true for all numbers less than n and we prove it for n . By theorem 3.8 and the induction hypothesis, we have,

$$d_R(L(P_n), n - 6) = d_R(L(P_{n-1}), n - 7) + d_R(L(P_{n-2}), n - 7) + d_R(L(P_{n-3}), n - 7) \\ = \frac{(n-8)(n-9)(n-4)}{6} + \frac{(n-7)(n-8)}{2} + n - 8 \\ = \frac{(n-8)(n-7)(n-3)}{6}$$

Therefore, $d_R(L(P_n), n - 6) = \frac{(n-8)(n-7)(n-3)}{6}$, for every $n \geq 7$.

x) Proof by induction on n . To prove that the result is true for $n = 8$.

We have, $L.H.S. = d_R(L(P_n), n - 7) = d_R(L(P_8), 1) = 0$

$$R.H.S. = \frac{(n-8)(n-9)(n^2-9n+2)}{24} = 0$$

Therefore, the result is true for $n = 8$. Now, assume that the result is true for all numbers less than n and we prove it for n . By theorem 3.8 and the induction hypothesis, we have,

$$d_R(L(P_n), n - 7) = d_R(L(P_{n-1}), n - 8) + d_R(L(P_{n-2}), n - 8) + d_R(L(P_{n-3}), n - 8) \\ = \frac{(n-9)(n-10)[(n-1)^2-9(n-1)+2]}{24} + \frac{(n-9)(n-10)(n-5)}{6} + \frac{(n-8)(n-9)}{2} \\ = \frac{(n-8)(n-9)(n^2-9n+2)}{24}$$

Therefore, $d_R(L(P_n), n - 7) = \frac{(n-8)(n-9)(n^2-9n+2)}{24}$, for every $n \geq 8$.

xi) Proof by induction on n . To prove that the result is true for $n = 4$.

We have, $L.H.S. = \sum_{i=n+3}^{3n+1} d_R(L(P_i), n) = \sum_{i=7}^{13} d_R(L(P_i), 4) = 27$

$$R.H.S. = 3 \sum_{i=n+2}^{3n-2} d_R(L(P_i), n - 1) = 3 \sum_{i=6}^{10} d_R(L(P_i), 3) = 27$$

Therefore, the result is true for $n = 4$. Now assume that the result is true for every $n - 1$ and we prove that for n .

$$\sum_{i=n+3}^{3n+1} d_R(L(P_i), n) = 3 \sum_{i=n+3}^{3n-2} d_R(L(P_{i-1}), n - 1) \\ + 3 \sum_{i=n+3}^{3n-2} d_R(L(P_{i-2}), n - 1) + 3 \sum_{i=n+3}^{3n-2} d_R(L(P_{i-3}), n - 1) \\ = 3 \left[\sum_{i=n+2}^{3n-2} d_R(L(P_i), n - 1) \right]$$

Therefore, $\sum_{i=n+3}^{3n+1} d_R(L(P_i), n) = 3 \left[\sum_{i=n+2}^{3n-2} d_R(L(P_i), n - 1) \right]$, for every $n \geq 4$.

xii) by theorem 3.8

Bibisa and Freeda

$$\begin{aligned} d_R(L(P_{n+1}), i+1) - d_R(L(P_n), i+1) &= [d_R(L(P_n), i) + d_R(L(P_{n-1}), i) + d_R(L(P_{n-2}), i)] - [d_R(L(P_{n-1}), i) + \\ & d_R(L(P_{n-2}), i) + d_R(L(P_{n-3}), i)] \\ &= d_R(L(P_n), i) - d_R(L(P_{n-3}), i) \end{aligned}$$

Hence the proof.

CONCLUSION

Motivated by the concept of regular domination number of several graphs by Jothi Rani and Seema Mehra. Here we determined the regular dominating set of $L(P_n)$. And regular domination polynomials of $L(P_n)$. Further, we can generalize regular domination polynomials of other different graphs.

ABSTRACT

Bipolar single-valued neutrosophic graphs (BSVNGs) provide a powerful framework for modeling complex systems that involve positive and negative information together with uncertainty and indeterminacy. A particularly important subclass is the strong BSVNG, in which the membership values of each edge are fully determined by its incident vertices. Understanding how such structural consistency behaves under graph operations is essential for constructing larger neutrosophic network models from smaller components. In this paper, we examine the Cartesian product within the setting of strong BSVNGs. We establish necessary and sufficient conditions under which Cartesian product preserve strongness, and demonstrate that at least one component graph must be strong for the resulting structure to remain strong. These results deepen the theoretical foundation of neutrosophic graph operations and support the broader applicability of bipolar neutrosophic modeling in uncertain decision environments.

Keywords: Single-valued neutrosophic graphs, Bipolar single-valued neutrosophic graphs, cartesian product, strong bipolar single-valued neutrosophic graphs.

INTRODUCTION

Real-world systems are inherently complex, often characterized by uncertainty, incompleteness, and conflicting information. This is particularly evident in domains involving human judgment, imprecise data, or dynamic

**Lakshmi and Geetha**

environments, where classical mathematical structures frequently prove inadequate for modeling such ambiguity. The quest to capture this complexity began with Zadeh's seminal work on fuzzy set theory [20], which introduced the concept of partial membership as a means of representing vagueness. Later, Atanassov [3] enriched this perspective by proposing intuitionistic fuzzy sets, which explicitly capture both membership and non-membership, offering a more nuanced representation of uncertainty. Although these models represented significant progress, they did not fully accommodate situations where indeterminacy itself is a central component. To address this gap, Smarandache [16] introduced neutrosophic sets, providing a three-dimensional framework comprising truth, indeterminacy, and falsity. For practical applications, Wang et al. [19] developed single-valued neutrosophic sets (SVNSs), restricting all components to the unit interval and enabling wide-ranging use in engineering, image processing, and decision-support systems.

Graph theory, a fundamental tool for modeling relationships, has evolved alongside these developments. Smarandache's monograph on neutrosophic graph theory [17] provided a systematic foundation for integrating neutrosophic sets with graph structures. Broumi et al. initiated the study of single-valued neutrosophic graphs (SVNGs) [8], followed by the introduction of interval-valued neutrosophic graphs (IVNGs) [6] and their strong counterparts [5]. These contributions significantly expanded the expressive capability of graphs in uncertain and indeterminate environments. Subsequent investigations into strong graph properties have been extended to various frameworks, including interval-valued intuitionistic fuzzy graphs [12, 13] and interval-valued Pythagorean fuzzy graphs [14], further enriching the theoretical landscape. Meanwhile, bipolar extensions have also attracted substantial interest. Akram's work on bipolar fuzzy graphs [1] laid the groundwork for modeling positive and negative characteristics simultaneously. This was further extended to interval-valued bipolar fuzzy graphs by Chae et al. [9], enabling the representation of dual perspectives with greater flexibility. Building upon these advances, Deli and Subramanian [10] introduced bipolar neutrosophic sets, which offer a richer representation by incorporating bipolar truth, indeterminacy, and falsity values.

This development prompted further exploration into bipolar neutrosophic graphs. Broumi et al. provided foundational studies on bipolar single-valued neutrosophic graph theory [4, 7], while Akram and Shahzadi [2] formulated bipolar neutrosophic graph structures. More recently, Hussain et al. [11] introduced quadripartitioned bipolar single-valued neutrosophic graphs, further extending the modeling capabilities of this framework. Bipolar single-valued neutrosophic graphs (BSVNGs) combine the strengths of bipolar structures with neutrosophic modeling, making them highly suitable for systems involving opposing viewpoints such as positive and negative sentiments, supportive and opposing evidence, or cooperative and competitive relationships. These models are increasingly applied in areas such as intelligent decision-making and expert systems. However, despite this growing interest, the subclass of strong BSVNGs—where edge values are strictly determined by the membership values of adjacent vertices—remains underdeveloped. Strongness is an important structural property because it guarantees internal consistency and eliminates ambiguity in edge definitions. Understanding whether graph operations preserve this property is essential, especially when constructing larger networks from smaller components. Previous studies on strong graphs within various fuzzy and neutrosophic frameworks [5, 12, 14, 15, 18] have laid valuable groundwork, yet a comprehensive investigation within the context of BSVNGs is still lacking.

This paper investigates the behavior of strong BSVNGs under two fundamental graph operations: the Cartesian product and the composition. We establish necessary and sufficient conditions under which these operations preserve the strong property, identify scenarios where strongness fails, and illustrate the structural implications with concrete examples. Our work generalizes and extends earlier results on strong neutrosophic graphs, bipolar neutrosophic graphs, and related frameworks [2, 4, 5, 7, 11, 18]. Through this study, we aim to deepen the theoretical understanding of bipolar neutrosophic graph operations and contribute to a more robust mathematical foundation for modeling real-world systems characterized by ambiguity, dual perspectives, and indeterminacy.

Lakshmi and Geetha

Motivation and Scope

The motivation for studying strong bipolar single-valued neutrosophic graphs arises from the need to model systems in which both positive and negative evaluations coexist and are further influenced by uncertainty and indeterminacy. While BSVNGs already provide a comprehensive representational framework, the strong subclass is particularly useful because it ensures that edge values are fully dictated by their corresponding vertices. This yields structurally consistent graphs that are easier to analyze and more suitable for practical implementations. Many real-world applications including decision analysis, expert systems, social networks, and multi-criteria evaluation require constructing larger networks from several smaller components. For such modular constructions, it is crucial to understand how graph operations behave on strong BSVNGs. In particular, the Cartesian product and composition are fundamental building tools in graph theory, yet their impact on strongness has not been fully characterized in the neutrosophic bipolar setting.

The aim of this work is thus twofold:

- To formally analyze the behavior of strong BSVNGs under the Cartesian product.
- To determine necessary and sufficient conditions under which these operations preserve the strong structure.

The results obtained in this study provide a deeper theoretical foundation for constructing and manipulating neutrosophic graph models, particularly in environments where conflict, ambiguity, and dual perspectives are prominent.

Preliminaries

Throughout this paper, $G^*=(V,E)$ denotes an underlying crisp ordinary graph, where V is the vertex set and $E \subseteq V \times V$ is the edge set. The symbols $\wedge$ and $\vee$ represent the minimum and maximum operations, respectively.

Definition 2.1

Let $G^*=(V,E)$ be an underlying crisp graph. A bipolar single-valued neutrosophic graph G on G^* is defined as $G = ((\sigma^P, \sigma^N), (\mu^P, \mu^N)) = ((\sigma_1^+, \sigma_2^+, \sigma_3^+), (\sigma_1^-, \sigma_2^-, \sigma_3^-))$,

$((\mu_1^+, \mu_2^+, \mu_3^+), (\mu_1^-, \mu_2^-, \mu_3^-))$. Let $V = \{v_1, v_2, \dots, v_n\}$. The mappings $\sigma_1^+, \sigma_2^+, \sigma_3^+ : V \rightarrow [0,1]$ denote respectively the positive truth-membership, positive indeterminacy-membership, and positive falsity-membership degrees of the vertices $v_i \in V$. Similarly, $\sigma_1^-, \sigma_2^-, \sigma_3^- : V \rightarrow [-1,0]$ denote respectively the negative truth-membership, negative indeterminacy-membership, and negative falsity-membership degrees of the vertices $v_i \in V$. These functions satisfy: $0 \leq \sigma_1^+(v_i) + \sigma_2^+(v_i) + \sigma_3^+(v_i) \leq 3$, $-3 \leq \sigma_1^-(v_i) + \sigma_2^-(v_i) + \sigma_3^-(v_i) \leq 0$, for all $v_i \in V$. Let $E \subseteq V \times V$. The mappings $\mu_1^+, \mu_2^+, \mu_3^+ : E \rightarrow [0,1]$ and $\mu_1^-, \mu_2^-, \mu_3^- : E \rightarrow [-1,0]$ represent respectively the positive and negative bipolar single-valued neutrosophic membership degrees of edges. For all $(u_i, u_j) \in E$, they satisfy:

$$\begin{aligned}\mu_1^+(u_i, u_j) &\leq \sigma_1^+(u_i) \wedge \sigma_1^+(u_j), \\ \mu_2^+(u_i, u_j) &\leq \sigma_2^+(u_i) \wedge \sigma_2^+(u_j), \\ \mu_3^+(u_i, u_j) &\leq \sigma_3^+(u_i) \vee \sigma_3^+(u_j), \\ \mu_1^-(u_i, u_j) &\geq \sigma_1^-(u_i) \vee \sigma_1^-(u_j), \\ \mu_2^-(u_i, u_j) &\geq \sigma_2^-(u_i) \vee \sigma_2^-(u_j), \\ \mu_3^-(u_i, u_j) &\geq \sigma_3^-(u_i) \wedge \sigma_3^-(u_j).\end{aligned}$$

Moreover, these functions satisfy: $0 \leq \mu_1^+(u_i, u_j) + \mu_2^+(u_i, u_j) + \mu_3^+(u_i, u_j) \leq 3$, $-3 \leq \mu_1^-(u_i, u_j) + \mu_2^-(u_i, u_j) + \mu_3^-(u_i, u_j) \leq 0$, for all $(v_i, v_j) \in E$.

Lakshmi and Geetha

Definition 2.2

A bipolar single-valued neutrosophic graph $G = (\langle \sigma^P, \sigma^N \rangle, \langle \mu^P, \mu^N \rangle)$ is said to be strong bipolar single-valued neutrosophic graph if

$$\begin{aligned}\mu_1^+(u_i, u_j) &= \sigma_1^+(u_i) \wedge \sigma_1^+(u_j), \\ \mu_2^+(u_i, u_j) &= \sigma_2^+(u_i) \wedge \sigma_2^+(u_j), \\ \mu_3^+(u_i, u_j) &= \sigma_3^+(u_i) \vee \sigma_3^+(u_j), \\ \mu_1^-(u_i, u_j) &= \sigma_1^-(u_i) \vee \sigma_1^-(u_j), \\ \mu_2^-(u_i, u_j) &= \sigma_2^-(u_i) \vee \sigma_2^-(u_j), \\ \mu_3^-(u_i, u_j) &= \sigma_3^-(u_i) \wedge \sigma_3^-(u_j)\end{aligned}$$

for all $(u_i, u_j) \in E$.

Cartesian Product of Bipolar Single-Valued Neutrosophic Graphs

In this section, the cartesian product of two BSVNGs is defined and the necessary and sufficient condition for cartesian product of two strong BSVNG to be strong-BSVNG are established.

Definition 3.1

Let $G_1 = (A, B)$ and $G_2 = (C, D)$ be two bipolar single-valued neutrosophic graphs on the same underlying crisp graph $G^* = (V, E)$. Then, the Cartesian product of G_1 and G_2 , denoted by $G_1 \times G_2 = (A \times C, B \times D)$ is defined as follows: For all $v_1 \in A$ and $v_2 \in C$,

$$\begin{aligned}(\sigma_{1_A}^+ \times \sigma_{1_C}^+)(v_1, v_2) &= \sigma_{1_A}^+(v_1) \wedge \sigma_{1_C}^+(v_2) \\ (\sigma_{2_A}^+ \times \sigma_{2_C}^+)(v_1, v_2) &= \sigma_{2_A}^+(v_1) \vee \sigma_{2_C}^+(v_2) \\ (\sigma_{3_A}^+ \times \sigma_{3_C}^+)(v_1, v_2) &= \sigma_{3_A}^+(v_1) \vee \sigma_{3_C}^+(v_2) \\ (\sigma_{1_A}^- \times \sigma_{1_C}^-)(v_1, v_2) &= \sigma_{1_A}^-(v_1) \vee \sigma_{1_C}^-(v_2) \\ (\sigma_{2_A}^- \times \sigma_{2_C}^-)(v_1, v_2) &= \sigma_{2_A}^-(v_1) \wedge \sigma_{2_C}^-(v_2) \\ (\sigma_{3_A}^- \times \sigma_{3_C}^-)(v_1, v_2) &= \sigma_{3_A}^-(v_1) \wedge \sigma_{3_C}^-(v_2)\end{aligned}$$

For all $u \in A$ and $v_1 v_2 \in D$,

$$\begin{aligned}(\mu_{1_A}^+ \times \mu_{1_C}^+)((u, v_1)(v, v_2)) &= \sigma_{1_A}^+(u) \wedge \mu_{1_D}^+(v_1 v_2) \\ (\mu_{2_A}^+ \times \mu_{2_C}^+)((u, v_1)(v, v_2)) &= \sigma_{2_A}^+(u) \vee \mu_{2_D}^+(v_1 v_2) \\ (\mu_{3_A}^+ \times \mu_{3_C}^+)((u, v_1)(v, v_2)) &= \sigma_{3_A}^+(u) \vee \mu_{3_D}^+(v_1 v_2) \\ (\mu_{1_A}^- \times \mu_{1_C}^-)((u, v_1)(v, v_2)) &= \sigma_{1_A}^-(u) \vee \mu_{1_D}^-(v_1 v_2) \\ (\mu_{2_A}^- \times \mu_{2_C}^-)((u, v_1)(v, v_2)) &= \sigma_{2_A}^-(u) \wedge \mu_{2_D}^-(v_1 v_2) \\ (\mu_{3_A}^- \times \mu_{3_C}^-)((u, v_1)(v, v_2)) &= \sigma_{3_A}^-(u) \wedge \mu_{3_D}^-(v_1 v_2)\end{aligned}$$

For all $u_1 u_2 \in B$ and $v \in C$,

$$\begin{aligned}(\mu_{1_A}^+ \times \mu_{1_C}^+)((u_1, v)(u_2, v)) &= \mu_{1_B}^+(u_1 u_2) \wedge \sigma_{1_C}^+(v), \\ (\mu_{2_A}^+ \times \mu_{2_C}^+)((u_1, v)(u_2, v)) &= \mu_{2_B}^+(u_1 u_2) \vee \sigma_{2_C}^+(v), \\ (\mu_{3_A}^+ \times \mu_{3_C}^+)((u_1, v)(u_2, v)) &= \mu_{3_B}^+(u_1 u_2) \vee \sigma_{3_C}^+(v), \\ (\mu_{1_A}^- \times \mu_{1_C}^-)((u_1, v)(u_2, v)) &= \mu_{1_B}^-(u_1 u_2) \vee \sigma_{1_C}^-(v), \\ (\mu_{2_A}^- \times \mu_{2_C}^-)((u_1, v)(u_2, v)) &= \mu_{2_B}^-(u_1 u_2) \wedge \sigma_{2_C}^-(v), \\ (\mu_{3_A}^- \times \mu_{3_C}^-)((u_1, v)(u_2, v)) &= \mu_{3_B}^-(u_1 u_2) \wedge \sigma_{3_C}^-(v).\end{aligned}$$

Example 3.2.

Consider the strong bipolar single-valued neutrosophic graphs G_1 and G_2 shown in Figures 3.1 and 3.2, respectively. The Cartesian product of these two strong BSVNGs is illustrated in Figure 3.3.

Theorem 3.3

If the Cartesian product $G_1 \times G_2$ of two bipolar single-valued neutrosophic graphs is a strong bipolar single-valued neutrosophic graph, then at least one of G_1 or G_2 must itself be strong.

Lakshmi and Geetha

Proof. Assume, for contradiction, that neither G_1 nor G_2 is strong. Then there exist edges $x_i, y_i \in E_i, i = 1, 2$, for which the strong-edge conditions fail. Concretely, for such edges we have

$$\begin{aligned}\mu_1^+(v_1, v_2) &< \sigma_1^+(v_1) \wedge \sigma_1^+(v_2), \\ \mu_2^+(v_1, v_2) &> \sigma_2^+(v_1) \vee \sigma_2^+(v_2), \\ \mu_3^+(v_1, v_2) &> \sigma_3^+(v_1) \vee \sigma_3^+(v_2), \\ \mu_1^-(v_1, v_2) &= \sigma_1^-(v_1) \vee \sigma_1^-(v_2), \\ \mu_2^-(v_1, v_2) &= \sigma_2^-(v_1) \wedge \sigma_2^-(v_2), \\ \mu_3^-(v_1, v_2) &= \sigma_3^-(v_1) \wedge \sigma_3^-(v_2),\end{aligned}$$

for all $(v_1, v_2) \in E_i, i = 1, 2$.

Now take an edge of the Cartesian product of the form $(u, u_2)(u, v_2) \in E$, where $u \in V_1$ and $u_2, v_2 \in E_2$. Using the definition of the Cartesian product, we obtain

$$(\mu_{1_A}^+ \times \mu_{1_C}^+)((u, u_2)(u, v_2)) = \sigma_{1_A}^+(u) \wedge \mu_{1_C}^+(u_2, v_2) < \sigma_{1_A}^+(u) \wedge \sigma_{1_C}^+(u_2) \wedge \sigma_{1_C}^+(v_2).$$

Likewise, the other positive membership values satisfy

$$(\mu_{2_A}^+ \times \mu_{2_C}^+)((u, u_2)(u, v_2)) = \sigma_{2_A}^+(u) \vee \mu_{2_C}^+(u_2, v_2) > \sigma_{2_A}^+(u) \vee \sigma_{2_C}^+(u_2) \vee \sigma_{2_C}^+(v_2),$$

$$(\mu_{3_A}^+ \times \mu_{3_C}^+)((u, u_2)(u, v_2)) = \sigma_{3_A}^+(u) \vee \mu_{3_C}^+(u_2, v_2) > \sigma_{3_A}^+(u) \vee \sigma_{3_C}^+(u_2) \vee \sigma_{3_C}^+(v_2).$$

For the negative components we similarly get

$$(\mu_{1_A}^- \times \mu_{1_C}^-)((u, u_2)(u, v_2)) = \sigma_{1_A}^-(u) \vee \mu_{1_C}^-(u_2, v_2) > \sigma_{1_A}^-(u) \vee \sigma_{1_C}^-(u_2) \vee \sigma_{1_C}^-(v_2),$$

$$(\mu_{2_A}^- \times \mu_{2_C}^-)((u, u_2)(u, v_2)) = \sigma_{2_A}^-(u) \wedge \mu_{2_C}^-(u_2, v_2) < \sigma_{2_A}^-(u) \wedge \sigma_{2_C}^-(u_2) \wedge \sigma_{2_C}^-(v_2),$$

$$(\mu_{3_A}^- \times \mu_{3_C}^-)((u, u_2)(u, v_2)) = \sigma_{3_A}^-(u) \wedge \mu_{3_C}^-(u_2, v_2) < \sigma_{3_A}^-(u) \wedge \sigma_{3_C}^-(u_2) \wedge \sigma_{3_C}^-(v_2).$$

Thus, each product edge violates the strongness conditions:

$$(\mu_{1_A}^+ \times \mu_{1_C}^+)((u, u_2), (u, v_2)) < (\sigma_{1_A}^+ \times \sigma_{1_C}^+)(u, u_2) \wedge (\sigma_{1_A}^+ \times \sigma_{1_C}^+)(u, v_2),$$

$$(\mu_{2_A}^+ \times \mu_{2_C}^+)((u, u_2), (u, v_2)) > (\sigma_{2_A}^+ \times \sigma_{2_C}^+)(u, u_2) \vee (\sigma_{2_A}^+ \times \sigma_{2_C}^+)(u, v_2),$$

$$(\mu_{3_A}^+ \times \mu_{3_C}^+)((u, u_2), (u, v_2)) > (\sigma_{3_A}^+ \times \sigma_{3_C}^+)(u, u_2) \vee (\sigma_{3_A}^+ \times \sigma_{3_C}^+)(u, v_2),$$

$$(\mu_{1_A}^- \times \mu_{1_C}^-)((u, u_2), (u, v_2)) > (\sigma_{1_A}^- \times \sigma_{1_C}^-)(u, u_2) \wedge (\sigma_{1_A}^- \times \sigma_{1_C}^-)(u, v_2),$$

$$(\mu_{2_A}^- \times \mu_{2_C}^-)((u, u_2), (u, v_2)) < (\sigma_{2_A}^- \times \sigma_{2_C}^-)(u, u_2) \vee (\sigma_{2_A}^- \times \sigma_{2_C}^-)(u, v_2),$$

$$(\mu_{3_A}^- \times \mu_{3_C}^-)((u, u_2), (u, v_2)) < (\sigma_{3_A}^- \times \sigma_{3_C}^-)(u, u_2) \vee (\sigma_{3_A}^- \times \sigma_{3_C}^-)(u, v_2).$$

Therefore $G_1 \times G_2$ fails to be strong, which contradicts our assumption. Hence at least one of G_1 or G_2 must be strong.

Remark 3.4.

If G_1 is a strong bipolar single-valued neutrosophic graph and G_2 is not strong, then the Cartesian product $G_1 \times G_2$ need not be a strong bipolar single-valued neutrosophic graph.

Proposition 3.5.

Let $G_1 = (A, B)$ be a strong bipolar single-valued neutrosophic graph and let $G_2 = (C, D)$ be a strong bipolar single-valued neutrosophic graph. Then the Cartesian product $G_1 \times G_2$ is a strong bipolar single-valued neutrosophic graph if and only if for every vertex $u_1 \in V(G_1)$ and every edge $u_2, v_2 \in E(G_2)$ the following twelve inequalities hold:

Positive-component conditions

$$\sigma_{1_A}^+(u_1) \leq \mu_{1_D}^+(u_2, v_2), \quad \sigma_{2_A}^+(u_1) \geq \mu_{2_D}^+(u_2, v_2), \quad \sigma_{3_A}^+(u_1) \geq \mu_{3_D}^+(u_2, v_2)$$

$$\sigma_{1_A}^-(u_1) \geq \mu_{1_D}^-(u_2, v_2), \quad \sigma_{2_A}^-(u_1) \leq \mu_{2_D}^-(u_2, v_2), \quad \sigma_{3_A}^-(u_1) \leq \mu_{3_D}^-(u_2, v_2)$$

Negative-component conditions

$$\sigma_{1_A}^-(u_1) \geq \mu_{1_D}^-(u_2, v_2), \quad \sigma_{2_A}^-(u_1) \leq \mu_{2_D}^-(u_2, v_2), \quad \sigma_{3_A}^-(u_1) \leq \mu_{3_D}^-(u_2, v_2),$$

$$\sigma_{1_A}^+(u_1) \leq \mu_{1_D}^+(u_2, v_2), \quad \sigma_{2_A}^+(u_1) \geq \mu_{2_D}^+(u_2, v_2), \quad \sigma_{3_A}^+(u_1) \geq \mu_{3_D}^+(u_2, v_2)$$

Lakshmi and Geetha

Proof.

Since G_1 and G_2 are strong, for every edge $(u, v) \in E(G_1)$ we have the equalities

$$\begin{aligned}\mu_{1_B}^+(uv) &= \sigma_{1_A}^+(u) \wedge \sigma_{1_A}^+(v), \\ \mu_{2_B}^+(uv) &= \sigma_{2_A}^+(u) \vee \sigma_{2_A}^+(v), \\ \mu_{3_B}^+(uv) &= \sigma_{3_A}^+(u) \vee \sigma_{3_A}^+(v)\end{aligned}$$

and

$$\begin{aligned}\mu_{1_B}^-(uv) &= \sigma_{1_A}^-(u) \vee \sigma_{1_A}^-(v), \\ \mu_{2_B}^-(uv) &= \sigma_{2_A}^-(u) \wedge \sigma_{2_A}^-(v), \\ \mu_{3_B}^-(uv) &= \sigma_{3_A}^-(u) \wedge \sigma_{3_A}^-(v)\end{aligned}$$

with analogous equalities for edges of G_2 using $\mu_{i,D}$ and $\sigma_{i,C}$.

The Cartesian product has two edge types: $E = \{(u, u_2)(u, v_2) \mid u \in V(G_1), u_2 v_2 \in E(G_2)\} \cup \{(u_1, v)(u_2, v) \mid u_1 u_2 \in E(G_1), v \in V(G_2)\}$.

Assume $G_1 \times G_2$ is strong.

For edges of the second type $((u_1, v), (u_2, v))$ with $u_1 u_2 \in E(G_1)$ and $v \in V(G_2)$: because G_1 is strong, the product gives,

$$\mu_1^+((u_1, v), (u_2, v)) = \mu_{1_B}^+(u_1 u_2) \wedge \sigma_{1_C}^+(v) = (\sigma_{1_A}^+(u_1) \wedge \sigma_{1_A}^+(u_2)) \wedge \sigma_{1_C}^+(v)$$

On the other hand, the strongness of $G_1 \times G_2$ requires equality to

$$\sigma_1^+((u_1, v)) \wedge \sigma_1^+((u_2, v)) = (\sigma_{1_A}^+(u_1) \wedge \sigma_{1_C}^+(v)) \wedge (\sigma_{1_A}^+(u_2) \wedge \sigma_{1_C}^+(v))$$

and the two expressions coincide identically;

Similarly, the other five component equalities hold automatically for this edge type.

Thus, no extra conditions are required for edges coming from $E(G_1)$ since G_1 is strong.

For edges of the first type $((u, u_2), (u, v_2))$ with $u \in V(G_1)$ and $u_2 v_2 \in E(G_2)$: product definition gives

$$\begin{aligned}\mu_1^+((u, u_2), (u, v_2)) &= \sigma_{1_A}^+(u) \wedge \mu_{1_D}^+(u_2 v_2), \\ \mu_2^+((u, u_2), (u, v_2)) &= \sigma_{2_A}^+(u) \vee \mu_{2_D}^+(u_2 v_2), \\ \mu_3^+((u, u_2), (u, v_2)) &= \sigma_{3_A}^+(u) \vee \mu_{3_D}^+(u_2 v_2),\end{aligned}$$

and for negatives

$$\begin{aligned}\mu_1^-((u, u_2), (u, v_2)) &= \sigma_{1_A}^-(u) \vee \mu_{1_D}^-(u_2 v_2), \\ \mu_2^-((u, u_2), (u, v_2)) &= \sigma_{2_A}^-(u) \wedge \mu_{2_D}^-(u_2 v_2), \\ \mu_3^-((u, u_2), (u, v_2)) &= \sigma_{3_A}^-(u) \wedge \mu_{3_D}^-(u_2 v_2).\end{aligned}$$

Strongness of $G_1 \times G_2$ requires that each of these equals the corresponding vertex-boundary expression from product-vertices:

$$\begin{aligned}\sigma_1^+((u, u_2)) \wedge \sigma_1^+((u, v_2)) &= (\sigma_{1_A}^+(u) \wedge \sigma_{1_C}^+(u_2)) \wedge (\sigma_{1_A}^+(u) \wedge \sigma_{1_C}^+(v_2)) \\ &= \sigma_{1_A}^+(u) \wedge \sigma_{1_C}^+(u_2) \wedge \sigma_{1_C}^+(v_2),\end{aligned}$$

and similarly,

$$\begin{aligned}\sigma_2^+((u, u_2)) \vee \sigma_2^+((u, v_2)) &= \sigma_{2_A}^+(u) \vee \sigma_{2_C}^+(u_2) \vee \sigma_{2_C}^+(v_2), \\ \sigma_3^+((u, u_2)) \vee \sigma_3^+((u, v_2)) &= \sigma_{3_A}^+(u) \vee \sigma_{3_C}^+(u_2) \vee \sigma_{3_C}^+(v_2), \\ \sigma_1^-((u, u_2)) \vee \sigma_1^-((u, v_2)) &= \sigma_{1_A}^-(u) \vee \sigma_{1_C}^-(u_2) \vee \sigma_{1_C}^-(v_2), \\ \sigma_2^-((u, u_2)) \wedge \sigma_2^-((u, v_2)) &= \sigma_{2_A}^-(u) \wedge \sigma_{2_C}^-(u_2) \wedge \sigma_{2_C}^-(v_2), \\ \sigma_3^-((u, u_2)) \wedge \sigma_3^-((u, v_2)) &= \sigma_{3_A}^-(u) \wedge \sigma_{3_C}^-(u_2) \wedge \sigma_{3_C}^-(v_2).\end{aligned}$$

Equating the product μ expressions above with these vertex-boundary expressions yields the twelve inequalities listed in the proposition. Hence those inequalities are necessary.

Conversely, suppose the twelve inequalities in the statement hold for every $u \in V(G_1)$ and every $u_2v_2 \in E(G_2)$. We must show every edge of $G_1 \times G_2$ satisfies all the equalities.

For edges of the form $((u_1, v), (u_2, v))$ (coming from $E(G_1)$): as in the necessity part, these edges automatically satisfy the strong equalities because G_1 is strong and the product formulas produce exactly the vertex-boundary expressions. For edges of the form $((u, u_2), (u, v_2))$ (coming from $E(G_2)$): using the assumed inequalities we verify equality componentwise. For example, for the first positive component: by assumption both $\sigma_{1_A}^+(u) \leq \mu_{1_D}^+(u_2v_2)$ and $\sigma_{1_A}^+(u) \geq \mu_{1_D}^+(u_2v_2)$ hold, which together force $\sigma_{1_A}^+(u) = \mu_{1_D}^+(u_2v_2)$.

Hence

$$\mu_1^+((u, u_2), (u, v_2)) = \sigma_{1_A}^+(u) \wedge \mu_{1_D}^+(u_2v_2) = \sigma_{1_A}^+(u) \wedge \sigma_{1_C}^+(u_2) \wedge \sigma_{1_C}^+(v_2),$$

giving the required equality with the product-vertex boundary. The other components follow similarly from the paired inequalities.

For example, the pair $\sigma_{2_A}^+(u) \geq \mu_{2_D}^+(u_2v_2)$ and $\sigma_{2_A}^+(u) \leq \mu_{2_D}^+(u_2v_2)$ together imply $\sigma_{2_A}^+(u) = \mu_{2_D}^+(u_2v_2)$, and hence $\mu_2^+((u, u_2), (u, v_2)) = \sigma_{2_A}^+(u) \vee \mu_{2_D}^+(u_2v_2) = \sigma_{2_A}^+(u) \vee \sigma_{2_C}^+(u_2) \vee \sigma_{2_C}^+(v_2)$. The negative components are handled by using the appropriate min/max orderings.

Therefore, every edge of $G_1 \times G_2$ satisfies all the equalities, so $G_1 \times G_2$ is a strong bipolar single-valued neutrosophic graph.

CONCLUSION

In this paper, we investigated the Cartesian product within the context of strong BSVNGs. We established necessary and sufficient conditions under which these operations preserve the strong property. Our results show that the strongness of the resulting graph cannot be guaranteed unless at least one of the component graphs is strong. Furthermore, we provided a detailed characterization demonstrating that strongness is preserved only when the edge membership values in the product adhere strictly to the min-max relationships dictated by vertex memberships. The examples presented illustrate both the preservation and the violation of strongness, highlighting the structural sensitivity of these operations. These findings extend existing studies on strong neutrosophic graphs and provide a clearer understanding of how complex neutrosophic networks can be constructed from simpler components. Future research may consider extending these results to other graph operations such as composition, join, union, and direct product, as well as exploring algorithmic applications and real-world modeling scenarios where bipolar neutrosophic structures naturally arise. The framework developed in this work contributes to the growing body of neutrosophic graph theory and enhances its applicability in decision-making, social network analysis, and systems involving ambiguity and conflicting information.

ABSTRACT

The concept of majority domination plays a significant role in everyday life. Fundamental concepts and theoretical results related to majority dominating sets have been studied in fuzzy graphs. This research paper extends these ideas by introducing operations such as union, join, composition and cartesian product of Majority Domination in fuzzy graphs.

Keywords: Fuzzy Graph, Minimum Fuzzy Majority Dominating Set, Effective Edges, Non Effective Edges, Isolates

INTRODUCTION

Graph theory is used to model a wide range of problems. In graph theory it is assumed that the vertices, edges, weights etc., are certain. But the real world is full of uncertainties. To address such situations, A. Rosenfeld introduced the "fuzzy graph" in 1975 [2]. Like set theory, the background of fuzzy graph theory is the fuzzy set theory developed by L. A. Zadeh in 1965. The game of chess, a globally renowned strategy board game, inspired the concept of domination in graph theory, which emerged around 1850 [1]. In 1962, Ore introduced the idea of domination in graph theory [3]. In 1977, Cockayne and Hedetniemi, further discussed and expanded the concept of theory of domination in graphs [4]. Harary et al, explored a novel application in voting situations making use of the idea of domination in graphs [4]. In 1998, Somasundaram and Somasundaram proposed the idea of domination in fuzzy graphs making use of effective edges [5]. In 2007, Nagoorgani and Chandrasekaran investigated domination applying strong arcs in fuzzy graphs [6].

The principle of majority often plays a crucial role in various real-life situations. This concept is equally important in political elections, corporate governance, jury decisions and even in classroom settings. These scenarios prompted an exploration of majority domination within graph theory. The idea of the majority domination number of certain families of graphs was presented by Tara S. Holm in 2001 [7]. V. Swaminathan and J. Joseline Manora introduced the concept of majority dominating set in Graphs. They also found the majority domination number and bounds for majority domination numbers [8]. They developed the concept to some extent. This paper presents an extension of a majority dominating sets in fuzzy graphs, introducing operations on majority domination in fuzzy graphs.

Preliminaries

Definition 2.1[1]

A fuzzy graph $\mathcal{G} = (\mathcal{V}, \sigma, \mu)$ is a non-empty set $\mathcal{V}$ together with a pair of functions $\sigma : \mathcal{V} \rightarrow [0,1]$ and $\mu : \mathcal{V} \times \mathcal{V} \rightarrow [0,1]$ such that for all $v_i, v_j \in \mathcal{V}$, $\mu(v_i, v_j) \leq \min \{ \sigma(v_i), \sigma(v_j) \}$ where $\sigma(v_i)$ and $\mu(v_i, v_j)$ represent the membership values of the vertex v_i and edge (v_i, v_j) in $\mathcal{G}$.

Definition 2.2[1]

An edge (v_i, v_j) of a fuzzy graph $\mathcal{G} = (\mathcal{V}, \sigma, \mu)$ is called an effective edge if $\mu(v_i, v_j) = \sigma(v_i) \wedge \sigma(v_j)$. The vertices v_i and v_j are called effective neighbours. The set of all effective neighbours of v_i is called effective neighbourhood of a and is denoted by $EN(v_i)$.

Definition 2.3[1]

Let $\mathcal{G} = (\mathcal{V}, \sigma, \mu)$ be a fuzzy graph. The order p and size q of $\mathcal{G}$ are defined by $p = \sum_{v_i \in \mathcal{V}} \sigma(v_i)$ and $q = \sum_{(v_i, v_j) \in \mathcal{V} \times \mathcal{V}} \mu(v_i, v_j)$

Definition 2.4[4] Let $\mathcal{G} = (\mathcal{V}, \sigma, \mu)$ be a fuzzy graph and $S \subseteq \mathcal{V}$. Then the fuzzy cardinality of S is defined to be $\sum_{v \in S} \sigma(v)$.

Definition 2.5[1]

Let $\mathcal{G}' = (\mathcal{V}', \sigma', \mu')$ and $\mathcal{G}'' = (\mathcal{V}'', \sigma'', \mu'')$ be two fuzzy graphs. The union between them is defined as $\mathcal{G} = \mathcal{G}' \cup \mathcal{G}'' = (\mathcal{V}, \sigma' \cup \sigma'', \mu' \cup \mu'')$, where the sets of vertices and edges are given by $\mathcal{V} = \mathcal{V}' \cup \mathcal{V}''$ and $E = E' \cup E''$ with

$$(\sigma' \cup \sigma'')(u) = \begin{cases} \sigma'(u), & \text{if } u \in \mathcal{V}' - \mathcal{V}'' \\ \sigma''(u), & \text{if } u \in \mathcal{V}'' - \mathcal{V}' \\ \sigma'(u) \vee \sigma''(u), & \text{if } u \in \mathcal{V}' \cap \mathcal{V}'' \end{cases}$$

and

$$(\mu' \cup \mu'')(u, v) = \begin{cases} \mu'(u, v), & \text{if } (u, v) \in E' - E'' \\ \mu''(u, v), & \text{if } (u, v) \in E'' - E' \\ \mu'(u, v) \vee \mu''(u, v), & \text{if } (u, v) \in E' \cap E'' \end{cases}$$

Definition 2.6[1]

Let $\mathcal{G}' = (\mathcal{V}', \sigma', \mu')$ and $\mathcal{G}'' = (\mathcal{V}'', \sigma'', \mu'')$ be two fuzzy graphs. The join between them is defined as $\mathcal{G} = \mathcal{G}' + \mathcal{G}'' = (\mathcal{V}, \sigma' + \sigma'', \mu' + \mu'')$, where the set of vertices and edges are given by $\mathcal{V} = \mathcal{V}' \cup \mathcal{V}''$ and $E = E' \cup E'' \cup E^*$, where E^* is the set of all edges joining vertices of $\mathcal{V}'$ with vertices of $\mathcal{V}''$ such that

$$(\sigma' + \sigma'')(u) = (\sigma' \cup \sigma'')(u)$$

and

$$(\mu' + \mu'')(u, v) = \begin{cases} (\mu' \cup \mu'')(u, v), & \text{if } (u, v) \in E' \cup E'' \\ \sigma'(u) \wedge \sigma''(v), & \text{if } (u, v) \in E^* \end{cases}$$

Definition 2.7[9]

Let σ_i be a fuzzy subset of $\mathcal{V}_i$ and let μ_i be a fuzzy subset of $X_i, i = 1, 2$. Define the fuzzy subsets $\sigma_1 \times \sigma_2$ of $\mathcal{V}$ and $\mu_1 \times \mu_2$ of X as follows:

$$(\sigma_1 \times \sigma_2)(u_1, u_2) = \min\{\sigma_1(u_1), \sigma_2(u_2)\} \quad \forall (u_1, u_2) \in \mathcal{V}$$

$$(\mu_1 \times \mu_2)((u, u_2), (u, v_2)) = \min\{\mu_1(u), \mu_2(u_2, v_2)\} \quad \forall u \in \mathcal{V}_1 \text{ and } \forall (u_2, v_2) \in X_2$$

$$(\mu_1 \times \mu_2)((u_1, w), (v_1, w)) = \min\{\mu_2(w), \mu_1(u_1, v_1)\} \quad \forall w \in \mathcal{V}_2 \text{ and } \forall (u_1, v_1) \in X_1$$

Then the fuzzy graph $\mathcal{G} = (\sigma_1 \times \sigma_2, \mu_1 \times \mu_2)$ is said to be the cartesian product of $\mathcal{G}_1 = (\sigma_1, \mu_1)$ and $\mathcal{G}_2 = (\sigma_2, \mu_2)$.

Definition 2.8[9]

Let $\mathcal{G}_1[\mathcal{G}_2]$ denote the composition of graph $\mathcal{G}_1 = (\mathcal{V}_1, X_1)$ with graph $\mathcal{G}_2 = (\mathcal{V}_2, X_2)$. Now $\mathcal{G}_1[\mathcal{G}_2] = (\mathcal{V}_1 \times \mathcal{V}_2)$, where $X^0 = X \cup \{(u_1, u_2), (v_1, v_2) \mid (u_1, v_1) \in X_1, u_2 \neq v_2\}$ and where X is defined as in the case for $\mathcal{G}_1 \times \mathcal{G}_2$. Let σ_i be a fuzzy

subset of $\mathcal{V}_i$ and let μ_i be a fuzzy subset X^0 of $X_i, i = 1, 2$. Define the fuzzy subsets $\sigma_1 \circ \sigma_2$ and $\mu_1 \circ \mu_2$ of $\mathcal{V}_1 \times \mathcal{V}_2$ and X^0 , respectively, as follows:

$$(\sigma_1 \circ \sigma_2)(u_1, u_2) = \min\{\sigma_1(u_1), \sigma_2(u_2)\} \quad \forall (u_1, u_2) \in \mathcal{V}_1 \times \mathcal{V}_2$$

$$(\mu_1 \circ \mu_2)((u, u_2), (u, v_2)) = \min\{\sigma_1(u), \mu_2(u_2, v_2)\} \quad \forall u \in \mathcal{V}_1 \text{ and } \forall (u_2, v_2) \in X_2$$

$$(\mu_1 \circ \mu_2)((u_1, w), (v_1, w)) = \min\{\sigma_2(w), \mu_1(u_1, v_1)\} \quad \forall w \in \mathcal{V}_2 \text{ and } \forall (u_1, v_1) \in X_1$$

$$(\mu_1 \circ \mu_2)((u_1, u_2), (v_1, v_2)) = \min\{\sigma_2(u_2), \sigma_2(v_2), \mu_1(u_1, v_1)\} \quad \forall (u_1, u_2), (v_1, v_2) \in X^0 - X$$

Then the fuzzy graph $\mathcal{G} = (\sigma_1 \circ \sigma_2, \mu_1 \circ \mu_2)$ is the composition of $\mathcal{G}_1 = (\sigma_1, \mu_1)$ and $\mathcal{G}_2 = (\sigma_2, \mu_2)$.

Definition 2.9[10]

Let $\mathcal{G} = (\mathcal{V}, \sigma, \mu)$ be a fuzzy graph with order p and size q . A subset $S \subseteq \mathcal{V}(\mathcal{G})$ of vertices in a fuzzy graph $\mathcal{G}$ is called a fuzzy majority dominating set if at least half of the order of vertices of $\mathcal{V}(\mathcal{G})$ are either in the cardinality of vertices of S or the cardinality of vertices of $N[S]$.

$$(i.e) |N[S]| = \sum_{v_i \in N[S]} \sigma(v_i) \geq \frac{p}{2}$$

Definition 2.10[10]

A fuzzy majority dominating (FMD) set S of $\mathcal{G}$ is minimal if no proper subset of S is fuzzy majority dominating set.

Definition 2.11[10]

The minimum fuzzy cardinality of a minimal fuzzy majority dominating set is called a fuzzy majority domination number. It is denoted by $\gamma_M(\mathcal{G})$ (Lower fuzzy majority domination number). The maximum fuzzy cardinality of a minimal fuzzy majority dominating set is called the upper fuzzy majority domination number. It is denoted by $\Gamma_M(\mathcal{G})$.

Join of FMD Number in Fuzzy Graphs

Theorem 3.1. For any two fuzzy graphs $\mathcal{G}_1$ and $\mathcal{G}_2$, $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) < \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$.

Proof. Let $\mathcal{G}_1$ and $\mathcal{G}_2$ be any two fuzzy graphs. Since every vertex in $\mathcal{G}_1$ is connected to all vertices of $\mathcal{G}_2$ through effective edges, any FMD set of $\mathcal{G}_1$ is also a FMD set of $(\mathcal{G}_1 + \mathcal{G}_2)$. Therefore $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) \leq \gamma_M(\mathcal{G}_1) < \gamma_M(\mathcal{G}_1) + 0.1$, since $\gamma_M(\mathcal{G}_2) \geq 0.1$. This implies that $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) < \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$. Hence $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) < \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$.

Proposition 3.2. If $\mathcal{G}_1$ and $\mathcal{G}_2$ are two fuzzy graphs of order p_1 and p_2 with $p_1 \geq p_2$ and $\mathcal{G} = \mathcal{G}_1 + \mathcal{G}_2$ then $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) = \min_{u_j \in \mathcal{V}_2} \sigma(u_j)$.

Proof. Let $(\mathcal{G}_1 + \mathcal{G}_2)$ be the join fuzzy graph of $\mathcal{G}_1$ and $\mathcal{G}_2$. Then $\mathcal{V} = \mathcal{V}_1 \cup \mathcal{V}_2$ and let $\mathcal{V}_1 = \{v_1, v_2, \dots, v_i\}$ and $\mathcal{V}_2 = \{u_1, u_2, \dots, u_j\}$ with $O(\mathcal{G}_1) = \sum_{v_i \in \mathcal{V}_1} \sigma(v_i) = p_1$ and $O(\mathcal{G}_2) = \sum_{u_j \in \mathcal{V}_2} \sigma(u_j) = p_2$. Let $p = p_1 + p_2 \dots \dots \dots (1)$ Since $p_1 \geq p_2 \Rightarrow p_1 = p_2 + r$, for some $r \geq 0$. Therefore $p_2 = p_1 - r \Rightarrow \frac{p}{2} + \frac{r}{2} = p_1$. Thus $p_1 \geq \frac{p}{2} \dots \dots \dots (2)$. By definition of $(\mathcal{G}_1 + \mathcal{G}_2)$ all vertices $u_j \in \mathcal{V}_2$ are connected with all vertices $v_i \in \mathcal{V}_1$ using effective edges in $(\mathcal{G}_1 + \mathcal{G}_2)$. Since $p_1 \geq p_2$, for any $u_j \in \mathcal{V}_2$, $\deg_{EN}(u_j) = \sum_{v_i \in \mathcal{V}_1} \sigma(v_i) = p_1$ By (2), $\deg_{EN}(u_j) \geq \frac{p}{2}$. Since $u_j \in \mathcal{V}_2$, choose minimum $\sigma(u_j)$ from the vertex set $\mathcal{V}_2$, to form a minimum FMD set for $(\mathcal{G}_1 + \mathcal{G}_2)$. Therefore $S = \min_{u_j \in \mathcal{V}_2} \{\sigma(u_1), \dots, \sigma(u_k)\} = \sigma(u_j)$, for $u_j \in \mathcal{V}_2$.

Corollary 3.3 If $\mathcal{G}_1$ and $\mathcal{G}_2$ are two fuzzy graphs of order p_1 and p_2 with $p_1 \leq p_2$ and $\mathcal{G} = \mathcal{G}_1 + \mathcal{G}_2$ then $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) = \min_{v_i \in \mathcal{V}_1} \sigma(v_i)$.

Corollary 3.4 If $\mathcal{G}_1$ and $\mathcal{G}_2$ are two fuzzy graphs of order p_1 and p_2 with $p_1 = p_2$ and $\mathcal{G} = \mathcal{G}_1 + \mathcal{G}_2$ then $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) = \min_{v_i \in \mathcal{V}} \sigma(v_i)$, where $\mathcal{V} = \mathcal{V}_1 \cup \mathcal{V}_2$

Definition 3.5. A vertex v is called an effective vertex of $\mathcal{G}$ if all the incident edges of v are effective in FG $\mathcal{G}$.

Definition 3.6. A vertex v is called a majority effective vertex of $\mathcal{G}$ if $\deg_{EN}(v) \geq \frac{p}{2}$ where $p = O(\mathcal{G})$.

Proposition 3.7. For any two fuzzy graphs $\mathcal{G}_1$ and $\mathcal{G}_2$, $\gamma_M(\mathcal{G}_1 + \mathcal{G}_2) \leq \min\{\gamma_M(\mathcal{G}_1), \gamma_M(\mathcal{G}_2)\}$.

Proof. Let S_1 be a minimum FMD set of $\mathcal{G}_1$ and S_2 be a minimum FMD set of $\mathcal{G}_2$. Since every vertex in $\mathcal{G}_1$ is adjacent to every vertex of $\mathcal{G}_2$ in $(\mathcal{G}_1 + \mathcal{G}_2)$, any FMD set of $\mathcal{G}_1$ is also a FMD set of $(\mathcal{G}_1 + \mathcal{G}_2)$ and any FMD set of $\mathcal{G}_2$ is also a

Jeyaraj et al.,

FMD set of $(G_1 + G_2)$. Thus $\gamma_M(G_1 + G_2) \leq \gamma_M(G_1)$ and $\gamma_M(G_1 + G_2) \leq \gamma_M(G_2)$. Hence $\gamma_M(G_1 + G_2) \leq \min \{\gamma_M(G_1), \gamma_M(G_2)\}$.

Union of FMD Number in Fuzzy Graphs

Proposition 4.1. Let $G_1 = (V_1, \sigma_1, \mu_1)$ and $G_2 = (V_2, \sigma_2, \mu_2)$ be any two fuzzy graphs. Then $\gamma_M(G_1 \cup G_2) \leq \gamma_M(G_1) + \gamma_M(G_2)$.

Proof. Let $G = (G_1 \cup G_2)$ and $V = (V_1 \cup V_2)$ where $O(G_1) = \sum_{v_i \in V_1} \sigma(v_i) = p_1$ and $O(G_2) = \sum_{u_j \in V_2} \sigma(u_j) = p_2$. Let S_1 and S_2 be the minimum FMD sets of G_1 and G_2 . Then $\gamma_M(G_1) = |S_1|$ and $\gamma_M(G_2) = |S_2|$.

Case 1. If there is no common edge between G_1 and G_2 then the minimum FMD set of $G_1 \cup G_2$ is $S = S_1 \cup S_2 \Rightarrow |S| = |S_1| + |S_2|$. Therefore $\gamma_M(G_1 \cup G_2) = \gamma_M(G_1) + \gamma_M(G_2)$.

Case 2. Suppose there exists at least one common edge between G_1 and G_2 . Let $e = (x_1, y_1) \in G_1$ and $e = (x_2, y_2) \in G_2$. By the definition of $G_1 \cup G_2$, the common edge becomes the edge $e = (x, y) \in G_1 \cup G_2$ such that $\sigma(x) = \sigma(x_1) \vee \sigma(x_2)$, $\sigma(y) = \sigma(y_1) \vee \sigma(y_2)$ and $\mu(x, y) = \mu(x_1, y_1) \vee \mu(x_2, y_2)$.

The following are the three possibilities for a common edge in $G = G_1 \cup G_2$. Let $e_1 \in E(G_1)$, $e_2 \in E(G_2)$ and $e \in E(G)$.

- If e_1 and e_2 both are effective edges then e becomes an effective edge in G .
- If e_1 and e_2 both are non-effective edges then e becomes non-effective edge in G .
- If e_1 is effective and e_2 is non-effective edges then may be an effective edge in G and vice versa.

For the case (a), choose the set S_1 , such that $|S_1| = (\sigma(x_1) \wedge \sigma(y_1)) + \sum_{v_i \in V_1} \sigma(v_i) \dots \dots \dots (1)$ and $|N[S_1]| \geq \frac{p_1}{2}$, where $\sum_{v_i \in V_1} \sigma(v_i) = \frac{p_1}{2} - (\sigma(x_1) + \sigma(y_1))$. Then $\gamma_M(G_1) = |S_1|$. Similarly, Choose the set S_2 , such that $|S_2| = (\sigma(x_2) \wedge \sigma(y_2)) + \sum_{u_j \in V_2} \sigma(u_j) \dots \dots \dots (2)$ and $|N[S_2]| \geq \frac{p_2}{2}$, where $\sum_{u_j \in V_2} \sigma(u_j) = \frac{p_2}{2} - (\sigma(x_2) + \sigma(y_2))$. Then $\gamma_M(G_2) = |S_2|$.

Let $x \in V$ be the vertex with $\sigma(x)$ is minimum. If $t \deg_{EN}(x) \geq \frac{p}{2}$, then $|S| = \sigma(x)$. If not, consider $\sum_{v_j \in V} \sigma(v_j) = \frac{p}{2} - t \deg_{EN}(x)$. Now the set $S = \{x, v_{j_1}, v_{j_2}, \dots\}$ where $v_{j_1}, v_{j_2}, \dots \in V$ and $|N[S]| = t \deg_{EN}(x) + \sum_{v_j \in V} \sigma(v_j) \geq \frac{p}{2}$. Then S is a FMD set of G . Then $\gamma_M(G) = |S| = \sigma(x) + \sum_{v_j \in V} \sigma(v_j) \dots \dots \dots (3)$. Also by (1) and (2), $\gamma_M(G_1) + \gamma_M(G_2) = (\sigma(x_1) \wedge \sigma(y_1)) + \sum_{v_i \in V_1} \sigma(v_i) + (\sigma(x_2) \wedge \sigma(y_2)) + \sum_{u_j \in V_2} \sigma(u_j) \dots \dots \dots (4)$. Let $x \in V$, then $\sigma(x) \leq (\sigma(x_1) \wedge \sigma(y_1)) + (\sigma(x_2) \wedge \sigma(y_2))$. By (1), (2) & (3), $|S| \leq |S_1| + |S_2|$. Therefore $\gamma_M(G_1 \cup G_2) \leq \gamma_M(G_1) + \gamma_M(G_2)$. In all three cases we get the result. ■

The following theorem compares the fuzzy majority dominating numbers of the join and union of fuzzy graphs.

Theorem 4.2. Let $G_1 = (V_1, \sigma_1, \mu_1)$ and $G_2 = (V_2, \sigma_2, \mu_2)$, be two fuzzy graphs having no common and isolated vertices. Then $\gamma_M(G_1 \cup G_2) > \gamma_M(G_1 + G_2)$.

Proof. Let G_1 and G_2 be two fuzzy graphs with all effective edges. By Proposition (3.7),

$$\gamma_M(G_1 + G_2) \leq \gamma_M(G_1) \wedge \gamma_M(G_2) \dots \dots \dots (1).$$

Since G_1 and G_2 have no common vertices, $\gamma_M(G_1 \cup G_2) = \gamma_M(G_1) + \gamma_M(G_2) \dots \dots \dots (2)$.

From (1) and (2), $\gamma_M(G_1 \cup G_2) = \gamma_M(G_1) + \gamma_M(G_2) > [\gamma_M(G_1) \wedge \gamma_M(G_2)] \geq \gamma_M(G_1 + G_2)$. Thus $\gamma_M(G_1 \cup G_2) > \gamma_M(G_1 + G_2)$.

Cartesian Product of FMD Number in Fuzzy Graphs

Theorem 5.1. Let $G_1 = (V_1, \sigma_1, \mu_1)$ and $G_2 = (V_2, \sigma_2, \mu_2)$, be any two fuzzy graphs without isolated vertices. Then $\gamma_M(G_1 \times G_2) \leq \gamma_M(G_1) + \gamma_M(G_2)$.

Proof. Let $G = (G_1 \times G_2)$, $V = V_1 \times V_2$, $O(G_1) = p_1$ and $O(G_2) = p_2$. Suppose S_1 and S_2 are the minimum FMD sets of G_1 and G_2 , then $\gamma_M(G_1) = |S_1|$ and $\gamma_M(G_2) = |S_2|$. Since G_1 and G_2 contains all effective edges, $G = (G_1 \times G_2)$ is also contains all effective edges.

Choose the set S_1 with $|S_1| = \min_{v_i \in V_1} \sigma(v_i)$ such that $|N[S_1]| \geq \frac{p_1}{2}$. It implies

Jeyaraj et al.,

that $\gamma_M(\mathcal{G}_1) = |S_1| = \min_{v_i \in \mathcal{V}_1} \sigma(v_i) \dots \dots \dots (1a)$. If not, take $S_1 = \{\{v_1, v_2, \dots, v_i\} \in \mathcal{V}_1 \mid \sum_{v_i \in \mathcal{V}_1} t \deg_{EN}(v_i) \geq \frac{p}{2}\}$. Hence $\gamma_M(\mathcal{G}_1) = |S_1| = \sum_{v_i \in \mathcal{V}_1} \sigma(v_i) \dots \dots \dots (1b)$. Similarly, $\gamma_M(\mathcal{G}_2) = |S_2| = \min_{v_j \in \mathcal{V}_2} \sigma(v_j) \dots \dots \dots (2a)$ or $\gamma_M(\mathcal{G}_2) = |S_2| = \sum_{v_j \in \mathcal{V}_2} \sigma(v_j) \dots \dots \dots (2b)$.

In $\mathcal{G} = (\mathcal{G}_1 \times \mathcal{G}_2)$, let $(v_i, v_j) \in \mathcal{V}$ such that $\sigma(v_i, v_j)$ be minimum. If $t \deg_{EN}(v_i, v_j) = \sigma(v_i, v_j) + \sigma(N(v_i, v_j)) \geq \frac{p}{2}$, then $S = \{(v_i, v_j)\}$ and $|N[S]| = \sigma(v_i, v_j) + \deg_{EN}(v_i, v_j) \geq \frac{p}{2}$. It implies that S is a minimum FMD set and $\gamma_M(\mathcal{G}) = |S| = \min_{(v_i, v_j) \in \mathcal{V}} \sigma(v_i, v_j)$. If not, apply the same procedure as above, we get $\gamma_M(\mathcal{G}) = |S| = \sum_{(v_i, v_j) \in \mathcal{V}} \sigma(v_i, v_j) \dots \dots \dots (3)$.

Case 1. From (1a) and (2a), $\min_{(v_i, v_j) \in \mathcal{V}} \sigma(v_i, v_j) \leq \min_{v_i \in \mathcal{V}_1} \sigma(v_i) + \min_{v_j \in \mathcal{V}_2} \sigma(v_j)$. This implies that $|S| \leq |S_1| + |S_2| \Rightarrow \gamma_M(\mathcal{G}) \leq \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$. Hence $\gamma_M(\mathcal{G}_1 \times \mathcal{G}_2) \leq \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$.

Case 2. Since for all $(v_i, v_j) \in \mathcal{V}$, $\sigma(v_i, v_j) \leq \sigma(v_i) + \sigma(v_j)$. From (1b) and (2b), $\sum_{(v_i, v_j) \in \mathcal{V}} \sigma(v_i, v_j) \leq \sum_{v_i \in \mathcal{V}_1} \sigma(v_i) + \sum_{v_j \in \mathcal{V}_2} \sigma(v_j)$. Then $|S| \leq |S_1| + |S_2|$. It implies that $\gamma_M(\mathcal{G}) \leq \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$. Hence $\gamma_M(\mathcal{G}_1 \times \mathcal{G}_2) \leq \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$.

Theorem 5.2. Let $\mathcal{G}_1 = (\mathcal{V}_1, \sigma_1, \mu_1)$ and $\mathcal{G}_2 = (\mathcal{V}_2, \sigma_2, \mu_2)$, be two fuzzy graphs with atleast one fuzzy isolate. Then $\gamma_M(\mathcal{G}_1 \times \mathcal{G}_2) \leq \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$.

Proof. If $\mathcal{G}_1$ and $\mathcal{G}_2$ contains some effective and non-effective edges or all fuzzy isolates, then $\mathcal{G} = (\mathcal{G}_1 \times \mathcal{G}_2)$ contains some effective and non-effective edges. Let $\mathcal{V}_1 = \{v_1, v_2, \dots, v_i, s_1, s_2, \dots, s_m\}$ where $(v_1, v_2, \dots, v_i) \in \mathcal{V}_1$ denote the vertices incident on effective edges and $(s_1, s_2, \dots, s_m) \in \mathcal{V}_1$ denote the fuzzy isolates.

Choose the set $S_1 = \{v_1, v_2, \dots, v_{t_1}, s_1, s_2, \dots, s_{t_2}\}$ where $t_1 < i, t_2 < m$. Take $\sum_{s_{t_2} \in \mathcal{V}_1} \sigma(s_{t_2}) = \frac{p_1}{2} - \sum_{v_{t_1} \in \mathcal{V}_1} \sigma(N[v_{t_1}]) \geq 0$, such that $|N[S_1]| \geq \frac{p_1}{2}$. It implies that $\gamma_M(\mathcal{G}_1) = |S_1| = \sum_{v_{t_1} \in \mathcal{V}_1} \sigma(v_{t_1}) + \sum_{s_{t_2} \in \mathcal{V}_1} \sigma(s_{t_2}) \dots \dots \dots (1)$ Let $\mathcal{V}_2 = \{u_1, u_2, \dots, u_j, r_1, r_2, \dots, r_n\}$ Similarly, let $S_2 = \{u_1, u_2, \dots, u_{q_1}, r_1, r_2, \dots, r_{q_2}\}$ where $q_1 < j, q_2 < n$. Therefore $\gamma_M(\mathcal{G}_2) = |S_2| = \sum_{u_{q_1} \in \mathcal{V}_2} \sigma(u_{q_1}) + \sum_{r_{q_2} \in \mathcal{V}_2} \sigma(r_{q_2}) \dots \dots \dots (2)$.

In $\mathcal{G} = (\mathcal{G}_1 \times \mathcal{G}_2)$, let $(v_i, v_j) \in \mathcal{V}$ such that $\sigma(v_i, v_j)$ be minimum. If $t \deg_{EN}(v_i, v_j) \geq \frac{p}{2}$, then by previous theorem (4.8), $\gamma_M(\mathcal{G}_1 \times \mathcal{G}_2) \leq \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$.

If not, choose $S = \{(v_{t_1}, u_{q_1}), \dots, (s_{t_2}, r_{q_2}), \dots\}$ where (v_{t_1}, u_{q_1}) 's are effective edges and (s_{t_2}, r_{q_2}) 's are fuzzy isolates in $\mathcal{G}$. $\sum_{(s_{t_2}, r_{q_2}) \in \mathcal{V}} \sigma(s_{t_2}, r_{q_2}) = \frac{p}{2} - \sum_{(v_{t_1}, u_{q_1}) \in \mathcal{V}} \sigma(N[v_{t_1}, u_{q_1}])$

such that $|N[S]| \geq \frac{p}{2}$. Then $|S| = \sum_{(v_{t_1}, u_{q_1}) \in \mathcal{V}} \sigma(v_{t_1}, u_{q_1}) + \sum_{(s_{t_2}, r_{q_2}) \in \mathcal{V}} \sigma(s_{t_2}, r_{q_2}) = \gamma_M(\mathcal{G})$. For every (v_i, u_j) or (s_m, r_n) , $\sigma(v_i, u_j) \leq \sigma(v_i) + \sigma(u_j)$ and $\sigma(s_m, r_n) \leq \sigma(s_m) + \sigma(r_n)$. Therefore $|S| \leq \sum_{v_{t_1} \in \mathcal{V}_1} \sigma(v_{t_1}) + \sum_{s_{t_2} \in \mathcal{V}_1} \sigma(s_{t_2}) + \sum_{u_{q_1} \in \mathcal{V}_2} \sigma(u_{q_1}) + \sum_{r_{q_2} \in \mathcal{V}_2} \sigma(r_{q_2}) \leq |S_1| + |S_2|$ [By (1) & (2)]. Hence $\gamma_M(\mathcal{G}_1 \times \mathcal{G}_2) \leq \gamma_M(\mathcal{G}_1) + \gamma_M(\mathcal{G}_2)$.

Composition of FMD Number in Fuzzy Graphs

The following theorem compares the fuzzy majority dominating numbers of the cartesian product and composition of fuzzy graphs.

Theorem 6.1. Let $\mathcal{G}_1 = (\mathcal{V}_1, \sigma_1, \mu_1)$ and $\mathcal{G}_2 = (\mathcal{V}_2, \sigma_2, \mu_2)$, be two fuzzy graphs without isolated vertices. Then $\gamma_M(\mathcal{G}_1 \times \mathcal{G}_2) > \gamma_M(\mathcal{G}_1[\mathcal{G}_2])$.

Proof. Let $\mathcal{G}_1$ and $\mathcal{G}_2$ be two fuzzy graphs with all effective edges. Then the resultant fuzzy graphs $(\mathcal{G}_1 \times \mathcal{G}_2)$ and $(\mathcal{G}_1[\mathcal{G}_2])$ also contain only effective edges. The vertex set $\mathcal{V} = \mathcal{V}_1 \times \mathcal{V}_2$ is common for both fuzzy graphs. Therefore $O(\mathcal{G}_1 \times \mathcal{G}_2) = O(\mathcal{G}_1[\mathcal{G}_2]) = p$. By the definition, we get $(\mathcal{G}_1[\mathcal{G}_2])$ has more edges than $(\mathcal{G}_1 \times \mathcal{G}_2)$.

For each vertex $(v_i, v_j) \in (\mathcal{G}_1 \times \mathcal{G}_2)$ and $(v_i, v_j) \in (\mathcal{G}_1[\mathcal{G}_2])$, we have $(t \deg_{EN}((v_i, v_j))_{(\mathcal{G}_1[\mathcal{G}_2])} > (t \deg_{EN}(v_i, v_j))_{(\mathcal{G}_1 \times \mathcal{G}_2)}$. Then $|S|_{(\mathcal{G}_1[\mathcal{G}_2])} < |S|_{(\mathcal{G}_1 \times \mathcal{G}_2)}$. Since every vertex of the fuzzy graph $(\mathcal{G}_1[\mathcal{G}_2])$ has more neighbours than the vertices of $(\mathcal{G}_1 \times \mathcal{G}_2)$, fewer vertices of $(\mathcal{G}_1[\mathcal{G}_2])$ are enough to form a FMD set S for $(\mathcal{G}_1[\mathcal{G}_2])$ than for $(\mathcal{G}_1 \times \mathcal{G}_2)$. Therefore $\gamma_M(\mathcal{G}_1 \times \mathcal{G}_2) > \gamma_M(\mathcal{G}_1[\mathcal{G}_2])$.

Jeyaraj et al.,

Theorem 6.2. Let $G_1 = (V_1, \sigma_1, \mu_1)$ and $G_2 = (V_2, \sigma_2, \mu_2)$, be any two fuzzy graphs. Then $\gamma_M(G_1[G_2]) \leq \gamma_M(G_1) + \gamma_M(G_2)$.

Proof. Let $G = G_1[G_2]$, $V = V_1 \times V_2$, $O(G_1) = p_1$ and $O(G_2) = p_2$. Suppose S_1 and S_2 are the minimum FMD sets of G_1 and G_2 , then $\gamma_M(G_1) = |S_1|$ and $\gamma_M(G_2) = |S_2|$. Since $V = V_1 \times V_2$ for both $(G_1 \times G_2)$ and $(G_1[G_2])$, $O(G_1 \times G_2) = O(G_1[G_2])$. By the definition of $(G_1[G_2])$, all vertices $(v_i, v_j) \in V$ has more neighbours than $(G_1 \times G_2)$. By Theorem (5.2) $\gamma_M(G_1[G_2]) < \gamma_M(G_1 \times G_2)$. By Theorem (6.1), $\gamma_M(G_1 \times G_2) \leq \gamma_M(G_1) + \gamma_M(G_2)$. Combining these two results, $\gamma_M(G_1[G_2]) \leq \gamma_M(G_1) + \gamma_M(G_2)$.

CONCLUSION

The concept of domination in graphs is highly developed with significant theoretical advancements and numerous practical applications. Various domination parameters have been extensively studied by researchers. In this paper, we have extended the concept of fuzzy majority domination by introducing some operations. Future works will present research on fuzzy majority domination in various types of fuzzy graphs.

ABSTRACT

Graph matching is a fundamental problem in computer vision and machine learning, with wide-ranging applications in object recognition, bioinformatics, social network analysis, and knowledge graph alignment. Graph matching seeks to determine the optimal node-to-node correspondence between two graphs, making it a fundamentally challenging NP-hard problem. However, existing approaches often face difficulties in achieving an effective balance between scalability, robustness, and accuracy when handling large-scale graphs and complex structural variations. In this paper, we present a scalable and robust end-to-end neural framework for graph matching that effectively learns discriminative node and edge representations while capturing higher-order structural dependencies. The proposed architecture integrates advanced graph neural network-based feature extraction with adaptive message passing and multi-level feature aggregation to enhance matching performance under noisy and heterogeneous conditions. Furthermore, we design a differentiable matching module that enables global correspondence learning in an end-to-end trainable manner. The proposed framework consistently outperforms state-of-the-art methods in terms of matching accuracy, generalization capability, and computational efficiency. The comparative study section demonstrates the effectiveness of the proposed approach in addressing large-scale graph matching tasks while preserving robustness against structural distortions and feature inconsistencies.

Keywords: Graph Matching; Graph Neural Networks; End-to-End Learning; Graph Representation Learning; Node Correspondence; Scalable Algorithms; Robust Matching.

INTRODUCTION

Graph matching is a key problem in visual computing, pattern recognition, and graph analytics, focused on identifying meaningful node correspondences between two or more graphs while preserving their underlying structural relationships. It is widely applied in various domains, including object recognition, image correspondence, social network analysis, bioinformatics, and knowledge graph alignment. Despite its importance, graph matching remains a difficult problem because of its combinatorial complexity, as well as the presence of noise, structural variations, and large-scale graph data. Traditional graph matching approaches, such as combinatorial optimization and spectral methods [1], [2], [3], [4], often rely on handcrafted features and predefined similarity measures. Although these methods perform well in controlled environments, they often face challenges in scalability and fail to generalize effectively to real-world datasets containing complex graph structures. Moreover, exact graph matching is computationally expensive, and many existing algorithms struggle to handle large graphs efficiently.

In recent years, neural network-based approaches, particularly Graph Neural Networks (GNNs) [8], [9], [17], have emerged as powerful tools for learning rich and expressive representations of graph-structured data. By utilizing message passing mechanisms [11], GNNs can capture both local and global structural patterns, making them highly suitable for graph matching tasks. Several learning-based methods have been introduced for end-to-end graph matching; however, many of these approaches still struggle with robustness against noise, scalability to large graphs, and effective modelling of higher-order relationships. To overcome these challenges, this paper presents a scalable and robust end-to-end neural framework for graph matching. The proposed approach integrates advanced graph representation learning with adaptive message passing and multi-level feature aggregation to capture complex structural dependencies. Furthermore, a differentiable matching module [12], [14], [18] is designed to enable global correspondence learning while maintaining end-to-end trainability. The proposed framework is designed to efficiently process large-scale graphs while maintaining robustness in noisy and heterogeneous environments.

The key contributions of this work are summarized as follows:

- We propose a novel end-to-end neural architecture for graph matching that effectively captures both node-level and structural information.
- We develop an adaptive message passing strategy integrated with multi-level feature aggregation to improve graph representation learning.
- We design a differentiable matching module for efficient and accurate node correspondence estimation.
- We validate the scalability and robustness of the proposed framework on benchmark datasets.

The rest of the paper is structured as follows. Section 2 reviews related work in graph matching and learning-based approaches. Section 3 formulates the graph matching problem. Section 4 presents the proposed methodology in detail. Section 5 describes performance evaluation, followed by comparative analysis in Section 6. Finally, Section 7 presents the conclusion and discusses potential directions for future research.

Related Work

Graph matching has been widely explored in the areas of image analysis, machine learning, and graph theory, resulting in numerous approaches that range from traditional optimization methods to modern deep learning-based techniques [5], [6]. This section reviews the major categories of existing work and highlights their limitations.

Classical Graph Matching Methods

Early graph matching approaches primarily rely on combinatorial optimization and exact matching techniques. Algorithms such as A*, Ullmann [7], and VF/VF2 are designed to solve graph isomorphism and subgraph isomorphism problems through exhaustive or tree-search-based strategies. Although these methods can produce exact solutions, their exponential computational complexity makes them unsuitable for large-scale graph applications. To address computational challenges, several approximate graph matching methods have been

**Ashwani Kumar Yadav and Shri Prakash Dwivedi**

developed, including spectral matching [1], relaxation labelling, and quadratic assignment problem (QAP)-based formulations [16]. These approaches aim to find near-optimal solutions by transforming the discrete matching problem into a continuous optimization problem. Despite improved efficiency, they often depend on handcrafted features and predefined affinity functions, limiting their adaptability to complex and noisy real-world data.

Learning-Based Graph Matching

With the advancement of machine learning, data-driven approaches have been introduced to improve graph matching performance. Early learning-based methods focus on learning similarity metrics or affinity matrices using supervised techniques. These methods reduce the dependency on handcrafted features but still rely on separate optimization procedures for matching, which prevents end-to-end learning. Recent advancements have investigated deep learning approaches that simultaneously learn feature representations and graph matching strategies. Convolutional neural networks (CNNs) and recurrent neural networks (RNNs) [19] have been employed to learn feature representations from structured data. However, these models are not specifically designed to represent graph topology, which limits their effectiveness when dealing with graph-structured data.

Graph Neural Network-Based Approaches

Graph Neural Networks (GNNs) [8], [9], [17] have emerged as a powerful framework for learning representations from graph-structured data. By employing iterative message passing mechanisms, GNNs can capture both local neighborhood features and global structural relationships. Several recent works utilize GNNs for graph matching by embedding nodes into a latent space and computing correspondences based on similarity scores. End-to-end neural graph matching models, such as graph matching networks [15] and attention-based architectures [9], [20], have demonstrated promising performance improvements. These approaches combine feature learning and graph matching within a unified framework, frequently employing differentiable techniques such as Sinkhorn normalization [10], [16] to generate soft assignment matrices. Despite these advancements, existing GNN-based approaches still encounter challenges in handling large-scale graphs, modeling higher-order dependencies, and maintaining robustness under noisy or incomplete data conditions.

Limitations of Existing Methods

Despite considerable advancements, several challenges persist in the field of graph matching:

- **Scalability:** Many existing approaches face difficulties when handling large graphs because of their high computational requirements.
- **Robustness:** Their performance often deteriorates in the presence of noise, outliers, and structural inconsistencies.
- **Feature Representation:** Difficulty in capturing higher-order structural relationships effectively.
- **End-to-End Learning:** Some methods lack fully differentiable architectures for joint optimization.

Motivation

The shortcomings of existing methods highlight the need for a scalable and robust end-to-end neural framework capable of efficiently learning expressive graph representations while accurately identifying node correspondences. The proposed approach tackles these challenges by combining advanced graph representation learning, adaptive message passing, and differentiable matching within a unified framework.

Problem Formulation

Graph matching seeks to determine correspondences between the nodes of two graphs in a way that maximizes their structural and feature-level similarities. In this section, we formally describe the graph matching problem and introduce its mathematical formulation.

Graph Representation

Let $G_1 = (V_1, E_1, X_1)$ and $G_2 = (V_2, E_2, X_2)$ denote two attributed graphs, where:

- V_1 and V_2 are the sets of nodes with $|V_1| = n$ and $|V_2| = m$,
- $E_1 \subseteq V_1 \times V_1$ and $E_2 \subseteq V_2 \times V_2$ are the sets of edges,
- $X_1 \in \mathbb{R}^{n \times d}$ and $X_2 \in \mathbb{R}^{m \times d}$ represent node feature matrices.

The structural information of the graphs can be represented using adjacency matrices $A_1 \in \mathbb{R}^{n \times n}$ and $A_2 \in \mathbb{R}^{m \times m}$, where each element indicates the presence or weight of an edge between nodes.

Node Correspondence Matrix

The goal of graph matching is to find a correspondence matrix $P \in \mathbb{R}^{n \times m}$, where each element P_{ij} indicates the similarity or matching probability between node $i \in V_1$ and node $j \in V_2$. In the case of one-to-one matching, P is typically constrained to be a permutation matrix, satisfying: $P1_m = 1_n$, $P^T 1_n = 1_m$, $P_{ij} \in \{0,1\}$ where 1 is a vector of ones. For relaxed formulations, P can take continuous values, enabling differentiable optimization.

Objective Function

The graph matching problem can be formulated as an optimization problem that seeks to maximize node and structural similarity. A general form of the objective function is: $\max_P \text{vec}(P)^T K \text{vec}(P)$

where:

- $K \in \mathbb{R}^{nm \times nm}$ is the **affinity matrix**, encoding pairwise similarities between nodes and edges,
- $\text{vec}(P)$ denotes the vectorized form of P .

This formulation captures both:

- **Unary similarities** (node features), and
- **Pairwise similarities** (edge structures).

Relaxed and Differentiable Formulation

Due to the combinatorial nature of permutation constraints, solving the above optimization problem exactly is computationally intractable for large graphs. Therefore, many modern approaches relax the discrete constraints and optimize over a continuous domain. In learning-based frameworks, the matching matrix P is often obtained using a differentiable function: $P = M(Z_1, Z_2)$, where Z_1 and Z_2 are node embeddings learned via neural networks, and $M(\cdot)$ represents a matching operator, such as similarity computation followed by normalization (e.g., Sinkhorn algorithm).

Learning Objective

Given a set of training graph pairs with ground-truth correspondences P^* , the model is trained to minimize a loss function:

$$L = D(P, P^*)$$

where D is a distance measure such as cross-entropy loss or Frobenius norm. This enables the model to learn optimal node correspondences in an end-to-end manner.

Challenges

The graph matching problem presents several key challenges:

- **Combinatorial Complexity:** The search space increases factorially as the number of nodes grows.
- **Structural Variability:** Graphs may differ in size and topology.
- **Noise and Outliers:** Real-world data often contains missing or spurious edges.
- **Scalability:** Efficient matching for large-scale graphs remains difficult.

Proposed Methodology

In this section, we introduce a scalable and robust end-to-end neural framework for graph matching. The framework is designed to jointly learn expressive node representations and compute accurate correspondences between graphs while maintaining scalability and robustness under challenging conditions. The overall architecture consists of four key components: (i) graph representation learning, (ii) adaptive message passing, (iii) multi-level feature aggregation, and (iv) a differentiable matching module [12], [14].

Overall Framework

Given two input graphs G_1 and G_2 ,

Given two input graphs G_1 and G_2 , $G_1 = (V_1, E_1, X_1)$, $G_2 = (V_2, E_2, X_2)$, where $X_1 \in \mathbb{R}^{n \times d}$ and $X_2 \in \mathbb{R}^{m \times d}$; P_{ij} reflects the likelihood that node $i \in V_1$ matches node $j \in V_2$.

The proposed framework consists of the following stages:

- Graph Encoding
- Adaptive Intra-Graph Message Passing
- Cross-Graph Feature Interaction
- Multi-scale Feature Aggregation
- Similarity Learning and Matching
- Differentiable Assignment via Sinkhorn Normalization

The proposed framework initially generates node embeddings through a graph neural network. These embeddings are progressively refined through message passing mechanisms to capture underlying structural dependencies. The learned representations are subsequently aggregated across multiple levels to capture both local and global graph information. Finally, a differentiable matching module computes a soft correspondence matrix in an end-to-end trainable manner.

Graph Encoding with Neural Representation Learning

To capture the inherent characteristics of graph nodes, we utilize a Graph Neural Network (GNN) to learn node embeddings. For each graph $G = (V, E, X)$, the initial node features X are transformed into latent representations. At layer $l + 1$, node embeddings are updated as:

$$H^{(l+1)} = \sigma(\tilde{A}H^{(l)}W^{(l)}),$$

where:

- $\tilde{A} = D^{-1/2}AD^{-1/2}$ is the normalized adjacency matrix
- $H^{(0)} = X$ represents initial node features
- $W^{(l)}$ are learnable parameters,
- $\sigma(\cdot)$ is a nonlinear activation function.

This process enables nodes to encode **local neighborhood structure** and **attribute information**, forming the basis for subsequent matching. This allows the model to encode both node features and structural relationships into compact embedding representations.

Adaptive Message Passing Mechanism

Standard GNNs treat all neighboring nodes equally, which limits robustness in noisy or heterogeneous graphs. To enhance robustness and capture higher-order dependencies, we introduce an adaptive message passing mechanism. Unlike standard GNNs, where all neighbors contribute equally, our approach assigns learnable weights to neighboring nodes:

$$H_i^{(l+1)} = \sigma \left(\sum_{j \in \mathcal{N}(i)} \alpha_{ij}^{(l)} W^{(l)} H_j^{(l)} \right),$$

where:

- $\mathcal{N}(i)$ denotes the neighborhood of node i ,
- $\alpha_{ij}^{(l)}$ represents attention weights computed based on feature similarity.

The attention weights α_{ij} are defined as:

$$\alpha_{ij}^{(l)} = \exp(\text{sim}(H_i^{(l)}, H_j^{(l)})) / \sum_{k \in \mathcal{N}(i)} \exp(\text{sim}(H_i^{(l)}, H_k^{(l)}))$$

Here, $\text{sim}(\cdot, \cdot)$ denotes a similarity function such as dot-product or cosine similarity. This mechanism enables the model to emphasize more informative neighbouring nodes while minimizing the influence of noise and irrelevant connections, thereby improving robustness against structural perturbations.

Cross-Graph Interaction Module

A key limitation of many existing graph matching methods is the lack of direct interaction between graphs during feature learning. To overcome this, we propose a cross-graph attention module, which enables nodes in one graph to dynamically attend to nodes in the other graph. The cross-graph attention weights are computed as:

$$\beta_{ij} = \exp(Z_{1,i}^T Z_{2,j}) / \sum_k \exp(Z_{1,i}^T Z_{2,k})$$

where Z_1 and Z_2 are node embeddings from the two graphs.

The updated representation for node $i \in V_1$ is:

$$\tilde{Z}_{1,i} = \sum_j \beta_{ij} Z_{2,j}; \quad Z_{1,i}^{\text{final}} = Z_{1,i} + \tilde{Z}_{1,i}$$

A similar process is applied symmetrically for G_2 . This module provides cross-graph contextual awareness, improves alignment of feature spaces, and enhances discrimination between correct and incorrect matches.

Multi-level Feature Aggregation

To efficiently capture both local and global structural information, node features are aggregated across multiple network layers:

$$Z = \text{Concat}(H^{(1)}, H^{(2)}, \dots, H^{(L)}),$$

or alternatively,

$$Z = \sum_{l=1}^L \lambda_l H^{(l)},$$

where λ_l are learnable weights. This multi-level aggregation strategy integrates information from different receptive fields, allowing the model to learn rich hierarchical representations. It also improves robustness by incorporating features at varying levels of abstraction.

Differentiable Matching Module

After obtaining node embeddings Z_1 and Z_2 for graphs G_1 and G_2 , we compute a similarity matrix:

$$S = Z_1 Z_2^T$$

To obtain a valid correspondence matrix, we apply a differentiable normalization operator such as the Sinkhorn algorithm:

$$P = \text{Sinkhorn}(S)$$

Ashwani Kumar Yadav and Shri Prakash Dwivedi

The Sinkhorn normalization iteratively performs:

$$P^{(t+1)} = \mathcal{N}_c \left(\mathcal{N}_r (P^{(t)}) \right),$$

where $\mathcal{N}_r$ and $\mathcal{N}_c$ denote row-wise and column-wise normalization. This ensures rows sum to 1 (each node matches one node), columns sum to 1 (unique assignments), and differentiability for end-to-end training. The resulting matrix P represents soft assignments between nodes, approximating a permutation matrix while remaining differentiable. This facilitates seamless integration with gradient-based optimization techniques.

Loss Function and Training Strategy

The model is trained in a supervised setting using ground-truth node correspondences P^* . We adopt a cross-entropy loss to measure the discrepancy between predicted and true matchings.

Cross-Entropy Loss

$$L_{ce} = -\sum_{i,j} P_{ij} \log(P_{ij})$$

Structural Consistency Loss

$$L_{struct} = \|A_1 - PA_2P^T\|_F^2$$

Total Loss

$$L = L_{ce} + \lambda L_{struct}$$

This formulation ensures both accurate node matching and preservation of graph structure. Additionally, regularization terms may be incorporated to enforce structural consistency and prevent overfitting. The entire framework is trained end-to-end using stochastic gradient descent.

Computational Complexity and Scalability

By utilizing efficient matrix operations and parallel processing, the proposed approach significantly reduces computational complexity compared to traditional combinatorial techniques. The computational complexity of the proposed framework is:

- GNN encoding: $O(L(|E_1| + |E_2|)d)$;
- similarity: $O(nmd)$;
- Sinkhorn: $O(Tnm)$.
- Similarity computation: $O(nmd)$

The use of matrix operations and parallelization makes the approach scalable to large graphs. The use of soft matching and relaxed constraints further enables efficient optimization for large-scale graphs.

Key Advantages of the Proposed Method

- **End-to-End Learning:** Simultaneous optimization of feature learning and graph matching.
- **Scalability:** Efficient handling of large graphs using neural representations.
- **Robustness:** Adaptive message passing reduces sensitivity to noise.
- **Expressiveness:** Multi-level aggregation captures complex structural patterns.

The proposed methodology offers a unified and efficient framework for graph matching while overcoming the major limitations of existing approaches.

Performance Analysis

In this section, we present the datasets, evaluation metrics, and baseline approaches used to evaluate the performance of the proposed graph matching framework.

Datasets

To assess the effectiveness and generalization ability of the proposed approach, we consider three widely used benchmark datasets for graph matching:

**Ashwani Kumar Yadav and Shri Prakash Dwivedi**

- **PascalVOC:**
This dataset consists of annotated object instances from multiple categories such as cars, bikes, and animals. Keypoints are extracted from images and represented as graphs, where nodes denote keypoints and edges capture spatial relationships between them. The dataset is commonly used for pairwise graph matching (2GM) tasks.
- **Willow_Object_Class:**
The Willow dataset consists of images from multiple object categories with manually annotated keypoints. It is relatively smaller but provides clean annotations, making it suitable for both pairwise (2GM) and multi-graph matching (MGM) evaluations.
- **SPair-71k:**
This large-scale dataset contains over 70,000 image pairs with diverse variations in viewpoint, scale, and occlusion. It provides challenging scenarios for graph matching and is widely used to evaluate robustness and scalability.

Evaluation Metrics

To quantitatively evaluate matching performance, we use the following metrics:

- **Matching_Accuracy_(ACC):**
Evaluates the percentage of correctly matched node pairs.
- **Precision and Recall:**
Assesses the quality of predicted correspondences, especially under partial matching scenarios.
- **F1-Score:**
Represents the harmonic mean of precision and recall, offering a balanced performance evaluation.
- **Mean Matching Score:**
Indicates the average performance across all categories or graph pairs.

These metrics provide a comprehensive evaluation of both accuracy and robustness.

Baseline Methods

We compare the proposed framework against several state-of-the-art graph matching approaches, including:

- Classical approaches (e.g., spectral matching, QAP-based methods)
- Learning-based methods (e.g., CNN-based matching)
- GNN-based models (e.g., GMN, PCA-GM, and other neural graph matching frameworks)

This comparison ensures a fair evaluation against both traditional and modern techniques. The model is trained in a supervised manner using ground-truth correspondence matrices. For each dataset graph pairs are constructed from annotated keypoints. The Data augmentation strategies including noise injection and edge perturbation are employed to enhance robustness. The dataset is divided into training, validation, and testing sets according to standard evaluation protocols. We evaluate the proposed framework under different settings:

- **Pairwise Graph Matching (2GM):** Matching between two graphs.
- **Multi-Graph Matching (MGM):** Matching across multiple graphs simultaneously.
- **Noisy Conditions:** Introducing random perturbations to test robustness.
- **Scalability Analysis:** Evaluating performance on graphs of increasing size.

Comparative Analysis

In this section, we present a comparative analysis of the proposed graph matching framework by evaluating its performance against state-of-the-art methods on multiple benchmark datasets. We further examine the effectiveness, scalability, and robustness of the model through comprehensive discussions and ablation studies as shown in table 1.

**Ashwani Kumar Yadav and Shri Prakash Dwivedi**

Quantitative Results

The proposed approach is evaluated on the PascalVOC, Willow Object Class, and SPair-71k datasets using standard evaluation protocols. The Proposed framework consistently achieves higher matching accuracy compared to baseline methods such as GMN and PCA-GM[12]. In particular:

- On **PascalVOC**, the proposed model achieves higher mean accuracy by effectively capturing fine-grained structural relationships.
- On the **Willow Object Class dataset**, the proposed method delivers strong performance in both pairwise and multi-graph matching tasks, benefiting from accurate annotations and efficient feature aggregation.
- On **SPair-71k**, the proposed model significantly surpasses existing methods, demonstrating strong robustness under large-scale and highly diverse conditions.

Overall, the results confirm that the integration of adaptive message passing and multi-level feature aggregation leads to superior matching performance.

Comparison with State-of-the-Art Methods

Compared to classical and deep learning-based approaches, the proposed framework offers several advantages:

- **Higher Accuracy:** Improved node correspondence estimation due to expressive embeddings.
- **Better Generalization:** Consistent performance is observed across various datasets and object categories.
- **End-to-End Optimization:** Unlike traditional methods, the proposed approach jointly learns features and matching.

While classical methods struggle with scalability and handcrafted features, and earlier learning-based methods lack structural awareness, the proposed GNN-based framework effectively addresses these limitations.

Robustness Analysis

To assess robustness, we introduce noise and perturbations in node features and graph structures:

- The proposed model preserves consistent performance even in the presence of moderate noise levels.
- Adaptive weighting in message passing helps reduce the influence of noisy or irrelevant nodes.
- The model effectively handles partial matching scenarios and structural distortions.

This confirms the robustness of the framework in real-world conditions.

Scalability Evaluation

We investigate the scalability of the proposed approach by progressively increasing the size and complexity of the graphs:

- The model demonstrates efficient performance due to parallel computation and relaxed matching constraints.
- Unlike combinatorial approaches, computation time grows more gracefully with graph size.
- The framework is suitable for large-scale datasets such as SPair-71k.

The integration of GNN-based representation learning, adaptive message passing, and differentiable matching allows the model to achieve high accuracy while preserving robustness and scalability. However, some limitations remain, as the performance of the model may depend on the quality of the initial node features, and extremely large graphs may still pose computational challenges. Future research can investigate more efficient architectures and self-supervised learning techniques to further improve performance. Overall, the proposed framework establishes a strong baseline for scalable and robust graph matching, outperforming existing methods across multiple challenging benchmarks.

Conclusion and Future Work

In this paper, we introduced a scalable and robust end-to-end neural framework for graph matching that effectively overcomes the limitations of existing approaches. By combining graph neural network-based representation learning with adaptive message passing and multi-level feature aggregation, the proposed approach effectively captures both local and global structural dependencies. Furthermore, the incorporation of a differentiable matching module enables

Ashwani Kumar Yadav and Shri Prakash Dwivedi

accurate and globally consistent node correspondence estimation within a unified end-to-end learning framework. The performance of the model largely depends on the quality and availability of node features, and computational efficiency can become a limitation when dealing with extremely large graphs. Furthermore, the current framework mainly depends on supervised learning, which requires labeled correspondence data that may not always be easily accessible. Future research will focus on overcoming these limitations by investigating self-supervised and unsupervised graph matching methods to reduce reliance on labeled data. We also aim to investigate more efficient and lightweight architectures to further improve scalability and real-time performance. Moreover, extending the framework to handle dynamic graphs and incorporating cross-domain adaptation techniques could broaden its applicability to a wider range of real-world problems.

Algorithm 1: Proposed Scalable and Robust End-to-End Neural Framework for Graph Matching

Input:

Graphs $G_1 = (V_1, E_1, X_1)$
 $G_2 = (V_2, E_2, X_2)$
 Number of GNN layers L
 Sinkhorn iterations T

Output:

Correspondence matrix P

1: Initialize node embeddings:

$H_1(0) \leftarrow X_1$

$H_2(0) \leftarrow X_2$

2: for $l = 1$ to L do

 Compute intra-graph attention weights:

$\alpha_{ij}(l) \leftarrow \text{Attention}(H(l-1)_i, H(l-1)_j)$

 Perform message passing:

 end for

3: Aggregate multi-level features:

$Z_1 \leftarrow \text{Concat}(H_1(1), H_1(2), \dots, H_1(L))$

$Z_2 \leftarrow \text{Concat}(H_2(1), H_2(2), \dots, H_2(L))$

4: Compute cross-graph attention:

$\beta \leftarrow \text{Softmax}(Z_1 Z_2^T)$

5: Update graph embeddings:

$\tilde{Z}_1 \leftarrow Z_1 + \beta Z_2$

$\tilde{Z}_2 \leftarrow Z_2 + \beta^T Z_1$

6: Compute similarity matrix:

$S \leftarrow \tilde{Z}_1 \tilde{Z}_2^T$

7: Apply Sinkhorn normalization:

$P \leftarrow \text{Sinkhorn}(S)$

8: return P

ABSTRACT

Protein-based films have become more and more popular as biodegradable substitutes to synthetic polymers. The present research paper presents the development of a biocomposite film of casein-stearic acid based on solvent casting method. The structural and morphological characteristics of the prepared films were examined with the help of Fourier Transform Infrared Spectroscopy (FTIR) and Scanning Electron Microscopy (SEM). FTIR analysis showed the presence of characteristic amide bands of casein and aliphatic C-H stretching vibrations indicating the successful incorporation of stearic acid into the protein matrix. SEM images showed a comparatively homogenous surface morphology with a good distribution of lipid parts within the casein network. The biocomposite film was tested via the Kirby Bauer disc diffusion method against Gram-positive and Gram-negative bacterial strains in accordance with the antibacterial activity of the biocomposite film. The findings showed moderate, but significant antibacterial activity of the prepared film. These findings suggest that the Casein-Stearic acid biocomposite film has potential applications as an active biodegradable material for packaging and biomedical uses.

Keywords: Casein, Stearic acid, Protein – based film, Biodegradable film.

INTRODUCTION

**Saranya and Malar Retna**

The widespread application of synthetic plastic resources has led to serious ethical issues associated with their inability to break down and their concentration in the natural ecosystems [1]. Over the last few years, there has been a growing concern over the production of biodegradable and sustainable polymeric materials, which are made out of renewable resources [2]. Protein-based materials have become the better alternatives among other biopolymers because of their biodegradability, film making capability, and biocompatibility [3]. Casein is a phosphoprotein of milk which has been extensively studied in the film preparation due to its outstanding emulsifying capacity and cohesive lumping capability [4].

The casein-based films contain excellent properties as oxygen barriers and mechanical flexibility, but the limitation of the casein-based films is enormous because they lack moisture resistance and functionality in humid environments [5]. Therefore, modification strategies are necessary to improve their structural and functional characteristics. Introduction of lipids into the protein matrices has also been noted to be a viable method in improving the hydrophobicity and the barrier properties [6]. One such long-chain saturated fatty acid is the stearic acid, specifically because of its hydrophobic property, biodegradability, and compatibility with protein systems [7]. The stearic acid hydrophobic chains interaction with the protein backbone may affect the structural organization and morphological appearance of the formed composite films [8]. Besides structural modification, there is a high demand to develop films that possess antibacterial activity particularly the active packaging of the foods [9]. Antimicrobial biopolymer-based films can prevent the proliferation of foodborne pathogens as well as increase the shelf life of food products [10]. In the research, casein-stearic acid based biocomposite film was developed and structural, morphological and antibacterial properties of biocomposite film were systematically researched by use of FTIR, SEM and Kirby-Bauer disc diffusion techniques.

MATERIALS AND METHODS

The materials used here are Casein prepared from skimmed milk, Stearic acid, glycerol, NaOH and deionized water.

Methods and preparation**Preparation of Casein from Skimmed milk**

Casein was prepared from skimmed milk by precipitation using glacial acetic acid. Water and ethanol were used to purify the precipitate. Then it was dried with air and powdered.

Preparation of Casein - Stearic Acid Based Biocomposite film

Casein powder was added to glycerol and then mixed with distilled, deionized water which is 10 times by weight of casein. About 6 ml of 1M NaOH was added to the solution with continuous stirring to increase the pH of the solution to 10. The pH of the solution was monitored using an electronic pH meter. The alkaline pH (around 10) promotes protein unfolding and structural rearrangement due to disruption of hydrogen bonding and electrostatic interactions [11, 12]. The solution was then stir – heated in a water bath maintained at 80°C. At the end of 30 min, Stearic acid was added to the solution and pH was adjusted again to 10 using the 1M NaOH solution. The solution was continued to be stir – heated at 80 °C for another 30 minutes. The heated solution was then poured on silicone oil.

Characterization of Casein- Stearic acid Biocomposite film**Fourier Transform Infrared Spectroscopy (FTIR)**

Chemical interaction between Casein and Stearic Acid was studied in the Department of Chemistry, Holy Cross College, Nagercoil, Tamil Nadu, India with the help of Shimadzu Fourier Transform Infrared Spectrophotometer (Shimadzu Corporation, Kyoto, Japan). The samples of dried biocomposite films were measured in wavenumber 4000-400 cm^{-1} in the ATR mode with a resolution of 4 cm^{-1} and 32 scans were taken at room temperature. The ability of

**Saranya and Malar Retna**

the stearic acid to interact and be incorporated successfully into the casein matrix was observed by the evaluation of the characteristic absorption bands of the amide I, amide II, and aliphatic C–H stretching vibrations.

Scanning Electron Microscopy (SEM)

Scanning Electron Microscopy (TESCAN, Czech Republic) of the surface morphology of the prepared casein stearic acid biocomposite film was carried out at Gandhigram Rural Institute (Deemed to be University), Dindigul, Tamil Nadu, India. The dried samples of the film were sliced into small pieces and then attached to aluminum stub with carbon double sided conductive tapes. Before imaging, the samples were coated with a thin film of gold by sputtering to improve the conductivity of the samples. To assess the surface morphology and structural homogeneity of the biocomposite film, the micrographs were captured under accelerating voltage of 10–15 kV and under suitable magnifications.

Antibacterial Activity

The antimicrobial ability of the casein-stearic acid biocomposite film was determined with the standard Kirby-Bauer disc diffusion technique in one of the microbiology testing labs at Vadasery, Nagercoil, Tamil Nadu, India. Mueller-Hinton agar medium was aseptically prepared by following the instructions of the manufacturer, then sterilized and poured into sterile Petri plates (90 mm diameter). The bacteria strains (*Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Bacillus cereus*, and *Staphylococcus aureus*) were grown, and the inoculum turbidity was modified to 0.5 McFarland standard ($\sim 1.5 \times 10^8$ CFU/mL). Sterile cotton swabs that had been dipped in the bacterial suspension were then applied on the entire agar surface in three directions within 15 minutes to ensure even growth. Using sterile forceps, the test sample was carefully put on the inoculated agar surface using sterile discs. The positive control was Amikacin (30 µg/disc, HiMedia Laboratories, India). The plates were incubated between 18 and 24 hours aerobically at 37°C. The zone of inhibition was measured with a digital Vernier caliper after incubation in millimeters in diameter. Each of the experiments was conducted three times and the average of the values was taken.

RESULTS AND DISCUSSION**FTIR Analysis**

The FTIR spectrum of the developed Casein–Stearic acid biocomposite film (Sample C-3) is shown in Figure 1. The spectrum shows certain absorption bands that hold good for the structural composition and intermolecular interaction between casein and stearic acid. The broad and intense absorption band at 3413.47 cm^{-1} is attributed to the overlapping of -OH and -NH stretching vibrations, which suggest hydrogen bonding in the biopolymer matrix. The asymmetric and symmetric C-H stretching vibrations of the aliphatic hydrocarbon chains are responsible for the major contribution of the peak at 2937.87 cm^{-1} and are contributed by the stearic acid component. The Amide I band corresponding to the C=O stretching vibrations of the peptide backbone of the casein protein is prominent at 1645.91 cm^{-1} . The absorption band at 1404.12 cm^{-1} is likely to be the bending or symmetric stretching of the C-H groups of carboxylate group. In addition, the peaks at 1106.47 cm^{-1} and 1035.45 cm^{-1} are associated with the C-O stretching vibrations, indicating interaction between the protein matrix and fatty acid due to blending and cross-linking. The weak band at 815.20 cm^{-1} is related with out of plane bending vibrations. These spectral characteristics all indicate successful embedding of the stearic acid in the casein matrix, which is the basis for a stable biocomposite film.

Scanning Electron Microscope (SEM)

The surface morphology of the developed casein-stearic acid biocomposite film was determined by the Scanning Electron Microscopy (SEM) technique, as presented in **Figure 2**. The SEM image shows that the surface has a clear and distinct structure, with irregular aggregates of particles and micro-flaky domains visible throughout the image. The extracted cross-sections of pristine protein films are generally smooth and homogeneous while the stearic acid incorporated film is rougher with some phase separation. This modified topography is explained by the hydrophobic behaviour of the lipid part that results in the crystallization of the stearic acid into crystalline domains or into

**Saranya and Malar Retna**

micellar structures during the solvent casting and the drying process. The occurrence of these micro-structures suggests that the components are commingled but the long aliphatic chains of the fatty acid form localized crystalline networks in the continuous casein matrix that can significantly affect the moisture barrier and mechanical properties of the film.

Antibacterial activity

The antibacterially effect of the prepared casein–stearic acid biocomposite film (Sample C-3) was tested with the selected bacterial pathogens by using the Kirby-Bauer disc diffusion method. The quantitative zones of inhibition (ZOI) values obtained and compared with the standard antibiotic control (Amikacin) are summarised in Table 1 and the appropriate experimental agar plates are shown in Figure 3. The biocomposite film showed outstanding broad-spectrum antibacterial activity, proving to be very effective against both Gram-positive and Gram-negative bacterial strains. The experimental results showed that the C-3 film exhibited maximum zone of inhibition of 15.5 mm against Gram-positive pathogen *Staphylococcus aureus* and 15.2 mm against *Bacillus cereus* that was superior to the control antibiotic Amikacin (16 mm) and C-3 film (15 mm respectively). For the Gram-negative strains the zones of inhibition were 15.3 mm against *Pseudomonas aeruginosa* and 15.0 mm against *Escherichia coli*, which were equal or nearly equal to the zones of inhibition of the standard antibiotic control. This antimicrobial activity of the film could be attributed to the incorporation of stearic acid into casein biopolymer matrix. The active component (stearic acid) slowly diffuses into the moist agar surface when the film disc is placed on the surface of the agar medium. Long-chain fatty acids such as stearic acid interact very well with the bacterial cell envelopes. Specifically, the hydrophobic hydrocarbon chains destroy the lipid bilayers of the bacterial outer membranes (in Gram-negative strains) and the cell membrane networks (in Gram-positive strains). This mechanical disruption changes the permeability of membranes, causing leakage from the cells and ultimately killing the cells. The results can be clearly seen that the casein–stearic acid biocomposite film has a very good potential application in food packaging to help reduce foodborne pathogens and prolong the shelf life of the product.

CONCLUSION

The present work focused on the successful fabrication and characterization of a biocomposite film of casein–stearic acid, using the solvent casting technique. FTIR spectroscopy was used to confirm the intermolecular interactions and structural integration between the casein matrix and stearic acid, which showed characteristic bands of functional groups, such as Amide I and aliphatic C-H stretching vibration. The results of SEM morphological analysis confirmed the successful dispersion of the hydrophobic fatty acid in the continuous protein matrix in the form of micro-flaky domains. In addition, the antibacterial tests revealed the excellent broad-spectrum antibacterial activity of the prepared biocomposite film against both Gram-positive and Gram-negative bacteria. The film showed a higher number of zones of inhibition with 15.5 mm against *Staphylococcus aureus*, 15.2 mm against *Bacillus cereus*, 15.3 mm against *Pseudomonas aeruginosa* and a good 15.0 mm against *Escherichia coli* which was very similar to standard antibiotic control Amikacin. The incorporation of stearic acid essentially changed the functional properties of the active components of the casein matrix without compromising its environmental friendliness. For this reason, the fabricated casein–stearic acid biocomposite film has a tremendous commercial potential in the fields of green active food packaging and biomedical materials for the achievement of antibacterial efficacy.

ABSTRACT

The purpose of this study was to measure the intervertebral disc space at the L4- L5 segment using magnetic resonance imaging (MRI) in the evaluation of low back pain (LBP). The lumbar spine is a critical structure component of the human skeletal system, with the intervertebral disc playing a vital role in weight distribution and flexibility. Morphometric analysis of these structures is essential for understanding degenerative changes, planning surgical interventions, and establishing population-specific anatomical and L4-L5 is the most common site for disc herniation and degenerative changes. The objectives of this study were to perform a detailed morphometric analysis of the lumbar spine, specifically focusing on the measurement of intervertebral disc height at the L4-L5 level using Magnetic Resonance Imaging. A retrospective cross-sectional study was conducted using a dataset of 50 patients who underwent lumbar spine MRI morphometric measurement of the L4-L5 intervertebral disc space from mid- sagittal T2-weighted image. Parameters included anterior disc height, middle disc height and posterior disc height. Statistical analysis was performed to determine the mean value, standard deviation and any significant correlation related to patients. The analysis provided standardised measurements for

**Ekta Singh et al.,**

the L4-L5 disc space within the study group. Statistical evaluation using ANOVA and p-value calculations was utilized and ensure the reliability of the data. It states that the calculated p-values of anterior, middle and posterior disc space was greater than the standard p-value that is 0.05.

Keywords: Disc herniation; Disc height; Lumbar intervertebral disc space; Low back pain; Magnetic resonance imaging.

INTRODUCTION

Magnetic Resonance Imaging

MRI is a non-invasive, radiation-free medical imaging technique that utilises strong magnetic fields and radio waves to produce detailed images of the human body's structures, including tissues, bones, muscles, ligaments, soft tissues, and fluids. To create images of the body's organs, magnetic resonance imaging (MRI) scanners employ radio waves, powerful magnetic fields, and gradients (5). It doesn't damage the patient's body because it uses non-ionising radiation. When a patient is placed in the strong magnetic field of an MRI scanner, the hydrogen nucleus in the body aligns with the electromagnet when exposed to a brief rush of electromagnetic energy in the form of radiofrequency (RF) pulses. The patient's hydrogen nuclei absorb the energy, producing an MR signal that aids in the production of images (9,11).

MRI Principle

Magnetic Resonance Imaging is based on the principle of nuclear magnetic resonance [NMR], the area of medicine that focuses on the behaviour of the nucleus, particularly on protons. Protons are positively charged and have rotatory movement called spin; any moving charge generates current, and every current has a small magnetic field around it. The human body is most abundant in hydrogen protons (11). The hydrogen protons in a patient's body align, some parallel and some antiparallel to the MRI machine's external magnetic field, when the patient lies down on the test table. A net magnetisation vector (NMV) is produced when the surplus hydrogen proton is cancelled. The radiofrequency pulse then causes the NMV to change from longitudinal magnetisation (LM) to transverse magnetisation (TM). The signal is then received, the radiofrequency pulse [RF] is shut off, and the monitor displays a picture (4).

Steps for MRI

- The patient is put inside the magnet: In the body of the invention, every randomly travelling proton aligns and precesses along the external magnetic field. Along the Z-axis, longitudinal magnetisation develops.
- An RF pulse is transmitted: To reach a higher energy level and precession in phase with one another, protons absorb energy from radiofrequency pulses. As a result, longitudinal magnetisation decreases and transverse magnetisation forms in the X-Y plane (11).
- MR signal: Due to transverse magnetization the current will be produced in the transverse plane, and the radiofrequency coil will receive the signal.
- Image formation: The MR signal received by the coil is transformed into an image by a complex mathematical process, such as the Fourier Transformation, by computers (16).

Intervertebral Disc Space of L4- L5

Magnetic resonance imaging (MRI) has recently become the most commonly applied diagnostic method for making the diagnosis of lumbar spinal stenosis or herniation because it is non-invasive, it provides diverse information on the lumbar soft tissues, and it provides high resolution image of the sagittal, axial and coronal planes. MRI enables precise measurement of disc height and morphology while also assessing the nucleus pulposus, annulus fibrosus,

**Ekta Singh et al.,**

and adjacent vertebral endplates (2). Low back pain (LBP) is highly prevalent in adult populations, and the number of studies on the diagnosis, classification, and treatment of LBP is rapidly growing. LBP has been reported to incur pain, sick leaves, considerable social and economic expense, and disability in young adults (9,12,17). As in this study, the intervertebral disc space was measured at the L4-L5 segment. The five vertebrae (L1–L5) that make up the lumbar spine are divided by intervertebral discs. These discs serve as cushions, enabling mobility while absorbing shock. The largest and strongest vertebrae in the spine, the lumbar vertebrae support the weight of the upper body and allow for a variety of motions, including walking, lifting, and bending.

The lumbar spine plays a critical role in weight-bearing, mobility, and protection of neural elements. Among its segments, the L4–L5 level is particularly prone to degenerative changes, disc herniation, and height loss due to its anatomical position and mechanical load-bearing function. Accurate assessment of the intervertebral disc space at this level is essential for diagnosing degenerative disc disease, monitoring disease progression, and planning surgical or conservative treatment (5,8). The anterior surface of the intervertebral disc is larger than the posterior surface. Lower back pain can have a range of physical and psychological effects. Physical effects include pain, stiffness, decreased range of motion, and muscle spasms. It can also cause referred pain in the legs, affect posture, and impact sleep. Psychologically, it can lead to stress, anxiety, and even depression. The intervertebral spaces in the lumbar spine, formed by the intervertebral discs, are crucial for spinal health and function.

They act as shock absorbers, allowing for flexibility and movement while also separating the vertebrae to prevent grinding and nerve compression(18,20). Disc degeneration is a progressive condition that modifies the geometric morphology and biomechanical behaviour of an intervertebral disc, eventually affecting its ability to transmit and distribute loads. Lower back pain is a major cause of disc degeneration(24). This study focuses on the height of the intervertebral space of the lumbar region at the L4-L5 segment as the anterior, middle and posterior regions of the intervertebral space of lumbar region in patients aged 18-80. The L4 and L5 vertebrae are the fourth and fifth bones of the lumbar spine, and they also consist disc space, which refers to the area between these two vertebrae. The disc is the critical structure and performs many functions. The flexible pads that lie between each of the spinal column's bones are called discs. Each is a round, flat capsule with a soft, jelly-like interior called the nucleus pulposus and a hard, fibrous outer layer called the annulus fibrosis. Ligaments that connect the spinal bones to the surrounding muscular sheaths securely hold them in place (6,22). The purpose of the discs, a crucial component of the spinal joints, is to keep the vertebrae apart and stop them from rubbing against one another.

METHOD AND METHODOLOGY

Study site and inclusion criteria

This scientific study was a hospital-based observational study conducted in the Department of Radiodiagnosis, equipped with a United Imaging uMR780 3.0 Tesla MRI scanner, manufactured by Shanghai United Imaging Healthcare Company Limited. The patients were included with age group 18-80 with a history of low back pain.

Research design

This study was carried out on the “Measurement of Intervertebral disc space of L4-L5 segment of Lumbar spine using 3.0 Tesla MRI” with patients in the age group 18-80 years. The patient was scanned, and data were collected from the United Imaging uMR780 3.0 Tesla MRI scanner, which was manufactured by Shanghai United Imaging Healthcare Company Limited.

Sample size

This scientific study includes 50 patients with a clinical and radiological measurement of the intervertebral disc space of the L4-L5 segment of the lumbar spine using a United Imaging uMR780 3.0 Tesla MRI scanner.

Statistical analysis

The statistical method used for result was ANOVA (one-way analysis of variance). The standard deviation (SD), Mean, and standard error (SE) for all parametric variables were used. The probability value(p-value) was obtained and considered statistically significant, and the SYSTAT 13.2 software was used.

RESULT

It includes a sample of 50 patients with complaints of low back pain, where the focus was especially on the height of the intervertebral disc space anterior, middle and posterior at L4-L5 lumbar spine. It includes both males and females within the age range of 18 to 80 years and the patients are categorised into four age groups.

Age Distribution: According to age group, they are arranged in four groups (18-33 years), (34-49 years), (50-65 years) and (66-80 years) with equal intervals of 16 years each, which balanced the sample distribution and provided a clear comparison of degenerative changes. In (18-33) age group the young adults with minimal changes expected, (34-49) age group early changes phase begins, (50-65) age group the moderate degenerative changes are common due to loss of bone density and (66-80) age group there are more chances of advanced degenerative changes as the L4-L5 is prone to degenerative changes, disc herniation, and height loss due to its anatomical position and mechanical load-bearing function. The majority of patients in this study belonged to the 34-49 years age group (50%), followed by the 18-33 years age group (28%), 50-56 years age group (16%), and 66-80 years age group (6%). This suggests that middle-aged individuals formed the largest proportion of patients examined in this study. The higher number of patients in this age group may be related to increased occupational stress, lifestyle and mechanical strains on the lumbar spine during this period of life.

Anterior Intervertebral disc height: The mean middle disc height at the L4-L5 level showed slight variation among different age groups. The mean anterior height was 2.8mm in the 18-33 years age group, 3.0mm in the 50-56 years group, and 3.3mm in the 66-80 years group, with an overall mean of 3.0mm. Although minor differences were observed among the age groups, statistical analysis showed that these differences were not significant ($p = 0.312$). This indicates that age does not have a significant difference on anterior disc height in the study.

Middle Intervertebral disc height: The mean middle disc height at the L4-L5 level was 1.7mm in the 18-33 years group, 2.9mm in the 34-49 years group, 2.1mm in the 50-65 years group, and 3.4mm in the 66-80 years group, with an overall mean value of 2.5mm. Although the middle disc height appeared higher in the older age group, the difference was not statistically significant ($p=0.644$). This finding suggests that variations in middle disc height across age groups may occur, but age does not have a significant effect on middle disc height in the study.

Posterior Intervertebral disc height: The mean posterior disc height was 1.1mm in the 18-33 years group, 2.2mm in the 34-49 years group, 1.2mm in the 50-56 years group, and 3.0mm in the 66-80 years group, with an overall mean value of 1.8mm. Similar to the anterior and middle heights, no statistically significant difference was observed among age groups ($p=0.701$). This suggests that posterior disc height does not have a statistical difference in this study. This study aimed to measure the height of the intervertebral disc space anterior, middle and posterior of the lumbar spine at segment L4-L5 based on different age group 18-80 years with the help of the United Imaging uMR780 3.0 Tesla MRI scanner. A total of 50 patients were included in this study, and the measurement of anterior, middle and posterior disc heights. In some previous studies, the measurement was done from x ray of the lumbar spine, with a 1.5 Tesla MRI, which also provides the effective result and measurement of data in this study. The 3.0 Tesla United Imaging uMR780 scanner is used, which is AI- driven, minimises motion and provides high-resolution image quality for measurement and diagnosis.

DISCUSSION

In the previous study of found that lumbar X-ray measurements can predict lumbar disc herniation (LDH) and degeneration in young adults (20-25 years) with low back pain. The standard lumbar spine MRI sequences were reviewed, and disc height at L4-L5 was measured at anterior, middle, and posterior points on the midsagittal view.

**Ekta Singh et al.,**

Measurements were averaged for analysis. MRI provided precise disc space measurements with clear visualisation of endplates and disc margins, enabling detection of early degenerative changes. Based on the measurement of L4-L5 disc space is a reliable method for quantitative assessment, aiding in diagnosis, monitoring, and treatment planning of lumbar spine disorders. L4-L5 disc space showed a significant difference in different age groups. Another study found the changes in height and area of the intervertebral foramen at the L4–L5 level in degenerative lumbar discs under varying pushing heights using the finite element method. A male volunteer in good health provided CT and MRI scans of the T12–S1 regions. Mimics 16.0 and Geomagic Studio 2014 were used to create a three-dimensional finite element model of the typical lumbar spine. Models simulating mild, moderate, and severe degeneration of the L4–L5 disc were generated by adjusting disc height and nucleus pulposus area according to the classification.

This study aimed to measure the height of the intervertebral disc space anterior, middle and posterior of the lumbar spine at segment L4-L5 based on different age group 18-80 years with the help of the United Imaging uMR780 3.0 Tesla MRI scanner. A total of 50 patients were included in this study, and the measurement of anterior, middle and posterior disc heights was analysed using the ANOVA (one-way ANOVA) with the help of SYSTAT 13.2 software. In this study, the gender distribution showed that 26 patients (52%) were male and 24 patients (48%) were female, indicating an almost equal representation of both genders in the study population. The mean anterior intervertebral disc height at the L4-L5 level showed slight variation among age groups, with an overall mean value of (3.0mm), middle height mean value (2.5mm) and posterior height mean value (1.8mm) for the total study population. Although a small variation in disc height was observed among different age groups, statistical analysis revealed that these differences were not statistically significant. The results state that the p-value of anterior, middle, and posterior disc height is greater than the standard p-value of 0.05, which indicates that there is no significant difference in height of the intervertebral disc between the anterior, middle, and posterior regions according to the different age groups.

CONCLUSION

In this study, 50 patients between the ages of 18 and 80 had their intervertebral disc space at the L4-L5 segment quantitatively analysed using Magnetic Resonance Imaging (MRI). This study emphasises the significance of morphometric data in the diagnosis and treatment of lumbar spine disorders by evaluating the anterior, middle, and posterior disc heights. It was conducted to evaluate the intervertebral disc space height at the L4-L5 level in different age groups, the patients were arranged in four age groups with a uniform difference of 16 years that is (18-33) years which includes young adults with chances of minimal degenerative changes, (34-49) years which include early degenerative phase begins, (50-65) years it includes the moderate degenerative changes occurs in patients body and (66-80) years it includes the highly chances of degenerative changes due to loss of bone density and bones become fragile. This study successfully provided the normative dataset for the L4-L5 disc height within the specific population, as the L4-L5 segment bears the highest degree of mechanical stress and disc degeneration. This measurement provides the quantitative data of given samples. It highlights the significant correlation found between disc height reduction and clinical symptoms like lower back pain, degenerative changes, disc herniation, nerve blockages, etc. It provides a better pathway to the Healthcare professionals, including neurologists, radiologists and neurosurgeons for preoperative assessment, optimise treatment planning, artificial surgery implants and surgical outcomes.

The United Imaging uMR 780 3.0 Tesla MRI scanner offers advanced features to improve the lumbar spine imaging through a high-density 48-channel spine Coil, AI- Driven system and high-quality image resolution. It plays a vital role in lumbar intervertebral disc space height measurement with high-quality imaging and without exposing the patients to better diagnosis. For future aspects, the researcher can measure by using the superior Signal to Noise Ratio (SNR), 3D imaging with biochemical mapping to detect disc degeneration at the molecular level before physical height loss of the disc. The integration of Artificial Intelligence (AI) further uses this process by providing automated segmentation, which eliminates human variability and allows for the longitudinal tracking of disc height index with accuracy. It facilitates the functional diagnostic range and measurement accuracy with realistic stability of spine and

Ekta Singh et al.,

nerve root compression at the high stress junction L4-L5, directly improving the surgical planning and patient outcomes. This scientific study concludes that the measurement of intervertebral disc space height did not have any effect on different age groups. A total of 50 patients were included in the study, and the anterior, middle and posterior heights of the intervertebral disc space were measured and analysed using the ANOVA (one-way ANOVA) with the help of SYSTAT 13.2 software. The p-value of anterior, middle and posterior disc height is greater than the standard p-value (0.05), which states that there is no significant difference in height of intervertebral disc space height anterior, middle and posterior according to the different age groups.

ABSTRACT

Cardiac arrest remains a leading cause of preventable death globally, with survival rates critically dependent on immediate bystander intervention. Allied health science students, given their clinical proximity, represent a high-yield target population for basic life support (BLS) education. However, evidence regarding the adequacy of their BLS knowledge across all domains remains limited and methodologically inconsistent. This study quantified BLS knowledge across five domains among undergraduate allied health science students and identified determinants of adequate performance. A cross-sectional survey was administered to 500 undergraduate allied health science students using a validated 20-item questionnaire assessing BLS conceptual knowledge, victim assessment, technical proficiency, and equipment familiarity. Descriptive statistics, chi-square tests, and binary logistic regression were employed to characterize performance and identify associated factors. The mean overall BLS knowledge score was 13.31 out of 20 (SD = 3.24; 66.6% correct). Conceptual knowledge was highest (79.7%), while technical proficiency was lowest (59.6%). Only 35.6% of participants had prior BLS training. In multivariate logistic regression, prior BLS training (OR = 3.47; 95% CI: 2.31-5.21; $p < 0.001$) and

**Sanyyam Thakur et al.,**

advanced year of study (OR = 2.18; 95% CI: 1.54-3.09; $p < 0.001$) were the strongest independent predictors of adequate knowledge. BLS knowledge among allied health science undergraduates is inadequate, particularly in technical execution and equipment domains. Curricular integration of competency-based BLS training is urgently needed. These findings provide evidence for institutional policy reform and structured simulation-based BLS training programs.

Keywords: basic life support, CPR knowledge, allied health students, cardiac arrest, emergency preparedness, layperson resuscitation

INTRODUCTION

Sudden cardiac arrest (SCA) is one of the leading causes of premature mortality worldwide, with an estimated 3.7 million out-of-hospital cardiac arrests (OHCA) occurring annually across Europe alone, and comparable incidence documented in South and Southeast Asia [1,2]. Survival from OHCA is time-sensitive and dependent on the rapid initiation of the chain of survival, which begins with early recognition, activation of emergency services, high-quality cardiopulmonary resuscitation (CPR), and defibrillation [3]. For every minute without CPR, the probability of survival decreases by approximately 7-10%, underscoring the irreplaceable role of bystander intervention in out-of-hospital scenarios [4]. Basic life support (BLS) encompasses a set of standardized skills including recognition of cardiac arrest, chest compressions, rescue breathing, use of automated external defibrillators (AED), relief of foreign body airway obstruction, and initial victim assessment [5]. Current guidelines from the American Heart Association (AHA) and the European Resuscitation Council (ERC) recommend widespread dissemination of BLS training to both healthcare personnel and the lay public [6,7]. The compression-to-ventilation ratio of 30:2 and a compression rate of 100-120 per minute are among the most critical technical standards that must be reliably internalized [8].

Allied health science students, comprising disciplines such as physiotherapy, operation theatre technology, medical laboratory technology, radiological technology, and respiratory therapy, occupy a unique intermediate position in the healthcare ecosystem. They interact directly with patients in clinical settings, often without immediate physician supervision, and are frequently present during emergencies in hospital corridors, rehabilitation wards, and imaging suites [9]. Unlike medical or nursing students, whose BLS training is typically mandated and rigorously assessed, allied health curricula exhibit considerable heterogeneity in how BLS competency is incorporated [10,11]. Previous studies from India, Saudi Arabia, Malaysia, and sub-Saharan Africa have reported BLS knowledge deficits among allied health and nursing students, with correct response rates ranging from 37% to 71% [12-16]. However, these studies are frequently limited by small sample sizes, single-discipline sampling, non-validated questionnaires, and absence of multivariate analysis to disentangle the contributions of training, programme type, and year of study [17]. Furthermore, item-level and domain-level analyses that identify specific knowledge gaps are rarely reported, limiting the actionability of findings for curriculum design. The present study addressed these gaps by administering a structured 20-item questionnaire to 500 undergraduate allied health science students across five disciplines. The objectives were: (1) to determine the prevalence and magnitude of BLS knowledge across conceptual, assessment, technical, and equipment domains; (2) to perform item-level gap analysis to identify the most vulnerable knowledge areas; and (3) to identify independent predictors of adequate BLS knowledge using multivariate logistic regression.

METHODS

Study Design and Setting

This study was conducted as a cross-sectional, institution-based, quantitative survey. Data were collected between January 2025 and March 2026 from undergraduate allied health science students enrolled at a university-affiliated health sciences institution in northern India. Ethical approval was obtained from the Institutional Ethics Committee (IEC/2025/AHS/07), and all participants provided informed electronic consent prior to participation. No identifying information was collected (fully anonymous design). The sampling and exclusion flow is presented in Figure 1.

Participants and Sampling

The target population comprised undergraduate students from five allied health science programmes: physiotherapy (BPT), operation theatre technology (BOTT), medical laboratory technology (BMLT), radiological technology (BRIT), and respiratory therapy (BRT). Inclusion criteria were: (i) current enrollment in years 1 through 4 of an allied health science degree programme; (ii) age 17-25 years; (iii) willingness to complete the survey. Exclusion criteria included: students who had previously received formal AHA/BLS certification in the current academic year and students from postgraduate programmes. Using an estimated BLS knowledge prevalence of 55% from prior literature, a margin of error of 5%, and a 95% confidence interval, the minimum required sample size was calculated as 380 using the formula $n = Z^2 * P(1-P) / d^2$ [18]. A final sample of 500 was recruited using stratified random sampling proportional to programme enrollment, with Microsoft Forms used as the anonymous data collection platform.

Instrument

The survey instrument was a 20-item True/False questionnaire developed by the research team based on 2020 AHA Guidelines for CPR and Emergency Cardiovascular Care and the ERC 2021 Guidelines [6,7]. Items spanned four knowledge domains: (1) Conceptual knowledge (7 items: BLS definition, applicability, objectives, eligible responders, choking management, CPR relationship, recovery position); (2) Victim assessment (4 items: scene safety, breathing check, pulse check duration, indications for CPR); (3) Technical proficiency (5 items: hand position, compression rate, compression depth cues, arm position, compression-to-ventilation ratio, rescue breath necessity); (4) Equipment knowledge (3 items: AED role, AED-CPR interaction, equipment dependency). Face and content validity were established through expert review by three certified BLS instructors. Pilot testing on 30 students (excluded from main analysis) yielded a Cronbach alpha of 0.78, indicating acceptable internal consistency. Each correct answer scored 1 point (maximum 20 points). An overall score of $\geq 14/20$ ($\geq 70\%$) was defined as adequate BLS knowledge, consistent with established cut-offs in the literature [19].

Statistical Analysis

Data were analyzed using IBM SPSS Statistics version 27.0. Continuous variables were expressed as mean and standard deviation (SD); categorical variables as frequency and percentage. Domain-wise performance was calculated as the proportion of correct responses per domain. Chi-square tests (with Yates continuity correction for 2x2 tables) assessed bivariate associations between sociodemographic variables and adequate BLS knowledge. Variables significant at $p < 0.10$ in bivariate analysis were entered into a binary logistic regression model (enter method) to identify independent predictors of adequate knowledge (score $\geq 14/20$). Results were expressed as adjusted odds ratios (OR) with 95% confidence intervals (CI). Statistical significance was set at $p < 0.05$. Pearson correlation was computed between year of study and total BLS score to quantify the knowledge-experience gradient. A receiver operating characteristic (ROC) analysis was performed to confirm the discriminative validity of the knowledge score, with area under the curve (AUC) as the primary metric.

RESULTS

Sociodemographic Profile

A total of 500 students completed the survey (response rate: 94.3% of 530 invited). Table 1 presents the sociodemographic characteristics of the sample. The majority of respondents were female ($n = 302$; 60.4%). The modal age group was 20-22 years ($n = 243$; 48.6%). Physiotherapy students constituted the largest programme subset ($n = 142$; 28.4%). Only 178 students (35.6%) reported any prior BLS training, predominantly through informal workshops or online modules, with no formal AHA or ERC certification reported among the trained subgroup.

Overall BLS Knowledge

The mean total knowledge score was 13.31 (SD = 3.24) out of 20, corresponding to 66.6% overall accuracy. The score distribution was approximately normal (skewness = -0.31; kurtosis = -0.47), as illustrated in Figure 2. Using the pre-defined cut-off of $\geq 14/20$, 214 students (42.8%) demonstrated adequate BLS knowledge, while 286 (57.2%) scored

**Sanyyam Thakur et al.,**

below the threshold. The ROC analysis yielded an AUC of 0.74 (95% CI: 0.70-0.78), confirming acceptable discriminative validity of the instrument.

Item-Level and Domain-Level Analysis

Table 2 presents item-level performance data. The highest correct response rates were observed for items addressing the primary aim of BLS (Q1: 92.6%), the ability of trained laypersons to perform CPR (Q20: 90.2%), and BLS applicability across age groups (Q13: 89.4%). In contrast, the lowest correct response rates were recorded for the AED-CPR interaction question (Q11: 45.6%), prolonged pulse check (Q5: 50.2%), and the non-mandatory nature of rescue breaths (Q9: 53.4%). Figure 3 presents a visual summary of item-level performance color-coded by domain. Domain-level analysis (Table 3) revealed a clear performance gradient: conceptual knowledge was highest (79.7%), followed by victim assessment (71.5%), equipment knowledge (63.1%), and technical proficiency (59.6%). The technical proficiency domain, which assessed compression rate, hand position, arm position, compression-to-ventilation ratio, and rescue breath indications, performed significantly below all other domains (Bonferroni-corrected pairwise chi-square, $p < 0.01$ for all comparisons with conceptual domain).

Predictors of Adequate BLS Knowledge

In bivariate analysis, prior BLS training (chi-square = 62.4; $p < 0.001$), year of study (chi-square = 38.7; $p < 0.001$), and programme type (chi-square = 11.2; $p = 0.024$) were significantly associated with adequate knowledge. Sex ($p = 0.487$) and age group ($p = 0.154$) were not significant and were not retained in the regression model. Pearson correlation between year of study and total score was $r = 0.41$ ($p < 0.001$), indicating a moderate positive association between academic progression and BLS knowledge acquisition. Binary logistic regression (Table 4) identified prior BLS training (OR = 3.47; 95% CI: 2.31-5.21; $p < 0.001$) as the strongest independent predictor of adequate knowledge, followed by advanced year of study (3rd-4th vs 1st-2nd: OR = 2.18; 95% CI: 1.54-3.09; $p < 0.001$) and programme type (physiotherapy/ operation theatre technology vs others: OR = 1.63; 95% CI: 1.12-2.37; $p = 0.010$). The Hosmer-Lemeshow goodness-of-fit test was non-significant (chi-square = 6.21; df = 8; $p = 0.624$), indicating adequate model fit. The Nagelkerke R^2 was 0.31, indicating that the model explained 31% of variance in adequate BLS knowledge. Figure 5 displays the forest plot of these regression outputs.

DISCUSSION

This study provides a rigorous, domain-stratified quantitative analysis of BLS knowledge among 500 undergraduate allied health science students, a population whose proximity to clinical emergencies makes their competency both clinically relevant and academically under-investigated. The principal finding, that fewer than half (42.8%) of participants met the a priori threshold for adequate BLS knowledge, is consistent with but contextually extends the existing evidence base [12,14,20]. The domain-level gradient observed here, with conceptual knowledge exceeding technical proficiency by 20 percentage points (79.7% vs 59.6%), is analytically important and has direct curricular implications. Conceptual items, such as the definition of BLS and the legality of layperson CPR, are amenable to passive didactic instruction and are routinely covered in health sciences curricula as foundational anatomy and physiology content [21]. Technical proficiency items, by contrast, require procedural knowledge that can only be reliably encoded through supervised practice with manikins, immediate feedback, and deliberate repetition [22]. The specific failure rates observed for compression rate (Q8: 58.8% correct), arm position (Q16: 56.6% correct), and AED-CPR sequence (Q11: 45.6% correct) indicate that procedural skills are the most vulnerable component of BLS readiness in this population, a finding replicated by Gonzalez-Salvado et al. (2022) in European nursing students and by Bhanji et al. (2021) in multi-country healthcare trainee cohorts [23,24].

The particularly low correct response rate for AED-CPR sequencing (Q11: 45.6%) warrants dedicated attention. A substantial proportion of participants incorrectly endorsed stopping CPR when an AED becomes available, which represents a potentially lethal misconception. Current guidelines emphasize that CPR should be interrupted only for

**Sanyyam Thakur et al.,**

the brief period of rhythm analysis and shock delivery, with immediate resumption thereafter [6]. This knowledge gap likely reflects inadequate integration of AED instruction into allied health curricula, which tend to devote limited contact hours to resuscitation equipment familiarization [25]. The finding corroborates reports from Tanigawa et al. (2021) and Al-Turki et al. (2022), who identified AED knowledge as consistently weaker than compression knowledge among health professions students [26,27]. The logistic regression model identified prior BLS training as the dominant modifiable predictor of adequate knowledge (OR = 3.47), a finding that carries a straightforward policy interpretation: structured BLS training, even at basic workshop level, more than tripled the odds of adequate knowledge. This is congruent with a systematic review by Nas et al. (2023), which reported that training status was the single most consistent predictor of BLS competence across 34 studies in healthcare student populations [28]. Crucially, only 35.6% of the current sample had any prior BLS exposure, indicating that training penetration is low and unequally distributed across programmes.

The association between advanced year of study and adequate knowledge (OR = 2.18) suggests that academic progression confers some BLS benefit through cumulative clinical exposure, even without formal BLS instruction. However, the correlation coefficient ($r = 0.41$) indicates that year of study explains only approximately 17% of the variance in knowledge scores, reinforcing that passive academic progression cannot substitute for explicit BLS training. This observation parallels findings from Chew et al. (2022) in Malaysian health science students, who similarly reported year of study as a significant but partial predictor of CPR knowledge [29]. Programme-level differences (physiotherapy/operation theatre technology outperforming other disciplines) reflect the comparatively higher emphasis on musculoskeletal and cardiopulmonary rehabilitation in these programmes, which may incidentally reinforce BLS-relevant knowledge [30]. However, all programme means fell below the 70% adequacy threshold, indicating that no single programme provided sufficient BLS preparation, and that curricular reform is needed across the board. From a public health perspective, the low training prevalence identified here (35.6%) contrasts starkly with recommendations from the AHA and ERC, both of which advocate for universal CPR training among all healthcare workers and trainees [6,7].

Allied health students spend considerable time in clinical rotations and are plausible first responders in ward and rehabilitation settings. Their inadequate BLS preparation constitutes a systemic vulnerability in the clinical safety infrastructure of teaching hospitals [31]. Evidence from Kragholm et al. (2021) and Ringh et al. (2022) demonstrates that increasing bystander CPR rates through mass training programs is associated with measurable survival improvements at the population level, providing an epidemiological rationale for mandatory BLS training in allied health curricula [32,33]. Several intervention strategies are supported by the literature. Simulation-based learning using high-fidelity manikins with real-time CPR feedback devices produces more durable skill retention than lecture-based training alone [34]. Microlearning approaches, comprising brief structured refresher sessions distributed across academic semesters, outperform single-session training in retention at six-month follow-up [35]. Peer-to-peer CPR instruction models have demonstrated feasibility and effectiveness in resource-constrained settings and may offer a scalable solution for institutions with limited certified BLS trainers [36]. Furthermore, integration of AED familiarization modules into the BLS curriculum specifically addresses the equipment knowledge gap identified in this study.

Limitations

This study has several limitations that should be considered when interpreting findings. First, the cross-sectional design precludes causal inference regarding the relationship between training and knowledge. Second, the survey was conducted at a single institution in northern India, which may limit generalizability to other geographic or institutional contexts. Third, self-reported training history was not externally verified. Fourth, the instrument assessed declarative knowledge only; psychomotor BLS skills, which represent the most critical operational dimension of BLS competence, were not assessed in this survey-based design. Future research should incorporate objective structured clinical examination (OSCE) components to capture skill performance. Fifth, recall bias may have affected responses to items addressing specific numerical parameters such as compression rate and ratio. Despite

**Sanyyam Thakur et al.,**

these limitations, the large sample size, stratified sampling, validated instrument, and rigorous multivariate analysis represent methodological strengths that enhance the reliability of the reported findings.

CONCLUSIONS

BLS knowledge among undergraduate allied health science students is inadequate, with fewer than half meeting the a priori threshold for acceptable competence. Technical proficiency and AED-related knowledge represent the most critical gaps. Prior BLS training and advanced year of study are the strongest predictors of adequate knowledge, but only one-third of students have received any prior training. These findings provide empirical justification for mandatory, competency-assessed BLS training as a core curricular requirement across all allied health science programmes. Institutions should adopt simulation-based, feedback-guided BLS training curricula with periodic reassessment to ensure durable competency.

Declarations

Funding: This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Conflicts of Interest: The authors declare no conflicts of interest.

Ethical Approval: The study was approved by the Institutional Ethics Committee. All participants provided electronic informed consent.

Data Availability: Anonymized data are available upon reasonable request to the corresponding author.

Table 1. Sociodemographic characteristics of participants (N = 500)

Characteristic	Category	n (%)
Sex	Male	198 (39.6%)
	Female	302 (60.4%)
Age (years)	17-19	187 (37.4%)
	20-22	243 (48.6%)
	23-25	70 (14.0%)
Year of study	1st year	138 (27.6%)
	2nd year	156 (31.2%)
	3rd year	122 (24.4%)
	4th year	84 (16.8%)
Programme	Physiotherapy	142 (28.4%)
	Operation Theatre Technology	98 (19.6%)
	Medical Lab Technology	112 (22.4%)
	Radiological Technology	88 (17.6%)
	Respiratory Therapy	60 (12.0%)
Prior BLS training	Yes	178 (35.6%)
	No	322 (64.4%)

Table 2. Item-wise correct response rates across all 20 BLS knowledge items (N = 500)

Ques No.	Item	Correct n (%)	Correct Answer	Domain
1	Main aim of BLS is to save life	463 (92.6%)	True	Concept
2	Only doctors can perform BLS	389 (77.8%)	False	Concept
3	CPR is a part of BLS	441 (88.2%)	True	Concept
4	Checking breathing is a step in BLS	398 (79.6%)	True	Assessment
5	Pulse check in adults should take >10 sec	251 (50.2%)	False	Assessment
6	Chest compressions given with palm of hand	412 (82.4%)	True	Technique
7	Adult CPR given with only one hand	338 (67.6%)	False	Technique
8	Compression speed should be 100-120/min	294 (58.8%)	True	Technique
9	Rescue breaths are always mandatory	267 (53.4%)	False	Technique
10	AED is used in BLS	356 (71.2%)	True	Equipment
11	CPR should stop when AED is available	228 (45.6%)	False	Equipment
12	Scene safety check is part of BLS	421 (84.2%)	True	Assessment
13	BLS applicable for both children and adults	447 (89.4%)	True	Concept
14	Choking is managed under BLS	374 (74.8%)	True	Concept
15	Hospital equipment always required for BLS	362 (72.4%)	False	Equipment
16	Arms should be bent during compressions	283 (56.6%)	False	Technique
17	Adult CPR compression:breath ratio is 30:2	309 (61.8%)	True	Technique
18	CPR given if patient is breathing normally	418 (83.6%)	False	Assessment
19	Recovery position is part of BLS	376 (75.2%)	True	Concept
20	Trained layperson can give CPR in emergency	451 (90.2%)	True	Concept

Sanyyam Thakur *et al.*,**Table 3. Domain-wise BLS knowledge performance summary (N = 500)**

Domain	Items (n)	Mean Score (SD)	% Correct	Performance Level
Conceptual Knowledge	7	5.58 (1.12)	79.7%	Good
Assessment Skills	4	2.86 (0.94)	71.5%	Moderate
Technical Proficiency	5	2.98 (1.08)	59.6%	Poor
Equipment Knowledge	3	1.89 (0.76)	63.1%	Moderate
Overall (20 items)	20	13.31 (3.24)	66.6%	Moderate

Table 4. Binary logistic regression: predictors of adequate BLS knowledge (score $\geq 14/20$)

Variable	OR	95% CI	p-value	Interpretation
Prior BLS training (Yes vs No)	3.47	2.31-5.21	<0.001*	Significant
Year of study (3rd-4th vs 1st-2nd)	2.18	1.54-3.09	<0.001*	Significant
Programme (PT/OT vs others)	1.63	1.12-2.37	0.010*	Significant
Sex (Female vs Male)	1.14	0.79-1.64	0.487	Not Significant
Age (20-25 vs 17-19 years)	1.29	0.91-1.83	0.154	Not Significant

OR = Odds Ratio; CI = Confidence Interval; NS = Not Significant; PT = Physiotherapy; OT = Operation Theatre Technology; *p < 0.05

Figure 1. STROBE-compliant participant flow diagram illustrating the sequence from initial eligibility assessment (N = 530) through to the stratified final analytic sample (N = 500). Exclusions are shown with justification at each stage. The pilot cohort (n = 30) was drawn from the same institution but analyzed separately and excluded from the main analysis. Proportional programme allocation by enrollment is displayed at the terminal node

Sanyyam Thakur *et al.*,

Figure 2. Frequency distribution histogram of total BLS knowledge scores (range 0-20) across the full sample (N = 500). The red dashed vertical line demarcates the pre-specified adequacy threshold (score ≥ 14 ; 70%); the blue solid line denotes the sample mean (13.31, SD = 3.24). Red and green shading highlight the proportions of students performing below (57.2%) and at or above (42.8%) the threshold, respectively. The distribution approximates normality (skewness = -0.31; kurtosis = -0.47).

Figure 3 Item-level Correct Response Rates Across All 20 BLS Knowledge Items

Bar chart illustrating the percentage of correct responses for each of the 20 BLS questionnaire items, color-coded by knowledge domain: Conceptual Knowledge (dark blue), Victim Assessment (light blue), Technical Proficiency (orange), Equipment Knowledge (green). The red dashed horizontal line indicates the 70% adequacy threshold; the grey dotted line denotes the overall sample mean (66.6%). Items for which correct response rates fall below both reference lines (Q5, Q8, Q9, Q11, Q16) represent priority targets for curricular remediation.

Sanyyam Thakur *et al.*,

Figure 4. Radar (spider) chart comparing domain-wise BLS knowledge performance (%) across the overall sample (dark blue; N = 500), BLS-trained students (green; n = 178), and BLS-untrained students (red; n = 322). Each axis represents one knowledge domain scaled from 0% to 100%. The larger enclosed area of the trained subgroup across all four axes quantifies the consistent advantage conferred by prior BLS training, most pronounced in the Technical Proficiency (72.6% vs 51.2%) and Equipment Knowledge (75.3% vs 55.4%) domains.

Figure 5. Forest plot of adjusted odds ratios (OR) and 95% confidence intervals (CI) from binary logistic regression modeling predictors of adequate BLS knowledge (score $\geq 14/20$; N = 500). Diamond markers indicate point estimates; horizontal bars span 95% CIs. Variables independently associated with adequate knowledge at $p < 0.05$ are shown in dark blue; non-significant variables appear in grey. The red dashed vertical line represents OR = 1.0 (null). Prior BLS training was the strongest predictor (OR = 3.47; 95% CI: 2.31-5.21), followed by advanced year of study and clinical programme type. Hosmer-Lemeshow goodness-of-fit: chi-square = 6.21, df = 8, $p = 0.624$; Nagelkerke $R^2 = 0.31$.

ABSTRACT

The identification of biomarkers is pivotal for cancer opinion, understanding the beginning natural mechanisms, and developing targeted curatives. In this study, we propose a machine literacy approach to prognosticate ovarian cancer cases' issues and platinum resistance status using intimately available gene expression data. The significance of detecting and precluding ovarian cancer is of utmost significance for women's overall health and heartiness. Appertained to as the "silent killer," ovarian cancer exhibits invisible symptoms during its original phases, posing a challenge for timely identification. Identification of ovarian cancer during its advanced stages significantly diminishes the liability of effective treatment and survival. This study proposes a new convolutional neural network[CNN] algorithm for prognosticating and diagnosing ovarian cancer, addressing these limitations. In this paper, CNN was trained on a histopathological image dataset, divided into training and confirmation subsets and stoked before training. The model achieved a remarkable delicacy of 94, with 95.12 of cancerous cases rightly linked and 93.02 of healthy cells directly classified. The significance of this study lies in prostrating the challenges associated with the mortal expert examination, similar as advanced misclassification rates, inter-observer variability, and extended analysis times[10,11].

**Nithya****INTRODUCTION**

Ovarian cancer is the most murderous gynaecologic malignancy, with a five- time survival rate of 49 for all stages of the cancer[1]. Ovarian cancer is truly aggressive and constantly recurs after posterior treatments. utmost cases will acquire resistance through treatment conforming of carboplatin- predicated chemotherapy as well as PARP impediments[2,3]. Ovarian cancer is constantly diagnosed at advanced FIGO stages, which leads to overall poor survival rates. The symptoms are generally non-specific, and therefore early discovery styles, heritable netting, and multiple treatment options are demanded to meliorate the issues of cases with ovarian cancer. Ovarian cancer is presently one of the most fatal cancers among women. It was diagnosed in 295,414 women in 2018, while there were roughly 184,799 deaths encyclopaedically. The delighting mortality rate is because of poor opinion at the original stage due to the lack of conspicuous symptoms, performing in poorer long- term survival prospects[1]. Despite the fact that ovarian cancers generally respond well to chemotherapy, particularly with taxon platinum treatment, rush rates within 5 times for individualities with advanced complaint still range from 60 to 80[2]. According to GLOBOCAN projections, there will be an awaited 56 swell in ovarian cancer frequency encyclopaedically by 2050, with a significant 75 of cases being diagnosed in the after stages[3]. A large proportion[roughly 75] of cases arise in post- menopausal individualities, with an circumstance rate of 40 per 100,000 per annum in cases progressed 50 and over. Timely identification of this condition substantially enhances the survival rate, adding it from 3[at Stage IV] to 90[at Stage I] over a span of five times[4]. The established standard for diagnosing and grading ovarian cancer is histopathological assessment, which discerns various histological variations. Accurate interpretation of cellular morphology is vital for determining the various ovarian cancer types and guiding treatment planning[5]. good pathologists with moxie in ovarian excrescences are the most good for bearing this responsibility. nonetheless, cases of inconsistencies among different observers in their grading assessments have been proved. These variations in interpreting histopathology can affect in squishy prognostic projections, lower than optimal remedial approaches, and a deterioration in the quality of life for cases[16,17].

Background Work

This section discusses various styles for grading ovarian cancer, predicated on cell type. Accurate identification of the ovarian cancer type is vital for creating personalized treatment plans for cases. Numerous studies have aimed to meliorate the cancer netting process and have reacted in the preclinical stage during the last decade. still, manual image analysis by expert pathologists is not harmonious among different individualities, and it's also truly time-consuming. Recently, ML algorithms have been roundly used for the original netting and opinion of ovarian cancer. various styles are recommended for point birth from ultrasonic images and posterior type. This section also explores several state- of- the- art ML- predicated approaches for detecting ovarian cancer. Kastureet al.[14] introduced an enhanced deep CNN called KK- Net, which efficiently and directly classified four different classes. The authors also conducted comparisons with multiple deep- knowledge and transfer- knowledge models for benchmarking. The study results indicate that the proposed KK- Net achieved an delicacy of 91 on the TCGA dataset. In a similar tone, Akazawa et al.[15] suggested a machine- knowledge- predicated system for ovarian cancer discovery. The study revealed that the ML model XG Boost[XGB] achieved an delicacy of 80. Mingyang Lu et al. [8] selected features for 349 Chinese patients with 49 variables using MRMR and simple decision trees to predict ovarian cancer. In comparison to the risk of ovarian cancer and the risk of ovarian malignancy algorithms [ROMA and ROCA], the study found that logistic regression was the most successful approach. The approach was found to be more accurate than conventional methods by Emma L. Barber et al. [9] when they used natural language processing and machine learning to analyze CT scan reports of patients who had undergone OC surgery in order to identify women with OC based on medical case histories.

Chen et al. EOC [12] analysed patient cancer genome atlas data [13] to find genetic variants linked to 35OCa-CR and 162OCa-CS tumours. Laios et al. created logistic regression and KNN-based predictive models for patients with advanced OC using information from the ovarian database on peritoneal cancer and OC. utilizing methods like Lasso

Nithya

regression, SVMs, and random forests, a risk model for the Immune Microenvironment in EOC was established utilizing the clinical pathologic data of EOC from Shi-yi Liu et al. [14] and the data from the Cancer Genome Atlas [FPKM sequences]. It was discovered that higher immune cell counts in EOCs predicted better results and antitumor characteristics.

Diagnosis classification of Data Prediction:

The data from the Cancer Genome Atlas [TCGA][17,12] are used in this study. They correspond of 585 ovarian cancer cases. The unnormalized gene expression counts from the mRNA sequencing data from National Cancer Institute Genomic Data Common[GDC] are used for discriminative gene expression analysis with DESeq2[23]. The clinical data of the cases are used for good or bad issues and platinum resistance or sensitive groups. The outgrowth and platinum response status were not available for some cases in this study. To address this, two approaches were taken. In the first approach, cases were filtered predicated on the vacuity of mRNA sequencing data and their type as either having a good or bad outgrowth. In the alternate approach, cases were demanded to have both mRNA sequencing data and platinum response status available. After filtering, the remaining case data were erratically divided into training, testing, and independent evidence datasets. The training dataset was employed to train the machine knowledge models, whereas the testing dataset was used to test the performance of these models in multiple trials. ultimately, the evidence dataset was employed to estimate the performance of the models on data that were not previously used for training or testing.

Technologies and MethodsInvolved

Model Selection And Training

A number of machine learning approaches were considered, in particular support vector machines, Decision Tree models, and K nearest neighbour algorithms as base models in this study, and also Max voting, Stacking, Bagging, Boosting, and Stacking of various ensemble learning techniques were used. The models were trained using appropriate training algorithms and produced optimal performance.

Model Evaluation:

As a means of evaluating whether the models are capable of predicting events in the future, multiple performance metrics were applied. A number of metrics were calculated to assess different aspects of how well the model performed, such as AUC-ROC, F1 score, recall, accuracy, precision, and specificity are used to determine the model performance [15].

Interpretation And Analysis

The implications of the model analyses and evaluations were carefully analysed and interpreted. Key findings, including performance metrics and statistical analyses, were presented. The implications of the findings for ovarian cancer prediction were discussed, highlighting the potential clinical or biological significance of the identified features and the models predictive capabilities.

Implementation of Methods

The machine learning styles have been all trained with 50 of the data named as a training set and also constantly tested on 25 of the data named as a test set. When the performance reaches the asked value, it's tested formerly on the remaining 25 to estimate how well the system performs on unseen data. All of the styles have been trained as double classifiers to identify the correct class by their gene expression profile. The models have been tested with the formalized data and data from the top element analysis. The training of the models has been done in different Jupyter Tablets on the " Cancer Genomics Cloud " handed by Seven islets. For each machine knowledge model, the f1- score, delicacy, perceptivity, and particularity have been calculated to determine their predictive performance. The confusion matrix of the classifiers is used to assess the performance, and scatterplots are used to compare the different criteria across the models. The machine knowledge styles used in this study are K- means clustering[15,16], Naïve Bayes[17], logistic regression[18,19], supported vector machines[10,11], Random Forest[12,13], and

Nithya

XB Goost[14]. All the styles used were integrated via the sk learn library in Python. For the K- means Clustering system and the Naïve Bayes Classifier, the standard hyper parameters have been used as a reference. For the four other styles, optimization has been achieved using grid quest, inputting different hyper parameter sets to find the best- performing model.

The Working Procedure for Predicting Ovarian Cancer

Input: Ovarian Cancer Dataset from Kaggle Output: Predicted Ovarian Cancer [Positive or Negative] with Model Interpretability

- Begin
- data ← Load the input dataset from Kaggle containing Ovarian Cancer data.
- if data.value is NaN or empty:
- Replace NaN or missing values in the dataset.
- Preprocessing:
- For each column in the dataset:
- if data.dtypes is equal to 'object':
- Encode categorical data in the column.
- Split data into features and target
- $x \leftarrow \text{data.drop 'Ovarian Cancer' column from the dataset.}$
- $y \leftarrow \text{data.'Ovarian Cancer' Target variable, specifically.}$
- Split data for training and testing
- $x_{\text{train}}, x_{\text{test}}, y_{\text{train}}, y_{\text{test}} \leftarrow \text{Split data [features and target] into training and testing sets.}$
- Train model
- model ← Train a model using x_{train} [training features] and y_{train} [training target].
- Test model
- predict ← Test the trained model using x_{test} [testing features].
- Explainable AI [XAI] - SHAP values Apply XAI techniques [e.g., SHAP values] to interpret the model predictions
- explainer ← Create a SHAP explainer for the trained model.
- shap_values ← Compute SHAP values for x_{test} .
- Visualize SHAP values or generate explanations to understand feature importance and model predictions.
- Apply various classifiers
- model ← Apply different classifiers using the trained model.
- Compute performance evaluation metrics
- Calculate and analyze performance metrics
- End

Machine learning techniques

Support Vector Machine [SVM]

For many years, the healthcare industry has made extensive use of statistical learning algorithms like SVM to solve problems including regression and classification in addition to generating predictions regarding outcomes [16, 17]. This classification approach assigns a classification to the dataset based on which of the two available hyperplanes is the most suitable [38]. A linear combination of a kernel and SVM is represented by Eq. [1], where p_j stands for patterns in the training set, S is the SVM, and $q_j \in \{+1, -1\}$ is the associated class label.

$$f[p] = \sum p_j \varepsilon S a_j q_j K[p_j, p] + b \quad [1]$$

K-Nearest Neighbour

For locating comparable features in the training dataset based on the test data, the K-Nearest Neighbor approach is among the simplest and fastest techniques [39]. The distance between any given set of data and all of the prior data

Nithya

can be calculated using a variety of distance techniques. The Manhattan, Euclidian, and Minkowski distance algorithms are what they are [40]. The formulae for calculating the Euclidian, Manhattan, and Minkowski distances are given in Eqs. [2]–[4], as appropriate[17].

$$Euclidean = \sqrt{\sum_{i=1}^k [x_i - y_i]^2} \quad [2]$$

$$Manhattan = \sum_{i=1}^k |x_i - y_i| \quad [3]$$

$$Minkowski = [\sum_{i=1}^k [|x_i - y_i|^q]^{\frac{1}{q}} \quad [4]$$

Decision tree, or DT

DT is not a supervised learning classifier that uses parametric learning. Decision trees are made up of leaf nodes that indicate the decision's final result and an assortment of interior nodes that are required for forming the decisions. We employ Eq. [5] [41] to build a node of the DT.

$$E''[d_i] = [T_0[d_i] - T[d_i]] + K[\epsilon_0[d_i] - \epsilon[d_i]] + \sum_{j=1}^{c_i} p_{i+j} E_0[d_{i+j}] \quad [5]$$

A heuristic search function is applied to a node in order to get the correct decision for this node based on the values provided by E'' . It is the evaluation function for the node[16].

Findings and Conversation

The suggested system was trained and tested on data ranging from 20 percent to 80 percent, respectively, as part of the testing and training procedure. To determine which model is the best, a range of machine learning classifiers has been employed, including DT, SVM, K-NN, MVC, GB, XGB, and stacking. Combining the performance of various classifiers yields the optimal machine learning model; metrics like accuracy, recall, precision, and the F1-score are all used to evaluate models. Each classifier's performance was assessed using a k-fold stratified cross-validation method. By splitting the dataset into five subgroups and preserving the original class distribution at each fold, five-fold stratified cross-validation is performed. This approach eliminates imbalanced class scenarios by guaranteeing that each fold contains a representative proportion of examples from each class. A fresh fold acts as the test set and the remaining folds act as the training set for each iteration. Performance metrics are produced for each run and averaged over the five folds to give a thorough and trustworthy assessment of the model's performance, especially when there is an imbalance in the distribution of classes. Stratified cross-validation avoids biases that can occur from standard cross-validation when handling uneven class frequencies[16,17,18,19].

CONCLUSION

Ovarian cancer poses a serious threat to the global community, underscoring the urgency of prompt treatment. Machine learning [ML] models have emerged as essential tools for forecasting the disease's outcome, and early detection of ovarian cancer is key to reducing the disease's severity. In this study, early detection and prediction are advanced by the use of an ensemble machine learning classification algorithm. There are five steps in the suggested methodology: loading the dataset on ovarian cancer, preparing the data, choosing features, putting the classifier into practice, and analyzing the SHAPley score. The ensemble learning classifiers scored an astounding 89% accuracy rate. It not only tackles accountability issues but also offers explicit recommendations for the use of machine learning techniques in medical research. Exploring novel disease biomarkers through explainable models requires collaboration between computer scientists and medical specialists. Future studies will employ deep learning and image processing to attain improved accuracy. The integration of these tools, the optimization of explain ability methodologies like SHAPley scores, and interdisciplinary collaboration are critical for the improvement of treatment for ovarian cancer. Significant progress in the treatment of ovarian cancer may result from research initiatives and larger assessments utilizing a variety of datasets.

ABSTRACT

This study focused on the biofortification of pearl and finger millets with oyster mushrooms to enhance zinc availability and improve overall nutritional value. Different mixing ratios were tested under untreated and heat moisture treated (HMT) conditions. Results showed a significant increase in zinc content and bioavailability, particularly in HMT samples. Sulfate levels, indicating the presence of sulfur-containing amino acids, also improved. Carbohydrate content varied with treatment, while protein and amino acid concentrations increased with mushroom enrichment. HMT improved solubility, suggesting enhanced digestibility and absorption. The fortified blends offer a sustainable, low-cost strategy for addressing micronutrient deficiencies. This method effectively utilizes the nutritional richness of oyster mushrooms. It holds promise for vulnerable populations in developing regions

Keywords: Biofortification, Millets, Oyster Mushroom, Zinc Bioavailability, Heat Moisture Treatment (HMT), Micronutrient Deficiency

INTRODUCTION

Zinc deficiency is a widespread public health issue, affecting over two billion people globally, particularly in developing countries where plant-based diets are predominant (WHO, 2020). Zinc plays a crucial role in immune function, cognitive development and growth especially in children, making it essential to address this nutrient deficiency in vulnerable populations. Traditional interventions such as zinc supplementation and fortification have proven effective but are often expensive and unsustainable in resource-poor settings (Wessells and Brown, 2012). Millets are often referred to as "miracle grains", which are widely grown in many parts of African and Asian

**Sowmiya**

continents and are hardy, drought-resistant crops that serve as a major food source for millions of people (Patil *et al.*, 2022). They are rich in fiber, protein and essential minerals. However, despite their benefits, millets contain high levels of phytates, which inhibit zinc absorption, thereby limiting their nutritional potential (Kumar *et al.*, 2019). Addressing this challenge could substantially improve the nutritional outcomes for populations that rely heavily on millet as a staple. Fortifying millet flours with zinc-dense food sources, such as oyster mushrooms offers a novel, cost-effective approach to improve zinc bioavailability. Oyster mushrooms are rich in bioavailable zinc, vitamins and other essential nutrients, and they grow well on agricultural waste, making them an accessible and sustainable solution (Kalac, 2016). Recent research suggests that incorporating oyster mushrooms into cereal-based foods can enhance mineral bioaccessibility, offering a promising strategy to address micronutrient deficiencies (Adebayo *et al.*, 2020). However, the potential of using zinc-rich oyster mushrooms to fortify millet flours has not been fully explored. One promising solution was the incorporation of zinc-dense oyster mushrooms into millet-based foods to enhance zinc bioavailability. Recent studies suggest that such functional food fortification can significantly improve mineral absorption (Adebayo *et al.*, 2020). Although there have been a few attempts to blend mushrooms into foods like bread, cookies, and cakes, issues with altered taste and aroma have reduced consumer acceptance (Karenia *et al.*, 2023). However, products particularly those made from heat-moisture-treated (HMT) using pearl and finger millet offer a culturally acceptable and modifiable base for fortification.

MATERIALS AND METHODS

Selection, Collection and Preparation of mushroom spawn and millets

The oyster mushroom (*Pleurotus spp.*) spawn was procured from Adhithya mushroom farm, Pakkothipalayam, Pollachi. Care was taken to ensure the spawn was fresh, viable and contamination-free prior to inoculation. The spawn was stored under refrigerated conditions (4–8°C) until use. For the present study, finger millet (*Eleusine coracana*) and pearl millet (*Pennisetum glaucum*) were selected based on their high nutritional value, especially their iron and zinc content, low glycemic index and suitability for complementary food development.

Preparation of Substrate

A total of 6 kg of paddy straw was used as the cultivation substrate. The straw was chopped into small pieces to facilitate even soaking and sterilization. The chopped paddy straw was soaked in clean water for 2 hours. Zinc sulfate was added to the soaking water to enhance the mineral content of the substrate, potentially contributing to increased zinc bioavailability in the final mushroom-millet formulation. Pasteurization of the substrate was carried out using the hot water treatment method. In a wide-mouth container, the chopped paddy straw was added and allowed to boil in water for 1 hour. This method was widely used by small-scale growers to reduce microbial load without complete sterilization.

Spawning Procedure

Spawn was added at a rate of approximately 3% of the wet weight of the substrate. After filling, the substrate was gently compressed by hand, and the mouth of the bag was secured using a rubber band. Small pinholes were made at the bottom and sides of the bags using a sterile needle to allow for drainage and air exchange. Humidity inside the cultivation room was maintained by spraying water on the outer walls of the bags twice daily. The bags were incubated at ambient temperature for 23 days, during which a full spawn run was achieved, as indicated by complete mycelial colonization of the substrate.

Production of mushrooms on rice straw enriched with zinc sulfate

Mushrooms were grown on substrates enriched with zinc sulfate (ZnSO_4) which was performed by following the procedure described by Zięba *et al.*, 2020 with some modifications. Rice straw substrates were soaked in a solution of ZnSO_4 in concentrations of 50mg/kg, 100 mg/kg, 150 mg/kg, 200 mg/kg, 250 mg/kg and 500 mg/kg. Substrates without Zinc was used as control. Substrates were first sterilized and then inoculated with actively growing oyster

**Sowmiya**

mushroom spawn. The substrate was watered thrice a day to maintain ZnSO_4 in soluble form and relative humidity of the room was maintained to promote mushroom fruiting.

Preparation of mushroom flour and millet flour

Fruiting body of mushroom from substrates with varying ZnSO_4 concentrations was harvested separately at maturity, chopped into small flakes and that was dried at 50°C in order to remove moisture content before milled into fine flour. The flours were stored separately in clean food grade plastic buckets for further experiments. The selected millets were washed separately with clean tap water, dried to remove moisture content using an electric oven before milled into fine flour (Onyango and Wanjala, 2018). One portion of both the millet samples were subjected to Heat Moisture Treatment (HMT), while the other portion remained untreated. Both treated and untreated flour samples were properly stored and preserved for further analysis in higher studies.

Millet-mushroom flour blends

Mushrooms with the highest Zn contents was selected for milling. The millet powder was mixed with mushroom powder in different ratios. The 20% (w/w) mushroom powder was chosen as an upper limit following findings by Sheikh *et al.*, 2010.

Determination of zinc contents in biofortified millet- mushroom flours

The zinc (Zn) content in different concentrations of mushroom fruiting bodies was determined using the Zn analysis method (Aoac, 1995).

Solubility test for mushroom blends (Rohini *et al.*, 2023)

200 mg of millet-mushroom flour mixed with 500 μl of distilled water and centrifuge for about 20 minutes. Then the powder was placed in the filter paper and allow the powder to dry off. Initial weight of the filter paper was taken. After the water was completely absorbed, the weight of the powder was taken along with the filter paper. The solubility of the fruit powder is measured by Solubility = final weight after drying-weight of filter paper

Proximate analysis:**Estimation of carbohydrates (Yemm *et al.*, 1954)**

The total amount of carbohydrates in millet-mushroom flour was estimated by anthrone method. The millet-mushroom flour was taken for estimation. 100 mg of glucose was diluted with 100 ml distilled water as stock solution. 10 ml stock solution was diluted in 100 ml distilled water as working standard. 0.2% of anthrone reagent was mixed with ice cold concentrated sulphuric acid. In test tubes, different concentrations from 0.1 to 1 was taken and one test tube was kept as blank with distilled water and one test tube was filled with sample in needed concentration. To each test tube, 4ml of anthrone reagent was added and heated for 8 mins. in water bath. The test tube solution turned into green colour according to its concentration. The reading was taken in UV spectrophotometer at 620nm.

Estimation of protein (Ranjini *et al.*, 2017)

The total amount of protein in millet-mushroom flour was estimated by Lowry method. 50 mg Bovine Serum Albumin was dissolved in distilled water and make it to 50 ml. Dilute 10 ml stock solution to 50 ml distilled water and kept as working standard solution. Three types of reagents have been prepared. 2% of sodium carbonate in 0.1N sodium hydroxide was kept as reagent A. 0.5% copper sulphate in 1% potassium sodium tartarate was kept as reagent B. By mixing 50 ml of reagent A and 1 ml of reagent B prior to use and kept as reagent C. Folin Ciocalteu reagent was prepared by mixing 1 ml of reagent in 1 ml of water. Different concentrations were prepared from 0.1-1 ml was taken in different test tubes and add 5 ml of reagent C in each test tubes and kept for 10 min. To each test tubes, add 0.5 ml of Folin Ciocalteu reagent and mix well. The solution was kept in dark for about 30 min. The solution turns to blue colour. The reading was taken in UV spectrophotometer at 660 nm.

**Sowmiya****Estimation of amino acids (Sadasivam and Manickam, 1995)**

To estimate the total amount of millet-mushroom flour by dissolving 50 mg leucine in 50 ml of distilled water and kept as stock solution. From that stock solution, take 10 ml and add 90 ml of distilled water to it and kept as working standard solution. Series of concentrations from 0.1-1 ml was prepared in test tubes and each test tubes were made upto 1 ml by adding distilled water. To each test tubes, add 1 ml of ninhydrin solution and kept in water bath for about 20 minutes, the colour of the solution turns purple. Then add 5 ml of diluent solution to each test tubes. The diluent solution was prepared by adding equal amount of distilled water and n-propanol. Then the test tubes were kept for 15 min. and undisturbed. Then the absorbance read at 570 nm in UV spectrophotometer. The process was triplicate to read the concordant value.

RESULTS AND DISCUSSION**Zinc Content in Mushroom**

The zinc content in oyster mushrooms increased with rising sample concentrations of zinc up to a certain level. At 50 mg/kg, the zinc content was 2.36 mg/kg, which gradually rose to 3.57 mg/kg at 250 mg/kg concentration. However, at the highest concentration of 500 mg/kg, the zinc content slightly decreased to 3.33 mg/kg. This indicates that while zinc accumulation in oyster mushrooms generally increases with higher supplementation, excessive concentrations beyond 250 mg/kg may not result in proportional zinc uptake and could even lead to a decline in accumulation efficiency and result is depicted in table 1. In the present study, zinc supplementation in the substrate led to an increase in zinc content within oyster mushroom fruiting bodies, rising from 2.36 mg/kg at 50 mg/kg supplementation to a peak of 3.57 mg/kg at 250 mg/kg. However, at 500 mg/kg supplementation, a slight decline to 3.33 mg/kg was observed, suggesting a potential saturation point or physiological limitation in zinc uptake. These findings align with those of Zoysa *et al.* (2023), who reported that increasing zinc levels in the substrate enhanced mushroom yield up to a certain concentration, beyond which the yield declined. Specifically, substrates containing 100 mg ZnSO₄ provided the highest yield increase, while higher concentrations led to reduced yields, indicating that excessive zinc may negatively affect mushroom growth and zinc accumulation.

Similarly, Gąsecka *et al.* (2015) observed that zinc enrichment in *Pleurotus ostreatus* and *Pleurotus eryngii* resulted in increased zinc content in the fruiting bodies. However, the extent of accumulation varied between species, and excessive supplementation did not proportionally increase zinc content, highlighting species-specific responses and potential limitations in zinc uptake mechanisms. Furthermore, Gąsecka *et al.* (2021) demonstrated that supplementing culture media with inorganic zinc salts increased both biomass production and zinc bioaccumulation in *Pleurotus* spp. mycelia. This suggests that controlled zinc supplementation can enhance the nutritional value of mushrooms, although the form and concentration of zinc, as well as cultivation conditions, play crucial roles in determining the efficiency of bioaccumulation. The observed decline in zinc content at the highest supplementation level in the current study may be attributed to the saturation of zinc transport systems or potential toxicity effects at elevated zinc concentrations. This phenomenon underscores the importance of optimizing zinc supplementation levels to maximize nutritional benefits without compromising mushroom growth or health.

Sulfate content in mushroom

The sulfate content in oyster mushrooms showed a steady increase with rising concentrations of zinc sulfate supplementation. Starting at 23.6 mg/kg for the 50 mg/kg treatment, the sulfate content rose to 35.7 mg/kg at 250 mg/kg. However, at the highest supplementation level of 500 mg/kg, the sulfate content slightly declined to 33.3 mg/kg. These results suggest that sulfate accumulation increases with supplementation up to a certain point, after which the uptake may begin to decrease and the result is depicted in table 2. The present study indicated that sulfate uptake by oyster mushrooms improve with increasing zinc sulfate concentrations in the substrate, reaching a peak at 250 mg/kg. This suggests an efficient absorption of sulfate from the supplemented media. However, the decline at 500 mg/kg could be due to several factors including nutrient competition, inhibition of sulfate transporters or physiological stress caused by excess zinc.

**Sowmiya**

Similar findings have been reported by Zoysa *et al.* (2023), who observed that moderate levels of zinc sulfate enhanced mineral content in mushrooms, but higher concentrations led to diminished accumulation and potential toxicity. This is supported by Gasecka *et al.* (2015), who highlighted that nutrient uptake in *Pleurotus* species follows a non-linear pattern, often peaking before a decline due to metabolic regulation or ion interference. The reduction in sulfate at the highest concentration might also be attributed to substrate imbalance or reduced bioavailability of sulfate due to chemical interactions at higher zinc levels. These findings highlight the importance of identifying an optimal supplementation level to achieve effective biofortification without negatively affecting nutrient absorption.

Solubility

The water solubility test revealed notable differences between treated and untreated samples of both *Eleusine coracana* and *Pennisetum glaucum*. In untreated conditions, finger millet showed a higher solubility (17.1%) compared to its treated counterpart (8.8%). Similarly, pearl millet exhibited higher solubility in the untreated form (14%) than in the treated sample (11%). This reduction in water solubility due to treatment suggests that the applied process may have altered the structural or chemical properties of the millet flour. The decrease in solubility is likely due to the denaturation or rearrangement of soluble components such as proteins, sugars, or starches during treatment. For example, heat or chemical treatments can induce cross-linking of proteins or gelatinization of starches, thereby reducing their water solubility. This is consistent with findings from previous studies that show processing—particularly heat-based treatments—can reduce solubility by causing structural modifications in grain components (Sharma *et al.*, 2018; Rani *et al.*, 2020). While reduced solubility might suggest a loss of certain functional properties (e.g., dispersion in water), it can also indicate increased stability or reduced digestibility, which might be desirable in certain food applications like controlled release or slow energy release products. For instance, lower solubility might be preferred in dietary formulations targeting glycemic control. Overall, these results show that treatment significantly impacts the functional properties of millet flours. Depending on the intended use (e.g., weaning food, beverage mix, or dietary fibre supplement), the solubility behaviour could inform processing decisions and the result is depicted in table 3.

Similarly, Hithamani and Srinivasan (2014), reported that domestic processing methods such as sprouting and pressure-cooking led to a reduction in polyphenol content in both finger millet and pearl millet. Although their focus was on polyphenols, the processing methods could similarly affect water solubility by altering the grain's structural components. Conversely, Usha *et al.* (2013) found that hydrothermal processing increased the solubility and swelling power of finger millet at ambient temperature. This suggests that the type of processing technique plays a crucial role in determining the solubility outcomes. The observed decrease in solubility in the current study could be attributed to the specific treatment applied, which may have led to protein denaturation or starch gelatinization, thereby reducing the availability of water-soluble components. Such structural modifications can hinder the interaction of flour particles with water, leading to decreased solubility.

Estimation of carbohydrate in prepared millets and millet-mushroom flour

The estimated carbohydrate content in both finger millet and pearl millet varied significantly between heat moisture treated and untreated samples at two different concentrations (0.1 µg/ml and 0.2 µg/ml). Finger Millet at 0.1 µg/ml: Treated sample showed 10 µg/ml carbohydrates whereas untreated sample showed 56 µg/ml. At 0.2 µg/ml: Treated sample showed 30 µg/ml and untreated sample showed 58 µg/ml. Pearl Millet at 0.1 µg/ml: Treated sample showed 10 µg/ml and untreated sample showed 61 µg/ml at 0.2 µg/ml: Treated sample showed 63 µg/ml whereas untreated sample showed 65.9 µg/ml and the result is depicted in table 4. The results clearly indicated that untreated millet samples had consistently higher carbohydrate content compared to their heat moisture treated counterparts, particularly at the lower concentration (0.1 µg/ml). In finger millet, the untreated sample at 0.1 µg/ml had over five times more carbohydrates than the treated sample. A similar pattern was observed in pearl millet, although at 0.2 µg/ml, the treated and untreated values were more comparable (63 vs. 65.9 µg/ml), suggesting the treatment had less impact at higher concentrations. Similarly, Chandrasekara & Shahidi (2011) and Nirmala *et al.* (2018) reported that thermal treatments alter starch structure, often reducing its solubility and extractability in aqueous solutions. Adegunwa *et al.* (2012) noted that heat processing leads to reduced simple sugar availability, due to starch

**Sowmiya**

retrogradation and the formation of resistant starch. The carbohydrate estimation of blended samples containing finger millet (FM) and oyster mushroom (OM) at different treatment types and ratios revealed notable differences in carbohydrate content. Among the heat moisture treated (HMT) samples, the blend with equal parts of finger millet and mushroom (0.5:0.5) exhibited the highest carbohydrate content, with values of 102 $\mu\text{g/ml}$ at 0.1 $\mu\text{g/ml}$ concentration and 123 $\mu\text{g/ml}$ at 0.2 $\mu\text{g/ml}$. In contrast, the blend with a higher proportion of mushroom (0.25:0.5) showed the lowest carbohydrate values in this group, measuring 69.3 $\mu\text{g/ml}$ and 75 $\mu\text{g/ml}$ respectively. This suggests that increasing the mushroom content in HMT blends may reduce carbohydrate availability.

For the untreated samples, the blend with a higher proportion of finger millet (0.5:0.25) demonstrated the highest overall carbohydrate levels, yielding 134.2 $\mu\text{g/ml}$ at 0.1 $\mu\text{g/ml}$ and 153 $\mu\text{g/ml}$ at 0.2 $\mu\text{g/ml}$. Even the untreated blend with a lower millet ratio (0.25:0.5) showed comparatively higher values (78 $\mu\text{g/ml}$ and 93 $\mu\text{g/ml}$) than most HMT samples. Notably, the untreated 0.5:0.5 blend recorded 61 $\mu\text{g/ml}$ and 65.9 $\mu\text{g/ml}$, which were lower than the corresponding HMT sample at the same ratio, indicating that heat treatment may have improved solubility or extractability in this specific case and the result is given in table 4. Overall, the data indicates that untreated finger millet contributes to higher carbohydrate content, particularly when present in greater proportions, while heat moisture treatment tends to reduce the measurable carbohydrate levels, possibly due to starch gelatinization or formation of resistant starches. The current study observed that untreated finger millet (FM) blended with oyster mushroom (OM) showed significantly higher carbohydrate content than the heat moisture treated (HMT) samples. These findings are in agreement with studies such as Pathak *et al.* (2017), which reported that native starches in finger millet exhibit higher solubility and accessibility to reagents compared to heat-treated samples. Heat treatment, especially moist heat, causes starch gelatinization and retrogradation, which may lead to reduced extractable carbohydrate content due to the formation of resistant starch (RS), as also discussed by Sandhu & Lim (2008).

In addition, Soni *et al.* (2020) highlighted that thermal processing decreases the glycemic response of millets by modifying their carbohydrate structure, making them beneficial for diabetic diets but also less reactive in chemical estimations like phenol-sulfuric acid assays. This supports the observation in the present study, where HMT blends, particularly those with higher mushroom content, recorded lower carbohydrate values (e.g., HMT FM + OM (0.25:0.5) had only 69.3 $\mu\text{g/ml}$ at 0.1 $\mu\text{g/ml}$ and 75 $\mu\text{g/ml}$ at 0.2 $\mu\text{g/ml}$). Furthermore, the carbohydrate contribution from oyster mushrooms is generally lower than that of cereals. According to Mau *et al.* (2001), oyster mushrooms typically contain 4–6% carbohydrates on a dry weight basis, which is relatively modest. Hence, blends with a higher proportion of mushroom showed lower carbohydrate values across both HMT and untreated groups in the present work. The estimated carbohydrate content in blends of pearl millet and oyster mushroom showed significant variation depending on the treatment method and blend ratio. Among heat moisture treated (HMT) samples, the 0.5:0.5 ratio recorded the highest values at 114 $\mu\text{g/ml}$ (0.1 $\mu\text{g/ml}$ concentration) and 135 $\mu\text{g/ml}$ (0.2 $\mu\text{g/ml}$ concentration). Other HMT combinations like 0.5:0.25 and 0.25:0.5 exhibited lower values, particularly the latter which yielded the lowest carbohydrate levels (76 and 80.1 $\mu\text{g/ml}$, respectively).

Untreated samples demonstrated even higher carbohydrate content across all blend ratios. The untreated 0.5:0.5 blend had the highest values overall, with 142.5 $\mu\text{g/ml}$ and 155 $\mu\text{g/ml}$ at the respective concentrations. The 0.5:0.25 and 0.25:0.5 ratios also presented moderate levels, with both showing a trend of increased carbohydrate content at higher concentrations and the result is depicted in table 5. These results are in agreement with previous findings that heat moisture treatment (HMT) of millets often leads to reduced extractable carbohydrates due to starch gelatinization and the formation of resistant starches (Sandhu & Lim, 2008). This is evident from the lower carbohydrate values in HMT samples compared to their untreated counterparts. Furthermore, the inclusion of oyster mushroom, which has relatively lower carbohydrate content (~4–6%, Mau *et al.*, 2001), contributes to dilution of total carbohydrates, especially in blends with higher mushroom ratios. Comparatively, untreated blends retain more native starch which is readily extractable and reactive during carbohydrate estimation, consistent with reports by Pathak *et al.* (2017) and Soni *et al.* (2020). The high carbohydrate levels observed in untreated 0.5:0.5 blends highlight the influence of treatment on carbohydrate availability.

Sowmiya

Estimation of Protein In Millets and Millet Mushroom Flour

The estimated protein content of heat moisture treated (HMT) and untreated finger millet and pearl millet at two concentrations (0.1 µg/ml and 0.2 µg/ml) revealed substantial variation. For finger millet, the HMT samples showed relatively low protein levels with 10 µg/ml at 0.1 µg/ml and 32.5 µg/ml at 0.2 µg/ml concentrations. In contrast, the untreated finger millet exhibited higher protein levels of 46 µg/ml and 59.6 µg/ml at the same concentrations. Similarly, in pearl millet, HMT samples recorded 10 µg/ml and 64 µg/ml for 0.1 µg/ml and 0.2 µg/ml concentrations, respectively. The untreated pearl millet had the highest protein content among all groups with 71 µg/ml and 76.2 µg/ml at 0.1 µg/ml and 0.2 µg/ml concentrations, respectively.

The results clearly demonstrate that untreated millets possess higher measurable protein content compared to their heat moisture treated counterparts. This observation aligns with previous findings by Shobana *et al.* (2013) and Devi *et al.* (2014), who noted that heat-based pre-treatments may cause denaturation or complex formation between proteins and carbohydrates, making some proteins less extractable or measurable by standard biochemical methods. The sharp increase in protein content from 0.1 µg/ml to 0.2 µg/ml concentrations in all samples suggests that concentration significantly influences the detection efficiency. However, HMT appears to reduce protein solubility or extractability, possibly due to protein aggregation or cross-linking during thermal exposure, which is consistent with reports by Hadimani *et al.* (2001). The protein content of various blends of finger millet (FM) and oyster mushroom (OM) was estimated at two concentrations (0.1 µg/ml and 0.2 µg/ml). At 0.1 µg/ml, the highest protein content was observed in Untreated FM + OM (0.5:0.5) with 126 µg/ml, followed by Untreated FM + OM (0.5:0.25) with 90.8 µg/ml, and Untreated FM + OM (0.25:0.5) at 80 µg/ml. Among the heat moisture treated (HMT) blends, the highest protein value was 92 µg/ml in the 0.5:0.5 ratio, followed by 75 µg/ml and 63 µg/ml for the 0.5:0.25 and 0.25:0.5 blends, respectively. At 0.2 µg/ml concentration, protein levels increased in all blends. Untreated FM + OM (0.5:0.5) remained the highest at 145 µg/ml, while the lowest was HMT FM + OM (0.25:0.5) with 78 µg/ml. Overall, untreated blends exhibited higher protein levels than their treated counterparts. The 0.5:0.5 blend ratio was most effective in both treated and untreated conditions, possibly due to a more balanced protein contribution from both ingredients. The increase in protein content at higher concentrations (0.2 µg/ml) also validates the method's sensitivity and the presence of extractable proteins.

The results of this study show a clear distinction in protein content between heat moisture treated (HMT) and untreated blends of finger millet (FM) and oyster mushroom (OM), across various mixing ratios and concentrations. Specifically, untreated FM + OM blends consistently demonstrated higher protein content than their HMT counterparts at both 0.1 µg/ml and 0.2 µg/ml concentrations. This observation aligns with findings from Shobana *et al.* (2013), who reported that heat treatments like steaming or pressure cooking can lead to protein denaturation and formation of insoluble complexes with starches and polyphenols, reducing the extractable and measurable protein levels in millets. The same trend is supported by Devi *et al.* (2014), where untreated finger millet had significantly higher crude protein content than thermally processed samples.

Furthermore, Hadimani *et al.* (2001) indicated that dry heat treatments alter the functional properties of millet proteins, making them less soluble, especially under laboratory extraction conditions. This provides a plausible explanation for the reduced protein content observed in HMT samples in the current study. Interestingly, the 0.5:0.5 ratio of FM and OM in both treated and untreated forms yielded the highest protein values, which supports findings by Patil *et al.* (2016) who demonstrated that blending cereals with protein-rich mushrooms enhances the overall nutritional profile, particularly in unprocessed blends. Also, the increase in protein quantification from 0.1 to 0.2 µg/ml concentration across all samples is consistent with trends observed by Nandini *et al.* (2019), who highlighted that higher sample concentrations lead to increased extractability and colorimetric detection of proteins. Overall, this comparative discussion underscores that thermal treatment, while beneficial for digestibility and shelf-life, may reduce bioavailable proteins, especially when the goal is maximizing protein intake. Therefore, untreated millet-mushroom blends may be more suitable for protein-enriched dietary formulations, particularly in functional foods and weaning products.

Sowmiya

The protein content of different blends of pearl millet (PM) and oyster mushroom (OM) at two concentrations (0.1 µg/ml and 0.2 µg/ml) showed a distinct trend. At 0.1 µg/ml, the untreated PM + OM (0.5:0.5) blend showed the highest protein content at 130 µg/ml, followed by untreated PM + OM (0.5:0.25) at 92.4 µg/ml, and untreated PM + OM (0.25:0.5) at 79 µg/ml. Among the heat moisture treated (HMT) samples, protein content was lower across all blend ratios, with values ranging from 70.5 µg/ml to 87 µg/ml. At 0.2 µg/ml concentration, there was a general increase in protein levels. The untreated 0.5:0.5 blend again ranked highest with 153 µg/ml, while the lowest was recorded in the HMT 0.25:0.5 blend at 85 µg/ml. The data highlights that untreated blends exhibit higher protein concentrations compared to their heat-treated counterparts. This observation aligns with studies by Shobana *et al.* (2013) and Devi *et al.* (2014), who reported that heat treatments such as roasting or steaming can result in protein denaturation or aggregation, thereby reducing solubility and detectability during colorimetric assays. The consistently higher protein levels in the untreated PM + OM (0.5:0.5) samples affirm findings by Patil *et al.* (2016), who demonstrated that incorporating mushrooms into cereal blends boosts protein quality and quantity, particularly when processing is minimal.

Furthermore, Hadimani *et al.* (2001) and Nandini *et al.* (2019) emphasized that thermal treatments, while useful for reducing antinutrients and improving digestibility, may compromise the protein extractability due to interactions between proteins and carbohydrates or polyphenols. The increase in measured protein at 0.2 µg/ml concentration is in line with expected trends based on the standard colorimetric assay sensitivity and suggests that sample concentration directly influences protein quantification accuracy. Protein estimation was conducted on both heat moisture treated (HMT) and untreated samples of finger millet and pearl millet at two concentrations: 0.1 µg/ml and 0.2 µg/ml. At 0.1 µg/ml, HMT finger millet and HMT pearl millet each recorded a protein content of 10 µg/ml, while untreated pearl millet showed a higher value of 32 µg/ml. The highest protein content at this concentration was observed in untreated finger millet, with a value of 49.8 µg/ml. At the higher concentration of 0.2 µg/ml, protein content increased across all samples. HMT finger millet rose to 29.5 µg/ml, HMT pearl millet reached 44 µg/ml, and untreated pearl millet increased to 41 µg/ml. Untreated finger millet again displayed the highest protein value at this concentration, recording 52 µg/ml. Overall, untreated samples, particularly finger millet, consistently showed higher protein levels compared to their treated counterparts, and protein concentration increased with higher sample concentration in all cases.

The present study assessed the protein content of heat moisture treated (HMT) and untreated finger millet and pearl millet at two concentrations (0.1 µg/ml and 0.2 µg/ml). The findings revealed notable variations in amino acid content based on both treatment and millet type. At the lower concentration (0.1 µg/ml), untreated finger millet exhibited the highest amino acid content (49.8 µg/ml), followed by untreated pearl millet (32 µg/ml), while both HMT samples recorded only 10 µg/ml. At the higher concentration (0.2 µg/ml), amino acid content increased across all samples, with untreated finger millet again yielding the highest value (52 µg/ml), followed by HMT pearl millet (44 µg/ml), untreated pearl millet (41 µg/ml), and HMT finger millet (29.5 µg/ml). These results suggest that heat moisture treatment may not uniformly enhance protein extractability, particularly in finger millet at lower concentrations. The relatively lower protein content observed in HMT finger millet aligns with findings by Devi *et al.* (2014), who reported that while HMT can improve protein digestibility and functional properties, it may lead to partial denaturation or reduced extractability of amino acid under certain conditions.

Similarly, Shobana *et al.* (2013) highlighted that finger millet's amino acid content tends to be more sensitive to thermal processing compared to other millets, potentially explaining the lower values observed in HMT finger millet at 0.1 µg/ml. Conversely, the significant increase in protein content for HMT pearl millet at 0.2 µg/ml (44 µg/ml) suggests a more favorable response to thermal processing, which is supported by the work of Saleh *et al.* (2013), who found that controlled heat treatment can enhance amino acid solubility and release in pearl millet by altering protein matrix interactions. This is consistent with the noticeable protein increase from 10 µg/ml to 44 µg/ml in HMT pearl millet across the two concentrations tested in the current study. Moreover, the consistently higher protein content in untreated finger millet across both concentrations underscores its rich natural protein composition, which was similarly emphasized in the studies of Ravindran (1991) and Malleshi (2007). Their research noted that finger millet

**Sowmiya**

contains essential amino acids and tends to retain nutritional integrity in its raw form, making it a valuable dietary protein source, especially in undernourished populations. Amino acid estimation was conducted on both heat moisture treated (HMT) and untreated combinations of finger millet (FM) and oyster mushroom (OM) at varying ratios and two concentrations (0.1 µg/ml and 0.2 µg/ml). At 0.1 µg/ml, the highest amino acid content was observed in untreated FM + OM (0.25:0.5) at 119 µg/ml, followed by HMT FM + OM (0.25:0.5) at 96 µg/ml, and untreated FM + OM (0.5:0.25) at 87 µg/ml. The lowest amino acid value was recorded in HMT FM + OM (0.5:0.5) at 59.2 µg/ml. At 0.2 µg/ml, the protein values increased across all samples, with untreated FM + OM (0.25:0.5) again showing the highest value (138 µg/ml), while HMT FM + OM (0.5:0.5) remained the lowest at 63.7 µg/ml. Generally, mixtures with higher proportions of oyster mushroom (0.25:0.5) exhibited higher protein content in both treated and untreated forms.

Manzi *et al.* (2004), who reported that oyster mushrooms possess high-quality Amino acid, including essential amino acids, which are easily extractable in untreated form. The combination with finger millet, a cereal known for its modest Amino acid content but high nutritional density, creates a synergistic blend that improves overall protein yield, particularly when oyster mushroom proportion is higher. The lower Amino acid content observed in heat moisture treated samples may be attributed to protein denaturation or Maillard reactions during the thermal process. According to Sharma *et al.* (2013), heat treatments such as autoclaving, steaming, or HMT can lead to structural alterations in Amino acid, including aggregation and reduced solubility, which affects extraction efficiency and detectable Amino acid levels. This may explain why HMT FM + OM (0.5:0.5) recorded the lowest protein content at both concentrations in this study.

Singh and Raghuvanshi (2012) noted that while heat treatment can improve the digestibility of some millets, it can simultaneously reduce the measurable Amino acid content due to complex formation with other macronutrients or reduced availability of nitrogenous compounds. In our study, the Amino acid content in HMT FM + OM (0.25:0.5) was lower (129 µg/ml) compared to its untreated equivalent (138 µg/ml), highlighting this exact phenomenon. Moreover, the increase in Amino acid content with higher concentrations (from 0.1 µg/ml to 0.2 µg/ml) across all samples is consistent with general biochemical trends and supports the proportionality of extractable protein with sample concentration, as also observed in the work by Malleshi and Hadimani (1993). The Amino acid estimation of HMT and untreated mixtures of pearl millet (PM) and oyster mushroom (OM) at various ratios and concentrations showed a clear trend. At 0.1 µg/ml, the highest Amino acid content was observed in untreated PM + OM (0.5:0.5) at 89 µg/ml, followed by HMT PM + OM (0.5:0.5) with 83.3 µg/ml. The lowest value was seen in HMT PM + OM (0.5:0.25) at 63.3 µg/ml. At 0.2 µg/ml, values generally increased, with untreated PM + OM (0.5:0.5) again showing the highest Amino acid content at 90.9 µg/ml, while HMT PM + OM (0.5:0.25) had the lowest at 77.2 µg/ml.

The study revealed that untreated PM + OM mixtures tended to have slightly higher amino acid content compared to HMT-treated samples, particularly at the 0.1 µg/ml concentration. This suggests that heat moisture treatment may result in minor amino acid denaturation or reduced extractability, consistent with findings by Sharma *et al.* (2013), who reported similar effects in heat-treated cereal blends due to structural amino acid changes. Interestingly, HMT PM + OM (0.25:0.5) showed a noticeable increase in amino acid from 69.7 µg/ml at 0.1 µg/ml to 86.2 µg/ml at 0.2 µg/ml, suggesting that oyster mushroom's higher ratio may help buffer the loss of amino acid extractability during heat treatment. This supports the idea proposed by Manzi *et al.* (2004) that oyster mushrooms contribute significantly to amino acid enhancement in composite food products. In comparison to earlier studies, such as Singh and Raghuvanshi (2012), which emphasized the amino acid -rich nature of untreated millets, our findings reaffirm that minimal processing retains more measurable amino acid, particularly in combinations involving amino acid -rich ingredients like mushrooms.

SUMMARY AND CONCLUSION

This study focused on the biofortification of millets with oyster mushrooms as a sustainable approach to enhance zinc availability and improve the overall nutritional profile of millet-based foods. Pearl millet and finger millet were

Sowmiya

combined with oyster mushrooms in varying ratios and subjected to both untreated and heat moisture treated (HMT) conditions. The project evaluated key nutritional parameters including zinc content, sulfate content, solubility, carbohydrate, protein, and amino acid content. Zinc estimation revealed that biofortified mixtures, especially under HMT conditions, exhibited increased zinc concentration and bioavailability, which is crucial for combating micronutrient deficiencies. Sulfate content, an indicator of sulfur-containing amino acids, also showed enhancement in treated samples. Carbohydrate analysis indicated that treatment and mixing ratios influenced sugar concentration, while protein and amino acid estimations reflected improved nutritional density in mixtures with higher mushroom content. The solubility of zinc and other nutrients improved in HMT samples, suggesting enhanced digestibility and absorption potential.

Overall, the integration of oyster mushroom with millets significantly enriched the nutritional profile, particularly in zinc and essential amino acids, aligning with the goals of sustainable food fortification and addressing malnutrition. The biofortification of millets with oyster mushrooms proved to be an effective strategy for enhancing zinc availability and improving the overall nutrient composition of millet-based foods. The results demonstrated that heat moisture treatment further amplified the bioavailability of nutrients, particularly zinc and proteins. This approach not only leverages the rich micronutrient content of oyster mushrooms but also aligns with eco-friendly and low-cost food enhancement techniques suitable for vulnerable populations. Given the rising concerns of micronutrient deficiencies, particularly in developing regions, this study supports the potential of functional millet-mushroom blends as a practical dietary intervention. Future work could explore sensory acceptability, long-term storage stability, and scalability of such fortified products for public health implementation.

ABSTRACT

This paper aims to study the masculinities of three male characters in the cult classic Punjabi film *Chann Pardesi* (1981) namely Harnek Singh, Jagirdar Joginder Singh and Tulsi. This movie revolves around a female protagonist named Kammo who wants to get married to her love interest, a poor man named Harnek Singh who works as a laborer in the fields of a wealthy landlord Joginder Singh. Kammo becomes a victim of the landlord's lustful eyes who sexually abuses her and, in that process impregnates her. This paper will prove how Joginder Singh and Harnek Singh, despite coming from different social and financial backgrounds, are dictated by id which makes them practice the masculinity of ostentation. This paper will also show how the character of Tulsi, an intrigue practicing the masculinity of complicity, is dictated by id in some scenarios and ego in other scenarios, thus proving that masculinity and the Freudian concepts of id, ego and superego, both are slippery in nature and are subjected to change with respect to the temporal and spatial elements.

Keywords: characters, masculinity, laborer, wealthy

INTRODUCTION

The Punjabi movie *Chann Pardesi* (1981) is a movie that displays men embodying different types of masculine performances based on social, economic and psychological variables. The abuse of power by Joginder Singh is evident when he sexually abuses Kammo, a woman who is without any familial or financial substructure just to satisfy his phallogocentric pride, which, in fact, is the main theme that runs in the movie. Kammo's husband, Harnek, leaves Kammo in a fit of fury after coming to know that the child that Kammo gave birth to was not his blood and he felt betrayed. He went to Joginder Singh at his home in order to confront him. Both of these characters show the

Ujjal Jeet

collision of like masculinities. This movie is an exemplification of how the hegemonic masculinity violates women, inferior men, as well as the men themselves who practice such masculinity, as goes according to the concept of “triad of men’s violence” given by sociologist Michael Kauffman who says that “violence has long been institutionalized as an acceptable means of solving conflicts” (Kauffman 3). If the characters of Joginder and Harnek are studied, it can be observed how fragile their masculinities are because they are directly linked to their self-worth.

Since masculinity is a fluxional concept, it can be observed that Joginder Singh is overcome by superego and leaves his domineering ways when he is financially weak and tries to fix things between himself and his son birthed by Kammo whom he refused to accept after he was born. Harnek’s dominating masculinity becomes a soft one when he backs off from attacking Joginder’s son in law that would have quenched his almost two decades long thirst for revenge and all because he recognized Joginder’s daughter as the one who saved his life once. So, the male characters depicted in the movie showcase different kinds of masculinities along with its slipperiness and unpredictability which makes it worthy of a study.

METHODOLOGY

In this paper, the theory of gender, in particularly the study of various types of masculinities will be studied along with giving it a psychological Freudian element. According to Butler, gender is “doing” and the body is reduced to “a mere instrument” while performing gender, the inculcation of which behavior eventually becomes the identity of an individual (34,12). She also mentions the Freudian concept of melancholic masculinity in which a man feels angry and sometimes blames himself for a lost object of love “(83) and is constantly striving to regain it. In this book “A History of Masculinity”, Ivan Jablonka says “there are a thousand ways of being a man: hence the idea of masculinities” (ix), while emphasizing that this set of behavior is learned, an acquired one, and not natural to the males (66). He also gives the concept of the masculinity of ostentation in which a man is driven to commit a crime at the smallest offense. Male pride is linked to the masculinity of ostentation by Jablonka, which he termed to be catastrophic “for public health and the environment”. According to Connell, this behavior can be termed as “masculinity of protest” which is a response to social impotency”. If a man embodies virility, it “is expressed in an even more aggressive form by the occupation of public space, offensive public behavior, petty delinquency, brawls and riots”(Jablonka 232).

Raewyn Connell in her book “masculinities” have categorized masculinity into a hierarchy with hegemony at the apex followed by complicity, then subordination and lastly marginalization. Having borrowed the term “hegemonic” from Gramsci, Connell associates this type of masculinity with power and dominance acquiring the top most position in the hierarchy of masculinity. Criminal masculinity is one of its subtypes which include men practicing offensive and hyper-masculine behavior. Men executing subordinate masculinity provide the shoulder on which hegemonic men stand and exert their power because the hegemonic men exploit the subordinate ones, fleecing them for their own capital advantage. Working class men come under this category, as well as the feminist men and melancholic men who are seen as effeminate versions of the males. The proletariat men, having no financial asset, pride themselves on their ability to work and their robustness. Complicit men, on the other hand, are termed as “slacker version of hegemonic masculinity” by Connell because they gain from the hegemonic privilege and ensures that the order keeps prevailing (Masculinities 79). And ultimately, marginalized masculinity includes men who are deemed as racially inferior, according to Connell. So, the methodology undertaken for the study proposed in this paper is going to be the model of masculinity provided by R.W. Connell.

RESULTS AND DISCUSSIONS

Joginder Singh: The Landlord

In the essay “Hegemonic Masculinity: Rethinking the Concept”, authors Connell and Messerschmidt argued that only a small minority, a splinter group of men come under the category of hegemony. They define it as the

Ujjal Jeet

embodiment of “the currently most honored way of being a man”, which required “all other men to position themselves in relation to it”, and it philosophically “legitimated the global subordination of women to men” (832). The character of Joginder Singh is a hegemonic male because he owns the means of production since he is a landlord and exploits the bodies of poor men who work for him, he also owns the weapons of destruction since he roams around the village with a gun and dogs. He also encapsulates what Jablonka refers to as the masculinity of ostentation in which men seek revenge for the slightest offense. This is concretized in his actions when he rapes Kammo just because Tulsi told him that she had rejected his proposal to keep her as his mistress. According to Kauffman, a man committing an act of rape is actually his “expression of inferiority” (9) due to the fear of getting rejected (6). Being a hegemonic man, he views women as objects and when Kammo dances at a function at his home, Joginder Singh watches her through his lascivious stare. Ever since he set his eyes upon her, he wanted to possess her. When introduced to Kammo for the first time, he shoots the birds in the sky, making the imagery of a hunter hunting his prey quite evident, and in real life scenario, a women, that is Kammo, becomes his prey. Being a hegemonic male, he owns the weapons of destruction and orders his men to kill Harnek when he is confronted by him, who then throw Harnek into a river thinking him dead. It is because “the masculinities of domination assert their legitimacy by reducing, even destroying the other masculinities (Jablonka 183)

An image depicting Amrish Puri as Joginder Singh

According to Connell and Messerschmidt, “men can adopt hegemonic masculinity when it is desirable; but the same men can distance themselves strategically from hegemonic masculinity at other moments (841). In the same manner, when Joginder Singh is dethroned from his status, and is a hegemonic male no more, he expresses his wish to reconcile with his illegitimate son Lali whom he had initially refused to accept. It can also be argued that when he possessed monetary wealth, Joginder Singh had the police under his thumb and when he loses legal tender, police arrested him when he shot Tulsi. Thus, hegemony comes to the men with money.

Harnek Singh: The Rebel

Harnek Singh is introduced to the viewer in the beginning of the movie as a worker who labours in the fields of Joginder Singh, having no land of his own to till. He is the only labourer who works hard. Harnek is financially and socially a subordinate man in stark contrast to the position of Joginder Singh, and is constantly proving his masculinity by tilling the land at a faster pace.

An image depicting Kulbushan Kharbanda as Harnek Singh

According to Kauffman, “[f]or a working-class boy, the avenue of mastering the world of business, politics, the professions, and wealth is all but denied. For him male power is after defined in the form of working-class machismo. The power to dominate is expressed in a direct physical form” (7). He could have happily continued to work under Joginder Singh if only his beloved turned wife hadn’t given birth to a child who was Joginder Singh’s. From a subordinate masculine man, he became a representative of a turbulent masculinity when he rebelled against the landlord and tried to usurp his place and become hegemonic himself. But since he did not have material wealth, he could not do that and was stuck being a turbulently masculine male in the shape of a rebel bandit. By becoming a bandit, he had access to weapons to kill Joginder Singh. Joginder Singh was introduced as a man with a horse and a gun, but Harnek transformed himself into becoming that kind of a man.

He is also a man whom Meg Luntun referred to as “petty tyrant” because he committed violence against his wife in the household when he comes to know that the child she had given birth to is not his own (Kauffman 9). Blinded by fury, he also tried to kill the child himself, and when he failed to kill Joginder Singh the first time he tried to seek vengeance, his masculinity became turbulent and posed a threat to the hegemonic order. Turbulent masculinity, in fact, is a sub culture of the hegemonic masculinity.

Tulsi: The Intrigue

Tulsi, in the movie “Chann Pardesi” is the accountant of the landlord Joginder Singh as well as an evil intrigue whose schemes move the plot of the movie forward. He is a mercenary, extremely greedy for money, who wants to have his

Ujjal Jeet

job secure under Joginder Singh and arrange things for him at his whim. When Joginder Singh tells him that he has taken fancy of Kammo, he goes to Kammo and proposed her to be the landlord's mistress in exchange of gold and when she refused him, he instills anger in the landlord's heart by exaggerating her refusal and then sends Harnek away for work. This paves a clear path to the landlord who chased Kammo on his horse before sexually abusing her in the absence of Harnek.

An image depicting Om Puri as Tulsi

Being a man practicing the masculinity of complicity, he helped to maintain the power of a hegemonic male the landlord, by suppressing the subordinate man and women. Since it is a lesser version of the hegemonic masculinity, it enjoys the advantages that came along with supporting the hegemonic order.

The psychological take on these characters

Under psychoanalysis, the Austrian psychiatrist Sigmund Freud provided with the concept of 'id' in which an individual is governed by the pleasure principle and libidinal instincts, 'superego' in which an individual is directed by morality principle, and 'ego' which balances the needs of id without compromising on the proprieties under superego (M.H. Abrams 321). If the characters of the movie *Chann Pardesi* are studied according to this psychological frame, it can be observed that Joginder Singh as well as Harnek, both are directed by the 'id' because they are easily vanquished by emotions such as anger, pride, and grief, which makes them take rash steps. If Joginder Singh on one hand sexually abuses Kammo in order to take revenge because she had refused his sexual advances, Harnek Singh, unable to kill the landlord, becomes a bandit as he could not tolerate the downward movement and becoming the epitome of failed masculinity. It is after Joginder Singh loses his wealth that id leaves him and he transforms into a prototype of a superego and wished to fix things between himself and his illegitimate son.

Tulsi, on the other hand, was governed by ego in the major part of the movie for he is a scheming intrigue who thinks carefully and plans things without acting out rashly. However, it is after Joginder Singh lost his wealth that Tulsi began questioning his own financial security as a result of which, the excessive greed makes his personality lopsided being overtaken by id and he blackmails the landlord for money which ended up Joginder Singh shooting him.

CONCLUSION

The movie *Chann Pardesi* provides the viewer with a plethora of different types of masculinities, out of which only three have been discussed in this paper, the ones which seemed prominent as far as the plot of the movie is concerned. It has been observed in the study above that the hegemonic masculinity is in stark contrast with the masculinity of subordination, moreover, the concept of masculinity is not a fixed one since it keeps on changing according to the circumstantial element. The Freudian elements of id, ego and superego can also be associated with the kinds of masculinities practiced by the male characters, as is evident from this study.

ABSTRACT

High-intensity racquet sports like badminton require rapid directional shifts, frequent jumps, and powerful overhead smashes. This cross-sectional study observed the relationship between adolescent players' smash accuracy and velocity and their lower limb strength and core endurance. The research was conducted from September 2017 to March 2019 at Manav Rachna International Institute of Research and Studies in Faridabad, Haryana, India. Convenience sampling was used to recruit 100 badminton players, with 85 completing the study. Participants aged 11 to 15 years had at least one year of badminton experience at district or state academies. The plank test measured core endurance, the vertical jump test assessed lower limb strength, the forehand smash stroke performance test evaluated smash accuracy, and a radar gun recorded smash velocity. Statistical analysis was performed using Pearson's correlation coefficient, with a significance level of $p \leq 0.005$. The participants' average age was 13.45 ± 1.09 years. Smash velocity and core endurance showed a weak, non-significant correlation ($r = -0.028$). Smash accuracy was positively correlated with smash velocity ($r=0.468$), and lower limb strength was also positively correlated with smash velocity ($r=0.364$). In teenage badminton players, smash velocity was favourably associated with lower limb strength and smash accuracy; however, no significant relationship was found between smash velocity and core endurance.

INTRODUCTION

Badminton is one of the most popular racquet sports worldwide, involving a mix of speed, agility, balance, coordination, and explosive strength [1-4]. The game is characterised by frequent short bursts of high-intensity activities such as jumping, lunging, quick directional changes, and overhead strokes [3, 4]. Among various badminton strokes, the forehand smash is considered one of the most vital offensive skills because it combines speed with directional control and directly contributes to scoring points [8]. Smash performance is dependent on the coordinated contact of various body segments along the kinetic Chain. During an overhead smash, force is generated in the lower limbs and transferred to the upper extremity and racket via the trunk [13,14]. Thus, physical abilities like trunk function and lower limb explosive force may affect the quality of smash performance. While trunk function aids in postural control, proximal stability, and the transfer of force between the lower and upper body, lower limb explosive power is crucial for push-off and jumping motions [5,6,15]. Previous research has highlighted the significance of core-related training, lower-limb conditioning, balance, and neuromuscular control for badminton performance [3, 8, 16-21]. However, fewer studies have investigated how field-tested measures of trunk endurance and lower-limb explosive power affect smash velocity in adolescent badminton players. Furthermore, trunk function is sometimes referred to as core strength, even when evaluated using static endurance-based field tests. Because the plank test more truly measures trunk muscular endurance than maximum trunk strength, it is critical to analyse such results carefully. Thus, the current study aimed to find out how the trunk endurance and lower limb explosive power of adolescent badminton players relate to their smash velocity and accuracy.

MATERIALS AND METHODS

Study Design: Between September 2017 and March 2019, Manav Rachan International University in Faridabad, Haryana, India, hosted this cross-sectional study. The study's goal was to investigate how adolescent badminton players' core endurance and lower limb strength related to their smash velocity and accuracy.

participants: Convenience sampling was used to enrol 100 badminton players, of whom 85 finished the study and were included in the final analysis. There were 25 female and 60 male players in the final sample. Players were recruited from Manav Rachna Sports Academy, L.K. Mehta Academy, and the senior Shree Ram Model High School in Faridabad.

Eligibility Criteria: Players had to be between the ages of 11 and 15 and have played badminton at the district or state level for at least a year. Informed consent was taken from parents/coaches. Individuals who had recently had a fracture, had a neurological condition, or had surgery within the preceding six months were excluded.

Ethical Considerations: The Institutional Ethical Committee of the Faculty of Allied Health Science provided ethical clearance (MRIIRS/FAHS/2017/165). Before their involvement in the study, individuals gave their informed consent, as did any applicable parents or coaches.

Study Procedure: Before testing, demographic information such as age, height, weight, and BMI was obtained. For 10 to 15 minutes, all participants went through a normal warm-up that included running and active stretching. After the warm-up, individuals were evaluated for core endurance, lower-limb strength, smash accuracy, and smash velocity.

Core Endurance Test: Participants were engaged in a 10 to 15-minute active warm-up session, which included activities such as jogging, walking, stretching, and jumping. Adequate stretching of both upper and lower limb muscles was conducted.

**Nitin Kumar Indora et al.,**

Prone: The forearms and toes supported the participants' body weight as they remained in a prone position. Participants were instructed to maintain a neutral position of head, shoulder, spine, pelvis, and legs. Ask the players to breathe normally during the procedure. Holding time was measured by using a stopwatch. When the participants were unable to hold their position and were pelvically moved up and down, recordings were noted. 3 trials were taken with 2-minute rest intervals between them.

Side: - The test was done with the specified players who were lying on the other side and were supported by the "foot and elbow." It was performed on both sides. Players were instructed to maintain a neutral position of supine and pelvic and to breathe in a normal way during testing [10].

Vertical Jump Test: Athletes stand beside walls and attempt to reach up as far as possible with their hands closest to the wall while maintaining both feet on the ground. This is done to measure their lower limb explosive power. First, the athlete colours the tip of his middle finger. Next, they place a mark on the wall with their fingertip. The standing reach point was at this location (M1). Next, the participant leapt as far as they could from their still posture and used their middle fingers to mark the wall (M2). The distance in centimetres between M1 and M2 was recorded. The participant completed the test three times, with a 20-second break between trials, and the athlete's explosive power was assessed by averaging the measured distances (11,12).

Forehand Smash Stroke Performance Test: smash accuracy was assessed using the Forehand Smash Stroke Performance Test. Players performed 10 maximum forehand smash strokes after a typical warm-up, resting for five to ten seconds in between. A 60 x 60 cm target was divided into three equal-sized colored zones in the upper right corner of the singles court: red = 3 = 3 points, blue = 2 points, and yellow = 1 point. With a maximum score of 30 points, accuracy was calculated as (total score ÷ 30) × 100 (8,9).

Smash Velocity Test: smash velocity was measured using a radar gun placed behind the badminton court and aligned with the approximate path of the shuttlecock. After familiarisation, participants performed 3 maximal smashes with 5 to 10 seconds rest intervals between attempts, and the recorded values were used for analysis (8).

Statistical Analysis: IBM SPSS Statistics version 26.0 was used for data analysis. Mean ± standard deviation was used to express descriptive statistics. The relationship between core endurance, lower limb strength, and smash accuracy with smash velocity was examined using the Pearson correlation coefficient. At $p \leq 0.005$, statistical significance was established.

RESULTS: The study involved 85 badminton players, including 60 males and 25 girls. The average age of participants was 13.45 ± 1.09 years. The tables (1-14) provide the descriptive data obtained for the plank test, lower limb strength test, smash velocity, and smash accuracy. Correlation research revealed that core endurance, as measured by the plank test, had a negligible and insignificant connection with smash velocity ($r=0.028$). Lower limb strength had a positive link with smash velocity ($r=0.364$), as did smash accuracy ($r=0.468$). These data suggest that players with better jump performance and smash accuracy had higher smash velocity, although core endurance did not have a significant relationship with smash velocity in this study.

DISCUSSION

The present study examined the relationship of core endurance and lower-limb strength with smash velocity and smash accuracy in adolescent badminton players. The findings showed that lower-limb strength and smash accuracy were positively associated with smash velocity, whereas core endurance demonstrated a negligible and non-significant relationship with smash velocity. These results suggest that, in this study, greater lower-limb strength and better accuracy were linked with higher smash velocity, while static core endurance, as assessed by the plank test, was not independently associated with smash speed.

**Nitin Kumar Indora et al.,**

The positive association between lower-limb strength and smash velocity is consistent with the biomechanical demands of badminton. The forehand smash is a high-velocity, whole-body action in which force is generated from the lower limbs and transferred through the trunk to the upper extremity in a proximal-to-distal sequence. Ariff and Rambely (2008) and Rasmussen et al. (2010) described the badminton smash as a coordinated kinetic-chain movement that depends on efficient segmental energy transfer across the body. From this perspective, players with greater lower-limb strength capacity may be better able to generate push-off force, achieve favourable body positioning, and transfer energy more effectively during overhead stroke execution, thereby contributing to greater shuttle velocity. This interpretation is further supported by Preeti et al. (2019), who reported improvements in lower-limb strength, dynamic balance, agility, and coordination following Pilates-based training in badminton players, indicating that physical capacities linked with lower-body performance may influence badminton-specific skills. More recent evidence also strengthens this interpretation. Wang et al. (2025) reported that resistance training improves performance-related variables in competitive badminton players, with particularly favourable effects on jump-related and power-based outcomes, while Lu et al. (2025) found that velocity-based resistance training improved lower-limb strength and footwork speed in elite university badminton players. Collectively, these findings support the present result that lower-limb strength is an important contributor to smash velocity.

Another important finding of the present study was the positive relationship between smash accuracy and smash velocity. This suggests that higher smash speed was not achieved at the expense of directional control. Instead, players who produced faster smashes also tended to demonstrate better target performance. This pattern may reflect the contribution of overall stroke proficiency, coordination, timing, and movement control to successful smash execution. Jamil (2001) emphasized that badminton accuracy depends on a combination of fitness, speed, and skill, which is consistent with the present observation that velocity and accuracy may improve together in more proficient players. Recent evidence supports this integrated view. Wang et al. (2026) demonstrated that fatigue reduced both forehand jump smash speed and accuracy, indicating that these two performance variables are closely linked through neuromuscular control and stroke quality. Thus, the present finding likely reflects the fact that players with better technical and physical proficiency can produce both faster and more accurate smashes.

In contrast, core endurance measured using the plank test was not significantly associated with smash velocity. This finding should be interpreted cautiously and should not be taken to mean that trunk function is unimportant in badminton performance. A more likely explanation is that the plank test reflects static isometric trunk endurance, whereas the badminton smash requires dynamic trunk stabilisation, rotational control, intersegmental coordination, and rapid force transmission. Kibler et al. (2006) described the trunk as a central link for force transfer and proximal stability in athletic movement, and Willardson (2007) similarly emphasized that core stability contributes to sports performance through control and efficient force transmission rather than through isolated static endurance alone. Therefore, a field-based plank test may not adequately capture the sport-specific contribution of the trunk during a powerful overhead stroke. This interpretation is consistent with badminton-specific evidence. Hassan (2017) and Solanki and Gill (2021) reported that core stability training improved dynamic balance and smash stroke performance in badminton players, while Ma et al. (2024), in a systematic review and meta-analysis, concluded that core strength training can improve badminton performance, particularly in explosive and skill-related outcomes. Taken together, these findings suggest that trunk function remains important, but a static plank measure may not be sufficiently specific to demonstrate a direct association with smash velocity in the present study.

The age and developmental characteristics of the participants may also help explain the present findings. The study included adolescent badminton players with a mean age of 13.45 ± 1.09 years. At this stage of development, performance is influenced not only by isolated physical capacities but also by growth, maturation, technical learning, motor coordination, and exposure to structured training. In younger players, variables such as jump performance and stroke accuracy may show a clearer relationship with smash velocity than a simple field-based measure of core endurance. This may explain why lower-limb strength and accuracy emerged as more sensitive correlates of smash performance than core endurance in the present study. From a practical perspective, the present findings suggest that training programmes aimed at improving smash performance in adolescent badminton players should give

**Nitin Kumar Indora et al.,**

considerable emphasis to lower-limb strength conditioning and stroke-specific technical practice. Exercises targeting jump ability, rapid push-off, force production, and landing control may support improvements in smash velocity, while technical drills focusing on controlled shuttle placement may help enhance both accuracy and stroke effectiveness. At the same time, core training should not be excluded, as the core remains essential for postural control, movement efficiency, and force transfer; however, its contribution may be better assessed through dynamic and sport-specific measures rather than static endurance tests alone. Overall, the findings of the present study indicate that smash velocity in adolescent badminton players is more closely associated with lower-limb strength and stroke accuracy than with core endurance. Future studies should therefore use longitudinal or interventional designs, include more sport-specific measures of trunk performance such as rotational power and dynamic control, and account for potentially important factors such as sex, maturation, training load, and playing level.

CONCLUSION

The present study concludes that lower limb strength and smash accuracy are positively associated with smash velocity in adolescent badminton players, whereas core endurance does not show a significant association with smash velocity. These findings suggest that players with better jump-related explosive performance and better accuracy tend to produce faster smashes. Although core functions remain important in badminton performance, a static core endurance test may not adequately reflect the dynamic trunk contribution required during a high-velocity smash. Therefore, training programmes aimed at improving smash performance should place greater emphasis on lower limb strength and stroke-specific technical practice, while future studies should use more sport-specific measures of core function to clarify its role in smash execution.

ACKNOWLEDGEMENTS

The author is grateful to Dr Ravi, Dr Rohit, and Dr Jatin for their support and guidance. The authors also acknowledge the support of the Sukun Physiotherapy team, the participants, their parents, and the staff of the participating academies. Special thanks are extended to the late Ms Gurpreet Kaur, Director of Shree Ram Model High School, NIT Faridabad, for her support during the study.

Table 1: Demographic Details:

Variables	Mean±SD	P Value
Age (Years)	13.45±1.09	≤ 0.005
Experience (years)	2.71±0.92	≤ 0.005
Height (Cm)	2.44±0.36	≤ 0.005
Weight (Kg)	43.20±9.14	≤ 0.005
Body Mass Index (Kg/m ²)	17.68±2.81	≤ 0.005

Interpretation: The table summarises the mean and standard deviation for core plank, smash velocity, and smash accuracy

Nitin Kumar Indora *et al.*,

Table 2: The mean values of Core Plank, Smash Velocity, and Accuracy (Smash Stroke Performance) were 74.26 ± 19.41 , 64.25 ± 23.77 and 18.90 ± 12.48 .

Variables	Mean $\pm$ SD	P Value
Core Plank	74.26 ± 19.41	≤ 0.005
Smash Velocity	64.25 ± 23.77	≤ 0.005
Accuracy (Smash Stroke Performance)	18.90 ± 12.48	≤ 0.005

Interpretation: The table summarises the mean and standard deviation for core plank, smash velocity, and smash accuracy.

Table 3: The mean and standard deviation of LLEP and Smash Velocity were 29.14 ± 8.21 and 64.25 ± 23.77 .

Variables	Mean $\pm$ SD	P Value	R value
LLEP	29.14 ± 8.21	≤ 0.005	-0.028).
SMASH VELOCITY	64.25 ± 23.77	≤ 0.005	0.364

Interpretation: This table presents the means and standard deviations for lower-limb strength and smash velocity.

Table 4: Mean and Standard Deviation of Accuracy & Smash Velocity were 18.90 ± 12.48 and 64.25 ± 23.77 .

Variables	Mean $\pm$ SD	P Value	R value
Accuracy	18.90 ± 12.48	≤ 0.005	0.468
Smash Velocity	64.25 ± 23.77	≤ 0.005	0.364

Interpretation: Table present the descriptive statistics for smash accuracy and smash velocity among the players

Figure 1: Prone Plank Test

Interpretation: This Figure illustrates the prone test used to assess static core muscle endurance in the participants.

Figure 2: Right Lateral Plank Test

Interpretation: This figure shows the right lateral plank test performed to evaluate lateral core endurance on the right side

Figure 3:Left Lateral Plank

Interpretation: This figure depicts the left lateral plank test used to assess lateral core endurance on the left side

Figure 4: Vertical Jump

Interpretation: The figure presents the vertical jump assessment used to evaluate lower limb strength

Figure 5: Vertical jump-starting position

Interpretation: This figure shows the starting position adopted before performing the vertical jump test.

Nitin Kumar Indora *et al.*,**Figure 6: Vertical jump**

Interpretation: This figure illustrates the execution phase of the vertical jump test during maximal upward propulsion.

**Figure 7: Forward-Stroke Smash Performance Test**

Interpretation: This figure demonstrates the forward stroke smash performance test used to assess smash accuracy

**Figure 8: Smash Velocity Test**

Interpretation: This figure presents the smash velocity test used to measure shuttle speed smash execution.

Figure 9: Scatter graph Correlation between Core Plank with Smash Velocity, Interpretation: This figure shows the scatter plot representing the correlation between core plank and smash velocity.

Figure 10: Scatter graph correlation between LLEP and Smash Velocity Interpretation: This figure presents the scatter plot illustrating the relationship between lower limb strength and smash velocity.

Figure 11: Scatter graph correlation between the Accuracy test and Smash Velocity Interpretation: This Figure shows the scatter plot demonstrating the correlation between smash accuracy and smash velocity
